With the siege of Philip Augustus ends the main interest of this castle. In 1261 St. Louis dated a charter thence. In 1314 it was the prison of Margaret and Blanch, the adulterous wives of Louis Hutin and Charles-le-Bel. Margaret died there in 1315, some say being strangled. Blanch survived for a longer period, and seems to have been kindly treated.

In 1334 King David of Scotland found an asylum here. In 1356 it was the prison of Charles the Bad, king of Navarre. Another Charles, afterwards Le Sage, was a visitor here in that same year. In 1413 Charles VI. reduced the wages of the governors.

In 1419, after the battle of Agincourt, the English besieged Châteaun-Gaillard, which it took them sixteen months to reduce, and it is said that its surrender even then was due to the well-works being worn out, so that the water was inaccessible—a cause scarcely sufficient for the consequence, seeing that in so soft a rock steps could readily have been cut. The English then held it for twelve years. They were dislodged by escalade in 1431. Soon afterwards they again recovered it, but of these vicissitudes no particulars have been preserved, nor, unfortunately of their final loss of it in 1449, when Charles VII. in person laid siege to it, and by means of "bastilles," or wooden towers on the counterscarp took it in six weeks.

In 1591 the Leaguers held it, and rendered it to Henry Quatre in person. At the request of the States-General of Normandy it was then dismantled, all but the donjon. The battlements were taken off and part of the works blown up so as to render the place indefensible. In 1603 the Capuchin Monks of Great Andelys had a licence to remove timber, stone, and tiles from the ruins for their convent, and this destructive grant was extended to other orders. The donjon, however, was garrisoned until 1616, when Louis XIII. reduced the whole very nearly to its present condition.

It is thought that this is the earliest instance of a Norman machicolation, or rather of a Breton *tasche* executed in stone.

Châteaun-Gaillard has been fortunate in its historian and its illustrator. M. Deville's book on this building is not only an excellent history, of which what is given above is but an abridgement, but he has given plans of the building, which, if not strictly accurate, yet represent well its peculiar features. M. Viollet-le-Duc has made this castle the subject of parts of the articles "Siege," "Châteaun," and "Donjon" in his Dictionary, and, although some of his restorations are only probable, his general account of the works is a masterpiece of military description.

The traveller who can afford to pause between Rouen and Paris will not regret the employment of four or five hours in a visit to Les Andelys and Châteaun-Gaillard, or the purchase of the volume of M. Deville.

1867.

THE MANCHESTER TOWN-HALL COMPETITION.

ONE hundred and one of the preliminary designs, not selected, are now being publicly exhibited. To 78 of these (including four double sets) the names of their authors are appended. Amongst the competitors are seen to be Messrs. A. Billings, John Robinson, Medland & Maberly, E. W. Pugin, T. Allom, W. H. Beeley, J. Honeyman, C. S. Nelson, R. Reid, Ridge, E. B. Lamb, Mayhew & Calder, S. C. Frupp, James Hibbert, Hirst, H. S. Snell, J. B. Badcock, Finch Hill & Paraire, W. & G. Audsley, E. H. Carson, J. Pritchard, J. Moyr Smith, E. Godwin & Crisp, W. A. Moy, T. Roger Smith, Hayley & Dawes, &c.

EAST GRINSTEAD, SUSSEX; PROPOSED CEMETERY.

After much delay and discussion, it seems to be settled that East Grinstead shall have a cemetery. The principal entrance will be from the London-road into the Swan Mead, by Mr. Clarke's workshop, which is to be removed, crossing the Swan Mead by a semicircular roadway.

At the entrance of the cemetery will be placed the sexton's house and garden. Passing through the unconsecrated part of the ground we arrive at the two chapels, which will be in the Gothic style, and built of native stone with Bath and Mansfield dressings. The chapels will be divided by an archway, through which will be the entrances, and above will be erected a spire with bell-turret. The consecrated chapel will have a vestry attached. The portion of the ground on the south-west of the chapels, and leading from them to West-street, will be consecrated. The cemetery will be enclosed by a wall of native stone, with dressed coping, and iron gates at the two entrances. The design was made by Mr. J. L. Parsons, architect, Lewes, and it is estimated that the total outlay will be about 2,750l. The tenders were opened on Tuesday last, and that of Mr. Robert Pink, East Grinstead, accepted. The following were the tenders sent in:—

Longley & Fuller, Turner's Hill	£2,464
Mercer & Co., Tunbridge Wells	1,889
Walker, Tunbridge Wells	1,831
Morris, Ashurstwood	1,783
John Godly, East Grinstead	1,742
Chandler, Crawley Down	1,689
R. Pink, East Grinstead	1,671

Either Mr. Longley or Mr. Pink has made a bit of a mistake.

East Grinstead is looking lively, thanks to the railway. Building is going on in, and around it, and carriages rolling in from the increasing number of seats in the neighbourhood, to "do shopping," give life to the street. The country around is so charming, and the drives are so numerous and beautiful, that we look for an increase in its prosperity rather than retrogression.

ARCHITECTS AND QUANTITIES.

We have briefly alluded to some proceedings connected with the designs and tenders for the proposed Hertford Union new workhouse. Mr. J. C. Timmis, surveyor, thinks he has been ill-treated by the architect, and has sent us a biography of the transaction from his point of view. We are unable, however, to print the whole of it, but give his reasons for being so determined, and as some of your readers may be inclined to think rather important.

1st. Because I had obtained permission from the building owners, and saw no reason why the architect's caprice should be allowed to act to my detriment, and to frustrate the wish of the guardians.
2nd. Because some of the builders who instructed me much wished to submit a tender, but they would rather not do so than be forced to take Mr. Peck's quantities, unless the quantities could be made part of the contract, into which I knew the guardians would not consent, as Mr. Peck had been pleased to say he would guarantee the accuracy of his own work in a bond of 1,000l.; and if such an unusual course as this was deemed necessary by Mr. Peck or the guardians, I thought it only fair to look to the builder's interest.

3rd. Because I have known bills of quantities prepared by Mr. Peck very recently to issue from his office without Mr. Peck's autograph on the endorsement, and as a rule, I think builders like to know upon whose quantities they are tendering.
4th. Because my opinion of the right course to adopt was confirmed by ten highly respectable members of the profession.

In consequence of statements made to the Board of Guardians by Mr. Peck, the selected architect, respecting the mode in which the quantities were being taken out; and after Mr. Peck's refusal to let Mr. Timmis see the plans and specifications to take out the quantities on behalf of eight or ten building firms, although Mr. Timmis had an order from the Board to that effect, to Mr. Peck for him to see them,—Mr. Timmis addressed the following letter to several firms:—

"I am desirous to get some evidence as to the custom of taking out quantities, and shall feel obliged by your kindly answering the question on the other side. The principal points are as to the propriety of an architect taking out his own quantities, and refusal on his part to allow a surveyor nominated by some eight or ten builders to have access to the drawings, and take out the quantities on their behalf."

These opinions being of general interest, we reprint the whole of them:—

QUESTIONS.	MESSRS. STRUDWICK & BARRY.	MR. W. H. GRITTEN.	MR. J. S. LEE.	MR. E. LAVERDER.	MESSRS. STRUDWICK & MENNIE.	MR. T. M. RICEMAN.	MR. D. W. YOUNG.	MR. P. H. SMITH, BERTS.	MR. JOHN GILLES.	MR. J. H. H. DOUGHERTY.
1. Is it usual for an architect to take out the quantities of work designed by himself?	1. No.	1. It is not usual nor desirable, but is often done.	1. No.	1. Certainly not.	1. No.	1. Not in new works.	1. No.	1. No.	1. No.	1. Certainly not, as he would thereby become an interested party, and disqualified to do his duty to his employers.
2. Is it usual for him to have them taken out in his office by his clerk, or a person acting in such capacity, and not practising as a quantity-surveyor?	2. It is contrary to the Rules of Institute of Architects.	2. As above.	2. No.	2. I should consider it most unjust and full of risk to the building owner.	2. No.	2. I never heard of such a case.	2. Certainly not.	2. Decidedly not.	2. No.	2. Creditable not, as this method is an endeavor to avoid incurring any responsibility for the accuracy of the quantities either to the employers or the builders, and may be adopted by incompetent persons.
3. Is it customary for an architect to guarantee the accuracy of the quantities when prepared by a surveyor of his own nomination?	3. No.	3. No.	3. No.	3. No.	3. No.	3. I do not consider that an architect can properly guarantee quantities.	3. No.	3. Decidedly not.	3. No.	3. It is not customary, neither have I ever heard of such a proposition.
4. If the quantities are taken out by the architect, or by his clerk, or by any person appointed by him, is not the building owner liable for any deficiencies, the architect being his servant?	4. We believe so.	4. I should think so, though I do not know the law on the subject.	4. Yes, in the absence of any agreement to the contrary.	4. Yes.	4. Yes.	4. I understand such to be the case.	4. I should imagine so.	4. Yes.	4. I believe so.	4. The architect being the building owner's agent, and having the power to pledge his client's credit for his benefit and to the detriment of the work, is undoubtedly liable for any deficiencies.
5. Is it the practice of every day that a surveyor is appointed by the builders, to examine the plans and specifications, and to take out the quantities for them, either by himself or in conjunction with a surveyor appointed by the building owner?	5. Certainly, if large amounts.	5. It is usual practice in large works for two surveyors to be appointed, one by the architect and the other by the builders.	5. Yes.	5. It is the rule in the War Office in all contracts over 5,000l.	5. Yes.	5. In all works of any importance it is usual for the builders to have voices in the nomination of the surveyor.	5. Most decidedly.	5. Yes.	5. Certainly.	5. In large works it is usual and customary, and the most equitable method, for a majority of the builders to appoint a surveyor to take out the quantities, with a surveyor for the owner, and the two surveyors are then liable separately and jointly to the building owner for their accuracy, and no liability attaches to the owner.
6. Is the surveyor appointed by the builders responsible to them for the correctness of quantities?	6. Yes.	6. Yes.	6. Yes.	6. Yes, certainly.	6. Yes.	6. Yes.	6. Yes.	6. Certainly.	6. Yes.	6. Yes, if appointed alone; but if conjointly with one on behalf of the owner, then both are liable.
7. If the quantities are taken out by a surveyor appointed by the builders, can the building owner become liable for any inaccuracies?	7. No.	7. No.	7. No.	7. No.	7. No.	7. No.	7. No.	7. No.	7. No.	7. No.
8. Is it the custom for the surveyor or surveyors to affix their names and addresses at the bottom of each bill of quantities, as a guarantee of accuracy?	8. Yes.	8. Yes, invariably.	8. Yes.	8. Yes, invariably.	8. Yes.	8. Certainly.	8. Most certainly.	8. Invariably.	8. Yes.	8. Most undoubtedly. No respectable architect would be of course of quantity to go out of his office without doing so.

* Mr. Giles adds: I think it a very bad and dangerous system for architects to bays anything to do with "quantities."

THE GATESHEAD TOWN HALL DESIGNS.

THE Town Hall Committee have reported that in accordance with the resolutions of the meeting of the Town Council, held on the 17th July last, specifications and detail drawings have been furnished by Messrs. John Johnstone & Thomas Oliver, and a specification and two drawings have also been furnished by Messrs. Austin & Johnson.

The Committee met on the 5th ult., and directed the specifications and detail drawings of the three designs to be referred to Messrs. Reed, with a request that they would state the total cost at which each design could be executed.

Mr. Reed stated that the total cost at which the designs of Messrs. Thomas Oliver & John Johnstone could be carried out might be ascertained for 50L, provided the Committee would also engage a competent person on their part to go through the designs with him. Mr. Reed also intimated that the two drawings sent in by Messrs. Austin & Johnson were not sufficiently in detail to enable him to state the total cost at which their design could be executed.

The Committee have engaged Mr. J. G. Brown, architect, Sunderland, to go through the specifications and drawings on their behalf, at a fixed remuneration of 50L; and Messrs. Reed and Brown are actively proceeding with this work. The Committee requested the confirmation by the Council of the proceedings they had adopted in this matter, and their authority to pay to Messrs. Reed and Brown the sum of 50L each, on the completion of their reports, &c., to the satisfaction of the Committee.

The Council passed the following resolution in connexion with the motion that the report be adopted:—"That the architects be invited to attend to give evidence on all occasions on which the estimates of the plans are being considered."

THE TRADES UNION INQUIRY AT MANCHESTER.

OUR readers, who may remember the account we gave some time ago of a shameful strike against an architect in Manchester, will scarcely be surprised to learn how completely organized the system of tyranny and terrorism has been proved, by the evidence before the Commission, to be in the Manchester district. Were all the metropolitan burglars and murderers, thieves and fire-raisers to be invited into the witness-box as into a confessional, with the promise, on Government authority, of having all their sins pardoned unless they did not confess all, no more revolting or horrifying exposure of villainy could thus be obtained. The Manchester tribe of Thugs are far wiser in their generation than those of Sheffield. They have reduced their despotism to an elaborate system, with laws and regulations, under fearful penalties for infringement against all and every one who has the misfortune to come within the scope of their operations. And this is especially the case in certain branches of the building trades. The violence and plunder in the shape of broken bones and murder, fines and penalties, destruction of property, ruin in business, and so on, are not merely levelled against masters as a class, but against fellow-workmen. Non-unionists must not live, inasmuch as masters must not give them the means of life, either for themselves or their families,—in short, must not employ them at all; otherwise, both the master and his men know the certain consequences, which are of vital import to both. We spoke of one master having been ruined in his business "for life," and another for a stated number of years at Sheffield: that is nothing; in Manchester we have the principle carried out as a general rule.

A master bricklayer or brickmaker must only employ unionists, under certain stated penalties on both, ranging from 5L to 50L on the master, according to circumstances; and it is well with him if he has not property destroyed beyond even that amount besides, or his business stopped altogether. If he dare to complain of bad work he is fined 5L, and will be, over and over again, and compelled to pay it, too, or to suffer something worse, unless, as he is often obliged to do, he stop work altogether. The making of bricks by machinery is strictly prohibited. The bricklayers, by a special treaty with the brickmakers, have refused to lay machine-made bricks, and the brickmakers refuse to supply hand-made bricks to masters who use those made by the

machine. Moreover, the machines are destroyed. And all this is done, although it is almost universally admitted, and is undeniable with any truth, that "machine-made bricks are better and cheaper than hand-made, and would supersede them in an open market." Bricks must not even be transferred from one district to another: none but Manchester bricks must be used in Manchester district. One would almost suppose that the stupid brutes who inflict the penalties for infringing such rules bear malice against the horses used on such occasions, because they are not unionists. Hamstringing the horses is a mild mode of punishing both them and their masters, and so is cruel violence to the carters. The executioners of the decrees will even torture a horse to death for doing his work: they will tie it up by the head, apply shavings to its belly, and set it on fire, keeping up the fire for a couple of hours till it is burnt to death!! Was anything so abominable ever done in all the devilry of the first French Revolution? Never. Yet this has been done by the trades unionists of Manchester.

EXHIBITIONS.

It is proposed to hold another International Working Men's Industrial Exhibition next year in the Agricultural Hall, Islington, if the hall can be obtained for the purpose. A meeting to promote the object in view has been held in the King Edward Tavern, Liverpool-road, and there a public meeting was resolved on, to be held in St. Pancras Vestry-hall, on Monday evening next. Mr. McCallagh Torrens, M.P. for Finsbury, is to be requested to take the chair.

The Eastern Counties Working Men's Industrial Exhibition, at Norwich, has been closed, after being open daily for six weeks. It has been successful. The receipts amounted to upwards of 900L. The average weekly attendance amounted to upwards of 10,000 persons. This satisfactory result is attributed to several causes,—first, perhaps, to the novelty of the undertaking; next, to the creditable character of the exhibition itself; and lastly, to the way in which the committee have discharged the duty of management, and provided for the amusement as well as the instruction of the visitors, in the musical programmes which they have weekly issued. The various bands and musical societies of the city also came forward and gratuitously gave their services to the committee. The prizes will be distributed on the 6th of November, in St. Andrew's Hall, under the presidency of the mayor. Some of the articles exhibited are to be sold by auction.

CONTINENTAL NEWS.

Brussels.—Immediately after the death of the late lamented King of the Belgians subscriptions were set on foot throughout the country for the purpose of erecting a fitting monument to his memory, and contributions were at once forthcoming for so laudable an end. The amount collected in this manner now amounts to 252,705 francs, to which must be added 200,000 francs from his present Majesty, 50,000 francs from the Count of Flanders, and 1,000,000 francs from the State, making a total of upwards of 62,000L. A recent decree of the Minister of the Interior and of Public Works determines the form the memorial shall take. A large public park is to be laid out at Laeken, and will contain a special monumental structure (the form of which, however, has yet to be decided) to the late king's memory. It will stand immediately opposite the castle, and near the church erected to the memory of Queen Louise Maria. The park will be a great acquisition to the environs on that side of the capital, and will include drainage and other improvements much wanted in that low-lying neighbourhood.

Cologne.—The Domban Society has just celebrated the twenty-fifth anniversary of its creation, and the proceedings were the more interesting as the Crown Prince of Prussia was present, and also became the top stone of the beautiful and elaborate gable over the western porch—between the two towers—was laid with due ceremony on that occasion. His royal highness concluded his answer to the address presented to him with the following words:—"With joy and pride I am amongst you this day, for I have fresh proofs of what German industry,

German strength, and German endurance have brought about in a few years; and these mighty walls, which have risen immensely within the last twenty-five years, should be to us a symbol of the great step our fatherland has but lately taken. Let us continue together with iron steadfastness of purpose to finish the work even to its last stone, and let us not rest until the colossal towers shall proclaim in farthest distance the glory of the German name."

Dresden.—The committee appointed to award the prizes for designs for the new Academy of Arts, to be erected in that city, has just published its award. Messrs. Vielweger & Peritz, of Leipzig, obtain the first prize; Mr. Lipsius, of Leipzig, the second; and Messrs. Rosbach & Rumpel, of Dresden, the third. A fourth design, motto, "Art is regal," received honourable mention.

Hamburg.—The authorities here have published an order fixing the size of common bricks, said order to take force on the 1st of July next. We mention this unimportant fact because the dimensions seem so curiously chosen, namely, 9½ x 4½ x 2½. In the south of Germany, where the decimal system is daily gaining ground, the dimensions are 10 x 5 x 2½, which seems a readier proportion, though, doubtless, in the above figures due allowance is made for joints.

SANITARY MATTERS.

Worcester.—Dr. Lankester lately delivered a lecture in the Guildhall, at the request of the United Vestries' Sanitary Committee, upon sanitary arrangements as they affect the health and mortality of the people. There was a poor attendance. The lecturer urged in a forcible way the importance of good sanitary arrangements to health, and recommended the appointment of an officer of health. The still defective state of the local drainage was adverted to, and the amount of the mortality of the city, which was said to be 27 per 1,000 of the population, declared to be more than it ought to be. The local *Chronicle* in reference to this point remarks in a leading article on the subject of the lecture, that in October, 1859, the mortality was 25 per 1,000; that since that time, 60,000L have been expended on the drainage; and hints, therefore, that sanitary improvement is worse than useless. The argument reminds us of more than one somewhat similar case. After the drain-god of Croydon, for example, had been effected, it was found, to the perplexity and mortification of those interested, that a very serious increase of mortality took place, with typhoid fever prevalent. Croakers against sanitary improvement had it all their own way for a little, but it was soon discovered that from defective arrangements connected with the drainage, sewer gases got into the houses and rendered them more unhealthy than they were before the drainage had been carried out. This defect in the drainage being remedied and other sanitary progress made, Croydon became far more healthy than it had formerly been, and now it is regarded as one of our most healthy towns, and a proof of the benefit of sanitary improvement. We do not mean to say that the defect in the drainage of Worcester is precisely of the same nature; but this and other cases go to show that the 60,000L expended are not worse than useless as regards the local health, and that a little further expenditure is probably requisite before the original outlay will yield all the profit it is capable of conferring on Worcester. The writer of the leader referred to says:—

"The public are entitled to know exactly what are the points of detail in which the sewerage is pronounced to be shortcoming, and what is the exact nature of the deficiency in Worcester sanitary arrangements. If these particulars be not supplied they will be tempted to regard the alarm so lustily rung by Dr. Lankester, at the instance of the united vestries,—suddenly associated for the purpose,—as mere empty thunder, meant to terrify them into the appointment of an officer of health off-hand, the parasites of a certain class of philosophers, who have got hold of the seal of science by the tail, for all the ills that flesh is heir to."

What is the exact nature of the deficiency or shortcoming in the sewerage details and sanitary arrangements, it appears to us, was just what Dr. Lankester urged should be discovered and remedied for behoof of the public, and in order that all possible benefit might be derived from the work already done and the money already expended; but it appears, to apply a somewhat vulgar but expressive axiom to the objector's figure of speech as to the eel and its tail, as if he willingly ate the eel but felt inclined to choke

upon the tail. Such a line of argument as this writer's is not creditable to any respectable and well-conducted journal such as many years' weekly acquaintance with it assures us the Worcester Chronicle is. Moreover, the editor has since discovered that both the writer of his article and Dr. Lankester were wrong; the mortality is now only 234—not 28; but even that requires a further reduction.

Maidenhead.—A Government inquiry has been made here, respecting the sanitary state of the town, before Mr. Arnold Taylor, the Government inspector. Some of those in authority were evidently inclined to throw obstacles in the way of the inquiry; and one of them, Mr. Baker Smith, barrister, who appeared on the part of the local Board, or rather of the Mayor without the authority of the Board, applied the argumentum ad hominem to one of the complainants, Mr. Hibbert, who Mr. Smith said was "the very personation of health," and a very fitting and proper personation too in one of those who desired to confer similar health upon the whole town. But Mr. Baker Smith's peculiar ideas on sanitary subjects may be gathered from the fact that he called a witness to prove that his hay-makers drank the water of a stinking ditch complained of, but lately cleaned out, in preference to so much beer (being a good deal stronger, we suppose), and that he had had some that morning and it was very good. The result of the inquiry was that the inspector intimated that if the local Board satisfied the Secretary of State that they were really going to work, the matter might not be pressed further.—At a recent meeting of the local Board of Health, the surveyor reported he had seen Mr. Bird, respecting plans for the drainage, and if he were appointed to do the work he could work with the present plans, but could not lay down new plans with other persons' levels. Mr. Bird's terms for making the necessary plans and superintending the works would be 5 per cent. on the first 2,000*l.* and 2½ per cent. on the remainder. Mr. Bird would be willing to let the payment for the works be spread over some years. The following resolution was carried:—"That this Board sanctions Mr. Bird doing the work at a schedule of prices to be submitted to a committee, and that a committee of the Board be formed who are favourable to the said plan, viz., to draw off all sink and waste water from houses and manufactories, to carry it out." A committee was then formed.

Canterbury.—The directors of the Canterbury Gas and Water Company having reported to their shareholders that they strongly recommend the adoption of Mr. Homersham's plan of water supply from a well in Winchvale in preference to Mr. Filbrow's from Silverhole, or from Miller's field, the shareholders have adopted the report of the directors, and empowered them to raise 17,000*l.* for the purpose in 10*l.* shares.

DRAINAGE OF TOWNS IN THE THAMES VALLEY.

UNDER this title two members of local Boards, Windsor and Eton, and who are also medical men, have addressed a communication to members of local Boards generally, setting forth the difficulty they find in determining on the best system of drainage for their respective districts.

"There appear to us," they say, "to be three systems of drainage worthy of special consideration, either on account of their intrinsic excellence, or of the sanitary engineers who advocate them—

1st. That in which the whole of the sewage and rainfall of a district is conveyed by one set of sewers to a given point.

2nd. That in which the sewage and a portion of the rainfall is conveyed by sewers to one outlet, whilst the remainder of the rainfall is carried away in a composite manner to the nearest watercourse.

3rd. That in which the sewage and the rainfall are kept perfectly distinct, and each conveyed away by itself to a sewer to a given outlet, and the rainfall to the nearest watercourse.

The first system is that which has hitherto been in general use, wherever a town has been able to discharge its drainage into a river or into the sea. The whole of the sewage, as well as the whole of the rainfall from the houses, streets, yards, &c., and the subsoil water, is conveyed by one channel to a given outlet. This resembles the system upon which Windsor and Eton have been drained, and upon which the drainage of London itself is now being completed.

It appears to us to require no great engineering skill to see that, to pump all this uncertain quantity of matter on to land for irrigation purposes, is simply impracticable, and very questionable as an agricultural experiment, first, at the very times when the soil would least require irrigating, then the supply would be most abundant, and it might be given at the wrong time. The profit or loss in this ultimate disposal of the sewage is quite as much a matter for consideration as the expense incurred in the actual draining of the town itself. The subsoil of the towns in the Thames Valley in flood time is in direct com-

munication with the bed of the river; so that the faster the pumps acted at one end of the drain, the faster would the water pour in at the other, and along the whole line; in fact, it would be pumping the river itself, and the subsoil would be now the driver for the process. The river also, at the same time, would rise and bring back the water upon the engine, unless there were a valve and dam to shut the river out. The rain, also, would be pouring off the roofs of the houses, to the right amount as well as in the day, so that it would appear impossible that this system should help us out of our troubles."

After discussing the first and second systems they set forth the third, in which the drainage and rainfall are kept distinct from first to last. They incline to this:—

"We were lately with several other members of our local boards to inspect the asylum and adjoining buildings at Broadmoor, where this plan was carried out in accordance with Mr. Monzie's instructions, and under his supervision from first to last. The area of the roofs, as ascertained, was 23 acres; the area of the site of the buildings about 17 acres; the population varying from 600 to 800, but arrangements made for an increase to 1,000. Here we found the rain-water off the roofs all saved for washing purposes; the surface water discharged into the nearest ditch, and all the soil drainage conducted by itself, filtered, and applied to about 15 acres of land for utilization. One part of this land was planted with Italian rye grass, the third crop of which was then in cut. This was irrigated with the water, and the cows fed on it with an excellent supply of milk, and this is used in the establishment. Another portion of the land was planted with turnips and oats, but not irrigated this year; and a third portion of the land was laid out as garden ground. Here the appearance of the different vegetables and fruit was perfectly astonishing; everything looked so fresh, healthy, and clean. The contrast presented by this garden to the surrounding heathy and barren district was most striking, and certainly most encouraging. The man who attended to the irrigation told us he had not had a day's illness since he had begun to occupy it. What struck us most was the extreme regularity and economy of the system: one man attending to the whole process. We visited one point where the drainage is ultimately discharged into a brook, and took notice of the water as it passed from the drain: this to the taste, smell, and sight, was not to be distinguished from ordinary spring water."

They want further advice. They do not understand, they say, the recommendation of the Rivers Commissioners (though its meaning seems to us quite clear), and they ask for a committee of members of Parliament, or some such non-professional body, to assist local Boards. If engineers cannot yet quite settle the question, we can scarcely expect a solution of it from amateurs.

SEWAGE IRRIGATION AND WATER SUPPLY.

Sir,—I suggest that sewage irrigation should be carried on under cover of a glass roof over an inclosed space, and that the sewage should also, when expedient, be heated before it is applied to the land. By this means a less area of land would suffice for the sewage. The sewage might be preferably distributed under the surface, for by that method the noxious gases would be absorbed by the dry earth. By the exclusion of rain-water the earth would receive but a better more sewage. By maintaining a high temperature the growth of vegetables would be more rapid, and, therefore, more sewage would be used. In, and above the earth, vegetables, fruits, and flowers might be forced and sent back to the producers of the sewage. The rain-water falling on the glass roof might be collected in reservoirs and sent on to the towns below. Instead of, as now, sending them sewage. The plan of construction might be very simple. Any size piece of land might be covered with a glazed roof, about 6 ft. from the surface of the land, supported on gutters in rows, about 10 ft. apart, and these gutters supported on hollow pillars standing in a water channel. The rain-water falling on sections of the roof would flow along the gutters down the hollow pillars and along the channels to the reservoir. The plan provides for the utilization of sewage on a less area of ground, for the growth of forced vegetables, and for a supply of rain-water. For the provision of any one of these alone, perhaps the outlay might be profitable.

J. WHITE.

POULTRY FARM.

Sir,—I am about establishing a poultry farm. Can any of your correspondents inform me where any are to be seen in working, the best books on the subject, and what number of fowls are calculated at per acre?

ROOSTER.

CONCRETE HOUSES AND THE BUILDING ACT.

Sir,—Referring to the letter inserted in the last number of the Builder, I beg to state, for the information of your correspondent, who proposes to erect concrete cottages, that about eighteen months since I felt it my duty as district surveyor to direct the erection of concrete walls to houses; and my reason for doing so was this:—After giving the matter my most careful consideration, I came to the conclusion that the rules in the Building Act, as to the construction and thickness of walls, did not apply to or include the particular kind of concrete walls described as intended to be built. For although in "Clause I, 1st Schedule, Preliminary," mention is made of "other hard and incombustible substances;" yet this clause, taken in connection with the next, "shall be properly bonded and solidly put together," I think prevents the district surveyor from allowing the erection of such concrete walls as were proposed to be built; that is, of materials mixed in a particular manner, to be held together by means of long boards, or iron plates, fixed on

both sides of the wall until the concrete had set. When done, such walls could not be said "to be properly bonded," having regard to the strict technical meaning of the word "bonded." At the same time, believing the Metropolitan Board had power to deal with this case pursuant to sec. 56, part I, of the Building Act, I accompanied my objection with a recommendation to the builder to make application to the Board on the subject. I understood the builder did so apply; and as the houses I understood had not been built, I conclude the Metropolitan Board refused their consent. This, however, could be easily ascertained by applying at the office of the Board.

HENRY LAYTON, District Surveyor of Camberwell.

* * * We remain of one opinion that the construction of concrete houses is not prevented by the Metropolitan Building Act. It is desirable that the matter should be at once authoritatively settled. The Board of Works have the matter now before them.

PHOTOGRAPH OF THE VICTORIA TOWER.

MR. STEPHEN AYLING has produced a very remarkable photograph of the Victoria Tower, Westminster. It is taken from a height about level with the roof of the Royal Gallery, and shows the tower from the bottom to the top, and the adjacent portion of the building below. The tower is perfectly upright, and all the detail comes out with wonderful sharpness; it is, in short, a marvellous work. Lambeth Palace, faintly delineated, is seen on the other side of the river. The size of the photograph is 22½ in. by 16½ in.

HOUSE-AGENTS' CHARGES.

At the Warwick County Court the Deputy Judge read the following judgment by Mr. F. Dunsdale, in the case of Wilding and Brown v. Leech, which was heard at the last Court:—"This action is brought to recover 13*l.* and the following circumstances. In the year 1864, the plaintiffs, who are house agents at Leamington, were employed by the defendant to procure a tenant for the defendant's house and premises in Leamington, called Spotsland Villa. They introduced to him Mr. John Wackrill, who took the premises under a written agreement bearing date July 16th, 1864. The tenancy was to be from August 12th, 1864, to March 25th, 1865, and for three years next ensuing the latter day, and defendant paid to plaintiff the sum of 4*l.* 10*s.* as their commission on such letting. On setting the terms of the agreement, Mr. Wackrill appears to have required the insertion of a clause giving him the option during the continuance of the term of purchasing the premises for the sum of 700*l.* to which the defendant reluctantly assented, and on which Mr. Wackrill has elected to purchase the property, whereas the plaintiffs, relying upon an alleged custom of their business, claim the sum of 17*l.* 10*s.* as their commission on a sale, at the same time giving him credit for the sum of 4*l.* 10*s.* the commission on the letting previously paid to the defendant. Now, there is no question that, if in the language of Chitty, there is an invariable, certain, and general usage or custom of any particular trade, persons contracting with members of such trade upon a matter to which such usage or custom has reference, are bound by it, whether they have knowledge of such usage or not; but it is incumbent on the plaintiffs relying upon such a custom to prove its evidence to the satisfaction of the Court clearly and undeniably. That the plaintiffs have in this case failed to do, having regard to the evidence of Mr. Cooke on cross-examination, and the direct testimony of Mr. Hawkes, it is impossible for me to find that the plaintiffs have proved the custom they rely upon to entitle them to my judgment. Therefore direct judgment to be entered for the defendant." Mr. Overell, who appeared for the defendant, applied for costs, which were allowed.

FALL OF A CHIMNEY IN NEWCASTLE.

A SERIOUS accident has happened in Onseburn, Newcastle, resulting in the death of one person, the injury of another, and the destruction of a very considerable amount of property. The place of the catastrophe was Mr. C. T. Malings's Ford pottery, Onseburn. The accident was the fall of a chimney, or shaft, 100 ft. in height, upon a mill, in which many persons were engaged in the grinding of flint, and manufacture of jars and other articles used by makers of marmalade and jams. Recently, Mr. Maling has been improving his premises; the flint mill, formerly of two stories, having been raised by another floor. This extension has been carried out during the past three or four months. The foundations of the shaft had been laid 30 ft. below the ground, and were of stone. The proposed work had been approved by Mr. Bryson, the borough surveyor, at the time, and even more precautions, it is said, had been taken to render the work more substantial than he had thought necessary. The chimney was about 8 ft. square, and had reached its full height—100 ft.—the last stone being about to be placed on the summit. The brick-work of the chimney was about 18 in. in thickness. The lightning conductor would have been fixed probably in a day or two. The damage, it is said, will amount to some 2,000*l.* or 3,000*l.* The chimney, it is suspected, fell through some

sinking or defect in the foundation. A cause of weakness has been suggested by some, that the chimney had not yet been tied by iron bands. The old chimney, which was to have been removed on the completion of the new, possessed hands which, it is said, were intended to be used hereafter for securing the new chimney. The demolition was so complete that scarcely a single instance occurred where two bricks were found adhering to each other. It was also observed after the accident that the mortar used was not dry, even towards the base.

PARTNERSHIP OF INDUSTRY.

A *réunion*, in Whitwood, Yorkshire, of a suggestive kind, has taken place. It was a *soirée* in commemoration of the conversion of the collieries of Messrs. Henry Briggs & Sons, at Lillworth and Methley, into a partnership concern, in which the workers have an interest, and a bonus is paid yearly to every labourer, in proportion to his wages and the success achieved. Up to two years ago the proprietors had constant disputes with their workpeople, and, as a consequence, the success of the firm was small, and the dividends by no means satisfactory. The proprietors formed a company, on the limited principle, in which the workmen are allowed to have shares, and after a fixed dividend has been paid upon the capital the remainder of the profit, provided there is any, is divided amongst all interested, including those labourers who have no pecuniary stake in it. The *soirée* was attended by 1,800 persons, all in some way interested in the colliery. The chairman said that they had been able to divide a large sum amongst their operatives. Last year it was 1,800*l.*, now it was 2,700*l.* He believed that they would continue to prosper, and that the operatives would improve in their character for steadiness, thrift, and sobriety, as they had already done. Mr. Hughes, M.P., congratulated the meeting on the great success of the concern during the past year. Both those who advanced the money, and those who worked in the collieries, being pleased with the results of their year's labours, this, he remarked, was a strong proof that they were in the right road, not only to success, but to something higher than any mere money success could bring.

PROVINCIAL NEWS.

Reigate.—The copyholders of the manor of Reigate have agreed to give up to the Corporation sixty-three acres of land on Earlswood-common conditionally, on the purchase by the Council of the sixteen acres of land formerly bought by the Government for the purpose of building thereon a military hospital, to be laid out as a recreation-ground for the people. The Council thus secure a pleasure-ground, and at Earlswood a place in which to dispose by irrigation of the sewage which the new drainage works will take from Warwick Town, and both at a comparatively small cost.

Bristol.—The contract for the new drawbridge at the bottom of Clare-street (or rather for the ironwork of it) has been obtained by Messrs. Finch & Heath, of Chepstow. Their estimate is 1,590*l.* The bridge is to be completed in about three months. The new Colston's Hall, St. Augustine's, which has been in the course of erection for the last four years, is now completed. The portion finished forms only a part of the original design: it is said to have cost 25,000*l.*, and that 15,000*l.* more will be required to complete the plan. The new hall is 150 ft. long, 80 ft. wide, 70 ft. high, and will accommodate 3,000 persons. The capitals of the freestone columns, the window and door frames, &c., are carved; the ceiling is ornamented with panellings, and a cornice runs round the room. The orchestra will hold 400 performers, and space is left in it for a large organ. The spandrels over the arches are to be enriched with medallion portraits of celebrated Bristol citizens. Two are already occupied with busts of Mr. Geo. Thomas and Mr. Conrad Finzel. The hall is lighted with fourteen large semicircular windows of coloured glass. The chandeliers are of Mediaeval pattern brass work, painted chocolate and gold. Provision has been made for heating and ventilating the hall.

Lancaster.—A site for an asylum at Lancaster for the idiots and imbeciles of the northern

counties has been obtained, comprising 67 acres of land, and the buildings—capable of accommodating 500 patients—are now in course of erection. Nearly 40,000*l.* have been obtained, and 20,000*l.* more are required to complete the buildings and fit them for the reception of patients. Vigorous steps are being taken to realize the requisite sum, and a committee has been appointed to obtain subscriptions.

Bradford.—The foundation stone has been laid of a Tradesmen's Home, auxiliary to the Tradesmen's Benevolent Institution. The work of erecting the cluster of dwellings which are to be known by this designation has formally commenced. The site of the Home is a field at Lillycroft. The Home will consist, when finished, of thirty houses, placed so as to form three sides of a quadrangle, of which the length is about 105 yards and the width 33 yards, open towards the south. In the centre of the longest side of the square is a reading-room, 21 yards long and 10 yards wide, with an open timber roof and apsis! end. This room is intended for the recreation of the inmates of the Home. Each of the houses contains a parlour, living-room, pantry, coal-place, and outbuildings on the ground-floor, and two bed-rooms above; and as each of them has also a separate back-yard and doors at front and back, the occupant of each will be quite independent of his neighbour. The erections are to be entirely of stone, and the roofs will be covered with Taylor's patent tiling. Pointed architecture has been selected for the style of building. The windows have no mullions, however, and a domestic character pervades the whole of the structure and fittings. The contractors are Mr. Richard Crabtree, mason; Messrs. John Ives & Son, of Shipley, joiners; Mr. John Lattewell, alster; Mr. Samuel Ullathorne, plumber; Mr. Thomas Hargreaves, plasterer; and Messrs. Brown & Pullar, painters, all of Bradford. The Home will be erected from the designs and under the superintendence of Messrs. Milnes & France, architects.

Yarmouth (Isle of Wight).—By the plans of the Bouldner estate, it is intended to erect a large number of fashionable villas and lodging-houses, and a church is to be built in the centre of the estate. A pier is to be made to run on a long distance northward into the sea, for the accommodation of yachts and steamboats visiting the new town which is now about to spring up. In addition to this an esplanade along the seaside is to be made, besides new roads and pleasant walks which are to be laid out, to afford every convenience and accommodation to the residents and visitors. The surveyors are already engaged marking out the roads and plots for the various erections. 100 men, it is said, will shortly be employed on the works. Bouldner is situated about one mile from Yarmouth. It is well timbered, and has a pleasant view of the Solent, ranging from Hurst Fortifications to Spithead. At Yarmouth itself there is ample room for improvement, and other lands, situated between Yarmouth and Bouldner, are offered for disposal on building leases, one villa having already been built and another partly finished.

Overstrand.—The old church having fallen into ruin, and being very insufficient for the accommodation of the parishioners, Mr. J. H. Gurney, some time ago, originated the intention of building a new one. This, after a delay of two or three years, has now been accomplished, and a small church has been completed by Mr. R. Cornish, of North Walsham, as contractor; Mr. A. Salvin, of London, being the architect.

STATUES AND MONUMENTS.

The first of the statues to be placed in the vacant niches in the west front of Salisbury Cathedral has been fired. It is the statue of Christ holding a globe, and is 7 ft. high.

A huge block of stone is being removed from the quarry of Messrs. Townshend, at Moscar, near Ashopton, to Heeley Churchyard. The stone, it is calculated, weighs over 20 tons, and it is intended to be erected, after suitable dressing, over the tomb of the late Mrs. Shortridge. The process of removing so vast a block has been a work of great difficulty. After the lapse of ten days since the work of removal commenced, the stone had only reached the neighbourhood of Rivelin Bridge. Day by day thirty horses had been struggling with the work of drawing it—the roller on which it rests weighing in itself 6 tons.

The group of sculpture executed in Paris, from designs by Ross Bonheur, representing a tigress bringing food to her cubs, and presented to the city of Glasgow by Mr. Kennedy, of New York, has been formally uncovered on its site in the lower level of the West-end Park. After the ceremony of unveiling the party adjourned to Kelvin Grove House, where wine and oske were served, and various toasts were given appropriate to the occasion.

CHURCH-BUILDING NEWS.

Highway.—The little church of Highway, which has been completely rebuilt at the sole expense of the Hon. and Ven. Archdeacon Harris, the incumbent, has been consecrated by the Bishop of Salisbury. Highway is situated immediately beneath the downs, between the villages of Compton Bassett and Clyffe Pypard. Mr. Bunterfield was the architect, and the builders were Messrs. Restall & Cox, of Bisley, Gloucestershire; the clerk of the works, Mr. Knight.

Amberley.—The chapel of ease here has been re-opened for divine service. The restorations have been projected and carried out entirely at the expense of Lady Lindsay. They consist of new roofs to the nave, chancel, and porch; a repair of the masonry of the fabric, new floors, open sittings, pulpit, font, lectern, and stalls. A screen has been reproduced from the discovered fragments of the ancient one, and set up in the original position; and new bells have been mounted in the cote. The church-yard will be levelled and inclosed with a fence. The work has been carried out from the designs and under the superintendence of Mr. Thomas Nicholson, of Hereford, diocesan architect.

Chigwell.—The new Church of All Saints, Chigwell-row, erected upon ground recently inclosed from Hainault Forest, has been consecrated by the Bishop of Rochester. Chigwell-row is a scattered hamlet of the parish of Chigwell, situated on very high ground overlooking the valley of the Thames, and commanding views of Hainault and Epping Forest; and the site of the new church is almost immediately opposite the Maypole Inn, which village tradition points to as the identical old Maypole immortalised in "Barnaby Rudge." The new building as it at present stands comprises a nave 73 ft. long by 22 ft. 6 in. wide, and 50 ft. high, having an arcade of four bays and lean-to aisle on each side. Along the whole width of the west body of the nave is an open lean-to porch, with three arches in red stone, columns, and carved capitals. A tower and spire, which will rise to the height of 150 ft., is intended to be built hereafter; and the erection of the chancel, with its transepted aisles, is also postponed. All the walls are 3 ft. thick. Molded arches of freestone, borne upon circular columns, with carved capitals, support the clearstory, the windows of each bay of which are a group of large cusped circular openings, with two lancet windows, one on each side. Internally two red Mansfield columns support their triple near arches, while above, from a deep moulded cornice, springs the arched boarded ceiling under arch-roofed braces. This is divided by moulded ribs, and is intended to be painted hereafter. A large rose window forms the principal feature of the west end. The style of the church is Early Gothic. The designs were by Mr. J. Seddon, of London. The builder was Mr. Thos. Williams, of Canton, near Cardiff. The carving was by Messrs. E. Clarke & Son, and the glass-work by Messrs. Clayton & Bell. The building is in brickwork, faced with Godalming stone, with Bath stone dressings, and it will accommodate 300 persons. The cost, so far as the work at present goes, is about 4,000*l.*, which is only half the estimated cost of the entire fabric. The parsonage-house, commenced at the same time, is sufficiently near to the church to group with it. The cost of the parsonage is 2,300*l.*, and it is proposed to add hereafter stabling, nursery, and lawn. An organ, built by Bryceson, of London, has been placed in the church.

Heytesbury.—The church of Heytesbury has been re-opened after restoration and enlargement at a cost of about 5,000*l.* The pillars of the nave had fallen much out of the perpendicular, and they have been rebuilt. The tower has been repaired, and the eastern arch has been widened. Some Early English arches and columns, which had long been hidden behind the plaster of the walls of the chancel, have been opened and

repaired, and the side aisles which formerly existed have been rebuilt, and the high pitch of the original roof restored. The galleries, one of which blocked up the arch of the nave, and entirely separated the chancel and transepts from the rest of the edifice, have been pulled down, and the whole of the church has been reseated, whereby there has been a great increase of accommodation and a gain of many free sittings. The west window of the nave, which was given by the Hon. Miss à-Court, is in the Perpendicular style, and is filled with glass of old pattern, with coloured borders. The nave is paved with Peake's Staffordshire tiles, and the seats are of deal stained with imitation walnut capping. The roof of the nave is coned with moulded ribs. The tower rises at the junction of the cross, and stands on four arches supported by piers. The eastern arch has been widened and the piers rebuilt. The window in the south transept is filled with stained glass, the expense of which was defrayed by money collected by Lady Heytesbury. The subjects in the window are St. Peter and St. Paul, with the Saviour, St. Gabriel, St. Michael, and St. Raphael. The north transept, which was formerly the burial place of the à-Courts, has been fitted with seats for Lord Heytesbury and his family, the remains of the dead having been removed into the churchyard. The stained glass window in this transept was given by the Hon. Mrs. Daly. It has figures of Abraham, Isaac, Jacob, and Melchisedec. The chancel is Early English in style, and consists of three bays. The columns and arches, which were formerly hidden, have been restored, and new aisles have been added. The old roof has been replaced by a new open roof, which has been raised to the former pitch. The walls of the church are inlaid with Minton's coloured tiles. The arcade at the east end is supported by Purbeck marble shafts, and the reredos is inlaid with coloured tiles. The east window is a single lancet, forming a triplet inside. It is filled with stained glass, the cost of which was borne by Lady Heytesbury. The subjects are the Nativity, the Crucifixion, and the Resurrection. The chancel is paved with Minton's encaustic tiles, with interlaced stone bands. All the fittings of the chancel are of oak and walnut. There are four windows of stained glass in the chancel, the gift of Mrs. à-Court Kepington, the Rev. Prebendary Fane, and the Rev. Hyde Beadon. The figures in the window represent John the Baptist, Isaiah, Jeremiah, Ezekiel, and Daniel. The restorations have been effected from designs by Mr. Butterfield; Mr. Strong, of Westminster, being the contractor, and Mr. Burdett clerk of the works. The woodwork was executed by Messrs. Searchfield, of Heytesbury, and the stained glass windows are by Mr. Gibbs.

Nichol Forest.—The small chanoh of Nichol Forest, which has been erected at Kingfield, to supersede the damp and inconvenient chapel of ease, which formerly existed there, has been consecrated by the Bishop of Carlisle, and opened for divine service. The undertaking has been accomplished chiefly through the instrumentality of Mr. Ewart, of Kingfield; the total cost of the building, including the churchyard wall, having been about 1,700l. Nearly all the resident landowners and farmers, in addition to their subscriptions, contributed to a very large saving of expense by arranging among themselves to cart all the building materials. The site of the new building is near that on which the old chapel stood. The architecture is Geometric Gothic, and the edifice consists of a nave 50 ft. by 21 ft., and transept 12 ft. by 8 ft., an apsidal chancel 20 ft. by 15 ft., and a south porch and vestry. Sittings are provided for about 220, and the church is so planned that a considerable number of sittings can be added at a future time, should the requirements of the district render it necessary. The five chancel lights and the three west windows are to be filled with stained glass, by Mr. John Scott, of Carlisle. Three of these lights are already fixed, and the remainder will be completed this autumn. In the centre light of the chancel is a representation of our Saviour as the Good Shepherd, having on either side figures of the Evangelists St. Mark and St. Luke, with their appropriate emblems in the tracery; and the two other Evangelists are to be added. The walls of the church have been constructed of stone from the Fairloan's quarry, near Rickerton, and roofed with blue Bangor slate, with cut hands of purple. The whole of the aisles are laid with tiles in three colours, and a cornice of tiles is carried round the internal walls. The roof is hoarded inside, the boards being laid

diagonally, and is stained and varnished. The seating is of yellow pine. The architect was Mr. Graham, of London. The builders were Messrs. C. & J. Armstrong, of Carlisle.

Woobly.—The chancel of the parish church of Woobly, Herefordshire, has been lately restored at the cost of the vicar, the Rev. J. B. Peploe. The restoration consists of stripping the plastering from the internal dressed stonework, replastering the walls between the same, restoring the masonry of the windows inside and out, removing the whitewash, and pointing down all external walls. The old plaster ceilings have also been taken down, and a new open timber roof, hoarded above the rafter, set up in its place. The chancel has been paved with Godwin's encaustic tiles. The work has been carried out from the designs, and under the superintendence, of Mr. Nicholson, of Hereford, the diocesan architect.

STAINED GLASS.

Edenham Church (Lincolnshire).—Three stained-glass windows, executed by Messrs. Thos. Bullie & Co., of London, have just been erected in the north aisle of this ancient edifice by the tenants and friends on the Grimsthorpe estate, as a memorial of the late Lord and Lady Willoughby d'Eresby. The windows are complete, with tracery lights, and are divided in the centre by stone transoms, so that there are four openings in each window. Commencing from the west end of the aisle, the first window contains in the tracery the arms of Lord Willoughby d'Eresby surmounted by the baron's coronet, &c. In the dexter upper opening is the figure of St. Paul, with sword; below which is represented St. Paul in prison, dictating to St. Luke the "acts of the Apostles." In the sinister upper opening is figured St. Peter, with keys; below which is shown St. Peter's Release from Prison by the Angel. In the next or centre window tracery are shown the arms, quarterly, of Lord and Lady Willoughby, surmounted by their respective crests. In the dexter upper opening is the figure of St. Matthew, with pen and Gospel; below which is shown St. John the Baptist preaching in the Wilderness, and the command, "Prepare ye the way" (St. Luke iii. 4). In the sinister opening is the figure of St. Mark, with pen and volume, and below is represented our Saviour raising Jairus's daughter. In the tracery lights of the third window eastward are the arms, &c., of Lady Willoughby (Drummond). In the dexter upper opening is the figure of St. Luke, with pen and Gospel; below which is a group representing our Lord feeding the Multitude. In the sinister opening is the figure of St. John the Evangelist, with pen and volume, under which is represented our Lord raising Lazarus.

St. Philip's, Burnwash, Sussex.—Three stained-glass windows have been erected in the apsidal chancel of this church at the expense of Mrs. Harriet Gould. The windows are lancet-shaped, and the centre one contains, in the middle group, the Crucifixion of our Saviour, above which is a group, the Baptism of our Lord. The group at bottom is the Last Supper, and the whole is surrounded by an ornamental border on a mosaic background of deep colours. On the north side is a window containing in the centre group the Resurrection of our Lord, above which is the Agony in the Garden, and the Group below is the Entombment of our Lord. These are also surrounded by an ornamental border on mosaic background. On the south side the window contains, in the centre, the Ascension of our Saviour, the group above being the Adoration of the Magi, and below is the Nativity of our Lord, surrounded by borders, and background similar to the window on the north side. The groups are contained in separate medallion shapes. These windows were executed by Messrs. Thomas Baillie & Co. of London.

Kensworth Church.—The east window of this church has recently been filled with stained glass, at the cost of Mr. John Harding, of Tattenhall Lodge, Leamington, in memory of his late surviving son. The window is in the fourteenth century style; and the glass has been treated in accordance with that period by the artists, Messrs. John Hardman & Co., of Birmingham. The subject chosen for illustration is the Crucifixion. The centre light contains the figure of our Lord on the Cross, surrounded by an aureole of glory, which again is edged by a band of Cherubim. At the foot of the cross kneels a figure of St.

Mary Magdalen clasping the cross and weeping over the death of the Saviour; and the background is a representation of the City of Jerusalem. In the dexter light are figures of the Virgin Mary, Mary of Salome, and Mary Cleophas. The figure of the Virgin is depicted in an attitude of grief, and one of the Marys is shown supporting her. The sinister light contains the Good Centurion and St. John the Evangelist, and in the background is the figure of St. Joseph of Arimathea. Each group is placed under an architectural canopy.

Books Received.

The *Popular Science Review* for October contains an excellent paper on Ventilation and Ventilators by the editor, Dr. Lawson, who is the Professor of Histology in St. Mary's Hospital, and a distinguished physiologist. It would not be easy to say much that is new in the *Builder* of what is yet known on the subject of ventilation and ventilators. Were all that has there been printed within the last quarter of a century on the subject incorporated into volumes, a goodly "library" would be the result. So good and popular a *resumé* of what has been said and done of late years, however, as Dr. Lawson's, more especially with his own suggestions incisive, well merits the perusal and consideration even of those constant readers of the *Builder* who are more particularly interested in the subject. As we not long since remarked, there is no little humming in much of the popular talk of ventilation: still even that gives indication of a growing public opinion in its favour which must ultimately lead to permanent benefit to the public health. Dr. Lawson's introductory remarks on the popular cant as to ventilation are much to the point: he says,—

"If we may be permitted to define cant as the current expression of unintentional insincerity, we believe that there is no species of cant more general than that which people talk about ventilation. Go where we may, whether in the houses of the wealthy or into the miserable dwellings of the poor, we hear the same cry about ventilation and its advantages; but in no cases, or at least in few, do we see any reason to think the cry a genuine one. How many people tell us of the healthy influence of pure fresh air, but how few ever take proper steps to introduce it into their houses. How seldom do we see anything like a rational system of ventilation in public buildings, and where are the private dwellings in which vitiated breathing-air is not abundantly present?"

Let us hope, however, that this smattering about ventilation is only introductory to a real knowledge and appreciation and a beneficial adoption of it in its most practical forms; and we regard such endeavours as Dr. Lawson's to be important aids towards so desirable an end. His paper thus concludes:—

"What we have said, has been said rather with a view to draw the attention of the thoughtful to a subject of the most vital interest, than to convey the idea that any perfectly satisfactory scheme of ventilation has yet been proposed. Our aim has been to lay before our readers a general expression of the conditions as to the quality of air necessary for healthy ventilation. This, we think, has not hitherto entered sufficiently into the considerations of those who have pursued the study of methods instead of principles. It must, nevertheless, be admitted that no system of ventilation can be satisfactory unless it be in accordance with the laws of hygiene. Of these laws, as they relate to ventilation, we have given our readers a general idea; and we would, in conclusion, assure them that, since they are capable of mathematical demonstration, they must inevitably form the basis of every efficient plan for the maintenance of a healthy atmosphere in our private dwellings and public buildings."

—Mr. W. E. Hickson, once the editor of the *Westminster Review* and an advanced Reformer, is publishing, under the title "Tracts for Inquirers," a selection from the notes he has been in the habit of making through many years on various subjects. No. 2 is called "Reform Illusions" (Groombridge), and is intended to show the evils that must result from government by the majority, the majority being necessarily the least wise. "The Court of Rome," says he, "would desire nothing better at the present moment than to place on the electoral register the agricultural population of Calabria and the Ahruzzis." There is much in the pamphlet deserving serious attention, but Mr. Hickson is too fearful of the result of recent legislation, which we feel no doubt is in the right direction, and shouts

"Awake, arise, or be for ever fallen!"

to an entirely different class from that to which it has been heretofore addressed in England.—In the current *Fraser*, Mr. C. R. W. Egd gives an agreeable view of the Paris Exhibition. The number contains some very good and thoughtful writing. Professor Owen replies in it to Mr.

Lewes's argument of "Infirmity."—The *Art Journal* notices of the Paris Exhibition include papers on the "Northern Schools of Painting," "Adaptations from the Antique," and "Art Products in Clay, Stone, &c." The engraved illustrations of the Exhibition are numerous and valuable. The engraving of "Les Femmes Savantes" after Leslie, is not up to *Art-Journal* mark,—in fact, is a disfigurement.

Miscellaneous.

TECHNICAL EDUCATION IN IRELAND.—During the past week Mr. Buckmaster has addressed meetings in the chief towns in Ireland, with a view of organising a system of scientific instruction suitable to the industry and requirements of young men, artisans, and those who have left school. The meetings on the whole have been most satisfactory.

ARTISANS IN PARIS.—If an artisan coming to the Paris Exhibition has not already made in London his arrangements for lodgings, by correspondence with Mr. Leyard's committee, 265, Strand, London, or through Mr. Cook, the excursion manager, he is advised to proceed immediately he arrives in Paris, by a cab, which costs two francs, to the workmen's lodging-house, in Avenue Rapp, close to the Exhibition. If this house be full, then let him go to the British Workmen's Hall, in the Exhibition, and ask for M. Houssoulier, and he will escape all fleeing.

ANCIENT SEPULCHRAL CROSSES.—On taking down the old walls of the church at Brompton, near Northalerton, prior to rebuilding the edifice, the remains of several sepulchral crosses, with the Runic knot cut upon them, were discovered. Mr. N. S. Heineken suggests that they should be most carefully preserved, either by being built into the outside walls, or within in the vestry. One of the crosses is tolerably perfect, and might be so placed in the vestry that access could be given to both sides,—a slight recess being made in the wall for this purpose.

THE GRASSHOPPERS AGAIN IN AMERICA.—A train on the North-Western Railroad, in the western part of Iowa, was recently delayed one hour and a quarter by grasshoppers, which covered the track so thickly that the engine-drivers slipped on the rails. A Page County (Iowa) letter says:—"The ground is perfectly alive with them; they fill the air for many hundreds of feet upward; they strike you as you walk to and from your meals; the public and private buildings are black with them; they infest everything. In consequence of their presence no fall wheat will be sown. The West is full of them, and they are journeying eastward."

OUR NEW FORTIFICATIONS.—"There appears to have been some serious mismanagement in the erection of the new forts," says a daily contemporary. "On the banks of the Medway the results of our work appear positively ludicrous. The mere substructure of the forts had scarcely been completed when these foundations settled down, and the masonry cracked and yawned in fantastic fissures from top to bottom. The mass was screwed up again by stout iron braces, and the building continued, but no sooner was a course of stones laid upon one of the faces of the work than it suddenly sank with the weight, while the opposite side rose in the air, after the fashion of a see-saw. In fact, the works at this point seem to have been fairly given up as impracticable."

THE SEWAGE UTILIZATION OF LIVERPOOL AND LONDON.—A few of the directors of the Sewage Utilization Company of Liverpool have paid a visit to the works of the Metropolitan Sewage Company among the Essex marshes. The object of the party was to become acquainted with the operations of the London company, and to inquire into the success of the steps by which they are carried out. In this object they were greatly aided by Mr. Hope, of the International Financial Association, who is also the managing director of the Metropolitan Sewage Company, and who afforded them every possible information as to all the details of their operations. The Liverpool gentlemen, who have taken the sewage from the corporation of that town, were informed and encouraged by their visit, and will no doubt now proceed with redoubled hope. A destructive fire has occurred at the farm of the Metropolitan Sewage Company.

TAUNTON COLLEGE SCHOOL.—The successful competitors are Messrs. Giles & Robinson.

THE STONE-CUTTERS' STRIKE IN BELFAST.—According to the local papers, the stone-cutters have accepted the terms proposed by the masters. "The men were on strike for nearly three months, during which time they have lost in wages nearly 3,000*l.*"

THE NEW YORK POPULATION.—Were Brooklyn technically, as it is practically, annexed to New York, says the *New York Tribune*, it would have a population of 1,700,000, and a territory of nearly circular form with a radius of ten miles.

SHOCKING DEATH OF A LIVERPOOL ARCHITECT AND HIS WIFE.—Mr. William Green, of the firm of Green & Paislow, architects, was crossing the line of railway at the Broad Green Station hurriedly to save his wife from a coming train, while also crossing, but the train caught both, and killed them, mangling the bodies in a shocking manner. They were both young, and had been only two months married. Three fatal accidents have occurred at the same level crossing during the last eight months, and when the second occurred the coroner's jury recommended the directors to throw a light foot-bridge over the line. Should they not be indicted for culpable homicide?

JUNCTION OF BRIGHTON AND CLIFTONVILLE.—Preliminary steps have been taken towards bringing Brighton and Cliftonville more immediately into connexion, by the removal of the walls which enclosed the pathway running from the rear of St. John's Church, at the top of Palmeira-square, to Church-street, Cliftonville, through what were formerly known as Hove-fields, preparatory to the formation of a roadway, for vehicles, &c., in continuation of that which now runs on the north side of the enclosure at the top of Palmeira-square. Arrangements have been made for drainage. The western esplanade is to be continued from its present point, south of Palmeira-square, to Mills's-terrace. When this desirable improvement has been effected, and the land is covered with buildings, there will be a junction between Brighton and West Hove and Cliftonville, forming an extensive and unrivalled marine frontage.

CLERKS' DINING COMPANY, LIMITED.—A final prospectus of this company has been issued. The offices are at 38 A, King William-street, City. The capital is 20,000*l.*, in 20,000 shares of 1*l.* each. Paid up capital, 5,000*l.* or 5*s.* per share. No shareholder to possess more than four shares. "The intention," says the prospectus, "is to limit the trading of the company at first to four establishments—to be increased eventually to ten—(one at the West-end)—at any one of which, shareholders or members can dine. The cost of the dinner to be one shilling, and to consist of fish or plain soup, joint, two vegetables, bread, cheese, and half-pint of ale or porter. No fees to waiters, and all extra beer, or wine and spirits, to be charged at the wholesale price." Lucheons, tea, &c., will also be provided at equally reasonable rates, and there will be a reading-room and a smoking-room. To a certain extent the co-operative principle will be brought into operation. The plan is said to have great support in the City, and is being taken up with energy. A public meeting has just been held for its promotion.

DESTRUCTION OF THE GOVERNMENT HOUSE AT BUENOS AYRES: CHUBB'S SAFES.—Our fellow citizen, Mr. Chubb, has certainly reason to congratulate himself on the result of a fire which we see, from a Buenos Ayres paper, has ravaged the Government House there. The fire originated in the Treasury office, and spread thence to other parts of the building. The paper referred to, in describing the ruins, says:—"At eleven o'clock yesterday the only things saved in the S.W. quarter of the building, where the fire originated, were two of Chubb's patent iron safes. The Government, with admirable celerity, before opening these safes, sent to advise the managers of Thompson's house, and Mr. Bell at once came down. On opening the safes Mr. Bell had reason to be proud: there were the papers quite untouched; the inside of the safe was not even hot. It must be stated that one of the safes had fallen from the upper story and lain among the burning ruins for several hours. The ornaments, &c., were completely burnt off, but the papers inside were as perfect as 'the cock and pound of hutter,' of historic memory, in the Yankee's safe."

NEW BRIGHTON.—A new promenade at New Brighton, a fashionable watering-place on the Cheshire side of the Mersey, has been opened.

MEMOIR OF THE LATE MR. WILLIAM GEORGE DREW.—At the chapel of the Licensed Victuallers' Asylum, the memorial window and tablet which have just been erected to the memory of Mr. Drew, has been unveiled in the presence of a large number of ladies and gentlemen, friends and admirers of the deceased. The memorial was considered due to so large a contributor to the funds of the asylum as well as to those of the Licensed Victuallers' School. The window is situated on the left of the pulpit. It is composed of a mosaic background, on which are placed some medallions, coloured. In the centre of the window is the subject of our *Saviour* "Feeding the Hungry." This is surrounded, in oval form, by a border of flowers, leaves, and berries. Although the size of the window is only about 7 ft. high by 3 ft. 6 in. wide, there are upwards of 1,400 pieces of coloured glass, so placed together as to appear to be one piece or square of glass, if that be any merit.

THE HIGHEST CHIMNEY IN YORKSHIRE.—Bradford has acquired considerable notoriety on account of its long chimneys, but the longest of them all must hide its diminished head in comparison with one that has just been completed at the works of Messrs. Mitchell, Brothers, spinners and manufacturers, Manchester-road. This chimney, measured from the bottom of the foundation, is 110 yards long, and rises a clear 100 yards above the ground line. It is said to be the highest in Yorkshire, the next in size being a brick chimney near Huddersfield, built in 1857, the length of which from the foundation is 105 yards. The foundations, which consist of two courses, 22 ft. and 21 ft. square, and 12 in. thick each, rest upon the rock. A good bed of coal was obtained in excavating for this part of the structure. The chimney is built of stone, is octagonal in form, and measures 20 ft. across at the foundation and 9 ft. at the summit. The flue is perpendicular, and 7 ft. in diameter. The "stalk" has been erected by Messrs. John Monson & Son, Little Horton-green, contractors, from plans made by Mr. Mark Brayshaw, Old Bowling-lane, architect. The foundations were laid in August, 1866, and the work was completed on Tuesday last, no accident having occurred during the progress of the erection.

GRINDING CEMENT.—A millstone of the style for grinding wheat is not at all fit for grinding cement. The eye of the stone should be at least 16 in. in diameter. The balance-ryne should be semicircular (old style), with chambers in the lugs for the driver to work in. However good in theory it may seem to drive a stone near its centre, all millers of varied experience know that a stone driven near its centre wears down rapidly around the verge, leaving the centre high. Under the most favourable circumstances, a stone which grinds cement wears out of "face" very fast, and is much more difficult to be kept in proper order than a stone for grinding wheat. If the cement is not ground fine and even, it is not much better than sand, unless it is by itself. When not to be mixed, it should not be ground fine; when to be mixed with sand or other material, it should be as fine as possible. In all cases, but especially with some kinds of rock that cannot be evenly burnt, the cement should be bolted. A bolt 10 ft. long and 30 in. in diameter, covered with wire cloth, would in all cases make an even quality of cement. What would not pass through the wire could be returned to the stone again. It takes a greater quantity to fill a barrel when coarse than fine. It should always be ground while there is a little heat in it, as it takes less power and makes better cement. As French Barr is best for grinding wheat, so it is best for cement. It should be as hard and free from pores as possible, the hardest block or blocks around the eye of the stone. A stone 4 ft. 6 in. in diameter (the best for cement) should be divided into sixteen parts, with two furrows to the part. The lands should all be of equal width at the verge and tapering inward. The furrows should be 1½ in. wide, and about three-eighths deep at back. There should be a cast-iron stand for the concave, with four legs obliquely set. It could be bolted to the floor. The concave need only bear in the stand at top and bottom. The crusher shaft should have an oil-cup, set screws, and centre lift, like a millstone spindle. — *Correspondent of Scientific American.*

The Builder.

VOL. XXV.—No. 1288.

Harmony in Colour and Sound.

It is told that the eye has not the power of resolving a mixed colour. Extending our complaint,* we suggest, this is a hard saying. When comparison comes into question, at any rate, it distinguishes with facility a blue green from a yellow green, and recognises blueness in one and yellowness in the other, and we have to pursue the experiments of complementary colours but a little way to have abundant experience of the fact: if we please to press the more ob-

red, orange, yellow, green, blue, purple, and so return to red.

Let each section be coloured with tints in gradation, with the deepest next to the centre and the lightest outward; and let a black spot occupy the common centre, and a white ring surround all. Each colour should then commence with the grade in which it is most nearly indistinguishable from black, and be extended outwards towards indistinguishableness from white. The degrees between the limits of all continuous gradations are infinite, and therefore there is no question whether all the colours are susceptible of equally numerous gradations; it may, perhaps, be a question worth asking, in what way it is possible to arrange a solar spectrum, or the electric, so as to exhibit such a parity most effectively and distinguishably.

Assuming the fact, we may see that a scale upon this plan, divided by concentric circles, would give a series of rings, in any one of which the various included tints would have the closest possible relation of quantity to each other: the secondaries in such case would, of course, accurately represent the result of uniting the adjacent included primaries. Even the primaries in such case acquire a link of agreement in respect of gradation of tone: the circular zones or bands may be called circles of tone.

In such an arrangement, in which purple, orange, and green have their tones decided by those of the adjacent primaries, we seem to exclude or not to have provided for one important form of gradation. Why may not a green, let us say, be formed by the union of a yellow of the first circle and a blue of the fourth, and so on? So we should have a new gradation of secondaries accordingly as they favoured one or other constituent,—a blue-green or a yellow-green, and so forth.

To exhibit such gradations as these exhaustively, it would be necessary to set up the gradations of one of the component primaries vertically, and that of the other laterally against it for its entire length,—to cross them, in fact, so that a horizontal line through any portion of the vertical column of blue intersecting one of its tones would pass to right or left through every tone of yellow in succession. Thus we should have every possible tint of green that could be produced by the mixture of yellow and blue in any proportion whatever.

If the tables of secondaries thus produced were placed in line, they would exhibit multitudinous tones and their affinities as determined by analogous place and derivation.

Again, we may produce tertiary colours by mingling secondaries, as

Orange and green,
Orange and purple,
Green and purple.

This proceeding is manifestly equivalent to mixing the primaries in new proportions:—

Orange and green = 1 red + 1 blue + 2 yellow.
" and purple = 2 " + 1 " + 1 "
Green and purple = 2 blue + 1 red + 1 "

To exhibit these further variations exhaustively it would be necessary to superimpose the completed tablets of secondaries, assumed to be of like dimensions, one on the other; and then,—but the permutations are all but inexhaustible: in such a tablet every square—every point—has a different tint, and has to be brought successively into combination with every point on the other.

A type of the secondary combinations may easily be prepared by the use of lines alone, to represent, by gradation of closeness, gradation in depth of colour; the lines might indeed be printed in the respective colours. Thus, in the case of the secondary colour green, a square would be printed with horizontal blue lines,

becoming more and more open from the bottom upwards, and with perpendicular yellow lines crossing them, and more and more open from the left to rightwards.

Apart from some very sufficient objection being adduced, we should scarcely hesitate to regard the phenomena of complementary colours in the eye as the correlatives of audible harmonics or overtones. When the eye has been steadily excited for a certain time by a spot of bright colour, and then closed, it is well known that a spot will be seen of a colour complementary to the original,—that is, comprising a mixture of the hues that accompany the original colour in the solar spectrum,—that are its complements in the constitution of the pure white light broken up by the prism. That the ocular phenomena are in sequence, and those of the ear concurrent, amounts to no essential difference; indeed, it is most probable that there is almost as much concurrentness in one case as in the other, and that the excitement of the eye that manifests itself when the eye is closed had been going on previously when it was still open, and though overpowered by the actual excitement of the light had not been without effect on the resulting sensation.

What relation in tone is there usually between the exciting tint and its complement? This is a matter of experiment for those who have strong as well as sensitive eyes. We assume that they are lower—the complementary; but that if the eye is to be fully satisfied by exhibition of the actual complementary colour, it will have to be taken from the circle of tone that comprises the original exciting tint. Eyes vary in strength as well as in keenness, and there is, no doubt, a great diversity in the susceptibility of excitement by complementary colours and of the distinctness with which they are seized and recognized. It is worth while to consider what are the consequences that the condition of the phenomenon taken in itself seems to lead to.

The sensation of red excites the complementary spectrum of green, and the green, if we assume sufficient vividness and sensitiveness, would, by parity of condition, re-excite red; but, by the exclusion of the red object, the stimulus is declining, and with it declines the reaction, and so both come to an end. But it is not to be supposed that the tendency to reaction is due to the withdrawal of the actual exciting redness; and, therefore, while the open eye is still fixed on it, the reaction must be constantly setting in, but as constantly checked. But now let a green spot of the complementary tone be associated with the red, the green will heighten the red, and the red the green, it may be supposed, by each positive impression having a complementary excitement to reinforce it. The eye is presented in each case with the exact stimulus that is prepared by its reactionary condition to entertain.

This is, perhaps, the explanatory fact of the agreeableness of simple gradation. Excitement exhausts sensibility, and vividness declines with it, and the succession of modified excitement falls in happily with modified sensibility.

Complementary colours, it would thus appear, are contrasts indeed, but heightening and enlivening contrasts; but in every case one of the colours is a mixed colour; and in the various contingencies of relative vividness and sensibility this will be apt to be—so at least it pleases us to speculate—practically resolved; it is produced by conjoint excitations, which may or may not die out concurrently,—and what then? Then the yellow element of green will have a tendency to excite the spectrum of purple, or the blue element to excite orange; and even when these new complementaries are not actually excited, the susceptibility for them will be stimulated; and thus in case of their actual presentation as colours to the eye, an expectation, an unconscious appetency, will be satisfied, and herein will be a harmony.

* See p. 705, ante.

The new complementaries are adjacent to red, and thus the most actively stimulant colour is heightened by the opposed contrast, green, and relieved by its allied secondaries, purple and orange. The remaining colours, blue and yellow, are now adjacent to admitted tints, into the composition of which they enter, and thus acquire an opening for introduction, although in themselves the most harshly opposed to the leading tint of red.

A certain assistance to distinctness and unity of effect is given by favour to one of the sides of the chief complementary over the other,—as in the illustration adopted, to yellow and orange, rather than to blue and purple, or *vice versa*.

But here, again, harmony depends not on absolute equivalence, but on selection of appropriate proportion.

When the selected key is a secondary colour, its complementary contrast will of course be a primary, but the rule of relief and predominance of contrasts obtains unaltered and runs its circuit all the same.

Adjusted combinations of whatever kind for a definite purpose of convenience or delight, must have reference to the variety and the degree of the elements treated of, and may fail,—may be offensive by ill-management in either respect, and by sin of excess, whether in one direction or another. The liabilities and responsibilities involved are shared by colour at least on an equality with sound.

Thus harmony is liable to disturbance—

1. By want of variety or by excess; by monotony that is, or by distracting multiplicity of elements; by absence of an essential element or intrusion of a superfluous.

2. By tediousness in gradation,—or its opposite error, abruptness,—harshness of transition. These faults have a certain appearance of tending to neutralize each other; but this is scarcely a necessity.

A composition that sins by excessive variety, let us say of tints, may offend also, and in aggravation, either by the tediousness of transitions or by harshness in intermixture; and so not even limitation of the number of tints treated will in itself secure, accordingly as they may be selected, from tamelessness of transition or as distressing violence.

Elementary selection and limitation of number, therefore, are the primary conditions of harmony, and will be found to have been exercised, when successfully, under caution of the disparaging liabilities we have just enumerated and classified.

Any colour whatever, any tint of a colour, beauty and purity being always assumed, may be taken as a point of departure; and a first restriction of distracting multiplicity is effected by conferring upon it a decided predominance. How this can be done is matter for analysis. In any artistic composition the selection of a leading colour and its leading tint will of course have to be made with reference to the properties and expression involved on the occasion; we assume it now to be in these respects appropriate.

The predominance of a tint,—its manifestation as a governing tint,—is displayed by its proper strength and quantity,—its brightness and pervading distribution,—and then more indirectly, but still most important, by its influence on the tints associated and on the selection of them.

We will assume that our governing colour shall be red, and the question of predominance first concerns the relation of the particular tint of red that governs to all the other reds in the composition. The predominance of one may, of course, be favoured by secondary assistance from other colours; but we ask first,—How can a tint of a same colour come or be made to lord it over its other fellow-tints? We assume that all the tints in themselves are equal in quality, and so also that any one may be chosen for predominance over the rest. What will secure for it this predominance? In the first instance, no doubt, the lighter tint attracts the eye to the disadvantage of its darker fellows, but these may be emancipated by superior brilliancy due to higher illumination. Let a luminous beam be thrown upon any degree of the scale of red, and the more luminous tint thus distinguished will govern the rest.

Thus distinguished simply on the scale, it will have a double range of predominance as over the degrees above it and those below it. Now, concentration of effect, it would appear, would be consulted by all or the majority of the associated tints being either above or below the

luminously-distinguished key. There should be a marked difference when it is the deepest red in the series applied that is most luminous, and when it is the lightest; and then, again, as the balance of the tints above and below it is variously adjusted. It is only artistic instinct that can decide on the varieties of combination that are available for various artistic purposes within these limits. The case seems parallel to the musical choice first of a key-note, then of its pitch or of the pitch at which it shall be most frequently or expressively applied, and of the range of unisons above and below that shall be admitted. To the artist again, to his invention and his instincts, must be left the determination how far mere force of brilliancy can enable a deep tint to make head against its lighter competitors, or can contend with tints of the same colour that are indeed less luminous, but in grander masses. Daring things have been done, and happily, and graceful things also, that, in truth, involved quite as much daring; for failure, the catastrophe in either case, is quite as imminent and disastrous.

Thus it appears that, even within the limits of the scale of a single colour, there is unlimited scope for election, first, of the primary or governing tint, and then of the characteristic formula leaning first either to the grave or the cheerful, and then, whichever of these may be adopted, and in whatever form, of the characteristic formula of milder gradation or spirited contrast.

The primary tint itself, and all others associated likewise, may, of course, be exhibited on occasion in various degrees of light and shadow, the tint itself not changing tint in shade; as, if shade be thrown upon the entire scale, each degree of tint will still retain its place and still be different from all others. Thus, in a picture we may see a certain of a self-colour, and unaffected by reflected colours, taking every variety of light and shadow in successive folds or in the same.

Even in these variations, however, there is opportunity for the assertion of unity. The uniformity of daylight illumination is the great harmonizing influence of the picturesque, every difference that different exposure produces being still relative to the primary difference. So the omission of intermediate tints of the leading colour, the affecting of wide intervals, may be responded to by similar sudden transitions from lights to shadows, and neglect or exclusion of half-tints, be kept in countenance by sameness of half-shadows or the avoiding of them.

The variable illumination of a given tint seems most analogous to the variable loudness and emphasis that may be assigned to the occurrence of a musical note. A note when it occurs upon the accented part of a bar may be said to be in light, and otherwise, according to position, in deeper or deeper shadow.

The most gentle and insensible transitions, then, that the scale of colours affords are, first, between differently illuminated degrees of the same tint; then between successive tints of the same colour; and, accordingly, as we glide or leap along these successions, we have modes even here of contrast as well as of relief.

But a more varied succession comes in if we move from one colour to another. Here the transition is made most gently—naturally, as it is called—by passing laterally through its circle of tone. Red passes to yellow through orange, which partakes of red as well as yellow, and yellow again finds itself represented in green, which has an equal relation to blue; blue again passes into the next division, where blue is broken up with red, and the resulting purple leads back to the starting point. In some respects it is preferable to substitute a spiral for the concentric circles of tone, and so the conclusion of one circuit, which in itself will have thus acquired a new element of variation, will glide into the commencement of another, as the octave of a note is the recommencement of a new series.

From any tint whatever then in the gamut of colour, there is a way, by a series of easy transitions, to any other; the easiest transitions are to the adjacent, which include a common element; the omission of a link produces a contrast, more or less harsh, and in the interests of harmony, which above all repudiates a jar, demanding to be qualified and finally resolved.

The primary colours are the richest in contrasts; for red, for instance, has no proper immediate connexion with any but the adjacent secondaries, purple and orange; and is in contrast not only with its complementary green, but

even more violently with both blue and yellow. A secondary, on the other hand,—orange, for instance,—is only in uncompromising contrast with its direct opposite primary, of which it is the complement,—blue; it has an element of sympathy with red, and with the purple that contains red on one side,—with yellow, and the green to which yellow is a contributor, on the other. It is, therefore, the characteristic of the secondaries that they all relieve each other, while the primaries are all in strongly pronounced contrast—a principle of vigour, however, rather than a disability.

The adopted leading tint has, therefore, its contrasts, complementary or otherwise, and its transitional reliefs; and these tints of associated colours will participate in the claim to special distinction, as they will, indeed, be chief instruments in enhancing the distinction of their chief. Each associated tint, again, of the leading colour will equally have its own circle of contrasted and relieving colours of its proper tone, with supplies of tints available, most numerous, and yet all united with the principal tint by a law not the less absolute because it involves the facilities for such free modulation.

But there is a further principle of division,—a duplicate division,—applicable to the general scale, which is of the utmost importance and influence. This is into warm and cold colours,—or colours which advance and meet the eye, and colours which seem to retire, and tend to appear more remote than they really are. Red and yellow are classifiable as warm and advancing colours, and blue as cold and retiring. It is for the physicist and the physiologist together to investigate the natural differences on which the difference of effect is dependent. No doubt, association heightens the original influence, whatever may be the nature of this. Flesh colour and blood, and fire, enhance one set of feelings, and ice and wintry skies reinforce the other. Still this is not all. Things may be very hot and yet be of a cold colour; and if, indeed, specific temperature does correspond with colour in prevalent instances, it opens the question whether such colours may not be in these cases common effects of some common cause.

In painting it is certain that the contrast of effect between warm and cold colours is very remarkable, and the titles have been given to them from a sense that their effects have considerable analogy to secondary effects, accompanying, at any rate, sensations of warmth and coldness. We turn from a Rubens to a Guido, and are conscious of it at once, without any regard to the subject of the picture; and it gives the point of the epigram in Albano's picture of the Loves of Venus conquered and effaceless against the boys of Bacchus.

The warm half of the scale comprises the two primaries, red,—red especially,—and yellow, and their intermediate orange; and each casts a certain glow and reflection upon the adjacent purple when inclining to red, and upon green when the yellow is predominant. The single blue, however, dominates the frozen segment of the circle, and has such power that it subdues the warmer tendencies of both purple and green.

We are inclined to think that it is in warm or cold treatment that we are to recognise in the music of colour the equivalent of the major and minor keys in the music of sound.

The same notes may be made the key of either a minor or a major series, accordingly as one line of harmonizing notes or another is chosen. There are two notes very near to each other that are at an interval of a third above the key note; one of these has to be taken, involving the exclusion of the other, and the determination of the character of the scale. Thus, in the case of a key-tint of red, the effect will necessarily vary considerably, accordingly as the harmonies are taken in preference from the side of the purple or the orange, the blue or the yellow. Whether the leading colour selected, then, be warm or cold, it is of no slight moment in respect both to harmony and effect that a due counterpoise should be adjusted between colours as divisible into these classes. It is not that one set must be the exact equivalent of the other, a plan which would tend to neutralize both,—but that they should bear to each other some apt and definite proportion. It were vain, of course, to give rules for adjusting colours proportionately; as well might we attempt to teach singing by ascending to first principles and setting a future prima donna, to study the mathematics of resonance, or trusting to instruction in terms of the muscles that subserve

vocalization. Enough that proportionate adjustment involves effective predominance of one element without obliteration of the other; that its successful formulas, no less than its possible failures, are infinite; and that genius must invent them, and that taste will be happy to enter into the enjoyment, asking not why, and caring not wherefore, in the first instance, but willing enough that the men of science should entertain and should answer the questions if they may.

Black and white are terms in the succession of tints of every colour, and thus are not to be assigned to the class of either the warm or the cold. They harmonize with every colour; may be interposed between any colours; and thus afford most valuable resource for tempering the very harshest contrasts. White, moreover, confers ever brilliancy without heat, as black composes without chilliness. Indeed, but for the high environment that white confers upon other colours generally by its well-attenuated proximity, it might seem as if it verged rather to coldness than to the opposite.

Still both black and white are dangerous indeed for employment in absolute purity; and white especially so far disturbs the eye by irradiation, that colorists have been known to wish that all the white paint in the world were annihilated. Much may be done, and it is almost the only resource,—by a firm administrative hand adjusting quantity. The eye must be the guide; but if the eye is to be the guide, it must to original fine endowment have conjoined discreet and persevering education. Among the examples of handed architecture in Italy, the exterior of the baptistery at Pistoia is a happy example of the improvement obtained by relatively narrowing the bands of black. But otherwise these examples can only be cited either way with qualification and a caution; for time and weathering sometimes mar and sometimes rescue design, and, moreover, the so-called black bands are usually but a very deep-tinted green.

Broken tones of mixed black and white—the family of greys—have a range of applicability and a value when employed with best effect, of which it is far easier to admire the hearty than to expound the theory.

But,—*quorsum hæc?*—it is quite open to follow up the exposition of the claim of colour to be harmonious,—musical no less than sound,—by another exposition of the rightful assertion of the architect to be a master of this music even no less than the painter. Regard to the exigencies of space has restrained illustrations throughout,—otherwise, whether for good or evil, they might have been gathered in sufficiency from our own art. Nature herself will ever be the great inductor to the theory and illustrator of its perfections; and it may be, that when we have quite accounted to ourselves for all the delight of the harmony between flower and leaf and bark of the pomegranate-tree before the window, we may have little more to learn. Titian himself, in his sacred and profane love of the Borghese Palace, can only teach us, when we come from the school of Nature, how majestic a height it is possible for man to reach in rivalry,—a height where we become conscious indeed that "the art itself is Nature." Nature herself, it is certain, must often be contentedly left, in a climate such as England's, to work out her own effects of colour upon the materials of our structures. But, still, her treatment can be anticipated, assisted, heightened; in any case it is an opprobrium to trust to it entirely. Never yet, it is true, was there structure that could not become picturesque, and even beautiful, in ruin and decay; but this is cold comfort for the architect. The physician can only anticipate with bitterness the return, on that "first dark day of nothingness," of the hearty that he has been baffled in his hope of re-uniting with health, and the world may be fairly excused for grudging an average lifetime in waiting for even comparatively venial ravages to be mellowed by time. If we are to speak frankly, we should say, that as regards the application of colour to architectural exteriors, art has scarcely at present, in existing monuments, even approached its best. In this case the best prize is still to be won; it will be assigned to him who shall attain "every chord of the lyre, and be master of all," and by the fullness and freshness of his harmonies make us forget that important buildings have too often been entirely destitute of colours or overdone with them, bedizened with streaked or spotted contrasts, or with gradation of hues so subdued purplistically down as to be still more unendurable in tameness.

SUMMER DIARRHŒA IN LARGE TOWNS.

INFANT MORTALITY is now generally acknowledged to be a useful test of the physical and sanitary condition of any aggregation of human beings, although its value for comparison may be in some cases partially destroyed by varying birth-rates. With almost greater safety may we assume that the extent of the mortality among infants in summer, from diarrhœa, affords conclusive evidence of the stamina and strength of constitution possessed by infants in different localities. Healthy parents as a rule have healthy children, and we may therefore fairly conclude that where infant mortality is habitually high, or even exceptionally so in summer, through the prevalence of diarrhœa, there is the general standard of health low.

Recent weekly returns of the Registrar-General have furnished some useful facts connected with the extent of the mortality from diarrhœa in our large English towns, during past weeks. This year, moreover, can scarcely be called exceptional; for as surely as the summer comes round, from year to year, so are the deaths swelled by the mortality from this disease. In ordinary years this mortality is principally confined to infants, as has been the case this year; periodically it becomes epidemic in a choleric form. During the past three weeks, in ten of our largest towns, including London, of 7,673 deaths from all causes, 1,520 were the result of diarrhœa, being 20 per cent. of the total deaths. We are not able to state the exact number of these deaths which occurred among infants, but, taking London as an example, it is quite safe to conclude that at least 95 per cent. of these deaths from diarrhœa are of children not exceeding one year of age. Much of this waste of infant life is doubtless owing to carelessness and ignorance of mothers, who first probably induce the complaint, and then either neglect or are unaware of the proper treatment. Medical practitioners in crowded neighbourhoods well know to what extent these causes tend to the fatality of this disease. The presence of organic impurity, however, in either the atmosphere or the water is now thoroughly acknowledged as one of the leading causes which produce the summer scourge. It will, therefore, be useful to compare its fatality in the different towns.

Of the annual death-rate per 1,000 from all causes in the three past weeks, the mortality from diarrhœa has been 2 in Bristol, 3 in London, 5 in Newcastle, 6 in Liverpool, 8 in Sheffield, 10 in Manchester and Leeds, 11 in Birmingham, and 12 in Hull. These figures at first sight appear somewhat contradictory, but should be studied side by side with full information as to the sanitary activity prevailing in the different towns, and the nature of their water supply. Bristol, though possessing many natural disadvantages, has, in the results of the past few years, every reason to be proud of its sanitary condition, and we are, therefore, prepared to find it stand at the head of the list with a low mortality from diarrhœa. London, having spent its millions on a system of main drainage, having an efficient staff of medical officers, and a water supply which, although not beyond reproach, is now steadily improving, thanks in a great measure to public attention having been awakened to its vast importance, now stands next to Bristol, not only in its general death-rate, but also with the lowest mortality from diarrhœa. It is, however, somewhat surprising to find Newcastle appearing with but half the mortality from diarrhœa from which other large towns have suffered, when the recent and present high death-rate from all causes in that town are taken into consideration. Sheffield has recently enjoyed a death-rate below the average of the other towns, and the health of Liverpool is fast improving; but in Manchester and Leeds the continual high rates somewhat prepare us for the fatality of diarrhœa. Not so with Birmingham and Hull, both of which towns have, in the last two or three years, stood well as regards their death-rates among the list of large towns. It would be well that these towns should endeavour to discover the cause of this fatality of summer diarrhœa. The water supply of Birmingham, at least, is rather suspected of being deficient both in quality and quantity. If this suspicion be founded on fact, we need look no further to account for the prevalence of this disease.

In the Registrar-General's return for the week ending 21st September, it is gratifying to find that the fall in the temperature of that week had somewhat influenced the mortality from

diarrhœa; it is worthy of remark, however, that whereas in London it was only at the annual rate of 1.9 per 1,000, the rate in the nine other large towns furnishing weekly returns, with more than two millions of population, averaged 7.7 per 1,000. This fact is somewhat remarkable; and should be pondered upon in our large towns. Either the ignorance and carelessness of mothers, or medical assistance is not so ready to hand, or sanitary supervision is not so effective in keeping the atmosphere free from organic emanations, or the water supply is more liable to sewage contamination; it may be that any, or a little of all these causes is at work, but whatever the causes may be, the fact itself should not be lost sight of. The thousands of infants annually dying from summer diarrhœa are surely worth an effort to save.

THE EARLY CONDITION OF MAN; THE ORIGINATION OF RACES; AND THE RELATION OF THESE QUESTIONS TO PRE-HISTORIC ART, AND TO VARIATIONS OF STYLE AND CHARACTER.

THE title prefixed will sufficiently serve to show what is our idea of the great interest that should be taken by architects and others, in reports of certain papers and discussions in the Geographical and Ethnological Sections of the British Association for the Advancement of Science at the late meeting in Dundee, and to which particular importance of the subject-matter we have already alluded. We subjoin a summary. The papers, more immediately referred to in this present notice, may be said to have commenced with one by Mrs. Lynn Linton, on the "Ethnography of the French Exhibition." It contained these observations:—

Scattered throughout the building are examples of almost every condition of human life, from the rude works of the savage, whose first ideas of art are embodied in a necklace of shells, a mark of tattoo, or a temple of skulls, through the intermediate grades of the semi-civilized making their first awkward efforts after an intellectual life, up to the latest productions of European skill, and the grandest combinations of human power and material forces which the world has yet seen. One of the most interesting parts of the Exhibition is the Archaeological Gallery, which leads us by successive stages from the primitive condition of the lake-dwellers to the complex life of modern times. Then how expressive of ethnological conditions are the special manufactures of various races!—the intention, so to speak, of different national workmanship. At first sight it would appear that all gold and silver work would have much the same meaning; that diamonds and emeralds could never be much more than diamonds and emeralds; and that silks and satins, if they answered their final end of clothing the human body, would have no other function or expression. But seen and compared together, the work of each nation has a distinctive character of its own, evidencing the peculiar habit of thought and intellectual status of the race. Within the larger area of ethnological differences in art lies the smaller one of international differences, seen very clearly in the various European courts, and the direction which the genius of productive art has taken in each. Take the jewels as one very small but popular example. There are lovely Italian ornaments of the purest taste, broad and simple, though so highly wrought; and there are Palais Royal prettinesses of diamond birds and golden hoes, and green leaves, with lady-birds settled on the edge, and drifting flower-petals, bearing dewdrops in the curve, and childish toys as pins and charms, and brooches and buttons; and, to crown all, automic singing birds, executing a duet of song most creditably for metal windpipes. Then we have the English jewelry, outshining in Lady Dudley's jewels, incomparably the finest in the Exhibition, but owing nothing to their treatment. They are set quite quietly announcing themselves, and dependent only on intrinsic value. A Frenchman would have isolated the finest, and have massed the smaller into an overwhelming conglomerate of brilliancy. The Englishman simply sets them so as to show themselves in order. Is there no international difference here?

After a comparison of the features and costumes in the model-figures, the writer ob-

served.—Out of doors, the annexes, architecture, and restaurants offer the same immense national varieties. The forward races fill their allotted spaces with scientific material, and the latest mechanical contrivances; while Egypt builds up a model of the Temple of Edfou, with its sphinxes, lotus capitals, and the Eternal Neph upon the architrave. But as repetition invariably vulgarises, the subtle grace of line and harmony of colour of the original is lost in the copy, which, however, does not prevent our feeling the wonderful union of past and present, when we find a modern model of Lesseps' Canal and the whole Egyptian country inside the doors which Neph overshadows and the sphinx protects.

The paper concluded:—There is one little fact in the English Food department which must not be omitted, though apparently insignificant. Owen Jones, our best illuminator and ornamental artist, has given his skill for the better display of Huntley & Palmer's biscuits; and Crosbie & Blackwell have used a beautiful Wedgwood vase for their preserved ginger. The meaning of which is surely the endeavour, now making itself felt through all English life, to get a true and noble manner of art into our daily surroundings, and the desire to unite the idealising presence of beauty with the practical advantages of utilitarian science, hitherto at war together.

The subjects of race and the antiquity of man occupied a large amount of attention in the lecture. On the Saturday, three papers by Mr. Crawford were read.—They were:—"On the Antiquity of Man"; "On the Complexion, Hair, and Eyes as Tests of the Races of Man"; and "On the supposed Aborigines of India, as distinguished from its Civilised Inhabitants." In the course of the first paper, it was said that the discovery of metals, without a knowledge of which man must have ever remained a feeble savage, attested man's antiquity. The difficult art of making malleable iron seemed to have been immemorially known and practised, even by the rudest people of the Old World, but it might be fairly conjectured that the first discovery must have been made by natives who had previously made considerable advances in civilization, and that from them the art came to be disseminated among ruder tribes. He was led to entertain that opinion because the same word of the Malay or Javanese language was given to iron, and even to steel, in all the languages of the Malayan archipelago, and in the language of the savages of Borneo. Were the languages of the negroes of Africa investigated—the rudest of whom are known to practise the art of fabricating malleable iron—it would probably be found that it was acquired from the Mauritians, Carthaginians, and Egyptians on the western, and from the Hindus on the eastern side of the continent. After reference to the ages that must have elapsed before man acquired power of making a record of his actions, the writer said:—The countries in which—through the auspicious character of the physical geography and intellectual quality of the races inhabiting them—the earliest civilization sprang up, were Egypt, Syria, the valleys of the Tigris and Euphrates, India, and China; and, in a minor degree, Persia, the region lying between India and China, Japan, and one or two islands of the Malayan Archipelago. In all these writings had been early discovered, and a calendar formed—arts indispensable to the rudest record of human events. But it was not necessary alone that the capacity of framing a record should exist; it was not less necessary that the monument containing it should be of durable materials, and be under conditions favourable to its preservation. In regions subject to violent alternations of heat and cold, drought and moisture, the most lasting materials were in time decomposed, while in tropical climates the same destruction was produced by a rank vegetation. Hence made true history begin with the first page of Thucydides; but man's story went far back beyond the time either of Thucydides or Herodotus. Egypt was, far beyond all other countries, that in which the chronicle of civilized man could be carried to the highest antiquity. After many dynasties of gods and demigods, the earliest date which, with any show of antiquity, could be ascribed to the history of Egypt, began with the first dynasty of civil writers, and the learned made that correspond with the year before Christ 8986, which would make the first dawn of reliable history 10,833 years old, reckoning to our own time. The Pyramids of the first dynasty were

built, according to the same authority, Lesueur, B.C. 3460; the Great Pyramid, B.C. 3280—respectively 5,327 and 5,127 years ago. At the earliest of these dates the Egyptians were already a civilized people, in possession of a high scale of numbers, of a calendar, and of the art of writing; while at the latest of them they were certainly a numerous people, skilled in architecture, and equal to the construction of gigantic monuments. The history of the Jews could pretend to no such antiquity as that of the Egyptians, or even as that of the Chinese. There was a general assent among critics in fixing the building of the Temple to the year before Christ 1015—a date which would make it 2,446 years later than the construction of the oldest of the Pyramids. Reckoning backwards, the Exodus preceded the building of the Temple by 480 years, and the bondage in Egypt was given as having lasted 430 years. There were other races of man which, from their conspicuous position, must have made a very early advancement, although probably not equalling that of the Egyptians. The valleys of the Tigris and Euphrates, from their climate, fertility of soil, and facility of investigation, with the genius of their inhabitants, were formed by nature to be the seat of a very early civilization, and we have abundant evidence of such a civilization having sprung up, rivaling that of Egypt in extent, and greatly surpassing it in power. Its perishable monuments, however, do not furnish us with the same satisfactory evidence of antiquity as do the enduring monuments of Egypt.

Mr. Crawford's conclusions, recapitulated, were that man, though the latest creation of the class of beings to which he is most nearly allied, is yet of vast antiquity, whilst the time elapsed since he acquired the art of making a durable record forms but a small fraction of the period. In the early portion of the period he was without speech, ignorant of every art, and like the lower animals, chiefly guided by instinct. This, according to Mr. Crawford, he inferred from the fact that, where material evidence of man's presence exists, whether in caves or "drifts," he is already found in possession of implements of stone, implying a considerable step in advance. But over the greater part of the earth, auspicious locality and genius of race were not so combined as to enable man to reach the point of skill necessary to production of the enduring record. Some races have never approached it.

Sir John Lubbock thought Mr. Crawford somewhat underrated the quantity of human remains which had been found under circumstances which implied their great antiquity. It was quite true, no doubt, that in the drift beds, from which so many specimens of human workmanship had been obtained, no undeniable traces of human bones had yet occurred; but it must be remembered that many traces of human skeletons had been found, and that it was only on account of the extreme difficulty, in every case, of feeling quite certain that they belong to those beds in which they had occurred, that archaeologists and ethnologists had not felt justified in putting them forward as indubitable traces of human remains. There were very many cases on record of caves in which human bones had been found under circumstances which implied that they belonged to the same antiquity as the weapons which were found associated with them. They found as many remains of bones in such localities as they could expect to find, and he would even venture to go further than that, and to say that they found more than they might naturally have expected to find in caves which had also been used as the dwelling-places of man. Of course, it was natural that, under any circumstances, men were not buried in caves during the time these were occupied as places of habitation; but any difficulty they might have on that head was removed when they found that the Esquimaux, who lived under such very similar conditions, and with animals identical with those that were living with our earliest predecessors in the west of Europe, paid very little attention to the remains of their dead, allowing them to lie about neglected in the neighbourhood of their dwellings, and also that there were many races of men who were actually in the habit of burying their dead in the houses which they occupied when alive, so that the tomb was not only figuratively, but was literally "the house of the dead." Among many races, such as the Esquimaux, when a man died, his body was laid in the house which he had occupied, and it was shut up; and there were traces of the same thing in

other parts of the world. It was, therefore, partly to be accounted for in this way that so many traces of human bones had been got in caves which had evidently been inhabited. Upon that point he could not help thinking that Mr. Crawford would find that he need not explain or apologise in any way for any supposed absence or rarity of human remains in those caves which had latterly been examined with so much care.

Mr. Cyril Graham called attention to the fact that the chronology followed by Mr. Crawford was that of only one person. There were several eminent Egyptologists who followed a different system, and there was great reason to believe that the Pyramids, which the writer of the paper spoke of as having been built so very long ago, had been built within a much more modern period.

Dr. Hunt said there were some little difficulties in the paper which he should like Mr. Crawford to explain. First, there was that with regard to the innate incapacity of the Australians. Mr. Crawford went on to speak of the people who were once without speech and had only instinct—and he called these Men. Well, it was rather a difficulty if they were once without speech, and with only instinct, why he called such beings men. Mr. Crawford had said that the Australians had the innate incapacity to accept civilization, and thus argued from that absolute original distinction. With regard to the other subject—that of Egypt: Bunsen was the first advocate for the unity of man, and he said it was utterly impossible to explain it in fewer than twenty thousand years.

In replying, Mr. Crawford said that, as to the unity of the human race, of course he did not believe in that. His friend believed in the theory of special selection, and he hoped to be able to hear Sir John describe his theory of the human species, to explain how he discovered the missing link, how a monkey became a man, and how all the different races of men had undergone the change they had now done. He would like to see a single particle of evidence to show that a black man became white, or a white man became black, or how a black woman could be compared to the women he saw before him. He did not quite understand what his friend Dr. Hunt had said about speech. He had made remarks upon the difference between speech and instinct. Dr. Hunt having explained that he understood Mr. Crawford to have stated that there were men without speech, and with only instinct, whereupon he (Dr. Hunt) had asked how these creatures could be classed as men, Mr. Crawford replied that Dr. Hunt had only misconceived what he did say. He said that there was capacity for speech, but that they could not speak, because they had never learned. In the same way they could not use gunpowder or steam-engines, because they knew nothing about them.

In his second paper, Mr. Crawford adduced facts which, he argued, at once disposed of the hypothesis of climate being the cause of colour in the human complexion. In the course of an animated discussion that followed between Dr. Hunt and the reader of the paper, the latter said he recognised sixty distinct creations of men, and the former spoke of the structure of the hair as most important in a question of race, saying that dark colour of hair and eyes, combined with curliness of hair, was always a mark of mental inferiority, and he challenged exception to this generalization.

The third paper showed that in many parts of India there existed rude tribes, differing widely from the great body of the civilized inhabitants. People in that state of society were found only in districts more or less inaccessible, and by their comparative sterility holding out little temptation to conquest and occupation. He accounted for the existing circumstances by supposing detached growth of numerous distinct civilizations; which would remain for a long time unknown to each other, as were the Mexican and the Peruvian in America. All this most probably happened long before there was an Aryan invasion, or a religion of Bramah. The state of India at such a time would be a parallel to that of America on its discovery; the wild and savage tribes would be numerous; and the civilized few in number. Proportionate to its extent, it would have as many small tribes, speaking as many distinct languages, as America itself.

On a subsequent day a paper was read by Sir John Lubbock, "On the Origin of Civilization, and the Early Condition of Man." It began by alluding to the different opinions which have always been held as to whether man constitutes

one or many species, and to the two very different views which there are also as to the primitive condition of the first men, or first beings worthy to be so called. Many writers, Sir John Lubbock said, have considered that man was at first a mere savage, and that our history has on the whole been a steady progress towards civilization, though at times, and at some times for centuries, the race has been stationary, or even has retrograded. Other authors of no less eminence have taken a diametrically opposite view. According to them, man was from the commencement pretty much what he is at present. If possible, even more ignorant of the arts and sciences now, but with mental qualities not much inferior to our own. Savages they consider to be the degenerate descendants of far superior ancestors. Of the recent supporters of this theory, amongst the most eminent was the late Archbishop of Dublin, who enunciated his opinions in these words:—"We have no reason to believe that any community ever did, or ever can emerge, unassisted by external helps, from a state of utter barbarism, into anything that can be called civilization. Man has not emerged from the savage state; the progress of any community in civilization, by its own internal means, must always have begun from a condition removed from that of complete barbarism, out of which it does not appear that men ever did or can raise themselves." The paper proceeded with an examination of the reasons that led Dr. Whately to his conclusion. In the course of this it was shown how short a period is a century in the history of the human race, and that if, taking the ordinary chronology, in 6,000 years a given race has only progressed from a state of utter savagery to the condition of the Australian, we could not expect to find much change in one more century; for, many a fishing village, even on our own coast, is in very nearly the same condition as it was 127 years ago. Civilized races, according to the views advocated by Sir John Lubbock, are the descendants of races risen from a state of barbarism. Barbarians, on the contrary, argue his opponents, are the descendants of civilized races, and have sunk to their present condition. But, according to Sir John Lubbock, Archbishop Whately admits that the civilized races are still rising, while the savages are now stationary, and seems to regard this as an argument in support of the proposition that the difference between the two is due not to the progress of the one set of races, but to the degradation of those whom he himself maintains to be stationary. The delusion, Sir John says, is natural, and like that which every one must have sometimes experienced in looking out of a train in motion, when the woods and fields seem to be flying from us, whereas we know that in reality we are moving and they are stationary. Having considered the arguments brought forward by Whately, Sir John proceeded to state facts on the other side. First, he endeavoured to show that there are indications of progress even among savages; second, that among the most civilized nations there are traces of original barbarism. He adduced evidence in favour of our assuming that if Australia, New Zealand, or South America had ever been peopled by a race of herdsmen and agriculturists, the fauna and flora of these countries would almost inevitably have given evidence of the fact, and differed much from the condition in which they were discovered. Further, we might assert that no weapons or instruments of metal have ever been found in any country inhabited by savages wholly ignorant of metallurgy. A still stronger case, said Sir John, is afforded by pottery. Pottery is not easily destroyed: when known at all it is always abundant; and it possesses two qualities there,—namely, that of being easy to break, and yet difficult to destroy, which render it very valuable in an archaeological point of view. Moreover, it is in most cases associated with burials. It is therefore a very significant fact that no fragment of pottery has ever been found in Australia, New Zealand, or the Polynesian Islands. It seems to me extremely improbable that an art so easy and so useful should ever have been lost by any race of men. Moreover, this argument applies to several other arts and instruments. I will mention only two, though several others might be brought forward. The art of spinning and the use of the bow are quite unknown to many races of savages, and yet would hardly be likely to have been abandoned when once known. The absence of architectural remains in these countries is another argument. Archbishop Whately, indeed, claims this as being in his favour, but the absence of monuments in a country is surely indication

of barbarism and not of civilization. The mental condition of savages seems also to me to speak strongly against the "degrading" theory. I have elsewhere pointed out that, according to the almost universal testimony of all writers on savages—merchants, philosophers, naval men, and missionaries alike—there are many races of men who are altogether destitute of a religion. The cases are perhaps less numerous than they are asserted to be, but many of them rest on doubtful evidence. Yet I feel it difficult to believe that any people which had once possessed a religion would ever have entirely lost it. Religion appeals so strongly to the hopes and fears of men—it takes so deep a hold on most minds—it is so great consolation in times of sorrow and of sickness—that I can hardly think any nation would ever abandon it altogether. Where, therefore, we find a race which is now ignorant of religion, I cannot but assume that it has always been so. Sir John then mentioned a few cases in which some improvement appeared to have taken place, including that of the inhabitants of the Andaman Islands, who have recently introduced outriggers; of the Bachapins, who, when visited by Burchell, had just commenced working iron; and of the Wajiji negroes, who have recently learned to make brass. The rude substitutes for writing found among various tribes, Sir John said, must also in many cases be regarded as of native origin. In the case of the system of letters invented by Mohammed Doan, a negro of the Vet country, in West Africa, the idea was no doubt borrowed from the missionaries, although it was worked out independently. In other cases, however, this could not, he thought, be maintained. Take the case of the Mexicans. Even if we suppose that they are descended from a primitively civilized race, and had gradually and completely lost both the use and tradition of letters—to Sir John's mind a most improbable hypothesis—still we must look on their system of picture-writing as being of American origin. Even if a system of writing by letters could ever be altogether lost—which he doubted—it certainly could not be abandoned for that of picture-writing, which is inferior in every point of view. Although, therefore, we have no historical proof that the civilization of America was indigenous, we have in its very character evidence, perhaps, more satisfactory than any historical statements would be. After a reference to systems of figures and account-keeping amongst savage races, the paper proceeded to certain considerations that seemed to show that even the most civilized races were once in a state of barbarism. Not only throughout Europe, not only in Italy and Greece, Sir John said, but even in the so-called cradle of civilization itself—in Palestine and Syria and in India—the traces of the stone age have been discovered. It may, indeed, be said, that these were only the fragments of those stone knives, &c., which we know were used in religious ceremonies long after metal was in general use for secular purposes. But why were stone knives used by the Egyptian and Jewish priests? Just because they had been at one time in general use, and there was a feeling of respect or reluctance to use the new substance in religious ceremonies.

After having adduced a great amount of other evidence, and after remarking on one of the illustrations as showing that similar ideas in distant countries owe their origin, not "to an era before the dispersion of the human race," but to the original identity of the human mind, Sir John wound up thus:—"While I do not believe that similar customs in different nations are 'inherited from a common source,' or are necessarily primitive, I certainly do see in them an argument for the unity of the human race, which, however, he it remarked in parenthesis, is not necessarily the same thing as the descent from a single pair. In conclusion, then, sir, while I do not mean for a moment to deny that there are cases in which nations have retrograded, I regard these as exceptional instances. The facts and arguments which I have here very briefly indicated might have been supported by many other illustrations which I could not bring before you without needily extending a communication already somewhat too long. They, however, I think, afford strong grounds for the following conclusions:—namely, that existing savages are not the descendants of civilized ancestors; that the primitive condition of man was one of utter barbarism; that from this condition several races have independently raised themselves. These views follow, I think, from strictly scientific considerations. We shall not,

however, be the less inclined to adopt them on account of the cheering prospects which they hold out for the future. If the past history of man has been one of deterioration; but, on the other hand, if the past has been one of progress, we may fairly hope that the future will be so too; that the blessings of civilization will not only be extended to other countries and other nations, but that even in our own land they will be rendered more general and more equitable, so that we shall not see before us always, as now, multitudes of our own fellow-countrymen living the life of savages in our very midst, neither possessing the rough advantages and real, though coarse, pleasures of savage life, nor yet availing themselves of the far higher and more noble opportunities which lie within the reach of civilized man.

The chairman, Sir Roderick Murchison, expressed his adhesion to the views of the author of the paper, and his conviction that there had been progression throughout the works of Nature.

Professor Busk said there was a previous question, which should be settled before they could enter into the substance of this paper, namely, what was meant by "civilization." The word might be explained in several ways. In one sense it might be regarded as the obtaining of a command over the powers of nature, and the invention and application of useful arts; but in another and much higher sense, "civilization" meant the cultivation of moral qualities and of intellectual pursuits. Now, when they regarded mankind from this last point of view, he thought the results would be very different from those which should be arrived at if they considered civilization simply in the broad sense of the mere application of useful arts for purposes of ordinary life. In the higher sense of the word, they had at the present time in the world perhaps three, but at all events two, distinct kinds of civilization. They had the Chinese in the westward parts of Asia, the origin of which was lost in remote antiquity; they had, secondly, a civilization in western Europe, and probably throughout Hindostan, though that might, perhaps, be a distinct centre, but at any rate it diverged at a very remote period from European civilization. But the one to which he was particularly desirous of drawing attention was the civilization of Europe, which was drawn entirely from the Greeks—for all modern inquiry, even in the form of physical inquiry, was to be traced to the ancient civilization of Greece. He thought that in one sense—that was the intellectual sense—the moderns had not advanced one single degree beyond the civilization of ancient Greece: there had been no progress whatever in that respect. Of course, there had been a great acquirement of physical knowledge, and an abundant application of that knowledge to the useful arts. The condition of mankind had been very much improved in consequence; but the real essential civilization of the human mind had not advanced, he supposed, in Western Europe from the time of Aristotle and Plato to the present. They reasoned in the same way as we do; they had almost the same moral sentiments—and the higher among them, those of Socrates, for instance, were equal to ours. There had been no advance in civilization in that direction, so far as he (Dr. Busk) could see from the period of these great men, and probably for some time before it. The origin of this Greek civilization was as yet a great mystery; but he thought he might say, expressing himself widely, that all the civilization in the world with which they were acquainted, leaving out the Chinese, was due to one common source, whatever that source was, although it was lost, like that of the Chinese, in the remotest antiquity. They had no evidence of nations which had been debarred, from their geographical position and circumstances, from coming within the sphere of this Greek civilization. They had no instance of any nations having become civilized except as they had come into contact with it since. The whole civilization—or so-called civilization, which was merely the invention of industrial arts among savage nations, with the exception of a trifling influence of that kind—the whole of their advance was due to their contact with the European mind; he thought no one could deny that. He fully concurred with Sir J. Lubbock in the assertion that these savage nations were not degenerated from any former condition of civilization of any kind; but at the same time he was hardly prepared to admit that there was any evidence to show that savage nations had the power of advancing themselves by their own

naïved intellect. They had a striking instance to the contrary in the case of the African Continent, or rather that part of it south of the Great Desert. That part of Africa, of course, was quite cut off from the rest of the world, as well in modern as in ancient times. Those Ethiopian races had existed in Africa in vast multitudes, in some of the most fertile countries in the world, with every possible advantage of metals and minerals, and with abundance of animals which they might tame, and which other races than themselves had tamed. He referred to the African elephant; the negro had never domesticated it, though it was perfectly capable of domestication. The negro was so stationary a creature that he had never from the beginning of time invented an alphabet, or built a ship, or domesticated a single animal; he was as great a savage as he had been in the early dawn of his country. He had never been brought sufficiently in contact with European civilization; but, even if he were, it seemed doubtful whether he would ever advance to be more than a mere copyist; but that he would never originate ideas, either moral or intellectual.

Sir Walter Elliot was understood to ask Sir John Lubbock whether it was not the case that no race of men had ever been discovered who were not possessed of highly artificial language. It was almost impossible to conceive that savages gradually emerging from utter barbarism should be able to form a structure of grammar such as was to be found among them. There were instances of races falling from a high civilization to a lower. He mentioned, in detail, several Indian races as an illustration of this. He also related as a curious fact that an instrument like the boomerang of Australia was represented on some of the Egyptian monuments, and had evidently been in use among that people 5,000 years ago.

The Rev. K. B. Tristram wished to suggest to Sir John Lubbock whether his statements and facts were not compatible with some other conclusion than that at which he had arrived. He agreed with Sir John in the emphatic statement which he had put forth of the original identity of the human mind; but at the same time he would suggest whether many races which had not yet risen might not still rise to a higher place in the scale of civilization. While on the Gold Coast and the Slavo Coast even the commonest arts of life had been lost, and lost from the earliest time of which the Portuguese voyagers gave us any account of the Guinea Coast, yet in the interior of the country south of the Sahara, in the centre of Senegambia, many of those arts were found, such as melting barley, weaving and dyeing, and smelting iron. These arts certainly told of a civilization which put the negro a little above the position in which Professor Busk would place him. But granting that the negro had as yet shown no aptitude for or power of invention, and that he had never risen without our help, was there not a time when the civilization of the Greek race was far behind that of the Egyptian race? Did not history seem to say that there was some sudden start at some period? First, the Chinese civilization, then the Assyrian, then the Egyptian, then the Greek civilization, of which we are the successors, which had arisen at different periods, in different nations, perhaps independent of each other; but ever since these civilizations arrived at a certain height, Dr. Busk tells us, they have not advanced. Perhaps they did not: certainly the Chinese and the Assyrians did not advance, and the Egyptians were stationary for many ages. May not these other races have their turn to advance, if they have a sufficient draft on the bank of time, and produce, too, their Socrates and Platos? Then he thought Sir John Lubbock had hardly given sufficient allowance to one very probable way in which the islands in those distant regions were peopled. If the northern parts of Europe were peopled with outcasts from civilization—if they were peopled with shipwrecked crews cast ashore in boats—was it not most probable that these individuals could not possibly, from the force of circumstances, on their first arrival preserve their arts; and then the very first terms of language that they would lose would surely be the abstract terms. While they would preserve the names of any particular tree, the abstract idea of a tree would be the very first that they would lose. He (Mr. Tristram) was submitting this on the hypothesis that there had been degradation as directly opposed to Sir John Lubbock; he was submitting that it was true that Sir John's facts might be reconciled with the hypothesis of de-

gradation, which he himself believed in most firmly. He never could see anything in the state of these savages which might not be easily accounted for by their isolation; and the difficulty of the unity of language seemed to him to arise from the fact, that as they lost their knowledge of the arts, they lost all terms of speech which represented those arts that they had forgotten. He did not see it was impossible to reconcile Sir John's facts with the fact of all barbarism being a degradation from a previous civilization—not such a civilization as we have at present, but such a civilization as existed at present in Arabia, Armenia, and in the Plateau of Northern Asia.

Dr. Hunt entirely disagreed with Professor Busk respecting his opinion that there had been no advance in the civilization of the people of Western Europe during the last two thousand years. Two thousand years ago there were a small people who had arrived at a very high state of intellectual culture and civilization, but it was no less true that that was confined to a very small portion of Europe, and that since that period it had extended throughout the whole area of the Continent. They saw then a centre from which civilization radiated, but there were no doubt other centres at this time from which a higher civilization was again radiating, and possibly Dundee was one of these centres. With regard to his opinion that no savage race had advanced, that was also to some extent the opinion of the author of the paper. He had told them that there were several races who had raised themselves, but it was only a question of degree, and he understood Sir John Lubbock to mean that these savage races had raised themselves only to a certain position. He thought that, up to this time, there had been no real scientific satisfactory reply to the questions Whately had propounded. He said they never knew of any savages civilizing themselves, and that, therefore, civilization was the original state of man. Now he (Dr. Hunt) was very much surprised that, after the concisive and exhaustive, satisfactory and final, answer to the question, and the facts there brought forward, that there was any member of the Association who would still advance the opinion which they had heard from Mr. Tristram. Sir John Lubbock seemed to have brought forward all the evidence in such a clear manner as to leave no mistake on the minds of those who were open to conviction, that the original state of man was not certainly that which was depicted by those who believed it to be a state of civilization. With regard to the unity of language of which Mr. Tristram spoke, the progress of scientific inquiry showed that there were great diversities which could not be reconciled by any theory of unity. Mr. Tristram had told them that they must wait with regard to the civilization of the negro and other savage races, but that was not science. They had to found science on facts which they at present knew. They were not called upon, before bringing forward a scientific theory, to say what might take place in the future. All they could do was to trace the history of the races in the past, and see according to that what were the theories to be propounded. With regard to the original unity of the human mind, to which Sir John Lubbock had alluded, did Sir John mean an original unity in the shape and the form and the size of the brain or the skull? If he did, then he (Dr. Hunt) must entirely differ from him; but if he meant an original unity of all animal life, then he for one had no objection to that expression; or if he meant to say the original unity of all organic nature, he should not raise the slightest objection to the words; but he should be very glad to know exactly what was meant by Sir John Lubbock with regard to the words, "the original unity of the human mind." With regard to the conclusions to which Sir John Lubbock had come, he entirely agreed with the first and second. As to the third, that several races had raised themselves, perhaps Sir John would kindly mention any race which had done so. He (Dr. Hunt) did not know at this moment of any race who had raised themselves since we first knew them, with the exception of the races of Europe. The whole races of mankind appeared to him to have derived their progress and their advancement in civilization from the European races.

Sir John Lubbock, in reply, said he thought the remarks which had fallen from Mr. Tristram and Dr. Hunt showed the necessity there was for his reference to the opinions of Archbishop Whately, which had been called in question by Mr. Crawford. In answer to remarks about

religion, he would only repeat that many travellers had met with savage races who had no knowledge of religion. Dr. Hunt had asked him for some cases of nations who had raised themselves. He thought many might be given, but he would merely mention the Chinese, Mexicans, and Egyptians as three races who appeared to him to have raised themselves to a certain amount of what Professor Busk would still permit him to call civilization, independently of any assistance from one another.

The discussion then terminated.

Connected with the subjects of the papers and discussions that have occupied so much of our space, was the announcement made by Sir Roderick Murchison, of "The International Congress of Anthropology and Prehistoric Archaeology for 1867." The decision as to a meeting in England had been made, on the 29th August last, at the meeting in Paris, over which M. Lartet presided. In making the announcement, Sir Roderick referred to some local manifestation of feeling as to the tendency, supposed, of one of the papers read in the section.*

MONUMENTAL.

We learn that the execution of the proposed statue of Mr. Peabody is now resolved upon. At a meeting of the general committee on Saturday, the amount reported was over 3,000*l.*, when it was decided by the unanimous vote of the meeting to entrust the work to Mr. Story, the American sculptor. Mr. Peabody will give sittings in Rome, and it is hoped that the statue, which is to be of bronze, may be ready within eighteen months. The Corporation of London have been memorialized to grant a site near the Royal Exchange. The subscription list will be closed this month. The treasurer is Sir Benjamin S. Phillips, alderman; and the honorary secretary Mr. Charles Reed, F.S.A.

The Birmingham town council have resolved "That the Free Libraries Committee be instructed to consider if accommodation can be afforded in the Gallery of Art for the temporary keeping of the statue of H.R.H. the late Prince Consort, and to report to the council."

It has been resolved to erect a memorial of the late Lord Feversham, at Helmsley, and a design, in the form of a market cross, with a suitable inscription, has been accepted, the architects being Messrs. Banks & Barry, of Westminster. The memorial is to be placed in the market-place, and already about 600*l.* have been subscribed towards the necessary expenditure.

A Brockett Memorial has been erected in St. Edmund's Cemetery, Gateshead. The committee selected the design of Mr. Pearson, marble and stone works, of the Red Barns, in this town, and the work was intrusted to him. The monument is a square Gothic one. The inscription is "in grateful remembrance of Wm. Henry Brockett J.P., Mayor of Gateshead, 1830-40."

A mausoleum erected to the memory of the late Duke de Morny, in the cemetery of Père la Chaise, is now terminated. This monument stands on the western summit of the eminence which overlooks Paris, not far from the tombs of Casimir Delavigne and Honoré de Balzac.

OPENING OF PRESTON TOWN HALL AND PARKS.

THE Duke of Cambridge has inaugurated the new Town Hall and two public parks, and the Mayor next day opened Moor Park. Both occasions were celebrated by holiday ceremonial.

The new Town Hall has been about five years in building. We gave a view of it in the *Builder* of 30th August, 1862, p. 620. The architect was Mr. Scott. The building occupies the site of the previous Town Hall, at the top of Fishergate and the higher end of the market-place. The architecture is Gothic of the early part of the fourteenth century. The ground-floor contains an exchange-room, 50 ft. by 40 ft. Over the exchange-room there is a great hall for the holding of public meetings, &c. All the windows are filled in with stained quarry glass. The entire cost of the Town Hall will be about 70,000*l.*

The new parks, opened by the Duke of Cam-

* In making this summary we have derived assistance from the *Dundee Advertiser*, whose reports of the entire meeting fully described the enormousity they have received.

bridge, are situated on the south-western side of the town. One of them is called Avenham Park and the other Miller Park. The former has long in the main part of it been a recreation ground, but until lately has not been laid out to any particular extent. The latter is quite a new park, the land for the greater part of it having been given on certain conditions to the town by the late Mr. Alderman T. Miller, of Preston. Both parks have been laid out according to designs by Mr. Miller, landscape-gardener. At the higher end of Miller Park there is a belvedere of stone, and in the centre of the ground a fountain. Moor Park is 100 acres in extent. It is situated on the northern side of the town, and is a new one.

CAMBERWELL.

THE land on which Christ Church stands being required by the South Metropolitan Gas Company, the site and building have been purchased under the powers of an Act of Parliament for the sum of 6,000l. A new site has been obtained in the Old Kent-road, near the "Half-way House," being the bonse and grounds lately occupied as a ladies' school, and known as Claremont House, but which was formerly the residence of the notorious "Dick Turpin."

The foundation-stone of the new church was laid last week, and the building, which is now in active progress, will be ready for use by Midsummer next. It will be a brick structure, with dressings of yellow and blue stone, and in style a free adaptation of Early French Gothic. The chancel will be to the road, which places the building as nearly east and west as the exigencies of the site will permit.

The plan consists of a wide nave and south aisle, containing a gallery for about four-fifths of its length, but set back from the nave-arcade about 7 ft., and stopping short of the east end of the aisle about 3 ft. The gallery is reached by a Portland-stone staircase of semicircular plan, and the building containing this also serves as a means of exit for the sittings under the gallery. The main entrance is by a large porch at the east end of the south aisle in the corner formed by it and the vestry, with organ-chamber over, which in its turn fills the south-east angle formed by the chancel and aisle. There will also be a large doorway at the western end of the north nave-wall, near which the font will be placed. There will be no clearestory-lights: the nave will be lighted by a large west window and four large three-light windows in the north wall. The present contract does not include the tower, to raise the funds for which, however, an effort is now being made: it will be erected over the vestry and organ-loft.

The present contract is taken by Messrs. Dove, at the sum of 4,750l., which will be increased by another 1,000l. if the tower is erected before the completion of the present contract, and of this there is every probability. Mr. Bassett Keeling is the architect.

The spire of what is known as Camberwell New Church, one of Mr. Scott's earlier works, is now surrounded by scaffolding, with a view to necessary extensive repairs, rendered necessary by decay of the stone.

THE MAGNESIAN CEMENT.

We have had experiments made with the cement alluded to in *Galignani* as having been invented by a M. Sorel. The ingredients are oxide of magnesia and chloride of magnesium, and the "cement" is therefore an oxychloride of magnesia. That it has cementive power to some extent appears to be the fact, but the experiments are not very encouraging. Time, at all events, will be necessary to enable us to say what power the cement may ultimately display, but it certainly does not show much haste in setting and hardening thoroughly. Other cements are far superior in this respect. A good deal of gravelly sand, however, may be mixed with it into a somewhat cementive mass. How the ingredients can ever be made to compete with those of other cements in cheapness we cannot see. Oxide of magnesia is by no means a cheap material: neither is chloride of magnesium. Oxychloride of zinc displayed more cementive power than oxychloride of magnesia.

HOLBORN VIADUCT AND LONDON THOROUGHFARES.

AFTER being under the ban of public opinion for half a century, Middle-row has disappeared, and the viaduct looms up in the distance, giving evidence of an earlier completion than the public had recently been led to expect. When finished, people will wonder how the hill had remained so long a standing reproach to the public spirit of the City, and the constant source of serious accidents. The new streets in connexion with it are hardly of less importance than itself, and, when completed, will necessarily suggest others: for instance, the one from Hatton-garden to Smithfield will hardly be allowed to end at Charter House-square; it certainly ought to be continued not only into Aldersgate-street, but through Bridgewater-gardens to Bunhill-row, and thence between the Artillery-ground and Bunhill-fields burial-ground to the City-road. This would not only be in itself a desirable new thoroughfare between Smithfield and the north-eastern parts of the town, but it would be an important sanitary improvement for one of the most crowded and dirty neighbourhoods in London already pointed out by you,—namely, the large block within Old-street, the Barbican, Aldersgate-street, and Bunhill-row.

There is, however, in streets a difficulty of great importance which the completion of the viaduct will rather increase than diminish, because the traffic will most likely be considerably promoted by the opening up of wide and convenient streets of easy grade converging at the Old Bailey, having an aggregate width of some 200 ft., the said traffic going east and west by Newgate-street, which when widened will only be 50 ft.; and, still worse, Cheapside in some parts is less than 40 ft., with very little prospect of being widened. I am aware that Mr. Haywood projected a new street through Christ's Hospital eastwardly to Whitechapel, but there does not seem much prospect of an early commencement of this undertaking; and, even if made, I have some doubts about the extent of diversion of traffic which it would cause, being mindful of other experiments in this way.

On the other hand, considering the value of property and the nature of business in Cheapside, it seems hopeless to expect any relief from an increased width of that street; and as Gresham-street was hopelessly botched from its commencement we are left with one expedient only, that is, a new street, or streets, as near Cheapside as possible. I would propose a street commencing on the north side of St. Vedast's Church, Foster-lane, and running as nearly straight as possible to Prince's-street, crossing the Old Jewry at St. Olave's Church, and passing in rear of Grocers' Hall. The access from St. Martin's-le-Grand would be rather difficult, as the Post-office encroaches on a direct continuation of Newgate-street; still, with the sanction of the authorities, a practicable street might be laid out without interfering with the integrity of that building.

And here I cannot help adverting to its entire inadequacy to the enormously increased business now forced upon that branch of the public service. The style of architecture chosen is ill adapted to the irregular form of the site, as, including porticoes, nearly or quite one-third of the space is lost. A two-story classical building for strictly business purposes, not half large enough for the wants of the Department, is not the best way of utilising the land worth probably half a million per acre. Two or three portions of the service are lodged in neighbouring streets, to the great inconvenience of the public, and a large space on the opposite side of the street is now being purchased for an extension; but it seems to me that, with the traffic of such a street between them, this is nearly as bad as the present method of having them in different streets in the vicinity. My idea would be to buy all the property within King Edward-street, Bill and Mouth-street, St. Martin's-le-Grand, and Newgate-street, and there to raise a lofty business-like block of buildings with an interior court, the whole of sufficient capacity for double the present business. This would, of course, be very costly, but the sale of the old site would partly recoup the expense, and in the long run the most costly would really turn out the most economical, as nothing can well exceed the extravagance of our perpetual makeshift patchwork way of doing such things.

When the Newgate meat-market is removed to Smithfield, which, I fancy, may take place some time next year, I look forward to an agitation for a new street from Cheapside through the

market site, Warwick-square, between the Court House and Newgate, to Farringdon-street, which, if accomplished, would with the one I have proposed settle the question of streets in that vicinity for half a century at least. J. W.

A correspondent writes,—Some years since there was a plan noticed in the *Builder* for uniting Tottenham-court-road with St. Martin's-lane by a new street.

Now that the North Western and Charing Cross Underground Railway (which company was to have made the new street) is given up, would it not be as well to call the attention of the Board of Works to the desirability of making the new street? It would be an immense improvement to the W.C. District, and could be made at a moderate expense.

YALE COLLEGE MEMORIAL CHAPEL, NEW HAVEN, CONNECTICUT, U.S.

IN accordance with the request of the Alumni of Yale College, expressed at the commemoration in July, 1865, a committee then appointed have considered various plans suggested for a memorial of their brethren who fell in the recent civil war. After consulting with a committee appointed by the corporation of the college for the construction of a new chapel, they reached the conclusion that the desire could be best accomplished by connecting this memorial with the chapel which the college had for some years past proposed to erect. Designs were submitted to the committee by several leading architects of New York, each presenting some attractive features, and from these the design presented by Messrs. Vanx, Withers, & Co., of which we give a view and plan, has been selected. Permission has been obtained to devote to the memorial chapel a gift from Mr. Joseph Battell of 30,000 dollars, which now amounts to about 36,000 dollars; but, in addition to this generous contribution, the sum of 160,000 dollars will be required in order to carry out the design selected, and this sum the committee are now seeking to raise.

The purpose of the chapel, that it should be a memorial of the graduates of Yale College who fell in the service of the country during the late rebellion, necessarily gave the key-note to the design as a work of art.

Two lofty halls, or ante-chapels, are provided, opening through archways in the side-walls of the tower entrance, and only separated from it by ornamental iron screens. These two ante-chapels, with the principal vestibule between them, will thus present the effect of one apartment devoted to memorial purposes. The windows being 20 ft. from the floor, there will be ample wall-space beneath them for mural tablets.

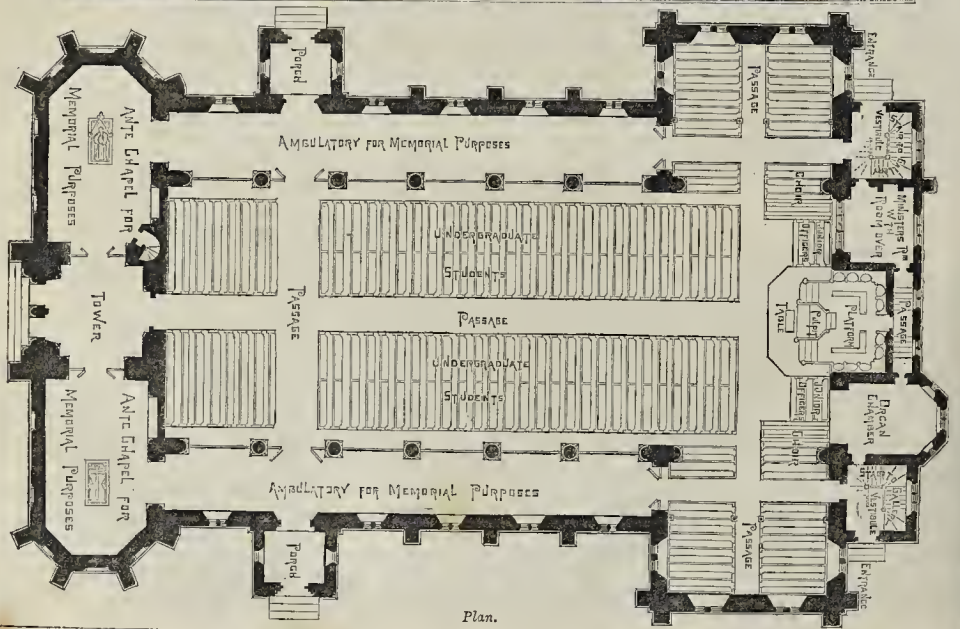

This general arrangement is adopted, say the architects, in order that every one on entering the main building from the principal entrance may at once be made aware of the particular intention of the design, while yet no portion of the area thus set apart will be used as a common passage. Each of the ante-chapels is extended in the form of an aisle or ambulatory, parallel with the chapel proper, from which it is separated only by arches filled to the springing line with light iron screens. The chapel proper, with its aisles, will be lighted mainly by twelve large clearestory windows, as shown in the general view, the small ambulatory windows being introduced rather with a view to their being filled with memorial glass, than to their serving any important purpose in the general system of lighting.

The whole number of sittings provided by the plan is 1,100, of which 960 are on the ground floor, and 140 in the transept galleries.

The principal front of the exterior design includes the two monumental ante-chapels and the tower; and this part of the composition is depended on to embody the memorial idea, the bronzes or marbles in the panels being of a less personal character than the moments in the interior. The exterior architectural effect of the chapel proper is intended to be simple, and will depend mainly on the clearestory, the transept gables, and a broad stretch of roof.

It will thus be seen, that although the expression of the memorial idea predominates both in the interior and exterior of the design, the portion of the building intended to be used for religious services occupies the central position, and has an individual character.

YALE COLLEGE MEMORIAL CHAPEL, CONNECTICUT.—MESSRS. VAUX, WITHERS, & Co. ARCHITECTS.

FAÇADE OF THE NEW OPERA HOUSE, PARIS.—M. GARNIER, ARCHITECT.

THE NEW OPERA HOUSE, PARIS.

THE immense pile the Parisians call *Le Nouvel Opéra*, and the *Académie Impériale de Musique*, vies with the Great Exposition in attracting the attention of Parisians and strangers. This new wonder of Paris is progressing steadily towards completion, and has now attained a stage that gives tangible assurance of the stupendous effect of the whole. Situated in the centre of an open Place, presenting its four façades to full view, in one of the best neighbourhoods in Paris, close to the junction of the Boulevards des Capucines, and the Boulevards des Italiens, well set back from both, and easily accessible from three spacious thoroughfares besides these, the position of the Opera-house is satisfactory. The façade looking upon the boulevards is sufficiently completed to admit of the removal of the scaffolding, though the rest of the edifice is in parts still concealed in it. Besides scaffolding, the structure is further covered up with the wonderful glazed screens that are used in Paris to protect buildings from the weather, or shield the workmen when in course of execution. Over and above the boarding with which English builders are content to protect the public and their workmen, rises, to the full height of the structure, a huge timber-work screen, pierced with large glazed openings for the purpose of admitting plenty of light. Behind this glazed screen is the scaffolding, the various stages of which form light sheltered galleries, in which the sculptured decorations and other advanced operations can be conveniently carried on, at any height, in most weathers.

To give a rough idea of the form of the new Opera-house, we may liken it to an Italian palace, full of spacious suites of apartments, corridors, loggias, staircases, salons or foyers, vestibules, &c., built close up against a Greek temple. But this comparison only holds good as far as the general effect as seen from a distance, for there is much more in the building than can be suggested by it. The palace, or palatial-looking portion of the structure, has an inscription, in the centre of the frieze in gilt Roman capitals upon it, which describes it as the *Académie Impériale de Musique*; the raised part, covered by a huge pediment, as in a Greek temple, is that occupied by the theatre. At the point of junction where the *Académie* abuts upon the theatre, there is, on both façades, a pavilion two stories high, with spacious and handsome circular carriage-drive approaches to them. These pavilions, it is whispered, are for the use of the Emperor and Empress. All that is seen of the theatre from the streets around is the huge pediment standing up above all the other roofs of the building, for it is built on as a centre by a façade of angular-fronted houses having tier over tier of windows in them, assigned for the use of the *personnel*—*employés*, choristers, *figurants*,—and for the transactions of various departments of the administration, and residences of the officers. The Academy has a richly-ornamented frieze and attic story, and a roof of pavilion-like construction. The style in which the whole is designed is French Classic Renaissance, of a most enriched kind, covered with carvings of great boldness and profusion, and ennobled as to material by a free use of marbles, and bronzes in juxtaposition with the sculptured mass of the cream-coloured stone of the fabric.

The façade of which we give a view is that which is seen from the boulevards. It consists of two open loggias, one over the other. A slightly advanced wing flanks the centre on either side, and returns as the commencement of the façades that form the second and third frontages. The first open loggia, or that on the ground-floor, is approached by a flight of steps extending along its entire length. There are five semicircular-headed arches here, besides one in either wing, and another in each return, making nine in all. Between each of these openings is a pedestal, with a group of sculptural figures upon it. Balconies project between every two columns of the upper loggia. Marble pillars enrich the openings on this story. Over each opening are circular piercings, or openings, in which busts are placed. Mozart occupies the central place, or post of honour, unsupported by Spontin, Meyerbeer, Auber, Halevy, and Mendelssohn; and the busts of other musical celebrities are ranged all round the building in the same circles. On this façade is the inscription, "*Académie Impériale de Musique*," and on one wing is inscribed "*Chorographes*," and on the other "*Poésie Lyrique*." A bronze cresting runs from the

pediment of one wing to that of the other. Over the handsome frieze, which is principally formed of boys, boldly carved, supporting crowned shields bearing the gilded letter N, is a second cresting, which is eccentrically formed of gilded masks. At the summit of each angle, making a pyramidal finish to each wing, is a group of sculpture. We may here note that in some of the recent public works the Napoleonic initial is intertwined with that of the Empress, but in this case the imperial N is alone used.

Within the unfinished parts of the structure a marvellous sight presents itself in the multiplicity of the iron pillars, girders, tie-rods, &c., most of them fixed in their places, and others in course of being raised by steam-engines. Those who saw the interior of the domes of our International Exhibition of 1862 while in progress would be immediately reminded of them when gazing upon this labyrinthine construction. At present there is not a bit of timber scaffolding to be seen, except the forest of ball-timber scaffolding: it is a vast so-called fire-proof shell full of iron spider-webs. A tall massive iron column rises from the ground to the roof at the interval of the boxes all round the interior of the house, rising from the parterre to the amphitheatre. From these pillars depart girders to carry the floors of the *stalles de balcon*, *loges*, *baïgnaires*, and corridors. This arrangement is carried out in tier above tier. Two immense lattice-girders cross the body of the house, high in the air, from the proscenium to the back of the auditorium, to carry the roof and the fireproof back arching of which the ceiling and roof are composed. We noticed very substantial pedestals by the side of the proscenium, which appear likely to obstruct the view from several seats, as well as a general massiveness in the ironwork, which, when the construction is lined with wood, as must be the case in the boxes and elsewhere, would be of consequence in a smaller house. It remains, however, to be seen whether the extent of the structure will altogether obviate this possibility.

The groups of sculpture shown in the view surmounting the wings are but temporary models cut in wood and brilliantly coloured. The gilding is at present confined to the bronze cresting, the inscriptions on the frieze, and the imperial Napoleonic initial letters on the shields on the attic story.

The *coup d'œil* will, doubtless, be magnificent. The art-work for the interior will, of course, be placed in competent hands; for, as the existing treasures boast of sculpture, frescoes, and paintings by Klaxmann, Guichard, Sechan, Dieterle, Desplodin, Duret, Fetti, Lesorme, and this is intended to be the finest in the world, the sister arts must be represented in it by the first talent of the day.* Another year must elapse before the structure can be finished. Considerable impatience having been betrayed by the Parisians, those concerned removed the screen-work of one front, and revealed the yet incomplete façade we have illustrated, as an assurance that the work is not standing still.

ART EDUCATION.

A MEETING has been held at Oxford in the Music-room, Holywell, under the presidency of Dr. Acland, to consider what steps should be taken to render the School of Art for the Working Classes, established in the Taylor-buildings, more attractive to those for whom the school is specially instituted. There was a numerous attendance of those who have always taken a practical interest in the school, and there were many present who have not hitherto identified themselves with the movement.

The Chairman said the object in view was essentially the cultivation of the mind of the working-classes, and that was the subject he would ask them to consider upon the present occasion. He need scarcely tell them that the skilled workman always commanded the higher rate of wages; and, as a School of Art was essentially one in which men were taught to be skilled, they would readily see the importance of the objects in view. Besides, Oxford was a city so closely connected with art that it possessed advantages not to be obtained in any other place in the kingdom; and therefore he invited the working-classes to attend the opening of the Art School for the ensuing season. There were

* A list of the artists to whom the decorations are entrusted has been published.

three kinds of art: the purely mechanical, the imitative, and the ideal, or works of fancy. No person was a great artist who did not possess all those parts, who could not copy anything he pleased, and who had not that power of idealization by which he could give expression to them. Every artist had those powers to a certain degree. It might be said that every carpenter's apprentice had within him the mechanical and imitative parts, and hoped by practice and attention to improve upon them; and, if that were so, every man was an artist in his own nature; but the object to be obtained was proficiency in art, which did not rest either upon mechanism or imitation, and if the British workman wished to excel, he would train his mind to the higher branches of art, or otherwise he would be left behind. Let them, if they would, look at the thing in a commercial and purely financial light, affecting as it did the mass of the nation in that respect. Let them consider what descriptions of art it was that affected the artisans of the country? It was that kind of artisans now before him. They would not become either Raffaello or Michelangelo, but, if they were not, they might study so far as to make themselves good skilled mechanical artisans, and then, in future life, their master would, if he thought they were worth anything, know how to make the distinction between one class of workmen and another.

Several speakers besides the chairman addressed the meeting, and appropriate resolutions were passed.

THE BIRMINGHAM AND MIDLAND INSTITUTE.

THE winter session of this Institute has been opened. The president for this year is Mr. Commissioner Hill, Q.C., for a quarter of a century recorder of the borough.

The learned President, at the commencement of his address, cited a few sentences from a speech delivered by the late Prince Consort in laying the foundation-stone of the building twelve years ago. The illustrious Prince on that occasion said,—

"This work I do not look upon as a simple act of worldly wisdom on the part of this great town and locality, but as one of the first public acknowledgments of a principle which is daily forcing its way among us, and is destined to play a great and important part in the future development of this nation and the world in general,—I mean the introduction of science and art as the unconscious regulators of productive industry."

The learned President said that much as had been done in the direction defined by the Prince Consort, he was persuaded they felt acutely that much still remained to be done; but effected it assuredly would he, unless he formed a false estimate of his fellow townsmen. The continued prosperity of the town, he said, could only be retained by an uninterrupted series of victories. In no place on the face of the globe was so rapid a succession of trades necessary for the full employment of the population. Staple trades, with the exception of gun-making, there were none, or next to none. Numerous manufactures, however, started into existence, prospered for a time and died out again at the caprice of fashion. What was better, because of more permanent benefit, discoveries in science were speedily applied here to the arts of life. In conclusion, the president expressed his conviction that the removal of every obstacle to the permanent welfare of the town, and the promotion of whatever tended to its advancement, must concurrently foster the love of knowledge in the rising generation.

LIVERPOOL ARCHITECTURAL SOCIETY.

THE Liverpool Architectural Society held their first meeting of the session on the 2nd inst., at the Royal Institution, Mr. T. J. Kilpin in the chair. In his opening address the president alluded to the subject of laborers' dwellings, and said that nowhere had it received such anxious consideration as it had done in Liverpool. The talent, experience, and practical energy of the borough engineer had been called into requisition, and some excellent plans had since been tendered. There were upwards of seventy of these designs; but the difficult problem still remained unsolved of how to square an inevitable expenditure with adequate remuneration. With all their talent they were unable to accomplish their difficult task. Then

a revision and relaxation of the laws now regulating the erection of buildings for the working classes would become a matter of imperative necessity. He spoke with deference and with due consideration when he expressed an opinion [in which we are not disposed to agree] that important reductions might be made in the thickness of the external and internal walls, and in the scantlings of the timber. He would also venture to suggest that the distance and open spaces now required to be left between the blocks of buildings might in some instances be reduced, and this would also tend to the reduction of cost.

THE WEST HAM (STRATFORD) TOWN HALL COMPETITION.

The West Ham Local Board have awarded the first premium of 100l. to the plans marked "Civis," the joint design of Mr. Lewis Angell and Mr. John Giles, of Craven-street. The second premium of 50l. is awarded to Mr. G. A. Wilson, of Leadenhall-street, for design marked "Adam," and the third premium of 25l. to Mr. H. S. Legg, of Bedford-row, for the design marked "Industria."

The sum is not to exceed 20,000l. That sum includes the site and cost of the building.

PREMIUMS, WINCHESTER DRAINAGE.

At the last monthly meeting of the local Board, the General Purposes Committee brought up a report containing the following paragraph:—

"Mr. Newman, the surveyor to the local Board, having been instructed by the committee, presented the following report upon the merits of the different plans for the drainage of the city:—

"Gentlemen.—I beg to say that I have very carefully considered the relative merits of all the schemes for draining the city and the disposal of the sewage, and consider that awards should be made as under:—

1st Premium, to No. 7; 2nd ditto, No. 3; 3rd ditto, No. 11.
H. NEWMAN.

Oct. 11, 1867.

Your committee having, in their last report, presented to the special meeting of the Board on the 17th of September last, dealt with the question of awarding premiums to the plans then before them, viz., Nos. 1, 5, 7, and 11; and having again fully considered the matter with reference to the plans originally sent in to the Board; and having referred to the report of the surveyor, Mr. Newman, which was presented to the Board on the 4th of April last, and which embraced the whole of the plans in competition; and after consultation with Mr. Newman as to the relative merits of the same, have determined finally to recommend to the Board that plan No. 3 be awarded the second premium of 50l., and that plan No. 11 be awarded the third premium of 25l., and they trust that a satisfactory conclusion of the preliminary matter will be thus attained. They also recommend that the Finance Committee be authorized to sign cheques for the amount of premiums, and the clerk be instructed to write to the authors of schemes Nos. 3 and 11 to forward their plans to the Board."

No. 3, "Eato Perpetua," Mr. C. W. Whitaker, C.E., Southern Thames Embankment Works, London; No. 11, "Economy," Mr. W. Russ, C.E., 35, Grosvenor-street, London.

ACCIDENTS.

At Clapton an accident has occurred on the works of the main sewer in the new road from the Priory Estate, to the Lea-bridge-road. It appears that the soil was sandy, the sewer was about 25 ft. below the surface, and the sides gave way, and two poor fellows were buried in the debris, in which position they remained for upwards of three hours. Animation was restored, but the leg of one of them has been twisted in a peculiar manner by the falling earth.

A fatal fall from the tower of a new church at Stockwell has occurred. The workman killed was engaged in serving up the cement for pointing the brickwork of the tower, and his foot slipped, so that he fell a depth of some 70 or 80 ft. His skull was terribly fractured.

At the Prince of Wales's-road, Norwich, a gentleman narrowly escaped serious injury the other day from the careless way in which the pavement was left after the removal of some scaffold-poles, used for building purposes. The flags were carelessly put down, no regard being paid to their projecting a considerable distance above the level of the pavement; and persons hurrying to and from the railway station could not escape stumbling and falling. The gentleman above alluded to was precipitated with great force upon his head.

Near Blackburn a serious explosion has occurred at Messrs. Hodgkinson, Swain, & Codlin's mill, Livesey. A number of large pipes, called economisers, were connected with two boilers, to supply them with condensed water. These pipes were fixed in the chimney flue, in order that the spent heat from the boiler might be made serviceable. The water on entering these pipes was about 110 degrees, and on leaving them it was raised from 250 to 270 degrees. The boiler shed was about 35 yards long and 20 yards wide, and was used for the purpose of storing cotton. It was covered with a slated roof, the joists being supported by iron pillars. Immediately adjoining is the shed, and on the opposite side of the shed is a row of busses. The explosion occurred in these pipes, through some yet unexplained cause. The roof of the shed was blown off, and the outside wall entirely demolished. The pipes were broken into fragments, and large portions of them, and also the boiler-valves, were thrown 30 or 40 yards into the air. All the glass in several alleys has been removed, and a great many of the looms are broken with the bricks, stones, and piping thrown upon them. The damage is roughly estimated at 5,000l. The pipes in question were put in by Mr. Ellson, of Oldham, about eight weeks ago, and at present no opinion can be given as to how the accident occurred.

At Pimlico, on Tuesday morning, a frightful accident (similar to the late Blackfriars-bridge accident) occurred at Messrs. Fabbriotti's Carrara Marble Wharf, Grosvenor Wharf, Pimlico, which unfortunately has resulted in the death of two men. They were at work on a "traveller," shifting a block of marble of an immense weight, when the framework suddenly gave way, and the traveller with the unfortunate men were precipitated to the ground, a depth of about 28 ft. Shortly after they were extricated both died.

THE STAGE.

New Theatre Royal, Leeds.—The new theatre, to which we have before alluded, has been opened. The front is lofty, and is Italian in style. There are three doors in it, and they are sheltered from the weather by a permanent awning. The floor of the vestibule or crash-room is laid with eucassian tiles. The walls are coloured to harmonize with them, and stencil ornaments relieve the surface. Over the marble fireplace a large mirror is suspended; by the sides of the chimney-piece are a couple of niches, coloured blue, containing statues representing Tragedy and Comedy, holding lamps in their hands. Several pieces of classical statuary are also placed in niches on the stairs. A broad flight of stone steps, ornamented by a gilt balustrade, leads to the upper saloon. The statuary has been supplied by Signor Brucciani. On this saloon landing are retiring-rooms, fitted up with velvet-covered seats, and having lavatories supplied with hot and cold water, and other conveniences; and near them are separate coffee-rooms and refreshment-rooms, most comfortably furnished with small marble tables, chandeliers, &c., in the French style. The boxes are reached by a central door leading from the upper saloon. This part of the house is lighted by three Chinese prismatic lanterns and gas brackets. In front of the boxes, and separated from them by an iron balustrade, is the dress circle. It is fitted with *fouteuils*. There are twelve private boxes, lower and upper, approached by separate entrances, and fitted with chairs. The entire range of boxes will accommodate 280 persons. In the pit the seats are stuffed and fitted with backs. By an arrangement of the orchestra, the front of the pit can be turned into pit stalls, having a separate entrance, on extraordinary occasions. The pit will hold 1,100 persons without inconvenience. The gallery will seat 1,150 persons, and, like the pit, it can be divided into higher and lower priced seats. There are three separate exits from the pit, and a similar number from the gallery. The decorations are a reproduction of the designs which embellish the theatre in the Palace of Versailles. The proscenium is white and gold. In the centre of the arch is a bust of Shakspeare, and over this are the arms of Leeds. On the ceiling above is an oval panel, bearing the monogram, in gilt letters, of the proprietor, "J. C." A dispersed cover runs round the ceiling. A large circle, coloured blue, and studded with stars, is formed in the centre by a framework of conventional foliage, and the four spandrels

at the corners are filled in with richly-decorated pendants and scroll work. The large sunlight in the centre of the ceiling is enclosed in a basket of prismatic glass. A shaft above the sunlight carries off the heated and impure air. The fronts of both boxes and gallery are enriched by scroll work, elaborately ornamented in gold and colours. The stage was laid down by Mr. Richard Haby. The machinery can be worked on one side; and, from the height and depth of the stage, everything can be taken up or down quite out of the way. The width of the proscenium is 25 ft., the height 28 ft., and the depth from the front to the back of the stage, 55 ft. The scenery is entirely new. Mr. James Gates has painted an act drop, and the principal scenes of the opening pieces; Mr. Chas. Smithers is the painter of a new curtain. There are upwards of twenty dressing-rooms, in every one of which hot and cold water has been laid on; and everything has been done that can conduce to the comfort and convenience of the performers and others employed in the house. The architects are Messrs. Moore & Son, of Sunderland. The builders are Messrs. Nicholson & Son, of Leeds. The decorations have been executed by Mr. Jackson; the arch of the proscenium, with the bust of Shakspeare and the arms of Leeds, and the whole of the designs in *carton pierre*, by Mr. Alfred Walker; the upholstery, including the fittings-up of the private boxes, is by Messrs. Roberts & Wouldhave; the iron-work by Mr. Tennant; the plumbers' work in the lavatories, the hot and cold water apparatus, and all the gas-fittings, including the central sun-light, by Mr. Lindley; the slating by Messrs. Watson & Wormald; and the plastering by Mr. Mountain, of Leeds. The entire cost of the building is estimated at from 15,000l. to 20,000l.

Bristol.—The new theatre here, will be opened on the 15th inst. The auditorium is identical in size with that of the Queen's Theatre in London, the same architect superintending both; but the stage and surroundings of the Bristol theatre are much larger.

A New Theatre for East London.—A new theatre, to be in future known as "The East London," is to be opened this week. It is situated in the Whitechapel-road, and occupies the site of the Eltingham Theatre. To make room for the new theatre the old Eltingham and some adjoining houses have been swept away, and a building has been erected in their stead, capable, it is estimated, of accommodating 4,000 persons. It possesses a large stage. There are two tiers of boxes. Those nearest the stage are fitted up for the accommodation of private parties. The centre of the first row of boxes is to be the dress-circle. The centre portion of the second tier is the amphitheatre, and behind that the gallery. The architect was Mr. Hudson, and the builders were Messrs. Palmer & Sons.

RAILWAY MATTERS.

The large depot of the Great Western Railway Company, beneath the site of the Smithfield Market, has been opened for goods. It is intended to supply the place of the warehouses at the Bull and Mouth, which are shortly to be pulled down. The rails are not yet laid down which are to connect the depot with the Great Western system, so that the yard will as yet be merely used as a receiving station for goods to be transported by the company's wagons to Paddington. This will ultimately form the largest and most important goods station of the company. The road into the depot is a spiral one, occupying the centre of the old Smithfield Market, and descending at a gradient of one in twenty-five. At the end of the descent are three large arches, of skew brickwork, which carry the road above, and through these is the passage to the yard, where temporary platforms and offices have been erected for the receiving and delivery of merchandise.

The traffic receipts of the railways in the United Kingdom for the week ending September 20th, 1867, upon a mileage of 12,537, amount to 815,181l., being equal to 65l. per mile. For the corresponding week of last year the receipts were 769,692l., the number of miles open 12,364, or 61l. 15s. per mile. A comparison of the two weeks shows an increase in the aggregate receipts of 51,363l., and in the number of miles open of 173. On the lines having termini in the metropolis, the increase has been, on the London and Brighton, 1,750l.; Great Northern, 4,171l.; Metropolitan, 4,250l.; London, Chatham, and

Dover, 2,891; South Eastern, 3,769; Midland, 5,975; North London, 891; Great Eastern, 733; London and South Western, 2,187; Great Western, 2,905; and London and North Western, 4,141. On the principal lines in England and Wales there has been an increase on the Lancashire and Yorkshire of 3,207; on the Manchester, Sheffield, and Lincolnshire of 1,724; on the North Eastern of 2,824; and in Scotland the North British and Edinburgh and Glasgow shows an increase of 847; on the Glasgow and South Western of 1,052; and on the Caledonian of 1,319.

The largest railway contract ever made by a single person, in the United States, is said to have been made recently by the Hon. Oakes Ames, of Massachusetts. It is reported that he has contracted to build the mountain section of the Pacific Railway, some 600 miles in length, for 17,000,000 dollars.

SANITARY MATTERS.

Sidmouth.—The drainage works in connexion with the sewer outlet have been completed and successfully brought into operation. The junction of the old sewers with the new outlet had just been effected, and all ready for putting the sewer into use, when heavy rains and high tides combined to test the utility of the sewer, which is said to have been completely up to the occasion, and prevented the usual swamping and flooding of houses. The only thing regretted is, that the pipes were not 2 ft. 6 in. in diameter, instead of 2 ft. 3 in. Mr. Phillips, who planned the works, has since submitted a plan and report for carrying out the Western Town drainage, which is also urgently needed.

Chippenham.—A company is being established to supply this town with water from the Locksweil Spring. Pure water is much needed here.

Leamington.—The steps taken by the local Board, in obedience to the order of the Court of Chancery, to cleanse the bed of the river Leam, from below their sewage outfall to its confluence with the Avon, has revealed that the decolorising works fail to render the town sewage sufficiently innocuous to permit it to be discharged into the river with impunity. The lime process is the one adopted, and the works are said to be as perfect as it is possible to make them. Now that the water of the Leam is diverted, however, into a temporary channel, that in the natural bed of the river appears perfectly black, loaded with offensive matter, and emits a horrid stench. It is only about five years since this part of the river was straightened and widened, so that the whole of the existing sewage deposit has taken place since then. It is not probable that the cleansing of the Leam, which will supply evidence that will strengthen the case of the plaintiffs in the Chancery suits against the local Board, will satisfy the Court, and in all probability steps will have to be taken to entirely remove the sewage out of the river.

THE PUBLIC HEALTH.

THE annual mortality of the ten large cities and boroughs in England for the quarter just ended, compared with the corresponding quarter of last year, was as follows:—

	1867.	1866.
Quarter ending September 28,	Quarter ending September 28,	
London	31.3	29.2
Liverpool	28.5	60.5
Manchester	31.6	30.7
Birmingham	25.9	19.3
Leeds	28.8	30.9
Sheffield	23.8	24.0
Bristol	19.2	20.7
Newcastle-on-Tyne	25.3	31.8
Salford	28.4	28.3
Hull	26.2	22.3

The high death-rate in Liverpool for the summer quarter of 1866 was owing to cholera. London and Bristol have been remarkably healthy this summer. But in all the other places the public health has been unsatisfactory. Infantile mortality from diarrhoea and scarlatina was excessively great. In Newcastle-on-Tyne, scarlatina has been very fatal for five consecutive quarters, a circumstance unparalleled in any of the large cities and boroughs since the death returns were established. So fatally prevalent has scarlatina been in the borough of Newcastle-on-Tyne in the above-named period, that the annual mortality per 1,000 was raised to 31.6, 36.7, 37.0, 27.3, and

29.5 for the five successive quarters, ending September 28, 1867, being an uninterrupted prevalence of that dreadful and exceedingly fatal epidemic for no less than fifteen months!

Manchester has lately decided to have a medical officer of health; but so nearly was the project being negatived by the Town Council of that city, that on a division the numbers were found to be equal, immediately on which the mayor gave his casting vote in favour of the proposition.

The Town Council of Birmingham have been memorialised in two petitions from the inhabitants of that borough to appoint an officer of health. To the second memorial were attached the signatures of eighteen borough magistrates, the leading members of the medical profession, and principal householders and tradespeople of the town. The petition was also signed by many of the merchants and manufacturers, and a large number of other eminent and influential mercantile houses within the borough.

The prayer of the memorialists is now under the consideration of the Town Council.

It may be as well to observe that Birmingham is the only great town in England which is deprived of the excellent sanitary advantage of an officer of health.

THOMAS L. PLANT, F.R.S.

SCARCITY OF HOME-GROWN FRUITS.

Sir,—In the notice you kindly gave (p. 703, ante) of my proposal to plant the waste lands of the Government and the sides of railways now unoccupied, with fruit-trees, you raise an objection (solely, I am pleased to see) on the possible obstructions of the view from the railway-carriages. Certainly, if standard pear and apple trees were grown continuously this would be a valid objection, and not the only one; but standards (high orchard trees) need only be planted where there is plenty of room, and where the view would not be intercepted. I propose, in cases such as you anticipate, dwarf trees, such as pyramids and hushes, which at no season of the year could possibly interfere with the view, which in the spring would be attractive for the bloom, and in summer and autumn for the fruit.

My calculations for profit would, no doubt, remain much the same; for where one large tree is grown, six to twelve small bushes would flourish; and the price of 3s. a bushel for apples might be doubled, or even quadrupled, for choice winter apples and pears.

My remedial suggestions have now been for four years before the public. I cannot learn whether they have yet been even partially adopted and acted on in England; but in France I have reason to believe they will shortly be properly tested.

C. ROACH SMITH.

"QUANTITIES."

Sir,—Allow me to ask one or two further questions on the subject of quantities.

1. Does not the employer, in some shape or other, pay under the present system the charges of both surveyors, i.e., the one appointed on his behalf, and also the one nominated by the builders; the cost being added to the contract?

2. Is it right that this should be the case? and, if so, should there not be clear understanding on the point?

3. In case of the abandonment of the work after the quantities have been taken out, in consequence of the amount proving too high, should the employer pay all the charges of the surveyors?

4. Is the architect liable in case the amount has exceeded the limit of his instructions? and, if so, is any margin, calculable on a percentage, to be allowed as regards such excess? (For instance,—given the instructions to have 1,000, and the lowest tender proving 1,100, or 2,000.)

5. Is it not presumable that the surveyors would know as well or better than the architect, previously to the quantities being taken out that the tenders would prove in excess? and, if so, should not the responsibility be shared by them, and to what extent?

The above are points of practical importance to employers, architects, and surveyors, and it would be desirable to ventilate them.

AN ARCHITECT.

CLOYNE NEW ROMAN CATHOLIC CATHEDRAL.

Sir,—An announcement has been very generally made through the Press that the designing of the new Catholic Cathedral for the diocese of Cloyne, about to be erected at a large cost and on a proportionally large scale in the city of Queenstown, Ireland, has been entrusted to Messrs. Pugin & Ashlin. As many members of the profession are aware that it was originally intended there should be a competition for this important work, we think it necessary to inform them, and those interested in the question of architectural competitions, how it has occurred that Messrs. Pugin & Ashlin have now acquired the work without the test of a competition. Early in this year we received a circular from the Rev. Dr. Rice, the Secretary of the Building Committee, inviting a competition for the proposed new cathedral between Messrs. Pugin & Ashlin, Mr. J. J. McCarthy, and Mr. George Gohle. This circular contained the terms of the competition, and also requested the intending competitors to visit Queenstown for the purpose of receiving further instructions. We accordingly visited Queenstown in a few days, and saw the Right Rev. Dr. Keane, the bishop of the diocese, and the very Rev. Dr. Rice. We expressed our satisfaction with the general fairness of the conditions of the competition proposed by the Committee, but as one of these conditions was that the successful competitor should give security that his design could be executed for the stipulated sum of 25,000*l.*, we thought that, on the other hand, the competing architects should have some guarantee that the Committee would not, as has too frequently occurred, select a design, the execution of which would ultimately far exceed the proposed outlay. Furthermore, being aware that Messrs. Pugin & Ashlin had powerful family connexions and other influences over the general committee, we considered that a perfectly impartial sub-committee of selection should be formed in the way to which we shall hereafter refer. We mentioned all this in conversation to the Bishop and Dr. Rice, and they highly approved of our proposals. The Bishop said, moreover, that what we advised would ensure not only fair play for the competing architects, but would secure the committee from being involved in a scheme which would far exceed their resources; and he mentioned a case of the kind which occurred some time ago in the City of Cork. Finally, the Bishop and Dr. Rice suggested that we should put our terms in writing, and invite Messrs. Pugin & Ashlin to join us in requesting their adoption on behalf of the Committee. The Bishop said further, that if Messrs. Pugin & Ashlin refused to join us in asking for reasonable conditions it would produce a very bad impression on him, and also on the committee in their regard, but in such case he might say for certain that the request of two out of the three proposed competitors would be quite sufficient to secure the adoption by the committee of the conditions we proposed. We accordingly drew up the conditions of competition, a copy of which we enclose, and having signed them ourselves, forwarded them to Messrs. Pugin & Ashlin, requesting their signature. This, however, they declined to append; and as the Bishop and Dr. Rice advised, we forwarded the conditions to the committee, requesting their adoption. The committee declined to adopt them, but drew up a new set of conditions, substantially the same as the first, except that it was provided that each of the unsuccessful competitors should be paid 200*l.* instead of 75*l.*, as originally provided. After mature consideration, we decided, under the circumstances mentioned above, that our safest course was to adhere to our original conditions, and to ask Messrs. Pugin & Ashlin again to join us in requesting their adoption by the committee. Messrs. Pugin & Ashlin again declined, adding that they had addressed their reasons for so acting several months previously to the committee. We then once more requested the committee to adopt our conditions, urging that we saw no other course by which fair play in judging of the merits of the designs could be ensured. The only assurance we could get on that point was that the committee had passed a resolution that fair

* The following are the principal conditions suggested:—

1. That all the plans and specifications shall remain in the hands of the bishop and administrator of Queenstown parish, till the expiration of twelve calendar months after the actual commencement of the building; and that they are not to be returned to the architects on any pretext whatever till the expiration of the time named.

2. That the architects' securities required by the resolution, No. 1, be obtained in the following manner:—The architects whose competition plans, and specification, are deemed by the Committee of Selection first in order of merit, shall furnish all supplemental drawings and specifications that may be necessary to enable builders to prepare tenders. Such supplemental drawings and specifications not to introduce any alterations or deviations from the original plans, but to be merely illustrative of them.

3. A sub-committee of selection to be appointed to consist of the Bishop of Cloyne and the administrator of Queenstown parish, three gentlemen not belonging to the architectural profession (one to be named by each competitor); and two architects of eminence to be elected by the five foregoing members. That the successful competitor shall be the gentleman whose plans shall, in the opinion of the foregoing sub-committee of selection, guarantee the most beautiful, commodious, and cheapest building.

4. That the plans and specifications so prepared be advertised for tenders from competent builders, and if no respectable builders (with two solvent and approved securities for the amount of 5,000*l.*) will undertake to build the cathedral according to the said plans and specifications for the sum of 25,000*l.*, the said plans and specifications are to be entirely rejected, and the architect of them to be dismissed from all further share in the competition, or in the erection of the cathedral, and is to receive no compensation whatever, and is to have no share of the sum of 150*l.*, mentioned in the fifth resolution of the committee meeting of the 20th January, 1867.

5. That in the event of the plans considered first in order of merit being rejected as above described, the architect of the second plan in order of merit shall be directed to proceed as mentioned in condition four; and in the event of such second plan being rejected for the same cause as the first, the plan considered third in order of merit shall be advertised for tenders in the same way as the two others; and if it be found impossible to have the cathedral built according to it for 25,000*l.*, the said plan and its architect shall be rejected without compensation as in the two preceding cases.

play should be shown; the fact, however, of their refusing to accede to conditions which the bishop and Dr. Rice (and we think all impartial people) consider fair and reasonable, joined with the persistent refusal of Messrs. Pugin & Ashlin to associate themselves with us in our endeavours on behalf of fair play, left us far from satisfied that a simple resolution on the part of the committee was a sufficient guarantee that justice would be done in the matter. In reply to our second application, the committee, through their hon. secretary, invited us either to accept their conditions or to persist in the competition. In reply we expressed our unwillingness to decline so important a competition, and repeated our hope that the committee would after all adopt our terms. With this the correspondence ended, for the newspapers very shortly announced that Messrs. Pugin & Ashlin were appointed the architects of the new cathedral. From this simple statement of facts, we think our professional brethren, and those who take an interest in such subjects, will be enabled to appreciate the exact value of the chances of fair play that existed in the Cloyse Cathedral competition as proposed by the committee.

J. J. McCARTHY, R.H.A., M.I.I.A.
GEORGE GOLDIE, M.R.I.B.A.

CONCRETE HOUSES AND THE BUILDING ACT.

Sir,—I observe the Camberwell district surveyor has come somehow to the conclusion that a wall which is mechanically homogeneous cannot be even "said to be properly bonded," and so opposes the erection of cottage walls of concrete, notwithstanding the convincing proofs which ancient and modern buildings afford of the strength, solidity, and prolonged duration of that economical and invaluable material.

Are we then to prefer the letter of the Building Act confined narrowly to what the above surveyor calls "strictly technical meaning," which, although his own point at issue, he unfortunately abstains from defining, to a comprehensive and liberal interpretation of the spirit?

If the former, as some advances are now being made on old "rule-of-thumb" notions, it appears reasonable that the Act should be modified to suit the exigencies of the age, without necessitating perpetual appeals to the central Board whenever "strict technical meaning" (as of bond, which may be considered closer and more effectual in concrete than in brickwork) is vaguely cited on fantastic or minute questions of degree, that admit neither of unending uniformity nor of rigid regulation by martlets in building or in law.

The thin drawn work rubble (permitted) and concrete (prohibited) walling meet must be fine indeed. The plain meaning of bond is the mode of connecting bodies.

E. L. TABECK.

We have received a letter from Mr. Tall, saying he is the builder alluded to by the district surveyor of Camberwell. His opinion as to the force of the Act (he being the party concerned) would, of course, go for little. We have already expressed our own distinctly. He says, in the course of his letter:—

"Of the six sets of apparatus now being made by me one is for a large London firm, to build a 2,000, house, under direction of a well-known architect. The tracings supplied me to make moulds are herewith inclosed. In conclusion, allow me to contrast the conduct of the Metropolitan Board with that of the Emperor of the French. The Board has spent the whole time in consideration, while the Emperor has honored 144 poor families in concrete houses. If, after a few more years' consideration, the Board are of opinion that the Act is against concrete, I am confident it would only be so much the worse for the Act."

PRESERVATION OF STONE.

Sir,—In your number of the 23rd ult. there is a report of a paper on "The Decay of Stone," read by Mr. J. Spiller, of Woolwich, at the meeting of the British Association for the Advancement of Science recently held at Dundee. After describing his process for preserving stone, he lays claim to the invention of another and new process for effecting the same object, viz., by using baryta, as a means for neutralising the effect of the sulphurous and sulphuric acids in the atmosphere upon dolomite and limestone used in public buildings.

As one of the five persons in competition with Mr. Spiller, when the experiments were tried upon the Houses of Parliament in 1864, I beg to say that I was the first person who suggested the use of baryta for the purposes mentioned by Mr. Spiller, which can be proved by reference to the report of my examination before the Commissioners. Hence Mr. Spiller can scarcely bring forward his (?) invention as a novelty. JESSIE REED.

WOLVERHAMPTON.

New Infectious Wards have been erected at the Union Workhouse for the accommodation of two classes of patients. The building consists of two males' and two females' wards, each 30 ft. by 20 ft., and 12 ft. high, providing accommodation for seven beds in each ward, with an allowance of 1,030 cubic feet for each bed. A separate stone staircase is provided for each pair of wards, and on the ground-floor is a kitchen, with nurses' room above.

The wards are lighted and ventilated by sash windows on each side, and also by air-bricks in the lower and upper parts of the walls, covered with perforated zinc, and each having a sliding shutter. In each ward is fixed one of Galton's patent ventilating warm-air grates, provided by Messrs. Kennard, of Upper Thames-street,

London. Proper lavatories, baths, and w.-c. are attached to each ward, and on the outside are four airing-yards, having the access to each arranged so that no communication takes place betwixt the different classes of patients.

The whole of the works have been carried out by Mr. S. Thompson, builder, at an expense of 780*l.*, from the plans and under the superintendence of Mr. J. R. Veall, architect.

Exhibitions.—An ecclesiastical exhibition or collection of vestments used in the service of the Church according to Roman Catholic observances, and by some clergymen in the Established Church, has been opened at the School of Art in Darlington-street. The exhibition is restricted chiefly to the lecture-room of the school. The declared purpose is to extend the practice of ritualism, and to furnish purchasers the means of worship, public and private, according to ritualistic views. Copes, and stoles, and chasubles abound in almost every variety of colour, design, and arrangement of material and workmanship. Many of the contributions have been sent by the sisterhood of St. Thomas-the-Martyr, Oxford; others from "Sister Katherine M. Household, St. Mary's Priory, Ash Grove, Hackney;" others from "The School of Embroiderie, St. Margaret's, East Grinstead;" and others from different vestment-makers at Norwich, Birmingham, Manchester, and London. The amount of had art included was astounding. An exhibition of local manufactures, models, curiosities, paintings, &c., has been opened in the lecture-room of the Athenæum, Queen-street, in aid of Canesway Lake New Church Building and Mission Funds. The number of articles sent for exhibition was large, and the tables much crowded together.

METROPOLITAN BOARD OF WORKS.

At the usual weekly meeting of this Board, the following among other subjects came under notice.

Encroachments on Wandsworth Common.

A deputation from the Wandsworth Common Preservation Society waited on the Board, and drew attention to some building encroachments being made on Wandsworth Common. The deputation requested the Board to assist them in resisting these encroachments on the common, and preserving it to the public.

The request of the deputation was embodied in a memorial, and that document was referred to one of the committees for inquiry and consideration.

Southern Main Drainage Outfall.

Mr. Lovman Taylor drew attention to reports which he had heard had been circulated to the effect that there had been some serious mud deposits at the southern outfall of the main drainage. He was given to understand that the expense of removing the accumulations would be enormous.

Mr. Bazalgette, the engineer, was understood to say that one section of the works referred to was made in 1861, and another in 1867. No doubt some considerable deposits had taken place between the years of 1861 and 1867. The works of the Board were not opened till 1864. The question, therefore, was how much of the accumulation took place between 1864 and now. There had always been a tendency to mud accumulations at the site of these works, particularly at Barking, but he had no hesitation in saying that the accounts which had been published were very much exaggerated. The matter stood thus: in some places there had been an increase of mud accumulation and in others there had been a decrease. The whole subject was, however, under consideration, and nothing would be left undone to get at the truth of the matter.

Park-lane Improvement.

The Works and General Purposes Committee submitted a plan for forming a paved footway 8 ft. wide, and making good the roadway on the additional site to be added to Park-lane, at an estimated cost of about 3,500*l.*; and recommending that the engineer be instructed to prepare plans and specifications, and that advertisements be issued inviting tenders for the execution of the works, which was approved.

CHURCH-BUILDING NEWS.

Milborne Port.—The chief stone of the enlargement of the parish church has been laid. The increased length of the nave will be 25 ft. The aisle will be 74 ft. long, and 12 ft. in width. The new work, which is on the north side, will have five windows, and three windows corresponding to it will be opened on the south. The old roof under the tower is panelled and bossed. The old Norman pillars will remain untouched. The designs of the enlargement are by Mr. Henry Hall, of London. The windows are copies from an original window on the south side of the church. The works, under Mr. Alfred Reynolds, builder, are in active progress.

Faversham.—A reredos in the parish church has been commenced. It will be of Caen stone, with three centre canopies and three arches on either side for inscriptions, the whole being inlaid with marble. The columns of the arches

will also be of marble, while at the summit between and outside the canopies four figures will be placed. The cost will be 380*l.* The architect is Mr. Scott; and the sculptor Mr. J. B. Phillips, of Chelsea.

Ipswich.—Mr. F. Barnes, architect, having been employed to examine St. John's Church, California, Ipswich, has suggested certain repairs and strengthening of the walls, as well as increase of accommodation, and his report has been formally received by the vestry. Mr. Barnes, however, was requested to revise his report, to ascertain what amount would be required to put the church into substantial repair, and to extend the west end so as to provide fifty additional sittings.

Drinkstone.—The parish church of All Saints, Drinkstone, near Bury St. Edmund's, has been re-opened, after twelve months spent in the work of restoration, under the superintendence of Mr. Edward Hakewell, architect. Amongst the most interesting features of the building are, first, the preaching-stone, which was discovered under the pew flooring, and which consists of a Purbeck marble slab raised 16 in. above the pavement on sides of carved stone. This has been simply restored to its supposed original use, a carved oak standard having been placed upon it, from which the Bishop preached the opening sermon. Secondly, the rood-screen, which for many years supported a gallery in front of the tower, but has now been replaced in its original position. The font is the oldest portion of the building, and consists of an octagon of Purbeck marble on eight circular pillars surrounding a central shaft, all of the same material. Many fragments of old stained glass of the fourteenth century were found in different parts of the church. These have been re-arranged by Mr. Hakewell, and replaced in accordance with their supposed original position at his own expense. The work lately undertaken has consisted of a new roof over the nave and aisles, of rafters, a pavement of blue and red tiles, open benches, all of oak, and for the most part carved. The new east window, by Messrs. Lavers & Barraud, is given in memory of the father of the present rector, the late Rev. William Home, of Barming, Kent. It is hoped that the remaining portions of the work, consisting chiefly of the tower and rearing of the bells, will shortly be taken in hand.

Lynn.—All Saints' Church, South Lynn, has been re-opened for divine service, having been closed a short time for the purpose of completing the restoration of the chancel. The works have been performed by Mr. W. Brown, builder, Lynn, from the designs of Mr. E. Christian, architect to the commissioners, the amount of the contract with them being over 400*l.* The restoration is of a simple character, and included scarcely any attempt at ornament, the principal works being the repairing and replastering of the chancel walls, opening out of scaffolds, removal of a plaster of Paris rector, construction of a timber and slated roof, raising and paving the floors with Milton's tiles, &c. Some improvement has been made in the seating, and the view of the chancel has been opened out by getting back the pulpit and removing altogether the great square reading-desk or pew, and substituting for it two small desks, one against each pillar of the chancel arch. The organ chamber is built in the angle formed by the north side of the chancel and the east side of the north transept.

Lincoln.—The Dean and Chapter of the cathedral have undertaken the restoration of the beautiful woodwork of the choir, which is unrivalled both for variety of design and for accuracy of workmanship. One portion on the south side is completed, and the change effected by the removal of the high pews-fronts that had been added to the old stalls and benches makes one anxious to see the improvement carried out through the whole choir. The work has been done by Messrs. Rattee & Kett, of Cambridge. The tessellated Roman pavement, discovered some years since in the cloister, and which had been almost destroyed by damp, is being removed to a place of greater safety, and the hideous red brick shed which covered it is about to be pulled down.

Shortlands.—The foundation-stone of a new church at Shortlands, near Bromley, Kent, dedicated to St. Mary, has been laid by Miss Wilkinson. The land has been given, and the building will be erected, at the sole cost of the Wilkinson family. The style of architecture is Gothic of the thirteenth century, and the church will comprise a nave, side aisle, transepts, chancel, and

gan-chamber, together with a lofty tower and spire at the north-west angle. The material employed is Kentish rag stone, with dressings of ash stone. The roof is framed with open rafters, covered with boarding, and the seatings will accommodate 400. The design has been prepared by Mr. Whiccomb, architect, under whose superintendance the works are being carried out. Messrs. Dove, Brothers, are the builders.

Books Received.

Index to Foreign Scientific Periodicals contained in the Patent Office Library. Vol. I. June—December, 1866. Printed and published by order of the Commissioners of Patents.

This is a most useful publication, and, indeed, it affords the only way for the British public to obtain direct access to foreign scientific connected with science and art, manufactures, agriculture, and commerce. The subscriber to this twopenny fortnightly periodical, for example, has only to consult the Index and he will there find, translated into English, the titles of papers connected with subjects in which he may be interested, together with the authors' names, and of course the title of the foreign periodical containing the paper or article. He can then obtain access to the periodical itself at the Patent Office Library. Facility of access such as this to foreign stores of science and art is of vital importance to us as a nation, and the public ought extensively to take advantage of it: the knowledge sought is diffused through so many channels, and hidden under languages so various, as to be difficult of access even to the rich and learned, whilst, but for this Index, it is entirely beyond the reach of the mass of the people, and especially of the operative class, to whom it would be of the greatest benefit.

VARIORUM.

"A SKETCH of the History of French Railways; with Suggestions in favour of thorough Railway Reform at Home." By Samuel Haughton. Dublin: Wehh, printers, Great Brunswick-street. The author of this pamphlet urges that railways ought to be public property, and the lines laid and upheld at the public cost; rates of fares to be only sufficient to pay the expenses of working the traffic. It may not be visible, he admits, for the Government to undertake the working of the traffic; but, at all events, he thinks,—

The real question for the State seems to be the policy of placing railways as nearly in the position of roads and bridges as can possibly be done with the regard to the safety of the traffic, so that the country at large may reap the full benefit of rapid and cheap intercourse; and this not to be thoroughly and satisfactorily attained by any of measures propounding the systems of toll bridges, turnpike roads, by the abolition of which Ireland has won a fine example; and it seems probable that she will soon take the lead on the railway question."

"The Second Report of the Quekett Microscopical Club and list of members (July, 1867), which has been published in the form of a pamphlet. Numerous useful papers appear to have been read at the meetings of this new club last year.—"Report on the Drainage of Gibraltar." By Edward Roberts, C.E. Published by the Sanitary Commissioners of Gibraltar (Garrison Library Printing Establishment). This report accompanied plans and estimates for a new system of drainage and a supply of water for fishing, prepared by the direction of the Right Hon. the Secretary of State for War, for the consideration of the local Sanitary Commissioners. Mr. Roberts's estimate is 26,000. It appears that the principal supply of water comes from crevices or fissures in the rock, which receive the water during the rainy season, and are instantly pouring it out in the form of springs on the foot of the Northern escarp.—one of these alone during the whole of last year yielded an average quantity of 144,000 gallons a day; and even now, although there has been during winter but half the usual rainfall, it is yielding daily from 60,000 to 70,000 gallons. From various attendant circumstances, although the water is slightly brackish, it is held to be of its original. Works are now being carried on on the view of tracing it to a higher level where it will necessarily be free from contamination by thesea.—"Manchester New Town Hall," the title of a Letter to the Mayor and Corporation, in which Mr. J. King, jun., makes another attempt to induce them to enlarge and improve the site (now heater-shaped) on which it is pro-

posed to erect the New Town Hall. The long delay that has already occurred doubtless induces many to consider any proposition that would have the effect of again postponing action. It occurs to us to suggest that a valuable improvement might be made without going so far as Mr. King, by taking in an angular plot on the Lloyd-street side. The fact that more than one very good design was put out of consideration by the failure of the designer to provide the requisite rooms on the right floor, shows that the accommodation required is not easily obtainable on the area already provided. Setting back the front of the New Hall behind the line of Cross-street, as shown in Mr. King's plan, does not seem to us desirable.—"Report on the Drainage of the Borough of Belfast. J. J. Montgomery, Engineer." Belfast: Braid, Arthur-street. The plan reported on by Mr. Montgomery to the local authorities has been in the main approved of by Mr. Bazalgette, whose separate report is here also given. It is proposed to irrigate the sloe-lands adjacent to the town, as well as others on the shore, and Mr. Bazalgette suggests sewage reservoirs nearer the town than Mr. Montgomery has done, with the view of meeting this desideratum as regards the nearest sloe-lands, and also the discharge of sewage at the fitting time of tide. The cost of Mr. Montgomery's plan for high and low level intercepting sewage, and outfall and reservoir arrangements, is estimated at 150,000. By this plan an uninterrupted flow of the sewage would be obtained at all points, instead of the present intermittent flow, which causes deposit, and districts drained which cannot now be drained from want of outfall. The harbour and streams would also be purified, and the sewage sent out to sea until it could be utilized.—"The Tinher Merchant's Pocket Companion." By Charles Gere, Wisbeach.—This is merely a small doubled card, convenient for the pocket, and useful as a table, containing calculations of prices per Petersburg standard.

Miscellaneous.

FALL OF A TUNNEL.—A portion of the roof of the Summit Tunnel of the Lancashire and Yorkshire Railway has fallen. Fortunately the occurrence was discovered in time to prevent any accident.

LONDON ASSOCIATION OF FOREMEN ENGINEERS.—The members of this institution held their first monthly meeting of the present session at the George Hotel, Aldermanbury, City, on Saturday evening.

WINTERING AT LUXOR.—People who are thinking of paying a visit this winter to Egypt may be interested in the following letter from Lady Duff Gordon, dated Cairo, the 10th ult. :—

"Judging from the number of people who have asked me to find them lodgings at Luxor (Ancient Thebes), I think many of your readers, invalid or antiquaries, will be glad to know that an hotel will be opened there this winter by one Shmoudah, a respectable Coptic Christian. It is a handsome house, built in the European style, and surrounded by a pretty garden, full of shady trees,—a very pleasant thing in Egypt. He offers board and lodging at 10s. a day each, including a pint of common wine."

PROPOSED ROMAN CATHOLIC CATHEDRAL.—It is stated in the daily papers that a site has been obtained for the erection of a Roman Catholic cathedral as a memorial of the late Cardinal Wiseman. "It is close to the Victoria Railway Station, not far from Westminster Palace, and bordering on that new quarter which is springing into existence round Buckingham Palace. The whole architectural profession will be called upon, it is thought, to compete for the designs; but it is just possible that the competition will be restricted to Roman Catholic architects alone."

NEW ST. THOMAS'S HOSPITAL.—The foundations for the new hospital adjoining the Thames at Stangate are approaching completion. An enormous mass of concrete has been put in behind the embankment-wall, over the whole site, and on the greater part of this the brick-footings and counter-arches have been built. Some of the concrete that we saw thrown in near the bridge would have been the better for a little more stone in it. The enormous size of the intended establishment is now apparent. When it is completed, Westminster Bridge and its surroundings will be a remarkable piece of London,—a sight worth looking at. The regret we expressed at the time that the hospital should be placed here is, nevertheless, in no way lessened.

CLARK & HUNT'S REGISTERED SECURE SASH FASTENER.—This sash-fastener puts a difficulty in the way of the sash being opened from outside, and serves at the same time the double purpose of sash-fastener and window-wedge, as, when screwed firmly down it prevents the sashes from rattling. It seems to deserve recommendation, and the prices are not high.

A LABOUR EXCHANGE AT SAN FRANCISCO.—A leading citizen of San Francisco has offered, upon certain conditions, to give 50,000 dollars for the foundation of a "Labour Exchange," an institution "for the protection of labour and the advancement of industry; a place where every one who seeks employment can find it without fee or reward, and where the minutest information and statistics respecting every branch of industry shall be collected and imparted gratuitously."

BIRMINGHAM LUNATIC ASYLUM.—This asylum needs enlargement. More than 100,000, have been already spent upon the building and the land attached to it, and the committee now ask for leave to spend 10,000, in addition. When the asylum was built provision was made for 300 patients. This number has been extended to 631; and it is proposed to raise the total to 810,—the whole of whom, it is estimated, will be paupers belonging to the parishes within the borough. It would appear from this demand for additional space that the increase of lunatics is proportionally much larger than the increase of population.

THE DRY EARTH SYSTEM.—The Rev. Henry Moule has received from the Indian Government a substantial recognition with reference to his system of dry earth sewage. A letter to him from the India Office says:—"I am directed by Sir Stafford Northcote to forward for your information copies of reports which have now been received from the Government of India, on the successful and general adoption of your dry earth sewage system in India. In consideration of the very satisfactory character of these reports, and on the recommendation of the Government of India, the Secretary of State for India in Council has much pleasure in authorizing the payment to you of the sum of 500!"

THE RAILWAY LINES IN BATTERSEA.—The last completing link of the system of high-level lines in Battersea, which has been in course of development since 1864, to improve the access to the Victoria Station, was inspected during last week by Major Rich, R.E., on behalf of the Board of Trade, who submitted the various heavy bridges and other works on the main line of the London, Brighton, and South-Coast Railway to severe tests, nine of the heaviest class of locomotives and tenders being employed for the purpose, giving a moving load of 450 tons. The works, which have been carried out under the superintendence of Sir Charles Fox & Sons, as engineers to the company, are of a heavy character. The contractors for the brickwork, &c., were Messrs. William & John Pickering, and Mr. James Haywood, of Derby, was the contractor for the iron-work.

DISCOVERIES IN ROMSEY ABBEY.—In connexion with the work of restoration some interesting discoveries have been made. The ancient entrance, known as the Nuns' Doorway, but which has long served as a window, has been restored to its original purpose, and in opening the chancel arches some curious Norman paintings were found upon the column near the vestry door. In removing one of the screens of these arches, two stone lamps of curious form were discovered. The Vicar of Romsey, in writing to the local papers, says that it is certain these lamps are of very ancient date, inasmuch as the rubble-work in which they were embedded was built against some of the very earliest painting upon the stonework of the piers, and from this he presumes they were made and last used in the twelfth century. One of the lamps resembles a rather large brick, with a thick handle like half a ring on one edge. The other lamp consists of four cylindrical cavities in a lozenge form. In these are fragments of charred wicks, and a carbonised substance that burns with a brilliant flame—evidently tallow, says the vicar, seven hundred years old. It has been suggested by some that these curious lamps were used in the night processions of the nuns. Others think they were made and used by the stone-cutters who carved the Norman capitals and mouldings of the abbey church, when Henry de Blois, brother of King Stephen, was Bishop of Winchester and the first Henry began his reign.

DAMAGING DRINKING FOUNTAINS.—A "drunken and dissolute" scoundrel, who, with the true public-house spirit, looks maliciously on the progress of temperate habits amongst the people, has been very properly sentenced to a month's imprisonment with hard labour for wrenching off some iron ornaments from a fountain in the Southwark Bridge-road. It is to be hoped the police in other districts will be more on the alert than they have been in securing the punishment of such fellows.

THE PROPOSED CONVALESCENT HOSPITAL AGAIN. A gentleman well known in the commercial circles has, says the *Sunday Gazette*, recently invested in the names of trustees the princely sum of 250,000*l.*, for the purpose of founding a Convalescent Hospital in the metropolis. The plans for the building have been entrusted to Mr. Dale, of New Inn. Is the gentleman who is known in commercial circles the same of whom we spoke some time ago, and whose intention was erroneously attributed to the Queen?

WARE NEW COIN EXCHANGE.—This new exchange has been opened for business. The exchange is about 75 ft. long by 42 ft. broad. It is lofty, with a circular roof, a portion of which is glass. Gas-burners depend from the roof, but do not come low enough to light the place properly without an extravagant consumption of gas. At the rear of the exchange is the new cattle market, now nearly completed, which opens into Church-street, opposite the Congregational Chapel. It is hoped that some means will be found to make the exchange serviceable for meetings and lectures: the town-hall is not adapted to these purposes.

THE STATE OF OUR INDIAN RAILWAYS.—The remarks in our Journal a few weeks ago as to the defective construction of railway-works in India are justified and confirmed by last week's news. Two large bridges over an unopened portion of the Great Indian Peninsula Railway between Kundwah and Hurdah have given way. A crack has been discovered in the largest viaduct at Thull Ghaut, and three other viaducts over the same ghaut are in such a dangerous state that passengers have to leave the trains and walk across. Seventeen other bridges over unopened portions of the Nagpore Extension of the Great Indian Peninsula Railway have been condemned by the company's engineer. A fatal accident, we may here observe, has occurred on the Great Indian Peninsula line by a collision, in which Mr. E. I. Howard, a barrister, the guard of a train, and a native foreman have been killed.

THE SOCIETY OF ENGINEERS.—A visit to the Thames Embankment works and the Blackfriars Bridge works was made on Friday in last week by a considerable number of the members of this Society, to whom the contractors afforded every facility. The party had opportunities of inspecting almost every class of engineering work. At the first meeting of the members for the session, held on Monday evening last, Mr. W. H. Le Feuvre, the president, alluded to the incorporation of the Society by registration under the Companies Act, 1862, and stated that the matter would be fully considered at a special meeting of the council, to be held at the offices of the Society on Friday. A paper was read by Mr. Ewing Matheson, on "The Quality of Iron as at present used." A discussion took place on Mr. J. Pendred's paper, on "Water-tube Boilers," read on the 6th of May last.

THE IRON TRADE.—Ryland's "Circular" for Saturday last says:—"The general agitation evident in the metal trades has resulted in a rise, materially aided by the reduction of production both in copper and tin at home. From similar causes—the increase of home demand, the reduction in production, and the shortness of stock—iron, both pig and manufactured, is susceptible of a like rise, which may now be expected in a partial, although, at present, but slight degree. The position of continental finance tends to check both production and competition in that quarter. Everywhere in the United States the makers of iron are succumbing to the tyranny of our last export, trades-unionism; which has accompanied the emigration of workmen, so delusively brought about and encouraged to their own ruin by ironmasters seeking to bolster up a falsely-based trade by protection, and hoping, by drawing from us our discontented workmen, to embarrass our means of supply, and enhance the wages paid here to a non-remunerative point so far as masters were concerned."

ADVERTISING ARCHITECTS.—A correspondent sends us the advertisement of an undercutting architect in Leeds, but no good would be done by reprinting it.

PRICE OF LAND IN PARIS.—The *Moniteur* gives the following as the price of land for building in several of the new streets of Paris:—Place du Théâtre Français, equal to 45*l.* the square metre; Rue Turbigo and Réaumur, 34*l.* 16*s.*; Rue Jaffite and St. Georges, 33*l.*; Chaussée d'Antin and Rue Olivier, 28*l.*; Rue Lafayette, 42*l.*; Rue Taibout, 40*l.*; Rue de Rennes (continued), near Mont Parnesse, 6*l.*

THE BUILDING TRADE AT BARNSELEY.—A meeting of the masters and operative masons of Barnsley, at the request of the latter, has just been held with a view to a settlement of the long pending strike. The men accepted the proposition of the masters, and on these terms work has been resumed. The strike commenced on the 1st of May last, since which time large contracts have been held in abeyance. The men have of course lost some thousands of pounds in wages.

COWPER'S SUMMER-HOUSE AT OLNEY.—With reference to the remarks on the desirability of maintaining this relic of the poet, and which originally appeared in our pages, Mr. W. H. Collingridge (of the *City Press*) deprecates a "restoration," and suggests the erection of a hall as a memorial. We asked for no "restoration," in the modern sense of the word, but that the summer-house should be put into a proper state of repair, to resist time and the elements, and this we ask still.

CHESTER CATHEDRAL.—This church is now closed, except in the Lady Chapel, to allow of extensive alterations and repairs which the dean and chapter are making in preparation for special evening services. Amongst other important works begun, that of hanging five new bells in the central tower must be included: the bells are from the foundry of Messrs. Warner. It is to be hoped that the new dean will before long see his way to begin the repairs which are much needed to preserve the fabric of the cathedral.

KING ALFRED'S REMAINS.—The ancient parish church of St. Bartholomew, Hyde-street, Winchester, is shortly to be rebuilt, and made a suitable resting-place for King Alfred's remains, and also for those of his queen, Alswitha, which since the period of their discovery by Mr. John Mellor have reposed in two plain chests in the little vestry of the church, sent to the excavator by the rector and the Dean of Winchester. Two new gilt mortuary chests, with gilt crowns and suitable inscriptions, have been designed by Mr. T. Butterworth, to receive the bones and relics, and are to be set up over the new chancel and choir, which will henceforth be called King Alfred's Aisle.

MARYPORT.—The report of Mr. Hawshaw on increased harbour accommodation at Maryport has been made to the local trustees. The surveying and boring operations of Mr. Brunel have been confined to the south side. It is said that Mr. Hawshaw's scheme provides a five-acre dock and four-acre basin on the south side, with 5 ft. greater depth on the sill than the Elizabeth dock. The cost is estimated at 80,000*l.*, but Mr. Hawshaw advises the trustees to apply for borrowing powers to the amount of 100,000*l.*—The Carlisle, Cockermonth, and Maryport dock trustees have resolved to grant permission to the trustees of the town and harbour of Maryport to lay pipes for the conveyance of water from the Goat to Maryport, along the high road between Cockermonth and that town.

TENDERS

For gaslights at St. Matthew's Church, New Kent-road. Mr. Jarvis, architect:—

Basingham	£190 0 0
Lawson	186 14 0
Comyn, Ching & Co.	178 0 0
Stevens & Son	173 15 0
South	156 0 0
Biggs	133 10 0

For erecting a villa residence at Reymers, Sussex, for Mr. W. J. Smith, Messrs. Gouly & Gibbins, architects:—

Hall	£1,165 0 0
Lockyer	1,048 10 0
Bimms & Marten	896 12 6
Nightingale (accepted)	973 0 0

For reseating St. Matthias Church, Plym. Mr. W. H. Fenton, architect:—

Crabb & Vaughan (accepted)	£647 0 0
----------------------------	----------

For six houses at Hove, for Messrs. Tooth & Co.:—

Simms & Marten	£3,577 0 0
Nightingale	9,487 0 0
Cresceman & Co.	9,300 0 0
Bayer	8,968 0 0
Bland	8,845 0 0
Longhurst	8,890 0 0
Hazel	8,460 0 0
Chappell	8,185 0 0
Hall	8,650 0 0

For erecting a public-house at North-road, Brighton. Messrs. Gouly & Gibbins, architects:—

Hall	£667 0 0
Lockyer (accepted)	567 0 0

For houses and shops at Clapham, after deducting the old materials. Mr. R. P. Nolley, architect:—

Newman & Mann	£8,815 0 0
Hart	8,600 0 0
Turner & Son	8,675 0 0
Colls & Son	8,370 0 0
MacLaughlan	8,368 0 0
Browne & Robinson	8,215 0 0
Adamson & Son	8,080 0 0
Webb & Son	7,737 0 0
Myers & Sons	7,758 0 0

For manager's house and stabling at the Forest Vale Iron Works, Cinderford, Gloucestershire, for Mr. James Russell. Mr. E. J. Reynolds, architect:—

Baker & Heaven (accepted)	£521 0 0
---------------------------	----------

For building a house in Maple-road, Penge, for Mr. Bigwood:—

Brooks	£430 0 0
Eastace	430 0 0
Larmerston	410 0 0
Crocker	360 0 0

For a new Wesleyan chapel, at Buckley, Flintshire, North Wales:—

Lloyd	£233 0 0
Williams	756 0 0
Hamblyn	730 0 0
Foulks	600 0 0

For erecting house and premises, London Bridge, for Mr. Toby. Mr. H. Currey, architect. Quantities supplied by Messrs. Stradwick & Co.:—

Webb	£3,324 0 0
Coleman	2,989 0 0
Newman & Mann	2,890 0 0
Hart	2,666 0 0
Downs (accepted)	2,437 0 0

For building four cottages at Ventnor, Isle of Wight, for Mr. John Webber. Mr. Augustus F. Livesey, architect. Quantities supplied:—

Ingram & Son	£578 0 0
Thurle	577 3 0
Moses & Walder	575 0 0
Newsham	548 0 0
Beavis & Son (accepted)	530 0 0

Enquiry.—Amongst names of competitors, Manchester Town-hall, for "H. S. Smith's" Book of T. Smith.

We are told that the estimated income of the Hop Exchange building is 20,000*l.* per annum, not 3,000*l.* There is cellar room for 30,000 barrels of ale.

We are compelled to decline pointing out books and giving addresses.

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication.

None—the responsibility of signed articles, and papers read at public meetings, rests, of course, with the author.

[ADVERTISEMENTS.]

BUENOS AYRES GOVERNMENT CERTIFICATE.—TRANSACTION.—We, the undersigned, at the request of Messrs. Jas. C. Thompson & Co. certify that the IRON SAFES of Messrs. CHUBB & SONS, London, of which these gentlemen are agents, were exposed for several hours to the fire that took place in the offices of the National Government on the evening of the 26th inst.; that in our presence they were easily opened with their respective keys that the moneys and important documents they contained were found in perfect order; and that these safes are now in use in the National Treasury Office.—(Signed) J. M. DRAGO (Treasurer of the National Government), JOSE TOMAS ROJO, JUAN M. ALVAREZ. A true copy—A. M. BELL.—Buenos Ayres, July 31, 1867.

CHURCH, TURRET, and STABLE CLOCKS. J. W. BENSON, having erected steam-power and improved machinery for clock-making, at the manufactory, Ludgate-hill, will be glad to furnish to clergymen, architects, and committees Estimates and Specifications of every description of Horological Machine, especially cathedrals and public clocks, chiming times on any number of bells. A descriptive pamphlet on Church Clocks post free for one stamp. Watch and Clock Maker by Warrant of Appointment to H.R.H. the Prince of Wales, and maker of the great clock for this Exhibition, 1862. 25, Old Bond-street, and 33 & 34, Ludgate-hill, E.C. Established 1749.

The Builder.

VOL. XXV.—No. 1289.

*Bristol and Clifton.
Elmdale House,
on the Downs.*

THE growth of Bristol within the last eight or ten years is something to wonder at, and the change that is now being made in the city itself is equally marvellous. Hundreds of houses faced with stone, many of them costly, and of considerable size, have been built, and are being built, in Clifton; and we hear at the present moment, of a fresh undertaking, which includes the erection of 300 houses on property at Redland, extending far on the road to Horfield. The corporation are about to spend nearly 200,000*l.* in forming new roads; let us hope under good advice,

and that the improvements are to be all carried on with relation to each other, and so as to produce the most satisfactory whole. They are also straightening their river, and making a new lock, at the cost of 150,000*l.*; the rock and earth removed being hoisted to the Downs, and used there to fill up some large quarries, whereby they hope to gain several acres of available recreation-ground.

Elmdale House, of which we give illustrations,* faces the Downs, and has been built by Mr. Alderman Proctor, for his residence, Messrs. George and Henry Godwin being the architects. For a house making no pretensions to be a mansion, it is noticeable for the size of the rooms, and the amount of accommodation afforded. The hall, of some size, is open from bottom to top, with galleries on the different floors leading to the rooms around it, and is lighted by a large flat skylight, containing coloured glass. The dining-room, with ante-room, has a length of 61 ft. by 18 ft., and the drawing rooms are of the same dimensions, affording the opportunity for a fair walk in foul weather. The billiard-room, including the bow (as in the case of the other rooms), is 31 ft. by 23 ft. 6 in., and is connected with the dining-room by double folding doors. A tube all round the billiard-room, under the ceiling, one side of it being formed by a perforated enrichment in the cornice, and which communicates with the outer air by valves under control, assists the ventilation. A pipe from the outer air opens in the hearth of each fireplace with a grating that can be closed or opened at pleasure, the object of course being to supply the fire with air without creating draughts in the room. We are scarcely prepared, however, to recommend the indiscriminate introduction of this arrangement. It needs intelligent regulation. The dining-room, it will be seen on the plan, is "served" from the conservatory, where there

is a lift from the kitchen department. The whole of the exposed woodwork throughout the house, except the staircase, which is of oak polished, is of picked pine varnished. This part of the work is very creditable to the joiners employed. There is no cast-work in the cornices, with the exception alluded to in the billiard-room, and the walls are hung with lining paper merely coloured in distemper and bordered. The height of the ground-story, we should mention, is 14 ft. On the first-floor the height is 13 ft. Here there are a library and various chambers, all of large size. To meet the views of the owner, who maintains that a screen in a large room answers all purposes, there are no dressing-rooms. There is a second-story of chambers, including the bath-room, with boiler; and a staircase leads up to a flat on the roof, whence is obtained a view rarely surpassed.

The house externally is of stone, dug on the spot, with Bath stone dressings. A previous quarry on the site, by the way, necessitated some rather heavy work in the foundations at one corner of the building.

The front we have illustrated next the Downs faces North-West. For comfort's sake (the circumstances of the ground permitting) the entrance porch is placed on the other face, south-east; and on this side are the lodge, the stables, and the glass-houses.

We can scarcely refuse to let the owner say a few words on two or three points. Mr. Proctor thus writes:—

"We find the situation of the house and arrangement of windows and hall very favourable for ventilation. During the cold weather we were enabled to keep the house comfortably warm, and still obtain all that agreeable freshness which nothing but plenty of air will give. In the summer we could so regulate the change of air, and light, as to have it agreeably cool. The supply of air to the fires answers well, except in windy weather, when we close the gratings on the windward side of the house. The ventilation in the billiard-room also answers well. The advantages of placing the house south-east and north-west as regards light, ventilation, and enjoyment of prospect from the windows, forces itself upon us daily, particularly as the rooms open by folding-doors and run through to these points.

"Our prevailing wind and rain are from the south-west, and I attribute a great deal of the comfort we enjoy to our not having any opening on that side. I would venture to suggest that you recommend the building of houses with large rooms, if the occupants wish to be comfortable; and, if cost is an object, save money by omitting decoration; have large plain rooms rather than small rooms highly decorated. We find that, by placing large paintings upon the walls, a few large pieces of furniture in the rooms, with the advantage of the well-proportioned doors and windows you have given us, we obtain that homely comfortable feeling we all enjoy, but which we were afraid we should not find in rooms so large."

Mr. Proctor has covered the walls with a very considerable collection of agreeable modern paintings and drawings, including Eddy's "Joan of Arc," and works by Miller, Woolmer, Hopkins, Bright, Hill, Syer, Wolf, Pyne, Hulme, S. Tovey, Meadows, Shayer, Anthony, E. Barnes, Cooke, Nienmann, Ward, "Jock" Wilson, Wells, Dawson, and others.

Close by the house the Guthrie memorial chapel, recently completed from the designs of Mr. Hansom, in connexion with Clifton College, forms a very agreeable feature. It is Decorated in style, and has a polygonal apse. The college altogether forms now an important pile. It seems regrettable that the style adopted in one of the masters' houses recently erected, a large rectangular building, with overhanging roof, should be such, whatever may be its merits, as should entirely separate it from the establishment to which it belongs. A handsome Congregational chapel, Mr. Hansom being the architect, has been erected near the college. A Baptist chapel in the White Ladies-road is another noticeable building in the neighbourhood.

Getting away down Park-street, soon it is to be hoped to be rendered a less steep descent, a boarding will be seen in College-green, behind which Mr. Street is shortly to begin to complete the cathedral, for which some thousands of pounds will be required. Some difference of opinion exists on the subject, but the work will doubtless go on. College-green Hotel, lofty and

large (five stories besides attics), is approaching completion. It was designed by Mr. Hawtin, is all of stone, Italian in style, and in parts a little weak in character. On the other side of College-green, adjoining the mayor's chapel, there is a shop-front at the establishment late Mr. Charles Taylor's, and now belonging to Messrs. Peters & Co., which deserves a word of praise. It includes piers of granite, with well-carved white marble capitals, and brown stone arches. The credit of the design belongs to Messrs. Foster & Wood, and Mr. Broad was the builder. Mr. Broad, an old resident of Bristol who worked under the writer many a year ago, is also the builder of a handsome pile of stone-fronted offices and shops in Nicholas-street; Mr. Pouton being the architect.

This front includes tiers of semi-circular arches, and some very good carving in the shape of heads and ornamental dragons in spandrels. Close by, at the corner of High-street, Mr. Pointing, the chemist and something more, has rebuilt his house in North of Italy style, probably under the direction of the last-mentioned architect. Here, too, there is some very well executed carving, including a series of large heads in circular frames over the windows of the one-pair story, inscribed Apollo, Esculapius, Celsus, Minerva, and so on. The appearance of the front is very good, but it is none the better for a row of eight Mediaeval lions along the top of it, holding shields, the effect of which from some points of view is *disagreeable*. Minerva plays a prominent part in the pediment of a new building in Corn-street, now in progress, under Mr. Gingell, architect, for the Liverpool, London, and Globe Insurance Company. The group, of which Minerva forms the centre, is intended to symbolise the wisdom of insuring against fire and the damage of death; and, so far as can at present be seen over the scaffolding, seems very creditable, in point of execution, to Mr. Colley, the sculptor. The front, which is very elaborate, and promises to be an ornament to the too-narrow street, includes life-size figures of the Seasons, and much other carving. In this building we get back to classical forms and mouldings.

We must hasten on. At the fine church of St. Mary Redcliff, Mr. Godwin, architect, considerable progress has been made with the restoration of the tower, commenced in the spring. The lower part of the structure was found to be in an actually dangerous state. Many tons of stone have been used below ground to strengthen and support it. The organ here—always a good instrument—has been greatly enlarged and improved by Mr. Vowles, and has been set up in the chancel, part on each side, the works communicating by means of a tunnel. When the old Georgian case in the gallery is removed, the great west window will be exposed to view. This is about to be filled with stained glass, at the cost of Mr. Sholto Vere Hare. Messrs. Hardman, we believe, will have the opportunity it affords of showing their skill. It is a fine chance and should be made the most of. In the south transept, a window, executed by Messrs. Clayton & Bell, and a very charming work, has been quite recently set up. It tells the story of Lazarus, in accordance with a pre-arranged scheme for filling the various windows that are at present glazed with plain glass, and was produced, if we mistake not, at the cost of the vicar, the Rev. H. G. Randall. It is simply inscribed, as a thanksgiving offering for great mercies. The same artists have another window in hand for the church, the Sacrifice of Isaac; and Messrs. Heaton, Butler, & Bayno are at work on glass for the west window of the south aisle, illustrating the Life of Moses; the gift of Mr. Cruger Miles.

When we add that amongst many other works a new post-office is being built in Small-street, that the Assize Courts are to be re-constructed,

* See p. 705.

that there is to be a new hotel in Broad-street, that a new hospital is about to be erected at Stapleton, and that on Monday evening last a new Theatre was opened and the architect shown upon the stage, we shall surely have made good our preliminary assertion, that wonderful activity prevails in Bristol.

FRESH AIR.

Most people are advocates, in theory, at all events, for fresh air; but few care to think where the difference lies between the smoke-laden atmosphere of a large town and the pure air of the open heath or breezy downs. Much of the exhilaration produced by changing the air of London for, say, that of Salisbury Plain, is undoubtedly due to the difference of scenery and to the sense of freedom from the cares and troubles of this life; but there is something more than this, and an impression has been gaining ground for the last few years, that the quantity of ozone contained in the atmosphere exercises a very important influence on the healthiness of a district. This theory has not only been denied, but the very existence of ozone in the atmosphere has been doubted. The literature of the subject is already very large, and amongst the most important contributions we must assuredly place those of the discoverer Professor Schönbein, of Basle. Putting aside the more elaborate researches, we propose to gather up into a small compass the arguments in favour of the existence of ozone, as stated by Professor Schönbein himself. The subject is well worthy of attention from a sanitary point of view.

When oxygen gas is submitted to a series of electric discharges, it undergoes a remarkable modification, and a peculiar smell is noticed. Amongst the new properties acquired by the gas is the power of liberating iodine from its compounds, a property which is manifested by mixing a soluble iodide with starch-paste, and exposing it to the air which has been thus acted upon. A deep blue colour immediately appears, caused by the combination of the liberated iodine with the starch. Ozone may be produced by other methods, but it is not necessary to mention them. This new power possessed by the oxygen is said to be due to ozone, the ordinary "ozone test" being nothing more than a slip of paper moistened with iodide of potassium and starch.

So far all are agreed, and no one denies that oxygen does undergo some modification when submitted to a series of electrical discharges. Further, it is admitted on all hands that the atmosphere is always more or less highly charged with electricity. Since, then, an electric discharge cannot take place through air without a portion of the oxygen in the path of the spark being converted into ozone,—a fact which is rendered abundantly clear when an ordinary electrical machine is set to work,—it follows that ozone must be formed in the atmosphere by the ordinary operations of nature. It should be remembered that electrical action may still be going on without the palpable evidence furnished by a thunder-storm.

When the ozone test is used for demonstrating the presence of that body in the atmosphere, the opponents of the theory refuse to admit the evidence, saying that similar appearances are produced by other substances which may be, and sometimes undoubtedly are, present in the atmosphere. Besides ozone, chlorine, bromine, and hyponitric acid, have the property of displacing iodine from its compounds, leaving it free to form the well-known blue colour with starch. The occurrence of chlorine and bromine in the atmosphere is very improbable; but with regard to hyponitric acid, Professor Schönbein admits that, during the electrical discharge, the oxygen and nitrogen of the air sometimes combine to form hyponitric acid; and, although the quantity produced in the atmosphere is in all probability very small, it may still be sufficient to liberate the iodine in the test paper. "According to my experiments," says the Professor, "the addition of a very small quantity of hyponitric acid (N₂O) is sufficient to communicate to water the property of producing the characteristic blue colour; but, chemically, pure dilute nitric acid has not this effect. It might, therefore, very well happen that rain-water collected during a severe thunder-storm should possess this property, thus indicating the presence of free hyponitric acid in atmospheric air. No

chemist has, perhaps, made more observations on this subject than myself, but I have never met with any rain-water capable of turning starch paste blue, or which indicated an acid reaction with litmus paper, although I have frequently observed that rain-water, when treated with dilute sulphuric acid, does communicate a blue colour to starch." This effect is probably due to nitrous acid, set free from the nitrite of ammonia which most rain-water contains. The presence of nitrite and nitrate of ammonia in the atmosphere is explained in the following manner:—Amongst the products of the decay of organic matter on the surface of the earth is carbonate of ammonia, which, being a very volatile salt, evaporates into the atmosphere. When this body comes into contact with the hyponitric acid assumed to be formed by the discharge of the atmospheric electricity, it becomes converted into nitrate and nitrite of ammonia, which salts, in consequence of their solubility in water, are conveyed to the earth by the first shower of rain. The Professor's argument, then, runs thus:—Hyponitric acid has the power of liberating iodine from its combinations, and this acid is formed in the atmosphere by electrical discharges; but it never (or, at all events, very rarely) occurs in a free state, being instantly seized upon by the ammonia always present in excess, and formed into nitrate and nitrite of ammonia, neither of which is capable of setting iodine free.

There is, however, another test for ozone depending upon the property possessed by that body of converting the colourless protoxide of thallium into the brown peroxide. Hyponitric acid does not produce this effect, since it becomes decomposed, as we have already seen in the case of ammonia, into nitrate and nitrite of thallium. It is true that this brown compound might be sulphide of thallium, due to the sulphuretted hydrogen contained in the atmosphere; but Professor Schönbein has observed that the colouring takes place when a slip of acetate of lead-paper (the ordinary test for sulphuretted hydrogen) remained perfectly white. In the course of his experiments he discovered that peroxide of thallium assumed a blue tinge when moistened with tincture of guaiacum, so that we have an infallible means of ascertaining whether the brown compound formed when thallium papers are exposed to the air be really the peroxide of that metal or not. Professor Schönbein finds that it is. The thallium test is not nearly so sensitive as the iodide of potassium and starch test. An exposure of twenty-four hours, or even more, is necessary to obtain the brown colour on thallium papers. The shortest time ever observed was on the 6th of January of the present year during a heavy snow-storm, when an exposure of six hours was sufficient. So great was the quantity of ozone that the starch papers were discoloured in the short space of half an hour.

So much, then, for the evidence in favour of the existence of ozone, which has been maintained for some years through evil report and good report by Professor Schönbein. Assuming that the facts already stated are sufficient to prove that ozone is something more than a figment of the laboratory, we proceed to consider the part it plays in the grand scheme of nature. During the decay of animal and vegetable matters large quantities of mephitic gases are generated, the chemical composition of which is not well understood. We do know, however, that they are destroyed and rendered innocuous by powerful oxidizing agents, such as the hypochlorites and the permanganates. The well-known "Condy's Fluid" derives its disinfecting properties from the presence of the latter salts. According to Professor Schönbein's experiments, artificially produced ozone has precisely the same action on fetid exhalations, and it is, therefore, not a far-fetched hypothesis that ozone is nature's own disinfectant. After a severe thunder-storm, the remark is often made that "the thunder has cleared the air," and there is probably more in this than people are aware of. That the air is purer and fresher after a thunder-storm few persons will deny; but much of this is due to the rain which generally accompanies such phenomena. This freshening of the atmosphere occurs, indeed, after most storms of rain, whether accompanied by thunder or not. M. de la Rive, an eminent physicist of Geneva, has recently put forward the opinion that the increased transparency of the atmosphere after rain is due to the removal of the foreign matters and germs or spores which are perpetually floating in the air, ready to settle

and germinate wherever they find a fitting soil. Professor Pasteur's beautiful researches leave little room for doubting that minute fungi really do exist in the atmosphere. To return, however, to our subject. We have already referred to the well-known fact that ozone is generated during the electrical discharge; and we should therefore expect to find it largely developed during a thunder-storm. May we not attribute to this a large proportion of the freshening effect experienced on such an occasion? As to the precise manner in which ozone acts we know very little with certainty. The following view of the case has, we believe, not yet attracted attention. Some years ago a theory was started that infectious diseases were propagated by extremely minute corpuscles or organized bodies which floated in the atmosphere and communicated the disease to persons who breathed them. Attempts have been made to obtain these infusoria, or whatever they may be, by suspending large glass globes, moistened with water, in the small-pox and fever wards of hospitals. About two months ago, M. Poulet read a paper before the French Academy of Sciences, in which he showed that infusoria existed in the breath of persons suffering from whooping-cough. He describes two species of monads, or bacteriums, as they are called by some authors, as present in the liquid obtained by condensing the breath of a child attacked by whooping-cough. The infusoria were seen by the aid of a powerful microscope in very large numbers.

It has been shown by Professor Schönbein that comparatively large animals,—such as mice,—are killed by breathing air containing an insignificant quantity of ozone, perhaps in consequence of the rapid inflammation of their tissues. A former pupil of the Professor's, Herr Scharr, of Berne, noticed, whilst making some experiments with permanganates and hypochlorites, that infusoria were immediately killed when immersed in even very dilute solutions of these salts; and he concludes that this effect was due to the rapid oxidation and consequent destruction of the albuminoid substances in the bodies of these organisms. Assuming the theory of the propagation of diseases noticed above to be true, we may, without pushing speculation beyond reasonable limits, state that the comparative absence of epidemic diseases during those periods when the atmosphere contains a large quantity of ozone is due to the destructive action of that substance upon the germs by which such diseases are propagated. We do not wish to be understood as stating that it is absolutely the true explanation of so-called healthy and unhealthy seasons. It is simply an hypothesis, and is not incompatible with the present state of our knowledge of this very important subject.

The great difficulty at the present moment in the way of further investigations is the absence of any method of determining the per-centage of ozone present in the atmosphere. The iodized starch paper hitherto used is certainly a good and very sensitive ozonoscope, but we require an ozonometer. For purposes of comparison, our present test is as useless as are the indications of the oat-board and hair hygrometers compared with those of the wet bulb hygrometer. In extreme cases the quantity of ozone contained in the atmosphere does not, in all probability, exceed one-millionth part. It is obvious that an apparatus of extraordinary delicacy will be necessary for measuring even this,—the largest proportion of ozone with which we have to deal. If science ever supplies the requisite method,—and we see no reason to doubt that it will, sooner or later be forthcoming,—it will, in all probability, be a volumetric process, in which a substance, having a powerful affinity for ozone, will be either coloured or discoloured by its oxidation.

HOUSES OF THE WORKING CLASSES AND THE NEW REFORM ACT.—Mr. W. E. Hickson writes:—"I thank you for your little notice of my 'Tracts for Inquirers' in the *Builder* of the 5th inst.; but let me urge you not to think lightly of those provisions of the new Reform Act which abolish compounding, disfranchise owners, and substitute the personal rating of temporary occupiers of the lowest class. As affecting the burden of the poor-rates in all districts, and the improvement of the dwellings of the working classes, in which you have always taken an interest, these provisions of the new Act must work as a natural calamity; and the *Builder* might do great service in taking up the subject."

STATISTIC CONGRESS IN FLORENCE.

THE International Statistic Congress—the sixth held since the first assemblage for such interests, in Brussels, in 1853,—concluded its proceedings in the Italian Senate-hall, on the 5th of October. The number of deputies from different countries gathered in Florence for this occasion is reported as 463, of whom ten represented England. Many were the preparations made by the Florentine authorities to show honour to their guests. A “committee of reception,” presided over by the Duke Casigliano, was formed with the express object of rendering such attentions and escorting them to visit all the *mirabilia* of this city; another committee, like aristocratic in composition, charged itself with the ordering of a banquet, illumination, and musical performances, at the Pagliano Theatre, the largest among such buildings here; and the municipality, we are assured, voted 30,000 francs for the expenses of that entertainment. All the leading journals reported the discussions more or less fully; and if tokens of interest on the part of the public, as well as in the minor journalism here so redundant, were wanting, this might be ascribed to the absorbing interest in political questions now uppermost in the Italian mind.

The hall where the Italian senate assembles, in the Uffizi buildings, was a most animated scene during these scientific sessions, owing to the large number present, the variety of subjects discussed, and the warm expressions of approval in which the public, as well as the members of the Congress, took part. Not, indeed, that that public was at any time in great force; for we were surprised to observe how few availed themselves of the facility of obtaining tickets (given most courteously, for the entire course), and how slight the sprinkling of auditors in the strangers' gallery, where, strange to say, the attendance of ladies, in their separate compartment, was generally larger than that of the other sex. The modern and brilliant decoration, paintings, gilt carving, &c., with which that hall of Medici origin was fitted up when first destined to the uses of the senate, did not indeed seem appropriate to the gravity of these assemblies, reminding rather of courts and theatres than of things in the sphere of abstract science. It was to be regretted, also, that the gallery assigned for male auditors is too high-placed to allow of such close attention to the speakers as is requisite for the full apprehension of long discourses illustrated by statistic details. In this case it was better to read than to hear.

At ten a.m. on Sunday, 29th September, was held the inaugural meeting, under the presidency of the Minister of Agriculture and Commerce, Baron de Blasius, who opened with a not very long but appropriate and well-composed speech, bearing chiefly on the condition of Italy as a field for statistic illustration, and the favourable dispositions of her government for encouraging and promoting whatever tends to national benefit or scientific progress. After this the office of president was confirmed in the person of the same minister, and the members of the Junta (*Giunta Superiore di Statistica*) were aggregated as vice-presidents, together with all the delegates of foreign governments; as secretaries, the four gentlemen who had acted in that capacity at the previous private meetings of representatives, together with four others of different countries, one being English, of the name Brown. The assembly then dispersed, and the rest of the proceedings for this day, not public, were the formation of the sections and what the Italian journals designate as *segni* (seats), thus distributed:—1. Theory and technicality of statistics; 2. topography; 3. agricultural statistics; 4. communal statistics; 5. monetary and banking statistics, circulation and trustees; 6. moral and juridic statistics; 7. medical and military statistics. On the afternoon of this Sunday, all the members, both of this and the other Congress, that of the Italian Chambers of Commerce, whose sessions had opened on the same afternoon, under the presidency of the same minister, were entertained by the municipality in the palace (ex-ducal) of the Cascine, where refreshments were served, and two military bands kept up concert during the social meeting, the beautiful parks of Florence being throughout this fine evening more gaily frequented by the *beau monde*, on foot and in carriages, even than usual in the hours of promenading on festivals. On Monday, at ten a.m., was the first public assembly of the Statistic Congress for transacting general business, despatched this morning in about an

hour and a half, the minister opening with another well-turned discourse; the most animated passage in the debate referring to the question as to the language for future discussions, one deputy (an Italian) proposing the exclusive use of French; others, the language of each nationality, with translations from all idioms except French and Italian, by the secretaries; but such discussions were over-ruled by the minister-president through the simple announcement that this matter had been already settled by the sections; the choice of language to be *ad libitum*, with the system of compendious translations, save from two idioms, as on one side proposed. It would be beyond our limits here to attempt any abstract of the discussions and reports that occupied every day for the rest of this busy week; the daily arrangement for the sections to meet from nine to twelve, and the general public assemblies to be held from half-past twelve to four p.m.; in the last instance, from nine to one p.m.; in the evenings all being invited to spend their time, at pleasure, in the halls on the ground-floor of the Uffizi, connected with the senate-houses, and now serving for a sort of political club. The subjects in debate, and those topics dwelt on in the several memoirs read aloud, went through the general range of statistical science, with such collation of relevant facts as did credit to the zeal and research of those engaged, in some cases exciting discussion, carried on with the warmth and gesticulation inseparable from Italian oratory, but not always contributing to make the point at issue more intelligible to auditors. The extreme difference of intonation and delivery on the part of English and German speakers, contrasted with the Italian, was a source of difficulty to the hearers in the galleries; and we had cause to regret the deficiency of our own countrymen in the mode of delivering what itself was well worthy of being listened to. The last public meeting, adjourned, instead of breaking up as announced at one, till two p.m., came to a close at half-past three, winding up with a speech from the ministerial president (suitable as was all that he said) and general vote of thanks, this sitting being in some respects the most interesting, as the topics brought forward were more various than on other days.

In reference to the statistics of art galleries and museums, it was proposed that not only public collections, but the works of sterling value in studios and private keeping should be brought into the sphere of official report. On this took place a discussion of some warmth, participated in by men of note. For the juridic reference it was proposed that not only crime itself, but the moral dispositions of convicts before death should be contemplated. There was also long and able speaking on the hygeian question and the statistics of cattle, the proper literature for inquiries relating to such interests, &c. It was determined, on the proposal made in a section by M. Quelet, to found a permanent committee, or section, of Italian statistics. Shortly before the breaking up, was mooted the question of the next international assemblage and its locality: Russia, Sweden, Holland, Switzerland, the countries severally proposed. The Dutch deputy, in the name of his Government, invited the Congress to meet at the Hague; the Swiss deputy made earnest recommendation of his own land, though speaking but in private capacity; and Mr. Lockhart (English) so far anticipated a much desired future as to propose Rome—the elect capital of Italy!

On the evening of that day, the members were entertained at dinner, in the Pitti Palace, by the King, who had invited them, in a few gracious words, on occasion of a general reception, when all had been presented to his Majesty. The English minister sat at the right hand, the Minister of Commerce at the left of the royal host. But the grandest entertainment was the banquet at the theatre, with admission by paid tickets, the Baron de Blasius, as usual, taking the lead in the speeches that ensued after good cheer, and proposing health “to this Congress and its future, and to the continual development of its scientific conquests,” the Swiss delegate (M. Poda), “To the Sovereign of this great and beautiful country,” the French delegate (Chev. Legoyt), “To the Minister, De Blasius, who had so ably discharged his task,” the Austrian delegate (Baron von Czörnig), who had acted as vice-president at the public meetings, and delivered himself in three languages with equal readiness, “To Florence, the capital of

Italy, and her worthy magisterial representatives;” lastly, the distinguished writer invited all to drink—not their wine, but their coffee—“To the Solidarity of Nations,” proceeding, in a brief but excellent speech—perhaps the best of the occasion—to congratulate on the intellectual fraternity, the common bond uniting peoples for mutual benefit, secured through such means as science and culture are now rendering more and more efficient, so that the countrymen of Goethe, Shakspeare, Thorwaldsen, Canova, Pascal, Galileo, are becoming in a true sense brethren.

Beyond comparison, the most picturesque of these scientific entertainments was the reception, on the night of the 3rd, at the ancient Pretorio, *alias* Palace of the Podesta, whose Gothic halls and corridors were illuminated, whilst all those representatives of different nations were mingling in converse under their vaults, and in the largest of the fine old building's apartments was given a supper, served at a late hour; ladies being invited by the authorities to this really memorable *fiata*, and musical bands performing in the *corfide*, one of the most majestic specimens of Medieval civic architecture in Italy. It may be imagined how striking and fairy-like was the effect of this gaiety and lustre, thrown from lamps and tapers, in the interior of that grand, gloomy-looking pile, reminding one of things so different, of conditions of society no doubt more stirring and romantic, but assuredly by many degrees less favourable to human happiness than those in which scientific International Congresses prove possible.

PHYSICAL EDUCATION.

A VERY excellent reason exists for that suspicious dislike of the dead languages which is evinced by some of those who most loudly counsel their fellow countrymen to be guided by their advice. To these teachers the fable of the fox who had lost his tail is inapplicable, or at least it should be written for their use in an entirely new version. It should be the Manx cat and the household cats, or the ape among the monkeys. The fable holds in respect to the counsel given—namely, that others should dispense with an ornament not possessed by the lecturer; but the discrepancy lies here, that it is not an ornament lost by that disinterested friend, since it is something in which he is not only deficient, but with the use and value of which he has no acquaintance whatever. The true reason, then, is further to seek, and it may possibly be found to be this, that the man who offers a programme for the future that is perfectly satisfactory to himself, inasmuch as it is the child of his own imagination, has a sort of half-messy fear of the ghost of the buried past. In other words, he would rather not have his bran new theories contrasted with the experience of those two thousand years of human history of which we find certain relics in the pages of Greek and Latin authors.

The clear perception of the manner in which history ever reproduces itself is rarely attained. The man busily occupied with the present is apt to forget his boyish recollections of the past. The man steeped in the learning of the academy shrinks from the loud din and personal squabbles of the politics of the day. Or, if, as in the case of so illustrious an exception as De Tocqueville, a writer brings a profound knowledge of history to illumine his all but prophetic insight into the course of the present and the future, his disciples are but few and rare. The daily journals, which more and more assume the position of the instructors of the public, make it a rule to handle no topics of more than twenty-four hours' growth. There is but little time for a colloquy with the ancients at the disposal of the reader of the morning's news.

It thus comes to pass that we are not unapt to take for granted propositions that are not only unproved, but actually disproved by history. We speak of progress where there really exist decadence and decay. Attention is at this moment directed to one of these subjects, a matter in which the English of the nineteenth century are very far inferior to the Greeks of the Alexandrine age,—inferior not only to the Greeks as Aristotle lauded that they should become, or as Plato dreamed of them in his Utopia; but as they actually were. Nor is this comparison to be made with men of different blood and different climate alone. We can trace an inferiority, not so marked because not so general, but sufficiently marked, in the education of the English gentle-

man of to-day, as compared with that of the English gentleman of the time of tournaments and chivalry.

The portion of education to which we refer, is that which is strictly physical. It is the purpose, intelligent, systematic training of the bodily powers. At the time when the human intelligence was at its acme, and in the race which subdued the world, the exercises of the palestra were as incumbent on a youth who hoped for distinction, as were the wisest lessons of philosophy. The great annual games of Greece were not mere assemblages for the purpose of gambling on the speed of horses, or for the exhibition of the most costly toilets. They formed an essential part of the physical education of the Grecian youth. It was not then, any more than now, given to many to excel in very different branches of study. And those branches, moreover, were far fewer, and some of them far more limited, than is the case at the present time. But if chemistry was unknown, if metallurgy was in its infancy, if mathematics were confined to geometry, if astronomy was awaiting the discoveries of Galileo, and if the boldest reach of the navigator was confined to the circumnavigation of Africa, we must not forget that politics was a science, even if some sought to make it a trade, and that the physical welfare of the race was directly cared for by the institutions of legislators, and by the solemn order of the public games.

As Europe emerged from the flood of barbarian invasion, and down to the time when the increasing use of gunpowder tended to equalize the advantages of strength and of skill, and finally to induce the abandonment of defensive armour, the physical education of noble youth received even an undue share of attention. To ride, to use weapons of all kinds, to inure the body to toil, was the object of youthful study and competition. In the chase and in the tournament was to be found the school of the soldier: careful training in many exercises, for the express purpose of developing bodily strength and skill, was not confined to the aspirant for knighthood. The English statute-book here witness to the anxiety of our rulers that the yeomanry should maintain that familiarity with the bow which told with such terrible force in our French wars; and in the times of the Stuart kings, when the jack-boot, the spire of the arquebuse, was displacing the jointed plate-armour that had replaced the older mail covering of the legs, the aim of the publication of the "Book of Sports" must not be held to be merely or even mainly polemical. The idea of the primary duty of attention to the physical training of all classes of the nation was only densely obscured by the increasing smoke of gunpowder, and forgotten in the search for gold and the effort to make the most of the maxim that time is money.

Thus it came to pass that the manly out-door exercises which toughened the muscles of our forefathers were more and more regarded as mere amusement. Sour-faced men spoke of them as sinful, sharp-faced men spoke of them as waste of time. The best batsman on the cricket-ground was warned of the end of the idle apprentice. Books and work were extolled at the expense of healthful play. Heavy impositions, useless repetitions framed for the purpose of strengthening the memory (as if memory were a special faculty of the mind, and not a phase of the action of many very distinct faculties), keeping in from the play-ground or the cricket-field, were prevalent in our public schools. At the beginning of the present century physical education had probably sunk to its lowest ebb amongst ourselves, and the peaked bookworm, whom a wise and comprehensive discipline might have developed into a noble man, was held up as the pattern by the teachers of the good-hoy school.

The change which we are now witnessing in this respect appears to have sprung from the manly instincts of the nation rather than from the wisdom of its teachers or the forethought of its legislators. Sports, never quite extinct, are becoming more carefully organised. Such an annual contest as the Oxford and Cambridge boat-race has far more of the mettle of the Olympic games than is to be met with at Epsom or at Ascot. An increasing interest in Alpine adventure is apparent. Men whose opinions on education are known and valued advocate something far beyond the mere constitutional walk necessary to the maintenance in working order of that ill-used machine, the brain of the hard-reading student. In that great military academy which exacts from the card-

dates for admission a standard of mathematical proficiency, and of acquaintance with language, either living or dead, and with physical and classificatory science, of an order that claims the very respectful attention of the Oxford first-class man and of the Cambridge wrangler, the utmost care is given to the exercises of the perfectly-appointed gymnasium. Dangers and idle use of this portion of the machinery of education is rendered impossible, at the same time that proper and beneficial use of it is made obligatory. The result is the supply for the services of our engineer and artillery corps of a set of men who, in accomplishment of mind and of body, as well as in discipline and in the habits of gentlemen, are, if not *facile principes*, at least second to none in the world. More and more through our larger schools the gymnasium is becoming recognised as a place, not of idle amusement, but of essential importance to complete education.

With this great improvement of the day arise, as usual among us, the clash and conflict of opinion. Much of this would be avoided if men would only devote to the real study of a case on which, very likely, they feel not only strongly, but properly, the time which they consume in shouting out their own crude opinions. The man who is perfectly aware of all that is known on a subject is never vociferous, never violent, never over-bearing. It is the totally or the partially ignorant man who is intolerant,—the imperfectly-convinced man who insists on his convictions with the most acrimony. When a child first acquires a new idea it hastens to communicate it to its fellows. *Monsieur Jourdain's* wonder and delight at learning "*tout ce qui n'est pas vers est prose*" is instantly communicated to Nicole, in the absence of a fitter pupil. Take a subject on which actual knowledge is unattainable, and it is just the one on which controversy is most fierce. What ever exceeded the fury of the *homoousian* and the *homoousian* quarrel? Thus it is very natural that men who, manly sportsmen it may be themselves, are personally unaware of what well-ordered and systematic training can actually effect, should clamour for the open air and unchecked exercise of rowing, or of other less regulated sports, as the proper substitutes for the gymnasium. No less natural is it for those who have become aware of the ill-effects of exercises carried to excess, such as rowing, for instance, when pursued as a passion, and not regulated by an experienced trainer, to discredit our returning attention to our too-long neglected physical education. Common sense and daily observation, experience that may be acquired in a few years no less than the testimony of history, our duty to posterity no less than our regard to our own completeness of life, all point to the extreme importance of the provident and well-counselled development of the body, no less than of the mind, by appropriate and effective training.

In a national point of view, physical education will, perhaps, hereafter, as it was formerly the case, be regarded as possessing claims on the attention of the legislator, even prior to those of moral and of intellectual tuition. Morals are, to a certain extent, conventional. The code differs amid different races. Science is subject to that change which is a condition of healthy growth. But so many inches round the chest, and such a girth of the arm, are facts independent of theory. A stalwart and able population has a double value in a political sense: it constitutes the hope of the future no less than the safety of the present. In it we look for the fathers of future men and women, as well as for the defenders of our coasts. Nor must it be lost sight of that the equalising effect of gunpowder has reached its limit, and that with every improvement now introduced in its application, the advantage of the able-bodied soldier, able in skill as well as in celerity and in endurance over his weaker competitor, becomes more apparent. The soldier is no longer mere food for powder. The statistics of the battles of the century, if their accuracy may be relied on, show that it takes as many or more rifle-bullets to kill a soldier as was the case with the heavier halls of Brown Bess. Sadova was gained by the marching powers of the Prussian troops as much as by the needle-gun. To say nothing of accuracy of aim, a subject which attracts, and deservedly attracts so much attention in our rifle-grounds, aptness for rapid manoeuvre and for sustained fatigue, is an element of the utmost military importance. Drill is much simplified. With the Spider rifle the old manual is at an end. The endless routine of "Shoulder arms!

Ground arms! Port, ho! Charge bayonets!" is superseded by a simpler set of movements. The less the soldier is embarrassed with a cumbrous manipulation of his arms the more he is at liberty for a complete and improving gymnastic training. The more fatal and deadly become our projectiles, and the means of discharging them, the higher must we rank the value, and the more carefully must we study the education, of the soldier. The finer, the healthier, the more skillful, and the more enduring are our soldiers, the higher will be the physical status of our whole nation. The art of war has done much to brutalise the private soldier: it is now useful to raise him in the scale. The improvement in destructive, no less than that in constructive, machinery must ultimately serve to the elevation of the human race.

Gymnastic training holds the middle ground between neglect and the needless severity of the pipe-clay and pig-tail school. It neither leaves the man a clod, nor stiffens him into a machine. The gymnastic teacher looks askance at the time-honoured stock that still maintains its place in the British uniform, with scarcely less disfavour than at the heavy iron-shod boots which have devoured the calf of the rustic. The man who can go with ease through all the feats of the vaulting-room, the bars, and the trapezium, will be the one most ready to scale a precipice or to afford prompt aid in any emergency. He is equi-distant between the humpkin and the mere drill-sergeant, and is worth more than the pair of them put together. Propriety of dress, not smartness alone, but fitness for the greatest amount of service with the least fatigue, is yet far from being attained, either in the army or out of it. How many questions on this score are still open! how many are yet openly set at naught! Which is the best hat? which the best great-coat? which the best hat? No reply has as yet been given to these questions by one consent. The well-known defect in the gait of our heavy-booted country swains, the destruction of the calf of the leg, and the slouching and fatiguing walk that are characteristic of the ploughman and the wagoner, are constantly recurring proofs of the need of some guidance more correct than an instinctive sense of comfort. The long-stirrupped, rupture-threatening seat still maintained by our cavalry is even a more inexcusable error in exactly the opposite direction. The completion of the gymnastic code, and the subordination of dress, of drill, and of seat, to the requirements of the gymnastic trainer, are matters of no trifling importance to the country, and improvements which we no longer despair of seeing carried into effect.

May we offer a word of advice to our professional brethren in this matter? It is this. In every design, for school, or college, or public building, in which provision is in any way to be made for the home or the education of youth, let them never lose sight of the necessity for a commodious gymnasium. Not a damp patch of ground, garnished with one or two poles and swings, such as we could point out within the walls of a building that assumes for itself a high rank among our educational establishments. A lofty, light, water-tight roof, a floor boarded throughout, and padded under the bars and poles, with a distinct portion of the building set apart for spectators, should be considered as essential a part of a scholastic building as either classroom or theatre. Great comfort and perfect adaptability can be attained at small expense, but not without proper forethought. Let those who are in want of precedent to guide them, pay a visit to the noble gymnasium at the Royal Military Academy at Woolwich. Let us add one other caution. The gymnasium, when provided, is intended for education,—not, as in the instance of the open yard above referred to, for rough and harsh larking. Such a use of its facilities involves danger to limb or even to life, and should be strictly and carefully prohibited. The eye of the principal, and the invariable presence of a fully-qualified attendant, are requisite to make the gymnasium the scene of a noble branch of education, not the mere resort of mountebanks and of roughs.

ART-UNION OF LONDON AND THE MANSION HOUSE.—The Right Hon. the Lord Mayor (Gabriel) has invited the Council of the Art-Union of London to a dinner at the Mansion House on Friday, the 25th instant, and will have a large party to meet them. This will be the last state dinner of the present mayoralty.

THE WROXETER EXCAVATIONS.

THE excavations at Wroxeter, which had been discontinued during the harvest time, were again commenced about a fortnight ago. A spacious room has been discovered and laid open, 34 ft. long by 32 ft. wide, having in its centre a square bed of stone, similar to the one found in the apartment called the enameller's shop, and which probably sustained a central pillar which supported the roof. A good many curious things have been found, especially in what has been a *taberna*. As usual, plenty of hair-pins and cocks' legs have been collected. But the greatest rarity brought to light was a small clear red cornelian stone, six-eighths of an inch in length, and of an oval shape. It had probably been set in some metal, and used as a seal or signet-ring. It was deeply cut or engraved so as to represent in the centre a large goblet or vase, on each side of which, perched upon a round stand, was a parrot well characterised by the hooked beak: from the mouth of each issues a stream of liquid flowing into the bowl. Before this remarkable work of Roman art could be placed in the proper museum-case, it was shown to a party of "gentlemen," one of whom, it is supposed, must have slyly made off with it, as it can nowhere be found. An impression in wax had previously been taken, so that the article can at any time be identified. It is to be hoped the thief will now see the uselessness of retaining such a relic, which he dare not show to any one in respectable society, and that he will therefore send it back to the museum before the police get hold of him and it.

STRATFORD TOWNHALL COMPETITION.

A CORRESPONDENT writes as follows,—“The account in the local papers of the meeting of the Board to decide on the designs, shows that the author of the selected design marked 'Civis,' was shown to several members of the Board to be his own surveyor, Mr. Lewis Angell, F.R.I.B.A. Before competing, I applied through a friend to one of the most influential members of the Board to know whether they had any particular architect in view, and was assured that they had no preference for any one architect, but that it would be fair and straightforward. One of the clauses in the conditions says,—‘Any competitor communicating his motto, directly or indirectly, to any member of the Board, will be disqualified from receiving a premium.’ Now, I think, could the members of the Board have known that the plans marked ‘Civis,’ belonged to their surveyor unless the above condition had been infringed, whereby Mr. Angell is ‘disqualified from receiving a premium’? I have no doubt that the selected plan is the best, as the author would have opportunities of knowing exactly the requirements of the locality which no stranger could possibly possess. But why the Board would advertise for designs when they had a fellow of the Institute of Architects at hand, with a suitable design, passes my comprehension.”

The Board have acted most injudiciously, if not unfairly. With an architect acting as their adviser, if they considered that he was in a position to carry out the work, with his other duties, they might very properly have placed the matter at once in his hands; but having appealed to the profession at large, they should not have allowed their surveyor to compete. His position would necessarily give him advantages, and his selection, they might be sure, would bring down, as it has done, a cry of unreason that no explanation could wipe away. One of the local papers writes,—

“If such a building is really essential for the best interests of the parish, the ratepayers have no cause to regret the decision. On the contrary, it must be some consolation to them to know that the choice has fallen upon the superior to the Board, inasmuch as had any other plan been accepted, a sum of 5,000, or 6000, would have been paid as remuneration for superintending the erection of the building; and the Board will hardly award this to their surveyor, in addition to his present handsome salary, for the duty could only be performed in the Board's time.”

Whether or not this belief weighed at all with the Board in making the selection we do not know. If so, they will doubtless be disappointed. Mr. Giles, at any rate, is not an officer of the Board. We make no question as to the superiority or otherwise of the selected design (an elevation has considerable merit: the plan we have not seen); our objection rests solely on

the ground we have stated. The proceedings of the Board before selecting the designs ought to be instructive. Some of the members were anxious that an architect should be called in to assist in the selection, and the clinching circumstance that led to the rejection of a motion to an impartial professional man were appointed to the task, there would be the same abuse of the referee and questioning of the decision as if the Board had acted for themselves. The question whether, spite of this unseemly and unwise conduct, the decision in the former case would not nevertheless be the better one, was not raised. Every member of the profession, indeed every person anxious for the right conduct of competitions, is interested in putting a stop to the proceedings pointed to in this discussion, or the result will be that no architect with any regard to his own dignity will accept the office of referee, should any committee still think it desirable to invite him so to act.

THE LATE MR. CHARLES FOWLER, ARCHITECT.

WE heard with great regret of the death of this gentleman, on the 26th of September, at his residence, Western House, Great Marlow, Bucks. Mr. Fowler was in his 76th year: he was born at Cullumpton, Devon, where his family had been settled for several generations. At the age of fifteen he was bound apprentice for seven years, as the manner then was, to Mr. John Powning, at Exeter, architect and builder, as he styled himself (he held, we believe, the appointment of surveyor to the Dean and Chapter of the Cathedral). During this long apprenticeship Mr. Fowler, no doubt, acquired that thorough knowledge of all the practical details of his profession for which he was remarkable. Soon after the expiration of his articles, in 1814, he came to London, and entered the office of Mr. David Laing, who was then engaged in the building of the new Custom House and numerous other works. Here he became acquainted with Mr. Tite and Mr. Bellamy, who were fellow-students, and whose friendship he retained to the end of his life. He appears to have remained with Mr. Laing between three and four years, after which he commenced practice on his own account. His first work of importance was the building for the Courts of Bankruptcy in Basinghall-street, completed in 1821. In 1822, he sent designs in competition for the proposed new London Bridge, for which he obtained the first premium out of fifty-two competitors; but he was not allowed to carry out his design. He also made designs for bridges at Kingston, Littlehampton, &c.; but the only one he carried out was that at Totness, over the river Dart. The following list of buildings designed and executed by Mr. Fowler is taken from the inscription on a silver trowel formerly in his possession, and used in laying the several foundation-stones:—

Totness Bridge, 1826; Hungerford Market, 1831; Exeter Lower Market, 1835; Charnouth Church, 1835; Honiton Church, 1835; Brickleigh Church, 1838; Devon Lunatic Asylum, 1842; London Fever Hospital, 1848; Wax-chandlers' Hall, 1852.

To these may be added Covent Garden Market and St. John's Church, Paddington; small markets at Gravesend and Tavistock; extensive works at Powderham Castle, for the Earl of Devon; several country seats of minor importance, &c., &c. The work to which, perhaps, more than any other, Mr. Fowler owed his professional reputation, particularly abroad, was Hungerford Market, now removed; the peculiarities of the site and the different levels to be accommodated afforded great opportunity for the designer's skill, both in the arrangement and architectural treatment. Those who only knew the building in its subsequent altered form would be unable to realise the striking effect produced by the original arrangement.

In the earlier part of his professional career Mr. Fowler frequently engaged in public competition, and several of his most important works were obtained in this manner. In conjunction with his friend, the late Mr. Sievier, the sculptor, he submitted a design for the Nelson monument in Trafalgar-square, to which the second premium was awarded.

Mr. Fowler was one of the founders of the Institute of British Architects, and for many years filled the office of honorary secretary, and

subsequently that of vice-president. He was also a member of several other learned societies.

Mr. Fowler commenced his professional life in Red Lion-square. From thence he removed to Great Ormond-street; and subsequently, for nearly twenty-five years, he resided in Gordon-square. In 1852 he was induced by failing health to retire into the country, and soon afterwards he withdrew from professional practice. He continued, however, to take an active interest in professional matters, and never relinquished the use of his pencil and drawing-board, amusing himself with working out different architectural ideas, which occupied his mind to the last.

His son, Mr. Charles Fowler, an accomplished member of the profession, is district surveyor of St. Giles's in the Fields and St. George's, Bloomsbury.

EARLY CONSTITUTION OF THE "OFFICE OF WORKS."

THE Committee of Professional Practice appointed by the Council of the Institute of Architects, recently considered as to the remuneration paid by the Commissioners of Works and Public Buildings to the architects employed by them, and have now printed some "Rough Memoranda on Professional Practice," extracted from reports on the Board of Works, 1813—1828. The commencement of their minute shows the early constitution of the Board of Works, and is interesting.

"Our attention," they say, "was first directed to the Report from the Commission of Inquiry into the conduct of business in the Office of Works, ordered by the House of Commons to be printed the 3rd June, 1813. This Report of the Commissioners states the mode in which the business of the Board was conducted from the 12th October, 1705, to Lady-day, 1715, passing on to the constitution of the Office of Works in 1742, within which period (p. 6) 'Sir Christopher Wren held the office of Surveyor to the Board of Works, and Sir John Vanbrugh that of Comptroller.' 'In 1718 Mr. W. Benson' (who was not of the profession), whose history is so much involved in mystery, 'was appointed to the office of Surveyor;' with 'power to appoint a deputy, and he appointed Mr. Colin Campbell,' whom the Commission 'believe to have been an architect of eminence.' From 1718 (p. 7) the office of Surveyor-General ceased to be held by a professional person, 'and a Deputy Surveyor, receiving 1800, per annum salary, as such,' is one of the officers enumerated in the list. Soon after the commencement of the reign of George III., two architects, with a salary of 3000, each, were added to the establishment, and the offices of Surveyor of the Royal Gardens and of the Private Roads ceased to be held by professional persons; and in the eighth year of the reign of George III. a new set of regulations was established, and the Board consisted of the Surveyor-General, Comptroller-General, Master Mason, Master Carpenter, and two Architects, and in addition there were six Clerks of the Works, having the power of appointing labourers in trust. It appears that in 1733 the Surveyor-General had possessed, in right of office, two extensive houses and premises in Scotland Yard, another at Hampton Court, and another at Kensington. Sir W. Chambers (p. 8) seems to have been the active member of the Board, and had the special superintendence of the works at Somerset Place (House) (p. 9), and he was allowed only 2½ per cent., by deduction from the tradesmen's bills, for his trouble and expense in superintending the works at Somerset Place, and in keeping and making up the general accounts of the same; but that, on a representation to the Treasury of his loss by this service, he was allowed to charge in addition 2½ per cent. on the expenditure. Sir W. Chambers had also a house, which belonged to him as Comptroller, worth 1500, per annum. On the occasion of the new works, and considerable repairs executed at the public prisons subsequently to the riots of 1780, the Clerks of the Works, immediately superintending these services, were allowed, under the authority of the Treasury, 2½ per cent. on the amount of the bills for their trouble in making plans, in attending the execution of the work, and in measuring and making up the bills for the same, agreeably to the prices of the Office of Works, but that it was directed that this per-centage should be deducted from the bills so settled, and not be charged over and above the same; for the public was not to be put to any additional expense;—a most clumsy device to

conceal the true state of the case; for if the tradesmen had to hear this additional charge upon the fair trade profits, they would add it to the prices charged, and thus the public would have to pay the value of the services of their office, despite the transparent attempt to keep them in ignorance of the fact. The Commissioners quote a return of salaries received as follows:—

The Surveyor-General, Mr. Keen (p. 9), received clear per annum 657l. 16s. 4½d.; the Surveyor of Private Roads, Mr. Fane, per annum, 730l. 11s.; and the Paymaster, Mr. Selwyn, per annum, 1,017l. 11s. 7½d. The Paymaster's advantages arose from a salary of 3d. in the pound on all payments made by him.

The Act of 22nd of George III., chap. 82 (p. 9), suppressed the principal offices of this department, and directed (p. 10) that all H. M. buildings, which had been under the management of the Board of Works, should thenceforth be under the direction of some one person appointed by H. M. Surveyor or Comptroller of H. M. Works (the said Surveyor or Comptroller being *bona fide* by profession an architect or builder), with such officers or clerks under him as His Majesty might from time to time direct and appoint.

It appears that the Clerks of the Works were to be allowed a convenient habitation or apartment at the place of their appointment, in which they were constantly to reside, and they measured the works and rendered their accounts to the Surveyor, Examiner, and Inspector.

Mr. Wyatt was at the head of the department (p. 24) at the time this report was made (1813) (p. 14), had a salary of 510l. per annum, and an allowance of 10l. for stationery. He was architect to the Ordnance at a salary of 280l. per annum; Surveyor to Somerset-place at 200l., with allowance of commission on extra works of 5 per cent. (p. 97). He had been much employed in superintending as an architect some very important works carried on under special votes of Parliament, and he had extensive practice as an architect. On the occasion of Lord Nelson's funeral he charged for his attendance, and for all new works at Somerset-place, and for the works carried on under votes of Parliament, he received a commission of 5 per cent. He had, in virtue of his office, the appointment of labourers in trust, of the constant labourers, gate-keepers on the king's road, the office-keeper, messenger, and tradesmen. Mr. Wyatt occupied an apartment in Windsor Castle attached to his situation of Surveyor-General of the former Board of Works, and it seems to have belonged to the Surveyor-General as far back as Sir Christopher Wren's time.

Mr. Wyatt admitted that there were no peculiar duties to be executed by the Surveyor at Windsor, but added that his attendance was more required where the king resided, in order to give his Majesty information respecting the works carried on in other places. It was, perhaps, for this reason, that residences were assigned to the Surveyor-General at Hampton Court and Kensington,—these places having been formerly the residences of King William III. and George I. He was at no expense for taking measurements of works (p. 98), or making out accounts of same, and only gave so much of his own time as was necessary. With respect to the Clerks of the Works, as they were then called,—but which at the present day would more properly be called resident architects,—it is stated that, with the exception of the Clerk of the Works for Windsor, they were all educated for the higher branches of their profession, carrying on practice, having salaries varying from 250l. to 100l. per annum, and all having official residences within their respective departments, as directed by the instructions, and they seem to have been allowed from 2 to 2½ per cent. on occasions of any large expenditure on new works carried on in their departments. They had to measure the work and make out the accounts.

The Commission (p. 45) suggested a reconstruction of the Board, to consist of a Superintendent, who should also be the Public Accountant for the department (and not necessarily an architect), and two Architects, a resident and assistant Clerk, and six Clerks of the Works. The Architects to be men of eminence, with a salary of 500l. per annum. And when employed under the orders of the Treasury in carrying on any extra works in places or districts, not within the Office of Works, an allowance of 2½ per cent. on the tradesmen's bills. In the case of the Houses of Parliament, or Speaker's House, no extra

allowance to be made to the Architects. One of these officers to be always in attendance to make up the Board. The Clerks of the Works (or resident Surveyors) were to have salaries varying from 300l. to 200l.

The salaries and advantages of the clerks of works, ought to depend on the quantity of business under their care, and on the different situations in which they may be placed (p. 47). We propose, consequently, that the clerk of the works having the care of Hampton Court, and the Richmond and Kew departments, should have a salary of 300l. per annum, with a residence at Hampton Court. The clerk of the works for Kensington and the Queen's Palaces, 250l. per annum, and a residence at Kensington. The same description of officer for Windsor, &c., 200l. per annum, and a residence; and 250l. per annum to the clerk of the works for St. James's and Carlton House Palaces, and the new; and 300l. to the clerk of the works for the Whitehall and Westminster departments, according to the arrangements before mentioned, and 50l. per annum additional, unless residence can be provided for them; and to the remaining clerk of the works, who is to have the care of the Tower, the Rolls-buildings, and the prisons, 200l. per annum, and 50l. per annum, or a residence; if Somerset House be put under his care; and we propose that an allowance of 5l. per annum be made to each of these six officers for stationery. The appointment of these officers should rest with His Majesty, as in the case at present.

The duties (p. 48), now executed by the clerks of the works are, as we have before shown, rather those of surveyors; but whilst professional men, of the qualifications and respectability of those now holding these situations in the department, will undertake the employment in consideration of the salaries and advantages hitherto annexed to it, we would not propose any further alteration in this part of the establishment, neither do we see any objection to their carrying on private business, if in the opinion of the superintendent, such employment does not interfere with their official duties. The propriety of this arrangement must, however, depend upon the competency of the labourers in trust, to execute those duties which it was intended by the instructions should be executed by the clerks of the works. We think, therefore, that as the clerks of the works are to be responsible for the labourers in trust, they should have the appointment of them, subject to the approbation of the Board, as appears to have been the regulation under the former constitution of the department, and subject also to their being suspended or removed by the same authority. They should have residences in their respective districts or places, which they should occupy themselves and their constant attendance should be required of them during the usual hours of work, unless their respective principals, the clerks of the works, should give them leave of absence; but notice of this leave should be communicated to the officer.*

THE COMMISSION OF MONUMENTS AT LIÈGE.

THREE years ago a commission of monuments was appointed to the charge of certain of the public buildings in Liège. During the interval that has elapsed the members of this commission have unfortunately deemed themselves competent to deal with the renovation of some of the most celebrated and important structures, including the world-famed church of St. Jacques. The arabesque treatment of the vaulted roofs of this structure is one of the most delicate wonders Medieval times have left us; nevertheless, they have not hesitated to deal with it as though it were in truth as common as they have contrived to make it. The groining of the nave, aisles, transepts, choir, chapels, and the intersection of the nave and transepts, is arranged to form different designs. The mighty ribs rising out of the stately piers and read-like columns, and spreading out like so many stems, divide each compartment into angular subdivisions, all of which are studded with bosses and medallions and team with arabesque conceptions rendered in the most harmonious colouring. All the central angular panels of the nave roof are filled with medallions, surrounded by light feathery foliage mixed with flowers; and the prominent ribs are picked out in hands of colour, yellow, red, and blue, with a black and white zig-zag border, alternating with yellow, blue, and green, finished with the same zig-zag border. In the centre of each rib is a long length of yellow, and the arrangement we have mentioned occurs in each case between these broad bands of gorgeous colour and the four bosses on the points of intersection. The bosses are carved and coloured. They represent frequently the heads of men, occasionally those of women, sometimes full-length figures of saints, and there are instances of birds. The heads are treated in the most fanciful fashion, the wreaths of foliage with which some are surrounded proceeding from their mouths, others being crowned, helmeted, turbaned, capped, and hatted. A circle of gold surrounds both medallions and bosses, save in rare instances. In like manner the choir is treated, except that angels playing musical instruments are freely introduced into a set of bosses terminating the ribs that vault downwards from a crowning boss, representing the Majesty, and that each panel is filled with flowers and foliage, to the exclusion

of medallions. Each roof is marked by a similar slight variety in the design. All of them, with the spandrels of the arches of the nave, are treated with the same spirit, and the colouring is of the same tone throughout. Under the auspices of the Commission a trial piece of repainting of the ribs in the most staring and astounding of bright colours was approved, and the whole of the vast spider-web work of ribs is now painted from end to end in the same fashion. "Heureusement," sighs our guide, "*le fond n'a pas touché.*" The graceful flowing and intertwining arabesque work on the panels is left untouched. But the effect of the contrast of the prodigiously lavish use of the ribs against the other staring colours upon the ribs against this ancient, subdued, and beautiful background is intensely offensive and disastrous. "*Tout le monde les blâme.*" acquiesces our guide, in answer to our expostulations. It is difficult to understand why the ribs should have required so thorough a re-painting, when the panels are sufficiently good to remain. We can only conclude that the Commission was unaware that it was possible to renew any decayed or effaced portion of the work, to correspond with the ancient part, without wiping out good and had together. Some years must now lapse before anything like harmony of tone can again prevail. And the disparity is never likely to be quite overcome, for as the ribs mellow down with age, the same lapse of time will not be useful by the already ripe colouring on the panels.

A second want of feeling is exhibited in the renewal of the tracery of some of the windows. The ancient mullions and flamboyant tracery have been removed, leaving the ancient arch mouldings and jamba *in situ*; and new tracery of an offensive whiteness inserted beneath the ancient time-stained mouldings. Removed thus from all association of idea with the form of the window openings or with the colour or identity of the stone of the whole of the exterior, the new tracery has the most meaningless, marring, and intrusive effect.* St. Jacques, we perceive, retains possession of its ancient stalls. A large organ in a Renaissance case occupies the whole of the gallery at the west end.

In the cathedral the choir has new tiers behind tiers of stalls, screen, and altar-rail of light oak of early Medieval design, untouched by colour. We have no fault to find with this except that they impress the beholder more with a sense of the lavish expenditure of money on a than with any artistic excellence.

Perhaps the crowning display of want of wisdom is the travesty of noble work, executed at St. Martin's-on-the-Hill. In the choir of this edifice we find an absurd attempt to copy the wonderful roof of St. Jacques. The fan-groining ribs and bosses are there, but very much depressed in their arched forms. The whole is painted, recently, in the grubby yellow ochre and other colours in imitation of the original, and has a most theatrical aspect.

There is really need for a judicious renovation of a part of this structure that affords one of its chief sources of attraction to strangers. The view from the top of the tower is magnificent and not to have seen it is not to have seen Liège. But the ascent, instead of being mad, safe and commodious, is as perilous as it can be. The adventurous hero who sets out on this aerial tour, after paying the franc charge for the opportunity, leaves the ground for a short distance by means of an ordinary and tolerably-proper stone turret-staircase, which however, soon stops short, and the rest of the ascent is made by a series of shaly step-ladders through the different floors of the bell-tower. The rickety oak steps and the loose handrails are indeed dangerous companions, and the platforms by which every step-ladder reached, as one after the other is climbed, are pit-falls. Not unaccustomed to climbing ladders and walking-planks at great elevations, we owe there is good cause for fear here, and that we heartily commend the prudence of a fellow climber who declined to complete the ascent and turned back half-way up. Arrived at the summit, by dint of grip and scramble and dexterous selection of strong points and the avoidance of weak places, the stranger steps out upon the gutters at the top of the tower, and makes the tour of the four sides round the parapets. Here his only protection from wind,

* If the mullions and tracery were decayed, doubtless they should have been removed; but they should have been replaced by stone work of the colour and kind of the mouldings with due regard to the integrity of the edifice, not by careless patchwork.

giddiness, or any kind of mortal sickness, or the indefinable longing to take a header from high places that is almost irresistible to some temperaments, is a low parapet about a foot high! Below lies the city, once boasting sixteen gates, the cathedral, the castle, the palace, the council-house, the famous monastery, and a convent, all huddled together by the busy streets, and watered by the Rivers Meuse and Ourcho, which are spanned by bridges, and seem to divide the intersected parts of the city together. And beyond the great mass of roofs and house-tops, between them and the girdle of mountains in the distance, lies a landscape as lovely, as full of hills and dales, waterfalls and streams, as our own famous Highlands. We point out to the Commission a remunerative investment for their money, as well as an attraction to the edifice, in the provision of a safe and easy mode to ascend this tower. This would be more to the purpose than dabbling with yellow ochre or one of the most delicate pieces of arabesque colouring hequeathed us.

FROM MELBOURNE.

The New General Post-office.—After about nine years, during which it has been in course of erection, the new General Post-office has arrived at completion, and been appropriated to the purposes for which it was designed. The fittings are all of South Wales cedar, and cost something like 6,000*l.* The building is heated in a cold weather by hot-water pipes, supplied by Messrs. Bobardt & Co., and the floors will be covered with coxos-nut matting. The lighting arrangements are on Dempster & Co.'s patent. Perhaps the most faulty of the internal arrangements in the whole building are the sanitary. Baths for the mail guards and delivery who travel all night by coach in rain, heat, or dust, ought to have been provided. The lavatories are also very circumscribed. The large clock shown at the Intercolonial Exhibition will be placed at the north end of the Elizabeth-street facade, in juxtaposition with the postal boxes. A little short of 20,000 persons visited the building the first day of its opening. The general contractor for the work has been Mr. Samuel James. The entire cost will be nearly 40,000*l.* After the public had retired, a few friends met Mr. James to congratulate him upon the completion of the work. Not the slightest accident had occurred in the erection.

St. Jude's Church, Carlton.—The foundation-stone of this church was laid by the Bishop of Melbourne, in October, 1866; and that portion of the building now erected was opened for public worship in March last. The site of the church is the most elevated in Carlton. It is about half an acre in extent. The style of the architecture of the church, the first of its kind in Melbourne, is the Pointed Gothic of Italy, or Lombardic, and the material is brick. The general structure consists of Hawthorn bricks, relieved with red and white quoins, arches, masonry, and other ornaments. Freestone is sparingly used for springers, drips, &c., and the roof is covered with slate of different tints and forms. The chancel measures 23 ft. by 12 ft.; the vestry, 12 ft. square. The nave, when completed, will measure 80 ft. in length, its width is 24 ft., and the highest point from floor to ceiling is 45 ft. The tower, serving also as an entrance porch, is 135 ft. high to the top of the roof. The windows are glazed with cathedral glass, and ordered with stained glass. The chancel window is ornamented with the emblems of Faith, Hope, and Charity. The artists were Messrs. Arguson, Urie, & Lyon. The reading-desk is surmounted by a displayed eagle, designed and carved in cedar by its donor, Mr. Felix Lewicki, wood-carver. Another friend, Mr. C. C. Towster, an amateur sculptor, designed and executed in parente stone, and presented, the baptismal font. A bell has also been presented to the church by Mr. Lee. Messrs. Reed & Barnes are the architects, and Mr. John Pigoon, of Carlton, the builder. The *Australian News*, to which we are indebted for these particulars, gives a good view of the exterior of the church. This paper is profusely illustrated. The last number which has reached us contains, besides numerous engravings, a very large one, showing a series of panoramic views of Melbourne itself, which really merits the name of a great city, with its numerous public edifices, and its long and spacious streets.

PROVINCIAL NEWS.

Taunton.—The inmates of Huish's Alms-houses in Hammet-street have shifted their quarters to the new almshouses in Magdalene-street. Messrs. Giles & Robinson were the architects, and Mr. John Spiller was the builder.

Birmingham.—The estimate of Messrs. J. Cresswell & Sons has been accepted for the erection of the new Birmingham and Midland Bank. The work has already been commenced, under the superintendence of Mr. Edward Holmes. The site is opposite the Exchange buildings, in Stephenson-place, immediately adjacent to the Central Railway-station, and occupies the central position of New-street. The two principal fronts will be erected in Portland stone (being its first introduction as a building stone in Birmingham). The columns and bases of the portico will be of polished granite.

Gloucester.—The Children's Hospital, at Kingsholm, near this city, has been formally opened. The building has been erected at a cost of upwards of 3,000*l.* Mr. Jacques, of Gloucester, is the architect. The entrance is approached by a broad gravel road from the highway. On the left are the cloisters, 150 ft. in length, connecting the Hospital with St. Lucy's Home. The sick-wards are reached by a broad staircase, open to the roof, and furnished with a lift, for raising invalids, and for other purposes. On the first landing there are two wards,—one for boys, containing seven beds; and another for girls, with eight beds. The walls are decorated with coloured Scriptural pictures. Each ward has a nurse's room adjoining, and several rooms for attendant nurses. At the end of the landing is a small chapel, with a stained-glass window, the centre of which represents the Crucifixion, with the figure of St. John on the right, and the Virgin Mary on the left. At the top of the house is another ward,—called the infection ward,—furnished with seven beds for boys. There is a nurse's room adjoining, with a small dispensary. There is to be accommodation for twenty-three beds. There are several linen-closets, a bath-room, and two servants' bed-rooms. On the ground-floor is the servants' hall, leading to the cooking-kitchen, which is fitted with a gas-stove, and every convenience. Adjoining this is the laundry, with scullery, wash-house (underneath which is a large tank, holding 10,000 gallons of soft water), and back kitchen. At the north wing is the convalescence-room, decorated with appropriate texts of Scripture, and other offices. There are several outbuildings, including the mortuary, the gift of a lady, over the door of which is inscribed "The angels do always behold the face of My Father which is in Heaven."

Hereford.—The improvements at the Infirmary within the house have been begun, in accordance with the recommendations of Dr. Bristowe, the inspector from London, for its complete ventilation and improvement. A large number of men are employed, with the view of limiting the inconvenience it occasions to the shortest possible time. The contracts for extending the staircases at each end of the building to the top, with large glass lanterns over each; for building up two tiers of new waterclosets in the back angles of the Infirmary, and removing the present ones from the wards; for making two large wards back and front; for re-arranging the wards, and including all collateral expenses, amount to 887*l.* 15*s.* This sum completely exhausts all the funds at the disposal of the committee. The estimated cost of putting in gas, with all the fittings, burners, and lamps complete, is 110*l.*

NEW CHURCH NEAR LUTON, BEDFORDSHIRE.

A NEW ecclesiastical district is being formed near Luton, in Bedfordshire; and sites have been given, and a church and parsonage are being built upon them by Mr. John S. Crawley, of Stockwood, near Luton. The church is substantial, and contains a nave, chancel, chancel aisles, vestry, south porch, and warming cupola. The nave is 68 ft. long and 26 ft. wide; the chancel 36 ft. by 20 ft.; and the chancel aisles 20 ft. by 10 ft., opening to the chancel by a double arcade on each side, supported upon polished marble pillars.

The walls generally are 3 ft. thick, that of the west front, which is surmounted by a double bell-cote, being 4 ft. thick, and are faced inside and outside with cream-coloured bricks, relieved

with bands of red Mansfield stone. All the door, window, and arch dressings are of free-stone. The roof is open-framed with pitch pine timber: they are boarded with pitch pine above the rafters, and covered with felt and green Pembrokeshire slates, finished with red Mansfield stone ridge tiles. The roofs are intended to show the raw timber, without either staining or varnishing. All the seats are in pitch pine, unstained, but varnished. A carved oak screen divides the chancel from the nave; and the chancel contains stalls arranged choir-wise, a double sedilia, piscina, and credence.

The east wall will be decorated with a reeded of enamelled tiles, with a carved stone brattishing over. The works, which have now progressed to the level of the window-heads, are being carried out from the designs and under the superintendence of Mr. Thos. Nicholson, diocesan architect, Hereford.

ST. GEORGE'S CHURCH, TUFNELL PARK, HOLLOWAY.

This church, which is peculiar in plan, was consecrated on the 28th ult. The building is arranged as a large circle, 85 ft. 6 in. diameter, with eight 10-in. iron columns supporting arches 31 ft. in height, and octagonal clearestry above, which central octagon is no less than 54 ft. 3 in. diameter; the total height of it from floor to ceiling being about 50 ft. East of the circle, the plan runs out into chapel-like projections or aisles to the chancel, which is 36 ft. long and 25 ft. wide, with circular end. The total length from west to east of the church is 120 ft. internally. The accommodation is for 1,040 adults on the ground floor. The building is of Kentish rag, and Bath stone dressings: it is intended some day to erect a lofty tower and spire. Up to the present time the church has cost, including heating, gasfittings, &c., about 6,000*l.* The architect is Mr. George Truefitt. Messrs. Carter were the builders.

ST. ALBAN'S CLOCK TOWER.

TRAVELLERS in England have all seen and remember the famous clock tower of St. Alban's, in Hertfordshire. What an old-world, needless thing it was in our grandfather's time, who was wont to tell strange stories about it to the Highb Little Johns of modern Verulamium. Not unlike old Barbican in London, a "moth-eaten fort," time and neglect had eaten deeply into it; and St. Alban's clock tower had become a neglected nuisance; the peaceful bell-hung fortification of the wars of York and Lancaster, sunk to a patched Batty-Langleyed, bricklayered, old trunk, sad sight to the eyes of antiquaries, who look with true Medieval eyes on its many associations. This year of 1867 has happily seen its restoration under the watchful eye of Mr. Scott.

Our object in prefacing these stray remarks is to call public attention to the appropriate use to which the clock tower of St. Alban's is now put. The warden of the tower can send messages further far and infinitely quicker,—

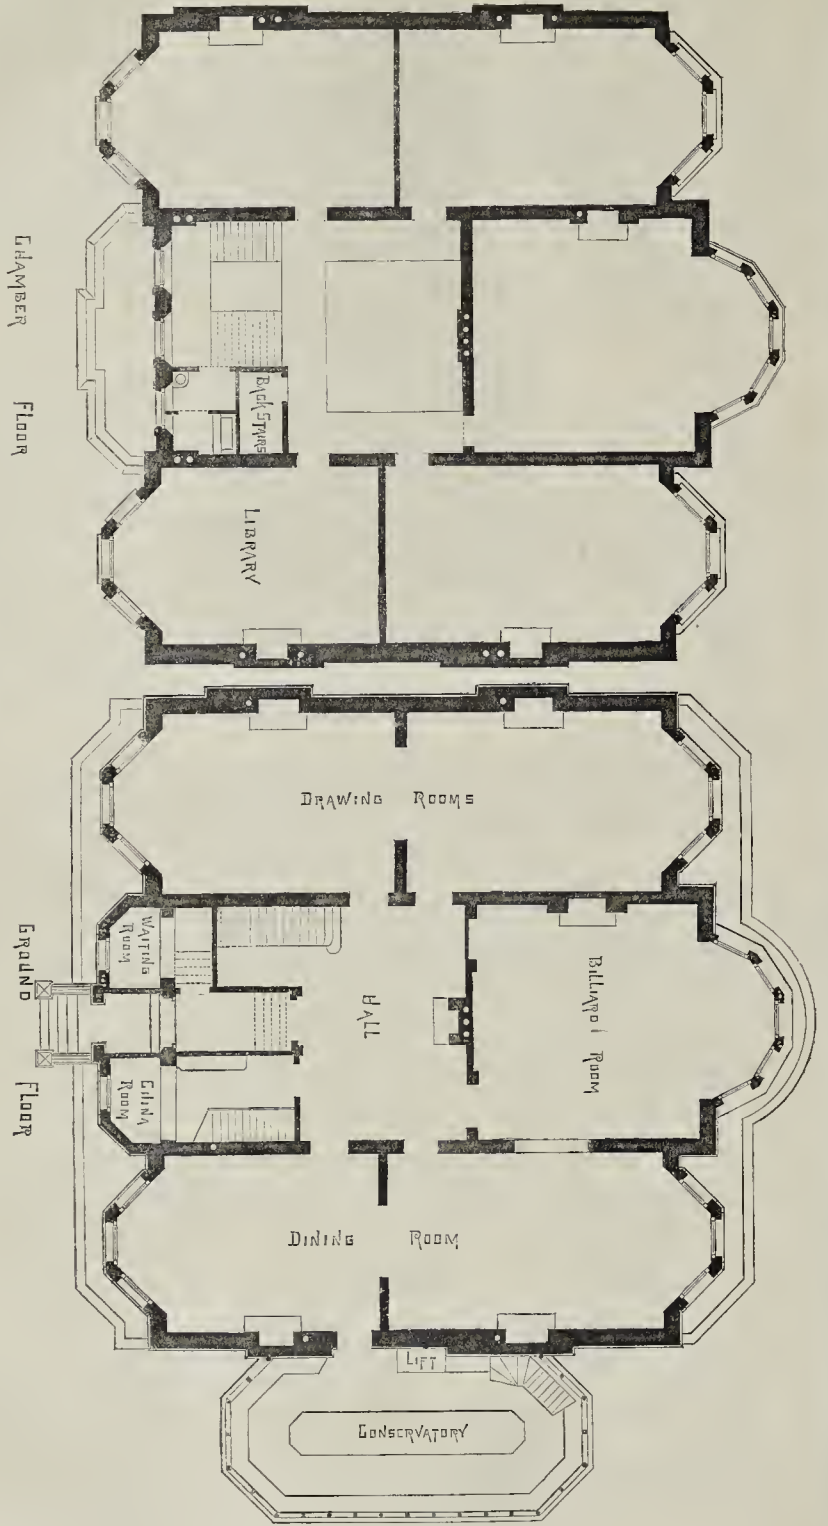

"Speed the soft intercourse of soul with soul,
And wait a sigh from Indus to the Pole."

than the blazing bale-fires and far-reaching beacon-lights could cover in Tudor and Stuart times. The restored clock-tower of St. Alban's is now a magnetic-telegraph station to and from all parts of the civilized world. Few old cities or towns in England have done so well with its "past" history as St. Alban's has done in this instance. Thanks, in many ways, to the memory of the Abbey's late rector, the Rev. Dr. Nicholson, who knew St. Alban's Abbey by heart from foundation-stone to crowning-stone, and worked to preserve and continue the memory of monuments that often need memorials to tell unborn ages why they were erected. Good time is now kept in St. Alban's; so that the apprentices of the sainted town have no reason to complain with the apprentices of London and Bow Bells. The threat of the young Cockneys, some four centuries ago, to the clerk of Bow Bells, was alarming enough:

"Clark of the Bow Bell, with the yellow lockes,
For thy late ringing thy head shall have knockes."

Significant enough. The clerk replied in rhyme:

"Children of Chespe, hold you all still,
For you shall have the Bow Bell rung at your will."

BLIMDALE HOUSE, CLIFTON DOWNS.

[See p. 737, ante.]

BLANDALE HOUSE, CLIFTON DOWNS, BRISTOL.—MESSRS. GEO. & HENRY GODWIN, ARCHITECTS.

BELLY DEL.

THE OPERATIVE FLINT-GLASS MAKERS AND THE QUESTION OF EDUCATION.

A CONFERENCE of the Flint-Glass Makers' Society of Great Britain and Ireland is held every three years, and at the last of these, which was held in Edinburgh within the last few months, the delegates took into consideration the question of the better education of boys learning the trade. The subject was introduced by Mr. John Cartwright, of Oldswinford, near Stourbridge. Since then a circular to the employers has been issued, urging their co-operation. In this circular the operatives propose:—

"1st Suggestion: To establish schools in the various districts solely connected with the trade, to be open on Mondays and Saturdays, or such other times as may suit the working hours of the districts. These schools may be taught by employers, by the better educated operatives, or by their nominees. One-third of the expenses to be borne by employers, and the other two-thirds by the Flint Glass Makers Society. Boys to pay a small sum weekly to form a fund from which to give prizes annually, in tools, books, &c., to such of them who have attended most regularly and made most progress during the year. Boys to find their own books, slates, &c. 2nd Suggestion: To compel boys to attend a national, or other public school, when of work, on Mondays or Fridays, and to obtain the services of a trained or other approved schoolmaster; to have school open for our boys and apprentices half-days on Saturdays."

They suggest that a fine should be inflicted on boys for neglecting to comply with any regulations which masters and workers may agree to; and, after about two or three years from the time of making such provision for their better education, no boy should be advanced to make foot who could not read, write a legible hand, and pass a simple examination in arithmetic.

"In issuing this to our employers [they add], we are aware that we are only taking the initiative in a direction which many of you have already intimated a wish for, and that without your hearty co-operation, any effort of ours to improve the intellectual condition of the boys and apprentices will, to a very great extent, prove abortive. We, therefore, the more earnestly ask you to give a serious and candid consideration to our contents."

We believe the masters have the subject now under consideration. From replies already received from individual manufacturers, it appears that the proposals of the men are regarded in a friendly light, and it is hoped will lead to some practical issue.

NORTHERN ARCHITECTURAL ASSOCIATION.

THE quarterly meeting of the Northern Architectural Association was held on the 9th inst., at the Old Castle, Newcastle-on-Tyne, Mr. John Green in the chair. The following officers for the ensuing year were elected:—President, Mr. John Green; vice-president, Mr. Matthews Thompson; hon. treasurer, Mr. R. J. Johnson; hon. secretary, Mr. T. Oliver; hon. solicitor, Mr. G. W. Hodge; council, Mr. Greener, Mr. A. M. Dunn, Mr. John Johnstone, Mr. F. Charlton, and Mr. Wm. Peaseley. Mr. Pearson was elected an associate. The meeting discussed the conditions of the Durham Union Workhouse Extension Competition.

FIRES IN SCOTLAND.

THERE has been a series of fires in Scotland, all accidental, so far as is known, within the last ten days.

On Wednesday in last week the most serious of these fires, so far as regarded loss of life, occurred in the Canongate, Edinburgh. This is one of the best known streets in the "Old Town," and is flanked with exceedingly lofty houses,—the palaces of bygone times,—separated by narrow, dismal alleys. These houses, now occupied in flats, with a common staircase, each contain a sufficient number of families to people a small hamlet. The shop on the ground-floor of one of them was occupied by a maker of fireworks. A rocket he was engaged in making exploded in the ramming, causing further explosions, which set fire to the premises. A great volume of flame stopped egress by the common stone staircase, and at the same time sent suffocating fumes into the many rooms above. The occupants of the rooms at the time were mostly women and young children, the men being at work and the elder children at school. The women rushed to the windows, screaming frantically, and a most painful scene occurred. Five persons were killed, and a still larger number were burned or otherwise injured. Fortunately prompt help was given, and the consequences would have been far more calamitous.

On the night of the following day a ten-yard took fire at the bottom of North Gray's Close, on the north side of the High-street, midway between the North Bridge and Leith Wynd. This place is surrounded by numerous closes, the

crowded and unwholesome dwellings of a host of poor people. The whole of these adjoining buildings were placed in the most imminent peril by the fire. Crowding upon each other in pestilential confusion, and towering in all directions to most unwieldy heights, it seemed all but hopeless, with this fierce naked fire rising up in the midst of them, to prevent a general and most disastrous conflagration. The tan-yard buildings were destroyed, but happily the fire did not extend to any of the surrounding closes.

On Thursday morning, at an early hour, a fire broke out in Dalhousie Castle, on the banks of the South Esk, near Dalkeith, and eight or nine miles from Edinburgh. The fire originated in an upper-story room, called the sky-parlour. After the fire had been so far subdued as to allow investigation to be made, it was found that the third and attic stories of the main portion of the building were a total wreck; that the sky-parlour and the room below it were totally destroyed; and that the roof of the staircase had given way. The fire, happily, was kept out of the east wing; but in consequence of the great quantity of water poured upon that part of the building, it was percolating to the ground-floor, while in the middle section of the castle, the second and drawing room floors were drenched. The library and other rooms in the west wing were uninjured. In the east wing a great quantity of water percolated from floor to floor. The damage to the castle, which is covered by insurance in the Scottish Union, has been estimated at about 3,500l.

At Dundee a great fire took place on the night of Tuesday in last week, by which two ship-building-yards were ravaged, timber and buildings burnt, and two ships on the stocks, and nearly finished, were entirely destroyed. The property destroyed in the yard containing these vessels is thus estimated: the whaling ship, 13,000l.; composite ship, 7,000l.; general loss, 15,000l.; total loss, 35,000l. In the other yard it is calculated that three or four thousand pounds will clear the loss.

In the Canongate fire, at Edinburgh, the want of fire-escapes was lamentable. No such thing as a fire-escape seems to be in use. Ladders and ropes, and even sheets, were used for lowering those in peril, but no fire-escape. The Lord Provost, in allusion to this extraordinary want, said, at a meeting of the Justice of Peace Court, that "it was felt that more lives might have been saved had the city been furnished with a fire-escape: it would be the duty of the town-council to procure one as soon as possible. They would also take measures immediately for looking into the system of selling and preparing fireworks in the city." They have much need to do, as well as to establish stricter police regulations for the management of fire. The want of proper organization was manifest. Great complaints were made by the inhabitants of North Gray's-close and adjoining closes, of thefts committed while the fire was going on. Houses were entered by hands of roughs, pretending to help to rescue furniture, and in many cases it was not seen again. Some houses left by their inmates with locked doors, on going out to watch the progress of the fire, were found broken into and the contents removed. Great quantities of furniture were destroyed.

STAM ROAD-ROLLERS.

IT is to be hoped that ere long no macadamised road will be left in the rough state for poor horses to flatten with feet and wheels. A new steam road-roller, made by Messrs. Richard Moreland & Son, has been tried in Hyde Park, in the presence of Sir J. Thwaites, Mr. Bazelgette, Mr. Pollard, and various other gentlemen connected with the Metropolitan Board of Works. The trial was superintended under the direction of Mr. Mann, the superintendent of the park and park roads. The road had been specially prepared with metal, sand, and water. A very few passages of the roller speedily reduced the road to a smooth surface. The operations of the machine met with general approbation. The new roller, however, has not been constructed for metropolitan use, we are sorry to say, but for the government and municipality of Bombay. It is designed in accordance with a recent patent of Mr. D. Thomson, and consists, externally, of a square wrought-iron casing of great strength and rigidity, which is nearly balanced on a large central roller, with the engine on one side and

the boiler on the other. On the boiler side are two leading wheels, which take only a small portion of the load, and serve for steering. The boiler is vertical, on the Field principle, and the engine works direct on the large roller, by means of two pitch chains, without any intervention of gearing. The dimensions are:—Diameter of roller, 7 ft. 6 in.; length, 6 ft.; length of external casing, 18 ft. 6 in.; width, 8 ft.; height above roadway, 8 ft.; diameter of steering-wheels, 3 ft. 6 in.; width, 1 ft. 2 in. The machine was shown turning at right-angles into roads, and is quite manageable even in a crowded street. When at work it is not turned round at the end of its course, but goes backwards and forwards with equal facility. The vertical boiler is said to be a great source of safety. The diameter of the boiler is 4 ft. 3 in.; height, 10 ft. 6 in.; two cylinders, 11 in. diameter, 1 ft. 6 in. stroke. The pressure of steam is 100 lb. per square inch, and the gross weight 25½ tons—21½ tons on roller, and 4 tons on steering-wheels.

THE QUANTITATIVE THEORY; OR, THE DOCTRINE OF DEFINITE PROPORTIONAL RELATION WITH REFERENCE TO THE HARMONIES OF SOUND AND COLOUR.

SIR,—In my work, "The Science of Moderation; or, The Quantitative Theory of the Good and the Beautiful," portions of which have appeared from time to time in the columns of the *Builder*, I attempted to prove that all things exist in, and that all harmony in nature is fundamentally resolvable into, definite proportional relation. That there is but one scale of ratio, or of the relation of one quantity to a second, of which 2 : 0 represents the extremes and 1 : 1 the mean; but one scale of gradation from 1 to 0, 1 and 0 being the extremes or limits. And not only this, but that the principle involved in the monochord appertains to all phenomena fluctuating between limits or extremes, the compass of variation being the unit holding the same relative position to each species that that does to the variety of musical notes. Also that there are certain points of agreement in the greater fitness of things, and to sense, in the variations of phenomena within the tenor half of their respective scales; and in the universality of the law of quantitative compensation in external nature and in sense, which may be thus generally expressed,—that any temporary persistence of phenomena to one extreme of their scales of variation necessitates, at some time or other, an equivalent reaction in the opposite direction, in order to re-establish that balance, or mean state, which is eternally maintained in nature directly or indirectly. This principle of compensation producing harmony both of colour and sound has long since forced itself upon the attention of musicians, painters, and scientific men. An eminent musical composer once said to me, "Music is a system of balance;" and painters know that *good colour* is also a system of balance. I have also shown that the same principle of compensation, of balance, holds in the planetary system, not only by surmise, but by the testimony of celebrated astronomers; and I might trace it in meteorology, politics, &c. There is, therefore, not merely an analogy, as often noticed and discoursed upon, between the harmonies of music and colour, but a certain fundamental identity; nevertheless, there may be certain specialities in the organization of each sense which prevents absolute identity in both systems of harmony, but I hope to be able to show by some curious experiments, at no very distant date, other points of conformity than those I have already mentioned. Consider for a moment the logical conclusions which the adoption of the popular theory of the correlation of forces lead to. If all the powers of nature be only modifications of force, sound and colour have the same fundamental form, and all the differences in notes and colours are only proportional. The correlation theory, therefore, is resolvable into a more fundamental theory still—the quantitative. For force is only a form of sense underlying others more complex; but quantity is a more general form, and the only firm basis of the human understanding. If, however, force be considered as a nonmenon, which appears to me to be the error of modern physicists, it would be homogeneous and could only be recognised in proportional relativity, and find exact expression in measure and number. Professor Baines recently, in an able article in

Macmillan's, on "The Theory of the Correlation of Forces in reference to Mental Phenomena," inevitably passes into a quantitative estimate of functional power such as I had previously formulated from the more abstract and general point of view of the quantitative theory. I feel, however, how difficult it is to express oneself concisely concerning these *outpost* subjects of the understanding; but as I have thought them over with much labour, I trust there will be a reader or two who will not throw them aside without pondering them a little while. I believe metronomy will be the great science of the future, and hope you will favour me with space on another occasion for a more elaborate investigation of the theory of colours.

W. CAVE THOMAS.

CLAM SHELL FOR FOUNTAIN.

The "clam" shell your correspondent refers to is the shell of the so-called "Giant clam" (*Tridacna gigas*) of the West Indies. There is an enormous specimen in the Church of St. Sulpice, Paris, used as a holy-water stoup. A pair of small specimens may be purchased for 3s. or 4s., but the larger ones vary greatly in price. A single shell will sometimes weigh two or three hundredweight.

They are often brought to this country by sailors and others, as curiosities, or to be sold to dealers. Iamrach, of St. George-street, E., is the man who usually buys them to sell again; or, after him, they may probably be bought of Cutter, of Great Russell-street.

W. G. S.

THE BELLS AND CHIMES OF THE ROYAL EXCHANGE.

Public attention having lately been called to the subject, I offer a brief account of the bells and chimes in the tower of the Royal Exchange.

I may first observe that, in one of my former communications on bells and chimes, is the following remark:—"If in any case the number of bells can be increased to fifteen, or more, so much the better." Allow me now to give an example. If you have a peal of twelve bells tuned to the diatonic scale, in the key of C major, by adding three extra bells, F sharp, its octave, and B flat, you can modulate to or set tunes in two other keys,—namely, G and F major. Moreover, certain passages can be played in A, E, and D minor.

Now, the bells of the Royal Exchange, fifteen in number, were cast by Messrs. Taylor, of Loughborough, and are tuned according to the above example, the note of the largest bell, which weighs 34 cwt., being C. The chime machinery, constructed by the late Mr. Dent, has a metallic cylinder with movable pins: so that if the force of the action were perfectly equal and regular—assuming, of course, the intonation of the bells to be accurate—a variety of pleasing melodies might be neatly performed.

The tunes at present set on the cylinder are "God save the Queen," "Auld Lang Syne," "The Rosset Beef of Old England," and "The Hindredth Psalm." The clock now chimes the quarters, and strikes the hours, as usual. But the tune-chimes are silent, the machinery being imperfect.

THOMAS WALESBY.

COFFEE-HOUSES AND OUR SUNDAY.

Is there no one possessing wealth, and at the same time a sufficiency of selfish practicality and desire for his pecuniary advantage, who can perceive that there is a large scope for action in opening coffee-houses for the people, where, while temperance may be greatly promoted, instruction of progressive character may be obtained?

Coffee-houses, until the last four or five years, were comfortable and rational resorts, and always filled with the temperately inclined and useful knowledge seekers. They should now be even more attractive and more in number. Without doubt they would always be thronged with customers, instead of being emptied of them as we now see. What an immorality and vile anomaly are presented to us by the fact that many thousands of single persons leading compelled solitary lives, and possessed of tolerable incomes, down to the very poor in means, have no other resource after church or chapel service, or spiritual consolation,

is ended, at about 8 p.m., than to go either to their dens, or lodgings, and to bed, or else to a gin and beer palace. Yes, a palace wherein ruin to body and soul is drawn in under the guise of a false social enjoyment. And this is the progression in England and in London in 1867, or is it not more truly a very terrible retrogression?

A very large majority of our single men and women, who are compelled to lead isolated lives because they are removed from their friends by death or distance, are forced into intemperance; for most of the coffee-houses are closed at nine or half-past nine on ordinary days, while on Sundays, when they should be open all day long, they are (with but a very few exceptions) all closed against the seekers of temperance refreshments and rational enlightenment. They are now dirty disorderly places, where tea, coffee, &c., are sold utterly unfit to drink, having only one or two newspapers and no serial publications. Their customers have also no opportunity to study books that would elevate their minds.

It is a disgrace to any country, and especially to one so advanced as England is (or was), that tens of thousands should be unable to procure temperate liquid refreshments, and have no place to sit in and acquire useful, truthful knowledge, and this is the case in London.

SCINTELLA.

PUNISHMENT FOR DEFACING MONUMENTS.

A PARAGRAPH in the "Miscellanea" of your issue of September 14th, headed, "Defacing a Monument," leads me to suppose that the public are ignorant of the existence of a very stringent law enacted to punish those who injure monuments exposed to public view, whether in churchyards or elsewhere. The statute which I refer to is the 24th & 25th of Victoria, cap. 97., sec. 39, and the primary cause of its enactment was the wanton destruction of the Portland vase. The penalty is imprisonment and whipping. A reference to the Act will show that it is very effective, and if only put into force would give ample protection to our ancient monuments. The only case on record of a trial under this Act was a Crown prosecution of a man named Gleeson, for injuring ancient sculptures at Clonmacnoise, in Ireland. The trial took place on July 11th, 1864, at the King's County Assizes, when the accused party escaped by the disagreement of the jury.

JAMES GRAVES.

THE HERTFORD UNION WORKHOUSE.

MR. HENSHAW, whose tender was the lowest, offered, when security was required of him, to deposit 500l. in good bonds. The guardians at first required sureties to the amount of 2,000l., but ultimately said they would be contented with 1,000l. in bonds. This, however, Mr. Henshaw refused to give, and has thrown up the work. The tender of Mr. H. Norris, at 7,847l., has since been accepted by the guardians. Mr. Norris is engaged at this moment, amongst other things, on the enlargement and repair of Wareside Church, in the same county, under the direction of Messrs. Godwin.

ANOTHER COMPETITION, LUTON.

SIR,—Your condemnation of the injustice which is so often practised on architects and builders in competition matters must be a sufficient excuse for troubling you with this letter. Some months since, the Local Board of Luton advertised for plans for a Corn-exchange and other buildings, and received, in answer to their advertisements, a number of elaborate designs. As to their choice in the selection they made is not for me to comment upon, but I know that some of the best drawings were laid aside, in consequence of the outlay, which, in their judgment, exceeded the amount limited in the conditions. Why was the work not given to the author of the first premiated design? Had he no friends at Luton? Whether he had or not, the committee seemed to think it desirable to get the four architects whose designs were selected to again rack their brains in another competition. In this second contest it was clearly stated that any design exceeding 2,000l. would be excluded. What is the result? A set of drawings were selected; tenders advertised for; eight received, and opened,—the lowest, 2,189l.; the next, 2,195l.; the highest, 2,726l. Is the lowest tender accepted? No! and has he no friends at Luton? And what about the other tenders? Are their estimates too high? or do the worthy members of the Local Board wish to show their impartiality by giving to the contracting competitors the

* The prosecution was undertaken at the instance of the Kilkenny and South-East of Ireland Archaeological Society.

same honour they bestowed on the architectural ones,—namely, a second competition? Let their reasons be what they may, they are now advertising for fresh tenders based in every way upon the same drawings, but with the additional bait that the quantities are furnished by their own architects. Now, I must say, as a practical man, and having, with others, given the matter, that the building would be cheap at 2,500l., although this sum would not include extras, which are inevitable to carry out the works according to the design.

Now, Sir, if you will agree with me that two great acts of injustice have been committed on architects and builders,—the first in resorting to a second competition, and in selecting a design that will cost more than the amount stipulated in the conditions; and, secondly, in rejecting the whole of the tenders, and re-advertising for fresh estimates to be furnished from the same drawings on which the rejected tenders were based.

W. P.

PRESERVATION OF STONE.

SIR,—I have no wish to carry on a public discussion with Mr. Jesse Rust, but it seems necessary for me to reply to the challenge which that gentleman offered (in his letter to you last week), who, questioning the novelty, and hinting at the origin, of a chemical method of preserving stone which formed part of my communication at the recent meeting of the British Association.

Until now I was not aware that Mr. Rust had employed baryta in the composition applied by him to the decayed stone of the Houses of Parliament; but since he makes a statement to this effect, and refers to the published report of my examination before the Royal Comptrollers, I assume that he carried out the process described by him on the 22nd June, 1861, and used this substance in conjunction with fluosilicic acid. Mr. Rust is evidently under the impression that he alone of all the competitors was using baryta. I can assure him, however, that it was used in different forms of combination by half our number. Speaking of the use of baryta in the acid, and slight excess to separate the small quantity of sulphuric acid invariably present in the samples of superphosphate I had in use between the dates of April, 1861, and May, 1861. This fact was stated in the official specification handed in by me at the time of completing my work at the Westminster Palace (2nd May, 1864).

With respect to the acid selected for hardening the stone, Mr. Rust is but one of a large number of advocates who rely upon the indurating properties of fluosilicic acid, and he was not even the first to inform the Commissioners on this point. On the 3th June, 1861, Mr. Crookes, Dr. Bernays, and Mr. Field severally gave evidence on the use of fluosilicic acid, both alone and in conjunction with various bases; and other parties, representing "The Fluosilicic Company," have even been admitted to take part with us in the competition.

These facts will, I trust, be deemed a sufficient answer to the accusation brought against me. In the meanwhile, I beg to assure Mr. Rust that I have as yet no permission to make trial, upon the Houses of Parliament, of the improved method of proceeding which seems to have caused him so much alarm.

JOHN SPILLER.

CONCRETE HOUSES AND THE BUILDING ACT.

SIR,—I have read the paragraph on concrete for cottage walls in your last number, but having been from town for the last few weeks, I have not seen the previous remarks on the subject. The question seems one to be solved by quiet argument rather than by passion. Reference is made to ancient practice. The Romans in their walls never used concrete without courses of brick bond, at heights of 3 ft. or 4 ft., and strengthened the quoins also with brick or stone construction. The Medieval builders also used tiers of bond in their walls of less thickness. But it is to be observed that the concrete of the Romans and Mediaevalists was used in walls of from 5 ft. to 10 ft. thickness, and even then with some precautions to strengthen the mass.

The unbecoming use of terms such as "strictly technical meaning," and "rule-of-thumb notions," are unworthy of a calm reasoner. It is invidious to endeavour to force an officer to be responsible for experiments in construction; the Board of Works is the only proper authority to grant the permission, leaving the responsibility to the experimenter.

A DISTRICT SURVEYOR.

INFANT MORTALITY.

In the "Health" Section, at Belfast, Professor Redfern read a paper from Mrs. Baines, "On defective alimentation as a cause of infant mortality." The paper stated that the writer intended to confine her remarks to one view of the question only— that which related to defective alimentation as a source of the excessive disease and mortality prevalent amongst infants. It was a sad, and referred to was the most prolific in bringing about such a high rate of infant deaths, at the same time it was perhaps in a greater degree preventable than many other causes of disease and death that consign thousands of children annually to the grave. Poverty of condition was no great enemy to the health and life of the infant poor as the ignorance of those upon whom these little ones are depending for succour and care. The more simple the food the better it is contained in a proper amount of nutriment; but the children of the labouring classes, as a rule, partake of the same kind of food as their parents. Thus milk, which ought to be a plentiful article at the poor man's table, was really scarce one, and what little milk is purchased daily is consumed in rendering

enough the tea or coffee of the adult members of the family, instead of being employed for the purpose of enriching the infant's food, which, by some strange inconsistency of arrangement, was either composed of "bread-crumbs" or of the most heterogeneous and otherwise unsuitable ingredients. Thus convulsions and other disorders followed, which too often terminated fatally, and when death takes place it is ascribed to "teething," or to what is much the same thing, "natural cause." The fact that the want of maternal milk forms a prominent cause of infant death is a reproach to the mothers of England. If this commodity, the most benign of all Nature's gifts, were scarce on the land the case would be different; but it is not so, for, with very rare exceptions, every infant is provided with its own natural nutriment during the early period of its existence, and to withhold it is to do a child most grievous, perhaps irreparable, wrong. The writer suggested some inquiry respecting a new kind of food for infants which has been introduced to the notice of the public under the sanction of Professor Liebig's name, and with respect to which great difference of opinion existed, for it had been condemned by the Academy of Medicine at Paris.

METROPOLITAN BOARD OF WORKS.

At the usual weekly meeting, Mr. Hows introduced a deputation from the inhabitants of Packington-street, City-road, and its immediate neighbourhood, for the purpose of presenting a memorial in favour of a direct route for vehicle traffic from Essex (formerly Lower) road, and proceeding along Packington-street, Shepherdess-walk, Bath-street, Bunhill-row, and Moor-lane, into the centre of the great termini and of the Metropolitan, Great Northern, Midland, Great Western, London, Chatham, and Dover railways, Moorgate-street, Cripplegate, and the immediate widening of Shepherdess-walk, at the cost of the Metropolitan Board of Works as a part of a great metropolitan improvement.

The memorial stated that at present there were from 30,000 to 40,000 who went from the Islington district every day to the City.

The subject gave rise to a short discussion, and the memorial was referred to the Works and General Purposes Committee for consideration and report.

A report was read from the Works and General Purposes Committee recommending that the salary of the superintending architect be increased from 1,000l. to 1,200l. per annum, and that the resolution of the Board of the 4th of March, 1864, in relation to the salary of the superintending architect, be varied accordingly. The report was adopted.

The Solicitor to the Board drew attention to certain advertisements by the Gas-light and Coke Company, to the effect that they intended to apply to Parliament in the next Session for an Act to alter or repeal and consolidate all their former Acts, and to confer further powers on the company, to define, fix, and regulate their capital, and the necessary powers to manufacture, store, and sell gas at Barking Creek. He further read an advertisement from the *Gazette* respecting the Metropolitan Gas Companies' amalgamation; and said that Messrs. Baxter, Rose, Norton, & Co., had given notice that it was intended to apply to Parliament next Session for the necessary Act or Acts to amalgamate into one, two, three, or four companies the metropolitan gas companies, and to vest in those new companies the necessary powers, as now possessed, to purchase or hire ships, coal-mines, &c., in order to procure coals at a cheaper rate for the manufacture of gas, and to repeal or alter the Metropolitan Gas Act of 1860. The subject was referred to the Works and General Purposes Committee.

CASES UNDER METROPOLITAN BUILDINGS ACT.

Railway Exemptions.—Mr. Steward was summoned by the District Surveyor of Central Lambeth and part of Battersea, before Mr. Elliot, at the Lambeth Police Court, for having erected a building enclosed with wood, contrary to the 1st. Schedule of the Act, on land belonging to the London and South-Western Railway Company, at Nine Elms.

Mr. Taylor, for the District Surveyor, contended that (the facts being admitted) the exemption clause would not apply, inasmuch as the building in question was but 16 ft. from the nearest building. That the other clause was conjunctive, requiring the building both to belong to and to be used for the purposes of the railway. That even though the railway company might be the owners under the Act (Mr. Steward being only an annual tenant of the ground), the building was not used for the purposes of the railway, but for the business of Mr. Steward as a hay salesman. That the building did not belong to the railway company, as in the agreement there was a provision for terminating the tenancy by three months' notice, upon which, if the company declined to purchase the office, Mr. Steward should be required to remove it at his own cost. The company would not have agreed to purchase what was already their own.

Mr. Crombie, of the Law-clerks' Office of the London and South-Western Railway, for Mr. Steward, argued

first, that Mr. Steward was not the builder, as when he stated to the district surveyor that he was building the office in question, he meant he was employing some one to build; that this was not building, as it was not at all substantial or worthy of the name of a building; that it was constructed away from the spot and completed, leaving a space for the fire-place on one side, and then brought to the spot; it was consequently moveable, and of a temporary nature; that being 78 ft. from the ground or building of an adjacent owner, and 28 ft. from a public way, it came within the exemption; that the railway company were the owners, as when the building was once erected it became a fixture and a part of the freehold; that it was used for the purposes of the railway, being for the receipt and despatch of hay, &c., by the railway, and that they had terminated the agreement and bought the office from Mr. Steward.

Mr. Elliot determined that the building did not belong to the railway company, they having demised the land to Mr. Steward with a covenant to build; that it was not used for the purposes of the railway, being for Mr. Steward's business as a hay salesman; but Mr. Steward not being the builder, the summons as against him must be dismissed,—a summons must be taken out against the builder, upon which he would make an order. As to the company having purchased the building, he thought that would have to be settled with the Board of Works.

A Circus.—On Wednesday, the 9th, the District Surveyor of Camberwell, took out two summonses against Mr. John Barrington, the proprietor, and Mr. G. W. Circus, erected at Peckham. The one summons was for not having given him the two days' notice required previously to commencing the works; the other for having the enclosure of wood and the roof of canvas. It was argued by the defendant that, as the erection complained of was simply a large gallery for 1,600 people, lined at the back with wood, and sheltered at the top by a covering of canvas, it was no more than a large booth; and, therefore, he considered it exempt from the operation of the Building Act. After having heard the case, the magistrate decided that the Circus was a building, and fined the defendant 10l. penalty, remarking that if the defendant was dissatisfied, he could appeal to a superior court. No order was made upon the summons for irregular construction, as it was ascertained by the surveyor that the defendant had made application to the Metropolitan Board for their approval of the plan and construction of the building, and that they were about to construct it.

CHURCH-BUILDING NEWS.

Leicester.—The foundation-stone of St. Luke's Church, Humberstone-road, has been laid. The ground-plan consists of a nave, with six arches on either side, forming side aisles, with apsidal chancel and aisles, the organ being placed in the north one; there being also a vestry, heating apparatus, and other conveniences. On account of the nature of the site and the number of sittings to be provided, the general form of the building is somewhat peculiar, and the tower is made to project to the west. The style is Late Pointed, and the materials to be used are brick and native stones of various colours, formed into bands, both on the exterior and interior faces. The west and principal front will comprise a central entrance, with a three-light window over, and high pointed gable. At each end of the north aisle there will be a three-light window, and at the end of the south aisle the tower is to be placed, in which are to be girth and west doorways, a bell-chamber (access to which will be obtained by circular turrets stairs in the south-west angle), a bell-chamber surmounted by four pinnacles, and a spire, which, to the top of the spire from the ground, will be about 130 ft. The south side will be simple, divided into six bays, with windows of two and three lights alternately. No windows could be obtained on the north side. The roof is to be open-timbered, and the whole interior will present a simple appearance, and provide upwards of 800 sittings. The architects are Messrs. Bellamy & Hardy, of Lincoln. The contractor is Mr. John Firn, of Leicester; and the works are being superintended by Mr. Samuel Davies.

Slingsby.—The chief stone of a new church has been laid on the site of the ancient church of All Saints. The new church will be in the Perpendicular style, and will be built upon the site of the old structure. Appletton stone will be used in the building of the church, and the old stone will be made available as far as possible. The dressings, moldings, arches, &c., will be of Whithy stone. The roofs throughout will be covered with lead. The tower will be set at the west end of the church, and it will contain the three bells which were in the tower of the former edifice. On the north side of the nave will be placed the porch, and the sittings will be low pitched and open timbered, and the sittings in the nave are to be of oak, with carved ends, whilst the chancel will be fitted up with stalls, having finials at each end. The floor throughout the church will be paved with coloured tiles, and these used for the floor of the sanctuary will be of a superior description. The east and west windows will be Perpendicular in style, and have five lights each. The chancel, nave, and east-west window will have eight two-light windows on each side, filled with cathedral glass. On the north

side of the chancel will be placed the vestry, and provision is to be made for warming the church by means of a hot-air apparatus. It is intended to have an organ in the new church. The new church will seat between 300 and 400 persons. The structure will cost in the erection about 1,500l., the greater portion of the expense being borne by the Hon. Admiral Howard. The dimensions, as finally fixed, will be as follows:—Chancel 31 ft. by 18 ft., with south aisle 19 ft. by 8 ft., and north aisle, 19 ft. by 11½ ft., having eastward of it (occupying N.E. angle) a vestry, 11½ ft. by 10 ft., beneath which the heating apparatus will be arranged, and from which the hot-air flues will radiate. The nave will be 39 ft. by 19 ft., the north aisle, 39 ft. by 10½ ft., and the south aisle, 39 ft. by 7 ft. The chancel will have the five-lighted eastern window filled with Perpendicular tracery of two orders. The south window of the chancel will be appropriated to memorial glass for the late rector, the Rev. William Walker. The western window it is intended also to fill with coloured glass, in memory of the late patron, the Earl of Carlisle. The new church is the same length as the old one, but is wider towards the north.

Parkgate (Rotherham).—The chief stone of a new church, to be known as Christ's Church, has been laid. It will be in the Early English style of architecture, and will accommodate upwards of 600 persons—all free. The dimensions will be 106 ft. by 40 ft.; the height from the floor to the eaves 80 ft., and to the ridge of the roof 50 ft. The walling inside and out will be of random rubble; the roofs will be open, plastered between the rafters; and there will be a wood block flooring. There will be the usual nave and chancel, with a north aisle and north chancel aisle and vestry, and both the chancel and the aisles will be paved with Minton's tiles. The ground work will be laid for a tower, which, for want of funds, will not be erected until some future occasion, but there will be a bell-turret. The cost of the new building, exclusive of the land, which has been given by Mr. G. S. Foljambe, will be 3,000l., of which 2,000l. have been subscribed, leaving 1,000l. yet to be provided. Messrs. Chadwick & Thirlwall, of Masbro', are the contractors and builders; the architect being Mr. W. White, of London; and the clerk of works Mr. M. Macklin.

Sheffield.—The corner-stone of the new church of St. Silas, in the Hanover-square, the gift of Mr. H. Wilson, for the ecclesiastical district of Gilcar, has been laid. The plan of the church consists of a nave, 27 ft. wide and 80 ft. long, having north and south aisles, with a chancel 27 ft. wide and 33 ft. long, on the right side of which is the organ-chamber and vestry, and on the other side an aisle for the children, having a separate entrance from the Hanover-square side. Entrances are provided from Hanover-street and Hanover-square. The interior of the church will be lighted by clearstories, carried on arcades with simple circular piers, having capitals enriched with conventional foliage of varied design. The benches are open-framed ones, stained and varnished. The whole of the roofs are boarded, the nave being supported by principals carried by stone corbels. The chancel is coved and divided into panels. There is a large window at the west end. The tower is at the junction of Hanover-street and Broomhall-street, and will form a feature in the approach from Broomhall-park. It rises for some height with little ornamentation, save its projecting buttresses. Two of the heavy-windows are placed on each of its sides, and enriched by shafts, whose carved capitals are connected by a cornice of similar design round the tower. The whole is surmounted by a parapet, with foliated cornices, terminating in eight pinnacles, the total height being about 96 ft. The style is of the Early Geometric period. The heating will be by means of Mr. Johnson Smith's Gill-stove. The contractors for the work are Messrs. Badger & Holmes, Messrs. Blackmoor & Mitchell-Withers, of Sheffield, and Rotherham, are the architects, and Mr. Mellers the clerk of the works.

Bristol.—The district church of St. Silas, newly erected in St. Philip's-mars, has been consecrated by the Bishop of Gloucester and Bristol. The site was purchased, facing the Flood and nearly opposite Avon-street, for 850l. The church is 120 ft. long and 40 ft. wide, and is built of Pennant stone, with freestone dressings. The style is Early Gothic, the church consisting of a nave and circular chancel, which forms an apse. The roof is open timbered, of stained red deal, the trusses of the roof resting on carved corbels. The frames of the windows

are of freestone, and the rough stone is relieved with four freestone bands, which run round the entire building. There is a porch on the north side, and also a vestry, while over the western entrance is a large gallery for the children. Over the vestry is also a small gallery for the choir and organ. The church contains 780 sittings, 551 free. The total cost, including the land, has been between 5,000l. and 6,000l. The church was erected from the designs of Messrs. Pope & Bindon, and the work was carried out by the following Bristol tradesmen:—Mr. J. Thorne, mason; Mr. G. Humphries, carpenter; Mr. Bevan, plasterer; Mr. Williams and Mr. Leaman, smiths; Mr. W. Tuckey, plumber; Messrs. Hale & Sons, gas-fitters; Messrs. Gay, glaziers.

Wallington.—Holy Trinity Church has been consecrated. The church is situated not far from the Carsbaton Railway Station, from whence it is conspicuous by its white stone spire and square flint tower. This church is the gift of Mr. Nathaniel Bridges, the lord of the manor of Wallington. He commenced the work alone, and had intended to complete it without aid from any source; but, whilst the building was in course of erection, he received the unsolicited aid of Mr. Joseph Lawrence and another friend interested in the parish, which enabled him so much the sooner to bring the work to maturity. The edifice comprises a nave and two side aisles, a tower (open to the flooring of the belfry), the chancel, and robing-room. The walls are of flint, and the windows and doors are dressed with stone. The spire is also of stone. The roof is open, with plaster between the timbers. The seats are low open benches of varnished wood, the pulpit and reading-desk corresponding. The paving is of black and red diamond-shaped tiles. There is no stained glass in the windows at present. The aisles are separated from the nave by stone arches, supported on columns with carved capitals. The tower contains a bell, which has been presented by Sir Brook Bridges, bart., and is intended to be only the first of a fine peal.

Llanbrynmaur.—The chief-stone of a new church has been laid here by Lady Williams Wynne. The site of the church, which was presented by Sir Watkin Wynne, in addition to a donation, is about half an acre in extent, and is situated eastward of the village on a gentle eminence. The walls at present erected define the extent of the edifice to be 80 ft. 6 in. by 27 ft., and comprise a nave, chancel with apsidal end, and vestry on north front. The principal entrance is at the west end, which portion of the edifice has been treated as the principal feature of the erection, and will be approached by a flight of steps on to a terrace from the road. It consists of buttresses, which flank the springers of the entrance archway, the inner ring of which is constructed of moulded Cefn stone, the outer arch being formed of Talerddig stone, the intermediate vousoirs being of slate from the Machynlleth quarries, which will form a contrast with the general walling. The bell turret rises to a height of 50 ft., on the western front. Accommodation is provided for 230 persons. The interior will consist of open seats, the whole of which are to be free and unappropriated. The nave roof is formed of open timber work, and plastered between the rafters, the aisles being paved with encaustic tiles, and the edifice is intended to be heated by hot air. The roof will be covered with slate from the Aberllefenny Quarries, Machynlleth, surmounted with Peake's terra-metallic crest. The cost of the church will be about 900l., Mr. John Harrison, of Montgomery, being the contractor; and Mr. David Walker, of Liverpool, is the architect, from whose designs, and under whose superintendence the works are being carried out.

Sparkbrook.—Christ Church, Sparkbrook, has been consecrated by the Bishop of Worcester, in whose diocese the edifice is situated. The church has been erected from the designs of Messrs. Medland, Maberly, & Medland, of London and Gloucester. It consists of nave, with north and south aisles; tower placed at the south-west angle; chancel, with vestry and organ-chamber; and a porch to the north aisle. The style is Decorated, and the material Ironpstead stone with Bath stone dressings. The roof timbers are wrought and stained, and the sittings are of deal stained and polished; those in the chancel of oak, and the chancel is paved with encaustic tiles. The building has been fitted with warming apparatus by Messrs. Haden & Son, of Trowbridge. The dimensions of the church are as follows:—Nave, with north and south aisles, 103 ft. by

58 ft., divided into seven bays; chancel, 28 ft. by 20 ft.; organ-chamber, 12 ft. by 10 ft.; height of nave to apex of roof, 50 ft.; and height of tower and spire to top of vane, 150 ft. The edifice will accommodate 890 persons, and a third of the sittings will be free. The works have been carried out at a cost of 8,000l., under the superintendence of the architects, by Messrs. Briggs & Son, of Birmingham. The carving was done by Messrs. Purdy & Allen. The tower has been constructed especially for a peal of six bells, which, with the organ, for which a chamber is provided, have yet to be supplied. Land has been purchased for schools.

Stratford.—The first stone of the new church, to be dedicated to St. Andrew, at Barking-road, Plaistow, has been laid by the Bishop of Rochester. The locality, a few years ago a rural village, has now a large commercial and manufacturing population. The works connected with the church, parsonage, and schools, which it is proposed to erect, have commenced, and more than 3,000l. have been promised or paid in aid of the object; but a sum of not less than 7,000l. is still required finally to complete the undertaking.

Newbury.—The parish church has been reopened. The edifice consists of a chancel and nave, with aisles to both, and a tower at the west end. The chancel was restored about two years ago. The present restoration embraces the heightening and completion of the tower with its pinnacles, the clearing away of the embossed galleries and high pews, and the substitution for these of new oak and open sittings. The nave-roof has been entirely restored and decorated, and the aisle-roofs are new, but copied from the old ones, which had gone to decay. The whole of the stone-work, both externally and internally, has been cleaned and restored, a new chancel-arch built, and the north and south chancel-aisles, hitherto walled off from the nave-aisles, have been opened out with new arches. A new vestry has also been constructed at the east end of the north chancel-aisle. On removing the old pavement, &c., it was found that the true bases of the piers were far under the then level of the floors, and it was decided to excavate and lower the floor to the former level, and thus restore the original proportions of the church. When the old plaster, also, was stripped from the walls, they proved to be built of a rough ashlar of freestone; this has been being again covered with plaster. The nave-roof has been entirely restored. The three stained-glass windows at the west end of the church constitute a chief feature in the work. The great west window under the tower consists of ten lights and tracery. The subject chosen is that of the Last Day. The whole of this window is designed, drawn, and painted in the style of the fifteenth century, to harmonise with the stone-work of the window. The glass itself is of the most uneven varied character of the old glass used by the Medieval artists. The west window of the north aisle is a somewhat peculiar specimen of the same style of architecture as the west window, viz., the Perpendicular or fifteenth century. The subjects chosen for illustration have been the six corporal works of mercy. The window has been executed in the same manner as the west window of the nave. The west window of the south aisle is very similar in style to that of the north. The subjects are five scenes from our Lord's life on earth, intimately connected with the priesthood. All these windows have been executed by Messrs. John Hardman & Co., of Birmingham and London. The whole of the windows in the church have been entirely reglazed, those on the south side having shaded glass, and all showing green borders. Messrs. Wheeler, of Reading, were the general contractors, putting into the hands of the following tradesmen of the town the several branches of work, namely, woodwork, Messrs. Adey & Son; ironwork and heating apparatus, Messrs. Plenty & Son; plumber's and decorator's work, Messrs. Boyer; gasfitting, Mr. Long; carving, Mr. Turrill. The ornamental ironwork was done by Mr. Filmer, of Cullindford. The restoration was carried out under the superintendence of Mr. Walker, as clerk of the works, Messrs. Wheeler have been represented throughout the undertaking by Mr. J. Gibbs, their foreman. No accident has befallen any of the stone-masons or other artisans employed in restoring the building. Messrs. Bevington & Sons, organ-builders, have removed the old organ, retaining

the valuable part of the old pipes, and erected in its stead a new organ, with modern improvements and extended compass.

Llanfair Caerllion, Welshpool.—The chief corner-stone of a new church has been laid here. It will consist of nave and chancel, north aisle, vestry, and south porch, and afford accommodation for 430 persons. The old roof will be refixed over the nave and chancel. Local blue stone is being used for the walling, and Sheloke for the dressings. To cover the expenses connected with the church upwards of 2,000l. will be required. It is proposed, when sufficient funds are forthcoming, to carry up the west tower, of which little more than the base now exists, and add a stone tower. The extra cost of the tower and spire is estimated at 1,000l. The style of the church will be Early Decorated. The architect is Mr. E. Haycock, jun., of Shrewsbury; and the contractor, Mr. Lloyd, of Welshpool.

DISSENTING CHURCH-BUILDING NEWS.

Sittingbourne.—The foundation-stone of a new Wesleyan chapel, at Key-street, near Sittingbourne, has been laid. The building is to seat 150 persons. There is to be a school-room beneath, 40 ft. long and 22 ft. wide in the clear, and the body of the chapel will be of the same dimensions. Mr. W. J. Beaumont, of Milton, is the builder, and Mr. Stephens, of Maidstone, the architect.

Whitby.—The foundation-stone of a new Congregational church has been laid by Mr. S. Morley, of London, the most liberal contributor to the building fund. The edifice will be built on the West Cliff. It is to be a Gothic edifice, with spire, and will cost about 4,000l., of which about 2,400l. have been promised. The architect is Mr. Pritchett, of Darlington, and the builder, Mr. Robert Robinson, of Whitby. It will seat about 950 persons. The old chapel, in Silver-street, will be adapted for lectures and other similar purposes.

Blyth (near Newcastle-upon-Tyne).—The foundation-stone of a Wesleyan chapel has been laid at Blyth, by the Rev. R. Haworth, of Gateshead. The edifice will occupy a position facing the main road from Blyth to the railway-station in Waterloo, and having the river on the east side and the lake on the north. The Classical style has been adopted, and the building will be 65 ft. long by 51 ft. wide, with a central projection of 9 ft. at either end. The south front shows a large central door on the lower part, with a window on each side to light the lobby. Above these is a strongly marked cornice across the central projection, and over this a moulded stone pedestal with four columns of the composite order engaged on the wall, carrying the moulded stone cornice, which again is surmounted by a pediment and circular window. Between the columns are three windows with circular heads. In the east front there will be six windows, the upper ones corresponding with those of the south front. The walls are to be built of red brick, the dressings being of stone, and to ensure stability the main walls are all to be carried down to the rock. Internally the ground-floor is to be divided into three groups of pews, the metal pillars carrying the galleries marking the lines of the passages between them. The side-pews will occupy the whole length of the chapel, the centre group finishing against a cross aisle, on the north side of which is placed the enclosed communion space. The gallery will contain three pews in depth at the sides, and ten pews at the south end. In the north projection over the minister's vestry the organ will be placed, and in front the seats for the orchestra. The total accommodation is for 800 adults, and there will be 250 free sittings. The whole of the internal woodwork will be varnished, and the chapel will be lighted by sun-light in the ceiling, and by brackets under the galleries. The contract for the whole of the works has been let to Mr. Wm. Middleton, of Blyth; and Mr. F. A. N. Haswell, of North Shields, is the architect, from whose design, and under whose superintendence, the works will be carried out.

Small Heath (Birmingham).—The chief stone of a Congregational Chapel for Small Heath has been laid by the Mayor of Birmingham (Mr. Thomas Avery). The chapel will be Gothic in style, and from the designs of Mr. W. P. Ponton, architect, Reading. Blue brick, with stone dressings, will form the material of the structure, the internal measurement of which will be 40 ft. by 70 ft.; height, 35 ft. 6 in. The roof will be

open, and the internal fittings of deal, stained and varnished. It is proposed to erect a gallery at the extreme end of the building, with access by a staircase at the side. The chapel, with gallery, will accommodate 600 persons. Mr. Jones is the builder.

Lanchester.—The foundation stone of a Wesleyan chapel has been laid at Lanchester. The style of architecture adopted is the Decorated. The chapel will seat 230 adults, and behind the pulpit provision is made by sliding doors to accommodate part of the congregation in the school-room if necessary. The building is detached, and will be enclosed in the front by iron palisades. The situation is about the centre of the village, and fronts the main street. The cost of the building, including site, will be about £1,000. The architect is Mr. John Smith, of Medomsley; contractor for mason work, Mr. John Rutherford, Hexham; for slating, Messrs. Nicholson, Leadgate; plastering, not let; joiner, Mr. Routledge, Consett; plumbing, Mr. Smith, Consett.

ROMAN CATHOLIC CHURCH BUILDING NEWS.

Bath.—The spire of the church on the South Parade has been completed. The cross, with a large part of the tower, has been added during the present year. This spire takes the lead of all the Bath spires in height. St. Michael's is 182 ft.; the Abbey follows suit with 170 ft.; while in order come St. Matthew's (Widecombe), St. James's (including lantern and dome), Bathwick St. Mary, and St. Saviour's, with 155 ft., 150 ft., 120 ft., and 120 ft. respectively. The spire of the Roman Catholic Church, however, is 222 ft., and so it has a superiority of 40 ft. over St. Michael's, standing as it does upon the same level. The cross was placed in its position by Mr. Herdridge, the clerk of the works. Mr. Hanson, of Clifton, was the architect, and his design is now complete. The whole edifice has cost, we understand, £5,000. The spire is in accordance with the whole erection, being in the Decorated style. When the chapel was opened four years ago, 60 ft. of the tower had been erected, sufficient to clear the roof of the nave. Above this is the belfry, with turrets at the angles, which changes from its form below, that of a square, to that of an octagon. Around this is a pierced parapet, and four crocketed pinnacles terminating the angle turrets. 40 ft. above the height which it has retained for three years and a half commences the spire, which is therefrom 122 ft. high. The material is Bath stone, that having been used in the erection of the church. Messrs. Bladwell & Ambrose were the contractors.

Haverstock-hill.—A Dominican church has been opened at the Dominican Priory, Haverstock-hill. The church, which is an unpretending building, is only intended for temporary use during the erection of the new church which was commenced some time since, and which will, it is estimated, cost £50,000. When the new church—which is to be a Gothic building capable of containing some 5,000 or 6,000 persons—is opened, the temporary one will be used as the priory library. Among the subscribers to the new church, the walls of which are just appearing above ground, was a lady, who refused to have her name mentioned, but who is a donor of 9,000.

SCHOOL-BUILDING NEWS.

Newnham.—The new National Schools here have been opened. The schools were designed by Messrs. Medland & Maberly, of Gloucester, and built by Mr. James Coleman, of Chaxhill.

Thropton (Newcastle-upon-Tyne).—The old school having fallen into a dilapidated state, it was resolved to build a new one. The plans and specifications were furnished by Mr. T. Arkle, Shaftoe. The present building is erected at the east end of the village. The school, with a house adjacent for the master and mistress, is of rock stone. It is 35 ft. long and 18 ft. broad, and is capable of holding upwards of eighty scholars.

Pownhope.—The chief stone of a National School has been laid here. The school buildings to be erected, to which will be added a house for the master, will be built with stone of the district, random ranged, with freestone dressings, and the roofs will be covered with green Penbroke slates. The architecture employed will

be Gothic, somewhat eclectic in treatment. The plan comprises a school-room, 52 ft. long by 18 ft. wide, with separate entrance for the boys and girls; a class-room, 16 ft. by 14 ft.; a sitting-room, kitchen, scullery, pantry, three bed-rooms, and requisite conveniences. The site, which is dry and elevated, with a southerly aspect, will be enclosed with a wall and gates next the road, and with fences on the other sides. The design has been prepared by Mr. T. Nicholson, the diocesan architect; and the buildings will be erected by Mr. Ford, of Pownhope, under the architect's superintendence.

Newcastle-upon-Tyne.—The foundation stone of the Bramel wing of the Ragged and Industrial Schools has been laid. The extension will consist of a large boys' school-room, with class-room, store-room, and work-rooms on the ground floor, and a large boys' dormitory and reading-room above. In addition to the extensions, very considerable alterations are being made, and proposed to be made. The dining-room has been enlarged by the removal of the printing-office to another part of the building; and the school-rooms for boys and girls will be thrown into one, to be used in future for a girls' school only. New class-rooms for the girls and lavatories are also provided. Alterations are projected in the administrative department, and in the sick ward. The new wing will correspond in its style of building with the existing premises. Care has been taken to make it dry, warm, cleanly, and well ventilated. A layer of slates set in cement is carried all round the foundation, to prevent the damp from rising; and the walls of the school-room, class-room, dormitory, and reading-room, are built in the inside of buff-coloured glazed bricks, to a height of 5 ft. from the floor, and above this height they will be faced with Parian cement, so that no paint, whitewash, or other absorbent material will appear to view, and the whole of the walls can be washed down more frequently. The ventilation will be self-acting, with additional resources when required: it is designed on the "through and through" principle, with openings opposite, and the windows are also arranged on the same plan. There will be a large cubic quantity of air to each person, and abundance of light. The warming is entirely by open fireplaces, which also assist in ventilating the rooms. New latrines are provided for the boys, and will be thoroughly ventilated on the same principle as the rooms and dormitories. Increased accommodation will be provided for between fifty and sixty inmates, and about 100 day scholars in addition. The drawings have been made by Mr. Thomas Oliver, under whose superintendence the works are now being carried out. Mr. Henry Andrews is the clerk of the works; and Mr. William Gibson, of the Red Barnes, is the sole contractor. The total cost, it is expected, will not exceed 2,000l.

Books Received.

The Gymnasium and its Fittings. By E. G. RAVENSTEIN and JOHN HULLEY. London: Tribner & Co.

This pamphlet gives a description of gymnastic apparatus, illustrated with 38 woodcuts and 143 figures on 14 plates; so that any carpenter employed may be able to construct all that is required; and, indeed some of the apparatus might readily be put together by any one with a mechanical turn without even the help of a carpenter. The intention is to guide clubs and others in the construction of gymnasia, both open-air and covered. Mr. Ravenstein is president of the German Gymnastic Society of London, of which we have before spoken, and Mr. Hulley is a Liverpool gymnasiarch.

Miscellaneous.

"RAMBLER ON RAILWAYS."—Under this title Sir CHAS. ROBEY is about to publish the results of a long experience in that line, including some curious facts in connexion with mountain-railways, especially that of Mount Cenis. The work also includes details relative to railways in various quarters of the globe, and to tunnels, curves, and roadways, constructed in the most ancient as well as in modern times; together with observations on the respective arrangements made between the railways and the Post-office.

THE LOUVRE AND M. FOULD.—The Paris correspondent of the *Morning Post*, speaking of M. Fould, says,—“It was under his direction and inspection that the new Louvre was built, that magnificent architectural triumph which faces the old Tuileries. When the gorgeous building was completed, the Minister of State ordered a banquet in honour of the completion of a great national work. Who was invited? The workmen who had taken part in the construction of the elaborately decorated blocks and pavilions. I remember M. Fould saying,—‘You must come and dine at my table, and you will be surrounded by dozens of masons, and shake the hard horny hands that built the building.’ I mention this little fact as an illustration of M. Fould's thorough appreciation of the democracy of Imperialism.”

MUSEUM OF THE ARCHIVES OF FRANCE.—This new museum, the opening of which was announced a few weeks since, presents a very interesting collection of documents and objects illustrative of the history of France. The museum occupies six rooms in the Hôtel des Archives, formerly the residence of the Prince de Soubise, in the Rue de Paradis, not far from the Place de la Bastille. The courtyard, the grand staircase, and other parts of the hotel are remarkable in an architectural point of view. The museum is on the first floor, and the first *salle*, which is the largest of the six, contains a large number of rare charters, diplomas, and other documents of the Merovingian and Carolingian periods, written on papyrus or parchment; charters of the fourteenth century; and registers, cartularies, and illuminated manuscripts of the thirteenth, fourteenth, and fifteenth centuries.

CO-OPERATIVE CLUBS AND CHEAP FOOD.—A co-operative club, without the paraphernalia of stores or offices, is being established in the north of London by a Mr. Heine, the object of which is to contract with tradespeople for the trade of the association at certain reduced prices for ready money. In this way, butchers, bakers, grocers, hootmakers, &c., are glad to provide the members with goods at such reduced prices for ready money. For example, suppose the 4 lb. loaf to be at 9d., as it now is, or even dearer, a club member will be charged 8d., and the baker will pay 3d. out of this to the club for its patronage. This farthing goes to pay expenses, and any surplus will be devoted otherwise to the benefit of the members. The entrance fee is 2s. 6d., which is the only other outlay. A clerk or workman may thus save a good few pounds in the year off his small income. It is to be hoped the plan will be extended. We some time since noticed the establishment of a club of this kind in which Mr. William Howitt, the author, took an interest, but we do not know whether this be the same or a new one.

OPENING OF ANOTHER TUMULUS ON THE YORKSHIRE WOLDS.—The Rev. Canon Greenwell, of Durham, and other pre-historic inquirers, have made an examination on the Mid-Wold range of East Yorkshire. The tumulus contained about twenty-four burials, but had been previously disturbed. The mound was 56 ft. diameter, and 6 ft. high. The burials presented an extraordinary line of bodies, huried in a great measure on a stone pavement, and although laid in all possible positions, yet forming a line of interments running S.E. by N.W., nearly cropping out on the N.W. end. Pottery, implements, and flints were found. Among them were a stone pounder, hammer, or rubber, extensively "used" at one end; a square (cube) flint, all rubbed on the edges; a long piercing implement of flint, twelve "thumb" flints, two flint arrow-heads of the leaf shape; enormous quantities of potsherds of a peculiar plain black ware; part of a cinerary urn and portions of a drinking-cup; two handles of small urns; a great number of flint flakes and chippings, and several rounded stones, rubbed flat on one surface; one extraordinary stone utensil or implement, most like a cobbler's stone, rolled very smooth, and over 1 ft. long, and a great quantity of animals' bones, broken for the extraction of marrow, and among them the teeth of the ox and the red deer in great numbers. A sickle-shaped bone implement, made from a very long tusk of the boar, was also found. The skulls were dolichocephalic, or long-headed, and of a smallish person, supposed to be of the earliest date. Ten feet S.E. of the centre was a hole in the chalk, 2½ ft. diameter and 2 ft. deep, but this contained nothing but soil.

DECAYING MARBLE.—Many buildings were constructed in Chicago a few years since of "Athens" marble, which is already crumbling, and has to be painted.

COTTAGE PLANS.—The premium, a silver cup, offered at the Working Men's Flower Show held at Derslington on the 25th ult., "For the best plan of a single cottage, the cost of which would not exceed 100l.," has been awarded to Messrs. Dean & Yeoman, of York. Seven designs were sent in.

COST OF HERBERT MEMORIALS.—The total cost of the public memorial raised to Lord Herbert has been rather over 8,000l.—namely, 5,888l. 17s. 1d., for the Convalescent Seaside Home, just opened at Bournemouth; 2,021l. 18s. 10d., for the statue of "Sidney Herbert," by Baron Marchetti, erected in the market-place at Salisbury; and the remainder for printing and incidental expenses.

DECORATION OF THE LEEDS EXHIBITION BUILDING.—The Executive Committee have placed the entire designs for decoration of the building in the hands of Professor Lewis, of University College, London, who is now engaged in carrying out the scheme originally proposed by Mr. J. B. Waring, chief commissioner. Promises of contributions continue to come in, and there seems every reason to expect that the Leeds Exhibition will be a great event.

SOUTHWARK NEW PARK.—The People's Park for Southwark, situated partly in the parish of Bermondsey and the remaining portion in that of Rotherhithe, is rapidly approaching completion. The principal entrances are three in number, viz., one on the north side, one on the west side, and one on the south. There are also three minor entrances. The lodges at the principal entrances are designed in a decorative style. A large number of gardeners and labourers are employed in laying out the flower-beds and walks, and in transplanting young trees, evergreens, and flowering shrubs. Three drinking-fountains are to be erected within the enclosure, and an ornamental fountain in the centre of the grass-plot, and which will be placed amidst a grove of trees and shrubs. The walks are gravelled and completed, and it is expected that the park will be opened to the public on or about Christmas.

THE FALL OF A CHIMNEY IN NEWCASTLE.—At the adjourned inquest, Mr. Bryson, town surveyor, was examined. He said the bricks and other materials had been removed from the foundation, and he had found that the foundation had not given way in the slightest. The ground upon which the concrete was laid had not subsided, nor had the concrete itself. He thought, therefore, that the fall had been caused by the equinoctial gale which blew at the time. He thought the chimney was not sufficiently strong, being weakened by the construction of the boiler-lead leading into it. Mr. Maling was going to re-build the chimney, and had arranged to submit the plan to witness for his approval. The jury found "that the said Robert Turner Moore was killed by reason of the bricks and other materials of the chimney falling upon him, and that the said chimney fell in consequence of the violence of the wind; and that it was not sufficiently strong in its construction, by reason of the weakness of the flue near its base leading to the boiler."

STEAM BOILERS.—A mode of preventing incrustation consists in forming an interior case for the boiler by means of small curved plates, arranged like tiles on a roof, and thus leaving a thin layer of water between them and the boiler. This thin layer heats rapidly, and a circulation of the fluid is produced, which prevents deposit, except in powder, on the plates. Heat is thus economised, and danger of explosion lessened. Nothing, however, can be more conducive to the prevention of steam-boiler explosions than a reliable means of ascertaining the level of the water. Many contrivances have been devised for this purpose. A simple one is coming into use in the United States. It consists in surrounding a short tube, which issues in a horizontal direction from the boiler, just beneath the proper water level, with a jacket containing water. So long as the tube is filled, as it should be, with water, and not with steam or foam, water remains between the jacket and tube; but when there is no water in the pipe, the water in the jacket evaporates, forming steam, which blows a steam whistle, and even, if desirable, opens a safety-valve.

ARCHITECTURAL ASSOCIATION.—The *Conversations* with which the session is usually opened will take place on the 25th instant, when the president of the year will deliver an address.

ORIGIN OF NAMES.—Sir: After reading the article on Names in the *Builder*, I venture to send you two instances of peculiar changes of name through marriage. One is that of Hogsflesh (some corrupt it to Hoffesh) to Bacon; a case, however, which was mentioned to me so long since that I should have difficulty in verifying it; and the second is that of Mew to Cat, mentioned to me by a Brighton solicitor while staying at the Eagle Inn, Newport, Isle of Wight, kept by Mr. Mew. I was told that Mr. Charles Cat, of Brighton, married Miss Emily Mew, to whom, I believe, Mr. Frederick Mew, architect, is related. This you will be able to verify yourself. My own name, Male, is peculiar; but I know of no corresponding name of Female. I may add that the name of one of the foremen, for many years, at Betts's Patent Brandy Establishment, was Tipple.—**DUDDY MALE.**

PROPOSED WORKING MEN'S INTERNATIONAL EXHIBITION.—A crowded public meeting has been held in the Vestry-hall, St. Pancras, for the purpose of considering the best means of promoting a Working Men's International Exhibition in London. The chair was taken by the Hon. Auberon Herbert. Mr. Ward (secretary) read the report of the committee by whom the details of the scheme have been planned. A resolution in favour of the report having been moved, Mr. Patterson, of the Working Men's Club and Institute Union, asserted that the report as read differed from that which was agreed to at the meeting of the committee. He expressed his dissatisfaction at the constitution of the Provisional Committee, and moved as an amendment that the arrangements for the Exhibition be undertaken by a honorary council; that the Hon. Auberon Herbert, Mr. Hamilton Hoare, Mr. Hodgson Pratt, and several working men whom he named, be members; that the committee be half composed of guarantors; and that the surplus money be devoted to the founding of a permanent Exhibition in which working men would receive awards for their skill, and recognition for their individual merit. After a stormy discussion the amendment was all but unanimously carried.

THE VICTORIA HOTEL, BRADFORD.—A new hotel has been erected adjoining the station of the Lancashire and Yorkshire Railway, at Bradford. The edifice is of stone, six stories high, and designed in the simplest style of Italian architecture. The principal front is flanked by lofty pavilions rising to a height of 105 ft., and terminated by conical roofs, decorated with wrought-iron work. The entrance portico, and also the large bay windows facing the station-yard, are flanked with polished red granite shafts and carved capitals, while other carved decorations are sparingly introduced into the design. Internally, a spacious entrance-hall and broad corridor, the latter laid with Maw's encaustic tiles, give access to the various reception-rooms, some of which are of stately proportions. The arrangement of the interior is simple. A long corridor runs from end to end of the building, on each of the six stories, access being gained to the rooms on the left and right. The coffee-room is 70 ft. by 30 ft., exclusive of a large bay window. The commercial-room is 36 ft. by 20 ft.; the billiard-room, 36 ft. by 31 ft.; and the smoke-room, 31 ft. by 24 ft. Numerous private sitting-rooms, also sets of rooms arranged *en suite*, are planned on the ground and first floors, and the hotel is capable of making up 100 beds. The principal staircase is 21 ft. by 15 ft. It is painted in imitation of marble, as also is the principal corridor. The arrangements for the service of the hotel, including the luggage hoist and dinner hoist, waiters'-room, and bar, &c., are on the newest principle, and communication through the hotel is kept up by means of electric bells. Separate staircases are provided for the servants. The corridors and staircases throughout are fire-proof, and the decorations have been carried out by Mr. Briggs. The contractors for the masonry and brickwork are Messrs. J. & W. Beaudant; Mr. Dixon is the plasterer; and Mr. Walsh, plumber. The cooking apparatus has been fitted up by Messrs. Jeakes & Co., of London. The estimated cost, exclusive of the furnishing, is 22,500l. The building has been erected from the designs and under the superintendence of Messrs. Lockwood & Mawson, architects.

REQUEST OF 80,000L FOR A CHURCH OF ENGLAND COLLEGE IN DEVONSHIRE.—The late Admiral Benedictus Marwood Kelly, who died at Saltwood House, near Bath, September 26th, and was buried at Kelly, Devon, October 8th, 1867, has bequeathed nearly the whole of his property, which will probably realise little short of 80,000l., to trustees in trust, to apply the dividends to the education and maintenance of boys, sons of members of the Church of England. The trustees are to provide a school-house in Devonshire, at some point west of a line drawn north and south through the parish church of North Tawton, under special restrictions as to the amount to be expended on building. The institution is to be called "The Kelly College."

ENLARGEMENT OF HASLAND CHURCH, DERBYSHIRE.—About twelve months ago, this church was found to be too small for the congregation, and its enlargement was deemed necessary. A plan, drawn by Mr. Rollinson, of Chesterfield, architect, was accepted; and its enlargement soon afterwards commenced, and its completion lately took place. Two stained glass windows have been placed in the church. The east window is by Messrs. Warrington, of London, the subject being Christ's charge to Peter to feed his sheep. The west window is by Messrs. Heaton, Butler, & Bayne, of London. A new aisle has been added, and the church has been benefited by sittings for about 150 persons. Messrs. Hoole & Handby, builders, did the work of enlargement. The cost amounted to over 700l.

A PUBLIC PARK FOR CHESTER.—The Marquis of Westminster has, during the past three years, been converting a tract of land on the banks of the Dee, at Chester, into a park and pleasure-ground. It was anticipated by the public that his lordship intended the park for the use of the citizens, and their expectations have just been realized by the offer of the park as a free gift to the citizens. The council have accepted his lordship's munificent offer, and a committee has been appointed to consider the best means of maintaining the park. A residence has been provided in the grounds for the park-keeper, and the marquis, it was announced, would charge a portion of his property in Chester with the annual sum of 100l., to be applied by the corporation in payment of the salary of the keeper and other expenses of the park.

ZINC PAINT.—An improved metallic zinc paint has been invented by Messrs. Webster, Deane, & Rumble, of Birmingham. They propose to take spelter and melt it in a suitable furnace, and raise it to about 800° Fahr.; they then cover the molten metal with a flux or borax mixed with caustic of soda or chloride of ammonia, or other suitable flux, to prevent the action of the atmosphere upon the surface of the molten zinc; they then add thereto about 7 or 8 per cent. (or more or less) of finely-divided iron wire or scrap, agitating the whole with an iron rod until the whole of the iron or scrap particles are taken up by the zinc; they then add sufficient antimony to cause the metal to run freely from the surface. When the metal thus prepared has cooled down, it is next pulverised and ground, when it may be mixed with any oleaginous matter or varnish, and the metallic zinc paint results. When the paint is intended to be used for coating ships' bottoms or for marine purposes, they add thereto 1½ per cent. or thereabout, of vermilion or sulphide of mercury.

TENDERS

For stabling at Southside House, Holloway. Mr. J. W. Dennison, architect:—

Mann £687 0 0

Crabb & Vaughan (accepted) 659 0 0

For three houses and a Baptist chapel at South Kensington. Messrs. C. G. Searle & Son, architects:—

VOL. XXV.—No. 1290.

The Road to India.

If it be true that charity begins at home, it cannot be unnatural to suppose that other virtues may follow her example. On this showing, patriotism must take precedence of philanthropy, and the more venerable moral attributes will move in narrower circles than the junior graces. It may be objected to this view that we come at last to selfishness, pure and simple. The reply to this criticism may be, that an enlightened selfishness, if not in itself an actual virtue, would very well fill the place of less intelligent good intentions. And, apart from the ethics of the case, there can be little doubt that in all those great enterprises

which are proposed with the object of at once altering the face of the world, and turning a stream of wealth into the pockets of their projectors and supporters, the *paying* character of the scheme is of primary importance, not only to those directly interested in its success, but to the public at large.

If the charity which begins at home be the same excellent grace of which it was once said that it "thinketh no evil," we trust that this Christian virtue will rule the minds of those Englishmen who are interested in our obtaining the shortest road to India. Our French neighbours, and our Italian friends, look with a lively interest to our need in this respect, but as yet these nations are not altogether as unanimous as could be wished. Three grand ideas have been struck out to facilitate this communication. There seems to be no reason why they should not, if each by itself be practicable, be carried out as integral portions of the same great scheme. We might, indeed, raise the number of these engineering marvels to four, although it is not only the Indian, but the entire Continental traffic that demands, in order to effect a great engineering triumph, an outlay that has yet to be commenced. We allude to such a well-arranged steam ferry over the English Channel as shall receive the carriages at Dover or at Folkestone, and land them on the opposite coast, without troubling the traveller to alight; while the size and build of the ferry-boat shall, after the example of the *Great Eastern*, be such as to preserve a majestic calm amid the choppy seas of the passage. There can be little doubt that a well-considered improvement of the steam transit across the Channel, if it received the assent and support of all the railway companies interested in the route, would be one of the best undertakings in which a portion of the idle capital of the country could be advantageously employed.

When once landed on the Continent, two objects command the attention of the engineer who seeks the best route to the far East. The first is, to go as far as possible on the Continent before taking ship in the Mediterranean; the

second is, to make the best possible connexion between that sea and the Indian Ocean.

Up to the present time Marseilles has been the natural port of embarkation for the Oriental traveller. Large sums have been expended on the improvement of the harbour, and on the embellishment of the town; and the obstacles to a longer land route which were presented by the physical barrier of the Alps, and by the political condition of Italy, were such as to lead the owners of the lines of land and of sea carriage which meet at Marseilles to anticipate a longer permanence for that city as the Eastern port of Europe than they are altogether likely to be able to maintain.

With Italy as she existed before 1860, the position of Marseilles was secure. So long as France adhered to the policy from which none of her rulers but the present one ever departed, no Italian port was likely to be put in a position to rival the great French harbour. The influence of Austria was directed to support Trieste, and Trieste, as an Oriental point of departure, was not a formidable rival to Marseilles. While the Austrian rulers of the northern and eastern divisions of Italy knew how to discourage any projected line of through communication which would be likely to injure Trieste, the Papal provinces presented a natural barrier to a north and south Italian line of traffic of a yet more formidable character. And in Southern Italy, while King Ferdinand well knew what would be effected for the physical welfare of his states by railway communication, while he assured the English engineer, whom he induced to undertake the charge of the most important line projected in his dominions, that he would not rest until he could enter a railway carriage at Brindisi and step out of it in Paris, that timid and vacillating sovereign dreaded the political, more than he desired the commercial, effects of such a thorough communication. He therefore granted a concession for the line, and constantly expressed his anxiety for its completion, while his ministers so constantly threw new obstacles in the way of its execution that no real progress was made. Thus a company held the concession and occupied the field, while their contract was constantly infringed by some new edict of the Government, and the ground, as far as works of any magnitude were concerned, remained unbroken.

With the movement of the French troops into Italy, King Francis II., following so far as his more than limited capacity would enable him to do, the wily policy of his father, sought to serve his person and his crown by large concessions to commercial enterprise. Naples was forthwith to be threaded by three main trunk lines of railway, and the pathless districts of Calabria were to be intersected with serviceable roads. French capital, or, at least, French speculation, came in at the summons, but not in time to restore the tottering throne of the Bourbon king by the spade and pickaxe of the "navy." It was too late. During the changeful and stormy times which followed the death of King Ferdinand II., the concession of the great line from Naples to Brindisi was given, and broken, and bought and sold, and tampered with and rendered worthless, after a fashion probably without precedent in Europe. With an English *cessionnaire* actually on the ground, a parallel, or even for much of the route; an identical, line was promised to a French speculator by Francis II.; then to Rothschild, then to an Italian speculator, for whom the State was to find the money, by Garibaldi; then to Rothschild again by the sub-Alpine ministry. Then the Chambers, thinking the affair too good to be shared by any but Italians, out-voted the ministerial contract, and made over the concession to Bastogi, who, for that purpose, abandoned a political for a commercial position. Then Bastogi came to grief, and a scene of scandal, of tears, and of recrimination not readily to be forgotten, took place in the

Chamber of Deputies. The subsequent steps, after a great line through a populous district, where the people were ready to sell their very coats to hasten its completion, had been thus discredited and rendered all but impossible by the had faith of the successive Bourbon, Sardinian, and Italian Governments, are less known in this country. Through them all, however, it would seem that the great natural importance of the line has so far enabled it to struggle, that we are told that a practicable line of railway is now actually existing between Susa, at the foot of the Alps, and the noble harbour of Brindisi, the ancient Brundisium, the eastern port of Italy in the time of Horace, a harbour of which the mouth is yet partially closed by a bar caused by and covering the smoken fleet of Pompey the Great.

While a through line of railway, more or less in practicable working order, is thus provided from the Alps to the most eastern port of Italy, the French and the Italian Governments have carried on a most honourable and fruitful rivalry in boring through the barrier of the Alps. The long tunnel, at the summit of the Mont Cenis pass, bids fair to be completed in the year 1871, and in the meantime an English engineer, Mr. Fell, has constructed, on a new system, a railway over that summit itself. The advantage of the route thus obtainable, taking to the water at Brindisi instead of at Marseilles, is 77 miles out of 2,536. This actual saving in measured distance is rendered more important by the fact that the Brindisi route, while 451 miles longer by land than that by Marseilles, is no less than 728 miles shorter by sea, being a saving of very nearly one-half of the voyage from Marseilles to Alexandria. A rough estimate of the relative speed of sea and land transit indicates a possible saving of more than 48 hours by the adoption of the Italian route. The advocates of this route are content with indicating a gain of 43 hours on the completion of the tunnel through the Alps, of 39 hours on the opening of the summit railway, and of 35 hours according to existing arrangements. Of this precious time nearly 18 hours are now lost by the studious misfits of the French railways. The night mail from London has to wait for more than thirteen hours at Paris before a train is allowed to carry its bags and passengers towards the Italian frontier; and in the route from Mâcon to St. Michel occur further vexatious delays, besides that careful misfitting of the second and third class carriages which tends to force passengers to take the more costly railway ticket, as involving less expense than the extra hotel charges which they will otherwise be called on to support.

It is not to be supposed that this unfair and unwise opposition on the part of the French Railway Companies will continue. If they do their worst, there is still a gain of nearly twenty-four hours to be secured by the use of the Italian line. Public attention will be fixed on the subject; every traveller vexed by the purposed waste of time, will join in the complaint, and it is difficult to know what reply can be made to representations from this side of the Channel as to the inconvenience wantonly, and without result, thus thrown in the way of a most important stream of British traffic. More than all this, it should be borne in mind that we are by no means dependent on French railway companies for taking us to an Italian port. The same disposition to take the most rapid route that has led us to encounter the trouble and expense of a double shipment and unshipment of passengers and of mails, and the use of a foreign land route in place of a sea route in our own steamers,—and to make Marseilles, rather than Southampton, our port of departure for Alexandria,—will infallibly lead us to choose Brindisi in lieu of Marseilles. The Alps are pierced for the locomotive in other passes besides the Mont Cenis, and any persistence in the attempt to

keep us to the passage through the Gulf of Lyons, instead of starting from the heel of the boot, will infallibly lead us, as a matter of self-defence, to send our Indian mail by a route less liable to what can only be termed imposition.

With the Alps pierced, the Italian coast line in working order, and the port of Brindisi freed from the bar caused by the sunken vessels of Pompey the Great, no serious obstacle will remain to oppose our making the best speed towards the best Mediterranean port. Of the excellence of the service attained by our steam-vessels in the Mediterranean itself it is needless to speak. The next point that attracts the attention of the engineer is the transit through Egypt. It is here that we are called on to be careful of our own prejudices (call them patriotic if we will, and even admitting them to be not without foundation), do not actually cause us to stand in our own light.

The power to sail in the same steamer from Brindisi to Bombay would be a boon to the Indian traveller of even more importance than the facility to travel in the same carriage from Calais to Brindisi. This is what the enterprising M. de Lesseps offers to our hopes. We were about to write the well-known enterprise; but the fact is that, famous as it undoubtedly is, it is anything but well known or well understood among Englishmen. It is extraordinary to note what a change as to the reliable character of information takes place when once the watershed of the Alps or the Pyrenees is passed. Reports suffer sadly in the robust character of a truthful health if they have to climb those eminences. And travellers who have gone by those routes, and who have used their own eyes and ears in Spain, Portugal, Italy, or Greece, have come to the conclusion that the latter organs are comparatively of little value in those countries. Eye-sight alone, and that the eye-sight of your own eyes, or of eyes well known to you to see straight, can be relied on for information as to doings on the shores of the Mediterranean.

It is for this reason that the actual condition and prospects of the Suez Canal form so much of a mystery in London. It is quite true that the disfavour with which, as we cannot disguise, the enterprise has been regarded in this country is based on two assumptions which seem at first sight to be mutually destructive. One is that the canal cannot be made and maintained; and the other is that it is unsafe and impolitic to entrust the keeping of the gate of India to our French neighbours. We speak with all reserve on the subject, from the feeling that nothing short of a prolonged residence on the site of the great work in question would enable us to speak with certainty as to the prospects of the undertaking. We remember that Mr. Stephenson's opinion was unfavourable to the success of the undertaking, and, so far as our own personal experience enables us to speak, we share Mr. Stephenson's opinion. How a traffic can be found to pay interest on outlay, and maintenance both of canal and approaches, we are at a loss to understand. And a recent appeal to the capitalists of London to come into the scheme at the very moment when the difficulties are said to be surmounted, and when it only remains to reap the golden fruit of the undertaking, is in itself a puzzling circumstance.

So far as we feel justified in expressing an opinion, it is to the effect that the Suez Canal is a most noble and important undertaking, but one that is entirely out of the limits of commercial enterprise. To the sovereign of a country like Egypt it might present no insuperable obstacles, and the immense contingent advantages that his country would derive from its completion might justify not only an enormous outlay, but an annual charge upon the revenues of the State. To a private company no such collateral advantage can offer itself; and therefore it would seem to be only by such expedients as large territorial purchases, or as disposal, under one form or another, of the resources of the State, that disastrous failure can be avoided. To such *imperium in imperio* established in Egypt, we think that England has cause for grave and solid objection. A broad line from the Mediterranean to the Red Sea, under the shadow of the French flag, is not desirable for the insular lords of India. Nor can there be any doubt in the minds of those accustomed to the sort of *legerdemain* that seems invariably to take place when any "fusion" of private interest and political action is attempted, that it would be preferable, as far as England is concerned, for the French Government itself openly to be the proprietors of such an international

work, rather than that a company, formed under political auspices and "inspiration," should be the ostensible owners of the route. Difficulties which in the former case would be either removed by diplomatic means, or afford a just ground of direct international complaint, would in the latter become permanently insoluble when their origin was lost in the relations of the *cessionnaires* and the protecting Government. That an Egyptian canal should exist, would be most desirable for this country. Failing this, a French canal, belonging not to French speculators, but to France, might, if possible, be of almost equal value to Great Britain in any case except that of actual war with France. But the attempt to construct and to maintain such a canal by private enterprise, having regard to the questions of the remunerative employment of capital, of the side issues or subsidiary sources of profit which the proprietors would hardly fail to seek, of the political complications likely thus to arise, and of the want of guarantee for the due maintenance of the canal if once completed, is one which we need much more detailed and reliable information than has yet reached this country to enable us to regard without grave and serious apprehension.

THE LAST BLUE-BOOK ON PUBLIC HEALTH.

The last blue-book on the public health, or the ninth report of the medical officer of the Privy Council, gives some very satisfactory information. Perhaps the most so is the result of an official inquiry concerning the improvement made in the health of the inhabitants of twenty-five towns in which sanitary structural works are in operation. Hitherto the advocates of sanitary improvement have not had many fully established facts to advance in favour of the results of structural works; for lapse of time was necessary for them to accrue; and the largest proportion of our re-modelled towns do not date their improvement from a period sufficiently distant to have admitted an inquiry into the results to have been made before the present time. In 1865, Mr. Simon submitted to the Lords of the Council that it would not be then premature to commence an investigation of the kind, and, with their approval, Dr. Buchanan commenced the tour of inspection. The report, now concluded, places beyond dispute the fact, that towns, after systematic drainage and water supply, immediately become places of abode in which people are less liable to die prematurely, through disease, than they were formerly. The twenty-five towns examined contain an aggregate population of more than 800,000 people. Some of them show more startling differences in the death-rates before and after the completion of their sanitary works than others, which circumstance should show us that the two items of town improvement we have mentioned, town-drainage, and water supply, are not all that constitute sanitary perfection in the condition and management of towns; and that some cases evidently require more provision for the public health to be made than is necessary in all. In Cardiff nearly a third part of the mortality from which the town suffered before the commencement of the sanitary works has now ceased; while, in others, the improvement has not been so very remarkable. In Newport the reduction on the former mortality, exclusive of infantine epidemics, is about 32 per cent. Croydon, Macclesfield, and Salisbury can boast a reduction of 20 per cent. Merthyr-Tydfil can show a death-rate from typhoid fever and diarrhoea reduced from 33 to 15 since the improved removal of nuisances, abatement of over-crowding, and pure water supply; as well as a death-rate from cholera reduced in 1866 to 20, whereas it stood at 84 in 1854, and was 267 in 1848. Brynmawr, after paving, draining, supplying with water, and constant attention to removal of nuisances, has abated 15 per cent. of its former general mortality, and reduced its death-rate by typhoid fever and diarrhoea one-half. In Ely and Banbury the last-mentioned diseases have been likewise deprived of half their death-dealing power. Dover, Leicester, Cheltenham, Bristol, Carlisle, Warwick, Rugby, Penrith, Stratford, Alnwick, Worthing, Morpeth, and Ashby have all reduced their death-rates since the completion of their sanitary works. But, as we have said before, some of these towns do not appear to have been benefited to the extent that the

greater decrease in the death-rates of others that have employed the same means would lead us to expect. Before entering into the particulars of these cases we must, however, point out a very important and unexpected piece of information that has come out of the present investigation. Dr. Buchanan finds that the death-rate from consumption is materially affected by sanitary works. This fearful scourge of our climate, it would appear, is open to influences over which we can exercise a large amount of control. In those cases where the drying of the subsoil of the site of the town has been effected by the new measures a decrease from a third to a half of the whole mortality from this cause has taken place; in other words, there appears to be a connexion between phthisis and subsoil waters, and a fluctuation, as between cause and effect, in the number of deaths by consumption according to the amount of dryness produced by drainage in the soil. Such towns as have had special arrangements made for the drying of their subsoil, such as Salisbury, have most conspicuously improved, and those that have large sewers and deep storm culverts stand next on the list. The cases where the least improvement under this heading has taken place are those where the soil was already dry, as at Penzance and Brynmawr, or where the drainage consisted of impervious pipes laid down in channels in which no drainage of water could occur, as at Penrith and Alnwick. Dr. Buchanan is somewhat puzzled, however, over four exceptions. Carlisle and Chelmsford, where the ground-water has been removed to a greater extent than in some places where a large decrease in the number of deaths has been made, keep up their rate in spite of favourable conditions; and Worthing and Rugby have lowered theirs without much drying having been achieved. The solution he suggests for this variation is, in his own words, "that the nature of the change in climatic conditions, produced by drying the subsoil of a locality, is not everywhere the same (the environs of Chelmsford, for example, still get flooded through the action of a mill-dam), and that different degrees of effect may hence be produced on consumption." Here, then, we are brought face to face with an inkling of a fact bearing upon the grand subject of the improvement of the condition of mankind. If we are able to add phthisis to the list of diseases that are preventible or capable of amelioration by structural works we have surely been armed with another weapon to use against the destroyer.

We now turn to consider the reason why the decrease in the death-rate has not been equally marked in the case of every town that has incurred the expense of sanitary works. It must be allowed that the very worst cases are those most susceptible of improvement; therefore we cannot be surprised that places that were in the filthiest condition have benefited the most by thorough cleansing and a proper water-supply. Cardiff, Newport, and Merthyr-Tydfil must be ranked in this category. But, contrasting with the excessive fall here, and six other cases, and the more moderate decrease in eleven instances, there are three or four towns that have made but the slightest improvement, and one shows a small increase in the rate of mortality since the execution of the sanitary works it now possesses. Penrith, Worthing, Penzance, and Ottery St. Mary, are the towns that have partaken in the least degree of the expected benefit, and Chelmsford is the puzzling case in which no improvement appears in the statistics. This town has suffered from diphtheria to an extent of 65 per 10,000 of its population in 1858-62. And in Dover we have another instance of outbreak of diphtheria after works of drainage and water supply were completed, although the great reduction in deaths from other causes does not make this appear to be a case of general increase. It is noticeable that different items in sanitary works have especial results. The removal of excreta and house-slop tells principally upon typhoid fever. At Rugby, Carlisle, Worthing, and Chelmsford, the sewage is received into pumping works at the outfall, in such a manner as to retain much of the sewer gases in the pipes, and the result is, the atmosphere being charged with the gases arising from decomposing organic matters, there is no considerable reduction in typhoid. At Worthing, this tendency had, it will be remembered, very serious consequences in 1865; and it will be seen that Chelmsford may owe its want of improvement of the public health to this cause.

We quote the doctor's view upon this subject—

In Chelmsford, again, there had been no decrease of typhoid fever. Here, too, the sewage is delivered into an outlet pipe, which enters some 6 ft. below ground. The opening can be covered by a sluice, or it may get covered by the rise of the sewage in the well when the engine is not at work, or the quantity of liquid is in excess of its pumping power. There is, indeed, a storm-overflow into the river, to prevent the sewage backing up beyond a certain point; but it is a fact that in certain conjunctions cessars do occasionally get flooded by the sewage, in spite of this overflow, and still more must there then be a tendency of sewer gas to escape from the pipes; and though this is provided for by some down-pipes being left untrapped, it is at critical times, as in the case of the overflow, that the sewage is left for a very easily-occurring stoppage in a rain-water pipe to determine whether or not sewer gases shall be forced up through the inch or two of water that is provided to exclude them in the ordinary sink and closet.

Sewer gases, we may be sure, must be disease-dealing agents of the greatest power for evil, wherever they occur; and it is extraordinary that any system of sewerage should be adopted that is likely to entail the possibility of their escape into dwelling-houses. Those who assent to the execution of such schemes are merely shifting their ill-favoured load from one shoulder to another, instead of getting rid of it. Excreta in the form of gas is as fatal as in any other guise; and Chelmsford only shows us the soundness of the conclusion that the health of the inhabitants of a town requires that all the excremental produce of the population should be promptly and efficiently removed, so that the air and water should be uncontaminated by it.

Dr. Buchanan finds that measles are in many instances influenced by structural works and the removal of pre-existing organic impurity in the air. He says—

"In the towns where there was most room for improvement in this respect, and where most improvement has been actually made, measles has commonly been reduced, and the towns where it has remained stationary, or has increased in amount, are those which either had less foulness of atmosphere to begin with, or have made less radical improvement of it. But there are several exceptions to this general statement. The introduction of better drinking-water has not perceptibly affected the prevalence of measles; but some connexion appears probable between reduction of measles and diminished density of population."

Overcrowding appears, too, to have exercised a deleterious influence in favour of whooping-cough and scarlatina. Only those towns that have improved the lodgment of the people present any notable decrease in either of these diseases. Diarrhoea, on the contrary, does not appear to be affected by the condition of lodgment, nor by dampness of subsoil, but more especially by purification of air and water. But the crowning glory of sanitary measures are what we may almost call their defeat of cholera. In the twenty-five towns under examination cholera has shown its fearful face but in the following instances in 1866:—Merthyr, where the town is still undrained, though there is good water; Cardiff (15½ per 10,000, whereas 208 in the same number died in 1849); Newport (12 per 10,000); Bristol (1½ deaths per 10,000 only, against 82 in 1848-9); Dover (4.2-3rds in 10,000); and Croydon (2 per 10,000). Merthyr, Cardiff, and Newport are all recent cases of amendment, and, therefore, may be allowed not to be already in possession of the full benefit of their new works. Nevertheless, the worse case, Merthyr, must be considered a triumph when we consider its great general improvement and compare its last cholera rate, which was 20 per 10,000, with that of 1849, when 267 out of the same number fell victims.

The report goes fully into the cholera question. Indeed, when we bear of sanitary conferences at Constantinople and Weimar, we must own the subject of the public health is, at last, widely taken up. At Weimar, Mr. Simon met at Easter the leading epidemiologists of Germany, who had proposed an international medical conference with the object of consulting the interests of the public health, in considering the best defences against cholera, and the sort of investigation likely to lead to a knowledge of the right principles upon which to act. Though England and Germany are undoubtedly the two best authorities upon the cholera question, it so happens that each has worked the subject in different directions; and though Mr. Simon was able to impart the very important sanitary experiences of England, which included the results of Dr. Buchanan's examination of the twenty-five towns, the continental observers, who were chiefly German, placed before the conference information as startling in the form of facts of great importance in branches of the study that had been scarcely cultivated in our country, and

are, therefore, valuable accessions to our experience. There were three different departments discussed by the continental authorities, the caprices of cholera, chemical disinfection, and the cholera fungus. By the term caprices of cholera is conveyed a theory that the occurrence of the pestilence is due to certain states of the local soil. A geological map of Thuringia was shown, in which the sites of the epidemics of 1866 were marked, and, curiously, it was clear that they were almost exclusively on one geological foundation. And some smaller maps showing Bantzen, Zwickau, Altenburg, Apolda, Würzburg, &c., showed boundaries of epidemics agreeing as distinctly with the geological formation. Observers from St. Petersburg, Lübeck, and Pesth, advanced facts bearing upon the character of "time caprices," which they connected with temporary variations in the thickness of superficial porous soil, and its penetration by air, or occupation by "ground-water."

In the department of chemical disinfection there was some conflicting testimony. Mr. Simon laid before the conference Dr. Budd's account of the successful disinfection of Bristol from cholera by Mr. David Davies, the medical officer there. This was met by a statement of an equally assiduous disinfecting of Leipzig with exactly an opposite result.

"In Leipzig, Professor Victor Carns, as a volunteer for his town, had been all that Mr. Davies was in Bristol: the town was divided into 100 disinfection districts, each with an officer who visited daily for disinfection with sulphate of iron every house in his district; over these district officers were four young chemists, constantly inspecting under Dr. Carns's instructions to see that all disinfection was satisfactory; and Professor Carns himself, besides superintending all this work, personally, every day, visited all houses which had cholera in them: disinfection had never before been done in Leipzig, yet never had Leipzig suffered so severely from cholera."

But there were more failures than this. In Stettin there was an equally free use of lime and chloride of lime, and yet the epidemic, when these disinfectants were used, was severer than it had been in the thirteen previous devastations by cholera. Carbolic acid was used so profusely in Erfurt, that the drinking-water tasted of it; nevertheless, cholera was three times more fatal than it had ever been before. In the last-mentioned case, however, it is easy to see that if the water tasted of carbolic acid applied to the cess-pools, there must be connexion between the two that would account for any amount and obstinacy of cholera.

The cholera fungus is a more strictly medical branch of the subject, but as a knowledge of its existence and consequences also shows the immense importance of efficient drainage and other structural works, we will give a slight outline of it. Dr. Thomé, Professor Kloh, and two leading mycologists of Germany, Professors Hallier, of Jena, and De Bary, of Halle, were associated in this investigation as a committee. They found in cholera evacuations and in the intestinal mucus of the dead from cholera, exceedingly minute and definite organic structures, which they identified as zoo-gloea. These organisms consist of fine granules, which divide and subdivide, and form beaded threads, which interlace themselves into masses in the mucus. What they would develop into has not yet been determined, though some wonderful experiments have been made; but what they have developed from is not quite so hidden a mystery. Professor Hallier states that the fungus, which in the bowels of the human subject performs so fatal a part, cannot be of European origin, as it requires a high temperature for its fructification, and conjectures that originally it may have been a clue till the granules found in cholera patients have been actually cultivated, the seeds sown on a solution of sugar, on paste, and on muscular tissue, and a growth observed exactly like that originally found in the intestinal canal. The idea, however, that choleraic disturbances are the result of an active cryptogamic vegetation, is not altogether new; nor is the supposition that rice is the habitat of the death-desiring fungi, now made for the first time. Dr. Tytler, in 1833, descended on *Facts establishing the deleterious properties of rice as an article of food*; and several of our own microscopic observers announced their detection of a fungic growth in the stools of choleraic patients twenty years ago. Their discovery was not considered of much value, but now that the learned German professors have shown the vitality of the seeds, with what ease they reproduce themselves, and the consequent importance of a prompt and thorough removal of all excremental matter

by efficient drainage, it is to be hoped we shall be able to turn it to some advantage. Hallier tried the possibility of producing the fungus on rice. He planted some rice in a situation, as regards heat and moisture, as nearly identical with an Asiatic rice-field as could be contrived, and watered it with the stools and vomita in which he had found the fungus. On examining his little rice-plants he found the epidermis of each perforated by fungus threads in great numbers, and though not able to identify the parasite with the cyst-bearing plant, ascertained that it was of the same type. The epithelium of the intestine is destroyed by the operations of the cholera fungus in like manner. This train of investigations carries more weight when we call to mind that the English physicians in India first called upon to treat Asiatic cholera named it "rice disease," and recognised some connexion between it and a diseased condition of the rice-plant.

Dr. Thudicum enriches the report with thirty nine coloured diagrams illustrating a series of observations he made as to the effect of temperature upon choleraic cases; and Mr. Radcliffe gives a map showing the distribution of cholera in London and its environs from June 27th to July 21st, 1866. Smaller maps stamped with direful black patches of different degrees of density show the comparative extent to which certain districts were affected; and another diagram represents the deaths from cholera and diarrhoea in each week of the six months from June to December, 1866, with the meteorological phenomena registered at Greenwich in the corresponding weeks. Thus it will be seen cholera has been attacked from geological, botanical, chemical, meteorological, and sanitary engineering points of view by able minds within the last few months; and the present blue-book gives records of all that has been ascertained.

Concerning the working of the New Sanitary Act, 1856, the reporter is content with the exception of its insufficiently stringent bearing upon water companies, who at present may bring death into thousands of houses without incurring a penalty greater than a fine of 200l. The engineer of the East London Water Company owns to having distributed a most improper water without having passed it through the ordinary filtering beds; and Mr. Radcliffe brings very forcible evidence that the outbreak of cholera in the district watered by this company was occasioned by this most culpable negligence. It is urged that such distribution of polluted water should be punishable with greater severity than it is at present. Altogether, this is certainly a valuable blue-book.

LONDON ORPHAN ASYLUM COMPETITION.

THE managers of this important charity have obtained a large piece of land close to the Watford Station on the London and North-Western Railway, and are about to erect buildings on it to accommodate 400 boys and 200 girls, with facilities for extension when needed. It consists of about 36 acres, 20 for the institution and 16 for protection, so to speak, on which latter house will probably be built. A limited competition having been decided on, designs have been sent in by Messrs. Belcher, G. S. Clarke, John Collier, Henry Dawson, F. R. Peck, E. C. Robius, Thomas Henry Watson, and F. Williams,—eight architects, who have sent nine sets of drawings. The grounds on which Mr. F. Williams was invited to the competition are not obvious, as he is evidently a tyro, and has sent a design which may at once be put on one side. The Committee offer three premiums, 250l., 150l., and 100l., and their desire is, of course, understood to be to employ the author of the design selected as No. 1 to carry it into execution as architect, or with such modifications as may be found desirable. The sum named for expenditure is 55,000l. The designs are commodiously exhibited in a large room in Old Jewry; all the competitors have adopted Gothic as the style (one, Mr. Collier, sending an alternative design in a modern dwelling-house style), and we may add, that the majority of the designs are set forth with most creditable artistic skill.

Competitors were informed, if we understand rightly, that each fifty boys were to have an establishment of their own,—day-room, matron's room, offices, dormitories, and so forth. School-rooms, large dining-room, swimming-bath, the

administrative department, chapel, and infirmary were amongst the other chief requirements, and the way in which these are provided by the several competitors, the amount of light and air given, the modes of approach, means of supervision, &c., when judged by the various officers of the establishment, will of course materially influence the selection. Beyond convenience and commodiousness, however, the committee must see that they obtain a building which shall be worthy of the charity and fitly mark its nobleness.

Mr. Dawson has produced what seems a very good plan: all the rooms are well open to air and sun. His eight homes for boys have the living-room on the ground-floor, the schools, &c., above, and are for the most part hut two stories in height. The covered ways leading from part to part are under the first-floor. The infirmary is made a great feature, and would seem to prepare for a larger amount of illness than would be creditable to the managers of the Institution. Great care seems to have been bestowed in planning it. The elevations are less satisfactory than the plans, and are suggestive of the railway station. The cost of the design as it stands is estimated, we believe, at 78,000*l.*, to be reduced to 68,000*l.* if confined to the requirements made by the committee.

Mr. Watson's design presents a more important pile of buildings externally, with an estimate of 65,350*l.*, the adoption of a third story aiding to cheapen. The dining-hall is made a very handsome feature, and is placed in the centre of the main block building. The boys are housed in a quadrangle (we should prefer one side down or all the corners open), to the left of the dining-hall; and the girls have a building, with two wings, on the other side of it, so that the separation is complete. The chapel and the infirmary are placed in front of the girls' block, for sake, with reference to the latter, of aspect. The approach to the girls' department from the carriage entrance is not very obvious. Mr. Watson places the boys' living-rooms on the first-floor, nor are we certain that there is any great reason against this arrangement; though the majority seem to think the ground-floor the better position for them.—Mr. Peck places six of his boys' homes on the ground-floor and two above. He gives handsome elevations, including a lofty campanile, of red brick and freestone dressings, with tastefully adorned chapel, and estimates the cost at only 55,000*l.* The cause of its less cost as compared with some of the other designs, which have many cubic feet of building less, is not immediately obvious.

Mr. Robins has adopted the pavilion system, and with much skill, each home for girls as well as boys radiating from a connecting corridor. Whatever advantage this arrangement might have upon the boys' side, it would probably be found less workable for the girls, where the same amount of separation is not desired. The elevations look business-like; and the cost is put down at 71,000*l.* The design deserves full consideration, and will doubtless have it. The living-rooms are on the ground-floor.—Mr. G. S. Clarke, by showing where other buildings are to be erected within the quadrangle in the event of greater accommodation being required, has rendered his plan unattractive. Indeed, without these the ground seems to us too closely covered. A number of small courts in a building of this character, and in the country, are scarcely defensible. The elevations are artistic and effective, if we except the centre portion, which has too much the character of modern German Gothic, with thin buttresses and pinnacles running up the face of it, to please us quite. The cost as the design stands, the designer says, would be more than the committee name, 65,000*l.*; but, if the building be reduced to their requirements, it could be done for the money.—Messrs. Belcher give some handsome elevations, partly faced with stone, and name 67,500*l.* as the cost of the building they would like to erect.—Mr. Collier, in his design, follows more the old almshouse type than the other competitors have done, and puts down for it 62,000*l.* His alternative design, three stories in height, and very monotonous, he estimates at 57,000*l.*

The committee, we are told, have already given long consideration to the drawings, and have amongst them an architect, Mr. Geo. Pownall. There is every reason, therefore, to expect, remembering, too, the importance they must attach to obtaining the best possible building for their purpose, that justice will be done to the competitors.

SCOTLAND YARD.

How shall we designate, bow shall we describe them? Scots, Scotsmen, Scottishmen, Scotchmen, Caledonians, North Britons? Call them what we will, Sandies or Sawneys, the Scots have left visible and enduring memorials of their settlement in London. See what Gihns, "frae the far north" has given us in the noble church of St. Martin-in-the-fields by Charing-cross. See what the brothers Adam (horn beyond the Tweed) have left us in the hold Adelphi of the Strand. See the wonders James Watt has wrought for us, both on land and water, in his noble application of steam to countless uses. See what John Rennie—a sturdy Scot—has done for the Thames in London by a bridge worthy of Sesostris or the Cæsars. See what John Rennie's sons (Caledonians to the back bone), have done for London in Middlesex and London in Surrey, by making them part and parcel of the same city land. A Scot, James Walker, made the noble bridge that spans the Thames between Pimlico and Vauxhall.

Our population returns reveal a curious and instructive fact, that in this London—the metropolis of Great Britain and Ireland—there are more resident and *vagrant Irish* than resident and *wandering Scots*. St. Andrew is comparatively well to do in London, not so St. Patrick. The thistle takes root in English soil where the shamrock will not grow.

Who has not heard of Scotland Yard? Thieves and rogues and vagabonds within the city and metropolitan districts know Scotland-yard equally well with the exterior of Wren's St. Paul's, and the exterior (not the interior) of Soane's Bank of England.

When the York and Lancaster "long jars" were raging, Scotland-yard and much of Whitehall were waste places between the parish of St. Martin-in-the-Fields, and the Thorney Island of the city of Westminster. When King James VII. of Scotland became King James I. of England and Scotland, Whitehall rose into importance, and the Banqueting House, under Inigo, into a classic celebrity, which it still maintains. The royal palace at Westminster was deserted by the house of Stuart for Whitehall, as Whitehall has given way in its turn for St. James's and "our Palace at Pimlico."

Scotland-yard has been for centuries a London locality of interest to architects and masons, and, indeed, with all who have aught to do with the profession or trade of building. It was in Scotland-yard that the surveyors, comprolloers, and paymasters of the works to the crown, had their offices. Here in Scotland-yard, *alias* Whitehall, long before the days of Lord Duncannon, of Lord Morpeth, and Lord Lansdowne, Inigo Jones and Sir Christopher Wren were to be seen "on business," touching estimates, alterations, travelling expenses, and salaries in arrears. Hither from Berners-street, Oxford-street, Sir William Chambers was often to be seen, talking influential officials into good humour with their cheque-books concerning Inigo's chapel for "the Infanta," and the wants of the Commissioners of Wine Duties, the Auditors of Imprests, and the Commissioners of Stamps and Taxes. Here Mr. Pennetborne, Chambers's worthy "continuator," may be found forestalling the unroted estimates of '68 and '69, by puzzling first Mr. Gladstone and then Mr. Disraeli. Hither Sir Charles Barry was often to be found on tiptoe about his "Victoria Tower," or dreadfully downcast about the perishable nature of Nottingham stone.

I once heard, years ago (the memory of it is still fresh upon me), a Highland roll-call, called over in a loud guttural voice fit to be heard at Glencoe or the Pass of Killcrankie. It was on the Surrey side of Vauxhall Bridge, and Cockneys stood and stared, and gaped at the Campbell-Argyll sergeant who summoned,—Duncan Macpherson, 1; Duncan Macpherson, 2; Duncan Macpherson, 3; Donald Macpherson, 1; Donald Macpherson, 2; Donald Macpherson, 3; Donald Macpherson, 4; Dugald Macpherson, 1; Dugald Macpherson, 2; Dugald Macpherson, 3; Dugald Macpherson, 4," varied at this point by a call for MacGregors sufficient to compose a clan for Rob Roy himself. A friend, who was by my side, suggested what a humorous roll-call a list of names of men of colour would make—ten Greens, fifteen Blacks, twenty Browns, and five-and-twenty Whites. A hue and cry for the Smiths and the Smythes, another friend remarked, would be an amusing, though a puzzling call to hear from a Cockney's tongue.

Two illustrious Englishmen,—one a Londoner by birth, the other a Staffordshire man—paid Scotland a visit. Ben Jonson went on foot there as far as Edinburgh and Ben Lomond; and Samuel Johnson, a century and a half later, visited Edinburgh and the Hebrides with a thorough Cockney Scot, James Boswell, of Auchinleck, in Ayrshire, esquire. That Ben and Sam were well pleased with their reception, we have enduring testimony in the "Heads of Conversation," jotted by Drummond, and the "Tonn" and "Life" published by Boswell.

Among the Scotsmen in London, late in the last century, was William Burns, a brother of Scotland's poet. He was ten days in his passage from Shields to London. He wrought as a saddler in the Strand, possibly in the same house in the Strand in which the late Mr. Archibald Hastie carried on a saddler's business, and collected merry men and true Scots around Burns's punch-bowl filled with reeking and beading whisky to the very brim.

A true child of Scotland—a Caledonian to the hock-bone—is, when settled in London, all eagerness to get other Scotsmen about him. Thus Allan Cunningham, when he had settled as a mason (and something more), in the studio and "shops" of Sir Francis Chantrey, actively worked to bring other Scottish lads from the banks of his native Nith to the banks of his adopted Thames. Thus he tempted to London, and with a certainty of work and good pay, four or five sturdy Scots, rejoicing in the Northern names of Affleck, Dunbar, Sandilands, and, of course, a Cunningham,—and excellent masons they turned out, to the full satisfaction of a Derbyshire man, with a smack of a Yorkshire Riding about him—Francis Chantrey.

I may be pardoned for mentioning here, that an elder brother of Allan's served assiduously long and died in the service of the Rennies (the engineers), and that he lies buried in the churchyard of St. John's, Waterloo-road, beneath a monument erected to his memory by his brother Allan.

"Cannie Scotland" has not supplied (strange to say) its fair share to the corporation of the City of London. We can call to mind only three Scots who have filled the office of lord mayor, and been right honourables and privy councillors for a year. Let us name them:—Sir James Shaw, Sir Peter Laurie, and Sir John Pirie. It was good Sir James Shaw who brought two of the sons of Robert Burns (the poet was then dead) from the shadow of the Mid Steeple in Dumfries to the cloisters and school of Christ's Hospital in London. I do not remember, when I was a Bluecoat-boy, a period extending from 1825 to 1831, that there was a sample of a Scot to be found in the school. Had there been one, the boy, whether a *red* or *black* Douglas, would have found Christ's Hospital, off Newgate-street, a little too hot for his Caledonian "bluid."

London possesses (and will take care to keep) two noble memorials of Scotland and the Scots,—the Stone of the coronation-chair in Westminster Abbey, and the punch-bowl of Robert Burns, now one of the curiosities of the British Museum. The Coronation Stone (the Kob-i-Noor of Scotland) was a theft committed by King Edward of the Plantagenets; the bowl was a bequest to the Museum by "a Paisley body"—I mean, a member of Parliament for Paisley.

That the finest sight a Scotsman sees,—

"The Caledonians armed with want and cold,"—is the high-road to London, we have the authority for asserting of no less a person than Samuel Johnson. Scots, when once in London, are unwilling to return. The "gaeing back agen" is not grateful to a Scot, and yet, strange to say, the epitaph on Lord Belhaven, who died in 1639, records the astounding fact that "he returned to his country." In the year 1639 the country Lord Belhaven returned to was rampant with troubles, civil and religious; nor was London, indeed, at that time, in a much more pacific condition.

We have no evidence whatever that any of our Scottish kings had ever set foot in London before the death of Queen Elizabeth in 1603. It is, however, within the range of probability that King James I. (the poet-king) saw it on his way to his prison in Windsor Castle. The march into England of King James IV. was stayed at Flodden. Mary, Queen of Scots, was never farther south than fatal Fotheringay. Sir William Wallace saw London at the cost

extent, by a careful stoker, by the admission of a moderate supply of air by opening the furnace door a few inches for a few minutes after each firing. This may lessen the production of steam, but it will prevent the loss of fuel from smoke passing up the chimney.

It appears, therefore, that the emission of smoke from chimneys may be prevented, the chief requisites being:—

1. A sufficiency of hoiler accommodation to allow of easy firing, so that the fire need never be overloaded with coal or forced in its work.

2. A chimney having sufficient height and sectional area to provide a good draught, without which it is impossible that the temperature of the furnace can be raised sufficiently high to effect complete combustion.

3. The admission of atmospheric air in sufficient quantities to allow of the complete combustion of the fuel, an extra supply of air being admitted to every fresh charge of coal.

4. Due care and attention on the part of the stoker in the management of his fire, by having his fuel properly prepared before commencing to charge, by charging his fire quickly, evenly, and regularly all over; by keeping a uniform depth of coal, and not allowing any part of the bars to be uncovered; by not covering more than half or two-thirds of the grate with fresh fuel at once, and as the draught is strongest at the back near the bridge, placing the fuel thickest at the back, and allowing it to diminish gradually towards the front; and, lastly, by doing as little stoking and stirring as possible.

By an observance of the above simple regulations, the prevention of smoke from the chimneys of manufactories may be effected within certain limits, the cost of the necessary apparatus not being such as to render it an obstacle to its application; and the economic value of the coal and the evaporative power of the hoiler may be at the same time increased. The saving in fuel has been variously estimated from 10 to 40 per cent.; Dr. Ure, in his examination before the Parliamentary committee, putting it at the former rate, and Professor Rankine, at the recent meeting at Dundee, stating it to be as high as the latter.

The law relating to the subject is included in the Towns Improvement Act, 10 & 11 Vict., cap. 34, sect. 108, by which it is enacted that every furnace constructed after the passing of the Act, within the limits of the Act, for working engines by steam, or in any mill, factory, dye-house, bakehouse, brewery, gasworks, or any manufactory whatsoever, shall be so constructed as to consume the smoke arising from the combustion in the furnace. Every existing furnace used for any of these purposes not so constructed must, within two years after the application of the Act to the district, be so altered in its construction as to consume its own smoke. In case of failure to make the necessary alterations in the furnace, or for using the same negligently, a penalty of 40s. is incurred, one month's notice in writing having first been given. This clause was incorporated in the Local Government Act, 1858, thus extending its provisions to all towns where that Act has been adopted, an additional clause being added giving local Boards the discretion of excepting from the operations of the Act certain processes, such as coking, making bricks, the smelting and manufacture of iron or glass, &c.; and giving justices the power to excuse people who have used the best known means for preventing the nuisance. The interpretation of this last clause has been settled in the case of *Cooper v. Woolly*, which was an appeal from the conviction of Birmingham magistrates heard in the Court of Exchequer in January last. The appellant carried on the trade of annealing brass for wire-drawing, and for this purpose had a furnace. It appeared that the smoke emitted from the furnace might have been much diminished by the admission of cold air, but it also appeared that if air were so admitted the even temperature necessary for the manufacture could not be maintained. The conviction was quashed, the Court holding the words "as far as possible" to mean as far as possible consistently with the carrying on of the trade.

The Sanitary Act of last year (29 & 30 Vict., cap. 90, sect. 15) defined the word nuisance, under the Nuisance Removal Act, as including any fireplace or furnace which does not as far as practicable consume the smoke, and used within the district of a nuisance authority, such authority being by the 18th & 19th Vict., c. 121, and the 23rd & 24th Vict., c. 77, either a Board of Health, Improvement Commissioners, or Board of Guardians; but any inhabitant who

is aggrieved may lay a complaint before the justices, who can, however, dismiss the same if they are satisfied that the fireplace is constructed in such a manner as to consume its smoke, and that such fireplace has been carefully attended to by the person having charge of it.

The negligent stoking of furnaces is one of the great difficulties to be contended with. Magistrates are not inclined to convict a master when he has done all in his power to put his furnace in a proper form, but where his efforts have been frustrated by the negligence of his servants. The total absence of smoke also is an impossibility; an escape must take place when the fuel is first ignited, and on certain other occasions. To meet both these cases a certain amount of discretion is necessary on the part of the authorities. The rules laid down by the Board of Health at Leicester seem entirely to meet the case, and their effectiveness is proved by the very successful result of the operation of the law as carried out in that town, from the entire absence of any annoyance arising from the smoke nuisance, and the greatly improved appearance of the town since active measures have been taken. The limits allowed by the Board are one hour for lighting, and in subsequent hours ten minutes out of the sixty is allowed. In case of any excess of that time, the stokers are summoned before the Board of Health, and, in the first case, cautioned; in the second default they are taken before the magistrates, and fined. If the stoker can show that the fault arises from the construction of the furnace, the Board direct proceedings to be taken against the master; the operation of the law thus being made to hear upon the person actually guilty.

In conclusion, then, it may be stated, that wherever a town suffers from the annoyance arising from smoke and blacks; and wherever the chimney of a manufactory, whether situated in a town or elsewhere, may be seen constantly sending forth streams of black vapour, the fault is with the authorities of the place, and not with either science or the legislature.

W. H. W.

CONDITION OF GLASGOW.

GLASGOW ARCHITECTURAL SOCIETY.

AFTER the annual supper of this Society, held at the close of the General Meeting on the 21st inst., Mr. John Honeyman, jun., president, in giving the toast, "The Glasgow Architectural Society," made an interesting address, though we cannot agree with him in what he said as to the proposed demolition and improvements in the city, to which we look hopefully. We give a portion of his address, with which we more fully coincide. There is a subject, he said, which demands, I think, a larger share of our attention than it has hitherto received, and that is the practical application of the knowledge which hygienic science has placed at our disposal. Of late years, thanks to the labours of such men as my friend here, Dr. Gardner, and to such publications as the *Builder*, and others, an immense flood of light has been thrown on sanitary matters, and the thousand subtle agents which affect the health of town populations especially, are noted and understood, and their influence duly appreciated—while the valuable reports of the Registrars, and an accumulation of statistics, prove how greatly the death-rate of a city is affected by the introduction of improved sanitary arrangements. It is satisfactory to think that not only are these things more perfectly understood, but a conviction of their importance has greatly spread among every class of the community. That is indeed satisfactory, and a token for good. What is unsatisfactory and disgraceful is, that, notwithstanding our knowledge and our convictions, so little is done. During the last thirty years, I make bold to say, that in our dwellings, for example, we have not introduced a single sanitary improvement worth mentioning; and in many classes of property—and these by no means the lowest—the state of matters is infinitely worse now than it was at that remote period in the history of sanitary science. This is hard to believe, and I may not pause to pursue the subject. I speak as to wise men, who can investigate it for themselves. I cannot, however, resist offering one illustration. Let us compare, for instance, an old and a new tenement of flats of four and five rooms and kitchen. There are some very good specimens of the former at the east end of West Regent-street. In these, access to the flats is by a close going

right through the building, and perfectly open at both ends. At the back, on the ground floor, a paved balcony leads right and left to the staircases. Only one "house" enters from each landing, and only two houses are approached by each staircase.

In each house the water-closet has a good sized window to the exterior; the staircases are entirely of stone, and have no doors at the foot. In short, the hall doors are as nearly as possible independent entrances from the external air, and every apartment is lighted and ventilated directly from the exterior. Now, contrast with this a tenement of houses of the same number of apartments not yet occupied which I visited last week. The entrance to the upper floors is by a close such as we are all so familiar with, having a swing door at the front; this leads to a dingy contracted staircase, lighted by window 6 ft. high by 3 ft. wide. Two houses enter from each landing; and, as the tenement is four stories high above the basement, the staircase is the common entrance for six families. The water-closets are entirely without light or air, except what they get through a sheet of perforated zinc from the dingy staircase already mentioned. I did not venture into these, but tried to get an idea of their size by groping for the walls with my umbrella. A continuation of the stair below the street floor gives access to a wretched little back court, the chief feature in which is the ash-pit, where all the refuse of these eight families may be allowed to ferment and rot for months together. Such, gentlemen, is a tenement hardly finished, yet in one of the most salubrious and pleasant situations in the outskirts of our city; and I leave it to my learned friend or any other man to estimate the value of its arrangements in a sanitary point of view as compared with those of the tenement first described which was built before my day.

Since visiting this building, I have seen one of the same class in one of the finest situations on Hillhead, where eight houses enter within the one swing door, and the eight W.-C.s are lighted and ventilated from the staircase alone, and the said staircase has not even small windows; it has none but a skylight, which is closed and fixed. If we descend still lower in the class of dwellings, we find the change for the worse not so marked, but we fail to detect much change for the better. The houses of two apartments and of single apartments are almost all as bad as possible, whether old or new. Before passing from this subject I must refer to a mistake which is often made by the public in supposing that we architects have anything to do with the present state of this lowest class of house property. Whatever may be the case hereafter, I may say that, in times past, the builders of such houses have considered the services of an architect quite unnecessary, and it is the exception when even tenements of a superior description are put up under the supervision of an architect. But, gentlemen, other sanitary delinquencies crowd upon us. What, for example, have we done in the way of ventilating our common sewers,—a matter of the very greatest importance to the general health of the community. Indeed, I think this is by far the most important sanitary measure which can engage the attention of our authorities,—the effectual trapping of house-drains, and the complete ventilation of sewers. It is now nine years since I insisted on the importance of this in a paper read before this society. About that time, as now, many schemes for purifying the river and for utilising the sewage were propounded, and there was a general agreement that "something must be done." I ventured to assert that the purification of the river, however desirable, was of very secondary importance compared with the efficient drainage of the city and the thorough ventilation of its sewers, and I am still more convinced of this now. I must not, however, attempt to illustrate this subject at present. This has been very admirably done in a recent number of the *Builder*, in an article entitled "What there is still to do in Glasgow," which I strongly recommend to the attention of any who have not seen it. The writer of that article adverts to many other defects in our sanitary arrangements,—such, for example, as the disgraceful state of our streets in regard to scavenging—worse certainly than in any city I have visited—the filthy and dilapidated condition of footpaths, our system of accumulating refuse in ashpits, the condition of the river—that standing reproach—and other things of less consequence. Now, gentlemen, we have been alive to the existence of these evils for years—our knowledge of their operation and effects has been

come more and more precise and complete, but we have been contented year after year to speak about them and to do nothing, absolutely nothing. They are all (except the purification of the river) capable of being soon disposed of, without even great expenditure, and I think it well becomes us, the members of this society, to lend all our influence towards this desirable consummation. We cannot, I am sure, direct our efforts to a more important end, or one which will more conduce to the health and so to the happiness of our fellow-citizens. We are professedly a body of men who know more about these matters than other people; but while our proper function is this our collective capacity is educational; we are bound in our individual capacities to do our best to carry into effect those measures of practical sanitary reform which are omitted by our own and contemporary discussions and researches.

Professor Gairdner, in the course of a speech made afterwards, said that he concurred in the remarks which had been offered by the chairman with reference to the purification of the river. He believed that the architect had ten thousand times more to do with improving the health of Glasgow than the engineers who would improve the state of the river, and he did not hesitate to repeat what he had said at another society meeting, although he by no means approved of having a dirty river, that the injury to the health of the inhabitants by the river was excessively small, scarcely anything at all, while that from imperfectly constructed houses stared them broadly in the face. Although no doubt the business of an architect must always have a great relation to the ornamental, it also looked to them to give the public good, comfortable, well-ventilated houses. He believed in what the chairman had said, that it was not architects who were to blame for the present state of matters. The public had got it into their heads that they did not require an architect to build houses, and the consequence was, they were always being built upon the same bad models. The most modern buildings in Glasgow were, as a rule, just as bad in construction as the old houses in the centre of the city which were now wanted to be taken down. There were common stairs in Garnet-hill quite as bad, in a sanitary point of view, as those in the centre of the city, although not so dangerous, on account of their not being so overcrowded.

THE WILTS ARCHEOLOGICAL SOCIETY'S CONGRESS AT HUNGERFORD.

The members of the Wiltshire Archeological and Natural History Society held their annual congress at Hungerford a few weeks since, and examined the objects of interest to be met with in that town, and also in the villages dotted here and there at that end of the county of Wilts, Hungerford itself standing partly in Wilts and partly in Berks.

At the general meeting it was stated in the report for the past year, that the total number of names on the books of the society was 331, and the finance report exhibited a balance of 250l. in favour of the society. After the president, Sir John Awdry, had delivered an address, Mr. W. L. Barker read a paper "On Hungerford." Dinner was afterwards served in a marquee, at the Bear Hotel. In the evening there was a conversation in the town-hall, and Mr. H. Godwin, of Newbury, read "Notes on a recent Visit to Wrocester, the ancient City of Uricoinum." This was followed by an essay on the "Ancient Earthwork Enclosures on the Downs, supposed to be Cattle-pens," by Mr. Smith.

The next day the members made an excursion to some churches and other buildings in the neighbourhood. The party first visited Chilton, where they examined the church. They then went to Littlecot House, Ramsbury Church, and the old Manor House, erected in brick, from Inigo Jones's designs. This house belongs to Sir Robert Burdett, son of the celebrated Sir Francis Burdett, and resident in Paris: for nine years he has neither lived here himself nor allowed any one to tenant it. At Ramsbury Church there is a tablet bearing the names of members of the Burdett family, but the party were astonished to find that although Sir Francis Burdett and his wife were buried there (on the same day), nothing is visible recording that memorable fact, and they were informed by a parishioner that through some family differences, Miss Burdett Coult's is prevented from erecting in the chancel a memorial of her deceased parents.

Leaving Ramsbury, the party went to Crowood, where they were hospitably entertained by Major Seymour. They next went to the village of Alkbourne, which Mr. Black said remains just as the Romans left it. The church was visited.

The party then returned to Hungerford, and had luncheon at the Bear Hotel, after which the journey was resumed with a visit to Upper Upton, which was so decidedly up, with the wind in their faces, that it was no easy task to reach this summit of the Downs. Here the party examined the ancient house of large proportions, built from the ruins of the hunting-seat of John O'Gaunt, where canonic tiles and other relics have of late years been found. Memory Fort was to be included in the excursion, but darkness was approaching, and the members returned direct to Hungerford.

ST. GILES'S CHURCH, EDINBURGH.

A MOVEMENT has been set on foot by Lord Provost Chambers, for the restoration of the choir of St. Giles's Church, the tower of which forms one of the most picturesque and marked features of the old town. This tower, or that of St. Nicholas, at Newcastle, gave the hint to Sir Christopher Wren for the tower of St. Dunstan's, but the latter falls far short of either of them in effectiveness. Opinions differ as to whether St. Nicholas's or St. Giles's bears off the palm: while the former is lighter, and probably more graceful, the latter is more picturesque, both as to position and outline. The chapel attached to King's College, Aberdeen, has a similar but much inferior tower, and the same feature of an open crown is supposed to have surmounted the towers of the Abbey Church of Haddington and the steeple church of Dundee. Illustrations of all of these buildings will be found in "Billings' Baronial and Ecclesiastical Antiquities of Scotland."

A church is said to have existed on the site occupied by St. Giles's, so early as the ninth century, but the present building dates from the fourteenth. It contains the full complement of nave, transepts, choir, and aisles, and is of considerable extent, measuring 206 ft. from east to west, and the transepts 129 ft. from north to south.

In 1446, St. Giles's was constituted a collegiate church, by virtue of a charter of James III., with a regular staff of officiating priests, and it contained no less than thirty-six altars. At the time of the Reformation, this church was despoiled, but it did not suffer to the same extent as many similar edifices throughout Scotland; but the brass screens and other metal details were sold by the civil authorities along with many valuable articles of church furniture.

The edifice was thereafter divided, by solid walls, into four separate churches, and parts of it appropriated as a court of justice, a grammar-school, and an office for the city clerk. Charles I., while endeavouring to establish Episcopacy in Scotland, ordained St. Giles's to be the cathedral of the diocese of Edinburgh, with a chapter of a bishop, dean, and twelve prebends; but it does not appear that active steps were ever taken to convert the interior into a cathedral, and it still remains divided into three churches, occupying respectively the nave, south transept, and choir, the north transept serving as a vestibule. As might be expected, the interior presents the usual concomitants of heavy galleries, blocking up the aisles, high pews, and other evil features. The gaunt, bare, plastered walls of the north transept are relieved by a few marble tablets of questionable design; and in the south transept is an altar-tomb to the memory of the Regent Murray in the Elizabethan style, which has recently been restored under the superintendance of Mr. Cousins, the city architect. Many other monuments and brasses are said to have existed, but they have disappeared.

Up till 1817 the exterior of the building was not interfered with, except by the erection of numerous small shops between the buttresses. These shops were called the Luckinhoods, and were occupied principally by jewellers and book-sellers. After the destruction by fire of the "Parliament Close," which stood immediately to the north of the church, and the erection of the present "Parliament-square" in its stead, the luckinhoods were removed, and considerable alterations (they were called improvements in those days) were effected

upon the exterior, which amounted to a total destruction of every ancient feature excepting the tower, which fortunately remains untouched. The course adopted by the architect, Mr. Burn, was to encase the whole walls in smooth-rubbed freestone, and to re-design the doorways, parapets, pinnacles, and, in short, every detail, the result being simply abominable. An amusing anecdote is told illustrative of the *modus operandi* of restorers fifty years ago. One of the workmen employed on the great east window was overheard exclaiming to one of his colleagues, "Odds, man, I've got this mullion out down nice and sma', and if I cut aff ony mair the hail window 'ill fu' tae hits."

A partial restoration is better than none at all; but a satisfactory result will never be attained till the whole edifice is re-converted into one church. Were this resolved upon, and the restoration entrusted to competent hands, with a sufficiency of funds at command, St. Giles's might be made the finest church in Scotland; but there are other impediments to this desired-for result besides the primary one of expense: the charge could not be made a collegiate one without the sanction of the General Assembly of the Church of Scotland, and it is very problematical if that reverend body would sanction such an innovation.

We trust that in the restoration of the choir the exterior will meet with attention as well as the interior; indeed, the one depends upon the other, for the effect can never be good either without or within so long as the present meagre tracery remains in the windows.

SURROUNDINGS OF ST. PAUL'S CATHEDRAL.

IN the heart of the City, at the confluence of five of its busiest thoroughfares, there is a wide, expansive area, bound in by an ancient and heavy railing of iron, which, while it obstructs the free intercourse of traffic, disfigures the majestic face that it was designed to adorn.

On the north side, which, as it leads to the principal entrance and to the chapter-house opposite thereto, may be called the Via Sacra, a bar interdicts the passage of carriages, and the width of the driftway from Fleet-street, on the east end, is but 15 ft., increasing to 22 ft. in the average, but closing in again at the grand portal and circular steps to only 7 ft., and that inclusive of two stone blocks. The rest of this causeway, along which are ranged many fraterate shops and business houses for an extent of about 250 yards to the opening of Cheside, is in actuality a Strada Clausa, except for pedestrians, or for the access of wains so far only as the central barrier, to return east or west by this way they entered.

On the south side the traffic road is wider, in some parts, towards Cannon-street, being of ample breadth; but at the east end it is cribbed and restricted in the most absurd way by the convolutions of the massive iron railing, which absolutely detracts from the building to which it ought to be subsidiary and ornamental. The entire traffic of London is forced to take these two sides, the south being 250 yards, the east 170 yards, making together 420 yards, and being 170 yards in excess of the north line, which would, if opened, form a direct communication between the Bank and the West-End. Besides that, the Cannon-street line, which will soon be more crowded by the new street from Blackfriars, requires separation in the torrents of traffic by Paul's Chain.

If there were any symmetry in the iron railing, or if the inclosure were filled with gorgeous tombs, there might be some plea for the maintenance of an iron barrier so lethal to trade, so unsuited to the enormous carriage traffic of London; but there are, in fact, no tombs nor gravestones, except in the north-east angle; and the unrivalled cathedral would be much better viewed if this hideous fence were removed, and a line of low railing or light balustrade were drawn along a reserve, equal in width, to the extent of the portico steps, on the south and east sides, with perhaps a little wider but still equal reserve on the north side, and if the whole of this unused and desolate interior space were thrown into a grand piazza, for the use of the public, the accommodation of trade, and for the glory of Sir Christopher Wren's grandest monument.

On the west side there is an extensive paved Largo, or Campo Santo, near the centre whereof,

opposite to the grand west portal, stands the statue of Queen Anne: the new fence might be placed so as to enclose this handsome royal monument, with appropriate gates of entrances, if the Dean and Chapter should think such a reserve requisite for grounds where no interments had ever been made. The rest would, in addition to the other surrounding liberated spaces, form an extensive and imposing area, from which the Cathedral could be viewed to advantage *without an iron screen*; and the few tombs that might be disturbed on parts of the south-east and north sides could be transferred to suitable mansions, where the names and legends are unnoticed, and for the most part illegible and undistinguishable; or a mural tablet inside the church, might more suitably reveal the names and designations of the transferred remains. A uniform ground-line, with massive granite curbs, and a continuous strong but light iron rail, would set off the edifice; and the removal of the oval projections, opposite Doctors' Commons and St. Paul's School, would at same time clear the way and open the aspect.

When St. Paul's was first designed, the surrounding routes were ample to accommodate the commercial requirements of an age of pack-horses and small wains. Now both population and trade have increased, as the metropolis has also extended, over twentyfold. It cannot be apprehended that the Church will stand in the way of great public requirements, or that they will uphold antiquated barriers which disfigure the cathedral whilst they cripple free intercourse.

QUONDAM.

SMOKE AND SEWERAGE IN THE POTTERIES.

A CONFERENCE of members of the various governing bodies of the Potteries has been held at Stoke-on-Trent, for the purpose of considering the questions of the consumption of smoke and the disposal of sewage. The mayor of Henley presided, and there were present representatives from all the towns in the district.

Alderman Boothroyd stated what had been done in reference to the question of smoke by the Hanley town council.

A committee, appointed by the council, had made inquiries of twenty-nine towns, in ten of which the consumption of smoke was enforced; in five of which smoke was partially consumed, in thirteen of which the consumption of smoke had not been attempted, and one where not only had there been no attempt to enforce the consumption of smoke, but the town surveyor declared all consuming apparatus to be "bosh." The result of the inquiries of the committee clearly proved that there were no trades carried on in this district but what might, to a considerable extent, consume the smoke at present evolved.

The alderman then read a report of the committee, in which the smoke-producing sources in the Potteries were classed, and the means of ensuring the consumption of smoke in the different classes discussed. The most annoying and injurious source, and the most difficult to deal with was the calcining of ironstone. The smoke and gases from ironstone might be consumed by the adoption of Mr. John Ojers's patent. Smoke from iron furnaces could be consumed by the adoption of plans which were named. The ovens and kilns in potteries could, the committee believed, be also dealt with, and to the advantage of the manufacturer, and there was no difficulty in regard to other chimneys. The Act could be at once applied to slip kilns and steam-engines, but as to ovens, it might be left a little longer, in order to ascertain what was best to be done with them. They would be better able to tell in six or eight months' time what to do.

After some discussion, it was resolved, with one dissent,—

"That the local governments be recommended to give notice that the smoke-consuming clauses of the Sanitary Act of 1866 be put in operation forthwith in the cases of slip kilns and engine chimneys, and such like chimneys, and that pottery ovens and ironworks' chimneys be referred to the Chamber of Commerce and the Coal and Ironmasters' Association."

A committee was then appointed to watch the carrying out of this Act in the cases in which it had been decided to recommend the enforcing of the smoke clauses, and also to deal with the question of fully carrying out the clauses by applying them at a future time to the chimneys at present excepted.

The conference then went into the sewerage question, which was discussed at some length.

At a meeting of the Henley Town Council the surveyor, Mr. Smith, reported on both subjects

what the committee (including himself and Mr. Boothroyd) had done, and what they recommended. On the subject of sewage, Mr. Boothroyd remarked, in the discussion which followed, that a district sewerage system would not be so formidable a matter as some people seemed to suppose, the estimate of Mr. Smith, the contractor, being something under 40,000l. for the sewer, without the purchase of the land: the surveyor said 32,000l. would suffice; and another member of the council stated that the Duke of Sutherland would take the sewerage. The surveyor seems to have laid great stress upon the dry-earth system of treating excreta, but it was remarked that this system would involve them in considerable expense, and would not obviate the going of filth into the general sewerage system, and the pollution of the river. Regret was expressed that in the north of the district an outfall sewerage was likely to be opposed.

The surveyor's report was received, and the matter referred to the Town's Improvement Committee.

BIRMINGHAM.

THE memorial stone of the new church of St. Nicholas, which is to serve a district of the parish of St. Stephen, has been laid by Mr. Frederick Elkington. The new church is to accommodate 600 persons. It consists of a nave with two aisles, a chancel, an organ, chapel, and vestry. The extreme length is 104 ft., and the extreme breadth of the nave and aisles 56 ft. The nave is 26 ft. wide, and 56 ft. high to the ridge. The nave is separated from each aisle by five brick and stone arches, carried on columns of Bath stone. Above these arches is a lofty clearstory, by means of which the church will be principally lighted. The roof is of timber, and will be open to the ridge. This chancel is lighted by means of a large eastern window of five lights, the head of the window being filled with geometric tracery. The total height of the chancel is 50 ft. The church is being built almost entirely of brick, the bell-turret, copings, and east and west windows, and entrance doorway, being the only portions of the exterior which have stone dressings. The style is Geometric; but, from the nature of the material used, it differs from the old typical forms of that style. The total cost of the church will be about 3,550l. The architects are Messrs. Martin & Chamberlain; the contractors, Messrs. W. & J. Webb. Messrs. Elkington give the site.

The corner-stone of the new church of St. Augustine, Hagley-road, Edgbaston, has been laid by the Bishop of Worcester. The new church will be situated on a site given by Mr. Joseph Giltott, near the corner of Hagley and Rotton Park roads. It will be cruciform, and consist of a chancel, nave, north and south aisles, north and south transepts, &c. The internal measurement will be from the western door to the inside line of the apse, 122 ft.; from wall to wall of the aisles, 52 ft. 10 in. Over the south transept a tower will be erected, and when the spire is built it will form the point of convergence of four avenues leading up to the church. The nave will be divided from the aisles by two arcades of five arches each, resting on round piers with carved capitals, and surmounted by clearstories. A plinth of Darley Dale stone will run round the base of the church, and over the plinth the wall will be of Box-ground stone, with occasional hands of Hamstead stone. Internally the church will be faced with grey and red Bromsgrove stone, piers and dressings of Corsham Down stone. The roof will be open, the arched ribs of the principals resting upon clustered shafts, with carved capitals. There will be accommodation for 700 persons. It is intended eventually to raise the spire to a height of 200 ft., but at first only 30 ft. of the tower will be erected. The cost will be 5,500l. Mr. Chatwin is the architect, and the builder is Mr. William Partridge.

A new site for the Aston Union workhouse has been purchased in Luckcock's-lane, near the Gravelly-hill Railway Station, containing about ten acres of land. Upon this it is intended ultimately to erect a new workhouse, with schools, infirmary, &c., complete. For the present, only a portion of the schools is erected. The work has been undertaken by Mr. Yeoville Thomason.

The schools, when completed, will provide accommodation for 250 children, in the proportion of 100 boys, 100 girls, and 50 infants. The

ventilation is arranged by a series of air trunks under the floor, with gratings in the floor to open and shut, and the foul air is passed off into extraction flues immediately underneath the ceilings. These are also covered with gratings to open and shut, the whole being of simple character, and not liable to get out of order.

The water supply will ultimately (at present it is only temporary) form a part of an extensive scheme for supplying the entire house, and will be obtained from a deep well sunk on the premises, and raised to cisterns placed at high levels by means of rotary pumps. The soft water from the roof is collected into extensive cisterns placed under the washhouse and laundry, capable of holding 10,000 gallons. The drainage, by reason of a good fall, is easily conveyed away to the agricultural land adjacent.

Externally, the whole of the buildings are of red bricks, with blue bricks to all plinths, strings, arches, &c., and moulded bricks to the windows and principal cornice, with stone, where required, for constructive purposes. All the roofs are covered with blue tiles; all the windows have double-hung sashes, as being superior to iron. Internally, the woodwork is stained and varnished. The staircases are of stone, the passages, &c., laid with quarries, and all day-rooms and dormitories hoarded. All ornamentation is avoided.

The cost of the whole, including engineers' work for the water-supply, boundary-walls, roads, and approaches, was estimated at 8,500l.; but as this was in excess of the borrowing powers of the guardians as allowed by Act of Parliament, it was determined until the full amount could be obtained to omit the dining-hall, infants' rooms, a portion of the offices, palisading, &c. The present outlay has therefore been limited to 5,200l. The works have been carried out by Messrs. Jeffrey & Pritchard, of this town, under the superintendence of the architect.

The Board of Governors of the Children's Hospital in Steelhouse-lane have resolved to lease, for ninety-nine years, a piece of ground in Steelhouse-lane, on which to build a new department of their hospital for out-patients.

OXFORD IMPROVEMENTS.

THE local papers, as usual, report progress on the architectural and building improvements of the city. These seem to show a gradual progressive movement, and a determination, on the part of the University especially, to renovate and restore what was becoming dilapidated,—an example which the city itself has not been slow to imitate. We cannot just now enter into the numerous improvements recorded in the *Local Journal and Herald*; but we may select two or three as a specimen, and first of the University:—

The important work of rebuilding the greater portion of Balliol College, and the Master's Lodgings, which was contemplated last year, has been vigorously proceeded with. The old buildings in Broad-street were pulled down in April last, and rapid progress is being made in the erection of the new ones, as upwards of a hundred men are employed upon the works. Miss Brackenridge gives the sum of 20,000l. towards the undertaking. The new building is not raised to a sufficient height to enable one to judge of what its peculiarities will be, but it is intended to build a finer front than the old one, to make a higher and more elaborate tower, and there will be some Oriol windows less confined than in the previous structure. The architect is Mr. Waterhouse, and the builders are Messrs. Brass & Co., London.

In addition to the library of All Saints' College, a law library has been formed, consisting of a room 50 ft. long and 16 ft. wide. It has an open timber roof, with panels of glass, and a glass ceiling at the line of collar-beam. Mr. Bruton was the architect, and Mr. Wyatt the builder.

The completion of Worcester College Chapel restoration is being proceeded with. All that remained to be done was the laying of a new floor down the centre, from the entrance to the altar, and this work is being done by Messrs. Fisher & Harland, of London. It is being executed in a most costly and elaborate manner, and some portion of it is laid down; but the nature of the design is of so complex a nature that much time must necessarily elapse before it is completed. The principal material used is polished marble, arranged in the form of tessellated pavement, and the figures in the portions

now finished represent SS. Gregory, Austen, Ambrose, and Jerome.

A work of considerable importance and difficulty has been executed at the Radcliffe Library. It having been ascertained that the rain found its way through the roof into the interior of the building, under the direction of Mr. Gutch, the architect to the Radcliffe Trustees, and Mr. Thomas were instructed to ascertain the cause. They found that the lead was perforated in several places from the top of the cupola to the bottom of the dome, which terminates at the parapet where visitors generally have access to. The trustees held a meeting to consider the subject, and they directed Mr. Thomas to execute the necessary repairs. He then found that the injury to the lead was confined to those parts of the roof where it was in contact with the oak supports. In those places a gallate of lead was formed—a subject known to chemists as a combination of gallic acid, the active principle of oak, and lead. The lead had been destroyed in those parts where there were pins of oak, and nowhere else. The more arduous portion of the task of executing the necessary repairs arose from the difficulty of erecting scaffolding to the injured parts, but this was effected, and the whole work has been carried out without accident. As it is an established fact that it is impracticable to place oak in contact with lead, mahogany is now being generally substituted.

It is impossible to visit any of the suburbs of Oxford without observing the spirit with which building operations are being carried out, and the formidable list of applications to the Local Board at every meeting of that body, for permission to erect new dwellings, is conclusive evidence that before many years have elapsed the City of Oxford will have entirely outgrown its original bounds with greater rapidity than almost any other town, the manufacturing districts excepted. East, west, north, and south, the same progress is perceptible.

MR. E. L. BETTS, THE CONTRACTOR.

THE inhabitants of Maidstone and its vicinity have presented an address to Mr. E. L. Betts, on the occasion of his departure from Preston Hall. It expresses a deep regret at the circumstances connected with the cause of your departure, and their deepest sympathy with you under misfortunes so rarely paralleled, and so equally unmerited. During a period of nineteen years you have often been the originator, and always the promoter, of every measure that would tend to advance the science of agriculture, and elevate the character of the labouring poor. By your schools have been erected, reading-rooms opened, old charities have been sustained, and new ones established; your aims have been directed to the relief of the sick, and the support of the needy. What you and Mrs. Betts effected in the parish of Aylesford alone entitles you to the gratitude of its inhabitants, leaving marks in strong characters not easily effaced. Mr. E. L. Betts, replying from Betchworth, says:—"Obliged as I have been by adverse circumstances to leave a place so long cherished as a home, it is no small gratification to see my efforts to fulfil the duties of my position have been so generally and spontaneously acknowledged and appreciated, not only by my more intimate friends, but by so many with whom I have not the honour of a personal acquaintance. I trust are long again to become a resident in my native county, to which I am bound by so many ties."

NEW WESLEYAN CHAPEL AND SCHOOLS, PRINCE OF WALES ROAD, HAVERSTOCK HILL.

TOWARDS the close of last year a plot of land, of about half an acre in extent, adjoining the Tailors' Benevolent Institution, in the Prince of Wales road, was, after some negotiation, obtained by a body of trustees, who proposed to erect upon it a Wesleyan chapel and schools. Mr. E. L. Hoole, of Craven-street, was appointed architect, and received instructions to prepare designs for a chapel, to accommodate at least 1,000 worshippers, with schools for the education of 500 children. After vacillating for a short time between the Classical and Gothic styles, the trustees chose the latter, and the plans were accordingly prepared and adopted. Some considerable delay was occasioned by the necessity

of the trustees were under of obtaining the approval both of the authorities of the Tailors' Benevolent Institution and of the Charity Commissioners, by whom its affairs were for the time administered. But at length all difficulties were overcome, and the works commenced. A portion of the school-buildings is now rapidly approaching completion, and will be used as a temporary chapel until the funds for the permanent structure are raised. As 620 persons can be seated in the school-room, it will answer its immediate purpose in a very efficient manner for some time to come. Stock brick and Bath stone are the materials employed for the exterior of the school-buildings, which, though plain, are of a substantial character. It is proposed to open this first instalment of the premises on the last day of the present month.

Mr. Hobson, of the Adclphi, is the builder.

REPORTS OF MEDICAL OFFICERS OF HEALTH.

St. James's, Westminster.—Dr. Lankester's report treats fully of what was done last year *versus* cholera in the parish of St. James, Westminster. The mortality of 1866 was 769, or thirty-seven in excess of the average for ten years; but this was not owing to cholera, for during the quarter when it was prevalent in London the death-rate was less than in any of the other quarters of the year: so much for active sanitary warfare with this deadly epidemic. Sudden cold Dr. Lankester regards as a more deadly influence than any other.

St. Marylebone.—Dr. Whitmore states that sanitary work of every kind has greatly progressed, and is still progressing with accelerated speed in this parish. The type of the cholera was not of that formidable kind which has heretofore distinguished it; and no doubt if sanitary progress does continue it would become still less and less formidable. There were fifty deaths, however, from cholera, and 175 from diarrhoea. The overcrowding and deficiencies in ventilation in the dwellings of the poorer classes are much dwelt on in this report, together with the practical difficulties in the way of satisfactory amendment:—

"If the amount of cubic space necessary to healthy respiration be allotted for each inmate of a house, how many thousands in this metropolis will find themselves without a home to shelter them? In the poorer and more densely populated districts of St. Marylebone there are numbers of long dreary streets, the houses of which consist of not more than six or eight rooms. For the most part each separate room is tenanted by a separate family; and, in many, the cubic spaces afforded to each inmate does not exceed 200 cubic feet: in some instances that have come under my notice, it has been less than 100 ft. Now, as every one at all conversant with sanitary subjects well knows that each adult person requires at least from 500 to 400 cubic feet of house-room, some idea may be formed of the extent that will result if the requirement be granted; and yet every consideration of health and personal safety shows its absolute necessity."

Mill-end, Old-town.—Dr. Corner, like others of his colleagues, feels this to be one of the chief difficulties in the way of sanitary amendment. The new regulations, he observes,—

"Must be carried into effect judiciously and with much tact and discretion; this course has always been my aim, to ensure that the sanitary measures are efficiently carried out, without at the same time creating opposition or annoyance to the owner or occupier by unreasonable or impossible demands. I believe this system has been most effective in staying the progress of diseases by destroying their infectious properties in the places where they had become fixed. Recently, in the west ward of this hamlet, where fever has been very prevalent for several months, I have observed many marked instances of the success of the course pursued, whereas in houses in which such measures had not been adopted the disease continued to extend."

"A labouring man sleeping, or rather narcotizing, with his wife and family in a room allowing from 50 to 150 cubic feet of air to each person, and without the most ordinary provision for ventilation, becomes totally unfitted for his work, and unable, however willing, to bring to his aid sufficient vigour and spirit to attempt to raise himself from their condition of poverty, misery, and dependence. In this way the statistics of pauperism are increased."

"I am fully conscious of the difficulties in the way of a speedy and perfect remedy for these evils, but seeing that they are literally the cause of so much disease and death, I think we ought, so far as we may reasonably be expected, to endeavour to mitigate them, and to this end we can do much."

If it be impracticable, in the meantime, to carry out the restrictions as to cubic space which ought to constitute the ideal to be more or less approximated to, according to circumstances, then to supplement shortcomings in this respect the powers of sanitary officers to compel the making of as efficient arrangements for ventilation as possible in bedrooms ought to be very great. Here too, however, another difficulty presents itself, especially in the winter

months. The poor are generally but too ill off as regards warmth of bed and other clothing; hence chiefly their inveterate propensity to stuff up everything in the shape of ventilators whether accidental ones or intentional. Then again, what medical authorities tell us as to the deadly effects of cold on health (especially amongst the ill-fed) must be well considered, and above all else the evils of draughts. To ventilate a room properly without incurring the risk of suffering from draughts, especially in winter, is no easy matter. Still, approximations may be made to a more satisfactory state of matters than as yet exists; and with judgment and great discretion much may be further done to improve the health of the people even in the most crowded localities till more and better accommodation be supplied to them in future years, as it is earnestly to be hoped it will.

OLD BEWICK, NORTHUMBERLAND.

A SMALL Norman chapel at the foot of a heather-clad hill in the parish of Egingham, that has long lain in ruins, has been recently restored, and was opened for the celebration of worship on the 4th instant. On the top of the hill there is a Celtic camp, in the form of a semi-circular entrenchment, with a double fosse and vallum, and at the foot, as we have said, lies the pretty little Norman relic in question, as open to the skies and as deserted as the camp of the ancient Britons. All around the country is one vast undulation of hills and moors. The village of Old Bewick is three miles distant from the parish church, and it has long been in contemplation to restore the chapel for the convenience of the inhabitants. As the population in 1851 only numbered 191 souls, it has been a work of time to gather the required funds together. It is about twenty years ago that a report and designs for the restoration were first procured from Mr. Hardwick, who has now carried out the work. The chapel consists of a nave with a chancel which has an apsidal east end. To this has been added a small vestry at the west end of the north side, and a small porch in a corresponding position on the south side. The windows of the north and south sides, and in the apse, are remarkably small: they have been filled with stained glass by Messrs. Clayton & Bell. Those at the west end are somewhat larger and have a small rose window above them. The roofs are open-timbered, and covered with slates. The sittings are of white wood varnished. There is a small stone retable at the back of the communion-table. The most pleasing feature of the structure is the beautiful tint which exposure for centuries on the moorland air has given the interior stone-work as well as that generally submitted to external influences. The ornamented north arch into the chancel, and the small second arch over the apse, with the rest of the masonry, have been toned down into a silver-grey colour that is particularly in keeping. On the exterior this effect is not so noticeable, the new slates intruding modern associations. A single bell-turret strides the point of junction between nave and chancel. About 120 persons can be accommodated with seats in this secluded and interesting relic of old times. Such of our readers as may be travelling northwards in these torrid days, and visiting the unique herd of wild cattle in Chillingham Park, will be within a knapsack-walk of old Bewick; and within sight of other Celtic encampments, specimens of the newly-found inscribed stones, and of a natural cave called Cateranes' Hole, formed by a fissure in a freestone rock which descends to a great depth at an angle of 15 degrees.

THE COURT-YARD OF THE INDIA OFFICE, WESTMINSTER.

THE India Office, as all must know, forms part of the new pile of Government offices fronting Downing-street, St. James's Park, and Charles-street. The main entrance to it is from this latter street. The accompanying engravings illustrate the Court-yard, a rectangle in plan, about 115 ft. in length, and 60 ft. in breadth, which occupies a nearly central position in the building, and affords means of light and air to a large number of the rooms in the north, east, and west sides, and to a portion of the main corridor on the south side.

INNER COURT OF THE INDIA OFFICE.—Part of Upper Story Enlarged.

The general design of the architecture consists of three stories of engaged columns and piers supporting arches; the upper story being much more richly ornamented than the lower stories. On the south side the columns are detached, and are double. Above the third story are a plain frieze, with slabs of red granite, inlaid, and a cornice: this entablature breaks forward over the columns, and has large scroll shields on the projections. The top of the cornice is crowned by a balustrade. The ends are occupied by open loggias, two stories in height, the columns and arches corresponding with those in the main structure. On the ground and first floors the arches are all filled with glass between the piers, excepting on the south side, where the columns are two in depth, and the windows are here fitted to iron stanchions between the columns. The upper story all round has two-light windows, a baluster-looking mullion of rich design separating the lights. The total height from the floor of the court-yard to the top of the balustrade is about 80 ft.

The whole of the work is constructed of Portland stone; the Doric columns and pilasters of the lower story, the Ionic columns and pilasters and the pedestals of the second story, being all of Peterhead red granite, with the caps and bases of the columns of red Mansfield stone. The columns of the upper story are of dark grey granite, from the neighbourhood of Aberdeen, with caps and bases of grey Dean Forest stone. The effect of the architecture is considerably

enhanced by the introduction of this red and grey granite, and further by the frieze of the Doric story being in Della Robbia ware, the ground of which is of a greenish grey, with enrichments of toned white, and the frieze of the Ionic order is partially of tiles and of mosaic, the prevailing colours of which are blue, and shades of yellow and brown. In the spandrels of the arches of the Doric story are moulded fluted discs with red centres, and in those of the Ionic story are panels similar in material and colour to the Della Robbia frieze below, with a fret border of red tesserae.

The cornice of the Corinthian story forms an impost for the arches above. These arches are deeply recessed and coffered, and in them is placed a series of busts of celebrated worthies, both civil and military, connected with the Indian empire, beginning with Admiral Watson and Lord Macartney, and including heroes of recent historical renown, as Havelock, Clyde, and Lawrence. The back-ground of the busts is in each case formed by a large scallop shell with a branch of laurel and oak on either side. The total number of these busts is twenty-eight.

Amongst the architectural ornaments are introduced representations of the fruits and flowers of India.

At the four angles of the court are niches, which are filled with statues: the four on the ground-floor are of Marquis Hastings, Minto, Amherst, and Wellesley, sculptured by Mr. Protat; those on the first-floor, immediately above the others,

are Cornwallis and Clive, by Mr. Nicholls; and Warren Hastings and Teignmouth by the hand of Mr. Phyllers, who has also produced the four sculptured panels in high relief representing striking incidents in Indian history, and the shields of arms near them.

The loggia on both the ground and first floors have tessellated pavements of Maw's tiles, by Messrs. Simpson & Sons, of the Strand, by whom also the mosaic frieze was executed. The access to these is through four arched openings on each floor, richly decorated with carving, and in the jambs and arches are arabesque panels in low relief.

The court-yard is occupied on the basement-story by record-rooms, above which is a floor of tiles. A terrace-walk crosses the centre of the court-yard, both longitudinally and transversely.

The court-yard was used, it will be remembered, as a ball-room on the occasion of the entertainment given to the Sultan by the Indian Government, when its merits were brought out very prominently under the aspect of interior decoration.

The Della Robbia frieze was produced by Messrs. Minton, Hollins, & Co. Mr. Earp executed the carving, and Mr. Protat modelled the busts in the upper story. The builders were Messrs. George Smith & Co., of Piccadilly. The whole of this, as well as the interior of the India Office generally, has been executed from the designs of Mr. M. Digby Wyatt, under the superintendence of Mr. Daniel Ruddle, the clerk of the works.

INNER COURT OF THE INDIA OFFICE, WESTMINSTER.—MR. M. DIGBY WYATT, ARCHITECT.

INTERIOR OF PRESTON TOWN HALL.

THE interior of the new town-hall at Preston, recently opened, displays a considerable amount of decoration. The entrance-hall, which is on a level with the ground-floor, is approached by a triple archway. The ceiling is composed of highly decorated cast-iron girders, which support the stone landing above. The flooring is laid on tiles, 12 in. square, of Hoptonwood and red Mansfield stone, alternately laid. The grand staircase turns to the right and left, and after passing up a flight of steps the landing approaching the Guildhall is reached. Looking westward from this point there is observed on the wall which divides the staircase from the main portion of the building, an allegorical representation of Industry, having on the left hand an allegorical illustration of Manufactures, and on the right an allegorical illustration of Commerce. Beneath the allegorical representations are full-length portraits of Caxton, Columbus, Raleigh, Linnaeus, Arkwright, Watt, Sir R. Peel, Dalton, George Stephenson, and Wheatstone, each bearing a device. Leaving the grand staircase by the east, the great hall is approached. The room is 82 ft. 6 in. by 54 ft.* The height from the floor to the apex of the roof is 48 ft. There is a spacious gallery on the south side, approached by a corridor running along the east side. The gallery is 69 ft. long and 15 ft. wide; and it is calculated that, exclusive of the accommodation for performers and others, about 1,100 persons can be seated in the room. At each gable there is a circular window. The east window contains seven compartments, and in the centre is one bearing the arms of the county of Lancaster. There are also emblazements of the arms of Preston, Liverpool, Manchester, Clitheroe, Wigan, and Lancaster. The west window has also seven compartments. The centre bears the arms of the United Kingdom, and surrounding it are the arms of England, Ireland, and Scotland, and the first Lancastrian sovereigns,—Henry IV., Henry V., and Henry VI. The other windows are all formed of stained glass, each window having alternately a medallion containing the arms of the borough of Preston, and the red rose of Lancaster. In the circles above the large windows are emblazoned the arms of Blackburn, Bolton, Burnley, Rochdale, Stockport, Oldham, Salford, and Warrington. In a circular opening on the west side are representations of the beads of Henry IV., Henry V., and Henry VI. Beneath the spring of the roof are portraits of the following celebrities:—Percell, Mozart, Handel, Beethoven, Mendelssohn, Faraday, Humboldt, Sir Humphrey Davy, Newton, Bacon, Herschell, Clive, Cook, Sir J. Franklin, Dr. Livingstone, Nelson, Wellington, Michelangelo, Raffaele, Titian, Reynolds, Flaxman, Wren, Gibbon, Goldsmith, Dr. Johnson, Addison, Macanlay, Chaucer, Shakspeare, Milton, Scott, Byron, Burns, Hunter, Harvey, Cuvier. On the west side, within the space devoted to the gallery, are also the shields and names of several benefactors to the town. The gallery is divided from the main roof by an arcade of four bays. The front of the gallery is open. The ceiling is supported by five pairs of principals, which are moulded, stained, and varnished. The ceiling of the main part of the hall is divided into 120 panels with carved ribs. The roof is supported on the south side by fluted iron columns. The orchestra is on the north side. On leaving the Guildhall by the principal entrance, the retiring-rooms for ladies and for gentlemen are passed, and on the right is a room to be devoted to committees connected with the Town Council. The lobby running between this room and the landing is richly vaulted. On the left, at the north end of the edifice, is the mayor's parlour, containing the arms of the present mayor (Mr. Birley), the arms of the Guild mayor (Mr. Parker), and the arms of the borough, which are carved on the stone fireplace. In the lobby approaching the council chamber the vaulted ceiling is filled in with Longridge blue stone and Bath stone alternately. At the north-eastern angle, and nearly facing the mayor's parlour, is the council chamber, which is 35 ft. long, 25 ft. broad, and 16 ft. 6 in. high. It is lighted by five two-light windows. The cornice consists of wood; and immediately under it, on the right side, is a coloured band, containing on shields the arms of all the known Guild mayors of the borough, from 1328 to 1862, inclusive. Between each shield are three roses, representing the historic rose of Lancaster, with the word "Lancastria" on the twisted

riband underneath. On the left side is a similar number of vacant shields, intended for the arms of future Guild mayors. The chimney-piece consists of carved red Mansfield stone, supported by Rouge Royal marble pillars, and surmounted by a shelf of Irish green marble. In the centre of the carved work are the borough arms. Leaving the council chamber, and proceeding in a southerly direction, a large committee-room is approached, measuring 26 ft. by 21 ft., lighted by two two-light square-headed windows. The chimney-piece is a handsome one, and bears at each side the borough arms. The vestibule, which is immediately opposite the entrance to the Guild-hall, has a floor of inlaid marble, variously coloured. Over the doorway leading to the Guild-hall is a sculptured allegorical representation of Music; over the gentlemen's retiring-room is a representation of Painting; over the ladies' retiring-room, Sculpture; and over the committee-room, Architecture. Over the door of the council chamber the borough arms are sculptured. The sky-light over the vestibule is filled with various heraldic shields; and the sky-light over the landing contains the arms of the mayors of the borough since the passing of the Municipal Reform Act. On the walls of the vestibules are representations of Peace and War, on land and at sea; and, running along the ceiling, is a representation of one of the Guild festivals. Beneath the mayor's parlour, on the first story, is the town clerk's office, with accommodation for his clerks adjoining. Under the council chamber is the office of the borough treasurer, and he has also a room for his clerks. The ground-floor contains the Merchants' Exchange. The ceiling is vaulted, and is supported by eight large polished granite pillars, with carved capitals in Penwick stone. There responds to the granite pillars are sixteen in number, and are formed of Devonshire marble. The Exchange also contains two hooded chimney-pieces, very elaborately carved, and containing in the centre the borough arms, supported by angels bearing shields, and also by small pillars of Rouge Royal marble.

TOWN v. COUNTRY.

Sir,—I was very much struck with a little passage of criticism in the *Builder* of September 15th. A North-Northamptonshire rector, whom you properly corrected, was proved guilty and convicted, in the first place, of the sin of omission in showing himself ignorant of the author's very name, and secondly, of the sin of commission in mangling and mis-quoting the beautiful and highly-suggestive line in Cowper,—

"God made the country, and man made the town."

Being struck with your criticism, I fell a thinking on the subject; and soon began to remember that I had somewhere read an elaborate argument against the poet's apothegm regarded as a philosophical truth. In fact, I remembered to have seen it laid down somewhere as an indisputable proposition, that God made the town as well as the country! I could not, at the moment, call to mind the author's name; nor could I recollect the precise phraseology in which it was expressed. Indeed, I could not lay my hands on the passage for several days; and I may as well tell you the process of reasoning by which I ultimately discovered it; for it may be useful to other people of short or failing memory like myself.

Being kept awake one night with the violence of the equinoctial gales, this paradox (for such I more than suspected it to be) came, like an unhidden guest, into "the chamber of my inmost thoughts." Who was its author? Where could I have read it? I could not tell. After a long taxing of my fugitive and somewhat treacherous memory, I hit at length on the idea of writing out the problem by the old process of syllogistic reasoning, which proceeded to do as follows. I do not know that the method is strictly accurate; but it did the business:—

Proposition I.—

"God made the country,
Man made the town."—Cowper.

These conjoined propositions I regarded as indisputable.

Proposition II.—

"God made the country,
God made the town."—Unknown.

First premiss admitted; second, *quære*.

Argument.—If God made the town (*universally*) He made every part of the town

(*particularibus*). Therefore God made Houndstitch or Bethnal-green—which is absurd.

Proposition III.—Author's (unknown) meaning must have been that God, *through man*, made the town.

Argument.—But God, through man, also made part of the country (fields, gardens, trees). Inconsequential, therefore, and incomplete.

Proposition IV.—Author's (unknown) meaning must have been that God made man, and man made the town.

Such, I supposed, must have been the identical language. And now for the author. On the principle of excluded middle this proposition signifies that God is the maker of the town,—is responsible for the errors of the town—in one word, that God made Bethnal Green. But no account is taken of man's responsibility and free-will. Accordingly, it is simply a distorted phase of the doctrine of inevitable necessity, of which there is an old, old illustration in existence. ["The woman that *Thou* gavest me," &c., Gen. iii. 12.] I then proceeded upon the exhaustive method:—

Proposition V. No English author could have written this.

Proposition VI. No German author would.

Proposition VII. It must, therefore, have been a French author.

Argument.—Voltaire? No. D'Alembert? No. Rousseau? Very likely.

But Rousseau died in 17—, and Cowper published his "Task" in 1782. It must be, then, a modern writer of his school, or the schools which sprung from his philosophy.

Argument.—A. The *Pantisocratists*. B. The *Egalitaires*. C. The *Socialistes*. Probably Fourier.

Proposition VIII.—That Fourier was in all probability the author of the dogma that God made man and man made the town. (See "*Le Phalanctère*")

At this stage of the argument I fell asleep. Next morning I discovered, not that Fourier or the French socialists had evolved from the tremendous depths of their perverted consciousness this formidable dogma; but, to my great surprise and astonishment, that it had sprung—fully armed like Minerva from the forehead of Jove—from the fertile imagination of a Scotch political economist! My deductions, it is proper to state, were to some extent correct with regard to the school from which it had emanated. For, while searching in a volume in which, as I now recollect, were discussed certain doctrines of the French socialists, I stumbled across the very passage I wanted. You will find it in Mr. Stirling's translation of Frederick Bastiat's well-known "*Harmonies of Political Economy*"* (at p. 36 of the Introduction). I have ventured to transcribe it for you literally, and I have quoted a few lines of the context in order to render the passage intelligible:—

"Bastiat was not one of those pessimists who persist in looking at the existing fabric of society as if it were some ill-made, ill-going clock, requiring constantly to be wound up, and to have its springs adjusted, its wheels lubricated, and its hands altered and set right. Far from this, he regarded society as a self-acting, self-regulating mechanism, bearing the stamp of the Divine hand by which it was constructed, and subject to laws and checks not less wise, not less immutable, not less trustworthy than the laws which govern the inanimate and material world.

"God made the country, but man made the towns" [*sic in originalis*], was the exclamation of an amiable but a morbid poet. He might as well have said, 'God made the blossom, but bees made the comb.' Reason asks, Who, then, made the bees? Who made man, with all his noble instincts, and admirable inventive reasoning and reflective faculties?

A manlier, because a juster, philosophy enabled Bastiat rather to say with Edmund Burke, 'Art is man's nature.' Looking at the existing fabric and mechanism of society, and the beautiful harmony of the economic laws which regulate it, he could see nothing to warrant constant legislative tampering with the affairs of trade. He had faith in moral and material progress under the Empire of Freedom. Sweeping away all Socialist Utopias and artificial systems of social organization, he pointed to society as it exists, and exclaimed, '*Digitus Dei est hic*.' Unlike the sickly poet, he believed that the same good and wise Being who created both town and country upholds and sustains them both; and

* The Exchange-room is 82 ft. 6 in. by 39 ft.

* See London: John Murray. 1863.

that the laws of value and exchange, left to their own free and beneficent action, are as much His ordinance as the laws of motion, attraction, or chemical affinity."

I will not take up more of your valuable space with pointing out the fallacies which underlie this argument. When the astute author has got the length of comprehending the difference between the instincts of bees and the reason of mankind, I shall then condescend to break a lance with him in defence of the fine philosophy and high-toned morality of Cowper. In the meantime I conclude by quoting, with your permission, a few more lines of the noble passage which, in my opinion, deserves to be written in letters of gold:—

"God made the country and man made the town:
What wonder then that health and virtue, gifts
That can alone make sweet the bitter draught
That His holds out to all, should meet abroad,
And least be threaten'd in the fields and groves?"
The Task, book ii.

Rus.

THE RAILWAY COMMISSION FOR IRELAND.

A CORRESPONDENT writes,—I suppose you observed the appointment of the Railway Commission for Ireland. There are some good names amongst them, but it appears to me there is no representative of the cheap railway system alluded to in your recent paper on the subject. I think on all these commissions all interests should be represented, otherwise it will be all one-sided, and not satisfy modern requirements; and surely those men who have helped to get our English system of railways into their present fix are not exactly the men to help the Irish out of theirs. The present Government have been tolerably fortunate in their selection of men for their public commissions; but I think in this instance they have omitted an essential element of the inquiry; as I presume it is the intention to bolster up that which has been shown to be utterly rotten and unworthy, as dividends prove.

SOUTHWARK PARK.

SIR,—I regret very much that you should be misinformed as to the progress of Southwark Park. I have seen the same statement elsewhere, and took no notice of it; but, when such a paragraph becomes inserted (in all good faith) in the *Builder*, it is a very different thing. Then it acquires importance.

The park is not "rapidly approaching completion;" it is not much more than begun. No "gardeners and labourers are employed in laying out the flower-beds and walks, and in transplanting young trees, evergreens, and flowering shrubs." So far from its being true that "the walks are gravelled and completed;" they are not, except here and there a bit at the side of the partially-formed road, even commenced. So far from its being true that "it is expected the park will be opened to the public on or about Christmas," it is, on the contrary, expected that two or three Christmases must come before that "opening" occurs.

It has been publicly stated that "the works of the Southern Embankment are nearly completed." You are aware that the total contract for that embankment is 300,000; and, by the engineer's report to the Metropolitan Board, the progress of that work to the 1st instant was (including 23,870, for materials on the ground) 139,730, leaving 171,000, to do!

My heart is so set on the rapid improvement of London, that I could not allow the above-mentioned paragraph about Southwark Park to stand in the *Builder* without a word.

ABSQUE LABORE NILL.

CONCRETE WALLING AND THE BUILDING ACT.

SIR,—There is something so questionable in the quasi-authoritative assertion of the Camberwell District Surveyor that concrete walling is not properly bonded within the meaning of the Building Act, that, perhaps, I may be allowed a little more space in examining a conclusion which, if endorsed, must exclude from the whole metropolitan district a material elsewhere successfully adopted in solving the problem of erecting economical, healthy, and durable habitations for the labouring classes.

The very word concrete, importing a mass formed by concretion, or the coalition of separate parts, is significant of its derivation from the essential fact of the materials composing it being efficiently bonded or connected.

"In masonry or brickwork," Gwilt says, "bond is that disposition of stones or bricks which prevents the vertical joints falling over one another." Concrete being so homogeneous in texture that there are no joints, its close bond can scarcely be considered inferior, as such, to that of masonry or brickwork. Then comes the question of solidity, or how far the respective materials resist crushing and hold together. On this point, recent impartial and conclusive testimony may be cited. In his report on healthy and economical dwellings, written for the English Commissioners of the Paris Exhibition, Mr. Edwin Chadwick says:—"It is proved that with a proportion of from one-fifth to one-eighth of Portland cement to sand, gravel, or small stone, a wall may be made one-third stronger than common brickwork; or, with concrete, a wall may be made of equal strength with one-third the thickness of

common brickwork, and of equal thickness about one-half the price. The common brick absorbs about 20 per cent. of water. The concrete's wall does not absorb one-quarter that quantity." Further, he remarks that the principle of concrete construction is that "everything is made, as it were, in one piece." Yet such are we now gravely informed, is not properly bonded, although its compressive strength, as in some concretes manufactured by M. Coignet, is often something enormous. Even flat roofs of wide span are formed of concrete, without what Mr. Chadwick elsewhere notes, "the insecurity of numerous mere common mortar joints;" and the workmen's dwellings erected by the Emperor of the French, with others in this country, practically exemplify the value of the system.

Next, turning to the Building Act, as you, sir, who had something to tell the Institute about concrete thirty years ago, and can speak officially on the Act, indicate, "the construction of concrete houses is not prevented by it." One section provides that,—"Every wall constructed of brick, stone, or other similar substances, shall be properly bonded and solidly put together with mortar or cement." That concrete walls fulfil these conditions appears manifest from Mr. Chadwick's report. If they are out of the Act, it must surely be because their bond is more effectual than that contemplated in it. "The thickness of any wall of a dwelling-house, if built of materials other than such bricks as aforesaid, shall be deemed to be sufficient if made of the thickness required by the table, or of such less thickness as may be approved by the Metropolitan Board." In this latter case also, I submit, when it is proposed, on account of their superior strength, to erect concrete walls thinner than the thickness prescribed for brickwork, in these rare occasions to apply to all to the Board; not when the walls are the tabulated thickness, or one-third more if horizontal bedding is urged; and not under sect. 68, until better evidence is adduced to class them with "buildings to which the rules of the Act do not apply, and for the purpose of which the rules of the Act are not intended."

But if, after all, it is true that, notwithstanding the severe tests of strength concrete has successfully sustained, it cannot be even "said to be properly bonded" in the sense intended by the Legislature, but that it is so undefined both by the officer who insists on "strict technical" purport and in the Act itself; then it seems, indeed, clear that the fulness of time has arrived for modifying or abrogating an enactment which admits of such misapprehension and mystification, and also unsuited to the legitimate requirements of the age.

E. L. TARRANT.

CLOYNE CATHEDRAL COMPETITION.

SIR,—A brief recapitulation of facts, without any comment on our part, will be sufficient answer to the lengthy communication from Messrs. McCarthy and Goldie on the above subject, which appeared in your journal of the 11th inst.

Three gentlemen are invited to enter a competition on certain stated conditions. Two of the gentlemen thus invited, without consulting the third, conclude for the purpose of effecting a total alteration of the terms of the said competition. They endeavour to impose upon the committee a set of "amended conditions," drawn up and signed by themselves, and then send them to the third competitor for signature,—having, however, previously done their utmost to secure two things,

1st, That their "amended conditions" should be binding on the third competitor, whether he signed them or not.

2nd, That his refusal to sign would make a bad impression on the committee.

The third competitor (1), not recognising the right of the other two gentlemen to interfere in the matter they had done, and (2) seeing no reason for departing from the original conditions, which he had already unreservedly accepted, refused to sign.

At last, after repeated but ineffectual efforts on the part of the coalition to force their "amended conditions" upon the committee, and obtain the signature of the third competitor thereto, the committee, finding that they were dissatisfied competitors either to accept or decline the competition on the original terms (with a minor alteration). The two still attempt to enforce their amendments, and therefore the third competitor is absolutely chosen.

It is the old story of the "biter bit" or "too clever by half."

PUGN & ASKIN.

DARLINGTON WORKHOUSE COMPETITION.

SIR,—You have done the public so much good by your publications on the vexed subject of competitions, that I trust you will think fit to insert my experience in the above. A year ago the guardians issued an advertisement for designs for converting their notoriously badly-arranged poorhouse into a properly classified establishment for 250 inmates. The terms of the advertisement were, however, so unreasonable, that the guardians, under protest, withdrew their advertisement, and consented to receive designs under fresh conditions, which, though poor enough, comprehended the payment of the successful architect 20% if he should not be employed to carry out the work. As I was engaged at the time converting the poorhouse of a neighbouring union into a properly classified house, and had the subject of surveying their work in my mind, I received great courtesy and proper professional treatment from the guardians of that union. I resolved to trust myself to the mercy of the Darlington guardians. I therefore went to Darlington, and, after some days, and after receiving the necessary elaborate plans. Previously to doing this I wrote to the clerk to ascertain whether estimates were required, because I had determined not to complete it if I had to incur the risk of this additional cost of time. Having, on the 28th of October, last year, received a reply from the clerk that no estimate was required, I sent my designs. After this, on the 10th of November, I received a letter from the clerk, asking me to send "the amount of cost I estimated the alterations and additions to the workhouse, according to my plan." In the full faith that the preparation of my estimate thus became a distinct transaction, not fettered by any condition, I accordingly paid for preparing it, I went carefully into the matter, and duly forwarded it. From that time to this I have not received a word from my plan, nor any intimation of the intention of the guardians relating to them, or my estimate. To my great surprise, I now find that the guardians

have issued advertisements for fresh designs,—this time for an entirely new house, on a new site. My unfortunate experience, therefore, is that the Darlington guardians have kept my designs and estimate nearly a year, and have entered into fresh arrangements, without informing me of their intentions as to my plans or estimates.

I have sent an application for my designs to be returned and claimed payment for the estimate.

AN OLD SUBSCRIBER.

FROM MELBOURNE.

ST. PHILLIP'S CHURCH, East Collingwood, has been consecrated. The foundation stone was laid by Sir Charles Darling three years ago. The church is built in the Gothic style, and, exclusive of chancel and tower, which are not yet added, costs 2,414. 3s. Mr. Lloyd Taylor is the architect. It at present accommodates 300, and when completed will hold double that number.

The new Independent Church in Collins-street East has been opened for divine service.

The foundation stone of a Roman Catholic church has been laid at Richmond. The edifice is dedicated to St. Ignatius. It will be Gothic in its style of architecture, and will consist of a chancel, two aisles, and Lady Chapel, and have a tower and spire. The ground measurement according to the plan is 140 ft. by 60 ft. It will be built of limestones with freestone dressings.

The relaying of the foundation stone of the Ballarat monument to the explorers Burke, Wills, and Gray, has been performed by Mr. Thomas Davey, mayor of the borough. The following document was placed with the coins, &c.:

"28th August, 1867. Burke and Wills Monument.—The Committee of the Burke and Wills Monument having failed to carry out the original design by Mr. Canute Anderson, the treasurer of the committee handed over to the borough council the balance of the funds in hand. The borough council decided to supplement the sum and to have a drinking-fountain in commemoration of the memories of the unfortunate explorers. The design was prepared by Mr. Canute Anderson. The contractors are Messrs. Murray & Broome for the stonework, and Messrs. Walker & Co. for the cast-iron work. The bottle containing the original coins and documents was replaced by the mayor of the borough, Thomas Davey, esq., on Monday, the 26th day of August."

The Bendigo Gas Company have declared a 5 per cent. dividend (per annum); the Daylesford, their usual dividend of 12½ per cent.; the Williamstown, a 10 per cent. dividend; and the Geelong, one of 10 per cent.

A LITTLE DIFFERENCE AT SOUTH HAYLING.

TENDERS have been delivered by seven builders for the erection of the West Town Hotel, South Hayling, Hauts, Mr. F. Whitaker, architect; and here is a list of them:—

Fish	22,054
Perry	2,060
Welch	1,829
Lacey, Brothers	1,695
Trigg	1,575
Strieder	1,323
Tyler, H. (accepted)	845

And a pretty little it is; the highest being about 140 per cent. above the lowest: 845l. one, 2,054l. the other; and this difference, it will be observed, is not the result of an accidental slip, because, mark, the amount of the next tender is but 4l. below it. The amount of the lowest tender is not so well backed up; but still more than 50 per cent. must be added to the lowest tender but one to bring it up to the figure of the highest. Will any one favour us with an explanation? Such differences, and they too often occur now-a-days, are very unsatisfactory, not to say disreputable.

LEAMINGTON SEWAGE.

THE engineer in charge of the sewage works of Leamington, Mr. T. D. Barry, writes to us denying the correctness of the statement made in our columns (p. 753) that the diversion of the waters of the Leam have shown that the filtration works fail to render the town sewage innocuous. He says:—

"In the river had a considerable quantity of black mud been found; and this deposit was known to have existed long before the filtration works were properly in operation, and occurred before any reliable mode of filtration was adopted, so that solid matter for a long time found its way into the river. So far from the bed of the river proving that our works are faulty, it proves the very reverse; as it plainly shows that, whereas at one time past black deposits had been made, now (in thick superstratum of road-silt, gravel, and sand) in some parts 2 ft. deep

been found covering up the old stratum of mud, and giving a clean surface. This has been the general appearance, except where the scour of the stream has kept the bottom part more or less free from silt and sand. It is known that in very sluggish streams large deposits continually take place, not necessarily sewage, but black and animal matter; and the river, for a long time, shows much deposit quite as black and offensive as is below the sewage outfall. The bed of the river is only free from any fall between our outfall and the Leam, but is in many places actually lower than the bed of the Leam, into which it flows; and there is scarcely any perceptible current unless during wet weather or heavy rains; and, when these floods occur, the river Avon rises and backs up the Leam, depriving it of nearly all the scouring benefit it would ordinarily receive from its own waters. Accordingly, it is contrary to fact that the water in the natural bed of the Leam is perfectly black, and emits a horrible stench. The water from the bed is being constantly pumped day and night (a process not likely to prove its condition), yet it does not discolor the shoots through which it passes, nor alter the colour of the diverted water in the temporary channel into which it discharges. Those who expect to find the bed of a stagnant river free from black deposit, should witness the occasional usings of canals, where they will find mud as black and as offensive as any we have found in the Leam, and this circumstance, so long as our filtration works, as at present intended, discharge clean water only into the superior bed of the river Leam, no sewage deposit can take place, and the water of the Leam be polluted by our outfall; and the peculiarity of our Chancery suit is that we charged not with polluting the Leam, but the Avon, whose banks the plaintiff lives, nearly half a mile from our outfall;—this river Avon receiving the sewers of Warwick by, of Milverton, Coventry, and other places; and Leamington is made to suffer for all the pollution of infected stream.

FALL OF HOUSES IN YORK-ROAD, BATTERSEA.

At the meeting of the Metropolitan Board of Works on the 18th inst., Mr. Valliary, superintending architect, presented a report on the fall of two houses in York-road, Battersea, which took place on the day previous. A report from Mr. I'Anson, the district surveyor, on the same subject, was also presented and read. Mr. Valliary said that two houses in course of erection have fallen this morning (October 17th), and injured one man. The works in progress about one month, and during that time the stories were built. One house still stands, but the chimney wall being injured, it was demolished for one day when inspected. The materials used were the best bricks and timber for small houses, and the walls were built on a good foundation. The fault is attributed to the use in erection and recent rains, but the mortar is brown and useless, not having sufficient lime, and loamy sand was used, and formed a very insubstantial building material. Preceding in such a case might be desirable, if any practice with regard to speculative builders had been more strict in requiring the use of well-compounded mortar. The punishment, in one sense, arises from the fact that the materials used were of a quality inferior to that upon a greater proportion of time being used. The report was referred to the consideration of the Building Act and General Purposes Committee.

ACCIDENTS.

A GAS-FITTER, whilst engaged in repairing one gas-piping at a house in Warrington-terrace, Maidenhead, accidentally dropped one of the screws, which caused the gas to escape; he very incautiously lighted a candle to enable him to find it, which caused an immediate explosion, burning him about the hands and face very severely. Fortunately, although the window-hinds took fire, it was speedily extinguished.

A building two stories high, in Bell-street, Maidenhead, has fallen, a woman who was in it at the time narrowly escaping with her life. The roof fell in upon the bedroom floor, and part of a side wall then fell, and broke down a flight of steps.

While two slaters were standing on a scaffolding slung with ropes to the side of a house which they were repairing in Simpson's-court, Maidenhead, Edinburgh, the ropes broke, and the men were precipitated to the ground, a distance of about 40 ft. One, whose right ankle was broken, was carried to the Royal Infirmary, but the other escaped with several slight bruises about the body.

A part of the church at Santa Croce at Padua, Province of Salerno, in Italy, has fallen to the ground, hurrying seven persons in the ruins. Seven were got out alive, one was dead, and the three others had not been found.

The Metropolitan Buildings and Management Bill appears to enact, sec. 82.—"Every wall constructed of bricks, stone, or other similar substances shall be properly laid and solidly put together with mortar, compounded of sharp, clean sand or grit, and good lime, in proper proportions, or with cement."

BUILDING IN THE METROPOLITAN DISTRICTS.

ACCORDING to the report by the Superintending Architect on the monthly returns of District Surveyors, under the Metropolitan Building Act, the total of the gross fees received for the year is 34,989l. 11s. 4d., in respect of 20,196 works, of which nearly two-thirds were done within the year.

The gross fees received in 23 districts vary from 43l. to 393l., six being under 200l. each, eight under 300l. each, and nine under 400l. each. In 32 districts the incomes vary from 409l. to 2,135l.

The expenses of district offices are 6,519l. 12s. 7d. The fees remaining due for arrears are 26,972l. 2s., but probably mostly of little value. The sums shated or lost are 1,760l.

It is a remarkable fact that every year, from 1856 to 1866, shows an increase in the amount of fees received, ranging from 19,904l. to 34,989l., with the single exception of 1861, when the amount of fees was 1,200l. less than it was in 1860.

NEW STABLES IN SWALLOW STREET.

SOME sound handsome stables and coach-houses have been built for the Earl of Zetland, in Swallow-street, Regent-street, by Messrs. Lucas, under the direction of Messrs. Banks & Barry. The floors are covered with Pyramont Seyssel asphalt, presenting a level surface hard as granite, and at present unbroken by a single crevice capable of lodging dirt or moisture. The stalls are supplied with Mr. James Barton's excellent patented fittings. The horses mostly live on the first-floor, a serrated inclined plane, also of asphalt, leading up to the stalls. The means of artificially warming are provided. The roofs are of iron and glass. The external aspect of the building is characteristic and agreeable.

THE BARRIERS ACROSS STREETS.

THE Metropolitan Board of Works at their last weekly meeting had this nuisance under consideration. Mr. Shaw asked what measures the Board proposed to adopt to ensure their removal. There were upwards of 150 of them in the metropolis, nearly the whole of which were in streets now subject to parish management, and which were maintained, repaired, and lighted at the expense of the general rates. He called attention particularly to the parish of St. Pancras, which, he said, had twenty-nine barriers, reducing the direct thoroughfares to three between the Edgware-road and Gray's Inn-road, a distance of three miles. He thought it hard upon the ratepayers that they were not only obliged to keep up the streets, but to open other thoroughfares, whilst the bar nuisances were allowed to remain. They ought to be treated like any other nuisance. He thought it the duty of the Board to go to Parliament for power to act, and he therefore moved that the matter should be referred to the works committee. Mr. Nicolay seconded the motion, which, after a brief discussion, was adopted.

GAS.

THE Stockport Gas Company have completed the additions to their works at the Heaton-lane Station. The gasholder was constructed by Messrs. William Mahon & Co., of the Ardwick Iron Works, near Manchester, from drawings and specifications prepared by Mr. Jacques, the practical superintendent of the Borough Gas Works, and approved by the Council. The cost of the holder and tank is 10,900l. The contractors for the tank were compelled to resort to the assistance of a pump, which discharged 200 gallons of water per hour for twenty-four hours, or between 5,000 and 6,000 gallons per day for the whole eighteen months. The holder, which is telescopic, is 100 ft. in diameter. It will contain 550,000 cubic feet, and being self-acting is divested of the old-fashioned weights and chains. In style it is of the Grecian order, having twelve columns, each 67 ft. high, with pediment on the top, and ornamental trellis wrought-iron girders, weighing 4 tons respectively. The excavation and construction of the tank were contracted for

by Messrs. W. & J. Worthington, of Manchester. The tank is 104 ft. in diameter and 33 ft. deep. There were 20,000 cubic yards of excavating and filling in; 30,000 cubic yards of puddling; 500 cubic yards of concrete; 2,000 cubic feet of stone; 3,000 superficial feet of landings; and 900,000 bricks.

A machine for drawing and charging gas retorts has been made at Messrs. Handyside & Co.'s Britannia Foundry, Derby. The machine is the invention of Messrs. Holden & Best, and is intended for the Alliance Gas Works, Dublin. The trial was successful. The object of the apparatus is, of course, to dispense with the exceedingly laborious duty of charging and drawing gas retorts by manual labour. It consists of a wrought-iron carriage constructed to run on rails laid in front of the retorts, the whole length of the retort-houses. Three long wrought-iron arms or rakes, and three long scoops, are carried by frames made to traverse the main carriage in the direction of the retorts. The apparatus is furnished with a pair of vertical high-pressure engines and hoiler. These machines have been applied with success, we understand, at the Chartered Gas Works, London, and at one of the gas works in Paris. The operation of charging and drawing the retorts, opening and closing the mouths, and completing the whole operation, occupies only nine minutes for a bench consisting of nine retorts, the operation for a set of three being accomplished at the same time. By the ordinary system at least three-quarters of an hour are occupied in charging and drawing, instead of nine minutes.

THE NEW TRAFFIC ACT IN THE METROPOLIS.

ON Friday next, the 1st of November, the Metropolitan Traffic Act, including the City of London and the jurisdiction of the Metropolitan Board of Works, will come into operation. The general limits of the Act extend four miles from Charing-cross, and the "special limits" any part taken out of the same by the Police Commissioner with the sanction of the Secretary of State, and the City Police Commissioner, subject to the approval of the Court of Aldermen. New regulations are to be made, and the route of vehicles arranged, and in a short time a new traffic may be expected, carrying out the preamble in making provision for the greater security of persons passing through the streets. Several important amendments are made in the law with respect to obstructions in the streets. By the Police Act passed in 1859 power was given, and it is now extended to the police of the City of London, and the law is further altered to carry out the intention of the Legislature, to provide for the public safety in the streets. No goods or articles are to remain in the streets for any longer period than is absolutely necessary to the unloading or loading. An addition has now been made which will prevent the exposure of goods in the public thoroughfares within four miles from Charing-cross (the general limits of the Act) beyond the shops. The words are:—"For the purposes of this Act the surface of any space, over which the public have the right of way, that intervenes in any street within the general limits of the Act, between the footway and the carriage-way, shall be, notwithstanding any claim of any person, by prescription or otherwise, to the deposit or exposure for sale of any goods or other articles on such surface, deemed to be part of the footway."

SINKING A WELL IN HALF AN HOUR.

IN the late American War, as we have already stated, a sharp inventor obtained an unailing supply of water for the soldiers by an ingenious system of well-sinking. Mr. J. L. Norton, of Manchester, bought the patent for this country, and he is now generally introducing the system. His agent, says the Gloucester Chronicle, lately showed the process behind a house now being built by Mr. Jenkins, on the clay bank at the top of Denmark-road, Wotton, in the presence of a number of gentlemen:—

"An ordinary wrought-iron tube, similar to a gas-pipe, 12 ft. long, of 1 1/2 in. diameter, pointed at the end, and perforated for 16 in. from that end by holes barely 1/2 in. across, was forced into the ground, by the aid of a moveable iron clamp fitted round the pipe, and driven by a hollow 80 lb. 'monkey' raised by pulleys and allowed to drop upon it on the principle of the old pile-driving 'monkey.' When that pipe was driven in a certain distance another pipe of equal length was screwed on, and

the driving process was continued. By a mishap, part of the pipe fell forward, and cut open the head of one of the workmen; but he was not seriously hurt. When the depth reached was 20 ft., there was a breakage of the pipe. No water had been obtained, and the attempt had to be laid aside for a few days, until more pipes can be obtained from Manchester."

A person wishing to have a well sunk, has to answer three questions—"At what depth from surface is water usually found in the district? What is the nature of the strata for that depth? In what kind of strata is the water?"

On the Heathville Estate, at the foot of the bank, where the experiment was made, Mr. Castree recently had a well sunk 16½ ft. into the sand, and found an excellent supply of pure water. To confirm the assurance of the existence of abundance of water, Mr. Castree, after the breakage on the bank, employed the agent to sink a tube-well on the estate. The boring was begun at half-past four, and by five o'clock, says our authority, "the tube had gone in 15 ft. 9 in., and the plumb-line showed a water depth of 5 ft. 9 in.: an apparently inexhaustible supply was bubbling up from the gravel." The agent showed the copy of an order from Colonel Simmons, of the Royal Engineers, for the apparatus for fifty wells to be sunk through the arid Abyssinian surface for the supply of the English force. The inventor was recently having wells sunk at Aldershot. Wells have also been sunk at Cheltenham.

CHURCH-BUILDING NEWS.

Arksey.—It has been determined to restore the church here, and Mr. Scott has reported to the vicar on the subject. Subscriptions amounting to 1,200*l.* have been paid, or promised, towards carrying out the work, but a much larger sum will be required.

Hinton Waldrist.—The parish church has been re-opened, after being restored. The gallery at the west end has been pulled down, the roof raised to its former pitch, and, instead of having to go down three steps into the church, it is now on a level with the ground without. The whitewash and daubing outside have been washed off and the stones pointed, and low seats put in the place of high-backed pews.

Eglosayle.—The parish church of Eglosayle, Wadebridge, having fallen into a state of decay, the parishioners raised a fund for its restoration. The contractor for the work was Mr. William May, of Pool, builder, and the building has recently been re-opened. The contract was for 1,400*l.* The tower and porch are to be restored.

St. Sennen, Land's End.—The church of St. Sennen has been re-opened for divine services after restoration. Two years since the rector, on the completion of some chancel repairs, found how decayed was the state, and unsightly the appearance, of the north transept and south aisle. Assisted by his parishioners, the church is now restored. The plans for the restoration were by Mr. J. P. St. Aubyn; and the work has been executed by Messrs. Carah & Edwards, of Crowan, at a cost of 800*l.* The church now consists of a nave, an aisle, and a north transept—the aisle 50 ft. long, the nave 60 ft., and the transept 14 ft. The roof is open. The seats will accommodate 200 persons. They are entirely free.

Gamblesby (Addingham, Cumberland).—The chief stone of a new church has been laid in this village by the Bishop of Carlisle. The style of architecture is Early Gothic, and the plan consists of a nave about 42 ft. long by 18 ft. wide; with an apsidal chancel, and a small transept on the south side, forming a vestry. The west end is surmounted by a wooden spirelet about 50 ft. in height. The interior has an open roof and open sitting, and affords accommodation for about 100 persons. The church will be built with new red sandstone. The architects are Messrs. Cory & Ferguson, of Carlisle; the contractors for masonry, Messrs. A. Watson & Sons, Kirkoswald; joiner, Mr. Pollock, Penrith; plumbing, glazing, &c., Mr. W. C. Porter, Penrith; slating, Mr. Watson, Penrith.

Lincoln.—The church of St. Peter at Arches, which has been closed for two months, has been re-opened for divine service. The part to which special attention has been given is the galleries, in which 260 sittings are kept free. These galleries have been repaired and painted. In addition to these and other practical and useful works, an attempt has been made to bring out the few architectural features the church possesses. This has been done by distemperring the arches in coloured patterns, and picking out the

few mouldings which exist. The columns, which have never received a finished face, have been tinted and "flatted." An attempt has also been made to make the chancel painting contribute to the improved cheerfulness of the church. The cost of executing the whole of the works has been 250*l.*

Selmeaton.—The ancient church of Selmeaton, after having been completely restored, or rather almost entirely re-built, has been re-opened. About eighteen months since portions of the building which were condemned were demolished, and the restoration commenced, the designs being furnished by Mr. Christian, of London, architect, and the contract undertaken by Messrs. Avis, of Hastings. The style of the old church, one of that kind so common throughout the weald of Sussex, has been strictly followed. The stained-glass windows around the aisle are all memorials. The north window in the nave has been erected as a thank-offering by the patients of Dr. Skinner, of Selmeaton. Another, in the east, has been put in by the schoolfellows of the vicar; while an inscription to a three-light window on the south side states that it has been placed there to the memory of children of Nathaniel and Harriet Blaker, of Tilton. There are other smaller ones put up at the expense of various friends of the church. The tower has been re-built, and the chimneys therein are arranged on a new principle—worked easily by means of a handle—arranged by Mr. J. Murray, jun., of St. Leonard's, and the same as that in use at Westminster. The wood-carving has been executed by Mr. Walter Avis, of Selmeaton; the iron-work by Messrs. Skidmore, of Coventry, and Mason & Filmer, of Guildford. The cost of the whole re-building has been 2,500*l.*

Weston (Herts).—The parish church of Weston has been re-opened for public worship, after passing through the process of repair and restoration. The foundations of the tower had given way, owing to some collars having been inserted under the south-west pier; and to the decay of courses of wooden slabs, which had been built at intervals nearly through the whole thickness of the walls of the tower, and which had probably formed the bottoms of the boxes in which the flint-work was built, the sides only having been removed. The walls had also become quite disintegrated, from numerous settlements; besides being out of the upright. This made it necessary to rebuild the tower; but owing to the stone-work of the Norman pier being of very hard stone (Barnack rag), it was found possible to use them again, and they were all marked, and have been rebuilt in their old places, thus leaving this specimen of Norman architecture unaltered. Of the five bells, one has been recast; and all the peal re-hung. The interior of the church has been re-paved and re-seated, with open benches of polished yellow deal. The south aisle has been roofed, and the whole of the church, except the chancel and nave roof, restored. Arrangements have also been made for heating the church with hot water. The works have been carried out under the superintendence of Mr. Robert Heskeoth, of London, architect. The builder employed was Mr. James Hayward, of London. The cost of the restoration slightly exceeds 2,000*l.*, of which Mr. Robert Pryor, we understand, contributed 1,500*l.*

SCHOOL-BUILDING NEWS.

Gateshead.—The building of the Gateshead Ragged or Abbot Memorial Schools is now rapidly progressing, and the chief-stone has been formally laid. The site is an open piece of ground to the south of Catherine-terrace, and facing Durham-road. The plan of Mr. Swan, of Newcastle-upon-Tyne, has been accepted; and the building has been contracted for by Messrs. N. & K. Reid, of Newcastle. The structure will be of a bright red brick, and the style Gothic. The outside walls are double, so as to allow a space between the four bricks, which comprise the thickness, to prevent damp. The building will be three stories, two only being accessible from the front. The basement floor will be the only one into which entrance can be had from behind, on account of the sloping nature of the ground, and will comprise at the extreme south side a large workroom, 25 ft. 5 in. by 24 ft. 8 in. On the northward of that are several workrooms, including a tailors' room, a printers' room (17 ft.), a general work-store; and also, at the north side, on the same floor, is a large drying-shed, 28 ft. in. by 22 ft.; a laundry,

kitchen, &c. Proceeding eastward on the same floor are the lavatories, baths, and large play shed, divided by a large wall for the males and females. A covered corridor runs in the same direction to the closets and coal-cellars. The main floor is the principal part of the building. At the south end there is the boys' school-room, 55 ft. 5 in. by 22 ft., standing directly above the general work-room. Next to this room there is a large work-room, 28 ft. 2 in. by 16 ft. 3 in.; another printers' room, 12 ft. 6 in. by 12 ft. 6 in.; and the girls' side of the building, having six apartments. The large dining-hall, to the east, measures 50 ft. by 27 ft. Northward, on the same floor, are the girls' school-room (same size as the boys'); also a class-room (same as the boys'). The ventilation and lighting of this flat have been especially considered. The dormitory floor is the third and highest story. The corridor running through the building are lofty, and at 6 ft. wide. The front entrance will be by a riser of stairs. Behind the building is a large open space for gardening.

Sheffield.—The chief-stone of the new School and Club Rooms, of St. Paul's parish, at the junction of Cross Burgess-street and Cambridge-street, has been laid. The new building will occupy a superficial area of about 650 yards. The elevation will be plain. There will be no tower. The ground-floor a boys' school, 52 ft. by 42 ft. and three class-rooms, respectively 17 ft. 6 in. by 19 ft., 29 ft. by 19 ft., and 29 ft. by 14 ft. Above the boys' school will be a girls' school of the same dimensions, and three rooms, respectively 26 ft. by 19 ft., 28 ft. by 19 ft., and 29 ft. by 14 ft. The girls' school will have a gallery, 26 ft. by 10 ft. There will be an occasional room in the roof. The girls' school and one class-room will be contrived so as to form one room when required, as for services, &c. The architect is Mr. H. D. Lomas; and the masonry has been contracted for by Mr. Butler; and the joinery work by Messrs. Badger & Holmes.

STAINED GLASS.

St. Peter's, Newcastle.—Two stained-glass windows have just been erected in this church. That at the west end has been erected as a memorial of the late Rev. Wm. Dodd, M.A., who was for many years the incumbent of St. Andrew's Church, in this town, and through whose exertions St. Peter's Church was built. The window is in the Decorated style of architecture, and consists of four lights. The subjects introduced in the upper portion of the window are the baptism of our Lord, and the baptism of the Eunuch by St. Philip; and in the lower portion, the subjects are our Lord calling Peter, James, and John to be his disciples, and our Lord's charge to St. Peter. The window and brass were from the establishment of Messrs. Heaton, Butler, & Bayne, of London. The other window, similar in architecture, consisting of three lights, has been erected as a memorial of the late Mrs. Abbot. The subject is taken from the ninth chapter of the Acts of the Apostles, and represents Tabitha or Dorcas. The latter window is from the establishment of Mr. W. Wailes, of Newcastle.

Ely Cathedral.—A new window has been added to the stained glass of this cathedral. It is put up in memory of Mr. Richard Freeman, who died about a year ago. He was well known as a builder, and executed, under the superintendence of Mr. Scott, a great deal of the work lately carried out there. The subject represented is the purchase of the cave of Machpelah. The left compartment represents the death of Sarah, her son Isaac apparently standing by her bedside. The centre contains a representation of the purchase of the cave of Machpelah from the sons of Heth, in whose presence Abraham is weighing out the purchase-money of 400 shekels of silver. The right compartment represents the burial of Abraham, who is borne on a bier into the cave; the name Machpelah being written over the tomb. The window was designed and executed by Mr. Preedy, architect. The whole of the windows of the north aisle are now filled with stained glass, representing various Old Testament subjects.

St. Mary's, Oxford.—A stained-glass window has been erected in the north side of this church, in memory of the Rev. Charles Marriott, B.D., formerly fellow of Oriel College, and for many years vicar of the parish of St. Mary-the-Virgin, who died in 1858. The window, which was executed by Messrs. Hardman, of

Birmingham, represents the patriarchs and other scriptural subjects. It is contemplated to erect another window, aided by a fund left by the late Mr. Bartley for that purpose.

Aston Old Church (near Birmingham).—A memorial window has just been completed and fixed in this church, executed by Mr. Holland, of Warwick, and containing two openings, with the subjects of Visiting the Sick, and Our Saviour healing the Lame, Halt, and Blind, under canopies, with inscription at bottom, and angel tracery bearing a scroll.

Books Received.

We have before us a little heap of books, mostly for boys and girls, recently published by Messrs. George Routledge & Sons,—Routledge's Every Boy's Annual," "Barford Bridge," "The Handbook of Football," "Original Poems, illustrated," three or four sixpenny coloured copy-books for children (such as "The Multicoloured Table in Verse," and "Old King Cole"). Every Boy's Annual" hasatory by Mrs. H. Wood, called the Orville College Boys, and a capital series of papers by the Rev. J. G. Wood, headed the Waves and their Inmates, illustrated, as are many of the other contributions. It makes an excellent present-book for boys. "Barford Bridge; or, Schoolboy Trials," by the Rev. H. J. Adams, is also a remarkably interesting book, of its class, inculcating right feelings, without preaching, and carrying the reader, whether he be big or little, on to the end with undiminished attention. It is, moreover, a handsome little volume, prettily illustrated. To young readers the title, "Original Poems" will convey the impression of something new, but their elders, looking through the volume, will recollect that these poems were published years ago under the same title, written, if we mistake not, by Jane and E. Taylor, and will be sent back to the days of their childhood by sight of "Little Ann and her Mother," "The Red-Breast's Petition," and "Honest Old Tray." The present edition is full of charming illustrations, and is elegantly bound. Amongst the books sent by Messrs. Routledge is a smart paper-covered edition of "The Life and Opinions of Sirtram Shandy, Gentleman," for sixpence; a book, we need scarcely say, not for children,—full of humour, wisdom, charming touches, and witty allusions. We have ourselves no great respect for the Rev. Lawrence Sterne, however such we may prize detached portions of his writings. The *Broadway* for November is in the same packet. We take from it a few notes on the value of land and rents in the city of New York:—

"Lots on Broadway bought, scarcely two hundred years ago, from the native Indian, for a handful of wampum, or string of beads; from hard-headed Dutchmen and proud Englishmen, in colonial times, for a score or two of pounds; and from sharp Yankees on one day for a few thousand dollars, are now worth half a million or more. The proprietor of the *New York Herald* paid for a lot, about 60 ft. in width and 120 ft. in length, the sum of 75,000 dollars, of which amount 250,000 dollars were paid to Baranum, the celebrated showman for the lease he held, and raised upon it a structure of white marble, which is said to have cost at least 300,000 dollars. The piece of ground next to the *Herald* building, 100 ft. in length and 66 ft. in width, was purchased by a New York insurance Company for 350,000 dollars, and upon it they are constructing an edifice which will cost 800,000 dollars. A thin slice of land, only 4 ft. in width, and 120 ft. in length, lately brought the large sum of 75,000 dollars. The lease—mark it, the lease only—of another Broadway lot was but a few days since sold for 200,000 dollars, although within the last ten years the same lease had exchanged hands at the comparatively insignificant price of 25,000 dollars. A merchant built a warehouse which, with the ground, cost him 400,000 dollars; its value is now estimated at 800,000. A stockholder bought, some ten years ago, the Society Library building in Broadway for 150,000 dollars, and a few months since sold the lot, after the building was burned down, for 450,000 dollars. The purchasers are building upon it a structure which is to cost a million."

—The October number of the *Church Builder* (Rivingtons), contains a short paper on the position of church organs, and an account of the origin of the Incorporated Church Building Society.—Mr. Laurent de Lara has just published some outlines for illumination, in which the designer has introduced *fac similes* in oil colours of works of old and modern painters, to serve as vignettes in the place of the photographs which are now extensively introduced in connexion with illuminated designs. The right colours for the various portions of the illumination are stated, so that people who wish to produce, mechanically, showy effects are provided with the means.

Miscellanea.

THE CHURCH OF ST. BENET, GRACECHURCH-STREET.—Messrs. Fuller & Horsey have received instructions to sell by tender, in lots, the materials of this church, which will be the first removed under the Union of Benefices Act.

THE TELEGRAPH AT FIRES.—We long since urged the junction of the Fire Brigade stations and police-offices by telegraph, and we are pleased to see that telegraphic communication is about to be provided between the chief police-office in Scotland-yard and the other police stations, as well as the chief station of the Fire Brigade at Watling-street, in order to facilitate the transmission of information as to fire in the metropolis by the police.

SANITARY IMPROVEMENTS IN KIDDERMINSTER. The town council of Kidderminster have decided to spend 40,000l. on a complete system of sewerage, and a constant supply of pure water, for the whole of their borough; and at their meeting on the 22nd inst., they appointed Mr. Josiah Forster Fairbank, civil engineer, of London, to be the engineer, to carry out these works. The sewage will be disposed of by irrigation on lands of the Earl of Dudley and others.

WINDSOR CORN EXCHANGE.—The propriety of rendering the market-house fit for a corn exchange has been under discussion, and the mayor and corporation have been requested to give their consent and to assist in carrying out the plan. A subscription list has been opened to defray the expenses; and a committee, consisting of the mayor and others, appointed to confer and act with the town council in carrying out the undertaking and obtaining subscriptions. About a third (105l.) of the requisite sum (350l.) has already been subscribed.

SEARCH FOR THE BODY OF ST. CUTHBERT.—Various attempts have been made to find this long-buried "treasure," and recently efforts were instituted from the exposure of a secret tradition, found on the body of Bishop Mayer, in 1769, and since then secretly preserved until September, when the search was instituted. The secret, however, as understood, has proved not to be a correct one. The recent search was made in consequence of Mr. Swinburne, the town-clerk of Gateshead, making public the secret, which was entrusted to his father, who was a Roman Catholic. The Roman Catholics complain. Why it should be desired by the Roman Catholics to keep the information (if they really have it) as "a secret" it is hard to say.

NEW SHIP ENTRANCE OF THE REGENT'S CANAL DOCK AT LIMESHOUSE.—The Limehouse Dock and the river entrances have been very inadequate to the requirements of the traffic there; and, under the advice of their engineer, Mr. Edwin Thomas, the company obtained powers to enlarge and improve the Limehouse Dock, and to make a new entrance from the river, with extensive wharfs and space for warehouses. The estimated cost, including land, is 200,000l. The foundation-stone of the new ship-lock was laid on Wednesday, the 16th instant. The ship entrance lock will be 350 ft. long by 60 ft. 7 in. in width at coping level, with the outer gate sills fixed at 28 ft. below Trinity high-water mark. The lock will be fitted with three pairs of wrought-iron gates, by which arrangement provision is made for dividing the lock into two compartments of 120 ft. and 230 ft. each, whenever necessary.

VALUE OF LAND IN LIVERPOOL.—About a month ago an arbitration took place in Liverpool, to decide the value of a quantity of property in Lawton-street and Fairclough-lane, required for the contemplated Central Railway Station about to be erected in Ranelagh-street by the Manchester, Sheffield, and Lincolnshire and Great Northern Railway Companies. The property belonged to Messrs. Fairclough, and covers an area of 464 square yards. There was great diversity in the valuations made by the professional witnesses examined on either side—the claimant's witnesses estimating the value of the land at about 14l. per square yard, while those for the railway companies assessed its value at about 5l. per yard. The arbitrator's award, though dated the 28th of September, has only now been made public, and the amount of compensation awarded is 5,800l., representing a value of over 12l. a yard for the land.

ST. JAMES'S TOWER, TAUNTON.—At a meeting of the parishioners to consider what should be done in reference to this tower, it has been resolved, after a lively discussion, that the plans and specifications of the churchwardens be produced, and that estimates be obtained for carrying out the work of taking down the tower to the groined ceiling and rebuilding it; a report to be made to a future meeting.

COAL IN SHROPSHIRE.—An important discovery of coal has just been made near Medely, in Shropshire, in a district leased by the Medely Wood Company. The coal has been struck at a distance of 256 yards from the surface, and the seam, known as the "top coal," is one of the most valuable found in the district, and is invariably followed, in regular succession, by the double coal, yard coal, best coal, flint coal, riddle coal, and little flints.

THE WORKMEN'S DWELLING QUESTION IN NEW YORK.—Dwellings for working men are occupying general attention in New York, and it is said that a company has been formed in that city for erecting such dwellings on the co-operative plan. They intend to build several blocks of houses contiguous to Central Park and other eligible localities, on the Parisian model. The design is to occupy the lowest floors with *restaurants* and provision stores, and to divide the upper into suites of six, eight, or ten rooms, where the occupants can enjoy all the quiet and comfort of a private home at a moderate cost.

HEALTH IN KEW GARDENS.—The Royal Gardens at Kew are acquiring an unenviable notoriety by the number of young men whose health is shattered by short terms of service there. According to the *Gardeners' Magazine*, four assistants in the herbarium have in succession resigned on account of ill-health, three of whom are dead, and the fourth, Mr. Helmsley, is quite incapacitated. The plant-houses ruin many young men of spirit and promise. They go there strong and hopeful; they soon after leave, with constitutions destroyed, and with little other hope than a quick consignment to the grave. There must be something wrong, and worth inquiring into. In all gardens the health of practical cultivators is exposed to a certain degree of risk, and the risk is usually in a direct ratio with the extent of glass and heating apparatus; but Kew Gardens appear to a great disadvantage in respect of the health of persons employed there, when compared with any similar establishments.

SITE OF THE NEW TOWN-HALL, MANCHESTER.—A meeting has been held at the local Chamber of Commerce, to take steps to induce the Corporation to enlarge and improve the site of the proposed new Town-hall, before the plans are finally decided upon, and to widen the contemplated approaches to the building. Mr. Malcolm Ross presided. It was resolved,—

"That this meeting is of opinion that the proposed new town-hall will be insufficient to meet the present and future wants of this city, and that the approaches thereto will not be so accessible as such an important building requires."

And also,—

"That with the view of testing public feeling on the subject, the mayor be respectfully requested to convene a meeting of the citizens at an early date to afford the ratepayers of Manchester an opportunity of approving or otherwise of the size and shape of the proposed building, and the arrangement of the thoroughfares leading to it."

It was also resolved that a deputation, consisting of the chairman and other gentlemen, be appointed to wait upon the Mayor, with these resolutions.

CAUTION TO LANDLORDS.—Mr. Thomas Mason, the owner of Nos. 1, 2, 3, and 4, William's-buildings, French-alley, Goswell-street, was summoned by Mr. James Neighbour, the sanitary inspector of St. Luke's, to the Clerkenwell police-court, to answer the charge of having the houses alluded to so overcrowded as to endanger the health of the inhabitants. The magistrate, Mr. Barker, made an order for the overcrowding to be abated forthwith, and fined the defendant 20s. and costs. The defendant was also summoned under the Metropolis Local Management Act for neglecting to provide necessary water-closets, &c. Mr. Neighbour, in giving his evidence, stated that there was only one water-closet to the four houses, which contained seventy-three persons, and that the premises generally were in a disgraceful state. The defendant was fined the full penalty of 5l. and 5s. per day for twenty-two days, the time elapsed since the date of the notice, making in all 10l. 10s. and costs. This is the second conviction of the defendant for the same offence.

CLOSING OF THE COVENTRY EXHIBITION.—The Industrial and Fine-Art Exhibition at Coventry, which was opened by Earl Granville on June 19, has been closed. The report states that the number of visitors has been 98,563, exclusive of 6,000 school children.

RAPID PRINTING.—M. Marinoni has put up in the new printing offices of the *Petit Journal* (a halfpenny daily paper), 61, Rue la Fayette, Paris, a machine of his invention, which prints 600 copies a minute. Four of these powerful machines turn out 144,000 copies an hour, the whole impression being 446,000 daily.

ALMSHOUSES, WANTAGE, BERKS.—The governors of the charities intend to erect a block of eight new almshouses in Mill-street, Wantage, for the residence of as many old pensioners. The works will be begun at once. Mr. J. F. Spencer, of Wantage, architect; under whose direction the old almshouses in Newbury-street and Mill-street are already being pulled down.

THE GLASS-BLOWERS' BURIAL SOCIETY.—The United Glass-blowers and Cutters' Trade Burial Society has recently been dissolved, and the property, in accordance with a resolution passed at a general meeting, presented to the oldest member, Mr. Logan, sen., who has been treasurer for some years. To "celebrate" the dissolution of the Burial Society, a supper took place last week. Twenty of the remaining twenty-seven members (most of whom are very old) attended. The society was established in 1783.

THE LARNHAM DRAINAGE PLANS.—One of the competitors writes us from Leeds, under the signature of "Expectation," saying,—“As the author of one of the schemes for draining the town of Larnham, I beg to ask the local Board of that place, through the medium of your paper, if they have inadvertently omitted to give me notice of the non-success of my scheme, or am I only one among the rest of those whose labours seem to be ignored?” He thinks that, to say the least of it, he has been treated in a very negligent manner. The plans were sent in on the 1st of March last. Letters from two other competitors have been received since.

CO-OPERATION IN LONDON.—It is to be feared that our butchers, bakers, and middle-men generally, are learning trades-union principles, and bringing them to bear on the public who are not trades-unionists; and it is fall time the public were co-operating for their own interests, in order to meet the co-operative or unionist tactics of their tradespeople. We lately alluded to the formation of a co-operative association in the north of London; and we are informed that this is not the only one already at work. There are two civil service co-operating associations in London, one of which, the "Civil Service Supply Association," numbers many more than 4,000 members, and the other, the "Civil Service Co-operative Society (Limited)," has already 2,500 members; and as they have opened the doors to the army, the navy, and the clergy, they will probably soon double their numbers. It is said that one firm alone received from members of the first-named society in the course of last year as much as 10,000*l.*, while the accounts of another firm in connexion with the West-End Society, show transactions with its members to the extent of 12,000*l.*

THE SUSSEX ARCHEOLOGICAL SOCIETY.—The members of this society took their autumnal trip to Slangham, and had a very pleasant excursion. Hayward's Heath was the place of rendezvous. Slangham is about six miles distant. Slangham Place belongs to Mr. W. J. Sergison, of Cuckfield. Mr. M. A. Lower, the editorial secretary of the society, gave a short account of the ruins. He said they were in a part of Tilgate Forest, which was a highly interesting locality in a geological point of view. It was formerly a resort of the Iguanodon, a monster some 70 ft. or 80 ft. long [Query: The ancient "worm" of so many places, according to various local traditions. If man existed, as is now said, in the time of the monsters, why not?], and afterwards the forest was one of the principal sites of the great ironworks of the county. The party, after inspecting the ruins in detail, repaired to the church, which was explained by the Rector, the Rev. W. Sergison. Leaving Slangham, the archaeologists returned by way of Cuckfield, and paid a visit to the old church there; and thence returned to Hayward's Heath. A luncheon had been provided at the Station Hotel, at which the Rev. Edw. Turner presided.

THE POOR-LAW BOARD AND THE VALUATION OF PROPERTY.—The Poor-law Board have issued a letter on the subject of the proper mode of ascertaining the gross estimated rental. The Board considers that the rent which is actually paid is the best criterion of value; but it is not regarded as being conclusive, as it may be shown that the actual rental value is above the sum paid as the rack-rent, or that there has been a depreciation in value, which renders the rent paid higher than that at which the premises might be expected to let from year to year.

PROPOSED SUBWAY UNDER THE THAMES.—Mr. W. Haywood, engineer to the Commissioners of Sewers, has laid before that body the particulars of an application which had been sent in by Mr. Peter W. Barlow, the well-known civil engineer, requesting permission to tunnel under Thames-street, to enable a subway to be constructed by him beneath the river Thames. It was stated in the application that permission had been obtained by him from the authorities of the sewers to sink a shaft at a point north of Thames-street, and that in the tunnelling the surface of Thames-street would not be in the slightest degree disturbed. It was added that the subway was to be of sufficient diameter to take an ordinary omnibus, which was to traverse the tunnel each way as fast as it was filled. The subject gave rise to some considerable discussion, and was opposed by some of the representatives of Thames-street and the locality, but ultimately the application was acceded to.

LAND SOCIETIES.—The last quarterly report of the Conservative Land Society states that the receipts for the fifteenth financial year ending September 30th were 116,983*l.* 11*s.* 11*d.*, and the grand totals to Michaelmas, 1867, 1,100,603*l.* 7*s.* 9*d.* The shares issued were 27,783 at 50*l.* each, making 1,389,150*l.*; and the total withdrawals since the formation of the society (1852) to Michaelmas, 1867, 306,749*l.* 0*s.* 2*d.* The total sale of land for the same period was 537,050*l.* 19*s.* 6*d.* The second portion of the East London Estate was allotted on the 2nd August, and building operations are in active progress thereon. Additional portions of the Forest Gate Estate will be offered in due course. Bolingbroke Park, with its frontage to Wandsworth Common on the one side and frontage to Battersea Rise on the other, had been acquired for the society. Mr. Percé Stace, public accountant, and Mr. Newham Winstanley for the Board, and Mr. W. H. Clewlow and Mr. Jas. Gead are the four auditors to report as to the accounts and balance-sheet for the financial year ending September 30th, 1867.

OPENING OF A "BROCH" AT THUMSTER, CAITHNESS.—An interesting account of local excavations is given in the *John O'Grady's Journal* of last week. The broch is a peculiar class of buildings, common all over Shetland, Orkney, Caithness, and Sunderland, but not found much farther south. The most perfect specimens are found in Shetland. They are circular buildings, having on the ground plan a wall from 12 ft. to 15 ft. thick, enclosing a central area of about 30 ft. to 40 ft. in diameter. In the thickness of the wall narrow chert chambers are formed opening into the interior court. A stair in the centre of the wall leads to a gallery, which winds upwards from story to story with a gentle ascent, traversing the whole circle of the wall like an interior cork-screw, and opening here and there into recesses, which are all lighted from the interior court. There is only one entrance passage, generally low and narrow, to this court, from the outside of the tower. These brochs stood originally 40 to 50 or 60 ft. high, and the central court was open to the sky. The lower story was a solid wall with chambers opening from the court, hollowed out, as it were, in its thickness, while, from the commencement of the gallery in the second story, the solid wall of the first became a double wall, with a spirally ascending passage between. At Yarbouse Loch one of these brochs has recently been uncovered. The excavations disclosed a very fine ruin of a broch in the centre of a cairn, surrounded by a congeries of cells or dwelling-places of later date, mostly founded on and erected out of the rubbish and ruin of the older structure. The cairns seem to have been occasionally used in still later ages as burial-places,—sometimes even in recent times. Amongst the numerous stone and flint implements found in the Yarbouse broch were a number of spinning-wheels, of polished stone, and one of baked clay, ornamented with concentric circles.

OPENING OF THE DUDLEY FOUNTAIN.—This fountain has been formally opened by the Earl and Countess of Dudley, in the presence of a large concourse of people, in the market-place of Dudley. The total cost of the fountain, a mode of which has been in the Paris Exhibition since its opening, is 3,000*l.*, a gift of the earl. The fountain is in form a quadrilateral, pierced by arches in one direction, in the other by semicircular projections, surmounted by two sea-horses. In the dome, two large plates of coloured glass have been inserted, and these throw a coloured light upon the water when thrown from three marble tazzas. The fountain also bears two figures, representing a miner and an agriculturist, in allusion to the characteristics of the county. The total height is 18 ft. Mr. Forsyth of London, is the sculptor.

TENDERS

For the erection of a shop and premises, No. 11 Church-street, Greenwich, for Mr. Mead, Mr. Lamb, architect:—
 Hatfield 21,515 0 0
 Adams & Son 1,437 0 0

LEREW will SELL by AUCTION, on the PREMISES, Camden-terrace, Camden-town, near the Camden canal Station, North London Railway, on MONDAY, OCTOBER 28th, at TWELVE for ONE, 30,000 FLETCHER ASH and PINE PLANK, 300 rim and oak stock, 300 dry oak spoked, 180 fresh poles, six tons board, dry cut stuff, 4,000 feet white Birch, and white, 4,000 feet wide plank board, 500 planks, deals, and battens, 1,000 feet square, 400 square, 3,000 feet white deal, 1,000 feet square scaffold pole, ladders, banister and pickaxe handles, turned posts, iron railing, stumps, drawer feet, iron pillars, table legs, oak materials, &c.—Auction Office, 5, Goringham-street, Goringham-road, near Austin-station.

To Navy Contractors, Shipbuilders, Railway Contractors, Timber Merchants, Instrument Manufacturers, Builders, and Others.—To be sold at the Office of Mr. A. H. Turner, at Easton Hill, 14 miles from Stamford.

MESSRS. RICHARDSON have the pleasure to announce they have received instructions to SELL by AUCTION, on THURSDAY, NOVEMBER 5th, and THURSDAY, the 6th, 8th, and 7th days of NOVEMBER 1867, 1,041 Oak and 240 Ash Timber, now lying at Easton Hill Side.—Catalogue of the above in 10 days of preparation, and will be forwarded from application. The Auctioneers can strongly recommend the above timber to all parties interested in the trade, as being some of the best in the kingdom. The principal part of the trees are of great length and substance, very clean, and of a quality that cannot be surpassed. They are close to good roads, and within a short distance of the Midland, London and North Western, and Great Northern Railways.—Auction Office, 5, Goringham-street, Easton Hill, 14 miles from Stamford, October 1867.

THURSDAY NEXT.—Courts of Justice Concentration (Six) Act.—Western Section.—Seventh Sale of Building Materials.

MESSRS. GLASIER & SONS are favoured with instructions from the Commissioners of the Works and Public Buildings, to SELL by AUCTION, on the PREMISES, on THURSDAY next, OCTOBER 25th, at ELEVEN o'clock, the RESIDUE of the STOCK IN TRADE of the ROYAL ARTILLERY, No. 231, 232, and 233, Strand, No. 3, Fleet-street, and No. 11 to 16, Newcastle-court, comprising about 600 capital stock bricks, pan and plain fire-bricks, slabs, 100 feet floor, and door, sashes and frames, plate-glass and other glazing materials, about 100 feet of iron paving, glass stop and public-house shutters, about 100 feet of iron sash, and catalogue obtained at the Office of Mr. Glasier & Sons, 40, Whitehall-place; and at the Offices of the Auctioneers, 41, Charing-cross.

TELDON, Middlesex.—To Land Holders, Capitalists, and Others.—Preliminary Advertisement.

MESSRS. BLEWER & SON are instructed to sell by AUCTION, at their Sale Rooms, 11, Mark-lane, early next week, in lots of several lots unless previously disposed of by private contract, a valuable and important FREEHOLD PROPERTY, comprising about 60 acres of excellent land, situated in the best part of the rapidly improving locality on the main road to Hampton near the Kings-cross, and extending from the Hampton road, within ten minutes' walk from Teddington and Hampton Wick Station, the property being bounded on the south by the river, Bushy-park, Hampton Court, and the market town of Kingston-upon-Thames. The property is in the midst of important residential buildings, and is bounded on three sides by excellent roads. The soil is fat, and the gas and water mains are laid. Also a valuable Plot of Freehold Building Land, situated in the Church-road which will double eventually become the main road from Twell-kenstons to Upper Teddington and Hampton Court, having a frontage of 250 feet and an average depth of 220 feet, and very near the site of the proposed station at the junction of the South Western and Thames Valley Lines, and the immediate neighbourhood of the dwelling of Strawberry Hill—Plans and conditions of Sale will shortly be prepared, and in the meantime particulars may be obtained of Messrs. J. ANSON, COBURN, & PERKINS, Solicitors, 41, Finsbury-square, E.C.; of W. G. BARTLETT, Esq., Architect, Painter's-hall, Old Broad-street, E.C.; and of Messrs. BLEWER & SON, Lead Agents and Surveyors, 2, Upper Hill-street, Richmond, S.W.

The Builder.

VOL. XXV.—No. 1291.

The Present Condition of Ecclesiastical Architecture in Germany.

HEN in future ages the history of the nineteenth century shall be written, no more striking event will be chronicled than the fact that a style of architecture disused for about three centuries again came into use, and that not only in one country, but all over Europe. These pages, from time to time, give specimens of the revival of Gothic architecture in England; and on many occasions we have alluded to the gigantic progress that that style of architecture has made in France within the last twenty or thirty years. Holland, Belgium, and Germany have also come under our notice; and we purpose now to give our readers a more extended account of the works in progress, and the present condition of Gothic architecture in the last-named country. In order thoroughly to understand the present condition of architecture in Germany it is necessary that we should take a retrospective glance at the history of art in that country.

The architecture which we call Gothic was not so early in use in Germany as in France or England. The Germans seem to have made use of the Round-arched or Romanesque style for nearly a century after it was abandoned in England. It must, however, be acknowledged that the Germans carried the Romanesque style to a pitch of excellence and perfection that it never reached in any other country. If, however, the Germans were the last people—except the Italians—to adopt the Gothic style, they clung to it with the greatest tenacity, and were certainly the last people in Europe to abandon it. This will be seen by referring to the dates of many of the Gothic buildings in Nuremberg and Augsburg, and particularly the Jesuit churches at Coblenz, Cologne, and Paderborn, all of which were built after the year 1600, and yet are thoroughly Gothic in style, although there is a slight admixture of Italian work in some of the minor details. Nor are these isolated examples, for along the banks of the Maine are many village churches of even later date whose chief features—windows, doorways, &c.—are quite Gothic, although the other portions of the buildings are Italian. The thirty years' war, however, put an end to all architecture, and the churches built after that struggle are Italian. The Roman Catholic churches, though often vulgar and gaudy, are sometimes rich and costly in the extreme. The Protestant churches of this date are remarkable only for their meanness and absence of architecture. The French revolution, and the events conse-

quent upon that overthrow of everything ancient, put the finishing stroke to the destruction of architecture in Germany. The Prince-Bishops, who had been the great patrons of ecclesiastical architecture, were driven from their sees, which were given over to princes little likely to build churches; and from that time until about the year 1830, little or nothing was done that is worth study or imitation.

In 1835, the church of St. Ludwig, in Munich, was built by the ex-king of Bavaria. The architect was Gärtner. The style is a kind of Romanesque. As this church was, perhaps, the very first attempt at a revival of ecclesiastical architecture in Germany, we must not criticise it too harshly, although some of its defects are of the most glaring description. Such as the want of a chancel or choir, the use of plaster instead of stone, the admixture of classical features in the details, &c. The church of St. Boniface, in the same city, was building at the same time; and the church of "Maria Hilf," in the suburb of Au, in the next year: this last is a Gothic church of large dimensions. The architect was Ohlmüller; and, whatever faults the building may possess, it was a great advance upon anything that had previously been done, and is, perhaps, the first specimen of a real Gothic church carried out in Germany. In 1842, a great impulse was given to the "revival" by the commencement of the works for finishing the cathedral of Cologne. The architect chosen was Zwirner, and the choice was a wise one; for, although possessed of little originality, he was one of those men who devote themselves heart and soul to the performance of any duty, instead of consulting his own taste or ideas. Zwirner devoted himself wholly to study what was the intention of the original architect; in fact, he looked upon himself merely as an instrument for carrying out the ideas of that great master; and it is a matter for congratulation that he did so. What makes that noble church so interesting is the fact that it is such a thorough link between the Middle Ages and modern times; it is the design of a thirteenth-century architect still being carried out, though nearly six centuries have passed since the drawings for it were made. How very few architects would have had the wisdom to sacrifice themselves as Zwirner did. September 2nd of this present year was the twenty-fifth anniversary of the laying of the foundation-stone for the completion of Cologne Cathedral, and on that day the final was placed upon the canopy over the great western doorway. It may interest our readers to learn what has been done towards completing this noble edifice during the last twenty-five years. In order that they may realize the greatness of the undertaking we must describe the church as it existed in the year 1841. The great choir and aisles, the chapels surrounding the "chevet," the two northern aisles of the nave, and the sacristy, were the only portions of the building completed. The nave and two south aisles were carried up as high as the capitals of the great arcade, and covered with a temporary roof; two bays of the eastern wall of the north, and two bays of the eastern wall of the south, transept were built. The great south-west tower was carried to the height of 150 ft.; of the north-west tower there existed only the foundations, and the north-east buttress to the height of about 50 ft. This north-east buttress of the great northern tower was the latest portion of the old part of the cathedral; it will be seen by examining it that although it follows the general outline of the buttresses of the opposite tower, its detail is quite late Third Pointed. From this description it will be seen that about half the cathedral was built, and in this condition it had remained for about 350 years, during which period no work of any consequence was carried on in connexion with the church. The last archbishop but one

first conceived the grand idea of finishing this noble building; but he did not live to see the work far advanced. His successor, however, brought great zeal and energy to bear upon the undertaking, and received considerable assistance from the kings of Prussia and Bavaria, but by far the greater portion of the money for this grand undertaking has been collected from private individuals by a society called the "Dombauverein." This society has branches all over Germany, and deserves the greatest praise for its zealous and disinterested exertions.

The first thing that it was found necessary to do in 1842 was entirely to restore the choir, both inside and outside. Then the foundations were laid for the west front; the south aisles were carried up to their full height, and the vaultings constructed. The next step was to raise the walls of the two transepts to a level with the aisles of the nave, and construct the arches of the six great doorways. After this followed the triforia over the nave and transepts. The whole building was then again covered with a temporary roof, which remained until the year 1863. During the eight or nine preceding years the works were carried on with great expedition,—the clearstories over the nave and aisles, the flying buttresses, and the great vaultings over the nave and transepts were constructed. In 1863 the temporary roofs were removed, and the whole of the interior of the cathedral, with the exception of the two bays of the nave between the towers, was completed. We are not aware whether Zwirner lived to see this glorious view; if he did it must have repaid him for his patience and self-sacrifice. We are sorry to have to find fault with any portion of so grand a work, and one carried out so conscientiously; but we cannot help expressing our opinion that the omission of the stone lantern over the "crossing," as shown in the original drawings, was a great mistake, and its loss is not compensated for by the stumpy and ungraceful *flèche* which occupies its place. What a pity it is that Zwirner did not reproduce or study the beautiful *flèches* at Amiens or Rheims, as the one he has erected at Cologne is simply a great stone-like pinnacle, executed in metal. Another feature which we must criticise, is the cresting which, like the *flèche*, is thoroughly unmetallic in character, and the design is more suited for a stone parapet than a metal "brat-fishing." The finials on the transept gables seem to us far too large, and have a heavy and clumsy appearance; and surely nothing can be more miserable and paltry than the new altar erected at the entrance to the choir, which looks as if it had been bought ready made at some upholsterer's shop. Since Zwirner's death, the chief works have been the raising of the north-west tower to the height of the south-west one, the turning of the arch and building the canopy over the great west doorway, and the grand terrace round the north and east sides of the cathedral. This terrace was opened to the public on the 2nd of September this year, and is really a very fine work, which adds greatly to the dignity of the exterior of the cathedral.

Internally we notice the two new windows at the ends of the transepts, which are very beautiful, and far more like old glass than most of the modern windows in this church. Four new statues, by Fuchs, of Cologne, have been placed against the large piers of the "crossing," and an altar has been erected in the eastern aisle of the south transept. The reredos of this altar, called the altar of St. Agilolphus, originally stood in the Church of S. Maria ad Gradus, which was destroyed at the commencement of the present century. The reredos consists of a triptych of large dimensions, raised upon a super-altar. When closed the valves are ornamented with a series of pictures, by a Flemish master, of the sixteenth century, representing the chief

events in the life of St. Agilolphus, and another saint. When the valves of the triptich are open, the reredos exhibits a series of niches, filled with small subjects, carved in wood. The whole is most elaborate and intricate, and is one of the most beautiful specimens of sixteenth-century carving in Germany. This magnificent work of art has been well restored, and forms a great ornament to the interior of the cathedral. Before leaving Cologne Cathedral, we must not omit to mention the new hangings which adorn the backs of the stalls; they are the work of the ladies of the city, and are thoroughly in keeping with the architecture of the building.

Another work of Zwirner's which we must mention is the church of St. Appollinarishurg, at Remagen. When we look at this church, we cannot feel too rejoiced that Zwirner did not indulge his own fancies at Cologne; for here, where he was unrestrained, he has produced a building which exhibits every fault possible in a church of its size: were it not for the glorious frescoes it contains, it would be difficult to find a more uninteresting building.

Contemporary with these works of Zwirner in Northern Germany, Heidlöff was restoring the churches in Nuremberg and the cathedral at Bamberg. We cannot, however, give much praise to his works, as in many cases his restorations were extremely destructive. This was particularly the case at Bamberg, where several most splendid Cinque-cento monuments were removed out of the cathedral, and a very picturesque "Passions Bild" destroyed. Of the new churches built from his designs, the less said the better. It is remarkable, but not singular, that a man who could write so ably about architecture, and draw so well, should fail so terribly in the practical part of his profession.

The restorations of the cathedrals of Ratishon, Munich, Ulm, and Speyer all helped to further, for good or ill, the cause of the Revival. We must now mention a church which is, perhaps, one of the finest monuments of the nineteenth century, the new church of St. Nicholas, at Hamburg, by Mr. Scott. This is certainly the noblest church ever erected by Protestants in Germany. We shall not attempt to describe this building, as we are speaking of the work of German architects, and it has been illustrated in our pages; but we mention it on account of the influence which it has had upon the taste for Gothic architecture in Germany. It showed the Germans that there was nothing to prevent the creation of a cathedral in the nineteenth century that should be perfect in all its parts, and a rival of the grand works of former ages. The works of Pugin, which were read extensively in Germany, had also the same effect. The works of Heidlöff, Gartner, and Möller had thoroughly instructed the German mind upon the principles of Gothic architecture; but still there was something wanted; for, however well the theory might be understood, the buildings erected were either tame and spiritless reproductions of ancient ones, or mere wild and fanciful jumbles of all kinds of styles. This want has at length been supplied by two men, both, we believe, pupils of Zwirner, and educated architecturally in the workshops of Cologne Cathedral: we refer to Vincent Städtz, of Cologne, and Professor Schmidt, of Vienna. Others have arisen round them who possess the same spirit, but we believe they were the first architects who ever built thoroughly good Gothic churches in Germany; and since they have set church architecture upon its proper footing, Germany has made immense progress in this art. We shall now speak of works at present in progress or recently finished, commencing by noticing some of the churches by Städtz.

The church of St. Mauritius, at Cologne, of which we give an illustration,* is one of the finest modern Gothic buildings in Germany. It consists of a nave and aisle, large western tower, crowned with an octagon lantern and spire, over 200 ft. high; transepts, with apses and small apsidal chapels, a deep chancel terminating in an apse, and two apsidal chapels. The arrangement of the eastern portion of the church is singularly original and good. The apse is in two stories, and bears a slight resemblance to the east end of the cathedral at Ratishon. The walls of the lower story of the apse are much thicker than those of the upper, and this gives internally a deep recess in front of each window. The angles between the transepts and chancel are filled up with two semi-octagon chapels, set obliquely between which is an

octagon turret; the angles between the nave and the transepts are also occupied by octagon chapels, but there is only one on each side, the extra space being taken up by the aisles cutting into the transept. The interior of the church is very noble; the whole building is heartily vaulted in brick, with stone ribs. The nave arches are rather narrow, and are supported upon very solid piers. Above the main arcade is a triforium, which is glazed in the apses only; and this accounts for the transom in the eastern windows, which is nothing more than the back arches of the triforium showing externally. This arrangement is precisely similar to that in Ratishon, and has internally a very pretty effect. The clearstory is noble and lofty, and lighted with large three-light windows. The chapels in the angles between the transept and chancel have a very picturesque effect when seen internally. Most of the fittings are temporary; but two very good side altars have been done, and a pulpit of good design is in course of erection. The sacristy opens out of the south transept.

There is very little sculpture made use of throughout the building; but in the tympanum of the western doorway is an old fifteenth century rood and attendant figures in stone, and on the top of the spire is a statue of the patron saint in stone. This is, perhaps, the only feature in the whole building with which we have any great quarrel. The effect of a statue on the top of a spire is never satisfactory. We know it was occasionally done in the Middle Ages, as in the case of the Capella della Spina at Pisa, and the cathedral at Milan; but we do not know of any ancient example north of the Alps, and we cannot help thinking that M. Städtz has ruined his spire by placing a statue at the top of it. To our mind, also, the spire has too many bands and lights in it, and would have looked better had it been kept more simple. However, we do not wish to criticise a building which is, on the whole, so extremely satisfactory. The length of the church is about 200 English feet, the width of transept about 120 ft. The material used is brick. The windows and dressings are of stone.

The next church we shall mention, and of which we publish a plan,* is the new cathedral of St. Mary, at Linz, on the Danube, also by M. Städtz. This church was commenced in 1862, and will, when completed, be the largest modern church in Europe and the largest cathedral in Austria. At present, however, the crypt, the lady chapel, and foundations only are completed; but it is expected that the church will be ready for consecration by the year 1884. The lady chapel was opened for divine service in 1866. The following will be the dimensions of the church (in Vienna feet) when completed:—External length, 410 ft.; width across transept, 211 ft.; height, inclusive of external roof, 136 ft.; height to vaulting, 96 ft.; height to vaulting of aisles, 42 ft.; height of spire, 410 ft. The material being made use of is granite, with sandstone dressings. The church will consist of a nave and aisles, with a western tower, flanked by porches and two apsidal chapels, opening out of the aisles of the nave, deep transepts, a large choir, and aisles, surrounded by chapels; a lady chapel, sacristies, munition room, and an extensive crypt, under the eastern portion of the choir, and lady chapel. The site on which this church is being built cost 300,000 florins.

The church at Euphen, by the same architect, is very similar to that of St. Mauritius at Cologne. It is, however, smaller. It consists of a western tower and spire, the design of which we prefer to the one at Cologne, a nave and aisles of three bays, transepts, and an eastern apse. The style is good Geometrical.

The churches at Kivlear, near Cleves, Höchen-sum, and several others in the neighbourhood of Cologne, are by the same architect; but our space does not admit of our giving a description of them. We shall carry on our observations in another article.

ANOTHER CITY CHURCH FOR SALE.—St. Mary Somerset, Thames-street, will be sold in the course of a few weeks, under "The Union of Benefices Act," and warehouses erected on the site which it at present occupies. Gilbert Ironside, D.D., warden of Wadham College, Oxford, who was Vice-Chancellor of the University in 1687, when James II. seized upon the venerable foundation of Magdalen College, and sent his commissioners to Oxford to expel the fellows, lies buried here.

CIVIL ENGINEERING IN INDIA.*

The civil engineer, who has been educated in England, and commences to practise in India, will find that there are many things he will have to learn over again from a different point of view, and large accessions to his stock of information and experience to be obtained before he can make a move. We are not aiming at a platitude in making this statement. The fact has been so forcibly impressed upon us after looking carefully through two new volumes, edited by the indefatigable president of the Thomason College, Roorkee, Major Medley, and coming face to face there with a realization of the difficulties and peculiarities that must be contended against in every-day practice in civil engineering in India, that we are fain to give notice of it; although many a harassed cadet has, doubtless, arrived at the same conclusion before. Trains of loaded elephants; railways drawn by hullocks; ever-recurring need of sunshades and punkahs; mighty inundations sweeping all before them; immense trees imbedded in rivers to the great increase of the dangers of navigation; vast deposits of silt choking up canals and rivers; boat-bridges; constant liability to the inroads, attacks, and devastations of a seemingly inconsiderable, but in reality insidious enemy it is impossible to exterminate, the white ant, are but a few of the local novelties quite unconnected with the puzzling differences in the building materials available, which, of course, present a still more important study to be mastered. On the principle that those who are forewarned are forearmed, Major Medley's works should be well digested by all who are in training for Indian service, as well as by those who have commenced practice. In many respects, however, the basis of Indian experience must be home experience, and we perceive this deftly interwoven with much of the major's teaching. To give an instance of this dovetailing of experience, we may note that the decay of the ornamental tracery of many handsome buildings at Agra and Delhi, including the Kootub Minar, would not have been so easily accounted for if the Cathedral of Lichfield, and some of the colleges at Oxford, had not also furnished examples of the decay of stone, and the cause of the misfortune.

The building materials, as we have said, present a most formidable difference from those in use in England. There are 164 kinds of Indian woods bearing the most outlandish names, either in use for house-building, furniture, agricultural implements, &c., or worthy of being experimented upon for those purposes. Some of them are familiar to us by name, and by force of association stand out picturesquely and almost poetically from the list,—the date-palm, sandal-wood, tamarind, cocoa-rut palm, locust, lancewood, ebony, all suggestive of Indian scenery or Indian industry in rich carvings and cunning inlayings; but most of them convey nothing to those who do not hold the key of their meaning in the native tongue. Novices would be puzzled with specifications naming such woods as Odroopco, kurroo-vangay, though this is but the Hindoo disguise of the sweet-smelling acacia, coorveo-allum, cash-nulla, jambo, keekur, kuddaph, maawah, neichitte, peddowk, htouk-gan, jedachoo, sissoo, the-byew, thingan, thumboognn, tseik-khyee, trincomallee, and the vomit-nut, which is the English name conferred in Hindostan, upon the *strychnos nux-vomica*. The Burmese have noted the close grain of a large tree growing on the high hills between the Sitang and Salween rivers, and have called it Theomin, the prince of trees; and in like manner these curious names we have culled as samples have their significations. Indian timber is, however, comparatively an easy subject to master in comparison with Indian stone. Although Major Medley intimates that there are but few records descriptive of the various building stones found in India, he runs through a minutely graphic list of upwards of fifty varieties of sandstone. Every colour of the rainbow is found in Indian sandstones. The Ainhthi rock yields stone of a pinkish white, or ochreous yellow, barred or striped occasionally with black. Paroah sandstone is white; that from Telri is of a dull blue-green colour, which turns to olive green after exposure; that quarried

* The Roorkee Treatise on Civil Engineering in India," Edited by Major J. G. Medley, R.E., Assoc. Inst. C.E., Principal, Thomason Civil Engineering College, Roorkee. Printed and published at the Thomason College Press, Allahabad: Hill & Son, Calcutta; Thacker, Spink & Co., Bombay; Thacker, Vining & Co., Madras; Gantz, Brothers, London; Smith, Elder, & Co., 1867.

close to the Gwalior Residency is of a dull brownish red hue; Bamor quarry yields a dirty white stone; and Manpoor a dingy pink. Laterite is the rock most largely employed for building purposes wherever it is procurable, as in the Mirdnapore and Orissa districts. Cretaceous limestones are quarried for the construction of small village pagodas and chattrams. The natives use gneiss for their temples; trap, quartzose, and greenstone rock for building and paving purposes; coral-reef limestones for their rice-mortars and water-troughs. English architects and engineers occasionally contrast one stone with another, as in the pavement of the Gwalior Residency, where squares of olive-green sandstone alternate with others of a brownish-red colour. When we come to bricks which are sun-dried and called *kucha*, or burnt and called *pucha*; tiles, which may be either pot tiles, pan tiles or flat tiles, flooring tiles, or drain tiles; limes, cements, mortars, concretes, and plasters, we come to just the same inconsiderable differences as we find in the tools and execution. Everywhere, of course, the amount of work performed by coolies and native horses is less than that easily executed by Europeans. A coolie labourer requires to be instructed in the use of the wheelbarrow, for hitherto a basket has been his only contrivance for carrying, and he does not care to dig more than 50 cubic feet a day. The force an English horse is calculated to exert when walking slowly on a level plain is about 120 lb.; but a native horse does not use more than 90 lb. An implement called a *scoop* is in much use here, as in America. This consists of an open box, like a hand-barrow, from which one side has been removed, leaving the bottom exposed. The edge of the bottom projects, and is sharpened, so, as the implement is dragged along, it scoops up the earth, and the three sides mentioned confine it for conveyance. A couple of hullocks or horses are attached to the scoop by means of chains or ropes, and a driver walking behind it guides it by means of a couple of handles united to the back of it. This implement is of no use, however, where the ground is not tolerably soft and loose.

In Indian railways there are many specialities. The greater part of the country being very flat, the gradients are very slight, and the tunnels very few. On the East Indian railway between Calcutta and Delhi, there is only one tunnel in a distance of 1,025 miles. This is the Monghyr tunnel, which is 900 ft. in length, and runs through an outlying ridge of the Vindhya range of hills, on a rising gradient of 1 in 500 up to within 75 ft. of the west face, where the gradient falls 1 in 500. On the Bhore Ghât incline there are, on the other hand, as many as twenty-six tunnels in a short run of thirteen miles. The white ants are a pest here as elsewhere, and have to be taken into account in the selection of sleepers and all timber work. The passenger traffic forms the most remunerative item in the receipts, although it was expected that the goods transit would have been the real source of profit. Major Medley divulges that it was laid down as a principle (when railways were first contemplated for India) that the great lines should be carried from end to end by the shortest and easiest routes, in the belief that it was the through traffic that must be looked to for profit rather than short local journeys; but, so far, the results tend to reverse this assumption, and to suggest that it is worth while to make very considerable detours to pick up the local traffic, as it is in reality more remunerative than any other. A ton of passengers, it might have been foreseen, though requiring no more haulage-power than a ton of goods, can afford to pay more for it than the competition, made by water-carriage and other transits, enables the directors to demand for goods. Short journeys in every-day life are more frequent than long ones; hence it follows that they should be well provided for in the laying out of a line to make it remunerative. A man may have occasion to visit the next town or station to that in which he resides several times a week, while he may, perhaps, never be obliged to proceed from one end of the line to the other. At Indian stations it is customary to provide verandahs, about 15 ft. wide, to extend the whole length of one platform, and waiting-sheds on the other; and a chutrota, well, and latrine for the use of third-class passengers, besides the ordinary waiting and retiring rooms. An Italian adaptation of Oriental architecture is the prevailing style used. Wells and bullock-runs are employed at some stations for the water supply of the tenders, and

Persian wheels at others. All the arrangements for traffic, such as the number of trains, the hours of departure, and the tariff are made in concert with Government through the medium of the consulting-engineer. Before turning from Indian railways, with their dark-faced, turbaned attendants, shadowy stations, alternating with glaring lines through scorching plains, we may state on the authority of statistics, furnished to the Major, that the East Indian Railway on the 21st December, 1865, was stocked with 322 engines and 5,547 traffic vehicles of all sorts. As in England, the receipts from the intermediate and third-class passengers exceeded those of either the first or second class.

Horse-railways offer several advantages in districts where unlimited traffic cannot be hoped for, and accordingly they have been put in operation in India. Our hard-working Major has explored these advantages, and lends his countenance to the conclusion that, where cheapness of construction and working is of more consequence than speed, horse and cattle power may be advantageously substituted for the locomotive; though he advises that the possibility of an increase of traffic warranting the use of locomotives should be borne in mind, and that, as a rule, all lines should be so constructed up to the surface of the roadway as to admit of such a substitution, leaving the immediate difference of cost to be effected on the lighter kind of rolling-stock, the cheaper kind of station required, and the sharper curves and steeper grades allowable for low speeds. Sir William Denison, with special reference to a proposed horse-railway in the Madras Presidency, advises the employment of stone blocks as supports for the rails instead of timber sleepers, adding, that in many parts of the presidency, where the gneiss crops out to the surface, the stone block would be cheaper in first cost than any other sleeper, as well as more durable. Iron-pot sleepers, where stone is not procurable, are the next, in his esteem, for this purpose. An early experiment of cast-iron sleepers was made on the East-Indian Railway, for a length of about seventeen miles; but the road made by them was so rigid and bad, that they were taken up, and wooden ones substituted. A second experiment has been made with wrought iron, for a length of one mile, the result of which has not yet transpired. The Government hullock-train is another description of cattle conveyance with which India is furnished. As the daily journey of a bullock is averaged at ten miles, this mode of communication is no rival of the locomotive, except in the matter of cost. Captain Yule, writing of a projected cattle-draft railway in Rohilcund, ignores the expediency of making the road at the first in the substantial manner that would permit of the eventual use of the locomotive upon it, or of maintaining the gauge of the great railways, deeming that a great saving of expense would be made in the cost of wagons, works, and way, by the employment of a narrower gauge. His estimate for one mile of cattle-draft railway, including the necessary earth-works, sand and brick-hallast, timbers, crossties, spikes, laying way, rails, amounts to 15,923 rupees; and adding sidings, culverts, small bridges, large bridges, station buildings, fencing and gates, plant and wagons, runs up to a total of 26,500 rupees for the same distance.

Irrigating works must form a large section in an Indian engineer's practice, especially canals and tanks. A canal of the importance of the Ganges canal performs as much work as 300,000 men assisted by 1,200,000 bullocks could do. Well, irrigation also gives employment to the engineer to devise the means of raising the water, now usually performed by the *pascothah*, which is a lever with a hocket at one end, attached by a rope and a counterpoise at the other, worked by two men, the *mit*, which is a leather bag, made from a whole ox-hide, raised from the well by two hullocks walking down a slope, and the Persian wheel, a cumbrous piece of machinery, also worked by hullocks. This mode of irrigation is inconsiderable in its results, compared to that effected by means of canals. Major Medley reminds us that the first canals opened out in India were those which had been made two or three hundred years ago, in the days of the Mahomedan Emperor, but which had been so neglected as to have become useless. These were repaired by the cheapest expedients, so as to bring them into working use again, without much reference to the true principles upon which such works

should have been constructed. Little, indeed, was known of the laws of running canals until observation wrought them out. Sir P. Cantley, in prosecuting the construction of the Ganges canal, which was one of the first undertakings of the kind, made great accessions to the current information on the subject, which will be, of course, available in further works, although there are still important points that are yet open questions. There are two systems of canal irrigation now in use in the north and south of India, which are known as the Madras and Bengal systems. The first of these is chiefly confined to the deltas of great rivers, and consists of throwing a dam across the bed of a river to raise the surface level of the water to canals, whose mouths are above the dam, which conduct the water to the lands requiring it. It is only available where the adjacent lands are not above the level of the surface of the river. But as the beds of many rivers are highly charged with silt during the rains, and thus raised to the necessary height to make this mode of irrigation possible, many long strips of fertile country are watered in this fashion. The other system is by inundation. Cuts are made along the borders of the Punjab rivers, for a certain distance, and are then carried in directions parallel with the fall of the country. When the river floods, these cuts water the autumn crop. In the cold season, when the water is low, the cuts are dry, and they are of no use to the spring crops. As the waters subside, it is found that they have left a deposit of silt in the canals, varying from 1 ft. to 10 ft. in depth, and the opportunity the subsequent dryness presents is seized upon for an effectual cleansing. A large body of labourers is employed in removing the silt. Some of these canals are 300 years old, crooked, following every winding of the ground, but still in good working order, owing to this annual cleansing. Lieut.-col. Anderson, who has had considerable acquaintance with irrigating works, considers that one of the first points in the management of canals is to keep up the velocity of the waters. Any change of direction causes a certain loss. The slope of the main channel should be less than that of the branches, which in their turn should be less than that of the minor channels and branches. By this means a uniform velocity will be maintained as far as possible, and the deposit of alluvial matter made as equal over the lands to be irrigated as is desirable. The snows of the Himalayas are in reality the great supply of some canals, as they feed the rivers in which the heads of them are fixed. From the necessity of fixing the source of supply high up on the river's course, so as to obtain plenty of command of level, that portion of a permanent canal near the head has to be built in a series of steps, down which the waters descend in falls. The first question is not, How much water do we want? so much as, How much water can we get? for, in Northern India especially, there is practically no limit to the amount of land requiring irrigation to prevent famines. It is not, however, considered economical to make the channel large enough to carry off the utmost quantity of water the river can spare when at its highest, for experience has proved that this extra water would only be available for one crop, from which there could not accrue sufficient profit to pay for the outlay on the extra size of the channel and masonry works. It is a singular fact that, though the minimum discharge of the Ganges is reckoned at 8,000 cubic feet per second at Hurdwar, where it leaves the hills, and the Ganges Canal is made to abstract 6,750 cubic feet, there is no perceptible diminution of the waters, nor is any interference with navigation felt. Each cubic foot per second of discharge is assumed to irrigate 218 acres. In the Soane Canal project, 1861, Colonel Dickens reckoned three-fourths of a cubic foot of water per second for every square mile of gross area. The Eastern Jumna Canal is found to irrigate 236 acres with each cubic foot; and in Madras, 40 acres of rice, or 100 acres of sugar, can be watered with the same discharge per second. But a new system is called for in the mode of payment. At present the area watered is the fact taken into account, not the amount of water used; and there is great waste.

The obstacle to an adjustment of this difficulty consists in the fact that no practical method has been devised for measuring water under a constantly varying pressure. Many things have to be contrived in the formation of these double-purposed canals. Some of the land through which they pass may be too swampy for irrigation; more may be reserved for forests, grass

preserves, or occupied by towns or cantonments: these tracts must be deducted from the sum total of acres to be watered. Major Medley puts the following case.—Suppose we desire to irrigate a particular district, say 200 miles long, averaging forty miles broad, lying between two rivers, by cutting a canal from one of them, and carrying it along the watershed of the country. The total area of such a district would be 8,000 square miles. Now of this our maps would show us (say) that 1,500 square miles were *khadir* land, which could be irrigated by wells, or by small canals cut from the river, leaving 6,500 square miles of *banjar* to be provided for, from which another 1,500 would very likely be deducted for town sites, swamps, forests, &c., leaving 5,000 square miles actually requiring irrigation. At the rate of 1 cubic foot per square mile, this would require a canal with a minimum discharge of 5,000 cubic feet per second.

Aqueducts are occasionally required. Of these the Solani aqueduct on the Ganges canal is a remarkable instance. The canal is carried across the valley of the Solani river on an earthen embankment two miles and a quarter long, raised to an average height of 16½ ft. above the country, having a base of 350 ft., and a breadth at top of 290 ft. On this embankment rise the banks of the canal, 30 ft. in width and 12 ft. in depth, lined with retaining walls formed in steps. The river itself is spanned by a masonry aqueduct 920 ft. long, having fifteen arches of 50 ft. span, and a clear water-way of 750 ft., dimensions which place it among the most remarkable works of its kind in the world. With so much solidity is the masonry executed that there is as much below the surface as there is visible above it. The piers are 10 ft. thick at the springing of the arches and 12½ ft. in height, and the side walls are 8 ft. thick and 12 ft. deep.

A tank is an artificial lake formed by an embankment, called in native speech a *bund*, thrown across a line of drainage or the gorge of a mountain pass, so as to collect the waters on the upper side, whence they are distributed for irrigation by means of sluices and channels. Some valleys possess several of these tanks, the head of one being placed where the cultivation under that beyond it ceases; and a breach in one leads to a breach in all, if proper precautions are not taken. The conditions most favourable for the construction of tanks are a channel bringing down an ample supply of water to a broad expanse of nearly level land suitable for a bed, with a rocky foundation, and which has in its rear a tract of country slightly lower in its level, to permit of its irrigation through masonry sluices constructed in the embankment, and communicating with earthen channels leading to each field. It is also a matter of moment that water may be at hand for the use of the work and work-people; and that stone, lime, and fuel be also procurable. As all these facilities seldom present themselves in one spot, it remains for the engineer to make a selection of a site embracing as many of them as are to be found in one locality. This especially is a branch of engineering in which but little home experience can be brought to bear. And so again in the removal of kunkur banks and the blasting of large trees. We mention one example out of numbers given by our author of the removal of a tree. It lay 200 ft. from the banks of the river at a village called Clupree, where there was a depth of 20 ft. of water at the root, and a number of branches spreading out in various directions, which were taken in hand one after the other. The root and stem were broken by successive charges of 25 lb. to 50 lb. of powder, and then separated and dragged to shore by crab capstans, but this was not effected till 850 lb. of powder had been expended. The root spread out in irregular masses to a diameter of 20 ft. facing the current, and was only demolished piece by piece, after having had several cylinders broken in the attack upon it. Such details as these given by Major Medley afford vivid pictures of the difference between Indian and home practice.

CROOK (DURHAM).—The foundation-stone of a Mechanics' Institute has been laid at Crook, by Mr. J. W. Pease, M.P. A large number of influential gentlemen were present. The site of the building—the largest room of which will seat between 500 and 600 persons—is situated at the end of Victoria-street. The building will cost between 500l. and 1,000l.

A MARKET FOR LONDON.

ARE the people of this mighty kingdom of houses, called the metropolis, ever to a market worthy of them and of it; and, if not, why not? Is it not a reproach to the public spirit of the age and its boasted intelligence, that there is not, within a radius line of four miles from Charing-cross, or from the cross of St. Paul's, anything fit to be called a market for retail produce? Are we for ever to be dependent on the mid-gauge of some private individual or other for our provision "exchanges?" What is the reason that Londoners, the knowing, the "go-ahead," the keen, the wealthy, the "hang-the-coat," are so stolidly content with markets that comparatively poor, struggling, third-rate towns would blush for?

The markets that we want the most are what may be called kitchen-markets; places where we may buy that which is to grow muscle and bone for us, and enable us to feast and make merry. Man is a wonderful-eating and drinking animal, and, as he possesses, and lords it over the genius of the "sacred" fire, the provision market is an important spot of land for him. As the ancient philosopher said to the would-be student: "If you know not geometry, then you are not yet on even the very threshold of knowledge;" we say, that if you know not marketing you are not yet on even the very threshold of civilisation. There is, however, an old saying that "when things are at the worst, if they move at all they must mend." That saying has been, and is being, exemplified a little among us. Miss Burdett Coutts is busy with the market-redemption of Bethnal-green and the east, and the Corporation of the City have, after much trouble and popular pressure, taken the centre of London City in hand. Leadenhall and Newgate are doomed, and a great meat-market will take their place.

Our list of markets on paper looks formidable enough, and deceives the stranger; in fact, many of them are like mock auctions,—down-right shams. To begin with, there is a book description of them before us, by which, were we merely a sojourner, we should certainly be taken in. There is Bloomsbury Market described as "for the sale of provisions generally." Now, we have lived in London a long, long time, many a year ago, but we never remember anything approaching to a market in Bloomsbury; we might just as well look for the green pastures and waving meads of St. Giles's-in-the-Fields as try to find a market in that locality. There is a decent-looking butcher's shop and the combinations of greengrocer and coal-shed standing *vis-à-vis* at the corner of a court to represent a market; yet none of the guide-books seem to have become aware of that fact. Bloomsbury "Market" is a kind of yard-street, of about 50 ft. in length and 25 ft. wide. It lies parallel between the High Holborn junction of New Oxford-street and Hart-street, Bloomsbury-square. A continuation of it, under another name, runs under an archway into Southampton-street. It is much patronized by the flying exiles of the neighbouring Seven Dials, who resort there to toss and gamble, during divine service on the Sunday morning. Then, again, we have "Brooke's Market," at the end of Brooke-street, Holborn, and, with the prolonging street leading you into Leather-lane. Here, another Guide to London speaks of "the sale of provisions generally." We have been in Brooke's Market many times during the last five-and-twenty years, and even very lately, and the only "provisions" we ever saw were those for dogs and cats. We believe there are the usual coal-shed and potato-bin; but whatever else there may be, there is certainly nothing approaching a market, save the name. The locality has an historical association, and is making a second one.

It was in the garret of a house at the end of Brooke-street, within sight of the market, that the unfortunate Chatterton transmitted his name to posterity as the literary hoy-sucide of 1770. The second association is in connexion with a prominent church erected within the last few years; but as it has more to do with Ritualistic Commissions and Pan-Anglican Synods than with our subject, we will pass it by. The population of Brooke-street and the adjacent market has altered greatly of late. Those fragile-ware shops, kept chiefly by the children of Italy, in whose windows mysteriously-marked glass-thing attracts the curious visitor, have broken out wherever a break-out has been possible. There are a great many courts that have burrow-runs

from all sides of the market. They lead into other courts, that lead again into Gray's Inn-lane and Leather-lane, and the population is such as may be expected among such human warrens, under a system that has compelled the needy, ignorant poor, to lodge and bring themselves up, generation upon generation, after the fashion of their own unbridled, animal instincts, and that is all about Brooke's Market.

The next of these shams is Clare Market, neither more nor less than a gutter market, with stalls of fish, fruit, and vegetables, which, however, "handy" to the residents, has no pretension to be called a market. It is something like Strutton-ground, Westminster, a mere collection along the carb-stone of costermongers' barrows. Then there is Newport Market, which is composed of a long, narrow alley, a kind of "6 feet" passage, with butchers' shops on each side. On Saturday nights it is somewhat crowded, but there is no competition, as the butchers settle the prices in the morning, when they arrive from the wholesale markets of Newgate and Leadenhall. At the very best it is a most unsuitable place to be dignified with the name of a market. We go towards Soho, and come upon what is known by the name of Carnaby Market, near to Broad-street, Golden-square. It is difficult to imagine how such places came to be gravely put into print as "markets." The Metropolitan Board of Works might step in here with a series of re-christenings.

Going still further westward, we come upon another of these puny "markets." Turning Whitehorse-street, Piccadilly, there is Shepherd's Market,—that elysium of retirement for prudent footmen and upper-housemaids into the gentler chandler's shop or greengrocer's business. But you have only to look round the 200 ft. of streeting, its high-life-below-stairs atmosphere, to discover that "market" is a sad misnomer.

Continuing our course, there is Mortimer Market,—a small huckster-shop-looking place near Tottenham-court-road, with not a single feature to suggest a market. Then there is Fitzroy Market, also, by Tottenham-court-road, entered by a court from the street. It seems to consist of shut-up, ruined, slum-looking shops, cats'-meat stalls, marine-store dens, and old-furniture brokers. We had almost omitted a most humble-looking place, by the upper end of Oxford-street, called by the mighty title of "St. George." It would puzzle a keen observer to discover what part of it constituted a market.

Again, we have Oxford Market, on the north side of Oxford-street. It seems to have been originally intended for a market "by construction;" but there the resemblance ends. It is half unoccupied, and the remainder is taken up by street-shops of a very crummy-looking kind, with nothing of the market character about them. Portland Market, Paddington, is quite a different affair. Although not fully tenanted, it has all the characteristics of the market proper. The Borough Market, too, in Southwark, is a regular market, at which a large business is done every week. It is chiefly noted for potatoes; but there are well-stocked shops for all kinds of provisions. Cumberland Market, Regent's Park, is chiefly a stableman's market for hay and straw. Farringdon Market, at the foot of Holborn-hill, is mainly kept up by the sale of water-cress; otherwise it is a failure. We go on further into the City, and we find Honey-lane Market, on the north back of Cheapside. It consists of a butcher's, fishmonger's, and shoemaker's shops, the City of London School in the centre, the back entrances to some warehouses, and a "public" or two. Hoxton Market is "nowhere," whilst Finsbury Market, in its deserted, tumble-down state, stands another witness to the folly that planned the sites and forms of these departed markets. Spitalfields Market is an extensive and a useful one, and Whitechapel, with its well-stocked butcher's meat and provision shops, offers a chance and a choice to the marketing housewife, should she venture out.

Of those small markets that are the more immediate objects of our present remarks, it may be asked, Why have they proved such failures? The answer is not far to seek, and, in giving it, we may ask another question:—Why were markets of such descriptions put in such places? Any market for provisions of a retail character of trade ought to be in the leading street of the district, having the whole of its interior open to the street, and not closed in by a curtain of shops. Look at Farringdon Market. Had that market been placed on the site of the Fleet Prison, where there was plenty of level

ground for all purposes, it would have presented a very different appearance, and have told a very different financial tale to-day. Our plan would have been to have had it quite open along its entire frontage, except some dwarf railings for police purposes. Then all could see it and be invited to enter as they passed along. It would have been well lighted everywhere, and that is a great point; for nothing is so depressing or deterrent to trade as a half-lighted, gloomy shop or market. Then, again, the market-carts could have driven in easily and unloaded, and the market would have been busy and popular. But what was done? The market was put on the side of a very steep hill, up which no fully-laden horse could possibly climb.

Then, as if to put the thorough extinguisher on the possibility of transacting business or drawing custom, a long curtain of shops was allowed to close in the whole line of front towards Farringdon-street, and the market proper was over-weighted and killed—at least not killed quite, but chloroformed into a state of stupor that has paralysed it to this day. *Facilis descensus Avernæ*, it is true, *sed revocare gradum* is not so difficult in this case as in the one put by Virgil. There is time, even yet, to make Farringdon a useful, thriving, popular market. Clear that unsightly curtain of shops, and bring the market down to the very edge of the pavement; have it all open, that it may see and be seen; make the cart-entrances all on the lower level of the street; secure land for extension northwards; then, with two levels, we might venture to stake the pen we write with that Farringdon Market, under the shadow of the new viaduct, and with these improvements, would put flesh on its starved, skin-cutting bones, and grow fat, prosperous, and happy.

With respect to the small retail markets, such as those we have previously enumerated, and whose rescination may be very desirable, the only successful way is to place them openly in the "high street" of the place; let them be convenient and low-rented, easy of occupation by everybody, and then rigorously sweep away street-stalls of every kind and degree, whether on wheels or otherwise. A retail market, properly regulated and inspected, ought to be a great guarantee to its locality. If unfit food of every kind were turned out of it with punishment, sharp and sure to the seller, and no possibility of costermongering it about the streets, the public health would gain largely. Make the market fair and reasonable; and, having done so, force every dealer into it, or mercilessly "wipe him out" of street-hawking as an act of public safety.

Look at Billingsgate. Can any one understand why three millions of people put up with the cost, inconvenience, and monopoly of a fish-market not much bigger than a good-sized jobbing carpenter's shop? It seems a marvel; but there is the fact. Three millions of people whose eternal throat-splitting cry is—"Local self-government and no surrender,"—allow their fish, gathered from the waters of every sea, to be sent down to Billingsgate, in order that tax and toll may increase the price of the already too dear funny food! We ought to have large, unfettered, well-supplied fish-markets, east, west, north, and south of Charing-cross, the modern centre of London. Why, even Paris has a fish-market ten acres in extent.

Let us turn now to its vegetable counterpart, the ancient market of Covent Garden. What do we find there? Why, that the market proper has now become only the centre of the market of business. On each market morning,—Tuesday, Thursday, and Saturday,—the laden carts, wagons, greengrocers' "traps," and costermongers' barrows completely block up, and make more hideous with their shouting, yelling, and imprecations in every street from the Strand to Long-acre, and from Drury-lane to St. Martin's. Here, again, is a curious phase of modern London character. Covent Garden has been, for generations, the chief fruit and vegetable market of the metropolis. It has altered little in size, at any rate, since 1830, when the present market buildings arose, at an expenditure of 50,000*l.*, under the superintendence of the late Mr. Chas. Fowler; the space has not grown with the growth of the people. A few years ago, a clearance was made at the south-eastern angle for flowers and roots, but this is like enlarging an estate by pulling down an out-house or two; but the market is still far too small, and, what is more, and what is worse, the "Bedford people" are at their wits' ends about "room, room," being made a leading cry of public

opinion; because, when that comes to pass, the market must "move on." Yet, there it is, and the same three millions of people before mentioned, with their battalion array of borough members and of county members in Parliament, with their vestries, their chief boards and district boards of works, and other things, and all their trumpeting and shouting about their power and their greatness, are content to have their principal market of this kind in a small crowded-in square, the property and tax and toll of a private owner.

Now, there is no enlargement, practicable, of Covent Garden Market on its present site; the cost would be enormous. Let us take, even, the most moderate extension to clear the ground. Begin at the right-hand corner of the Long-acre end of Bow-street, and walk down to the corner of Tavistock-street, then along to the corner of Bedford-street, turn up to the right to Long-acre, and on, again, to our starting-point. No, thing on a smaller scale would make a "good job" of it; yet does not the immense value of the property immediately brand the whole scheme as impracticable? The rebuilding of Covent Garden Theatre on the site of the old house was a fatal mistake, so far as the enlargement of the market was concerned, and so it is felt to be. But for the reconstruction of the theatre there was just the probable speculation that the market might have expanded eastward to the Bow-street line; the more especially as the police-court is to be removed over the way when the present lease expires in a couple of years or so. With that space thrown in from Tavistock-street corner to Hart-street, and on to James-street, a stop-gap might possibly have been found for the next ten years, but for no longer. A population that sweeps the farthest market-gardens of England for its earth-grown edibles, and then scours the continent of Europe, extending even to the fruitful fields of Algeria, is not likely to remain much longer contented with a stable-yard area for its principal centre of distribution, nor to let that centre continue in a private hand.

Old historic associations and memories are fast fading away from us before the flood-light of modern "improvements." We have mentioned the removal of the Bow-street Police-court in a few more years. It is intended to place it beside the present station-house, extending backwards, and then turning at right angles and debouching upon what was Little Russell-street—now Russell-street only—opposite the colonnade of Drury-lane Theatre. At this moment may be seen an indication of the proposed change in the newly-huilt entrance-front surmounted by the royal arms, now serving as a temporary builder's yard, opposite the pit-door.

Amongst the places doomed to be swept away is one old memory dear to the historic heart of a by-gone time. This is the Harp Tavern, Russell-street—the old "O. P. and P. S. House" of a former generation standing next door to the place just named. Up by the side of it is a gateway leading to a livery-stable yard, and as all are scheduled for the new court, the days of the tenebrous Harp are numbered; so, whilst we have the opportunity, let us place on record some incidents connected with its history. If we mistake not, it has been in one family connexion for nearly a century; amongst the "noted" houses for the sale of "pure malt and hop," it has always been noted; and, even in the present age of shameless and wholesale adulteration, it has not degenerated, if we are to believe some half-dozen certificates of Dr. Hassall.

The Harp is an old house. The yard was taken in and a square cottage built upon it, the ground-floor being the parlour of the tavern. It is the associations of this parlour that have helped to make the house famous. In times when actors lived on the battle-field of the drama the Harp parlour was one of their evening rendezvous both for song and supper. When the great Edmund Kean came out at Drury-lane, in 1814, he often refreshed himself at this hostelry, and amused the company, who were all, more or less, of the theatre, with his favourite song of "Lord Allen's Daughter." There is, now, a cast of his face over the seat where he formerly sat, and a suitable tablet recording that circumstance. The walls are covered with portraits of actors and actresses whose name are landmarks to the English stage. Many a

"Poor player
Who struts and frets his hour upon the stage,"

and who has long since

"Shuffled off this mortal coil,"

has found substantial aid in that parlour before he became famous. It was round one of its tables, too, that the flourishing "Society of Buffaloes," which now numbers thousands of branches, was formed.

There is still a curious social institution upheld there, called "The Ancient and Honourable City of Lushington," that, strange to say, claims to be the oldest temperance society in the world. But to go into an account of this curious association would lead us too far out of our way.

To return to the main subject. The question of market accommodation must soon force itself upon the governing powers of the metropolis and upon Parliament. To say that the great west-central market area can remain as it is, because it happens to belong to a powerful nobleman, is to say that Covent Garden must stand still whilst all the rest of the world progresses. The next inquiry is,—What is best to be done? Turn whichever way we will the prospect of expense is fearful. Suppose we were to buy the Duke of Bedford out, in what direction should we move? The cheapest way would be towards Bedford-street, by removing the church and the contents of the church-yard, and taking in the enclosing sides of Henrietta, Bedford, and King streets. This would give us double the present market area. Then we might at the eastern end push into Bow-street as far as the theatre would allow us. Here is the only palliative we can apply on the present site. The cry is still "Room, room, room!" and there is no room to give. The consequence is that a general choke up and corresponding nuisance take place every market morning, from an early hour in all the surrounding streets. Surely this can never be allowed to continue,—that, for the special benefit of an individual market proprietor, the whole of the adjacent thoroughfares shall be taken up by his market-paying customers to the inconvenience of the general public. To work our way into Long-acre would be too costly; but we might take the block from Evans's Hotel and throw ourselves in the same direction; whilst on the south side we might get into Tavistock-street and Maiden-lane. Our readers will now see the difficulty that envelops the subject, and, we believe, the anxiety of the Bedford office about it is no secret.

But is this the best we can do? Let us look round and see.

If we commence at the corner of Endell-street, Broad-street, St. Giles's, and go south to Castle-street, then, still keeping to the right hand, pass down Castle-street, we come to the top of St. Martin's-lane. We then continue our course up West-street, and Crown-street, to its junction with Denmark-street, by which we reach St. Giles's Church, and down Broad-street to the corner of Endell-street, our starting-point. In this tour we take the boundary-line of what is called "The Seven Dials." This will comprise an area about equal to that from Bedford-street to Bow-street, and from Long-acre to Maiden-lane, amounting to three times the length and three times the breadth of the present Covent-garden Market, and twice as large as Old Smithfield. This is the place in which a great metropolitan market could be planted. The streets of the Seven Dials are all "slums," and the lower strata of the inhabitants are composed chiefly of the dangerous classes. The place is like a rabbit warren, all cut up into courts and alleys. Who that has seen the cellar-dwellings of Monmouth-street, to which place the old, notorious "Field-lane" seems to have emigrated, cannot confirm what we say? All the property required within this extensive boundary is of a poor description. A thorough clearing away would purify the social and moral atmosphere of that part of the town. The next problem, of dealing with the dispossessed people, is one that is capable of solution hereafter: it would be too extensive for discussion in the present paper.

Now, let us look at the advantages of site of our market in such a situation. In the first place that long, much-wanted improvement, the continuation of Tottenham-court-road, by the western end of St. Giles's Church, to the top of St. Martin's-lane, could be carried out along the western line of the market boundary. By this means all the western and north-western traffic for the market could enter its gates at once by New Oxford-street, and Tottenham-court-road, Hammersmith, Fulham, Putney, and Brompton, could come along Piccadilly, and enter by the southern gates, whilst the eastern ones, opening upon Broad-street, St. Giles's, and

the south-eastern upon Endell-street, Long-acre, would admit of all that came that way. Nor would this space, large as it undoubtedly is, be too large.

In a comprehensive, self-contained chief market of that kind for London, it must be borne in mind, that room would be wanted for bait stabling to a large extent, and warehouse space for the necessary fodder. Besides, stores would be required for large consignments of fruit, potatoes, and other root edibles, in passing from grower to consumer. Provision must also be made for the sale of dairy produce as well. It is not everybody who will care to go to Smithfield for a turkey, or a pair of fowls, or fresh dairy butter. In such a market sufficient space would exist for the breaking of bulk, and the transfer of loads; the moving about of carts and wagons; the ingress and egress of railway vans from all points of the compass, and the proper supervision, control, and refreshment, of both man and horse. Classification of either districts or goods could be carried out to the greatest attainable perfection; there would furthermore be no crush, no crowding of adjacent thoroughfares, no shivering horses in the by-streets, and no confusion; laden vehicles could be emptied upon arrival, and their loads stacked for sale, when they could draw off to the stabling side of the market that would be set apart for their use. Here we could have entrances on all sides of the great arterial thoroughfares of the metropolis,—the eastern and south-eastern by the top of Bow-street, to the next corner of Endell-street; the south, the same way from over Waterloo Bridge; the south-western, by Piccadilly and St. Martin's-lane; the western and north-western, by Oxford-street and Tottenham-court-road; and the northern and north-eastern, by New Oxford-street and Broad-street. Compare such a market as this would be with the present coal-shed and greengrocer kind of affair. In the new market both sunshine and shelter could be at the optional choice of everybody and for everything, and nothing need be left undone or uncarried for.

OUR DEVONSHIRE VILLAGE.

Our Devonshire village is really a remarkable landmark on the map of England. Its scenery, its houses, its people, manners, and customs, are all fit for a novelist's pen or a painter's pencil; and yet, with all, its name sounds harsh. Boasting in all that is romantic, its name is as ungentle as could be. Glorifying in the name of Beer, its fame is not imaginary, for, cloaked with the grandeur of nature, it is surrounded, too, by an army of workers as busy as bees, who produce for our West-End worthies the elegant Lionton lace; and there is hardly a lady whose laced shoulders grace the "drawing-room" or "evening party" who knows what a charming and romantic district is that which produced her delicate covering.

It was the love of rambling, with the assistance of the travellers' friend, Murray, that caused our being introduced to this Devonshire village, one of it not the most romantic on the English coast. We had already commenced our tour along the South Devon coast, had taken our rest at several villages on our way, had enjoyed the borders of Dorset, the beauties of Lyme, had narrowly escaped a fall of 200 ft. in the great Pinney landslides,—a grand and solitary region, where giant cliffs and dense coepe, craggy pinnacles and Mistress Echo lend enchantment to the scene,—we had passed through Axmouth and Seaton, and along the coast hereabouts is a pleasant, as well as a dangerous ramble; but, when we cross White-cliff, called by Murray a "bluff, picturesque headland," we are eyewitness to a scene which well repays us for the venture.

From above we look down upon "Our Village" in the valley, and truly it is a picturesque view. A single street of small cob-houses has a rapid winding descent towards the shore. The background is enlivened by clusters of trees. In the centre of the village is its curious small shaped church; and down the street runs an open stream of clear spring-water. Rising in the hills above, and augmented by other springs on its route, its velocity is so great that at the foot a pretty cascade empties it into the sea. On our left a corn-field runs to the edge of a cliff, and from this another view is obtained. While the foreground shows houses amidst the clustering boughs of many a good-aged tree, and the merry laugh is

heard deep down in the valley beneath us, we see the ocean sending forth its glistening waves, contrasting admirably with the stone, the chalk, and the green bushes and landscapes which meet our view further west across the South-down Common. And on the edge, bounded by the sea on one side, and the rising ground on the other, we notice Beer-head, and while admiring this ivy-hung promontory of the lower chalk, we see before us the last chalk cliff in England.

It was a Sunday evening when we made our descent, and never did a village look happier. The cottagers, principally fishermen, were holding their evening converse with their wives, their children, and their neighbours, while the young girls, released from a week's lace manufacture, were taking their evening stroll down the highway or across the cliffs. And how the eyes of many of our London friends would have opened had they seen the gorgeous lace shawls which covered the shoulders of the majority of these Devonshire village beauties, who, reared humbly yet respectably, are not too proud to accept the title of "Dumplings," so healthy and well do they look. Of course the appearance of strangers was a signal for a village ovation. Every eye was turned, our features scanned, and inquiries daily made, and it is not too much to say that within a very short time after, who and what we were formed the leader of their "latest intelligence." And even this was lucky, for we were thrown into the society of a worthy fisherman, boasting in the name of William Good, whose life has been spent here, and who, bearing the character of a free and sincere adviser to his neighbours, was not the whit less courteous to ourselves. It was his lively conversation, and really useful knowledge, that assisted to bind us to the place, and to him our thanks are due for many expressions of goodwill and kindly advice while on our ramble.

Our Devonshire village has not changed much this century, for it likes not new faces. The same old houses stand that stood in the days of the residents' ancestors, and but a very few indeed have given place to rebuilding. Still it must be supposed the buildings are sufficient for its population—a reality sadly against the village; and it must be owned that the value of the property in rentals, ranging from two to six pounds, is detrimental to its participation in the great reform, long wanted, and hardly as yet awakened. The clear spring watercourse still runs through the village, as it did in the days of our forefathers, and though its course was contracted into a narrower channel some twenty years since, and it now forms an open sewer, yet it is ever clear, ever sparkling, and to the stream is to be attributed the health the villagers enjoy. Two conduits, erected in the street, give a "constant supply" of spring water, and the Lord of the Manor, the Hon. Mark Rolle, has already commenced other works to improve this luxury—a luxury which East London would indeed have worshipped in the last cholera year. The velocity, too, of this merry stream is so great, that anything put into its course at the top of the village would reach the sea within but a very few minutes. So curious, indeed, did this freak of nature appear to us, that we still have before us a vivid view, and we can still in imagination see it merrily capering towards its ocean bed. And while the stream runs merrily on, while we walked along the pebbled path, we can yet see another sight, for the very grass grows beneath your feet, and ducks and geese trot about, taking little head, and having little thought whether it be a village green or the Queen's highway.

At the upper end of the village are the schools and almshouses founded in 1820 by Baroness Rolle, whose liberality finds much praise in this part of the county, while a little farther on is the newly laid-out cemetery, which, to save the villagers carrying their deceased friends to Seaton, the Hon. Mark Rolle has, at an expense of 1,200*l.*, considerably given them. And let me not forget to mention another benefactor to the village, a Mr. Williams, of the Isle of Wight, who, having occasionally visited here, and noticed how difficult it was to get the fishing-boats on shore on their return from trawling, presented the fishermen with a capstan, which proves to be a great friend indeed to them.

But if the village is bright in the summer's sun, it is not so when the darkness of winter makes all look grim. When the shades fall, and the moon is far away, few can picture the scene. And when, three winters since, brackets for the lamps were fixed in the walls, many there

thought a great reform had come at last, that a good genius had been at work, and his deeds had but just been brought to light; yet curious still is the aspect, for along the single street, with the rushing waters beneath, and perhaps the stormy element raging above, the only light to be seen in this romantic valley is the strange flicker of a candle, or the but little better illumination from paraffine.

In the bay by Beer-head, the natural formation of the rocks presents one of the most favourable opportunities for the making of a harbour; and such a plan has been, I believe, some time in existence. Now Beer-head, called by the fishermen Berry-wold, is another curiosity, remarkable for its two natural towers of chalk, not to mention the ivy-clad appearance which gives a particular character to the scene. Looking up from the beach, and surrounded by the great cliff in this rugged cove, there is a certain enchantment lent which no words can here repay. And even while we see all this around us, while our minds become mixed up with retrospective glances and present-day experiences, other sights come to our gaze, and we recollect that the celebrated Beer quarry is worthy of a visit.

Beer quarry, about a mile up the road from the village, produces a most valuable stone, which for three centuries or more has been worked here. It is in two divisions, the old and the new. The old one, the stone of which is much softer, has not been worked for many years, but the new one is now supplying stone for many great improvements, not only in the neighbourhood but at a distance, including the cathedral at Exeter; and should a railway be made from here, and a harbour formed, this quarry will tend to raise our village to no small eminence in the history of these parts. Occupying, as already worked, about eight acres, it is at present held by Mr. Mivch, of Colyton, who, from what we could see, would do well to infuse more spirit into the work by a company or otherwise. Arriving at the entrance, low, gloomy, and forbidding, we shout as we had been directed, and in the distance is heard the echo. Soon we see a candle flicker, and a quarryman is duly introduced to our notice. We ask his name, and he answers, John Cowley. He commenced his work here so long ago as the 13th of November, 1825, while a mate of his, a James Tucker, who died two years since, dated his apprenticeship from 1807, showing that life, though thus confined, can exist in the deep recesses of a free-stone quarry.

It was then with this guide,—and "bad luck" to him who would venture into the labyrinths without one,—we entered the cavern and surveyed its precincts. And a wonderful sight it was, consisting of beds of freestone, lying at the junction of the chalk with the green sand, being principally composed of carbonate of lime, soft and easy to work, but hardening on exposure from the evaporation of the water it contains. You here see the huge blocks cut and removed by a single quarryman. These caverns are rendered, too, more imposing from the fact of the square pillars of stone left standing in order to support the roof; and which pillars are huge blocks, 18 ft. long, 7 ft. wide, and rising to the height of 14 ft., for the stone is generally constituted in layers of seven beds, and not higher. And when it is recollected that these deep recesses in the earth are under the rising ground in parts 300 ft. from the surface, it naturally excites our astonishment that falls in do not often occur—the last of any consequence taking place half a century ago. And far into the interior of the darkness—for our only light was a small and remarkably thin candle—are some curious nooks pointed out. Here, in a narrow compass, far underground, may be seen the remains of the Smugglers' Cave; here Jack Rattenbury, the bold smuggler of the Devonshire coast, kept his court, among the smuggled spirits; here existed—does exist still—the chamber wherein law was defied, and strange scenes enacted. Jack Rattenbury left this world some fifteen years since.

As already stated, the inhabitants of our village are for the most part a fishing population. The fathers employ their time in mending their nets at home, or casting their lines abroad upon the sea, for the distance of about ten miles from shore. Out with the early birds at two or three in the morning, they seldom return until the day has far advanced. Of course, the village is not great in fishing repute, but it is well known round the coast that the Beer boats are large and strong, and that the men bear the general character of being honest, sober, and industrious.

Some have other trades besides a dependance on fishing, and well for them that they have; for, when rough weather sets in, they would stand poor chance against the sea off Beerhead. The boats are twenty-three in number, of which seventeen are trawlers and six are employed in catching lobsters and crabs.

When your morning stroll is taken, when you return from a lounge at Seaton or a ramble over the South Downs, you take a turn to the beach, narrow and limited as it is; you watch a little speck in the distance; you see it approach nearer and nearer; you perceive a sail, and, waiting patiently, one of the long-looked-for boats runs to shore. Already have the buyers arrived; already we see excitement; and when the fish is landed, the Dutch auction held, and the haul sold for, say, 8s., 10s., or 20s., or even less than the lowest of these sums, the fish is soon hurried away to be retailed some miles inland. And, as each little sail makes a run for shore with her fresh cargo,—or none at all,—the produce of the briny deep, a continual excitement is kept up on this usually quiet beach for several hours. But the fish caught off here seldom, if ever, enter the London market; the consumptive powers of nearer cities claim the produce for themselves.

The housewives of Beer appear industrious, while the girls form parcel of the great lace manufacturing district, which though bearing the name of Honiton, is at least ten miles around it. Of course we have heard of Honiton lace; our lady friends have justly prized it from the time the Lollards introduced it in the reign of "Good Queen Bess," but we fear our fair friends of the West end little imagine that the earnings of those that manufacture it, do not reach to more than from 4s. to 6s. per week. How often do we close our eyes to the actual pay for labour in this country, when bent on enjoying its proceeds. This makes our girls marry early, and often leads them to a life of misery. Then they leave the village, and as often their ambition is to go to London, to the great metropolis they come.

The young men, too, of Beer seek their fortune, and many find employment in the great City houses, seldom forgetting, however, their native village. And as for the children, they all take early to the water, are good swimmers, and death by drowning here is rarely heard of.

But if our village is a model in one way, it is equally so in another. If the character of its buildings tend to tell us that Beer loves old associations, so the character of its people proves that all live in good fellowship with all men. It boasts not of the assembly,—

"Where village statesmen talk'd with looks profound,
And news much older than their ale went round."

It aims at a higher mark of distinction. In trouble, in sickness, or in health, the love of mischief is a prohibited pastime. Curiosity is at all times allowable, and Mrs. Gamp and Mrs. Partington are not ladies to be easily "put down" in this age of ours, but the horrors of scandal-mongering, as detestable a crime as a fellow-creature can commit, are in this village a name, but no reality. Woo to those that do scandal at Beer! Would we could say as much for all other villages.

But what will be thought when I state they have neither a doctor, a lawyer, nor a parson amongst them? The inhabitants say they nurse their own sick, and can well plead for themselves. As for the parson, he resides at Seaton, about two miles distant. Again, ever ready to help each other, a "Volunteer Life Brigade" has been formed; it now numbers 68 strong and active men embodied to protect their homes and families, and what was once a hotbed for smuggling is now the haunt of law-loving Englishmen.

Such, then, briefly, are the appearance and customs of our little village,—as romantic in realities as any village could be. And yet it is not alone: it is surrounded by others noted in more ways than one, and places of interest to us all. We have on the west the straggling village of Branscombe, picturesquely situated between three hills, one of which is 600 ft. high. At Branscombe, the workpeople of the late Mr. Tucker (the principal lace-merchant in the county) turned out, in 1839, the Queen's wedding dress, and here was produced for the Exhibition of 1851 a marvelous specimen of the art, value 3,000l. Beyond lie interesting and lofty cliffs, with their Weston-mouth, romantic little dell; Soutcombe Regis, once a fort, the last in the county to hold out for King Charles; and two miles farther is the much-vaunted Vale of Sidmouth, where the

Duke of Kent (the Queen's father) died, and where the world-famous Knowle Cottage (now closed) was, by the late Mr. Fish, of Walworth, thrown open every Monday to the eager inspection of the curious. It was a museum, menagerie, conservatory, and geological collection combined; and it was a sad blow to Sidmouth when, on Mr. Fish's death at his Walworth residence, in 1861, no more "Fishites"—as the visitors were called—passed through the place.

On the east of Beer, across the White Cliff, is the little village of Seaton. Beyond lie the magnificent, yet terrible, landscapes of Pinney; and, farther, the quiet and picturesque Lyme Regis, on the Dorset coast. More north is to be found the ancient, melancholy, and dreary town of Axminster, once famous for its carpets; with Honiton near at hand, which alike is celebrated for its lace and tinware; and recalling to mind as well as taste certain treats in wholesome Devonshire cream, butter, and cider, I often think of the pleasant time spent at our out-of-the-way village on the South Devon coast.

N.

THE SEWAGE DIFFICULTY.

A LECTURE on this subject was delivered some months since, by Mr. Baldwin Latham, C.E., at Maidenhead, before the Local Board of Health, in reply to a paper by Mr. J. D. M. Pearce, M.A., which was also read before the same Board; and both have been published in the form of pamphlets. Of Mr. Latham's able discourse* we give our readers an abstract:—

From remote periods works of drainage have been considered necessary wherever men have congregated together. Hence we find that the most ancient cities of the world were sewered. Then came a period in history when their benefits seem to have been forgotten or were ignored—when sanitary science, like many other sciences, descended to the very lowest ebb; and, though an object, as I will show you, of immense importance, and attended with great advantages, it has only been revived in its true spirit within the memory of living man.

The sewers of ancient cities were intended to convey the fecal and other matter; but the early sewers of this country were intended only to carry the rainfall to the nearest stream. In fact, it was illegal, until 1815, to carry fecal matter into sewers. Such matter was retained in cesspools, or by means of other contrivances. But the growing evils of harbouring such matter in the vicinity of or under our dwellings were so great, that the laws guarding sewers were allowed to lapse; but it was not until 1847 that it became compulsory to drain into sewers. Now, if we inquire how this great change was brought about, we shall find that it was not forced upon the country. No: the country adopted the measure in self-preservation; for it was not until epidemic diseases had devastated our populations, and were still threatening us with dire calamities, that works of sewerage were carried out. We find that in 1818 and 1849 no less than 53,293 men, women, and children of this country perished by that direful scourge, the cholera. Sanitary works were carried out in order to stem the tide of disease and death, and how they have accomplished that end, experience in towns in which they have been carried out will most fully demonstrate. At page 4 Mr. Pearce refers to "the failure of costly plans, which have been introduced" for the sewerage of London; but what is the failure spoken of? London, we find, is the healthiest metropolis in the world—far healthier than towns of much smaller size; and it is well known that, as the population increases in a town, the more difficult it is to retain the standard of health; yet London stands at the head of the large towns in our own country, because works of sanitary reform are carried out there more completely than in the other places. If we take Liverpool, Manchester, Birmingham, Leeds, or Sheffield, all of which retain excrementitious matter on the premises of the inhabitants, they are the unhealthiest towns you can bring forward. No population can be said to be healthy or free from devastating epidemics if living in the midst of aerial impurities arising from the detention of fecal or other deleterious matters. Then it becomes a question of vital importance for every town to adopt such measures as shall free it from the abominations which more or less crowd every ill-drained or

undrained place. A system such as Mr. Pearce deprecates, wherever carried out, has saved the lives of hundreds, and increased the standard of health among thousands. So it has fulfilled the conditions, and I may say the only conditions, that were laid down when the system was first inaugurated. Although the results of sewerage works are inestimable, I cannot but see that to some extent they have been marred by the state of pollution into which the rivers of this country have been brought. Yet it should be clearly understood that, although the present state of the rivers is a crying evil, it is not so great as the evils from which the towns have been freed. In fact, the lives and health of our citizens have been purchased at the expense of the rivers. It must be admitted that the purity of water is of great importance, and we shall not, as a country, derive the full benefit to be obtained from sanitary measures until our rivers have been freed from the abominations that have been poured into them.

In the opinion of Mr. Pearce, a rational mode is one that requires sewers, but also special appliances, such as palls, tubs, barrels, carts, horses, and men, for removing fecal matter; in fact, he considers sewers necessary; and so must all the advocates, whether it be of earth closets or of any other description of sanitary appliance. They cannot get away from the simple fact that sewers are necessary in every town which chooses to deal in a proper manner with its refuse matters, and preserve the health of the community, the only difference being as to what should be sent into the sewers.

The great difference between applying liquid and solid manure is, that, while the former are applied to the plant, the latter are applied more properly to the land. In both cases, the land is the medium by which the nutrient is given to the plant; but, if two given amounts of fertilizing matter be applied, one in a liquid and the other in a solid state, the solid manure needs to be exposed to atmospheric influences until it has become soluble; after this it requires to be taken into solution by water, before the plant can utilize it; while, on the other hand, we find that the fertilizing elements in the liquid manure are presented in a form fit for immediate assimilation by the plant. From which fact it is obvious, that a greater number of crops can be taken with liquid than with solid manure; which is equivalent to an increased area of land; but with this great advantage, that you have only one rent or first charge to pay for it. Water is the vehicle that conveys nutrient as well to plants as to animals. The quantity of water that usually enters the roots of plants is extremely large; it is then evaporated through the leaves, leaving the fertilizing matter to build up the tissues of the plant. The vegetable kingdom always takes its food in a state of extreme dilution; in fact, a concentrated essence of fertilizing matter will effectually destroy a plant.

Mr. Latham then enters at large into the case of Croydon, where, as he observes, 2,500 persons are now alive who would have been dead had it not been for the sanitary works there carried out.

At page 32 he says, "Mr. Pearce states that Edinburgh has had the best possible opportunity of judging, during the 200 years it has been practised in Craighentiny meadows, of the merits of sewage irrigation, and that it is emphatically and finally condemned; and he goes on to say, at page 10, 'and if Edinburgh gives it up, who hereafter will dare to uphold it?' The author has here quoted an article in the *Builder*, entitled 'The new Town of Edinburgh, its Drainage and Water Supply.' Yet I must say that the purposes of that article are greatly perverted. In reading the author's pamphlet, you would be led to conclude that Edinburgh was about to give up sewage irrigation; but such is not the case. Edinburgh has three outfalls for its sewage: one empties itself into the Waters of Leith, which have become far more foul than the Thames water before the construction of the intercepting sewers of London; another into Craighentiny Burn; and the third into a burn called Poy Burn. The system of sewers now being carried out (upon the completion of which the inhabitants may be congratulated) will free them from a crying evil, or that evil which exists in every undrained city. Edinburgh is an undrained city, and now adopts the system of drainage. But does it give up the system of utilization? No! The sewage flowing into the Craighentiny meadows will be utilized as in former years.

* "A Lecture on the Sewage Difficulty." By Baldwin Latham, C.E. London: Spon, Charing-cross.

As to Mr. Pearce's own particular scheme, that gentleman says at p. 17:—

'I propose that the Board should make it compulsory to close every cesspit in the borough, and to substitute a pail to be placed under the seat for the reception of the whole of the excreta; that it should engage or enter into contract with a proper person to empty these pails daily at such times and in such way as they may think fit, and convey the same from the town in hermetically sealed barrels or cisterns. The sale would cover the expense, and leave a profit.'

There you have a scheme advocating the daily removal of human excreta from every house, leaving all other matters to find their way to the sewers. He admits that sewers are required, and house-drains will also be required; for what is the use of sewers in streets if you have not the drains communicating with them? And yet he would tell you that this is a system which is to save the expense of 8s. or 10s. for every house. It is no such thing. And then you are to have a most expensive mode of collecting the material, and you are to have horses and carts for taking it into the country. To say nothing of the inconvenience of having the privacy of your houses invaded daily by men for the purpose of removing such abominable matter, is it not far better, taking a commonsense view of it, to let the sewage carry itself rather than you should carry it? And then you are told that, if you adopt this system, it will pay and leave a profit. A very similar system to that of the author's was adopted in the town of Hyde, in Cheshire. A certain company, called the Eureka Manure Company, undertook to collect the whole of the solid and liquid excrements of the population. Now, what has been the result in that town? Why, we find from parliamentary returns that the cost of applying this system to the town of 20,000 inhabitants would be 10,000l.; and the system is this, that water-closets or cesspools are done away with, that boxes or drawers are put under the seats of the closets, that these are removed from time to time, not daily. When this company was originally started, it was with the idea that they were going to give the people something for this very valuable matter; but they found out, after working a very short time, that they could not afford to give anything for it, so they took it for nothing. A little further experience demonstrated to them that, even that would not pay, so that they must make a charge of 2s. for every house; but before they have time to prosecute their labours any further an action is brought against them for creating a nuisance; they are found guilty, and the works are stopped, after incurring an expense and a charge of 2s., which, if capitalised, would amount to 15s. per head of the population. The town still had to carry out a system of drainage just the same, and at as great a cost as if it had been done for the reception of the water-closets. After the failure of the company, the Corporation of Hyde undertook to collect the matter in the identical manner portrayed in the author's paper; but when they went to work they found it did not pay to collect, and then they gave three months' notice to the inhabitants that they could not collect it. If fertilising matter is of any value, certainly it is in those districts of Cheshire in the neighbourhood of Hyde, and yet you find that the corporation, from accidental circumstances, actually adopted the system of the author; and yet we find that it could not have paid them, and so they gave it up, and a great number of the houses have put up water-closets, and others unfortunately have had to revert to cesspools. From a list of over forty towns in this country, in which the local authorities undertake to collect fecal matter from the houses, in not a single instance do they make a profit.

Birmingham is reported by the author as being one of the places that has an injunction against it for polluting its streams, yet it is not a water-closet town: not more than 5 per cent. of the whole houses have water-closets.

Birmingham is a town of ashpits and cesspools, and yet there you find the rivers polluted, and an injunction brought against the corporation, which would be the case in every town where a system is carried out that would only deal with fecal matter; because it may be laid down as a rule that any water brought into a town and serving the domestic purposes of man is not fit to be afterwards turned into a stream from which his fellow-man may derive his supply of water, until it has been purified.

The system of the author, like that of earth-closets, attempts to deal with fecal matter only, leaving all other matter to run into and pollute

your streams, so that you will not be relieved from the injunctions, which is one of the principles set up by the author; and not only so, but the system, instead of bringing in munificent profit, would be worked at a great loss to the town.

In conclusion, I would say, with regard to those systems of filtration which seem to be strongly advocated by Mr. Pearce as being far preferable, in his opinion, to irrigation, that a person only knowing the very first rudiments of chemistry would know how impossible it is to purify sewage by filtration. Filtration has merely a mechanical separation. Filtration has been tried and found not to succeed. Other measures have been adopted, such as precipitation and deodorization or treatment by various chemical substances; there is no single case in which the plan has been found to answer. There is one point which will ever stamp precipitation, deodorization, or filtration as unsuccessful, which is this, that ammonia is the chief constituent of value in sewage, and as there is no known mode by which it can be rendered insoluble in water, and as it is necessary, for the time being, to render it insoluble in order that it may be precipitated; on the other hand, if it is assumed that ammonia may some day be rendered insoluble, then in an agricultural point of view the system would be a failure, because insoluble ammonia would be valueless.

I trust a case has been made out for sewage irrigation to your satisfaction. I came here to explain facts and elucidate truths, and I hope I have thrown some light on this very important subject, sufficient to enable you to see your way out of the sewage difficulty."

ARCHITECTURAL EDUCATION.

In the course of the opening address at the *conversations* of the Architectural Association, elsewhere referred to, Mr. Spiers said,—I have from time to time during the course of my paper, made comments on the want of a theoretical education in architecture in this country; this absence of any system of teaching of the principles of either science or art has, of late, been deplored continually in the various journals, comparisons being drawn between the products of all countries in the Great Exhibition of Paris, and considerably to the detriment of our own. It would appear that, notwithstanding the immense advance which we had at one time acquired over other countries in engineering and commerce, the workmen of such countries as Germany and France, being instructed in the theory of their mechanical operations, were able to work with so much greater intelligence, that not only had they caught us up, but were really surpassing us on what we imagined to be entirely our own ground; and our great manufacturers, apparently not content with the result of the schools of the Department of Science and Art, have lately instituted commissions, to make serious inquiry into the system of the education of artisans abroad, with a view of introducing them into England. In art we have always been allowed to be far behind-hand, and though the progress made in England between 1851 and 1862 was such as to give us reason to hope that in a few years' time we should have equalled our foreign neighbours, this present exhibition shows us that we are still as far behind as ever. It would be out of the scope of an address to enter generally into the vast systems of education; but I wish to call your attention this evening to the great desirability of establishing some more definite system of architectural education. So long as the history and principles of art and architecture are completely ignored in our schools and colleges, as one of the most intelligent means of learning the history of nations, so long artists and architects must "*con amore*" instruct themselves in the best way they can, without expecting to receive from the public that assistance or approbation of their endeavours which is always necessary to the production of true art. At the present day the only class which can he said to take any interest in architecture are archaeologists; and though I must allow that they have worked much good among us, to be always dependent on them would be fatal, as we should always be obliged to move in the groove of precedent. Of this groove, however, we must free ourselves in some way, and it is best to be done by forming schools,

where students can walk together, interchange ideas, and co-operate with one another. In support of what I am now saying I cannot help referring to an admirable paper contributed to the American Institute by Professor Ware, who is now travelling in Europe forming materials for the formation of a school in America. Professor Ware remarks that "whilst every other branch of applied science has multiplied schools in every part of the country, the art of building, upon which more money is spent and misspent than upon any other, is handed down from generation to generation by personal tradition alone." "The system of articling or apprenticeship," Professor Ware says, "in America has disappeared, as being unsuited to the temper of the time, and no other sufficient means of education has taken its place. In the meantime the building profession is suffering from the isolation of its members; whilst in other professions they are brought together, as lawyers in court, physicians in hospitals. Architects never meet; and the profession presents the singular spectacle of a score of men, living and working within a stone's throw of each other, as much allied among themselves as they are separated from the rest of the community by taste and education, but each leading the life of a hermit, and not only cut off from the stimulus of personal intercourse, but, through all, are engaged in the solution of the same problem; never comparing results, nor profiting by each other's experience." Now our Association does much good towards remedying this state of affairs, and there is not one here this evening who will not bear me out, and especially the members of the Class of Design, when I speak of the great advantages offered in it for the study of architecture and the promotion of friendly intercourse amongst one another; but our members, or rather the members of those who attend here, are but limited, and a great deal has yet to be done. The Association has from the first exerted itself in favour of an increased architectural education, and from time to time has memorialised the Institute to that effect. To its pressure may be ascribed the formation by this body of a voluntary examination, and it did its utmost to promote the proposed school of which Mr. Scott threw out the first suggestions. The voluntary examination, for the possible reasons above stated, has almost fallen to the ground, and Mr. Scott's scheme never took wing at all. I hope, therefore, to be able to convince you this evening of the necessity of taking further steps in this matter. You will all, I think, agree with me, that the position of the Institute is such that, if a school were formed, it ought to be its chief promoter and director; and yet I fear that it may be taken out of their hands, for it is the intention of the directors of South Kensington to establish there a school of architecture, and the principles of the formation of this school will be adopted from one existing already in Paris, of which I propose in a few words to give you the purport and history. The "*École des Beaux Arts*" in Paris is, as you are probably aware, a Government Institute, open to students of all countries on their passing an examination. The chief prizes are, or rather were, awarded by a jury consisting of the members of the Institute of France; the secondary prizes by various professors of the school. Now, as many of these professors and some of the members of the Institute had private studios of their own, their feeling naturally prompted them to be indignant to their own pupils when awarding the prizes. A considerable abuse, therefore, had crept into the school, causing at the time great disturbance. In the midst of this M. Viollet-le-Duc, the eminent Gothic architect, obtained the ear of the Government; and in consequence a decree was published in November, 1863, changing the constitution of the school as follows:—

First, the prizes were to be awarded by a jury selected from the architects in Paris.

Secondly, studios ("*ateliers*") were to be established in the school, under the care of Government inspectors.

Thirdly, any Frenchman might compete for the grand prize without being a student of the school. And,

Fourthly, a new staff of professors were appointed, amongst whom M. Viollet-le-Duc himself was named a professor of theory of art and architecture, and the student was to attend regularly all his lectures, pass examinations in them, and frame their designs in accordance therewith.

Now, much as the students (hitherto of classic tendency) appreciated the publications of M.

Viollet-le-Duc on Gothic architecture, the pill he wanted them to swallow was much too large to be taken at one time; consequently, after three ineffectual attempts to make himself heard in the lecture-room, he retired in disgust, and the Government allowed the school to relapse into nearly its former state, without, however, stultifying itself, by withdrawing the decree. Shortly after this circumstance, M. Emile Trelat, professor of the school of arts and manufactures, conceived the idea of forming a school of architecture, based on the theories of construction and construction alone. He pretended that art had nothing to do with architecture, and that all the problems of antiquity had been worked out by reasoning alone; the necessary conditions for stability and equilibrium being all that the Classic or Gothic architect had had to deal with. To M. Trelat, M. Viollet-le-Duc goes to attend him in forming a rival school to the *École des Beaux Arts*; but, unfortunately, their principles were not the same. M. Viollet-le-Duc has the greatest belief in art and archeology, Mr. Trelat discountenances both. A compromise, however, seems to have been effected. M. Trelat would advocate the principles of art and lecture on them, if M. Viollet-le-Duc would give up archeology and the study of ancient monuments. The school, called "L'École Centrale d'Architecture," was formed two years ago; and when in Paris in August last it was conducted through the establishment, and there saw the result of the two years' labour. As far as architecture was concerned, the compositions were as wild, extravagant, and ugly as possible, and, as a rule, badly drawn; the system of study in the practical details of architecture, such as construction, materials, physics, &c., seemed good.

I was there informed that the authorities of South Kensington, fully alive to the great want of a properly defined system of architectural education, had made earnest inquiries into the whole system, bought a large number of drawings, which were pointed out to me, with the intention of forming a similar school at South Kensington.

Now, glad as I should be to see any system of architectural instruction established in England, it would be, I think, a source of regret to all here if the Institute should allow what is really their province, as the only chartered society of architects, to be taken out of their hands by a department which, though admirable in its own sphere, was founded for an entirely different purpose, viz., the artistic education of artisans.

Many will remember a paper read before the Association in these rooms, four years ago, by Mr. George Gilbert Scott, in which, after remarking on the utter inadequacy of the present system of articling, to supply to the student a theoretical knowledge of architecture and power of drawing, suggested a scheme of education, and recommended the nomination of a committee, consisting of delegates from various architectural societies, to make inquiries into the said scheme, and report upon it. The Association nominated four delegates, but as we have never had any communication from them, I may assume, as I believe to be the case, that this committee never met, and the whole affair was allowed to fall into "obeyance." Now, that scheme of Mr. Scott's, admirable in every way, and containing in it the chief elements of a school which will be one day established in England, had the further advantage of being more feasible than any other scheme (and these have been many), hitherto brought forward; but it would seem that a link of the chain, which connects its formation with the present system, is wanting. We are rather apt to sigh for fresh changes and improvements, without looking around us to examine, and find out what really exists; if, instead of endeavouring to graft a new and untried scheme on an old one, we were to take note of the numerous advantages and inducements held out already, and work them into a regular defined system, and proceed to study to begin upon, the difficulty experienced would be less, and the result, I feel sure, more satisfactory.

With your permission I will just enumerate a few of the opportunities which now exist for the acquirement of a proper knowledge of the theory and practice of architecture, and show what little use is now made of them.

The Royal Institute of British Architects offer each year nine prizes and medals, of the intrinsic value of 170*l.*, and there were last year twelve competitors only in all subjects. They hold also a voluntary examination, to pass which four only presented themselves this year.

They have a most valuable technical library; but, with the exception of the Librarian and one or two others connected with its establishment, there are no readers.

The Architectural Association offer seven prizes, of the value of 2*l.* guineas: there were twelve competitors in all this year. The meeting and classes, I am glad to say, are well attended, and good use made of the library, though it is small.

The Royal Academy offer four and three prizes, in alternate years, of the value of 180*l.* and 110*l.* respectively. The competitors for these prizes average four to six for all subjects. They have also, amongst others, a valuable course of lectures in perspective, and students are admitted to draw from the antique.

In addition to these societies we have the Architectural Museum; the Classes at South Kensington, and its library; the Society of Arts; and the lectures by Professor Hayer Lewis on architecture and construction at University College; and on constructive materials and design by Professor Kerr at King's College. A course of lectures also of the greatest utility at the two above-named colleges in surveying and levelling, geometrical and landscape drawing, descriptive geometry, mathematics, physics, geology, chemistry, &c., which to my certain knowledge are not attended at all by architectural students.

Here, then, is a long list of prizes and medals offered, and of inducements held out to students, which, from a want of some system of reduction to practical use, are almost entirely neglected; for the average number of competitors for prizes I find to be little more than one for each subject, whilst many of the lectures are not attended at all. How is this to be accounted for? I can scarcely believe when I see so many around me to-night, when I remember the large audiences at our meetings last session, that the younger members of the profession are apathetic, and care not for distinction; there must be some other reason, which I venture to think is this: during the period of his articles the student either does not yet take sufficient interest in his profession, or else is so hard-worked during the daytime as to be little inclined to continue his studies in the evening. When out of his articles he is inclined to fancy himself already an architect; and, instead of competing for those honorary prizes and medals as a *further means of study*, plunges into the vortex of public competitions, in which he is tied down to economy and practical conditions, and from which he learns little but of the partiality evinced by members of town councils, committees, and juries for their own private friends. Now, whether I am altogether right or wrong in my surmises, much of this could be remedied if the Institute would publish a pamphlet as advice to students and their parents or guardians of the course to be pursued in architectural education; pointing out, for instance, where instruction on special subjects could be obtained; what medals or prizes the student should compete for; and in what order and what should be the general skeleton of study to be adopted. Assuming, for instance, that five years be the least time (and it was formerly seven) that an architect's education can be completed, the first year might be spent in making up for that deficiency of scientific teaching, so much to be deplored, in our schools and colleges, by following the courses of lectures at King's and University Colleges, drawing from the cast at the Architectural Museum, and (when established) attending an elementary course of architectural design. The next three years should be spent in an office, learning practical work four days out of the six; the other two days being devoted to the getting out of competition drawings for the various medals and prizes before enumerated. The fifth year might be spent in travelling, and in preparation for the voluntary examination of the Institute, which might be supposed to terminate theoretically the architectural student's education in the same way as the degree of M.B. Ch.S. for a physician, and being called to the bar for a barrister on completing their course of study. Now such a programme as this, which I throw out as a suggestion only, is one which is perfectly feasible at the present day, and would go far to remedy some of the defects which are felt by one and all in the present system, or, rather, want of system, of a course of architectural study.

In concluding my address, let me call the especial attention of the members to the syllabus set forth for them this session; and, in doing so,

to remind them that the main object of our Society being mutual instruction, they are bound, to a certain extent, to attend our meetings as frequently as possible, and, by taking part in the discussion, to give whatever information may be in their power; and in order to be better prepared to do so, it is incumbent on them,—and let me especially impress this on you,—to read up and study beforehand the various subjects on which papers are read, that they may be able to impart to others the result of their labours, in return for that afforded to them,—so that working together and mutually assisting each other in the great object we all have at heart (viz., the advance of architectural art), remembering that the monuments we are called upon to erect,—if not more lasting than the recorded memory in history, painting, or sculpture,—of our great heroes and statesmen, exert a far more extended influence from their magnitude, utility, and constant presence amongst us. That as in all ages the architecture of a country has testified more than ought else to its greatness, so we have before us the proud calling of raising those edifices which shall in generations to come bear witness to England's greatness and power, and may thus attain to such honour as that which attaches itself to the memory of that great architect, Sir Christopher Wren, in whose *chef-d'œuvre*, St. Paul's Cathedral, the passing traveller now reads these words,—

"Lector, si monumentum requirit, circumspice."

THE MIXTURE OF STYLES IN A BUILDING.

ST. ALBAN'S ARCHITECTURAL AND ARCHEOLOGICAL SOCIETY.

THE usual autumn meeting of this really useful society was held last week (Thursday), in the Council Chamber of St. Alban's Town Hall, and was well attended, especially by the fairer sex. There was, indeed, much to attract, for on the walls of the room—and it is a handsome one—were hung some 200 folio-sized water-colour drawings of churches in Normandy, done with scrupulous care and spirit by more than a master-amateur, the Rev. J. Lewis Petit.

The meeting opened with a brief but sensible paper by Mr. Grove Lowe (the king of coin collectors in St. Alban's), called "Cold Harbours"—a puzzling subject among English topographical antiquaries. There are several "saucularies" (or Alsatian retreats) of the name in Hertfordshire—now, of course, of no use whatever to the murderer or the thief.

There was a "capital message," as Stow calls it, of this name in Dowgate Ward, on the Thames, in the City of London. The etymology of the name continues to be a riddle. Stow spells it "Cold Harbrough." A church in London, called Allhallows the Less, or Allhallows on the Cellars, was to be seen in Upper Thames-street before the Great Fire of London in 1666. Mr. Cunningham has a separate article upon it in his "Hand-book," with quotations from Ben Jonson's "Silent Woman" and Heywood & Rowley's "Fortune by Land and Sea," to which Mr. Lowe might have referred with advantage.

Mr. Lowe's paper was followed by Mr. Petit, who, from a few notes, and a good memory, proceeded to give a very interesting account of the "discrepancies of style" in the same building, which he was inclined to look upon rather as heauties than deformities; nor was he willing to look differently on the picturesque pent-honse bits that surround so many fine old cathedrals and churches on the Continent, and, as at York, give grandeur to the whole elevation. These, when they are unmistakably old, he would not pull down. He then referred to the beauty of the High-atreen, Oxford, which, by the way, must have been once far more beautiful in its irregular sky-line of roofs than it now is.

Here is a sample of Mr. Petit's matter:—"Among the objects which occupy a prominent position in the Acropolis of Athens, is a Mediaeval tower, perfectly plain, and evidently intended for the purposes of defence; it was, I believe, erected by the Venetians. It is possible that a rigid antiquarian, exclusively devoted to the art and architecture of ancient Greece, might wish this tower to be pulled down, as out of character with the pure Classic remains of the Propylæa, to which it is annexed, of the sublime

PLAN OF CATHEDRAL AT LINZ, ON THE DANUBE.—MR. STADTZ, ARCHITECT.

See p. 794, ante.

temple of the Parthenon, and the other relics of an age unsurpassed in the beauty of its productions. I confess this is not my feeling. I do not look upon the tower in question as any blemish in the scene. It rather improves than injures the general outline; it by no means detracts from the dignity of the other buildings comprehended in the same view, and it may have its value as a historical monument; for if the age of Pericles be the most interesting period in the history of Athens, it is not the only interesting period, and we are not called upon to sacrifice the records of other periods, for the sake of fixing the attention more especially upon one. If I am right in assuming that the individual tower is not out of keeping with the rest of the picture, it becomes a question whether there is any general principle which constitutes harmony between buildings altogether different in their character and architectural style. I feel very certain that my views on this subject will not meet with general acceptance, and I am not in the least disposed to bring them forward in a dogmatical manner; still, I trust they may furnish some suggestions not without value even to the practical architect." "We all know how perfectly the different Medieval styles harmonize together in our cathedrals and large conventual churches. Your own magnificent abbey offers the finest illustration that can possibly be found. What can be more different or opposite in character than the rude Norman tower and transepts, and the light and elegant Decorated choir? The nave comprises the Norman, Early English, Decorated, and Perpendicular styles (you must excuse me for sticking to the old terms, as I am used to them), and each worked in its most distinctive and characteristic manner, and yet who that has an eye for the picturesque, or a feeling of the value of architectural history, would wish to replace the effect by one of uniformity? Ely, Gloucester, Norwich, Winchester, Tewkesbury, are magazines of several Medieval styles, which are mixed and combined in the most perfect harmony; and the list, as you well know, might be much enlarged."

"Now my object is to suggest an inquiry as to what is the principal or the pervading element which gives to these groups that harmony which they decidedly possess. We notice that in all the cases to which I have referred the builder of every part has had his own definite aim and purpose, and has worked in the style, whatever it might be, which belonged to his own age and country. It may appear a paradox, but I fully believe that there exists so much harmony in each group, because there was so little attempt

on the part of the designers to ensure it. Their honest independence has proved a firmer bond of union than the most subtle adaptations and imitations. To my mind there is nothing which is less in keeping with an old Gothic building than a new Gothic building, not because it is inferior to it either in design or workmanship, but because the one actually belongs to its own age and expresses its spirit, and the other does not. It may be, or it may not, that the Gothic will again become our national style; if it does, there will be something about it to characterize it as such; and then it will no doubt harmonize with old Gothic on the same principle on which any building designed in the style of its own period will harmonize with it; nor do I suppose the similarity of detail will do otherwise than increase the harmony, but at present I doubt if even the most careful reconstructions, except it be on a very small scale, will perfectly satisfy the eye and the mind. In adaptations it is difficult to avoid deception on the one hand, or unsuccessful imitation on the other. Architecture is too high and noble an art to indulge in deception; and an imitation, to be worth anything, must be but little short of a deception. Our Gothic architects, are, indeed, now striking out a style in some respects distinct from and independent of the genuine Medieval styles; but while we cannot but regard their efforts with respect and admiration, and do honour to their genius, neither can we allow that they have as yet accomplished the task of forming or establishing a national style, and one expressing the spirit of the present age. But it is not my wish now to discuss the merits of rival styles; I would simply express my conviction that in almost every case in which buildings of different periods combine in a pleasing and satisfactory manner, each building is a genuine production of its own period, and not an imitation of the style of another. If we had a national style of the present day, I would rather see important additions, or what are called restorations, in our Medieval churches, carried out in such a style, than in imitation of the older building. It was in this manner that the Medieval architects themselves did their work."

Here is another example:—"The domestic style of architecture which prevailed in Queen Ann's time, at least such specimens as do not exhibit the classical orders too prominently, has always appeared to me to harmonize extremely well with Gothic buildings, and it is a style which might be used in the present day without giving the idea that we are adopting the manner of an age different from our own. For it is a style which, I may say,

without any modification whatever, is calculated to meet all the requirements of the day, whether we want size or number of rooms, fine proportions, good ventilation and lighting, convenience of passages and staircases, or a stately and dignified aspect. All these may be obtained in the Queen Ann style, with as little waste of material, or unnecessary expense, and with as much attention to durability, as any style that can be named." My belief is that genuine works of excellence, if they are brought together, as it were naturally, by accident, and without apparent effort, would always harmonise. I believe that Karnak, the Parthenon, the Colosseum, and York Minster, so brought together, would be found in harmony. I do not say that an artist could so bring them together, that is quite another question, for the great charm in such combinations is that they are not intended, or designed, for effect; the principle of unity is something natural, not artificial. If it is impossible to define or discover it, depend upon it we shall not find it impossible to create it. If there is anything in what I have said, the practical lesson we should draw from it is in the first place that we work, as far as it is possible, in our own national style, and that of our own age; or if there is not such a style, then take for our models such examples as seem best fitted to meet the purposes and the requirements of the present day, and which have architectural excellences we can appreciate. If such be found among the Medieval styles which have passed away, well and good; let us adopt it by all means. But if not, we are no more tied down to Gothic, than the Greeks were to the Egyptian, or the Romans to the Greek, or the Romanesque, Byzantine, or Gothic architects were to either. The men of the Renaissance did not think it necessary to conform strictly to their ancient models. Such an architecture as that of the Middle Ages could not pass away without leaving some permanent mark, and Italian churches show much that is Medieval in construction, composition, and spirit. The style, though derived from an ancient source, is anything but a tame and pedantic reproduction."

Some votes of thanks terminated the meeting.

COMPETITION.

Cheshunt College, Hertfordshire.—The design of Messrs. Lander & Bedells, of London, has been chosen, in a limited competition, for the intended new buildings at this college.

THE CHURCH OF ST. MAURITIUS, COLOGNE.—MR. STADIZ, ARCHITECT.

SIR ROBERT KANE ON TRADE UNIONS.

At the Social Science Congress, Belfast, Sir Robert Kane delivered an address, as president of the Economy and Trade Department. Touching on the question of trade-unions, he said,—To arrange the respective claims of capital and labour in the division of profits at any stage of an industrial undertaking, should require in itself very accurate knowledge of details to avoid injustice, and it is not surprising that, where both parties are interested in the result, and neither quite free from prejudices, serious difficulties and collisions should occur. It is, however, consoling to observe, that notwithstanding the deplorable revelations recently made at Sheffield and elsewhere, there has been of late years a steady tendency to more temperate and rational consideration of those questions both by masters and men. Instances of violence have been rarer and less serious, and the economic principles by which such questions must be governed have obtained more general acceptance. The gradual diffusion of education among all classes, the discussion of those subjects by the public press and in the Legislature, has helped to dispel a great deal of ignorance which had hitherto prevailed, and which was by no means confined to the lower or working classes, whose action, in seeking to protect themselves by associations for mutual defence against the overwhelming influence of capital was, when kept within proper limitations, not merely compatible with, but a consistent corollary from economic principles. The voluntary association of the members of any trade or industrial occupation to collect facts as to the circumstances of that trade, to discuss such questions as may influence its welfare, to determine and mark the qualifications of a skilled workman, and to propose the rate of wages by which his labour should be paid, cannot be considered as overstepping the legitimate field of action, provided that no attempt is made to coerce or injure those who do not freely embrace its membership and adopt its rules. An individual and isolated workman is so powerless—he is practically so unable to stand out for a higher price—his necessities are so pressing, and generally he is so ignorant of what really influences the labour-market at the time, that, unless by union with his fellows, he is not in a position to get even his plainest rights, if it is the interest of his employer to refuse them. On the other hand, by the discussion to which the relative claims of capital and labour, of the respective rights of the employer and employed, must be subjected at those meetings of the most active and best informed among the working-classes, many of the prejudices which darken the mind of the working-man in regard to his employer are certain to be weakened, if not removed, when he obtains more information as to the circumstances of his branch of trade. Hence, although their agency has been so often employed for purposes which nothing can justify or even palliate; although frequently made mere instruments of the vanity of ambitious men who prey upon the simplicity and absorb the funds of the honest artisan, the operation of trade societies has been, upon the whole, more frequently useful than otherwise, and may, as I believe, be rendered highly beneficial in arranging all questions in dispute among the industrious classes. The fearful system of outrage that has been revealed by the inquiries lately conducted at Sheffield will, in itself, prove the necessity for some legislation, which, whilst firmly repressing by condign punishment all attempts at violence or coercion, will recognise and support that which is wholesome and just in trade organization, and provide a legitimate and authoritative tribunal for the adjustment of such questions as may be in dispute between masters and men. A very useful and effective agency in abating prejudices and diffusing sounder knowledge of the economic laws which govern labour and its price, has been the establishment of co-operative societies, where the property of a factory or other undertaking is held wholly or in part by the workmen themselves, and where consequently they have to bear the responsibilities when they enjoy the profits of capital, as well as of labour. There is now no doubt of the practical success of a large proportion of the undertakings founded on that principle. Not merely in manufactures and general stores, but in mining and even railway management, that principle of co-operation has been tried, and with success. In Great Britain, in America, in France, and Germany, the workmen have thereby learned that the rate of wages is

by no means at the caprice of the employer; that the prices of produce may be raised and yet profits be none the larger, if the prices of raw materials have advanced in an equal or greater proportion. These co-operative undertakings have also had a valuable effect in bridging over the chasm which had for so long and so injuriously separated the capitalists and the working classes. For these countries, especially when, by the gradual development of our constitutional privileges, the middle and working classes are yearly acquiring more and more influence in public affairs, it is important that no feeling of hostility or estrangement should be allowed to remain between the employers of labour and those whom they employ; that all should feel that they are members of one common body, the producers of public wealth, the real sources of national power; that from the humblest workman to the great capitalist, there is but a graduated hierarchy, in which the ascent, though difficult, is not impossible to energy and talent; that the interests of all the industrial classes are indissolubly united, so that, for true and permanent success with men and masters, the strictest course is mutual goodwill and co-operation. When it is fully understood that all civilised society is based upon the reciprocity of rights and duties; that the property of the humblest worker in the products of his toil is equally sacred and inviolable with the hereditary rights or the accumulated treasures of the greatest in rank or wealth; that, under the protectingegis of public law, the weakest is safe from injury or injustice; then those barriers of ignorance and prejudice which have for so long obstructed the normal relations of landlord and tenant in Ireland will of themselves fall down, and the true interests of both classes will be found in friendly intercourse, fair business contracts, and co-operation for the general good.

THE LORD MAYOR AND THE ART-UNION OF LONDON.

The Lord Mayor (Sir Thomas Gabriel) entertained at the Mansion House, on Friday evening, the 25th ult., the council of the Art-Union of London, including Mr. Antrobus, F.S.A., Mr. Henry Baker, Mr. Chas. Barry, Mr. Bennoch, F.S.A., Sir William Bodkin, Mr. Broadwater, Mr. Butterworth, F.S.A., Dr. Dickson, Mr. Godwin, Mr. Thos. Grissell, F.S.A., Mr. Henry Hayward, Mr. Jas. Hoggood, Mr. Charles Hill, F.S.A., Mr. R. Hudson, F.R.S., Mr. Charles Mayhew, Sir Chas. Nicholson, bart., Mr. J. R. Planché (*Somerset Herald*), Mr. Lewis Pocock, F.S.A., Mr. Zouch Troughton, Mr. T. S. Watson, B.A., Professor Westmacott, Mr. Thos. Williams, Mr. Alderman Wilson, and others.

In the course of the evening, The Lord Mayor said,—Nothing tended so thoroughly to enliven any subject under consideration as just and correct comparison, and nothing so fully illustrated the marvellous acquirements made by society in the present day in the arts and sciences, and in everything that bears upon the moral and social condition of the people, as comparing the present state of things with the condition of society thirty years ago. And, amazed as we should be at the progress made in that time in all that conduces to commercial and political greatness, when comparing our present mode of communication and transport by telegraph and steam with the modes known and used thirty years ago, we should be no less astonished at the advancement made in the physical and moral condition of the people, and especially in the general dissemination of a taste for the Fine Arts, when looking back at the state of society in these respects thirty years. The sole adornment of the dwellings of the humbler classes then consisted in a few vulgar, staring earthenware figures, or the well-known pictures of a fine lady with a red face and dazzling green gown, enclosed in the universal black frame. These, fortunately, have become things of the past, and the artisan and humbler classes show that they fully appreciate the capital engravings, illustrating the first masters of the day, and other works of taste brought within their reach. Nothing had tended so much to bring about this marked improvement in the tastes of the people as the labours of the Art-Union of London, the council of which society had that day honoured him with their company. This society, composed of gentlemen of all professions and calling, united for the single object of the advancing of art, had, during the last thirty years, expended

about a quarter of a million of money in bringing within the reach of all classes the choicest specimens of works of art; and by thus familiarising the public taste with things of beauty, had helped the growth of the appetite for them by the things it fed on. If ever the labours of this society were necessary, they were so at this time, for nothing could enable us as a nation to keep our place among the manufacturing countries of the world but a thorough education, and training of the people in all that belongs to the arts. A love for the beautiful was innate in the human nature, and the rudest savage would prefer a decorated and well-proportioned tool or instrument to a rough, ugly article; but, if this is true in that class of manufacture, how much more so was it with reference to all those articles of every class required to meet the luxurious taste of the day incident on the vasty increasing wealth of every country. We might therefore depend upon it that if we wished to avoid seeing ourselves altogether distanced in the manufacturing of all articles in which any thing like taste could be introduced, and left as the manufacturers of only coarser articles,—in fact, becoming the hewers of wood and drawers of water among manufacturers,—we must diligently do all that tends to improve and raise the taste of our people; and in conclusion he said he would then give as a toast the name of the society which had done so much in bringing about the good already accomplished, joining with that toast the name of Mr. Godwin.

In returning thanks to the Lord Mayor on the part of his colleagues, as well for the observations he had then made as for his hospitable reception, Mr. Godwin said many years had elapsed since, when their esteemed co-member, Colonel Wilson, was Lord Mayor, the council had been received in the City. The career of the Art-Union had been an eventful and a remarkable one; and, when the history of the progress of art in this country should be fairly written, it would be found that the Association had played no unimportant part. The early progression of it was remarkable. When Mr. Henry Hayward, Mr. Lewis Pocock, Mr. Bond Cabbell, and himself, the only four of the founders remaining in the council, had sat down at a small table in a small room first to organize it they had hardly expected such a result as had followed. Scarcely able to obtain a subscription of 500*l.* in the first year, it soon became 1,000*l.*, then 2,000*l.*, 5,000*l.*, 12,000*l.*, 14,000*l.*, and so mounted to nearly 18,000*l.*, after which it subsided to a comparatively steady income of from 12,000*l.* to 14,000*l.* a year, according to the aspect of social and political events. About 340,000*l.* had been raised by its means, the whole of which large sum, with the exception of the necessary expenses for rent, clerks, printing, and so forth, had been devoted to the encouragement of artists, and the dissemination of works of art. The gallant admiral, Sir Alexander Milne, in replying for the Navy, had spoken of the extent of the service, and had mentioned many foreign ports. At all those ports, wherever an English man-of-war floated, the Art-Union had a colleague engaged in the dissemination of works of art: wherever, indeed, English men and women were located, whether in China, India, Barbary, Egypt, Russia, Turkey, New Zealand, or the gold diggings of Australia. It was surely no small thing thus to have spread over the world an associated brotherhood interested in the progress of the arts that ennoble and refine. Looking round the hall in which they were assembled, he was reminded of a member of their council, the late City architect, through whose endeavours mainly the corporation had been led to aid nobly the sculptors of the country, by filling the niches of that apartment with their works. It was to be hoped that before long the corporation would be led to call in the aid of the sister-art, painting. Strange to say, there was not a single picture in that Mansion House of the richest city in the world. He hoped he might not be thought impertinent for mentioning it: at any rate, it was a fact not to be proud of, and ought to be remembered. Many then present would remember a building in Venice, known as the *Scenola* of St. Rock; which, built by a fraternity of merchants 300 years ago, and still belonging to them, had been visited and enjoyed by pilgrims from all parts of the world. And why? Because that corporation had wisely devoted some of their funds to its adornment by Tintoretto and Titian, who had there set up grand specimens of their art. For many years the reports of the Art-Union had urged the desirability of placing works of art on the walls of

public meeting-places, and where they could delight, appeal to, and influence the multitude. Public galleries of works of art in our provincial towns were greatly needed. In most French towns, as at Rouen, Caen, Lyons, Lille, Bordeaux, there were galleries of art to which the public had free access: it was surely not creditable to us,—it was not wise, even commercially,—that, with the exception of those in the three capitals, no such collections were to be found in England. He was glad, however, to be able to mention, as a fact not yet generally known, that the corporation of Liverpool were about to redeem us from this opprobrium, so far as their town was concerned, having determined to erect a gallery and found a public collection of works of art. A leading member of that corporation and their architect had already commenced the examination of the principal picture-galleries in Europe, with the view of determining on the best plan; and as soon as that was settled the work would be commenced. It was earnestly to be hoped the example would be followed in our other large towns.

EVENING AND SATURDAY AFTERNOON RESORTS.

The London Early-closing Association has issued a printed syllabus of places of resort for instruction and amusement, such as literary institutions and evening classes; national institutions, including museums and art collections, to which should have been added the Schools of Art; and, for recreation, gymnasia, swimming-baths, parks, and environs, &c. It would have been well to have added places of temperate refreshment with instrumental music for the evening, where good tea and coffee, chops, &c., could be had at very moderate prices, and without either the strong drinks or the buffoonery of music-halls; but there is really no such place of resort in London at present that we know of. Hungerford Hall was the only thing of its kind, and it was knocked down when the Charing-cross Hotel and Station were built. We understand, however, that it is about to be revived, with the same name and on precisely the same principles, in the arches below the Charing-cross Hotel itself. At the old Hungerford Hall, a small teapot of excellent tea, with loaf and butter, and sugar *ad libitum*, could be had for sixpence, and good instrumental music all the evening, from five o'clock p.m., with chess and draught boards, newspapers, &c., all for nothing. The great want of such temperance *cafés* in London has often been pointed out in the *Builder*, and it is to be hoped the hint will be followed up. As regards instruction there are ample and excellent scientific lectures nearly all the year round and at almost nominal fees, on Monday evenings, at the Museum of Practical Geology in Piccadilly. These lectures have not been attended as they ought to be, nor are the Schools of Art.

SCOTLAND-YARD.

It was in Scotland-yard that Evelyn built and furnished a house for Mr. and Mrs. Sidney Godolphin, ancestors of the Dukes of Leeds. It will be remembered that Evelyn's great-great-grandson, the late Hon. E. Venables Vernon Harcourt, placed a MS. of the renowned diarist in the hands of the Bishop of Oxford for publication, in 1848. It was a biography of Mrs. Godolphin, who was one of the maids of honour of the queen of Charles II. The good Evelyn calls the subject of his memoir a "constellation of perfections," a "young saint," a "jewel," a "starr," an "incomparable Christian, virgin, wife, and friend;" and seen, as he saw her, against a background of frivolity, luxury, and licentiousness, her purity and piety could scarcely have been depicted with less encomium. Her affectionate friendship and early death invested her memory with a peculiar interest in his eyes; and he required but little solicitation to put the particulars together which constituted the neatly-written MS., that for 170 years remained unpublished. She died at twenty-five, in Scotland-yard, leaving an infant son ten days old. Her husband made no second marriage. He was created Earl of Godolphin, and lived to see his son, Francis, thirty-four years old. The son married the eldest daughter of the Duke of Marlborough: a daughter of this marriage, Mary, married the fourth Duke of Leeds.

When Mrs. Godolphin was five years old she was taken to France by the Duchess of Richmond, who gave her into the care of the Countess of Guildford, then in attendance on the widowed queen of Charles I. When her Majesty came back to England after the Restoration, the child was restored to her mother, Mrs. Blagge, wife of Colonel Thomas Blagge, groom of the bed-chamber to Charles I., with whom she stayed in London till the Great Plague broke out. She was visiting her father's relations in Suffolk during the prevalence of this scourge, when the Duchess of York made choice of her as a maid of honour. Upon this, though only twelve years old, she removed to court, and lived there till the duchess died, when her services were retained by the queen, and she removed from St. James's to Whitehall. It was here she made the acquaintance of Evelyn. After seven years of attendance on the queen, during which time she scrupulously held herself aloof from the surrounding gaieties, she begged permission to retire, that she might devote the whole of her time to works of piety and charity. After some delay, and with much reluctance on the part of the king and queen, she obtained her suit. It is suggestive to learn there was another kind of life pursued in that gorgeous palace besides *hasset-playing*, *love-song-singing*, and "toying" with three duchesses at a time. Before dawn, Evelyn tells us, there was always one figure there, kneeling in adoration of the King of kings. And, again, "Were it never so wet, cold, and dark, even before daybreak, in midst of winter," she was always present at the first of the four daily public services in the chapel, and attended the rest whenever she could contrive to do so. It was on the occasion of her subsequent marriage, that Evelyn built the residence in question in Scotland-yard. We know him to have been a man of taste, the patron of Crivling Gibbons, and can well imagine that these premises were as "sweet and pretty," and full of "all manner of conveniences," as Mrs. Godolphin appreciatively and gratefully declared them to be. Where are they now?

THE STAGE.

Haymarket.—Mr. Sothorn has returned with the untiring *Dundreary*, strengthened by the advent of Miss Robertson (sister of the dramatist of that name), from Drury Lane. Additions were needed to the lady portion of the company here, and this is a good one. "The Winning Card" is a poor farce, but it enables Mr. Compton to make the audience laugh.

Princess's.—"Arrah-na-Pogue" is running well again; and certainly, if a very interesting and well-constructed story, capital acting by Mr. Vining, Mr. and Mrs. Boucicault, and Mr. Dominick Murray, and very charming scenery, are of any avail, this is not to be wondered at. It is something, too, to have a piece which has been put into French, not translated from it.

Adelphi.—It is some time since a piece was so well put upon the stage here as "Maud's Peril" has been,—an effective though not in all parts agreeable drama by Mr. Watts Phillips, which will, doubtless, run some time, and ought to do so. The assistance of Mr. Grieve and his sons has been obtained in the scenic department, and with excellent effect. The first scene, an ornamental lodge with wide open verandah round, hung with plants in pots, and showing the hall and park beyond, is excellent; and the same may be said of an interior that follows. Miss Herbert has a part that suits her well, and does full justice to it, though her declamation is a little too silted. Mr. George Belmore, one of our best actors, plays with great power and intelligence a returned convict. On the first night his acting was a little overdone, but the experience of a few nights has brought the necessary moderation.

The New Queen's.—"The Double Marriage," the romantic play with which Mr. Alfred Wigan has opened his new theatre has the great merit of being entertaining. Mr. Charles Reade being a competent and well-known author, some disappointment has been manifested on the discovery that the story mainly proceeds from a French source. It would seem almost that we have few, if any, dramatists who can invent a dramatic story. Our own belief is, however, that no one ever invented anything,—certainly not a whole play. Nothing can come of nothing. Everything is built up. Many rills are needed to make a river, and a great many story-tellers went to the making of Homer. Let this pass,

however, just now. Acted and mounted as "The Double Marriage" is, it can scarcely fail, in conjunction, too, with the bright new theatre, to draw large audiences for some time to come. Mr. Wigan, Miss F. Addison, and Miss Ellen Terry are its main supports, all acting admirably; but Mr. W. H. Stephens, Mr. Lionel Brough (new to London as an actor), Mrs. Saville, and Miss Henrietta Hodson, contribute greatly to the general result.

THE CO-OPERATIVE MOVEMENT.

The co-operative principle, in various forms, is making rapid progress.

A numerous meeting of the inhabitants of Holloway and Highgate has been held in Hampden-hall, Hampden-road, in furtherance of the movement. The meeting was composed almost entirely of working men and their wives. Mr. W. T. McC. Torrens, M.P., presided, and expressed his approval of the co-operative movement. Mr. Heine made an interesting and suggestive explanatory statement, and in illustration of the importance to the working classes of co-operation, and the practice of the ready-money principle in the purchase of their food. Resolutions were passed approving of Mr. Heine's plan, and virtually establishing a company, to be known in future as the Holloway and Highgate Co-operative Society (Limited).

A Co-operative Society for the sale of meat was formed in London in May last. The store is at 23, Rood-lane, Fenchurch-street. Associates pay 5s. a year; members 1l., without further liability. The present price for the best meat is 8½d. per lb.; everything else at corresponding prices. The patrons are Earl Spencer and the Earl of Ducie. The committee consists of Mr. J. W. Malcolm, M.P., Captain Holman, Mr. D. Forest, Captain Mackenzie, of the London Scottish, and his brother, Mr. A. C. Mackenzie. Captain S. Flood Page is the chairman of the committee. The society is managed with a view to reduction of prices, and not to profit.

A lively scene took place in the carcass market of Bristol on Saturday morning last. No sooner were the gates thrown open than some fifty or sixty workmen, representing as many firms, made their appearance, and commenced buying meat in the carcass; to be cut up and retailed at "prime cost" to their fellow-workmen. Some of the butchers were outrageously abusive, and a good deal of ill-natured "chaff" went about, but the purchases were made, and the workmen attained their object, for during that very day meat went down in price in Bristol.

At Highbridge, Somersetshire, a "co-operative hakehouse" is about to be started to sell cheap haddock; and a firm has undertaken to purchase sheep and oxen and have them killed, so as to sell the meat for much less than do the local hutchers. In this way prime mutton is being sold at 6d. a pound, and good beef at 5d. and 6d.

The movement has made great progress in Cheshire, there being no less than twenty-seven societies at work in it, which is a high average for the population. The largest of these is at Stockport, which has 660 members, and the next at Hyde, which has 624 members. The Sunderland-street Equitable Provident Society in Macclesfield has 320 members, 148 of whom were admitted during the last year. The amount received on shares during the year was 968l., and the whole share capital was 1,241l. The cash received for goods during the year was 12,980l., of which 1,319l. was profit. Of this 1,011l. were distributed in dividend to the members; 117l. were applied to paying off interest; 153l. were set down for depreciation of stock; and 6l. expended in charitable gifts.

Mr. D. F. Powell, of London, has delivered a lecture at the Odd Fellows' Hall, Falcon-street, Ipswich, upon "Co-operation—what it has done and what it will do for Working Men." At the end a large number of those present gave in their names as members of a store. A successful co-operative store is in work at Chelmsford.

At Edinburgh, steps are being taken for the organisation of a supply association, on the plan adopted with so much success in London by the members of the Civil Service. A meeting of gentlemen, comprising representatives from various banks and Government offices, and a number of professional men, has been held, according to the *Scotsman*, and a provisional committee nominated to take preliminary steps. The proposal has been received with much favour

by the large class of householders having stated incomes, such as those engaged in banks, insurance offices, Government offices, and other like employments, upon whom the increasing cost of living presses with great severity. Already some of the leading establishments have offered to deal with the association on the same terms as in London.

A SWEET SHOP IN OXFORD STREET.

No. 56, OXFORD-STREET, a house erected a few years past, with some architectural pretensions, has lately undergone considerable internal alterations, to render the premises applicable for the purposes of a first-class "Confiserie Française," similar to those tasteful establishments of the Rue de la Paix and the Boulevard des Italiens. The front has been cleverly decorated, in the Pompeian style. The want of flat surfaces on which to execute the delicately designed ornaments of the style, rendered the treatment somewhat difficult. However, our attention is more with the interior, inasmuch as we have here specimens of French shop fittings and decorations. The whole has a pleasing effect. The colouring has been kept to the same tone as the furniture and fittings, and is relieved by the judicious introduction of contrasting colours, used in small quantities in their original intensity. Greater part of the furniture has been made in France, and very well made. The coloured decorations were executed by Mr. Hornum, who is, we understand, carrying out some of the decorative work at the Mansoleum erected by Her Majesty for the late Prince Consort. Messrs. Finch Hill & Paraire were the architects. The costliness and elegance of some of the *bon-bon* boxes here will surprise ordinary visitors.

PRESERVATION OF STONE.

In a recent number we printed the heads of a paper on this subject by Mr. Spiller, read at the Dundee Meeting of the British Association; and we had previously alluded to a remark which was made in the discussion on that paper by Mr. George F. Ansell, to the effect that the best plan for preserving stone would, in his opinion, be by exhausting the atmosphere from the wrought or "worked" stone or marble by means of an air-pump, as it is done in the case of "creosoted timber," and then to admit an atmosphere of that dense gas which is known as ter-fluoride of silicon, or, as Mr. Ansell preferred to call it, fluo-silicic acid. The president of the section remarked upon this suggestion, that it was just such a one as cropped up at these meetings, and was likely to be of practical value. Those who are interested in the preservation of stone will examine this proposition, and should take some steps to carry out the idea conveyed. Let us look at the subject a little more in detail. Mr. Ansell stated that he would operate upon the stone when it was fitted for its final position, whether as statue, block, or moulding, and he expressed an opinion that a stone so treated would become one solid mass of insoluble substance, upon which the atmosphere would have no influence, and that, in fact, marble so treated would become as permanent as granite, without loss of colour. This, if it be the fact, is easy of demonstration. The action of the gas would be as follows: when the stone had been exhausted, (in the term it is, it would represent a kind of sponge, into the pores or interstices of which ter-fluoride of silicon would, when admitted, permeate, so that the stone would become saturated with that dense gas instead of with water and air, as it usually is. So soon as the stone thus saturated came into the air, the moisture of the atmosphere would act on the ter-fluoride of silicon, and mutual decomposition would ensue, the result of which would be to fill the interstices of the stone with pure silicic acid, heterogeneously as sand; while the ultimate result of the substance would be the formation of a fluoride of lime, commonly known as Derbyshire stone. In the case of ordinary mortar it is well known that the sand under the influence of time, moisture, &c., combines with the lime, and forms an insoluble silicate of lime; hence Mr. Ansell expressed an opinion that the silicic acid in the proposed would also form a silicate of lime; and it will be seen that these changes are intended to take place throughout the entire mass of the stone. Expense can hardly stand in

the way of experiments in this matter, for ter-fluoride of silicon is readily obtained by hoiling together washed sand, or broken glass, and Derbyshire spar in common oil of vitriol. The gas could be conveyed or collected in the manner used by chemists. Should, however, it become necessary to invent a more simple plan of operation, the creation of the want would be but the forerunner to its accomplishment, as has been so often the case. According to Mr. Ansell, there would be little or no practical difficulty in applying this plan to completed buildings.

THE SEWAGE QUESTION.

Kingston and Surbiton.—A special drainage committee was lately appointed by the borough council of Kingston-on-Thames, to inquire into the best way of disposing of the sewage of the borough which now runs into the Thames. The report of the borough surveyor, Mr. Charles Slagg, to the committee on this subject, has now been made and printed. He proposes to use the surplus water at Teddington Weir in the disposal of the sewage, and thinks it advisable that the Sewage of Long Ditton, Thames Ditton, East and West Molesey and Hampton should be similarly dealt with, by making use of the fall of water at Hampton Weir. For Kingston and Surbiton he suggests the formation of a reservoir and outfall near Teddington Lock, and irrigation of lands in the neighbourhood by conveying the sewage beneath the soil in reverse drain-pipes, or semi-cylinders, with serrated edges, and topped by flat tiles, so that the liquid sewage will pass through into the soil, a layer of gravel intervening. Every three or four years a ripping-plough for the purpose should lift and clean these pipes, throwing the sediment on the soil to be ploughed into it. The drains should be about 12 ft. apart, and 1 ft. or less below the surface. The sewage on this plan would be conveyed direct to the roots of the crops, and the surplus moisture would of course be drained off clean. The surveyor proposes to deal with 300 acres in this way to begin with. The total cost of the system he estimates at 29,180*l.*, and he anticipates not only that all expenses will be covered, but a profit ultimately reaped.

Reading.—The pressure of the great question of the disposal of the sewage equally affects this town. The Thames conservators are here threatening as well as elsewhere. The borough surveyor, Mr. W. H. Woodman, and consulting engineer, Mr. John Lawson, have made a joint report to the local drainage committee, in which they propose a new scheme of drainage, at an estimated cost of 49,000*l.*, with outlet works near Blake's Lock, and a sewage farm of 387 acres at Lower Earley, Sonning; the soil to be irrigated by the sewage on the South Norwood and Worthing system.

NEWS FROM SANDRINGHAM.

GREAT progress has been made during the last few weeks in completing the new kitchen and offices, in expectation of a visit from their Royal Highnesses the Prince and Princess of Wales. This wing, which is built of Car stone, and white brick dressings, is divided from the Hall by a new block of building at present in an unfinished state, but is temporarily connected by a covered way. The portion now completed consists of the kitchen, 30 ft. by 23 ft., and 19 ft. high, and is fitted up with every modern appliance for cooking, by Messrs. Adams & Son, of London. The scullery adjoins, and is of the same height as the kitchen. The remaining portion of this wing extends at right angles with the mansion, and contains confectionery and pastry rooms, kitchen-maid's and footmen's room, and at the end a servants' hall of ample dimensions; out-buildings are again continued from this, consisting of washing-rooms, brushing and hoot-cleaning rooms, and a pump-room. An iron tank, holding 3,000 gallons, is placed over the scullery for the supply of water to this part; and a 2½-inch main leading right through the building, with hydrants at various points, will furnish a considerable supply in case of fire.

Gasworks have been erected by Messrs. Walker, of Donnington, Shropshire, near the farm buildings, and the mains laid through the grounds to the ball, also to the residence of Sir W. Knollys and the Egerny's Cottage in the park. The

lighting of the new wing is completed. It is proposed ultimately to light portions of the grounds with standard lamps, the Norwich gates, &c.

The old conservatory adjoining the house is being rapidly converted into a billiard-room, and an American howling alley, 100 ft. long, is being built: the wall on one side is of concrete, 18 in. thick, and has every appearance of being as hard as a rock. This alley and the billiard-room will be lighted with gas.

The intermediate block, now in course of erection, will consist of a large room, 30 ft. by 18 ft., to be used as the steward's dining-room, a housekeeper's room, linen-room, housemaid's sitting-room, butler's department, strong-room, coffee-room, &c., with dormitories over for female servants; a basement story runs under this portion of the building, and will be fitted with heating apparatus, wine, beer, and coal cellars. It is anticipated that this block will be rooted in by Christmas.

The whole of the building works have been carried out by Messrs. Goggs, contractors, of Swaffham, under the direction of Mr. Hambert, architect. Mr. Schofield is clerk of the works.

THE WARMING AND VENTILATING OF BUILDINGS.

MR. CONSTANTINE, known as proprietor of the Turkish Baths, in Manchester, has given much attention, with a view to obtain the best descriptions of apparatus for air-heating that could be procured. Some of these failed, from the constant tendency of the metal to superheat and overdry the air; others consumed an excessive amount of fuel, and rapidly wrought their own destruction. From defective internal arrangement, the combustion was so imperfect as to permit most of the heat to pass up the chimney. There was an obvious want of sufficient internal absorbing and external radiating surface, and an inter impossibility of securing uniformity of temperature, even with the most vigilant attention. In seeking to remedy these evils, Messrs. Whitaker & Constantine have devised and patented a stove, which they find, when in operation, fully to equal their expectations. Several have been erected in and around Manchester, for warming and ventilating churches, chapels, public buildings, Turkish baths, mansions, and drying-rooms. The apparatus may be thus briefly described.—The lower portion consists of an ash-box, with fire-grate above. These are surmounted by a series of nearly flat iron arches, each being deeply grooved, to form a chamber, with an aperture at the top of each arch leading to the smoke-box. These grooves extend also down the sides, and each is a separate casing, so as to be easily replaced, if necessary. They are fastened together by a peculiar joint, which is said to admit of expansion and contraction without risk of fracture. Fire-clay is used for projecting the flame into the convoluted flues, and for ensuring slow and uniform combustion of the fuel, and also for preventing superheating of the air, and at the same time protecting the castings. A stove on this principle, large enough for a small chapel, does not consume, according to the patentees, more fuel than an ordinary sitting-room fire; while, in consequence of the slow combustion, it only requires attention at long intervals. A circulating boiler could be fixed in the convoluted stove, without interfering with its use as an air-warmer.

ST. MARK'S, AT MARSKE.

THE new Church of St. Mark was consecrated by the Archbishop of York on Thursday, the 17th October. Owing to the old church, St. German's, being inadequate to the increasing population, the Church of St. Mark was commenced, under the liberal patronage of Lord Zetland and a zealous committee.

The new church is a spacious and substantial building of the Early French period, to seat 705, all being free. Dimensions of nave, 76 ft. by 31 ft.; chancel, 30 ft. by 23 ft., north and south aisles, 76 ft. by 13 ft., with an elegant and substantial tower on the south-east corner, and a spacious porch on the south-east side. The principal entrance is from the west, which forms a semi-porch with rich moulded doorway and carved capitals. The exterior is all built of pitched-face blocking, "light sand stone," from

Lord Zetland's Marsh Quarry; the windows of aisles being double lancet, having bar arches, with bases, shafts, and caps, &c., those to clear-story being sexfoil, and a beautiful rose window in the west end, filled in with cathedral glass. The east window is of stained glass, executed with great taste by Heaton, Butler, & Bayne, London, the gift of the tenantry to the memory of the late Countess of Zetland.

The main arcade in the interior springs from circular columns, which have carved capitals and bases of the same period. The lining is pressed bricks throughout, relieved with stone bands with good effect. The timber of the roof is all fir, constructed on the circular-ribbed principle, springing from stone and wood corbels, with ornamental hammer-beams, and boarded diagonally; that of the chancel forms a wagon-head ceiling, with moulded ribs. The benches are all red deal, stained and varnished. There is tile paving in the chancel, Maw's, of ornamental design; in the passages, red and black Staffordshire, neatly arranged. The heating apparatus was supplied by Messrs. D. & E. Bailey, London.

The contractors for other portion of the works was Mr. Wilkinson, Contham. The entire cost was upwards of 4,000*l.*, against which there were 1,000*l.* subscribed by the parishioners, and Lord Zetland presents the remainder. It ought also to be added that Mr. J. Pease contributes an illuminated clock and bells. The works have been executed from designs by Mr. F. P. Cockerell, London, and under the superintendence of Mr. G. Carter as clerk of works.

THE ARCHITECTURAL ASSOCIATION CONVERSAZIONE.

THE opening meeting and *conversazione* of the twenty-sixth session of the Association were held on Friday evening, the 25th ult., at the House in Conduit-street.

In the rooms were displayed a number of paintings and works of art. The drawings of the successful competitors for the various prizes offered by the Association were also exhibited.

The attendance of members and visitors was more numerous than usual, and included a number of ladies.

The chair, having been taken by the newly-elected president, Mr. R. Phené Spiers, it was announced that letters had been received from Sir F. Grant, Mr. Tite, M.P., Professor Donaldson, Mr. Godwin, and other gentlemen, expressing their regret at not being able to be present.

Mr. E. G. Tarver read the report on the class of design, which stated that the first prize had been awarded to Mr. G. Vials, and the second equally between Messrs. E. Lee and Metcalf.

Mr. C. H. F. Lewes announced that the prize for figure drawing in the Life School had been given to Mr. E. H. Bearne.

Mr. J. D. Mathews (hon. secretary) brought up the report of the judges on the Architectural Union Company's prize, which recommended that half of the amount should be awarded to Mr. W. R. Tilling.

Mr. T. Blashill intimated on behalf of the judges that the prize of 5 guineas, offered by the outgoing president (Mr. R. W. Edis), had been awarded to Mr. E. Lee.

The successful competitors having received their respective prizes, the President delivered the inaugural address, quoted on another page.

At the conclusion,
Professor Hayer Lewis ventured, both as a Fellow of the Royal Institute of British Architects and as a member of the Association, to congratulate the meeting on the prosperous and satisfactory condition of the Association. It was from the junior members of the profession that the Institute must draw its life-blood, and no machinery could be better devised for its circulation than an Association like that which had begun another session that evening, because all its members derived benefit from an interchange of knowledge, from healthy competition among themselves, and from a salutary system of self-government which was not too proud or too self-reliant to invite the senior members of the profession to visit them occasionally, and give them the result of their experience. He quite agreed with what had fallen from the president in reference to the necessity of sketching; and he thought he might paraphrase the words of Bacon, and say that sketching made a correct man; for it would be impossible for the student fully to understand the beauties of nature if he

did not carefully sketch. It was, in fact, careful sketching which accustomed the hand as well as the eye to appreciate the beauties of Nature and Art. The joining of the masonry, the forms and shadows of the mouldings, the light tints of colour, were all of importance, and might be overlooked without a sketch. He believed it was Mr. Street who, when dilating on this subject, said that, when the student had made a very good sketch, the best thing he could do with it would be to put it into the fire; and Professor Kerr, who was present on the occasion, thereupon observed, with much propriety, that for his own part, he would much rather the sketch were given to him than burnt. That which Mr. Street, however, no doubt intended, was, that when the student had made a careful sketch, he had got as much knowledge through its agency as could be acquired on that particular subject. At University College he found that the students failed most in sketching, and to improve them in this respect the questions were framed as much as possible so as to get the answers in sketches; for he felt no doubt that a few lines carefully drawn, and with a few references, would give a better description than any amount of writing.

The reason of the failure to which he referred was that the younger students frequently endeavoured to do too much in too little time. He would venture to throw out as a suggestion, that it might be desirable to set aside, in some of the classes, half an hour or so, to be devoted to putting on paper thoughts upon some cognate subject suggested on the spur of the moment, and then comparing these notes. This would, he thought, be the means of eliciting a good deal of practical information. This sort of inquiry, even into the most familiar subjects, often revealed the somewhat discouraging circumstance that one knew very little indeed about them. But, on the other hand, this appreciation of one's own ignorance was most useful because it put the student on the high road to inquiry and reflection, and then after a little work it became quite a pleasant surprise to him to find that he knew so much. With regard to figure drawing from the life, he was happy to say that at University College it was now in contemplation by the Council to establish classes for drawing from life models under the instruction of competent artists. He had been in communication on this subject with the head master of the college drawing school (one of the most successful existing), and also with a gentleman well known in that room, Mr. Poynter. In the course of his address, the president had referred to the Institute; and with reference to this subject he (Professor Lewtas) felt bound to allude to the discouraging circumstances that so few competitors came forward for the prizes which it offered. If, on the other hand, there were obstacles which were insuperable of removal, he was sure the Council of the Institute would be glad to consider them, and to act upon any well-considered suggestions which might be offered with that view. There was only one other point to which he would refer, and that was the modern style of architecture in France, noticed by the president. For his own part, he could not agree with the latter in his admiration of that uniformity, and he did not think foreigners themselves were enamoured of it, because he found it extremely difficult to get photographs of their modern public buildings. In conclusion, the speaker moved a vote of thanks to the president for his address.

Professor Kerr, in seconding the vote, availed himself of the opportunity to add his congratulations to those of the last speaker, on the progress which the Association had made for at least one-and-twenty years. The Association had steadily proceeded in one direction,—namely, the instruction of junior architects, and in this way had effected much good. The Institute had been referred to both by the President and by Professor Hayer Lewis, and all he would say on the subject was, that if the student depended upon the Institute for education, he would not be able to realize his expectations, for it would be perfectly impossible for it to do much more than it did. The little success which had attended the voluntary examination scheme, got up, as it was, at considerable expense, and in a spirit of perfect sincerity of purpose, was a proof of how little the Institute could do in the way of education. The best means of education, apart from office-work, was that furnished by the Association, and it was a gratifying illustration of the good which had been effected by it to find that more than a dozen of the best designers of the day had been educated by it.

Mr. T. Roger Smith observed, with reference

to the tinting of the architectural drawings at the Paris Exhibition (to which allusion had been made by the president), that those exhibited by Mr. Waterhouse, and which obtained the only grand medal awarded to English contributors, were all tinted by that gentleman's own hand.

In the course of the evening there was a concert of instrumental music, by Messrs. T. H. Waigt, Svendsen, Weiner, and Schmyer.

COMPENSATION CLAIM AT LIVERPOOL.

THE premises of an Italian warehouseman being required for the Central Station and Hoag's, on Kanolagh street, a claim for loss of property and business has been made against the Manchester, Sheffield, and Lincolnshire, the Great Northern, and the Midland Railway Companies. The original claim sent in was 12,000*l.*, being 8,500*l.* for leasehold land, messuage, shop, warehouse, stable, hereditaments, and premises; 1,023*l.* compensation for compulsory sale, severance, and damage; 3,022*l.* for loss or destruction of business; and 2,455*l.* for an undue resumption of stock-in-trade, and 184*l.* damage, compensation, and reinstatement. Subsequently an amended claim was put in for 11,907*l.* odd, which was resisted by the companies. The jury viewed the premises, which were shown by Mr. Jeatland, architect and surveyor, of Birkenhead, on behalf of the claimant, and by Mr. J. Arscott, for the companies. On returning into court a long consultation ensued between the legal gentlemen, and an award of 7,011*l.* was accepted, the claimant, who will occupy the premises for about twelve months, retaining the fixtures, which were valued at 500*l.*

DARLINGTON WORKHOUSE COMPETITION.

SIR,—Noticing a letter in your last from "An Old Subscriber," which conveys the impression that the guardians have not honourably fulfilled their conditions, by withholding the premium advertised, I think it only fair to inform your readers that so long ago as December 24th, 1866, the committee selected my design as the best. A question, however, arose at the same meeting respecting the tenure of the land, and the Board have been nine months negotiating respecting it and other sites, the question as to altering the old or building a new house depending on the result. Having failed to make a satisfactory arrangement as to the old property, the guardians have at length purchased a new site, and have paid me the premium in lieu of employing me to carry out my design.

I do not see what ground of complaint your correspondent has, except that the committee did not give me the premium as he himself appears to do. I think if any one has ground of complaint, it is I, that, "owing to circumstances over which" no one "had any control," I should only receive a small premium instead of a good commission, and have to compete again for the letter.

J. P. PRITCHETT.

* * * We do not agree with Mr. Pritchett, that our first correspondent has no cause of complaint; his actual complaint remains wholly unanswered by this letter.

HOLBORN BAR AND VIADUCT.

IT is evidently too true that, as this Journal has so frequently remarked, in all our endeavours to direct the course of Great Britain's streets, &c., they have been both, and simply in effect; that a defined plan is not previously fairly laid down and accurately adhered to. In consequence of this, the old Holborn Bar, which has at length yielded to common sense, if not good taste and judgment, exposing, as it now does, the very irregular, winding frontage of the former court-houses,—some of which have been recently expensively rebuilt on their former very distorted line. Surely the Board of Works, and the Local Board, must have long since foreseen the expediency of the removal at no distant period of this long, disgraceful encroachment in one of our greatest thoroughfares, and ought to have been empowered to enforce upon "the give-and-take principle" to arrange these frontages upon their retreating to a uniform line, ranging from the end of Staple's Inn buildings to the upper houses of the late Middle-row, or even to Southampton-buildings, thus giving or taking, in no instance more than 1*ft.* either way, but affording an undoubted improvement. To the great credit of the engineer of the Thames Conservancy, this system is now always enforced and adopted, in the removal of all wharfs, piers, and embankments up and down the river, on whose plan is bold and sweeping line is defined, bearing no doubt the motto, "Thus far shalt thou go, and no further," but with permission, where necessary or beneficial, to recede a distance. The fine given to a recently erected all sidewalk upon the above site must strike with regret for the hangle which has been committed.

H. R.

TOWN v. COUNTRY.

Your correspondent "Rs." thinks it clear that—"God made the country and man made the town,"—because the town contains Roundhead and Bethnal-green. That the country is wholly God's handiwork is true, but the town is man's, while equally certainly the silt, squallor, overcrowding, and disease manifest in Roundhead and Bethnal-green prove the town to be man's work. If, then, all silt, squallor, overcrowding, disease, and production, where does "Rs." classify the storm that tears up the mighty tree like twigs and flings them heaped on the ground, the lightning that splits and burns the oak, the countless creeping grubs that spread their late fall over hedge and thorn-tree and nip off every green leaf, the indolent earth that in her ignorant search for food, cuts out the plant and stops its summer growth, the unreasonable frost of an early spring which

seemingly satire and contempt strews the ground with tender shoots and makes the early tinge of green a broken promise, the universal law of nature by which the strong oppresses its weakly neighbour; the raven picks up for its morning meal the tender rabbit, with its nerves, its limbs, its wonderful eyes, when surely any disorganised mass of matter were as suitable food; the rabbit himself who wages ceaseless war on every green thing, and would rather see the earth were there not dealt out on him a morsel of grass than see it as an endless sea of the face of nature is vast, that the law established everywhere is the same which gives its filth, squallor, overcrowding, and disease to Houndsditch and Bethnal-green—the power placed in the seemingly irresponsible hands of the strong over the weak. If, indeed, in the reduction of this power to the rule of right and justice, is made manifest the work of God, we see such manifestation clearer in Houndsditch and Bethnal-green than in the country, for there this mighty work is plainly in hand.

Bethnal is surely right, and not "the amiable but morbid poet," and these injustices—these offences to our sense of what is just and good,—we were wise to attribute to the miserable conditions of early man, who, with God's full knowledge and in the intention of His unerring wisdom, must pass through the faulty state of ignorant immaturity so offensive to our aspirations before he can step out into the clear and wholesome breadth of a manhood achieved by God through the pangs of the Builder and other such manifestations of handi-work we justify His man's own, if, indeed, in the highest sense, the creature can claim anything of his Creator. H. F.

FROM SCOTLAND.

Edinburgh.—Designs for new Free St. George's Church have been prepared by Mr. David Bryce, architect, for a site secured at the angle of the old market-place and Stafford-street. The ground was occupied by houses, and in the purchase of the site something like 15,000*l.* were expended. The design is in the Palladian style, and will possess features new to the architecture of the city. The ground has been cleared, and already some progress has been made with the masonry. The cost of the building, exclusive of the site, will be from 17,000*l.* to 18,000*l.*, so that the net expenditure will not be less than 30,000*l.* The price obtained for the old church was 20,000*l.*, so that the congregation will have a saving amount to raise; but a large proportion of the sum required has been subscribed.

Glasgow.—A new Home, erected at Lochburn, near Maryhill, for the inmates of the Glasgow Magdalen Institution (in which institution the original Magdalen Asylum of Glasgow was merged in September last) has been formally named. The house is situated on the slope of a high eminence, about 300 yards north from the canal, at Lochburn. The front of the house faces the south. It is three stories high, the ground floor being occupied by such apartments as the directors' room, waiting-room, business man, matron's room, and the upper floor by dormitories. At each end of this range of buildings there is a staircase, giving access to the various floors, and from these extend backwards a range of buildings two stories high, the ground floors being occupied as work-rooms, and the upper floors as dormitories. The space between these two pavilions is roofed over, and supplied as the dining-hall and the chapel, the latter being only separated by folding doors, and, when desired, he used as one large apartment. Well lighted corridors extend along both sides of these apartments, which have stairs to each. There is a bath-room at the foot of each of the principal staircases. The dormitories are arranged to accommodate 100 inmates. Immediately north from the centre of the building there is a large range of buildings of one story in the plan of the letter T, the gable of the part represented by the lower limb being about 30 ft. back from the kitchen. This part is the laundry, and the carriage-entrance is a lodge. The whole has been carried out from the designs of Mr. Honeyman. The following were the contractors engaged:—Masons' work, Messrs. Lyle & McKie; joiners' work, Messrs. McCraw & Kay; plasterers' work, Mr. W. Reid; plasterers' work, Messrs. A. A. Campbell; and slaters' work, Messrs. James Stewart & Sons. The cooking apparatus fitted up by Messrs. A. & J. Nisbet; and the boiler and fittings of washing-house and laundry by Mr. Parnell. The clerk of works Mr. William Kent. On an adjoining site the new Girls' House of Refuge, also designed by Mr. Honeyman, is rapidly approaching completion.

Edinburgh.—The colossal statue of the Prince Albert, by Thesed, has been uncovered at Balmoral. The Queen and other members of the royal family were present.

London.—The construction of new waterworks to the cost of 3,000*l.* has just been brought to a successful completion. Messrs. Chalmers & Co., and Messrs. Dufferin, were the contractors.

Glasgow.—The new waterworks here have

been opened by the authorities. The works, which were done by Mr. Gale, C.E., Glasgow, have been in progress for the past year and a half, and consist of a reservoir, near the farm of Laperstone, and a filter and tank at the farm of Parkhill. The reservoir is 33 ft. above the mean level of the sea, covers an area of 26 acres, and is bounded by two embankments. The reservoir will contain 8,800,000 cubic feet of water, and is estimated to supply 12,000 people with water for a period of 100 days without rain, and 30 gallons per head per day. The cost of the works is as follows:—Reservoir, 4,339*l.*; conduct filters and tank, 22,301*l.*; pipes and pipe laying, 4,720*l.*; lands, engineering charges, &c., 5,000*l.* Total, 15,289*l.*

CHURCH-BUILDING NEWS.

Strathfieldsaye (Hants).—The church of St. Mary the Virgin, Beech Hill, has been consecrated. The site was given by Mr. Henry Lanny Hunter, and the cost of the church (upwards of 2,000*l.*) has been defrayed by Mr. Hunter's sister, Mrs. Forbes, and her daughter, and son-in-law, the Rev. E. H. Landon. Mrs. Forbes also presents 4,000*l.* for the endowment. The site is an elevated one at the south-east corner of the "Seventeen Acres" Field, on the Home Farm. The architect was Mr. W. Butterfield, of London. Messrs. Wheeler Brothers, of Reading, builders, were the contractors. The church is built of red brick, flint, and Bath stone on the outside, and of red, white, and grey brick and Bath stone, in patterns, on the inside. It consists of a nave and chancel under one continuous roof, with a short north aisle opening to the nave by two arches, an organ chamber and vestry also on the north side, and a south porch chiefly of oak. The church is covered with tiles, and has a holly covered with oak shingle at the west end, containing a peal of bells. A traceried screen of oak and walnut wood, with gates, divides the nave and chancel. The seats are low and open, and of one uniform character throughout. The windows are generally foliated lancet lights in different combinations, and the style of architecture may be considered as that of the thirteenth century. Some stained glass windows are in preparation, and will shortly be fixed.

Newmarket.—St. Mary's Church, Newmarket, has been enlarged. It was at first resolved simply to add a north aisle, or rather to convert the transept into an aisle, terminating at the east end in an organ chamber, which is in fact an extension of the aisle beyond the line of the chancel arch. In addition to this it was decided to build a vestry on the north side of the chancel. Mr. J. F. Clark was the architect, and Mr. Andrews (of Bury) the builder employed. After a time it was thought that as these extensions would only provide about 100 additional sittings, and there was already a gallery on the south side of the church, it would be better to place a gallery above the new aisle also, and this has therefore been done, so that the recent alterations afford accommodation for about 300 additional persons, making the total number of sittings somewhere about 900. The new aisle is lighted by four Perpendicular windows, in harmony with those on the opposite side of the church, two of them being entirely new, whilst the other two, previous to the alterations, lighted the transept and the west end of the nave. The aisle has been fitted with benches of stained deal corresponding with those in the body of the church. The total cost of the alterations is about 1,200*l.*

Sealand (Cheshire).—St. Bartholomew's Church, Sealand, has been consecrated by the Lord Bishop of St. Asaph. The church,—which is situated on the River Dee Company's estate, in the parish of Hawarden,—is about one mile from Queen's Ferry and five from Chester. The site occupied by the building was given by the River Dee Company, in addition to which they have contributed 1,250*l.* The total amount of subscriptions raised towards the building fund is 2,131*l.*, and up to the present time there has been an outlay of 2,300*l.* Only a small portion of the oak seating is at present complete, the nave being arranged with chairs. The church affords accommodation for 300. The heating is by Porritt's underground stove. The east window is filled with painted glass, by Messrs. Hardman & Co., of Birmingham. The church, which is in the Early Gothic style, is constructed of stone from the Helby quarries, the interior being finished with chiselled ashlar. The plan consists

of nave, 62 ft. by 26 ft.; chancel, 24 ft. by 17 ft.; a small transept on the north side to contain the organ, and the vestry is under the tower on the south side of the chancel. The tower is 65 ft. high, surmounted by a metal cross, but at present only contains one bell. The whole of the roof timbers and doors are of oak. The spaces between the timbers of the chancel roof are decorated with designs in black and gold on a blue ground. The architect was Mr. John Douglas, of Chester, and the builder Mr. Robert Bellis. The decoration of the chancel was executed by Mr. Robert Ellis.

Slough.—It has been resolved at a public meeting of the parishioners to erect a new parish church, retaining the old one as a mortuary chapel or a chapel-of-ease. A committee has been appointed, and a subscription-list opened. A site has been offered.

Birmingham.—The chief stone of St. Gabriel's Church, Bordesley-street, has been laid in the presence of a large concourse of spectators. This church is the second that is to be erected by the aid of the Ryland fund. After the ceremony, and (of course) a luncheon which followed, the company adjourned to witness the casting of five church bells, a branch of manufacture which has only lately been revived in Birmingham, by Messrs. Blows, who have established a foundry capable of turning out at one casting a peal of bells 9 tons in weight. These founded on the occasion were two of them for King's Norton Church, one of which, the seventh in the peal, weighs about 15 cwt., and the other, the treble, about 6 cwt. The other three were for Rock Church, near Bewdley, one, the tenor, about 13 cwt., the third bell 8 cwt., and the treble bell 6 cwt. Our old correspondent, the Rev. H. S. Ellacombe, was one of those present at the founding, and expressed his approval of the arrangements of the foundry.

Thorncombe (Dorset).—A new church has been consecrated here. The old one had been allowed almost to crumble to dust, and was dangerous to hold service in. It was accordingly decided that the old building should be pulled down, and that a new one should be erected upon a site presented by Mr. Bragge. Plans and specifications were drawn up by Mr. James Mountford Allen, architect, Crewkerne, under whose superintendence the edifice has been erected. The new church consists of nave, north and south aisles, Ford Abbey aisle, chancel, and north and south chancel aisle, and a tower at the west end. The walls are built of a portion of the material used in the old church, and facings of Ham-hill stone supplied by Mr. Charles Trank, of Norton-sub-Hamdon. The aisles are divided from the nave by arches resting upon pillars of Ham-hill stone, ornamented with Bath stone capitals. The church is of the Perpendicular style of architecture. The windows are characteristic of the period, the model being one of the old cloister windows at Ford Abbey, in conformity with the expressed wish of its former owner, Mr. Miles. The nave is lighted on the north side by four three-light windows, the south aisle having two three-light windows, a door, and Ford Abbey aisle. At the west end of the aisles are two two-light windows. The roof of the nave is open, of stained deal, with plastered panelling. An arch of Ham-hill stone, supported on Bath stone capitals, divides the nave from the chancel, which is raised two steps. The chancel is lighted by a five-light window, with pointed tracery. On the south side is a two-light window, by O'Connor, representing St. Peter and St. Paul, with medallions of the conversion of St. Paul and the release of St. Peter from prison. The tower is divided into three stages with string courses and bell turret on the north side, above which rise the cross and weathercock taken from the old church. The tower has three two-light windows and a peal of five bells which have been rebung. The nave is floored with blue Keinton stone, and fitted with open seats of stained deal. Open fittings formed of the old church pews fill the north and south aisles. The chancel stalls are of oak, as are also the fittings of the Ford Abbey aisle. The whole of the work has been carried out by Mr. Davis, of Langport, under the superintendence of the architect. The entire cost of the erection is about 4,000*l.*

Stundash (Gloucestershire).—The church here has been re-opened, after a restoration, which, with an organ, has cost 1,370*l.* Mr. St. Anby, of Gloucester, was the architect employed, and Mr. O. Esteourt, of Gloucester, the builder. The stone-tile roof has been entirely renewed. The walls have been cleaned and pointed, inside and

out: the steeple is to be pointed, and also repaired at the top. The windows have been made new in the old style, and filled (by Messrs. Lavers & Barrard) with plain glass, tinted green in the borders. The flowing tracery of the east window is similar in character to the west window of York Minster. The nave is ceiled with the ancient oak panels of the fifteenth century, with carved ribs and bosses, which have been cleaned and restored. The chancel has an open stained deal roof, nearly 40 ft. from the floor. The flooring is of Painswick stone throughout. The high oaken pews have been cut down, and cleaned; the oaken pulpit has yielded material for a lectern; and the chancel is fitted with choir seats. The communion space is paved with Godwin's tiles. A rood-loft stair was discovered in the south corner of the nave, and has been opened.

DISSENTING CHURCH-BUILDING NEWS.

Hythe.—The Building Committee connected with the New Congregational Church and Schools have opened the tenders sent in: they were as under:—

	Church.	Schools.	Total.
W. J. Adcock	£2,185 14	... 2,698 14	... 4,884 8
H. Uawia	... 2,168 7	... 709 9	... 2,878 16
J. Bowley	... 2,229 0	... 748	... 2,977 0
J. Waddell	... 2,192 17	... 652 2	... 2,844 19
J. Q. Petts	... 1,977 14	... 698 13	... 2,676 8
R. Hazell	... 1,925 0	... 625 0	... 2,550 0

Mr. Hazell's tender being the lowest, was accepted, subject to some inquiries to be made by Mr. Gardner, architect.

Richmond.—The memorial stone of a new Wesleyan School-Chapel has been laid here by Mr. P. B. Hall. The new building has been commenced, adjoining the Kew-road. It is Early Gothic in style, and consists of a chapel to seat 400 persons, with two class-rooms attached. The whole is designed to serve as a school when a larger chapel, for which space has been reserved, is built. The exterior is of picked stocks with Bath stone tracery and dressings. The roofs are covered with coloured slates, and surmounted with crested ridging. Mr. E. Hooile, of Craven-street, is the architect. The work is being carried out by Mr. Hookham, of Kentish-town, at a cost of 1,120*l*.

Wresham.—The new Welsh Calvinistic Chapel, recently built between the town and the railway-station, has been opened. There are on the Hope-road half a dozen places of worship within a stone's throw of each other, which have been built at a cost of above 20,000*l*. The outlay on the latest being about 5,000*l*. The style of architecture adopted in this building is the Romanesque, the material being brick-work, with ornamental bands of red and black bricks and moulded stone dressings for all the more important parts. The principal front consists of a gable, flanked by two square towers, terminating in slated spires, which rise to a height of about 100 ft. from the ground. The lower portion is pierced with three small deeply-recessed lights, over which, at the level of the gallery-floor, rises a group of three large moulded windows, filled up with tracery, the pillars dividing these windows having polished red granite shafts, banded with stone and carved capitals. Entrance is obtained by means of two porches, one in each tower. These porches project about 3 ft., and terminate in gables, supported on polished red granite columns, having carved bases and capitals. A wheel-window, 11 ft. in diameter, filled with plate-tracery, is placed in the east gable over the pulpit. The interior of the chapel is about 80 ft. long by 43 ft. wide, and rises to the height of 35 ft. from the floor to the ceiling. It is galleried on both sides and at the west end. Seats are provided for about 800 persons. All the windows are filled with quarry cathedral-glass, having borders, the tracery being worked in patterns of different tints. A vestry is provided under the east end of the chapel. The building is to be heated by hot-air from a Gill-stove placed in the basement. The chapel is placed back from Hope-road about 30 ft., and at the street-line is built a low ornamental-dressed stone wall, with two entrance-gates, opposite the porches, and ornamental cast-iron railings is to be placed between the gate-piers. A diaphragm with the borough surveyor as to this wall was settled by rebuilding the wall. The chapel has been built from the designs and under the superintendance of Messrs. W. & G. Andley, architects, Liverpool; by Messrs. Thomas & Son, builders, Menai Bridge. The glass was manufactured by Messrs.

Edmondson & Son, of Manchester; and the carving was done by Mr. Stirling, of Liverpool. *Crewe*.—The chief stone of a new Welsh Presbyterian Chapel has been laid in St. Thomas-street, off West-street. The plan and elevation of the proposed edifice have been prepared by Mr. E. H. Frost, of Crewe, architect; and the builder is Mr. Thomas Lee. The cost of erection will amount to about 600*l*. The building will be in the Gothic style, having a high-pitched roof. The front will consist of blue, red, and buff bricks, with stone dressings.

STAINED GLASS.

St. Andrew's, Smethwick (Birmingham).—The first light of a memorial window, to be dedicated "to the Glory of the Triune God, and in Memory of the Holy Dead who once worshipped in St. Andrew's Church," has been placed in the large chancel window. The colours are rich and brilliant, and the countenance of the saint, who is represented with uplifted hand, in the act of preaching from the knotted cross, to which, tradition informs us, he was tied for three days, is expressive. Nearly the whole cost of this light has been collected by the younger members of the congregation. It is to be regretted, however, that sufficient money has not been raised to complete the filling in of a window in one of the largest chancels in the neighbourhood, and so admirably adapted for this kind of ornamentation. The light has been executed from the design by Mr. T. W. Carr.

Haseley Church (near Warwick).—The east wall of the chancel of this church has been taken down, and carried out, to enlarge the church, and a new window built up.—Mr. Kibler, of Wellesbourne being the contractor,—and the openings of the window have been filled with stained glass, executed by Mr. Holland, of Warwick, and erected as a memorial of the late rector. It contains three openings, and the design is arranged in medallions by the Annunciation, Nativity, and Crucifixion, upon grisaille groundwork, with emblems in tracery.

St. Giles's (Willenhall).—The north chancel window of this church has been filled by Mr. Holland, with stained glass, representing Christ Blessing little Children, with ornamental groundwork of the vine foliage, and an angel in the tracery, bearing a shield, with the arms of the present rector.

Gloucester Cathedral.—Soon after the death of the late Mr. Francillon, Judge of the Gloucestershire County Courts, the registrars and the officers resolved to erect to his memory a window in this cathedral. The work was entrusted to Messrs. Hardman, and was completed a short time ago. The window selected was the western one of the south walk of the cloisters. The chief part of the window is divided into six lights. In three of these the Saviour is represented rising from the tomb, and holding a banner; and on the sides are two Roman soldiers in amazement, and another asleep; in the other three, the Angel addressing the devout women bringing spices to the sepulchre. The upper lights are filled with coloured glass.

Wapley Church.—A stained-glass window has been placed in this church to the memory of the late Sir William Codrington, bart., M.P.

PATENTS CONNECTED WITH BUILDING.

IMPROVEMENTS IN CONSTRUCTING QUAYS, JETTIES, PIERS, SEA WALLS, AND BREAKWATERS; IN THE FORMATION OF RESERVOIRS, DOCKS, BASINS, COAST HARBOURS, HARBOURS OF REFUGE, LIGHT HOUSES, AND SEA BATTERIES; APPLICABLE ALSO FOR THE RECLAMATION OF LAND AND FOR THE BUILDING OF BRIDGES.—*H. Buss, M.D.* Dated January 11, 1867.—This invention comprises, among other features, the construction in a suitable dock of a framework of iron, efficiently supported by internal framing, and covered externally on every side but the top with sheets of iron so riveted to the said framework as to form a watertight vessel. The precise shape of such vessel will vary according to the structure it is designed to erect. When a jetty, pier, breakwater, or sea battery is to be constructed, the transverse section of such watertight vessel will be of a pyramidal form, truncated at the apex, of the full height and width of the intended structure, and in length varying according to need from 100 ft. to 1,000 ft. The ends thereof

will be square, oblique, circular, or of any other suitable form. The framing of the bottom will vary according to the nature of the bed on which it is to rest. The entire iron jacket internally and externally will be coated with an incorrodible marine paint. Each pyramidal vessel, when completed, will be floated from the dock into open water, and be so weighted with blocks of stone, rubble, or concrete, as to sink it to a convenient depth. Next, it will be towed to its destination, and have as much water admitted as will compel it to sink down to its suitably prepared bed; and, after it has settled down in position, sufficient blocks of stone, rubble, or concrete will be introduced, to prevent, by their own weight, the vessel being filled up by high water. The contained water will be withdrawn, and provision being made in the internal framing, each pyramidal segment will, when deemed necessary, be invariably fixed to its sea or river bed by piles, iron bolts, screws, or otherwise, being driven through the bottom into its bed, and also into the end of the next segment. Finally, concrete will be poured in as quickly as possible until each pyramidal vessel is filled therewith. In some cases it will be more expedient, when the pyramidal vessel has arrived at its destination, to sink it at once by filling it up with concrete, instead of overweighing by the introduction of water as above.

WINDOW-SASHES AND WINDOW-FRAMES.—*Bullivant*. Dated 31st January, 1867.—The invention has reference to the construction and arrangement of sliding sashes and sash frames, and in the adaptation of roller-blinds thereto, with the view of rendering the sashes air-tight, and preventing any rattling or shaking of the same, as also readily removed for being cleaned or otherwise, and in fitting the roller-blinds to the head of the said sash-frames so as to protect the blinds from dust or dirt when not in use; and consists in forming the sash-frame with vertical metallic grooves, or otherwise, with pulley styles, in which metallic guides attached to the pulley-cords and weights on each side of the said frames are caused to work in such manner as to admit of the sashes aforesaid being taken out and replaced when required through the medium of fixing screws inserted within the sash style, flexible material being employed for covering the said metallic guides, so as to give a smoother sliding action to the window-sashes, and also to shut out the draught. By these arrangements the inner beading at the parting head, together with the projecting outside linings of the sash-frames, as at present are dispensed with. A box or cavity in connexion with the above is formed at the head of the said sash-frames for receiving the roller-blinds and sash-pulleys aforesaid, a space or opening between the movable head and front moulding being left for the blind to pass through when being drawn up or down.

Books Received.

Society of Engineers. Transactions for 1866
Spou, Charing-cross. 1867.

This volume contains a paper, by Mr. C. von Wessely, on "Arched Roofs" of Iron, should prefer to have it called on "Arch-roofs," which, with the discussion that followed, well deserves study. It is illustrated with sections and details of the Dublin Exhibition Palace, Derby Market-hall, Crystal Palace (Sydenham), Amsterdam Crystal Palace, a St. Pancras Station of Midland Railway (sp. 240 ft.). Papers on the utilization of sewers, and on the designing of storage reservoirs, with the discussions that followed, assist in rendering this a volume of more than ordinary value. We may add, that the paper on the designing of construction of storage reservoirs (by I. Arthur Jacob), with its illustrations, is published by Messrs. Spou, in a pamphlet form.*

A Treatise on the Strength of Materials.
PETER BARLOW, F.R.S. A New Edition.
London: Lockwood & Co. 1867.

We have to mention the publication of the sixth edition of the late Peter Barlow's well-known treatise, revised by his sons, Mr. P. W. Barlow.

* We have before us a pamphlet on the "Practical Designing of Retaining Walls" by the same author, A. Jacob, Esq. Printed by Chas. Cooper, Lincoln's Inn, Dublin. 1867. It is a very valuable contribution to the full understanding of the subject.

and Mr. W. H. Barlow, and arranged and edited by Mr. W. Humber. Professor Willis's Essay on the Effect produced by passing Weights over Elastic Bars, and various formula for Calculating Girders, &c., are given as appendices. Mr. Humber seems to have discharged his part of the work conscientiously.

Lyra Germanica: the Christian Life. Translated from the German by CATHERINE WINKVORTH, and illustrated by John Leighton, E. Armitage, A.M.A., and F. Madox Brown. Longman & Co. 1868.

The first of the Christmas books, and a handsome one,—a book not merely for this year, but for many. We may suppose from the appearance of this second series of translations from German hymns that the first volume found favour with the religious and art-loving public. It necessarily addresses itself, so far as the literature is concerned, to a special circle: by its artistic embellishments, however, it widens that circle and very greatly. Most of the hymns are popular for singing in Protestant Germany, and date from the sixteenth century to the present time. Six of the illustrations are by Mr. Armitage, three by Mr. Madox Brown, but the great majority are by Mr. John Leighton, whose fondness and skill, within certain limits, are very remarkable. Initial letters, bead-pieces, tail-pieces, and side-pieces, display an amount of quaint invention that is never wholly found out, and suggest never-ending matter for reflection. Some of his small landscapes, that at the head of "Servitude," p. 71, for example, and at the head of "Morning Prayer," p. 79, showing an avenue of trees in winter, are particularly agreeable and satisfying.

Of the designs by Mr. Armitage, we prefer the illustration of the passage, "Doth conquer sin and death for evermore," p. 19,—a large picture in little. The chief contribution by Mr. Madox Brown, is the "Burial of Christ," p. 98, which has great merit. It may be objected, however, that the head of the Saviour is detached from the body. The volume is beautifully printed, and altogether a genuine article of art.

VARIORUM.

The *Quarterly Review* for October contains an able paper on "Trades' Unions," and one on "Science in Schools." The paper on Trades' Unions gives a review of the more salient points in the Commission evidence, and asks, as we ourselves did, "Are we not rapidly tending to the institution of caste as is found in India?" After putting the case against the trades' unions in pretty strong terms, the writer says:—

We have by no means heard all that is to be alleged against them, and the evidence in their favour is utterly neglected. We say that they injure in the most vital manner the interests of the very working class whom they are meant to aid; that they threaten some branches of manufacturing industry, and seriously limit the diffusion of others; that they are carried on by means fatal to every other; that they are carried on in a spirit of enmity to that free country respects; that they are inimical to the legitimate ambition of industry and merit; that they can only be conducted by a systematic breach of the law; and that they run through the whole gamut of crime, from a mere conspiracy in restraint of trade, to robbery, fraud, mutilation, and murder. We do not say that they are all alike. A vast interval separates such an association as the Amalgamated Carpenters and Joiners from the Society of Lancers or the Saw Grinders of Sheffield. If they all contain within them the germs and elements of crime, they are all founded on the right of the majority to coerce the minority, on the absolute subjugation of the few to the many, and the employment of such means as may be necessary in order to give effect to these false and dangerous principles. Is such a state of things as we have described to be tolerated in this country? Is everything which has hitherto been the pride of Englishmen to be abandoned to the vain attempt to overthrow by brute force the most clearly established principles? Are we to be the only stand by which these bodies ruin our trade and our country, and tolerate a progressive demoralisation of our people, and a government to have a potential voice in the government of this country, to which no limit can be placed short of the worst and blackest of crimes? If we are to be the remedy?

The remedy, continues the author, depends, of course, upon the state of the law. The law, however, is not adequate to punish such enormities, although nothing is clearer than that comparative law will not allow conspiracies in restraint of trade or oppression either of workmen or of employers. The alterations in the law which he suggests are these:—

1. To prohibit absolutely, under pain of indictment,—or, if still milder punishment before two justices,—the establishment of any Friendly or Provident Society without the certificate of its rules from the registrar of such societies. Give a reasonable time to all existing benefit societies to come in and register, and after that time has expired declare all such societies illegal and members liable to punishment. Give to some

suitable tribunal a power of arbitrating between the society and its members, whenever it is impossible for them to comply with the requirements of the Registrar of Friendly Societies. Declare, in affirmance of what we believe to be the common law, that all societies formed in restraint of trade (other than those combinations prohibited by the 4th and 5th sections of the 6th Geo. IV., c. 129) are illegal, and give to justices a summary jurisdiction against their members.

The law will then be adequate to the mischief. If it can be enforced, society will have freed itself from a great peril; dangers to our manufactures and commerce, the amount of which no man can measure, will have been averted, and a demoralization which threatens to lower the character of the English operative to the level of the Hindoo will have been stayed; if not, we must be prepared to see our prosperity wither and perish under the ruinous influence of persons as ignorant of their own true interests as they are careless of the feelings and reckless of the interests of others.

With reference to the subject under notice, we may here incidentally allude to the important remarks of the premier on trades' unions in his recent speech at Manchester. Lord Derby characterised trades' unions, as they at present exist, as associations which endeavour not only to set class against class, but to promote ill-will amongst all classes. On the other hand, he extolled the co-operative principle, which he believed had already done great good not only in establishing habits of frugality and order, but in teaching working men to estimate the claims of capital as well as of labour. The almanacs and calendars are coming in foremost amongst them and in the various well-known shapes are those of De La Rue & Co. Little books for ladies and large books for gentlemen. Indefinite Diaries, Red-letter Calendars, and improved Memorandum Books. The astronomical illustration for the year shows Lunar Craters.

Cassell's Illustrated Almanack for 1868 contains a large number of illustrations; some of them very good. Everybody's Year-Book (Wyman & Sons, Great Queen-street) contains, in a small compass, for six pence, a mass of carefully-edited information, including popular facts, knowledge as to family fare, hints on gardening, a garland of anecdote, and the history of Great Queen-street, especially with reference to the Frankin press.—Readers interested in the important inquiry as to Pre-Angelina Christianity in Britain, as indicated by the discovery of Christian symbols, may be glad to know there are some interesting notes on the subject in the September part of "The Journal of the British Archaeological Association."—A paper in *London Society*, headed "How I fell into the Clutches of King Theodore," by Dr. Burette, is more than usually interesting under present circumstances. It gives a rough portrait of the king, and some curious insight into his character.

Miscellanea.

RESTORATION OF WORCESTER CATHEDRAL.—A meeting has been held at the Town Hall, Stratford-on-Avon, "to promote the completion of the cathedral of the diocese." There was a tolerably large attendance. Lord Leigh presided; and it was, on the motion of Lord Lytton, resolved, "That this meeting expresses its satisfaction with the progress made in the restoration of the cathedral of the diocese, and desires to reaffirm the obligation incumbent on the diocese generally to maintain the fabric in due order and architectural beauty." His Lordship remarked that the work at the cathedral had been commenced some eleven years ago, and the cost came out of the funds of the Dean and Chapter, aided by private friends, to the amount of about 30,000*l.*, and it was not until that amount had been expended that an appeal was made to the diocese generally, and it was computed then that it would require 20,000*l.* or 22,000*l.* to complete what had been begun. To perfect the whole, as was contemplated, it would need an outlay of something like 70,000*l.* If they could raise a sum of 15,000*l.* the work could be completed, and in a substantial manner, according to the plans drawn by Mr. Gilbert Scott, and now placed in that room. The whole amount, in fact, which had been subscribed up to the present time was 22,057*l.* 18*s.* 6*d.* from Worcestershire, and about 3,186*l.* from Warwickshire. Sir J. Pakington moved, "That this meeting expresses its approval of the plans for the restoration of the choir, as prepared by Mr. Scott, and engages to co-operate in the attempt to raise a further sum requisite for the completion of such plan." This resolution was also carried. The subscription made in the room amounted to 594*l.* 1*s.* 6*d.*, and an additional sum of 47*l.* was collected at the

PEOPLE'S PARK FOR LUTON.—An offer of 43 acres of land within a quarter of an hour's walk of the middle of the town has been made by Mr. J. S. Crawley, of Stockwood Park, in exchange for a portion of the Luton moor containing 11 acres, and a sum of 2,200*l.* The offer is looked upon as a liberal one.

NEW STREET FROM LINCOLN'S-INN-FIELDS TO THE STRAND.—A new thoroughfare, being an extension of Serle-street, Lincoln's-inn-fields, intersecting the site of the new Law Courts and leading into the Strand through Picket-place, is in course of formation. To effect this it has been necessary to pull down several houses in Carey-street, between Hemlock and New Courts, and the premises in the rear. To complete a direct and continuous communication for carriage traffic from Holborn to the Strand, the houses in Great Turnstile will be pulled down and the thoroughfare widened. Thus the necessity of widening Chancery-lane will be obviated.

ABATTOIRS FOR LONDON.—The corporation of London have under consideration a scheme for erecting, at an estimated expense of 36,550*l.*, a number of additional slaughterhouses at the Metropolitan Cattle-market, with all the necessary conveniences, and with the ultimate object of connecting them by railway with the new Meat and Poultry Market which the City authorities are now erecting in Smithfield. The site that has commenced itself to them for the purpose is a piece of ground, about eight acres in extent, on the east side of the market contiguous to the Great Northern Railway, and sufficient for fifty-five slaughterhouses; but the City architect, who has prepared the necessary plans and estimates, only recommends the immediate erection of twenty-two, with all the necessary appurtenances. For the estimated outlay of 36,550*l.* the architect calculates that an annual revenue of about 1,680*l.* would probably be derived by the corporation from the slaughterhouses proposed to be erected in conjunction with the Metropolitan Cattle-market.

PROPOSED EXTENSION OF BRADFORD WORKHOUSE.—The committee appointed by the local guardians called on the services of Messrs. Milnes & France, architects, and they reported that the present building used as imbecile wards, and also the building used as male sick wards, should be pulled down, and new buildings erected, according to plans furnished by them. The general plan of the new building for imbeciles is in the double form of the letter *H*, the centre part being about 50 yards long by 11½ yards wide, and the two wings each about 21 yards by 11½ yards. The plan of the infirmary is the letter *L*, the long leg being 30 yards by 8 yards, and the short one 20 yards by 8 yards. Each building is, for the present, proposed to be three stories in height, with the exception of the short leg of the infirmary, which will be four stories, having a cellar thereunder. By the new arrangement a superior classification of patients will be effected. The imbeciles' building was estimated at 8,000*l.*, and the infirmary at 4,000*l.* The consideration of the report of the committee recommending this plan has been postponed.

PATENT DIRECT-ACTING STEAM CRANE.—A satisfactory trial of a combined steam and hydraulic crane has taken place at the Duke's Dock, Liverpool, in presence of Mr. Mitchell, agent to the Bridgewater Trust, and many other gentlemen and engineers connected with steam shipping. The crane is the patented invention of Mr. A. B. Brown, C.E., of the firm of Brown, Wilson, & Co., Vauxhall Ironworks, London, by whom it was constructed. A flat containing 263 barrels of ale was placed underneath the crane, some 25 ft. below its level. These were raised, swung round one half revolution, and deposited in a warehouse in an hour and a half, the rate of lifting and swinging being in most cases two in one minute. The crane, we are informed, can raise 30 cwt. at a speed of 800 ft. per minute, and it has at the Hamburg docks, where sixteen have been at work, raised as many as ninety parcels of one ton each per hour, or 900 tons per day of ten hours, with a consumption of coal equal to 4 cwt. The advantages claimed by the patentee are as follows:—The direct utilisation of the elastic force of steam, governed by the inelasticity of water; the high working speed of load with low speed of machinery; the total absence of all cog wheels or revolving parts; lastly, extreme portability, combined with great power and speed, and without noise.

CLOYNE CATHEDRAL COMPETITION.—We have received a letter from Messrs. McCarthy & G. Goldie on this subject, hnt too late for consideration.

PIRACY.—The editor of the Calcutta Engineer's Journal will doubtless thank us for informing him that the article "Professional Skill in High Life," printed in large type in his September number, headed "Communicated," and signed "S. M.," is taken from an article published by us in March last.*

MANNINGTREE PARISH CHURCH.—The parish church of Mistley having fallen a victim to that well-known disease affecting timber, the dry rot, it is intended, if the requisite funds can be raised, to erect an entirely new edifice, at a cost of about 3,000l. The new church is intended to provide accommodation for 600 persons.

"RAMBLES IN THE RHINE PROVINCES."—A volume under this title, by Mr. Seddon, is about to be published by Murray. It will be illustrated with chromolithographs, photographs, and wood engravings, and has for principal object the preservation of some record of many interesting remnants of the old domestic as well as of ecclesiastical architecture, fast being interfered with by the wants of modern time. We can speak of our own knowledge of sad destruction since we first walked the banks of the Rhine, sketch-book in hand, in student days.

ONE REASON WHY LIVERPOOL IS UNHEALTHY. Some discussion took place at the meeting of the Health Committee of Liverpool, with reference to the fact that there are still in the town—in spite of the law—no less than 13,000 cellar dwellings. In answer to questions, Mr. Higgins, one of the inspectors of nuisances, said that people using the cellars had a trick of removing all traces of bedding, &c., in the day time, and the magistrates required proof—before condemning a cellar—that it was used as a sleeping apartment. In addition, the law also required two convictions in three months against a cellar before it could be legally closed.

THE MANCHESTER NEW TOWN-HALL SITE.—We understand that a meeting of members of the council favourable to some modification of the site of the New Town-hall, has been held, and, after a full discussion, the following decision was unanimously come to:—"That, whilst adhering to the choice of the Albert-square site for a New Town-hall, they were of opinion that, with a view of improving the present unsatisfactory shape, it is most desirable to extend the area so far in the direction of Dickinson-street, as to admit of the erection of a rectangular building." It was decided to call another meeting on an early day.

JOURNEYMEN BUILDERS AND THE HOUR SYSTEM. At the Sheriff's Court, on Saturday (before Mr. Commissioner Kerr), the case of Mitchell v. Prince came on for hearing. This was an action to recover 1s. 8d. for grinding-money. It was contended that since the introduction of the system of payment by the hour, an allowance for grinding tools would be equivalent to double pay. The Judge was clearly of opinion that as a matter of law plaintiff could not recover the money. It had been proved to the Court that the men might terminate an engagement at any period of the day, and it would be most unreasonable to allow grinding-money when the hiring was an hourly one. Plaintiff must be nonsuited.

SALISBURY CATHEDRAL.—A number of men are just now engaged in a work which, when completed, will add materially to the beauty of the northern and eastern views of this cathedral. The work may correctly be described as examining a large portion of the cathedral wall, which has been literally buried for the greater portion of a century. Nearly eighty years ago an enormous barrel drain or culvert, internally 2 ft. in diameter, was formed to carry off storm waters from the cathedral roof. At that time, as no outfall could be obtained lower than the palace ditch, the culvert would have projected above the level of the ground, and in order to conceal it, it was earthed over, thus necessarily covering some feet of the base of the cathedral wall. The greatest beauty of the wall having thus been hidden, the right proportions of the building have been unseen by two generations. The culvert, being now useless, is being removed, also the earth which covered it and the base of the wall.

STONE AT PUDICOTE.—On the 20th, a new Primitive Methodist Chapel, at Chilson, Oxon, was opened for public worship. The chapel is built entirely with the stone recently discovered on the adjoining Pudicote estate. Mr. R. Norton, of Chilson, was the builder.

DISCOVERY OF AN ANCIENTLY-CARVED STONE AT ILKLEY.—The excavators engaged by Mr. Metcalfe, of Bradford, in making new drains, streets, and roads, found, the other day, a stone 2 ft. deep in the excavations near the top of Green-lane, which, when turned face upwards, was found to be elaborately carved in deep relief with the representation of three figures,—a male on the left, a female in the centre, and a child on the right. The general opinion is said to be that it is of the Roman period.

THE AIR OF THE UNDERGROUND RAILWAY.—The inquest on the body of the young woman who died suddenly while travelling on the Underground Railway has resulted in a verdict of death from natural causes. The evidence of the scientific witnesses was conclusive as to the innocuous character of the atmosphere of the railway. Two independent analyses were made, and both agreed in the opinion that there were no impure gases which existed in sufficient quantities to affect the health, even of passengers who were in a diseased condition of body. We never had any other opinion ourselves.

ACCIDENTS.—A chimney at Wakefield has fallen. Two men were engaged in straightening the chimney, which is some forty yards in height and had been blown crooked in a late high wind, when the chimney fell, and hurled one of them in the débris. He was inside, and the other man on a scaffold outside. When the man inside was extricated it was found that his head was dreadfully battered, one of his legs broken, and that he had received serious internal injuries. The fallen material has penetrated the earth to a great depth.—A serious accident has occurred at Cliffe's Foundry, Bradford. The corporation, in driving the main sewer in the direction of Bowling Old-lane, have to pass it under the foundry, and a shaft has been sunk in the foundry for this purpose. A number of men were at work in the excavation, which is 19 ft. deep, and at the same time the foundrymen were proceeding to cast a large bridge plate, the mould being close to the excavation. The crane-ladle, containing 26 cwt. of boiling hot metal, was swung over the mould, and the men in charge of the ladle were in the act of pouring it out, when it obtained the mastery of them, turned over, and the mass of hot metal rushed about the foundry like a wave of fire, ran into the excavation, and dropped on to the persons of the eight men who were working below. These men were on three stages, one below the other, and consequently they could not all get out quickly. They were all more or less hurled.

Table with 2 columns: Name and Amount. For Church of St. Chad, Haggerston. Mr. James Brooks, architect: Hill & Sons, £7,670 0 0; Piper & Wheeler, 7,183 0 0; Perry & Co., 6,983 0 0; Higney, 6,780 0 0; Longmire & Burge, 6,757 0 0; Foster, 6,497 0 0; Hill & Keddell, 6,387 0 0; Ennor, 6,144 0 0; Ashby & Sons, 6,140 0 0; Henshaw (accepted), 5,990 0 0.

Table with 2 columns: Name and Amount. For Church of St. Columba, Haggerston. Mr. James Brooks, architect: Perry & Co., £9,065 0 0; Longmire & Burge, 8,877 0 0; Higney, 8,700 0 0; Higgs, 8,375 0 0; Ashby & Sons, 8,140 0 0; Ennor, 8,130 0 0; Piper & Wheeler, 7,990 0 0; Henshaw (accepted), 7,884 0 0.

Table with 2 columns: Name and Amount. Clergy House, St. Michael, Shore-ditch. Mr. James Brooks, architect: Asby & Sons, £2,660 0 0; Hill & Sons, 2,655 0 0; Hill & Keddell, 2,379 0 0; Henshaw, 2,343 0 0; Foster (accepted), 2,342 0 0.

Table with 2 columns: Name and Amount. For repairs, Wolstanton Vicarage, Staffordshire. Mr. James Brooks, architect: Barlow, £1,000 0 0; Sutton, 963 10 0; Lowe, 855 15 0.

Table with 2 columns: Name and Amount. For building new casual wards for the City of London Union. Messrs. Tress, Purchas, & Willis, architects. Quantities by Mr. G. P. Raggett: Wood, £3,889 0 0; Ransome, 3,840 0 0; Holmes, 3,651 0 0; Garrad, 3,590 0 0; Stangle, 3,388 0 0; Marter, 3,297 0 0; Eg, 3,140 0 0; Lacey, 3,119 0 0; White, 3,098 0 0; Crook, 3,010 0 0; Langley, 2,997 0 0; Turner, 2,990 0 0; Sheffield, 2,980 0 0; Hild, 2,924 0 0; Wilt & Son, 2,924 0 0; Mote, 2,913 0 0; Perkins, 2,884 0 0; Cooper, 2,890 0 0; Bland, 2,888 0 0; Wyatt & Son, 2,848 0 0; Henshaw (accepted), 2,768 0 0.

For detached villa residence in the Seven Sisters-road, Stoke Newington. For Mr. Henry Taylor. Mr. A. Manning, architect: £1,250 0 0.

For a detached house in the Seven Sisters-road, for Mr. J. Andrews. Messrs. Franklin & Andrews, architects: £1,160.

For proposed new Cemetery, Biggleswade, Bedfordshire. Messrs. Ludds & Hooker, architects. Quantities by Mr. Glenn: Chapels, 1,020; Lodge, 342; Entrance Gates, &c., 173; Boundary Walls, 250.

Table with 5 columns: Name, Chapels, Lodge, Entrance Gates, &c., Boundary Walls. Chappell, 1,020, 342, 173, 250; Bates, 994, 301, 166, 231; Redhouse, 913, 296, 172, 223; Thomas & Co., 856, 273, 145, 238; Roy, 845, 256, 139, 220; Howe, 815, 259, 134, 192.

* Accepted subject to revision of Lodge.

For house at Sutton. Mr. W. A. Murphy, architect: Smith, £1,714 0 0; Sharprington & Cole, 1,690 0 0; 1,617 0 0.

For parsonage house and offices, Temple Grafton Warwickshire. Mr. Thos. T. Allen, architect: Giles (accepted), £1,630 0 0.

The Builder.

VOL. XXV.—No. 1292.

The Manufacture of "Roughs."

OW shall we improve the education of our artisans, so that England may not be behind in the industrial race, is a question that is being earnestly asked in several quarters. We have done something towards echoing the question, if not towards the preparation for eliciting a right response. The answer must be obtained, and acted on with promptitude and earnestness, if this country is to keep its place; and we shall not be found wanting in endeavours towards that end. Just now, however, we would go a little lower in

the body-politic, and speak of the entire absence of education there, and the urgent and crying need for it that exists. The Reform Bill of 1832 gave an impulse to education. Let us hope that the new measure of reform about to be bestowed on the people of England will act in like manner, and with redoubled force, and we do hope it and expect it. People have talked of the school-master being abroad, and the general spread of education. Never was a greater or more mischievous error entertained. Talk of the spread of education? Why, Parliamentary returns show that one-third of the men of Hertfordshire, Cambridgeshire, and Norfolk, who married in 1865, had to make their mark instead of signing their name to the register; and that more than a third of the men of Suffolk, Bedfordshire, and Staffordshire were in the same discreditable predicament. Why, in South Wales more than half the women were unable to write their names when married; and in Bedfordshire, where the children are put early to work at straw-plaiting, the proportion of the uneducated was very little less. In Liverpool, out of 23,740 persons who were apprehended in 1866, only 258 could read and write well; while of 720 children, dealt with under the Juvenile Offenders' Act, not one could do so.

For the 148,000 marriages that were made in England in 1864, 42,000 of the men and 58,500 of the women (using round numbers) signed with a mark!

Whatever is spent on education is saved twice over, and more, in prisons and police; to say nothing of the mighty saving of misery and life. This is pretty generally admitted: how can it be denied? But we are very slow to act upon it. Some of the hindrances are found where, without knowledge of the human mind, one would scarcely expect to discover them. When all things are ripe for a large extension of the blessings of education, even Religion and Conscience step forward, and with a resist-to-the-death expression bar the way. Not that they are opposed to education; they have got beyond that after long reflection; they desire that education should be given, but it must be their own sort of education, and mixed up with their own menstruum.

"Orthodoxy" is my doxy, "heterodoxy" anybody else's doxy: and that doxy I oppose to the last."

And so neglected weeds grow apace, and instead of corn we get deadly-nightshade: instead of men and women with honest hearts and clear minds, we get "roughs;" and from roughs come hurdlars, garrotters, and murderers.

The cost of crime is enormous; in fact, it cannot be counted. It operates in a hundred ways. Look at what the expense of the machinery towards punishment of crime alone amounted to in 1866 according to judicial returns:—

Police	£1,827,106 18 7
Sums paid by her Majesty's Treasury on account of criminal prosecutions	143,511 6 6
Cost of prisons	514,677 12 8
Cost of convict prisons	237,933 2 0
Paid by her Majesty's Treasury on account of reformatory schools	51,734 6 1
Do. do. industrial schools	18,567 10 6
Criminal lunatics	45,037 12 0
	£2,987,967 6 4

Three millions sterling per annum, and this is not all or anything like all. Another million, at least, should be added for the interest on money expended on buildings, the salaries of various officials, and other items. And each year it becomes greater!

Convicts in England, according to returns, cost 34s. 7s. a head per annum. What do they cost the country when they are free? The number of the criminal population in England and Wales was computed in the year 1864-5 to be 145,000, and we believe this to be enormously under the mark. Including heggars and persons subsisting by other disgraceful means the number has been calculated at 250,000. Let us, however, take the first to be the number, and say there are 145,000 persons, 117,000 of whom are at large, destroying instead of producing, living upon the industry of others,—taking from the community instead of giving to it. Would 50l. per annum a-piece be too much to put down as the loss caused by them to the community? No, nor enough, and yet at that sum we get nearly six millions to be added to the other four millions; or ten millions sterling a year, the cost of crime. If part of the cost of pauperism were added to this, as it might fairly be, the amount would be raised some millions more.

Proper education would save much of this enormous expenditure, and would not cost what it saved. We may safely say that four boys can be educated at the annual cost to the community of one moderately successful burglar. What gain, then, to that community, what gain to the sum of human happiness, if we picked out of the dirt four boys who otherwise would probably become burglars, and rendered them fairly honest and industrious members of society! We will say nothing here about souls; we are talking only of bodies; and yet the recollection that they have souls ought to strengthen the argument.

This is no new cry with us, no fresh perception. Fourteen years ago and more, the writer of these lines said, and afterwards, again and again, in varied words,—

"The number of children who at this time are being educated in vice, fitted for disturbing and injuring society, forbidden from good and prepared for a life of misery; children who have no affections or ties; in whom natural good feelings have been quenched; who have no advisers but the bad; no home, no hope; is perfectly appalling. They are to be counted in thousands; we fear to say how many. Can nothing be done to save them, and so save society? Here is a fertile field appealing for labourers to the Christian, the philanthropist, the political economist, and the mere egotist, who would save himself money and annoyance by preventing, instead of punishing. Let us remember there is no irremovable reason why these children should grow to be disorderly and lawless—bars, thieves, perhaps murderers; they were born as capable of good as your own offspring; and, with the same nurture and teaching, would make as useful members of society. Lead them into good habits; imbue them with right principles, and their lives, in the natural course of things, will be in accordance with those habits and principles. Equally, as a matter of course, will the lives of these poor outcasts follow the training they are now receiving. Knowing the seed, we know what the plant must be. It seems almost an injustice to punish for a natural result."

A few evenings ago we spent an hour with five

ragged little waifs of the London streets, not one of whom knew what discipline or letters were. Two of them lived "bany how;" two "nohows;" and, with one exception, it seemed pretty clear that when an opportunity for pilfering with safety occurred, it was regarded by them simply as a piece of luck. The story told by most of them was similar to what has been often heard before, and we need not repeat it. The condition of mind exhibited (the mingled ignorance and cuteness) was dreadful to contemplate. One, as pretty a boy as could be found without difficulty, showed generous impulses and inclinations to right. In the rest all such feelings had been smashed out, if they ever existed, and their faces were as debased as their minds. It is unnecessary to say what might have been the fate of these children, and what it will be? What has become of the boys and girls we questioned thirteen or fourteen years ago in the Golden-lane district, the courts of Gray's Inn-lane and Drury-lane, the slums of Bishopsgate-street, Bethnal Green, and Whitechapel? What could they have come to but the bad? The great majority of them went to increase the ranks of the dangerous classes, have preyed upon society that disregarded them, and have filled, at society's expense, workhouses, hospitals, convict prisons, penal settlements, and pauper graves.

We showed years ago the extent and danger of the undercurrents of London society; that lying in the dark shadows of London, bred in town swamps, and living in the midst of ignorance, dirt, vice, and social degradation, an army of rough and desperate men and women existed unsuspected and uncared for. They are to be counted in thousands. An execution or a local riot sometimes brings them into daylight, but at ordinary times they are to be found only where they live, massed together, and under such conditions that improvement is scarcely possible.

Now is the time,—this very day,—to stop the recruiting of these fearful ranks. It is a disgrace to us that we should have such a class as "roughs;"—it means short-sighted parsimony and criminal neglect. The thousands of children running the streets of London and other places may be very nearly what we choose to make them. Humanity, Christianity, economy, self-interest, are all in favour of rendering them decent members of society. See that every child be awakened to a perception of the difference between good and evil, and receive the elements of knowledge. As the education and the training, so are the children; as the children, so are the men and women.

We stood nearly alone when we urged the Legislature to prevent men from murdering their own flesh and blood by a law against the overcrowding of dwelling-houses; and such a law has since been passed.

In calling upon the State not merely to see that the means of education are placed within the reach of every child, and that all connected with them should be compelled to avail themselves of these or other means, but in the event of this failing to give that education itself,—in fact, for the compulsory education of every child,—we have now with us a large portion of the public and many eminent social reformers. We have no doubt whatever that this will be ultimately done. We want it done at once. The Government that effects it, be it Whig or Tory, will deserve and have the never-dying gratitude of England in the future. Children are the sacred trust of the State. Improve the homes and teach the children, and we shall soon cease to have "roughs;"—soon lessen the number of the dangerous classes. We urge upon all interested in this holy cause the immediate necessity of renewed and continuous exertion:—

"Fail not for sorrow, falter not for sin,
But onward, upward, 'till the goal ye win."

* "London Shadows," by Geo. Godwin.

ENGINEERING AND AGRICULTURE.

The violent reaction brought about by the entire loss of confidence of the public in enterprises of every description, owing to the collapse of numerous rotten schemes brought out by speculators, after the passing of the Limited Liability Act, has resulted in a very anomalous state of affairs. With money at an unprecedented low rate of interest there is no appearance of activity in any of those channels which have, during the present century, employed to such a great extent one division of the professional talents of the country, and which have absorbed the investments of the people to an amount almost equal to the national debt. The railway system having extended itself to nearly every part of the island, and every town of importance being put in communication with the great centres of commerce, can no longer be expected to find sufficient employment for the great body of engineers who have been called into existence by the necessities of the construction of the various lines; and, although there yet remains a vast quantity of useful work to be done in that direction; in sawing some of our towns; in providing others with an adequate supply of water; in the construction of docks and harbours, and other similar undertakings; yet the engineering world cannot look forward to the same active times as those which have gone by, until some genius,—some other Watt or Stephenson,—shall arise and change the whole method of locomotion, causing railways to retire and keep company with the old turnpike roads of the past.

Engineering talent having, by the extension of railways, given such a surprising impetus to trade and manufactures, and so found employment for thousands of hands, which otherwise would not have been required, tending to a vast and annual increase in the population, may he said to be morally bound to do all that lies in its power to assist in providing for the maintenance of the growing numbers. While the population of the island is annually increasing at the rate of many thousands, the area of ground remains the same, and cannot be increased; and unless other means are taken, there is no remedy but to become more and more dependent on foreigners for our supplies, and to cripple our resources by sending capital out of the country in exchange for food, instead of keeping it at home to be employed in the more profitable cultivation of our own lands. It is obvious that every extra unit of useful produce we can compel from our soil, by availing ourselves of the resources of nature and art, is so much clear and actual addition to the wealth of the country; and although the island cannot be increased in size, yet a very considerable portion of it may be made to yield a large addition to its present produce, and much which is now utterly barren be turned into fruitful land.

Here then is an opening for unemployed engineering and mechanical talent, and an outlet for investments which would yield a sure and certain return to the investor, and be productive of a national benefit in its results.

The more prominent improvements in the cultivation of the soil which may be said to come within the scope of the engineer include drainage, irrigation, embankments, and steam cultivation.

Since the days when Elkington first introduced the modern system of drainage, it has made such way that prejudice has vanished, and there probably does not exist the farmer who is not convinced of the desirability of drainage for his land: the only cause to be assigned for so many thousands of acres yet remaining undrained is the want of spirit or capital on the part of the proprietors or their tenants. But, although much has been done, a great deal of it has been done very badly, and to little purpose. The necessity and advantage of drainage, having once thoroughly permeated the agricultural mind, through the unceasing efforts of the engineers who took up this department of their profession, and whose skillfully designed and executed works paid so well for the outlay, has, in proportion to the difficulty which was at first encountered in convincing the farmer of its utility, led to the idea that draining can be carried out without the aid of skill and experience. The services, therefore, of the drainage engineer are dispensed with; and the tiles being laid in the ground, the field is considered as drained,—only in many cases for the unfortunate occupier to discover that his work has done him more harm than good. There is hardly a land-agent or surveyor who could not

tell of numerous absurd mistakes, and large sums of money which have been thus wasted by tenants who have executed their own drainage, the landlords having provided the material, and thus wasted his own and their money. There ought not to be an acre of land in the country which is not properly drained, and it is to the interest of every proprietor that he should himself undertake this work. The want of capital need be no obstacle, special legislation having provided for this, and companies being in existence who will advance the funds required, whatever the title of the occupier to the land.

The arterial drainage of the country may also well deserve the attention of the engineer. Here is a fine field open for the exercise of talent and ingenuity by improving and straightening the natural hrooks and watercourses, cutting fresh channels, and training the outfalls of rivers through their estuaries to the sea. Perhaps there cannot be found now in this island a tract of land in the same condition as the fens of Lincolnshire and Cambridgeshire, where 600,000 acres of land have been converted by drainings from a swamp and a morass into one of the richest tracts of land in the kingdom,—a work which called forth the energies, at one time or another, of nearly all our great engineers. Old Rennie and his son Sir John have left their mark everywhere in these fens, in the canal-like drains, with their massive sea-sluices, and in the works carried out for the improvement of the great fen rivers, the Ouse, the Nene, and the Witham. Vermayden, Smeaton, Telford, Mylne, Cubitt, Walker, Brunel, and others equally celebrated, have at various times been employed; and although still there is work in the fens for the engineer, yet its present state is an example of what may be accomplished in draining flat districts, and rendering efficient the whole interior drainage by the improvement of the outfall of a river. There are thousands of acres of bogs and low lands in England equally capable of improvement as these fens, and only waiting the aid of the engineer and the capitalist to turn them into corn-fields and pastures.

But, while it is necessary to good cultivation that nature should be aided in her operations by the skill of the engineer in removing the surplus water which falls on the land from the clouds, or rises from underground springs, advantage may be found in bringing on to the very field which has just been drained a copious supply of water from a neighbouring brook or watercourse, and either inundating the field in order that it may take up the fertilising matter contained in the water, or simply refreshing the parched soil by allowing the water to flow in certain regulated streams across it.

Irrigation is of more importance to tropical lands than to a climate like England. In the former cultivation could not be carried on without it; and talent and ingenuity of the highest order have been called forth in designing the vast works which are to be found in those countries. The frightful famine which recently occurred in India has stirred up the attention of the Government to this all-important subject; and for the execution of contemplated works, they require at this time the services of an increased staff of engineers. In Spain, again, from the earliest recorded times, irrigation has been practised. Even now, large works are being carried out, the result of those already completed being to turn a barren, desert land, into fruitful gardens and fields. The engineer engaged in these works in Spain is looked upon by the peasantry as a public benefactor, and when surveying for a new canal, will receive the greatest courtesy and assistance from the occupiers of the land over which he has to pass. It is unnecessary to refer to the irrigation works in Italy; they are too celebrated to require comment. Although the English climate and soil may not yield such startling results as are found in the countries already enumerated, yet we have sufficient proof that even in this country there remains a wide field for the skill of the engineer in improving the grass lands of the country by irrigation. In Devonshire water meadows have been in existence for a great length of time; and wherever in other parts of England similar works have been judiciously carried out, most successful results have ensued. By the diversion of part of the waters from a natural stream, and the application of it to poor grass land, at an expenditure of a very small sum per acre, the land may be made to yield heavy and abundant crops, which will pay tenfold the interest on the outlay. The sewage of some towns has also been successfully applied to the land by irriga-

tion with surprising results; but whether this is the most serviceable mode of utilizing the sewage of towns is a question which has yet to be settled by experience. The attempt to convert a barren tract of sands into productive lands by the application of the sewage of London, which formerly was worse than wasted by polluting the great river of the metropolis, is an attempt worthy of all success, and a method of irrigation which, if it answers the expectations of its promoters, ought undoubtedly to lead to its imitation on every part of the coast where there are sands available for the purpose. The enormous tract of barren land of which Aldershott and Bagshot Heath form a part, lying in the heart of England and so close to its capital, which by irrigation might be rendered productive, is a disgrace to the intelligence of the country, and affords an opening for any enterprising capitalist and engineer.

Besides the improvement to lands already in cultivation, there are other sources to which the attention of the engineers might be directed. Around our coasts are many thousands of acres of accreted lands, which are now covered by the tides, but which, if embanked, would form rich corn land. On some parts of the East Coast, the land thus available for reclamation is from one to three miles in depth, the greater part of which is covered with coarse marina grasses or samphire, and which, with an expenditure of ten to twenty pounds an acre, could be enclosed, and would, when reclaimed, grow annually on every acre sufficient corn to keep at least one family, and pay ample interest on the outlay. The Roman engineers, during their occupation of the island, saw at once the value of this land, and the embankments thrown up by them to exclude the sea, on the south and east coasts, remain to this day a monument to their skill and perseverance. The reclamations on the Lincolnshire coast, of the large Crown estate at Sunk Island on the Humber; and in the counties of Essex, Hampshire, and Devonshire; on the estuary of the Dea; and more recently those made by the Norfolk Estuary Company; added to the numerous in-takes which are continually being made by private proprietors, show the feasibility of this work, and ought to raise a feeling of regret at the national loss which is being incurred in not availing ourselves of this land for growing corn, which now has to be fetched from Russia or America, the very cost of the freight of which alone would pay for the necessary works of enclosure. When the Romans formed the old embankments, they made their criminals work under the supervision of the military engineers, and their soldiers were also employed at these and other engineering operations. This example might well be imitated by our own Government. Work would be beneficial to the soldier, as has been urged before in these pages, and the gain to the country enormous.

Thus for the civil engineer, then, there is ample room for employment in the improvement of the productive resources of the country, in works of drainage, irrigation, and embankment. To the mechanical engineer there remains the improvement which may be effected in the various mechanical appliances which are used in the cultivation of the soil, and principally in the application of steam. Farming becomes yearly more and more of a science, and depends on machinery to a very considerable extent for its successful working. The machines used on a farm are endless, and their manufacture is a most important branch of our national industry. The several eminent firms of agricultural implement makers have displayed ingenuity and talent of the highest order, and give employment to an immense number of skilled hands. The Irishman who comes over annually with his sickle to help to reap our crops, finds each year less to do, and sees that his services are being gradually superseded by the reaping-machine; the flail had to give place to the thrashing-machine worked by horses, which only performed the same operation in a more expeditious manner. The horse has given way to steam; and now the motive power, taking its own machinery and appliances from farm to farm, at one operation thrashes the corn, stacks the straw, dresses the seed, and then retires, leaving the farmer nothing to do but to carry his corn to market; and how long it will be before the four horses dragging the wagon-load of corn slowly along the highway, will be superseded by the traction engine, who can tell? It is the manufacture of the machinery which will assist in cultivating the soil, and increasing the produce of the land which is now more especially

to be considered. Numerous inventions have been brought out for digging the soil, and otherwise manipulating it; but the perfection of the steam-plough, or cultivator, appears to be the great desideratum. So far back as the year 1618, a patent was granted to David Ramsey and Thomas Wildgosse, for "kinds of engines and other profitable inventions, as well to plough up ground without horses and oxen;" and from this time forward nearly every year produced some new invention for either digging or ploughing by machinery, until the commencement of the present century, when steam was applied to this purpose, a patent being taken out in 1816, by Joseph Reynolds, for "ploughs and other implements used in husbandry to be moved by steam, heated air, or vapours." In 1837, another patent was granted to Upton for "an improved method of generating steam power, and applying the same to ploughing and harrowing and other agricultural purposes." These and many subsequent inventions, however unprofitable to the patentees, formed links in the chain that led up to the comparatively perfect machines of the present day. The really successful application of steam to the cultivation of the land may be said to date from the show of the Royal Agricultural Society, held at Lincoln, in the year 1854, when Mr. Fowler exhibited his steam draining apparatus; the idea being suggested by a practical farmer, Mr. Smith, of Woolston, that this machinery might be applied to the cultivation of the land. Slowly, but steadily, steam ploughing is making its way: Messrs. Howards claim to have made and sold in England and the colonies upwards of 500 sets of machinery; and Messrs. Fowler, in their circulars, give references to 300 persons or companies who express their satisfaction with the apparatus which that firm had supplied to them. The manufacture of the supply for our own and foreign countries, Egypt deserving especial mention, has given sufficient impetus to the trade to render it a distinct branch of engineering.

The systems now generally adopted may be divided into two classes, the "roundabout" and the "direct;" the former, the method generally known as Howards'; and the latter, Fowler's.

Howard's system is generally considered most suitable for small enclosures. The method adopted is to place the engine in one corner of the field, and to surround it with an endless rope, stayed at the corners by anchors. To this rope the plough or cultivator is attached, and attendance is required to move the anchors and other parts of the machinery as the work goes on. One objection urged against this system is the waste of power in moving the great length of rope required, and the wear and tear of the same, an expensive item in steam ploughing. Fowler's plan is to place a traction engine on one headland, the rope running from that to a drum attached to a self-acting moveable anchor placed at the other side of the field, the plough being made to traverse backwards and forwards between the two. Where the work is carried on to any great extent, so as to warrant the additional outlay, as in the case of the steam ploughing companies, the drum and anchor are replaced by a second engine, the two engines alternately dragging the plough towards them, and uncoiling the slack rope. The engines employed are about 12-horse power. Beneath the boiler there is a large horizontal sheave or drum, 5 ft. in diameter, round which the rope is coiled. The plough or cultivator is a framework of iron balanced upon two large wheels. To each end of this framework are attached from four to six ploughshares, or cultivating tines; on reaching the end of the furrow, the part of the framework which was balanced is depressed, the other being raised, and the shares which were out of the ground, and which point in the opposite direction, are inserted in the soil and turn up the furrows on the way back to the other engine. To manage the apparatus three men are required,—two to drive the engines and one to guide the plough. The rate of speed is from three miles to three miles and a half an hour, and the quantity of work done in a day by the cultivator, under favourable circumstances, about ten acres. The cost of a single set of apparatus, with engine, self-moving anchor, ploughs, and scarifiers, may be put at 800*l*.

In the early days of steam cultivation, one of the greatest difficulties was found to be in connection with the rope. One inventor tried chains, which, as may be supposed, from their weight and other mechanical objections, were found to be impracticable. Hemp rope could neither

stand the strain nor the wear and tear over the ground, notwithstanding the aid of "porters" and other contrivances. Wire rope, although more durable, was found to be very expensive, owing to the frequent breakages. The great improvement which has been made of late years in the manufacture of steel has enabled that metal to be applied as a material for the purpose. The rope now used contains twenty-four steel wires, about one-twelfth of an inch in diameter, and of such wonderful strength and pliability is the steel that each of these wires, although it takes one hundred and seventy-six of them to form a section of 1 square inch, will bear a pull of upwards of a ton; and yet, although this wire is so stiff as hardly to be bent by the fingers, yet when force is applied it may be twisted round in a coil sufficiently small for all practical purposes. These ropes are at once tough, pliable, and enduring, very little liable to break, and, when broken, easily repaired. To this ingenious and marvellous invention, steam cultivation, in its present form, in a great measure owes its success.

The advantages of steam cultivation may be summed up as follows:—It enables the farmer to perform his tillage operations at the best season of the year, and to free his land more quickly and effectually from weeds. Tenacious soils are rendered more friable and porous, and good drainage promoted by the efficient manner in which the subsoil can be stirred by the aid of steam. The steam cultivator can be worked to advantage in an unfavourable season when it would be impossible to work with horses, and considering the depth to which the soil is stirred and the expedition with which the work is executed, it can be performed as cheaply as horse labour.

Numerous able writers in the *Times* and other public journals have, this year, testified to the advantage to be gained by steam cultivation. Mr. Bailey Denton, in an able letter, gives one very striking example of a farm at Blackheath, where three adjacent fields had been differently treated. The first, land not naturally fertile, being drained and steam cultivated, had a crop on it equal to forty-five bushels of wheat per acre, worth 18*l*. The second had been drained and treated in all respects similar to No. 1, with the exception of the ploughing, which had been done with horses. The yield was estimated at thirty bushels, worth 12*l*. per acre. The third field of similar land, but neither drained nor steam cultivated, had not more than twenty bushels, worth 8*l*. per acre. The difference here shown between steam and horse cultivation being 6*l*. per acre. Mr. Smith, of Woolston, who speaks with the authority of experience, having used steam for twelve years, gives, in a letter to the *Times*, some striking illustrations of its advantages, and the increased results obtained from the land by its use. At the time of writing his letter his steam cultivator was at work, following closely on the teams leading the corn out of the fields, smashing up the stubbles at a time when the horses on the farm were otherwise occupied, and at a rate which no amount of horseflesh, which a farmer could profitably keep, could accomplish; thus giving the land the benefit of a summer fallow in scorching and killing the weeds. To quote his own words: "I have looked round in all directions and can see more than a usual quantity of dead fallows, and no end of land in a state that will cost vast sums of money to clean it. Yes, and I can look over the hedge on to the best farmed land in the neighbourhood and see more twich on a square yard of land than there is to be found all over my farm. Such are the results of steam and horse farming after wet seasons."

The first outlay for machinery is no doubt heavy, but taking Mr. Denton's statement as correct, that a gain of 6*l*. per acre may be secured by steam cultivation, and the statement is borne out by the report of the Committee of the Royal Agricultural Society, who quote similar statistics, on a farm having 140 acres in wheat the cost of the apparatus would be gained in the first year, including the price of the engine, which would be useful for other purposes.

Here, then, is an opening for enterprise and the profitable employment of some of the redundant money now in the market. It has been calculated that every 2,000 acres of cultivated land could find work for a steam-plough; and as encouragement, it may be mentioned that the companies which have been already established are rapidly making progress. From personal experience it can be stated that some of them have full employment nearly all the year round,

and at times have more orders than they can execute. To the engineer an inducement is held out for the employment of his talents in the manufacture and perfecting of the machinery; to the capitalist, for a safe and steady investment of his money; to the farmer, from the increased profit from his land; and to the philanthropist, from the increased supplies thus produced for the food of the people and the addition to the national resources. W. H. W.

LIVING AND DYING IN THE THIRD QUARTER OF 1867.

CONSIDERING how short a time has elapsed since all statistics were voted a bore, and statistics of births and deaths the "flattest, stalest, and most unprofitable" of all statistics, it is, at any rate, a most healthy sign to find that many subjects, which can only be treated of through statistics, are at last beginning to assert in public interest that places which it is of such real importance they should hold. The Public Health is one of these subjects. There is no social problem to the solution of which it is more decidedly the duty of us all to lend our aid than the reduction to a minimum of the unnatural waste of life that has been for years going on around us, in town and country, through ignorance and neglect of the simplest sanitary laws. "Cleanliness," it has been said, "is next to godliness." Using the word cleanliness in its largest sense, only those who have seen the disease and misery in some of the worst parts of our unhealthy towns can fully appreciate the force of this axiom and its arithmetical. But the public does now, we are convinced, take an interest in its health, and an honest rivalry has been established between towns, with regard to their death-rates, which has already, it would seem, resulted in increased sanitary activity all over the country.

We have before us the Registrar-General's Quarterly Return for the third quarter of 1867, and the insight it gives us into the vital condition of the country is, on the whole, encouraging, both as to past months and the future prospects of the sanitary measures which have been, and are being every day adopted, in both town and country, for the improvement of public health.

During the past quarter the excess of births over deaths in England and Wales was 81,793, averaging very nearly 900 per day. In the corresponding quarter of last year the excess was only 62,156. This result has been as much due to the increase of births as to the decrease of deaths. The births were at the annual rate of 35·2 per 1,000, a rate unprecedented in the third quarter of the year. The deaths registered in the quarter were 108,462, giving an annual rate of 20·1 per 1,000, against 21·8 in the corresponding quarter of 1866, and 20·3 in the average rate in the corresponding quarters of 1857-66. Only twice in the eleven years 1857-67 has the death-rate in the third quarter of the year been lower than it was in the quarter just ended; in 1860 and 1862, when it was 17·2 and 18·0 respectively. The weather during the past quarter was, on the whole, favourable to health. The mean temperature at the Royal Observatory, Greenwich, was 59·7, agreeing almost identically with the average of the corresponding quarter of ninety-six years. The rainfall in the quarter was 11·3 in., and nearly 4 in. above the average of the same period in fifty-two years. Of this rainfall so much as 3½ in. fell during the twenty-four hours of 25th July: this fall is almost unprecedented for England. There was scarcely any really hot weather during the summer, and the rain was abundant: the combination of these two circumstances, it will be found in comparing a long series of summer quarters, almost invariably produces a low death-rate. The remarkably cold and wet summer of 1860 was the healthiest of England and

Wales, containing at the last census about 11,000,000 persons, the death-rate last quarter was 22·4 per 1,000, or 2·8 below that which prevailed in the same period of 1866, and slightly below the average of the ten previous corresponding quarters. In the remaining or rural population, amounting, in 1861, to rather more than 9,000,000, the rate of mortality was 17·0 per 1,000, or only 5 below both the rate in the same quarter of last year and the average of the past ten years. It will thus be seen, therefore, that the principal improvement in the public health during last quarter was shown in towns.

This must be attributed in a great measure to the epidemic of cholera, which last year un-naturally raised the death-rate; but, as we shall find, the improvement was also conspicuous in many of the towns which did not suffer from cholera last year. It will be useful to examine a little in detail the figures relating to those ten large towns of England for which weekly returns are published by the Registrar-general, both because the condition of these towns and the measures which have recently been adopted for their sanitary improvement, or which have been neglected, as the case may be, are pretty generally known, and because the means of comparison with previous years is ready to hand.

These ten towns, including London, are estimated to contain at the present time a population of rather more than 6,000,000. In these towns the excess of births over deaths in the quarter was over 17,000, and the birth-rate equal to 36·8 per 1,000, against 35·2, the general rate in the whole of England and Wales. The death-rate in the ten towns was 23·8, or 3·7 above the rate for the whole country, and 1·4 above the rate in the entire town population above mentioned. Although in some of the smaller towns no doubt great sanitary shortcomings exist, we may feel sure that in these ten towns are included most of those which have in past years principally contributed to the excessive death-rates in towns.

In the following list these ten towns are arranged in the order of their rates of mortality during last quarter, from the lowest, and against each town appear the death-rates per 1,000 prevailing in the third quarter of each of the years 1865, 1866, and 1867. Returns from Sheffield and Newcastle-upon-Tyne were, however, not published in 1865—

	1865.	1866.	1867.
Bristol.....	20·4	20·8	19·2
London.....	21·9	28·9	20·7
Sheffield.....	—	24·0	23·8
Birmingham.....	23·5	19·2	25·8
Full.....	30·3	22·4	35·9
Salford.....	29·7	20·3	28·4
Liverpool.....	33·7	60·5	28·5
Leeds.....	31·7	31·9	28·7
Newcastle.....	—	31·6	29·5
Manchester.....	32·9	30·6	31·6

As the figures for last year were somewhat disturbed by the epidemic of cholera in many of the towns, a reference to those for 1865 materially assists in arriving at just conclusions as to the improvement which appears in some of the towns, and the conspicuous absence of it in others.

Take Liverpool and Manchester, for instance. Ignoring the rate for Liverpool last year, the rate has declined from 33·7 in 1865 to 28·5 this past quarter. In Manchester the rate may be said to have remained stationary. It is well known that the Liverpool Corporation has, with the aid of their medical officer, resolutely set to work to clean their Angren stable. It is as equally well known that, in Manchester, they have not yet made that first great step which is an earnest of sincerity in such measures,—they have not yet appointed a medical officer of health, though the step is determined on. Leeds forms a good example of sanitary progress. In 1865 and 1866 the rate was almost stationary, although no cholera appeared in the latter year; but, since the appointment of the present medical officer, the fatality from fever and other zymotic diseases has continually declined, and the death-rate in the borough has fallen from 31·7 in the third quarter of 1865 to 28·5 last quarter. This town, however, still stands low down in the list. Newcastle continues to enjoy an unenviable notoriety for its excessive death-rate. This is another of the towns which is without a medical officer of health. Birmingham, too, presuming, it would appear, upon the comparatively low death-rate which generally prevails there through the natural advantages which the town enjoys, still holds back from the appointment of such an officer. It is to be hoped, however, that the recent mortality in that town from diarrhoea and scarlatina (the latter of which is still fatally prevalent), and the retrogression which is shown in their death-rate for last quarter, will stimulate them to delay no longer. Bristol still occupies the post of honour as the healthiest of our large towns; and it is satisfactory to know that this position is fully appreciated and valued by the inhabitants. It is needless to say that this city has some time possessed the services of one of the most active and efficient of the at present small body of our medical officers of health. Even in Bristol, which enjoyed the

lowest rate in the summer quarter of 1865, the rate has progressively declined from 20·4 to 19·2.

Without looking beyond what has been already achieved in Bristol, it is well to remember how terrible is still the waste of life that is going on in our large towns, compared with the number of deaths which would occur if the death-rate did not exceed 19·2 per 1,000 in our town populations. During last quarter, the saving of life in these ten towns alone would have been 6,063, of which 1,389 would have been in Manchester and Salford. We dare hope, however, that we may look for a still higher standard of health in towns. In many ways, life in town should be more healthy than in the country, and we see that the death-rate in the rural districts last quarter did not exceed 17 per 1,000. Salubrity appears by the present return to have attained a success, in her sanitary system, which but a short time ago would have appeared most wildly visionary; in this town the death-rate was 28 per 1,000 between 1841-50; 24 between 1851-60, and has steadily declined, until in the quarter just ended it has been only 10 per 1,000. This is indeed encouragement, if any be needed, to all those towns still hesitating to adopt sanitary reform, and to incur its necessary expense, from want of faith in the result.

THE EDUCATION OF THE WORKMAN.

The subject of this paper is, perhaps, not generally considered to be one upon which a painter has any right to discourse; but having in early life seen much of those trades of which the products have since been ennobled by the title of art-manufactures, and having devoted considerable time to the teaching of workmen engaged in such artistic occupations, I have very naturally given the education of the workman very earnest study. Moreover, a thorough investigation of the theories of art and education has shown me that their fundamental principles are the same,—that they should be influenced by the same formative idea.

The processes of modelling and of education are very analogous; it is in one case the lifeless clay, in the other the living earth which has to be formed in rectitude; but man can only be effectually remodelled by right reason working from within. The educator, therefore, commences the reformation of plastic humanity, by the rectification of the understanding, in order that the ideal pattern, which he in common with the statuary, keeps steadfastly in view, may ultimately be realised palpating with life.

Each successive International Exhibition has shown that English workmen,—art-workmen especially, require a more complete education than they have hitherto received. The present one, indeed, from all that I can gather from competent observers, has convinced them that some educational measure is imperatively and promptly required,—that British workmen may have a fair chance of successfully competing with their naturally clever allies. All the reforms in technical education which have been made since 1851, would appear to have been mere surface scratching instead of deep ploughing. To produce substantial and lasting results, there must be a radical change in the system of primary education.

You will, perhaps, trace through the lecture a leaning towards my favourite theory of "The Mean," of which the following four laws are the broad exposition:—

1. That the fundamental form of phenomena is quantitative.
2. That the mean is the scientific measure of rectitude and beauty.
3. That every aberration from the mean, either in excess or defect, must be compensated by an equal but opposite one. That any undue expenditure of vitality by one function, or group of functions, must be compensated by inaction in others; or by a system generally, by a period of absolute rest, otherwise organization will be impaired, the fund of vitality unduly drawn upon, and existence shortened.
4. That the lawful limits of departure from the mean are those of moderation, which permit variation in the tenor, half of the scale of possible fluctuation.

This is, I believe, the substance of what science yields towards a system of ethics; and on a former occasion I showed how universally

these principles obtain in the fluctuating phenomena of the entire solar system,—a theory, though perchance it be erroneous, often serves as a ground on which to marshal and parade one's facts; and I hope before I conclude that mine—if I may call it so—leads, at least, to some common-sense conclusions. If I appear to you to be somewhat doctrinaire, I believe you will find that I am also practical; and that I am doctrinaire only because no one can hope to be practically of any great advantage to others unless he be theoretically correct.

The art of education, as I have just now indicated is essentially formative, as essentially so as the arts of design; and I believe human nature to be as plastic to its hand, through periods of time, as the clay to the potter, and that in the plenitude of its mastery over means it will be able to develop whatever manner of man it wills. You will, I think, find, if you examine them, that most of the popular notions upon education have been derived from phrenology; hence tendencies, which appear to me to be only habits of thought and action, are elevated into faculties, and these so numerous that we can scarcely wonder at the anxiety of teachers and parents that our youth shall be cultivated by all the "ologies" that can be mustered. Let us, if possible, dismiss this notion for the present, and trace the natural order or sequence of our knowledge. Facts are first received by the outpost, observant senses; secondly, they are registered by the memory; thirdly, they are ordered, systematised, and utilised by reason; or, to describe the process by a lower analogy, there are the receptive, the retaining, and digestive processes. Now, it is no matter what kind of phenomenal knowledge it is, but it must pass through either the first, the second, or all these stages; and I should desire you to be impressed with this very natural inference,—viz, that if the senses be not correct observers, we can neither expect facts to be correctly remembered, nor just conclusions drawn from them. You will therefore be prepared for my return to this portion of my subject, and insisting upon the proper training of the senses. These three powers or faculties, observation, memory, and reason, should be of an equally apportioned excellence. For if the power of observation be cultivated to the neglect of the retaining and reasoning faculties, there will be a clinging to mere facts and minutiae, a too facile credulity, disconnected thought, uncertain and inconsistent action. If memory be cultivated to excess and hardened with encyclopedial information to the detriment of the observing and reasoning faculties, there will be loquacity on all subjects, and a facile dispensing of second-hand knowledge; but should originality be attempted by this conformation of intellect, the data will probably be incorrect, its conclusions false. If the reasoning faculty be unduly stimulated and the powers of memory and observation allowed to be dormant, it will be at fault in its premises, fruitful in reckless hypotheses, systematically wrong. The moral form or right constitution of these three functions, then, is when they are duly proportioned to each other, and which when thus constituted may be said to have the perfect capacity for investigating nature, for confirming or discovering truth, for receiving and communicating knowledge. Lord Macaulay says, when writing of the men of a certain eventful period of our history,—"The constitution of their mind was remarkably sound. No particular faculty was pre-eminently developed, but manly health and vigour were equally diffused through the whole." Or, as Shakespeare would have written,—"The elements were so mixed in them that nature might stand up and say, These were man!" Now, this equable development, these mixed elements, are precisely those moderate qualities indicated in the middle column of the following table; they are those, indeed, of the ideal man, whom a true system of education keeps steadfastly in view as its "pattern." It is that average or essential manhood divested of all the accidents of eccentricity, of aberration. Yet we may very frequently find the average man jauntily asked for, as if he were a common and very easily to met with creature, ready to answer and flock to advertisement by the thousand. Why, it is this manner of man, "in whom no particular faculty is pre-eminently developed," but the whole manhood, who has been at all times the true reformer and deliverer. He, of all men, is least likely to damage or wreck a good cause. It is because society is a conglomerate of disproportioned materials that the

State has to assume his functions, to harmonise and balance the whole.

TABLE OF MEAN AND EXTREME QUALITIES.

Excess—Immoral, Destructive.	Mean.—Moral, Constructive.	Defect.—Immoral, Destructive.
Fastidious Hesitant Humble Incontinent Irascible Lascivious Overbearing Pretentious Reckless Selfish Unpleasant Unpleasant Unpleasant	Mainly Courageous Prudent Liberal Wit Good-tempered Good-humoured Temperate Free Magnanimous Confidence	Clownish Timid Over-cautious Parasituous Dullard Immobile Austere Obstinate Morose Narrow-spirited False modesty
Predisposition to Disease.	Health.	Predisposition to Disease.
Excessive exercise Immoral use of function Deformed organization Shortened existence	Moderate exercise Moral use of function Moral organization Long life	Defective exercise Immoral misuse of function Deformed organization Shortened existence
Deformity.	Beauty.	Deformity.
Giant Gross forms and features Disproportion	Average height Average forms and features Average proportions, the beautiful or moral form	Dwarf Defective forms and features Disproportion

You will perceive, then, that the theory I am advocating is in direct opposition to the popular notion of cultivating and still further developing the strongest natural bias of a youth. Only attempt to carry out this notion thoroughly and consistently, and you will be convinced of its immorality. The strongest natural bias is always impatient of bit and curb; but give it head and spur, and it clean bolts with a man. The true object of education should be, on the contrary, to strengthen those qualities which may be defective and undeveloped. Both the intellect and the physique draw upon a common fund of vitality, the prodigal expenditure of which by either disturbs the desirable balance of the system. And not only is this the case as regards the general equipoise of mind and body, but by the extravagant use of any particular functional power of either. In fact, any disproportionate organization and activity in any portion of our natures destroy the just temper and harmony of their well-being. Having thus briefly given you my theoretical views upon the subject of education, I turn to the practical suggestions, which I believe, will be found perfectly consistent with them, and which, if the theory be rejected, may be judged of separately, as measures designed to improve the education of the workman and raise the quality of British workmanship.

Preserving the ideal of a well-balanced manhood before us, it will be seen to be of the utmost importance that the studies essentially necessary to its development should be separated from those which may be mere amplifications, specialities, or superfluities. These would appear to be,—1. The English language; 2. Ethics; 3. Arithmetic and Geometry; 4. Drawing; 5. Music; 6. Athletics. This was the course of training to be pursued in the primary schools which I proposed should be established throughout the country in a pamphlet which I published in 1851. Let me give the reasons for the foregoing selection. Those for the study of English and ethics are obvious. I will merely observe with reference to ethics that I use this word as a general title for religious instruction. For my own part, however, I lean to a rigorously secular system which would permit the study of scientific ethics only, or leave moral training to home direction. The studies of arithmetic and geometry are included, not for their more obvious utility alone, but also on account of the logical training they furnish. Nos. 5 and 6 in our list are drawing and music; of these studies I have more to say, having just now, as you will perhaps recollect, drawn your attention to the importance of educating the senses. Let us bear in mind, that through the eye and the ear we chiefly bear witness to what is passing in the world; and teachers of drawing and music only know, to the full extent, what false witnesses these senses are before they are properly cultivated. Let it not be forgotten, too, that it is upon these generally uncultivated senses that character and life are frequently at stake. The desire to obey the command,—“Thou shalt not bear false witness,”—may

sometimes be strengthened, but evidence cannot be guaranteed upon oath. If a witness be an imperfect observer by eye or ear,—and such he commonly is,—in default of the educational training we insist upon, he will conscientiously swear to the absolute truth of his erroneous impressions. I have on several occasions pointed this moral in teaching. “If,” I have said, “you misapprehend the truth with regard to the model immediately before you, and bidding your time for deliberate inspection, how can you expect to observe, and accurately record the fleeting facts and occurrences of every-day life?” It is not, however, in the witness-box only, that trained senses are required, but for the appreciation of harmony and beauty in nature, to preside watchfully over all kinds of work, and to endow the manufacturer of a nation with that permanent excellence which will insure their appreciation throughout the civilized world. I am speaking now more immediately of the education of the eye. I will venture to say that you would find that painters and sculptors would be more readily inducted to the exercise of any craft, could more readily turn their hands to any kind of work, than any other class of the community; and why? not only because their arts require the greatest dexterity of hand, but because they see better.

There is a certain affinity between all true work, be it of art or manufacture. The system I propose I believe to be the only true way to produce a nation of unrivalled workmen; depend upon it all the study of the physical sciences in schools, now so much insisted on, will never effect that. The study of the sciences promotes invention, extends our command over means, but does not materially and directly contribute to the development of the student's nature. And when I propose a course of study of drawing and music in these schools, I do not mean that drawing is to be practised in inconvenient and ill-lighted class-rooms, furnished with a coat or two and a few flat copies, for an hour or two in the course of the week, but that the class-room be properly designed for the purpose, well found, and that a fair share of every day's time be devoted to the study. I cannot so well speak of what is required for the proper study of music, but I would have the arrangement as thorough and complete. As the localities which would be fitting for the establishment of these schools for the workmen's children would very probably be also convenient for the workman, I would have these school studios, or others in close proximity with them, open to him in the evening, classes established for the study of the sciences, &c. Think of the effect such measures would produce upon manufacturing skill; what new and healthful sources of pleasure they would open to the workman, and how they would contribute to raise the whole status of art in the country; for as the toe of the mechanic “gibed” the heel of the artist, he, too, would have to move forward.

The last subject enumerated in our scheme of primary schools was physical training; but of this presently. The system proposed, therefore, provides for the appropriate expression of ideas by the study of English; for correct observation and the appreciation of beauty and harmony by the studies of drawing and music; for the exercise of right reason by the mathematics; and for the moral and physical health by ethics and athletics. If, then, this course of training be sufficient to educate the essential qualities of manhood, it is the fundamental system on which any extension of study in the direction of science and languages might be superimposed. The man is intellectually potent when he is able to observe, remember, and reason rightly. The formative system, I think, commends itself by its simplicity, and simplification in education is of the utmost importance to the workman; for his children cannot drone at school through long periods of time, and require, more than those of any other class, that the time which can be devoted to schooling shall not be wasted on what is not immediately necessary or what is inessential. General knowledge could afterwards be obtained and superadded in this and similar institutions. The scope of the local Schools of Design could easily be widened so as to embrace the larger plan proposed, and the new buildings about to be erected here* are arranged in a way which would favour the establishment of a school such as I have proposed.

I will now return to the subject of physical exercise. In most crafts this is amply provided

for the workman by the occupation itself, but not always of a kind calculated to improve the symmetry of the human frame. The subject on this account is one of great importance to the workman. There are some employments necessitating some particular list of the body, cramped position, &c., which are prejudicial to form and health, and which if it be not possible to mitigate by mechanical contrivance might be counteracted by judicious athletic training. And not only on this account, but that we have all to recollect that in the present state of the world true men must be militant; for we know not if the work of progress and the institutions most dear to us may be forcibly assailed; and if they be not, and the world move forward in the tenor of reason, we shall learn that symmetry of form is an index of a really progressing, healthy, and noble people. For however opposed it may appear to commonly accepted notions, rectitude of life does restore and preserve the beauty of a people: it may be a slow, but it is a sure and certain result. Great changes in the organization and form of living beings can only be gradually effected. If the deformation of nature be not the result of erratic action, what is its cause? The consequences of the irregular and careless treatment of machinery are well known. How much more, then, are the wonderfully delicate structures of living organisms affected by ill treatment? A variety of causes tend to shake the nerves, dwarf the bodies, deform the limbs, and distort the features in the present competitive haste of life, so fraught with mischief, morbid ambition, highly wrought nerves, unhealthy occupations, vice; and we may be certain that social disorganization will gradually increase till a higher and healthier purpose than the mere attainment of the power of wealth, supervene, and produce remedial reaction. We all know that physical exercise has long been considered an important branch of education by the founders of the Working Men's College; to them, indeed, I believe we may attribute the present popular recognition of the value of athletic sports, but as the new hobby is now in danger of being ridden to ridiculous excess, I venture to offer a few remarks in reference to its scientific direction. If the mean be accepted as the scientific measure of that stature and fullness, of that perfection of the human form, which has neither excess nor defect, of that ideal to which men are to gradually go on, and grow up unto, by the moral or just use of every function of their being, of that pristine symmetry which has been marred by error, and which is only likely to be restored by mind dominating body;—I say, if we accept this measure of rectitude, there will be no danger of muscularity being over-developed for the sake of being stronger in mischief, or for those purposes which had so long prejudiced and degraded athletics in the eyes of the public. In the exercise of the body this great law of formative ethics should be remembered, viz., that as vitality is a fixed quantity, no one faculty, or group of faculties, can be excessively exercised or developed, but at the expense of others; prodigious mental exercise at the expense of the body, great muscular effort by diminution of power of thought; and if the vital power be unduly and continuously directed to either of these purposes, abnormal deformation and disproportion ensue. The danger that has to be guarded against in the institution of athletic sports is, lest the true object of education be lost sight of, and an excessive development of them and sinew be educed, instead of that *moral form*, in which all the faculties are co-ordinated, and from which any departure implies deformity and predisposition to disease. Rewards, in my opinion, should never be offered for excessive feats of strength, but for general capacity of mind and body. I believe, if it were practicable, that it would be of greater advantage to human progress, to crown perfect form, than feats of strength. The Greeks, who of all people, perhaps, best understood the training of men, and consequently those proportions in which beauty of form inhere, had intellectual as well as physical development in view in the institution of their Olympic Games, which had a dignity of purpose wanting to the Roman amphitheatre, in which men, brutalized by strength, contended with brutes. The foregoing operations are perhaps, the more necessary, because some of the recently-established athletic associations have adopted the device of a figure of the Farnese Hercules, with the legend, *Mens sana in corpore sano*. Now this antique statue is an embodiment, as painters well know, of muscular

* The Working Men's College, where this paper was read.

excess, a mountain of physical strength capped by a weak summit. Such an embodiment is wide of the mark demonstrated to be the standard of manly beauty, in which all the faculties of mind and body are duly apportioned. The *mens sana* would be impossible in an incarnation of the Hercules; such a being, from his mental immobility, would only be useful as a club-bearer or porter. This device of the Hercules shows that the true objects of muscular training are not yet popularly understood. It has been raised as an objection to the formative theory that the power of remoulding human nature is very limited; but we all know that very great changes in the human form can be effected in the wrong direction, let us try if as much cannot be done in the right. We also know what changes knowledge can effect in other forms of being over which man exercises greater control. The true intellectual and physical conformation of man is, doubtless, the increasing purpose which, as Tennyson expresses it, is widening with the process of the suns. Let us give our energies to it, without minding how long it will take to accomplish. It takes a long time to learn how to be, and to be men. You may, perhaps, think this lecture has been less special than its title promised. But are we not all workmen who must set before ourselves the self-same ideal, and keep it steadfastly in view? To be men, I take it, is alike the ambition of the artisan and the peer.

If you think I have anywhere expressed myself too authoritatively and positively, set it down to the earnestness of conviction. I know you would rather forgive me for being a little too positive than for not being in earnest.

W. CAVE THOMAS.

ASSOCIATED ARTS' INSTITUTE.

We have before us the programme of the current session of this society, showing that several very interesting papers are promised, and we would take advantage of the opportunity afforded to draw attention to the existence of a society which offers considerable advantages in its bringing together the younger members of the three professions of architect, sculptor, and painter, and affording them an opportunity of yielding one another that mutual assistance and co-operation which history has shown us to be necessary for the production of true artistic works. The "Associated Arts Institute" meets at the House in Conduit-street on Saturday evening. The society now numbers 120 members, and Professor Westmacott, R.A., is its president. The essays or papers read are short, and a discussion on them afterwards is one of the more important objects held in view by the founders of the society. The subjects given for sketches are so selected that it be possible for any member, whether painter, sculptor, or architect, to contribute designs. There is also a class of honorary members, who are either amateurs or non-residents in town. We are disposed to think that such a society offers considerable advantages, and that publicity only is required to induce young students to enrol themselves as members.

OPENING MEETING OF ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE opening meeting of the new session of the Institute took place at the House, in Conduit-street, on Monday evening last, Mr. Charles Barry, one of the vice-presidents, in the chair.

The Chairman, in terms of regret, announced the obituary of Fellows and Associates deceased since the close of the last session, in June last. Chevalier Heinrich Ferstel, Professor the Chevalier Friedrich Schmidt, and Herr Carl Hassenan, eminent architects of Vienna, were elected by acclamation honorary and corresponding members of the Institute, their claims to that distinction having been stated by Professor Donaldson, the hon. secretary for foreign correspondence. Mr. Godwin referred to the Chevalier Ferstel and Chevalier Schmidt, from his own knowledge, as having played an important part in bringing about the present condition of ecclesiastical architecture in Germany, in conjunction with Herr Vincent Stutz, who was already on the list of foreign honorary members. He regarded this as a well-merited distinction to those gentlemen.

Professor Donaldson announced the liberal

donation of 100l. by the president, Mr. Tite, M.P., towards furnishing the library of the Institute with architectural works,—more especially those of foreign authors of great value, which it does not at present possess, and a special vote of thanks for the same was accorded to Mr. Tite.

Mr. Godwin mentioned the fact, to which we have elsewhere referred, that the Governor-General of India had issued a commission, for the purpose of ascertaining the best means, and acting upon those means, for the preservation of records of the numerous architectural remains which abound in our Indian empire.

Professor Donaldson expressed a hope that a similar spirit would actuate the Government with regard to the architectural remains of this country. He mentioned that, on the occasion of a recent visit to Wales, he found the castles of Conway, Carmarthen, Beaumaris, and Harlech in such a state of dilapidation as to threaten their entire destruction; which, he said, might be prevented by a little judicious repair with the materials on the spot. He had taken upon himself to communicate with the First Commissioner of Works and Buildings on this subject, and received a reply stating that the castles held under the Crown did not come within that department. By means of another letter he learnt that they were under the control of the Woods and Forests. He thought it specially became this Institute to take what steps they could for securing the proper preservation of the old castles and similar buildings of the country; and added that he would be prepared to place a motion in the hands either of the president or Mr. Bessford Hope, for a return of all the buildings held under the Crown since the year 1600, stating their present condition and by whom and under what terms and conditions they are now held. Until they had a return of that sort, the ancient architectural monuments would not be properly preserved.

The paper read was a "Memoir of the late Mr. Charles Fowler" (Fellow), written by Professor Donaldson, to some parts of which we may return. At the conclusion of it,

Mr. Edwin Nash said he knew Mr. Fowler sufficiently to form a very high appreciation of his works and character. As an instance of that gentleman's kindness of disposition, he mentioned that on one occasion he applied to him for some information respecting one of his works, when Mr. Fowler not only furnished the information required in writing, involving a considerable amount of labour, but added to those labours a number of drawings, which he specially prepared. He could not refrain from mentioning it on this occasion, and he did so with a view of encouraging intercommunication between themselves as a valuable means of promoting the interests of the profession as well as a personal gratification to themselves.

The chairman having risen to propose a vote of thanks to Professor Donaldson for this paper,

Mr. Godwin said he thought it would be a pity to allow the observations on the subjects brought forward by Professor Donaldson to terminate so abruptly as they appeared about to do, inasmuch as there were so many texts opened to them in the papers, that they afforded matter for half a dozen sermons. He had no intention of preaching a sermon on those texts himself, but there were one or two points on which he begged to say a very few words. For example, he was not able to agree with Professor Donaldson's statement, that there was a difference of opinion amongst medical men in the present day on the subject of having parallel wards, side by side, in hospitals. Anything more preposterously bad than such an arrangement as that could not be conceived. He spoke from long consideration of the subject, and from knowing the opinions of many of the most eminent medical men of the day upon it. It was impossible, with such wards opening into a corridor, as they usually did, to prevent the spread of an "hospital atmosphere," which there could be no doubt was highly detrimental to the recovery of convalescent patients; and in many of the old hospitals the inmates had died more rapidly, probably, than if they had been placed under a hedge, covered with a blanket, and decently fed. That was the opinion of men of long experience in the matter, in which he fully agreed. He should be very sorry if the expression in the paper should lead any architect to believe that if he submitted a design which included double wards side by side it would stand a chance of being selected. He was glad to think, he might even say he was proud to think, that no such design would now be selected. He

had laboured for some years in endeavouring to spread a knowledge of the advantages of the pavilion principle in hospitals, and he was happy in the belief that the double ward system would not now be admitted in the construction of those buildings. With regard to competitions he was glad to hear Professor Donaldson's observation—he put it very mildly—that the instructions to architects, instead of being more precise, should rather be left more open. It was a very difficult thing, he knew, to obtain a decision without precise instructions that would give satisfaction to all; but he was quite sure that instructions of a general character were best calculated to bring out the talents of architects, and more likely to lead to the production of good buildings. The restrictions under which architects were usually placed precluded the exercise of their own opinion and judgment in any case. It was of the utmost importance that the Institute should take up this matter, and discuss the four propositions which Professor Donaldson has laid down, with the view of arriving at a more general understanding in respect of competitions. A good deal might be done towards improving competitions by the profession itself. There was, as they all knew, a great disposition to cavil and find fault, often very necessary; nor was there any alteration in that respect when the committee or municipality called in professional men to assist them, the only difference in that case being that the referees came in for the abuse instead of the committee or municipality. Committees would feel that they might as well exercise their own judgment, and allow local prejudices and favoritism to have their weight; because there was the same abuse bestowed whether impartial persons were called in or not. Let the profession give their brethren credit for honesty of intention, and not assume a "job" without at least some evidence of the fact. He would, in conclusion, say one word with reference to their excellent friend, the author of the paper. They must all agree that considering his recent and still existing indisposition which precluded him from reading his own paper that evening, and other circumstances, together with the weight of some years upon him, the time and labour that he gave to the matters of that Institute, and for the benefit of the profession at large, were beyond all praise. He knew no man so ready ever to come forward to bear testimony to the good qualities and abilities of a fellow-labourer, whether he were alive or dead. In this respect especially he deserved the gratitude of all, and he was sure there were none present but would hope that when they died they might have such a friend to tell their story.

Mr. Digby Wyatt remarked that it was his good fortune to have known Mr. Fowler for upwards of twenty years. He had also seen most of his works, and he confessed they had all impressed him, as his personal acquaintance with him had done, with a profound respect for that gentleman's character. There was a degree of uprightness which was impressed upon him both in his life and in his works,—a straightforwardness of purpose of which any architect might be proud, when manifested alike in his life and works. Professor Donaldson had dwelt principally upon the architectural phase of their late friend's character, and had not touched upon the domestic phase of it. Happy in his every relation of life, Mr. Fowler was a man to be respected in all things; and in every piece of professional business, small or large, with which he was connected he never issued from that business without carrying with him the respect of his employers and the esteem of those who laboured with him. Mr. Wyatt fully endorsed all that had been said with regard to the great merits of Professor Donaldson and his exertions on behalf of the Institute, and the profession at large.

The Chairman, in proposing a vote of thanks to Professor Donaldson for his able memoir, expressed his unequalled concurrence in all that had been said of him by the preceding speakers, adding, that he had set an example to the younger members which they would never forget, and which he trusted they would all endeavour to follow.

The vote of thanks having been passed with acclamation,

Professor Donaldson returned his acknowledgments for the kind manner in which the proposition had been received by the meeting. He said if he had yielded to his own feelings he should have said more about Mr. Fowler and the

valuable qualities he possessed; but he felt assured his late esteemed friend would not have wished to have one word more said about him than others might be disposed to accept; and he had forbore to treat of his private character because there was so much in his professional career; such integrity, high honour, and straightforwardness, that he felt there was in that career alone sufficient to occupy their attention for that evening, as he hoped and believed, with interest and not without instruction. With regard to the young members of the profession he had written a few words, which he hoped would come home to them, so as to induce them to greater exertions, to infuse more energy into them, and lead them to sympathise in the feelings with which they looked upon their art, in which respect more was expected from them than they had yet done. It was from their ranks that the vacant places which were left must be supplied; and he hoped they would not only do honour to their profession, but also to their country.

It was unanimously resolved that the honorary secretary be requested to convey, in suitable terms, the sincere condolence of the members of the Institute with Mrs. Fowler and her family on the great loss which they have sustained.

THE NEW PUBLIC OFFICES FOR LIVERPOOL.

It is now some years since the corporation of Liverpool resolved to erect public offices in the town worthy of the importance and standing of the great northern port, and in which all their numerous officials should have accommodations sufficient to enable them to transact the business of their respective departments. The want of such offices had long been sorely felt; the inconvenience and expense of having the corporate servants dispersed about different parts of the borough became more apparent day by day, and the urgency of the case having become irresistible, the local parliament commenced what may, without exaggeration, be called a somewhat gigantic undertaking. That was some five or six years ago, but, owing to a number of unforeseen circumstances—the chief being its inability to obtain the particular kind of stone required—the work progressed slowly, and for awhile matters were almost at a standstill. The huge pile, but half complete, became for a length of time the subject of many a bitter comment, and afforded a capital illustration of the slowness with which corporate bodies are popularly supposed to proceed with any great public work intended to meet a great public want; but about a year ago matters were pushed on with considerable vigor, and the large building is now all but ready for occupation. The site chosen is in Dale-street, and is admittedly one of the best in the town, being situated in the busiest of the many busy streets of Liverpool. The building, which abuts considerably too close upon the public pavement, thus marring the general effect, presents a bold and substantial appearance. In size it is only inferior to St. George's Hall.

The Public Offices, which in form represent a quadrangle, cover an area of about 4,500 square yards, and have a depth of about 196 ft. The style is Corinthianesque, treated very freely. The height of the building to the upper cornice is about 60 ft., and to the roof of the pavilion between 80 ft. and 90 ft. A tower, to a height of about 200 ft. rises from the centre of the building, and its elevated position renders it conspicuous to a considerable distance off. The frontage is of course, in Dale-street. There is a large granite-framed doorway in the centre, and on either side of this are massive stone columns projecting so as to form a porch. At intervals along the front other columns are placed, and the wings at each end take a tower form, covered by a pavilion roof. Each angle of the building is similarly completed. The top story is constructed as an attic, and single figures, representing different branches of art and science, occupy positions upon broken entablatures. The cape of the columns which enport the front are not formed after the usual acanthus model, but from designs supplied by English ferns. It is proposed to place a clock in the tower, which is to be furnished with bells to strike the quarters, and which is to be regulated by electricity. The building has five main entrances, and there is plenty of vacant ground in its rear; which fact makes it the more to be regretted that the struc-

ture was not put much further back from the thoroughfare in Dale-street.

Round the entire building within runs a broad corridor with a groined roof, from which access to all the offices can be obtained. The ground and upper floors are similarly arranged, and at each entrance a stone staircase leads from the one to the other. The Tax Office is the most spacious room in the building, and it is 40 ft. by 60 ft. It is placed in the centre of the pile, and is lighted from the roof by means of skylights. The woodwork on the ground and first floor is all of oak, and on the upper floor of pitch pine; the whole of the work being very substantially done. There are upwards of 100 rooms: the corridors are lined up to a given height with tiles of a handsome pattern; while the staircases are lined with enamelled plate. The principal offices will be on the ground-floor; the clerks in connexion with different departments occupying the upper floors. A hoist travels from the basement to the top, having a communication with each floor; and the building is warmed by means of Price & Co.'s hot-air apparatus. The eastern portion of the building is appropriated to the departments under the direction of the borough engineer, the treasurer, the medical officer of health, and the officials at present having rooms in Cornwallis-street. The western wing, on the ground-floor, is assigned to the town clerk's department, with the exception of five distinct rooms, each 34 ft. by 18 ft., which are set apart for committees; and upon the second-floor will be the munition-room, and the offices of the borough architect and surveyor, the water engineer, and the deputy town-clerk. The different parts of the building will be communicated with by means of speaking tubes and electric bells. The land and furniture apart, the cost of the building will be somewhere about 100,000l.

We need only add that the design was originally made by the late well-known architect and surveyor to the corporation, Mr. John Weichman; that the builders are Messrs. Holmes & Nicol, Messrs. Haigh & Co., and Messrs. Parker & Son; and that the new borough architect and surveyor, Mr. Robson, has personally superintended the erection of the building, and has made such modifications in the first design as seemed desirable.

BIRMINGHAM ARCHITECTURAL SOCIETY.

A MEETING of this society was held on the 31st ult., at the Town Hall Chambers, Mr. J. J. Bateman, president, in the chair, when the session was opened by an address from the president. In the course of it he said, as to the Paris Exhibition building, that although in arrangement well adapted to its purpose, it was of all iron and glass exhibition buildings the very ugliest; indeed, it was scarcely possible to conceive a building erected in the present day so devoid of any attractive feature. Here Mr. Bateman remarked how very little we, in Birmingham, have attempted in the adaptation of iron in the construction of buildings, the town being so favorably situated for the development of designs in that material. After paying a passing tribute to Messrs. Payne & Maw, as the authors (though as yet unrecognized by the authorities) of the plan published in the *Builder*, from which the design of the building was taken, Mr. Bateman proceeded to speak of the Exhibition itself, and said it appeared to be the accepted verdict that England had not successfully competed in the fine arts, and there was little doubt of this being the case in historical painting. In our own department of the fine arts, he said, we appeared to have lost an opportunity of offering to France that of which she stood in need—a lesson in ecclesiastical architecture. Noticing the care and attention which French architects pay to the plan, Mr. Bateman said here we could take a lesson ourselves, in making the plan a more important feature of the design. No one could examine a French design without being struck with the greater amount of study given to it than we were in the habit of bestowing. The French plan was as much a picture as the elevation, and generally more carefully treated. We should also profit by studying from French designs the art of tinting, the beautifully transparent toned colouring of their geometrical elevations and plans, preserving clearly every line and detail of the design, and at the same time heightening the effect of the composition to the utmost. Next Mr.

Bateman referred to the much-praised practice of the French architects in making very large geometrical drawings as studies for their designs. However advantageous this system of colossal drawings might be to the painter, he totally disagreed with the practice as applied to architecture, as having an inevitable tendency to produce a want of boldness and a littleness in the detail of executed work, arising in part from the fact that they could not draw the building full size. While admitting that, under Louis Napoleon, Paris had become a magnificent city, Mr. Bateman remarked that there was little force or vigour of design, which their street architecture appeared to him always to want. In two particulars we might profitably study their buildings: firstly, the undisguised and effective treatment of the roof, which we resorted to, all expedients to cover up and hide; and, secondly, the beauty and delicacy of their sculptured detail. Being in a transitional state, we need not be afraid of interfering with the nationality of our school of architecture; we should, therefore, be ready to adopt, from whence-ever it might come, any suggestion which might aid us in producing a worthy, national, practical school of architecture.

RAILWAY MATTERS.

THE underground railway has carried in six months' time over 12,000,000 passengers, or about three times the population of London. The actual number transported over the line since its opening in January, 1863, is about 70,000,000. The line is only three miles and three quarters long, and was constructed at an enormous cost, but makes good annual returns in dividend.

A tube, intended for use in constructing pneumatic railways, has been patented by Mr. A. Beach, of New York, U.S. It is composed of sheets of wood veneer, about one-tenth of an inch in thickness, laid one over another in alternate transverse spirals, and firmly glued together, forming a shell about 1½ in. in thickness. The full-sized tube is cylindrical in form, about 8 ft. in diameter, and is put together in sections of about 5 ft. in length, with overlapping joints. The car is nearly cylindrical in form, running on wheels upon a track laid on the bottom of the tube. Around one end of the car is a disc, fitting as closely to the interior of the tube as it may without creating too much friction. The current of air pressing upon this impels the car. The impelling current in this case is created by a fan, shaped like an ordinary marine propeller, which is placed in one end of the tube, and driven by steam or any other power. Letter-boxes are to be placed at convenient points along the line of the road—in a town they might be at every street corner—the boxes being divided into two compartments, marked for letters going in either direction. The boxes are so arranged that, as the proper car passes, the bottom of the box opens and deposits its letters in a box of the car.

The thirty-sixth half-yearly general meeting of the Great Indian Peninsula Railway Company has been held in London. The report was adopted, and the chairman in reply to a question stated that the probable cost of the restoration of the works which had failed would be about half a million sterling.

PROPOSED NEW ROAD FROM BELGRAVIA TO SOUTH KENSINGTON.

WE would direct attention to the following communication:—

One of the most characteristic features of the age is the marked improvement which has taken place in our great city. Wealth, population, and civilization were always connected with London, but the beautiful and picturesque have long been wanted. Our noblest temples of piety and magnificence are buried in obscure places, and deprived of their otherwise commanding effect by miserable dwellings surrounding them. It is only of late years that we have erected a suitable senate-house for a parliament which has existed for 1,000 years. But the spirit and sense of beauty, combined with utility, which has made Paris the "city of the world" has at length come amongst us. It was the boast of a great Roman emperor that he found Rome of brick and left it of marble. Let it be the boast of our age that we found London ugly and left it beautiful.

ANCIENT BRONZE MEASURE, OCHSENFURTH: A.D. 1403.

In your most valuable journal you have repeatedly urged the necessity of improving our town thoroughfares and approaches. The Belgravia and South Kensington new road is a scheme which is considered not only likely to be commercially successful, but also pronounced to be of immense utility as a London improvement.

A complete barrier is now presented between Prince's-gate, on the one side, and Belgrave-square on the other: such a road as the above would at once bring these favoured regions into direct communication with each other, thereby uniting the district foreshadowed as the future centre of opulence and fashion with that which is at present so, to the improvement of the entire surrounding neighbourhood and the immense enhancement of the value of local property.

The communication in question will pass in a direct line from the part of Belgrave-square opening into Pont-street to the Cromwell-road; and it is proposed to render this not alone a mere thoroughfare between these two favoured points of our metropolis, now almost entirely cut off from each other, but to give to it the most imposing and attractive character, presenting a *straight mile*, such as no other city in Europe can boast, and giving to this quarter of our capital a grandeur of effect *par excellence*, of which she may be justly proud.

To accomplish this, and at the same time ensure sufficient privacy to the spot (there is already an authorised new road to the right of this from the Brompton-road to Eaton-square, over which the heavier traffic would pass), triumphal arches of allegorical design, honouring Fame, Glory, and similar attributes, might be erected at each end; the one opposite Cadogan-place in Sloane-street, directly facing Pont-street, the other at the opposite end, and in a line with Cromwell-road. These would open upon a Broadway sufficiently wide to allow in its centre

and throughout its entire length an ornamental garden, supplied with fountains and statues, and bordered on either side by rows of palatial mansions, after the style of the most attractive Boulevards of Paris, thus offering a striking feature of interest to our metropolis, regenerating the West-end, and at the same time conferring upon us a national *prestige* for awaking *practically* from a long lethargy, and at once give our chief capital rank by the side of the most tasteful cities of modern Europe. Opening up also, as this great artery would, the Government property at South Kensington, and especially the vast and important site of the Exhibition of 1862, as well as forming a direct line of communication between the Royal residence and a spot so associated with the memory of one who was ever the first to recognise and promote any enterprise of a great and useful nature, it cannot be doubted that such an improvement would meet with the highest countenance and favour, and also forward the future prospects of the West-end to an immense extent.

"The Birdcage Walk" would only be broken by the intervention of a few yards at Belgrave-square. A magnificent continuity of route westward from the Houses of Parliament, the Thames Embankment, Westminster Bridge, &c., would be developed to this important point, thus effecting an improvement worthy of the age, alike useful and ornamental to this aristocratic quarter of our great city.

South Kensington being now the cradle of science and art, in addition to possessing so many elements of attraction as it does in its Museum, Horticultural Gardens, proposed Hall of Science, and ere long its Royal Academy of Music, such a thoroughfare or Boulevard as this really would make, ought to be named the "Boulevard of Arts," and the statues, placed

at equal distances throughout its length, should be those of our greatest Englishmen, so many of which, now scattered in every direction, might here be appropriately concentrated, thus heightening the national character of the undertaking, and improving the countrymen might view so magnificent a triumph of their taste and skill.

A BELORAVIAN.

** The proposed road has our heartiest concurrence, and should have the aid of the Privy Council Department of Art and Science. A considerable part of the line is at present uncovered with houses, and we are informed that the required capital, or greater part of it, is forthcoming.

ANCIENT BRONZE MEASURE, OCHSENFURTH, GERMANY.

The accompanying engraving represents the "Eimer" measure still used in the town hall at Ochsenfurth. It is cast in bronze. On the rim is the date ✠ "Anno domini M^o CCCC und III^o" 1403. The mixture of German and Latin in the inscription is very singular. The subjects represented in low relief are the "Crucifixion," on the first and third compartment, and "St. Michael and St. Lawrence" in the second and fourth. The handles are curious, but very convenient. The following are the dimensions of this peculiar relic of antiquity:—

Height	29 in.
Diameter	22 in. at rim.
Figures	8 in. high.
Thickness at rim...	2 in.

This measure is preserved in the council chamber of the town-hall. On a future occasion we shall give drawings of other remarkable specimens of ancient furniture in the same room.

THE REREDOS AND ALTAR-TABLE, WESTMINSTER ABBEY.—PROFESSOR G. G. SCOTT, R.A., ARCHITECT.

NEW REREDOS AND ALTAR-TABLE, WESTMINSTER ABBEY.

The new reredos, executed in marble and alabaster, and the altar-table of cedar, are now in course of completion in Westminster Abbey, from the designs of Mr. Scott. The new works also include the restoration of the sedilia and a tessellated pavement of marbles and enamel mosaic surrounding the table. The work has been admirably well executed by Messrs. Poole, at a cost of about 6,000l., defrayed from a fund devoted to decorative purposes in connexion with the Abbey.

The design for the large mosaic of the "Last Supper" was made by Messrs. Clayton & Bell, and has been executed by Dr. Salviati, of Venice. The size of the recess to contain this mosaic was determined by the old central canopies of Bernasconi and by the length of the ancient retabulum, fragments of which are still preserved in the Abbey, under glass: it was, however, discovered, after the mosaic was prepared, that these canopies were not originally attached to this part of the reredos; so their restoration was abandoned, and the mosaic set between two necessarily disproportionate borders. The whole suffers in consequence. The upper border, not yet executed, but represented in the Abbey by a temporary cartoon, will consist of canopies in metal-work and enamel, and the lower part (also at present represented by a cartoon), of medallions in mosaic, after the manner of the old retabulum. The carving of the subjects from the life of our Lord in the cornice were executed by Mr. H. H. Armistead.

The table has been executed in pencil cedar, and inlaid with other woods, by Messrs. Farmer & Brindley, the front and sides being ornamented with Scriptural subjects, carved in relief, the gold marble slab being placed on the top.

The tessellated pavement on which the altar stands is now set back to its original position, so as to admit of the restoration of the part of the old marble mosaic floor which was previously hidden by it.

In previous numbers of the *Builder*, notices have been given of the progress of the work, with reports of several interesting antiquarian discoveries then made, to which we refer our readers.

ARCHITECTURAL REMAINS IN INDIA.

Our readers will be glad to hear that the Governor-General of India, Sir John Lawrence, has taken the praiseworthy step of issuing a commission to inquire into the best means of preserving the numerous fine and interesting architectural remains which exist throughout the whole of our dominions in India. For years Colonel Cunningham and others have been advocating this measure, but have failed to obtain a proper hearing. It is said that an efficient plan will be organized for taking photographs, plans, and measurements.

PROVINCIAL NEWS.

Liverpool.—The foundation-stone of the new Southern Hospital has been laid by the Earl of Derby. The new hospital, which will be built upon a plot of land in Caryl-street (late Harrington-street), will cost 35,000l. It will include, it is said, all the most modern and approved sanitary arrangements. The endeavour is to something entire simplicity of architectural outline with the most perfect internal arrangements, so doing, to prevent the occurrence among the patients of those diseases peculiar to hospitals, and which have often proved more fatal than the accidents and diseases for which they have been admitted. The subscription-list headed with twelve individual contributions of 1,000l. Altogether towards the cost of the building 25,000l. have been contributed. The principal front of the new building will be in Hill-street, presenting a frontage of 300 ft., and extending in depth 180 ft. There will be a centre and two end blocks. The former will contain the administrative department, with the operating theatre, chapel, ward-room, waiting and examination rooms. The end blocks, separated from the centre by corridors east and west, will contain one large and one small ward each, with nurses' rooms, baths, patients' lifts to each floor, and every arrangement for the comfort and convenience of the patients.

The proposed accommodation will embrace 200 beds. The building will be erected from the designs, and will be under the superintendence, of Mr. Culehaw and Mr. Summers, of Liverpool.

Penzance.—The state of the Penzance Western Esplanade wall engages attention. The further fall of 25 or 30 ft. of wall, and the consequent exposure to wintry gales of the path and roadway, begin to excite apprehension in the town. Already there is a thousand pounds' worth of wall to be rebuilt, for a foundation has to be sought 25 ft. deep through sand, beach, boulders, and clay, and a wall 1½ ft. or 15 ft. high raised on this foundation. But this is not the worst. A southerly or south-easterly gale would undermine more of the wall to the east, and furiously assail the shaly wall and ground outside the Baths, which is only about 12 ft. from the outer wall. It is feared that a gale might bring down this large structure. To make a good job of it, says the *Cornish Telegraph*, some would have the Local Board rebuild the whole length of the sea defence, widen the Esplanade 12 ft. or 14 ft., and purchase and remove the Baths. These ought to form the centre of a fine crescent on the unoccupied land known as Miss John's field. This improvement might cost 6,000l., but it would not be dear. A small rate thrown over thirty years would meet it.

Salthurn-by-the-Sea.—A meeting of the inhabitants of Salthurn has been held, for the purpose of considering the advisability (or otherwise) of establishing a company for the erection of a promenade pier at Salthurn. The cost of the proposed scheme is guaranteed to be under 6,000l., and it was ultimately resolved that a company under the limited liability principle should be formed, the capital being 7,500l., in 1,500 shares of 5l. each.

Exeter.—The buildings of the Devon House of Mercy, at Bovey Tracey, have been opened. The building is from designs by Mr. Woodyer. The plan is a parallelogram, running east and west, with two principal wings projecting to the south, the chapel being an extension of the main line of building to the east. Being built on a sharp declivity, there is a basement story under the west end of the house, containing the kitchen and other domestic offices, stores, &c. A large laundry and wash-house, extending to the north or back of the main building, contain all the modern conveniences for carrying on that branch of industry, by which it is hoped that the inmates will be able to earn funds towards their own support. The western wing contains a large dining-room, probationers' rooms, and dormitories, with sisters' rooms annexed for superintendence. On the ground-floor of the centre block of the building are class-rooms for the instruction of the inmates, and porters' rooms, with dormitories and sisters' rooms over. The eastern wing, which is not commenced, owing to a deficiency in the funds, will contain the sisters' community and dining-rooms, the superior's apartments, and the infirmary and visitors' room. The materials of the building are granite and Bath stone, and extreme simplicity, as is fitting for a building devoted to such a purpose, has been studied in every detail in the house. The chapel is lofty, and terminated in the east end with a polygonal apse. A chaplain's room and vestry are built on its north side. The windows are single lights, with moulded jambs and hoods, internally standing upon circular shafts of grey forest stone, and five of them are filled with stained glass, by Messrs. Hardman & Co., of Birmingham. The reredos is for the most part of alabaster, principally English, but some portions of white Italian. It consists of an arcade filled with figures of angels, above which the work is carried up in geometrical forms as high as the plate of the roof, and the openings will be filled with English mosaics. The east window is so treated as to be embraced by and form part of the reredos. The whole of the fittings will be of oak. At present, however, only the western screen, with the organ-gallery over, is completed. A simple bell-turret, of oak shingles, surmounts the west end of the roof. When completed, the house will accommodate eighty inmates,—viz., seventy-two penitents and eight sisters.

Greenstreet, near Faversham.—A small institute building has recently been erected in this village by a limited liability company, composed of a few spirited inhabitants of Greenstreet and its neighbourhood, under the presidency of Captain Lake, to whose assistance the company is mainly indebted for its success. The building comprises a lecture-hall, capable of seating about 400; reading-room, and offices. The hall has an

open-timbered roof, with a pierced quatrefoil cornice, forming the upper part of roof-plate, for the purposes of ventilation. The room is lighted with gas from bracket-lights against each side. The woodwork is stained and varnished, and the walls distempered a light fawn colour. Externally the building is of gray stocks, relieved with red and black brickwork. The total cost has been about 500l., and the works have been carried out from designs by Mr. Benjamin Adkins, architect, Faversham, the builder being Mr. S. George, of Greenstreet.

FROM SCOTLAND.

Dundee.—A serious accident has taken place at Dundee Old Gas Works, whereby twelve men have been dangerously hurt, and some of them, it is feared, beyond the hope of recovery. A gas iron tank, 100 ft. in diameter, is being erected by Mr. R. Laidlaw, of Glasgow. There is an excavation 26 ft. deep, into which the tiers of plates are lowered, the men working on scaffolding fixed in the middle of the excavation. The men—15 in number—were attempting to lower the third tier of plate, weighing about 10 tons, when it swung to one side, breaking the scaffolding and precipitating twelve of the men to the bottom of the excavation.

Grief.—Since the accident which occurred about the middle of August at the new bridge in course of erection across the Earn at Grief, the rebuilding has been pushed forward. The arches were finished some time ago, and the parapet on the east side is in an advanced state. One of the centre arches, however, has hinged out, and showed symptoms of again giving way. The contractor became alarmed, and gave orders at once to stop the traffic and works, which was accordingly done; and it is doubtful if the building can be proceeded with till after the winter months. The inspector from Edinburgh has examined the damaged arch, which measures in length from pier to pier upwards of 40 ft.

Jelburgh.—Another slip has occurred at the Castle-hill Tunnel. A somewhat serious slip had taken place owing to the presence of much water and sand. The contractor thought that the best thing for them to do was to sink another shaft at the place where the ground had slipped; and accordingly this was done, not, however, without a considerable amount of labour, the men having been working night and day in it so as to have it completed as speedily as possible; but another slip took place, and, as fears were entertained that the wall in front of the Castle might also be brought down, the workmen were ordered to fill the shaft up immediately for safety; thus undoing in a few hours what it had taken nine days and nights to accomplish. The work will now be carried on only by the shaft situated a little further towards the west, until the workmen again approach the dangerous spot which has just been filled up.

Glasgow.—Free Barony Church, erected at the corner of Castle-street and Mason-street, has been opened. The edifice (a notice of which has already appeared in the *Builder*) is seated for 1,100, and large side rooms adjoining will hold 500 or 600 in addition. The chief peculiarity of the interior is the arrangement of the pews, which are in concentric tiers, both in the area and gallery, so that the sinner in every part of the church directly faces the preacher. There is a tower, 130 ft. high. The style is Gothic. The building was commenced about two years ago; its cost is about 10,000l., inclusive of site. The architect was Mr. Honeyman. The contractors were,—For mason-work, Messrs. Bruce & Keir; joiner-work, Messrs. Watt & Wilson; plumber, Mr. R. Philip; plasterer, Mr. Alex. Campbell; slater, Messrs. J. McOnat & Son. The heating apparatus was fitted up by Mr. Ritchie, of Edinburgh, and the painting was done by Messrs. McFarlane & Smith.

Stirling.—Mr. M'Lean, acting for Mr. Rothead, architect of the new transept of the High Church here, has examined the unoccupied space above the modern plaster ceiling of the West Church, and finds that the old open timber roof of the thirteenth or fourteenth century still exists, in all its entirety. A tracing of this roof has been taken, and the wonder is expressed that it should ever have been hidden under a mass of plaster. It is hoped that the discovery will engage the attention of the town-council.

Alloa.—The Episcopal congregation finding their present church to be inconvenient in various

ways, began to move some time ago for the erection of a new place of worship. The Earl of Kellie offered to defray the cost of the new building, on condition that the old one should be placed at his disposal. The offer was at once accepted, and arrangements have now been completed for the erection of a new church. Mr. R. Anderson, Edinburgh, is the architect whose designs have been selected, and under his superintendence the work will be carried out. The church will accommodate in the nave 165 sitters, exclusive of space for chairs, and the choir thirty sitters, exclusive of the clergy. The entire cost of the church will be over 3,000L., the contracts amounting to 2,600L., exclusive of boundary walls, cost of site, and incidental expenses.

THE NEW ORPHAN HOUSES, - ASHLEY DOWN.

THE twenty-eighth report of the proceedings of the remarkable institution for orphans at Ashley-hill, Bristol, has just been issued by Mr. George Müller, its founder. It is, like all the statements on the same subject that have preceded it, very extraordinary. The institution has been more than thirty-three years in operation. Its beginning was very small, but the expenditure during the past year amounted to 31,849. 0s. 6d. In no case is an appeal made to any individual for help, and everything is paid for in ready money, although there is no capital to fall back upon should the hand-to-mouth system happen on any occasion to fail the 1,304 orphans who have to be provided with their daily food. It is a most perilous position for such a multitude of children to be placed in, unless, indeed, one believes that Mr. Müller and his wife are not liable either to accident or disease.

Here is the principle in operation,—

"Nov. 30.—This morning we had only received for the benefit of the orphans 107. 18s. 6d., and for the building fund 94. 2s. 6d. We gave thanks to the Lord for this, and asked for more. In the afternoon came in further 71. 13s. 3d. In the evening when my dear wife and I were giving thanks for this, came in further, while we were in prayer, 82. 5s. We again gave thanks for this, when presently, while we were yet in prayer, came in 27. 1s. 9d. and 7s. 6d. We further praised the Lord for this, and *bold Him* in prayer, that even this very evening He could send us more than He had done all the day, when a few minutes after there was a knock at the door, and a letter containing 300L. was handed in, which a gentleman had just sent. In prayer we had especially spoken to the Lord about the high price of provisions, &c., and asked Him for large supplies on that account."

The most of all this money was actually given, and on the way, before the prayers that we are to understand evoked it were uttered. Mr. Müller wants 40,000L. for the current year, and no doubt he will get it.

WREXHAM CHURCH, NORTH WALES.

THE parish church of Wrexham was re-opened for divine service on the 16th of October. The alterations effected in the interior, by the demolition of the huge galleries and the removal of the high square pews throughout, have restored to the nave arcade its massive and grand proportions. Previous to the changes nothing could be worse than the arrangement of the seating, &c. The aisles were choked up, and the fine Perpendicular windows cut in two by ponderous galleries, in which very few could see the clergyman; while the approach to the chancel was blocked by a huge pile of carpentry, forming the pulpit, reading-desk, and clerk's desk. The chancel itself was in confusion,—the fine old brass lectern stowed in one corner, disused, no proper stall-seats, and the north window of the chancel, next the apse, concealed by a monument of gigantic size, the work of Ronhilac. The curious metal screen to the chancel has been preserved. During the process of cleaning the walls from the successive coats of whitewash, some very interesting remains of mural painting were brought to light, the most important being portions of the representation of the Last Judgment, over the chancel arch, the colours remaining in good preservation. The east ends of both the north and south aisles were originally chapels; that on the north was probably the lady-chapel, the entire wall surfaces being powdered with *fleurs-de-lis* and other devices. Every trace of art-workmanship has been preserved, and the fragments of window-tracery depending from the new chancel-arch left as

historical evidence that the chancel and apse were subsequent additions to the church itself.

By the kind permission of Mr. Fitzhugh, the large monument on the north side of the chancel has been removed and fixed between the windows in the north aisle, and the window which it concealed has been restored. The chancel has been paved with handsome encaustic tiles, and studded with oak seating on each side. On the north-east side of the nave, at the entrance to the chancel, a handsome stone pulpit, having niches filled with the figures of our Lord and the Evangelists, and enriched with marble shafts and much carving, has been fixed. This has been presented to the church by Mr. Walker, the mayor of Wrexham. The prayer-desk stands on the south side of the chancel-arch, and the noble brass lectern is again used for the reading of the lessons to the congregation.

The entire area of the church is filled with wainscot open seats, having ornamental benches. It is much to be regretted, that owing to insufficient funds, the north chancel aisle (intended to receive the organ) has not been built. The western gallery, therefore, with the organ-chamber over, still remains; but the removal of the organ, and the erection of a suitable chamber for it, on the north side of the chancel, will probably be accomplished at no distant period; for, until this is done, the work cannot be said to be complete. The church has been efficiently warmed with a hot-water apparatus, by Mr. Roper, of London.

Mr. Yates, of Shiffnal, has carried out the works in a most able manner, under the architect, Mr. Ferrey, F.S.A., of London. The cost has been upwards of 3,000L.

THE POLLUTION OF RIVERS.

A CONFERENCE of representatives of the municipal corporations and other local authorities in the valleys of the Irwell and the Mersey, has been held in the Manchester Town-hall, upon the invitation of the corporation, to consider the steps it may be desirable to take when the Rivers Pollution Commission sits in that city. The Mayor of Manchester presided; and the mayor's parlour, in which the meeting took place, was crowded. There were representatives present from Bolton, Blackburn, Oldham, Macclesfield, Bury, Stockport, Wigan, Bradford (near Manchester), Newton Heath, Rusholme, Heywood, Bacup, Rochdale, Salford, Chorley; from the millowners' associations along the course of the Irwell and the Mersey; and a considerable number of the city corporation.

The Chairman, in introducing the business, said the question was felt to be a very important one. It seemed to him that nothing could meet the requirements of the Commissioners but the formation of very large sewers, upon the London model, by which the sewage and other impurities of the towns in the basins of the Mersey and the Irwell might be conveyed direct to the sea. If Manchester were to adopt that plan, the action which it might take would be useless unless the other towns above and below it on the Irwell acted in combination on the same plan. It was clear, therefore, that the works must be either undertaken at the national cost or be shared in by the whole country. It had been suggested that the sewage should be used for the purpose of irrigation; but it would be exceedingly difficult to carry out that system near Manchester, which was surrounded by a network of horse property for many miles. The atmosphere in and around the city was not very agreeable, but if the sewage was to be turned upon the land he was afraid that the present evils would be very much aggravated. He believed it would be unadvisable to attempt to carry out a scheme of irrigation; and he supported a plan which would remove the nuisance of the sewage matter from the neighbourhood and carry it direct to the sea. The practice in Manchester had been to collect the refuse and send it into the country, but the demand was falling off, because while the production increased the extent of land requiring the article was getting smaller every year.

The town clerk of Manchester said that the Rivers Pollution Commission would hold a preliminary inspection in that city on the 12th of November, preparatory to beginning their public inquiries in respect to the condition of the basins of the Mersey and the Irwell. The city surveyor had prepared a map (which was exhibited in the

room) of the towns which drained into the Irwell and some of its tributaries, and it showed that there were 159 towns, or villages, having more than 500 inhabitants, which were so situated. The commissioners recommended irrigation as the best means of disposing of town sewage, and that in order to carry out the plan local authorities should have the power to purchase or take land compulsorily to the extent of one acre for every fifty persons in the population. As regarded Manchester that suggestion was absolutely impracticable. First of all, the commissioners proposed that all privies and ashpits should be done away with, and they were of opinion that the system of sewage irrigation could never be effectively carried out until the water-closet system was more thoroughly adopted. It had never yet been proved that irrigation with pure water could not be as beneficial as irrigation with sewage. There were 50,000 houses in Manchester, and he estimated that it would cost 10L. per house to substitute water-closets for the present system, and it would require half a million of money at the outset. He could not even suggest what would be the probable expense of the sewers that would be necessary to carry away the volume of sewage. Where were the local authorities to purchase the land? Taking the population of Manchester at 380,000, that would give more than eleven million gallons of sewage water per day which they would have to dispose of; and if he added Salford, the population would be increased to 450,000, and the sewage matter to fourteen million gallons. It would require, on the commissioners' scale of one acre to every fifty persons, more than 7,500 acres for Manchester alone as a sewage irrigation farm. It appeared to him that that was an absurdity.

Great regret was expressed, in which we participate, that the town-clerk should hold such views.

A resolution was passed declaring that, in the opinion of the meeting, all the local authorities should combine in giving the fullest information to the commissioners; urging upon all corporations and local boards interested in the inquiry to be prepared with evidence of the mode in which sewage is at present dealt with in their respective localities; and to say to what extent irrigation or any other system could be carried out, and generally to point out the local difficulties of dealing with the whole question.

ACCIDENTS.

AN inquest has been held on the body of an excavator, who was killed whilst at work in the tunnel of the St. John's Wood Railway by the fall of a large quantity of clay which formed part of an embankment along the centre of the tunnel in the Park-road. The evidence showed that deceased, with another man, whose thigh was broken through the accident, was engaged in a rather irregular manner in attempting to drain some water which had accumulated at the base of the clay bank, and which would have impeded the progress of the works. Although a ganger had instructed the men to drain the water off, the superintendent of the works said this was not done by his orders, or he would, before allowing the men to proceed with the work, have shored up the clay bank. Whilst the men were making a small trench to carry the water off a portion of the soft clay halfway up the bank gave way, and the top of the bank, which had become hard through exposure to the wind, broke off for several yards in extent, and in falling struck deceased on the head and knocked him up against the wall of the tunnel. It also partly buried deceased's comrade. The jury, after deliberation, returned a verdict of accidental death; but added a resolution that, in their opinion, more care in future should be observed on the St. John's-wood Railway, in protecting the lives of workmen, by shoring up in the excavations.

At the Lewes-road Viaduct, Brighton, an accident in connexion with the Kemp Town Railway Extension Works has just occurred. Workmen were about to lower an iron girder on to the abutment of the viaduct which spans the Lewes-road, near the entrance to the Parochial Cemetery. There were three girders; and two of them, weighing 12 tons each, had been lowered safely, and the third weighing only 4 tons, was about to be lowered by the same tackle. A seaman, being practically acquainted with the making fast of ropes, had charge of the "sheer

eggs" and "crys," and was standing on the abutment to ease off the girder with a crowbar, a case it hung up anywhere. While attending to this, the stump to which one of the guyp-ropes was fastened was torn out of the ground, although it was driven into the earth 4 ft. at an angle of 45 degrees. When that happened, the "sheer legs" fell over, and a chain, catching him by the leg, pulled him over the viaduct, he being too near the edge to recover himself. The distance which he fell was about 51 ft., and the poor fellow died in the hospital. The ground into which the stump was driven was clay and slints, with only a few inches of mould; and it was examined before the girder was lifted. None of the witnesses could account for its giving way under the strain of the lighter girder when it had carried the heavier ones. The jury was of opinion that every precaution had been taken, and returned a verdict of "Accidental death."

At Chesterfield, a man was engaged in putting in the roof of the new building for the Sheffield and Rotherham Branch Bank, when he accidentally fell, and his body came in contact with the joists of the first floor. He was much injured in the side and head. A similar accident occurred in St. Helen's-street on the same day. Mr. Edwin Wragg was engaged in putting on the roof of some houses, and he fell, his body coming in contact with the joists of a floor. Several of his ribs were broken.

At Leeds, a chimney about 20 yards in height, attached to the Pontefract-line chemical works, which has been completely demolished. Great damage was caused to surrounding buildings by its fall. The chimney, which was a square one, had been built many years, and the damage to it and the buildings will only be repaired at the cost of several hundred pounds.

At Orpington, near St. Mary Cray, nearly twenty buildings have been destroyed by fire, rendering fifty families homeless. The fire, it would appear, broke out in a large wood and broom-handle yard, situated in the parish of Orpington, which is about half a mile from St. Mary Cray. The fire next seized upon a large barn, and the flames drifted over the roofs of fourteen private residences. Owing to the large quantity of wood used in their construction the whole burned with the greatest violence.

PROPOSED ST. PANCRAS INFIRMARY.

The Poor-law Board having sanctioned the purchase by the St. Pancras guardians of 4 1/2 acres of land at Highbury, on which to build an infirmary for the sick poor in the workhouse, the *British Medical Journal* says,— "It is proposed that 20,000, or 25,000, should be spent upon the building, and a limited number of architects are to be invited to send in plans for competition; but, as the tenders of builders for such works often far exceed the estimate of the architects, it is proposed that it shall be a condition with the architect that he shall make no claim upon the guardians if he cannot find a respectable builder to carry out the works at the same estimate them to cost."

Are the guardians prepared to pay each architect the cost of a precise estimate? or will they allow the builder who submits a tender to execute the works at that amount, without further competition? Of course the guardians do not wish to get something for nothing. Are they aware that each architect, if he employed a surveyor to make a correct estimate, would have to pay at the least 200l. (1 per cent.) for it?

DARLINGTON WORKHOUSE COMPETITION.

Notice.—The publication by you of my letter herein has brought about two results. On the 31st ultimo I received back my designs apparently from some anonymous source, but there is no communication therewith to lead me to suppose they are to be sent in plans for competition; my estimate returned, nor any reply received to my demand concerning it; and there was a paltry sum of 10d. sent for carriage. The other result is, Mr. Fritchett's letter in your last impression, conveying to the public as well as to me, a competitor, for the first time, the fact that the premium had been awarded, and that so far back as December 24th last year. My grievance with the guardians is, if saying, aggravated by Mr. Fritchett's announcement; for by it I find they have retained my designs ten months after they had awarded the premium to another; and left me in doubt how long or for what purpose they would have retained them had I not applied to them. The most honorable course for the guardians appears to be to advertise the award of their premiums and return immediately the competitive designs.

AN OLD SUBSCRIBER.

THE HIGHEST CHIMNEYS IN YORKSHIRE.

In your impression of the 5th of October, you call attention to a chimney lately erected at Bradford, as being the highest in Yorkshire.

The paragraph states that this chimney measures from the foundations to the top 110 yards, and rises a clear 100 yards from the ground-line. Its foundations consist of two courses, 22 ft. and 21 ft. square. It measures 20 ft. across at the foundations, and 9 ft. at the summit. The flue is 7 ft. in diameter. It is also said that the next chimney in size is one near Huddersfield.

I beg to state that this latter chimney was erected by me in 1857, for Messrs. Brooke, Fire-clay Works, Huddersfield; and the following statement of its dimensions shows that the Bradford chimney is not the highest in Yorkshire:—

Messrs. Brooke's chimney is built throughout of fire-bricks. Measured from the foundations to the top it is 107 yards high, and rises a clear 102 yards from the ground-line.

The base at the foundations is 36ft. square: at the ground-line it is 31 ft., and 11 ft. diameter at the summit.

The flue is 14 ft. in diameter at the bottom, and 9 ft. at the top. The chimney contains 144 cubic yards of concrete, 2,227 cubic yards of brickwork, 2,452 cubic feet of ragstone footings, and 3,541 cubic feet of ashlar.

By these it will be seen that Messrs. Brooke's chimney is 2 yards higher from the ground-line than that erected at Bradford, and is in every respect considerably larger. I have no reason to believe that there is a larger or higher chimney than Messrs. Brooke's in England.

ROBERT MORGAN, C.E.

COLLIERY EXPLOSIONS.—A CAUTION.

Sir,—Having given attention to this study, and believing that colliery explosions are induced by certain extraordinary conditions of the atmosphere, I now beg to return once more to the subject.

The most terrible catastrophes of this class were preceded by remarkable oscillations of the barometer and great changes of temperature, with frequent rains, and the characteristic meteorological features at the precise time of each explosion were high temperature and greatly diminished atmospheric pressure, with damp hozy weather. Such were the exact indications on the 10th, 11th, and 12th of December last. The barometer rose and fell considerably in a few hours, and the temperature as rapidly advanced and declined in the same way, the greatest heat being invariably registered simultaneously with the most reduced readings of the barometer, and the awful explosions at the Oaks and Kidsgrove collieries occurred on the morning of December 12th, at the very time when temperature, having been just previously very low, became suddenly high, and just when the pressure of the atmosphere, which had been considerable a few hours before, was then much reduced.

We have been and are still passing through the like conditions of weather,—dry and cold one day, damp and warm the next. The rash of those various kinds of air, with constant changes of atmospheric pressure, must interfere with the ventilation of our collieries. Hence the need of caution. The men should be warned of the increased danger of using naked lights. The shafting and other ventilating facilities should be closely watched. Every such mining inspector ought to study meteorological elements, especially in the winter season; and should make himself familiar with the changes of the weather, rise and fall of the barometer, and temperature, particularly during a critical period like the present and the season in anticipation.

THOMAS L. PLANT, F.M.S.

THE GULF OF LIONS.

In the article on "The Road to India" in the *Builder* for October 26th, your printer has fallen into an error, which, however, is very frequently made, and even in many of our best maps, in spelling the Gulf in the Mediterranean, the ancient "Gallienus Sinus," as the "Gulf of Lyons," as if it were so called after the city of that name. The city of Lyons is nearly 180 miles inland, and has no connexion whatever with the name of the gulf, which is properly the "Gulf of the Lion," or, as it appears in some French maps, of the Lions" (*des lions*), and was so called on account of the sudden and violent storms which prevail on its coasts.

The Abbé de Longuerne, in his "Description de la France," says it is called the Gulf of the Lion, "à cause des grandes tempêtes dont il est fréquemment agité, et des bas fonds qu'on trouve à ces côtes-là, qui sont parés les vaisseaux qui y abordent, ou qui y sont portés par la tempête; de sorte que l'on compare le croquant de cette mer orangee et dangereuse, qui engloutit ceux qui y navigent, à celle d'un lion dévorant."

Guillaume de Nangis, in his "Life of St. Louis," speaks of it as "Mare Leonis ides sic nuncupatur quod est semper asperum, fluctuosum, et crudelissimum."

M. Bruzen de la Martinière, in his "Dictionnaire Géographique et Critique," 1732, says,— "Quelques-uns imaginent faussement que cette ville (de Lyons) a donné son nom au golphe, ce qui n'est ni vrai ni vraisemblable. M. Bouvrand a conjecturé que ce nom pouvait avoir été donné à ce golphe à cause des tempêtes auxquelles il est fort sujet." M. Guizot says, in his "Dictionnaire Géographique et Statistique," "Golfe du Lion. On attribue l'origine de son nom à l'agitation continuelle de ses eaux, qui a été comparée à la violence du lion." The Spaniards call it "Golfo Leone."

In Blackie's "Imperial Atlas," edition 1856, under the head "Lion, Gulf of," we read,— "The name of the gulf is said to be derived from the fury with which the waves are often lashed by the violence of the winds, and not, as is sometimes supposed, from the French "City of Lyons."

By using the original orthography of the name, and writing the "Gulf of Lions," we should at once correct a popular error, and at the same time preserve the sound to which we have been accustomed. J. C.

POOR STRAW-PLAIT WORKERS.

APPEAL TO LADIES.

The *Builder* has long been known to readers as having several times gone beyond its diversified provinces to "do good." May I ask permission to submit through it the sorrows—I had almost said "wrongs"—of a large body of English women, in what may be termed a national manufacture, promising to willfully "set down nought in malice?"

The distress of the "plait workers" (to which, I now learn from the neighbourhood, should be added "bonnet-sewers") has been several times mentioned. A correspondent of the *Bedford Times*, in quoting *Echoes from the Clubs*, seemed to have hit the mark in observing, "Ladies should, from principles of humanity, wear straw bonnets, like their not less attractive mothers and grandmothers."

May I digress for an instant? The "young days" memories of my contemporaries will bear me out how very pretty young girls looked in "cottage" or other rather quaintly-shaped bonnets, with "ribbons"—not least when "blue"—at fancy. I am sure, also, that a "Thompson" or "Blossfield" would have agreed with me—quite equally attractive, or inclining to hyemal aspirations, as all the "silk" or "velvet" in the world. Would they receive less male admiration now, if known, as "good girls," to have reverted to the other from real patriotism and benevolence?

I shall probably have to meet one objection (though not from them) to dispose of. It "makes good" for the silk, &c., trade. Very likely; but pity if that rises on the unexpected and undeserved ruin of another.

Also, as certainly expected, I have received (equally disinterested) good medical corroboration, that the "patch," however rich, on the "top" of the head, is no sufficient protection. To me it has long seemed a special mercy that they have not frequently had sunstroke, else deadly chill in the opposite season; and can we be sure now that, "from want of proper bonnets," ought not to form a small part of each week's account of deaths; or that none, dear as fair, have been lost to parent or lover through this origin?

But, to the "point,"—Luton (long known to Antiquaries for its large church and "Baptistry"), now the straw plait "metropolis," even more than Drunstable, has a very large parish,—16,000 or 17,000 acres,—with enormously increased population of late years, believed now nearly 20,000. Of this I fear about five thousand females, of all ages, are "three parts starving," unable to earn half-a-crown "where they could "seven shillings" a week; and mainly supported by the poor-rates, which have reached "twelve" shillings in the pound. Also, we have read of "poor children crying for bread in the streets." The same applies more or less to several neighbouring places, including part of Bucks, and, I believe, Herts; and even at Bedford, twenty miles distant, one or two large plait-shops have been entirely closed.

Alas! for the "caprice of fashion,"—harmless,

perhaps, sometimes, but hardly so if it causes the helpless misery of many thousands. And this, perhaps, the work and continuation of three or four "Madame Mantalinas," as I will not believe, ladies of the aristocracy or middle class would have knowingly brought this distress on their country-woman. Might we not hope our beloved Queen might be moved to "set the fashion for straw" again?

There is yet a last view, rather delicate, but well worthy the attention of principled ladies for their less favoured "sisters." The morals,—or, rather, temptations,—of younger females in more than one manufacture have been thought a little perilous or "slippery," and I fear that at Linton is not exempt. How very sad, then, if they should anywhere have the added temptation of want!

A CAMBRIDGE MAN,
NATIVE OF THE QUARTER.

DERIVATION OF NAMES.

BEING very much amused with some remarks headed "Human Beasts, Birds, and Fishes," which appeared in a recent article in the *Builder*, induced me to try my hand, at what might be done in a similar fashion, with the surnames of my brother registrars, scattered up and down the land, and I have ventured to send you a few for perusal and insertion, if you think proper. I could make out lists embracing almost anything and everything, making altogether a very curious, amusing, and interesting lot of surnames.

JAMES JOHNS, Registrar of Births and Deaths.

REGISTRARS' NOMENCLATURE.

Disposition and Temper.—Allgood, Carnell, Croker, Cross, Faithful, Gay, Egar, Good, Jolley, Light, Noble, Savage, Smoothy, Wildish, Meek, Sturdy, Blaud, Moody, Still, Sharp, and Grave.

Animals.—Bullock, Bear, Back, Bull, Fox, Hare, Hari, Kid, Lyon, Fitch, Stag, and Wolf, with Hunters and Butchers to slay them.

Feathered Tribe.—Bat, Crow, Daw, Jay, Parrott, Peacock, Swan, Tesie, Martin, Kite, Nightingale, Wildgoose, Finch, Crane, Woodcock, Gosling, and Buzzard; but nothing but Archers, Fowlers, and Cannon to bring against them.

Food.—Bacon and Lamb, either Roast or in a Pye, with only Salt, Sage, Radish, Onion, Mustard, Garlic, and Rice as adjuncts, a very meagre bill of fare; to be washed down with Beer, Porter, Perry, Goodale, Hollands, and Water. There is a Kitchen provided and several Cooks.

Apparel.—Coat, Glove, Wig, Clock, and Bussel.

Useful Articles.—Fulley, Sponge, Saw, File, Gad, Pillow, Harness, Chalk, Candy, Hatchet, Hartshorn, Emery, Flint, Cork, and Wagon.

Considered Precious.—Alabaster, Ivory, Silver, Gold, Diamond, and Jasper.

Countries, Counties, Cities, and Towns.—Derbyshire, Cornwall, Lancashire, Cheshire, Holland, Ireland, Bradford, Bromley, Bromwich, Clapham, Crewe, Croxley, Davenport, Douglas, Fulham, Lancaster, Leeds, Leith, Oldham, Paisley, Preston, Sunderland, York, Cairo, Nuremberg, Whiby, Chester, and Hull.

Judicial Bench.—Barrister, Stuart, Wood, Wightman, Mellor, Shee, Williams, Martin, Willes, Byles, Lush, and a Wide for those tired of the marriage tie.

PROFESSIONAL SPARRING.

STB.—I am happy to find you set your back against allowing your periodical to be used as a sparring ground between professional men. If they have not sufficient self-respect it is well they should have the means of lowering the tone of the profession taken out of their hands.

AN OCCASIONAL READER.

THE BUILDERS' BENEVOLENT INSTITUTION DINNER.

THE Twentieth Anniversary Festival in aid of the funds of this excellent Institution was celebrated on Thursday evening (31st ult.), at Willis's Rooms, St. James's. Mr. W. B. Rogers, president of the Institution, officiated as chairman, and about 200 gentlemen were present. After the usual formal toasts.

The Chairman proposed "Prosperity to the Builders' Benevolent Institution." He said that most of those present were aware that the Institution had been established more than twenty years, for the purpose of giving relief and granting pensions to unfortunate members of every branch of the building trade, as also to their widows; and during that period a vast amount of good had been done, owing to the very great judgment exercised in conducting and managing the affairs generally. The desire still was to increase the society's sphere of usefulness, by increasing the number of pensioners. He found that they had put by sums of money every year, which were invested in the public funds; and he had no doubt, when he addressed them, there would be a good deal more. He found that they had in stock 13,000l.; then there was the interest to be added to that amount,

and also the new donations and subscriptions, which, without going into details, he might say would be considerably over 1,000l. (The sum of 13,000l. mentioned was not of itself entirely for the pension fund, for out of that sum 2,900l. had to be set apart for a special fund for building purposes. He would not, however, go further into that question, but call the attention of the gentlemen present to the number of pensioners then upon their books, namely, 45; and he would also say that at each election several of the candidates who were unsuccessful had to wait for a second, third, or even a fourth time. And then, again, in order that the candidates might be eligible to the rules, they must be 65 years of age. That was not what the builders of London would be contented with. No person, according to the rules of the Institution, could be eligible to the benefits until he reached the age of 65; and then, having been elected, his enjoyment of the pension could only last for a few years, say (as he understood was about the average), ten years. He wished to alter that, and for the purpose more funds were required. That was the way it was to be remedied. He was of opinion that the pensioners should receive the benefits of the Institution before they reached so advanced an age. He would make it sixty instead of sixty-five. He was very glad to find such sympathy among them. The question then was, how it could be done. There was only one way. There were 1,300 builders in the metropolis, besides a vast number of other persons connected with the different branches of the trade, from many of whom who were prosperous and wealthy an annual subscription had not been obtained. If they were to subscribe, the funds of the Builders' Benevolent Institution would be greatly enhanced and the desired aim could be attained. When he (the Chairman) became their president his first effort was to endeavour to raise that important element—the funds of the Institution. He could see that those subscribers who gave one guinea might give two guineas, or even three guineas, if they made a slight sacrifice; for really it was no charity to give away that which they did not want themselves. If they had any doubt as to whether it should be two, three, or five guineas, all he could say would be, "Give the Institution the benefit of the doubt." He was about to call their attention to another circumstance, and that was the vicissitudes by which their trade was surrounded. Any master builder might be taken by misfortune, through no act of his own, and become so reduced that he might be necessitated to seek relief from that Institution; and he mentioned that for the purpose of showing how needful it was that they should look after their unfortunate brethren. A very distinguished architect, upon whom he (the chairman) had called, gave a good subscription; but he was surprised that the builders were not able to help themselves. He (the chairman), since he had become connected with them, had felt a great interest in the Institution, and had collected a considerable sum. He would tell them what that sum amounted to,—it was 1,000l. He had done that with a motive. He thought the building trade should have ample funds to relieve their distressed brethren. He wanted to increase the number of pensioners, and he wanted to increase the amount given. At present they gave 24l. to the men and 20l. to the women, per annum; but how much more satisfactory it would be if they could give them 30l. and 25l. He was quite content to believe that ample funds could be obtained for such purpose, for there was no want of sympathy. The want was,—more funds, more subscriptions,—to make the declining years of their unfortunate brethren happier and to obtain such result he suggested that each well-wisher of the Institution should call upon his friends and obtain his subscriptions; for means they required, and he was sure that, if sought for, the efforts would be crowned with success. He had obtained ten subscriptions of 100l. each, and he was sure that if applications were made, such examples as those he had just mentioned would be followed. They would give a subscription,—they would give something in proportion,—so that their own Institution should be first supported before going to another. The chairman resumed his seat amidst great applause.

The successive toasts were then proceeded with, complimentary speeches accompanying each.

Mr. George Plunkett having replied to the toast "The Treasurer,"

Mr. Thomas Cozens, the founder of the in-

stitution, expressed his sentiments on the procedure of the child—his child—which had now passed his majority (as stated by their worthy chairman), and he hoped that the "big boy" would be provided with funds to carry him on.

Mr. Benjamin Hadden, the late president of the Institution, as also other gentlemen, replied to complimentary toasts given to them.

Mr. A. G. Harris (the Secretary) then announced the donations and subscriptions of the evening to amount to 1,323l. 12s. 6d.

Books Received.

Examples of Chinese Ornament, selected from Objects of Porcelain, Enamel, and Woven Fabrics, in the South Kensington Museum and other Collections. By OWEN JONES. London S. & T. Gilbert, Cophthall-buildings. 1867.

SINCE the late war in China a large number of works of ornamental art have found their way into England, and old opinions in respect of Chinese art have been greatly modified. With thousands the willow-pattern plate was the limit of their knowledge in that direction, and a lesson could be drawn even from that, but, like a very distant object, it required pointing out before it could be seen. The best works from China that have reached England have been gathered up by the South Kensington authorities, Mr. Alfred Morrison, Mr. Louis Hutby, and others; and Mr. Owen Jones, indefatigable with pencil and brush, has transferred their ornamentation to paper, and by means of chromolithography has given it to the public in the shape of a handsome volume of a hundred plates, which may be regarded as a supplement to his remarkable work, "The Grammar of Ornament."

"We have long been familiar," he observes, "with the power of the Chinese to balance colours, but we were not so well acquainted with their power of treating purely ornamental or conventional forms; and in the chapter in 'The Grammar of Ornament' on Chinese ornament I was led, from my then knowledge, to express the opinion that the Chinese had not the power of dealing with conventional ornamental form; but it now appears that there has been a period in which a school of art existed in China of a very important kind. We are glad to think that this art must in some way have had a foreign origin, it so nearly resembles, in all its principles, the art of the Mahomedan races, that we may presume it was derived from them. It would be no difficult task to take a work of ornament of this class, and, by simply varying the colouring and correcting the drawing, convert it into an Indian or Persian composition. There is, of course, in all these works, something essentially Chinese in the mode of rendering the ideas, but the original idea is evidently Mahomedan."

We have no desire to see these forms adopted and reproduced as a fashion of ornamentation to last for a season or two, like a chignon or an invisible bonnet, and it would certainly not last longer. The forms are not generally good. Many of them are ugly, and in entire contradiction of a system of ornamentation of which Mr. Owen Jones has been one of the chief exponents. Our author, however, views, as the chief merit, their suggestiveness. They show how unnecessary it is to be content with the stock forms; and that many natural objects may be conventionally rendered in ornamentation without overstepping the bounds of propriety; and so far we go with him. In another direction we can go further still. The system of colour adopted is for the most part excellent. The scheme of colouring of the Chinese is their own. They deal with broken colours: pale blue, pale green, and pale pink for the masses; dark pink, dark green, purple, and yellow and white, in much smaller quantities. There is nothing crude or harsh in their compositions; the eye is perfectly satisfied with the balance and arrangement of both form and colour; but there is, as we have already remarked, an absence of purity in the drawing.

As to arrangement, as Mr. Jones points out,—

"In the Chinese ornamentation, triangulation is the main feature; the geometrical arrangement is absolute and undisguised, but softened by a free treatment of the intermediate spaces left by the triangulation."

The examples given are mainly from works in cloisonné enamel and painted china vases and bottles.

The taste and skill shown by Mr. Jones in the selection and representation are entitled to the greatest praise, and we shall hope to find our manufacturers largely benefiting by the lesson to be learnt from his elegant volume.

Verba Nominativa; or, Words derived from Proper Names. By RICHARD S. CHAENOCK, Ph. D., &c. London: Trübner.

ANY well-known words have originated in proper names, and it is well to have a record of them made from time to time before the origin of such words is forgotten. Mr. Charnock's is a very good dictionary of such words, and is both instructive and amusing. It contains many words of interest to our readers, though the origin of few of these may be new to professional men. Passing over all such words as *Albion*, *Doric*, *Ionic*, *et hoc genus omne*, we may instance such as *Derrick*, *Parian*, *Travertine*, *Granize*, &c. Under "Parian" the author has alluded to those statues and other articles of artificial and marble-like composition called Parian. Under the word *Cockney* we find some amusing remarks on its origin: cockney, he thinks with others, had something to do with that land of Coccagne where fowls roasted cry "Come, eat me." Under "Sallice" are some interesting remarks on the monkish practice of seeing friends in the most sacred part of their churches. *Hnmburg* traced to *Home* or *Hume* of the *Bogue*: it has nothing to do with another gentleman of that name of more modern date. *Hurrah* is a word which originally denoted "Paradise" having its origin in an Eastern battle, on the idea that who died for their country went straight to *Paradise*, or *Hur*, and the *Huria*, or nymphs of *Paradise*. The discovery of an ancient city of the dead, called *Hur*, in the district once called *Haldea*, where *Eden* or *Paradise* was supposed to have been situated, might have been alluded to under this head, as well as the obvious association of *Horris* or *Huria*, as the word has also been spelt, with *Hur*, and the Slavonic *hur-raj*, *Kingdom*, no doubt, of *Hur* or *heaven*.

Antiquities of Hastings and the Battle-field. By THOMAS H. COLE, M.A. St. Leonard's: Earl Burg, 1867.

THIS little volume contains some interesting matter as to Hastings. In Part I. the possibility of Roman origin is considered, an attempt is made to fix the site of the Saxon town, and the stage in Domesday book relating to Hastings investigated with special reference to the "New Burg" therein mentioned. Some materials have been given for determining the date of the battle of the arms of the Cinque Ports. From Part II. it appears that in the course of a careful examination of the Battle-field the writer was fortunate enough to discover a ravine which corresponds in every respect so exactly with the "dial fosse" of the "Roman de Rou" that the writer considers that it settles the *questio venata* in its position; and this appeared to be the general opinion, it is said, of those who examined on the occasion of the late Octocentenary Anniversary.

Miscellaneous.

SALE OF THE BRIGHTON OLD WORKHOUSE.—The building materials comprising the Old Workhouse Infirmary, at Brighton, and outbuildings, have been sold. The sale was attended by a great number of persons, and there were thirteen bidders; the several lots realising 773l. 1s. 6d.

WORK NEW METROPOLITAN STREETS ACT.—The Act for regulating the traffic in the metropolises, &c., has come into operation. Some sympathy is felt for the costermongers, and for the poor who are their chief customers. Meetings have been held at the East-end to take the case as to street dealers into consideration, and the advisability of presenting a petition to the Secretary of State, praying for the revision of the Act approved. The occupation of the "putting men" seems gone, and a good thing. Suspended to various lamp-posts at the corner of the principal thoroughfares in the city are "police notices" directing attention to the streets and portion of the streets" having special reference to the Act with respect to carriage traffic. The cab proprietors are making most determined resistance to the clause requiring them to affix lamps to their cabs at night. A protest, all those cabs which have hitherto carried lamps of an evening, principally the cabs, have come out without them. The cab proprietors also threaten that, if the police commissioner determines to enforce the observance of the clause, after a given day no proprietor will send on his cabs after dark until the order is withdrawn.

THE HOLY SEPULCHRE.—Letters from Jerusalem state that the works of reconstruction at the grand cenopia of the Church of the Holy Sepulchre are advancing rapidly.

THE NEW PARK FOR HOLME AND CHORLTON.—MIDLOCK.—Arrangements have been made for the purchase of the land for the purposes of a new park on the south side of the city. The sum of 24,000l. will be paid to Lord Egerton, the owner of the soil, the area purchased being sixty acres. Lord Egerton will give the street land, and the corporation have agreed to pay 5,200l. for the making of the roads, for sewerage, and for the necessary fencing of the streets on both sides.

ST. JAMES'S TOWER, TAUNTON.—The announcement that a faculty had been granted to take down and rebuild a portion of this tower, and to restore the remainder, was somewhat premature. The court has just decreed that a copy of a resolution of the vestry to raise the necessary funds for the work proposed must be filed in the Registry of the Court, before the faculty would be issued. It is considered questionable whether the funds will be forthcoming. The churchwardens, however, have advertised for tenders for taking down the tower, and as soon as they come in will call a meeting of the parishioners.

THE TRAMWAYS SCHEME.—The Islington vestry clerk, at a recent meeting of the vestry, read a communication from Messrs. Noble & Co., the promoters of this scheme, stating that they intend to fix notices of their intention to apply to Parliament this session for powers to lay tramways in Archway-road, Holloway-road, Upper-street, High-street, City-road, Seven Sisters'-road, Camden-road, and Park-road, and inquiring if the vestry wished to give any instructions as to how those notices should be posted. Mr. S. Smith thought Messrs. Noble & Co. should conduct their business in their own way, and the vestry resolved to take no action in the matter.

AN ELECTRO-MAGNETIC "DIVINING ROD."—An American, according to the *Hamilton, C.V., Times*, claims possession of the secret of a wonderful discovery for making subterranean explorations from the surface for mineral deposits by the application of electro-magnetism. The apparatus, as described, will indicate the direction of the bulk of a mineral vein at any depth, and affords a principle for calculating the species of the ore and the richness of the deposit. The direction of mineral deposits, when away from any railroad line, which exerts a counter attraction of great power, is indicated at a distance of several miles. The remarkable success of an American silver mining company in the Lake Superior region is attributed to this discovery.

TUNGSTEN, IN DRILLING ROCK.—It is proposed by Mr. E. Gaudin to substitute tungsten for the black diamond employed for drilling rock. Mr. Gaudin prepares from tungsten, in a flame supplied freely with oxygen, a substance far more brilliant than the ruby, and which will pulverise the hardest granite quite as readily as the black diamond. Numerous experiments, it is said, have shown that it can be obtained in any form and of any dimensions without difficulty: it is equally applicable for drilling rocks and for working tempered steel, and even white cast-iron. We should think, however, that if it be far more brilliant than ruby, and attainable of any dimensions, its value as a precious stone would far exceed its money-value as an article of purchase for any other purpose in the mean time.

THE CHESTER CATHEDRAL BELLS.—Five new bells have been formally received at Chester Cathedral, and added to the three remaining there, so that there is now a peal of eight instead of five as before. The ceremony of depositing them was witnessed by a large concourse of spectators. The new bells weigh 32 cwt., the same weight, and said to be of the same sonorous tone, as the old one. It contains the following inscription:—"Benevolent! Civium ergo Decanus F. Anson, S.T.P. Warner et Fil. Loudini." There will now be a peal of eight bells in the belfry. It is proposed to form a Bell Ringing Association, consisting partly of amateurs and partly of paid ringers in connexion with the cathedral. The bells having been suspended in the cathedral, the Dean addressed the people who had assembled together respecting the reception of the new bells. The large bell has been contributed for by the citizens of Chester as a mark of respect to the late Dean, Dr. Anson.

PORCELAIN GLASS.—The New Bedford Glass Company (U.S.) has recently begun to manufacture porcelain glass for photographic plates. They are blown in hollow cylinders 4 ft. long, cut longitudinally, flattened in a furnace, and cut into plates of the required size.

ARCHITECTURE AT THE ROYAL ACADEMY.—Professor G. G. Scott will give a course of three lectures on Architecture this season, commencing on Thursday, January 23rd. The first course of the season will be by Professor Westmacott, on Sculpture, and will commence on Monday, the 11th instant.

BUILDING-BLOCKS, AMERICA.—The New Haven Building-block Company are manufacturing patent brick, having a long, narrow slit, or air-chamber, which they claim will keep buildings constructed therewith cooler in summer and warmer in winter than when built with ordinary brick. The bricks are made of a mixture of cement and shell lime.

AN ARCHITECTURAL SOCIETY FOR SHEFFIELD. A meeting of architects was held at the council hall on Monday morning, when it was resolved to form an architectural and archaeological society in Sheffield, to be composed of architects and gentlemen interested in the objects of the society. After preliminary matters had been discussed, and several resolutions passed, the meeting was adjourned.

ENGINEERING BEAVERS.—A paper was recently read before the American Association for the Advancement of Science, which stated that on the southern shore of Lake Superior, in Marquette county, Wisconsin, were found remains of long canals and dams constructed by the beavers for the purpose of transporting their outtings, consisting of trunks of trees, 2 ft. or 3 ft. long, from the places where the trees had fallen to their lodges. Some of these canals were 300 ft., 400 ft., and 500 ft., long. They were generally 3 ft. wide, with an average depth of 3 ft. In order to maintain a continuous depth of water, they made dams at certain distances, and followed the Chinese plan—to whom the lock was unknown—of drawing their cargo from one level to another.

LIVERPOOL ARCHITECTURAL SOCIETY.—The third meeting of the present session of this society was held in the Lecture-hall of the Royal Institution on the 30th ult. Mr. Kilpin in the chair. Mr. J. A. Pictou said he had lately made a pilgrimage to the village near Conway, which was the birth-place of John Gibson, the sculptor, and he looked in vain in the church for any monument of the artist. An idea had forced itself upon him that the Royal Academy, to whom Gibson had left all he possessed, should erect a monument to his memory in his native place; and, if they did not, he thought Liverpool would do itself honour by subscribing a small sum for the erection of a mural monument in that place to the memory of the eminent sculptor, whom, without much violation of fact, they in Liverpool might call a townsman of theirs. Mr. Pictou and Mr. Boulton agreed to co-operate and take initiatory steps to carry out the object.—The paper of the night was by Mr. F. Horner. The subject was "Notes on Progress in Architecture and the Arts."

THE GREAT CATTLE MARKET FOR PARIS.—The large market at La Villette, on the outskirts of Paris, for the sale and slaughter of animals used for food, was opened on the 21st of October. The constructions completed consist of three immense halls, built much in the same manner as the great *halles centrales*, at the east end of the Rue St. Honoré, that is to say, principally of corrugated iron and glass. The central hall is for horned cattle, that on the right hand for calves and pigs, and the other for sheep. Near the halls are two large streams of water, with sloping sides, through which the cattle are driven and thus refreshed, and beyond are large labyrinths and pens. The present market will contain upwards of 40,000 animals of all kinds, and when the buildings are completed half as many again. The establishment includes an exchange, a bank, and a *café restaurant* and *buffet* now in course of completion. The dealers draw lots every morning for the places which they are to occupy in the halls. The means of communication are admirable. The establishment stands close to the circular boulevard which lies round Paris, just within the fortifications, and has on one side a canal, and on the other the *Chemin de Fer de Ceinture*, which communicates with all the great lines of railway and all parts of the capital.

THE LATE PROFESSOR M'GAULEY.—We are glad to hear that a fund, to be called the M'Ganley Memorial Relief Fund, is being raised for the assistance of the widow and family of the late Professor M'Ganley, editor of the *Scientific Review*, whose death was recently announced. A committee, of which Sir David Brewster is chairman, is associated for this purpose, and particulars will shortly be made public.

PROPOSED RESTORATION OF DUNSTABLE PRIORY CHURCH.—There is a necessity for restoring this church, which is in some respects in an unsafe condition, but there is a difficulty in obtaining the means of doing what still requires to be done. The inhabitants are chiefly of the working classes, and have already contributed altogether nearly 3,000*l.*; and the county, and the public generally, are appealed to in the *Bedford Times* for aid in the work. Besides 1,700*l.* immediately wanted to complete the roof according to the plans, the east-end gable must be taken down and rebuilt, the north aisle repaired and lengthened, and the whole church repaired and fitted with new seats. Besides all this, the exterior much requires attention and restoration.

THE KERMESSE OF TENIERS.—The museum of Brussels has just made an important acquisition. A picture by Teniers, of a character such as is not to be found save in the collections at St. Petersburg and Vienna, has been for many generations in the possession of a family of Antwerp, handed down as an heirloom, and preserved as a sacred heritage. All the great amateurs of Europe have long known of this picture, and large sums have been from time to time offered to induce its possessors to part with it, but always without success until now. The subject is a Flemish feast, and the host or seigneur is Teniers himself, who is accompanied by his wife and two daughters. The Musée of Brussels have paid 125,000 francs for it.

IMPROVEMENT IN THE STEAM-ENGINE.—An invention, said to be of great importance, has been successfully tested, in the presence of a company of engineers, scientific men, and others, at the engine factory of Mr. Smith, Holborn. The most remarkable circumstance in connexion with the scheme is that the inventor (Mr. Alexander Cesar F. Franklin, junior) is a young gentleman of the tender age of thirteen! His invention is thus described. "By applying the steam to one side only of the piston a vacuum is caused, without condensation, as in the old low-pressure engines; and the cushions of ordinary high-pressure engines are done away with. The opposite end of the cylinder is left open, and the pressure of the atmosphere—15 lb. on the square inch—forces the piston back again. Irrespective of this pressure, the saving of motive power is exactly one-half." In speaking of "the immense value of Mr. Franklin's discovery to navigation, if it be successfully brought into practice," it is added, "the effect will be to dispense in most instances with any need of coal-stations on long voyages." But where is the novelty in "applying the steam to one side only of the piston?"

ARTISTIC INSTRUCTION.—Professor Leone Levi recently gave a lecture at King's College, London, on the need of extending artistic and technical instruction in the United Kingdom, and concluded his observations by stating that, with peace and progress in Europe in the last half century, a complete metamorphosis has taken place in the productive powers of the principal countries; that, after vain attempts to prop up manufacturing industry by restrictive legislation, most nations have accepted the economic axioms of Adam Smith and Stuart Mill, and have acted on the policy of free trade; that such freedom of trade has opened for British manufactures the commerce of the world; that, with the extension of mechanical knowledge in all countries, and the facilities of communication, British prosperity must henceforth more than ever depend on the abundance of capital and a plentiful supply of skilled labour; that it is all-important to remove all obstacles and discouragements to the investment of capital in manufactures; that the unhappy difficulties between capital and labour, which have produced strikes and dissensions, demand a prompt remedy; that it is necessary to improve the education and elevate the mind of our labouring classes; that the system of apprenticeship, as prevalent in many branches of industry, is not a sufficient means for affording art instruction; and that the support now given by the State to the teaching of science is not sufficient.

INSTITUTION OF CIVIL ENGINEERS.—Mr. Edw. Byrne's paper, "Experiments on the Removal of Organic and Inorganic Substances in Water," which was read at the Institution of Civil Engineers before closing for the recess, is to be brought forward for discussion next Tuesday evening, the 12th instant, when the meetings of the members of this Society are to be resumed.

THE SEWAGE QUESTION.—The works in connexion with Mr. Piltrow's scheme for the drainage of the city of Canterbury, have commenced at the point where the outfall sewer is, and empties itself into the deodorising tanks. A staff of labourers are employed in making excavations.—The New York press are urging that the sewage of that city and Brooklyn, which now runs to waste, should be saved and applied to filling up the marshes which lie on the neighbouring shores of New Jersey and Long Island.

THE LATE EARL OF ROSSE.—The astronomical world has lately met with serious losses. In ten days Lord Rosse, Lord Wrottesley, and Sir James South have all died. Lord Rosse and Lord Wrottesley had both of them been presidents of the Royal Society, and the only scientific noblemen who have held that presidency for many years. Every one has heard of Lord Rosse's wonderful telescope. The discoveries made with it have been of great interest and importance; and the telescope is still unrivalled. It was made chiefly by Lord Rosse's own hands, and cost 20,000*l.*

THE "ACCUMULATOR" DOOR-SPRING. TRADE MARKS.—At the Central Criminal Court, before the Recorder, Henry Brook, ironmonger, was placed at the bar on a charge substantially of forging a trade mark with intent to defraud. The prosecutor was Mr. R. E. Hodges, of Southampton-row, who manufactured an "accumulator" door-spring. For this article Mr. Brook acted as an agent for eleven years; but in 1866, Mr. Hodges, not being satisfied with his conduct, refused any longer to supply him. The defendant then got a similar article made, and sold them in printed wrappers similar to those used by the prosecutor. The patent having expired in 1863, anybody was at liberty to manufacture the "accumulator;" but the charge was that he disposed of those of his own make under the representation that they were the prosecutor's. The jury returned a verdict of Not Guilty.

OPENING OF A NEW PARK AT CHESTER.—The new park, lately presented to the city of Chester by the Marquis of Westminster, was opened on Tuesday with great expression of the citizens' appreciation of the gift. The park has been in course of construction about two years. On the right-hand side of the principal entrance there is a lodge which is built in the timbered style, and corresponds in every particular with the ancient characteristic architecture of the city. In November, 1865, a subscription was originated for the purpose of erecting a testimonial of the public and private worth of the Marquis of Westminster. Upwards of 5,000*l.* were raised for this purpose, and it was resolved that the testimonial should take the form of a statue, to be erected in the new park, which at that time had been just commenced. A fountain has been erected over a spring known from time immemorial as "Billy Hobby's Well." The entire cost is said to be 70,000*l.*

THE LEEDS EXHIBITION.—We may as well make clear that this undertaking is exclusively for the illustration of the fine and ornamental arts, and that the works will be distributed as follows:—1. Three galleries of oil paintings by the old masters, and a collection of their drawings and sketches; 2. Two galleries of oil paintings of the English school by deceased and living artists; 3. A gallery of oil paintings by modern foreign artists; 4. A gallery of English water-colour drawings; 5. A gallery of portraits of deceased Yorkshire worthies; 6. A collection of miniatures; 7. A gallery of engravings, etchings, &c.; 8. An Oriental museum; 9. A museum of ornamental art, from the earliest British period to the close of the eighteenth century, including furniture, tapestry, china, glass, metal work, &c.; 10. A collection of marble sculpture. The building in which the display will be held is the new Infirmary of Leeds, lately erected at a cost of 100,000*l.*, its principal interior features being a large central hall 150 ft. long by 65 ft. wide, surrounded by corridors and galleries.

DERBYSHIRE MEMENTOS OF NIAGARA FALLS. A Quebec paper states that the Table Rock ornaments, sold at the Falls of Niagara, are manufactured from spar imported into America from Derbyshire in England.

FROM IRELAND.—The improvements at the rising town of Holywood, according to the *Delfast News Letter*, are rapidly on the increase. New houses are being erected on a large scale. Holywood ranks amongst the healthiest towns in Ireland. The town commissioners have lately constructed new sewers in every part of the town. The public buildings are all of modern erection. The parish church is immediately to be greatly enlarged, and ground has been taken for the new Roman Catholic chapel. The increase of the population, within the last few years, has been remarkable.

MONUMENTAL.—The marble statue of Andrew Marvel, executed by Mr. W. D. Keyworth, jun., of Hull and London, and presented to the town by Mr. Winship, has been inaugurated at the town-hall, Hull. The ceremony took place on the ground landing, where the statue has been placed.—A statue has been inaugurated at Rotterdam, to the memory of Count van Hogen-dorff, the statesman who went to England to offer the crown of the Low Countries to William of Orange, son of the Stadtholder, William I. The King of Holland, the Prince of Orange, the ministers, and the principal personages of the kingdom were present at the ceremony, which was presided over by the burgomaster of the place.

TENDERS

For the erection of a pair of detached country houses in Croydon-road, Pease. Mr. H. Wiber Webster, architect:—

Foxon & Smith	£1,992 0 0
Alterations to the Vulcan Tavern, Salmon-lane, Limehouse, for Mr. John S. Easay. Mr. Arthur Harston, architect:—	
Heiser	£1,331 0 0
Hearle	1,275 0 0
Johnston	1,233 0 0
Palmer (accepted)	1,215 0 0

Alterations and reinstatements after fire at Vulcan Cottage, Frederick-street, Limehouse, for Mr. Easay. Mr. Arthur Harston, architect:—

Clemmas	£228 0 0
Allen	204 0 0
Heiser	190 0 0
Hearle	185 0 0
Bullock (accepted)	145 0 0

For building house, shop, and dairy, Whitehorn-street, Bromley, Middlesex, for Mr. Sharpley. Mr. Arthur Harston, architect:—

Brown	£237 0 0
Heiser	715 0 0
J. Allen	664 0 0
Golding & Son	600 0 0
W. Allen	555 0 0
Salt (accepted)	535 10 0

For building public-house, boundary wall, and fencing at Nunburnham, Peckham, for Messrs. Day, Noakes, & Sons. Mr. H. Alexander, architect:—

Public House. Wall. Fencing.	
Eustace	£247 ... £45 ... £28
Waterer	910 ... 60 ... 24
Tarrant	894 ... 68 ... 27

For additions and alterations at the Ship Public-house, Erith, for Messrs. Day, Noakes, & Sons. Mr. G. Elkington, architect:—

Blissfield	£560 0 0
Tarrant	555 0 0
Willis	540 0 0
Falkner	530 0 0
Eustace	493 0 0

For alterations to 18, Great Portland-street, for Messrs. G. Hague & Co. Mr. W. E. Potter, architect:—

Tozer	£187 10 0
Stephens & Watson	178 0 0
Gill	170 0 0
Perkins	158 0 0
Ashley (accepted)	150 0 0

For building a house at Beckenham. Mr. James L. Pedley, architect:—

Howard	£2,068 0 0
Messrs. Browne & Robinson	1,987 0 0
Messrs. Breeze & Russell (accepted)	1,688 0 0

For new shop-front, No. 26, Down-street, Piccadilly, for Mr. S. Benjamin. Mr. Joseph S. Moye, architect:—

Wyatt	£237 0 0
Bywater	178 0 0
Barnett (accepted)	170 0 0

For Building a public-house for Messrs. Vallance, Catt, & Co., at Brighton. Mr. Tappet, architect:—

Patching & Son	£1,945 0 0
Lockyer	1,635 0 0
Cheesman & Co.	1,620 0 0
Assonnie & Newham (accepted)	952 0 0

The Builder.

VOL. XXV.—No. 1293.

Coloured
Architecture.

IN the exposition of the claim of colour to contribute to harmonies which are the essence of music in the largest sense, we had but little occasion to refer to that theory of harmoniousness that refers all success to the admixture of colours in the proportions that constitute white light. This theory has had, at least, its fair share of prominence; but the combinations that have been most influenced by it, if the truth must be told, have not been so conspicuously satisfactory that we should be blamed for approaching the subject from another side. Beauty produced by a formula will seldom be worth very much, but it will be worth least of all when proposed to be

brought about by applying a rigid formula, and the works referred to hear too frequently the impress of such origin. From the seed so sown a more plentiful crop has sprung up of discords than of harmonies. Advancing to the analysis from another side, we were led to take note that every possible shade of every possible colour might take its place in a series along which the eye might travel from beginning to end,—encountering no sudden shock, turned back upon no harsh revulsion. Pleasingness of combination and pleasingness of transition are in colour as in sound the essentials of harmony and melody,—the negations of discordances. But discordances are continually inflicted on us by those who, having set their palette of architectural colours by the sanctioned rule, scatter its assortment of tints too much at random, and manage at last to fail as often by tame opposition as by harshness in absence of softening gradations.

Before, however, adverting to any of these failures, a few words may be given to the mischief which, so long as it lasts, must ever move a previous question in every discussion of colour, good or evil. Harmony of colour pre-supposes comparative parity of colour, and how can this be secured against the double invasion, from the road below and black-charged skies above, of all defiling dirtiness? While the causes that induce this subsist, we must,—at least in our cities and large towns,—limit our ambition for harmonies of colour: much of the only satisfaction we can hope for will be, that we do not make matters worse or invite the enemy that destroys us.

It is on this ground that brick has so much to answer for in the gloominess and griminess of aspect of many otherwise noble streets. Some-

thing may be done, no doubt, by excellence of material and workmanship, by closeness of texture, evenness of face, and fineness of joints. Something, again, might be done by an alteration of proportions of the brick; a flatter proportion would not only confer an appearance of general fineness to the construction and also solidity by subjecting each individual brick to the manifest bite of a greater number and a larger circumambient mass; but the very reduction of the difference in area between the face of the brick and the mortar-seams adjacent would enhance the sense of bond, and then a more general average would result of stains and discolorations on the bricks; and the colour of the seams, however fine they might be made, would become capable of contending in some degree with that of the plain surface they surround. After twenty years the memory lives in the mind of the sense of repose conveyed by large and plain hillings at the Hague, for which no other explanation could be given but the value of the long flat bricks. These suggestions leave aside, of course, the consideration of what sized brick will do for all constructive purposes,—will be most economical of labour in handling and brick-laying,—

“Oh, reason not the need [says King Lear], our best beggars
Are in the poorest thing superfluous;
Allow not nature more than nature needs,—
Man's life is cheap as beast's.”

and his dwelling will be scarcely dearer; and we shall descend even lower again from that style of accommodation in which some of the noblest of the land might seem at present less to be housed than warehoused.

Do what we will, however, brick, as we have it, will still absorb damp and harbour dirt, and even lodge lichen-growth. We by no means wholly escape from these evils when we move from brickwork to stone; and here there is the further disadvantage that stone can scarcely be becomingly introduced into architecture without some acknowledgment of its dignity by carving; and to nooks and crevices that are provided in abundance by a capital or a frieze, fly at once all the unhandsome miseries and abominations of our atmosphere,—like the heaped unhappiness and nihilness that huddled about the altar of Pity in the Agora at Athens, or took sanctuary at Westminster in the bright Middle Ages.

We can scarcely hope, then, for anything but palliations until after the suppression of coal-smoke, which those of us who are younger need not despair to see—if they will persist in reiterating the *delenda est*.

If brick be taken at its very best and under best circumstances, it is capable—we may not only say with memory of Roman ruins in our minds—of dignity, but of harmonies of colour of considerable value. For illustrations of this we must, it is feared, rather look to the works of the past than of the present. We demand colours good in themselves, and then in effective combination. Walks may be taken of no little interest in search of examples through the older streets of London that were once fashionable, and are still sometimes genteel, though often no better than highly respectable. Good bricks well set together will be here found, and often of a colour that may be safely accepted as original—as unchanged and very agreeable. The colour of the brick is the complexion of the future dwelling, and should no more be left to chance even within several shades than the colour of the same house would be if it were introduced by a painter into a picture. Rawness, coldness, crudeness, seem to be the opprobrious words that rise most readily to the lips when we are moved to revile brick architecture that offends us. The disagreeableness they indicate is very happily corrected in the best of the examples we refer to, by a clear warmth, not without obligation to an admixture that gives faint suggestion of an

orange glow. The uncleaned accretions of years do injury to the best examples, which it is easy to see, even now, only require the healthy application of a bath from a powerful fire-engine to discover themselves in all the grace of a tone as fresh as ever was recovered in an old master from under the brown varnish of Sir George Beaumont. The same process would reveal that no little, though by no means perfect taste, was exercised in the associated colour of bricks at the angles, edges, and borders of windows. In the distribution of these there is often much to desire; but in the selection of colour there is rarely a failure of harmoniousness. There can be no greater contrast to much of modern practice. The associated colours blend by the gradation of relationship,—we had almost said of consanguinity,—do not start asunder and fly into the fragments of repulsive contrasts and antagonisms. From one colour to the other we should not have to travel far if we compared the route between them upon the consecutive spiral of the diagram demonstrated in our previous article. The sin, as it seems to us, of too many later attempts at polychrome in architecture lies in harshness of contrast,—in breach of sequence. Contrast clumsily attempted ever founders on a discord. Black voussoirs alternating with cream-coloured, and not even kept in countenance by any analogous broken alternations elsewhere, are as painful to the musical eye as was ever unprepared and unresolved discord on the ear. The choice of the contrasting colour has to be sustained by appropriate place,—by happily proportionate mass. When these points are neglected or ill-managed, the eye is attacked—the word is not too strong—by the intrusive glare; is left without any intermediate help to escape; is carried away to other parts only by violence of will instead of spontaneous solicitation; and is teased by the apprehension of again encountering its enemy; worried by vagrant lines of red and spots of blackened angularities that defy all rational rule, as vexatiously as if it were pursued by a tormenting and dazzling reflection. To such baited misery, tameness is a relief, and insipidity for a moment passes with approval for sobriety; but why should we be exposed to either one or the other? Wearied by a reader or a declaimer, who is lavish of emphasis, but ever gives the distinction to the wrong word, the wrong clause, we may accept with gratitude for a time—through this it is not impossible to sleep—unaccentuated monotony or drawl; but when we escape from both in no moderate discontent, we are, if wise, no nearer to renouncing faith in the possibility of either true eloquence or coloured architecture as verities in art.

When stone is associated in the same work with brick, we may observe how all-important it is that its permanent colour, or that which it is sure to assume, should be duly allowed for in the colour of the brick selected. How the transition from one to the other is best managed—especially how the immediately adjacent mortar-beds can be masked by moulding or projection, and must be, at peril of much offence, is matter that belongs elsewhere: enough if it be noted here that unless some relationship of tone and hue is within reach, it were better that any presumed enhancement of dignity to the inferior material should be sacrificed, and the nobler left in its quarry or cast into the sea.

The permanence with which red granite preserves a high polish in a London atmosphere has recommended its employment in very costly and important external enrichments chiefly in the form of columns free or attached. The beauty of the material renders it a matter worthy of most careful study to secure for it a place and surroundings in every way appropriate: this can scarcely be unless in a building of any importance it be applied in such abundance as to

preclude the appearance of being but a *purpureus pannus*, and the effect of simply branding the general material with poverty by its implied costliness and rarity; the next condition is that when rightly applied in place and in quantity it shall be duly supported by the associated colours.

It is difficult even for an ardent admirer of Early English architecture to acquit it of having set but an unlucky example in its use of Parbeck shafts. The colour of these is ever in harsh contrast with the masonry contiguous and connected with them, and whether in the pillars of Canterbury or Ely, or in the pillars of the Temple in London, we shall fail to do free opinion justice if we accept the combination as harmonious. In some former papers on architectural development we showed how the application of Parbeck affiliated on the precedent of Pisa; but England failed in a wealth of varied marbles to complete the ideal. An age in which imitation and revivalism cannot but have important sway amidst reviving enthusiasm of ancient monuments, has ever to be on its guard against reviving the erroneous and taking the immature and the mistaken for models. We would say boldly that the Gothic architects never did full justice to any one of their styles; before they had perfected one by elaborating its best capabilities and revising its defects, they were carried off by suggestions of novel forms, and pushed on an improvement at once so rapidly, that it came out forthwith as blank substitution. If this be so, the task of the modern Gothic architect who selects a period for special attention should be quite as much to correct and complete as to imitate his master. How far he is capable of such a function he will have an opportunity to show, in his treatment of Parbeck shafts, as well as many another detail. Gothic apart,—there is much the same objection to the position of polished granite shafts where by splendour and permanence they shame the poverty of the stone above them and around, that is always taking stains and variegations from the atmosphere even when not suffering in surface as being "soluble in soot and water."

We see dust and weather-stains so far cooperating in some instances, that while the sheen of the granite is reduced, and its colour deadened, the stone of the building acquires a yellowish tone, that helps to some appearance of a ruin. But this is not architecture, any more than a sweep's dirty face is fall dress.

It is his seldom we see these enrichments without being tempted to cry, would there had been more or less. Costliness fails fatigued even before it has accomplished the column; and to escape a harsh discord, not merely in quality of material but in colour, we demand both for ease of transition and as matter of keeping that it should have such a bronze base as was familiar in Sicily to Pindar, and a bronze if not gilt capital. If any part whatever of the column is to be exceptionally rich, it would seem that it should be the naturally rich and conspicuous capital and moulded base. To leave these poor conveys the intimation that extravagance has made a vulgar blunder, and, exhausting its purse upon an equipage, has nothing left for horses.

OUR DAILY BREAD.

THE subject of the supply of food to the population of the United Kingdom is one which the annual increase of that population renders every year more important. Nor can we measure that increase by the moderate augmentation of some one per cent. per annum, indicated by the total of each successive decennial census. The ever-increasing complications of modern civilization, the strain put upon the productive power of Europe by the diversion from agriculture to military occupation of 4,000,000 of the flower of her youth, the competition of all manufacturing art with the patient toil of the farmer, and, perhaps more than all, the insatiable rapacity of speculation, tell with formidable weight on the exertions of the bread-winner.

The mother-idea, as our Continental neighbours would term it, of the British school of political economy, was that of the difference in the ratio of increase between consumption and production. In this, as in all theories which start from a single assumption, practice differs widely from hypothesis. The difficulty under certain given circumstances the difficulty feared by Malthus might arise, may be freely granted. That in a country which is a very hive of industry, and of which the ports are freely open for

the reception of the harvests of the world, an increase of the inhabitants should be, were all things wisely ordered, anything but an increase of wealth, may be unhesitatingly denied. Of all the products of civilized life the mature, healthy, educated man or woman is the most precious. It is that without which no other product has any value at all.

To secure this ultimate product of civilisation the first and most important requisite is an abundant supply of cheap and wholesome food. Increase in the price of food, or, what is the same thing, diminution in its quantity, or the deterioration in its quality, is instantly felt, and the immediate tendency of such a change is the deterioration of the race. Brought to a certain pitch, such a change is the sure cause of political convulsion.

That continental government which assumes to be the ultimate expression of the popular will invariably keeps a watchful eye on the supply of food for the people, and is accustomed directly to interfere when the price of bread threatens any notable rise. In our own country any such interference on the part of the Government is inconsistent with our habits, and foreign to our political forms. But it by no means follows that the supply and the demand will equalise themselves with the happy propriety promised as by political economists. It is true that the opposing interests are altogether disproportionate in their magnitude. The want of cheap and good food is universal. The benefit to be derived by individuals from the rise of price or from the adulteration of quality is disproportionately small in comparison to the injury inflicted on the consuming public. But, on the other hand, that small benefit is divided among so small a number of persons that the amount which may be received by each of them is very large. There is, therefore, a very powerful inducement to the formation of such an organised system on the part of the suppliers,—not the producers,—of food, as the consumers can only meet by some sort of counter organisation. In other words, the tradesman's profit has become disproportionately high. The difference between the wholesale and the retail price, between the sum which the farmer receives for his beasts and his wheat, and that which the butcher and the baker demand for a joint and for a loaf, is too great to do no more than cover the proper risks and profits of trade. Butcher will not undersell butcher, or baker, baker, because it is more to their interest to arrive at a common understanding, and to keep up the price of their commodities against their common prey,—the public.

The above statement is not matter of mere opinion. Not a season passes without the attention of the public being more or less forcibly called to the subject, by such means as the comparison between the London price of meat and that charged by the West-end or even by the country butcher; and the remark of the steady maintenance of the items of the baker's bill, in face of a fall in the corn market. But exposures in the newspapers effect little, unless it be by turning more and more the attention of those to whom domestic economy is important to the practical application of that remedy which lies nearest to the hand.

In every speculation, and in every kind of business, profit is in some sort dependent on risk. Risk and profit might be spoken of, in mathematical language, as "functions" of one another, were it not that the latter is generally so contrived as to increase much more rapidly than the former. The increased profit, in business as well as in the lottery system, generally far exceeds the increase of risk which forms its pretext. In this fact lies the secret of the large fortunes which are now so rapidly accumulated in trade. The risk of the tradesman, who is sufficiently at home in his trade to understand the art of purchasing his wares, may be reduced to two items,—want of custom and bad debts. If we except the risk of pilferage from his own servants, and suppose the salesman to be fit for his trade, he can only lose either from having his wares left on his hands from want of custom, or from having them taken off his hands by customers who subsequently fail to pay him for the goods. If these two sources of risk can be eliminated, the profit of a tradesman may be calculated with the most exactitude. It will depend, to a certain extent, on the amount of his business, because a certain fixed expenditure in rent, wages, &c., will have to be divided over a larger or less difference between income and expenditure; but we are supposing the magnitude of the business to be to some

extent determined beforehand, when we speak of avoiding the risk of want of custom. Let a man be assured that he shall have a steady demand for so many pounds, hundred-weights, or tons of food or other merchandise per week, and let him be assured that he shall be paid for such demand down on the nail, and he can afford to be satisfied with a very moderate per-centage upon the wholesale price.

This practical piece of political economy has been acted upon, with the best results, by some of the co-operative associations of the day. There are signs that the attention of the consuming public is being more and more steadily turned in the direction of self-protection by association. Of course the danger will arise, as we have not infrequently pointed out, of the waste of money from want of experience, or from want of faithful service. A number of householders uniting in a meat association, and appointing their own agent to buy and to manage for them all, are very much at the mercy of such a manager; and if they light on an incompetent or a dishonest agent will be likely by and by to sneak back again repentant to the triumphant butchers, who will, no doubt, celebrate the return of the converted prodigals by the addition of an extra halfpenny or penny to the price of the pound of meat. The great source of loss in all undertakings that are carried on by subscribed associated capital, namely, the want of a sufficient personal interest on the part of the manager, must never be forgotten by those who seek to save or to gain money. They must take care that the principles of human nature are acting for, and not against, their enterprise, or human nature will win in the long-run, and the enterprise will come to an end.

It is, therefore, rather by the association of a respectable body of customers, on the one hand, with respectable and selected tradesmen on the other, than by means of more directly self-originated undertakings, that we hope to see a reform in the supply of food. But such enterprises must have, in order to be sound, a certain degree of restriction. There must be a reality in the membership, if there is to be any position and permanent advantage to be derived by the members. A co-operative association must not sink into a mere means of advertising certain tradesmen. Above all, it seems important to insist on exclusive ready-money transactions, and that for a twofold reason: one is the avoidance of risk, for even with a weekly payment there is a certain amount of risk—a definite maximum, it may be, but still an appreciable item in the balance sheet; the other is, that the man who pays cash trades on his own capital. The returns are rapid. Pay day by day, and your shilling is turned daily by the tradesman, and earns its daily profit. Pay once a week, and the shilling is turned only once, instead of six times. The risk may be little; the time is very short; the bank will readily find the money to conduct the short credit business; all this is true. But it is no less true that 100l. daily turned over will earn just six times as much in a year as 100l. weekly turned over. If we are seeking for economy do not let us neglect so obvious an element.

With the function of the retail tradesman the supply of the family at the smallest remunerative advance on the *bona fide* wholesale price of the chief articles of consumption the question by no means ends. The full light of publicity has to be turned on the sources of primary production. Some producers, many, it may be, object to this. Farmers refuse to give information as to the acreage devoted to various crops, and resent what they consider an unwarrantable interference with their own business. Let them rely on it that they are wrong in so regarding it. They thus injure the consumer, and by no means benefit themselves. Ignorance is hostile to the true interest of either producer or consumer. Such a proposition, nakedly put, is self-evident. There is, indeed, a class of people who live upon that ignorance; it is the class which, known to our ancestors by odious names of forestaller, regrater, and the like, now dignifies itself by the name of speculator. We do not speak of that free and open speculation which is the life of all commerce—the fair risk which the merchant knowingly runs, and for which he deserves to be fairly remunerated. But it is the speculation which has prolonged the panic of 1866 to the winter of 1867; it is the unrighteous and accursed speculation which broke bank after bank that men might make money by the depreciation of shares, and grow fat upon the ruin of families, that we deprecate. The man who sells

that which he has not—cotton, iron, wheat, shares—in the intent, which he forthwith sets himself to work to carry out, *per fas et nefas*, so to force down the prices as to buy a week hence at a lower value than that for which he sells, or the man who buys that which he cannot pay for, in the hope that he can puff his purchase into imaginary value before he is called upon to pay,—these are the men, and these alone, whose interest it is to close the eyes of the public as to the actual operations of yearly husbandry.

With statistical knowledge of the actual state of our agriculture, should be associated full information as to the most reliable improvements in husbandry. Very much has been effected within the last ten or fifteen years. A ride or a drive through an agricultural district now, is very unlike what it used to be. If the progress of the railway system has, unfortunately, been brought to a stand, such is not the case with that of the steam plough. Drainage is annually adding to the productive acreage of England a far more certain gain than that effected by such operations as the annexation of Nice and Savoy to the French empire, at the cost of fifteen years of imperial rule. New manures, and, better still, the intelligent use of the refuse of our great cities, are only commencing their beneficial service, and the chemical investigation of soil, and scientific application of the deficient elements, in each particular case, are raising farming to the rank of practical science.

Connected with this application of science to agriculture, are the labours of the naturalist. Acclimatization, which hitherto has for the most part been studied for the sake of ornament and luxury, is more and more attracting attention for economical purposes. In our colonies and foreign dependencies, this is, perhaps, more the case than in Great Britain. The extension of tea and coffee culture in India has had a sensible effect upon the home market. The encouragement of the growth of cotton has received a powerful stimulus from the past campaigns of the American civil war. Perhaps the most noticeable of all similar efforts has been the safe conveyance, under circumstances of peculiar danger and difficulty, to suitable climates in India, of the seed and seedlings of the cinchona, and the successful inauguration of a new and domestic source of the invaluable drug quinine. In England itself we have welcomed the visit of that marvellous stranger, the *Raphanus Cavdata*, the new radish, with pods that grow with visible celerity, the very bean-stalk of the fable! We are just now witnessing an amusing newspaper discussion as to the merits of a new cereal, the Chinese sugar-grass, which disappointed purchasers declare comes up only by aid of the hot-bed, and is worth nothing when it has so come up. We are receiving lessons from the growers of Normandy pippins and *Bon Chrétien* pears as to the more productive management of our orchards. In kitchen horticulture, as well as in floral horticulture, our gardeners seem arriving at great power of modifying, and, in many instances, improving the ordinary operations of nature. That this skilful attention may be directed with the best results to the wider field of agriculture, we have at least two very notable and luminous proofs. One is to be found in the magnificent growth of giant turnips that has been attained by the carefully repeated process of selection of seed from none but the finest plants; the other is the similar result of a similar care in the case of wheat. The instances which we have quoted are enough to encourage the hope that we are but on the threshold of a very marked and beneficial improvement in the results of agricultural study,—an improvement which will combine the naturalisation and successful growth of plants hitherto strangers to our soil, with the transformation of those long cultivated among us into highly improved varieties.

We have left no space to speak of that which was chiefly in our thoughts on taking up the pen,—namely, the improvement in water-farming. Everywhere, indeed, by land as well as by water, the increase of scientific knowledge is leading men to respect more, and to destroy less, the works of God. The grouse disease of the present season has called attention to the ill results of a wholesale destruction of the birds of prey. But our rivers have suffered far more than our forests and bedge-rows, and that from the double cause of the wanton and greedy destruction of the fish, and the pollution of the streams by sewage. In both of these respects we have brought legislation to bear with visible success. The care of man, directed to the artificial hatching of fish,

is restoring the salmon to those rivers from which unardonable neglect has allowed this king of fishes to be driven. Even the Thames gives promise of a return of these noble migratory fish, and there is reason to hope that within a few years they may become common in many of our inland waters. It is, indeed, time that we should try to restore the fish to their element, or the element to the fish, for it is announced that we are at the end of our oysters. So vigorous has been the onslaught of the dredges, that the beds are exhausted, the price of the natives is becoming fabulous, and, without the scientific aid of the oyster farmer, the eaters of that nutritious mollusc will be driven to depend on the supplies furnished by the French and the Italian bays and lakes. Look where we will, the need of man has so far impaired the wealth of the uncultivated stores of nature, that he is called upon to labour in order to replace the waste. He has so far subdued the earth, that he has no time to lose in tilling her surface and in replenishing her stores.

MR. HENRY COLE'S ADDRESS TO PARIS ARCHITECTS.

THE opening meeting of the *École Centrale d'Architecture* in Paris was held on the 12th inst., when Mr. Henry Cole, C.B., delivered a discourse in French. We English it thus:—"Readers of the Bible, at your Universal Exhibition, thanks to the Emperor, you know well that no one is a prophet in his own country. If the South Kensington Museum were endowed with life, it would on this occasion express to you an once unshared and gratitude for the gracious consecration that you give to it in my person. In its own country, the museum has had to fight for its life. Parliament pays, but discusses seriously its existence, besides salutary opposition. An ignorant public, it is true, delights itself in filling our galleries; but in England our high priests of architecture have crucified the author of the designs for the museum buildings,—Captain Fowke, to whom, nevertheless, the International Jury of your Exhibition has awarded a gold medal of the first class. Finding myself in the midst of friends of the museum, as I flatter myself you are, allow me, notwithstanding the quality of my French, as well that I am not an architect, to say a few words to you on architecture. I ask myself why you have done me the honour of requesting me to preside over you, and I imagine I have found the reason in a certain analogy that exists between your Central School of Architecture and our museum at Kensington: we put in practice, I believe, the theoretic principles that you teach here. If I do not deceive myself, you regard construction as constituting the skeleton of monuments; so do we; you hold as a fundamental principle that a monument should be appropriate to its purpose, the same as we do. You believe that the nature of the materials used should regulate the form: we also. It is then, and then only, that you concern yourselves with decoration: we the same. You subordinate decoration to construction: so do we at Kensington. Is it, then, a heresy to proceed thus? The arrangements of a public museum, which thousands of blouses and short jackets frequent, differ from those of a religious temple, whether it be Egyptian, Greek, or Roman: they differ from those of a cathedral or of a church, reformed or not reformed; nor are they any more like those of a fortress, of a battlemented tower, of an imperial palace, or of a feudal chateau. Museums are, so to say, a sort of modern socialist monument, where the level is the same for all. There is no date, and there are no reserved places, and the architecture of the past furnishes us with but rare suggestions for their foundation. London not enjoying the brilliant clearness of the Paris climate, we have sought to obtain the greatest amount of light possible: that being obtained, we regulate it by means of blinds. It is easy to intercept the light, but not to make it. It is necessary for us to provide heat on a great scale, and we have miles of pipes moderately warmed. We have since our opening lighted the museum by illuminating each night 14,000 gas-burners, and we hope soon to have 40,000. Our ventilation is provided by that primitive process that consists in introducing an abundance of fresh air or of warmed air, according to the exigencies of the season, and allowing the vitiated air to escape by the ceilings. Not having that magnificent freestone of Paris, which

cuts like,—cheese, we use red brick and terra-cotta; and terra-cotta, you know, resists atmospheric influences better than granite itself. You have noticed, perhaps, in the Exhibition a semi-circular arch and a work in brick, which the despotism of a logical classification has placed in the gallery for machines. We have had the honour of offering these specimens to the *Conservatoire des Arts et Métiers*, where they will be placed in the garden. We imitate at Kensington the example you give us in Paris in daring to apply iron for the support of carpentry and ceilings. We even allow to be seen some of the iron ribs, which we decorate with gildings. Upon the walls we place majolica and mosaics of enamelled faience,—an invention to which I venture to call your attention, because it offers the means of giving an eternal duration to mural paintings. Gentlemen, if you are willing to brave the terrors of La Manche, to have faith in the recipes against sea sickness, and to come and see the Kensington Museum, we shall be happy to act as your guides, and you will find, I dare hope, that we are faithful to the true principles of architecture,—principles that are so resolutely, so brilliantly, taught to you in the Central School of Architecture. Perhaps you will find there some ideas,—some useful suggestions that you will accept in exchange for the magnificent examples of your studies that we have been permitted to obtain from your school. It seems to me that architecture, like many other things, is just now in a state of transition. The architecture of our days is not studied in the cloister for the purpose of building cathedrals, fortresses for the nobles, or numerous palaces for kings. It ought all over the world to supply the wants of a civilized democracy, and cannot progress but by resting on common sense directed by science and inspired by art; and it is thus architecture should devote itself in all humility. May M. Haussmann long continue to respect these tranquil gardens of the Central School, which recall to me the peaceful shelter of a cloister, and permit you to pursue your studies, so pacific, so useful, of a character so elevated, and which contribute so much to the happiness of humanity. Gentlemen students, I am happy to be able to say that your director has been so kind as to allow me to offer, for the end of the present scholastic year, a prize to be given to the most successful student in drawing the figure: this prize will be awarded by the students themselves.

Mr. Cole is a valuable public servant, and has often entitled himself to our warm thanks, which were never sparingly given. We are very sorry that we do not find ourselves induced to add to those thanks by this address. The work for which the International Jury awarded a medal to the late Captain Fowke has no connexion whatever with the building designed by him which provoked hostile criticisms, nowhere more severe than in France; nor did "the high priests of architecture" crucify Captain Fowke for those portions of the permanent museum which could now be shown. In setting forth the ordinary principles of architectural design as those in which the *École Centrale d'Architecture* and the South Kensington authorities agree, his Paris audience must have been led to suppose, erroneously, that these were not the principles taught in England, and carried out more or less by English architects according to their ability and taste. Again: surely it was neither necessary nor correct to say that the iron construction in the new Courts at South Kensington was the result of following what had been done in Paris. That Mr. Cole, of the Great Exhibition of 1851, should say this, is surely remarkable. The French architects who studied years ago the court of the Oxford Museum, and imitated everywhere the construction of our railway stations, must have listened to this remark with surprise, though much too jealous of national credit to question for a moment its correctness.

AMERICAN MANUFACTURE OF STEEL TIRES.—The manufacture of steel tires for locomotives, formerly a branch of trade done only in England, is now accomplished successfully at several places in the United States, one of the latest factories opened being located at Nashua, New Hampshire. Philadelphia was the first place in America where steel locomotive tires were made.

SANITARY AND SOCIAL ACCOMMODATIONS IN THE STREETS OF PARIS.

The sparkling streets of Paris have several features in sanitary and social accommodation that deserve a word of notice. Ever gay, with the use of light colours and gilding, and full of motion, with the fluttering of awnings drawn here and there over the footways in front of houses, and shops, and *cafés*, with jalousies and sombreros to the windows on the sunny side of the streets, and green, rustling, and leafy with the blending of trees with roadways, the authorities have made them still more attractive by erecting and allowing others to erect various constructions of an ornamental character for useful purposes in great numbers. The Boulevards, the Palais Royal, the Champs Elysées, the most frequented of the *places*, have all isolated erections of the kinds we are about to describe. But before specifying these we would allude to a still more important experiment, the concrete roads that are now in use. In some streets the noise and rattle we are accustomed to associate with much traffic is suddenly lost, and although the bustle continues and there is just as much swift coming and going to and fro, a comparative quiet reigns around. This is owing to the construction of the roadway. Instead of the surface presenting the rough, uneven form of granite blocks or macadam, it is entirely concreted and smooth. The wheels of the omnibuses are muffled, and all that is heard is the ring of the metal shoes on the horses' hoofs.

The disadvantages of this system appear to be the rapid casting off of a fine powdery dust; which inconvenience is only to be obviated by the use of the water-cart or watering hose. The limey nature of the concrete combined with the sun-heat absorbs the water rapidly, and watering is continuous in fine weather. Accordingly, a feature in Parisian streets is the frequent presence of the watermen. One of M. Hausman's grand points is evidently to effect a saving of labour; and this intention is carried out right and left, even to the watering of streets. The apparatus used for the purpose is ingenious. Several lengths of metal pipes, each about 10 ft. long, are attached together by hose junctions, the junction of each length resting on very low small wood tracks furnished with tiny wheels. One end is attached to the *borne-fontaine*, or water-plug, and at the opposite end is the nozzle, which the waterman carries in his hand, squirting the water right and left from the main, with great dexterity, among passengers and vehicles, easily moving the metal pipes on their wheels along the smooth surface in any direction he requires, and standing at considerable distances from the water-plug. This system can, however, only be applied in very wide and uncrowded streets. The new roadways are constructed on a principle that has some advantages on the score of cleanliness and sightliness as well as noiselessness. Instead of the gutters being made as open channels running parallel with the curb-stone, they are partly recessed underneath it. Besides the deep curve beneath the overhanging curb-stone there is a slightly-raised portion in granite blocks, which confines the waters in the channels, discharges them into the concealed gullies, and prevents them from overflowing on to the cement roadway. As the daily dust, waste, and *débris* accumulated by Parisian householders are turned out on to the gutters and collected by the scavenging carts every morning, the gutters necessarily hold for several hours before noon the filth. Water is turned on three hours a day to purify the streets, and men are employed to sweep them as the water runs; the gutter keeping the filth out of sight under the curb is therefore a desirable sanitary provision.

At intervals, among the trees that border the footways of the Boulevards and other places of public resort, are somewhat fantastically constructed pavilion erections, varying from the size of a pillar-post to a small Swiss cottage. Some are for the sale of light drinks, others for the exhibition and sale of newspapers and small literary wares, and others, again, are "stopping-places." The proprietors of *cafés* have, indeed, time out of mind, carried awnings over the pavements, and placed their inviting chairs and little tables under the green and shady flicker of the trees; but these smart little buildings are on the increase, and have a sort of affinity to the world's fair that has been such an attraction in Paris this year. We will describe one of them. It is for the sale of newspapers. The materials em-

ployed are wood, glass, and bronze. It is of an octagonal form, and its height is divided into three tiers of panelled compartments, of which the lowest is entirely of wood, and the two upper ones are glazed. One panel, or one side of the octagon, is left open for communication with the person in charge within. A bronze cresting finishes the octagon, which is covered over with a small domed roof. The entire diameter is about 4 ft. and the height 12 ft. The *windrois* are more like very tall pillar-posts, with a small recessed sink provided with a drain at a convenient distance from the ground. There are, however, numerous designs in these accommodations, which are for the most part situated in astonishingly exposed and public places. The municipal government boldly deals with the subject of the necessary conveniences. An Englishman is not prepared to find so much provision of the kind; nor the sites of it so conspicuous, nor the forms so studied, and ornamental, as may now be noticed.

At the main entrance to the Hôtel de Ville the first bay to the left has been furnished with simple slate divisions between the buttresses at the plinth level, without any further shelter for, or disguise from, the passers by.

Within sight of the Tuileries windows on that broad gravel-walk, where the prim orange trees with their twisted, gnarled, and knotted roots, stand in boxes, and the ornamented sentry-boxes are painted in dark green stripes upon a white ground, and the familiar statues stand out luminously white against a dark green foliated background, and all around is stately, palatial, and somewhat formal, we come upon two more conveniences of this description in a most public position. The broad flight of stone steps by which ascent is made from terrace to terrace has a retaining wall on either side, and in these retaining walls, close to the steps, are two arched recesses, made originally to relieve the blankness of the masonry, which are now each furnished with four urinal sinks, divided from one another by a slight projection, but in no respect partitioned off from the frequenters of these Elysian fields. And nearer than this to the Tuileries, at a gateway immediately under the windows, a *café* has been permitted to establish itself, and place a convenience for the use of its patrons on the side nearest to the palace windows. Provision for ladies is also made. Among the shops in the main streets are, here and there, shop-fronts in which no goods are exposed for sale. They have announcements in the windows to the effect that there are *cabinets inodores* within. On entering the open door, further notifications point out which cabinets are intended *pour les dames*, and which are set apart *pour les hommes*. We know not which is most startling, the amount of provision or its exposure.

In the Place de la Madeleine there is a fountain, in which flowers and water are alternated with a charming effect. The margin of the large stone basin into which the fountain daintly splashes and sprinkles its waters is bordered with flowers. Half-way up its height are more flowers and moss, and its summit is formed by a gaslamp, with which the whole is lighted up at night. We must add, admiration of flowers as ornaments sometimes lead to curious associations. We saw, a few days' since, a geranium growing in a pot deftly inserted in the inside of a fatted calf, that a butcher had recently killed, and suspended by a hook in his shop-window, and bouquets and flower-pots indiscriminately garnishing the meat.

The *cafés* are more resplendent than ever. They made Paris a city of colonnades of awnings and loggias. We note an arrangement in which the front of the *café* is raised from the façade of the house, so as to leave room for a row of velvet-covered seats and ornamental slate tables beneath the protection afforded from the overhanging house. Beyond the slate-covered table is a cane-bottomed *dos-à-dos*. Persons sitting on one side of this face the velvet chairs we have mentioned, and those on the other face a second row of tables, which are in their turn hounded by another row of seats, over all of which flutters a smart striped awning. In the Palais Royal, between the piers of four of the arches of the arcade, which are made to serve as a base, a glass and iron *café*, called the *Rotonde*, on account of its form, has been permitted to encroach into the gardens. Still more covered space is cleverly contrived by the extension of the flat, ornamental, zinc roof, which is fringed on its outer edge by a cresting above, and cusped valence below, considerably beyond the Crystal Palace-like *salle*. It is supported at

intervals by light iron columns, and forms a sheltered colonnade, which at this season is crowded with visitors. It is furnished with chairs and small tables. Protection from the sun is obtained for the occupants of the colonnade by curtains, which are looped to the columns, or drawn at pleasure. The whole is painted in stripes of colour. A second encroachment upon the gardens from the arches of the colonnade, forms another *café*. This is not glazed. It consists only, we might almost say, of a rectangular roof, supported on light iron columns, to which curtains are also attached. The Parisians, like ourselves, jealous of their open spaces, would, doubtless, not eye these encroachments with toleration, if it were not that coffee sipping in the open air is part of Parisian life, which any one may enjoy who can pay for it. Notwithstanding this feeling, the French press is beginning to inquire how much further are such encroachments to be permitted.

In all the public places, on the boulevards, on the quays, in the gardens of the Palais Royal, Tuileries, and Champs Elysées, there is an ample supply of double-seated benches with rails, so that people sit upon them *dos à dos*. These are free to the public. In addition to these there are tens of thousands of chairs provided by speculators, for the use of which a demand of two *sous* is made. The latest novelty in the form of a chair is that provided in great numbers in the outer circle of the Great Exhibition, concerning the monopoly of which there has been so much dispute. It has a spring circular seat, which is made of strips of thin metal, radiating from a flat central boss, each strip being narrower where it runs into the centre than it is at the outer edge of the seat, and rises up in a round cushion form. The novelty consists in the lightness yet strength of the chair, which is all painted metal, as well as in the elasticity of the seats. In noting these apparently inconsiderable sanitary and social accommodations, the improved roads, gutters, waterings of streets, newspaper-pavilions, seats, &c., we find the Government, while grasping with the greater features of public buildings and new streets, has not omitted attention to the minor matters that increase the convenience of the out-of-door public. In this respect our town authorities might well take some hints.

THE QUALITY OF IRON AS NOW USED.

At a recent meeting of the Society of Engineers, Mr. Erving Matheson read a paper under this heading, wherein he showed the difference there is in the character of iron, and how very dear a low-priced article sometimes is. We quote a portion of the paper as of great interest to our readers:—

This paper in being addressed to engineers at any rate, appeals to those who can discuss the facts put forward, and, if they think proper, act upon them; but unfortunately a large proportion of constructive ironwork is not designed by engineers at all, but by architects, who, of necessity, have to usurp functions in the proper exercise of which they have not had sufficient experience.* The materials of wood and stone and brick they use in all the forms and dispositions which the accumulated traditions of centuries have proved to be the best, and they have on every side examples of what to copy or avoid; but iron is a new element to many of them, in its present numerous varieties of application. The demand for fire-proof building, for open spaces involving large distances between bearings,—in fact, for iron in most of its modern forms,—finds many of them quite unprepared for its proper treatment. There are, of course, many exceptions; there are those who have wisely given the subject special attention, as one which is paramount, and there are those who, in these special matters, show their discretion by asking the advice of an engineer. But while some architects have a large and happy belief in the capabilities of iron, they cannot get out of their mind's eye, or rather their architectural eye, the forms and proportions of bygone days. There is sometimes to be seen in London the most extraordinary strength given to ironwork in warehouses, where stanchions have been placed that would have carried St. Paul's almost; and this feeling, again, is another result of the utter uncertainty that prevails about

* This refers to what is rather than to what ought to be.—Ed.

the strength of iron. The matter ends with the architect, when, in a nest hill of quantities endorsed "Smith and Fonder," his ironwork goes forth to the builders, and from them no one knows where, certainly, in most cases, all over Great Britain, directly or indirectly; and a contracting builder of the present day will obviously accept the lowest tender, unless something notoriously wrong appears in it. And naturally, therefore, the architect makes himself safe, and allows for a strength of casting which probably the vilest iron in England will give him. Architects often apply tests, but generally only to something higher than their working load, and no valuable knowledge is obtained. In the more conspicuous and ornamental ironwork an architect will examine critically the outside finish and appearance of his castings, quite unaware, in most instances, whether in strength or toughness the iron is twenty per cent. above or below a fair standard. What it is likely to be may be shrewdly guessed from the system under which it may be procured, it having very likely been purchased from the cheapest ironfounder, who cannot use good iron without loss.

In London, where space is valuable, where the skill of the architect is taxed to make the most of the ground, surely it would pay best to use the strongest material, and save in breadth and head room. Iron is simply iron in the eyes of a builder who does not care to make curious scientific inquiries into the material supplied to him. If it has a good appearance he is satisfied he has done the best for himself; but it is doubtful if the architect has done the best for his client. In the so-called fire-proof structures of the present day, the structures themselves may be so, but when filled with combustible goods, they are destroyed in spite of precautions. A warehouse composed of iron framing, of concrete floors, and stone staircases, is looked upon as invulnerable; but when filled with hemp, and tea, and oil, it catches fire, what of the framework then? Then, indeed, the iron stanchions and girders are tested. With the intense heat, all their power changes; they bend, they break, they fall; floor crashes through to floor, and the fire-proof building is in ruins. Who knows how much turned the scale, and whether just a little more strength and toughness in the iron would not have stood the ordeal; but the building has fallen because of cheap rotten iron, and all the ingenuity that contrived the structure is baffled and defeated. One other small instance, though it may seem a trivial matter;—the lamp-posts of London, the most conspicuous and oftenest repeated objects in the streets, and which are a disgrace to this city. They are common, clumsy, and ugly to a degree. If elegant, they might give a character and finish to the thoroughfares, but there is no public censor of taste, and a local Vestry Board ask for the old, old pattern; and, having invited tenders, obtain their pillars, painted and weighed, into stores for something like 6l. 6s. a ton. When any one sees a lamp-post smashed by a passing wagon, let him look to the article that was supplied to the parish. Bad iron, and the core perhaps all on one side, will show what is done in open competition and rotten iron.

And if it be now asked, What is the remedy for this state of things? It would not be unfair to reply that this should rest with the professional engineer, who needs only to be acquainted with the deficiencies he has to deal with. But, at any rate, some suggestions or hints may be offered for consideration. The main thing to correct is the great uncertainty that prevails, and the more of which is removed the greater nicety can be given to calculations, and the greater reliance can be placed on them when they are made. At present there is no standard held up for imitation, and every one has his own notions on the matter. If an ironfounder is asked if his metal is "good," it would not be in his human nature to answer but in the affirmative; while, if he were asked if his iron would stand a specific strain named in exact figures, he would think twice before he said that which could easily be proved to be false. Again, an honest ironfounder would prefer to have this uncertainty removed. He would know then what was expected from him, and how far he could compete; while, at present, he may see irons the difference in the value of which may more than cover the margin between the highest and lowest in a row of tenders. And for the engineer how useful would this certainty be. Any experiments he might make, or experience he might gain, would be based on positive facts as to the quality of

material, and he would know that in any successive work the same results would follow only where similar construction was combined with the same value of iron.

Nothing has been said here of the morality involved in the manufacture of good or bad iron; but when it is remembered how often human lives depend upon the structures designed for public use, and when engineers recall the failures that have occurred within their own experience from defective material, it will be acknowledged that the subject is one of the gravest importance.

THE HEALTH OF SWANSEA.

THERE are certain groups of our large towns in which commercial prosperity, inducing a rapid growth of population, has resulted in excessive death-rates. The cotton districts of Lancashire, the woollen districts of Yorkshire, the black country of Warwickshire and Staffordshire, the coal districts of Durham and Northumberland, and the coal and iron districts of South Wales, are the most conspicuous of these groups. The towns in these several groups have increased in population more rapidly than their house accommodation; and till lately their growth has been unheeded and untended by sanitary precautions; as a natural consequence, the overcrowding and neglected drainage and sewerage have resulted in high death-rates, with their usual heavy proportion of sickness, and in too many instances, a disastrous mortality from cholera during the epidemic which prevailed last year.

Not one of the above groups of towns suffered so severely from cholera during 1866 as that in South Wales, comprising Merthyr Tydfil, Bridgend, Neath, Swansea, and Llanelly. These towns had for some time previously considerably contributed to the excessive town death-rates in England and Wales; but the result of that epidemic stimulated a greater sanitary activity in many of these towns, the effect of which is already appearing in the periodical returns of mortality. We have before us the quarterly returns of Mr. Ebenezer Davis, medical officer of health for Swansea, for the three months ending the 30th of September last. The report itself is concise and unpretending, but the figures are conclusive both as to the amount of useful sanitary work which has been carried out by the Swansea Local Board of Health, and as to the present satisfactory condition of the health of the town.

The borough of Swansea contained at the census of 1851, a population of 31,461 persons; these had increased in 1861, to 41,506; and crediting the town with a similar rate of increase since 1861, the present population would not be far short of 50,000. The deaths registered during last quarter in this population, were 221, whereas Mr. Davies states that the average number of deaths in the third quarter of the four preceding years (omitting from the comparison last year, when the deaths from cholera alone exceeded the usual deaths from all causes), was 250. These 221 deaths give an annual rate of mortality for the quarter under 18 per 1,000 persons living. In the entire town population of England and Wales, the death-rate in the quarter was 22·4; in the ten large English towns furnishing weekly returns, the rate was 23·8; and the lowest rate enjoyed in any of these ten towns for the same period, was 19·2 in Bristol. Swansea, therefore, for last quarter takes a very high place among our most healthy towns for last quarter.

With regard to the causes of death we learn from the report that the deaths from zymotic diseases were only 38 in the quarter against a previous average of 75, and of these 19 were due to diarrhoea and choleraic diarrhoea. Swansea, like most other large towns, suffered severely from diarrhoea during September, but most of the deaths were of infants under one year. There were, moreover, five deaths each from fever and whooping cough. The deaths from zymotic diseases formed 17 per cent. of the total deaths, against 16 per cent. the proportion in London. Of the 221 deaths in Swansea, 68 were of infants under one year of age; a proportion due in some manner to the fatality of infantine diarrhoea.

During the quarter 66 houses have been connected with long existing sewers, 106 with recently constructed sewers, and 95 houses have been supplied with water. No less than 172 nuisances have been reported by the four inspectors. Such

facts as these are satisfactory evidence of the practical kind of sanitary reform which is being steadily carried out in Swansea, and which already appears to have borne fruit in the satisfactorily low death-rate last quarter.

We are aware that similar, if not yet quite so successful, sanitary activity prevails in at least one or two other towns of the South Wales group above alluded to: so we may fairly hope that these towns will not much longer contribute to the excess of town death-rates.

MODERN ART IN FLORENCE.

AMIDST the intense excitements and momentous questions that are now occupying minds and absorbing attention in Italy, we can hardly expect to find any interest awake for things pertaining to the serene sphere of art or intellectual produce. Yet in this city the claims in that order have not been forgotten, even at a period when all are convinced that a crisis involving the welfare and honour of the nation has arrived. We might describe some of the recent demonstrations in Florence as themselves presenting the most impressive subjects for modern art, especially one scene on the piazza "Della Signoria," where the dark masses of an angrily-excited crowd and long files of mounted troops, gleaming in war array, were at intervals made visible by flashes of lightning that threw lurid glows on the Palazzo Vecchio and the Loggia of Oragna, momentarily dispelling the darkness of a starless night, and showing what historic architecture formed a background to that apparently menacing scene. It must be added, however, for the credit of these good citizens, that Florentine crowds, however noisy and disposed to vent their feelings in terrible utterances, are, in the long run, far from dangerous, altogether docile and manageable, and little inclined to anything like brutality.

We still hear of the new projects for the façade of the Duomo; and lately has appeared a letter from one architect of note to another, in which the design by the latter, Signor Cipollo, is highly extolled by his correspondent, Signor Donna, and it is advised that all the designs prepared since the last exhibition should presently be made public, and that the artists should choose a point of view in which the façade is seen obliquely, instead of that immediately in front,—the oblique being the view presented in the drawing of Cipollo's composition. The design most generally noticed, and commended, among all recently made public, is that of Lasinio, now to be seen at all the principal printers' and bookshops in Florence; and the character of which, a richly-elaborated Italian Gothic, we have already noticed. Paying a visit to the Duomo the other day, we found it in a state of temporary desecration, to be entered by but one lateral door, and occupied by workmen with ladders and scaffolding, engaged in the process of a general cleansing, long wanted, and much to be desired for the venerable edifice. At various points of the exterior, the sharply-defined contrast between the white and green marbles lately inserted and the weather-stained surface around, shows the activity with which such restorations are now, as they have long been, progressing. At the Accademia were exhibited, till the other day, some sculptures, groups and statues, that excited attention, winning notice on the whole favourable from the press. Victor Emmanuel at the battle of Palestro, on horseback, with a dead soldier stretched on the ground, and three Zouaves addressing him to urge more regard for his own safety as he is dashing into the thick of the contest, is a group of statuette size by Corelli, marked by great spirit, and truthfulness, scarce attempting any idealization, yet making the most of modern costume, and successful in the intelligible presentation of the moral interest. Raffaello, as a youth, seated whilst drawing, and Columbus, also as a youth, seated on a rock, with a book and chart on his knees, are statues about life-size, by Zocchi (both to be sent to commissioning parties in New York), the latter far surpassing the former, as it struck us; for the sculptor's "Raffaello" seems tame and conventional, but his "Columbus" satisfies by intensity combined with simplicity; the earnest gaze that seems looking into a far-distant future, with endeavour to estimate unknown possibilities, giving to that heroic face something accordant with the destinies, and with one's own ideal, of the discoverer of new worlds.

At the studio of Consoni—certainly one of the first among living Tuscan sculptors—a life-size statue of Victory, subscribed for by different Italian municipalities in order to be presented to the King, and eventually, it is believed, to find its place in the Pitti gallery, deserves more than common notice for the character of intellectual power and elevated repose distinguishing it: seated on a rock she is inscribing on a laurel-wreathed shield the glorious names of Montebello, Palestro, and S. Martino; her figure being nude in the upper, amply draped in the lower part; her attributes recognisable in the moral expression, without any help from such symbolism as at once explains them. A wounded Amazon, defending herself on one knee in the combat, is another statue by the same artist, which was chosen by the commissioners for the Paris Exhibition. More interesting is the monumental figure of the Countess Matilda, recumbent in regal costume, and crowned, on an ornate sarcophagus; an affecting presentation of the historic personage in death that sends the mind through the vicissitudes of the great drama she acted her part in during life; this also, chosen by the commissioners among Consoni's works deemed worthy of a place at Paris, was to have been, but was not, sent thither.

The fate of art-works in the cloister might be uncertain in consequence of the laws lately passed against that institution, but for the measure well directed towards the preservation of all that is valuable. A circular from the Minister of Finance to the prefects of provinces orders that report should be made to government as to all objects found on monastic premises of such character as to claim respect, in order that buildings as well as the works of art they contain may be properly cared for, and authorities decide what should be preserved intact, what churches should, together with their decorations, be maintained for worship. A committee has been appointed to provide for the preserving of all that possesses artistic character, in monumental and other forms, on the monastic property exposed to sale.

The new streets, and the new "Lung' Arno," on the left bank of that river, are progressing in a manner that promises well for the enlargement and ultimate transformation of the city that it is desired should not be the permanent capital of Italy.

METAL FONTS.

WÜRZBURG CATHEDRAL.

The material used in modern fountains is generally stone, but we need point out examples in which costly marbles are introduced. We do not, however, know of a single example of a metal font, if we except one or two cast-iron abominations painted in imitation of stone, which are to be found in churches in the manufacturing districts of the North of England.

In the Middle Ages fountains were frequently made of bronze and brass. The examples to be met with in Belgium and Germany are very numerous and beautiful, and of every period from the twelfth to the seventeenth century. One of the earliest we know of is that in the cathedral at Hildesheim. This interesting work of art is in a most perfect state of preservation. It is bucket-shaped, and supported upon four feet, each of which consists of an allegorical figure representing one of the four rivers of Paradise, with the name inscribed upon it: on the first is the word "Phison," on the second "Gehon," on the third "Tigris," and the fourth "Euphrates." Each figure holds a water bottle in its hand. The basin of the font is ornamented with an arcade of four trefoil-headed arches, each arch of which contains an appropriate subject in low relief;—thus, the Israelites crossing the Red Sea, the Baptism of Our Lord by St. John, &c. The cover of this font is conical, and surmounted with a very beautiful finial: round the cone is an arcade. This font is a work of the earlier part of the thirteenth century.

A remarkably fine bronze font exists in the cathedral at Würzburg, and of this we gave an illustration in our last*, where, by a rare accident, it was made to take the place of a view of an ancient bronze measure of the fifteenth century, at Ochsenfurth, and is described accordingly.

The font is drum-shaped, and surrounded by six double niches, with crocketed gables, and separated by buttresses crowned with pinnacles.

* See p. 820, ante.

These double niches contain subjects in full relief; amongst which may be noticed the Crucifixion, the Resurrection, the Baptism of Our Lord, and the Annunciation. The figures are about 14 inches high, and very well modelled. The shape of the Cross in the Crucifixion is remarkable, and resembles the "Y cross" on the back of most ancient vestments. This font is cast in separate pieces, and then put together with bronze screws. Round the rim is an inscription, with the date 1279.

In the cathedral at Munster is a bronze font of the earlier portion of the fourteenth century. It is chalice-shaped, richly ornamented with statuettes, evangelistic symbols, &c. This is one of the earliest chalice-shaped fountains we know of in Germany. In the fifteenth and sixteenth centuries they are, however, by no means uncommon. A font of very singular design is to be seen in the cathedral at Louvain. It consists of three separate basins standing upon thin legs. The lever for raising the cover is a remarkable piece of metal work. The fountains are bronze. Five fourteenth-century fountains exist at St. Sivald's, Nuremberg, and the cathedral at Mainz. These fountains are also bronze. A remarkable font exists in the church at Ochsenfurth.

Bronze fountains of the latter part of the fifteenth century exist at St. Stephen's Church, Prague, and St. Mary's, Lubek; and a brass one in the church of St. Columba at Cologne. This font is chalice-shaped.

The churches of St. Maria in Capitolis and St. Peter in Cologne, contain brass chalice-shaped fountains of the sixteenth century.

In England, metal fountains were never much used; however, in the Abbey Church of Dorchester, Oxfordshire, is one cast in lead; it is probably a work of the earlier part of the twelfth century.

In the Great Exhibition of 1851 was a modern font of bronze, from the designs of M. Viollet-le-Duc.

ST. ALBAN'S NEW GAOL.

THE new prison at St. Alban's, Herts, was opened for prisoners on the 1st instant. It has cost about 14,000*l.*, and is situated on the north-east side of St. Alban's. The building stands on an eminence, from which it may be seen for miles round.

The architects are Messrs. Martin & Chamberlain, of Birmingham, and the contractor is Mr. Young, of Lincoln; clerk of the works, Mr. Wilcox. The building is of brick, with facings of dark blue Staffordshire bricks and Bath stone. It is constructed on the same plan as the county gaol at Warwick, and several of our large modern prisons. It is in a castellated style of architecture. Over the gateway there is a porticulis. The governor's house stands on the right of the gateway, and the chief warder's on the left. The front, with its entrance of lofty proportions, is surmounted by a large air-shaft, which is 60 ft. high from the entrance steps. This shaft conveys fresh air to every cell and other apartment in the building.

There is a spacious central hall, with long corridors to the left and right. This hall is lighted by a lofty lantern dome, which rises about 64 ft. from the basement floor. The corridors run in a straight line the whole length of the building, or about 150 ft. Along these corridors run three tiers of cells, with galleries running in front of the two upper tiers. The two corridors are respectively distinguished as the "A and B" wings. There are seventy-eight cells for the male prisoners in the corridors, and each cell is numbered. A cell is 12 ft. long, 7 ft. wide, and 9 ft. high, with a small window, which gives a not too cheerful light. The cell is provided with two flues. A grating is provided, through which hot air is let in for warming the cell. The vitiated air passes out through a grating above the floor of the cell, up the walls, and along the horizontal flues in the roof, to the shaft, outside the building.

The cells are heated by means of hot-water pipes, which are let in at different points along the wall. Each cell is lighted with gas, the tap being placed outside the cell, so that the warder can turn off the gas without entering. In the centre of the cell door is a little trap about a foot square, called a retion-trep, opening from without by a spring. Each cell is provided with a cistern holding eight gallons of water, which is conveyed to the cell by pipes from the upper stories. The supply is so regulated that the prisoner can-

not be cheated out of his allowance of eight gallons per day, nor obtain any more than that quantity. In each cell is a washing bowl with a tap over it, and a water-closet with its trap. In the walls of the cells, about 12 in. from the floor on each side, are four strong staples, on which is swung the prisoner's hammock. The door closes with a spring lock, of which the warder has a key, and the governor a "master key." A cell locked by the governor cannot be opened by the warder, and by this means the governor can, when he pleases, exercise a personal supervision over any prisoner. In the cell door there is a glazed inspection hole, rather larger than an ordinary eye-glass, by means of which the warder can at all times overlook the cell and the inmate. It enables prisoners to communicate with the officials. The prisoner pulls a handle drawing out a spring, which strikes upon a gong at the end of the corridor. When pulled the spring at the time it strikes the gong throws out a square piece of iron on which is marked the number of the cell from which the gong has been struck.

Near the entrance-hall is the visiting justices' room, a retiring-room, a waiting-room, the offices of the governor and chief warder, reception cells, bath-rooms, an examining-room, and a visitors' room. On arriving at the gaol, the prisoners are placed in the reception-room. They then pass to the examination-room, where they are examined by the surgeon. After being divested of their clothing, which is placed in a fumigating oven, they are compelled to take a tepid bath. After this generally very needful operation, they are supplied with the prison uniform, and placed in their respective cells. There are two separate cells outside the entrance, for prisoners afflicted with infectious skin disease, and a dead-house also outside the entrance. Attached to the infirmary are a surgery and a room for the infirmary warder. The chaplain has also an apartment. In the basement story are the workshops for the prisoners, called "associated rooms," which are a modification of the separate system. The kitchen is a large apartment. The prisoners' food is raised from the kitchen by means of a shaft. The scullery adjoins the kitchen, and near it are the bake-house, potato store-room, meat store-room, ordinary store-room, and an officers' mess-room.

There are two punishment cells in the male prison, in which prisoners may be placed in solitary confinement for three days, for breaches of prison discipline. These cells are provided with double doors, so that no sound can reach the ear of the prisoners confined in them. There is a visiting room, where prisoners at rare intervals are allowed to see their friends.

The chapel, which is in the upper part of the north side of the prison, is a spacious structure in the Gothic style.

The arrangements of the female prison (which communicates with the other part of the prison on the ground-floor) are much the same as we have described.

The works in common with the new gaol were finished by Messrs. Kirk & Belstone, as sureties for Mr. Young, the contractor. The heating, steam, and treadmill apparatus, with the pumps, were supplied by Messrs. Haden & Son, of Trowbridge, Wilts; and the works in connexion with the water-supply to the gaol were carried out by Mr. Whitworth, of Birmingham.

THREATENED DESTRUCTION OF THE GATEHOUSE (OR OLD PRISON) OF ST. ALBAN'S ABBEY.

THE inhabitants of once mitred, and now disfranchised, St. Alban's are in a divided duty "anent" what is now to be done with their old gaol, a genuine piece (in the main) of ante-Reformation or Dissolution Gothic, and a part (ere Henry VIII. and Thomas Cromwell were omnipotent and unsparing) of the great abbey itself.

This old gaol (now no more) was the gatehouse of St. Alban's Abbey, and very fine it is. Its central archway, with its great span and bold groinnings, cannot be forgotten by any one of taste who has seen it. Abbot Thomas de la Mare, of whom there is a fine monumental brass in the abbey, was the fortieth abbot of St. Alban's, and its founder, and (it is conjectured) its architect as well. St. Alban's has now got a new gaol of its own, at the London end of the town, close to the London road, high-placed, castellated, and baronial, with a prison look of

its own, compatible with security and architectural propriety. It is much admired.

Having of late newly restored the famous old clock-tower of St. Alban's, and turned the tower into a telegraph station (a most appropriate use for it), and added a new and excellent clock, let the authorities of St. Alban's turn their deserted gatehouse-gate into something useful and appropriate,—and at once. Touching the likely and to-be-deprecated fate of this interesting gatehouse, the *St. Alban's Times* has said what follows:—

"We sincerely hope that so venerable a relic of antiquity is not doomed to destruction. We feel sure that the magistrates of the Liberty will never suffer such an act of Vandalism to be committed. We would again remind our readers of the suggestion which has been made to convert the old building into a house for the Grammar-school, and the governor's house into a residence for the master, by which means the beautiful lady-chapel may be recovered from its present degradation, and restored to the Abbey Church."

There is in St. Alban's a "Young Man's Christian and Literary Association," with insignificant rooms; and there is, in the same place, a "St. Alban's Architectural and Archaeological Society," without any local habitation at all. Now, it appears to us that this noble Gatehouse of St. Alban's Abbey (it is the property of the corporation) might be applied with great advantage to the wants and purposes of both societies, while, what is so much needed is "A Museum of St. Alban's and Hertfordshire Antiquities," for the county is rich in early British and Roman remains,—witness Mr. R. Grovo Lowe's collection,—and the town and howels of the earth are both rich in treasures, relics of Roman Verulamium and of the civil wars of York and Lancaster.

Another seeming difficulty is distracting St. Alban's. The Ahhey parish wants a cemetery. The present burial-ground on the north side and west end of the Abbey is crammed with the dead, and buried architectural remains. It is here, on the north, that men in authority would have the new St. Alban's Cemetery. We hope not,—it would be too near the church, too near to human habitations, and would eminently disfigure one of the noblest abbeys in the three kingdoms of Queen Victoria.

The most celebrated "gate-house" in Great Britain was that which was once a part of the mired Abbey of Westminster. Sir Walter Raleigh was led from his last prison, the Gatehouse at Westminster, to the scaffold in Old Palace-yard. Sir John Eliot was taken from it to the tower. Here Colonel Lovelace sang and wrote his divine poem, "To Althea from Prison,"—

"Stone walls do not a prison make,
Nor iron bars a cage;
Minds innocent and quiet take
That for a hermitage."

No traces of it are now to be seen. We remember in early days to have had pointed out to us some architectural remains of it, which did little more than mark the site and call up miscellaneous memories of other days.

WORKS IN PARIS EXHIBITION.

THE ARCHITECTURAL ASSOCIATION.

The usual meeting of members was held at the House, in Conduit-street, on Friday evening (the 8th inst.). Mr. R. Phend Spiers, president, in the chair.*

Mr. J. D. Mathews (hon. secretary) stated that Mr. Haywood, the architect of the Holborn Valley Viaduct, had kindly offered to allow the members of the Association to inspect the very interesting works in progress in connexion with

* The following gentlemen were elected members of the Association.—Mr. S. E. Smith, Craven-street, Strand; Mr. G. Borer, Langlands-road, Peckham; Mr. Josiah Koss, Pittfield-street, Islington; Mr. J. B. Wernig, Mr. C. Price, Argylly-street; Mr. F. W. Tuckey, Argylly-street; Mr. N. R. Anapp, South-forest, Bedford-square; Mr. J. Bull, Manor-street, Clapham; Mr. H. Negrore, Camberwell New-road; Mr. A. Smith, Cambridge-street, Finsbury; Mr. H. W. Saunders, Hill-street, Peckham; Mr. F. J. Alexander, Hornsey-road; Mr. A. Lewis, Harrington-street, Regent's Park; Mr. R. A. Adwinle, Cleveland-road, Islington; Mr. J. T. Lucy, Guildford-street; Mr. Bernard Smith, Devonshire-terrace, Notting-hill; Mr. F. E. Thibak, Camberwell; Mr. H. W. Wilson, Whitehall-place; Mr. Scores, Whitehall-place; Mr. J. O. Scott, Adelphi; Mr. C. Leonard, Wellington-square, Chelsea; Mr. F. Stallier, Finsbury-place; Mr. R. Wild, Highbury New-road; Mr. Garrison, Brighton; Mr. A. Bailey, Charing-cross; Mr. H. G. Furner, Gower-street; Mr. E. R. Burton, Craven-street; Mr. J. T. Dressey, Wandstead; and Mr. C. F. Booth, Albany-street.

the improvements now taking place in Farringdon-street; and that the visit would be paid on the afternoon of Saturday, the 16th inst. He also announced that a proposition had been made for the election of honorary members of the Association, and that the suggestion would be taken into consideration on a future evening.

The Rev. C. Bontell then proceeded to make some observations in connexion with the archaeological collections of the Paris Exhibition. He regarded the latter as constituting the culminating point to such exhibitions. It was in the year 1797 that the first great exhibition of art and industry ever took place, and it was held on the site of the present building in the Champs de Mars. In each subsequent exhibition a development was observed which made the last more important and interesting than its predecessors. The exhibition just closed was, in many respects, the most important of its race. The arrangement of the building itself (a concentric oval, with a garden in the centre, and curves leading to it) was admirable, and not the least interesting portion of its contents were its archaeological illustrations. The idea of including archaeology originated with the Emperor himself, who wished to show what mankind had done in all generations, and thus to form what might be termed a history of labour. In his opinion England was very well represented at the Exhibition; at the same time, he was bound to confess that we might have done much better, and that our contributions suffered in public estimation on account of imperfect classification and arrangement. The earliest specimens of human handicraft among all nations, such as articles formed of flint and bone, were characterized by the same features; but some degree of taste and feeling was to be traced even in the formation of the rudest implements and weapons, showing in certain instances a more skilful hand and a more observant eye. These early specimens of inventive art had been brought together from various countries, and were so typical of various primeval races, that it seemed a pity to see them dispersed. Among the most extraordinary objects exhibited in the archaeological collection were the crystal vases of Hungary, contributed by Austria. These were, he believed, without a parallel in the world. The collections of Italy, brought together under the careful superintendence of Signor Castelani (including Ceramic ware and personal ornaments in the precious metals) were also most valuable for purposes of comparison. Most interesting, too, to architects were the drawings and models of architectural monuments in France. The preservation of these relics was declared by the Government to be a matter of public interest and importance, and he hoped the architectural body in England would take up the subject and bring its influence to bear on our own Government to induce them to follow the example set by France. If, however, this could not be done, he ventured to suggest to the Association the desirability of carefully examining, measuring, and drawing those monuments, so that an accurate record of them might be preserved to the country. The archaeology of the East was also extremely valuable, and amongst the most curious objects exhibited was a statue carved in wood of a human figure, which was supposed to be the oldest specimen of the kind in the world. It was found in one of the Egyptian tombs, and was believed to be of the period of Abraham. The personal ornaments found in the same locality were also very interesting. Nothing, he thought, was more remarkable in connexion with the Exhibition than the manner in which various works were reproduced. In Italian works, Signor Castelani was satisfied with reproductions of the antique, and in this respect he was so successful that it was almost impossible to tell ancient from modern works. Eight gold medals were awarded for goldsmiths' work; and of these six were given to France, one to England (to Mr. Phillips, of Cocks-pn-street), and one to Italy (to Signor Castelani). Had another medal been given to England, he believed it would have been awarded to Mr. Brogden. Illustrations of the application of ancient art to modern uses were not wanting in the Exhibition, and he was particularly struck by attempts by different persons to apply Egyptian and Etruscan art to objects of domestic utility. In the former case, an Egyptian tea-service was incongruous and unnausable; while in another, Etruscan forms were found to be all that could be desired. In the latter case, the work was the production of M. Boncheron, of the Palais Royal, who had also exhibited the

revival of an ancient art,—namely, translucent

enamel without any metallic back. Referring to the "democratic jewelry" exhibited at Paris, and purchased for the South Kensington Museum, Mr. Bontell observed that the design was so beautiful that the best consequences might be expected from its introduction into this country. This jewelry was in common use among the humbler classes in Italy, and he was sorry to say that it had been of late to some extent displaced by Birmingham work made from debased French models. Among other objects in the Exhibition important to architects were Signor Salvati's reproductions of glass for glass-painting. Referring in conclusion to the English contributions, and to the importance of the fact that much of the prosperity of the country and of its progress, in an architectural sense, depended upon the use made of the arts of antiquity, he observed that if the English collections were considered at home or abroad, there was this lesson to be acquired, that even if what we sent was as good as that of any other country, it was no better. This showed the necessity of study. We had great collections both at the British Museum and at South Kensington, but did they teach the public mind? It would not do for a country like England to suppose that, because she was strong, there were not other nations equally strong.

Mr. N. White called attention to some ornamental doors and door-cases from Norway exhibited at Paris, which were supposed to be of ninth or tenth century work. They were covered with Runic characters, and were probably originally used as the facing of some wooden construction. With regard to the remarks of Mr. Bontell, as to the necessity of keeping pace with the nations in art-workmanship, he thought it would be vain for us to attempt improving upon the work of others until we were able to copy the best things of the past.

Mr. H. W. Edis, although quite ready to recommend the careful study of archaeology, was not prepared to advocate architectural imitation, which he regarded as a great evil. He would give all the honour that was due to the works of the past, but he would regard them in the light of guides, and not as objects of servile imitation. He regarded it as in the last degree humiliating that we so seldom aspired to originality, and mentioned as an illustration of how not to do anything new, that when a gold box in which to place the liberty of the City of London, on its presentation to the Sultan by the Corporation had to be designed, nothing could be devised better than a monstrosity covered with mosques, minarets, and crocets, with a space for the autograph of the Loni Mayor!

The Chairman, referring to the want of proper classification and arrangement in our national collections, observed that the visitor, when entering the museums of France or Germany, might go in comparatively ignorant and come out a connoisseur, while in England it would be necessary to go in as a connoisseur. The only specimens of English archaeology which he was able to discover in the Paris Exhibition were confined to Chelsea China, in diam. photographs, and some plate of the time of the Georges. He recommended the members of the Association to act upon the hint of Mr. Bontell, and during their vacation ramble endeavour to measure and sketch the most interesting historical monuments of the country.

ST. SAVIOUR'S COLLEGE, ARDINGLY, SUSSEX.

ST. NICOLAS COLLEGE, LANCING, AND ITS SCHOOLS.

The third or "lower middle-class school" in connexion with the College of St. Nicolas, at Lancing, is being erected at Ardingly, in Sussex, on the slope of a hill overlooking the beautiful valley of the Ouse, and in sight from the great viaduct on the Brighton Railway between Hayward's Heath and Balcombe stations. A general view and plan of the school (or St. Saviour's College, as it is to be called) is given. It is designed to hold 1,000 boys of the superior artisan, or small tradesman class, and for the small sum of 14s. per annum, to board and educate them thoroughly, the education being based on church teaching. It will be entirely self-supporting.

The first stone of the buildings was, as it may be remembered, laid by Earl Granville, on the 12th day of July, 1864, and since that time the works have been pushed steadily forward, and are now far advanced. A reference to the plan will show the general scheme. It consists of two large quadrangles, the lower one being open on the southern side. The two wings of the lower quadrangle have accommodation for 400 boys in eight dormitories of 50 boys each, the ground floors being occupied with class-rooms, with masters' rooms at the end. The head master's house joins on to the south end of the east wing. The cross buildings between the two quadrangles comprise the upper and under dining-halls, had the two great school-rooms which occupy the whole space under the chapel. A tower stands between the hall and the chapel which is reached by a staircase communicating with the ante-chapel.

The upper quadrangle has on its three sides double dormitories for 600 boys, with class and master's rooms, and separate school-rooms for the very young boys. The kitchens and offices stand westwards of the dining-hall, and form a distinct quadrangle.

The ground falls rapidly towards the south-east, a terrace will therefore be carried along the southern front and the quadrangles kept on one level; below the terrace is a steep slope with a lake at the bottom. The river Ouse forms the south-east boundary of the estate.

The style adopted is simple Early Pointed, with alternate two, three, and four-light cusped windows in the wings, and three-light traceried windows in the upper dining-hall. The material is brick, with red facing bricks from St. John's Common, Chalfont, and elsewhere. The windows, arches, dormers, bands, and other architectural features are of the local sandstone of a light brown tone. The roofs are covered with brown tiles from St. John's Common. The fittings are of a very simple description, with iron frames and window casements. The estimated cost is about 40,000*l.*

The St. Saviour's boys are at present located in temporary buildings in the town of Shoreham, and will be removed to the Ardingly buildings as soon as they can be made ready.

Lancing.—Besides these schools the college have also during the last two years carried out very important works at the parent institution at Lancing. The great dining-hall, 100 ft. long and 38 ft. wide has been completed, and an open arched roof erected on it, surmounted by a lofty lantern of oak, with a shingle spire. A

series of stone dormer windows is erected above the cornice to light the roof; they are 24 ft. high to the finial, and of two lights, with traceried heads, with richly carved pinnacles and crocketed pediments. An ante-hall of equal height and width, and 40 ft. long, is erected at the north end of the hall, and opens into its gallery by an arcade of three arches, with polished granite columns. An elaborately moulded and carved bay window of stone reaches the entire height of the ante-hall, of six lights, the angles being ornamented with canopied niches and shafts. The kitchens adjoin the ante-hall, and are now being commenced. The grand staircase is in course of erection which leads from the cloister to the ante-hall. It is groined with stone, and is of three double bays of vaulting, supported on two clustered shafts, the north end being filled with richly moulded two-light windows. Besides these important additions, a wing of the upper quadrangle has been built with four additional dormitories and master's rooms.

Denstone.—Steps are now being taken to commence at once the erection of a new school on the model of St. John's, Hurstpierpoint, at Denstone, near Ashbourne. It is for 400 boys, and will comprise chapel, hall, dormitories, master's house, &c. A site has been given by Sir J. Percival Heywood, bart., who also gives a large donation to the building fund. It is intended by the founder that this school shall be the first of a series similar to those in Sussex. The plans for this school, as well as for the other buildings at Lancing and Ardingly, are by Mr. W. Slater & Mr. R. Herbert Carpenter, architects.

It is also in contemplation to commence next year the great chapel at Lancing, which will be on a scale sufficient to serve for great gatherings of all the schools, as well as for the college itself. It will have an apsidal choir and ante-chapel, with north and south aisles, groined for its entire length; a great western tower, 220 ft. high, and a tower on each side of the apse. The whole will have a lofty vaulted crypt underneath. The dimensions of the chapel will be 200 ft. long from the west wall of the ante-chapel inside, to the inside of the east wall of the apse. The width across the choir is 32 ft., and including the aisles, 62 ft. The height from the choir floor to the crown of the vault is 80 ft.

ST. SAVIOUR'S COLLEGE, ARDINGLY, SUSSEX.—MESSRS SLATER & CARPENTER, ARCHITECTS.

COLLIERY EXPLOSIONS.

WARNING was lately given in the *Builder* that the season was approaching when, from atmospheric causes, explosions and other accidents in collieries might be anticipated where the most care was not taken to prevent them. That season seems now to have begun, and as before with several almost simultaneous accidents. At the Ferradale Colliery, in the Rhondda valley, no less than 200 colliers (less or more), have been killed, it is believed, by an explosion. And yet this is said to be one of the best managed collieries in the district, with a good system of ventilation for such deep and fiery workings.

Twenty-one men have been seriously injured by an explosion at Homer-hill Colliery, near Courbridge, in Staffordshire. All the men were seriously injured by burns, and three of them, it is said, have since died. Explosions of fire-damp are of very rare occurrence in North Staffordshire, and at the time the explosion occurred between 2,000 and 3,000 cubic feet of air were circulating through the workings, in some places of which the draft was so strong that the candles had to be protected by a screen. It is considered that the fire-damp had been generated by a fall of material from the roof.

Three men have been killed by an explosion in Silverdale Colliery, also in Staffordshire. Mr. Wynne, Government inspector, said at the inquest that he considered the mine was in an unsafe state, but the accident might not have happened if two of the deceased had not taken the caps of their lamps. The jury found that the deceased met their deaths by accident, which resulted from their own imprudence. They considered the workmen ought to be visited frequently by overlookers, and that the proprietors of the pit should as soon as possible effect a better state of ventilation in the mine.

At the Eppleton pits of the Hetton Coal Company, near Durham, a serious conflagration was taken place, by which all the woodwork at the Jane pit has been destroyed, and the lives of about 200 men and boys jeopardized. A good fortune there was a way out through another pit. One man has died.

The Shankhouse pit, at Cramlington, Northumberland, has been deluged with water, by a break from an old pit adjoining, and 150 pitmen have made a narrow escape with their lives, but a good many ponies have been drowned, and the pit property is much damaged.

ST. PAUL'S AND THE MAIN CAUSEWAY OF LONDON.

A PLAN, recently given in the *Builder*, for the opening out of the wide space surrounding the Cathedral, and the removal of the massive iron dingy, with its heavy and decaying stone base, giving met general approval, an allusion to a few details may not be amiss.

Separation of the great torrent of traffic into two courses, by the north and south sides, would be a great public advantage, whilst it would benefit the side of Doctors' Commons, and reverse St. Paul's Schools and the east end, which, from its stunted width, is wholly inadequate as a footway; and the diversion of the spring tide of traffic to the north side, could in no wise interfere with the great retail houses in St. Paul's Church-yard, whilst it must confer an incalculable benefit upon the important wholesale houses on the south.

The great width which might be thrown in on the north, would allow at the narrowest part (only 6 ft.), a driftway of 40 ft., and a footway of 12 ft. here by an alteration of the circular steps; and the opening out of the large space of which the archway now blinded off, would give ample scope for cab-stands at either end of the cathedral, leaving room for resting-places, for harbouring carriages of purchasers, and a footway for pedestrians at either side of the driftway. It is as to ulterior improvement in surrounding areas, that would necessarily follow, as in all other quarters when opened out. The widening of Newgate-street, now nearly complete, will give that line to Cheapside; and then it will give to any observer from St. Martin's-le-grand that there is one house, at the corner of Barnstaple-row and the Churchyard, which projects just 10 ft. beyond the street frontage, and blocks off the east end of the cathedral, whilst it would to some extent obstruct the proposed new way. Remove this house, and the new line of

street would be in direct alinement, and would offer a noble causeway to the Bank well befitting this important position in the City's core.

The effect of wide open spaces round majestic buildings is evidenced by the Duomo at Milan, the Madeleine at Paris, and by the one-sided view of our own Abbey of Westminster. In the Strand, upon the same line, the church of St. Clement's Danes stands isolated in a very large space, with a wide street encircling an oval enclosure; the small church of St. Mary-le-Strand being similarly surrounded by driftways. In these localities great improvements will, doubtless, follow the completion of the New Law Courts; such as the clearance of Holywell-street and Temple Bar, and the withdrawing of ten houses between the Bar and Chancery-lane, at least 6 ft. backward. The traffic of the line will increase in a corresponding ratio, and, therefore, direct and commodious thoroughfares to the Bank and to London Bridge will become an inevitable necessity.

Such a route will give a better access to St. Paul's, which, although it has two portals, is entered only by that on the north side; if there be noise of rattle, the division of traffic, or diversion of a portion to either side, would rather diminish than increase it; and the removal of the heavy and irksome enclosure of iron, whilst it gave freedom of circulation to the public, might make way for a ground or basement line more consistent with the dignity and freedom of the stupendous design. Q.

YORK SCHOOL OF ART.

The annual meeting of the subscribers to this school has been held, in the large room of the institution, Minister-yard. The Rev. Canon Hay occupied the chair.

Dr. Procter read the report, of which the following is an abstract:—

During the past year there has not been much to distinguish the working of the school from that of former years. It has been with pleasure that the committee have had to refer to the steady advancement of the pupils, and the superior excellence of the works produced by them in each succeeding year. The number of pupils in attendance on the various classes during the year has been fifty-one. The committee have to acknowledge with thanks the gift of a carved Ionic capital from Mr. Wolstenholme, of this city. Mr. J. P. Pritchett also has given to the school a valuable collection of casts of modern ornamental and architectural details. The treasurer's account for the past year is not so satisfactory as the committee desire, showing as it does a balance due to him of 43*l.* 1*s.* 2*d.* Owing to the reduction in the Government grants, the income of the school is barely equal to the ordinary expenditure, so that any special expenditure has to be met by donations or special effort. No donations have been received during the year. A prize fund has been subscribed for by several gentlemen of the committee.

Mr. J. G. Fitch (Government Inspector of Schools) said he thought that the report, though it did not declare brilliant success, with regard to real and valuable progress, told a story modestly, and worthy of the recognition of the meeting. The report and the observations of Mr. Swallow, the head-master of the school, had called attention to a subject of considerable importance—he meant in reference to a deficiency in the matter of technical education. This had been a subject of many specific addresses which had been lately made to the Crown in connexion with the Paris Exhibition.

THE ARCHITECTURAL MUSEUM.

In consequence of the unexpectedly high amount of the lowest tender for the erection of the proposed new building in Bowling-street, Westminster, further efforts are needed to raise the required sum. The Council have received nearly the 2,000*l.* calculated on as necessary to cover the ground and to carry out the stipulations of the lease, which provides for that sum being laid out. 3,000*l.* were at first demanded, but through friendly intervention that sum was reduced to 2,000*l.*, and the rent diminished to 80*l.*

The lowest tender, by Mr. Roberts, of Islington, is 2,970*l.*, and to bring it to this sum he took 10 per cent. off the total. It is of the utmost importance that the Council should start free of any debt. Most of the members of this body have voluntarily promised 10*l.* each. At the same time, however, the Council of the Museum feels that for an object of such general interest it has a right to appeal to the public at large. The subscribers to the Architectural Museum have done well, but funds are still wanting for the completion of the work, and the Council has

no scruple in inviting them from all friends of architectural progress, without affixing any amount.

The profession have scarcely come forward as they might have done, though they have had more than one opportunity; but, judging from the inquiries that have been made about space to let in the new home, both Architectural Societies, and art-workmen, too, are alive to the privileges of being near such a collection as this well housed. Seeing how much the friends of the art have done, the Council may surely look to those for whose advantage the museum is intended for the further sum required.

THE WROXETER EXCAVATIONS.

The money subscribed being again nearly expended, the work has been brought to a close. Some of the walls lie so deep under a mass of earth, that, to uncover one square foot, it became necessary to dig out and convey away several square yards; the labour and cost were therefore very considerable. But they have succeeded to a great extent in laying open the arrangement of walls between the basilica and the adjoining buildings. A doorway has been discovered leading into the latrina, and the step, which is very well formed, is distinctly worn by feet. No exit has been traced from the drain; but a singular conformation exists underneath the outer wall of the basilica. This wall is the subterraneous continuation of the great wall which has for ages marked the site of Wroxeter above ground. Under this wall, where the excavations have been going on, they have discovered a wide open space, or large drain, which is to the rabbits an underground means of communication between one part of their dwellings and another. It is considered likely that this was a cloaca maxima, into which the drain already mentioned, and that long since discovered in the by-pocaust near the great wall, emptied themselves. The enameller's shop, or forge, or smelting house, and that adjoining, opened upon the great street (Walling-street), where we know there were handsome public buildings on both sides, and a considerable space of ground (perhaps the Forum) between them.

SITE FOR MANCHESTER NEW TOWN HALL.

A MEMORIAL on this question was presented at the meeting of the City Council on the 9th inst. from the Manchester Architectural Association. The memorialists say:—

"We, as architects, have never entertained a favourable opinion of the shape of the site as decided upon; but, after a careful examination of the competition plans, we are more than ever convinced of the unfitness of the site for the purpose of a Town Hall for this city; and our object in addressing you is to entreat you to reconsider your decision while it is yet time; in doing which we feel that we are only echoing the opinion of the majority of our professional brethren who supplied sketches in the recent competition; and we know of instances where men of talent and high reputation in the profession have thrown up the competition on account of the inappropriate nature of the site as regards its form. With its position no fault can be found, and in many respects it is admirably adapted for a fine architectural display. But we respectfully ask that the boundary line of the plot may be altered so as to form right angles, and thereby render the site more available for the production of a good and convenient plan."

From the general feeling which seems to prevail amongst the well-informed portion of the Manchester community, we may suppose it likely that the Council will reconsider their determination as to the shape of the site for the new structure, which a glance at the plan shows to be inconvenient and undesirable. The Corporation should see this opportunity of improving the street communication of the neighbourhood, and it would be well to adopt plans which would meet the probable requirements of the city for many years to come.

A correspondent writes, and with some force, matters having now so far progressed,— "Attempts are being made to induce the Corporation to alter the shape of the site, so as to make it rectangular; and the Architectural Association here has, *inter alia*, memorialised the Corporation on the subject. The Manchester Society of Architects has not yet moved in the matter, because, although I think they are pretty unanimous as to a rectangular shape being preferable to the triangular, yet they think it would be excessively unfair to the architects

now engaged in the second competition if their labour and the expense they have already incurred were thrown away. The mere 300l. each would by no means compensate for their loss and the loss of employment of their respective office staff. No; let this competition be decided on its present basis, the architect chosen, and then let the Council improve the site if they can. The architect who can design the best arrangement on the triangular site can surely do equally well on a rectangular one."

CONVENTION OF THE AMERICAN INSTITUTE OF ARCHITECTS.

The annual convention of the American Institute of Architects was held on the 22nd ult. Mr. Richard Upjohn, the president, made an address, in which he spoke of the interchange of courtesies which had recently taken place between the Institute and the Royal Institute of British Architects. Mr. Upjohn, as president of the American society, has been elected an honorary member of the Institute. The speaker referred to the evils of competition among architects, under the present system of proposals for plans. It was wrong, he said, for architects to submit their work without compensation, for the examination and rejection of a committee of business men, not one of whom probably knew as much of the subject on which he was to decide as any of the competitors. The proper way would be to appoint five commissioners of good repute, and three non-competing architects. The competitors should not exceed ten, nor be less than five, and should be properly remunerated. The plans submitted should be examined by the architects, and the best reported to the commissioners. The reports of several committees were read. The Committee on Education recommended the formation of a Polytechnic School by the Institute, under the management of a Board of Control. The following officers were elected for the year 1868:—President, Mr. Richard Upjohn; Treasurer, Mr. R. G. Hatfield; Secretary, Mr. Fred. C. Withers; Corresponding Secretary, Mr. W. R. Ware; Librarian, Mr. A. J. Bloor.

BRISTOL.

The Royal Infirmary.—This edifice has for some time been in the hands of the builders. The roof has been raised, and the height of the upper story rooms will now be 12 ft. There will be large dormitories for the use of the regular nurses, about forty in number, each of whom will have a separate sleeping-room. Large windows in the front, and a corridor between the dormitories and windows, secure ventilation. There are other improvements and conveniences. The cost of this portion of the work is 3,200l. The contractor is Mr. W. Baker; and the architects are Messrs. Popes & Bindon. In the rear of the building are being erected, on the pavilion plan, two new wards; the cost of which has been defrayed by Mr. T. W. Hill, of Clifton, who has given a donation of 3,000l. The new infirmary wards are now nearly ready for the roof. Each ward is 50 ft. by 25 ft., and 15 ft. high, and is designed to take twelve beds. The wards are cheerful and well ventilated, their floors will be of polished oak; the windows will be glazed with British plate-glass, and the walls and ceilings cemented. The two wards are built one above the other. The extra cost of other improvements, will be borne by the Infirmary Committee. There has been no attempt on the part of the architects to make an ornamental building, but rather to make it look like a portion of the old building. The firm by which the Hill wards were designed, is that of Messrs. E. Codwin & Crisp. The general contractor was Mr. E. J. Hatherly, the masons' work being done by Mr. J. P. Stephens. Mr. Tuckey did the plumbers' work, and Mr. Cowlin the plastering and glazing.

The New Lunatic Wards at Clifton Union.—These wards have just been completed by the addition of two wings, one for male and the other for female patients. They are built in keeping with the general plan of the workhouse. On the ground floor of each is a day-room, 70 ft. by 20 ft., and a spare room, 21½ ft. by 20 ft. Adjoining are a lavatory and water-closets. The first floor is approached by a stone staircase.

On this floor is a dormitory, 100 ft. by 21 ft., water-closets, and bath-room. The building has cost about 1,800l.

The New St. Philip's Police Station.—This building, which adjoins the Hannah More Schools, is a plainly-designed structure, 94 ft. in length. On the ground-floor are a charge-room, an inspector's-room, an inspector's retiring-room, a sergeant's-room, and a large mess-room, 24 ft. long by 17 ft. wide, with a room adjoining, and a kitchen, 20 ft. by 15 ft., and a scullery, 16 ft. by 10 ft. A corridor affords communication between the charge-room and the cells, which are eight in number. The place is warmed by Hayden's heating apparatus. Adjoining the station-house proper is a building in which the fire-escape is to be kept. On the first floor are four large dormitories for the men, calculated to contain eighteen beds. A lavatory and bath-room are attached. The premises have been built, at a cost of 2,700l., by Mr. J. Webley, from designs prepared by Messrs. Popes & Bindon, architects.

St. Augustine's Church, Montpellier.—A place of worship which is to bear this name, says our authority for these details, the local Times, has been erected by Brother Cyprion, on land adjoining the Home at Montpellier. The edifice, which consists of nave, chancel, and aisles, is designed to seat 500 persons. The exterior is of galvanized iron, and the inner walls and roof are of stained deal. Fifteen two-light Gothic windows in the front and sides furnish light. The nave and chancel are divided by a roof-screen. An organ of the value of 800l. will be placed in a chamber behind the communion. The main entrance in Richmond-road is surmounted by a bell-turret, with cross over. Below the chapel is a school-room for 300 children. The interior arrangements have been designed by Mr. Dundas, assisted by Mr. E. Grigg. The builders were Messrs. Tupper & Co., of London. The masons' work has been done by Mr. M. Kingstone, and the carpenters' work by Mr. Grigg. The gas-fittings have been supplied by Mr. Foley, and the paintings and decorations generally are by Mr. Ridley. The edifice will be heated by steam. The church is to be opened on the 6th instant.

New Chapel for the Penitentiary.—A new chapel has been erected on the premises of the Bristol Female Penitentiary, Manalieu-street. The cost, about 2,200l., has been defrayed by subscriptions. The gallery has been entirely reserved for the inmates of the Penitentiary, who will be enabled to enter the chapel and take their seats unobserved. The public will be admitted downstairs. The edifice is intended as a mission chapel. The chapel and building have been set back, and give a clear space in front of 50 ft. The style of the chapel is Gothic of the early part of the fourteenth century. The architects are Messrs. Popes & Bindon. The chapel will be opened in the course of a week or two.

The new Ritualistic Chapel erected by Mr. C. A. W. Dundas, better known as Brother Cyprion, has been opened. The building is situated in Richmond-road, Montpellier, and has cost about 2,000l., the whole of which has been defrayed by Mr. Dundas. It is called a collegiate chapel, from its connexion with St. Augustine's College, an institution which also owes its existence solely to Brother Cyprion, and which was established by him in July, 1861, for orphan and other poor boys, whom he feeds, clothes, and educates. In addition to this he gives them a trade, that of printing. The chapel will accommodate about 500 persons, and connected with it are schools intended entirely for the secular education of the poor children of the district.

PROVINCIAL NEWS.

Smethwick.—The new Public Hall, at Smethwick, is at length completed, and inaugurated by a grand concert, for the benefit of the Smethwick Library and Reading-room. The new building comprises the hall, a large room, with seats for 1,000 persons, and the rooms for the local board of health; the whole being, in fact, a town-hall, with its attendant offices. The hall is about 75 ft. long by 50 ft. broad, and is approached by an entrance in the central block of buildings, and two side entrances. It has galleries on three sides, the fourth being occupied by the orchestra. The style of the interior may be considered as a free rendering of the Venetian-Italian, adapted to modern requirements. The ceiling is elliptical, and is enriched

with moulded ribs and ornamental intersections; the window architraves are groined into the ceiling. The galleries have pannelled fronts supported by cast-iron columns, painted in woodcolours, and the capitals gilt. The orchestra is similar in character, but the front portion is brought forward upon carved brackets, that heighten the effect. The whole of the woodwork is stained and varnished. The hall is lighted by star pendants from the ceiling, and warmed by Mellings' apparatus. The remaining buildings consist of the Board-room, and rooms for the clerks, surveyors, and others connected with the local Board of Health. Externally the elevation to the road is a combination of brick and stone, of two stories. The principal entrance in the centre consists of an arched portico of four columns, with enriched capitals. On either side are two windows, with pilasters, with carved capitals supporting moulded arches worked with a combination of moulded brick and stone. The upper story and return side has corresponding windows, and the whole is surmounted by a mutilated cornice, with pediment in the centre. Arrangements have been made for the erection of a clock-tower above the north entrance, but this has been deferred for the present. The cost of the whole will be nearly 4,000l.

Grantham.—The foundation-stone of the new Town-hall has been laid by the mayor. The site for the new edifice is "The Firs," on St. Peter's-hill. The design was by Mr. Watkins, of Lincoln.

FROM SCOTLAND.

Edinburgh.—A preliminary meeting for the consideration of resolutions to be moved at a public meeting on the 19th current, on the subject of the establishment of a Free Public Library for Edinburgh, has been held, and appropriate resolutions agreed upon in favour of the object in view. The united council of trades delegates of Edinburgh and Leith have also had a meeting promotive of the same purpose, and a committee's report on the subject was read and approved.

Glasgow.—A new dock, which has taken three years in its construction, has been opened at Glasgow. Its cost will be about 115,000l.

THE VENTILATION OF SEWERS.

HAVING for many years devoted much time to investigations respecting the cause and distribution of disease, I have long since come to the conclusion that, with the exception of bad water, no disease is engendered by sewage-gases from indoor water-closets and waste-water drains (where such are in use), than from all other preventable causes together.

In reference to sewage-gases and the ventilation of sewers, the Registrar-general states, that "this is one of the serious complications of water-closet drains, as under that system every house is put into communication with every other house, so that the zymotic volatile stuff of disease has a chance to find its way from house to house through this artificial channel." Yet, great as the evils of this system are, as remarked in the *Lancet*, "where there are already extensively-constructed systems of sewerage, there is little probability of their being superseded, at least in our day." These quotations show the urgent necessity for some improvement in the ventilation of sewers, and any proposition for that purpose must be worthy of consideration; I therefore submit the following, hoping that its adoption might be found beneficial, although I believe that no means for ventilation will ever render the water-closet system free from risk to health. The plan I propose has been submitted to the consideration of some who are well qualified to judge on such subjects, and they recommend a trial of it; but, as I am no engineer, I leave the decision as to the utility of the plan to those whom it may most concern.

The above quotation from the Registrar-general's report seems sufficient to prove that all means now in use are inadequate for the ventilation of sewers; still I know that many hold the opinion that open shafts, of the height of or higher than the neighbouring houses, would be sufficient for the purpose. In a pamphlet "On the Ventilation of Public Sewers," 1854 (now out of print), I suggested that a ventilating pipe should be inserted into all water-closet pipes, &c., below the trap, so as to allow the gas to escape into the open air above the house-top of where convenient, but I contended, and still hold, that no system of ventilation, merely by high shafts or pipes, can render houses connected with the sewers free from contamination from sewer-gases. One can only escape from the sewers by the expansive force of the gas generated within them, and to do so in volume the expansive force must overcome the pressure of the atmosphere; I therefore hold that the gas pressure sufficient to force an escape at the height of 30 ft., or 40 ft., or higher, as the case might be, would be sufficient to force an entry into any house with defective water-closets, pipes, or waste-water drains connected to the sewers, and to such defects, from bad materials, failure of workmanship, or the effects of frost, every house connected with the sewers is liable. Even without such defects there would still be risk of contamination, as during severe frosts, when, from the exclusion of external air, and from respiration and combustion, the air within doors is more than usually vitiated—every house, from its greater heat, would act as an air-pump to suck in gas from the sewer.

The great point to be gained in the ventilation of sewers is to withdraw the gases directly from them, and thus keep the expansive force of the gases in the sewers less than that of the atmospheric pressure without; so that there is not a constant pressure into the sewers in case of such defects as exist, rather than an expansive force of the escape of gas from the sewer wherever possible. This is proposed to do by air-pumps connected with the sewers by long steam-pipes, so that the gases thus withdrawn from the sewer may be forced into a discharging pipe carried to any necessary height or distance, so as not to be a nuisance to the neighbourhood.

That pumping is sufficient to induce such effects could be applied cannot be doubted; the chief question here is, as to the expense of working such a plan. On this head I am informed that, in many of the condensed-air blast-furnaces in Staffordshire, upwards of 30 cubic feet of air, at atmospheric pressure, are discharged from a single cylinder at every stroke, and these at upwards of thirty per minute. On this calculation we have a discharge of gas from the sewers of 14,600 cubic feet per hour, or 3,450,000 per day; a quantity equal to the contents of a cylinder of one yard in diameter and more than thirty miles in length. What the working cost to produce similar effects on the plan I propose might be I cannot guess; but, as the gases to be pumped out would readily give any resistance, it may be calculated that all the force would be expended in merely working the engine itself, and therefore no very great steam-power could be required.

For ventilating purposes the pumping apparatus need not be directly in contact with the sewer, but might be at any convenient distance if connected with it by an air-tight pipe; or the pumping-chamber might be in such connection with the sewers at various parts, so that the force would be expended in drawing the air from the sewer over a large area, or from either or any of the connecting pipes as required.

It is much to be regretted that the public mind, and from the fact that the railways of the metropolis and, from the inspiration by so many persons, together with the constant combustion of so much gas and coke, carbonic acid gas is generated there in large quantities, and may become injurious to the public health. In this case also could be effected by the plan I propose; as separate pipes from a pumping-station could communicate with the sewers at various points, and by the use of a very considerable amount of water, the air could be withdrawn, while the gases of a lighter character could be drawn off by similar pipes at the same time from the sewers.

Although on the proposed plan steam power would be necessary for ventilating extensive systems of sewers, or, like other mechanical means, or horse or manual power, the application of steam power in carrying out the principle on a smaller scale, or where only occasionally required. By pipes, of the necessary size, distributed over a building on a plan similar to those for gas, steam pipes could be brought into connection with the pumping chamber, and the appliances for ventilation could thus be as readily at hand as gas for lighting purposes, and under similar control, as the communication or communication with each room could be more or less closed at will, and when needed the whole pumping power could be made to act entirely on any department.

For the ventilation of crowded or over-heated mansions, or the application of steam power in carrying out the principle on a smaller scale, or where only occasionally required. By pipes, of the necessary size, distributed over a building on a plan similar to those for gas, steam pipes could be brought into connection with the pumping chamber, and the appliances for ventilation could thus be as readily at hand as gas for lighting purposes, and under similar control, as the communication or communication with each room could be more or less closed at will, and when needed the whole pumping power could be made to act entirely on any department.

By pipes, of the necessary size, distributed over a building on a plan similar to those for gas, steam pipes could be brought into connection with the pumping chamber, and the appliances for ventilation could thus be as readily at hand as gas for lighting purposes, and under similar control, as the communication or communication with each room could be more or less closed at will, and when needed the whole pumping power could be made to act entirely on any department.

G. A. ROWELL.

THE STRENGTH OF CONCRETE WALLS.

DETERMINED to see for myself what had been accomplished with concrete, I visited the concrete houses at Gravesend; and, fortunately for the conviction, I arrived at the time of the termination by the committee of the Metropolitan Board. I saw a 9-in. concrete wall hattered by a 14 lb. sledge hammer. Mr. Valliant, architect of the Board, said that with about the same blows a hole would have been made through a 14-in. brick wall. I cannot say what number of blows were inflicted, but certainly the wall was struck vigorously, the only perceptible effect being a slight crushing of the surface of the concrete on the side struck. Mr. Valliant tested the wall on the other side with a straight edge, and ascertained that not the slightest effect was produced. ROBERT WHITLEY, Builder.

RYDE CHURCH COMPETITION.

SIR,—I enclose an extract from the *Telegraph*, regarding the competition for the proposed parish church at Ryde, and urging the desirability of selecting a local man's design. Upwards of sixty designs have been sent in, in accordance with the advertisement published in your journal, and the faith of the competition being a bond fide one. Comment would be superfluous.

ONE OF THE LONDON COMPETITORS. P.S.—After the appearance of such an article in a local paper, the only way to satisfy the public of the good faith of the advertiser, is for the committee to appoint some architect of eminence, unconnected with the competition or with the locality, to make the selection.

CONSPIRACY TO DEFRAUD ARCHITECTS.

At the Manchester city police-court, James Macmaster, master builder, and Adam Hamming and James Slater, foremen in his city, were recently charged with conspiring together to defraud Messrs. Pennington & Bridgen, architects, Manchester.

The evidence given for the prosecution was in substance as follows:—The prosecutors had been largely employed in the erection of villa residences in and around Manchester, and they had contracted with Mr. Macmaster to build them eight or ten miles from Fallowfield. A dispute arose between them as to the amount they were to pay Macmaster, and on Saturday, the 8th of February last, he came to their office about this dispute. When Macmaster left their office, he said he would find some way to make them pay the account without going to law. On the Tuesday, the 12th of the same month, the two defendants came to their office, and represented themselves to be a deputation from the Manchester Builders' Association, and that they had been sent to wait upon their firm in consequence of a complaint which Macmaster had made at a meeting of the society on the Friday previous. They had got two surveyors to measure the work for which they had contracted with Mr. Macmaster to build, and on the two defendants coming to them they showed them their own and Macmaster's account, which did not agree together. The cheque was given on the understanding that, although it was written for Clifton-avenue, it was in payment of all Mr. Macmaster's demands. The defendants and that Macmaster did not agree to the settlement, as "He dared not make fools of them, because if he did all his men would be drawn out of their jobs."

The men came again, and obtained H.P. for their expenses. David Foulkes, a foreman, and treasurer of the Manchester Lodge of the Operative Carpenters and Joiners' Society, held at the Cheshire Cheese, in Bridge-street, Manchester, stated that until lately the prisoner Slater had been secretary of the Lodge. Mr. Macmaster never brought the matter of his dispute with Messrs. Pennington & Bridgen before the lodge, and no deputation was ever appointed to wait upon them.

Sergeant Spibey, of the city police force, deposed that on Saturday, the 19th October, he went to Macmaster's house in Mercer-street, Hulme, and there saw Macmaster. He told Macmaster that he had come to make inquiries respecting two men who had been to Messrs. Pennington & Bridgen, and had received on his behalf a cheque for 100*l.*, stating that they were a deputation from the Joiners' Association. Macmaster replied, "No; it is not so. They were no deputation from the Joiners' Society; they were two men of mine. Pennington & Bridgen owed me 100*l.* and odd; I owed the men's wages, and I told them they might go and settle the matter for 100*l.*, and I would pay them if they got the money."

Mr. Addison, on behalf of the prisoners, said he believed there was a good defence to the charges. He submitted that with regard to Macmaster, even assuming that the other prisoners did falsely represent themselves as a deputation from the Joiners' Association, there was nothing to show that he was any party to that misrepresentation; or that his statement to the police officer was not strictly correct.

The prisoners were committed for trial at the Assizes, but were admitted to bail.

THE TRADES MOVEMENT.

General Builders' Association.—The annual meeting of the Birmingham branch of the General Builders' Association has been held. Mr. William Webb, the president of the branch, occupied the chair. The committee reported that the progress of the Association had been eminently satisfactory. This was mainly due to the accession of members consequent upon the amalgamation, in the spring of the year, of the late Master Painters' Association with themselves. They had now 112 members, as compared with sixty-three at the time of the presentation of the last report. For some time past the committee had been impressed with the necessity for some amelioration of the present system of contracts, agreements, and bills of quantities, and an effort had been directed towards the attainment of that object. At the end of last year a letter on the subject of the appointment of quantity surveyors and forms of contract, and bearing the signatures of sixty-one of the principal employers of labour, was sent to the honorary secretary of the Birmingham Architectural Association. A promise was given that the matter should be considered at the adjourned annual meeting of the Association to be held on the 21st of the present month. Until a settlement should be obtained, the committee recommended that a strike clause and provisions for arbitration in cases of dispute during the execution of a contract should be insisted upon. They would also advocate the incorporation of bills of quantities in the agree-

ment, and the adoption of a system of monthly payments on account. A scheme for the registration of non-union workmen had been originated. The committee regarded the proposed scheme as one of the utmost importance to the trade. The report was unanimously adopted. Mr. W. Briggs, jun., was elected president, and Mr. Cresswell vice-president of the branch for the ensuing year. Mr. Hardwick was re-appointed treasurer. A committee of twenty was elected.—The annual dinner of the Association took place on the day of meeting. Mr. George Dixon, M.P., presided, and there were about 170 gentlemen present, including the principal employers in the building trade of Birmingham and the neighbourhood.

Arbitration on the File Trade.—A monthly delegate meeting of file-smiths held at Sheffield has been considering the advisability of establishing a board of arbitration and conciliation in connexion with the file trade. The meeting adopted the following resolution:—

"That this meeting recommend the delegates present to consult with their several employers, and ascertain whether they are willing to co-operate in the formation of a board of arbitration and conciliation to settle any disputes that may from time to time arise in the trade respecting prices or other matters as between employer and employed, and to report the result of their interviews at the next delegate meeting."

Progressive Society of Carpenters and Joiners.

The annual dinner and entertainment of this society took place at Charlotte-street, Bedford-row. About fifty of the members of the society were present. Mr. George Potter presided. After dinner, Mr. Potter gave, among other toasts, "Success to the Progressive Society of Carpenters and Joiners," and took advantage of the opportunity to refer to the trades' union questions which have of late become a topic of much discussion throughout the country. He remembered, he said, that when he first came to London the joiners worked for 8*s.* a day, and had to work on the Saturday till half-past five o'clock in the evening. If he did not mistake, they now received 38*s.* a week, and left off work on Saturday at one o'clock. In addition to that they now possessed the great privilege of having their affairs published, so that the public might be able to judge as to whether what they asked was reasonable or not. The trades' unions were no doubt established in the interest of the working people, but they were perfectly legal, and had been, in his opinion, mainly instrumental in imparting to the working man that education which Government had up to the present failed to afford, and which had been the means of sustaining the character of England as a manufacturing country.

CHURCH-BUILDING NEWS.

Kennington.—The foundation-stones have been laid of a new school-church, which is to be erected in the Foxley-road, and which is designed to afford accommodation for some of the inhabitants of the thickly-populated district of St. Mark's. The design embraces a church and a superior middle-class school, which for the present, are to be worked together.

Pickering.—Rillington Church spire has had a considerable portion of its top displaced twice during the last thirty years, on the former occasion by the great January gale, and on the latter by being struck by lightning during the present summer. The restorations on both occasions have been effected by contributions of the landed proprietors and others. Mr. John Bisby, of Leeds, has executed the work; and it is hoped that the application of a new lightning conductor will prevent the recurrence of a similar accident.

Amshay.—The old church at this village has been restored and re-opened for public worship. The Norman arches were covered over and whitewashed, but now they have been cleared of that and restored. A gallery has been removed from the west end, and the tower arch, which was blocked up, has thereby been re-opened. The south aisle has been rebuilt, and a new roof put on it. The walls have all been replastered. The chancel had a flat roof on very high walls; these walls have been lowered, and a high-pitched roof put up instead, with open timber. The seats in the church are of deal, and varnished; the floor of small red quarries with coloured bands. There are three memorial windows of stained glass—one at the east or tower end, given by Mr. Perkins; a small one on the south side, given by the architect; the third window is given by the vicar, and is placed in the south side of the chancel. There is a new high-pitched roof put on the nave and aisles. Mr. John Loveday,

of Kibworth, was the contractor; and Mr. Millican, of Leicester, the architect employed.

Manchester.—The foundation-stone of the Stowell Memorial Church, situated at the junction of Cross-lane and Regent-road, Salford, has been laid by the Bishop of Manchester. It is estimated to cost about 7,000l. Mr. Mark Foggett is the builder; and Mr. J. Medland Taylor, Manchester, is the architect. The eastern end of the church is towards Cross-lane; and the tower and spire are at the east end of the north aisle, so as to show to advantage from every approach. The arrangement of the church on the ground plan comprises a spacious nave, with five arches on either side, marking it off from its north and south aisles. The chancel fittings will be of oak. The roofs will be covered with purple slates.

Salford (Bedfordshire).—The church of this rural parish having become dilapidated, as well as disfigured, has been under restoration in the hands of Mr. W. White. The tower has been removed and replaced by an open bell-cote, surmounting the western gable, and capped with a short spire, covered with oak shingles. The east wall of the chancel has been rebuilt, and also the arch opening from the nave. The roof has been reconstructed and covered with old tiles, relieved by hands of new. The chancel fittings are new. The nave roof has been reconstructed, and the western gallery removed. Whitewash has been cleaned off, and stonework renewed. Mr. A. Kimberley, of Banbury, executed the work done.

Hardwycke.—The parish church of Hardwycke, a secluded village, about four miles west of Wellingborough, has been re-opened for divine service after having been restored. The church was in such a dilapidated condition that it was almost ruinous. It was placed in the hands of Mr. W. Slater and Mr. R. H. Carpenter, of London, architects, and the work of restoration was at once proceeded with. The arches separating the south aisle from the nave were blocked up, and the aisle itself was in a ruinous state. The arches were thrown open, and the aisle was rebuilt on the old foundations. The porch on the north side is new, and the whole church, including the chancel, has been new-roofed. Originally the chancel was larger than it is now, but in the recent restoration it has been thought desirable to extend it. The old mouldings have been followed, and an old beam has been left at the west end of the nave. The windows are new, the east window being of the Early Decorated style, to which the original church belonged. The chancel is laid with Minton's encaustic tiles, the gift of Mr. Minton. There is a lantern-window at the west end, which now contains a picture of St. Leonard, to whose memory the church is dedicated. That was put in by Mr. Hall, of Northampton, by whom all the plumber's and glazier's work has been done. The contractors were Messrs. Clark & Heap, of Northampton, builders.

Nottingham.—St. Mary's Church, which has been restored at the cost of many thousand pounds, by Mr. Gilbert Scott, has been reopened for divine service. The following statement has been published by the committee. General works done:—Roofs, restored, 2,439l.; internal walls, recessed, 1,010l.; floors, new, 790l.; gas-fittings, new, 475l.; windows, reglazed, 250l.; window-tracery in transepts, restored, 175l.; warming apparatus, new, 200l.; chairs, 150l.; organ, removed and repaired, 120l. Subscriptions to meet these items, 5,000l. General works to be done:—Oak seats, vestry roof and walls, buttresses, parapets, and the whole of north exterior, organ-chamber and organ, wall and fence of churchyard, porch. Special gifts suggested:—Pulpit, reading-desk, chancel-stalls at 40l. each, stained windows. The gasfittings generally are supplied by Skidmore, of Coventry, and the heating is accomplished by four of Garney's stoves, supplied by the London Heating and Ventilating Company, the old arrangement for hot air having become useless. The whole of the works have been carried on under the direction of Mr. Scott and the immediate superintendence of Mr. W. Cook. The contractor for the whole of the works is Mr. J. E. Hall, of this town.

Lee (Ducks).—The chief stone of a new church has been laid in this village. The plan consists of a nave 46 ft. long by 21½ ft. wide, and a chancel 21 ft. long by 16 ft. wide, an ample vestry, and south porch. The roof of the nave will be open timbered; that of the chancel boarded. The walls will be of brick and flint, with stone dressings and gable crosses. A bell-turret surmounts the western gable. The church

has lancet windows and buttresses throughout. The east window is a triplet. The contract for the first portion of the work amounts to 1,065l. The seats are open, and accommodation will be immediately provided for 182 persons. The builder is Mr. James Honour, of Tring, and the architect, Mr. Augustus Frere.

Malden.—All Saints' Church has been re-opened. By removing the old pews, and erecting in their places the usual benches, additional accommodation is provided, the number of new seats thus obtained being 162; so that the church will now seat 1,000 persons. That is the chief alteration. The seats are free. The old pulpit has been replaced by a stone erection, octagonal in shape. A reredos, in Caen stone, has been erected, and the interstices have been filled by paintings from the studio of a local artist, Mr. Nightingale, the subjects being the chief sacrificial features in the life of Jesus Christ. The flooring of the church, which was of different levels, has been made into one, partly re-flagged with new materials, and the floor of the altar-steps laid with encaustic tiles. The alterations have been effected from the designs and under the superintendence of Mr. Wm. Adams, architect, of Malden, and of Newport, Monmouthshire, by Mr. E. Saunders, contractor. The cost of the new works will be about 1,200l.

Battle.—The parish church of St. Mary, Battle, is in bad condition. It dates from the twelfth century, and the stonework of the exterior is much worn and decayed by time; while the interior is not only defaced by injudicious alterations, but the area is wasted and encumbered by pews, which are as inconvenient in form as unsightly in appearance. Efforts are now making to restore and reset the church under the direction of Mr. Butterfield. The cost of the work will be about 4,000l.

Cottenham.—For some time past, the interior of the parish church has been in course of gradual restoration. The whole has been completed, with the exception of some of the more elaborate wood-carving, by village tradesmen and workpeople, under the superintendence of Mr. W. M. Fawcett, architect. The plastering of the walls, the stonework, flooring, roof, and woodwork, have all been restored. In the place of square pews, the church now has open-bench seats in oak.

Twywell.—The parish church of Twywell, a village about four miles from Thrapston, in Northamptonshire, has been re-opened for divine service, after having undergone a restoration. The tower was not safe, and had to be supported, and the whole edifice required almost to be reconstructed. The west end gallery has been taken down, and the arch opened. A new bay has been added at the west end to the south aisle. New windows and mullions have been put in. The whole interior of the church was plastered and whitewashed. This has been removed. The roof, even, was whitewashed; this has been cleaned off, and the rafters stained. The south porch has been partly rebuilt, and the chancel has been rebuilt, the north wall and the east end being entirely new. The old pavement remains. The old high pews have been removed, and open seats substituted, with a reading-desk also of oak. The carving on the pulpit was taken from an old low screen which was hidden from sight, and blocked up the high pews. The chancel has a pitched roof, which like the flat roof in the nave, was whitewashed. The church is heated with Mariott, of St. Neot's, hot-water apparatus. The work has been done by Mr. S. R. Brown, of Kettering, builder, under the superintendence of the Rev. Mr. Eise, who has been his own architect and clerk of the works. At a luncheon after the opening, the bishop of the diocese, in course of some remarks as to the church, said there was a peculiarity in the work, which he would not commend to their imitation. The church had been almost re-built without either architect or clerk of the works. Now, there were some very excellent clergymen—men of great attainments in various ways, but he must confess that if a clergyman came to him and told him that he was about to restore his church, without having either an architect or a clerk of the works, he should hesitate before he gave him a faculty. He admitted, however, that in the present instance he could not find fault.

Sheldon.—The church here, which for more than a year has been undergoing a restoration, has been reopened for Divine service by the Bishop of Worcester. Whilst being dismantled many curious old relics were brought to light.

The walls were found to be covered with paintings, and in some places superposed one upon another. Being rudely done in distemper it was impossible to retain them. The remains of a roof-loft and staircase were also discovered, and one or two pincinas became revealed to view as the old plaster was removed. Above the roof-loft was found a large cavity in the main wall 20 in. by 30 in., which was evidently used as a hiding-place for relics and church jewels and plate. There is an old inscription in the tower, now framed, with plate-glass front, recording the fact that the church was built in A.D. 1461. The roof, hid behind the plaster ceiling, was in good preservation, and remains now in the new church exactly as it was in the old. Twelve stained-glass windows, by Messrs. Ward & Hughes, have been entirely defrayed by cottagers, having the appropriate subjects of the widow's mite and the Mary "who hath done what she could" represented in the two lights. The architects were Messrs. Slater & Carpenter, of London; and the builder, Mr. Brownich, of Ragby. A new organ is now wanted.

DISSENTING CHURCH-BUILDING NEWS.

Finbury, London.—The Congregational chapel in Finbury Circus has just been reopened, after having been decorated throughout. A considerable alteration has also been made in the internal arrangement of the chapel on the north side, the accommodation on the ground-floor having been somewhat curtailed to allow of the erection of a large lecture-room, with minister's and deacons' vestries. A deep gallery, which forms the ceiling of these rooms, furnishes a space for a large new organ, built by Messrs. Bishop & Starr, and contains, besides, two rows of pewing. A new heating apparatus has been provided, and a fresh system of gas-fitting adopted, consisting of starlights from the ceiling, and brackets under the galleries. Mr. W. A. Dixon was the architect employed; and the works have been carried out by Messrs. Staines & Son, of Great St. Helen's.

Hoxton, London.—The new Barbican Congregational Church has been erected in the New North-road, Hoxton, in lieu of the old one of the same name which stood for upwards of eighty years in Barbican, but which has been purchased by the Metropolitan Railway Company. It was opened on September 26th. It is of the Early Decorated type. On the basement, which is more than half out of the ground, there is a lecture-room, 64 ft. by 41 ft. 6 in., and 12 ft. high, with platform and two good entrances; two infants' class-rooms, with galleries for 100 infants; and two class-rooms, for forty senior scholars; all possessing excellent light. On the ground-floor is the church, 102 ft. by 41 ft. 6 in. and 38 ft. 6 in. high, having accommodation for 900 persons. In the front are two entrances, with corridor 25 ft. 6 in. by 6 ft., paved with ornamental tiles; and in the rear are ministers' and deacons' vestries, a lavatory, &c., with staircase to the organ gallery. The church is well lighted. There are no columns above the galleries, the roof spanning from wall to wall. The front is of Kentish rag and Bath stone, with appropriate carving. The cost of the whole, including lighting, warming, ventilation, cushions to pews, architects' fees, &c., will be under 6,000l. The architects are Messrs. Lander & Bedells, and the work has been done by Messrs. Brown & Robinson.

Chequers-alley, London.—The space between City-road and Aldersgate-street, especially that portion of it in the rear of Bunhill Fields, is occupied by a dense network of narrow streets and alleys. The houses composing these thoroughfares are of the worst imaginable style of construction, and are many of them in the last stage of dilapidation. They are inhabited by a most poor and squalid class, to whom dirt appears to be a necessity of existence, or to whom, at any rate, cleanliness seems to be impossible. In the midst of this mass of wretchedness,—and it is to be feared of crime also,—a Wesleyan Chapel and schools have just been opened. Chequers-alley,—one of the narrowest and darkest courts in London,—affords a site for these buildings. Both this thoroughfare and Pump-alley, which intersects it at this point, are so narrow, that when a passenger in either of them extends his hands, he can touch at once the walls on each side. In such a situation architectural display would have been out of place, even if the limited

nds at command had allowed it. The structure, therefore, is of the plainest description, though commodious. The chapel will seat 50 persons, and is entered through a short arched passage, designed to exclude the noise of any disturbance outside. For the same reason, and to avoid the risk of damage, the window-sills are kept up as high as possible. An infant school is attached to the chapel. The remainder of the premises consist of a school-room of the same size as the chapel, with class-rooms, lavatories, &c., attached, and a house for the porter who takes charge of the whole. Bath stone and brick were the materials employed. Careful attention has been given to the lighting and ventilation of all apartments. Mr. E. Hoole, Craven-street, was the architect. The whole of the premises has been about 1,500l. The foundation stone was laid by the Earl of Shaftesbury. The chapel and schools have recently been opened. Mr. Hobson, of the Adelphi, was the builder.

Sunderland.—The foundation-stone of a new chapel has been laid in South Durham-street, Sunderland. About thirty years ago a large meeting-house, used by one of the Wesleyan Methodist ministers, was built in South Durham-street, and this has been found ill-adapted to the present day, and the United Methodist Free Church, who are busy erecting several chapels in the neighbourhood, determined to pull down the old tabernacle, and rebuild it in more modern style, at a cost of 2,000l. The new place of worship will be capable of holding about 1,200 people. The architect is Mr. Joseph Potts.

Books Received.

Golden Sheaf: Poems contributed by Living Authors. Edited by the Rev. CHAS. ROGERS, LL.D. London: Houlston & Wright, 1868. The composition of this very cheap and pretty book eighty-four writers have contributed, including, and we name those whose poems have been selected, the Rev. Goodwyn Barmby, C. Bennett, Fras. Bennoch, Sir John Bowyer, Mrs. Cowden Clarke, Mrs. Newton Cross, Canon Dale, S. C. Hall (a captain "Loverly to his Wife"), Fanny Haugerl, Mr. and Mrs. Howitt, Chas. Mackay, Eliza Ogilvy, Bessie Keane, the late Miss Power, J. E. Reade, Christina Rossetti (subtle and obscure), Charles Lamb, Martin Tupper, A. A. Watts, &c. The best work, with the exception of Mr. Edmund Spenser's "Battle of Hastings," and the one that belongs to our special subjects, is "Venice," by the author of "Blythe House." This is a charming verse a graphic account, and the only one, so far as we know, of the events that attended the assumption of Venice by King Victor Emmanuel. The descriptions are evidently those of an eye-witness. Here are some lines from it about—

Venice.

Venice gives a welcome, all her own,
No town in modern times could'er have shown.
Her world-famed citizen, Palladio, planned
Her an Olympian theatre. Death's head
Removed him when his work was scarce begun;
But worthily 'twas finished by his son.
As amphitheatre the inner space
Is formed. The stage is upward sloped to face
The enlarged arena. Radiating thence
Five streets are seen, which—to the mised sense
Of vision—seem to stretch far out of sight;
And these are crossed by others, left and right.
The stage-front a triumphal arch appears,
Where columns and tall statues rise in tiers
Up to the tent-like roof, beneath which a space
Is formed, where noble bas-reliefs have place.
The theatre is filled in every part
By faces whose expectant, eager look
Seems almost pain.

Verona.

Verona, with the wondrous legacy
Bequeathed to her through many a century
By ancient Rome, her massive world-renowned
Old amphitheatre, herein has found
The grandest medium whereby to convey
Her sense of joy on this her festa-day.
With well placed care she has contrived to keep
Her treasure almost perfect; save the step
Acread outer wall, the rest remains
The same as when proud emperors and their train
Of cruel courtiers came to gape their eyes
With tortured Christians' dying agonies,
And scarce less brutal contests of wild beasts,
Which formed the crowning glory of their feasts.
Among the illuminations of the night
This world-placid circus forms a striking sight.
Within the giant arches' yawning void
Throughout the evening, soldiers are employed
To tend each steady-burning deep red fire,
Whose floods of crimson smoke rise ever higher."

Departing thence, the king proceeds to—
Florence.

"—Forth from Verona's gates he's gone,
Through Virgil's native Mantua; and on
To his new capital, Florence the fair,
Where Brunelleschi's dome soars up in air;
Where Giotto's benignant Campanile stands;
Where grew the works of Donatello's hands;
Where Buonarroti's David rears its head;
Where Raphael's, Titian's works are richly spread
Or odorous walls; where, from the plastic hand
Of Luca della Robbia, bold groups stand;
Where Ghiberti's unrivalled bronze gates rise,
Said Michelangelo, "where Dante's Seat
Is still remembered; where dead heroes meet
In Santa Croce's fane,—heroes, that is,
In the world's progress! Of a surety this
Is the most noble conquest!
Oh! God grant
The sons of Italy again may part
For glory such as this!
May they once more
Revive their schools of painting as of yore.
In sculpture, literature, science, and art,
And in all strifes of mind take their due part;
Recalling the grand names which form their dower,
May they go forth with resurrection power,
To fill their post in heaven's wide-spread plan,
That man shall work, and aid his fellow-man!"

Heartily we re-echo the good wish.
The volume is introduced by a brief essay on
the Poetic Art, by Mr. E. J. Reed, who, besides
being chief constructor of the Navy, shows evidence
of skill as a critic.

Miscellaneous.

SUBSCRIPTIONS TO BUILDERS' BENEVOLENT INSTITUTION.—The secretary writes,—"In error I omitted in the advertisement of last week the name of Will Tite, esq., M.P., a donation of 10l. 10s. Will, you kindly assist me by taking notice of this in your publication of this week?" We willingly comply.

A NEW HOT-AIR ENGINE.—A number of gentlemen, most of them practical engineers, recently assembled at Edwards & Co.'s establishment, Oxford-street, to inspect their new patent hot-air engines. A one-horse engine at work, a two-horse engine not at work, and an engine in pieces, were exhibited and criticised. The engine consists of a large furnace, surmounted by a cylinder, through which the piston moves. The fire having been lighted, the piston begins to work, at first slowly, until it pumps in the fresh cold air. In less than a minute, the supply of air having become heated, the engine gains its full speed, which is regulated in the same manner as in steam-engines. The waste air escapes by means of a large pipe, which will also serve for the purpose of heating, as the pump through which the cold air is drawn in answers for ventilation. Difficulties and complications in the old caloric engine are avoided, we are told, and the cost is said to be exceedingly low.

HACKNEY BOARD OF WORKS REPORTS.—The eleventh annual report of the Hackney Board of Works, including the reports of their surveyor, Mr. Lovegrove, and their medical officer of health, Dr. J. W. Tripe, has been printed. There are also reports on the cholera epidemic appended. From that epidemic Hackney suffered comparatively little. Small-pox was the most prevalent of the ordinary diseases in course of the year, and want of vaccination is said to have been a cause of this prevalence. The general rate of mortality in the district was 229 per 10,000 inhabitants, by contrast with 264 in the whole of London. In respect to the very important subject of overcrowding, and the powers of the new Act as a remedy, Dr. Tripe says:—

"The 35th section, under which the regulations for lodging-houses have been framed, is one of the most important in the Sanitary Act, but so far as I have seen, requires much care in carrying it out. Before the passing of the Act, there was not any difficulty in obtaining convictions for overcrowding, under the Nuisances Removal Act, at some police courts, but I believe there was in this. This section has this great advantage, that the district authorities have been able to obtain a regulation stating what is, and what is not, overcrowding. The first district for which regulations were obtained, was Hackney, and the minimum space, viz. 300 cubic feet for each adult in a sleeping-room, may be considered as the minimum for other districts. The Secretary of State objected to this space as too small, but he granted it as being the first application to him to fix the breathing space requisite for an individual, and expressed a hope that a larger number of cubic feet would be afforded after a time. I can scarcely agree with this hope, and find great difficulty in enforcing this regulation. We have not found it necessary to say so yet to take out any summonses under the regulations, inasmuch as the ordinary powers under the Nuisances Removal Acts, have been found sufficient. The great error, so far as the regulations are concerned, in framing the regulations has been, that no district has fixed a minimum penalty, while all have adopted the maximum penalty mentioned in the Act."

THE NEW LAW COURTS.—We do not find any grounds for a recent paragraph in the daily papers as to a decision in this competition. The judges have not met since their report was returned by the Treasury, and nothing whatever has been done.

PAPER FROM WOOD.—Many very interesting samples of paper manufactured from wood have been shown at the Paris Exhibition. The invention is not new, but the processes by which the fibres are treated, the method of whitening the material and converting it into a pulp for the manufacture of excellent paper, have only now been successful; and the factories in operation in France and elsewhere abroad are preparing daily from 1,000 to 2,000, and, in some instances, 10,000, kilogrammes of pulp per day from wood, for the production of white paper. Hitherto there has been great difficulty in producing paper from woody substances, on account of it not receiving ink and pressure without deterioration.

NEW MARKET, ACCRINGTON.—The new market in Accrington, the result of a competition which took place last year, and was duly noted in our pages, is now up to the level of the plinth course, and the upper portion is about to be proceeded with, under a fresh contract. The size internally is 60 yards by 40 yards. Warrington stone, in large blocks, is used up to the plinth, and local stone (white) of good quality is used for the upper portion. Patent glazed bricks are to be used for lining the whole of the interior. The roof is entirely of iron, and covered with blue slates. The lighting is by means of splayed clearstories, and the appearance is expected to be novel and effective. The architect is Mr. J. F. Doyle.

OPENING OF THE NEW RIFLE DRILL-HALL, GREAT YARMOUTH.—The new rifle drill-hall, recently erected for the use of the Yarmouth rifle battalion, has been formally opened. It was built from designs prepared by Mr. J. T. Bottle, of this town, architect. The style is Gothic. The hall is 114 ft. in length, by 60 ft. in width. From the base to the centre of the roof the height is about 30 ft. The roof is elliptic, and springs from the floor. The south front is faced with flint, with Bath stone dressings, and contains a residence and offices, an armory, and other adjuncts. The edifice is constructed of red brick, with white brick string crossings. The total cost will be about 1,300l. Mr. Leggett was the builder, and Mr. Want the Carpenter. At the south end an orchestra has been erected. The hall is lighted at night with gas.

METROPOLITAN CEMETERIES.—A return, moved for by Mr. Berkeley, has just been issued from the Queen's Printing-office, which gives the number of licences and other particulars connected with burial grounds within the metropolitan district. By this return it appears that licences were granted under the Metropolitan Interments Acts, 1852, for now, or extension of old, burial grounds in the districts of Marylebone, Lambeth, Islington, Paddington, City of London, St. Pancras, Camberwell, Westminster, Charlton, Putney, Greenwich (Crooms-hill); Deptford, Sydenham, Hammersmith, Norwood, Battersea, Plumstead, and Willesden. Particulars are recorded as to twenty-one cemeteries, the largest of which belongs to the General Cemetery Company, Kensal-green. This burial-ground comprises an area of rather less than 80 acres, of which 73 acres have been consecrated, and 25,393 interments took place between the 1st of January, 1852, and the 31st of August, 1866. The Cemetery of St. Mary at the same place is used exclusively by Roman Catholics, consists of 30 acres of land, and between 1858 and 1866 inclusive, 12,561 interments took place. The Norwood Cemetery occupies 40 acres; that at Abney Park, 33 acres; the Brompton Cemetery, 38 acres; and the City of London and Tower Hamlets Cemetery, 25 acres. It appears from this return that the number of bodies permitted to be interred in one grave varies from one to five, and that at Kensal-green no restriction as to number is made, but that a layer of earth at least a foot thick is to be deposited between each coffin; so that under this regulation a grave 16½ ft. in depth will receive six coffins. Particulars are also appended as to these cemeteries, and the return specifies also the number of houses situated within 200 yards of each burial-ground.

SOCIETY OF ARTS.—The opening meeting will be held on Wednesday, the 20th instant, when the opening address will be delivered by the chairman of the Council.

THE COLLIERY EXPLOSIONS.—Mr. Plant invites attention to the fact that the explosion at Oaks Colliery on the 5th occurred just six days after his letter of "Caution" was sent to us, which communication, however, was not published by us until the 8th. Others have since occurred, as elsewhere mentioned.

LEICESTER-SQUARE.—An action has been brought against the Metropolitan Board of Works for alleged trespass in dealing with the inclosed space in Leicester-square under the Public Gardens Act of 1863. The plaintiff is Mr. Tulk, who claims that the inclosure is his property, and not a public garden.

CLIFTON WORKHOUSE INFIRMARY.—Attention has been called to the uncleanly management of this infirmary by the *British Medical Journal*, and we are glad to see that the guardians have been aroused to the carrying out of much-needed amendments in that respect. The journal named suggests to the guardians, that not only is it necessary that their rules should be good, but that they should be thoroughly carried out, and not neglected as they were at the time their inquirer paid his visit. Without extreme cleanliness in an infirmary, it is not possible to prevent the spread of disease.

THE ALBERT INSTITUTE AT WINDSOR.—An influential meeting was held on Wednesday in last week, at the Town-hall, Windsor, for the purpose of furthering the erection of the proposed Albert Institute. Captain Bulkeley presided. Mr. Hawlin read a statement and subscription list, from which it appeared that about 1,100, had already been subscribed. Mr. Ekyun, M.P., Captain Bulkeley, Mr. W. R. Harris, Mr. Hall Saye, Mr. Darvill, Mr. Browning, Mr. Gordon Gyll, and other gentlemen, addressed the meeting, and a resolution that "it was desirable to erect the proposed Albert Institute in order to express, in a work designed for the public good, the respect of those present for the memory of the Prince Consort," was unanimously carried.

PLANT-HOUSE GLASS.—M. L. Calletet details experiments on the influence of coloured rays on the decomposition of carbonic acid by plants. He observes that green light afforded unexpected results, whether this colour was obtained from grass, vegetable leaves, or solutions. Under its influence carbonic acid, he states, is never decomposed: a fresh quantity of gas seems, on the contrary, to be evolved. When a glass containing pure air and a leaf was placed in full sunlight, under a green glass shade, after a few hours a quantity of carbonic acid was obtained that was scarcely inferior to that which the leaf would have evolved in the dark. If correct, this would influence the glazing of greenhouses. Of course, for a plant-house a chief object must be to promote the decomposition of carbonic acid and the absorption of carbon by the growing plant, and hinder the evolution of carbonic acid, by day at least.

SELF-SUPPORTING PRISONS IN AMERICA.—The governor of the State Prison of Massachusetts (Mr. Gideon Haynes) forwarded a letter about nine months since to Mr. William Tallack, secretary of the Howard Association, 5, Bishopsgate-street Without, E.C., stating that the said prison receives about 120,000 dollars per annum for the labour of its inmates, and estimating that a clear profit of 20,000 dollars would probably be gained during the year. Mr. Tallack has just received from the governor a second letter (November, 1867), from which the following is an extract:—

"For the year ending September 30th, we have made a clear profit of 22,000 dollars. This has been accomplished notwithstanding that the Legislature has, since I wrote to you, increased the salaries of the officers of the prison to the amount of about 6,000 dollars per annum, which has been paid in the past year. This sum of 22,000 dollars is over and above all and every expense connected with the prison, viz., officers' salaries, clothing, bedding, and feeding the convicts, transporting them from the various counties where they were committed to the prison, adding 200 volumes to the library, providing all discharged prisoners with a new suit of clothes and five dollars in money, and paying all repairs connected with the building."

The governor estimates 30,000 dollars (6,000L) as the profit for the coming year. He remarks: "Our records show that crime is most prevalent among that class who are ignorant of trades. A greater per centage of reformation is obtained through the agency of good trades being taught the men than in any other way."

THE CONCRETE GROUYNE AT BRIGHTON.—The works in connexion with the Concrete Grouyne, the construction of which has, from various causes, been long delayed, have been brought to a close. The top forms a promenade, gradually inclining down to the water. The total cost of the Grouyne (constructed by the Town Council itself) has been nearly 5,000L, or something more than double the amount of the original contract price.

THE SANITARY STATE OF LEICESTER.—A paper upon this subject has been read before the local Literary and Philosophical Society, by Dr. Buck, as president. The author of the paper passed in review the works which have been done and are now being carried out for the promotion of the public health. He has been for some years officer of health to the borough, viz.—from 1849 to 1854, a period in which the important sanitary works of drainage and water supply were established. Leicester, he said, had certainly done much during the last twenty years, had accomplished deep drainage and some forty-five miles of sewerage, had abolished intramural interments, and had obtained, by the aid of the Leicester Waterworks Company, a constant supply of the most excellent water.

WORKING-MEN'S COLLEGE BUILDING FUND.—A fresh appeal to the public is being made on the part of this college by the principal, Mr. F. D. Maurice, for contributions towards extending their building in Great Ormond-street, in consequence of the great increase in the number of the students. The principal says:—

"A site is already provided, the ground in the rear of the house (12,000 square feet in area) being the freehold property of the college. We are advised that such a building as this can be well and substantially built in a plain but good style for about 2,000L to 2,500L. Of this amount we have 1,000L in hand and 200L promised."

Financially the college is self-supporting. Contributions may be sent, amongst others, to the London and county Bank, Oxford-street Branch ("Working-Men's College Account"); or to Mr. Thomas Hughes, M.P., 9, Old-square, Lincoln's-inn, or 33, Park-street, Grosvenor-square.

ECONOMY IN STREET-WATERING.—Cooper's patent for watering streets, &c., has been tried on roads in the district of St. George, Hanover-square; and the surveyor, Mr. H. T. Tomkins, says the trial "is most satisfactory, and far exceeds his expectations," and he anticipates its general adoption, both from its great economy and its doing away with the old annoyance of perpetual street-watering in dry weather. The materials, we understand, are dissolved in the water of the watering-carts, and are deliquescent: they are not only innocuous, but act as a deodorizer, and also as a consolidator of the roads. A single watering is said to last a whole week, so that the saving to the ratepayers, it is believed, will be of importance, as the ingredients are both cheap and abundant. The clearing of the streets from watering-carts is itself a great desideratum, both with the public and the ratepayers.

ANTIQUARIAN DISCOVERIES.—At the last monthly meeting of the Newcastle Antiquarian Society, Dr. Bruce laid on the table a paper impression of a stone found in the wall of Antoninus Park, about eight miles from Glasgow. It was now in the possession of Professor McChesney, American Consul at Newcastle, who intends moving it to the United States. It measured 2 ft. 10 in. by 2 ft. 3 in., and bore an inscription, which was thus interpreted:—

"Dedicated to the Emperor Cesar Titus Aelius Hadrianus Antoninus Augustus Pius, the Father of His Country. The Vexillation of the 20th Legion, styled the Valerian and Victorius, constructed three thousand paces of this wall."

A Portland cement cast will be taken of the stone for the Old Castle, Newcastle. Dr. Bruce then described an altar found near Wallsend, which had been presented to the society by Mr. B. Atkinson. When found, before 1845, it was surrounded by twelve stones. Dr. Bruce took the perforation in the centres representing the sun, and believed that twelve rays round it and the twelve stones had reference to the twelve months of the year. Much superstition was associated with such stones. Bargains made by shaking hands through the perforations were regarded as very sacred; and children were passed through them that they might be cured of any disease they had. A similar efficiency was supposed to belong to the passing of children through the cleft in a riven tree.

AN ANCIENT TREE.—A tree has lately been cut in Ohio which is declared by experts to be 792 years old. It weighed thirty tons, was more than 12 ft. in circumference, and made 7,000 ft. of inch boards, clear stuff.

ST. PAUL'S SCHOOLS, PORTWOOD.—The building committee of these schools have selected a tender for their erection from the numerous list sent in by the principal builders of the town and neighbourhood. Their choice, we hear, has fallen upon Mr. W. H. Brown, of Stockport. It is contemplated, we believe, to proceed at once with the building, so far as the weather permits.

BRIDGING THE OHIO.—Louisville will soon have a great bridge spanning the Ohio. The bridge is to be constructed with but one swinging span, or draw, which is over the Louisville and Portland Canal. The total length of the superstructure will be 5,220 ft., and of its graded approaches 2,500 ft., making the total length of the bridge, from the points where the ascent is commenced, 7,720 ft. The total length of the connexion between the Jeffersonville Railroad and Louisville and Nashville Railroad, including bridge, will be 3½ miles. Estimated cost, 1,500,000 dollars.

MONUMENT TO THE LATE MR. R. ASH, IN HIGHBURY CHAPEL.—A monument has just been erected in Highbury Chapel, to the memory of the late Richard Ash, of Victoria-square, by his widow. The design, has been prepared by Messrs. Hanson & Son, of Bristol; and executed by Mr. Bolton, of Cheltenham (late of Worcester). It is 10 ft. high by 5 ft. wide, commencing at 6 ft. from the ground. The front is divided into three niches or compartments, the centre being double the size of the two side ones, each being finished by a sharp-pointed gable, crocketed, and surmounted by a carved finial. The centre compartment contains the inscription, on a white marble slab. Above the inscription is a coat of arms of the deceased, carved in stone. In the side compartments are two recessed niches, containing standing figures of angels, holding scrolls, on which is engraved, "Blessed are the dead which die in the Lord." The base is a moulded string-course, having demi-figures of angels in the centre and at each angle. The divisions of the three compartments are marked by small buttresses, having moulded bases and crocketed pinnacles. Interspersed in various parts are demi-figures of angels, carved capitals and spandrels, &c.

TENDERS

For church and school-buildings for the district of Christ Church, Somers Town, St. Pancras. Messrs. Newell and Billing, architects. Quantities supplied by Mr. Rickman:—

Howard.....	£13,850 0 0
Carrier & Sons.....	13,450 0 0
Browne & Robinson.....	12,965 0 0
Coleman.....	12,850 0 0
Patrick & Son.....	12,525 0 0
Thompson.....	12,173 0 0
Dove, Brothers.....	11,925 0 0
Myers & Sons.....	11,530 0 0
Wells (accepted).....	11,850 0 0

For works at 34 and 35, Monkwell-street, for Messrs. H. E. & M. Moses. Mr. N. S. Joseph, architect.—

Condor.....	£4,918 0 0
Newman & Mann.....	3,993 0 0
Browne & Robinson.....	3,984 0 0
David King & Sons.....	3,708 0 0

For rebuilding and repairs to Brunswick Stables-yard and No. 122, and 122a, City-road; and Nos. 2, 3, 4, 5, 6, and 7, Lewington's-buildings. Mr. J. M. McCulloch, architect:—

Dove, Brothers.....	£1,468 0 0
Mansbridge.....	1,468 0 0

For building warehouse and stables at Ronpell-street, Lambeth, for Mr. F. Bowering. Mr. James L. Stewart, architect:—

Sawyer.....	£2,140 0 0
Shurmer.....	2,110 0 0
Smith & Son.....	1,956 0 0
Eustace.....	1,908 0 0
Cubbitt, Brothers.....	1,901 0 0
Wilcox.....	1,875 0 0
Quennell.....	1,750 2 3
Golding & Son.....	1,745 0 0
Pierce & Booth.....	1,698 0 0
Pearce.....	1,547 0 0
Finer (accepted).....	1,506 0 0

For rebuilding No. 54, Broad-street, St. James's. Mr. B. Tabherer, architect:—

Prince.....	£1,039 0 0
Key.....	917 0 0
Messrs. Batters.....	897 0 0
Larke.....	896 0 0
Bostel (accepted).....	887 0 0

For the erection of a pair of villas at Chislehurst, Kent, for Mr. D. Chattell. Mr. Joseph S. Moys, architect:—

Grover (accepted).....	£2,100 0 0
------------------------	------------

The Builder.

VOL. XXV.—No. 1924.

The Legitimate
Audit of Railway
Finance.

ARVELLOUS it is how contentedly a people amongst whom time is actually convertible into money will put up with the waste of time when that waste is the result of a cherished system of red tape. In the fourth quarter of the year of grace 1867, the Board of Trade limps after the steady progress of Time, and smilingly offers to the forgetful public complete railway returns for the year ending 31st of December, 1865. In the paper submitted last year to the Statistical

Society by Mr. Dudley Baxter, into the subject of which we entered at the time with some detail, the Board of Trade returns were only available up to the end of 1864, when a total of 425,482,000L. had been expended out of an authorised capital of 520,522,000L. on the railways of Great Britain and Ireland. The paid-up capital at the close of 1865 stood at 455,478,143L., showing an actual expenditure during the course of that year of close upon fifty millions sterling.

The point which would be most desirable to elucidate by these items is one, however, on which they cast but little light. We are informed that the average dividend on the ordinary capital of opened lines, amounting to 206,748,606L., was at the rate of 4l. 11s. 5d. per cent.—an average dividend which is greatly reduced by the low returns of the Irish railways, on which only 2l. 16s. 8d. per cent. was divided. The London and North-Western, the Midland, and the Great Northern, divide from 6l. 12s. 6d. per cent. to 7l. 2s. 6d. per cent., on capitals amounting to an aggregate of forty millions and a half sterling—a rate of dividend which, after the long Parliamentary warfare of these great lines, shows the elasticity of the railway system, and indicates what the property of the shareholders might by this time have become under sane and honest management. On the preferential capital, debenture stock, and debenture loans, amounting in all to 219,598,196L., dividends or interest have been paid at the rate of from 4l. 2s. per cent. to 4l. 8s. 5d. per cent. The question we should like to have answered is, how much of the twenty millions or thereabouts distributed within the year to the holders of these various descriptions of "titles" came out of the fifty millions received from the public during the same period under the denomination of "capital"?

The question is neither unimportant nor unfounded. Many years ago, during the great inflation of 1845, a violent attack on the railway system made its appearance in the form of a pamphlet, in which parallel tables were given of calls and of dividends, the object of the writer being to show that all the money distributed with one hand, as dividend, had been contempo-

aneously collected with the other hand, under the name of capital. The idea was indignantly scouted by the financial authorities of the day. The pamphlet has probably long been forgotten; but it would be happy for the country if the view which it brought forward had been altogether erroneous and visionary. It is in this very confusion of two distinct branches of expenditure that the great evil and misfortune of railway finance has invariably lurked. Nor will public confidence either be bestowed or be deserved until satisfaction is given on this simple but vital point.

The temptation to anticipate profit, to make the readiest and the pleasantest use of money actually to hand, and then to disclose admirable reasons for raising more, is by no means peculiar to railways. "The glorious, pious, and immortal memory" of that great and good king whose name is enshrined in two such diametrically opposite toasts by Irish wit, is associated with a deliverance from brass money as well as from wooden shoes. But the brass money from which King William is said to have delivered us was a far less national evil than the paper money—or, rather, paper which is not money—for which we are in great measure indebted to his wisdom. Loans, more or less voluntary, had been procured from a long-suffering people by many kings and ministers before the time of the hero of the 5th of November; but his name is associated with the transformation of loan into permanent debt—a transformation very similar to that which railway debentures are now in the process of undergoing. If we might at all illustrate the case of railway finance by that of the funded debt of Europe, the prospect would, indeed, be gloomy enough. That great incubus on the industry of the nineteenth century amounted at the close of 1865, not including America, to the sum of two thousand eight hundred millions sterling, of which eight hundred millions have been "borrowed" within the preceding ten years. The annual demand of the public creditor, in 1866, amounted to 98,000,000L. Of this surplus of taxation over expenditure supplied the modest portion of some 30,000,000L., the remaining 68,000,000L. of annual dividend being derived from an annual increase of loan. Such is the present financial position of Europe, in which two states alone, Holland and Great Britain, pay all the interest due to the fund-holder out of revenue.

The position of our railway property cannot be compared with justice to the insolvent, if not insolvent, state of European public debt. But it has made a notable advance in the same perilous direction, and it is an object of no little national importance that the tendency should be firmly and intelligently checked. For the 455,478,143L. which we have spent on our railways, we have, on a moderate computation, value in hand, in land, works, and plant, equal to at least three hundred millions sterling; and if between unearned but divided interest, secured by extortionate landowners, lawyers, and contractors, and waste by sheer blunder, we have thrown away the balance, yet we must remember that this large sum is not lost—it is only improperly divided amongst ourselves. The case is far other with the public deficit or irredeemable debt. The fleets, the fortresses, the dockyards, the arms, and the military stores of Europe would, if duly valued, form but a small set-off against the enormous sum contra of more than 2,830,000,000L. sterling. Again, the railway capital is self-supporting. The income is not raised by a tax, but is a *bona fide* payment for work done, and done, moreover, at an enormous gain to the country. To estimate that gain in its money value is no easy task. Money, indeed, cannot represent it; for if we could conceive that, from any change in the physical condition of our world, steam were to lose its elastic force, no combination of horse-

power, at any cost, would replace the present method of conducting our enormous traffic by land and by sea.

The purchaser, then, of any description of railway shares or stock knows that he is so far possessed of a property which cannot deteriorate more than to some two-thirds of its original par price. The property is one essential to the intercourse of daily life, and to the maintenance of the phase of civilisation at which we have arrived. With care and prudence it must improve; under any circumstances but those of wilful blindness and mismanagement, he not only knows, but now experiences, the worst.

The holder, on the other hand, of what is called funded "property," or a portion of the public debt of any country, but England or Holland, is the possessor of an acknowledgment of debt which, at the same time, is almost tantamount to an acknowledgment of insolvency. This property, under no possible contingency, can become productive or self-supporting. The annual dole must, on the most favourable hypothesis, be wrung from the pockets of an over-taxed people; and on the actual basis of fact, two-thirds of it must be begged as a loan from the speculative opitalist. In the former case it will be indispensable that the gross taxation of Europe, which now amounts to 334,000,000L. sterling of British money per annum, should be raised to the amount of 469,000,000L. sterling per annum. In the latter case it is necessary that the respectively responsible Governments shall among them horrow on the Exchanges of Europe an annual and an annually increasing sum of from 60,000,000L. to 70,000,000L. sterling for the mere maintenance of public faith by discharging the claims of the holders of *Rente*.

In the funded debt of Europe we can thus see an exaggerated condition of the same great canker that infests the English railway system, since the man who was once called the Napoleon of Railways, first found out the way to "make things pleasant" for shareholders. The disproportion, indeed, is great, and the character of the two properties differs as much as do the real and the fictitious. While the income of the fund-holder is derived, one-third from onerous taxation, and two-thirds from loans from year to year; the income of the railway proprietor is derived, four-fifths at least, from *bona fide* earnings, even if the remaining fifth be taken from one pocket to put into the other. But in this apparently harmless transfer lies the danger of his ruin. Directors have, for the time, ceased to throw the shareholders' money broadcast, in order to fight one another. They have now to learn only to distribute what they actually earn.

It is not the case, as assumed by some of our contemporaries, that this distinction between capital and revenue is so clear and palpable in fact as it may be made to look on paper. With the information we now possess, that engineer is inexcusable who cannot and does not estimate exactly how much money should be spent on a new line of railway. In the commencement of the railway system it was far otherwise. The accommodation that would be required for traffic was as little imagined beforehand, as was the enormous traffic which the constantly augmenting accommodation would continually increase. For the same reason for which the originally estimated capital was raised, did increase of this limited amount become again and again necessary. The true rule was, that new works required new capital; that maintenance and repairs were chargeable to working expenses. Then arose questions as to how much was repair, and how much was extension. A line had to be relaid: experience suggested that the new rails should be heavier than the old ones; six-sevenths of the expense then should go to revenue, and one-sixth to capital. In this manner, even with the best intentions, accounts would be sure to become confused in the absence of

one necessary check,—a check which, judging from the constant reports of railway meetings, would seem to have been utterly abandoned from a false economy, if from no other questionable motive.

The check in question is the distinct, public, professional responsibility of a competent engineer. In the early times of railways, the production of the report of the engineer-in-chief was a prominent and most important part of the proceedings of the half-yearly meetings. It is true that it was more eagerly looked to as a guide to the future rather than as a record of the past; but it was, in principle and in fact, the exact professional record, the regular preparation and reception of which might have afforded a barrier against the tide of disorder from which we are now suffering. As the great names of the fathers of railway engineering disappeared, as Brunel, Stephenson, and their contemporaries and earliest pupils fell into the grave hollowed out by their own incessant and never-resting toil, their succession fell to men less known to railway proprietors, less known to the world. The temptation to economize a thousand or two per annum in the salary of the engineer—a miserable and false economy as it has turned out to be—was irresistible to secretaries and directors so soon as they had to deal with men with whom they could take liberties. Then, little by little, the control, or the efficient check, of expenditure on works and maintenance, has passed from the hands of the educated and responsible class of men to whom it naturally belongs. Amateurs have taken the place of the profession, and we see the result.

It cannot be denied that the regular formal report of a competent engineer would act as an audit on which reliance might be placed. In lines too insignificant to demand the whole time of a man of eminence, the same advantage would be obtained by the application to such a person for the sole purpose of preparing an annual report, in which the actual distribution of the capital and revenue ought to be determined with that precision which scientific knowledge of the details of railway expenditure can alone give. An audit by an accountant is a totally different thing from such a searching audit as this. The accountant can tell you that so much money has been expended, and that there is such and such authority for its expenditure, and such and such vouchers for its disbursement, and he can tell you no more. The engineer can tell you how much has been wisely and how much unwisely expended; how much that revenue should support has been "cooked" into capital, and how much more revenue must expect to support for five or ten years to come.

It is, therefore, to the reappearance of the duly educated professional adviser in his proper position that the shareholders have now to look for an assurance, and thus for a restoration of the value of their property. If it once became the rule that no dividend should be divided without the formal sanction of the report of a responsible Engineer that it had been fairly earned, the great element of uncertainty which now, more than anything else, depresses the value of railway property, would be to a great extent removed. It is obvious that such a report would differ in its form, and, to some extent, in its object, from the reports commonly produced during the actual construction of a line. But the real object of both kinds of report would be the same, the assurance given to the shareholders, on the direct personal responsibility of the educated chief executive officer, of the due application of their money to its destined objects. At present no such responsibility exists. All that can happen, or all that ever *does* happen, to the individual members of a board which has been guilty of the grossest misuse of power, is—to be replaced. The man who, if he be fit for his post, is usually the real master of the enterprise, is not appointed by the shareholders at all. He is the nominal servant of the directors—responsible to them alone—the secretary of the board. With an executive responsible only to the shadowy and intangible personality of a board, and with the members of the latter under no sort of direct responsibility to the shareholders, all that bad system can effect towards the impoverishment of the latter would seem to have been provided and successfully carried out.

The contrast between this slovenly arrangement, a plan as unbusiness-like in its conception as it has proved disastrous in its general application, and the regular and formal responsibility of a competent executive chief, is as marked as can well be imagined. In speaking of the Civil

Engineer as the proper officer for restoring and maintaining public confidence, we make no objection to those cases where a tried and efficient manager, or even a properly paid and exclusively engaged chairman, may be looked to as responsible to the proprietors. Such instances, no doubt, may occur; but it is of the special nature of the education of the Civil Engineer to fit him for the post, and not only to fit him for the efficient discharge of the duty of a gentleman and trustworthy audit, but to give to the shareholders and to the public the warrant that the work for which he is responsible is fitly performed. What would be the effect on the value of the shares of a company which should circulate, with its half-yearly accounts, such a report as the following, if signed by a known and respectable name?—"To the Proprietors of the—Railway. Gentlemen, I have inspected the state of the line, works, and plant of your railway during the past month, and I have also verified the application of the various sums stated in the accountant's balance-sheet, which I have countersigned, and, with due regard both to the accounts and to the immediate requirements of the line, I recommend the payment of a dividend for the last half-year, at the rate of so much per cent. on such and such descriptions of capital."

Absolute security is not to be hoped for in human affairs. But all that maturity of experience and reliance on personal integrity could effect could be brought, by such a method, to guarantee the real stability of railway property.

WINTER EXHIBITIONS AT THE FRENCH GALLERY AND THE DUDLEY GALLERY.

MR. WALLIS has mixed foreign with English pictures for his winter exhibition this year; but its greatest difference from its precursors is brought about by some foreign work from British hands, and such work as unfortunately is too foreign. Without indulging in the "cant of criticism"—whatever that may be; at any rate, critics were never better worth reading than with rare exceptions they are now, seldom more independent or better informed—it would be very remiss, even in those whose business is rather to note than to analyse a production of such special and particular interest as Mrs. Benham Hay's great picture, to leave its merits unacknowledged,—a great picture, not with reference to its size alone.

Processions have been favourite and favouring introductions to more than one painter. Mr. Leighton was ushered into celebrity by some such honour-enshroued pageantry, and Mr. Calderon's election to the full dignity of R.A. was preceded like a Lord Mayor's to civic glory,—not omitting a suggestion of the "Watermen" (Salt) in the trip across the Channel, that proved so short a road for him. Mrs. Hay's "Florentine Procession" (conveying a collection of various articles of luxury, useless fantastic ornaments, immoral books, pictures, &c., to the burning of the "Vanities" during the Carnival of 1497), it is to be hoped, will bring for her an adequate compensation for the investment of much talent and the devotion of much time. The want of some such examples to our younger painters, to mark the repeatedly-expressed regrets that, with a vast amount of facility in producing, there should be so few instances wherein this facility is turned to a worthy account, is amongst the many considerations that secure for Mrs. Hay immense praise. It is undoubtedly an exceptionally fine picture, though the subject be one of the last that a lady in the nineteenth century might be expected to dilate on, as it advocates a contempt for all artificial adornments, with particular emphasis on those that are personal. The present discussions about vestments, and in vestries, may also add to the interest it is sure to excite; for it illustrates the influence of Savonarola's religious fervour and patriotic zeal. Boys were chosen and clothed in white to represent angels, crowned with olive wreaths, and badged with the red cross of their party; they were divided into little bands that paraded the streets and ways of the city, starting from the several points of it, and gathering "vanities" as they passed.

Some of the youthful disciples are beautiful enough to pass for angels at any time. Witness the child who carries the trinkets, and whose innocence has been a sufficient appeal to convert a damsel as lovely and innocent-looking as himself, for she has taken off her necklace to add her small sacrifice to the basket of jewels so

timidly held forth to receive it. A youth dressed in a deacon's vestment (consecrated for sacred service we are informed by the description in the catalogue,—an apology that can only be valid to the ritualists for not being burnt with the rest of the gauds), is already laden with volumes of such profane rhymes as might have been appreciated at the orgies of the Medici. Gorgeous drapery, vases of fantastic design, heathen statuettes, and all similar objects, with appliances of art that tend to no good and direct purpose, were the spoil of these detachments from the regiment of virtuous young forgers for food for flames, whose memory will not be much respected by "vertu" hunters, collectors of "bricabraç," and of old curiosities in general. The mother of the maiden so readily converted, a florid specimen of a Florentine matron, is expressing contemptuous repudiation of the proceedings, and indignantly refuses any explanation of the use of a ball of rouge beyond what her unattractively blushing cheek can tell to a little fellow who has ascended her, and unconsciously reproves her endeavours to create artificial attraction. (Do little boys ask such pertinent questions in our days?)

It is a pity there were not more spectators introduced to witness the proceedings, and to give more apparent evidence of what effect they had on the community at large; but this is only one of the many little bands, and others may have been more inconvenienced by the crowds; besides their absence here has enabled Mrs. Hay to make very much of an admirably selected and painted background, which is taken from the Piazza del Duomo,—and includes part of Giotto's Campanile, part of the Baptistery of St. John, and the Loggia del Bigallo. Fra Domenico, the enthusiastic friend and assistant of Savonarola, accompanies and directs this procession: the monk helps a young painter to carry a gilt banner, on which is depicted the Saviour as a child, with the Virgin Mother; the painter typifies aspiration towards the more elevating and purifying capabilities of art, making clear that the Reformer's purpose was only to destroy such as ministered to debased tastes and excited corrupt motives; the student indicates his reverence for nature and truth by wearing in his belt a few blades of common grass, and on his stamped leathern jerkin the pattern of a bird—an old spiritual emblem of the soul. Four young girls follow playing musical instruments: one represents a votary to the Ideal, absorbed in sympathy with the music she evokes and heedless of all that surrounds her; another, of the contrary or worldly temperament, more easily influenced by extraneous circumstances than by inspiration, accepting the influence of those around her rather than her own election. After these come a deputation of citizens to give countenance and authority to the proceedings, and who typify the degrees of regard that different constitutions or parties had for them. All the actors are invested with some significant attribute; in fact, symbolism has been a little too much relied on for conveying meaning, the need for which a more dramatic treatment would have reduced very much, but then it would have been a totally distinct method of enunciating the intention of the picture; and since the artist has chosen her own, preferring the typical to the real, it must be conceded that success has justified her choice, inasmuch as the result is a very remarkable and memorable production. Its chief defect is the one already alluded to,—the want of something to indicate the popular acceptance or reception of the ceremony,—as, in addition to the haughty ultra-fashionable matron and her charmingly modest daughter,—both very finely characterised and represented by the brush,—there are but the three *roués* bent on their own evil courses, and on passing the Carnival in their own manner with cards and dice, the tradesmen who sneeringly ridicule those who would destroy their wares, and a vendor of the red crosses that distinguish Savonarola's adherents, to represent the people. The technical merits of the performance are of so high an order as to outweigh the few objections that may be taken to their entirety. We will take no more, and will stop at a note of admiration!

Mrs. Benham Hay has emblazoned her name on a title-deed that makes rare possessions hers patent. If history records this to be an effeminate age, it will be by reason of woman's own superiority, rather than by that of decadence on the part of the shaming sex,—by the strenuous and persistent efforts of our sisters to be recognised as men and brethren to help in what may constitute our claims of progress in mundane

natters. Time was when man swore by his beard; time it is that he never swore at all, for ladies are now his companions, and equals ever. Given the Indian chief's taunt, "Your warriors are women, heugh!" may be stripped of its liberty disdain if the Adjutant-General's appeal or recruits should bring forth an army of amazons with rifles of precision and a very, very long range, warranted to kill anything before anything else had a chance of killing (a woman hits anything she aims at), and to become as effective as a desling wound as hitherto in healing them. The possibility is enough to make the shades of the late Mr. Fennimore Cooper's red-skinned heroes blush redder still through their warrant, if there was a chance of Reuter's telegrams reaching their "happy hunting-grounds," and more than enough to make superlative a pale complexion, that obscures at the bare mention of a baby in arms. No; let woman's acquaintance with gunpowder be limited to the shake of one hand that commingles it with the family lobe, and the only arms she cares for those that shall be her shield,—never weapons of offence. Mrs. Hay's picture, though the chief, is not the only attraction at the little gallery in Pall-mall, for, as usual, there are plenty of clever, plain emanations to while away an hour or so in examining. Mr. F. Goodsell, R.A., shows a delicately-natured and fair-faced Britanny girl, "A Prayer" (10); Mr. J. Sant, A.R.A., a splendidly-painted child-portrait (72), with the only "Query,—Fun or mischief?" about it for a title,—query, "What's the Difference at her Age?" excerpted. Mr. J. Q. Orchardson is another whose manipulation is extraordinary in its dexterity. His nobleman in fifteenth-century costume and an armourer's dusky workshop,— "Choosing a Respon" (30),—will prove this. He has so most enviable ability: why does he not apply it to better purpose? Mr. J. Pettie, A.R.A., has missed an opportunity of contrasting his grim negro with something more sympathetic than an unlovely lady who has come to pay "A Visit to the Necromancer" (64); but how deftly now it is! "The Acrobat's Rehearsal" (65) might be by Mr. Pettie, too; but it is not, but Mr. H. Roberts intimates in this that manner, like some of other physical affections, is to be taken. This is also very cleverly done, but the assertions of the poor little girl on skills having been her too many sobs and tears—look at her lid eyes—makes the picture an unpleasant omen for long; the little tumblers, who appear the worse for their tumbling, are very life-like in their resting attitudes. "Proud Margaret" (86). Mr. F. Sandys has given very little room for brains, and separated her head from her heart by a very long neck; perhaps purposely. (39) "The Sick Rose," by Mr. G. R. Leslie, is very pretty; but from constant repetition of the same idea, this designation gives some hope of "the last rose of summer" being Mr. Leslie's next subject. His studies are all delightfully elegant, and he is so prolific as profano. "Polly Peachum" (61), another sick rose, is too pretty to pass by, and with ease rest, and many more, may be classed under what may be called the perfume of the spirit of Mr. T. Lidderdale's "Happiness" (47) belongs to quite another order of things; its capital execution is as solid as the felicity it relates. In "The Morning Lesson" (52), by M. Gustave de Jonghe, is some beautiful drawing; for instance, the arm and hand of the child. This is a much more agreeable work than "The Mother's Whisper" (38), by M. R. Bayschlag, wherein what has been done from the life is curiously disjointed from what has been much better done from the lay-figure. Mr. Erskine Nicol, R.A., sends a clever study—something slightly flat flatter than usual with him—of "An Old man tying Flies" (60); and Mr. A. H. Tourrier capital painting interior, the figures in which, "The Rivals" (108), and the object of their rivalry, are spoilt by the ugly heads. Mr. M. W. Ridley aids in the conclusion that peculiarities are the easiest of all things to copy. Hope deferred maketh the Heart sick" (104) is very luminous, broad, and honest in its execution, though the lady herself is very ethereal-looking and engaging; has she been "whistled by the wind by a Whistler?" Both power and care are evinced by Mr. Long in his Italian episode of the (139) Christmas Speeches at the Church of the Caracci, Rome." A mite of a contadina, perched at the table, is reciting verses or making a speech to a large audience of the parents and other relatives of the monk's pupils. The expression of the little oratorist—as much as is

visible—is very suggestive of her being less impressed by the value of the words she is spouting than perfect in her past recollection of them. However, they have great effect with one open-mouthed listener, at least, whose delight and astonishment hetoken him to be the father of the prodigy. The right-hand half of the picture is the better.

(133) "The Young Smokers," by M. Duverger, have all the characteristics their origin promises for them; and although there are several that follow in the wake of M. M. Ed. Frere and Duverger, they remain unapproachable. Mr. Vicat Cole's "View on the Holmhury Common; Storm approaching" (83) has enough probability attached to it to make one in a hurry to change quarters.

The managers of the Dudley Gallery, in their desire to utilize the premises during the interregnum of "The General Exhibitions," have done a wise thing to institute an independent exhibition of oil pictures. The first year's collection could scarcely have been expected to attain such a character as a more thorough understanding of the arrangement, and the consequent confidence of artists will secure for it presently, though it contains many noteworthy contributions.

Mr. E. Armitage, A.R.A., fills the place of honour very deservedly with a Babylonian interior that looks less apocryphal than the source from whence he derives his instigation. In the story of Bel and the Dragon, the idol Bel is supposed to have a very large appetite, consuming every day twelve great measures of fine flour, six vessels of wine, and, what must appear more dreadful still in times of dear mutton, forty sheep; but everybody knows the story, and what a story it is. In the picture (128) Daniel is pointing out to King Cyrs the footmarks on the pavement left by the priests in the Temple, to prove that they were the real perpetrators of the gastronomic enormity. The work is very brilliant in colour, and the costume, with all the other accessories, most conscientiously studied and precisely given. Archaeological interest and precise realization are the great features in a similar production by Mr. E. J. Poynter. (65) "Adoration to Ra," though but a single figure of an Egyptian worshipper, from no opportunity being overlooked of making it thoroughly Egyptian, must be regarded as singularly interesting: even the tiger-skin, and most elaborate architectural ornamentation, are finished to a marvel, and nothing is left to be taken for granted. An exquisite "Daphne" (226) leaves all doubt out of the question that Mr. G. F. Watts, A.R.A., is inimicable to depriving nude studies of anything that can be hinted at as objectionable: it is the gem here, and a very covetable one. The portrait of the poet "Algernon Swinburne" (206) might be mistaken for a Rubens if it were not for the collar and the coat.

"Dorothy Vernon's Doorway, Haddon Hall" (187), is an instance in which painter-partnership has been carried on with mutual advantages; and the result in this venture wherein Mr. A. Elmore, R.A., and Mr. T. Crosswick, R.A., had each but limited liability brings comparatively a very rich return.

In (77) "A Summer Forenoon," apparently by the seaside, Mr. J. E. Hodgson deals with more matter-of-fact materials than is customary with him. Two ladies, one busy at a sewing-machine, the other idling over the *Cornhill Magazine*, are seated in a parlour with the window open. It is evidently very warm weather, and the effect is cleverly conveyed. "Wasted Away" (24), by Mr. F. B. Barwell, is a novel treatment of an old subject. Two women are leaving home, passengers in a barge; the younger is standing signalling her farewell, waving her handkerchief, but the elder is weeping piteously, her face buried in her hand, whilst the barge is being steered into the current, and, helped by the wind, will soon carry them out of sight of old, and within sight of new, scenes.

(21) "A Pastoral," is a clever landscape by Mr. George Mawley; (34) "Valley of the West Ockmont, Dertmoor," which resembles a bit of background by Velasquez, is another, by Mr. Henry Moore. "The Tinker" (51), plodding through the snow, by Mr. H. S. Marks; "Robespierre" (72), watching the guillotine and the carts going to it, from the window whilst he dined, by way of a zest, by Mr. Eyre Crowe; "The Thames, near Henley" (113), by Mr. Field Talfourd; "Pompeii, A.D. 67" (117), by Mr. F. W. Topham, jun.; and "Haymaking" (160), by Mr. F. Holl, we are obliged to be content with mentioning.

THE STORAGE OF RAINWATER: TOWN DRAINAGE.

THE sewage "difficulty" has become prohibitions. It is not so difficult to dispose of the sewage of towns as some people who raise the cry of difficulty would have it believed. Nevertheless there are some real difficulties to be overcome, and one of them is the excessive quantity of rain-water that is admitted into the sewers. To obviate this as far as we can the rainfall on all buildings ought to be arrested before it reaches the ground, and used for household purposes, and then sent into the sewers as sewage. If this were done, the quantity of water required to be applied by the waterworks would be sensibly diminished. In all towns supplied with water by pumps, the saving of even small quantities of exerted power would be considerable.

But the chief thing accomplished would be the lessening of the quantity of rainfall to be dealt with at the sewerage outfalls. Where the sewage is pumped at the outfall, there is again a saving of power to be made by reducing the quantity of sewage in wet weather, and, perhaps, what is of equal moment with the absolute reduction, a regulation of the quantity coming down to the pumps. This thing will never be carried out without a compulsory action of the Legislature. But legislative action is often taken upon questions of not more importance than this; and now that we have Rivers Non-pollution Acts actually in force in respect of the Thames, and prospectively of all other rivers in England, it becomes a question of serious importance whether action should not be taken at once to compel the storage of all rain-water that it is possible to store and use; and it is certainly both possible and easy to store all (or with very rare exceptions all) the water that falls on the roofs of buildings. The area of ground covered with buildings in a town is very great.

It is as much as half the area of some parts of a town. It is in many parts of a town a third of the area, and if we go to the average it will still be considerable.

The capacity of the tanks required to catch all this rainwater may be estimated, in the absence of more directly applicable data, upon the basis of what is found in practice to be the proper capacity for storage reservoirs; that is, allowing for variations of atmospheric peculiarities in various parts of the country, from 20,000 to 30,000 cubic feet per acre of gathering ground.

Reducing this to the dimensions of a house, we will take an average house to cover 400 square feet; and if we do so, we find the capacity of the tank to be 200 cubic feet, if we take 21,780 cubic feet per acre to be an average capacity. This quantity is contained in a tank little more than 8 ft. square and 3 ft. deep. Upon almost any outhouse this can be planted without much inconvenience or expense. But if the expense or inconvenience should constitute a valid objection to the proposition, let a water-tight tank be made in the ground, and the water he pumped thence for domestic use. It simplifies the matter to state the capacity of the tank as half a cubic foot per square foot of roof area.

It may be asserted that such a tank would not cost more than every house-owner ought to be called upon to contribute to the general prosperity of the town in which he holds property and receives so much substantial benefit as owners of houses usually do from the mixed population of towns; for house building is, in general, in England, the safest and most remunerative speculation for any one who has money to invest.

We have heard of property having its duties as well as its rights: let one of its duties be to store and use the rainfall upon all buildings.

Incidentally this storage of rain-water from buildings will have a third good effect. It is too often the practice to connect the down pipes from the roofs of houses directly with the drains, whereby the effluvia of the drains are carried up to a too close proximity to bedroom windows, causing bad smells in the houses.

The management of house draining in towns is not yet in a state of perfection by a long way; and the practice is too often to entrust the drainage of houses to ignorant men,—men of no scientific knowledge whatever, and who seem to think they have hit upon a most happy idea, by turning the rain-water into the drains; for, say they, see how it flushes the drains every time a shower of rain comes. But the bad effects of this system of connecting the

down-pipes of houses with the drains are sufficiently obvious. The drains and sewers must be ventilated, of course; but it is not by the rain-water pipes that they ought to be ventilated.

It has been shown in the *Builder* that house - drains ought to be ventilated by special arrangements, and not by the accidental proximity of rain-water pipes. We do not here touch upon the subject of the diversion of rain-water sewers; but in respect of that subject it may be mentioned that a good deal may be done in many towns to lessen the quantity of rain-water, to be dealt with by making use of the old surface drains to carry off the rainfall upon the streets, connecting, for that purpose, the street gullies with them. This is not of so universal application as is the storing of rain-water from the roofs of buildings; but is still of importance, and demands the attention of local authorities.

THE CASTLE OF BÔVES.

The castle and village of Bôves stand upon the left bank of the valley of the Noye, in the old province of Picardy, above and about a quarter of a mile distant from the stream. The Noye rises near to Crèvecœur-le-Grand, beyond Bretnil, and flows across a district of chalk. Both a little above and immediately below Bôves, it insinuates with the Avre, which rises near to Crèvecœur-le-Petit, and the combined stream, flowing past Longean, joins the Somme immediately above Amiens, which city is about five miles distant from Bôves. Both the Noye and the Avre exhibit the features which are still more strongly marked in the Somme. They flow sluggishly across broad flat tracts of peat and gravel, contained within steep and high banks of chalk. The peat has been extensively excavated for fuel, and the cavities are filled with dark peaty water. The supply of coal by railway and canal seems somewhat to have checked the demand upon these turbaries, and the neat surfaces are highly cultivated as nursery gardens, which appear in patches amidst the pools, and are chiefly reached by boats. The poplar is the prevailing tree of these damp, gloomy districts, and it there attains a very considerable size. Below the peat, and at the base and up the sides of the chalk hills, the rock is more or less thickly covered up with beds of gravel and light loam, in which are found the flint implements which have been the subject of so much speculation.

The village of Bôves contains under 2,000 persons, whose chief employment is henching in the open fields the cotton cloths manufactured in the neighbourhood. The church, the only public building, is a heavy Doric temple, of modern date. The village is built at the foot of the chalk hill upon which stands the castle, and which has been quarried for building purposes into a cliff of 50 ft. to 80 ft. high.

The castle, now a mere ruin of no great extent, is chiefly remarkable for its earthworks. It stands upon a chalk ridge, perhaps 150 ft. above the valley, and has been isolated towards the south by a curved ditch, about 50 ft. deep by 60 ft. or 70 ft. broad, and about a furlong in length. This ditch works out upon the face of the cliff towards the village, and upon the natural slope in the opposite direction. The ground without, or upon its counterscarp, has not been disturbed. The contents have been thrown inward, and cause the scarp to be crowned by an elevated ridge.

On the highest part of the ground, just within the ditch and near its centre, is a mound or motte, with very steep sides about 50 ft. high, and a circular flat top about 100 ft. in diameter. This motte has a basis of chalk rock, which has been scarped, and the material added to the summit. The ridge proceeds from the mound along the edge of the ditch, and probably was connected with or covered by the entrance into the work upon the motte. To the east and north of the motte the ground is tolerably level as far as the edge of the cliff, and of a deep hollow way ascending from the village. This space is now partially occupied by a public cemetery and some farm buildings. West of the motte is a sort of lunated platform, beyond which the slope is again scarped by art. Probably the principal buildings of the castle and its offices occupied these platforms under the motte.

The only masonry remaining stands upon the motte, and consists of the ruins of a tower and a fragment of wall. The tower stands at the

junction of the scarp ridge with the motte, upon the edge of the ditch. Its remains are quadrangular, with thick walls, of which only the north and south remain. It was of three floors, a basement, vaulted in round-headed barrel; a first floor, with timber ceiling; and a second floor, higher, and evidently a room of state. In the basement walls remain three rectangular loopholes, or small window openings, high up. The upper room may have been vaulted. Its walls show a round-headed gable, but this may have belonged to a coved plaster ceiling. Outside, against one wall, is a plain buttress, 3 ft. by 3 ft. The material is chalk rubble, without flints, and faced, within and without, with chalk ashlar, the stones being coursed, and about 9 in. long by 6 in. high, with rather open joints. This tower may have contained a small portal. From it extends a fragment of curtain, along the edge of the motte. This has one broken opening, perhaps a window, with a round head. It is difficult to form an opinion upon the age of this masonry. It may possibly be Late Norman. There are marks of the foundations of a shell of wall all round the edge of the motte, and of a central rectangular court. At present the summit is planted with trees, and the slopes covered with hrnshwood.

The history of Bôves is probably that of Amiens. It is supposed to have been thrown up in the ninth century, for defence against the aggressive Northmen, and the character of the earthwork favours this view. Some of the Sieurs de Concy were lords also of Bôves; and Henry IV., whose wars brought him to Amiens, is said to have occasionally visited Bôves with Gabrielle d'Estrees. The lordship, however, was, during that reign, the property of Philip de Mornay, son of that Du Plessis Mornay whose name is so intimately associated with the career of Henry. At this time there is little in the castle to repay the trouble of a visit. The earthworks are seen to great advantage from the Bôves station, the second upon the Amiens Railway towards Paris.

C.

1867.

THE WELLINGTON MONUMENT FOR ST. PAUL'S.

A RECENT paragraph in a morning paper, stating that "a monument of the late Duke of Wellington, which is now in the crypt of St. Paul's Cathedral, the work of Mr. A. Stevens, is neatly finished, and will shortly be ready for public exhibition;" and which then proceeded to give a circumstantial account of it, must have surprised those who knew anything about the matter, while it raised the hopes of a large number of persons who had begun to think there was to be no monument at all. Several have travelled to the cathedral in consequence, and we may as well save others the journey, by stating that there is not the slightest ground for the announcement. So far from the monument being in the crypt, the preparatory model is not finished, and what part of it is done is locked up and hidden away in the sculptor's studio. The affair is a scandal. Rumour says that a hard bargain with the sculptor, which keeps him out of money, prevents the completion of the work. Anyhow the exact position of the affair ought to be understood, and the blame laid on the right shoulders. We hope that immediately on the re-assembling of Parliament, some member will call for full particulars, and not be satisfied with the reply that the model has been seen by the Chief Commissioner, and is being proceeded with. A full history of the past proceedings in connexion with it ought to be called for, and an explanation from the sculptor himself.

A REMNANT OF OLD WHITEFRIARS.

It is as well to be reminded now and then of the vestiges of our old London, a city with a long story, that lurk about us and bear witness to the truth of history. The site between Whitefriars-street (formerly Water-lane) and the Temple, Fleet-street and the Thames, was occupied, as every student of the city's history knows, by a Convent of Carmelites or White Friars, founded in 1241. The church here was rebuilt in the middle of the fourteenth century, the spire being added at the commencement of the fifteenth. The convent was surrendered at the Dissolution, and in the reign of Edward VI. (sixteenth century), the church was destroyed, and various

houses were built on the site. The hall or refectory of the convent was appropriated as a theatre, — Whitefriars Theatre, — one of the earliest we had in London. Every novel-reader, as well as the aforesaid student, knows that this Whitefriars, too, became a place of sanctuary, a place where arrest was not permitted, and figures as "Alsatia" in the plays of an after-time. Well, between Whitefriars-street and the Temple run three or four courts, and our attention was accidentally directed the other day to the last house on the south side of one of these, called Briton's-court. Here, partly below the basement of the house, and used as a coal-cellar, is a portion of the Mediaeval building, a small space with stone groins radiating from a boss in the centre of the diameter. Some doorways, too, we were told, are to be seen when it is empty, which was not the case on the occasion of our visit. The groins are nearly black, and the vaulting is of a white stone, possibly chalk, but we had no means of trying. So few memorials remain of the ancient state of historical Whitefriars, that it would seem desirable to make some arrangements by which this interesting remnant might be preserved from rough usage well calculated to destroy it.

THE HOMES OF OUR ANCESTORS.*

The character of a dwelling, even in our advanced state of civilization, is influenced by the materials at the command of the builder; and if we look back to a period of barbarism, we shall find that the facilities of transport being at a minimum, the materials were limited to those in the immediate vicinity of the scene of operations. In districts where stone was not to be found, and wood abounded, it was used to the exclusion of other matter, saving mud or turf; and where stone was at command, the houses (if they are deserving of that name) were composed of the more durable material.

The most primitive style of house, however, is the cave or hurrow; the latter excavated in the ground, and protected from the inclemency of the weather by boughs of trees, rushes, or turf; the former being either the work of nature, assisted by the handwork of man, or of entirely artificial formation. Burrows were usually in groups, and were circular or oblong in form, seldom exceeding 7 ft. or 8 ft. in diameter. In Barry's History of Orkney, a Piet's house is described as scooped out of the ground, built of large stones converging to within a foot of the top, and externally honned by a wall 2 ft. high, the stones laid with considerable regularity, and jointed with clay, over which was a layer of turf or peat. The uncovering mound is about 140 ft. in circumference, and 40 ft. greatest diameter; internally it measured 5 ft. 9 in. by 4 ft. 8 in., and 6 ft. high. Some of these subterranean dwellings had several apartments communicating by narrow galleries. The entrance was small and low, and was formed by two stones converging to a point; the interior was generally dark, the door being the only aperture through which light was admitted, although occasionally a small opening was found opposite it for the exit of smoke.

At a later period a more fragile mode of building was adopted, scooped out of the side of a hill and roofed with timber. Dr. Daniel Wilson describes one at Inchutthill, Inverness, as containing seven circular chambers out in a steep bank, separated by partitions 12 ft. thick, the floors sunk 20 ft., and each chamber 15 ft. diameter; a long passage, 4 ft. wide, forming the ingress; and he says that similar abodes are occupied as summer shielings in the Hebrides to the present day.

Julius Caesar describes the dwellings of the Britons as similar to those of the Gauls; constructed of wood, circular in form, having high-pitched roofs of straw: they did not exceed 7 ft. or 8 ft. in diameter and 5 ft. or 6 ft. in height; the doorway was formed of matting or skins, and no other provision was made for light.

The Saxon hall consisted of one oblong apartment, around which were disposed the barn, cowhouse, piggyery, and beer-cellar, the whole being surrounded by a ditch or palisade. The material employed in these structures was wood, sometimes plastered over with clay, and covered with thatch or shingles. The door was either of wood or plated osiers, and the windows, which were very small, were closed in a similar man-

* By Mr. W. G. Shiells: read at a meeting of the Edinburgh Architectural Association.

ner, or by canvas frames, which admitted a feeble light. The hall was sometimes of considerable size, and served the purposes of kitchen, dining-room, and bedroom, which the heads of the family shared with their dependants, and the occasional guest. In the centre of the floor, which was composed of trodden clay, was placed the fire of logs, the smoke finding its way through a hole in the roof or gable. Sanitary arrangements there were none; an open gutter ran down the floor and debouched in a small opening in the wall. The furniture consisted of a rude table and benches, and the floor was the common bed,—gentle and simple reducing themselves to a state of nudity, wrapping themselves in sheep-skins or furs, and seeking repose as best they might. In the dwellings of the superior class the upper part of the hall was screened off by a curtain, and in rare instances an additional apartment was added; but even in such cases shared by the lord and lady of the house, their family, and such guests, male or female, to whom they desired to show respect. The palace of the king differed little from this type, saving that it was added a room or two, a chapel, and kitchen. Let any one of you picture himself the occupant of such an abode, courting repose after a day of toil, a dozen or two stalwart men snoring in consort, dogs barking at every symptom of disturbance from without, children crying, and add to the picture a fever-stricken fellow-mortal dying in a corner, and be thankful for the comforts with which he is surrounded. Such is not an overdrawn picture of an age of romance, the study of the history of our art corrects many false notions gathered from the works of those to whom "distance has lent enchantment to the view."

Sir Walter Scott gives an interesting description of one of the earliest kinds of fortifications upon the island of Mousa, near to the mainland of Zetland—

"It is a single round tower, the wall curving in slightly, and then turning outward again in the form of a dice-box, so that the defenders on the top might the better protect the base. It is formed of rough stones, selected with care, and laid in courses or circles, with much compactness, but without cement of any kind. The tower has never, to appearance, had a roof of any sort; a fire was made in the centre of the space which it incloses, and originally the building was probably little more than a wall, drawn as a sort of screen around the great council chamber of the tribe. But, although the means or ingenuity of the builders did not extend so far as to provide a roof, they supplied the want by constructing apartments in the interior of the walls themselves. The circumvallation formed a double inclosure, the inner side of which was in fact 2 ft. or 3 ft. distant from the other, and connected by a concentric range of long flat stones, thus forming a series of concentric rings or stories of various heights, rising to the top of the tower. Each of these stories or galleries has four windows, facing directly to the points of the compass, and rising, of course regularly, above each other. These four perpendicular ranges of windows admitted air, and, the fire being kindled, heat, or smoke at least, to each of the galleries. The access from gallery to gallery is equally primitive. A path, on the principle of an inclined plane, turns round and round the building like a screw, and gives access to the different stories, intersecting each of them in its turn, and thus forming a sort of spiral on the wall of the tower. On the outside there are no windows, and, I may add, that an inclosure of a square, or sometimes a round form, gave the inhabitants of the burgh an opportunity to secure any sheep or cattle they might have in Zetland; there are several acres of these burghs, occupying, in every case, capes, headlands, islets, and similar places of advantage singularly well chosen."

In Gough's edition of Camden's "Britannia" the Saxon castle or keep of Coningsburgh is thus described:—

"At the corner of the area, which is of an irregular form, stands the great tower or keep, placed on a small hill of its own dimensions, on which the six best projecting buttresses, ascending in a steep direction, to prop and support the building, and continued upwards up the sides as turrets. The tower within forms a complete circle, 21 ft. in diameter, the walls 14 ft. thick. The ascent into the tower is by an exceedingly deep flight of steep steps, 4½ ft. wide, on the south side leading to a doorway, over which is a circular arch crossed by a great transverse stone. Within this door is the staircase, which ascends straight through the thickness of the wall, not communicating with the room on the first floor, in whose centre is the opening to the dungeon. Neither of these lower rooms is lighted, except from a hole in the floor of the third story; the room in which, as well as in that above it, is finished with compact smooth stonework, both having chimney-pieces, with an arch resting on triple clustered pillars. In the third story, or guard chamber, is a small recess with a loop-hole, probably a bedchamber, and in that floor above a niche for a saint or holy-water pot."

The Norman keep or donjon was a square tower of about 20 ft. or 30 ft. diameter, the walls being 6 ft. or 10 ft. thick. It was three or four stories in height. The basement contained a vaulted cellar or dungeon, having neither door nor window, the only access to which was from an opening in its roof. Access to the story above was obtained from without by means of a narrow stair or wooden ladder, and this story, consisting of one room, was lighted by a small loop-hole,

and constituted the guard-room. A narrow stair in an angle led to the room above, which served the purpose of the hall, and was lighted by one or two windows of small dimensions. In it was a fireplace, having a smoke-flue. The uppermost was probably the bed-room, was usually lighted by one window, and sometimes had a fireplace. A small recess is occasionally found, which served as an oratory. The roof was flat, and formed of slabs of stone, and protected by battlements. The keep stood at the angle of a court-yard, surrounded by high and massive battlemented walls, sometimes so thick as to admit of a narrow passage along the top. At the end of the court-yard, opposite to the keep, was the gate-house, with an arched way through it, protected by a massive door, the whole being surrounded by a fosse or ditch. Within the circumvallation were erected the barn, stable, and cow-house, all of wood; and in case of attack the inhabitants of the neighbouring village,—which was invariably a group of miserable wooden huts,—found shelter. The White Tower of London, the royal fortress of England, presents the same distinctive features on an extended scale, the oratory being developed into a chapel, having below it two chambers. The walls do not appear to have been plastered in those early keeps, but their great thickness must have excluded damp. It was not till a later period that tapestry came to be used, so that the interiors must have presented a rude and uninviting aspect.

Of the Scottish keep of a later period, Udry Castle, Aherdeenshire, is a picturesque example. An illustration of it will be found in "Billings' Baronial and Ecclesiastical Antiquities of Scotland." The peel towers scattered over the Border Counties were similar to the keep. Smallholm Tower, which I visited last summer, is entered from the ground-floor, its situation on a steep rock being probably considered sufficient security. It is three stories in height, the first being entirely dark, the second lighted by loop-holes, and the third having two windows. The roof is not flat, but gabled. It has the usual surrounding wall, gate-house, and fosse.

In the Middle Ages the clergy were the originators of almost every improvement in science or art; and the first departure from the stereotyped plan of the keep seems to have been caused by the call of the family priest for a separate chamber. It is obvious that there could be little opportunity for study and pious meditation in a room common to a whole family, and hence the demand for separate accommodation. In order to satisfy this demand, another building sprang up alongside the tower, having a cellar in the basement, and a priest's chamber and chapel above.

The superior intelligence of the clergy, and their more refined and peaceful habits, led them to study comfort and convenience in their dwellings. Accordingly we find that the monastery presents a marked superiority to the castle. In order, therefore, to understand the development of the houses of the nobles we must take a glance at those of the ecclesiastics.

Attached to the cathedral or church we find an enclosed piece of ground, surrounded by a covered walk, forming the cloisters, and around this were grouped a number of chambers. A large refectory, or dining-room, with a kitchen, pantry, and larder attached, occupied one side of the square, the story above being used as the library and scriptorium. A hall for the novices, with a dormitory over, a hall for strangers, almonry for beggars, and a suite of chambers for the superior clergy, occupied the remaining sides of the square. The taste displayed, and the ingenuity and skill shown in the erection of these buildings, are familiar to every student of architecture.

The improved castle of the twelfth century consisted of a condensation, as it were, of the features of the monastery. The basement, as formerly, consisted of cellars, a narrow, winding stair in a turret, affording means of access to the stories above. On the first floor was the hall, which now began to assume an imposing aspect, being of considerable size, and often occupying two stories in height. On the floor level of the hall were the chapel, kitchen, pantry, and larder; and the third story contained two or three bedrooms. Whilst the baronial hall was thus increasing in importance, another class of buildings were making their appearance on the lands of the smaller proprietors, and the vassals of the nobles, the distinctive features of which were that they possessed less of the fortified character, and were not so massively built.

They were generally of wood, two stories in height, and the dwelling-house occupied one side of a square, and the offices the other three sides, much in the same manner as we see exemplified in some farm steadings at the present day. Of course you will understand that I am compelled to restrict my remarks to the general features of the houses of the various periods; the arrangements varied, more or less, in different localities, and according to the requirements of the possessors, but a description of the most marked and general characteristics must suffice.

The castle and manor-house of the thirteenth century differed little in arrangement from those of the preceding one, except in the increase of the number of rooms and their greater spaciousness. Parker describes a manor-house in the time of Henry III., as having, in addition to the rooms already referred to, a buttery with wine and beer cellars attached, a pantry, chandlery, and wardrobe. The latter chamber served the purpose of a piece of custody for the richer habiliments of the possessor, and also as a store for the family plate, preserves, and spices. It was occasionally used, too, as a workshop for dressmakers and tailors. Still, the plans even of Royal manors were very defective: one room served as a passage to another; and Henry III. complained that, in one of his manors, the only means of communication between his chamber and the chapel was by means of a trap-door. Withal, there was a considerable advance in refinement, as we find that royalty indulged in a bath, although it only consisted of a tub placed in a small closet, and the first attempt at underground drainage was made. Knives and forks had not as yet appeared; the practice at the dinner-table being for the servitor to carry round the piece of roasted or sodden meat from which the male guests cut off a portion with their daggers, which they shared with the lady at their side. Linen sheets and blankets were a rare luxury, and nightgowns were not thought of, royalty itself seeking repose *in pannis matorialibus*.

In the fourteenth century a marked advance was made in the elegance and refinement of the superior dwellings. Some of the halls then erected are still looked upon as models for imitation, and are in use to this day. To this period belong Westminster Hall and Crosby Hall, than which nothing finer has been produced by the modern Gothic revival. Part of Lintlogan Palace, which you visited last summer, belongs to this century, as also Falkland, Craigmillar, &c. In the last-named castle you have, within easy access, an excellent example,—take note of the south front as to the sanitary arrangements. There is no mistaking the use to which the corbelled-out closet in the third story was to be applied, and there is not the slightest trace of pipes having been attached to it. Large windows filled with glass now became a distinctive feature of better class architecture. The lady's hower, or boudoir, now appears for the first time, as also a small private dining-room, to be used in place of the hall, now reserved for state purposes. Bedrooms were multiplied; but even yet they were made to serve the purpose of day-rooms as well, and the bed was frequently used as a table. The hall still continued in use as a bedroom for the domestics.

We must now take a rapid glance at the state of domestic architecture in towns. In the thirteenth century the residence of the merchant was constructed of wood and covered with thatch. On the ground-floor was an open booth for the display of merchandise, with a room behind it, and an upper story which usually projected over the under one. In the fourteenth century the same arrangement was in vogue, with the addition of a third story. Specimens of this style of house are still extant in this city, one at the angle of the West Bow and Lawn Market, and others in the Cowgate. In these specimens the upper floor is reached by a turnpike stair, lighted by small windows, which were originally devoid of glass, but were provided with a strong sliding shutter. The lower part of the windows of the house were not glazed, but could be closed in with wood shutters, the upper part only being filled with glass. In some of the later specimens an outside stair was preferred. Drainage was almost unknown up till the end of last century, and many amusing anecdotes are told of the dangers of the streets at certain hours; dung-heaps stood in many parts of the streets; and it is not many years ago that they were still to be seen in some of the more obscure alleys and closes.

During the reign of Queen Elizabeth domestic architecture flourished with remarkable vigour.

The confiscation of the church property by Henry VIII., and its distribution amongst the nobles afforded them the means, and a period of peace gave them the opportunity of meeting the increased demands of social advancement. Mansions were then erected which are still used with but slight alterations; comfort and convenience were now studied, and architecture became a subject of more general study and interest than heretofore. We now find, for the first time, works published on the subject, and that architecture became a distinct profession in place of a closed guild, and that the professors visited the Continent to improve their knowledge and to import the styles of other countries into their own. The increase in the number of apartments was marvellous, in some instances exceeding one hundred, and the mode of communication was rendered more convenient by the introduction of corridors and broad staircases of easy ascent.

The style of architecture then practised is familiar to you all. Thenceforward originality disappears, and comfort and convenience were sacrificed to a pompous imitation of foreign works quite unsuited for our climate and the habits of the people. The plan was now made to suit the elevation, not the elevation to suit the plan. In some examples, such as Blenheim, in Oxfordshire, and Stoke Park, Northamptonshire, the only means of communication from one part of the house to another was by an open piazza; an arrangement that may be suitable for a climate such as that of Italy, but certainly not for ours. The arrangements otherwise are equally devoid of comfort and convenience. In Marlborough House, the town residence of the heir apparent, the kitchen is in one wing, and the dining-room in another, and both are on the ground level. The poor lacquies had to descend one flight of stairs to a dimly-lighted corridor, and to traverse the whole breadth of the building, and then to ascend another staircase to the dining-room level.

We certainly arrange things better in our day, and if the Gothic revival had effected no other change than a return to common sense planning, it deserves commendation.

THE VIEWS OF MANCHESTER ARCHITECTS.

PRESIDENT'S ADDRESS, MANCHESTER SOCIETY OF ARCHITECTS.

At the commencement of the third session of our society let us very briefly refer to what we have done in the past, and what we have to do in the immediate future. Our profession demands in us a threefold character: we are more or less, as may be, artists, men of science, and men of business; but when we formed ourselves into a society we did so mainly in the last-named capacity. We combined, not specially for the study of art, nor the advancement of science, but to elevate the status of the profession, and promote the interests of its members; to consider and determine our position towards our employers or clients, towards those employed under our direction as contractors, and towards one another as professional brethren. The result has proved the wisdom of this course, for, instead of discussing the question of the invisible lines of the Parthenon, or debating on the so-called "point of departure" for modern Medievalism, we were immediately brought face to face with questions of the present day, and affecting our every-day relations with the outer world.

Besides minor matters, four important subjects have occupied our attention. The first of these was the adoption and publication of a scale of charges for professional services; and the value of this step has been abundantly borne witness to by various members of our society. It has proved to be of use to ourselves and others in two ways. We are enabled to see more clearly what our charges ought to be in cases that are exceptional, and the public are informed upon them, and enabled to satisfy themselves that what we charge is in accordance with established rules.

The second subject taken up was that of the arrangements connected with competitions. The "Suggestions" we issued have borne fruit to some extent; but notwithstanding all that has been done by this and other societies to enlighten committees and awaken them to a sense of the extreme injustice of many of their proposals, and the grievous waste of time and labour and actual

outlay which these entail on the profession, advertisements which ever and anon appear show that the task is a hard and difficult one. Still, the arrangements connected with the Law Courts competition in London, and with that for the Town-hall here, have been so much in advance of former occasions that we may hope for an improvement in the future, as compared with the past. It would be much more so, would members of our profession steadfastly keep themselves aloof from every competition which does not offer terms that are at least honest, if not liberal. For my own part, I consider competitions in architecture to be the bane of art, and their action upon the profession to be cruel, as well as hurtful; and I regret also, that we did not add to our "Suggestions" a protest against the motto system, as being a delusion and a snare, as I believe this would have secured the unanimous consent of our society.

We had, thirdly, to grapple with a vastly more important subject, and our attention to it was compelled by the action of the master builders, who, having drawn up a form of contract and a code of rules for taking quantities, invited our approval of them. We found many objections in these to be, in our judgment, so objectionable that we could not accept them as they stood, but we were led to give consideration to both divisions of the subject, and to draw up and issue—first, suggestions as to what a contract should contain; and, secondly, a mode of measurement of works in preparation for a contract. In the first we conceded to the builders such points as we considered did not imperil our own standing as architects, or the interests of our clients. We take, I may say, this position, that so soon as a contract has been entered into the architect becomes, by necessity, an arbitrator between the builder and the employer, and has to see not only that the latter gets what he has contracted for, but also that he does not require from the builder more than the latter has contracted to give; and upon any point arising under the contract, and covered by it, we claim to be sole umpire and judge. And we cannot see how our duties could be carried on, if at every turn our decision could be called in question, and a referee appealed to. The builders admit that with many architects they have no difficulty, and no occasion to require a referee; and we consider that if there be architects whom they cannot trust,—men who ignore their own orders for extra work, keep back certificates when due, increase the detail of the work as it proceeds, and in other ways do injustice to the builder, the latter has his own remedy in hand, by declining to give in tenders to such men; and I think I am justified in saying, that those architects who deal, to the best of their knowledge, fairly between man and man, will be only too glad if, by such a step, a more honourable practice can be forced upon the former, or failing that, their practice fail them. In the second matter, we found that all discussion upon items of measurement showed the desire to set aside, in every case, trade customs of "allowances;" and, by preference, to measure net work, and schedule all extra labour in distinct items; thus making a set of quantities fit to be understood in any locality, irrespective of local customs.

The last important subject was that of the corporation by-laws; but upon this question I will only remark that, having succeeded in purging from them much objectionable matter, while improving their efficiency, we may hope that we have benefited other localities as well as our own, it being very much the custom for officials of one town or district to obtain copies of the by-laws in use elsewhere, and to adopt them *verbatim et literatim*, so that the very typographical blunders are even repeated.

Passing over the subjects which come before us this day, I will mention two others which I think ought to claim our attention at an early date. Uppermost in my mind comes the question of the right of light as affecting adjoining properties. No law is in a more unsatisfactory condition than that which bears upon, but does not regulate or settle this question. Perhaps no law bears more fruits of injustice, and I do not think our energies could be better applied than in considering how this may be remedied, and what ought to be the provisions of the law as amended.

We have banded together for the purpose of raising the status of the profession. One important means of this is to see that our places are supplied, when vacant, by men highly educated and well equipped with professional lore. At present our pupils are educated with-

out system, and they are without a definite object in pursuing their studies,—such of them as do study, perhaps in truthfulness, I should add. Ought we not to have certain courses of reading prescribed, and certain examinations to pass, the honour and *clat* of which would inspire the youths, and the order of which would most beneficially guide their efforts? Taking a step beyond this, it might even be desirable, if it were possible, to organize a school of architecture, similar in constitution to the schools of medicine which are established here and in several important towns, each of a number of practitioners taking one branch of study, and giving to the class a course of lectures which would form the basis of the subsequent examination for a certificate. That we have members who could undertake to illustrate the several branches of study, I doubt not; but the exigencies of professional life bear already so heavily upon many, if not all of us, that here I apprehend might lie the chief difficulty.

More I should have liked to say upon some of these subjects, and upon others, such as the beneficial effect of many of the workmen's regulations, not only upon our freedom of design, but upon their own handicraft-proficiency, and their own enjoyment in the work of their hands,—a gift from God which they are doing their best to put away from them and their children; but I forbear, knowing that we meet for business, and being desirous that I should not seem to abuse the privilege of the chair. I must, however, beg leave to refer to the loss we have suffered since our last meeting. The first breach by the hand of death has been made in our society, and the suddenness of the stroke, with the comparative youth of the member, adds to our sorrow. Your election of Philip Nunn to the council of the society in two successive years marked your appreciation of his character, and a business rapidly increasing testified to the satisfaction with which his work was regarded by his clients.

W. R. CORSON.

SCHOOLS OF ART.

The Cambridge School.—The annual meeting and distribution of prizes to the students of this School, took place at the Guildhall, in the presence of a large number of ladies and gentlemen. The Rev. the Vice-Chancellor presided, and there were also present the Masters of Christ's and St. Peter's Colleges, Mr. A. J. B. Beresford Hope, M.P., Professor Selwyn, Mr. C. T. Newton, of the British Museum, &c. Mr. Newton delivered a lecture upon "The Parthenon and the Art of Phidias." The report congratulated the school on the return of its master, whose health was restored. It stated that the influence of the school was extending. Of the success which the school has had the number of prizes obtained from Government was some criterion. The committee announced that twenty students had obtained certificates for passing in the Government examination held in March last, of whom two had obtained full certificates for having passed in all the various stages; and one obtained a prize. Besides these, six had obtained Government prizes for works executed in the school during the year. Six works were selected for the national competition at South Kensington, five of them done by young ladies.

The Coventry School.—The third annual meeting of this school has been held in the large room of the school, round the walls of which were ranged statues, architectural mouldings, and other casts for the students to copy. The room was crowded with ladies and gentlemen and pupils. Lord Leigh, the president, occupied the chair. The report stated that the work of the school continued to show progress. The number of students had slightly increased, and the attendance in the advanced classes had been more regular. The number of pupils who had attended the afternoon and evening male classes during the year was 138; last year it was 136. The evening ladies' class was 17, against 15 last year; and the ladies' class 48, against 49 last year. The Department of Science and Art had this year awarded five book prizes for drawings in the elementary stages, and one received honourable mention. Sixteen works were selected for national competition, and of these one received a medal and three book prizes. The examinations in free hand, model, geometrical, perspective, and mechanical drawing were held in March last, and were conducted under the superintendence of the local committee. The number of

pupils who passed was 27, against 13 last year; the number of successful papers, 36, against 17 last year. The report said:—

"A few presents have been received from the Department, but, for the most part, they are simply worthless. The circulation of such works as the 'Photographs from the South Kensington Portrait Gallery' cannot be supposed to tend to the advancement of art; whilst, if the provincial schools were allowed the money cost of such productions, to be applied to the purchase of examples, it would afford them very material assistance, which is greatly needed."

The Macclesfield School.—The annual meeting of the Macclesfield Society for acquiring Useful Knowledge was held in the Sunday School, Rectory street, Mr. Samuel Greg taking the chair. Productions of the pupils of the School of Art were exhibited in front of the platform, and along the fronts of the galleries. The attendance of members and friends of the institution was more numerous than could have been accommodated in the usual place of meeting in the Town-hall. The School of Art report for 1867 gave a favourable account of progress made and difficulties conquered as in previous years. The work of art-education had been steadily increasing, both as to numbers under instruction and proficiency of the pupils. Comparison with previous years showed that in elementary art-education the March examination stood highest in successful members since the formation of the school. The number of students who received instruction in the school during the year which terminated September 30, 1867, was as follows:—Ladies' morning classes, 27; general evening classes, 80; total, 107. In addition, 103 pupils were instructed in private schools, making the number who received instruction 210. At the annual local examination in March last, 36 pupils were successful in fifty exercises in the second or highest grade subjects; as freehand drawings, geometry, perspective and model drawing, 17 being marked excellent, 15 gaining guinea boxes of colours, boxes of instruments, &c., and the remaining certificate cards. Comparison of results:—1866, 16 successful; 1867, 50 successful. At the same time as the above local examination the year's works of 27 School of Art students were sent to the Department of Science and Art. The head master is Mr. James Ford.

CHURCH RESTORATIONS IN EAST ANGLIA.

ALTHOUGH the amount of church restoration going on during 1867 in the eastern counties has not equalled that of one or two former years, yet it has been considerable, and the following amongst others have either been completed or are in a forward state.

Cockley Cley (Norfolk).—This is a very interesting church, with a round tower, Decorated nave, and south aisle, and Early English chancel, and has been completely restored, and a new north aisle added, corresponding in character to the south, which opens with three arches into the nave. A high and ugly brick clearstory, built about eighty years ago, has been removed, and a new open roof of the original pitch substituted, the weather moulding of the old roof being still on the tower. The chancel has on each side five single-light Early English windows, connected internally by a hood moulding. The east window is of three lights, with shafted mullions, and is in detail not unlike the well-known one at Polebrooke. Three of the side windows had two-light Perpendicular insertions, and one had been cut down and formed into a modern doorway. These have all been restored to their original form. Three ambries were discovered in the chancel, and two piscinas in the south aisle, all in fair preservation, and are left open. A new trussed rafter roof of the original pitch, with curved braces, has been put on the chancel in the place of the modern low-pitched one with a plaster ceiling. A new south porch, of flint and stone, has been built, and the tower, which is 16 ft. in diameter and 43 ft. high, restored, and the belfry windows filled with slate louvres. There is no tower arch, but only a small door,—a not un-frequent arrangement in the Norfolk round towers. The font, a curious and rather rude piece of transition from Early English to Decorated, with a shafted pedestal and octagon top, has been refixed; the church is benched throughout with oak benches; the passages in the nave and aisles laid with Peake's; and the chancel with Minton's tiles. A new oak pulpit, prayer-desk, and lectern have also been fixed. The church is warmed with Gidney's

underground stove. The works have been executed by Mr. Barrell, of Norwich, and the entire expense has been borne by the squire of the parish, the outlay being about 1,500*l.*

Thorndon (Suffolk).—Thorndon Church consists of a wide nave, with chancel of the same width—no chancel arch, but the walls and roof run through at an equal height. There was nothing, in fact, to mark the nave from the chancel, except a step and the screen, the lower panels of which still remain. There are several churches of this type in the eastern counties; and they are, in this case, generally of the flowing Decorated period; but at Thorndon some of the side windows have been filled in with tracery of a later date; and the large east window—the shafted jambs and moulded arch of which remain—was some forty years ago partly stopped up and a three-light window of Perpendicular design, all in cast-iron, inserted. About the same time, the Decorated trussed rafter roof was taken off, with the exception of the two western bays, and a rough, low-pitched common tie-beam king-post put up in its stead. This has now given place to a new roof, the detail of which is a copy of the old part which remained, the only difference being that the architect has introduced, as he has also done at Burgate and some other churches with no chancel arch, a moulded arched timber rib, carried on carved stone corbels, to mark internally the chancel from the nave, the roof running through level, and having an ornamental cresting on the chancel roof-ridge only. A new four-light east window, fitting the original opening, has been put in, and below it a rather elaborate reredos of oak, the centre compartment being filled with the Last Supper in *alta relievo*, very beautifully carved by M. Abelois of Louvain. The apostles are all represented kneeling, and the Saviour standing. The other chancel windows, together with the door, buttresses, and outside flint facing, &c., have all been made good where defective, but there has been no scraping of the old sound work. This part of the church has been seated with oak benching, and the passages and altar space paved with Minton's tiles. Several of the old poppy-head benches still remain in the nave; these will be preserved, and the rest of the nave henched to match them. There is also a very good Early Jacobean pulpit and lectern, the latter being rather a rare thing to meet with, both of which will be refixed. A modern west gallery is to be removed, and tracery and mullions inserted in the west window, which is at present mutilated and partly bricked up. Below the west window is a very good doorway. On the south side is a fine tower of Decorated date, which forms a porch to the church, and, with the exception of the battlements and belfry-windows, is in good preservation. The cost of the works up to the present time has amounted to about 800*l.*, and about 400*l.* more are required to complete them. They have been executed by Mr. Grimwood, of Weybread.

Ade (Norfolk).—This is another of the round tower churches with a wide nave (having a thatched roof), and chancel: the latter was restored some years ago under Mr. Christian. The nave has now been henched, and the church heated with hot water, the windows restored, and the walls replastered. There is a good Perpendicular screen, which still retains some of its old painting, and a very fine font in the church: both have been carefully preserved. The round tower is 53 ft. 6 in. high, and 16 ft. 6 in. in diameter. The north porch is a good specimen of flint and stone work, and has a parvise or priest's chamber over it.

Mendham (Suffolk) is an Early Perpendicular church, the nave having originally a high-pitched roof and no clearstory; but shortly before the Reformation this roof was removed, and a high and disproportioned clearstory, with nearly a flat roof, the eastern bay of which retains its original colour, was put up. There are two aisles, a west tower, a good flint panelled south porch, and a very dilapidated chancel, which the lay improprator seems very unwilling to restore. The rest of the church, however, is being put in thorough order at a cost of about 1,300*l.*, the work being let to Mr. Grimwood, of Weybread. The roofs have all been restored and resealed,—the aisle roofs being so rotten that they had to be entirely new; the windows and stone work inside and out, where defective, made good, but not scraped; the walls replastered; and the church benched throughout with carved oak benches. The passages are to be laid with Minton's tiles, and the church warmed with Gidney's

underground stove: the windows are glazed throughout with tinted cathedral glass. The prayer-desk and pulpits are of oak. Stone corbels are introduced to carry the braces of the old nave roof, which were left cut square off. Their design is a series of angles holding the various emblems of the Passion, &c.; and they are carved with great spirit. A squint from the south aisle to the chancel has been found with its original sliding door, and two very nearly perfect piscinas have been opened in the south aisle.

Dickleburgh (Norfolk).—A Perpendicular church throughout, with nave, north, and south aisles, west tower, chancel, and south porch. This church has suffered in times past more by the hand of the restorer (?) than by that of time. It has poor modern chancel and nave roofs and battlements, all unfortunately in too good repair to induce those interested to replace them with some better work. The church has, however, this year been henched with some rather elaborate oak benching; the ends being square-headed, and filled in with many different tracery patterns. The chancel benches have poppy-heads; the old ones being refixed. A new oak prayer-desk has been provided, and the old Jacobean pulpit refixed. The side windows of the chancel and the "priests' door" are restored: the former were so dilapidated that they had to be almost entirely new. Some huge brick buttresses have been taken down and rebuilt in stone and flint to match those in the other parts of the chancel. The outlay has been about 500*l.*; and the work has been executed by Mr. Bishop, of Diss, and Mr. Wells, of Dickleburgh.

Uggeshall (Suffolk).—The chancel of this church is being restored, and a new organ chamber thrown out on the north side of it, at the expense of the rector. The chancel is of Early Decorated date, and the removal of the outer coats of white-wash has revealed several consecration crosses both on the walls and the jambs of the windows. The heads of two figures are also traceable; but the painting is so far gone that it is impossible to make out the subject. There are also some good running ornaments in red and brown. The new roof to the chancel is a careful copy of the old one, which was of trussed rafter construction. There is no chancel arch, and an oak moulded arched rib has been introduced as a division between the two roofs. The nave has a very good Perpendicular hammer-beam roof, which has been restored and re-thatched. The chancel is to be henched with oak benches, and the floor laid with encaustic tiles.

Ormesby (Norfolk).—Ormesby is one of the few village parishes on the eastern coast that have increased in population, and the enlargement of the church has become absolutely necessary. This has been accomplished by the addition of a north aisle opening into the nave, with four large arches. The nave and chancel are of the flowing Decorated period, and the new aisle has been built in the same style. The church is being henched throughout in oak, and the passages are to be paved with red, black, and buff tiles. The windows are glazed with rough-plate tinted cathedral glass, worked in patterns, with a white margin. The chancel has also been restored, and a vestry built at the expense of Sir E. Lacon, M.P., who lives in the parish. There are two very good recessed canopied Decorated tombs on the north side of the church, both alike in design, to the Ciere family, the builders of the church,—one in the nave, and the other in the chancel. The latter has been preserved intact, but the new aisle necessitated the removal of the former, and it has been carefully rebuilt under the east window of the new aisle. The cost of the entire works amounts to about 1,600*l.*, and they are being executed by Mr. Cornish, of North Walsham.

Fressingham (Suffolk).—The very elaborately carved benching and nave roof of this church are well known, and are, perhaps, of their kind unequalled, but both are beginning to suffer for want of attention, several of the carved bosses and crestings in the roof having dropped down and become lost. Plans have been prepared for the complete restoration of the church, and the tower at the west end, which stood in the most urgent need of repair, has already been restored. Subscriptions are being collected for the rest of the work, the architect estimating the total cost at nearly 2,000*l.*

Wickleswood (Norfolk).—Has a lofty nave and chancel, with a south tower, which serves as a porch, all of Early Perpendicular work. The roof of the nave is being restored, bay by bay, the decayed timbers taken out, and others of

equal size and similarly carved and moulded, put in their stead. The west gable, which was very unsond, is being rebuilt, and all the stonework of windows, buttresses, and doors restored, but not scraped. The external face of the walls throughout is rather unusual, being alternately a course of flint and thin bricks, which, now the whole has become grey, gives a very pleasing effect. There are two chambers in the tower, below the belfry, both of which contain fireplaces, and the lower one has also an oven. These are clearly coeval with the tower, the flues being carried up in the solid walls, and turned out just below the level of the string-course running under the belfry windows. There are low, side, narrow slit windows in both rooms, near the fireplace. A new north porch and vestry is being built, and the chancel will have a new east window. The church is to be benched in oak and paved with tiles. The outlay will amount to about 700l.; Mr. Cornish, of North Walsham, being the contractor.

The whole of the above churches have been or are being restored from the designs and under the superintendence of Mr. Phipson, F.S.A.

CHURCH OF ALL SAINTS, LITTLE MUNDEN, HERTFORDSHIRE.

The following appeal has been circulated:—

"The time has come when an effort must be made to repair thoroughly the parish church of Little Munden, and to restore it in some degree to its original condition, thus repaying to posterity what we owe to our forefathers.

The manor of Little Munden, it will be remembered, is very ancient. Domesday Book mentions the name of a vassal of Earl Harold, to whom it belonged in Saxon times, and how William the Conqueror afterwards disposed of it. The present church is for the most part due to the commencement of the fifteenth century, and is an interesting specimen of a parish church of that period, containing also some remarkable canopied monuments with sculptured effigies. The whole of the fabric has fallen into a bad state; the walls externally require refacing, the stonework generally needs repair or restoration; the woodwork of the roof has been disfigured by alterations, and is much decayed; drainage and paving must be attended to; there should be new seating throughout, and means must be provided to warm the church, at present so damp and cold as to be scarcely endurable in winter.

With the view of ascertaining what is really necessary to be done, Messrs. Godwin, architects, under whose direction various churches in the county have been restored (Ware, Standon, Great Munden), have been applied to, and these gentlemen report that the works required to be done will cost about 1,300l., exclusive of architects' charges, and the wages of clerk of the works. Before commencing, however, precise tenders would be obtained from builders, and a contract made, so that the exact sum to be spent would be determined. The patron of the living is willing to assist liberally, and in appeal is now made for aid in this good and necessary work to all who, whether resident in the county or not, desire to see our churches properly maintained."

By the exertions of the rector, the Rev. F. A. L. Foster, and the liberality of Lieut.-Colonel Loyd, great part of the required sum has been raised, and tenders for the performance of the necessary works will be invited forthwith.

THE RE-OPENING OF CHICHESTER CATHEDRAL.

AN interesting service has been held in Chichester Cathedral, where a crowded congregation assembled last Sunday to celebrate the restoration of the structure from the ruinous condition to which it was reduced by the fall of the tower and spire in 1861. Into the history of that catastrophe we need not now enter: it was fully described by us at the time. Immediate steps were at once taken to rebuild the fallen tower. Mr. G. G. Scott, R.A., was requested to make a report, and, after the removal of the debris, the work of reconstruction was at once commenced, and under his and Mr. Slater's superintendence the tower and spire have been completed in all respects, an exact reproduction, it is asserted, of what was lost. The builders were Messrs. Beauland; the clerk of the works was Mr. Marshall; and the foreman, Mr. Norrice. The tower being finished, and the scaffolding removed, the suspended works in the choir,—which were going on under Mr. Slater's superintendence, it will be recollected, at the time of the fall of the tower,—were resumed under the direction of Mr. Slater. The whole of the stalls, with the exception of those for the dean and precentor, had been completed from Mr. Slater's designs, as were also the marble pavement and the altar. During the rebuilding they were temporarily deposited in the lady chapel. They are now fixed in their places, together with

the new throne, the dean and precentor's stalls, the steps, screens, &c.

The original scheme for the re-arrangement of the choir has been completed in most of its essentials, though the reredos, organ-case, &c., are yet to be erected. It was proposed at first to retain the returned stalls; but this proposal was abandoned, and the dean and precentor's stalls now face respectively north and south.

The ancient canopied stalls of Bishop Langton have been re-erected in their original position under the tower: they are thirty-six in number, eighteen on either side. They have been restored, as have also the chancellor's and treasurer's stalls, at the eastern end of each block.

The reredos has been designed, and is now being executed, by Mr. Forsyth. The principal feature in it is the sculpture of the Ascension. The structure is of various rich marbles: the figures of very large size.

The organ-case has yet to be designed, but the organ itself has been altered and re-erected over the stalls in the north arch of the tower, Messrs. Hill & Son being employed for this work.

The whole of the stall work and throne have been executed Mr. J. Forsyth, and the pavement was done by Messrs. Poole & Son. The stall-floors, marble plinths to stalls, grilles, screens, &c., have been done by Mr. Marshall.

Although the fabric has been restored substantially, there remains still much to be done to render the interior complete.

THE EXCAVATIONS AT JERUSALEM.

THESE excavations, at the instance of the Palestine Exploration Society, have now arrived at a point of singular interest. Shafts of great depth have been sunk, and walls and passages discovered which require further excavation and further means to explore them. The depth or height and extent of the Haram wall are scarcely less than astounding. In a letter which Mr. George Grove, of the Crystal Palace, the secretary of the Fund Society, has sent us, he says:—

"The funds of the society are all but exhausted at the moment that Mr. Warren's strenuous and able labours are beginning really to tell.

Briefly to sum up his discoveries, the details of which will be found in his reports, Mr. Warren has established by actual demonstration that the south wall of the sacred enclosure, which contained the Temple, is buried for more than half its depth beneath an accumulation of rubbish—probably the ruins of the successive buildings which once occupied it; and that, if traced to its foundation, the wall would present an unbroken face of solid masonry of nearly 1,000 ft. long, and for a large portion of that distance more than 160 ft. in height; in other words, nearly the length of the Crystal Palace, and the height of the transept. The wall, as it stands, with less than half that height emerging from the ground, has always been regarded as a marvel. What must it have been when entirely exposed to view! No wonder that Croquet and Psalms should have rejoiced in the 'walls' and 'bulwarks' of the Temple, and that Tacitus should have described it as *moda arvis constructum*.

The question immediately occurs, What does the lower part of the structure formed by this enormous wall contain, our present knowledge being confined to the existing level of the ground? Of this I can at present say nothing, though the passage discovered by Mr. Warren, 30 ft. below the 'single gateway,' and described by him under October 22, promises to lead to important discoveries.

I sum up by recording the important fact that the discoveries have completely changed the conditions of research in Jerusalem. They are nearly equivalent to the discovery of a new city. Hitherto we have explored the surface, or at most the vaults and cisterns immediately below it. We must now go far deeper, and penetrate those mysteries which the kind earth has entombed and preserved for centuries for the advantage of our generation.

Exploration in Jerusalem is at present in the condition of a puzzle or joining-map, of which only half a dozen pieces are found out of sixty or seventy. Find the others, and the whole can be put together, and will then be intelligible enough. Extend to the other parts of the city the researches here begun, and the sites of the Temple, Calvary, the Holy Sepulchre, the Pool of Bethesda, will be problems no longer. I may, therefore, with good reason, beseech all who are interested in Biblical studies to give their aid to the Palestine Fund for this work. This society is no private enterprise. The Queen is our patron. The Archbishop of York is our president. The committee consists some of the most eminent names in science, literature, education, and religion.

In this work 3,242 have been expended—a sum which no one conversant with the subject will think extravagant. I entreat the public of England not to let it drop. Mr. Warren estimates his expenses at 200l. a month for six or eight months, 1,600l. What is this to raise in England from the very large number of persons who take an interest in researches bearing so directly on the illustration of the Bible? If Mr. Warren is obliged to relinquish his operations, not only will his shafts fall in and his trenches fill up, but the Arabs, who he has trained to work so well, will go back to their old habits of idleness, and the whole process will have to be gone over again, if, indeed, it is ever again attempted."

But it will not be relinquished. We cannot believe that an undertaking which has so many points of attraction to archaeologists and archi-

facts, as well as the religious public, can be allowed to fall through.

The shafts alluded to by Mr. Grove (one is 85 ft. deep) are mostly actually without boarding or protection to the daring excavators from sheer want of funds; and they were thankful lately to fill up one that had some boarding in order to make use of it for more pressing need. This is like filling up the necessary trenches on the way to the attack of a city which is about to fall into the hands of the entrenchers. We cannot for an instant imagine that a few thousand pounds will fail to be immediately forthcoming on such an occasion as this.

SCULPTURE.

MR. LOUGH, one of our very few sculptors who aim at the ideal and find a public to encourage them in the high endeavour, has four statues and groups in different stages of completion. Two of these represent hunters of heroic size and type, and are in course of translation to marble. One has just killed a buck, which lies at his feet, and keeps back a dog with his right hand. The other hunter is about to despatch a boar, already speared, and which he bestrides—a dead dog telling of the previous struggle. In both these groups, the first of which we prefer, Mr. Lough's skill in the presentation of animal form is strikingly shown. There is no occasion to ask the name of the third statue, a nearly nude Bacchic figure trampling on grapes: with his right hand he holds aloft a laden branch of the vine, and with the other supports on his advanced left leg a vessel of classic form. The figure is full of spirit and movement, the pose and modelling alike demanding praise. Of the same character of art, and calling for equal commendation, is "The Lost Pleiad," already in marble, a fresh female form, half reclining on a sphere just struck down into the water. The hours personified around the sphere suggest her descent to the finite. It was satisfactory to hear that this charming work was commissioned for marble (by Mr. Henry) before it was finished in clay.

PUBLIC ROUTES AND GARDENS.

THE march of improvement in horticulture is nowhere more evident than in the parks, squares, and open spaces of London. Some twelve years back, Sir Benjamin Hall (the late Lord Llanover) began the border decorations of the parks, at a period when the wild borders of the Kensington long walk was the sole floral resource of opipians. Since then Regent's Park has been laid out in gardens; Park-lane and Rotten-row have been adorned with an exquisitely beautiful arrangement of shrubs and potted plants; the squares have generally been more carefully tended; Paddington, Camberwell, and Islington greens have been raised in, laid out in flowering beds, and also, being provided with seats, have become, instead of repulsive wastes, pleasing and refreshing places of resort for residents or wayfarers.

Even the churchyards, formerly bristling with tombs, have been levelled, sown with grass, and planted, and now wear a verdant and pleasing aspect, since interments having been discontinued, no disturbance of the soil interferes with perennial vegetation; and those once baneful and melancholy domains of the dead contribute their share to the solace of the living.

Observations frequently made in the *Builder* may, perhaps, have had their effect in stimulating these improvements, which promote much the health and gratification of citizens generally, references having been often made to the ornate condition of *Père la Chaise* in Paris, to prove that the earthly abode of the dead need be neither unhealthful nor revolting.

Any one who walks the park borders and observes the groups of all ages occupying the frequent seats, and enjoying the exquisitely varied and planted flower-borders, must feel gratified at the expenditure of so much money, care, and skill, when he considers the solace such works of taste afford to the multitude, and the healthful recreation they bring within reach of London residents, who could have no idea of floral nature without them. Moreover, these displays have created a taste for floriculture that be decks every window and forecourt, and fills even sunken areas with beauty.

There is yet, however, a square in the very centre, close to Charing-cross fountains and the gallery of national taste, which is suffered to smoulder in waste, the rails broken, the weeds in luxuriance, the central equestrian statue mutilated and whitewashed in derision. Is there no resident proprietary in Leicester-square; or is it given up to devastation and to wilderness since the Great Globe itself has vanished, and Wyld made havoc of his dome? A theatre or panorama can certainly feel no interest in external garden decoration,—but oh! Shade 'of the Sablonnière,—*bel esprit de Stagz & Mantle*,—how can ye contemplate such desecration through your windows of British plate?

The fine causeways of Birdcage-walk and of Park-lane have been widened, giving more apparent scope, not only to the roads, but to the adjacent parks. It is to be hoped that the improvements assumed by such skillful management may be extended to the greater southern route, along Hyde Park, by Kensington-road, and that this, the grandest holloward of the west, may be made worthy of the royal suburb and the city that London is to become, so soon as the river embankment shall be finished. Already it is hordered by open park on the left hand, or on the right, from Devonshire House, Piccadilly, to Knightsbridge; thence begins a range of squalid shop-houses to the cavalry barracks, which stint the road, and defile the finest site of the circumjacent West-end. Surely these defaults ought to be abated, and at least some of the tottering fabrics removed; then the Kensington and Piccadilly approach to London would be the most central, as well as the grandest, thoroughfare of the whole metropolis, and a stimulus might thus be given thereby to the recently-projected traverse road, leading in continuation from Cromwell-road to Buckingham Palace.

QUONDAM.

MALICIOUS DAMAGE TO MASONRY AT PADDINGTON.

ON the night of the 11th instant some persons entered the mason's shop at the new Church of St. Mary Magdalene, Paddington, now in course of erection by Mr. J. D. Cowland, of Notting-hill, builder, and broke and defaced the moulded caps of two columns that were nearly completed. The marks were evidently those of a mallet and chisel, and the damage was done just where it could not be repaired. There were employed by Mr. Cowland five society and three non-society men, and the former had struck against the latter being employed. Mr. Cowland, determining not to discharge those who remained faithful to their duty, the union men were paid their wages and left accordingly, and next morning the outrage detailed was discovered. A reward of 20l. has been offered by the builder for the discovery of the malicious "rattener."

SANITARY MATTERS.

Guildford.—A fatal typhoid fever having broken out of a sudden in the highest and healthiest part of Guildford, and spread till there were 264 cases, not of a fatal type, however, a sanitary investigation was gone into, which has resulted in the discovery that the fever probably originated in the fact that the limited district of 330 houses in which this gastric fever broke out was precisely that part of the town which had upon a single occasion been supplied with water containing sewage, from a new reservoir, while the machinery ordinarily in use was under repair. Yet, although the fever broke out in more than one-half of the 330 houses almost simultaneously, a period of incubation for eleven days had transpired, during which the poison in the blood must have been at work before it issued in the recognizable fever. In course of the investigation it was made quite clear that the town drainage had got into a well from which the new reservoir had been supplied on the occasion referred to.

Epping.—A large number of influential ratepayers met recently in the Bench-room at Epping Police-station to meet Mr. Arnold Taylor, the Government inspector, who had been sent down to inquire into the advisability of acceding to the prayer of a petition from Mr. Clegg, surgeon, and about fifty other ratepayers of Epping and adjoining parishes, asking that an Epping Town District might be formed for sanitary purposes, to include portions of Theydon Bois, Theydon

Garnon, and Coopersale. At the close of the inquiry the inspector said he believed they wanted sanitary improvement in the town of Epping, and they would not get it until they had formed a sufficient district; but they must remember that even after the district was formed it would remain for them to consider to what extent they would go as regarded water supply and drainage.

PROVINCIAL NEWS.

Wolverhampton.—The New Town Hall Committee have reported in reference to the plans of Mr. Bates, the selected architect. The plans include a sessions-house, magistrates' court, police-barracks and offices, and prisoners' cells, together with the requisite offices for the Corporation. These buildings will occupy the site of the present Town Hall and of other premises. A street, 36 ft. in width, will also be made, leading from North-street to Red Lion-street. The principal entrance to the proposed buildings will be in North-street, and will lead into a vestibule and public hall. The public hall is centrally placed in the building, and at right angles to three of its sides are placed the sessions-house, magistrates' court, and council-chamber, respectively, which, together with the principal offices connected with the sessions-house, magistrates' court, and corporation offices, are placed on the ground-floor. The committee-room, mayor's parlour, recorder's room, and retiring-rooms are placed on the first-floor overlooking North-street. The prisoners' cells, fire-engine house, stable, and some of the inferior offices are placed in the basement. The police-offices and barracks are placed between the Town Hall buildings and Red Lion-street, and adutting on the proposed new street on the northern side, leaving a court-yard or parade-ground between them and the southern side of the site and Red Lion-street, containing about 900 square yards. The estimate, fittings inclusive, is 17,000l.

Dorchester.—The new Corn Exchange is nearly completed. The building, which has been erected immediately in rear of the Town Hall, is of brick, with Bath-stone dressings, each of the side walls being supported by four buttresses supporting the principals of the roof. The walls terminate abruptly with a kind of parapet, and altogether the exterior of the building is stunted, and of unimpressive appearance. The exchange-room is 80 ft. in length and 40 ft. wide, while from the floor to the summit of the arched roof is 40 ft. The roof is supported by five ribs of iron encased in wood, resting on corbels of Cosham stone. The cornice is of stained deal, pierced with ornamental scroll-work. The pillars supporting the iron girders at the south end of the roof consist of iron tubes with carved capitals of Cosham stone and bases of the same material. The carving was done by Mr. Benjamin Crasby, stone-carver, Dorchester. The architect is Mr. Hall.

UNIVERSITY OF LONDON.

AFTER long endeavours a building is being provided for the London University, at the public expense. It occupies the northern portion of the ground in which stands Burlington House, and fronts in Burlington-gardens. Of this elevation we give a view, together with a plan of the ground-floor. The claims which the University put forth in the endeavour to obtain a building, will serve to show the position the establishment holds. The University of London—of which the essential function is the conferring of Academic degrees upon qualified candidates from all classes and denominations of her Majesty's subjects, without any distinction whatever—is in every sense a national institution, and as such it is entitled to claim that whatever is necessary for the most efficient discharge of the functions confided to it should be provided out of the national funds. It originated in an address from the House of Commons; it was created and is governed by charters of the crown; it is supported by annual grants of Parliament; and it is fast rising to a position of even greater importance, as the head of all the higher education of the empire not embraced by the older universities, than was contemplated on its first establishment. Its history during the twenty-five years which have elapsed since it came into active operation is one of continued progress, notwithstanding the embarrass-

ments which it has experienced from the want of an edifice suitable for the performance of its functions; and the rapid increase in the number of candidates for its examinations which has taken place since its functions were enlarged by the charter of 1853, is sufficient to show the hold it has acquired on the educational sympathies of the country.

The advantage of a National Institution so constituted as to be entirely free to carry out the enlightened object for which it was established, has been made evident not merely by the independence with which the University of London has been able to adapt its curriculum of study to the general requirements of the times, but also in especial by the advanced position which it has from the first been enabled to take in the improvement of medical education, and by its recent establishment of degrees in science. Its medical degrees have now confessedly attained the highest rank in public estimation; and it may confidently be anticipated that the same value will be attached to its degrees in science, the examinations for which are conducted by men of the greatest eminence in their respective departments.

In addition to the accommodation needed for the conduct of its examinations and for the transaction of its ordinary business, the University also requires for its public assemblages and for the meetings of its convocation a hall of which it can claim exclusive possession; and it cannot be considered complete without a library and other apartments which may be employed as a centre of union among its members.

That these requirements should be combined in a distinct and appropriate building has been from the first the strong conviction of the Senate; who have repeatedly urged upon successive Governments that only by this step can the University obtain that universal recognition which it is entitled to claim in virtue of the comprehensiveness of its constitution and the importance of its duties. When, after repeated displacements the University was put in possession of the apartments it now occupies in Burlington House, that accommodation was accepted by the Senate "on the distinct understanding of its temporary character;" and they took the opportunity afforded them in the spring of 1859, by an inquiry made by Lord John Manners, then Chief Commissioner of the Board of Works, to renew the representation of their claims, and this representation they kept up until their object was, recently, effected.

The design at first selected was objected to after the works had been carried on to a certain extent, and a fresh design, that now illustrated and which is being proceeded with, was made. The plan shows the arrangement of the building and the principal apartments. The accommodation provided will be as follows:—

Upon the Ground-floor.	
	ft. ft.
Entrance hall or corridor.....	33 by 33
Public staircase.....	72 " 56
Hall for conferring degrees, &c.	72 " 53
Hall for public examination	61 " 32
Smaller hall ditto	61 " 32
Waiting-room for candidates	61 " 32
Two examiners' rooms..... each	26 " 18
General waiting-room.....	26 " 18
Clerks' room	18 " 14
Room for specimens and apparatus ..	26 " 18
Messengers' room	18 " 14

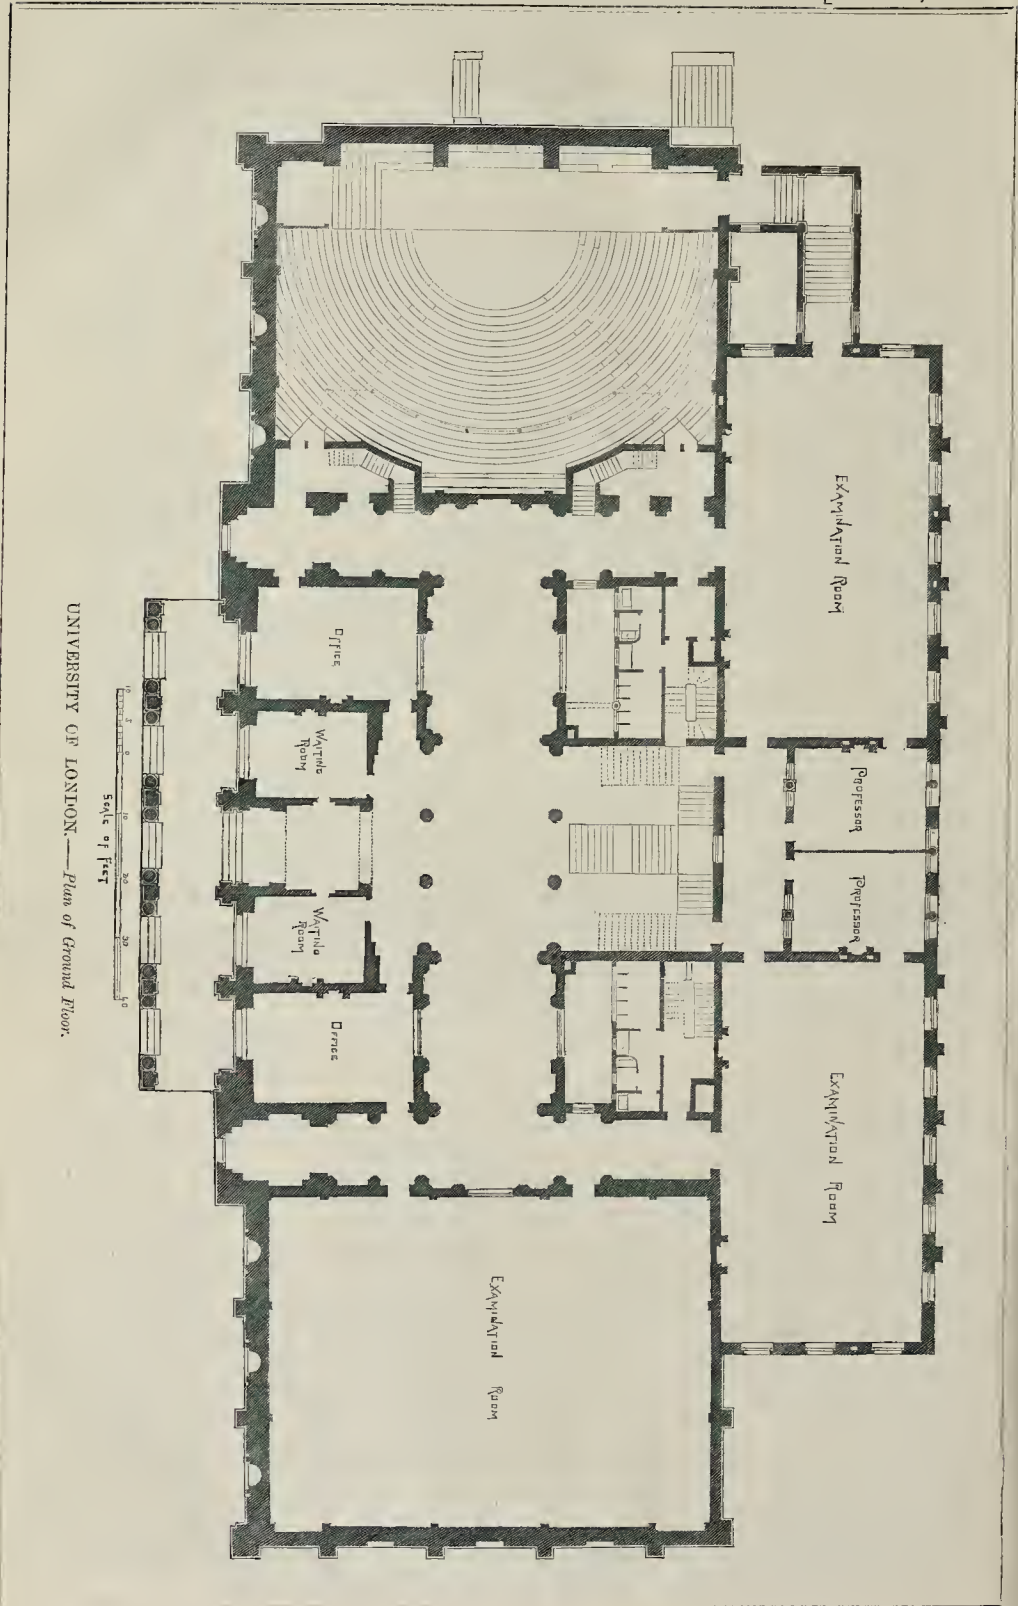

Upon the First-floor.	
	ft. ft.
Senate-room.....	43 by 27
Committee-room.....	26 " 18
Registrar's official room	26 " 18
Registrar's private room	17 " 12
Room for clerk of convocation	21 " 13
Library	34 " 33
Laboratory of chemical room	61 " 33
Anatomical room	61 " 33
Two professors' rooms..... each	16 " 12

Upon the second-floor will be apartments for the housekeeper, &c., &c.; and on the basement-floor rooms for the lithographer, for muniments, for stores, for the housekeeper, and so on.

The principal front of the building is, as we have said, towards Burlington-gardens, and will be faced with Portland stone and red Mansfield stone intermixed, the enriched string-courses being of Hopton Wood stone.

The work is being executed by Messrs. Jackson & Shaw, of Earl-street, Westminster, from the designs and under the superintendence of Mr. James Pennethorne. Mr. Warburton is clerk of the works.

The estimate submitted to Parliament for the building was 65,000l., exclusive of fittings; and this amount, it was stated in the House of Commons, will be considerably increased by the change of style.

W. & A. G. & CO.

UNIVERSITY OF LONDON, BURLINGTON GARDENS.—Mr. PENNYHORN, ARCHITECT.

T. J. B. & CO.

THE QUEEN AND A PUBLIC PARK FOR PORTSMOUTH.

UP to the present time the inhabitants of Portsmouth, Portsea, and Landport, a population numbering over 100,000, have been in much want of an open space suitable for exercise and recreation. With the exception of Southsea Common, which is in almost daily use for military purposes, they have had no place of the kind within a shorter distance than two or three miles from the most densely populated part of the district. Some time ago the civic authorities of Portsmouth represented those facts to the Government, and applied to the War Department for the appropriation, as a public park of a portion of the glacis before the old lines of fortification.

In consequence of a letter from Mr. Francis Fuller to General Grey, her Majesty the Queen was graciously pleased to interest herself in the matter, and the result has been the cession of the land for the desired purpose—a result for which the people of Portsmouth will doubtless feel duly grateful.

LONDON ORPHAN ASYLUM COMPETITION.

THE Board of Managers have awarded the premiums for the several designs submitted for the new asylum at Watford in the following order, viz.:—First, Mr. Dawson; second, Mr. Robbins; third, Mr. Watson. The committee have gratefully acknowledged to each competitor the great talent and labour bestowed by the competing architects in their endeavours to meet the requirements of the charity.*

RYDE CHURCH COMPETITION.

THE exhibition of designs for this work having been kept open long enough for every one desirous to see and examine them, the committee, on Tuesday, the 12th inst., selected a design by Mr. Penchey, of Darlington, as the first in merit. The amount prescribed is 8,000l. The second in order bore the device "Trefoil;" the third, "Simplex;" the fourth, "Faith;" and the fifth, "Proportion." The new church will be 60 ft. wide and 115 ft. long, and 60 ft. high to the point of roof, to the plate 37 ft. The tower will rise to the height of 177 ft. The church will accommodate 914 adults and 200 children, allowing 20 in. for each sitting, and with benches 4 ft. apart. The chancel will be 20 ft. wide and 14 ft. from the transepts.

THE INSTITUTION OF CIVIL ENGINEERS.

THE first meeting of the session, held November 12th, Mr. John Fowler, president, in the chair, was occupied by the reading of a supplement to and the discussion upon the paper, "Experiments on the Removal of Organic and Inorganic Substances in Water," by Mr. Edward Byrne, which was read at the close of last session. The author now gave an account of experiments he had since made on the well-known filtering materials, magnetic carbide, and silicated carbon; and, after recording the results in a tabular form, he proceeded to make a comparison between those substances and animal charcoal.

His experiments were to the effect, that the action of the magnetic carbide was exceedingly feeble as regarded the removal of organic and inorganic impurities, and that it did not possess the property of softening the water except to a very small extent; whereas, this property was possessed in a high degree by the two other filtering materials. Silicated carbon, however, decidedly lost this power, and, after a short time, rendered the water positively harder than it was before filtration. Animal charcoal, in its filtering property, was not only more powerful than the silicated carbon, but more permanent in its action; and so far as the experiments went, continued to remove inorganic matter. After a short time, however, it commenced to give back a portion of the organic impurity which it had

previously removed. The silicated carbon, too, was found in an equally short time, to give back not only the organic, but also the inorganic matter which it had previously taken up.

The author expressed the opinion, that while filtration must ever be considered most valuable for the removal of matter in mechanical suspension, it was practically useless as a means of removing substances in solution. He argued that the deductions to be drawn from these experiments, though made on a small scale, would, by reason of the systematic manner in which they were conducted, be safely applicable to cases of far greater magnitude. He concluded by expressing a hope, that the result of these investigations would serve the purpose of pointing out the danger of depending too much on the system generally of filtration, as well as of exposing the inconsistency of bringing home foul water, to undergo a delusive method of purification; instead of adopting the proper and only satisfactory plan of procuring water which was itself naturally pure.

NEW HOSPITAL IN SUFFOLK.

THE foundation-stone of St. Leonard's Hospital was laid on Friday, November 15, by Major Parker, M.P.

The building is being erected on an eminence at the entrance to the borough of Sudbury, and will command a fine view down the valley of the Stour. It will afford accommodation for twenty patients.

The necessity of such a building has long been felt, as Sudbury is sixteen miles distant from any general hospital. The building is faced with red bricks, and the whole expenditure, including land, is not expected to exceed 1,100l., three-fourths of which have already been promised.

Mr. E. Salter is the architect. The hospital is named after a local charity from which an annual income of between 400. and 500. will be obtained.

FROM SCOTLAND.

Alloa.—The projected new Episcopal Church of St. John the Evangelist, alluded to in our impression of the 9th of November as having been designed by Mr. R. Anderson, of Edinburgh, architect, is to be built on a prominent site in the Broad-street, several houses having been pulled down to clear the site. The church consists of a nave, chancel, vestry on the north side of the chancel, and a tower and spire on the south side of the nave, the ground-floor of the tower forming a porch. Provision is also made for building at a future time a north aisle. The dimensions of the nave are 58 ft. long and 22 ft. 6 in. broad; the chancel 28 ft. long and 17 ft. broad. The tower and spire measure 108 ft. to the top of the stone-work. The style of architecture adopted is that of the Early Geometric Pointed. The nave is divided into four bays, each having a three-light traceried window and buttresses. The west gable has a large three-light window and a doorway. The chancel is separated from the nave by a moulded stone arch, and is lighted by side windows of two lights and an east window of five lights, with tracery in the head. The church will accommodate in the nave 165, exclusive of space for chairs; and the choir 30, exclusive of the clergy. The entire cost of the building is being defrayed by the Earl of Kellie. The contractors selected are—Messrs. Smith & Honeyman, masons; Mr. Keir, carpenter, Tillycully; Mr. Ferguson, slater; Alloa; Messrs. Melvin & Co., plumbers, Alloa; Mr. Lennie, plasterer, Kincairdine. The contract amount is 2,600l., exclusive of boundary walls, the cost of the site, and incidental expenses. It is expected that the walls, the ceilings, and floors will be decorated with paintings and inlays, and the windows with the best class of stained glass.

Jedburgh.—The heritors of the parish of Jedburgh have at present under consideration the propriety of building a new church. The present church occupies the west end of the nave of the abbey, and it is the wish, says the *Scotsman*, of the Marquis of Lothian, the proprietor, to have all the modern buildings removed so as to show the venerable ruin to the best advantage. Should this take place, Jedburgh Abbey will be among the finest ruins in Scotland. The whole nave, with its three rows of pillars, is

entire. The marquis has intimated through his factor that, should the heritors of the parish assess themselves for the sum of 3,000l. or 4,000l. towards the erection of a new church, he will find the like sum, besides bearing his proportion of the assessment. The subject has been referred to a committee, who have to report to a future meeting of heritors.

FRIENDLY SOCIETIES.

THE 10,678 friendly societies of England which have made returns of their accounts for 1866—societies with more than 1,672,166 members, and with funds amounting to 6,668,386l.—are very unequally distributed among the various English counties. The Lancashire returns show in that county no fewer than 985,914 members of friendly societies; the Yorkshire, 11,824; the Cheshire, 60,419. Thus these three counties, with only a fourth of the population of England, have more than half the total number of the members of the friendly societies making public returns. But if Lancashire is remarkable for the number of its friendly societies, it can make little boast of their wealth; the amount of their funds is returned at 673,153l.,—fewer pounds sterling than members. The Cheshire societies are able to report funds amounting to 171,697l., nearly 3l. per member; and the Yorkshire, 525,617l., a higher proportion per member. But in amount of funds the Middlesex is far above any other part of the kingdom; its returns represent friendly societies with no more indeed than 99,832 members, but with funds amounting to no less than 1,399,200l. 1-16th of the members of friendly societies have thus more than one-fifth of the funds. The metropolis is the home of the greatest of these associations. The London Friendly Institution, in Farringdon-street, has 24,539l. for its fund; the United Law Clerks, 35,720l.; the Hearts-of-Oak Benefit Society, in Greek-street, 41,380l.; the Royal Standard Benefit Society, in Great Ormond-street, 71,544l.; the medical department of the Army Friendly Society, 78,578l., and with only 194 members. These figures are unmatched elsewhere. There are more than 500 friendly societies in England (including Odd Fellows, Foresters, Order of Shepherds, &c.), acknowledging that the amount of their funds is less than 20l.

THE STAGE.

Theatre Royal, Covent Garden.—With an excellent orchestra, a large chorus and corps de ballet, and admirable scenic appliances, Mr. J. Russell has produced Offenbach's Operatic Extravaganza (*very extravaganza*), "The Grand Duchess of Gerolstein," the book being Englished and adapted by Mr. Charles Lamb Kenney, a practised hand at such work. The extraordinary popularity enjoyed by this opera in Paris owed something to the exceptional fitness of Madame Schneider for the chief part; but there is so much fun in the piece, and the music is so lovely and striking, that it will have a certain duration of life wherever it is produced. The part of the *Grand Duchess* is filled by a lady new to England, Miss Julia Mathews, who, although it would be absurd to say that she will fully satisfy those who heard the piece in Paris, both acts and sings the part with great vivacity and effect. Several of the principal pieces committed to her were encored. Mr. William Harrison as Fritz has a part that suits him particularly well, and Mr. Aynsley Cook, Mr. Stoyler, Mr. Frank Matthews, Mr. Fred Payne, and Miss Augusta Thomson contributed to what on the first night was generally felt to be a complete success.

The *Lyceum*.—This theatre has been opened, under the management of Mr. Ryder, partly, as it would seem, to introduce to the English public a German lady, Madlle. Vestvali, who is said to possess the remarkable capability of acting in the language of three countries besides her own,—French, Italian, and English. We must confess to having had almost enough of Shakspeare in broken English; but there is so much real earnestness and power shown by this lady in her presentation of the part of *Romeo*, in which she has just now appeared, especially in the latter and more difficult part of the play, that we are contented to overlook the occasional accent, and to invite playgoers to witness what is really a remarkable performance. Miss Milly Palmer has made a step in her pro-

* A review of the designs will be found p. 775, ante. The three selected competitors are the authors of the designs of which we indicated a preference.

fessu by her representation of Juliet. It is much more than an ordinary performance. Mr. Ryder gives great importance to the part of the Friar, and with Mr. Walter Lacy for Mercutio, and Mrs. Marston for the Nurse, it will be seen that the new *Romeo* is not without good support.

HOUSES FOR THE WORKING CLASSES.

Sir,—The article in the *Builder* on the manufacture of "Roughs," stating "the cost of crime to be enormous, in fact it cannot be counted," with the engravings illustrating some of your former notices on the state of the homes of the people, the latter showing the cause and the former the effect, ought to be printed in large type, and exposed to view in every public building, market-place, town-hall, and parish vestry in the kingdom.

We should then have a general inquiry, and a remedy would soon be recognised and adopted; for, in addition to the four millions the machinery for the punishment of crime costs, there are upwards of one million poor persons receiving parochial relief; and it cannot be denied, as so often repeated by you, that the overcrowding of human beings, without regard to age or sex, is the cause of a fearful number of the deaths, and the principal cause of the demoralisation and debasement of the population, the heavy taxation and increase of parochial burdens, the separation, general dissipation, and distrust of all classes.

One of the chief causes of the greatness of our country is the fact that we all feel interested in our national honour: we can send at the cost of millions sterling an Abyssinian expedition to release a few: we can issue special commissions to punish the murderers of our policemen, and every true man, whether English, Scotch, or Irish, feels personally interested in justice being executed; but if we read the Registrar-General's report for 1864 we shall see that our industrial armies are cut down by diseases which are generated by inadequate house accommodation, and the want of sanitary arrangement. And, again, in the same report for 1866, that between 8,000 and 9,000 deaths are registered arising from preventible diseases in the eastern districts of London only. I am at a loss to distinguish the difference to the victims between the malicious deaths and preventible deaths: in one case it may be a hanging matter, but in the other it would seem a matter of no concern, either to the State, the Government, or any large section, except the poorest of the people, whose chief crime is they cannot help themselves: hence they chiefly form the number of the dead registered under the heading *preventible*, and are the chief cause of the four millions sterling it costs for punishing crime and "the cost of crime itself, which cannot be counted."

The Premier and the Secretary of State have both informed me there are no funds at their disposal to assist the object I have in view to improve the homes of the wage-classes; and I only applied for a public inquiry into the remedy I propose, but, by your kindness, I may obtain the same, by your insertion of this letter, as it cannot be denied that the architectural profession, and the nearly-defunct building trade, are very much interested in finding out and promoting plans by which such a great blessing can be obtained as profitable employment both for capital and labour in reconstructing and building proper and sufficient house accommodation for the people.

In the first place, the guiding star in this national movement must be individual self-interest. The Government cannot advance, and it would not be proper to accept funds to benefit a class: to supply one want: all their other wants would, of course, have to be supplied from the same source, if the principle be once admitted.

The Board of Works have been so much engaged in public London that private London seems to have escaped their notice, only when it is wanted to supply funds.

The municipal and parochial institutions cannot move, if they were united, without dipping further into the tax-payer's pocket; and the parochial brokers are now the only tradesmen that are driving a successful trade, with the exception of a few butchers and bakers.

Philanthropy and the model dwellings, as at present proposed, are not at all applicable; for in the Paris International Exhibition, as referred to in Mr. Chadwick's Report, Class 93, although

the best plans and models were exhibited, they were all passed by for further improvements; besides which the building trade have not in a single instance followed any of the models either for investment or speculation.

The plans I propose, and of which I have sent you photographs, are for separate dwellings of one, two, three, or four rooms, or more, built and finished as first, second, and third-class, each having a separate front door, approached by public single or double staircases and bridges at the corners of the streets, or as often as may be required, and a public balcony or foot pavings alternately fixed to both fronts raised to the level of each floor to be under the same regulations, and used for all purposes as the foot-paving in the streets.

Each dwelling to have a scullery and separate sanitary appliances. No gas, dust, water, sewer, or other pipes of any description to be allowed inside the dwellings.

On the ground-floor or basement, and in between the basement or shops, are workshops, with or without steam power; baths and wash-houses, &c., &c., covered over with a flat concrete roof, and tarred paving for public promenades; or the same space can be used either for drying or play grounds, or shrubberies and gardens, the same as West-end squares.

The separation is complete, the poorest tenant can, by leasehold, capitalise his or her rent, as on the Mulhouse estate on the Upper Rhine. The weekly wage is not paid more regularly than the weekly rent. Capital is not required to give credit, and the best security is obtained by their production, and the two great sources next to unproductive expenditure will be diverted, viz., the drunkenness of the people and the national savings banks, to make small purchases of real property, which labour as a class is entirely prohibited from under present arrangements.

As this letter may tend to ventilate the subject, I shall be happy to reply or give any further information required.

JAMES MORTIMER, Builder.

THE TOWN OF LUTON, BEDFORDSHIRE.

Sir,—I regretfully endorse the statement of your correspondent of Saturday last, signed "Cambridge Man," that the staple trade of this town and neighbourhood is suffering great depression through the change of fashion in hometies, and should gladly welcome a return to the straw head-covering of early days; but in his zeal for our cause he has erred in his statement of the call for rates, which I think calculated to do an injury to owners of property, and shall feel obliged if you will correct the error in your next Journal.

As a member of the Local Board of Health and ex-chairman of the Board of Guardians, I can guarantee the enclosed schedule as a correct statement of the whole of the calls made upon property here, exclusive of the land, property, and assessed taxes collected by the Government.

E. O. WILLIAMS.

The schedule shows for Luton parish an average of 2s. 2½d. per year, for five years, as assessed to the poor rate for relief of the poor, county and town police, lunacy, valuations, and all other charges customary thereon.

For Luton township it shows an average of 2s. 6d. in the 17. per annum, for five years, for purposes of the Local Government and Board of Health Acts, inclusive of interest and repayment of borrowed money for lighting the town, and for highways, pavements, and sewerage.

ARCHITECTURAL EDUCATION.

Sir,—In the opening address at the *conversations* of the Architectural Association, observations were rightly made as to the course that ought to be adopted in this country in regard to the study of architecture, in order that it might be enabled to compete with such countries as Germany and France.

There can be but little doubt that the system of education in this country (or, rather, no system whatever) has been, and still is, very defective for those who are brought up as architects.

The very commencement of the study of the art for young students is quite erroneous. The youth, in the first place, enters an architect's office too often without the slightest knowledge of drawing, or what is at all required. The principal is either too much engaged in his own pursuits, or unable to lay down a system for the study of his pupils. This at once shows the necessity of some course being taken for the advancement of the art. For this purpose, it appears very desirable that schools should be established for its study, that no youth should enter an architect's office before he is well grounded in the rudiments of the profession,

either in drawing or surveying, and studying the best architectural works, either from taste, theory, or practical knowledge, of which, at the present day, there is no lack, when one reflects on the respect work about forty or fifty years since in this respect, when the Ware's or Chambers's works were the only ones in use.

A student, when he has studied in schools and made himself rather proficient, should then undergo a certain examination to qualify himself for the architect's office: he would then be enabled to judge of what he might require in following his profession. It would prove of great advantage to any student if he were to take up a particular design, either in Grecian, Roman, or Gothic architecture, and carry it regularly through, commencing with the foundations, the whole general construction, the finishings, decorations, &c. After this to form a correct specification of the works; and after this an estimate of the whole, with the working drawings, &c. By adopting this course he would at once obtain a knowledge of what is required in the profession; and this system might be adopted before he enters an architect's office for any not a longer period than three years, as he would ere this have obtained much theoretical knowledge of his art.

A SUBSCRIBER.

NEW LEWIS COURT'S COMPETITION.

Sir,—This affair seems to lie at sea, and in imminent danger of foundering. And why? Surely not because there are certain crabs about it, and, as it is going down, even though "The Thunderer" and "The Heavy-pounding Quarterly" should be numbered amongst them. This is not the first competition in which the unsuccessful competitors and their friends have been dissatisfied, nor is it the first time that we have heard would-be competitors and unsuccessful ones demonstrate, each to his own entire satisfaction and to the great amusement of the better design would have been obtained" had his been chosen. In this particular instance we have had, in fact, little more than the usual discontent. All that has been wanted, from that astonishing attempt to transform the matter out into a political question to the efforts of would-be competitors to attract a little notoriety to themselves, may be properly assigned to the waste-paper-basket; and it certainly will arrive at that destination, and remain there, if the judges of the designs will give expression to their opinion in a firm and decided manner, as men who have honourably discharged the trust imposed upon them and who have made up their minds. There is a report, which I, for one, believe to be unfounded, that they have not made up their minds, and this is the real cause of the supposition, that the affair is at sea and in danger of foundering. It is this which gives courage to the malcontents. They hope for everything from intercession in the powers that be, which infers fear of responsibility,—the *l'été noir* of English officialdom. Let the judges resist the devil, and he will flee from MALLET.

CHARGES OF ARCHITECTS AND ENGINEERS.

WILL you allow me space in your valuable paper to touch upon a subject connected with the architectural and engineering professions, which I, with many others, consider requires discussion, viz., the scale of charges which are generally adopted by these professions.

As this is a subject that concerns the public as well as those who gain a livelihood by these occupations, I think it right to start it in a public paper. Some of our architect friends have said that "we are a much enduring race." I have always accepted this as an axiom since my *entrée* to the study of architecture. I think it will be granted that the professions in question require long study and stern application to become proficient in; in fact, our work is never done; we scarcely know what recreation means, except as connected with study; and yet what is our reward? While the builder, and others connected with building, are allowed a minimum of 16 per cent. profit on the outlay expended, the architect gets a miserable pittance of 5 per cent. as a maximum for the conception and supervision of the whole of the works. I ask, is this equitable?

Very few knowing anything of these professions will follow them as a pursuit owing to this proverbial *low pay*. It is almost impossible for any but a few of the more fortunate to keep up a proper position in society, and it is well known that the clerks, the majority of whom are gentlemen with good educations, and who have served their apprenticeship to learn these professions at great expense, are paid less than artisans' wages. In fact, the remuneration is quite inadequate to the times; for while the value set upon labour in every other profession and trade has been increasing, in these professions it has been stationary, and at the same time all the necessities of life have increased in value.

A great deal has been said of late of the state of art of the nineteenth century. I think it impossible that, at present, architects and engineers can be expected to do full justice to their clients, as, to live, they must take upon themselves more work than they have time to devote personally to the execution thereof, or can afford to employ fully competent persons to assist them in carrying out. I am sure nothing but a deep devotion to their professions would induce architects and engineers to put the attention they ungenerously do, to the utmost of their power, for the furtherance of art; and I have no doubt, if they had more means at their disposal, it would add to the public satisfaction, and for the reasons stated, conduce to the improvement of our national architecture.

I trust the Institute of Architects will give this subject their consideration, and that others will express their opinions in the matter.

ZETA.

ACTION TO RECOVER ARCHITECT'S DRAWINGS.

MURRAY V. GILES.—LANGHAM HOTEL.

THIS was an action in the Queen's Bench. Mr. Justice Peck, brought by the plaintiff, Murray, of Portman-street, against Mr. S. Craven-street, Strand, for the detention of certain plans, fifty-three in number, designed for the construction of the Langham Hotel, Strand.

It appeared in evidence that Mr. Giles was a successful candidate in a competition for the appointment of architect to the Langham Hotel Company, and was appointed accordingly in October, 1862; but the designs of Mr. Murray, who was the interior of the proposed building being liked, at a subsequent meeting of the directors, they arranged for the two to act as joint architects. The agreement appears to have been that Mr. Giles should receive commission on the first 75,000*l.* expended on the building, and Mr. Murray on the second 75,000*l.*, the commission on anything over 150,000*l.* to be divided into equal shares. The building in all cost 200,000*l.* After the completion of the building, all the plans, with but few exceptions, were returned to Mr. Giles, and Mr. Murray at once claimed those which he had drawn in his own office, or those which had been done at the direction or his expense, out of his office, by persons in his employ. This request Mr. Giles refused to accede to, but offered Mr. Murray to do so to deliver up the whole of the plans to the Company, or to refer the case to arbitration. His offers were refused, and the action was brought to recover these plans.

Mr. Hannay and Mr. Conolly (P. Mr. Williams) were counsel for the plaintiff, and Mr. George Wyke for the defendant.

The judge throughout the case suggested that this was a matter for arbitration by some member of the architectural profession, but this the plaintiff declined; his lordship at the same time remarking, that he was quite willing to proceed with the hearing, as it was "a very interesting case," and it appeared to be "a dispute about nothing," both plaintiff and defendant having confessed that the plans "were not his."

Mr. Murray, Mr. Johns, a director of the Langham Hotel Company, the clerk of the works, and the foreman of Messrs. Lucas, the contractors, were called as witnesses for the plaintiff, to prove that the plans were those of the plaintiff, and that they were carried out under his direction. The examination of these witnesses took the whole of one day. Mr. George Wyke made a speech on behalf of the defendant, in the case, and the profession of architecture generally.

At the following day Mr. Giles and a director of the Langham Hotel Company were called as witnesses for the defendant to prove that there was a partnership between the plaintiff and defendant, and that the plans were the property of the partners till that partnership had been dissolved, and some arrangement had been come to to return them as to the division. Counsel intended to produce as witnesses two architects to whom the custom in the case (?). As, however, whose case turned on whether there was a partnership between plaintiff and defendant, their services were not required.

The counsel for the plaintiff endeavoured to prove that Mr. Giles and Mr. Murray were joint architects; whilst the counsel for the defendant said they were not only joint architects, but partners in the work.

After the several speeches of counsel, and the summing up of the judge, the jury, having deliberated some time, gave a verdict for the plaintiff, so far only as regards twelve drawings of the fifty-two claimed, and no damages. A sum of 50*l.* was asked for.

It seems desirable that on appointment of joint architects an agreement should be made, specifying to whom the drawings are to belong at the termination of the work.

CHURCH-BUILDING NEWS.

East Bergholt.—For some years past the parish church of East Bergholt has been undergoing gradual restoration and improvement. The last of the series (consisting chiefly of substituting open benches in the nave and aisles for high pews) having just been finished, the edifice has been re-opened for divine service, by the Bishop of Norwich. The church, which is dedicated to St. Mary, was built in the sixteenth century, and the style is Perpendicular. The cost of the restorations has been defrayed by subscriptions amongst the parishioners, and the east window, which has five lights, has been filled with stained glass, the upper part by the late Mr. Charles Douglas Halford, in memory of his wife, who died in the year 1860, and the lower by the son of that gentleman, in memory of his father. The five lights of the window are devoted to the depicting of five of the principal events in the history of our Lord, his birth, baptism, crucifixion, Mary Magdalen at the sepulchre, and Jesus showing his hands and his side to Thomas. The new benches, so as to conform with those already finished. The columns of the nave have been cleaned of the paint, with which they were formerly disfigured, and the interior of the church altogether improved.

Scarborough.—The corner-stone of a new church has been laid at Falsgrave, dedicated to All Saints. Of 6,000*l.* required for the work, above 4,000*l.* have been promised. The building was commenced a few weeks ago.

West Bromwich.—Christ Church, Oldbury, has been re-opened after undergoing renovation and improvement, at a cost of about 1,000*l.* The organ has been removed to the east end of the church, by means of which a hundred more free sittings have been added in the west gallery. The chancel has been lengthened, stalls provided therein for the choristers, and a new pulpit has replaced the old one. New and ornamental gas-fittings and a warming apparatus have been furnished, and the whole interior has been repainted and the ceilings and walls simply decorated. The whole of the work has been carried out under the supervision of Mr. G. Holmes, architect, by the following contractors, viz.; Mr. Bonser, of Oldbury, for the builders' work; Mr. A. Gee, of Stafford, for the painting and decorating; Mr. Averil, of Oldbury, and Messrs. C. Smith & Son, of Birmingham, for the gas standards and ornamental ironwork; and Messrs. Haden & Son, Trowbridge, for the warming.

East Moulsey.—The chief stones of the new tower to the parish church has been laid. Mr. Talbot Bury is the architect. The men employed in the erection of the tower were provided on the occasion with a dinner at the Bell Inn.

Polesworth.—The foundation-stone of a new church, to be erected at Dordon, has been laid. The erection is undertaken by Messrs. Clarkson, of Tamworth, from a design by Mr. G. E. Street, and will be capable of holding 149 people. It is dedicated to St. Leonard.

Scottisham.—The parish church has been re-opened. In addition to repairing and restoring the old fabric, a new and supplementary north aisle has been built, the old pews have been replaced by benches, the old chancel-roof restored, and a new open roof added to the nave. The whole has been repaved,—the chancel with Staffordshire tiles, red and black, and the altar-space with Minton's tiles, in three colours. The alterations have been carried out under the superintendence of Mr. Hakewill, architect, the contractor being Mr. H. Luff, Ipswich, and the mason Mr. Frewer, of the same town.

Hereford.—During the past month Messrs. Bennett & Brown have been engaged in placing stoves in the cathedral, for the purpose of warming it. The stoves employed are those invented by Sir Goldsworthy Gurney, on the radiating principle, and are similar to those employed for warming the Houses of Parliament, St. Paul's Cathedral, York Minster, and other large public buildings.

Brecon.—Cantref Church, which is situated about three miles from this town, has been re-opened for public worship. The church and tower were in a very dilapidated state. The plans and specifications of the restorations were prepared by Mr. C. Buckeridge, of Oxford, and the contractors were Messrs. Williams & Sons, of this town. There are restored five two-light windows in the nave, four single windows in the chancel, one three-light large window, surmounted by tracery, at the east end of the

chancel, plinth introduced around the nave and chancel, and an entirely new porch with plinth around. The coatings of whitewash on the outside of the nave and chancel have been removed, and the joints of the masonry raked out and pointed in uncoloured mortar. Coping is fixed upon the gables of chancel and porch with borders of apex stones, each surmounted with a cross, and a new intress has been erected on each side of the church. The joints of the masonry of the west end of the tower have been raked out and pointed in Portland cement, and so many of the tower windows as were previously blocked up have been opened, and the stone-dressings renewed where defective. The oak work of the roof of the tower has also been restored, and the whole of the roofs covered with native stone-tile, with an ornamental ridge-crest of two patterns of red clay, supplied by Mr. Cooper, of Maidenhead. The roof of the chancel and nave is new. The timber in the roof is exposed to view, and is not stained or varnished. The rafters in the chancel are all curved or ribbed. The interior walls have been stuccoed, and the inner sills and arches of the windows chamfered. The floors of the chancel, the aisle, and the porch are laid with Godwin's encaustic black and red 4-in. tiles, those in the chancel being figured, glazed, and glazed. The floor of the tower is laid with ancient memorial stones and slabs. The seats in the nave are of deal, stained and varnished.

Hayton.—The new church of St. James, in the village of Hayton, near Aspatria, has been consecrated by the Bishop of Carlisle. The total cost of the erection has been 1,800*l.* The church accommodates between 200 and 300 persons. It stands at the upper end of the village, and is built of red freestone, from the design of Mr. Travers, of Manchester, architect. The exterior view is at present somewhat spoiled by a low unsightly-looking schoolroom, which stands directly in front of the church. The interior of the church consists simply of a chancel and a nave. The pews are open.

Scraptoft (Leicestershire).—The parish church has been re-opened after restoration. The edifice consists of a chancel and nave, with aisles, and a tower at the west end. The restoration has included the whole of the roofs, with new chancel window, and two new west windows, north doorway, and north aisle windows, dry area round the outside where the soil had accumulated, and a general cleaning and pointing of the stonework. The old square high pews have been removed, and new open sittings substituted, in which the old oak has been re-worked with new framing, and a new floor of Whetstone's encaustic tiles has been laid. The two west windows are filled with stained glass, memorials of the late Mr. Sheldon Cradock, of Leicester, his wife, and son. These windows are by Mr. F. Freedy, of London. The chancel has been restored solely at the cost of Mr. E. B. Hartopp, who was also a large contributor to the general funds. Mr. W. Jackson, of Leicester, was the architect, and Mr. John Firm and Messrs. Sharp & Son, the contractors employed.

Ambeth.—It is proposed to refit and rearrange the interior of the church here, which is a modern building of no architectural pretensions, and is in a state requiring considerable repairs. The principal features of the rearrangement are, dividing the ground-plan by a series of arches and columns in Bath stone (which at present is under one roof) into three compartments; the central compartment comprising the nave, the chancel, and entrance under tower; the northern comprising aisles to the nave and chancel, extended westwardly by throwing in a portion now occupied as a lumber-room below and a gallery above. The southern compartment is similarly treated. Messrs. Kennedy & O'Donoghue, of London and Bangor, are the architects employed.

Rhos-celyn.—It is proposed entirely to restore the parish church, increasing the accommodation by adding a chancel. Messrs. Kennedy & O'Donoghue have prepared the plans.

Llechymferry.—The present church here having become very dilapidated, the rector has determined to rebuild it, with the exception of portions of the south and west walls, which are still sound. Increased accommodation will be secured by extending the area of the church northwardly and eastwardly. The contract has been taken up from plans prepared by Messrs. Kennedy & O'Donoghue.

Bodeyedd.—The small and interesting parish church requiring extensive repair and rearrangement, the incumbent has determined to

LATE MR. CHAS. FOWLER'S DESIGN FOR LONDON BRIDGE.—It is regretted that no plan of this design, which was premiated, can be discovered amongst the architect's papers. The design itself is amongst the records of a committee by whom the competition was judged. The City architect, Mr. H. Jones, is believed, would probably be able to discover its whereabouts.

raise funds for the purpose; which, from the circumstances of the parish, will prove a difficult task. The plans have been furnished by Messrs. Kennedy & O'Donoghue.

Ross.—It is intended to restore the parish church at Linton, near this town, which has become sadly dilapidated. Plans are being prepared by Mr. Street, and upwards of 1,000*l.* have been promised towards the object.

Kirby Lonsdale.—Lord Kenlis, son of the Earl of Bective, has undertaken to defray the entire cost of restoring the parish church. It is estimated that the work will cost more than 6,000*l.* The gentry of Westmoreland intend placing a memorial window on the south-east side of the church in acknowledgment of Lord Kenlis's gift.

SCHOOL-BUILDING NEWS.

Chelmsford.—The memorial stone of the Chelmsford Independent Sunday Schools, in course of erection at the corner opposite the Cloisters, New London-road, has been laid. The new building will be from designs by Mr. C. Pertwee, architect, Chelmsford, the builder being Mr. Gozzett, of Woodham Walter, whose tender of 1,910*l.* 10*s.* was the lowest sent in. The buildings will comprise a schoolroom, 70 ft. by 30 ft., capable of accommodating 400 children on the ground-floor, and 100 in the gallery at the end. Opening out of this room are five class-rooms for boys, each affording space for twelve to fifteen scholars; also a senior class-room for about twenty persons. At the end of the schoolroom are two class-rooms for girls, and an infant schoolroom, 22 ft. by 14 ft., for 100 children; also a kitchen or heating-apparatus room, and other conveniences. A stone staircase at the end of the schoolroom near the girls' entrance, will lead to four girls' class-rooms upstairs, accommodating from twelve to fifteen in each room; all these rooms open direct into the gallery. The large room will be 21 ft. high to plate, and about 28 ft. in centre, and will have a semi-open roof, with arched trusses, the timbers being stained and varnished. All the rooms will be lined round 4 ft. in height with dado boarding, and will be fitted up with seats, benches, and hat rails. Light and ventilation are provided throughout, and the whole will be heated with warm air by Mr. Allaway, of Manchester, engineer. The class-rooms will be lighted with starlight burners, and the large schoolroom by three corona gas-lights. The buildings will be of white brick, relieved with yellow bands and arches, the window and door openings having circular heads, the general character of the architecture being Romanesque. The works are being executed by Mr. Henry Gozzett, builder, Woodham Walter. The cost, including site and other expenses, is estimated at 2,300*l.*

Cambridge.—The new building of the Jeslane Sunday School has been opened. The cost of the building, which is situated in Paradise-street, has been about 2,300*l.* It includes one large school-room and a number of smaller class-rooms. The design was by Mr. W. M. Fawcett.

Burslem.—The new National Schools at Sneyd have been opened. The plan of the schools is in the form of the letter L reversed. That for the boys is 60 ft. long by 20 ft. wide, and for the girls 50 ft. long by 20 ft. wide. There are class-rooms attached to each. The schools will accommodate 400 children, and are divided by large sliding doors, which, when opened, make one large room for lectures or other purposes. The building is of a plain Gothic character, and is constructed of brick,—red pressed ones—blue brick for bands, &c., being used for the exterior, and white pressed ones for the interior walls. The roofs are covered with blue and red tiles laid ornamentally, and surmounted with a bell turret and spire. The roof timbers and other woodwork are all wrought and stained and varnished. The yards and play-grounds are enclosed by walls, and the front of the schools facing Nile-street by iron palisading. The total cost of the building, including fittings, &c., will be about 1,500*l.* The builders are Messrs. Bennett & Brindley, of Burslem; and Mr. Dain, of Burslem, was the architect.

Dedham.—The new grammar schoolroom here has been opened by the Bishop of Rochester. It has been erected by the present head-master, the Rev. G. T. Lermitt. The room is 60 ft. long by 30 ft. wide. The walls are 18 ft. high; and the roof, which is open and lined with deals stained and varnished, is 14 ft. high, giving a height

internally of 32 ft. in all. It is lighted by four windows on the north side, a triple window at the east end and two single ones at the west, besides two large skylights in the roof facing south, one fitted with ribbed plate-glass calculated to admit the light, but not the glare and heat of the summer's sun. The walls are 18 in. thick, of red brick and concrete, the splay course, piers, coirns, and arches of windows, and the cornice being of white bricks. The roof, which, for its breadth, might have been pitched higher, is light and simple in its construction, covered with slates, but having between them and the deal lining a layer of Crosgon's roofing felt, for tempering the cold of winter and the extreme heat of summer. The bell tower at one end contains a bell by Messrs. Warner, of London. There are two small class-rooms attached to the building, and the whole has been built from designs made by the head-master, aided by the practical experience of Mr. Downes, of Stonlands, Dedham, a friend of the school. The cost of the new building is nearly 1,000*l.*, and it will afford accommodation for 100 scholars.

Ringstead.—A new school has been opened, at Ringstead, by the bishop of the diocese. The school is a Gothic building, in keeping with the church, from which it is separated only by the churchyard. It consists of a large school-room, and a class-room adjoining, the other portion of the building forming a residence for the master and mistress. The material is the local stone, rough dressed, with freestone coirns. The building is tiled, the roof being of timber, stained and varnished. The internal walls are composed of concrete, covered with plaster. The architects were Messrs. Sudmore & Baker, of Great St. Helen's; Messrs. Cosford & Co., of Northampton, being the builders.

DISSENTING CHURCH-BUILDING NEWS.

Lewes.—The opening service in connexion with the new Wesleyan Chapel, now rapidly approaching completion in Station-street, Lewes, has been celebrated. The total cost of the chapel, lighting, and fence, has been about 1,400*l.* The architects are Messrs. Pocock, Corfe, & Parker, of London; and Messrs. Ranger & Wagborne, of Lewes, are the builders. The chapel stands back a few feet from the level of the line of houses, and before it is a fence of brickwork with stone caps, iron palisades, and oaken gates. The edifice is about 37 ft. wide, and upwards of 40 ft. high. The masonry is of red brick, with black handing courses, and dressings of Bath stone. The principal feature is a window of stonework, 20 ft. high and 12 ft. wide, divided into four compartments, with a head of ornamental plate tracery, and carved corbels, representing birds, flowers, and fruits. On each side of the window are light columns, the shafts of which consist of red Mansfield stone, and the capitals of carved Bath stone. Beneath the chief window are four small windows of single light to lighten the space under the gallery. The north and south sides are divided into six bays, supported by massive buttresses, and this part of the interior is illuminated by eight windows of two lights each. The interior dimensions are 63 ft. by 34 ft., the height of the walls, 18 ft., and to the top of the roof, about 20 ft. more. The ground floor of the chapel will accommodate about 400, and the gallery at the west end about 125; the whole of the seats are open, and of stained and varnished timber. It is intended, as soon as funds permit, to rebuild a portion of the old chapel, which adjoins the new building, and to fit it up as schools.

Eastwood.—The foundation-stone of a new Congregational Chapel has been laid at Eastwood. The edifice is constructed to hold 600 persons, inclusive of the galleries. The architects are Messrs. Bidlake & Tait; and Messrs. I. & H. Herbert are the contractors, for the sum of 1,823*l.*

Ilford (Essex).—The memorial stone of a chapel and schools for the congregation of the United Methodist Free Church has been laid by Mr. George Axton, of Shepherd's Bush. The building is a brick structure, containing chapel on ground-floor, with seating for nearly 800 adults, and schools in basement. The works are being executed from the designs of Mr. M. A. Manning, architect, by Messrs. Hill & Keddell, of White-chapel-road.

Chard.—The foundation-stone of a new Congregational Chapel has been laid here. The edifice will be in the Early English style, and

built of native stone and flint, with Bradford stone dressings. The roofs will be covered with slates, the timbers inside being open, stained, and varnished, and supported with light iron shafts resting on gallery columns. There will be a tower at the north-west angle of the building, with stone spire, supported by eight circular columns, with carved caps and molded bands and bases. The entrances to the galleries will be on each side, and the principal entrance to the ground-floor in the centre of the west elevation, through a porch and vestibule. The organ chamber will be at the back over the vestry, with arches opening into the chapel. All the seats will be open and of deal, stained and varnished. Mr. W. J. Stent, of Warmister, is the architect, and Mr. Hawker, of Chard, the contractor.

STAINED GLASS.

Rhosymedre Church, near Ruabon.—A large five-light window, in the Early English style, is about to be placed in Rhosymedre Church. The subject is the Ascension. It runs through the whole of the five openings, the figures being nearly life-size. In the lower part of the window are the Disciples looking upward to our Saviour, who is ascending to heaven, surrounded with angels. Above and below the subject is mosaic work, forming canopies and bases. The tracery of the window is filled with shields. The inscription states that "This window was erected, by subscription, in memory of the late Sir W. W. Wynn, bart., Wynnstay, who built and endowed this church." The glass is the work of Messrs. Done & Davies, of Carlisle.

The Collegiate Church, Wolverhampton.—A stained-glass window has lately been placed in the chancel of this church, in memory of the late Mr. Nesbitt. The motive or idea of the window bears reference to the calling of a physician. The design illustrates, in six groups, the scripture from the Gospel of St. Matthew, chap. ii. verse 28,—"Come unto me, all ye that labour and are heavy laden, and I will give you rest." The three upper groups, as subject, are intended to suggest "The Physician of Souls." In the centre is our Lord (our Hope), seated, with, at his feet, angels in adoration, who bear a scroll with the words "Come, ye blessed of my Father." On the right and left sides respectively the chief figures are St. Paul (Faith), and St. Stephen (Love), and with these are grouped figures representing sufferers, as the fatherless, the widow, the prisoner, &c. The three lower groups represent "The Physician of the Body." The centre subject is our Lord healing the lame man at the Pool of Bethesda,—on one side His healing Peter's wife's mother, and on the other His healing of a paralytic. All the subjects are enshrined within canopies of a pearly tone of colour, and in the tracery-openings, which are numerous, the emblems of Faith, Hope, and Charity,—the cross, anchor, and burning heart,—form the principal portion of the design. The groundwork is entirely of arabes, with varied tones of colour. Messrs. A. & W. H. O'Connor, of London, were the artists.

St. Peter's, Newcastle-on-Tyne.—A memorial window has been placed in this church. The window, which is on the north side of the nave, is of three lights with tracery, and is designed with special reference to the doctrine of the "Incarcation." In the first compartment is the Annunciation to the Virgin; in the centre is the Nativity of our Lord, and the subject is carried into the tracery by angels in the act of adoration and praise; the third compartment is filled by the representation of the Adoration of the Magi. The design has been divided by a text, and the lower portion of the window portrays acts of affection, viz.—St. John leading the Virgin to his own home from Calvary; our Lord as the Good Shepherd; and Ruth refusing to leave Naomi. The window is the work of Mr. Bagley, of Newcastle. The church now contains thirteen or fourteen stained-glass windows.

St. John's, Percy Main.—A stained-glass window has been erected in this church, as a thank-offering, by the father of the incumbent. The principal subject is our Lord giving Sight to the Blind. The other part is filled with angels and Early English foliage. The window has been executed by Mr. Bagley, of Newcastle.

Ulverstone Church.—A window has been put up in the parish church, Ulverstone, at the cost of the inhabitants of the town, as a mark of respect to the ancient family of the Braddylle, of Conishead Priory. The window is Perpendicular in style,

and composed of seven lights divided by a transom. These divisions are filled with different illustrations of the life of our Saviour, and are enclosed within canopies. The tracery is filled with sacred emblems and foliated ornament, and at the base of the window a space is filled with the Braddyl achievement, a shield of numerous quarterings. An illuminated brass at the foot of the window is inscribed with a record of the purpose for which it has been erected. This work is from the establishment of Messrs. R. B. Edmondson & Son, of Manchester.

Traverse Church.—The west gable of this church contains four windows and a quatrefoil, which have been filled with stained glass in memory of the wife of the Rev. Mr. Page, the minister of the church. The style is Early English, and the subjects contained in the four windows respectively are the Transfiguration, the Ascension, Christ teaching Humility, and Christ Blessing little Children. The subjects are framed by canopies and borders, and the quatrefoil contains the descending Dove. A memorial inscription is placed across the base of the four windows. Messrs. R. B. Edmondson & Son, of Manchester, were the artists.

Stoke Prior Church.—A new stained glass window has been erected in this church by Messrs. Clayton & Bell. The subjects are the Raising of Lazarus and the Healing of Jairus's Daughter. The window is given in memory of the late Mr. Watling, a medical man, and of other members of his family. It makes the fifth stained-glass window lately erected in this village church.

PATENTS CONNECTED WITH BUILDING.

MEANS OF CONVEYING SOUND FROM PREACHERS OR LECTURERS TO THE CONGREGATION OR AUDIENCE.—*F. C. Reim.* Dated 22nd January, 1867. The patentee makes a pulpit or tribune with an inner and outer casing, thus obtaining an intermediate space forming a conduit, through which the voice travels down to the pillar of the pulpit, &c., and may be led through fixed or flexible tubes to various parts of the churches, &c. Branch tubes with ear-cups may be provided for persons whose hearing is not good.

GLAZED STRUCTURES FOR HORTICULTURAL AND OTHER PURPOSES.—*H. Rickardson.* Dated 2nd February, 1867.—The patentee constructs such buildings or structures of glazed or other frames, or equivalent members, so placed and fitted together that an open space or open spaces shall be left between such frames or members, in order that, by means of such open space or spaces, ventilators for the interior of such buildings can or may be obtained by providing such space or spaces with one or more glazed or other movable frames or members capable of being raised or lowered, as may be desirable, for the purpose of creating ventilation openings that can be closed or partly closed, as may be requisite, such movable frames when closed resting upon, against, or near the frames or sides of the open space or spaces, and, when open, being raised above these sides at the distance of a few inches, or other convenient extent, which distance may be regulated so as to be more or less, according to the amount of ventilation from time to time required, an open space being thus left for the admission or escape of air on every side of such movable frame or member, and at the same time a protection is formed against rain, wind, or a direct or downward current of air into the building or structure.

The upper ends of two or more arms of iron or other material (such arms being of corresponding length one with the other) are fixed at a distance apart at or near one outer edge, and the same number of such arms at or near the other edge of the movable frame or frames, member or members, the lower ends of such arms being fixed to the sides of the first-named open space, at a suitable distance below the level of their upper ends, all such arms being parallel with each other, and the fixing of their upper and lower ends being in all cases with a movable joint. The position of these arms is in an oblique direction with the movable frame or member when closed, their shape being straight or otherwise, as desired, the said frame being opened for the purpose of ventilation by turning the arms in an upward direction upon the joints or axes at their lower ends, this being effected by one or more of the arms being extended below the joint at the lower end as a lever and handle, or by being fixed upon a rod or shaft in place of

the joint or joints before described, such rod or shaft being made to turn as an axis, and extended, if required, so as to open and close a number of movable rectangular frames simultaneously by handle, lever, or other arrangement for turning such rod or shaft.

Books Received.

MESSRS. ROUTLEDGE appear to have taken under their special care the Boys of Great Britain, and a very important part of the population they are,—the future governors, teachers, inventors, amusers, head-winners of the State. A new edition of "Every Boy's Book" by Archie Blake, by Mrs. Eiloart; "The Boys of Beechwood" by the same author, an amusing story, inculcating the old saying, "honesty is the best policy" (both stories illustrated with wood engravings); and "The Boys' own Pocket-book for the Year 1868," are amongst the works most recently published by them. The pocket-book is just the thing for a school-boy, and includes some notes on the games that boys most love. As to "Every Boy's Book," it is a perfect cyclopaedia, containing 788 pages and some hundreds of illustrations. A dozen years have passed since the first edition was issued, and things have so much changed since then that Mr. Edmund Routledge, who has edited the present edition, found it necessary to remodel the whole, calling in a number of well-known writers to aid in the work. It may be viewed as almost a new book. We may safely say it will be found by boys a never-failing source of amusement and instruction.—"The Purgatory of Peter the Cruel," by James Greenwood, illustrated by Ernest Griset, and issued by some other publishers, has for its object "to check thoughtless cruelty towards creatures that are dumb and helpless." Peter tumbles from the mast-head when endeavouring to maim a cockroach, and while insensibly undergoes the life of a beetle, a blue-hottle, a snail, an ant, and a newt, and brings home to the young mind the several capabilities of these creatures for suffering. It is amusingly written, and the illustrations by Ernest Griset, thirty-six in number, are humorous and spirited.—"Our Four-footed Friends," by Mary Howitt (Partridge & Co.), is a very charming book indeed; nicely written, capably printed, and profusely illustrated by Mr. Harrison Weir, who has the whole animal creation at his fingers' end. In a dedication to H.R.H. the Princess of Wales, Mrs. Howitt says,—

"Lady, a nation loves thy little ones;
And in that love would ask of thee a boon
That shall be heed'd to them—
Teach them to love
All things that God has made."

And this is the object the author has had in view throughout her book.—Mr. Warne has published another series of cheap-illustrated texts on cardboard, most of them very well executed.—"A Key to one of the main Difficulties of English Orthography," by Henry Beadnell, Corrector of the Press. London: Sold by the Author at 75, Great Queen-street, Lincoln's-inn-Fields. Mr. Beadnell is the author of an excellent standard "Guide to Typography, literary and practical," which has been already noticed in the *Builder*. The present little sixpenny publication is an alphabetical compilation of nearly 3,000 words resembling each other in sound but differing in sense, spelling, or accentuation. In copiousness, lucidity of arrangement, and consequent facility of reference, it is superior to anything of the kind heretofore published, and cannot but greatly aid the student of English orthography, in relieving him from perplexity and annoyance as to the correct spelling of similar sounding but yet different words. To foreigners learning the language it must be invaluable.—"Thames Valley Outfall and Inter-ception of the Kingston District Drainage." Plan proposed by J. W. Crover, C.E., and E. Wragge, C.E. London: Longmans & Co. The authors of this pamphlet propose schemes for preserving twenty-three miles in length of the Thames from pollution on both sides by means of intercepting sewers, with river-crossing syphons, pumping stations, &c., between Chiswick and Chertsey, including all such places between the two as Barnes, Mortlake, Kew, Brentford, Isleworth, Richmond, Kingston, Hampton, &c. There are two plans, one extending from Chertsey to Richmond, and the other from Richmond to Chiswick. Sewage irrigation farms are proposed near Perivale for the lower portion of the

scheme, and near Bedford for the upper, with pumping stations for each. The estimated cost of the scheme between Chertsey and Richmond is put at nearly 130,000*l.*; and the other nearly 80,000*l.*—"The British Workman," 1867, and "The Band of Hope Review," 1867 (9, Paternoster-row), still remain distinguished by the admirable wood engravings they contain, as well as by the good advice they offer. The numbers of the year, put together in a cover, give, in one case for 18*d.* and in the other for 1*s.*, an illustrated volume of sound and amusing teaching of much greater intrinsic value. Not long ago the coloured cover of the *British Workman*, "The Protest of the Birds," drawn by Harrison Weir, would have cost the whole money. "The Children's Friend," vol. vii., and "The Infant's Magazine," vol. ii., from the same publishing office, explain their purpose by their titles, and are equally recommendable.

Miscellanea.

HOUSE PAINTERS' AND DECORATORS' IMPROVEMENT ASSOCIATION.—A lecture was delivered before this society, on the 19th inst., by Mr. J. G. Crace, "On Colour as applied to Decoration." We will return to it.

THE COLOSSEUM, REGENT'S PARK.—Something is said about converting this building into a club for young men engaged in professional and commercial pursuits, and a large gymnasium. The scheme is at present, however, only in embryo.

PROPOSED NEW CHURCH IN WINDSOR, LIVERPOOL.—A committee has been organized to collect subscriptions in behalf of a fund now being raised for the erection of a new church, to be called St. Nathaniel's, in Windsor and Edgell-hill district. A site of 1,512 square yards has been purchased in Oliver-street. The total cost, including the endowment, has been estimated at 5,000*l.* Of this sum, 750*l.* have already been subscribed, and one gentleman has promised a donation of 250*l.*, on condition of three others joining him in giving sums of the same amount.

NAPOLEON'S WILLOW AT KEW.—Our readers will be sorry to hear that this historical tree has been cut down. Forty years ago it was taken from the willows surrounding Napoleon's grave at St. Helena and planted in Kew Gardens. At this time, and before the gardens became national property, so great was the curiosity to see it that one Sunday a crowd of people (on being refused admittance) broke open the gates merely to look on the tree. More recently it has been no uncommon thing to see French visitors bare their heads, or even fall upon their knees, before it.

BUILDERS' CONTRACTS IN 1726.—A document, dated 20th March, 1726, and titled "Articles of Agreement between Col. Hanner and Robt. Phillips for building his House and Offices, &c., in Grosvenor-street," has been obligingly sent to us for inspection. It is a stamped agreement, neatly and clearly written out, and has numerous endorsements on the back on account of partial payments made as the work went on; but there is nothing peculiar or special in it requiring notice. Mr. Phillips was a builder in "Great Queen-street, in the parish of St. Giles's," and various of the endorsements are signed for him by one Edward Cook. The details as to quantity and quality of work are pretty full, and altogether the document more closely resembles one of the present day in all essentials than might be expected. It is specification and contract in one.

A MAN AND HIS WIFE SUFFOCATED.—A man and his wife, named Jacques, have met with a most untimely end, at Gainsborough. Their cottage had been recently built, and the wife, fancying the sleeping-room was rather damp, bought a small shop-stove, and had it put in this apartment. Although no pipe had been fixed, or other outlet provided, a fire was lighted in this stove just before retiring to rest. The consequence was that both persons were suffocated while they slept. Two dogs and a cat were in the room. The cat, when the room was opened, seems to have been not much the worse, but the dogs were nearly dead. Stoves without flues are most dangerous; and yet there are tradesmen who actually recommend and sell such stoves as "self-consuming." We have often had occasion to show the deadly nature of such stoves.

WREXHAM CHURCH.—The heating apparatus in this church was fitted up by Messrs. Rosser & Russell, London.

NEW LAW COURTS.—The competing designs have been removed from New Square to the offices of the Commission, and the Exhibition building, in New Square, is now being pulled down.

ARTIZANS' DWELLINGS.—In the House of Commons Mr. W. M. Torrens has brought in a Bill to make better provision for the dwellings of artizans and labourers in large towns, which has been read a first time.

SOCIETY OF ARTS.—The 114th session of this society has been opened under the presidency of Mr. W. Hawes, chairman of the council, who delivered the opening address, and distributed the prizes awarded by the society.

"CURIOSITIES OF LONDON."—We are glad to hear that a new edition of Mr. Timbs's "Curiosities of London," corrected and enlarged, in a library volume of 880 pages, with a new portrait, will be published early next month.

LIVERPOOL SCHOOL OF SCIENCE.—The introductory meeting of the seventh session of this school was held on Monday evening in the lecture-room of the Free Library, William Brown-street. There was a crowded attendance.

AN INK FOR GLASS.—M. Kessler, of France, has, by means of hydro-fluorate of ammonia, and hydro-chloric acid, properly thickened, made an ink by which, with any pen, ineffable characters can be traced on glass. This ink will be of service to the chemist and apothecary in labeling bottles, and marking gradations on glass.

THE LATE FALL OF HOUSES AT BATTERSEA.—At the meeting of the Metropolitan Board of Works on Friday, the 15th instant, the Building Act Committee presented a report, stating that they had considered the subject of the fall of two houses in York-road, opposite Price's candle factory, Battersea, the particulars of which appeared in the *Builder*; and that it did not appear that any blame attached to the district surveyor.

FALL OF A ROOF AT GREAT YARMOUTH.—A fatal accident has occurred by the fall forward of the roof of a large fish-office, in St. Peter's paved row, Yarmouth, through the roof of a cottage which it overlapped, killing a girl who was asleep on the attic, and breaking through the attic floor. Rot in the timbers of the fish office roof was considered by the town surveyor, Mr. H. H. Baker, to have been the cause of the accident. The coroner's jury found a verdict of accidental death.

TECHNICAL EDUCATION.—The Council of the Society of Arts, Manufactures, and Commerce have unanimously resolved to hold a conference in the third or fourth week of January next, at the Society's house, to consider and prepare an outline of measures requisite to be adopted for the promotion of industrial and scientific instruction among the various classes of the community. To that conference the Chambers of Commerce and Agriculture and other public bodies will be invited to send representatives. The two points on which anxiety may be felt are these:—Firstly, that extended and improved primary instruction be emphatically laid down as the necessary basis of secondary or technical instruction; and, secondly, that the latter should be declared necessary for all classes, and not merely for artizans and workmen.

NINE HOURS MOVEMENT AMONG THE MASONS.—A meeting of the operative masons was lately held at the Temperance Hotel, Broadway, Westminster, for the purpose of hearing the delegates' report respecting the adoption of nine hours working time during the winter season. Mr. Gray was in the chair. The delegates gave in their reports from several shops and jobs, and on the number being summed up it was found that there were 814 masons working nine hours. After some discussion, Mr. Connolly moved the following resolution:—"That it is the opinion of this meeting that a reduction in the hours of labour from ten to nine hours during the winter months would be a great advantage to the trade, and we here express our satisfaction that 814 masons are now working the nine hours, and that we hereby recommend to all who are working ten hours to use their endeavours to get the nine." After several opinions had been expressed the resolution was carried, and the meeting adjourned for a fortnight.

HUNGERFORD RAILWAY STATION DESTROYED BY FIRE.—The station at the quiet town of Hungerford, on the Great Western Railway, has been completely destroyed by fire. It is supposed that the fire originated in the fire of the booking-office.

GOLDCUTT'S DRAWING OF ST. PETER'S AT ROME.—The late Mr. J. Goldcutt, architect, made, while at Rome, a beautiful drawing of the section of St. Peter's, elaborately coloured, and with the enrichments picked out in gold as in the building itself. It procured him great credit and a gold medal from the Pope. An opportunity presenting itself for the Institute of Architects to become possessed of this memento of one who rendered essential services in its foundation, a subscription was set on foot, and the amount, some 80*l.* or 90*l.*, having been raised in a fortnight, the drawing has been presented to the Institute by the subscribers.

TELEGRAPHIC.—Official intimation has been given of the introduction of a Bill into Parliament this session, from which it appears that the Government has decided on entering into arrangements with the principal telegraphic companies of the United Kingdom with the view of placing the various lines under the management of the Post-office department. This scheme, when carried into effect, will, of course, involve a thorough revision of the present tariff and system of management hitherto used by the private companies. The details of the plan will be under the superintendence of Mr. F. J. Scudamore, the assistant-secretary of the Post-office.—An American paper remarks that some of the editors are beginning to call a despatch by the ocean telegraph a *cablegram*. This is really too bad.

ALLEGED FATAL SUBMERSION OF AN ISLAND. The curt telegraphic news across the Atlantic to the effect that the British island of Tortola, in the West Indies, had been submerged, and 10,000 lives lost, is not being authenticated by subsequent intelligence. The island did not contain more than 3,000 inhabitants, and it has since been reported to have been "submerged" for eight hours only. It could not have sunk and risen again, that is clear. It is a mountainous and volcanic island, six or eight miles long, and three or four broad, and its highest ground rises to the height of 1,650 ft. above sea-level; so that it must be understood to have suffered (if by water at all) by some extraordinary local rise of the sea; but how all the inhabitants,—"every living thing," as is sensationally alleged,—could have been drowned so long as there was high ground behind them, one cannot conceive. In all probability the hurricane which visited St. Thomas's, another island not far off, may have done damage by a rise of the sea to the town of Tortola, and have destroyed the town and drowned some people. The same thing occurred in October, 1819. It is now reported, however, that the town was destroyed by fire. What with island submersion abroad and mine explosions at home, not to speak of political disturbances, this is an eventful time.

GLASGOW ARCHITECTURAL SOCIETY.—At the last meeting of the Glasgow Architectural Society, Mr. John Honeyman, jun., president, in the chair, after the transaction of some routine business and the admission of members, Mr. Bromhead laid before the meeting a letter he had received from a firm in town who supply upholstery, &c., for houses, in which the following paragraph occurs:—"Well aware how frequently a recommendation from yourself has decided who should supply carpets and general upholstery, we ask the favour of your allowing us to send samples and estimates for any house furnishing in which you may interest yourself. We make an allowance in your favour of 5 per cent. on the gross amount of all accounts with which you may intrust us." Several of the members present said that they had sometimes received similar applications, which they had always treated with contempt. On the motion of Mr. Bromhead, seconded by Mr. Alex. Thomson, the meeting unanimously agreed in expressing their unqualified condemnation of the proposals contained in the letter. A discussion afterwards took place on the first part of the president's opening address, which treated of the present position and prospects of architectural art; the second part, which dwelt with the present position of sanitary matters, being left over till a future meeting. Among those who took part in the discussion were, Mr. Bromhead, Mr. Stevenson, Mr. Leiper, and Mr. A. Thomson.

METROPOLITAN FOREIGN CATTLE MARKET.—Notice has been given of an intention to apply to Parliament for powers to the Corporation of London, the Metropolitan Board of Works, or Commissioners, to construct a complete market establishment for foreign cattle. No particular site is named.

STATUE OF LADY GODIVA FOR COVENTRY.—A letter having been read in the local council from Mr. C. M. Marshall, R.A., offering the statue of Lady Godiva, sent by him to the late Exhibition, the letter was entered upon the minutes, the statue accepted, and the best thanks of the corporation conveyed to Mr. Marshall for the gift.

LEICESTER-SQUARE.—The Court of Queen's Bench have decided in favour of Mr. Tulk, and against the Metropolitan Board of Works, who had intended to take possession of the open space, under the Public Gardens Protection Act of 1863. The judges say that the Act was never intended to divest owners of any of their rights, and that the open space in Leicester-square was only devoted by the owner to the use of the inhabitants of the square under their leases, and not to the use of the public at all.

EVENING RESORTS FOR INSTRUCTION AND RECREATION.—A Public Museums and Free Libraries Association has been formed, for opening the national collections on week-day evenings, and for promoting the adoption of the Free Libraries and Museums Acts. Among the vice-presidents are the Earl of Lichfield and Lord Ebury, Mr. Ewart, M.P., and other influential gentlemen. The secretary is Mr. J. T. Dexter; and the office of the association is at the Working Men's Club and Institute Union, 150, Strand. A prospectus has been issued asking the support and inviting the co-operation of all who desire the intellectual improvement and social elevation of the people. The association has our most cordial approval. The national collections are almost worthless to the majority of the working classes until they be opened in the evenings. As to free libraries, the position of the metropolis in that respect at present, by comparison with that of various provincial towns, is simply disgraceful.

ENGLISH HOSPITAL AT SNEZ.—With a view of obviating the expense and lengthened sea voyage incident to the conveyance of invalid troops from India to England, her Majesty's Government have decided to build a hospital at Snez in the vicinity of a similar hospital already erected there by the French Government. The materials are being conveyed from England in three steamers, in the same way as the barracks at Barbadoes were built. The windows, fire-places, and woodwork are got ready in England, and transported as portable packages, so as to be fitted together on arriving at Snez with the least possible delay. Captain Willoughby, R.E., is superintending the work on behalf of the Indian Board. The *Blonde*, a steamer of 1,300 tons, Captain Catmur, left the Royal Arsenal yesterday with the requisite War-office stores, having a further cargo of 95,000 bricks, timber, stone, iron pillars, &c., on board, belonging to the contractors. The new hospital is being built from designs by Colonel Collyer, R.E.

THE STALL-KEEPERS AND COSTERMONGERS.—A petition to Parliament is being signed by the stall-keepers and costermongers of Whitechapel and its neighbourhood, and ministers of religion, tradesmen, and others interested on their behalf, laying before the House "the terrible amount of want and suffering which they anticipate will be caused to not fewer than 50,000 of the poor of London, if the sixth clause of the new Metropolitan Street Act be carried into full execution." The cessation of their business, the petition also urges, would cause great inconvenience and loss to a large body of poor purchasers. The petitioners pray in their own behalf and in behalf of all their fellow tradesmen in London, that clause No. 6 of the new Metropolitan Street Act may be enforced only where the necessities of the traffic absolutely require it. It is to be hoped Parliament will prevent the utter ruin of these poor people by some modification of the objectionable clause in the Traffic Act complained of, and not leave the matter to the tender mercies of the police, who seem not seldom to prefer occupying their time in driving honest though humble tradesmen to thieving as a profession, rather than endeavouring to bring thieves under the influence of law and honesty.

LIVERPOOL FINANCE.—We have some astonishing figures illustrating the magnitude of Liverpool finance. The Mersey Docks and Harbour Board now owes something about 13,000,000; and in the year ending June 24, 1867, the income of the Board was 861,811., while the expenditure was 848,311., showing a balance of 3,500. to be carried to the sinking-fund account. The Liverpool town council has borrowed on its water account 2,009,994.; on its sanitary account, 623,755.; on various improvement accounts, 591,243.; and on the public parks account, 388,550.; making a total of 3,613,543. Against this, however, there is a set-off of 286,434. invested in Consols and other securities on the sinking-fund account. The council has still unexercised borrowing powers to the extent of 1,000,000. A valuation of all the corporate real estate is to be made. It will be seen that the aggregate liabilities of the two great Liverpool public bodies amount to about 17,000,000.

THETFORD ARCHEOLOGY.—An ancient fortified Roman camp has been discovered at Thetford. Banow Hill, an ancient Roman fortified camp, is situated on the south-west side of the town, discovered here in the last century by Salmon. It is surrounded by a trench and ramparts, and from the south-east side of this hill runs an embankment for about 1,000 yards in the direction of the London turnpike. About midway down this embankment a deep walled ditch (mistaken by Blomfield and Thomas Martin for the foundation of a hermit's chapel) cuts off the communication between the road and the hill, and on the other side the embankment branches off in a south-westerly direction for nearly a mile and a half, parallel with the road where it ends in a mound now thickly covered with brushwood at the south-western extremity of the borough boundary. At distances varying from 200 to 700 yards along this bank, other ramparts and trenches of a more complicated kind support it in various directions, and it must have completely defended the southern approach to the town.

THE ROMSEY PALMERSTON MEMORIAL.—Mr. Noble, by whom the statue of Lord Palmerston is to be executed, hopes to have it ready for erection by next Easter. It will be 8 ft. in height, and will stand on a granite pedestal 7 ft. high. Its site will be the market-place of Romsey. The church memorial has been undertaken by Messrs. Clayton & Bell, who say that they mean to use their utmost exertions to make it their greatest work. The cost, however, will require an additional 400. to be collected. It is the west window, a triplet, that is to be filled. The central division will have a representation of Our Lord in Majesty, with saints, at the top, the Sermon on the Mount below that, and next the Judgment of Solomon, with a representation of Liberty in the lowest division. The dexter side of the triplet will have representations successively downwards, of angels and apostles, Tribute-money, Daniel as Ruler, and War; while in the sinister there will be angels and apostles, Feeding 5,000, Joseph distributing Corn, and Peace. The arms and inscription will run across the window below the various subjects represented.

TENDERS

For alterations, &c., at 80, Fenchurch-street. Mr. D. Campbell, architect:—
Abby & Horner £369 0 0
King & Sons 342 0 0
Mann 319 0 0
Piper & Wheeler 314 0 0

For the erection of timber stage, &c., for Mr. R. S. Loader. Mr. H. J. Hammon, architect:—
Henshaw £390 0 0
King & Sons 338 0 0

IT is quite rightly the relatives of the architect of the Palace at Westminster thought it desirable to place before the public some account of his life and works, and this has been done by his son, the Rev. Dr. Barry, in a handsome volume of 407 pages.* He has been assisted in it, to some extent, by his brothers, Mr. Chas. Barry and Mr. Edward M. Barry, but more so by the notes of Mr. J. L. Wolfe, the life-long friend of his father. One of the most enviable features of Sir Charles Barry's life, by the way, was the possession of such a friend as Mr. Wolfe. From the time that he first made his acquaintance in Rome, whence

he wrote, February 20th, 1820,—“A Mr. Wolfe, an architect, and pupil of Mr. Gwilt, has just arrived, and I have made his acquaintance with great pleasure. He is an enthusiastic admirer of art;”—to the last hour of his life, Mr. Wolfe appears to have been always at his side in any difficulty ready and able to aid, encourage, or sympathise. In the list of subscribers to the statue which was raised to Barry after his death, Mr. Wolfe's name is seen down for 200*l.*, or, as we remember to have heard at the time, for any amount that might be necessary to carry out the proposition satisfactorily, and not many weeks ago he came forward ready to protect with his evidence the fame that had been assailed. His true happy the man who finds such a friend! Immediately after first meeting Mr. Wolfe in 1820, Barry wrote,—“I say immediately that he was a man with whom I could coalesce and become intimate; and the result is that I now reckon him among the few sincere friends that one can hope to obtain in the world.” Never were anticipations more completely realized; never were first impressions more fully borne out.

It is unnecessary now to give readers of the *Builder* an outline of the life of Barry. This has already been done at considerable length.† Illustrations of his principal works, too,—Bridge-water House, the Board of Trade, Cliefden House, Halifax Town Hall, his design for the National Gallery and the Royal Academy of Arts,‡ the Westminster Palace, including the interior of the Houses, the Victoria Tower, the Clock Tower, and many other works,—will be seen in our pages; and throughout his connexion with the Houses of Parliament it was satisfactory to us to find ourselves usually able, in the various discussions that grew out of the works where, to side with him in his views and defend his proceedings. What we have now chiefly to do is to give some idea of the volume before us. It contains thirty-nine illustrations in the shape of views and plans of his works and projects,

* “The Life and Works of Sir Charles Barry, R.A., F.R.S., &c.” By the Rev. Alfred Barry, D.D., Principal of Cheltenham College. London: John Murray, 1867.

† See especially our volume for 1860 (xviii.), pp. 305, 321, 342.

‡ Vol. xviii., p. 417.

and a portrait, which is only moderately like. We are enabled to reproduce three of the engravings as examples. We have chosen Shrubland Park, Suffolk, as showing some of his best garden arrangements, made in 1848.* The old House had been improved by Mr. Gandy Deering in 1830, and on this Barry had to work. The chief glory of Shrubland lay in its gardens, and it was in that direction he made the greatest improvements. The upper garden near the house was re-arranged and enclosed with balustrades. A handsome flight of steps led from the upper to the lower garden. At the foot of the steps an open loggia was placed, and the adjoining ground was laid out with architecturally formed beds. These gardens at the present moment, we may mention, are being talked of, and the greatest praise has been given to the use made there of stonework and vases for gardenesque effect. “Some of them are urn-shaped, having no place for plants; others, such as the fine handsome ones in the balcony-garden, are flat, open-topped stone baskets, not furnished; and many more of the more common patterns are scattered about, planted and unplanted. These, with the beauty of the different walls, the richness of the balustrading, and the massiveness of the copings, give a sculpturesque character to the scene which adds dignity, grandeur, and the idea of valne and costliness to the whole, such as is rarely met with. Seldom or never has dead stone done more, or better, to exhibit the beauty of living flowers than at Shrubland.”

The Birmingham Grammar School, the uppermost of our examples, was designed in 1833, and completed in 1836, and it was in connexion with this, Dr. Barry states, that Sir Charles first made the acquaintance of Mr. A. W. Pugin, “whose assistance he secured in making out some of the drawings for details.” Here, too, he lighted on Mr. John Thomas, afterwards so intimately connected with him at the Houses of Parliament, and who was then working as an ordinary stone-carver. A remarkable man was John Thomas,—too early cut off! The Birmingham school may be viewed as Barry's preparatory step towards the great work that was to follow soon.

The third illustration we give shows his design for the enclosure of Palace-yard, and the connexion of the two great features of his building, the Clock tower and Victoria tower. His proposal was to erect a line of building, occupying the site of the Law Courts and the western and northern sides of New Palace Yard, giving ample accommodation for all public needs. New Palace Yard was to be entered on its west side by a grand gate-tower, or triple archway flanked by towers, leading by a gentle slope to the present entrances. On the south side, Westminster Hall would form a grand centre with a range of buildings on each side of it; and on the north side, if a high range of buildings were thought objectionable, a cloister with one story above it, or an open arcade, might (he thought) mask the building from the high ground of Bridge-street. The great entrance gate-tower he had proposed to call the Albert Tower, in a kind of correspondence with the Victoria Tower, which is the royal entrance, serving like it to mark the date of the building, and to commemorate the lively interest which the late Prince Consort took in all that concerned its artistic decoration.

Such was the scheme formed by him, and again laid before Lord Palmerston's Government by his son, Mr. Edward Barry, in 1864. The annexed woodcut will show its general character. It has now some special interest, because the removal of the Law Courts must soon give the question a practical importance. All that is at present being done is to complete the Clock Tower on its western side, to enclose New Palace Yard by a handsome iron railing, and to construct an arcade or cloister along its eastern

side, with a subway at the northern end passing under Bridge-street to the Thames Embankment.

The volume furnishes at the commencement some interesting notes of Barry's early travels, and we are tempted to make a few extracts. The palatial fronts at Vicenza and Venico did not take the same hold upon him as those at Rome and Florence. “The Library of St. Mark at Venice, the greater Porto Palace, by Palladio, at Vicenza, and others of the same kind, had not only the cardinal vice of superimposed orders, but were offensive by the multiplicity and prominence of their details. . . . To engaged columns,—‘colonnades walled up’—he had a great dislike; and when, as at the Board of Trade, he had to employ them, he always relieved them from the wall by grounds or margins. Even then they never thoroughly satisfied him. The disposition of the windows (grouped in the centre) in some of the smaller Gothic and other places at Venice was noted by him with approval, and was not forgotten when he was designing the garden-front of the Travellers' Club. Of palace fronts, in which an order was employed, he was most struck with those of the public prisons at Venice, and Palladio's Thiene Palace at Vicenza.”

The Ducal Palace, magnificent as he felt it to be, did not satisfy him. Of the beauty of the arcaded stories he was fully sensible, nor did he object to arcaded exteriors in general. “But no consideration could reconcile him to arcades or colonnades supporting, as here, a heavy mass of building. Whatever might be the character of the superstructure, he required that the lower part of the building should be comparatively solid and plain: the reverse appeared unnatural. In the finest portico he was not satisfied unless the basement (or the steps) was equal in mass to the pediment above. Even in the river-front of his new Palace at Westminster he rejected the idea (once entertained) of introducing a cloister; and was so jealous of the solidity and plainness of his basement, that he grudged every window and would hardly enrich a gateway.”

In the study of details of arrangement he was somewhat discouraged by considerations of the great differences between Italy and England as to climate and life. “The open *cortile*, surrounded with arches or colonnades, was a feature which delighted him, and which he often longed to introduce. There was one in his first design for the Reform Club. But in England he felt that a central hall had the advantage both in convenience and in effect. He suggested in after years the covering in of the area of the Royal Exchange, and of the still more spacious area of the British Museum. This delight in a great central hall became a passion.”

The great staircases might have served more immediately as models; but he had peculiar ideas on this subject, which interfered with his admiration of those usually deemed most excellent. “Where scenic effect was given by various flights of steps, arcades, and columns, he seemed to think that space was sacrificed and a grand hall spoilt. He did not like to see ‘steps hanging in the air’ or supported by cumbrous walls; and sudden changes in the direction of the flights annoyed him. His ideal staircase was a grand straight flight, the whole space, however great, being occupied by the steps; but if this were impossible, he required that all that could be seen at one view should be straight, and preferred the staircase, so common in Italy, where each separate flight is enclosed in solid walls.”

In Italy he first acquired that liking for visible roofs, which he afterwards showed, both in his Italian and Gothic works. He approved of them, because, being essential features, they ought not to be concealed; because, in fact, their visible appearance was the proof that the building was covered and was not a mere shell.

In study and criticism he passed the last few months of his sojourn abroad. They were

* See p. 572.

months of great enjoyment; for his spirits were buoyant, his disposition frank and genial. But they were also months of thought and study. "It was evident" (says his friend) "that the leading principles of composition which influenced him throughout his career were already rooted in his mind."

First came a love of truth. "The false in architecture he abhorred; and all external features, which did not at least indicate the internal design, he condemned ruthlessly. Even a blank window offended him. The showy but screen-like façades, so often applied in Italy to comparatively mean buildings, were to him impostures, worthy of contempt."

Next came a love of unity and regularity. "That he had an artist's eye for the picturesque was certain, from the happy choice he was sure to make of the best points of view for sketching. But actually to plan irregularly because it was picturesque, he thought unworthy of the dignity of art." Every feature, especially every ornamental feature, he would subordinate to the preservation of the main outline, and the main principle of the design, sometimes even at the cost of boldness and variety. Unity rather than multiplicity of effect, he thought the object of human art,—a lower beauty, indeed, than that which results from the unstudied harmony of nature, but the only one which seemed to him really attainable. This view he continued to maintain, and, though he saw much beauty in works designed on the opposite principle, yet the observation of their general effect tended to confirm him in his theory.

Connected with this was his great love of the effect of spaciousness. Probably the next point most evident in his criticisms was the love of perfection and completeness in detail. Nothing disturbed him so much as incongruity or want of keeping in the various parts of a design; the mingling of grandeur with pettiness, and of rich decoration with bare and unadorned features, seemed an offence against harmony; and he held that the hand of a master of his art was almost as much shown in the study and adaptation of every detail, as in the conception of a great general design. With this was connected his keen sense of symmetry and proportion. "The least offence against either,—a single feature out of scale, an opening too narrow, or even a moulding too heavy,—jarred upon him like a discord."

Early in his course he had an alarm. His churches at Manchester may be looked on as his first entrance upon a successful career. Soon after the opening of his church at Prestwich there came an express from Manchester, stating that one of the galleries had shown signs of falling during service, that the congregation had rushed out in panic, and that many were seriously hurt. By the time the long journey to Manchester was over, the report had grown into "Stand Church fallen, 300 killed and wounded." It turned out that a small hair crack had appeared in the plaster in consequence of too rapid drying. A man under the gallery perceived it, and fancied that it widened rapidly, whereupon he shouted out, "The church is falling!" The consequence of this proceeding was a sudden rush to the doors, at one of which the steps had not yet been fixed. Down went the temporary steps, and the congregation over them. Happily but few were hurt, and those not seriously; so the architect's reputation escaped.

Rather more than a fourth of the book is devoted to the Houses of Parliament, giving some particulars with regard to,—

I. The history of the competition, of Barry's success, and of the opposition with which that success was greeted.

II. The order and dates of the erection of the various parts of the building; the alterations made during the progress of design, and the notice taken of them by Parliament; the new elements introduced into the work by the appointment of Dr. Reid, to superintend the warming and ventilation of the building, of the Fine Art Commission to direct its embellishment, and of Mr. Denison and Mr. Dent, to construct the great clock; and the assistance received during the progress of the work from other artists.

III. The controversy carried on with Her Majesty's Government on the subject of the professional remuneration of the architect.

IV. The growth of the design, and the reasons which dictated its general scheme and details; and,—

V. The general description of the plan and design, so far as such description is needful as a key to the observation of the building itself.

While offering praise to the author of the biography for the manner in which he has executed his doubtless agreeable task, we are forced to remark that we miss in the book much that we looked to find. The biographer says, and we have no doubt correctly, that Barry's mind was "singularly fertile in all kinds of mechanical contrivance," but for an account of any such contrivance we look in vain. In fact, in those respects in which the volume would have been most valuable to the professional reader it is defective; and it is impossible to shut our eyes to the fact that the life would have been better written by a literary architect than by the most eloquent of divines.

A full account is given of some of the controversies in which Sir Charles Barry became involved. Difficulties, not wholly constructional, followed one upon the other; the heating, the lighting, the clock, the bells, the drainage, brought each its share and harassed him very greatly. On many occasions he felt these bitterly, and expressed himself equally so. Thus when objections were raised to the drainage he wrote no some stringent remarks on the course that had been taken by the late Mr. Anstin in making his report:—

"As I have just reason to complain, not only of the matter of Mr. Austin's report, but of the manner, in which it has been made, I would remark upon the unfair and unaccountable conduct of Mr. Austin in making his first examination and report upon the system adopted and the state and condition of the works which were obviously incomplete, without giving me any notice of his doing so, or affording me any opportunity of explanation, before his report was printed and published. Some notice should also, I think, be taken of the exaggerated and highly-wrought descriptions and ridiculous vignettes contained in his report, which are calculated only to appeal to the feelings rather than to the judgment and good sense of the country."

Intentions wrongly attributed to him also annoyed him. When it was said that he was about to take off the roof of Westminster Hall, he wrote to us thus:—

"There is not one word of truth in the report that the Westminster Hall roof is to be raised, nor have I made any application for authority for that purpose, although I think it would be a good job if it were raised, and the floor also, so that the latter might be well above high-water mark, which is not the case at present. What would the conservative writer in the *Guardian* say in justification of the great liberties that were taken with Westminster Hall in the time of Richard II.? or of the disregard of Medieval architects in altering old buildings, of all that had been done by their predecessors?"

CHARLES BARRY."

Dr. Barry seems occasionally to be seeking excuses for the length of time the Houses of Parliament occupied, whereas he might have said justly, they were built not merely quite fast enough, but too fast. We complained, again and again, to the extent of our ability, the charges of "unnecessary delay," that were constantly raised by persons ignorant of art, though influential, and had the satisfaction of hearing on one occasion, from Sir Charles himself, that our observations read to a committee of the Lords had been productive of a better feeling, and much advantage.*

The only allusion in the book to the claims recently made in behalf of the late Mr. A. W. Pugin, is contained in the following "Addendum" to the Preface:—

"Since this work was printed, the risk alluded to in page 156, as likely to arise from the employment of the late Mr. A. W. Pugin on the New Palace at Westminster, has been unexpectedly realised fifteen years after his death by some extraordinary claims put forward by his son. These claims, referring as they do to a question raised and settled in the life-time of those concerned, have not appeared to me to require any notice in these pages. I have therefore left the whole passage in pp. 154-155 precisely as it was originally written, without the alteration of a single word. It contains the exact account of the connexion which existed between Mr. A. W. Pugin and my father, and which, I repeat, so far as Sir Charles Barry's knowledge and feelings were concerned, was broken by any dispute or outrage from the day when Mr. Pugin (then a young man of 23) was first employed on the drawings of the New Palace, until the day of his death in 1852."

The account here referred to we quote,—

"As soon as he [Barry] was appointed architect to the new palace, he immediately thought of his friend, and resolved to invite him to his aid. Convinced that Mr. Pugin was at that time unrivalled in his knowledge of Gothic detail, admiring his extraordinary powers as a draughtsman, carried away by sympathy with his burning artistic enthusiasm, he could wish for no other conductor. The invitation was accepted, and a connexion was established equally honourable to both artists. No man was more original than Mr. Pugin. He held strongly certain principles, on the evolution of which he greatly disagreed with

* May we be pardoned for praising a few lines he wrote us on the subject:—

"Westminster, 21 Feb., 1843.
My dear Sir,—Accept my best thanks for your able and disinterested defence of my position as the architect of the New Palace at Westminster. It is only worthy of yourself and of the character of the journal, that you have the advantage of your editorial control.—Yours, very truly and gratefully,
CHARLES BARRY."

his friend: he was one whose name and genius could at all times command independent authority. Not for the furtherance of his art he was willing to accept a distinctly subordinate position, and to work under the superintendence and control of another. His acceptance of the post, and the spirit in which he discharged it, showed the generosity and unselfishness which were his well-known characteristics. Nor, on the other hand, could Mr. Barry be unwary of the danger of calling in a too powerful coadjutor. He knew the almost inevitable risk which he incurred of being supposed to wear other men's laurels, of having all that was good or spirited in the details attributed to Mr. Pugin, and of finding it difficult or impossible to show by the strong disclaimer which he put out, when an attempt was made to attribute to him more than he felt to be his due. The misapprehensions of others he could afford to disregard.

The first aid which he received from Mr. Pugin was under the pressure of shortness of time in making the original design. Working under Mr. Barry's own eye and direction, Mr. Pugin sketched for him in pencil a complete set of details in a style perhaps a little less carefully proportioned, and less purely English, than would have been adopted by himself. In the design they differed *foto eto*. Mr. Pugin would have recommended irregular and picturesque grouping of parts, utterly at variance with the regularity and symmetry actually adopted. Except in details, he neither had, nor could have had, any influence whatever, and those who concern the details of his own building, with those of the New Palace will readily see that even here his influence, however valuable, was chiefly indirect.

After Mr. Barry's appointment as architect, he still received the same aid in preparing detailed drawings for the estimate, most of which, however, by changes in design, were afterwards set aside. Finally, at his recommendation, Mr. Pugin was formally appointed superintendent of the wood carving, and in that capacity he directed, first the formation of a valuable collection of plaster casts of the most famous examples at home and abroad, and next the execution of the wood-work, of metal metal-work, stained glass, and encaustic tiles throughout the whole building. In all cases it was thoroughly understood between them that the architect's responsibility was to be unimpeded. Every drawing passed under his eye in all cases for supervision, in very many for alteration. Mr. Pugin's originality and enthusiasm never interfered with this understanding; he would carry out vigorously and loyally what he himself could not altogether approve. His suggestions and criticisms, freely given and freely received, were invaluable; and his enthusiasm, even in its eccentricities, was inspiring, and his experience was to be unimpeded. Every drawing passed under his eye in all cases for supervision, in very many for alteration. Mr. Pugin's originality and enthusiasm never interfered with this understanding; he would carry out vigorously and loyally what he himself could not altogether approve. His suggestions and criticisms, freely given and freely received, were invaluable; and his enthusiasm, even in its eccentricities, was inspiring, and his experience was to be unimpeded. Every drawing passed under his eye in all cases for supervision, in very many for alteration. Mr. Pugin's originality and enthusiasm never interfered with this understanding; he would carry out vigorously and loyally what he himself could not altogether approve.

To the question that has been discussed elsewhere we shall not here return. As every one now knows, Mr. Pugin personally requested us on all occasions to make it understood that he did nothing in carrying out practically Barry's own designs and views. We printed his letter to that effect in 1845, and repented his statement in 1843 when commenting on a critical article in the *Westminster Review*, which contained the expression of a belief that the interior of the building had been committed to Mr. Pugin.*

Sir Chas. Barry was not a great letter-writer, and as no examples of his style are given in the biography, we print a letter written by him immediately after the burial of the late Mr. Pugin,—

"Westminster, September 26, 1852.
"Dear Godwin,—I am much obliged to you for the *just mention* you have made in your memoir of poor Pugin, of the part he has taken in the decorations of the New Palace at Westminster. It relieves me of all necessity of contradicting the false reports that have been put in circulation on the subject. I would almost rather let it be supposed that the whole of any credit that may be due to the work should be attributed to him, than that I should be obliged to put forth any statement of facts at the present time that might to an ill-tempered world appear to be ungenerous and calculated to dim in some degree the lustre of his great fame.

I wish I could evoke your thunder in blowing up the design for the Crystal Palace *reditions*, which I carried out as proposed, will be a disgrace to the country and the arts of the age in which we live. I should much like to show you the suggestions I have made in view for its improvement, which I have been induced to volunteer from a strong national feeling and a conviction that a really palatial edifice of glass on the glorious site it is to occupy, with a good outline relieved by domes and towers reflecting the dazzling lustre of a bright sun, would have such a striking and fairy-like effect as has never yet been witnessed in any mortal production hitherto created.—Yours, very sincerely,
CHARLES BARRY."

An engraving of his proposed design for improving the Crystal Palace is given in the Biography. We may not, however, devote more space to the subject, though two very interesting subjects are treated of in the volume to which we have not alluded, namely, a curriculum of architectural study proposed by Sir Charles Barry to the Royal Academy, and his plans for the improvement of Westminster. Suffice it that the book contains much to interest, and rightly holds up for admiration the character of our great artist-architect.

THE CONVERSION OF THE "ROUGH" MATERIAL.

"The Manufacture of Roughs" is a phrase well worth holding to till the repetition of it has done most of the good work it is capable of, and then it may cheerfully render up its place to another that, under such circumstances, cannot do more, encouraging. It is something to have been brought on our own way even thus far. The phrase of "the dangerous classes" has had its currency from mouth to mouth, but spoken too often in defiance, and at best prompted by repugnance, appealing to and aggravating alarm. It is well that we should be urged to hethink ourselves of a responsibility in the case, and confront an admitted evil with all its inconveniences and dangers under some sense that doings and misdoings and omissions of our own rise up in this form of threat and annoyance. The gods are just, says the old British Edggar,—

"The Gods are just, and of our pleasant vices Make instruments to scourge us."—

But some of the severest knots in the thong are due to the carelessnesses that have little enough easiness to recommend them, and to others that are almost as disagreeable in themselves as any punishment they bring on afterwards. What is the Rough at his best and his worst,—his *status et eide*,—outside and in? We have had certain opportunities of seeing him as gregarious; and specimens of the habitually solitary meet us every turn of our best streets,—at every step more degraded districts. *Rough* is but a moderate word as applied to the external man; that the clothing, even when sufficient, is remarkably foul if only from unrefreshed use, and that it is too often abundantly insufficient even in the better seasons of an uncertain climate,—this is but part of the account to be reckoned in with cumulative irritation that comes upon the clean and the unkempt. All this, however, is less distressing to remark than the undervalued air of the physical man that carries about such unsavoury surroundings. There is no single type;—it is now the hulking frame that suggests how Rough may be but equivalent for *man*, and now the small, light weedy growth that denotes the confraternity of *Picci*. In a "Beggars' Opera" rather than one of the *hardier* or more enterprising followers of *Richthaus*. "Will it please you,—hear his *bird* *now*," at least as regards his growth. Comparing the roughest congregations of the Rough with recollections of certain large Continental cities, we are bound to admit,—we had most said asert,—for our own, a freedom from the prevalent marks of physical degradation that have intruded themselves elsewhere. Indeed, it is at once a depressing and a hopeful regarded as what the Greeks would call *σώματα*,—we discover still not merely remains but even the materials of a recovered man. The gait is shambling, the whole man lacks not only tone but tension, the joints are infirm, the tendons inelastic, and yet it is an instrument out of tune and out of repair that we have before us, and not, in the majority of cases, the visible heir of a constitution ruined at core by the most pestilential miseries vice or entailed. We have seen different things in strata several degrees higher than the Roughs among populations under happier skies. They are still at any rate "not less than," we do not say archangels, but "Englishmen used," which, if not saying quite so much, is, at least, a good deal. And whence, then, comes the ruin? What is the process of manufacture that has turned out as Roughs the men who were capable of utility and of enjoyment, certainly,—time enough to think about it. The roughness of the Roughs is prominent in that less vile but ever objectionable element of all coarseness and hoariness and want of sympathy with anything but the most animal pleasures and excitements; and this, after all, is but the mild outgrowth of idleness and want of healthy amusements, and privation alternating with intemperance. There is but one single step it is again that divides the condition described from one of reckless violence and intemperance, and all crime in all worse forms. But, again, we would say for the mental as well as the corporeal qualifications of the English Roughs, that, speaking of the mass, the deduction made for the necessary subsistence level of all that is worst from all grades

of society, we miss the signs of essentially and irremediably vicious breed. They are to a large extent good things in had places, and comforting themselves as good things under such inveterate disadvantages will.

And so the question comes round again,—Whence do the mis-manufacture that has spoiled good stuff? How does it come that what should be a supply of hardy labour, graduating from the coarsest upward to the skilled, and the sufficient capacities and fair dispositions that should find hearty exercise in the relaxations and in the domestic relations that are within reach of the humblest, should be a dangerous deposit of combustible materials at the very base of society; that the wasted energy should be ready at any opportunity and invitation to declare itself in enmity to society, to side with brutal assailants of policemen fulfilling duties in which all should aid them; that they should only have the use of language, like Caliban, as if to "know how to curse;" and that family ties should be unknown to them, or known only to be abused by unfeeling cruelty?

There is one deep black line that runs across society and cuts off an unhappy section inexorably as the "deep gulf." The line is drawn by criminal conviction. The brand, and even more, the consciousness of the prison, clings to the unhappy, and the inscription over its gates might add a horror even to the fearful line of Dante,—for he who passes out of this gate again, even more surely than he who passes in, has forfeited hope for ever. Can hope be restored to any of these? As regards adults the question would open here too large a digression; as regards the younger, these pages have already pressed urgently the considerations that are most to the purpose. Already the success of the reformatories has been a reward to those who, like Lord Houghton when in the House of Commons, braved ridicule in demanding the experiment. It is a curious peculiarity of the youthful mind that it is forgetful of the most agitating events in the very years that it is most receptive of lively impressions.

The skillful reprove grave faults of the young severely with mingled exhortation, and, when the heart is touched, immediately pass from the subject, and seem as though they entirely forgot it, as the culprit will as happily forget, even while by no means unprofitable. The wound of conscience at this age fortunately heals under good treatment, and not even a cicatrice remains, or none at least can challenge it.

Education can do much to keep the poor from requiring even the saving help of the reformatory, but it must be education truly to the purpose,—to the purpose of starting the young with good chances of healthy minds in healthy bodies. The cheap gymnastic exercises should be as absolute requirements in a school for pauper children as copies of the alphabet or a black board; this sentence is somewhat dogmatical, but still one more go with it—in every school that is under public control, if music is taught in no other form, it should, at least, take that of choral singing. Our theme is how not to manufacture Roughs, and the answer has been from all time,—by the dutiful instilment of the generous arts.

And then, what is to be said of instruction in the technical arts by which honest industry achieves a generous livelihood? Here the material that we manufacture into Roughs is in the presence of the possessor of industry's own field—the skilled artisan and trades-unionist, who claims it as his frehold, and hedges about the admission to it with restrictions more jealously than a lodge of Freemasons or a conclave of the Inquisition. And yet is the periclitant Rough a man and a brother. He is not excluded distinctly from consideration, either by the Bill of Rights or Magna Charta. It is the glory of England, and has been a main source of happiness, that the various classes of her society blend gradually into each other; no invidious limitations of race and descent and alliances exclude all classes but one from court; sons of peers sit down at a market table, and the debates of peers have been presided over from the woollack by the son of a man who shaved for a penny. Is the hroach of continuity to come at the line between the hungry labourer and the highly-waged artisan? Is it—we will not say fair—but is it tolerable, and shall it be tolerated, that those who are willing to give knowledge to those who most of all require it shall be hindered? that any class of society whatever shall enforce the law, "none that are lower than ourselves shall be as high as we are, and none that are as low as ourselves

shall get higher?" There could be but one enhancement of the principle here involved,—"those who are higher than we are shall be brought down to our level, and those below us shall be kept down if not got down further." The country does not stand alone in the world; it will have to hold its own against others that are becoming relatively stronger daily, and such a repudiation of balanced organization would no more carry us through a crisis, of which assuredly we shall have more than one, than reducing all officers to the ranks and refusing recruits, would have carried our flag from Lisbon to Toulouse.

But if the artisans are to be called on to give free chance to those who at present are manufactured into Roughs, to become competitors in skilled labour, are they alone to make a sacrifice? Whether a sacrifice would be involved may be a question; but, waiving this, we are not disposed to pass by other classes of society without making demands upon them, and not in the way of charity, but as a right.

The condition of our cities is disgraceful in respect of uncleanness, and of uncleanness in positions that properly fall to public responsibility. We have not to go far for illustration. Those whose route leads them from regions Mesopotamian to York-street, in quest of their *Builder*, will find illustration for themselves in the damp rough paving of St. Giles, and the revelations of underground conditions given by the tub of disinfectant powder awaiting the black contents of some evil sewer. From a public point of view we assert the right of such streets to be as well paved and sewered and lighted as any. Streets pertain to the general public, not to the houses adjacent; and for their maintenance and cleanliness the community must be responsible—must pay. The demand upon the public purse, if the public recognizes its duties very scrupulously, is likely to be heavy. A cry comes from the children for some other space to play in besides the intervals between the tread of foot-passengers and the trunks of cabs,—some acre with a mound, if possible, for running up and down. So much for health,—and for cheerfulness something more: no street of any length should be without green leaves visible in season. Trees flourish in Cheapside and plane-trees, at least, would grow in St. Giles's and Spitalfields, and the brick encampments of the East-end,—time enough when these localities are provided, to restore them to Trafalgar-square. Here we might enlarge also on the provision of workmen's halls and such cheerful amusement therein as would enable them to give up their present resorts to the undesirable classes with whom they at present have to share them so incongruously.

In conclusion,—for the body politic to be purified, strengthened, refined, we must use to some better purpose the material we now mis-manufacture into Roughs; howbeit, all classes of society have to concede what, after all, they have no right to,—if skilled labour have to give up its aim at monopoly, and capital to perform the duties justly chargeable upon it, and be content with the balance only for profit.

AN EDUCATIONAL VIEW OF THE PARIS EXHIBITION.

THERE are many reasons why more than a cursory consideration should be given to the late Paris Exhibition, not the least important of which is the probability that, as far as France and England are concerned, it will be a very long time before we shall have the opportunity of criticising a similar display. The example set by our own country in 1851, by the International Exhibition in the first Crystal Palace, was followed in 1855 on a larger scale at the French Exhibition in Paris, and this in its turn was surpassed by the second English Exhibition in 1862, whilst the Paris Exhibition of the present year, 1867, exceeds all its predecessors either in France or England, both in the comprehensiveness of its contents and their excellence as objects of fine and industrial art. Other exhibitions of a somewhat similar nature have been held at intervals between the above dates, in different parts of Europe, though less of an international than of a national character. The frequent recurrence of displays on so large a scale, and involving such costly preparation and expenditure, has had the effect of making manufacturers and exhibitors scrutinise very closely the actual advantages to be derived from a participation in them. Where brilliant reward

have been received or distinction won by exhibitors, it may be considered that a return has been made for the great outlay expended upon individual displays; but when only moderate success has been achieved, or even no recognition of excellence obtained, then it is only natural that an adverse opinion should be formed of such costly competitions. It is in the nature of these peaceful contests that the few only meet with any reward, and, as a consequence, for a diminutive minority of successful exhibitors who are made contented and happy by their distinction, a large majority of disappointed ones must feel that their money has been nearly thrown away, or, what is still worse, expended upon making manifest to the world their own inferiority. Add to this a sense of the anxiety which has been felt by every extensive exhibitor, and the soreness arising from any instances of apparent injustice in the distribution of awards, and we have causes of dissatisfaction sufficient to account for the feeling that the present Paris Exhibition may be the last of its kind. Whether it will really be so it is impossible to say, though, judging from the present condition of the public mind, the probability is strongly against another international exhibition for a very lengthened period. This, as before said, confers an additional interest upon it, and the extraordinary excellence of much of its contents, serves to increase the importance of the lessons which may be received from their careful examination and through an impartial judgment upon them.

Tendency of International Exhibitions.

That periodical exhibitions of fine and industrial art have an educational value cannot be denied; and that their influence, both personal and national, has tended towards a general and individual elevation of taste, is easily demonstrable. The progress in refinement of public taste, and the singular excellence of the productions of individual manufacturers or firms are to be traced almost directly to the periodical application of high standards of excellence in these international contests for superiority. There is, however, a dangerous as well as a beneficial tendency in competition so keen and thorough in the industrial branches of manufacturing art, which can never befall the more extended field of fine art. This danger is, that when unlimited pecuniary resources are available to the manufacturer, and a demand has been created for the costliest objects, excellence and fitness of design give place to mere extravagance of ornamentation, and the simplicity and refinement of true art are supplanted by a meretricious plastering of expensive details. When this stage of art manufacture is reached, the original use of an object becomes lost sight of, a pampered luxury takes the place of chaste design, costly materials become substituted for grace of conception, and instead of the cabinet or the vase being examples of the matured skill of the human mind in art applied to the necessities of the human being, they degenerate into mere indications of wealth or proofs of luxuriousness. Beauty of materials enriched and enshrined by the consecrating influence of true art-workmanship, and made harmonious by purity of style, will always have its place in the highest developments of industry; but, it should ever be remembered, that the mere money-value of the materials used may be made an apology for barbarous or frivolous art.

Another danger which may be engendered by monster exhibitions, where so much reputation may be won or lost, is the creation of an artificial and fictitious standard of manufacture, representing not so much the actual condition of various branches of industrial art, as the energy and resources of manufacturers, when pitted against one another. This produces a feverish condition, in which consistency and good workmanship are sometimes sacrificed to mere novelty and love of display. It is impossible to fix a limit at which sound workmanship or thoughtful and beautiful design shall stop; but there are well understood boundaries in the ornamentation of every object beyond which, having regard to the fulfilment of its actual use, elaboration becomes impertinence, and the application of art a frivolous waste of money.

The magnificence of the collective display of any nation is not necessarily therefore an accurate gauge of its general character as an art-producer, nor a true indication of the actual condition of industrial art among its people. In France, a country in which art appears a necessity, and its cultivation and enjoyment, through all changes of govern-

ment, have been steadfastly followed for many centuries, the Exposition at the French Department of the Exhibition is not regarded as being much, if at all, above the level of the ordinary condition of industrial production. But in many other countries, as well as our own, the works of the best known and most successful exhibitors are considered to be examples only of exhibition work, too costly for the possession of any but the affluent or the luxurious, and far above the standard of taste of the majority of even the middle classes; whilst, if we turn from these show-works to the objects which surround us every day in England, we are conscious of the great gulf which lies between our apparent taste in Paris and our actual taste at home.

Their Good Effects.

The good effects resulting from these great International Exhibitions would seem, however, to overbalance the evil ones. Each country may possibly, in the interchange of ideas, lose one or more of its cherished monopolies, but it gains also the advantage of remedying some of its known deficiencies. Thus in the Exhibition of 1851, France was far behind England in mechanical engineering; but in 1857 there is not much difference between the two countries; and the great lead which was taken by France in industrial art and design was not felt so strongly in 1862 by England as it had been eleven years before. This year, again, we feel that in many branches of art and art-manufacture we have fallen into the rear, and shall require to make some important changes in our means of art-education before we can regain the ground already lost. Some of our manufacturers have complained that the only result of their exhibiting the best of their works at an international display has been that foreigners have copied their designs or works, and having better skilled labour than we have in England, been able to reproduce them at a cheaper rate, and thus taken away their foreign trade in those articles. This is, undoubtedly, an individual hardship, though it is easy to see that society may be a gainer even by such a result; for it is only by similar means that nations become educated, and civilization progresses.

Educational Character of the Exhibition.

In the Fine Arts, Painting, Architecture, and Sculpture, the works displayed by the various countries of Europe were sufficiently national to be full of valuable information to the educationalist, and to others they could not help being educational in the highest sense of the word. Even the History of Labour collections were so thoroughly characteristic of the several nations and people who exhibited them, that an analysis of the objects displayed, without a knowledge of the countries represented, would have enabled an educated man to determine the main features, with much of the details, of the history and character of the various races whose antiquities were there exhibited. The same may also be said of the different groups and classes into which the whole modern collection was divided, that, where the industry of any country was fairly well represented, it displayed to the educationalist almost all that was worth knowing of the condition and history of the nations themselves. An examination of the objects which give an opportunity for the application of design and ornament, either in form or colour, would have enabled us to ascertain with almost precise accuracy the state of art-education in the country whose works were being considered, even if there were no other means of arriving at a conclusion concerning it. Perhaps it is almost a fairer test of the condition and success of art-education in a country to judge of it by its results as seen in the application of art to industry, than to form an opinion from the exercises of the students in art schools, or from illustrations of complete systems of instruction. Happily, however, both sources of information were open to us in the Paris Exhibition, for not only could we see the results of art-education in the products of many nations, but the means by which instruction was given and the systems pursued in the Schools of Art and Design were also submitted to our inspection and criticism. Having regard to our own position in England in the matter of art-education, a consideration of the question broadly may be of some interest just now; and I propose, therefore, to submit the conclusions come to by myself after a long and careful examination of the Exhibition, and to make some suggestions as to the future development of art-education in England.

English Works.

With the experiences derived from former Exhibitions it might have been expected that in some of the most essential features of fine art, the English School would be deficient, and that in many branches of industrial art our manufacturers would be surpassed by Continental rivals. This has proved to be the case; and though England may well be proud of several masterpieces of industrial art exhibited in the British department, we cannot, on a comparison of the entire English display with those of some foreign nations, congratulate ourselves upon the result. It is not that we cannot, under pressure, produce works of great excellence. The cabinet of Messrs. Wright & Mansfield, the pottery of Minton, Wedgwood, and Copeland, the locomotives and machinery of Kitson, Stephenson, and Whitworth; the paperhangings of Woolmans, the silver plate of Hunt & Roskell, and Elkington—all these prove that there is the power to do good things in us. What was most strongly impressed upon us in a general survey of the Exhibition was the conviction that from the contrast which existed between the best and the worst of the English works, the best were the result of extraordinary and exceptional efforts, under very great difficulties, and that the greatest of these difficulties was the absence of art power, executive ability, and technical education, in the great mass of English workmen, who were the producers of the works. Whatever other great qualities may be possessed by Englishmen, the most patent feature in the Paris Exhibition was that, as a nation, in comparison with some other nations, we could not draw; and not being able to draw, we translated art-workmanship, as it were, into our productions, as though it were a foreign language, which we speak with but an imperfect pronunciation and an evident ignorance of its grammatical construction. This was observable in almost every branch of industry or fine art, in the practice of which the knowledge of form is necessary. If we compared the English architectural designs with those of the French especially, the former, with but two or three exceptions, appeared before us utterly marred by the feeble, poor manner in which they were drawn, and in which also the absence of the power of drawing was visible in their original composition. If, again, we examined the pictures of the great European schools, the sweet harmonious colouring, the human element and the truthful history of the English school, with its pleasing subjects and perfection of finish must have been acknowledged by all; but for powerful and majestic drawing we must go to the French and German schools. In architectural drawing the French works were pre-eminent, the same power and mastery handling being evident in them as in the paintings of the French school. In their tapestries and damasks, carpets, and paperhangings, furniture, pottery, metal work, the French, and some German nations, betray perfect facility in drawing, the freedom, and boldness with which form is represented, almost in some cases, and altogether in others, running into licentiousness. Indeed, the taste and principles of design displayed in many of the foreign works are vastly inferior to some English productions. This springs more from the extravagance of power in drawing than from any other cause, as though the designers, conscious of their own strength, refused to be bound by nice degrees of subordination, or correct axioms of taste, and this is the most prominent failing in French design. The error is traceable to a deficient education in the elementary principles of ornamental art, which, though it gives a wrong direction to the taste of the ornamentist or designer, does not control his power of execution. The opposite fault is, as a rule, characteristic of English works,—the design of form, proportion, and enrichment being on the whole sound in principle, but the execution in many cases weak and feeble, as though the workmen aimed at the imitation of a design in a mechanical manner, without knowledge of art or ability to draw, and thus the original ideas, which may have been excellent, having to pass through an interpreting medium of weakness and ignorance become marred and powerless.

Influence of Instruction in Drawing.

This difference of feeling which is observable in both fine and industrial art, between the English and Continental works, is not difficult to account for; the explanation of it is to be found in the very different degree to which drawing is taught generally in England, and in France and

Germany, but principally is it owing to the superior system upon which the subject is studied, in France, at least, to what it is in England. Having examined somewhat minutely the exhibitions of the French schools of art and drawing classes at the Palais de l'Industrie in 1864, and seen some of the principal Parisian schools in operation both then and since, both of which sources of information convinced me that in ordinary schools for the middle and working classes, as well as in the special schools of design and sculpture, drawing is more generally and thoroughly studied in France than it is in England; the general superiority in art of the French, whether in industrial or fine-art subjects, at the International Exhibition, occasioned me no surprise, but appeared rather the only possible and inevitable result of a wide diffusion of education in the direction which develops taste and makes art-power possible. If a whole nation is systematically trained to a knowledge of the beautiful, the higher and more refined will become either creators or appreciators of art, and will raise or maintain a high standard of taste by their works or their demands; whilst the naturally vulgar and tasteless have their consciousness heightened and their eyes opened to the elements of beauty. Besides the general public, there are the thousands of professional men and working men to whom a knowledge of drawing, and a perception of good forms, make the difference between the artist and the machine; and in France the architect does not rely on choice or necessity upon the carver to design his sculptured details, or the decorator to supply his surface ornament; nor among workmen are there arbitrary lines between the art-workman and rough worker, but each is in a transition state from the latter to the former, or from the former to higher ground still, according to their length of experience or diligence in study—all recognising the prime necessity of having truthful eyes and skilful hands, and knowing that the enjoyment of their work and its money value also depend upon their ability to incorporate their lessons in the schools of art with the work they have to perform, day by day, each in their separate calling. I was quite prepared, therefore, by this knowledge, for the display in the French Department this year, of such excellent workmanship, gracefulness, and fitness of form, and for the one prevailing strength running through all their works, viz., good drawing. The systems of study in the German states are not so different to that we are familiar with in England as to make them subjects of great interest; nor is their display so superior to ours as to make us curious about their art education. The French method is, however, so opposite, and the results of the instruction, as seen in painting, architecture, sculpture, and industrial art, so far beyond all that we have done recently in England, that it would be well for us, if upon the basis of our English school of art method, we could engraft that element in the French (if we can only discover it) which gives such extraordinary mastery over drawing possessed by both their artists and workmen.

Art Schools Exhibitions.

Having a desire to profit by the opportunities given of an examination into the several European methods of art education, with a view of seeing to what extent our own might be improved, I spent many days in comparing the students' works in various educational courts, and afterwards pursued the inquiry in some of the Paris schools. From the collections in the Exhibition alone an accurate comparison could not well be made, for whilst that exhibited by the Science and Art Department was an "illustration of the course of drawing, painting, and modelling, and studies for the improvement of manufactures, pursued in English art schools," the French and German studies (with the exception of those of Wurtemberg) only professed to be disconnected examples of students' works. The collection of studies produced by the students and exhibited by the master of the Lambeth School of Art, might have been fairly compared with the foreign examples of studies, because, in it no effort had been made to illustrate a system, few works having been shown, and those only of the most advanced kind.

United Kingdom.

The collection of drawings from Kensington illustrated completely every one of the twenty-three stages of art study, with their subdivisions and sections, into which the English school of

art course is arranged. It included fifty distinct branches of study, commencing with that of plane geometrical drawing, and ending with examples of designs for manufactures, architectural, surface, and plastic designs. For comprehensiveness of subject the collection was not equalled in the Exhibition; nor could it have been if all the other European nations had contributed a selection from all their exhibited works to form one collection. In point of excellence of individual works, it was perhaps only surpassed by a few French crayon drawings from the east, and by drawings of similar subjects from Nuremberg. It is to be regretted that the whole of the drawings from England were not, as they might have been, from one school of art,—such as Kensington,—and that they were not the productions of *bona fide* students of art-schools, but principally those of students training to become art-masters. This would have enabled us to compare them fairly with other studies of the foreign schools by artisan students. As it was, they illustrated only the stages of study in which art-instruction is given, and this they did admirably. Quite as good illustrations might, however, have been obtained from the productions of the regular students in the art-schools, whether in London or the provinces, and then we should not have laid ourselves open to the charge that whilst other nations have exhibited their students' works, we have exhibited our masters' works. Should another opportunity ever occur for a similar exhibition, perhaps it would be advisable to bear this in mind; for, from an examination of the national competition works for this year exhibited at Kensington, I believe even better drawings were available from amongst them than were displayed as representative works in Paris.

Wurtemberg.

The only other collection which appeared to illustrate the system of instruction given in schools of art was that before referred to, viz., the Wurtemberg collection. This included freehand outline drawing, geometrical, perspective, mechanical, and architectural drawing, crayon, pencil, and charcoal shading from the cast and copies, and models in plaster. The system illustrated was very similar to, but far less comprehensive than the English; and the only works deserving of remark were the crayon and charcoal drawings, which were excellent. There are, however, indications of sound and sensible methods of study in these schools, as regards system. What is, perhaps, more interesting to us in England, just now, whilst we are on the look-out for some plan upon which art-education, in common with other branches of technical education, may be more generally extended to the masses, is the wide diffusion of the means of art-instruction in the very little kingdom of Wurtemberg. I had the privilege of meeting, whilst examining this collection, with one of the royal commissioners of the Kingdom, a Dr. Steinberg, who informed me that in a population of about two millions of people, they had in active and successful operation sixty-four schools of art; that the Government appointed and paid the teachers, the municipalities in each town or village providing the place for study. The payment for instruction from the pupils varies; in some it is wholly, in others nearly gratuitous; but in one instance, that of Stuttgart, the students pay a fee of eight shillings a year. The works of forty-five of these sixty-four schools were exhibited, or portions from the works of each; and, considering the scanty population of the country, and circumstances of the people, the display was a very creditable one. In common with the English, the Wurtemberg system commences with a bold outline practice of a geometric description, advancing to curves of a more elaborate design, and, though never pursuing the practice of outline drawing through all the subjects and sections of study which we do in England, yet it seems to make clearness of line, balance of form, and cleanliness of workmanship in the use of the medium, a required accomplishment in all pupils before advancing to more difficult studies. Much importance is attached to drawing from the cast both in outline and in light and shade, and a complete set of the casts used in the schools was exhibited. Some of these were ordinary reproductions of well-known subjects, used for purposes of study in all countries, but many casts were from conventional forms cut apparently in wood, designed especially as subjects to draw from, showing in their treatment the hard outline strongly relieved, almost detached from the background,

against which in England sculptors have so earnestly and so rightly protested.

Hesse, Baden, Nuremberg.

The collections from Hesse and Baden, and the Nuremberg drawings, served only to show us that art education is being very systematically pursued in those places, and that in the curriculum of their studies scientific drawing holds an important place. Much attention is evidently bestowed upon projection, solid geometry being a favourite subject, orthographic and perspective projection in the form of drawings and models, making a large proportion of the works displayed. In the German collections of works, as in the French, the absence almost entirely of coloured subjects, was, perhaps, to English art masters, the most striking feature. If exercises on colour, either from copies or natural objects, form any part of the study pursued in German or French schools of art, their importance would appear to be placed much lower in the scale than either scientific drawing, or studies in light and shade.

Darmstadt.

Educationally, the display of the Polytechnic Institute of Darmstadt, the models of geometric solids, details of machinery, and illustrations of the science of projection, was one of the most valuable collections in the Exhibition. Efforts have been made at different times in England to produce similar works for our own Schools of Art and Science, without very great success, and it would be most useful to us if this collection could be secured for the English schools.

France.

The most interesting study to an English art-master was the educational display in the French court. Here, if at all, could be detected the secret of that power of drawing before referred to which is the chief characteristic of applied art in French manufactures, as well as in the fine-art works in architecture, painting, and sculpture. After the elaborate *exposés* of the English art-school system, with its numerous stages of instruction and many sections and subdivisions, each differing from the other and all well represented, the German schools of design and art appeared to offer only a limited range of education. The contrast in this respect of the English with the German was however not so great as the German with the French, for the prevailing impression after examining the works of the latter is, that in France there are no stages, and no subdivisions, and no delicacies of system; one object is alone prominent,—drawing is the commencement of the course, imperfect and feeble enough sometimes, drawing is the middle, and drawing the end; as the accomplished draughtsman and possible artist ends, so the faltering, ignorant student begins, with the same medium, chalk or charcoal, on the same subjects as to kind, and with the one prevailing principle always in view, the absolute imitation, in masses and contrasts of light and shadow, of forms presented to the eye. There are degrees of difficulty in the subjects used for study, and infinite degrees of success in the accomplishment of the object sought—precise imitation; but if the utter absence of stages of study and nice distinctions between the several mediums used to obtain expression, if the ignoring of systematising and subdividing art study constitute in itself a system, then we may say French art-education recognises as the basis of its system, drawing alone. The schools exhibiting in the French Court were by no means so numerous as those which were so excellently represented in the Palais de l'Industrie in 1864, nor were the works of the schools, which exhibited both then and in 1867, so many or so excellent. The insufficiency of wall surface and space generally in this year's Exhibition, was sufficient to account for the comparatively imperfect manner in which the French schools were represented. Though the number of works was limited, there were sufficient to display what are the aims of the schools, and to allow of a fair judgment concerning the success which meets their efforts. The aim is very humble, the success distinguished. It is refreshing after seeing the handsome drawings, nicely mounted, of the English and some German courts, to see here the rough and roughly presented studies of French students. Occasionally a moderately elaborate light and shade drawing from the antique, was elevated to a place of honor on the walls of the French court, but the great majority were in portfolios in the wooden bins, one of which was allotted to each school. Here upon common paper were numerous studies, some from

the most execrable flat examples of ornamental design; others from casts of the antique of ornament and figure; and others from the living model; all wrought in charcoal and crayon, rubbed and stumped in their general working, and many finished by spirited touches with the chalk point, and enrichment of the deep shadows by the same means. The method of progression appeared to be from shaded flat copies to the cast, and from the cast to the living model. The first exercises were large details of ornament and animal forms, coarsely but effectively shaded in chalk, so that from the very beginning the student is taught that the end of his work is to get an effect of perfect realization in light and shade. This course of study I saw in operation in several of the municipal schools in Paris, both male and female, and can speak of it with the greatest admiration. Little boys, who with us would be languishing over outline drawing of difficult pieces of ornament, which they have to do for many weary months, in the French schools are working away deeply interested over their drawings in charcoal and chalk, studying the effect of roundness in their copy, and struggling hard to get it in their own drawings. Then I observed, that though a student in England might work for weeks over an outline which is only a bad imitation of another outline, done as it were by brute force, the French pupil either makes or mars his study in three or four evenings, and it is more or less an effort of his own feeling, his own spirit and knowledge. If he is in a low stage of perception of form or effect, he does his best honestly in that stage, and goes on quickly from it to something higher, without stopping to siffet in his work a refinement he does not feel, or waste his time in the mere mimicry of finish he cannot understand.

An excellent feature of the French plan is that within a few weeks, or months at the farthest from commencement, a student leaves flat examples and goes at once to drawing from the cast—that is in effect, nature. The drawings displayed in the French Court were principally in this subject, the works themselves varying from the roughest effort to the most refined. In the portfolios from the schools of M. Levasseur, M. Leqien, and others, there were also studies from the living model, showing excellent power of drawing and thoroughly artistic treatment. Having gone through both of these schools, I am bound to say the drawings exhibited in the Champ de Mars were rather under the mark of what the students usually produce than above it.

It appears to me that this French method of teaching drawing is the one lesson which may be learnt by an art-educationalist from the Paris Exhibition. We see in all the French productions of art and industry, without exception, intense power and perfect facility of drawing, and we see in French Schools of Art a simple, easy way of teaching drawing, differing totally from all other methods displayed in the Exhibition, or that we know to exist. I do not attribute the brilliant artistic powers of Frenchmen wholly to the way in which they learn to draw; but I do say there is a definite connexion between the two things, the unique method of instruction and the attainment of unique and perfect drawing power in art. For a curriculum of professional study to produce professional artists the French municipal schools are not intended, and are, therefore, not adapted. Their aim is to get the greatest amount of the common element of all art into artisans in the short time they are under instruction. For this they are adapted, and in it they are more successful than the schools of any other nation, tested by every standard, whether it be facility in drawing, design for manufactures, or applied art, or to form the basis for further professional art study.

Compared with the English School of Art system, the French is deficient in breadth and comprehensiveness, and yet it gets more valuable results than the English does. The latter is as well suited to professional artists as to artisans; but in trying to secure both objects it decreases its own usefulness to manufacturing industry. What we want in England is to engraft upon our system this French plan as to drawing, and then we should have absorbed, as it were, the soul of French art education. It is, I am prepared to allow, a very rough and ready method; all the more suitable, therefore, for students who begin their studies with taste and power at zero; but it has, on the other hand, capacity of development to suit the education of the most perfect taste and the maturest power. Some years ago the practice of working light and shade drawings with leather and stump as instruments, using

chalk or charcoal as a medium, was entirely scouted in English Schools of Art. The examination and reports upon the French Art Schools' Exhibition by inspectors and masters of the English schools in 1864 drew attention to the excellence of the method, and its adoption was very strongly advocated by at least one master. Since then, both in London and the provinces, several masters have partially adopted the system, and it was well represented in this year's national competition in London. Anxious that we might have a fair opportunity of judging the style of work, I strongly urged upon the Science and Art Department the advisability of obtaining examples of French charcoal drawings, in my report on the French Schools in 1864. This does not appear to have been done; but in order that there might be specimens of such works in England, I ordered two specimens when in Paris, from, perhaps, the best school in Paris, a commission cheerfully undertaken by the master, and since carried out by two of his best students. These works are deposited, for the use of the students, in the Leeds School of Art; and I may add that I shall be happy to show them to any person interested in art education who may desire to examine them.

With your permission, I will conclude this "Educational view of the Paris Exhibition" with some suggestions concerning the development of our English system of art education, founded on observations upon the French and German methods, as seen in the Exhibition and in the schools, in a future number of the *Builder*.

WALTER SMITH,
Head Master of the Leeds School of Art.

SOCIETY OF PAINTERS IN WATER-COLOURS.

This is the sixth annual exhibition of sketches and drawings provided by the members of the Society of Painters in Water-colours, and differs very little from those of former years, excepting, perhaps, in its being more than usually corroborative of the ungratifying fact that figure-painting in this medium is an art that is gradually dying out, and that the few left who follow it show anything but a liveliness of imagination. There is this consolation, however, that there is no visible decline on the part of others whose worship of Nature includes everything that stands, moves, lives, and grows, excepting what may be positively human; who deal with the lights and shadows of existence in their positive scene, and not in their metaphorical relatedness to the prose—much less the poetry—of a living world.

As a landscape exhibition, the present collection is a very good one, with rather more distinctive evidence between sketch and finished drawing than has been the case when the white spandrel was or was not the only frame of excuse, why either designation should or should not apply to the work; but even here exceptions may be found, and one of the most remarkable is by Mr. F. Walker, whose truthfulness has made it difficult to find a name for his picture; so he has given it none. 336 in the catalogue is number one in real precedence, and belongs to such effects as are not so easily described as appreciated. Two rustic gardeners—woman and boy—are tending rows of a violet plantation; they are apparently searching for the slug and snails likely to lessen their blossom-harvest; with such unpromising assistance as a late autumnal approach of twilight; young tree-stems nearly stripped of their foliage and webbed by the spiders; fallow-fields for a background, and a cold yellowish sky, Mr. Walker has succeeded,—by rare power of imitating and a certain gift he has to make such things seem worth the imitation,—in commanding an extraordinary amount of interest and admiration for them. Mr. John Gilbert's forte is not that of imitativeness, and he himself is inimitable; whatever suspicion there is in his style of Rubens's influence has long been recognized to be as much his own—inmate—as his great prototype's. His "Battle of the Standard" (20) is a full of action and as indicative of his well-known characteristics as any previous work; the sketch is resonant with the dim of contest, and very suggestive of mortality to all engaged in it but the painter. A study for "Cardinal Wolsey" (192) discussing with himself the inexpediency of King Henry's impending marriage with Anne Bullen, is also by Mr. Gilbert, and as easily identified by its brilliant

colour and broad treatment. Mr. F. W. Topham has but one contribution, a large sketch of "A Spanish Letter-writer" (176), very forcible, and cleverly done. Mr. F. Taylor's studies for hunting and hawking subjects have all the old vivacity and dexterity of performance common to many hundreds of cognate specimens:—"Two Sketches of Hawking in one frame: 1. A Gallip; 2. A Flight over the Sand-hills" (170); and three others,—two "Hunting" and one "Hawking" (179); the last, a fair heroine on horseback, with a falcon on her wrist, is especially agreeable. More so than Mr. F. Burton's chalk "Study from Life" (199); for, though masterly in drawing, it will disappoint those who expect to find in it one of those heartily idealized female heads so often exhibited by him: cream-coloured high lights on a blue ground may have helped to give little charm to an ordinary set of features, of which a short nose and a long upper lip are the most striking. Mr. W. Goddall's Pyrenean peasant girls have the recommendation of being represented in a manner creditable both to them and to him, heteroking improvement on his part and little need of it on theirs; whether at "Prayer" (107), very like Mr. F. Goddall's picture at the French Gallery,—"At the Roadside Cross" (212); similarly engaged, or just after being so employed (19), they are substantial and well-depicted figures. Mr. E. Lundgren's smaller studies of heads, such as those in (176), the two drawings occupying one frame, 1. "An Arab Woman," 2. "Norwegian Children," have better claim to attention, because they are more natural and unforced than (44) the larger, "Study of an Egyptian Woman," which is black and very artificial-looking. Mr. F. F. Shields is of the few who do more than copy their models; his actors are usually informed with some expression proper to their situation, and even when it seems least likely to be imparted; the child clinging to her sister's arm almost speaks the title (264), "Let me go with you," in the complete and well-studied little picture, which is the best of his four contributions. But where is Mr. Birket Foster's nicely washed and combed and cleanly-pinafored village children, who always bring such comforting assurance that bread-and-butter are no delicacies, and that soap is a widely-spread blessing; that fresh air is food, and dew the only cosmetic to be relied on? "Let me go with you," would he the loud cry of many a metropolitan boy and girl, if they saw such inviting playmates. But where are they? Have London Directors and Social Improvements Commissioners hought them all up to hide such horridly healthy disheartening examples; or does Manchester still absorb as many of these contrasts to her factory tribes as formerly? Mr. E. K. Johnson's "Night-Studies" (328) having nothing to do with elucidating social questions, it is better to return to subjects that have had more light shed upon them; these heads are very brilliant, that of the sixteenth century cavalier particularly. A "Sketch of a Girl at an Organ," by the same, is very gray and graceful in appearance, and far better than that of "A Girl at a Birdcage" (365), wherein, with regard to fitter and finish, Mr. Johnson has been his own critic, and cut up his handiwork most unmercifully. Several studies of heads by Mr. F. Smallfield, amongst some eight or nine emanations, show delicate finish and careful observation, as well as the most indomitable industry, more frequently belong to those who, obedient to their call, pay deference to the nodding trees to mature out of doors, and listen to the sighs of the south or west breezes that whisper her loveliness under clear skies, or to the louder voice of the north proclaiming her cold and fickle, but still as alluring as most things categorized under the feminine gender are always allowed to be: they follow their instincts and their mistresses all the more closely because her changes are as puzzling as charming.

Years ago (it behoves long memories sometimes not to be very precise as to dates) the late Mr. F. Danby, A.R.A., painted a splendid picture, and named it "The Painter's Holiday," wherein an idler in supine enjoyment of such a sun-bath for a landscape as he might only safely leave to his more industrious friend to paint, gave a pleasant intimation that there were intervals of rest available for the painter; but this was long before the institution of exhibitions of sketches and studies; and there are few now who would doze in fine weather, and in sight

f such a fair prospect, for with the artistic feeling there seems to co-exist a moral obligation to be always exercising it.

Mr. Carl Haag, who used to elaborate figure subjects once, and to show good academic training in all he did, seems now to devote himself entirely to landscape, unless "The Halt at the Pyramids" (6), with its camels and attendants, may be asserted in contradiction: "The Akropolis of Athens" (161), and "The Sphinx of Giza" (203), are the themes on which he loves to glowingly to dissertate. Mr. J. J. Jenkins, too, has forsaken his Britany first affections, and forgotten Watteau reminiscences in favour of homelier matters; and his transcripts, made "At Eashing, Surrey" (14), with that of "Goring Church, on the Thames" (22), are so rich in colour, and offer so strong an argument in support of his views, that the change is not to be regretted. "The Thames at Wargrave" (31), with green banks, a cloudy sky, and a breeze trailing along the smooth water, affords sufficient means for Mr. E. Duncan to provide a choice example from Mr. G. A. Tripp proves himself an enthusiastic student as well as a perfect master; bow carefully drawn are the "Oaks in Early Summer" (55), and how admirably conveyed is the idea of light, air, and space in Hayfield or Cornfield (180). Mr. Davidson's numerous items make him an instance in proof that painters can have very few holidays; (195) "Misty Moonlight, North Wales," is the more noticeable, because, unlike anything else easily remembered of his, it is also very exquisitely done. Mr. George Dodgson, in his four choice little bits in one frame (56), looks to have added more finish to his method of production. "1. Village Gossip; 2. The Village Smith; 3. Interior; and 4. Evening in the Woods," are all remarkable for light and shadow effects and fine colour. Mr. Paul J. Nafel's "Junction of the Greta and the Tees, Yorkshire" (62), is an important study, but the use of body-colour is carried to excess in it, giving even in the foreground stones a wooden appearance; this objection is still more cogent in a sunset effect, "Near Wickham, Surrey" (74), with the sky made solidly opaque. Most of Mr. Nafel's drawings are forcible and attractive, but his manner is very confirmed. All the dozen contributions of Mr. A. W. Hunt have some peculiar charm to distinguish them; but the charms of all are culminated in (349) "Carrying Hay on the Thames," which is exquisite in its purity and variety of colour, and as nearly perfect as those who doubt the possibility of perfection will allow anything to be. "The Weir at Pangbourne: Windy Day" (340), will show, to some extent, that it is not only with such aids as dappled sky, pellucid water that clearly reflects surrounding objects in its depths, or the richness of hue proper to trees, and their shadows under calm evening influences, that Mr. Hunt succeeds; and that he is versatile in his extraordinary apprehension of natural facts. Mr. J. Holland and Mr. E. A. Goodall are still doing "Venice," and the latter has done a picturesque bit of "London, from the Thames" (277), well enough to compare with his Venetian scenes, which are known to be admirable. Mr. S. P. Jackson's "Scraps on the Thames: 1. At Streathly; 2. Old Bridge at Goring; 3. Whitechurch Lock; 4. Streathly Mill" and a larger study of "Twilight" (298), bear witness to his careful consideration and great ability as a draughtsman, though even stronger evidence might be adduced from the seventeen opportunities afforded. Mr. H. Gastineaup vigorously upholds his fame as a sketcher some twenty times in the course of the gallery; so does Mr. Collingwood Smith, if less often, not less well; and Mr. W. Callow, whether in landscape or marine, shows an equal facility in rendering either. Mr. H. B. Willis, whose art is sometimes in the Highlands, (284), devotes as much attention and apt dexterity to the portrait of "A Heifer's Head" (25), and again to a "Study of a Sheep's Head" (205), as if they had been commissioned by their respective family. (237) "A Sketch of Farm Horses," by the same, is very excellent, and these form but a small portion of what Mr. Willis exhibits. Mr. S. Read has a capital study of the "Tomb of Rubens, in St. Jacques, Antwerp" (227), and Mr. J. Nash several interiors. Besides a bold impressive drawing of a "Mountain Pass, Loch Katrine" (3), Mr. T. M. Riordian has, amongst other forcibly-executed sketches, "Two Studies in Charcoal: 1. Inverlochy Castle, Argyleshire; 2. A Highland Glen" (236), which are very masterly, and show what satisfactory

results may be expected from those who know how to use whatever most readily comes to hand. Mr. Branwhite is not to be deterred from following his profession under the most chilling circumstances; if "Winter Evening" (272) were studied out of doors, he must be one of Nature's most ardent admirers indeed; whilst Mr. E. Burne Jones's manual expressions lead to the inference that he does not know that lady, and does not want, since his designs are for Gothic decoration. Mr. T. R. Lamont exhibits several figure compositions of various degrees in merit; Mr. F. Powell some clever but mannered landscapes; and Messrs. A. Glennie, Whitaker, Collingwood, D. Cox, G. P. Boyce, J. Callow, and S. T. G. Evans, are ably represented.

(346) "Near Soll, in the Tyrol," is Mr. T. Danby's most attractive contribution,—a very pleasing, brilliant little drawing.

THE DANGERS OF THE VIRGIN ISLANDS.

Our readers will observe in the public papers the account of the dreadful calamity that has befallen some of the Virgin Islands, amongst them that picturesque and charming little island, St. Thomas, "the gem of the Tropics." The fearful destruction of human life, amounting, it is said, to upwards of 500 persons, and property, both the houses at "Charlotte Amalie," and shipping of the harbour and neighbourhood, is perhaps unparalleled in the history of hurricanes.

The writer of this has the advantage of being in two hurricanes, one on land and one on water, and he can speak feelingly as to the depredation and panics those dread convulsions of nature produce: the accounts that have usually been published (and probably the one in the present instance) fall very short of the actual reality: they must be seen and felt to be duly appreciated.

Those who have not experienced such stirring scenes, and live at home at ease, can scarcely form an idea of the horrible upheavings, oscillations, and vibrations of earthquakes, or the still equally dreaded hurricanes, when the blasts from heaven appear all concentrated in one fell roar and swoop, as if intended to sweep all living things from the surface of the earth and sea, and reduce all creation and created things to one inextricable and common ruin.

It is sincerely to be hoped that this melancholy catastrophe, coupled with the devastation that has taken place amongst the crews and passengers of the steam-ships belonging to the Royal Mail Steam-packet Company for some time past, from yellow fever, produced by that hot-bed of disease, the harbour of St. Thomas, will induce that company to seek some other station as the rendezvous for the Atlantic and inter-colonial steamers.

The picturesque beauty of this fair isle, the exquisite and perfect character of the harbour, being securely land-locked, with the entrance opened to the south, the excellence of its geographical and commercial position, ought not to be taken for one moment into consideration against the weighty arguments that it is unfit for their station, in consequence of being more exposed to hurricanes than other places; and its unhealthiness is so notorious, that few like to land there, and the sailors of the steamships dread lying there, as many as thirty men having been lost of the crew of one ship in one fortnight, while the outward-bound steamer is waiting for the return or inter-colonial mails.

Of late years St. Thomas seems to have been frequently visited by hurricanes: from 1827 to 1837 there were four hurricanes there, while there were only two at Antigua in the same period: they appear to take their rise near the Leeward Islands, and sweep towards the north-west, and therefore do not produce so much danger there as in those places situated in their course, when they have attained their concentrated force, fury, and impetus.

The distance from Antigua to St. Thomas is about 240 miles, and the former does not appear to have been affected by this hurricane.

In 1863, when the contract for the conveyance of the mails was about being renewed between the Royal Mail Steam-packet Company and the Government, the writer suggested, that the station should be removed to a more convenient and healthy place, and for that purpose he made a survey and report of Falmouth and English harbours in the Island of Antigua (an

English colony), for the Governor-in-Chief of the Leeward Islands, which survey and report were sent home to the Lords of the Admiralty, and were highly approved of by the late Admiral Washington, at that time hydrographer of the Admiralty.

The soundings of these harbours were found in the Admiralty charts to be incorrect, and accordingly Commander Parson, R.N., was sent out by the Admiralty to resurvey and sound the harbour, and prepare a corrected chart, with proper soundings, and other data shown thereon, and the harbour of Falmouth was found admirably adapted for the purpose of the packet station, requiring only slight alterations and improvements, and it is quite large enough to accommodate the whole fleet of the Royal Mail Company, with their attendant colliery ships.

It was suggested to dredge and deepen the entrance to Falmouth Harbour; throw out a breakwater to protect the shipping while lying there from the effect of hurricanes, to which it is not often exposed; and to connect the two harbours, English and Falmouth, together by cutting a ship canal through a narrow neck of land that separates them, and thus to make English Harbour as well as Falmouth available for the service of the Company.

English Harbour is now a naval station of the Admiralty, and part of our West India fleet occasionally shelter there during the hurricane months (from July to November), the first-class frigates of which draw from 22 ft. to 23 ft. of water,—quite as much as the largest West India steamer when fully laden.

It is to be hoped that this awful catastrophe will produce a good effect and open the eyes of the Government and the Royal Mail Steam Packet Company to the desirableness of carrying into effect the suggestions thrown out; as, apart from the terrible hurricane calamity, our Government ought not to be a party to a contract with a Company who, by a perverted and short-sighted policy in pertinaciously adhering to this station (St. Thomas), thereby inflict such a deadly injury upon a valuable and indispensable body of men like our true British tars, who can be ill spared at the present moment.

PARKFIELD, PERSHORE ROAD, BIRMINGHAM.

This house has been built by Mr. Cranston, of Birmingham, architect, for his own occupation, and is constructed entirely of bricks, the great bulk of the work being in red bricks, relieved with blue bricks for the sills, and Maw's tiles, in hands, under the eaves and round the entrance doorway.

The house stands upon a terrace, and is raised up several feet above the general level of the site, which measures an acre in extent.

The labels over the windows, and the caps to the piers between the windows, are all formed in red bricks, cut by hand, this being found less expensive than having moulds made and bricks burnt to the required shapes, as well as producing much greater sharpness of outline. The drawing, dining, and breakfast rooms, with the entrance-hall and staircase, have ornamental wood cornices and ceilings, each being different wood cornices and ceilings, each being different wood in detail, but of uniform character throughout. This woodwork is cut, pierced, and slightly treated with colour, and in the two principal rooms the ceilings are broken up, each into three divisions, by beams and cornices running across, carried by cut corbels, springing from brick pilasters in the side walls. The bricks in these pilasters are decorated in colour, and midway up in each is a marble bracket, placed to carry the gaslights, made for these positions, and arranged with a bell-shaped consumer over each movable arm of the lights, so that the ceilings are protected from the effects of the gas.

The conservatory, of construction as patented by Mr. Cranston, is placed between the drawing and dining rooms, and is common to both by plate-glass windows in the rooms, as well as being a very agreeable feature in the hall, from which it is screened by a glazed partition and doors.

The fireplaces in the living-rooms are large and open, with chimney-corner seats, and are constructed with bricks, iron, marble, and Maw's tiles. Grates of the ordinary kinds are not used, but octagonal solid fire-clay lumps, 18 in. in diameter and 6 in. thick, with iron spikes round them to keep up the coals, are placed upon the hearth-stones. The fires upon these

WORKS OF THE LATE SIR CHARLES BARRY, R.A.

[See p. 865, ante.

PARKFIELD, PENSORE ROAD, BIRMINGHAM.—MR. GRANSTON, ARCHTET.

solid clay blocks answer well, we are told, every particle of coal being consumed and the heat radiating effectively into the rooms.

The drainage of the house is purposely made independent of the public sewers, the plan adopted for the water-closet being to convey the soil by iron pipes into a dry-brick tank in the garden. This tank is 6 ft. in diameter and 3½ ft. deep, and in the centre of it is a second tank, 3 ft. in diameter and of the same depth, this inner tank being closed in at the top, and having bores all round it a few inches below the lid. Into this smaller tank the water-closet soil flows; and, as it fills, the liquids percolate through the bores into the outer tank, and are taken up by loose turfy soil and peat placed there to receive them. The whole is covered over with 18 in. of garden-mould; and, when the tanks are fully charged, the gardener removes this soil, and takes out the contents of the tanks to apply them to his crops.

In addition to the conservatory attached to the residence, there are vinerias, greenhouse, mushroom and cucumber houses at the top of the garden, built upon Mr. Cranston's patented principle of construction.

ON COLOUR.*

FORM and colour are the great elements of beauty: colour gives spirit and life to form, which it develops by contrast. Like the harmony of sweet sounds, one of the greatest enjoyments nature offers to the mind is colour; colour, as nature gives it, with all her beautiful varieties of hues; in flowers and foliage, in the plumage of birds, in the varieties of butterflies, in the glowing sunset; and, above all, in the radiant arc which spans the heavens when the sun is reflected on falling rain. When the direct rays of light are intercepted, as by a prism, they give out a series of brilliant colours, known as the Solar Spectrum. These colours are presented in the following order:—Violet, indigo, blue, green, yellow, orange, red. To obtain this result, it will not be difficult to make the following experiment, the one originated by Sir Isaac Newton: make a narrow slit in a shutter of a darkened room, facing the sun; let the rays of sunlight strike through the prism, held at a proper angle, and the spectrum of vivid colours will be thrown on a screen suitably placed. To carry this experiment out more perfectly, the following plan has been contrived:—In a box about 16 in. square, adapt a lens through which the rays of light must be thrown through a narrow slit, about 6 in. from the lens. Then place another lens about 12 in. beyond the small opening and the prism about 6 in. beyond this second lens; the rays of light passing through these lenses and prism will throw the coloured spectrum vividly on a screen, placed at a suitable distance to receive it. If used by sunlight, a mirror will throw the rays through the lenses on the prism, but if at night the electric light should be used. The effect of light on various colours is curiously exhibited in photography, where blue objects are taken as if they were white, and those which are yellow or red, as if they were black. Thus a lady in a blue dress, with yellow ribbons, would be represented in the photograph as in a white dress with black ribbons. Modern philosophers deny that there are seven distinct colours in the spectrum; they declare that there are only three so-called primary colours,—namely, blue, yellow, and red; and that the other four are produced by the blending of the primaries. If you look at a sheet of white paper through the prism, you will find that the warm rays verging from orange to red are on one edge, and the cool rays green shading to blue are on the other. There is no line of separation between yellow and red; it is impossible to say where the one ends and the other begins. If the sky is clear the sun appears bright yellow; when obscured by fog it becomes deep red. It may be that in light there are only two fundamental colours,—orange representing

essentially light and heat, and blue coolness and shade. These phenomena of light are especially interesting; they are, in fact, the foundation of the whole theory of the harmony of colour, and a knowledge of them will simplify the study of those principles to which I will now direct your attention. Perfectly pure light may be represented by white; the total absence of it by black; between these range the tones of grey, which are combinations of colour. There are three primary colours, so called because they cannot be compounded of other colours. These primary colours are yellow, red, and blue. In shades of white light the three primary colours exist in the following ratio:—Yellow, 3; red, 5; blue, 8; and, if mingled in these proportions with white, they produce grey exactly the same in tone as by the admixture of black and white.

The Secondaries.—By mingling any two of the primary colours together, the secondary colours are produced. Blue combined with yellow produces green, yellow with red produces orange, and red with blue produces violet. Thus green, orange, and violet are the "secondaries."

The Tertiaries.—If the secondaries are combined any two together the tertiaries are produced. Green and orange produce citrine, orange and violet produce russet, and violet and green produce olive. Thus citrine, russet, and olive are the tertiaries.

On Contrast.—Every primary colour has a complementary composed of the two remaining primaries; and every secondary has a complementary formed by the remaining primary. Thus every arrangement of colour demands in some shape or other the presence of the three primaries; the eye expects them, and without them remains unsatisfied. For example, take three circular pieces of coloured paper; place them separately on three larger pieces of very light grey paper. Look fixedly on each for a time in a rather subdued light, and you will notice that the red is bordered by a halo of soft green, the yellow by one of violet, and the blue by one of orange. The secondaries again, violet, green, and orange, if placed in the same way, will be found margined by their relative primaries; thus proving that these colours are in fact complementary to each other. They are also essentially contrasting colours, being those which most strongly oppose certain qualities in each other. Thus, red is hot and glaring; green is a quiet, cool colour; yellow is bright and advancing; violet retiring; blue is a cold, orange a fiery colour. This in a few words briefly explains the basis of the whole theory of the laws of contrast in colouring. Nor must I, while speaking of contrasts of colour, omit white and black, the most powerful and most concentrated of all. White reflects light, black absorbs it; and from this cause a white object will appear larger than a black one of the same size.

On Simultaneous Contrast.—When two contrasting colours are brought into contact, they are each affected by the complementary of the other: this is called "Simultaneous Contrast." Allied to this is "Successive Contrast." When the eye has looked fixedly for some time on a coloured spot, such as a large red wafer on a greyish-white ground in a shaded light, if that object is suddenly removed the space lately occupied by it will be tinted with the complementary of it, which in that case would be green.

And, again, there is "Mixed Contrast," where the eye, having looked at a particular colour for some time, suddenly transfers its sight to another object of a different colour, carrying with it the complementary of the first colour, to the injury or advantage of the second, as the case may be. Several men of high attainments have written upon this subject, more particularly Goethe, who published his interesting work on "The Doctrine of Colours" in 1810, and it has since been translated by Sir Charles Eastlake, who added to it notes of great interest and usefulness. It is also treated of by our own countryman Field, who published most practical and valuable works on colour in 1816. And, lastly, Monsieur Chevreul, who, in his work published in 1838, illustrated the question of simultaneous contrast by a series of experiments of the utmost importance. This subject of contrast and the complementaries deserves very careful consideration; for they affect materially the relative value of colours juxtaposed. Those who have not considered the subject can scarcely estimate how strongly the complementaries occasionally influence colour. Some years ago I was on a busy morning walking with a friend over Waterloo Bridge, when my attention was directed to the two towers carrying the Hunger-

ford Suspension Bridge. These were stone colour, with projecting roofs, covered with red tiles. The cornice, in shadow under the roofs, appeared as if painted the most vivid green. When I returned an hour afterwards, the day had cleared, the mist had passed away, and with it the bright green cornice I had so lately seen. In one of the rooms of a club recently decorated by me, where the woodwork is painted warm vermilion, and the windows are covered with red blinds, the mouldings of the door opposite these blinds, especially where they are most in shadow, show a bright emerald green, there being no green in fact. I was lately in a church where a stained-glass window threw strongly-coloured lights upon the floor. I placed my umbrella on each colour, one after the other, to try what effect the shadows would have upon them; and was delighted to find that in each case, the shadow interrupted the reflected colour and gave the complementary, so that when placed on yellow it became violet, on red it became green, and on blue it became orange. Goethe gives an example of "Successive Contrast." He says, "I had entered an inn before evening and as a well-favoured girl, with a brilliantly-fair complexion, black hair, and a scarlet hodie, came into the room, I looked attentively at her, as she stood before me at some distance, in half-shadow. As she presently afterwards turned away, I saw on the white wall which was now before me a black face surrounded by a bright light, while the dress appeared of a beautiful sea-green." Here I may as well mention that by tones I mean variations of depth of any one colour; and by hues I mean varieties of colours.

I will now call your attention to a series of examples showing the effect of simultaneous contrast on various combinations of colours. Our first illustration shows that when a dark colour is placed near a light, one of the same hue, at the point of contact the light will appear lighter, and the dark darker. The succession of shades, though perfectly flat, has the appearance of flutings through this cause. If you look carefully at the illustrations, you will remark in the contrasts of green and red, or orange and blue, or yellow and violet, how powerfully these colours are acted upon by contact, how they intensify and brighten each other; how orange, by its complementary blue, makes each colour next to it of a bluer tone; how the red renders them more green, the yellow more violet, and *vice versa*. Others give examples of primary and secondary colours juxtaposed with white, which will be found to heighten the tone of these colours, and is also in turn affected by their complementaries; that grey and white and black and white are each intensified by contact; that grey in contact with other colours adds to their brilliancy, and is itself affected by their complementaries. These illustrations of simultaneous contrast follow upon the theory explained by M. Chevreul with great precision and ability in his work on colour. Though I highly appreciate and admire his theories, I do not always agree with him when he regulates decorative effects of colour. There is another subject of contrast which, although similar to the preceding as to the laws which regulate it, is different in its application. It relates to the effect produced upon one colour when applied upon the ground of another colour. The changes thus caused are most startling to those who have not experimented upon them. You will find that what looks blue on one ground is green on another; what is yellow in one case becomes orange or green in others. In fact, there are no colours of any positive tone; they are only what they are made to appear.

On Harmony.—I have endeavoured to explain how the various colours act upon each other when contrasted. I have now to consider how they may be brought into harmonious combination. Beware of confusing the laws of contrast with those of harmony, of using in equal proportions contrasts of bright red and bright green, bright blue and bright orange, without such modification as will neutralise one or the other. I speak the more earnestly of this because I believe it to be a popular delusion that contrast is harmony. To arrange satisfactorily various modulations of colour, so that they may mingle together and form an agreeable whole, demands a careful study, practice, and taste, and is often a work of great difficulty. Nothing is so charming and refreshing to the eye as a harmonious arrangement of colours. They are "like a sweet chord of music to the sense." I have often been delighted and surprised to find how wonderfully

* From Mr. J. G. Croce's lecture to the House Painters' Association. Although necessarily elementary, a section of our readers may be glad to have the advantage of reading it.

the laws of harmony in colours are expressed in flowers. The hand of nature never errs, whether it brings together in rich full harmony the tones of the blue contrasted by yellow and orange in the Garden Iris, or the blue passion flower with its fibrous coronet of deep maroon, and its greenish yellow stamens, the *lancifolium* lily of pearly white dashed with spots of intense carmine, or in defiance of all rule brings the crimson bloom on the glowing scarlet cactus, or the scarlet petals round the violet centre in the *fuschia*: the most delicate and difficult combinations in each flower are perfect and beautiful, and even its leaves are of the tone of green most suitable for its colouring. Who that has travelled over the Yorkshire moors in August, but must have gloried in the magnificent prospect before him—a hold undulating expanse, thickly covered with rich red purple heather, broken at intervals by patches of feathery ferns, their green intensely bright by contrast with the surrounding heather. I cannot too strongly urge any man who seeks to improve himself in decorative art to study carefully from natural flowers: both for gracefulness of form and freshness, richness, and harmony of colour, they are the very best school for the artist in decoration.*

STEAM POWER AND ELECTRICITY IN AGRICULTURE.

OUR prediction, of a good many years' standing, that the time would come when steam-power in agriculture would vie with that of those other branches of manufacture whose expansion had done so much for this country, is on the fair way to accomplishment. Already steam is largely employed in farming operations, and every day its use is on the increase, and improvements and new uses are being discovered and applied. One of the most recent novelties is the application of steam-power to the drying of crops in wet seasons by hot air blast, patented by Mr. Gibbs, of Cillwell Park, Essex. The plan is simple. It consists in attaching a gigantic iron fan, or blast, to the ordinary agricultural steam-engines, such as are already used on many farms, and still more extensively hired out for thrashing grain and other purposes. This fan is so arranged as to draw the waste heat from the furnace after it has passed through the tubes of the boiler and generated the useful power for the engine, and to apply and utilise this great volume of hot dry air in the various ways most suitable to the different crops to be dried. Of course coke or melting coal is used in the furnace, so that no smoke is produced, and a guard of maling-wire is interposed at the inlet of the fan to intercept sparks. In some recent experiments wet hay was carted to the engine and pitched on the cart, in quantities of about 2 cwt., on the ground before the mouth of the blower, and each lot was thoroughly dried in about seven minutes. In this way a two-horse load was dried in rather less than one hour, so that 12 acres of land might thus be cleared of hay in 24 hours. Wheat was also completely dried, but in a somewhat different way. Each sheaf was spiked upon a hollow conical tube in a small portable shed, and dried by the hot air rushing through the tube. In 15 minutes 92 sheaves were effectually dried. Farmers examined it, and declared it to be in perfect condition for threshing out on the spot. Some amusing experiments in sending hay and wheat through a shaft by the fan-blast to the top of stacks followed. Sixteen sheaves of wheat per minute were thus stacked, or at the rate of 20 acres in 12 hours.

Some new machinery for steam cultivation has been successfully tried on the estate of the Duke of Buckingham. The principal feature was the non-stoppage of the cultivator at the headlands, which is spoken of as one of the greatest novelties in steam cultivation. The machinery (a set of Hayo's of Stony Stratford), was set to work, ploughing with a Beard's plough, which, notwithstanding heaviness of soil from previous rains, did its work well, ploughing from 6 in. to 8 in. in depth, and at a rate of from three to four miles an hour. One of Smith's ordinary cultivators was attached, in the place of the plough, on which a man sat in the same manner as a driver on a Hansom cab. The implement, at a rapid pace, made its way to the headland, and without the slightest check in speed ran within a yard of the turntable, and turned round

back into its work without the slightest stoppage; and it continued to do so throughout the remainder of the day. This novel feature was produced by a peculiar self-acting windlass. Mr. Hayo is the patentee. The peculiarities and advantages of this windlass are thus summed up:—

1st. By its use there is no stoppage at the headlands in cultivation. 2nd. No checking the speed of the cultivator at the headlands. 3rd. One man superintends both engine and windlass with ease. 4th. No wheels are put in and out of gear. 5th. The anchor man at each headland can stop the implement at the headland or any other part of the field without stopping the engine. 6th. The work can proceed in fogs or by moonlight, as we were told had been done. 7th. An ordinary ten-horse power portable engine, with one cylinder, is all that is required, as it runs continuously, and the steam is never shut off.

Messrs. Howard write to us in reference to the article, "Engineering and Agriculture," in the *Builder* of the 9th, saying, "Your correspondent, 'W. H. W.,' gives no description of the latest mode of working tillage implements by steam-power, and evidently supposes that our productions in this branch are confined to the stationary or 'roundabout' system, whereas we manufacture four different kinds of machinery for steam cultivation." Of these they give detailed descriptions, but it is unnecessary for us to occupy our space with these details.

"This new power in tillage," they add, "is destined to work great and important changes. Steam has supplanted every other power with which it has been brought into competition, no matter whether in the mine, the factory, on the road, or in the stackyard; and we believe that it is to the same powerful agent we must look for increased fertility in our fields, and the means of producing food for an ever-increasing population."

M. Blondan has sent in a paper to the French Royal Academy explaining the action of electricity on the muscular and nervous system of plants. The scientific world has long been acquainted with some of the facts communicated, but others are curious, and perhaps new:—

"It seems from these experiments of M. Blondan," says the Paris correspondent of *Land and Water*, "that an induction current only produces a destructive effect on the organs of plants when they are lathy and their tissues filled with liquid matter; on solid tissues it produces but little effect. Nevertheless, by increasing the intensity of the current and applying it for a considerable length of time, the tissues of ligneous plants may be disorganised to death. When the current acts on fruit it hastens its maturity. Electric seeds germinate much quicker than others, the stalks and leaves being greener and stronger. Beans appear to have been so astonished at this process that the roots struck up after being electrified, and branched into six."

If proved not to be unwholesome, remarks our authority, we shall soon see our farmers ploughing by steam and raising crops by electricity, and the faculty recommending a loaf of electric bread in cases of rheumatism.

TECHNICAL EDUCATION.

The Committee of Council on Education have under consideration a scheme for the formation of museums of patterns used in trades and manufactures, designed to improve the technical knowledge of workmen and employers.

Mr. Doulton recently gave notice in the Commons, that, on the 29th instant (this day), on going into committee of supply, he should call attention to the report on technical education by the Schools Inquiry Commission, and should ask whether the Government intended to carry out the recommendations of the Commissioners by instituting a special inquiry into the state of education abroad.

The Committee of the Macclesfield Useful Knowledge Society, with which is connected the local School of Art, draw our attention to the fact that the subject of technical education is now engaging most of the minds of the silk manufacturers of Macclesfield. The local Chamber of Commerce has taken up the subject, and formed a separate committee on it, and the question is about to be investigated. The Useful Knowledge Society itself, and its able Art Schoolmaster, we need hardly add, are also promoting this very important movement. The Macclesfield Council have unanimously resolved,—

"That this council is deeply impressed with the necessity which now exists for a national system of education in this country, particularly with regard to technical education in the manufacturing districts, and that a representation to this effect be made to the members for the borough and county."

The mover of the resolution, Mr. Alderman Bullock, said he was inclined to think, with Mr. Brocklehurst, that this technical education would not only improve the country generally, but Macclesfield in particular. Mr. Bury had spoken

about the introduction of new trades. He thought that, with the great improvements which were now being made in manufactures and the throwing trade, the silk trade would yet again flourish in Macclesfield. The mills of Messrs. Brocklehurst were going when other people's mills were standing. He believed that, if they were to thoroughly educate their youth, they would not have the turnings-out as at present, and that the operatives would not be ruled by a few demagogues, as they were now.

Mr. Alderman Jesper said that the resolution seemed a little foreign to the business of the Council, but it was a most important one. The ex-mayor, Mr. Wright, at the recent meeting of the Useful Knowledge Society, pointed out the necessity for such an education as that referred to, and showed that on the Continent, where they had labour of a much more scientific character than ours, there were many advantages which we did not possess. He also showed that care was taken to educate even the poorest. That could only be done by a proper system of government support and inspection.

The Macclesfield *Courier*, in allusion to the designs exhibited at the late meeting of the local School of Art, says,—

"Many of the designs, we understand, are well adapted for being wrought in silk. It is very desirable that the French plan should be adopted, of providing in the school not only the means of drawing patterns, but all that is necessary for showing how they may actually be adapted to the loom. For this purpose it would be necessary to connect with the school a reeding machine, a carding machine, and a loom, and thus to localize art by completely adapting it to the requirements of the town, instead of adopting another part of the French system, that of centralizing instruction in art, like everything else in that country."

We hope the school will soon be enabled, by better support than it has had, to do all that is requisite; and that for the future the inhabitants of Macclesfield will set a higher value than they have heretofore done upon their School of Art, where the proper technical education of its silk manufacturing artisans will require to be carried on.

SCHOOLS OF ART.

The *York School*.—The annual meeting of the subscribers to this school has been held, in the large room of the institution, Minister-yard. The Rev. Canon Hey occupied the chair.

The report said:—
During the past year there has not been much to distinguish the working of the school from that of former years. It has been with pleasure that the committee have had to refer to the steady advancement of the pupils, and to the superior excellence of the works produced by them in each succeeding year. The number of pupils in attendance on the various classes during the year has been fifty-one. Some of the works of the students have been exhibited in the Yorkshire Fine Art and Industrial Exhibition, and a medal has been awarded to the school for several artistic designs by the pupils. The committee have to acknowledge with thank the gift of a carved Ionic capital from Mr. Wolstenholme, of this city. Mr. F. Pritchett also has given to the school a valuable collection of casts of modern ornamental and architectural details.

Mr. Swallow, the master of the school, addressed the meeting. He said that,—

During the past year the progress made by the pupils had been satisfactory. The number of prizes from South Kensington had not been so great, owing to fewer prizes being now awarded, and those principally to artists—a class to a certain extent incapacitated from taking any part in the competition. The standard of success was also comparatively high, and, being of an arbitrary nature, entirely in the hands of officials, could be increased or decreased at pleasure; and, as the tendency has lately been in the direction of decrease, it was not much a matter of surprise. . . . A noticeable feature in the working of the school has been the addition to the artisan class from the railway, and the loan of machinery from the company's works. Technical instruction was exceedingly valuable to the various trades and callings. It enabled a master or foreman to lay down ideas on paper with precision, and the workman, with his cultivated intelligence, to carry out the same. It spoke much for schools of art that they could be so practical in their work. Among the various branches of art, a knowledge of which is capable of imparting the key to sculpture and carving, is the plastic art. One of our best modelers, George Milner, is one of the foremen to Mr. Raddock, of London—a native of York, and one of the best, if not the best, decorative carvers in stone at the present day. He remembered another student labouring away at a bas-relief of the Resurrection, something like the one over the gateway of St. Giles-in-the-Fields. That student afterwards received the gold medal of the Royal Academy; and John Adams is now keeping up our country's credit as a clever and successful sculptor in Rome. This teaching must have a practical value, for Walter Crispier, another of their students, is disseminating the benefits of art instruction at Chester, as master of its School of Art, and at Crewe, where there is a branch school.

At present this school is in debt, and an appeal is made to the local public on its behalf.

The *Oxford School*.—A public meeting was held in the town-hall, on Thursday in last week, for the distribution of the prizes gained by the pupils in this school. The attendance was very

* The conclusion in our next.

numerous, and for a considerable time before the hour announced for commencing, several persons, including members of the University and citizens, were present to inspect the prize-drawings and other drawings by pupils of the school, which were exhibited, together with pictures lent for the occasion by the Department at South Kensington, and by Mr. Combe, the Rev. R. St. John Tyrwhitt, Alderman Spiers, Mr. James Wyatt, Mr. Ryman, Mr. Macdonald, and Dr. Acland. The chair was taken by Mr. T. D. Acland, M.P., supported on either side by the dean of Christ Church, the rector of Lincoln, the Rev. C. L. Wingfield (hon. sec.), the mayor, Alderman Spiers, &c. In the body of the hall there were several prominent members of the University, and members of the city corporation and others, who take a deep interest in the progress and success of the school. Amongst those who addressed the meeting was Mr. Macdonald, the head master of the school, who stated that this year they had forty-nine passes, eight certificates, and fourteen prizes of the second grade to be distributed. In the third grade the result of the elementary works was, that four prizes were given, and two were honourably mentioned. Four were selected for national competition, and one silver medal and a prize of books were awarded. At first sight, in comparing the present with the previous year, it might seem that they were going backward, but if they compared the drawings on the walls, that would be explained; and the conclusion he came to was, that the department had exercised the right they claimed of raising the standard of competition. Considering that this was only the second year of the existence of the Oxford School, and that some of the works against which they had to compete were sent from schools of twenty years' standing, he considered they had done well.

TRADES COUNCILS.

The London Council.—This council has recently held its monthly meeting. The following trade societies were represented:—Iron-founders, carvers and gilders, zinc-workers, hoot-closers, plasterers, men's and women's boot and shoe makers, basket makers, &c. Mr. Wood, iron-founder, was called to the chair, and read a letter from Mr. Alfred Walton, of Brecon, in which the following proposition is made to the trade societies:—

"I expect to be in London shortly, and purpose employing my time in something like the following manner. As the building trades appear to me to be about the best suited to form a building company, I intend to devote five nights to the five principal branches of the building trades, beginning, say, with the carpenters the first night, the bricklayers the second, the masons the third, the plumbers and glaziers the fourth, the plasterers the fifth, and submit resolutions in favour of co-operative production."

The secretary was instructed to inform Mr. Walton that the trade societies took great interest in the question of co-operative production, and would call the attention of the trades to the subject, as proposed by him. The president then read the Bill which had been prepared for presentation to the House of Commons, for the purpose of placing trade unions on the same footing in the eye of the law as other associations. This Bill, after some deliberation, was unanimously approved of.

The Wolverhampton Council.—Seeing that capital and labour are not on quite such friendly terms as they ought to be, and also that there are distinct associations representing each, but no association representing both, the Wolverhampton Trades Council wrote a letter to the Chamber of Commerce, suggesting some kind of union between that body and the trades council, for the mutual benefit of masters and men. The council of the Chamber received the communication in the spirit in which it was written. They appointed a deputation of their body to meet an equal number of members of the trades council to settle preliminaries. Mr. Rupert Kettle, who has already done much towards the settlement of labour disputes in Wolverhampton, is one of the gentlemen appointed to represent the Chamber of Commerce. The local *Chronicle* suggests that perhaps something like the Nottingham plan may be hit upon—a standing council of masters and men, in equal numbers. The plan has been in existence six years, and during the whole of that time there has been, not only no strike, but no serious labour dispute of any kind.

WORKMEN'S REPORTS ON THE FRENCH EXHIBITION.

In the course of the presidential address at the Society of Arts, on the 20th inst., Mr. Hawes, referring to the steps that had been taken to send a number of English workmen to Paris, to study the French Exhibition, on the condition that each workman should write a report, to be sent to the Society, on the special industry to which he belonged, said,—

The sum subscribed amounted to 1,030l. which enabled your council to assist about eighty skilled workmen, representing the principal industries of the country, to visit and examine the quality and cost of the work executed in their respective trades by the best workmen of foreign countries. So eager were the workmen of London and of other seats of industry to avail themselves of this assistance that selection sometimes became difficult; and I believe I may state that not one man was so assisted (for the committee did not pretend to pay their entire expenses) who did not bring a recommendation from his employers, or from a number of his fellow workmen, and in some instances from both, assuring the committee of his fitness to undertake the task assigned to him. The endeavour of the committee was to select men whose intelligence and knowledge of their particular trades, and whose position among their fellow workmen, were such that their reports on their respective branches of industry would not only be good in themselves, but would command the attention of their fellow-workmen.

The reports, nearly all of which have been received, are now in the press, and, with a few trifling literal and grammatical corrections, will be printed exactly as they have been delivered to the Society. They will be ready for publication before Christmas, and the council believe they will form an interesting volume, and that the result of the inquiries made by these artisans will convey a great deal of useful information to their fellow-workmen in this country.

The men were received in the most friendly manner by the French workmen. They had access to many workshops, and, by means of the very intelligent body of guides and interpreters provided for them, and with the assistance of several of their own body who spoke French, they were able to obtain a very good insight into the quality of French work and the habits of French workmen. I regret I cannot illustrate these remarks by extracts from the reports, but any attempt to do so would occupy too much time.

It is gratifying to find that the conduct of the men whilst in Paris, and the intelligence they displayed in their inquiries, were so appreciated by the French authorities at the Exhibition, that they have applied for permission to translate the reports for circulation among French workmen.

The committee received valuable co-operation from the members of the Chamber of Commerce at Birmingham, who subscribed liberally to the fund, and selected twenty-five workmen and foremen to represent the various branches of trade carried on in that district. The Chambers of Commerce of Bradford and Nottingham, and the mayor of Sheffield, also afforded considerable assistance.

The success of this attempt to improve the acquaintance of our artisans with the work of those engaged in the same branch of industry abroad has been so marked, and the aid afforded has been so gratefully received by the workmen themselves, that the Council hope, ere long, to submit the report of another committee, just appointed, to consider the best mode of continuing this inquiry by working men into the state of the industries of their competitors in foreign countries generally; the intention being, if funds are forthcoming for the purpose, to send annually a small number of artisans, carefully selected, to one or more of the capitals of Europe, to study the productions of their respective trades, and report upon them. The plan is not yet matured, but is one which I have every reason to hope will tend to continue to English industry the benefits which an intelligent study of the French Exhibition by our workmen of the present day must certainly have conferred upon it.

The Council hope that the reports of the artisans sent to Paris to study the French Exhibition will induce their fellow-workmen to appreciate the importance of the cultivation of that pure taste which characterises most foreign work, and that trade societies will thereby be

brought to see the necessity of co-operating in the work begun by this Society, by applying a portion of their funds, as we have done, in assisting their members to obtain a knowledge of foreign industry, its capabilities and its cost, instead of applying them to the maintenance of trade regulations, the tendency of which is often to cramp the energies and intellect of their members, and to foster ideas of native superiority quite inconsistent with the efforts which must now be made if we are successfully to compete with our intelligent and industrious foreign rivals.

The Council have every reason to believe that the reports, when published, will be interesting not only to the writers' fellow-workmen, but to all interested in the progress of industry; they will be found to contain a singular unanimity of opinion upon the deficiency of artistic education in this country,—upon the want of the opportunities enjoyed by foreign workmen to cultivate their taste, and upon the superior position workmen hold in Paris to that held by the same classes in England; and, considering that they are written by men most of whom have never before attempted to write a report on any subject, and all of whom are actually engaged in industrial occupations, they will be found, I venture to think, in most cases, creditable to their authors, and will, I feel satisfied, be received with the consideration they deserve. They will show the public that working men do not fear fair criticism, and that they are not unwilling to admit superiority when and where it appears to exist; and they will be specially acceptable and useful to working men as emanating from members of their own body, selected only with reference to their fitness for the work they undertook.

MONT CENIS TUNNEL.

The Italian Government have published their usual monthly statement of the progress made in the Mont Cenis tunnel. According to this an advance of 131.85 metres has been made during the month of October, of which a length of 71.20 m. was excavated on the Italian side at Bardonnèche, and 60.65 m. on the French, at Modane. At the Italian end the tunnelling proceeds more rapidly than at the other. Up to the 31st October the length of tunnel excavated was 4,610.10 m. at Bardonnèche, and 3,024 m., making a total length of tunnel executed of 7,634.10 m.; deducting this from 12,320 m., the total distance from Modane to Bardonnèche, there remain 4,555.90 m. of tunnelling to be done. From the satisfactory manner in which this important work proceeds, there seems to be little doubt that it will be completed in 1870, if not earlier.

During the present year 1,329.56 m. of tunnelling have been done, whilst during the whole of last year the progress made was only 1,024.99 m.

ST. MARY-LE-BOW CHURCH, CHEAPSIDE.

The re-arrangements of this church, which are now completed, have been carried out by Messrs. Browne & Robinson, the contractors, from the designs and under the superintendence of Mr. James L. Pedley, architect. The alterations consist of the removal of the north and south galleries, organ loft, and organ, pulpit, desk, high square and irregular pews, and strong-closet. The large oak screen at the north-west entrance has been taken away, and turned round to face the south. The large monuments which formerly blocked up one of the west-end windows have been taken down, cleaned, and refixed at the end of the north and south aisles, and all the ironwork which formerly guarded these works of art (one by Banks) has been removed. The pulpit is lowered, and stands upon a moulded Caen stone base at the north side of the nave. The prayer-desk, which is made of the old wainscot and carving, is placed on the south side, and there is a lectern provided. The pews are all open, and reduced to a uniform height and width of 3 ft., with sloping backs, and are made of the old wainscot as far as practicable, and to accommodate 400 adults.

The organ (which has been reconstructed, considerably enlarged, and improved by Mr. G. M. Holdich) is placed on the floor of the church at the east end of the north aisle. The additions made to the case have been ornamented with

perforated panels; the aisle flooring has been taken up and relaid,—the centre aisle and space in front of the altar-rails with tile pavement in black, red, buff, and white quarries in a pattern, by the "Architectural Pottery Company." The ceiling has been cleaned and slightly tinted. The lighting of the church is by five stars of twelve lights each, and suspended by brass rods from the key-stones of the arches; and two gaseliers, each 6 ft. diameter, having eight branches, each containing three burners, making a total of twenty-four burners in each gaselier, and a total of 108 lights. This department has been carried out by Mr. Geo. Benkert, Finsbury. Nearly 2,000l. have been spent. The windows require a little stained glass, and the walls some colour.

THE PROPOSED NEW METROPOLITAN CATTLE MARKET.

The intention of the Government to apply to Parliament for power to establish a cattle-market for foreign cattle is meeting with opposition. The Corporation of London have sent a deputation to the Privy Council-office, objecting to it on the ground that the market in Copenhagen-fields is already a losing concern, which the new project would utterly ruin, and that the corporation had intended to have devoted a portion of that establishment to the reception and slaughtering of foreign cattle. The president of the Privy Council promised to consider the matter. The butchers have passed condemnatory resolutions on the proposal, on the ground that it will compel them to slaughter all foreign cattle imported into London in the abattoirs adjoining the market. Correspondents of the *Mark-lane Express* urge the slaughtering of foreign cattle at the port of debarkation, and also object to the building of additional slaughter-houses at the present cattle-markets. The object is said to be to secure a constant and certain supply of dead meat at the new Smith-field Market; but it is considered that by slaughtering foreign cattle in London, our English herds will never be safe from devastation.

CITY RAILWAY IMPROVEMENTS.

Sir,—May I venture to appeal, through the medium of your columns, to that board of directors whose recent railway improvements have cast such a lengthened shadow over the street that is called "Sun," believing that the partial caprice of business caused thereby will shortly pass over, if the following public improvements be carried out, it is simply that the long waste piece of ground at the side of the Broad-street Station, extending from Liverpool-street to Sun-street, be thrown open, thus relieving the traffic of Liverpool-street (which, by the bye, its title looks very foreign, in striking contrast with the elegant terminus, opening up a "short cut" for those who have to return along Bishopsgate-street, relieving the present approach to the station of a considerable number of people, and acting as a market for the traffic of Sun-street to something like its normal condition, and completing the arrangements of this very handsome and commodious station. The appearance of the waste ground alluded to is in contrast in striking contrast with the elegant terminus, and would require little or no outlay to render it useful in the manner described. I trust that the above suggestion will be favourably received.

VIAZOE.

ENGINEERING AND AGRICULTURE.

THE LAND DRAINAGE ACT.

The article signed "W. H. W." in your number of the 9th instant, and under this title, has attracted my attention. It relates to a subject in which I have taken a special interest, and which I consider in all your correspondent allirms as to its very great importance, and its being one in which engineers may be profitably engaged, whilst at the same time they may confer great benefit upon the country.

There can be no doubt that arterial drainage, irrigation on an extended scale, reclaiming land from the sea or rivers, are enumerated by "W. H. W." and I will add, wet and dry warping, are amongst the best works that the profession can be engaged in, not alone as national, but as safe and profitable commercial undertakings.

There is already an enormous amount of talent and industry at work in producing mechanical appliances, which are used for every possible purpose to the different operations of the agriculturist; but the civil engineer has not hitherto been enlisted in the cause, or he has not considered it worth his attention to practise in the branches connected with the subject, although there is a very wide field open to him.

I cannot agree with "W. H. W." that there is that want of spirit in the lauded proprietors in not undertaking improvements on an extensive scale which he attributes to them; and we should consider the difficulties that many of them incur under, either in the want of spare funds, or their having only a life interest in their properties, or their lands being subject to leases or agreements, which present the same difficulties, and many other impediments; but I know that they are generally fully alive to the value of such improvements. One of the

difficulties in their way is the occupying tenant, who is frequently averse to improvement because it increases his annual charge, notwithstanding that he is really, for the time being, by far the greatest gainer.

I fully agree with "W. H. W." as to the mistake committed in the Act, that has been suggested by works, more particularly those of drainage, being designed and executed without the aid of the skill and experience of the engineer, and, above all, the limited and half-measure views which so frequently prevail in designing these works.

"W. H. W." seems so fully to have discussed all the questions relative to agricultural engineering which are the basis of all the minor operations, for the purpose of extending the productions of our island, that I need not occupy more of your space, but proceed to point out, which is the reason for my troubling you with this letter, the means by which arterial drainage and outfalls, and reclamations of land from the sea and rivers, can be carried out.

The difficulties that have hitherto stood in the way of those who may have been willing to effect these objects, have arisen from the want of unanimity and mutual co-operation of all the parties concerned; and for the owner of ten acres of land could, till lately, prevent the improvement of 5,000, and this obstruction could only be overcome by the tedious, uncertain, and expensive process of procuring a special Act of Parliament. In 1861 was passed an Act "The Land Drainage Act, 1861," 24 & 25 Vict., cap. 133. I was engaged by the late Sir G. Cornewall Lewis, then at the Home Office, to assist in drawing it up. This Act gives powers under two forms to enable landowners to combine to carry out the works of widening, deepening, straightening, and otherwise improving all rivers, and reclaiming lands by embankment from the sea and rivers, and to tax the areas in proportion to the benefit conferred.

Engineers and others will see in this Act that there are ready and simple means of effecting these objects. As inspector under that Act, I have held about twenty meetings, and have settled in many cases, some of which have been carried out to the great advantage of the promoters, some are in progress, and others are in abeyance.

I shall be glad at any time to explain the working of the Act, or to give any information to those who may require it. I make this offer as I am fully assured of the good that would result from the extended application of the Act, and have no positive opinion, I can pronounce it, but can hardly myself, except under certain circumstances, undertake works.

RICHARD B. GRANTHAM.

STOP-COCKS IN HOT-WATER PIPES.

Sir,—Will you allow me space in your columns to warn the trade, especially hot-water men, of the danger caused by placing stop-cocks in the flow and return pipes of hot-water apparatus by which the boiler can be, as it were, hermetically sealed. Out of several instances I will mention one that came under my notice on Monday, the 4th instant. The job (new boiler and pipes) had only been finished on the Saturday previous by a first-class London firm, in which a stop-cock, with spanner screwed on, was fixed in both flow and return pipes leading from kitchen boiler next the hot-water cistern upstairs for supplying baths, &c. I was told that these were placed there to stop the water off, should the boiler or pipes leak at any time; very little advantage that for the risk incurred.

It appears the gentleman had misunderstood the use of them, for on Sunday night, finding but little water in the cisterns for supplying the above, he turned off both cocks, thinking to avoid an accident through an insufficient supply of water; but the fire was lighted on Monday morning, an unusual hissing noise in the boiler and pipes, and some of the joints commencing to leak, so frightened the hatter that he had the fire raked out immediately, whereas there would have been an explosion, and most likely loss of life. I hope this will be the means of condemning so dangerous and at the same time useless an addition to hot-water apparatus.

F. FISHER.

THE AMERICAN SYSTEM OF SINKING PIPES FOR WATER.

Sir,—Can any of your correspondents inform me in the above system of sinking pipes for water (which is to be tried for the Abyssinian expedition), whether it is necessary to take any steps to prevent the pipes from being stopped up at the bottom in the act of boring. It is supposed that five or six small pipes might prove sufficient where there is a probability of coming to water.

W.

VENTILATION OF SEWERS.

Sir,—Under the above heading I have read Mr. G. A. Rowell's letter in the *Builder*. Before the principle which he suggests could be applied extensive structural alterations would be required to be made in sewers and their attachments.

At present, both brick and pipe sewers are ventilated by means of air shafts, built at intervals along their course, and to provide for more secure trapping of street gullies, water-closet pipes, and kitchen sinks, otherwise the power of the engine would be spent in pumping atmospheric air through these and other openings, which the lighter and more deleterious gases would still lodge unmoved in the summit or highest parts of the sewers. I am doubtful of the success of any such plan of ventilating sewers to a useful extent; but if practicable, furnaces in connexion with openings to the sewers and tall chimneys would perform the requisite work as efficiently and much more economically than steam power. Any contemplated damage from explosions could be comatated by making the parts exposed to this danger strong enough to resist.

That "the gases to be pumped out would hardly give any resistance to the steam power." The engines at the blast furnaces in Yorkshire and Staffordshire run up to very high powers, as much as 600-horse

nominal, the expense of which I leave you to judge. The real difficulty to be grappled with would be the length of the main sewers and their numerous ramifications not air or water tight on their first construction, to which must be added the numerous openings and connexions, and the imperfectly trapped gully-shoots connected with the street gullies, these latter occurring on both sides of the road, at intervals never or seldom more than 200 ft. apart. As I have stated, the power of the engine would be spent in pumping atmospheric air through these openings, whilst the radical danger of accumulating gases in the summits of the sewers would remain unchanged.

I have faith in the method of ventilation often suggested of carrying up pipes by the sides of chimneys above the level of the roofs, in connexion with the method in present use. I regard the common bell-trap to kitchen sinks as a source of greater danger than properly-placed and properly-constructed water-closets. In this opinion I think I am justified by facts, as well as in the danger existing at the summits of sewers. This latter could be diminished, if not effectually prevented, by the pipes carried above the level of the roofs.

It appears to me that any plan of ventilation, to be efficient, must be simple, constant, and self-acting, and not violent in operation. This constant and simplicity, without taking the cost into account, could not be maintained by engine-power. I could offer a suggestion to improve traps generally; and should like to offer a few remarks on the ventilation of chemical works and factories, but must leave these for a more convenient opportunity.

JOHN BLEEKMAN.

A THIRTEENTH CENTURY FOUNDATION.

At the village of Boughton, in Nottinghamshire, a new church is being built, and part of the stone is obtained from the old church, which is only distant a few yards. When the foundation of the old building was reached in the progress of demolition, a number of large unworked stones were found thrown together *pile-a-mille*, one over the other, in a very unusual manner. On these stones being taken out for squaring and use in the new church, singular concreted masses were found beneath them, presenting at first sight most puzzling characters. On careful examination, however, I have found these masses to consist of the large stems of the great bull-rush of our ponds, mingled with the stems and leaves of the yellow water-flag, the whole enveloped and concreted together with the thirteenth century cement, now nearly as hard as stone.

The district (which I know well), is eminently boggy, and it seems probable that the old church was built on a site where marsh and bog plants grew. To get a sure foundation it would appear that large stones were thrown in, and cement thrown over them. The cement naturally trickling through the interstices bound the bull-rushes and flags together in one stony mass, and has thus preserved them in a state fit for recognition for eight hundred years.

W. G. S.

A SUGGESTION FOR THE CRYSTAL PALACE.

Now that the Paris Exhibition is closed, and the buildings in the surrounding *Parc* are, I presume, to be taken down, according to agreement, will you allow me to suggest through your columns to your Crystal Palace Company, that several of those buildings are well worth transporting to Sydenham for re-erection; and would, in some measure, compensate to England—and, indeed, to the world, for the collection was unique—the painful losses occasioned by that most disastrous fire, which can never cease to be a subject of sorrow to all lovers of the beautiful.

The Champ de Mars' Turkish Mosque may not be comparable to Owen Jones's exquisite Alhambra, but it is a very lovely thing; and the Egyptian Temple, with its avenue of conchoid lions and handsome flight of steps—to say nothing of its interesting interior,—would worthily fill a space, if not in our despoiled Crystal Palace, at any rate in the grounds.

There were, too, a Turkish Kiosk, very beautiful, in which the blending of colours was most charming; the Palace of the Bey of Tunis; and a handsome Egyptian building, with a fine bold gateway at the end of an avenue of ten large concrete sphinxes painted to represent red granite, and which was used for a museum. This and its contents—arranged in glass cases raised on large square plinths of exquisitely made woodwork, inlaid in bands of a darker colour—would be a most desirable addition to the Sydenham collection.

Ask Mr. Grove, if he be not too much absorbed by his interesting and arduous task of assisting in the Palestine exploration proceedings, to urge this matter upon his directors before the objects are cleared away and lost sight of. Want of

funds will, I suppose, be the great difficulty; but something will have to be done to restore the Crystal Palace to a nearer approach to its pristine beauty than it now exhibits; and the objects I have named, being so unavailable to the general public, and, therefore, unsaleable, might doubtless be secured for infinitely smaller sums than would be required to recreate them.

R. F. H.

STRENGTH OF CONCRETE WALLS.

I LIVED many years in the county of Suffolk, where, from the scarcity of strong clay, this kind of wall was common, and most of the old walls are formed (though not with so strong a flux) in this manner, occasionally faced with split flints. One of the finest church towers of the kind, St. Peter's, Ipswich, has been erected nearly 400 years, of concrete, faced with split flint and stone dressings. The tower has an area of 140 square yards, and a height of 100 ft., as perfect and substantial now as when first built. This affords the strongest proof that can be required of the simplicity of those who talk about the instability of concrete erections, and the necessity of bonding them throughout. Clay in Suffolk being so scarce, the early builders, even so far back as the thirteenth and fourteenth centuries, turned their attention to this compound substance: the idea was roughly worked out, I admit, but true in principle, and in pulling down such buildings, the men have far more difficulty, and it takes an infinitely longer time with pickaxes than a dozen brick ones would. I have seen the bricks which have been embedded in the concrete of these old buildings smashed to pieces before the concrete would give way. Some of the walls of the old Grammar School, Ipswich, 300 years old, I saw pulled down myself. The men could not pick them down, but were obliged to mine with gunpowder before they could level them.

Putting aside the known great porosity of bricks, and therefore their great susceptibility to disintegration, and the necessity of some profit to the builder, which the high price of lead almost prevents, I trust that I have given proof of the advantage of such concrete erections.

THOS. C. BOGLEY.

MURRAY v. GILES.

SIR,—As attorneys for the plaintiff, we trust you will allow us to correct a slight inaccuracy in the report of the above case in your last week's paper. In the last paragraph but one it is stated that "The jury, having been locked up some time, gave a verdict for plaintiff, so far only as regards twelve drawings out of fifty-two claimed, and no damages." The jury simply gave a verdict for the plaintiff. In the course of the trial it came out in evidence that many of the drawings claimed had been sent to the contractor's office, or to a Mr. Messom, and that the defendant had only fifteen drawings in his possession. By consent, a nominal value of 6*l.* was set upon those drawings, and the judge, upon the verdict of the jury, ordered those fifteen (not twelve) drawings to be given up to the plaintiff, and certified that he was entitled to costs.

BOWKER, PEAKE, & BIRD.

REMOVAL OF HISTORICAL MONUMENTS

A CORRESPONDENT writes,—“I want to enter an indignant protest against the sale of the inscribed stone from the Roman wall to the American consul at Newcastle (*vide* p. 844). Why should “a Portland cement cast” be taken “for the Old Castle, Newcastle,” while he carries off the original? When he has moved it to the United States, it becomes merely an object of antiquarian interest; but while it remained *in situ*, ‘about eight miles from Glasgow,’ in the wall of Antoninus Pines, recording the erection of the 3,000 paces, it was an invaluable portion of irrefragable history that the surrounding inhabitants ought to have felt too proud of having had bequeathed to them, to have ever allowed it to pass out of their hands. Inquiry ought to be made as to by whose permission this inscribed stone was taken from the wall and delivered over to Professor McChesney. It would be wiser even to take some Roman monument out of one of our museums, and give that to the Professor. The suggestion, doubtless, seems a barbarous one; but it is not really half so barbarous as parting with this link from the chain of our national history. I am quite furious about it.”

We fully agree with our enraged correspondent, and must express our surprise that the Newcastle Society of Antiquaries received the state-

ment so coolly. Some endeavour should be made to buy it back from Professor McChesney, that it might be deposited, at any rate, in the neighbourhood of the wall it labelled. We refer this suggestion to Dr. Bruce to see it carried out.

CHURCH-BUILDING NEWS.

Oldbury.—The church here has been re-opened for divine worship, by the Bishop of Worcester. The edifice, which originally consisted of nave, with north and south aisles, and galleries, had a shallow chancel formed by one bay, which has now been materially lengthened. The front portion of the western gallery has been removed, and benches, which previously occupied that part of the ground-floor under the west gallery, have been replaced by modern open seats with hench ends. An organ-chamber has been provided on the north side of the chancel, with choristers' vestry in the rear. The chancel has been lengthened inwardly. The church has been thoroughly cleaned, painted, and decorated. The ceilings and walls have been simply decorated. The whole of the work has been carried out under the supervision of Mr. G. Holme, architect, the entire cost being under 1,000*l.*, and by the following contractors, viz.:—Mr. Bonser, of Oldbury, for the builder's work; Mr. A. Gee, of Stafford, for the painting and decorating; Mr. Averill, of Oldbury, and Messrs. C. Smith & Son, of Birmingham, for the gas standards and ornamental ironwork; and Messrs. Haden & Son, Trowbridge, for the warming.

Worcester.—The interior of St. George's Church is now undergoing a partial renovation and repewing, under the direction of Mr. Hopkins, architect; contractors, Messrs. Cox, of the Butts. The ground-floor has been entirely re-seated, the seats being of varnished deal, with leaning backs, and no doors. Godwin's encasitic tiles have been laid down in the chancel and aisles. New windows, with frosted glass, and stone mullions and transoms, have replaced the old ones in the lower side walls. The walls and ceiling have been coloured. When the east window is removed, and the galleries made to harmonise with the arrangements on the ground-floor,—improvements which can only be effected by the accession of more funds,—something will have been done to render this poor and unsightly church less objectionable and more convenient in the interior.

Madresfield (near Malvern).—By the liberality of the lord of the manor, Earl Beauchamp, another church has just been completed and opened for the use of the inhabitants. The new edifice is situated near the Court, and is in the Decorated style. It contains a chancel, nave, tower, and spire. The building is of grey stone, with bands of red, and facings of freestone. North of the chancel are vestry and organ-chamber. The roofs are steeply pitched, and of open-timbered work. In the east window are three lights, as there are also in the window at the west end: the other windows are chiefly two-light. The tower opens into the nave by a lofty arch; and the church is approached through a stone porch, and through a wooden lych-gate. There are six bells and a set of chimés. The interior is decorated. At the east and west ends there are some coloured windows. The architect was Mr. Preeley, of London.

Liverpool.—The erection of the mortuary chapel, “owing to circumstances of a painful character,” says the *Aldion*, is now suspended. It has reached an advanced stage, and in places is almost ready to receive the roof. It would be a boon to the inhabitants of the poor and crowded districts of Scotland-road, where it is being erected; and it must give a matter for sincere regret if, owing to the commercial disaster of a gentleman who purposed being its sole donor, it should not now be completed, and its uses put fully and fairly to the test. The corporation should take the building in hand and finish it at the public cost; or, failing that, a public subscription should at once be organized to carry out this desirable object, by completing the building without delay.

Hoylandswaine.—The chief stone of a new church now in progress of erection at Hoylandswaine, about two miles from Penistone, has been laid by the Bishop of Ripon. A site has been given by Mr. F. W. T. V. Wentworth, and the parsonage which is nearly completed, has been erected at the sole cost of the Stanhops family. The church, which is being erected from designs furnished by Mr. W. H. Crossland, of

Leeds, architect, is estimated to cost 3,000*l.*, and will seat 308 persons. The plan comprises nave, with north aisle and chancel, with chancel aisle, to be used as a vestry and organ chamber. At the west end will be a tower, rising to the height of 70 ft. The height of the nave is to be 30 ft.; length of the church, 87 ft.; width 38 ft. 6 in. The style is Decorated. The roofs are open, and are, together with the sittings, stained in oak. There are 308 fixed sittings, including 80 seats for children, and all the sittings are to be free.

Blackheath.—All Saints' Church has recently been improved by the completion of the upper portion of the tower, and by a broach spire. As the church stands on the Heath, these additions are conspicuous for some distance around. The tower is 14 ft. 6 in. square internally, and the spire is about 133 ft. 6 in. to the apex stone. The materials are similar to those used in the body of the church, namely, Kentish rag for the main walling, and Bath stone for the quoins, dressings, &c. The cost has been about 1,200*l.* Mr. Ferrey was the architect employed, and Messrs. Dove, Brothers, carried out the work. The tower stands at the south-west angle of the church.

Scalthingham Nethergate (Norfolk).—The church here is about to undergo restoration, and also to be considerably enlarged. The present church consists of nave, chancel, south porch, and west tower. These are to be restored (the porch to be rebuilt), a new aisle, equal in size to the present nave, is to be erected on the north side, and a new vestry on the north of the chancel. The works have commenced, the builders being Mr. Rnst for bricklayers' and stonemasons' work, Mr. Burrell for carpenter and joiner's work, and Mr. Devereux for plumber, painter, and glazier's work. The whole church is to be seated in oak, with hench-ends and carved poppy-heads; there will also be a carved oak roof-screen, decorated and gilded. The present contracts amount to 1,328*l.*, exclusive of restoring and relighting the bells, of which there are six, of beautiful tone. The architect is Mr. James S. Benest, of Norwich.

Halsburygate (Norfolk).—The parish church here, the nave and tower of which underwent entire restoration some years back, is now to be completed, by the erection of a new porch. The chancel, which is a very primitive structure of red brick, will also shortly be restored. The architect is Mr. James S. Benest, of Norwich.

DISSENTING CHURCH-BUILDING NEWS.

Sheffield.—A memorial-stone has been laid by Sir Francis Lyett, ex-Sheriff of London and Middlesex, at the Methodist Chapel, in course of erection on Ellesmere-road. The chapel,—the architects of which are Messrs. Wilson & Crossland,—will be in the Early English style, and will almost join the Methodist schools which were erected some little time ago. It will be capable of accommodating 1,000 persons, and the cost of the erection will be about 3,500*l.*

Malmesbury.—A new Congregational chapel has been opened here. The building stands in the Westport of the borough, near the place where the celebrated Hohhes once lived. The means to build the chapel have to the extent of 1,000*l.* been promised. Mr. Stent, the architect, supplied plans, which were adopted. The structure is hid from view by a mass of small tenements and farms. The style of architecture is Anglo-Lombardic. There are two entrances from Church-street, which forms the frontage of the church, leading to the body and gallery, which latter runs along two sides of the building. The front contains a centre circular window, filled in with stained glass of simple design. One of the entrances spoken of is under a turret which rises on the south-west side, and to the top of the spire which surmounts it, measures about 70 ft. The church contains sitting accommodation for about 260 on the ground-floor, and about 200 in the galleries. The roof is partly open-timbered, being a semi-wagon-head roof. The pews are all open, and all the joiners' work is of deal, varnished. The chapel is lighted by a large central corona light, and brackets under the galleries; and it is heated by apparatus supplied by Messrs. Haden & Son, of Trowbridge. At the rear there are an assembly-room, vestry, and other rooms, over which there is a school-room with separate approach. The chapel was erected by Messrs. Light & Smith, of Chippenham.

Umbroine Wells.—The new Countess of Huntingdon's chapel has been dedicated. The edifice

is in the Early English style, and capable of seating about 700 persons. The architect was Mr. John Wimple, of London. Standing as it does on one of the highest eminences in the town, its tall white spire may be seen for many miles. The roof is arched, and supported by groins and light iron columns. A gallery is erected at the eastern end, capable of seating some 200 or 300.

Victoria Park, London.—Mr. Samuel Morley has recently laid the foundation-stone of the new Victoria Park Congregational Church, situated in Approach-road, Victoria Park, immediately adjoining Bonner's-road, in the presence of an immense concourse of spectators. The new building has been designed by Mr. Poulton, architect, of Reading, for the accommodation of some 3,000 persons, at an estimated cost of about 8,000*l.*, and will be a plain, but commodious, structure.

York.—The chief stone of a new Wesleyan school-chapel has been laid on a site between the south end of Pilgrim-street and Charles-street, Clarence-street. The total cost of the ground and the buildings to be erected upon it has been estimated at upwards of 2,000*l.*, and towards this sum between 900*l.* and 1,000*l.* have been subscribed. The buildings will cost about 1,200*l.* The school-chapel will consist of one principal room 61 ft. 6 in. long by 40 ft. wide, and 30 ft. high. It will be divided into bays by the roof, and principals partially exposed to view. The room will be lighted by six large windows on each side and five at the end. The entrance will be by a porch in the side transept. The inside of the building will be lined with white brick, relieved by red and black brickwork in arches, strings, &c. The outside of the building will be faced with red stock brickwork, relieved by arches and strings of white and black brick. The transept gable will be finished by an ornamental bell-turret. Mr. Edward Taylor, of York, is the architect; and the contractors are Mr. Joseph Walker for the brickwork; Mr. R. Slatfor for the joiner's work; Mr. H. Brumby for the mason's work; Mr. H. Young for the plasterer's work; Mr. W. K. Hartley for the plumber's and glazier's work; Mr. H. Sanderson for the slater's work; and Mr. J. Thomas for the painter's work.

Bolington.—A new Congregational chapel has been opened here. The site is on the north side of the main thoroughfare, Great High-street, at the corner of Beeston Brow. Space has been reserved on which to erect a minister's house. Externally the building presents the appearance of a nave and transepts, the former being the chapel and the latter the school building, the whole being so planned that without any disturbance of the external walls, the transept may be added to the chapel whenever circumstances require its enlargement. The axis, or centre line of the building, forms a considerable angle to the line of street; but owing to a bend in the latter, the south or front gable directly faces the spectator as he ascends Great High-street, whilst on approaching the village under the canal aqueduct a view is obtained of the west side, including the school gable and the tower and spire at the south-west angle. All the external walls are faced with Karridge porpoins, set in regular courses, the masonry of the quoins, jambs, buttresses, and other dressings being in Bolington stone. The front gable is terminated by a wrought-iron finial, and the spire has a weather-vane. The roof, which has a steep pitch, is covered with slating, formed to a geometrical pattern, in three varieties of tint. The chapel is internally 65 ft. 6 in. by 36 ft. wide, and including the small gallery at the end, opposite the pulpit, will seat 450 persons. It is lighted on each side by five double lancet-headed windows, glazed with cathedral tinted glass, having a coloured border. There is also a large geometrical window at the back of the gallery. Perhaps the main feature internally is the inner roof or ceiling, which is in the form of a pointed arch springing from the side walls, groined over the window heads, and intersected by bold ribs, moulded in plaster. The seats are low, with slanting backs, and are without doors. The floor has a slight longitudinal rise from the communion. The school building is of two stories, and comprises on the ground-floor an infants' room, three or four class-rooms, and a minister's vestry, the upper story being in one large room, 57 ft. long, 25 ft. wide, and 25 ft. high, with an open-timbered roof. It is lighted on three sides, and will accommodate upwards of 400 scholars. The whole premises are heated by steam. The style is Early Decorated, according to the designs and

superintendence of Mr. Williamson, architect, Manchester. The contracts have been undertaken by local tradesmen in separate portions,—viz., masonry, Mr. Thomas Allman; wood-work, Mr. S. Handford; plumbing, &c., Mr. W. Halliwell; plastering, Mr. John Mellor. The total cost, exclusive of land, will be about 2,800*l.*

PROVINCIAL NEWS.

Worcester.—New premises have been opened by Messrs. Badger, ironmongers, at the corner of the Foregate and St. Nicholas streets. The building was constructed from the designs of Mr. Johnson, of this city, architect; but owing to legal difficulties the original plans were not adopted, and instead of its being four stories it is reduced to three. The building consists of a shop, show-rooms, store-rooms, and all necessary offices required in the trade. The shop-front contains the largest panes of plate-glass in the city, each containing 100 superficial feet. The exterior of the building has been ornamented, the sash-panels to the arched windows being filled with wood carvings. The interior is lighted at night by sun-lights on a new principle. The wood-work was executed by Messrs. Hemming, the brickwork by Mr. Beard, the stonework by Mr. Hiron, the plumbing and glazing by Mr. Tomlinson, and the carving by Mr. Forsyth. The Messrs. Badger gave a supper to the workmen who had been engaged in the erection of the premises, as well as to their own workpeople and a number of friends, to commemorate the completion of the house and to inaugurate the opening of the new shop. About 100 sat down to supper at the Holly Bush Inn.

Miscellaneous.

THE COSTERMONGERS.—Mr. Gathorne Hardy has brought in his Bill to modify the operation of the Streets Act so far as the costermongers are concerned, and it has been read a second time.

A PEOPLE'S PARK FOR LUTON.—At a large public meeting of the inhabitants, the offer made by Mr. J. S. Crawley to the Moor Committee, of forty-three acres of land on the old Bedford-road portion of the moor, containing about eleven acres, and a sum of 2,400*l.*, has been accepted. He will also give up the title on the land, amounting to more than 5*l.* per annum, and present the committee with 50*l.* to help them to fence the park, on condition of its being laid out by some competent person.

MRS. GLADSTONE'S CONVALESCENT HOME.—An influential meeting has been held in the London Tavern, to promote the object in view in the establishment of a convalescent home at Snarbrook. Mr. and Mrs. Gladstone were present on the platform, as also the Bishops of Chester and Rochester, Lords Cranbourne and Hay, Mr. Hepworth Dixon, and many others. Appropriate resolutions were unanimously passed, the enlargement of the Home being the chief object in view. Committees are to be formed, and subscription lists opened for the purpose. The object is an excellent one, such as we have long advocated, and we hope that abundant means will shortly be forthcoming to ensure the desired enlargement.

OUR SCIENCE AND ART COLLECTIONS.—In the House of Commons, Mr. Layard asked the Chancellor of the Exchequer whether it is his intention to propose any measure for the better administration of the British Museum and other institutions in the United Kingdom connected with science and art. In reply, the Chancellor of the Exchequer said he was not prepared to bring forward so extensive a measure as that suggested, but he was engaged with a more limited measure, which, if accepted, will effect such a separation of collections as he promised to give his attention to last session. Mr. Layard also asked whether the sum of 15,000*l.* voted by Parliament for purchase of objects in the Paris Exhibition, in consequence of a report of the select committee appointed last session, has been expended? and if not, why not? In reply to which Lord R. Montagu said, that it was the opinion of the House that we should only expend for this purpose the sum saved out of the fund; and as that did not exceed 4,775*l.*, no more could be expended.

ALL SAINTS CHURCH, YORK-STREET, LAMBETH. This church has been re-opened. From being one of the gloomiest churches of all London, it is now one of the brightest. Colouring has been used, and the seats have been thrown open.

WALKING ON WATER.—At Holyhead nearly the entire population turned out this other day to witness a gentleman walking on the water in the harbour in large shoes, like snow shoes. He did not at any time sink below the knees and went along at his ease, smoking a pipe. Between forty and fifty years ago, a person traversed the harbour of Leith in a somewhat similar way, only in that case the "shoes" were air-tight tins, three of which were affixed to the three feet of a tripod, on which the water-traverser rode. He had paddles attached to his feet, by which he rapidly propelled himself.

DESECRATION OF A CHURCHYARD.—At the Arches Court judgment has been given in the case *Adlam v. Coulthart*. The promoter is one of the magistrates of Somerset, and the defendant churchwarden of Chew Magna, who had caused soil and human bones to be removed to improve a pathway to the church, and had placed them in a field. Mr. Adlam instituted proceedings before Dr. Lushington, and the defendant was ordered to replace the soil and bones and to pay 100*l.* costs. He alleged that he could do neither—that he was a bankrupt, and that the field was in the possession of trustees under a marriage settlement of his daughter. The present application was a commitment for contempt. Sir Robert Phillimore gave judgment, and dwelt on the sanctity of a churchyard. A serious offence had been committed, and he pronounced the defendant in contempt. He would withhold the proceedings for six days, in the hope that the bones would be restored, otherwise the order would go to the Court of Chancery for contempt.

THE INITIALS F.S.A.—The secretary of the Society of Antiquaries, Mr. C. Knight Watson, wrote thus to Mr. Le Neve Foster, the secretary of the Society of Arts:—"Would you have the kindness to call the attention of your governing body to the following resolution, passed at the last meeting of our council, Earl Stanhope, president, in the chair.—'It having been represented to the council that several members of the Society for the Encouragement of Arts and Manufactures, &c., have appended to their names the initials F.S.A., and thus led to a confusion between the "members" of that society and the "fellows" of this, the secretary was instructed to call upon Mr. Le Neve Foster, secretary to the aforesaid society, and invite his attention to the inconvenience of this practice.' Hoping some measures may be taken by your council to deter your members from adopting initials to which they have no title, I am, &c." Mr. Foster has accordingly informed members of the Society of Arts that, "neither by the charter, by the bye-laws, nor by custom, is there any authority for their placing the letters 'F.S.A.' after their names."

COOKHAM BRIDGE.—A new iron bridge over the Thames has been recently opened for traffic, at reduced tolls. The tender accepted for the work was that of Messrs. Pease, Hutchinson, & Co., of Darlington, and London, whose estimate was 2,520*l.*; and premiums were awarded for the two next best designs, those of Messrs. Pele & Co., and Mr. John Pinchbeck, of London. The length of the new bridge over all is 335 ft., and its length between abutments, 300 ft. The clear width of the roadway is 20 ft., and the height of the bridge at the centre, from the bed of the river to the top of the handrail, is 30 ft. The superstructure consists of a wrought-iron continuous girder supported at intervals of 40 ft. upon piers formed of iron piles. Ornamental cast-iron brackets are introduced at the angles formed by the piers and girders. The platform is of Mangel planking, 3 in. thick, and is covered with a thick coating of asphalt before the metalting was put on. The abutments are of red brick, with ashlar caps and string courses. The contractors are large iron manufacturers as well as bridge builders. The solidity and strength of the new bridge was lately tested when immense vans containing Mander's manure passed over it. There were three of them upon it at one time, the first of which weighed about 14 tons, exclusive of its nine draught-horses. The work was carried out under the superintendence of Mr. W. G. Fosswick. The bridge was erected under the inspectorship of Mr. William Atkinson, of Westminster, C.E., who acted as the representative of the Cookham-bridge Company.

CAMBRIDGE ARCHITECTURAL SOCIETY.—On Thursday evening last, Mr. William M. Fawcett gave some account of a tour in Belgium, which he illustrated with several photographs.

PASSENGERS AND GUARDS.—It is said that Government is about to impose an order upon the railway companies for the adoption of a uniform system of intercommunication between railway passengers and guards, and between guards and drivers. The Duke of Richmond, President of the Board of Trade, has met the engineers (telegraphic and general), and the managers of the principal railway companies, for a conference on the subject.

NEW NATIONAL SCHOOLS AT BULWELL.—These schools have been inaugurated. The building, together with the master's house, is of Bulwell stone. Mr. R. C. Sutton, of Nottingham, was the architect; and Messrs. Dennett, of Nottingham, were the builders. The cost was about 2,000l. There is a boys' school, 40 ft. by 24 ft., and girls' school, 70 ft. by 20 ft., separated by a movable partition. The building is surmounted by a bell turret. There are separate playgrounds, on a large scale, for the boys and girls, adjoining the schools.

SOUTH LONDON WORKING MEN'S COLLEGE.—This college is intended to offer to working men in South London an education of a high character, by means of classes in languages, mathematics, and physical science, together with lectures on history, politics, moral and social science, &c. There will be also, in connexion with the college, a night school (for men only), a day school for boys and girls, and afternoon classes for women. The college is to consist of six classes of members. The college is expected to open immediately after Christmas. Particulars of the classes, school, &c., may be had from the Hon. Secretary, Mr. William Rossiter, Tottenham, N.

NEW THEATRE IN LANGHAM-PLACE.—It appears that we are likely to have a comic opera in London, Mr. German Reed having taken St. George's Hall, Langham-place, for the purpose. The project could not be in better hands. The hall is undergoing the necessary alterations, in the construction of private boxes, and the enlargement of the stage for the production of opera and extravaganza. An undertaking like this interests all classes; and it has been intimated to us that the prices of admission will be within the range of the poorest amateur. A new operatic extravaganza will be immediately announced, from the pen of Mr. F. C. Brauand, and Mr. A. S. Sullivan, a rising composer. The Gallery of Illustration will be unaffected by Mr. German Reed's connexion with the St. George's Opera House.

IMPROVEMENT IN THE SANITARY CONDITION OF LIVERPOOL.—At a meeting of the Liverpool Health Committee, the chairman stated that the mortality during the past year, as compared with the two previous years, showed a satisfactory decrease; and in comparing the years 1866-7 with 1865-6, there was a saving of between 4,000 and 5,000 lives, the death-rate having decreased from 36 in the 1,000 to 29·4 in the 1,000. During the year the corporation had expended 10,000l. in connecting the drainage of poor property with the main drains, 1,800l. in opening courts, and upwards of 45,000l. in the improvement of poor dilapidated property. In reference to the sub-letting of houses, the medical officer of health said that there were 1,867 houses registered under the Act of Parliament, which he considered was one of the most salutary that could be formed.

BURSTING OF A RESERVOIR AT PRESTON.—A very alarming accident has happened on the premises of Messrs. McGuffog, cotton manufacturers, Preston. The establishment of the firm named has at the rear of it two lodges or reservoirs for warm water. One of the lodges is a new one, and about six weeks ago, when it was being filled, it burst through the breaking of an iron pipe. Since then the contractor has repaired the breach, and steps were again taken for filling it. The lodge is about 57 ft. long, 37 ft. broad, and 7 ft. deep. When the water had got about a foot from the top, the northern wall of the lodge, which is about 14 ft. high, 5 ft. 6 in. broad at the foundation, and 3 ft. at the top, gave way in the centre; an aperture about 18 ft. wide, and reaching from the bottom to the top of the wall, was made, and through it all the water rushed with great impetuosity, deluging houses and streets in the vicinity. There were no buttresses to the wall which gave way.

SNPPER TO A FOREMAN.—On the evening of the 20th inst. a complimentary snpper was given by the farmers and tradesmen of the village of Stratton Audley, at the Plough Inn, to Mr. Copping, foreman to Mr. Simpson, who has recently completed Cotmore House for Mr. W. W. M. Deever, as a mark of the good opinion he has won in connexion with the building of this mansion.

LIBRARY FOR EDINBURGH.—A meeting for the establishment of a free public library in this city has been held in the New Assembly Hall, the Lord President in the chair, supported by Lords Neaves and Ardmillan, and other gentlemen on the platform. Various resolutions in favour of the object were passed by acclamation, and a subscription list is to be opened at the banks and public places, the proceeds to be devoted to the purchase of a free public library building to be handed over to the town council. Bailie Skinner was appointed to act as honorary secretary.

POLLUTION OF RIVERS.—The Pollution of Rivers Commissioners, Mr. Robert Rawlinson, C.E., Mr. John Thornhill Harrison, C.E., and Professor J. T. Way, with their secretary, Mr. S. J. Smith, have paid a visit to Bolton, for the purpose of inspecting the Crol and its tributaries, comprising the river Tong, the Bradshaw Brook, and the Middle Brook, and their tributaries (which are numerous), and the water-shed to which streams embraces an area of about 50 square miles. Mr. Rawlinson explained to the mayor and other local authorities, that his colleagues and himself had come to make proper preparations for the official inquiry to be hereafter held. The commissioners were entertained to luncheon by the mayor.

NEW CONCERT HALL AT BRIGHTON.—A new hall for concerts, &c., is about to be opened at Brighton. It has been built by Mr. William Childs. The concert-hall will be approached by four entrances,—two in West-street and two in Middle-street,—8 ft. each in width. At the former will be a stone staircase leading to a gallery, 35 ft. in width, capable of seating 300 persons. The front of the building is intended for dining-rooms and other purposes. In Middle-street rooms will be set apart for cloak-rooms, &c. The hall itself is 200 ft. in length, 46 ft. 6 in. wide, and 51 ft. 9 in. in height. The design of Mr. Childs, and the builders under his direction, has been to make the building fire-proof. There are also many means of convenient egress. The architect is a townsman, Mr. Horatio N. Gouly. The floor is composed of rolled iron joists, filled in with 6 in. of concrete, the flooring being laid upon the top thereof, and able to support 3 cwt. of every square foot of surface. The construction has been supervised by the Town Council authorities, and the requirements of the Local Act are adhered to.

SANITARY STATE OF NOTTINGHAM.—The annual report of the local sanitary committee is more satisfactory than usual, and the tables are more comprehensive. The death-rate now is 19 per 1,000, and has been gradually reduced in consequence of the formation of new and wide streets in the old and densely populated part of the town; the new sewerage system, which has been very extensive and not yet complete; the extermination as far as possible of cesspools; the regular disinfection and removal of all refuse and decomposable matter; the ventilation of the sewers; and, above all, the regular, systematic, and complete washing and scouring of the courts and alleys from the water mains, aided lately by a steam fire-engine. During the past eight years the expenditure of the corporation on new streets, sewers, subways, opening out courts and alleys, sanitary work generally, paving with granite, and flagging with Yorkshire flags, and in new buildings, houses, and other works of construction appertaining to sanitary and municipal welfare, has been about a quarter of a million; while the total borrowed money is only about 140,000l. The rates for the works referred to, i.e., those imposed under the Public Health and Sanitary Acts, are after all no more than 1s. 6d. in the pound. The rateable value of the town proper is about 170,000l.; the population of the town proper, 85,000l.; and the population of the true urban area, which is, in fact, Nottingham, is about 130,000l. The report contains meteorological and rainfall tables by the able surveyor to the corporation, Mr. Tarbotton, C.E. Mr. Richard Townley is the sanitary inspector of the borough.

WORKING MEN'S COLLEGE.—We understand that it is determined to proceed at once with the meeting-hall, museum, and studios at the Working Men's College. The committee have 1,200l. subscribed, and are endeavouring to raise another thousand. A design for the new buildings has been furnished by Mr. Webb.

LABOURERS' DWELLINGS IN LIVERPOOL.—The seventy designs submitted in response to advertisements offering premiums of 100l. and 200l. for the best plans of labourers' dwellings, are to be exhibited publicly from the 28th inst. to December 12, in the Exhibition-rooms, Post-Office-place, between the hours of three o'clock and nine p.m.

THE LAKE IN REGENT'S PARK.—Mr. T. Chambers asked the First Commissioner of Works the nature of the alteration proposed to be made in the ornamental water in the Regent's Park. Lord J. Manners said it was proposed to drain off the water, and level the bottom of the lake to a uniform depth, so as to avert any such calamity as occurred last winter.

TOWN-HALL FOR EAST GRINSTEAD.—At a meeting in the Public Room, at East Grinstead, it has been resolved to erect a town-hall. There was a good attendance. The sum required has been estimated at 1,500l., and it is proposed to raise the money by shares of 1l. or 2l. each. There is a difference of opinion, however, as to whether one floor be enough, and two floors it is calculated would cost 2,000l. The chairman of the meeting, Mr. C. Cheval Tooke, spoke in favour of two floors. It would be unwise to build less.

THE LINCOLN ART TREASURES EXHIBITION.—The number of visitors to this interesting collection of pictures, objects of art, geological and other specimens, has been very considerable since it was opened, but not to the extent that could have been desired. The committee have been working during the last twelve months to bring together this collection, their object being that skilled artisans and tradesmen's assistants should have an opportunity of enjoying for a time such an exhibition the equal of which could only be seen by a visit to London. Each evening instrumental music has been provided.

CO-OPERATING AND COMMINGLING.—The employees, on opening the extensive retail grocery department of the Bacup Co-operative stores one morning lately, found the place piled up with broken ironmongery, earthenware, bacon, broken timber, a large quantity of bugs of flour in all directions, parcels of groceries mingled in confusion with heavy wringing-machines and such like articles. It appears that during the night the store-room, which is above the grocery and general shop, had fallen in, in consequence of the great quantity of goods stored in it. The building was erected in 1862. The damage will be considerable.

INDUSTRIAL EDUCATION OF FOREIGN AND ENGLISH WORKMEN.—An excellent speech on this subject by Mr. Samuel Smiles has been printed. It was delivered at the Hindersfield Mechanics' Institute in October last. Mr. Smiles thinks, with others, "it is every year becoming more clear that it is not only in the school of practice, but also in the school of science, that the advanced workmen must be trained." He dwells upon the sad inferiority of our workmen in general and technical education by contrast with foreign workmen. "While the working class organizations of this country," he remarks, "are exacting regulations for the limitation of skill,—so that the standard of work shall be not that of the best but of the most ordinary workman,—the foreigners are stimulating the skill of their workmen, rewarding those who excel in it, and in all ways actively promoting the industrial education of their people." These are, indeed, serious facts, which can no longer be ignored.

TENDERS

For the erection of six houses at Lower Norwood, for Mr. George Nightingale. Mr. Albert Bridgman, architect.—
Cumming (accepted) £1,400 0 0

The Builder.

VOL. XXV.—No. 1296.

The Ninth Crusade.—Recovery of the Site of the Temple.

AMONG the wonders of the nineteenth century the future historian will remark the re-appearance on the scene of active life of names long since consigned to silence, if not to oblivion. A military emperor,—not a long-descended sovereign bearing that august name, but a soldier who arrived at supreme command from the rank of ashaltarn,—has again overawed the Government of Rome by legions raised in Gaul. A second of the name, if not of the blood, of the Corsican Emperor has restored in Western Europe

the personal mode of rule of the Cæsars, and has claimed the inviolability attributed to the perpetual Dictators of the Augustan series, on the ground that they were Tribunes of the People. Eleven centuries after the death of Desiderio, the last Lombard king, the title which the Gothic and the Lombard chieftains here has been assumed by a Savoyard prince, who (if we disregard mere titular sovereigns who played a brief part during the decadence of the Carolingian monarchy), is the thirty-third king of Italy. In the presence of a Gaulish emperor, and of a northern-bred king of Italy, it seems not incongruous to speak of the origin of a ninth crusade.

Whatever changes the past eight centuries may have witnessed in European society, it is clear that one of the most remarkable phenomena of social life, namely, the liability to sudden and violent gregarious impulse, in the form of a panic or a mania, has been of repeated occurrence during the whole of that lengthened period. The currents of human thought have changed their direction no less than the aspect of the great centres of European life has altered, since the date of the consecration of Westminster; but no modern instance of violent contagious impulse has exceeded, if any has equalled, the force of that which, during the last years of the eleventh century, and on several succeeding occasions, hurled the chivalry and the piety of Europe against the walls of Jerusalem. Fantastic as they may appear, to our colder reflection, the confidence that all crimes were secure of pardon at the price of so much infidel bloodshed, there can be no question of the deep and fervid religious feeling that prompted and fed those crusading expeditions the indirect results of which have had so much influence on the national life of the Europe of the Middle Ages.

To speak of a crusade in the nineteenth cen-

tury may, at first, provoke the smile which greets an anachronism. But it is a positive fact, however incredible it may appear to many, that during the time of trepidation and of change that marked the last few months of the reign at Naples of Francis II., when the regulations fettering the press were relaxed, and when the revolution was making headway in Sicily, fly-sheets were issued and sold at the price of a Neapolitan farthing, calling on the youth of Naples to rally for an actual crusade for the recovery of the Holy City from the Turks. It is more than probable that this ill-timed exhortation was intended as a forlorn hope to divert into a channel harmless to church and state the hot blood that was beginning to seeth in Southern Italy. The defence of one holy city from revolution, by occupying in another direction the ideas of those who were disposed to rise, or, at least, to shout, for some cause or for some cry, was probably much more present to the minds of the authors of those crude and absurd appeals, than was the rescue of another and a more ancient city, begirt with a far loftier sanctity, from the disciples of Islam. However that may be, so it was that in Southern Italy, in the full blaze of the nineteenth century, an attempt was made, simply and literally, to revive the teaching of Peter the Hermit, and the cry of *Dieu le veut*. Certainly there is a school to which Time fails to impart wisdom.

While such warlike outbursts as the South of Europe witnessed in 1860, and again in 1867, have been directed to the secularising of Rome instead of the Christianising of Jerusalem, there has been in our own land, and among a class of persons not ordinarily swayed by ignorant impulses, quietly organised, and not only organised, but commenced, an actual crusade. Nay more, the success of the crusaders of 1866 has hitherto been as marked as their enterprise has, in its commencement, been unpretending. If we can hardly say with propriety that our late guest, the Caliph, has struck his flag to them, his Highness has, at all events, ceased to oppose their progress. By sap and mine they have attacked the very walls of Jerusalem, and the siege is so well and skilfully ordered that, if the column of attack he only duly supported, there is military reason to count upon complete victory. Over the hosts that have hitherto kept such invaders at a distance a signal advantage has been recently maintained. The howling dervishes, who were wont to excite the fury of the mob if a Frank dared to profane the Sacred Precincts, have been silenced. The natives appear to have lost their hostility to the strangers who came to dig for the buried treasures which alone would instigate, it was thought, their activity. The very Governor of the beleaguered spot, the Pasha of Jerusalem himself, has been awed or persuaded into non-resistance. Her Britannic Majesty's Government has contributed an auxiliary force of the ablest and most distinguished corps in the Queen's service, and an officer of the Royal Engineers is in command of the attack. And from time to time the public is made aware, through the press, of the proceedings of the sap of Jerusalem.

The results already obtained are of no light importance. The final result of this most liberal and enlightened crusade can hardly fail to be the rolling back of that dense cloud of oblivion and of ignorance that yet shrouds the storied localities of the most famous spot on earth. Besides that general interest which appeals to many educated men,—to most children who have attended to the instruction of a Sunday school,—to all women who ever listen to a verse of the Gospel,—a special and peculiar interest exists for several distinct classes of thoughtful readers and leisurely investigators of history. The archaeologist has a field of unrivalled fertility opened to his research by a labour that lays bare the long-buried remains of so many massive re-

constructions of the structures and defences of the Holy City. The architect has vexed questions to solve of the traces left by his predecessors in the times of Constantine and of Hadrian; by the magnificent builder king, Herod; by his more renowned, if not more marvellous, predecessor, the first builder on the spot yet held sacred under the name of the Haram. Farther back than the reign of King Solomon, more than 4,000 years before the date at which we write, we have the earliest historic mention of the "City of Peace," and indications may be traced here and there that the enormous bulk of the stones prepared by Solomon, and yet to be found *in situ* and in quarry, was the consequence of the resolution of the wise king that his structure should not be dwarfed by comparison with the fresh remains of the earlier builders, the giants, whose name yet lingered in his times in the valley of Rephaim.

To the engineer many questions of extreme interest are presented by the system of water supply of ancient Jerusalem; the tanks, wells, and conduits; the course of the brooks; and the aid rendered to, or the constraint enforced upon nature, in that series of pools, culverts, and subterranean arching of which so much remains in high preservation. We will not speak of the ecclesiastic; but the primate of the English Church encourages by his authority and example not only his own clergy, but those of other communions and denominations, to aid by voice and hand, not forgetting the *obolus*, in the illumination of the cradle of Christianity. Nor is it possible to foresee with accuracy the great advance, in the true comprehension of both the Greek and the Hebrew Scriptures, to which the removal of the topography of Jerusalem, from the dominion of doubt and dispute to that of accurate survey, may give rise.

We have seen the recovery of two cities of Campania from beneath the accumulated lava and ashes of Vesuvius, which not only overthrew, but to a wonderful extent preserved them; and we have thus acquired a familiar acquaintance with much of the Latin life of the Imperial times which we could never have derived from literary sources alone, copious as they are. We have heard, some years since, of a proposal to divert the course of the Tiber, in order to search its bed, paved as it is with fractured marble, for relics of art which must have been so freely committed to its tide during the successive assaults on Rome, and its capture by Goths, Vandals, and by Christians. But it is only very recently that we have become aware how much there is of ancient Jerusalem in buried, but actual, existence, needing only the quiet maintenance of works that are now really being carried on, to bring it to light. The survey and disinterment of Jerusalem will do as much for the student of the Old or of the New Testament as the excavation of Pompeii and of Herculaneum has done for the classical scholar.

Very much has already been placed within the reach of the English student by the researches of the Palestine Exploration Fund. Much of Palestine has been accurately mapped and levelled. A plan of Jerusalem itself, on a large scale, has not only been completed, but contour lines are drawn upon the map. The numerous and excellent photographs that are published with the two above-named maps are calculated to answer many a curious and important question, and to transport the imagination to the sacred scene. The men of the present time look like dwarf scales by which to measure the thickness of the enormous courses of the ancient wall. So much has been already done that no lover of the subject can rest content until the buried city gives up her yet hidden stores of information. The researches actually in progress show that the rude demolition of Titus has to some extent, like the lava and pumice of Vesuvius when poured over the

doomed cities at its base, preserved in a violently-made grave very much of the architecture of the past that would otherwise have gradually, but certainly, mouldered beneath the touch of Time. We have not space at this moment to enter minutely into the subject of the course and aim of the excavations, but we will refer to a single instance of the manner in which the enterprises of the present explorers bids fair to throw light on the history of the most famous spot on earth.

There exists in Jerusalem a spot held sacred both by Jew and by Moslem, and venerable to both Latin and Greek. An oblong area, of some 1,800 ft. by 900 ft., surrounded by a massive wall, and within the nearly bare plane which surmounts it, is adorned by famous mosques, and covered with earth, which the piety of a former caliph purified from infidel defilement by the expenditure, it is said, of seventy-five camel-loads of rose-water. Here stands the mosque of Omar, one of the most famous sanctuaries on earth; here stood the yet more venerable sanctuaries raised by Herod, by Zorobabel, and by Solomon. Vast galleries and lofty piers beneath the present surface show how, in accordance with the description of Josephus, the level of the highest part of the mountain was carried on towards the south and east by colossal masonry, the original work and design of Solomon having been augmented by later additions, most especially by those of the magnificent Herod, shortly before the Christian era. The southern wall before the Christian era. The southern wall of this terraced mountain reached a sheer height of 150 ft.

Now it is upon this sacred spot Mr. Ferguson supposes that the Church of the Holy Sepulchre was built by the Emperor Constantine. Tradition, on the other hand, in which there seems no room or opportunity for any break to have occurred, sends the Latin and Greek pilgrims to pay their devotions in a building situated in an entirely different part of the city, and long known by that name. The subject has been previously discussed in our pages. The thorough investigation of the whole structure of the Haram wall, when complete, enable a competent judge to distinguish with certitude the masonry of Moslem, of Crusader, and of Roman, from that of Assyrian times, and to trace beneath all the mighty relics of the work of Solomon. It will then be no longer matter of doubt whether it was possible for the scene of the entombment to have been so near the site of the Holy of Holies; nor can we fail to expect that the position of that sanctuary itself, of the Tower of Antonia, of the subterranean passage connecting the latter with the Temple, and of the four gates leading from the Temple inclosure to Zion, and to the lower city, will all be distinctly recovered and determined by excavation. For the Crucifixion to have taken place within the limits of Herodian masonry, is of course impossible.

There is one point connected with the exploration of Palestine to which, so far as we are aware, attention has not as yet been directed. The chief records which we are now slowly learning to decipher in Egypt are sepulchral. Temples and palaces exist in that unchanging climate, as they have done in the Mesopotamian cities, rich in sculptured records of their builders, engraved in pictorial representations and in long inscriptions on marble slabs that lined the stately apartments. But our chief knowledge of Egyptian history and manners has been derived from the tombs, from the sepulchral rites, from the Book of the Dead, and from the papyri enclosed in the mummy cases. In Palestine this source of information, if it exist, is as yet untouched. We are, indeed, aware of a remarkable series of sepulchres, called the tombs of the kings, which can in no way be plausibly connected either with the Assyrian dynasty of Princes of Jerusalem or with that of the House of David, and which, therefore, if the title be appropriate, must have belonged to the ancestors of the Jehuiste Arahmah, who "did as a king give unto the king" whose sword had won the city of Zion, the site of the opposite hill Moriah, and to the kindred of that earlier "King of Peace" whom Jewish tradition identifies with the patriarch Shem. We have no record of any violation or spoliation of royal sepulchres either by Nebuchadnezzar or by Titus. In the latter case, from the full account which we possess of the siege, we are justified in assuming that no such event occurred. In the former instance it is no less unlikely, as the entrance of Herod into the outer part of the sepulchre of David and Solomon is mentioned by Josephus (Ant. xvi.

7.1). There is, then, a fair probability of the existence, not under the Haram but in Zion, of the undisturbed sepulchral vaults of David, and of many of his successors, in which copies of the Sacred Books and other contemporary records of the utmost interest may yet await the search of those who may be undeterred by the awe that fell on Herod himself, or by the mysterious huff that is said even now to greet any who venture to enter the last dwelling-place of David's progenitor, the patriarch Isaac.

We have spoken of the claims which the supporters of the Palestine Exploration Fund have upon special groups of scientific or professional men. These claims are not alone for admiration and for praise, but for that free contribution of money without which the task of the actual labourers in Palestine is indeed ungrateful. A good and generous example has been set by the President of the Royal Institution of British Architects, who has not only written to give the weight of his personal and official support to the no less practical document of a cheque for a hundred pounds. To the tens of thousands of persons able to aid in the work, and who will not be unwilling to do so when addressed on the score, if not of religious principle, at least of religious sentiment, it is not our special function to appeal. There is another, and a very extensive class, each of whom will so well understand our meaning, that it is unnecessary to be more explicit in their description, which we may well and unhesitatingly address. Bound together by the common tie of a brotherhood in works of charity and of mercy, they can turn no deaf ear to a call for aid in a work of illumination. The recovery, in the quarried interior of Mount Moriah, of the yet unobliterated masons' marks of Solomon and of Hiram; the determination of the exact dimension of the sacred cubit; of the measurement, in English feet and inches, of the porch and the altar, and the symbolic hazen columns; the illustration of a site and of a structure second only in its venerable antiquity to that of the earlier wooden symbol of a universal church: these are objects which can never be abandoned for want of pecuniary support, if they are clearly set before the attention of those who would think any sacrifice small if it led to the recovery of a "lost word" hidden beneath the secular foundations of the Temple. We do good service to good men in calling all within reach of our appeal to aid, by voice, and hand, and purse, in the crusade of the nineteenth century.

THE ARCHEOLOGIST'S HANDBOOK.

THE popular notion makes an antiquary a grey-headed old gentleman, "with spectacles on nose and pouch on side," like Mr. Oldknuck of Monkhamns, one who has generally mounted many more than half the rounds of the ladder of life. Perhaps the reason is that the information, the possession of which constitutes the antiquary or archaeologist, is spread over so vast an area, and is therefore so difficult of attainment, that it is not usually attributed to any till years have given them leisure and inclination for its pursuit. A very useful volume has been compiled by Mr. Henry Godwin (of Newbury), for the purpose of placing a large quantity of this information, in a condensed form, in the hands of the students of archaeology.* No one need wait, now, till he can attack the Record Office and the British Museum, or ponderous county histories, or visit our exhausted cities, to commence the fascinating study of archaeology. Beginning with pre-historic times, this new guide steps through the centuries claimed by the Ancient Britons, Romans, Saxons, Normans, and English of the Middle Ages, placing upon his page as he goes strings of the most prominent facts appertaining to each. These facts are for the most part such as it is indispensable to be familiar with, generally, before selecting any particular branch which choice, or facilities, may render an inquirer anxious to pursue further. "The experience of some years of irksome and humiliating though unavoidable ignorance," as a silent but not unobtrusive Fellow of the Society of Antiquaries, has guided him, he modestly says, in the selection of the information that is most requisite. This, as any

one knows who has taken a single step in search of it, has to be sought in tomes of price and weight, and, more frequently still, in public documents only to be viewed by journeys to the place where they are kept; and as often in local museums, private collections, or by means of examination of buildings and objects in different parts of the country. In the handbook before us we have the pith of many volumes, the results of many journeyings, the proceeds of much observation. Besides a chronological account of our antiquities, the author gives us a number of lists and tables that will save even the accomplished archaeologist much more tiresome references, such as a list of the Roman emperors and consuls, of the Roman governors in Britain, of the British princes subsequent to Roman domination in England, of the kings prior to the Heptarchy, of the kings of the Heptarchy, and a table of the establishments of bishoprics in that age. Coming down the stream of time, he gives chronological tables and alphabetical lists of most of the events and objects which it is necessary for the archaeologist to have within immediate reference, if not indelibly engraved on his own memory, such as the geographical divisions of the country under the Romans, Saxons, and Normans successively; Danish antiquities; tables of the hirths, marriages, and burials of the sovereigns of England, in the Norman and Mediaeval period, their judges and supporters, the architectural works executed in their reign, and so on. Then, again, he gives a list of mitred abbeyes, of monasteries, and of religious orders; an alphabetical list and history of English castles, of royal licences and arms from the eleventh to the seventeenth century; a list of the places appointed for holding tournaments; and a quantity of miscellaneous information as to brasses, helms, ecclesiastical symbols, representation of saints and their emblems, tombs, seals, and other objects of antiquarian interest. As we have said before, this is a very useful collection, condensation, and classification of facts hitherto scattered over a large area, in costly forms, and often in inaccessible places.

Widened wishing to be thought as difficult to please as the clergyman who was not satisfied because there was one vacant seat in his otherwise crowded church, we must regret the loss the work has sustained in the absence of a few woodcuts to make the information precise that it is impossible to convey without illustration. As in old time pictures were the hooks of the simple, so they will ever be the assistants of the learner. No language is graphic enough always to give precise realizations of minute and important distinctions in objects to some minds, while a few strokes of the pencil bring in a fresh faculty to aid the task and secure the performance of its aim. In descriptions of the differences in architectural mouldings and other ornamentation which mark the transitions and perfections of various periods of art, what can compensate for the absence of the representation of specimens? It seems to us that it would be as easy to describe the differences in archaic numerals, letters, and abbreviations, without examples, as to convey to students a swift, just, and discriminating appreciation of architectural distinctions without outlines of them.

A little more fulness in other respects would have improved the work without taking from its handbook character. The author suggests that it should also form a companion to the English tourist. If so, the tourist must confine himself to a line of wanderings almost exclusively south of the Humber. Except in some of the lists and tables, the great store of northern antiquities is untouched. The Archaeologia Eliana of the Society of Antiquaries of Newcastle, and the carefully kept proceedings of the Surtees Society, would afford many additions; so that to a great extent the archaeology of the north is not represented. To begin with the beginning, we observe that our author deems it inexpedient to give more than "a passing notice" of pre-historic relics and epochs. This is a matter of regret, because any one consulting the handbook would be sure to expect mention of the leading terms and views relating to each period of antiquity. Thus Sir John Lubbock's classification of the Palaeolithic, Neolithic periods and ages of bronze and iron is quoted without reference to the views of some of the leading Scandinavian antiquaries of the day, who divide the stone age into two long-enduring periods. In the matter of Celtic earthworks, there is no mention of the existence of extensive remains of

* "The English Archaeologist's Handbook." By Henry Godwin, F.S.A. Oxford and London: James Parker & Co. 1867.

ancient British towns upon the Northumbrian hills, nor of the wonderful lines of mounds and ditches upon the Yorkshire wolds, one of which runs along the edge of the chalk escarpment for some twenty miles, and, with a similar line running along a corresponding ridge of oolite on the north of the Derwent, doubtless served as boundary-line between the possessions of tribes; and again, in the slight reference to the hearing of ethnology upon the identification of the races of this remote period, there is a somewhat vague statement that the skulls found in very early barrows are generally of the Dolicho-cephalic type, unaccompanied by the information as to what kind of skull is found in the exceptional cases. Now, Mr. Greenwell's recent and long-continued explorations in the wolds have placed a great many facts at our command relating to the ethnology as well as customs of these early peoples with which every student of the subject should be acquainted. From these we may conclude that the long-headed people were the makers of the long barrows, and the round-headed people were the builders of the round barrows; that the long-headed people were the earlier of the two; and that it was the round-headed people who brought with them a knowledge of bronze. More than this, it appears likely that the long-headed people were cannibals. Barrows have been opened in which as many as eighteen remains of hodies have been counted, with all their bones broken and separated, as if for the purpose of eating the flesh upon them more conveniently. One of the skulls examined by Mr. Greenwell, found in such a collection, was broken into six or eight pieces with two blows, the marks of which were distinctly visible. This violent death, taken in connexion with the dismemberment of the bodies, leads us up pretty closely to the inference that cannibalism was a feature in pre-historic feasts. It is worthy of note, too, that in the heap of chalk and flints piled upon these hodies are found quantities of pieces of pottery and chippings of flint, as though they had been thrown in in accordance with the custom indicated in the Welsh saying, *Karn ar dy ben*, equivalent to our "I'll betide thee," but literally "A heap be upon thee."

In the Roman section of the work there is a quantity of valuable information. Among other lists that must have taken considerable research to compile, is a list of the Roman altars found in different parts of the country. It so happens that the explorations at Rochester, Breminium, executed at the cost of the late Duke of Northumberland, led to the discovery in a vault there of a fine altar, inscribed with the following dedication: "To the genius of our Emperor and of the standards of the first cohort of the Varduli, and of the detachment of pioneers of Breminium, Cornelius Equatius Lucilianus, the imperial Legate, Proprietor, under the superintendence of Cassius Sabinianus, the Tribune, erected this altar," an example which should be included in any subsequent edition. And a short time ago the *Builder*, in a notice of Dr. Bruce's work on the Roman Wall, gave an illustration of a fine altar to the unknown god Antenocivius, which may be added. In this same list, which is alphabetically arranged, we come to Riechester, Northumberland; and subsequently, after the intervention of mention of nine altars found at Bisingham, we come to Rochester in Northumberland (Breminium), as though it was a different place, but in reality Riechester is merely the name given to Rochester by some of the old antiquaries. The superb silver lance, nearly as large as a modern tannoy (1 ft. 7 in. by 1 ft. 3 in.), found in one of the supporting stations south of the wall, deserves a word for its impressive suggestiveness of Roman magnificence. In the Saxon section we do not find any reference to the Saxon crosses that form so considerable a part of the scanty architectural remains of that period; on the other hand, upwards of 120 churches are mentioned that contain remnants of Saxon work. Mr. H. Godwin gives the localities of 100 Saxon ceremonies. The old Anglo-Saxon poem "Beowulf," likened by Longfellow to a piece of ancient armour, "rusty and battered, and yet strong," is quoted by our author to show the Saxon skill in goldsmiths' work. We have but to peruse more of the adventures of that Viking in his successful fight with the giant Grendel, and ultimate discomfiture of the monster's mother, ending in the release of her soul from its "hone-house," to pick up sufficient mention of Saxon folk-steads, ale-revels, hear-carouses, wine halls, bracelets, bright ornaments borne on the naked breasts of chieftains, shields, axes, swords, and other war

gear, to stock a mental museum; and it has always seemed an oversight to us that archaeologists have not made more use of the fragments we possess of Anglo-Saxon literature. We commend our author's taste in this respect. Hereafter notice may be given of the existence of the Basle houses, which were a later kind of fortified dwelling in the oft-disturbed North; of Early English bridges, of which there are several beautiful examples in this country; and wayside chapels. Among the houses of the Knights Hospitaliers, we miss Chibburn, in Northumberland. This building stands about half a mile from the sea, facing Druridge Bay, surrounded by a moat. The ground plan forms a parallelogram, having a courtyard in the centre. It is mentioned in the return made of the goods of the Hospitaliers in the year 1313, preserved in the register of Bishop Kellaw, at Durham, as well as in the volume accidentally discovered on the removal of some plaster-work in the house of the Knights of St. John, at Malta, which contained a survey of the possessions of the Hospitaliers prepared by themselves, and which record has been printed by the Camden Society.

Our author goes systematically through the reign of every monarch from William the Conqueror, mentioning a large number of the ecclesiastical buildings executed in each of them. Of the seventy examples of Norman architecture, fifteen belong to the reign of the first William, beginning with Bury St. Edmund's Abbey; eight to William II., out of which five are the cathedrals of Lincoln (west front), Gloucester (crypt), Carlisle (north transept and pier arches), Durham (choir), and Norwich, Lindisfarne, Hurley Priory, Berks, and Christchurch Priory, Hants, making up the number; twenty-two to Henry I., amongst which are further portions of cathedrals, such as the choir of Canterbury, and the superb priories of Rievaulx, Fountains, Buildwas, and Furness; fourteen classed as Later Norman to Stephen; and eleven as Transition Norman to Henry II.,—a goodly array. The successive styles are still more numerously illustrated by mention of churches, colleges, and a few hospitals, houses, and halls. Our cathedrals are also treated alphabetically, the name of the builder or designer of its various parts being given with the date of the work. Thus, in the Cathedral of Canterbury, the works of "Lanfranc, Prior Ernulf, William of Sens, English William, Prior Henry de Estris, Prior Chillenden, Prior Goldstone, and Thomas Goldstone" are pointed out in the order in which they are said to have been executed.

Of course, in so long a list, there are little points which examination will enable him to rectify. Mr. Scott, for example, is not yet "Sir G." but this will be all right in time.

The author says of Arabic numerals that they were introduced into England about 1253, and the plate at the end of the volume gives one date in such figures as 1154! There must be some little mistake about this. We know of no date in Arabic figures in England earlier than the fifteenth century.

The author gives in a note the table of the dimensions of our cathedrals and principal churches which appeared in the columns of the *Builder*. As he regrets that he is unable to make the usual acknowledgments to the writer who took the pains to gather these together, having mislaid his reference, we may note for him that the table in question was compiled by Mr. Denison.

The number of alphabetical lists give the work somewhat of the character of a dictionary. An old lexicographer called his labours a world of words, and in the same figurative way we may call this gathering of antiquities a dictionary of archeological objects. We have heard it made a matter of complaint sometimes that everybody who can read an archeological work sets about writing one. Such butterfly writers will rejoice over this dictionary, where so much matter is set and dried ready for use. They have but to fix upon their period, for our author has done everything else for them. Suppose they select that of the great war-smith, Edward I. In this book, easily held on the palm of one of their hands, they may see when the monarch was horn; when he married Eleanor of Castile; when, whilst some of the crosses erected on the places where her bier rested could have been scarcely more than completed, he married Mary of France; where he was buried; the sort and shape of the armour he and his knights wore; the kind of helmet; the pattern of spur; the chain-mail comparisons of their horses; their poitrails, chanfrons, and fan-crests;

the heraldic devices on their high-pomelled saddles; the arms they bore, the form of falchion, anelace, stahing-sword (*épée à Vestoc*), and dagger (*miséricorde*); the varieties of their pole-axes; their triangular pennons charged with heraldic devices fluttering on the points of their lances. Then they have but to turn over a few pages to see what castellated work was executed in his reign; a few more, to see how our cathedrals progressed under his auspices, and what churches were built; a few more, to see whom he favoured with licences to ommatle; and others, to be reminded of the kind of tombs in which he, and his nobles too, found their long rest. The descriptions of the varieties of armour may be useful to the architect in assisting in arriving at conclusions as to dates of edifices. A summary of the changes in armour groups all that is "nusted, ringed, trelliced, tegulated, massled," and edge-ringed, as belonging to the twelfth century; complete mail, with the exception of pieces of plate for the knees, to the thirteenth; mixed mail and plate, with a preponderance of the former, to the fourteenth; that which is all plate but the gorget and gussets, and sometimes that which is all plate, to the fifteenth; fluted armour to the sixteenth; and half-armour to the seventeenth century. For all the wearers of these varieties of armour there were but five places in which tournaments could be held for the display of their prowess, viz., between Sarum and Wilton, Warwick and Kenilworth, Stamford and Wallingford, Brakeley and Mixberg, Blie and Tickhill. A knight of the reign of Henry VI. was not fully equipped without fifteen pieces of war-gear, beginning with his salhaties, or steel clogs with long rowelled spurs, counting the greaves, cuisses, breeches of mail, tallettes, breast-plate, hack-plate, vambraces, corselets, taward, and bassinet, that gradually covered his legs, body, arms, and head, and including his naked sword hanging on his left side, and his dagger on his right, and the pennoncelle put into his gannetted band as a finishing-stroke. In one example given by our author, this last was "pointed with Seynt George or our ladye to blisse him with." But have we not said enough to show the attractiveness, as well as usefulness, of this collection of Medieval word-pictures?

LABOURERS' DWELLINGS COMPETITION, LIVERPOOL.

In response to the offer of 200l. premium by the Liverpool Corporation, seventy-four sets of plans have been sent in. These plans are now being exhibited to the public in the old Academy's rooms, Post Office-place, and on the whole are exceedingly well hung, hot as regards light and level. This may seem, at first sight, but a trivial advantage; but those competitors who, in other competitions, have had their plans piled up in heaps behind doors, while others more favoured were hung in *the line*, will fully appreciate the advantage.

The whole of the plans were placed in the hands of the borough engineer for him and the town clerk and medical officers of health to report upon with respect to their accordance with the Local Building Act and Sanitary Bye-laws. We do not hear that the latter-named officers have had anything to do with the report, which has not been published; and we do not see in what way they could be expected to interpret bye-laws that are practically enforced only by the borough engineer, who is also the building surveyor. As far as we can remember, the plans must have been in the engineer's hands for about three months; and as we understand he has gone through them carefully one by one, they ought to have been pretty well turned over by this time. The Building Act seems to have been the great difficulty with most of the competitors—the rock upon which they have split; nor is this to be wondered at, for though a few of the later bye-laws with respect to width of streets and courts, distances between backs of houses, &c., were printed and supplied to the competitors, the Building Act, of which it is impossible to obtain a copy now, it being out of print, was a sealed book, a Liverpool Talmud, to most of the competitors. We are informed by the local papers that many of the best plans have been thrown out through their want of conformity to the Building Act. It really would seem to be a right question whether the mere deficiency of thickness in a wall, or depth, or distance apart of joists, a clerical error that could be remedied,

should be visited so heavily upon those who have given time, trouble, and expense to the solution of an interesting problem, without even the solitary satisfaction of knowing in what they are defective. The Liverpool Building Act may be termed pre-Adamic, and its inconsistencies and anomalies can, we are sure, be only fully appreciated by those professional gentlemen who practise in Liverpool, and have constantly to conform to it, and so in many cases weaken their constructions by adopting the antediluvian notions of the half-educated inventors of the code. But, enough of this at present; we may have to return to it.

In consequence of the special study and knowledge this said Building Act requires, it is not surprising that most of the plans selected as being in conformity with it, are by local architects well known to have gained sad experience from the submissal of plans for cottage property. In fact, taking the terms of the competition not as given in the instructions, but as exhibited by the interpretation put upon them by the authorities, the restrictions and the limitations enforced, and generally the putting every difficulty in the way of obtaining a good plan, it would almost seem that the friends of the jerry builders who are in the council, have had the ordering of everything. Indeed, this must be true; for the engineer's own plans were overthrown in consequence of their not being able to withstand this crucial test—this trial by fire.

Three plans, we are informed, have been selected by the sub-committee for the investigation of the council, and the final selection of the favoured one for remission. They are as follows—No. 52, marked with three triangles; No. 38 B, "Pro Bono Publico," and No. 59, by W. & R. Duckworth. We shall confine ourselves this week to an account of these three only.

Before entering into a description of any of the plans, it will be necessary for their elucidation to give our readers an idea of the site and the conditions of the competition.

The site selected by the council as the most favourable for the experiment they are about to try is situated in one of the lowest districts of the town between two streets named respectively Ashfield and Sylvester street. The former is 10 yards wide, and the latter 20 yards wide. Ashfield-street being only 10 yards wide, but constructed before the bye-law regulating the height of the buildings by the width of the street came into operation, the competitors were informed that the bye-law did not apply to this case, and the buildings facing that street might be carried up the full height allowed by the Building Act, viz. 65 ft. to the eaves or cornice. Now herein lurks the fallacy that runs through the whole of the proceedings, the letter of the bye-laws seeming to possess some chalcistic charm to the official mind. Either the bye-law referred to is of use, or it is not. If it is not of use, the sooner the restriction is repealed the better; if it is of use, the council should have insisted upon the spirit of it being observed when the opportunity was in their own hands; for, if there was no legal obligation, surely a moral one existed.

The frontages to Ashfield-street and Sylvester-street are respectively 248 ft., the sides of the parallelogram being formed by adjoining properties east and west, and being each 119 ft. The land inclines to the west and to the north—a fact that is taken little notice of in most of the sections.

The competitors are told that the premium will be given to the design that provides the largest number of convenient healthy dwellings at the smallest cost, and that if the tender for the selected design exceeds the estimate by 5 per cent., the council has the power of withholding the premium. We hope this latter part will be carried out, for there are some flagrant violations of truth in the statements of the probable cost. The usual demoralising effect of the competitive system in this particular is painfully apparent.

No. 52, marked with three triangles, consists of six blocks of dwellings, arranged in three rows, with a central transverse street, 10 yards wide, intersecting them, and running from Ashfield to Sylvester street. Two longitudinal courts are thus formed, 25 ft. wide, and the central row of buildings is only four stories high, while the two outer blocks facing Ashfield and Sylvester streets are five stories high. The dwellings are arranged one on each side of the staircases, which are eighteen in number, three to each block. The water-closets are on the landings. The lowest story is in the base-

ment, the floor being sunk 6 ft. below the level of the streets and courts. The total number of dwellings is 146. The smallest dwelling, containing living-room, bedroom, and scullery; and the largest, living-room, scullery, and three bedrooms. The largest bedroom, we notice,—and there are but few of them,—is 12 ft. 6 in. by 9 ft.; but the great majority of them are but 9 ft. by 8 ft. 6 in. The dwellings in the basement range from 2s. 6d. to 3s. 6d. per week, and ground-floors from 3s. 3d. to 6s. 6d., and the others above in proportion.

The estimated cost is 15,200*l.*, and the annual return to be expected is stated at 7 per cent.

A great deal of space appears to be lost in the roofs of the two outer rows.

The chival capacity is about 800,000 ft.

No. 59, by W. R. Duckworth, local architect, are arranged upon what is known as the balcony system. There are only two blocks of buildings, five stories high, facing respectively Ashford and Sylvester streets, each containing a central staircase only. The space between is reserved for a playground. All the dwellings contain not less than two or three bedrooms, in addition to living-room, scullery, water-closets, closets, &c. A bath-room is placed on each landing of the main staircases. The lowest rentals are 3s. 6d. per week, and highest, 6s., the majority being 4s. 6d. The estimated cost is 10,462*l.*, and the yield per annum stated at 9½ per cent. The water-closets are all *internal*.

The cubical contents are about 700,000 ft. The total number of dwellings is 110.

No. 38 B, "Pro Bono Publico," consists of three parallel longitudinal blocks, the centre block being the full length of the land, excepting 4 ft. passages at each end, and the outer blocks shorter by 50 ft., leaving accesses 25 ft. wide to the two internal courts from both ends.

The total number of dwellings is ninety-four. The staircases are arranged similarly to No. 52. The lowest rental is 4s. per week; the highest 5s. The estimated cost, 9,500*l.*

In all cases we have stated the estimated cost, exclusive of land.

The cubical contents are about 600,000 ft.

The principle of the arrangement of No. 52 and No. 59 is almost identical, the greatest difference being that the openings to the inner courts are in one case at the ends of the blocks, in the other case in the centre.

As regards ventilation of the dwellings, No. 59 is capable of being made the best, but to effect this some openings must be broken through from the street into the inner enclosure: as shown it is a mere basin. Nos. 52 and 38 B we consider far too crowded. Courts only 25 ft. wide, with five-story buildings on one side and four-story on the other, and not directly open at both ends, are extremely inadvisable in a sanitary point of view; and the cellar dwellings common to all ought not for a moment to be countenanced. But, while No. 59 is best in the respect named, it does not meet the requirements of the case at all. The lowest rentals, even in the basement, are 3s. 6d. per week. Now, if the dwellings are to meet the wants of the lower class of labourers, the rents are far too high. The accommodation provided is far beyond their means. The estimate is ridiculously low. The cost of the buildings, at 6d. per cubic foot, which is a fair price, including everything in the shape of fittings and architect's commission, would be 17,500*l.*; and the two others would cost not less than 20,000*l.* and 15,000*l.* respectively. No. 52 provides dwellings as low as 2s. 6d. per week, but the bedrooms are far too small, containing only from 600 to 700 cubic feet, and the land too crowded with buildings for efficient ventilation. Moreover, the number of staircases will make them difficult of supervision, for which the balcony system is the more fitted. The internal water-closets of No. 59 are questionable as bringing the sewers into direct connexion with the dwellings.

On the whole we are afraid none of these plans will be found paying or satisfactory speculations when the tenders come in; and we cannot see even how Nos. 52 and 38 B are even in accordance with the letter or spirit of the bye-laws; the backs of the five-story buildings not having the prescribed 150 superficial feet exclusively belonging to each dwelling substantially front, that is, the external wall faces the inner courts. Now, the bye-laws say that no house in a court must be above 30 ft. high; and if we stretch a point, and call them streets, we find that the houses must not be erected of greater height than the width of the street; so that in either case they are out of court.

It would be a mere quibble to say the outer block does not *front* the courts, because the entrances are at the other sides.

We should not have dwelt so much on these points had they not been made such a stumbling-block to most of the competitors. We shall return to the subject.

THE NEW LAW COURTS.

We cannot conceal from ourselves when we read the latest account of the progress towards a decision respecting the new Courts of Law,—that we stand on the brink of a great architectural misfortune. Various delicacies towards various susceptibilities are involved in speaking out a very strong opinion; we fear that punctilios must be left somewhat aside. A work that is to be before our own eyes as long as they last, and then to be either a credit to us or an opprobrium with our posterity,—to be to them, as it had been to us before, a constant delight or an annoyance that is not to be escaped from, is a matter of something more serious than even what is ordinarily meant by business. We have many of us been reading lately how a time came in the career of Napoleon when none ventured to tell him the exact truth even about the movements of an enemy, without qualification to make it suit in some degree with his predilections; and not an architect at present claims, as none ever ought to claim, to be allowed indulgence so destructive to his own fame and the just expectations of those from whom he at least accepts employment. Moreover, the very fact of a competition implies an admission that no one who joins in it asserts exclusive and irresponsible consideration. Where out of six only one can be successful five must be disappointed, and each of these is certainly entitled to persist in his preference for his own design and vindicate his complacency as he may; and if he succeeds in making a convert, there is no reason why the friend should be in any degree more reticent.

Criticism, therefore, will come up sooner or later, and the sooner it comes, if it be worth anything, the better;—nay, if come it must, let it come at once, though it be indifferent; and so let us get it over, and he all the more satisfied from the conviction that *pros* and *cons* have been fairly argued, or might have been, had two opinions really existed.

It must not be concealed that we do not live just now our architectural lives through fair weather times. We have escaped, and are thankful to have done so, from stagnation,—and it is well. We are out of the zone of calms; but the probabilities of the trade-winds are conjoined with those of a hurricane, and the well-found vessel must be prepared for either. Wherefore this preamble? It is far, indeed, from being intended as an apology preliminary; it is intended as an assertion of right on the part of whosoever has a strong opinion on a public question, and believes he can justify it, to take what chance may be allowed him of bringing others to his point of view for the general benefit.

Of the strength of the opinion in the present case the writer would be sorry to leave an uncertainty, or of its scope and purport. His justification of it is open to individual appreciation.

The opinion in question regards the official approval that has been notified of the exterior designs of Mr. Street for the new Courts of Justice. Upon the evidence before us in the architect's own engravings, we can only anticipate that a building erected according to them or to the principles and predictions that they involve, and that indeed are stated, will be a deformity and an eyesore for all time.

So much for the purport of the opinion and the strength of it; they are both derived from the case in its greatest simplicity,—the published designs,—and, it may be added, are not affected in any degree by regard to any of the designs, or designer, that stood, and may even yet stand, in the relation of competitor.

The justification is the matter next to hand. It is the great misfortune of Somerset House that its façade is on the wrong side of the Strand in every respect; it is in all but constant shadow, and the daily flow of population passes close to its walls, and apices but few to pass and repass along the opposite side of the way, whence alone it can be seen at all, not to say seen to advantage. The façade of the Courts of Justice will have the better position; but whether this will be to them the good fortune

it should be, depends on the worthiness of the aspect they present. As the matter stands we suspend our congratulations.

The front extends from at least the entrance to Holywell-street westward, as far as Bell-yard to the east, beyond Temple Bar,—a noble, an enormous, or a preposterous extent, accordingly as it may be treated. The question will arise to the economist,—what necessity was there for such costly consumption of frontage in the main line of a great thoroughfare,—frontage of secondary value hiterto, but not to be so under the conditions of the reconstructed neighbourhood and its approaches. On the other side, it is to be said, that frontage, as valuable, means trade, which will not fail to find its place. To supersede one station only transfers it to enhance the value of another. It is from the main thoroughfare that the busy occupants of the interior of the building have to be drawn, and on what are called higher grounds, and not without reason,—the concentrated Courts of Justice, the palace in which law is to become the instrument of obtaining justice, and justice is to be occupied with holding its own against the obscurities, the indefiniteness, and technicalities of law, is in itself a symbol of such a leading and dignified interest of society, that it claims a public presentation only second to that of temples of religion.

But in the very interest of this dignity we demur to the excessive proximity of the basement line of the façade to the footway. The architect may reply that he is himself even more discontented,—strained and pinched as he has been in every adjustment, by the restricted area relatively to requirements obliging him to cover every square foot available in any way. We acquit the artist, but do not acquiesce in the design. Our magnificence that intends so extensive a display is so stunted then at last of necessary space as to be unable to withdraw itself to some moderate degree from contact with all that is crowded, common-place, and noisy. What, then, becomes of the solemnity of the subject,—nay, of its tranquillity? Practically, these are well cared for; for the courts are withdrawn into the heart of the building, and the rooms that face the Strand are, for the most part sale-rooms, spare rooms, &c.; but then, in fact, it is the side or the back of the grand structure that turns itself towards us in the Strand, and we must go elsewhere to find a true façade. At best we have before us only a screen, utilized it may be, but for very secondary purposes relatively to the grand purpose of all. That a side of the building, which is not the front, should press thus unconsciously on the footway, is fair enough; but then it would be well that it should not be the most elaborated side facing the most important approach.

The advance conceded to a central portion, and to the returning westward end, only makes matters worse.

The qualified preference that has been given to Mr. Street's designs does not include his interior distributions, and in case of joint operation with another architect the Strand front might be differently occupied and some of these objections vanish. Nay, even some yards of vacant space between the wall and the walking public might be allowed. But a more serious objection touches the very principle of the distribution of the façade, and characteristics which it is clear that Mr. Street has far too dearly at heart to sacrifice under any transformation,—characteristics that make us mistrust the compeer-ship of judges, be they who they may, who could overlook them, or only recognise them to be indifferent or to admire.

Be it said plainly that the irregularity and asymmetry of this front evince notions as to architectural composition that are something more, and much more unpleasant, than extraordinary; that may sit comfortably with a theory adapted to suit them; but that to the architectural sense of nine-tenths of the world will be intolerably vexations, and to the other tenth, also, as soon as it has outgrown the domineering influence of fashion—and awakes in torment.

The line of the front is broken on plan by an advance of a central division, and by the double-gabled ends of the returned sides of the grand quadrangular building; but the western of these advances is cut off from view by a heavy prolongation of a Gothicized Temple Bar that bolts into the main façade just at the angle,—with the inevitable effect of obliterating entirely one flanking projection, while itself as inevitably appears an afterthought, built up against a building with which it vainly attempts to assume an

air of articulating. On this eastern side a barrier is carried along at about the line of the projection, and seems to terminate with a return uncomfortably enough against the centre. Had it been continued along the entire front, there would have been less to say against it; as it is, it houses a cab-stand, and enhances the overcrowded pressure upon this unfortunate angle by an enclosure in a corner.

When we look to the "General Conclusion," at page 32 of Mr. Street's letter-press, we find certain enunciations that convict these and various other eccentricities as committed of theory preface. "I have taken occasion, as far as was reasonable, to make all my façades tolerably regular in their arrangement; so I have made distinct centres to the north and south front, and have also made the other main fronts equally uniform in their general character. With all this uniformity, there are, however, very often of necessity features where uniformity was unnecessary, and irregularity a virtue, and I have gladly availed myself of them in all cases. So that I hope my design has sufficient picturesqueness not to be tamely uniform and yet enough uniformity to prevent the building looking trivial or frittered away."

"I am glad to observe," said the military squire to his curate, "that you kept your discourse to the twenty minutes." "I think it best with a mixed congregation to avoid being tedious,—I do it on principle." "Ah, yes—yes," said the squire, half reflectively,—"but you were tedious."

Tediousness is not excluded by cutting off the odd ten minutes, and uniformity—"So vast a building," says Mr. Street (p. 31), "is necessarily, to a certain extent, the victim of uniformity"—uniformity may be given up without anything that approaches to genuine picturesqueness being acquired in exchange.

Anything more irregular and, indeed, less picturesque than most of the distributions of the façade, it would not—as it seems to us—be easy to conceive. Synopsical is doubtless an elegance elegantly applied; but persistent neglect of the recurrent places of accentuation can only generate disorder and clumsiness. The centre is treated with a certain moderation; but even here the wall—certain on either side the gable is divided disproportionately by what seems to be a huge polygonal buttress oppressing adjacent windows on either side, answering no visible purpose, and suggesting only such tubular applications as had better not be expressed so prominently. They enhance the weak appearance of certain flat strips of buttresses between them that for themselves suggest nothing but the infancy of the art of keeping walls perpendicular.

In the centre, however, and in the west gabled end, there is an admission of allegiance to symmetry such as it is; and, such as it is, it renders more glaringly inconsistent the studied neglect of it in the intermediate wall curtains. Neither of these has a symmetry within itself or an agreement with its fellow. Anarchy reigns;—section after section seems to do what seems good in its own eyes. Architect and clerk of the works must have been spirited away to Dream-land; and the masons, tired of waiting for them, have evidently got the working drawings into confusion and finished the undertaking somehow—anyhow. Do we look, we ask, at a new building made up by matching old fragments not very cleverly, or at an old building that has been altered and adapted, broken into tenements, and then recombined with as little disturbance as may be to the several tenement improvements of their own portions. Some pinnacles are allowed, but sparsely, and even they do not subserve their ordinary function of defining the commensurable. There are two on one side emergent from the parapet that is as long as the church opposite; on the other, not corresponding side, there are three; all marking divisions that are all at odds with each other.

As regards windows, we have on the ground-floor of the western half of the front, eight decorated Gothic windows of magnificent size, and indicating apartments of the joint height of the ground-floor and floor above in the rest of the front. They are the windows of the sale-rooms, ominous surely in their conspicuousness and emphasis. But this is a moral consideration,—architecturally, they reduce to the insignificance of pigeon-holes the smaller windows above and around them; and by the lightness natural to such large openings they give an odd impression that the building is wrong-side upwards. Then the difference of spacing is caprice—not

picturesqueness,—and perversity were an apter word than either,—we have two of the set divided by an interval equal to the window opening; between three the intervals are contracted to about a third of this; and between three others there is no blank interval whatever, the intermediate millions being confluent. Then there are small pairs of windows nestling together here and there like love-birds, and door openings ranging in elevation with nothing at all.

As to the distribution of openings, and the ordination of divisions in the eastern wall curtain, suffice it to say that it does not match the western in any sense whatever, and has even less self-consistency. To attempt to give particulars of these differences and discordances would be like essaying to describe accurately a comminuted fracture of the shin bone. The best success would only try patience and jeopardy temper.

Enough, and more than enough, and let us be thankful that we have not to observe further on the ventilating towers growing up out of the enclosure,—even these not regularly,—than to quote three lines that after what has been said will tell the story:—"So vast a building—necessarily to a certain degree the victim of uniformity—requires some decided vertical lines to break its monotony, and I am not sorry to have to vary it, therefore, by the erection of the Ventilation and Record Towers, &c." (p. 31).

We have not here to discuss the questions that may be opened between treabated and arcuated architecture, or as between round and pointed arcuation; the value of symmetry is a matter that subverts the theory of architecture on a grand scale, of all styles whatever. It is strange to hear repeated and parroted,—and stranger to hear by whom,—the avowment that a leading advantage of Gothic over Greek or Italian architecture lies in its admitting,—favouring,—the freest departure from symmetry. It is quite intelligible that idlers or sentimentalists in search of impressions, and with no particular knowledge whatever, should bring away such a notion from Peterborough or Gloucester or Ely, or almost any English cathedral; but what shall we say of those who should know, and must know, if they bethink themselves, that a Gothic architect's design for the cathedral as he hoped and intended to finish it, was ever symmetry embodied. The elements of his composition may have been far more varied than those involved in the design of a Greek temple,—that is a different consideration,—but his elements, multifarious as they were, were ever marshalled with as strict regard to bilateral symmetry; and the strictness was the more conspicuous from the very fact of the multifariousness it was applied to. From Westminster Abbey, and earlier, to Cologne Cathedral, a symmetry obtains in the master works of Gothic art that emulates not merely the Greek, but the very works of nature,—the two balves and two sides of the chapel repeated each other as manifestly as the two halves of the buck that was destined for the abbot's table.

Invention may find itself hampered by such requirements, but it will be such invention as if turned towards musical instead of architectural composition, would be sorely shackled by the exigencies of counterpoint. Buildings have special purposes, which according to their dignity require, and in unspontaneous ages seem naturally to generate, expression of like grade of dignity. A purpose so defined has its own coherency; it is itself a combination of primary and subsidiary purposes; and a balance and unity are thus its very essence. It is on this account that a structure that is apt to accommodate such a complex but still congruous purpose, will itself bear the visible impress of congruousness and subordination. In this our day at last the confused disorder of English law is being reduced to the happy regularity of a Digest,—shall we choose this very day to house it in a structure only fitted to symbolize the very wilderness of obsolete craze out of which at last is proceeding our hopeful exodus? W. WATKISS LLOYD.

DOUGLAS HARBOUR, ISLE OF MAN.—At the Manx Tynwald Court the following resolutions have been adopted:—1, That breakwater accommodation is requisite in Douglas Bay; 2, That a sum of not less than 175,000, shall be expended in providing that accommodation; and 3, That should another engineer of equal eminence approve of Mr. Cooke's plans, the court will agree to their adoption.

AN ITALIAN BATTLE-FIELD.

THE impressive solitude of the Roman Campagna often recalls to us, through certain vagueness not easily explained, the lines in which Wordsworth asks the subject of the Highland girl's song in the fields,—

"Of old, unhappy, far-off things,
And battles long ago?"

But an interest quite novel for this region is a battle among the things of yesterday; and this one more association of historic tragedy with the characteristic scenery around Rome will henceforth give attractiveness to a site little frequented by residents, scarcely known to tourists at this capital. Leaving the city by the Porta Pia, and pursuing the Nomentan Way, after crossing the Anio by the picturesque towered bridge, Ponte Nomentano, which was destroyed by Totila in the Gothic War, rebuilt by Narses, and castellated, as we see it, by Nicholas V., we first pass under the "Mont Sacer" of historic renown; further on reach the ruins of the disinterred basilica of S. Alexander; and thence continue for several miles through one of the most desolate among the almost desert tracts of uncultured land in these parts; a few large farm-houses—grey, dismal, and dilapidated—the sole human habitations in sight, except those villages high perched on the mountains, which, eastward and southward, form majestic boundaries to the wide landscape. Some ruinous square tower, lofty and grim, reminds us also where man dwelt and combated in mediæval periods; one of these, strikingly conspicuous, and built of brick and stone in different colours, called "Torre Lupara," being supposed to mark the site of the Aborigine, one of the cities founded by the aborigines after they had driven out the Siculi,—the Civitas Figlina mentioned in "Acts of Martyrdom." Several mansions in highly picturesque ruin,—one popularly called "sediacca," from a fancied resemblance to a great throne,—rise near this road; and at intervals we pass over remains of massive antique pavement, reminding that we are still in the track of the Via Nomentana. Near the eleventh mile stands a column marking the limits between the "Agro Romano" and the territory now called "De Lamentana," from the name of the ancient town, now modernized as Mentana, whence this road also takes its designation. A change comes over the wild solitary scene as we descend, after a long gradual ascent south-eastward, into lower and cultured regions spread to view in fair varieties of hill and dale, gracefully undulating or abruptly sinking, so as to present distance beyond distance; the slopes being either cultivated with grain, clothed with vineyards, or overgrown by woods of oak and ilex—a romantic and pleasing contrast to the waste Campagna. In the midst of that prospect appears, first descried from the high ground where the road winds through the skirts of a forest, the village of Mentana, and about two miles farther on the same perspective line westward, Monte Rotondo, crowning an isolated and peculiarly rounded knoll, whence its name—both insignificant places as to size, but with external array of towers and walls, and the prominent feature in each of a ponderous baronial mansion rising high above the humbler dwellings; so that in those instances (as usually the case with Italian town and village, especially in these mountain districts) the distant gives a notion of dignity and importance far from corresponded to by the nearer view. Mentana is but an impoverished village, of about 540 inhabitants, whose sole street stands on the high road, extending from the stately, though now decayed, mansion founded in the thirteenth century, by the Orsini, once feudal lords of this place, but now belonging to the Borghese family. The primitive Nomentan was one of the most ancient colonies founded by the Alban kings in the Sabine territory, and from still earlier date peopled by aborigines, afterwards subjected to Rome by Tarquinius Priscus, and engaged in the Latin league that waged war on behalf of Tarquinius Superbus; its site probably on the hill side that dominates over the modern villages at the east, and, admitting the modern to be the representative of the antique, we may regard the actual Nomentan, under its Italian name, as the only one among those seats of the "Prisci Latini" still inhabited. At mediæval periods the place had some importance; Ughelli (*Italia Sacra*) gives the series of its bishops from A.D. 415 to 964, after which its rank in the Catholic episcopacy was lost, how, or at what

precise date, is unknown; and at the opening of the ninth century it must have been not insignificant among Rome's dependencies to have the honour of receiving Charlemagne and Pope Leo III., as rendezvous where the Pontiff met and dined with the Emperor elect before the state entrance of both into the capital, in the November preceding that Christmas, 800, when Leo so astonished the world by crowning the Frankish king as Emperor of the West at St. Peter's. In the next century Nomentum meets us again in the historic page as birth-place of Crescentius, the dauntless consul, who long defied both Papal and Imperial power from the Castle of St. Angelo. In classic times this town, so pleasantly situated near the Sabine hills, was noted for its fertile and salubrious neighbourhood, frequented by Roman patricians for summer residence; and it is certain that Ovid, Martial, and Seneca had villas here,—the latter inhabiting such a home or territory mentioned by Columella with reference to the amazing quantity of wine produced from its vineyards, often at the rate of eight *cuculi* for every acre. Nomentum wines, commended by the same writer and by Martial, still maintain their reputation among the many from the hills and villages around Rome. Sundry marble fragments have been found here, but no distinct traces of remote antiquity; a high-relief figure, life-size, now seen on the *piazza* (if such dignified term can be given to any part), is called by the inhabitants *Santa Giorgia*. Beside the gate of the Borghese mansion we see a togged statue, obviously antique Roman; and under the tower of the church, several epigraphs on marble from some vanished tomb, with the names of the *gens* Erennia and Bruttia. The more prominent Monte Rotondo (fifteen Italian miles from Rome, and peopled by about 2,400 souls) is supposed by Gell and other writers to occupy the site of the ancient Crustumernum, where an Alban colony settled long before the founding of Rome; this population proving a faithful ally to that dominant city in after ages, but exposed to frequent assault from the Sabines, who besieged the town in the year 260, and devastated its territory, which seems to have extended as far as the Nomentan bridge,* 297 U.C. (Dionys. l. ii., 58). Its fertile soil is noticed by Ling as inducing many Roman families to establish themselves here; and we are told that its neighbourhood was known for the abundant growth of pear-trees (the *Crustumina pyra* mentioned by Servius); as to this day (see what Gell observes in support of his theory) the Monte Rotondo district is overrun by such trees, bearing a wild fruit, small but well flavoured, that form testimony in favour of its claim to represent the Latin Crustumernum.

No antiquities are found here; and perhaps the erection of the cincture of walls and round towers that fortify the place, led to the demolishing or concealing of the remains previously visible. Once a duchy that gave a title to the Barbarini, after being first held as a fief by the Orsini family, the feudal residence of the former passed successively into the possession of the Del Grillo and Piombino families, the last its present owners; and the finest object in the town is that castellated mansion, now in picturesque decay, and almost unfurnished, with a lofty tower commanding a magnificent view, itself conspicuous from great distances around. No fitter locale for an Italian ghost-story could well be chosen than that vast and melancholy, and long all but deserted, tenement of Monte Rotondo. Compared with Mentana, the aspect of this town, though streets be dismal and tortuous, houses out of repair and comfortless-looking, has something aristocratic; and at the present day, while a strong French garrison occupies it, the place receives life and movement from such stranger population.

It is not our purpose to give statistic report of the battle that crushed the attempt against Rome and the Papal Government, leaving associations of such tragic interest to these hitherto quiet scenes; an encounter kept up, with great slaughter, during about four hours on the afternoon of Sunday, the 3rd of November; the immense clouds of smoke from cannon and musketry during which hours we had distinctly seen from the tower of the S. Lorenzo Basilica that eventful evening. Suffice it here to state that the forces on the Pontifical side were (according to official report) 2,913; on the French about 2,000; of the army of volun-

teers under Caribaldi, opposed by these allied troops, about 6,000 (though as to this amount it is difficult to decide among various statements); that, in the result of that momentous action, the loss on the French and Roman side was 32 killed, and 139 wounded (General Ranzler's report); on that of the Italian volunteers, above 600 killed, wounded in proportion, and 1,600 prisoners (General de Failly's report); though popular rumour, full of discrepancies as usual after such stirring events, has raised the mortality among the Papal Zouaves alone to 300 or 400; and it seems certain that the number of prisoners brought into Rome is at least 1,760.

On the second day after this decisive battle was a concourse of visitors to the field, in public or private vehicles; and there were witnessed sights of ghastliest description, though the work of interest had been to a degree accomplished. We had not opportunity of going till the third day, yet even then was enough to leave painful and lasting impressions. On the high ground, where is first seen the view of the lower valleys, with the two towns so picturesquely standing amidst cultivated uplands, lay beside the road, in the shade of oak trees, several corpses, evidently of volunteers in the humbler class, for the scanty garments they wore had no resemblance to regular uniforms; their faces up to the sky, with red gashes on their naked breasts, there they remained, as if forgotten, in the midst of a scene beautiful under the sunshine of the glorious autumn day. Long before reaching that field of death we had observed the countless cartouches and heaps of blue paper smelling strong of gunpowder along the wayside; also, along the outskirts of the road, half-burnt trees and hollow old trunks blackened by fire, showing what the soldier's work had been in the now quiet haunts of the bird and the forest-creature. In a villa, on some ground above this road, with the name "Vigna Santucci" over a gateway, we perceived like tree trunks, and heard from peasants the details of combat long kept up at that point. Along the roads lay others dead, at distances from Mentana; and soldiers were still at work digging trenches for their burial. On the tilled ground, and amidst the underwood on slopes descending below the road, we saw fragments of almost all kinds of military accoutrement, iron capulets and belts, bloody clothes, broken weapons; a pack of soiled cards strewn under a hedge; a mutilated photograph, the portrait of a lady, that told the affecting story of the lover or husband, who had worn it in his breast till he was struck down. Proceeding to a deserted convent-church among the trees we observed the many dark stains where pools of blood had saturated the soil; and in the sacred building (long left to decay) saw the tombs just closed over numerous dead; here being accosted by some peasants who offered bent bayonets and shattered muskets for any price they could get. But sadder still was the scene at Mentana, in the condition of a deserted village, left to awful solitude by man's violence. The first house we reached had its interior all in blackened ruin, and the woodwork entirely burnt out; the small church, in which two wounded men had died that morning, showed traces of the bivouac and the military hospital. The confessional was broken, but the high altar seemed still serviceable for rites; and a strange contrast, amid this gloomy desolation, was the dressed-up and life-size wooden image of some saint in a niche above,—emblem of that superstition the terrible reaction against which was read in clear tokens around. The poor inhabitants were just beginning to return from some caves in the rocks along a hill-side which we had passed, where they had taken refuge during the battle; but their squalid homes in the long straggling streets were mostly shut up; not a sign indicated the usual engagements of life, of trade, or industry; and there was something like grim irony in the attempt at mirth on the part of two or three poor men who were drinking wine out of coarse earthenware vessels at a table before a wretched little shop half open. In some respects still more painful were the sights at Monte Rotondo, though there we found ourselves again surrounded by civilized man and his activities. Before seeing the things done and traceable in that town we had never realized the intensity of hatred against the Church and priesthood that has animated the invaders of the Papal States, and we believe still animates, in more or less violence, the youth of Italy, save under exceptional influences. The principal church of Monte Rotondo, dedicated to

* Inferable, from the fact that the celebrated retirement of the Plebs to Mont Sacer is called the "Crustumine Secession."

S. Mary Magdalen, is a large, and in the interior much-decorated building, collegiate, and served by canons, and containing some pictures of value, especially one of the local patrons, SS. Philip, and James, by Carlo Maratta, and a "Purgatorio" of the school of Dominichino. We here beheld a scene of wreck and desecration such as no Christian, from whatever theological standing-point, could contemplate without pain.

We next visited the Piombino Palace, and roamed through long suites of unfurnished halls,—one of those Italian interiors "where comfort dies in vastness," and where, notwithstanding the occupation of a part by French soldiers, silence and gloom now prevailed. Some municipal offices are located here, and in a subordinate *cortile* we saw the pavement entirely covered with the torn registers and documents of local importance thus wantonly destroyed. In the principal court, where many soldiers were idling away their spare time, we found heaps of broken muskets and bayonets, reported as 2,000, here left by the volunteers on the surrender of the town the morning after the battle, when about 800 were taken prisoners, to be brought to Rome that day. By the principal street we reached the gateway at which the assault had been made, on the taking of this town, by the invaders, the 25th of October. On this spot were many traces of the terrific contest that closed about two hours after midnight before the morning of the 26th; the valves of the gate, burnt with turpentine when the entrance was forced, hung in charred fragments from the iron frame, and the attic above was in ruin; all the houses near, both within and without the walls, were riddled with shot. Leaving by this gateway, we visited a Franciscan convent, on level ground, about a quarter of a mile distant; one of those specimens of the larger dilapidated Italian cloister, neglected and dingy, inhabited by a few friars, though spacious enough for the quarters of half a regiment. The three Franciscans, who formed its whole community, had saved themselves by hiding in private houses within the town; and the father guardian, when at last discovered, and dragged before Garibaldi, had been allowed by that leader to go his way in safety. The church had been, and was still (for French had succeeded to former occupants), the soldiers' dormitory, with mattresses lying the nave; in one of the confessionals Garibaldi himself had spent two nights—a not enviable couch! and the choir now served as a military provision store.

To be just to those responsible, at least officially so, for the immense injury inflicted not only at Monte Rotonda but other towns also of these States by the invasion, we should add that, as we learnt on the spot, outrages against person and property were punished with death, by Garibaldi's order, at the former place. Nothing in the antecedents of that extraordinary man exposes him to the charges of cruelty or lawless vindictiveness; and having followed the steps of his volunteers, since the late alarming events, at other towns in the Roman neighbourhood, at Tivoli and Palestrina, we have there learnt nothing discreditable in details of their conduct towards citizens—save, indeed, the proceeding to be expected from such visitants under all like circumstances, the seizure of public money.

Returning that evening about sunset, the romantic landscape, before we reached the wilder Campagna region, seemed to us in sadly beautiful contrast to the realities caused by man. We hear with satisfaction of the sympathy excited at Rome for the sufferers at Mentana and Monte Rotondo; that a subscription has been opened, received at the offices of journals; and the Pope at once sent 2,000 francs for the benefit of the principal church, whose woful conditions we this day witnessed.

RESTORATION OF THE ANCIENT CHURCH OF MONKWEARMOUTH.—A meeting of gentlemen was recently held in the National School, Monkwearmouth, Sunderland, when steps were taken for raising 10,000*l.* for the restoration of the ancient church of that parish, and the erection of a new district church. A list of subscriptions already forwarded was read,—namely, Sir H. Williamson, 2,000*l.*; Mr. V. Stobart, 500*l.*; Alderman Tyzack, Mr. M. Robson, and the Incumbent, 100*l.* each; and several smaller sums, making over 3,000*l.* The gentlemen present resolved to form themselves into a committee, and Messrs. Lampton & Co. were appointed treasurers.

THE LATE OUTBREAK OF FEVER IN GUILDFORD.

We briefly alluded last week to the recent epidemic of fever in Guildford. The official report of Dr. Buchanan upon this outbreak is so full of interest that it may be useful to consider it in some detail, hearing as it does on one or two of the most important matters connected with the sanitary welfare of our large towns.

Guildford, estimated to contain at the present time a population of about 9,000 persons, inhabiting 1,675 houses, is situated on the side of a chalk hill, above the valley of the Wey. The chalk forms a complete natural drainage to the town; but there is no artificial system of sewerage, cesspools cut in the chalk being almost universal. It is said that these cesspools cut in the chalk "keep themselves dry, and are commonly so inoffensive that they are not emptied for many years together." Shallow drains or sewers, if they may be so called, receive the surface-water from the streets and the slopes from the houses; and it is well known that of late, without the consent of the authorities, more or less night-soil, chiefly its liquid portions, have been also discharged into these sewers, which were never constructed for such a purpose. These naturally empty themselves into the river Wey. So much for the drainage of Guildford.

The water-supply of Guildford is derived "partly from the public waterworks, which are fed by two wells, sunk some 20 ft. into the chalk, at the lowest part of the town; secondly, from an old well, from which water is raised by the power of an adjacent water-mill; and thirdly, from a new well, from which, for a short time in the middle of the present year, water was distributed to the higher parts of the town by engine power." It is worthy of notice, however, that of the 1,675 houses in Guildford, only 928 are supplied by the waterworks, 747 obtaining their water "from private wells, and some few from the river."

Guildford may generally be considered a healthy town, and the average rate of mortality in recent years has been low. Its situation is no doubt salubrious; and although the lodges, evil in small tenements exists to some extent, we are told that there is very little serious overcrowding in the town. Typhoid and low fevers, however, have not infrequently prevailed in Guildford and the neighbouring villages; but local inquiry appears to have convinced Dr. Buchanan that a larger proportion of the fatal fever cases returned in the registration district of Guildford in recent years, have occurred outside, than within the town itself. During the present summer, cases of typhoid fever had occurred in neighbouring villages, and a few in the town before the outbreak which gave rise to the official inquiry. Ten cases of fever occurred in the town during the first four weeks of August, of which six occurred within the practice of one medical man. The report states that "in the last three days of August cases of typhoid fever came under treatment in Spital-street and Pannell's-terrace, high lying and usually very healthy parts of the town. In the first two days of September a few others came under observation, and on September 3rd and 4th a surprisingly large number of people sent for medical assistance, and were found to be suffering from the same fever. In the first ten days of the month a total of some 150 cases had come under treatment, and this number had increased to 264 by the end of September." The outbreak culminated in intensity about the middle of September, and soon after declined pretty rapidly.

A circumstance connected with this outbreak very soon attracted attention. Whenever on previous visitations of fever in Guildford, the poorer and low-lying parts of the town had been principally affected, this sudden outburst "was restricted, with almost absolute precision, to the high levels; well-to-do people had suffered as well as the poor; the best houses were invaded as much as dirty ones. Except the coincidence with high level, there was nothing approaching uniformity in the distribution of the epidemic." As the prevalence of the disease began to decline the proportion of cases occurring in other parts of the town was larger. This result, however, may be naturally traced to the almost unavoidable dissemination of the fever by contagion. Inquiry into all the circumstances which might by any possibility have given rise to this extraordinary outbreak of fever led to the disposal, one after another, of more than one

apparently reasonable theory. It was evident that drainage could have had very little direct bearing upon it, inasmuch as the town does not boast of any system of sewerage, and the natural drainage was best in that part of the town most affected. Finally, Dr. Buchanan says,—“Only one condition could be discovered generally coincident in distribution with the outbreak, and that was the high-service of the town water supply.” Further inquiry based upon this conclusion led to the elucidation of the fact that all the houses attacked at the beginning of September were supplied with water from the high service. Many of the cases which appeared at first sight to be exceptions to this general rule, turned out to be those of "children and others, who, living in houses not supplied by the high-service water, spent the hours of the day in houses so supplied. Towards the end of September the new attacks were less exclusively distributed to such houses." Excluding the few sporadic cases occurring before the 28th of August, and those which occurred after the middle of September, and making a deduction for school children and others above mentioned, less than a dozen of the 150 persons attacked in that fortnight lived in houses which were not supplied by the high-service water.

Convinced that in some way the fever outbreak was due to the high-service water supply, Dr. Buchanan pursued his investigation into all the details of the operations of the Water-works during August. The engine which pumped the water from the new well to the high-service reservoir having broken down on 1st August, his theory appeared somewhat upset by the intelligence that from that date "no water had been pumped from the new well, but the high-service mains had been charged by the water-wheel in connexion with the low-service." In fact, that both high and low service had used the same water, that of the old well. Further inquiry, however, elicited the important admission that on or before the 1st of August, when the pumping-engine of the new well broke down, a hulk of water from that source had been stored in the new high-service reservoir, and that "on August 17th,—the water-wheel of the old well being on that day under repair—this stored water was distributed to the high-service houses of the town; it was distributed on no other day, and to no other houses. These 330 houses, therefore, on which the fever almost exclusively fell, had received a different water from the other houses of the town,—namely, water from the new well, stored up from August 1st, and delivered on August 17th."

Subsequent analysis of the different waters making up the water supply of Guildford proved, beyond doubt, the presence of organic and putrescible matter in the water of the new well, but not to that extent which might be supposed sufficient to account for the fever outbreak; but it must be remembered that the analysis was not made until September 25th, when the special circumstances which may have so remarkably affected the water at the time the supply was pumped for storage in the new reservoir, and at the time of distribution, had probably been dissipated. Investigation proved that the new well was supplied by a different spring from that which feeds the old well; and, moreover, that the new well obtained its water not only by percolation, but from a "notable fissure in the chalk," into which, and the chalk round the well, it will appear that it was "certainly easy for excrementitious impurities to have entered."

A sewer or drain runs within 10 ft. of the well, through which the iron delivery-pipe of the high-service passes. It is stated that the cause of the engine breaking down was an intense vibration, which was found to have loosened the bricks of this sewer sufficiently to cause the escape of its contents, though only to a small degree. These sewer drains, as we have seen above, often contain not only the surface drainage for which they were intended, but the overflow of many privies, cesspools, and water-closets.

Dr. Buchanan appears to have been fully justified by the train of facts elicited in the course of his investigation in concluding that the late outbreak of fever arose from no other cause than the contamination of the water in the new well from this sewer, produced by a leakage caused by the very vibration which broke down the engine, almost the last work which was to fill this reservoir, from which these 300 houses were supplied on the 17th of August. No one, indeed, who carefully reads the report, can reasonably feel any doubt that

such and no other was the true cause of the outbreak. Apart, however, from this accidental contamination, grave doubts are raised by a perusal of the report as to the source of the water supply of this new well. An acknowledged sympathy between the height of the water in the river Wey and the new well (which, by the way, does not exist in the old well), suggests the probability of a far larger amount of the water coming from the river than from the chalk-springs.

With regard to the system of the cesspools cut in the chalk, which absorb the liquid portions so completely as to "keep themselves dry," when considered in conjunction with the fact that the wells for the water-supply are cut in the same chalk, and fed principally by percolation, nothing can be said except to express astonishment that Guildford has so long remained healthy. In conclusion, however, we would say one word upon a fact brought to light during this inquiry. It is admitted that a communication exists between the river and the pipes of the water-works. It is said to be *very rarely used*, and only for the purpose of getting a first sucking power to the pumps. It is also stated not to have been used at all this summer; but an analysis of water taken direct from the high-service mains at Charlottetown, seemed to throw considerable doubt upon this assertion. The state of the water may, however, be accounted for by the above theory, that in point of fact the new well draws its principal supply almost direct from the river. However this may be, such communication between the supply-pipes of a water company and the unfiltered water of a foul river, should be immediately interdicted by Act of Parliament. Only last year the terrible cholera epidemic in London was traced to a similar use of unfiltered water by the East London Water-works, through such a communication. Surely it is high time, now that the vital importance of the quality and quantity of water-supply is beginning to be understood, that some effectual system of inspection and surveillance of the source of supply of all water companies should be established, which should above all assure the water-consuming public that no communication between the pipes of the different water-works and unfiltered water any longer exists.

ON COLOUR.*

In considering the question of harmony of colour the tertiaries become essentially valuable. They have the same relation to the secondary colours as to shade that the primary colours have to light. Citrine is to dark violet as yellow is to light violet; russet is to dark green as red is to light green; olive is to dark orange as blue is to bright orange. Thus each of the secondaries is neutralized by that tertiary in which the remaining primary predominates. By a proportionate adjustment of the primaries with the secondaries or tertiaries, harmony of colour is produced. In decoration it may be laid down as a principle that one colour should dominate; that this dominant should be a primary or secondary; and that the other colours must be subsidiary to it. In the majority of cases, the most perfect and beautiful harmony is produced by employing neutralized hues of colour for the larger masses, and then giving freshness, cheerfulness, and beauty to the whole by the introduction of the primary or secondary colours that may form the proper equivalents to the prevailing colour. It should be always remembered that the eye is never satisfied with any arrangement of colour unless all the primaries are present in some shape or other.

In carrying out decorations, it will be found that all colours have two kinds of harmony; that of analogy or sympathy, and that of contrast. For instance, we will suppose the walls of a room to be of a soft green colour, and that curtains are required: two colours are open to us; on the one hand, a rich yellow brown, which is the softer or more sympathetic harmony; on the other hand, a warm maroon, which is the harmony of contrast. And again there is the important matter of carpet still to be decided on. Now, if you have to combine with the yellow brown curtains, a maroon-ground carpet will be the best; but if with the maroon curtains, the carpet must be brightened with green ornament, leaves, or even flowers, if for a drawing-room. All these prin-

cipal colourings of the room being thus decided, the decorator will have to consider how best to relieve with colour his cornice and frieze, the ceiling, and the woodwork. The cornice is a very important feature in a room; it acts as a kind of frame to the walls between these and the ceiling; but it should always be borne in mind, that except in peculiar cases, it should be made to belong to the walls, and with that view particular care must be taken in the colouring of it, either by a recall of the wall colour, or by a colour referring to the curtains or other harmonising hue. Thus there are three masses of colour to be considered in living-rooms,—the walls, the curtains, and the carpets; but it is by no means necessary that these should be all of different colours; two of them may accord, either the walls and curtains, or the curtains and carpet. If the walls of a room are highly ornamented in colour, either by arabesque painting or otherwise, it is desirable that the curtains be quiet in tone, and not of contrasted colours, and that the carpet preserve a subdued effect that does not interfere with the decoration of the walls. On the other hand, if the walls of a room are of a quiet tone, or are white and ornamented with gilding, various colours in ornament or flowers may be introduced with propriety in the carpet. As regards the colouring of carpets I should generally recommend the ground to be of a deep rich retiring colour, such as maroon or green, and the patterns, whether in ornament or flowers, to be as flat as possible, and entirely without cast shadows. The Indian carpets imported from Masulipatam are at all times quiet, retiring, and harmonious in their colouring, and worthy of particular study for the well-designed distribution of their ornament. It is surprising when we consider the poverty and general ignorance of the men who work at these carpets, that the result should show such refinement and delicacy in the modulations of the colours. I will not be led away from my more immediate subject by a further consideration of the colours in manufactured textile or other fabrics, but return to the painting and decoration of rooms.

When rooms are papered or painted in tints of colour, the combination necessary to carry out a pleasing effect is sufficiently simple and easy; but even in these great care should be taken to have those tints of a soft, agreeable tone. There are greens and greens, and blues and blues, and greys and greys; in the one case as ugly, raw, discordant, offensive, and displeasing as in the other they may be soft, harmonious, agreeable, and refreshing to the sight. What can be more incompatible than a crude emerald green? Soften it, however, with a little sienna or other moderating colour, and make it suitable in depth of tone to the size of the room, and your skill and taste will make it as agreeable as it would be otherwise repulsive.

In the woodwork of our rooms it seems to be too generally considered that it must be either a tinted white or grained in imitation of some wood. Now, I do not proscribe graining; on the contrary, I like it occasionally; but I think it is used far too frequently. Why not employ a good brown, or maroon, or black, well relieved with light-coloured lines, taking care to face up the work to a very smooth surface, and to varnish it? Above all, however, I like the real wood, even if it be plain deal or pitch pine; for this, if well finished by the joiner and kept clean, will, when varnished, have a very handsome effect, and can be readily ornamented to any degree, by painting dark lines and ornament as if laid upon it. The wear of this kind of work is far beyond any painting. Again, on walls of staircases or entrance vestibules, or dados of rooms, imitations of marbles are often painted, and very beautifully painted, too; for many of our English artists excel in this kind of work; but these imitations are adopted not always because they are appropriate to the place or particularly required, but because, being varnished, they wear well, and nothing else is suggested. I think, however, that in a moderate-sized house, where quiet taste is appreciated, stencilling in geometric patterns in two shades of one colour is preferable to marbling, which, if done in an inferior manner, is a most unsightly sham. In determining the colours for rooms regard should be had to their aspect, giving cool and refreshing shades to the north, and warm comfortable colours to the south. The use of a room should also, of course, influence the colour. Then, also, pictures require particular consideration; if there are many in the room, and they are truly works of art, the colour of the walls must be subservient to them.

If the pictures are not very large, and the colouring of them not dark or heavy, sage green is a good tone; in this case the windows and doors might be cinamon colour, if not real wood; the cornice of the room might be vellum colour, relieved with the cinamon and the green in suitable parts of it; the ceiling might be pale grey, or if it is paneled it may be cream colour, relieved with the other tones of the room. If, however, the room be large and the pictures boldly painted, red is an excellent colour for the walls; it gives freshness and vigour to the painting, and, if the room is lighted from above, it renders it bright and cheerful,—not undesirable qualities where there is no external prospect. The woodwork, if already painted, may be black, or vellum colour, properly relieved on the mouldings. The cornice and ceiling of the room should be carefully toned, so that nothing be too obtrusive; but no special colours can be proposed as they would depend on the design of the architecture.

Considerable discussion has occurred in late years as to the proper background for statues, whether it should be a quiet neutral tone of grey or a more decided colour such as maroon red. I am strongly in favour of the decided colour. There may be special circumstances making the light neutral tone desirable for one or two statues; but, taken as a rule for a gallery, or for even a single statue, I prefer the deep colour. This must be modified of course, according to the condition of the marble; if the statues are old and stained, the colouring must be lowered in tone accordingly. The hue for walls where prints or photographs are to be hung should be a rich yellow brown, or a leather colour. This gives lustre to the back of the print or the tone of the photograph. Occasionally there may be some special object in a room requiring a corresponding modulation of the colouring, such as an allegorical painting in a ceiling, much darkened and obscured by age; such cases have often occurred to me, and have caused difficulty; for you must manage to make the painting look well, and the ceiling not too gloomy. I will give an example. In an old castellated house, there was a room in which were to be arranged a series of family portraits. As the room faced the south, it was desired that the walls might not be red; so it was decided to have a bold damask pattern green flock upon a brown leather and gold ground. The ceiling was divided by projecting beams into fifteen compartments, in each of which was a large oval painting of a cardinal virtue, in *chiaro oscuro* on a dark olive ground; these ovals were surrounded by low relief framing, and outside that by very high foliage ornament. We made the framing deep vellum colour, relieved with gilding, and in the margin put a tone of maroon red, the light ornament vellum, and the ground of the surrounding panel was painted blue sufficiently modulated. The beams which were enriched we painted a brown oak colour, and the ornaments on them were picked out the colour of light wood, and relieved with maroon red and gilding. The curtains of the room were red, and the carpet also, but relieved in subdued colours. The ceiling of this room was of the nature of a discord, as it would be called in music; and yet to my eye it was satisfactory and harmonious. You cannot lay down precise laws as to what colours shall be brought together: a careful modulation will enable an experienced artist to bring any colours together. Discords can always be made to modulate if you but know how to do it. I once heard a learned man observe that "science is a collection of laws, but knowledge is a collection of facts;" and there are facts which experience teaches us, which it would be difficult to explain by reference to the laws of harmony; though these laws are just, sound, and indisputable.

Hitherto we have been considering the principles of contrast and harmony, or its application to simple forms, under ordinary circumstances; but in churches, large halls, or public buildings of importance, it is necessary to consider very carefully the peculiar circumstances of each of them before designing the decoration. I am not surprised at architects dreading the indiscriminate use of colour in a building on which they have bestowed much careful study and labour. Judicious and well-designed arrangements of colour should add to the architectural effect; the principal constructive features of a building should be emphasized or clearly expressed; and the whole, avoiding confusion, should present a glorious combination of symmetry of form and

* By Mr. J. Gregory Crace. See p. 874, ante.

harmony of colour. As for me, I abominate white-wash; I see not the beauty of raw stone walls unrelieved; nor do I see the impropriety of colouring those raw stone walls with glowing colour.

I will now briefly allude to colour as applied by the ancients at various periods. Those who have had the opportunity of visiting the interior of Egyptian temples express their warmest admiration at the harmony and richness of the colouring, preserved through so many centuries. The walls are mostly covered with sculpture in low relief, made distinct and intelligible by colour. Judging by what is seen at the British Museum, one cannot but wonder at such good effect obtained by simple means, for their colours appear to have been very limited. Their ornamentation is simple, but beautiful. The Greeks, I have no doubt, carried the art of coloured decoration to the same degree of perfection as the other arts in which they so excelled. All the interiors of their public buildings were coloured, and not only the interior, but in many of them the exterior also. According to the French architect, M. Hittori, the colouring in the Parthenon was as follows:—"The main architectural features, such as the columns and entablatures, were coloured yellow; the surfaces of the walls of the portico, and the cells and all the parts behind, were painted red; the triglyphs and the metules were painted blue, the grotto of the latter with red spots; the mouldings, filets, and grand cyma, were ornamented in different colours, the mouths of the lions' heads were red and the eyes blue; the ceilings were decorated by blue grounds with gilt stars." The traces of Greek coloured decoration are few; but we know that it was successfully practised, and the works of their descendants in a provincial Roman city, show even at the present day how beautiful it must have been; for the Romans were soldiers,—their art-workmen, their sculptors, painters, gold-workers, bronze-workers, and potters, were Etruscans or Greeks. Yes, it is in Pompeii we must now look for evidences of Greek art in harmonious colouring. The city of Pompeii, submerged by a continuous flow of mud and ashes alternately, from Vesuvius, lying dead, forgotten, for nearly eighteen centuries; now brought to light again, shows us all the details of Roman life as it existed at that distant period. The walls of the various palaces and houses,—roofless, indeed, but glowing with colour, in its utmost beauty of combination,—the various marble and bronze statues, jewelry, domestic and trade utensils, mosaic floors, and grottoes, all are exposed as the excavations are made, nearly as fresh-looking as when they were submerged; even the paved streets on which the visitor now walks are indented with the marks of the ancient chariot wheels. Here is, indeed, a mine of wealth to the student in polychromy, here he will find wonderful combinations of colour always harmonious and beautiful. There are paintings, too, some evidently copies of celebrated works by eminent Greek artists, and what elegance, fancy, and beauty in the various playful arabesques everywhere abounding! A visit to Pompeii is, indeed, an event in a man's life, especially if he has a soul to feel the influence of art. In considering the specimens of decoration from Pompeii, it must be remembered that owing to the manners of the time the chambers were small, and that the heat of the climate, and the bright sunlight, made deep colours sometimes preferable. The discovery of the decorations of the Roman baths, about the time of Raffaele, caused the introduction of what is now called arabesque ornament; though it was then named grotesque, from the grotto-like look of the baths. The arabesques in the loggie of the Vatican are said to be inspired by these, and are well represented in the work by Volpato; there is one part of them I always much admire, namely, the groups of fruits and flowers suspended by red cords on a rich blue ground, painted on the wall surface round each window. All over Italy are to be seen interesting specimens of coloured decoration of the fifteenth and sixteenth centuries at Florence, Mantua, Sienna, Perugia, the Cortona near Pavia, Assisi, and a host of other places. My son studied in these places, and made a great number of coloured sketches, which show how very interesting these works are to the student in decoration, and what value may be given to surfaces otherwise unadorned, by a bold application of harmonious colouring, and refinement and delicacy in the ornament. In another series of drawings, made by myself some years ago from decorations done at Munich in recent

times, you will see what great use the Germans have made of early Italian art in applying the result of their studies to modern work. I think the very simple but beautiful, rich, and glowing colouring of the arch soffits of the Allerheiligen Capellen is a model of successful decoration. It will be recollect that modern Munich is the creation of the late King Louis, late king though still living, of a man strongly inspired with a love for art, and who devoted himself to the adornment of his small capital by the erection of a series of art monuments such as picture-galleries, statue-galleries, museums, libraries, palaces, churches, all combining in their construction and adornment the talents of architects, sculptors, artistic and decorative painters, &c., and thus forming a city which has acquired high renown in art, as compared to which our big, dull, ugly, smoky London, sinks into insignificance.

What I have attempted to explain are merely the rudimentary principles of an art which requires study and constant practice to make it available. One must learn the grammar of a language before it can be correctly understood; and it requires much knowledge and deep reflection before one can write an essay or a poem. But how many a self-made man has raised himself by his own careful training. I say to every house-painter, learn to draw; keep a sketch-book in your pocket, and when you see anything you admire, attempt to draw it; you will find you will soon get on. There are schools of design in various parts of London where you can acquire a knowledge of ornament. It is an amusing occupation—it is likely to be a profitable one; at any rate, do your best, and if you do not command success, it is a last satisfaction to feel that you deserve it.

SCHOOLS OF ART.

The Bristol School.—The distribution of prizes and certificates awarded at the last examination to the successful students, took place at the Fine Arts Academy, Queen's-road. Mr. P. W. S. Miles presided over a large attendance. From a statement supplied by the master, and read by the chairman, it appeared that the result of the second-grade examination in March last was, that 90 exercises were executed by 62 students, that to the satisfaction of the examiner. Of these, 17 passed, and five had certificates awarded. In the third grade, 17 students' works were considered very satisfactory; twelve gained prizes, and five honourable mention. Fifteen students' works were selected for national competition, and two received national prize medals. The chairman distributed the prizes.

Gloicester and Stroud Schools.—The annual exhibition of the works of the students of these schools, took place in the Cornhall, Stroud. The works were of a meritorious character, and showed marked progress on the part of the pupils. Several local prizes were offered, and a public meeting was held at the Cornhall for the distribution of these and of those gained by the pupils of the science classes. Mr. S. S. Dickinson presided, and several interesting speeches were delivered. Among those who spoke were Mr. Shree, Mr. Winterbotham, the Rev. Dr. Badcock, and Mr. Kemp (master of the schools of art). Mr. Pullen, the master of the Science Class, who is leaving to take an important appointment at Brighton, was presented by the chairman with a money testimonial subscribed by Mr. Pullen's pupils. Mr. Dickinson remarked that Mr. Pullen had been most successful in his teaching, and had been the means of securing for one in his class the great honour of the single gold medal offered by the Department in Geology. The committee, in their report, said that in many respects there had been a great improvement in the Science Class during the year. The annual exhibition of the works of the students of the schools was to take place at the Gloucester school in Longsmith-street; and the distribution of prizes by Mr. Gambier Parry, president of the school, at a public meeting in the Tolsey.

The Carlisle School.—The annual meeting of this school was held in the Academy of Arts, Finkle-street. The mayor presided. The receipts for the year ending 30th June were stated to have amounted altogether to 74l. 14s. 11d., of which the principal items were:—Annual subscriptions, 26l.; fees of school, 52l. (of which half is deducted for the master); and balance due by treasurer at last account, 21l. The expenditure amounted to 61l., and 13l. remain in

the hands of the treasurer. Captain Ferguson, in moving the adoption of the report, said it was very satisfactory to find that the school was now out of debt. There were few schools conducted in such a satisfactory manner as this, and that circumstance was due in no small degree to the ability and attention of the master, Mr. Herbert Lees. The master regretted that so few operatives took advantage of the facilities the school afforded, and that those who did remained such a short time; and mentioned that there were only two operative painters in Carlisle who attended the school of art, although the instruction they could receive there was likely to benefit them so much.

A Lewes School.—After Christmas, an effort will be made to establish a branch school of art, in connexion with the Lewes Mechanics' Institution, under the auspices of Mr. John White, head-master of the Brighton school.

THE HAVRE INTERNATIONAL MARITIME EXHIBITION.

THE programme has been issued for a Maritime International Exhibition at Havre in 1868, including forty-three classes, in the five following groups: Navigation, Goods, Fishing, Aquiculture, complementary Classes.

A Maritime and International Congress will take place during the time of the Exhibition. There are to be an aquarium and the sea-water ponds worthy of notice with regard to their inhabitants and aquatic plants. The Exhibition will be held in closed galleries which were begun in the month of July, 1867, on the grounds situated by the sea-shore, opposite the roadstead on the Boulevard Impérial and the Boulevard François I. These grounds are granted by Government.

The first 500 exhibitors will have free admission to the club belonging to the Exhibition serving as a place where exhibitors may meet and treat of their affairs.

The rewards adjudged to exhibitors, on the decision of the International Jury, will consist of pecuniary gifts and objects of art, gold and silver medals and honourable mentions: there will be several great prizes amongst the rewards.

Exhibitors pay for space, but pictures and purely art productions will be admitted free of charge.

The Exhibition will open on the 1st of June 1868.

CARVED STALL-ENDS, CHICHESTER CATHEDRAL.

We have engraved views of half a dozen of the oak seats for the choir which have been set up in Chichester Cathedral. All the plants and trees mentioned in the Bible are introduced on the stall-fronts and ends. On the Dean's and Precursor's stalls English plants and flowers have been used. These stalls, like all the other internal fittings, were designed by Messrs. Slater & Carpenter, architects. Mr. Forsyth was the carver.

NEW AUCTION MART, TOKENHOUSE-YARD.

IN consequence of the old Auction Mart at the corner of Bartholomew-lane having been sold by its proprietors to the Alliance Bank in the year 1864, a number of the members of the leading auctioneering firms in London formed themselves into a limited liability company, and having purchased a site in Tokenhouse-yard, Lothbury, the present convenient structure for the use of the profession and public generally has been erected from the designs of Mr. G. Somers Clarke, architect to the company.

The site formerly was covered by a row of old brick houses, let out as offices, no higher than 40 ft., whilst the additional height of 14 ft. required in the new building to give the number of auction-rooms essential to make the investment at all remunerative to the company, caused an amount of litigation on the vexed question of damage done to light and air of the adjoining properties hardly paralleled in the history of that fertile subject. For nearly one year the lower floors were occupied by the company with a temporary roof on the building. During that period the whole matter was fought out in Court before Vice-Chancellor Page Wood, when the

NEW STALL-ENDS, CHICHESTER CATHEDRAL.

verdicts were generally against the company. Eventually, the best solution in cases of this sort, viz., a compromise and a money compensation to the aggrieved parties, terminated the dispute, and the building was allowed to be finished in its integrity.

The front next Tokenhouse-yard measures 97 ft. in length, and is 54 ft. high to the top of the cornice from the pavement level, by an average depth of 36 ft. It is constructed generally of Portland stone, but portions such as the base and sur-base of the entire building, the principal door, the centre shafts of the two-light windows, and the panels between them of the second-floor, are executed in red Mansfield stone from the Lindley quarries.

The foundations were carried down to a depth of 22 ft. below the level of the street, as the site consisted of made ground, probably the filling in of the old Walbrook stream. The excavations were

obliged to be done by mining in short lengths, as the adjoining buildings, upwards of 200 years old and very lofty, required to be underpinned and shored up most carefully before the trenches for the new building could be constructed. The great depth of this excavation necessitated the formation of a vaulted sub-basement 11 ft. high, let to Mr. Renben Hibbard (the lessee of the Auction Mart Restaurant on the floor above) as wine-vaults. These vaults, built in Portland cement, with white brick facings, and paved with fine Staffordshire paviers, being below the level of the City sewers, were drained into a sumpt-well, from whence a force-pump discharges the contents into the sewer above in Tokenhouse-yard. In these cellars are deposited upwards of 20,000l. worth of wine, ranged in a symmetrical form in wrought-iron bins the whole length of the building, and they are lighted throughout with gas. A staircase enclosed by a wrought-iron grille leads

to the floor above, or basement proper, appropriated as a luncheon-bar and restaurant, with kitchen, scullery, larder, and so on. Access to the restaurant is obtained direct from the street, and also by the principal stairs on the ground-floor of the Mart itself.

The whole of the ground, first, and second floors, with the exception of one room occupied by the Estate Exchange Company, are in the hands of the company, and let as auction rooms. They vary in size from 33 ft. by 27 ft. 6 in. to 24 ft. by 18 ft. There are also consultation-rooms, retiring rooms, W.C.s, and housekeeper's rooms. Messrs. Lucas, Bros., were the builders; and Mr. John Athey the clerk of the works. Mr. Earp executed the carvings.

Some critical remarks on the exterior of the building will be found in our last year's volume.*

* Vol. xxiv., p. 792.

THE AUCTION MART, TOKENHOUSE YARD, LONDON.—MR. G. SOMERS CLARKE, ARCHITECT.

In England there are no elements of comparison between the Royal Academy and Schools of Art, and in France the sort of education attempted in the Municipal Drawing Schools and the *École des Beaux Arts* are vitally different. In the Royal Academy we have an institution similar in its aims for educating professional artists as in the *École des Beaux Arts* in Paris; whilst the Municipal Schools of Paris and the French provincial towns are in their aim and intention the same as our English Schools of Art. In the one case the Academy and the *École Impériale* seek to give technical instruction of a high order to professional students in fine art; in the other, the Art and Municipal Schools endeavour to impart a knowledge of the elements of art such as would be practically useful in the trade to artisans. It may very much concern the refinement in art and the status of English artists to discover the similarity or difference between the nature or degree of education given in the professional schools of the two countries and in the German schools; but as this does not materially influence the art-element in industrial production, it is not my intention to institute any comparison, or search for information concerning them. What I propose to do is to see whether we cannot combine with our English art-education those good features by which the French and German educationalists try to develop art-feeling among the actual producers of the works, in which the artisan either displays knowledge of good form and a taste for the beautiful, or betrays an ignorance of both.

Schools of Design and Schools of Art.

The experiment of national art education in England is one of thirty years' duration, the first School of Design having been organized at Somerset House in 1836. During the subsequent fifteen years several of the leading provincial towns also established schools of design, which, together with the head school in London, were supported principally by direct Parliamentary grants to the several localities. The first object of the schools was to supply an education to designers and art-workmen. Examples for study were supplied to the schools by the Board of Trade, which had the control over them and determined the amount of annual grant to each locality, according to its importance as a manufacturing centre, it being recognised that the work of encouraging improvement in design could best be achieved in the towns in which manufactures were carried on. No difference in this respect was made between London and Manchester, and nothing which the Board of Trade gave to the Central School at Somerset House was withheld from provincial schools. Excellent examples for study were furnished to all, and the schools thus supported effected a great deal of good at comparatively little cost to the country. The subjects of study were few, and the drawings produced in the schools were annually forwarded to London for examination by the heads of the Central School, who reported on them to the Board of Trade. There was no examination, as at present, of the students by means of papers on elementary subjects. In 1852, the system by which it was sought to develop an art-feeling throughout the country was entirely changed. Design became one of a multitude of subjects of instruction; the education in elementary art of the public generally became the aim of the Schools of Design, thereafter called Schools of Art; and the task of supporting the schools was shifted from the Board of Trade to the localities in which the schools existed, with the exception of the London School, to which this did not apply; whilst the management of the schools was transferred to a new Government Department, called the Department of Practical Art, which subsequently became the Science and Art Department of the Committee of Council on Education. Many and very various have been the changes made in the conduct and direction of Schools of Art, which it would be both unprofitable and digressive to consider at present. It will be, perhaps, sufficient to remark that design especially is no longer the work of the schools, though it is one of the twenty-three stages of study in the schools' course. At present the art education of the country is carried on by the certificated teachers of the Art Department in, 1st. Primary schools; 2nd. Night classes in mechanics and other institutes; 3rd. Schools of art for both day and night classes; 4th. Private schools and colleges. The course of instruction is divided into three grades. 1st. Elementary drawing in primary

schools; 2nd. Elementary drawing in schools of art; 3rd. Advanced drawing in schools of art. Teachers of drawing are qualified after examination by certificates in two grades, the second, which bears testimony to teach elementary drawing in primary schools for first grade, and in night classes in the subjects of second grade, in which the certificate is held. (This second grade certificate is that usually held by National schoolmasters.) The third grade of qualification is that held by art-masters, the teachers of schools of art, the whole of the subjects of study being divided into six groups, and a separate certificate granted for each. The State supports art education when given by certificated teachers, not on the School of Design system of a fixed sum to each manufacturing centre, but upon the results of examination of the pupils of the schools, in the second and third grade of instruction, in schools of art or night classes, and in the first grade in primary schools.

The encouragement offered to students in schools has varied much also. For a time freestudentships, medals, and hook prizes were given, but at present only ten gold medals, twenty silver, and fifty bronze medals are awarded to the whole of the United Kingdom, and these are for success in either (1) painting from nature in colours, (2) drawing in light and shade from the antique, and (3) design. Other rewards in the form of books are given for success in third-grade elementary subjects, and of hooks or drawing materials for success at the second grade time examinations, under the local committees of the schools. Upon the success of these examinations grants in aid are made to the schools, from which it will be seen that unless certain subjects of study are pursued in the schools, little or no aid is given by the State; and even then, if the students are absent from the examinations, or have not attended sufficiently regularly to produce a fair year's work previously to the examinations, no assistance is extended to the schools on their behalf.

From this statement it will, however, be apparent that the object of schools of art is to cause a diffusion of knowledge of drawing principally amongst the artisan classes; and, assuming that working men cannot afford to pay the full value of such instruction, to encourage and assist them by rewards, and to share the cost of extending this education with the localities by grants in aid to the teachers.

Concerning the value of the system upon which the schools are thus managed there are various opinions. In it are several features as good as they can be, and others which cannot be so described. Some very successful regulations, which worked well and were the cause of so wide a diffusion of instruction as at present exists, have been discontinued, and other much less satisfactory arrangements substituted. Others, which are improvements upon anything preceding them, have been adopted, and thus our art-schools, which from various causes have been in a condition of perpetual change since 1852, may fairly be supposed to be still in an embryotic state, requiring care and increased experience to develop them, if ever they are to become what they should be, or even what they profess to be. The greatest difficulty in the way of the extension of the advantages of schools of art at present, is the very limited amount of assistance obtained from the public by way of annual subscriptions, or in the shape of annual grants in aid, given to provincial towns, by the central department, in the first place, and secondly, the impossibility of obtaining suitable examples for art-instruction in the schools from the limited funds at their disposal. A reconsideration of these questions, and the adoption of means to obviate these difficulties, for a definite period, would probably enable a large number of localities to resuscitate their schools of art where at present they languish, or to establish new schools where they do not exist. A liberal aid to meet local efforts for a period of say ten years, and the furnishing of all schools willing to provide satisfactory accommodation for them with the best examples for study, would, I feel sure, give the subject of technical education in art so fair a beginning that it would take root, and at the end of such a period be able to draw its own nutriment largely from its own soil. In the long run, the course proposed would be the cheapest and the best; for eventually the cost of these schools must fall equally on the State and on localities, though it will always be a profitable investment of public money that in London and some of the more populous of the provincial towns, schools and

museums of a high class should be supported in a condition of the greatest efficiency, by the State.

Elementary Examinations.

The present system in English schools of art of attaching so great an importance to elementary knowledge on the subjects of second-grade examination is peculiar to them, and not altogether satisfactory, judging by the results, which are obtained by them in facility of drawing, and the still greater facility and mastery of drawing obtained by French and German students without these tests. In such subjects as freehand and model drawing, and perhaps geometrical drawing, the imposition of a time test is satisfactory, and produces readiness and ease of work quite consistent with a fair understanding of the subjects. In perspective and orthographic projection, little good is done by examinations as at present, for only a superficial knowledge of either can be conveyed to students so badly educated as our artisans, as a rule, are; and the knowledge which it is possible to get into them, when sufficient to pass the test, requires a vast outlay of labour, and rapidly disappears afterwards, as I have found from a long and disagreeable experience.

Advanced Time Examinations suggested.

On the other hand, in English schools of art we have no time examination whatever in subjects such as light-and-shade drawing from the cast, or examples, which is found to be so excellent a practice in the French schools. I have been present at these examinations in Paris; and, whilst they convinced me that the French method of teaching drawing in light and shade from the first, is the best possible system for artisans, they made me regret that our own system of examinations does not include the testing of the more advanced students in our schools by similar time drawings. This seems to be worthy of consideration, whether it would not be advisable to add to our elementary examinations the further time examination of advanced students in—1. Light and shade from examples of ornament, figure, and foliage in chalk; 2. Ditto, from the cast; 3. Ditto, from the living model and from natural foliage; 4. Colouring; 5. Drawing in various mediums from memory; 6. Drawing from architectural models, and models of machinery; 7. Original design, as a time exercise.

If, for instance, a student, who had already passed the elementary tests, were required to offer himself for examination in all the subjects of study he had pursued since the last examination, or in those represented in the set of works which he had produced during the year, both in time and memory drawing, the good features of such tests would be continued for the benefit of the student's education, after the elements had been passed, and more difficult work was being encountered.

Modification of Elementary Teaching.

Another suggestion I would make is the discontinuance in our schools of such severe tests of accuracy in outline drawing. I confess to having, at one time believed thoroughly in the virtues of this hard outline drawing; and, as long as the present view, theoretical and pecuniary, is attached to it in the school of art system, it must be insisted on by art-masters. Yet, after all I have seen, both of French works and some German drawings, I believe we are the only people who lay this heavy burden, grievous to be borne, upon the shoulders of our beginners in art-study. The French pupil begins his study with thick, coarse lines and rough effects of light and shade, which do attempt to be a representation of what the eye sees, in the manner in which it is most easy of expression. We in England require our students to begin their efforts to represent form in a manner it is never seen by the eye,—a conventional, expressionless way, requiring precision and accuracy precisely at the time when it is fully to expect it. Experienced artists, even, never resort to so severe a test as embodying their ideas in a wiry line, which does not exist in nature. Their roughest sketches which pretend to the imitation of forms, include a little sketchy shading and variety of thickness in lines, in imitation of emphasis as the eye sees, and are not mere geometric, colourless, shadowless, front elevations of forms. What Mr. Ruskin recommends the pupil to do with pen and ink as a means of studying form (in his "Elements of Drawing"), the French do with chalk and charcoal, using

INSTITUTE OF PAINTERS IN WATER COLOURS.

LIKE the senior society, the Institute of Painters in Water Colours is best represented by those of its members practising landscape-drawing; or, at all events, in this present exhibition of "minor" works,—since the proper denomination of sketch, study, and picture remains a moot point,—the figure-drawings have lent too little assistance calculated to support a different opinion.

It must be rather amusing, and sometimes vexatious, to those who have made the study of nature their life-long business, to be corrected in regard to what may be accepted as a *presentation*, in fact, of their study, to be told that what indicates the greatest hurry ought to be endorsed with the strongest acknowledgment of its truth, whilst obviously earnest watchfulness and honest care, that make the fruit of it apparent, should be accounted as discount in the value received. Sun-gleams, clouds, light and its reflexions, are aspects as transient as a lady's frown, and observation and recollection are the only means by which they may be recorded.

Did one day's study of a mountain for Mr. W. Bennett's study of "A Mountain Torrent" (76), or for Mr. James G. Philp's of "The Beat of the Atlantic" (62), with its clever realization of seething spray and mysterious variety of shadow-tints on the beach it washes; or was the sun slow enough about settling in gloomy splendour "On the Adur, Littlehampton" (38), to enable Mr. H. C. Hine to paint his portrait before, suddenly sinking into his sea-bed, he quite hid his face in the sheets of fat cloud, after having lent Mr. Bennett a patient gleam inland (106) for his immediate and particular pictorial purpose, and being similarly kind to others?

Winter or summer, an exhibition by the Institute of Painters in Water Colours would be strangely imperfect without numbering amongst its leading features one of those Eastern desert subjects for which Mr. Henry Warren has become so famous; and (11) "The Race of the Two Romes—who will be first for Water and Fuel," though small one, is a very admirable specimen.

The goal is a well in the desert: to reach it two parties are strenuously racing their camels, whilst pedestrians are running a spirit, with the probability of little reward for the winners, since "it not infrequently happens that, on arriving at a well, but a scant supply of water is found." This is, in all probability, a study for a larger picture; the finish of the workmanship and completeness of the composition dignifying it above the slighter pretensions of a sketch—a designation more properly belonging to an illustration of "The Finding of Moses" (289), and other works of less importance. Among the rest of Mr. Warren's contributions is the figure of a maiden, who, in a low-necked dress of early eighteenth-century cut, and defiance of bronchial affections and all propriety, is walking out when it snows, dissolving the flakes into tears of envious admiration and grief that her complexion should be so clear (308): the idea is more enthusiastic than the artist's treatment of it, and to connect its value with the worth of an "old song" (whence the inspiration) would be to underrate it considerably.

Mr. John Absalon's idealities help to vary a little the collection, though none of them offer an opportunity for adding anything like new comment on the agreeable qualities his sketches usually possess, even when as slight as the "Milkmaid and Angler" (391), or (418) "The Whisper." Mr. E. H. Wehnert, in numerous instances, shows a partiality for depth of colour, including illustrations of Shakespeare's "Taming of the Shrew" (39 and 50), and sketches of some of his well known larger drawings. He recalls one of his early successes in (122) "Sebastian Gomez, the Mulatto Slave of Marillo, surprised while painting a Virgin and Child," breadth of light and shadow, and subdued richness of colour, as well as for the interest that must always be attached to it as the germ of a masterpiece, make this one of the most notable things in the room. Mr. Louis Haghe is not at all conspicuously represented by his "Sketch for a Drawing made by command of her Majesty the Queen, of the Investiture with the Order of the Carter of his late Majesty Louis Philippe, King of the French, at Windsor, October, 1844" (80): except it be for the associative recollections that are awakened by its presence, it can only be regarded as a cleverly painted interior; but, taken as a starting point, what a number of pages of a yet unwritten history will

be devoted to the interim between its date and now. Two studies of Italian costume (300 and 316), are also by Mr. Haghe, though some would not think it. "Joy and Sorrow" (10), by Mr. Guido Bach, shows great facility in dealing honestly with water-colour; the work has much of the luminous quality of fresco, though the subject of it is not quite so clear: is it slavery envying freedom, or is the dark lady an unmothered mother contemplating the felicity of the fair one, who bears the weight of the chubby lump of happiness on her lap amid surrounding antecedents of the dative case? However, the drawing is admirably, though loosely, done; and betokens power enough to do still better. There is no mistake to be made about (142) "A Citana: a Study," by the same; a very pleasant though dangerous study if the artist should happen to be as good-looking as the model, whose brothers and consins may possibly think long knives short remedies for heart complaints. Making allowance for preternaturally large and liquid eyes, this head is very beautiful, though somewhat of a conventional type; but then, how far preferable to such unconventional type that, to speak as gently as possible of it, is not pretty—is not refined, and braves it as "The latest Thing in Hair and Hats." Mr. A. Bonvier's physically frail ladies rise above the golden cloud of idealism into the haze of impossibility; she who gazes on "The Cameo" (67) is of such ultra-refined but nevertheless ably drawn and stippled, "Sibilla" (218). How much more real-looking is Mr. James D. Jinton's "Study of a Head" (205); and this is finished to a fault, but without that total destruction of vitality that so often attends elaboration. Mr. G. C. Kilburne's "Country Girl" (242) is life-like and natural; though, with a tithé of the labour bestowed on this, Miss Emily Farmer's "Village Child" (414), with "Sorrow and Mirth" (400), are more vivacious, and far more agreeable company. Miss Farmer's child-portraiture is reaching excellence. Mr. W. Luson Thomas has some pleasant little drawings; if the themes he selects for exhibiting his taste for colour upon had the recommendation of being less time-worn, he would secure a more decided recognition than his "French Fish-girl" (237), presented singly or engaged as one of "The Cossips" (337), or idling with a younger sister on the beach in "Sunshine" (429), even now outlive him to claim; this, (349) "The Round-head's Daughter," with a bright day-light effect to illuminate her as she cogitates over her needle-work, will help to prove. Mr. C. Green, with great precision of touch, makes much of such trivial matters as the most ordinary acquaintance with London common life would furnish *ad libitum*: a coster's barrow on "Saturday Night" (408) is surrounded by the most probable of customers, who, sharing amongst them some appropriate character, are made quite worthy of depiction. With such aid as the light of the paper lantern and focus of colour provided by the fruit and other vendible commodities, they form an effective group, soon to be scattered by the inevitable and inexorable policeman seen approaching in the distance to assert the majesty of the law. "An Acrobat" (367) and a companion study of one of those sylphs who dance hornpipes on a deal board, with a drum accompaniment, are also by Mr. Green, who is seen to best advantage in miniature works of this kind that are usually so well done as to disguise their commonplace origin.

Mr. Charles Catermole is likewise great in miniature; but his illustrations are of the past, not the present; the traditions of feudal times furnish him with motives: (283) "A Council of War," (386) "After the Battle," and "The Baron's Chapel" (399) are of his best examples, showing as much appreciation of Mr. John Gilbert as Mr. Gilbert has previously shown of the Catermole recognised long ago as one of the most original of artists, and of the least likely to follow anybody.

This brief summary will exemplify the figure and face department; but it would take a longer description to do as much justice to the landscapes, coasts, and sea-pieces, with architecture exterior and interior. The greater number of these possess such qualities as declare immediate reference to nature, but with little evidence of haste or uncertainty in execution, or, in most cases, of incompleteness. Stones are unalterable things (unlike stocks), except by time and such temporary changes as the hand on the dial will account for under reasonable conditions of seasonable weather.

Mr. Carl Werner's sketches bear the impress of authenticity, in that ready facility—not carelessness—which which he transmits facts to paper. "Entrance of Mosque at Cairo" (32), "Jerusalem from the North," introducing the encolpas of the Holy Sepulchre" (197), "Street of Damascus" (210), "Entrance of an old Palace at Cairo" (238), "Old Balcony at Cairo" (324), and a very unpossessing portrait of a dusky "Girl of Antioch, Upper Egypt" (264), with others, stand in need of no verbal intimation that they were painted on the spot. Mr. C. Vacher's drawings look more like studio-work, and are not stated to be otherwise. "Remains of the Numidian City, Zambesa, North Africa" (31), bathed in a rose-coloured atmosphere, is a good specimen. There are admirable instances of contrast to the more pains-taking and patient of students, in Mr. D. H. McKewen's "Borrowdale, Cumberland" (75), and his capital interior, "Lady Betty Cerma's Bed-chamber, Knole" (296); Mr. W. L. Leitch's "Study from Nature on the Waters of the Awe, Argyleshire" (304), "Evening" (181), and others, by the same. But where so much is to be noted, it is difficult to make selection. So in following the order of the catalogue it may be observed that Mr. J. L. Wood's hits of Haddon Hall (4 and 356); "A Lugger riding out a Gale," by Mr. E. Hayes (15); "Sunset at Earlswood, near Reigate" (21), encouraging fresh belief in Mr. T. L. Rowbotham's pretty Italian adaptations, "On the Lake of Lugarno" (42), &c.; Mr. W. W. Deane's "Palazzo Verica, Cenoa" (53), and "Sta. Maria de Salute, Venice" (94), with the curious effect of water liner than the sky; Mr. J. H. Mele's pleasant platitudes "Pegwell Bay, Isle of Thanet" (74); "At Langley, Sussex" (120); and some others still prettier. Mr. J. McGuffin's "Sunset, West Coast of Scotland" (127); Mr. H. C. Pidgeon's "Stand at Burnham Beeches" (189); Mr. Stimmer Frons's "Candebeec, on the Seine" (199); "A Silvery Morning" (201), very positively rendered by Mr. J. C. Philp, and welcome after stormy weather; a very careful drawing of the "East Cliff, Hastings" (282), by Mr. H. G. Hine; Mr. J. H. D'Egville's Venetian scenery, particularly "Chioggia" (305), and a very literal view of "Hillsborough, taken from the Harbour at Ilfracombe, North Devon," by Mr. Aaron Penley (343), are marked for more notice. Mr. Benvis's horses' heads (348), and small drawing of "Harvesting in Sussex" (325); Mr. Harrison Weir's "Forgers" (54); Mrs. W. Duffield's Studies of Roses, and Mr. J. Shorin's "Bough of Apples" (422), are all excellent in their way. Mr. Bennett's drawings throughout are delightfully fresh in tint; and though he generalizes and only suggests natural appearances rather than copies them, his method conveys a very truthful notion of them: the same may be said of Mr. J. W. Whympy, whose sketch of a "Homestead at the Foot of Hindhead" (301), and, again, a "Bit on Blackdown" (312), will show how much affinity there is between their styles.

AN EDUCATIONAL VIEW OF THE PARIS EXHIBITION.*

BEFORE it is possible to learn what features of Continental art-education are worthy of incorporation with our English system, it is requisite that we should inquire into the objects sought after in supplying instruction in art both in England and on the Continent; because, unless our aims are nearly the same, the means for accomplishing those aims will be necessarily dissimilar. Nothing, for instance, could be gained by a comparison of the art-education of artisans in one country with the professional instruction of artists, architects, sculptors, or painters in another. The education of all classes in every subject may be identical in kind up to a certain point, but beyond that point it will vary for different classes, not only in degree, but in kind, and though thoroughness in education is desirable for all, it is of no use to fail in securing sound knowledge of the possible in attempting to cover a wide field of knowledge, desirable in itself, but beyond the reach of the many. In other words, the education of the artisan and the artist may be the same in elementary work, but the success of the former will depend upon readiness and skill in a limited field; whilst for true greatness in the latter all kinds of knowledge to the highest degree are absolutely necessary.

* See p. 387, ante.

wash-leather and stump as instruments; and I feel quite convinced that, if ever we are to make ready and powerful draughtsmen of the students in our art schools, it will be by the modification of our system of teaching drawing, beginning with the vehicle and method of work which the French and some of the German schools have adopted.

Re-arrangement of Advanced Instruction desirable.

In comparing the South Kensington collection of drawings with those of other nations represented in the Exhibition, the most striking feature was the variety in modes and subjects of study, and the high finish in many of the works. This, though apparently a good feature, is not so in reality, remembering the object of schools of art. If they were professional schools, nothing could be said against either the wide field of art culture displayed nor the high artistic qualities of the specimens illustrating the course of study. But they are not professional schools, and as long as they are partially supported by the State, they ought not to aim so evidently at the development of such purely artistic practice. They are established and supported for the benefit of trade through the improvement in the handwork of artisans; and considering the amount of time usually given by young workmen to study, the effort at the high finish and beautiful manipulation seen in these works, is, for them, simple waste of time.

One excellent feature of the recent regulations concerning the examination of students' works in schools of art, is that the whole set of drawings produced during a year's study in the school by any one student, is forwarded to the central department, and upon the progress of the pupil and the fair amount of work done by him, an award is made, both to the student and his school. This is an equitable rule, and its effects will be toward increasing the thoroughness of the course of study pursued by the students, and in decreasing the time wasted by them in seeking after an artistic finish and beauty of manipulation, which in the mass of artisan students is mere affectation. Another arrangement, by which the highest rewards in the national competitions are given to such purely artistic work as painting in colour from nature, and drawing from the antique,—subjects as a rule beyond the power, as they are beyond the use, of the majority of artisans,—is as unsatisfactory. It is true that this exclusiveness is tempered by the admission of design into the trinity of subjects for which the highest rewards are given; but taking all three subjects together, they are not those for which, as it appears to me, the country should offer its highest prizes alone, being rather professional study than study for working men.

Nine-tenths of the trades represented by the students in schools of art would never require instruction in either of these subjects; and when students pursue them it is more for amusement than use, with the exception of design, in which only an insignificant fraction of all the pupils of art-schools in England ever study. If some of the highest prizes were offered for progress in improvement in any branch of study useful to the individual student, judging from the works produced by him, dated from the beginning to the end of his year's work, then artisans studying the more humble and useful branches of art education would have equal encouragement with that now given solely to the student of fine art and design.

In mechanical drawing, a subject of very great importance in England, though the National rewards are now withheld most unfairly from it, we are losing ground rather than gaining it, and, as I noticed in 1864, next to freehand sketch shading from the cast, it is the one study which the French and Germans are thoroughly pursuing, keenly alive to the near relationship between the scientific education of artisans and the general excellence of workmanship in mechanical trades. That is to say, in France and Germany, where freedom and power of drawing is of the greatest value, it is imparted by an effective method of freehand drawing; where accurate and scientific knowledge is required, it is taught through a complete course of orthographic projection, illustrating not only the theory of mechanics, but their application in machines and tools; the principles of the various branches of trades brought into use in building operations being also taught by courses of lessons on the details of workmanship in each branch.

Examples for Instruction required.

We have no examples to use in giving this practical instruction to artisans in England, and it is to say the least singular that our schools of art have existed so long without an effort being made to produce the means of education in mechanical and constructional drawing.

I cannot help feeling that in England, where our public galleries and museums of construction are so few and so far between, great good would result from an effort to supply both schools of art and the public with thoroughly good examples for study in all the branches of art-education required for disseminating knowledge and taste. It is impossible for others than those who are practically engaged in giving art-instruction to realise how the want of suitable examples and copies with which to convey this instruction meets them at every turn, and cripples their best efforts. If it were possible that every artist in charge of a school of art could be a universal genius; and, whilst taking his round of instruction, illustrate his remarks by masterly sketches or carefully finished studies in some fifty branches of art, then we might do without many examples we urgently require now. Even then the student, when left to himself, would be lost. All teachers need specimens of good work to place before their pupils, and at present in England we cannot obtain them.

Branch National Museums.

Very much of the artistic tone of French works in industrial art springs undoubtedly from the atmosphere of taste in which the workmen are always placed. From the time when it is possible to receive impressions, and have their mind surrounded the artisan, examples of good art in developing incipient taste. The art culture of the French public also is such as to necessitate the infusion of the art element into the design and execution of all objects, and thus there is a demand for skilled workmanship which acts as an incentive to the workman to possess himself of art power, and which offers him also the certainty of brilliant rewards for its exercise in his calling. In England the leverage of an art atmosphere may be said not to exist publicly, and the demand for objects of highly-skilled workmanship is not so general as to create the necessity of art-power in all workmen. Yet as labour, controlled by scientific knowledge, or influenced by skilled hands and good taste, is so much more valuable, both nationally and to individuals, than mere labour unaffected by these influences, it would seem to be a profitable course to supply this deficiency of public taste as much as possible by museums and galleries of industrial masterpieces and works of fine art. If we cannot make our outward influences in the streets and buildings what they are abroad, we could at least in museums and galleries insure the existence of a correct standard of taste for those to study from who have either the desire or the necessity. We want in all the most important seats of manufacture local museums, branches of the South Kensington Museum upon the same system of arrangement, supported principally from the same sources and under the control of the same authorities, so that the national expenditure on museums of art and industry for the improvement of industrial manufactures and the elevation of public taste may become in its influence general, instead of, as at present, existing in London alone, and being therefore only local. There can be no reason of a public nature why the good resulting from the Kensington collections should not be extended to the provincial towns; nor is there any plea for the existence of that collection in the metropolis which does not apply with equal force to such towns as Birmingham, Manchester, Leeds, Glasgow, Sheffield, and Nottingham. The national treasures locked up in one place are like a well-stocked granary full of seed, whilst the fields that should reproduce its value a hundred fold, are left barren and uncultivated, a prey to profuse weeds and the contempt of passers by.

I would not have the central museum spoiled, nor decreased in artistic value in the smallest degree; but the distribution of duplicates of objects, or examples very similar of certain styles and periods of manufacture or craftsmanship, would not do this. If the national grant for the provision of specimens of industrial masterpieces is not sufficient to enable the authorities of the central museum to distribute examples to the more important towns, a fair representation of this to Parliament would

probably lead to a provision being made for this purpose specially.

It might be made conditional that any locality desirous to obtain the advantages of one of the Branch National Museums should, at its own cost, provide suitable rent-free premises, having every provision for perfect security, and undertake also its current expenses of lighting, cleaning, warming, insurance, and of the officers and attendants upon it, with the exception, perhaps, of one occasional inspecting officer from the central department, who would represent the nation in the meetings and deliberations of an influential local committee of public men, appointed to manage the details in the conduct of the museum. Such a committee of management might consist of the lord-warden of the county and the mayor of the town in which the branch national museum is located, other members being nominated from the county and borough magistrates, from the town councils, and some elected by the subscribers to the museum.

Branch museums so constituted, and in connexion with the schools of art of the district, should be empowered to receive objects and works of art on loan or as donations or bequests, to supplement the national collections lent to the locality. It ought, however, to be understood that, once the property of the nation, always the property of the nation, should hold good of the objects in these museums. No locality should possess the works of art lent to it absolutely; but at definite intervals they might be exchanged for others of additional or varying interest from other branch museums in different localities.

The establishment of these branch museums will be the most direct means of influencing public taste, and it is what ultimately we must adopt. Again, however, I would reiterate that I would have no sacrilegious hand laid upon the South Kensington Museum with a view to its utter dispersion, or even injury, as a collection.

I feel nowhere so proud of being an Englishman as when I am in the permanent portion of the South Kensington Museum. I know the good the Museum has done and is doing in London; and it is this knowledge which leads me, together with my practical experience of the grievous want of such examples of art in the provinces, to plead so hardly for similar museums, on a smaller scale, in all the great centres of manufacture. I see, also, the very important influence of works of art and galleries and museums upon the Continent, in the education of the public and in the training, indirectly, of the workman; and now that we have a system of instruction in existence, in our schools of art, capable of improvement no doubt, but still active and efficient, the only great want which remains is that of public galleries of fine and industrial art, to supplement the action of schools of art, and to remedy some of their present deficiencies. We want to have the public impressed (as Yorkshiremen say) with a feeling for the beauty and the value of good art over bad art and barbarism; and picture-galleries and museums are the readiest, and pleasantest, and most effectual means of conveying this inspiration.

Local Training Schools.

The establishment of these museums would facilitate the utilizing of a good deal of educational power which is now made but little use of, and also give the means to advanced students in the more important provincial schools of art to which museums may become attached, of prosecuting their studies to a higher pitch before leaving the local schools of art, and to earn what allowance the State extends to them during their period of training whilst in the receipt of it. The way in which these good points could be secured, and which I would take the opportunity of suggesting for adoption, is by letting each provincial school of art having the opportunity and the desire, be a training school for two or three art-masters, where, during the period of training and whilst in receipt of the allowances now given solely in London, they might be of great help to the masters and committees of schools of art by assisting in teaching. The greatest blow ever inflicted on the art-education of this country was the withdrawal of the assistance in teaching to provincial schools of art, when the salaries of the art-pupil-teachers were reduced to a nominal sum, viz., from 25l. per annum to 10l. per annum, and even the number at this salary limited. This step, against which I and a few others strongly and urgently argued, has made a dif-

ference in the numbers taught from my own school alone of 5,000 pupils decrease, and I doubt not that similar evil effects have proportionally followed its application elsewhere. What I would propose would help to remedy the mischief already done, and open up new fields for art-instruction. Instead of admitting students to the training school in London as soon as they possess the first certificate, and giving them a maintenance allowance of 50*l.* a year or more during the period of their study at Kensington, I would make this grant to the student after taking the first art-certificate, whilst remaining at the local school of art in which he studied, on condition that he prepared for another art-certificate, and carried out the wishes of the committee in the work of teaching,—only admitting him to the training school when in the possession of two art-certificates instead of one, as at present. This would be giving very valuable assistance to the schools, precisely in the way it is most required, and in remedying the most fatal of all recent regulations concerning provincial art-schools. The teaching of drawing in night classes of mechanics' and other institutions by persons possessing only the certificate of second grade, is both limited in amount and not satisfactory in kind, and its inefficiency will make it a short-lived experiment; whilst the withholding of all National prizes from students so taught would appear to indicate that its temporary character is acknowledged, or the punishment of the students by making them ineligible to take national prizes through the want of qualifications of their teachers, would not be seriously persevered in.

If what I suggest were done, then in a large number of schools of art there might be one or two assistant teachers holding the first art-certificate carrying on efficient art-teaching in the numerous night-classes which would undoubtedly spring up, when it would be possible to teach artisan-students in them well, at a working-man's fee. At present little or nothing is done by many of the art-masters in training, whilst in London, in the matter of teaching, except in assisting the district London schools of art, so that the State gets very little during that time for the assistance it gives. On the plan I propose, there would be no additional cost to the State, the same allowance being given to the same student in the provinces instead of in London, and the student himself would feel that he was fairly earning the assistance given. And I think no one should be admitted as at present to the advantages of further and higher art-study in London, unless he had done this fair share of work in local schools, and proved his capacity as a teacher; thus giving a *quid pro quo* for his own education.

This suggestion, though one which could be more efficiently adopted when branch museums have been established, could be applied with great advantage now, and no arrangement, costing nothing, as this would, could be of such assistance to the larger schools of art, or insure so much good to the cause of art-education, and its dissemination among the working classes.

Importance of Technical Education.

The deficiency of technical education in England, so manifest in a general scrutiny of the Paris Exhibition, has been represented by some of the most distinguished English jurors, to the Schools Inquiry Commission. Probably in some future session Parliament will be called upon to institute an inquiry into this subject specially, and to provide the means, when the method has been decided upon, to offer the advantages of technical education in art and science to all classes of our countrymen. To obtain information of what has been done in this direction upon the Continent, inquiry will have to be made in the schools and institutions of France and Germany, and when this inquiry is undertaken it seems to me that special attention should be directed to the schools of art in France, Wurtemberg, and Nuremberg; and that the subjects of inquiry should also include,—(1) the means whereby examples for instruction are obtained so readily and efficiently for the use of schools, both of art and science in those countries; (2) the organization, management, and support of public galleries and museums of art and science, in metropolitan and provincial towns in all the great countries of Europe; (3) the system upon which private or local efforts to promote art instruction are supplemented by the governments of the several countries; (4) to what extent the direction of the schools and classes are under

local management; and in what manner, if any, the Government authorities test the nature and efficiency of the instruction given in the schools.

Already some of the specialities of England's manufactures are being developed on the Continent, and when the material and physical advantages we have hitherto almost exclusively possessed shall be shared equally by nations, whose energy is as great, whose education is more widespread, and whose taste is infinitely greater than our own, it is not difficult to foresee what must be the fate of those branches of our manufactures in which good design, and the most educated and cultivated skill, are elements of pecuniary value. If, with equal powers of production, Continental manufacturers infuse into their works that life-giving art feeling which is the common possession of themselves and their workmen, our manufactures hitherto required by the world will become distasteful, barbarous, and antiquated by comparison with foreign works, and our trade in them will disappear. The progress in scientific invention tends to equalise the material powers of all nations, by multiplying and facilitating their means of distribution, so that eventually a nation's wealth and safety will depend upon its education more than upon its natural products or the accident of its position, or even its historical antecedents and associations. We have seen very recently how the adoption of one simple scientific invention has, in the ordeal of war, given triumphant superiority to one of the contending parties, and changed the map of Europe. The adoption or neglect of the means of improvement and advancement in the arts of peace may lead to somewhat similar triumphs and commercial disasters, and it seems to me that the Paris Exhibition is a warning to this country to take up in earnest the subject of education, both general and technical. We can afford to spend a few extra thousands a year on education better than to lose the trades of Manchester, Birmingham, Leeds, and Newcastle; and if our exported manufactures will only be accepted by semi-barbarous people, England may soon expect to become again a poor agricultural country.

Institutions of Science and Art.

The general want of trade skill in our display at the Paris Exhibition, referred to by Dr. Playfair and others, would indicate that the time has arrived when, together with these museums, a development of schools of art, in the form of institutions of science and art, might be usefully established, offering education of a secondary character to all classes of society in both art and science, at a cost within the reach of all who can in any way profit by such instruction. The most economic manner of conducting such an association of educational agencies, and ensuring their efficiency and support in any town or district, would be by placing them all together in one building, and under the same management, so that the schools might make use of the works of art and technical collections during class hours, and apply in the class-rooms the lessons learned from the master-pieces of art, or illustrations of the sciences, or processes of manufacture; and that the public could, at stated times, have free access to the collections; or free at some times, and by a small entrance-fee at others, as at South Kensington.

I would most earnestly caution those who may take action in this matter, not to contemplate the disconnection of the museums from the schools of art and science; for this would both increase the cost of maintaining each, and limit very decidedly the efficiency of all. Museums or collections without active education in class going on in connexion may be interesting as shows, but educationally they are simply worth nothing. If you disconnect the illustrations of art and sciences from instruction in these subjects, you sever the body and the soul of education, and have two agencies which, united, are living; disunited, are dead.

Schools of art and schools of science, now in no way connected with each other, may be improved by a relationship, and the connecting link should be museums and collections in which all have a common interest.

The time has passed when, with any regard for national interests, we can stoke the success of our manufacturing industry any longer upon the precarious support derived from local sympathy, or rely upon local agency for initiating schemes of education suitable to the demand which exists, or to direct them when established. Nothing but a comprehensive national scheme,

deriving its motive power from the State, and adapting itself both to general wants and to local necessities, will effectually operate on the need which is both general and local.

I am very conscious that schools of art are not what they might be, if properly organized by the Government and supported by both it and the localities; and considering that for fifteen years no serious and practical adaptation to the progress of events has been made in their conduct and management, it is not surprising. All changes that have been made during that time have been in the direction of withdrawing both the direction and support of the State, and this is opposed to development. But if schools of art and science are inefficient or wrongly organized, let the nation take up the whole question of technical education, with a determination after the fullest inquiry of reorganizing the schools, and making them what they should be, part of independent institutions offering the advantages of technical education to all classes of the community, according to their several needs.

Above all rocks of destruction, in the conduct and management of these public institutions, museums of art and science and technical collections, the subordinating them to any denominational or class institutions should be avoided. It is impossible that any merely local institution, or body of men attached to it, competing with similar institutions in the same town or locality, and having a multitude of objects to accomplish, with only limited means, whether of members or money, to do its work, can succeed in giving that prominent importance to the work of technical education which our commercial interests as a nation demand should be accorded to it. That all such agencies should be utilized, and receive great and direct advantages by affiliation to central schools and museums of art and science in all the large towns, is obvious; and this would be the best result of their previous work, with reference to the institutions themselves and the public good. In this way, feeders to our central schools are made to our hands, and their usefulness may be thus developed, by assistance not hitherto received by them.

The great lesson to be learnt by England from the Paris Exhibition is, that notwithstanding all her annual grants for education in science and art, we are not yet so successful in it as would be desirable and profitable. That the subject is of too great an importance nationally to allow of our present experiments in their present form being continued a day longer than is required for the organization of a more matured scheme. That now for the first time our Paris experience has brought the public mind into favour of a judicious expenditure of public money in furtherance of well-considered plans for national education of a technical character; and that voluntarism in subjects of imperial importance has proved itself incapable of competing with the national will of countries where voluntarism is recognised, but not exclusively relied on.

In conclusion, I would epitomise the suggestions made by me as those most useful towards remedying our national deficiencies:—

1. A royal commission of inquiry into the subject of technical education in art and science, both upon the Continent and in England, with a view to the organization of institutions for education in science and art, to include Fine Art and Industrial Museums.
2. The establishment of such Branch National Museums in all the great centres of trade and manufactures, on the plan of the South Kensington Museum, having, in addition, technical collections, giving especial prominence to the trades and manufactures of the locality in which each museum may be placed.
3. A re-organization of the system of national aid and instruction in schools of art, and examinations in shading, colouring, and drawing from examples, casts, nature, and from memory.
4. The provision of suitable examples for study in the various branches of art-education for schools of art and the public generally, by the Science and Art Department.

WALTER SMITH,
Head Master of the Leeds School of Art.

WOOD STAMPING IRON.—A New York street-railway was taken up lately, and it is said that the wooden sleepers were found to have printed their exact representation on the iron. The grain, knots, and curvatures were easily detected, both by the eye and by the touch.

THE ARCHITECTURAL ASSOCIATION.

The ordinary meeting of members was held at the House in Conduit-street, on Friday evening (the 22nd ult.), Mr. R. Phené Sprier, President, in the chair.*

At the instance of Mr. J. D. Mathews (honorary secretary) the meeting was then invited to discuss the desirability of admitting gentlemen as honorary members of the Association, under certain limitations, which he explained. He observed that he had spoken to several senior members of the profession, and he believed many of them would be disposed to join the Association, not as student members, but as honorary members. If he thought that the introduction of this class would lead to anything like patronizing he would be the last person to propose it; but he contended that it would not have that effect. If the Association had exhibited any desire to be patronized, he believed it would have ceased to exist long ago; but there was a difference between admitting gentlemen to qualified membership who manifestly could not come in as students, and admitting a class of patrons to whom undue deference was to be paid. An accession of honorary members would, he thought, bring not only dignity and permanence to the Association, but also bring funds which might be employed to extend its advantages, especially in the augmentation of the library, which was daily growing more useful. In conclusion, he moved the following resolution:—

"That it is desirable that a class of members to be called 'honorary members' be established, who shall have the same privileges of ordinary members, with the exception of voting and standing for office, and a vested interest in the property of the Association; such members' names to be passed by the committee before being proposed to the Association for election."

The motion was seconded by Mr. J. S. Quilter, and supported by Mr. T. Roger Smith.

The following amendment was moved and seconded:—

"That, in the opinion of this meeting, the introduction of a new class of members in the Association is an unnecessary alteration in its constitution, and one by no means likely to be advantageous to the prosperity of our Association."

Ultimately the original motion was carried.

The report of the committee, showing the operations of the society for the year 1866-67 was then read. It stated that 105 new members had joined the Association, and that the total number of members was 438, minus those who had resigned, or whose names had been struck off.

SANTITARY MATTERS.

Manchester Ladies' Sanitary Reform Association.—The annual meeting of this association has been held at the Town-hall. The Mayor presided. In course of his address the chairman said the town council could take steps for getting the streets swept, the cesspools emptied, and everything appertaining to draining, but it was impossible for them to enter into the households of the poor or attempt to improve the habits of the people. That duty devolved upon the ladies; and he was glad to see that the Ladies' Sanitary Association were interesting themselves about it. He believed the Ladies' Sanitary Association had rendered great assistance to the town council in the important work which they had in hand. The Rev. R. A. Tindall contended that it was essential that the female portion of the working classes should be better educated before they could hope for good results in the sanitary and social condition of the people. He believed the overcrowding amongst cottagers was very often due to intemperance and extravagance, and he attributed the intemperance of the working men to the discomforts which they met with in their own houses through

the neglect of home comforts by their wives. The reformation of this state of things was only to be brought about by the assistance of the ladies. The report was unanimously adopted, and it was also resolved, "That the members of this association, feeling the importance of the work before them, desire to extend its usefulness by the employment of a sanitary woman in connexion with this society, and appeal to their friends to assist them in the formation of a special fund for that purpose."

The Sewage Question at Totton.—This important question has received the anxious consideration of the committee, with a view to the prevention of the pollution of the river Tone, into which the whole of the sewage of the town at present flows. The best plan they could recommend to the Board, it is thought, would be that adopted at St. Thomas's, Exeter, Croydon, and Leamington, whereby the sewage was deodorized by the carbonate of lime process, and the construction of filtering tanks, whereby it was rendered free from smell. The surveyor has written to the surveyor at Leamington, and has received a reply to the effect that the works there give the greatest satisfaction, and pay 400*l.* a-year, over the working expenses, by the sale of the manure. With regard to the general question of the pollution of the river Tone, the surveyor has reminded the Local Board that no less than thirty-nine towns and villages drain into it. Mr. Taylor and the surveyor have been requested by the Board (who have passed a vote of thanks to the surveyor for his valuable assistance and information) to go to Leamington and inspect the works.

THE BIRMINGHAM CONCERT HALL.

This hall, in Coleshill-street, Birmingham, has just been re-decorated. The proscenium is surmounted with the royal arms between Arabesque designs, which contain the heads of Shakespeare and Milton. On each side are pilasters adorned with arabesque. The caps and cornices are painted dead white, picked out with gold; and amongst the foliage are medallions, wherein music is represented by the portraits of Beethoven and Mozart. The cove of the ceiling is paneled. The colours used are chiefly buff and light-blue raised with vermilion. The *façade* below, pierced with its circular windows, has, between each of them, well-executed figures, emblematic of the quarters of the globe, painted in cold grey tints on crimson grounds, which give extreme richness to this part of the hall. The gallery fronts are paneled with arabesque designs, centred with medallions, and enriched with gilding. The whole of the remaining portions of the building, the ante-rooms, staircases, and approaches, present a light, clean, and cheerful aspect. The decorations have been carried out by Mr. W. Holland, of Warwick.

THE PROPOSED METROPOLITAN MARKET.

A SPECIAL meeting of the members of the Metropolitan Board of Works has been held, for the purpose of receiving a communication from Lord Robert Montagu in reference to the Foreign Cattle Market Bill, and passing such resolutions thereon as might be necessary. Sir John Thwaites presided.

The Chairman said that the Government were very anxious that energetic steps should be taken for the prevention of the cattle disease by the erection of a market exclusively for the sale of foreign cattle arriving in this country, and wished to know if the Board would be willing to undertake the erection and direction of such a market in the metropolis. The Board, no doubt, would have absolute authority; but at present he could say nothing as to the horrowing powers which the Board would have.

Mr. Shaw asked if the metropolis would have to bear the expense, or whether such expense would be spread over the whole country, as the establishment of such a market would benefit all parts of the kingdom.

The Chairman said the metropolitan district would, he thought, have to do the same as very many of the largest towns in England were doing. A toll was levied to cover the expense of preventing the spread of the cattle disease, and the Board would have to fix such reasonable toll as would cover the expense of the market with-

out making any profit. Of course there would be some increased expense at the outset.

The meeting was addressed by Mr. Taylor against the proposition, and by other members in favour of it; and Colonel Hogg, M.P., moved the following resolution:—

"That the chairman be requested to inform the President of the Privy Council that the Board is willing to undertake the duty of erecting and maintaining a market for the slaughter and sale of foreign cattle, should Parliament act that duty upon them, reserving to themselves the right to make such objections, as may seem expedient when the bill is laid before them."

The motion was carried by a majority of nine, the numbers being 14 to 5.

THE TECHNICAL EDUCATION OF THE WORKING CLASSES.

A DEPUTATION of members of the Associated Chamber of Commerce waited on Lord Robert Montagu, at the Privy Council Office, Downing-street, last week, for the purpose of urging upon Government the necessity of providing and fostering technical education in this country. The deputation was accompanied by Mr. Baines, M.P., Mr. W. E. Forster, M.P., Mr. Dixon, M.P., and other members of the House of Commons. The president of the Association was introduced by the hon. member for Leeds, who stated that there were thirty-nine chambers in the Association, that this conference, was the most important meeting they had ever held, and that the vote upon the subject in question was unanimous.

Mr. Mundella, of Nottingham, brought under the notice of his lordship the educational facilities afforded to those connected with science, art, and manufacture in France and Germany, and contrasted them with the requirements of this country in that respect. His experience as juror at the Paris Exhibition, and his extensive knowledge of foreign manufactures, caused him to feel utter humiliation and shame at the education of our working men, as compared with that of the working men of Germany.

After some remarks from Mr. Sampson Lloyd, Lord Robert Montagu assured the deputation that no pains or trouble had been spared by the Government or himself in giving this question its due share of consideration. The Government had asked for reports on the subject from their secretaries of Legation, and that a *procès* of those documents would be given when they were ready to be submitted to the public. Mr. Sarnelsson, who had volunteered to go abroad and judge for himself, had sent in a very voluminous letter containing his observations and views, and Professor Leone Levi, whose services had been engaged by the Government in the matter, had furnished a report, which was now in type. He heartily wished that before long they should see a satisfactory scheme carried out. In the Department of Science and Art at South Kensington, we had the basis upon which to work, if we could only make up our minds to carry out some system.

PREHISTORIC REMAINS IN CORNWALL.

ON the Cornish hill-sides and moors there are many remains of buildings of extreme antiquity, and some of them of unknown or unascertained purpose, to which the general attention may be said to have not yet been called. "From the Land's End to John O'Groats' House" there seems to have been a singular similarity between some of these buildings, the general names of which, handed down by tradition, would appear to indicate that they were the elements of prehistoric towns. Thus the analogy between the northern broch or broch and borough or burgh is obvious, as also is that between the southern clytton and city. The ancient terms, however, apply to individual buildings, and there are clytton in Cornwall which might be generally described by the words we used lately in giving an account of a broch recently uncovered in Caintness. Thus, in an interesting paper by Mr. J. T. Blight, F.S.A., which is printed in the *Cornish Telegraph*, it is said that,—

"In West Cornwall the prevailing type consists of a massive encircling wall, in its breadth containing several small chambers, whilst in the centre is a large open area; the Chysanter huts are founded on this plan. In East Cornwall I have not yet found an instance of these wall cells; each but (or cell) is generally unattached, forming a separate building of itself, though occasionally having two circular compartments, leading one into the other."

* The following gentlemen were elected members of the Association.—Mr. W. Harrison, Kings-road, Brighton; Mr. Alan Bailey, Trinity-place, Charing-cross; Mr. H. G. Farmer, Gower-street; Mr. C. B. Barton, Craven-street, Strand; Mr. G. T. Breezy, Wansstead, Essex; Mr. Ches. Booth, Albany-street; Mr. Jas. Rogers, Engineer's Office, Euston-square Station; Mr. J. Watts, Cannon-street; Mr. E. Haslam, St. George's-terrace, Ryde; Mr. J. D. Simmon, Oakley-square; Mr. B. O. Carne, India Office; Mr. J. B. Mitchell Withers, Sheffield; Mr. W. Logan, Edward-square, Kensington; Mr. R. F. Deal, Farnivall's-lane; Mr. Thomas Holbyer, Byde; Mr. James Crombie, Whitehall; Mr. W. Day, Tachbrook-street, Pimlico; Mr. F. E. Windsor, Camden-town; Mr. W. F. Hammond, Dr. Bealmer Town; Mr. W. L. Harrison, St. Mark's-borough-street; Mr. J. M. Kemp, Arlington-street; Mr. E. Robson, Parliament-street; and Mr. S. S. Stallwood, Folkestone.

In Wales, the celtic, in fortifications, were constructed partly by excavations, and partly by stones set round the edge of the excavation. Some of the Welsh cell-dwellings, however, are like those of West Cornwall. On the Northumberland moors are fortified enclosures strongly resembling those of West Cornwall. It is notable that Cornwall, Wales, Northumberland, and the Scottish highlands, are all high-level districts.

Circular and rectangular buildings are sometimes associated in Cornwall and Anglesea. Mr. Blight gives an interesting account of a rude sort of rectangular walling, designed, as he thinks, to enclose habitations, at Smallcombe, near the celebrated Cheesewring, in the parish of Linkinhorne, Cornwall. This walling stands on a hill-side, and is 12 ft. to 15 ft. thick; but Mr. Blight is of opinion, that from its position and peculiarities—sloping outside and perpendicular within, for example—it could not have had any military purpose. Could it have been a reservoir for water? or was it designed to resist some other natural force, such as that of snow? There have evidently been less ancient buildings erected on the older and more massive foundations. Here also are examples of those beehive-shaped or dome-formed structures which are also found elsewhere, as in Ireland and Scotland. Sir Gardner Wilkinson is disposed to think structures of this form to be less ancient than the hut circles; and Mr. Blight says he has seen beehive structures of stone built not a hundred years ago. It is hard to say, however, into what extreme antiquity we may have to penetrate in order to get at the origin of such structures, some of which are certainly of very great age.

A THEATRE BY CO-OPERATION.

The Prince of Wales's Theatre, Rochdale, opened a few nights ago, has been built by means of 11 shares mostly taken by working men. A few earnest working men have thus accomplished what the upper classes of Rochdale have long said was a desideratum, but one which they could not see their way to realise. The Company was formed in April, 1865. Shortly afterwards operations were commenced which resulted in the securing of an eligible site, and the construction of the foundations, and then for some time the scheme received a check. A few months ago the matter was taken up with renewed energy, and designs previously obtained from Mr. Salomons, Manchester, have been carried out.

It was the original intention of the promoters to erect a building combining a larger internal area, with more outward embellishment, but further consideration decided them to operate within more moderate bounds, and instead of a building to cost 8,000l., they decided to raise one to cost 6,000l.

The exterior is plain. It is 20 yards in breadth, and 40 yards in length, and is calculated to seat comfortably 2,200 persons. The shape is described as a "graceful horseshoe," though why that form should be continued we do not know. The pit is a good one, and will hold 1,100 persons. The ceiling is plain, and has a powerful sun-light in the centre. The dressing-rooms and the property-room are in the cellars under the pit (a very improper place, by the way), and are reached by steps proceeding from each side of the fore part of the stage behind the wings. Messrs. Warburton were the builders. Mr. Grieve painted the drop-scene.

RAILWAYS.

The *Moscow Gazette* publishes the following:—"M. Bogdanowitch, who is making a journey of exploration in Siberia to study the possibility of constructing a railway in that immense province, has sent the following telegram from Omin:—"The object of our expedition into Western Siberia has been attained; the information we have gathered shows by facts the brilliant future reserved for the Siberian railway. The co-operation afforded us by the Governor-general has produced an excellent effect in the country. At the commencement of the spring the line from Sarapul to Tioumen will be constructed at the expense of the Siberians. This route will be called the Russia-China-Taschkent Railway."—M. Belin, a

Prussian author, has contributed to Peterman's *Mittheilungen* a statistical account of the means of transport and locomotion existing in the world at the present time. The railways of the world are 80,600 miles long. Over one-third the total length is found in the United States, or about 30,000 miles; England has 13,072; Germany (Austria included), 13,000 miles; France, 8,400; India, 3,200; Italy, 3,080; Spain, 2,920; Russia, 2,600; Canada, 1,810; Belgium, 1,500; Sweden, 950; Switzerland, 730; Holland, 650. It appears that the railways of Prussia have cost just about half as much per mile as those in England.—The number of private bills for which application will be made in the session 1867-68 will be much smaller than in past years. Saturday evening, at eight o'clock, closed the time at which the plan and section, book of reference, published map, and copy of *Gazette* notice had to be deposited at the Private Bill-office. In 1866 there were 450 sets of plans and other papers deposited; last year there were 181; and for next session there have been 123 sets of plans and other documents lodged. The number of bills of which notice had been given is about 250, against 280 last year, 633 in 1866, 594 in 1865, 504 in 1864, and 381 in 1863. The plans deposited relate to fifty-nine railway and canal bills, and to sixty-four gas, drainage, and miscellaneous bills. The schemes relating to London include a railway from Islington to Finsbury, which will be above ground all the way, and about 1½ mile in length. Market bills will be applied for for Paddington, Lambeth, and Kennington; and a bill for a sub-way under the Thames on the upper side of the Tower. Notice has again been given of a boulevard, to extend from New Palace-yard to Eaton-square. Plans have again been deposited for the widening of Park-lane. An underground railway, pursuing the course of the highway, will be proposed, to extend from Bow to the City.

THE BUILDERS' BENEVOLENT INSTITUTION.

A GENERAL meeting of the subscribers to the Builders' Benevolent Institution was held at Willis's Rooms, King-street, St. James's, on Thursday, the 28th ult., for the purpose of electing two pensioners on the funds,—one male and one female. The chair was taken by Mr. W. R. Rogers, president of the Institution.

The Chairman, in opening the proceedings, said they had met for the purpose of electing two pensioners on the funds of the Builders' Benevolent Institution. There were eight candidates, and he was sorry to say that only two out of that number could be elected, owing to the want of funds. There would, however, be another election in May next, when those who were unsuccessful on that occasion would have a further opportunity of obtaining the desired result.

The roll was then declared open, and at its conclusion Mr. T. Stirling, who acted as scrutineer, read over the respective numbers allotted to each candidate. The following were then announced as having been elected:—

George Newman Lambert, plumber, painter, &c., of 4, Hereford-street, Lisson Grove, aged 71. Debility, rheumatism, and an injured arm prevented him from earning more than a few shillings per week.

Hannah Lawrence, aged 79, Desborough-terrace, Harrow-road. Feeble and necessitous, and supported by her daughter, who is in service.

THE ARCHITECT OF THE LANGHAM HOTEL.

Sir,—Your report of my action with Mr. Murray relative to drawings of the Langham Hotel falls in some respects to put the case correctly.

The real point was the authorship of the principal plans, i.e., the arrangement of the building. Mr. Murray never had any pretensions, nor did he claim the design nor any part of the architectural detail of exterior or interior; and he did claim the plans; and I insisted that, as I alone planned the building, so far as basement, ground and first floor were concerned, leaving only the mere drawing out of these correctly to my own signed dimensions, and the upper floors and sections for Mr. Murray or his clerks to draw, I had a right to retain them.

The result of the action is, that I proved my authorship of these plans, and I retain them; but inasmuch as I did not make the upper floors and sections, I lose these—and the costs; my claim that they were thought out by me, and merely followed the walls of my plans below, not being equal to the fact that they were made on Mr. Murray's paper, and at his cost.

The iron construction I left to Mr. Murray, who employed Mr. Meeson, an engineer, to make the drawings. Again, Mr. Murray was never appointed joint architect with me by the directors.

I was successful, and received the appointment of architect unconditionally from the directors. Mr. Murray's friends then interested themselves on his behalf (he being an unsuccessful competitor), and I made an arrangement with him some days before I saw any one of the directors. I made it a condition that the credit or disgrace of the design (whichever it might be) should be solely my own, and I defended this action because my right to this was disputed.

JOHN GILES.

TENDERS FOR THE DRAINAGE AND WATER SUPPLY FOR FLUSHING GIBRALTAR.

Sir,—On the 25th of October last, tenders were opened in Gibraltar for "Drainage and water supply for flushing the city of Gibraltar," quantities supplied by Mr. Edward Roberts, engineer for the commissioners of that city. As I have not seen any notice of the same in your publication, and as in one instance there was a great discrepancy in amount, I send particulars. I have gone carefully through the quantities, and, carrying them out at very low English prices, the cost should be at least 30,000l. Can you explain how it is to be done in Gibraltar for 28,620l., where materials and labour are very much in excess of English prices? A. B. C.

H. J. Saunders, Southampton	£41,100 0 0
Waring, Brothers, Victoria Chambers	49,680 0 0
John Fews, London	37,080 0 0
G. B. Peters, London	36,587 0 0
Peter Amigo, Gibraltar	34,100 0 0
Fredk. Furniss, Portsmouth	33,965 0 0
Henry d'Almonte, Gibraltar	33,960 0 0
A. Ryan & Co., Battersea (accepted)	28,620 0 0

DRAWING AND DESIGN AT OUR SCHOOLS OF ART.

I HAVE read with much pleasure Mr. W. Smith's admirable report upon Art Education in the French and English Schools in last week's number of the *Builder*.

I trust that some real benefits may result from the inquiries now being made with respect to the working of schools of art throughout the United Kingdom, not only with respect to the system of instruction, but also with regard to the position and standing of each school. Mr. Smith has not estimated too highly the importance of "drawing correctly," as exemplified in the French system, which, I fear, with us, is sometimes lost sight of in an elaboration of detail; and the spirit of the drawing is often sacrificed to the extreme high finish of the work. This is owing, I think, in a great measure to a very erroneous opinion which appears to be very general in the minds of our students in schools of art, namely, that a work, to stand any chance in the national competition, must be an evidence of great labour and extreme finish. Again, a master in a provincial school of art is naturally desirous that his students' works should be represented in the annual national art competition in London. The students themselves take a great pride in the success of such works, and will sacrifice any amount of time and labour to such end; consequently, when a student possesses a moderate amount of ability, he is set down to produce some competition drawing, perhaps the outline of the "Madeleine scroll," or the shading of the "column from the flat" (both works looked forward to by students with apprehension, and when finished looked back upon with rejoicing); whereas his time might have been more profitably employed in executing a series of works, with a view to obtaining power in the study of light, and shade, and form; but the latter works are only looked upon as studies, while the former are eligible for national competition.

I think this evil might be obviated were the Department of Science and Art to offer as high a prize for a series of studies, showing the student's progress in the power of drawing in light and shade, as they do at present to the very highly finished and elaborate drawings submitted for competition.

One would naturally suppose that a school of art situated in this locality would be very well attended by those who intend becoming designers; yet upon being appointed to this school as master, last Midsummer, I was surprised to find not more than six or eight students attending the school for the purpose of studying design. That number, I am happy to say, has since increased; but, surely it would be to the interest of the manufacturers to insist upon their apprentices going through a systematic course of study. Were they to do so, I am convinced that in a short time they would not have to resort to the Continent (as they are at present obliged) for their first-class designers. The proper element is not wanting in our young designers, but it requires to be properly developed.

In too many cases a young designer joining a school of art has as much to unlearn as he has

to learn, owing to his never having had any previous training or direction in his course of study. I may here remark, that upon being appointed to this school I immediately started a special class or club, for the study of design, which I have found to work remarkably well, and with great success. This club is attended by designers and others, who have formed a committee among themselves, and hold a meeting every fortnight, when the subject for the future design is chosen, and the sketches or drawings, as the case may be, of the previous subject (which have been entirely worked out at home) are submitted for inspection and criticism.

I would strongly recommend the formation of similar classes in schools where the study of design is a leading feature; it helps the younger students by giving them greater confidence, and develops an individuality of design. I would suggest, the careful study of natural foliage, plants, fruit, &c., from nature, with a view to their growth and development, treated conventionally as a material for design; and finally, how to arrange the above according to geometrical laws and principles. I would make the study of practical geometry a feature in connexion with the class, as an important element in the construction of ornamental design.

WILLIAM H. STOFFORD,
Head Master, School of Art, Halifax,
Yorkshire.

THE ORIGIN OF NAMES.

As you were pleased in your issue of Nov. 9th, to insert my communication, relating to names of registers in England, I have ventured to send you another batch, which I hope will find the like favour at your hands.

JAMES JOHNS, Registrar.

REGISTRARS' NOMENCLATURE.

- Occupations*—Archer, Baker, Barber, Carpenter, Carter, Clothier, Cook, Cooper, Cutler, Diver, Driver, Farmer, Fowler, Gardener, Groom, Glover, Glazier, Merchant, Mercer, Merrimen, Miller, Packer, Page, Plummer, Plowman, Oiler, Brazier, Tanner, Tailor, Doller, Steiner, Shepherd, Weaver, Skinner, Chandler, Stone-cutter, and Usher.
- Names of Poets*—Addison, Byron, Blair, Butler, Blandford, Campbell, Cowper, Collins, Dryden, Falconer, Mason, Milton, Moore, Otway, Prior, Pope, Scott, Shelley, Shakspeare, Spenser, Young, Watts, Waller, and Wordsworth.
- Names of Antiquity*—Adam, Abraham, Amos, Benjamin, Daniel, Gabriel, Jacob, Jude, Levi, Solomon, Sampson, Joseph, Saml, Jesse, and Nathan.
- Past and Present Governments*—Russell, Grey, Wood, Cresswell, Gibson, Lowe, Graham, Hutt, Cooper, Fortescue, Cadlier, Palmer, Wodehouse, Foster, Stansfield, Hornam, Hardy, and Cave.
- Names of History*—Cromer, Ridley, Latimer, and Hooper, with a Bonner for a persecutor.
- Names distinguished in Literature and Science*—Archbold, Berry, Buryan, Bowering, Clark, Dalton, Day, Locke, Stodd, Stephenson, Beutham, Swift, Mill, Hughes, Dugdale, Price, Arnold, Pugh, Millner, Miller, Buckland, Paxton, Latham, Arr, Walton, Sterne, Stewart, Drew, Jenner, Sheridan, Ferguson, Rothburgh, and Habington.
- Not very desirable*—Ziggs.—Flood, Thorn, Kaggod, Coward, Crimps, and, to registers more particularly, Bachelors.
- Unsuitable in Name for Office*.—A Baby, Tootle, Tipple, Dribkall, and a Dedman.
- Better desirable*—Cash, Riches, Fortune, Goodwill, Mercy, Smiles, Profit, Neighbour, Friend, Counsel, Talents, and Nurse.

PAYMENT OF ARCHITECTS AND ENGINEERS.

Sir,—I cannot but think the remarks of your correspondent "Zeta" are likely to give the general public a wrong idea as to the relative positions of architect and contractor. If architects and civil engineers enforced their legitimate claim of 5 per cent. upon all sums paid to the contractor, I do not think they would have much reason to find fault with their remuneration. "Zeta" will need to mind that most of the hard treatment which has lately been accorded to one of the most honourable of the professions has been the result of the indiscriminate and cutting in on the part of many of its own professors; and when men of superior education will undertake to execute elaborate works for 1 or 2 per cent. upon the outlay of capital, it behoves all respectable architects and engineers to insist and maintain the dignity of their professions. "Zeta" remarks, while the builder or others connected with building receive a minimum of 15 per cent. profit on the outlay, the architect gets but 5 per cent.; but he does not take into consideration that upon the architect's side is no risk of losses, and that his commission remains the same, irrespective of the work proving to the builder remunerative or the reverse. Besides this, in all large contracts an utterly impossible for the contractor to make sure that the margin, as left by him for profits, shall prove, as at the date of his tender he believed it would, sufficient. I think, if these things be considered, together with the interest of contractor's capital, they will show that the latter's position at 15 per cent. is not more desirable than the architect's or engineer's at 5 per cent. S. T. B.

TUBE WELLS.

Sir,—In reply to your correspondent "W." I may state that it is not necessary to take any steps to prevent the pipes or tubes becoming filled at the bottom. Yesterday I drove one of the patent wells through a quite soft and low bottom got firmly packed with fine sand that on pouring water down, it was found to be almost impervious, yet we got it clear in less than a quarter of an hour. Again, on the 25th ultimo, I drove a well 35 ft. deep, through hard concrete, opposite the Surrey Arms, Cherry Orchard-road, East Croydon. The well was found to have several feet of grit and sand; this was got out in a short time, and 1 1/2 ft. of water were ascended to be in the well; by in other words, we had sunk the well 1 1/2 ft. into the water stratum, which no amount of pumping would effect to any perceptible degree, as the cistern is in extent only bounded by the water-holding stratum into which it is drilled. This well can be seen by any parties desirous of ascertaining for themselves the true merits of the invention.

Besides, I may state that by the kind permission of Mr. Williams et Shepherd's Bush (the station next to Notting Hill), the tube wells may be seen any day in his brick-yard, just beyond the church, where they are driven Tuesdays and Fridays.

G. J. BARTER.

LONDON IMPROVEMENTS.

Sir,—The improvements now making in Holborn render it more palpable that the removal of the three houses at the north-west corner of Chancery-lane will become an absolute necessity.

On looking at the situation, it will be easily seen that such removal would be in the form of a downpouring of their whole water-supply through their ceilings and into their walls, the following hints regarding a method of avoiding such misfortunes in future may prove acceptable at the present season.

W. H. BUTTERFIELD.

SAFETY OF WATER-PIPES IN FROSTY WEATHER.

To those of your readers who have ever suffered from the effects of frost and thaw on the hydraulic mechanism of their houses, these have been built, according to their whole water-supply through their ceilings and into their walls, the following hints regarding a method of avoiding such misfortunes in future may prove acceptable at the present season.

I do not propose to call in an architect to dismantle the house, or to alter the form or direction of the water-pipes (though these have been built, according to an ancient usage of folly, in the coldest corners and most exposed outer walls of our houses); but I propose only to send for the plumber once more, to give him the means of never more, we hope, to see his face again, as we have been in the habit of seeing it after every severe frost.

Every one probably knows that the raising of the soft lead pipes—the mischief which I propose to obviate,—is caused by the water freezing within them, and that the danger is probably increased by the superincumbent weight of the upper columns of water pressing down the weight of the upper column of water, and preventing its natural expansion under the process of turning itself into ice, in which latter form, though lighter in weight, it becomes, in fact, the same quantity of water of which comes larger in bulk than the quantity of water of which it is composed; but every one does not know a certain law of hydraulics, in obedience to which water in our pipes, like all other water, contracts as it passes from warm to cold, and in fact, contracts 22 deg. Fahr. when it assumes its crystallized form of ice, it expands in bulk to such extent and with such force as to burst, as has been practically proved, a strong iron shell, filled with water at closed ends, the expansion of that laden pipe, then, may resist such pressure as this?

Obviously, then, the safest plan would be to keep the pipes empty in our houses during severe frosts; but at the same time we cannot afford to deprive ourselves of our home supply of water, which is the inconvenient alternative adopted by some. My method of securing the safety of the pipes which brings the water down to our rooms and kitchens, at its nearest possible point to its outflow from the bottom of the water-reservoir above. This point will be commonly found at the top of the wall of an upper water-closet, over which the reservoir is commonly placed; but the water-closet supplies of water come down either separate and distinct pipes of their own, which, being only momentarily flushed as required, do not remain permanently charged with water, and, therefore, do not require any looking after.

In the topmost main stem, then, of this pipe,—which, like an inverted cone, shooting downwards from its root in the reservoir above, enters the house, and in its descent to the kitchen, sends out its branches to taps in various rooms (in some of which the mischief always occurs),—a stopcock can be inserted with little trouble, and its future use is an equally simple matter, causing no trouble at all worth counting against the mischief which it will assuredly prevent.

During ten months of the year, probably, this stopcock need never be touched; but when frost sets in, and especially at night-time (when the damage is generally caused by the water being motionless and the frost most severe), one turn of the stopcock will divide the water in the reservoir above from the water in the network of pipes beneath; then, as the pipes below have been opened, the water from below the stopcock must be allowed to run away out of the pipes. Two or three pints of water will be wasted, but all the pipes will then be safe, having been drained to the bottom up to the stopcock, while the reservoir above will remain full of water ready to replenish the pipes, when allowed to run down again by the re-opening of the stopcock. One turn of the stopcock, alone, and run the risk of a deluge.

Next morning there will be a call for water for domestic use, which is at once supplied by re-opening the stopcock; for the severest night of frost will have merely created a

crust of ice on the upper surface of the reservoir, beneath which there will be plenty of water fluid, and ready to come into the house; and there will be no danger of the water freezing in the pipes as long as it is in frequent use and constantly running down in fresh supplies, to be drawn off at the taps. When there is no longer any need of water for household use, and again at night, if the frost lasts, reclose the stopcock and drain the pipes as before.

This is all simple enough,—so simple that probably many persons are already in the habit of using some such preventive; but its simplicity will be considered no drawback; and that many,—very many indeed,—have adopted no such check against bursting pipes is proved by every thaw, which, exposing the mischief done in the frost, brings floods of injury to so many houses, and dismay and heavy expense to so many householders.

ASPECTS DOCK.

FLIES AND ANTS.

DURING the late autumn many houses in Holborn were infested with small flies. Latterly they increased with such rapidity and swarmed in such immense numbers as to become a positive plague. The creatures have been recognised as a common species of fly, which in its grub state feeds on sawdust and vegetable refuse.

It has been estimated that the deprivations of the white ant in India cost the Indian Government 100,000*l.* a year, expended in repairing the woodwork of houses, barracks, bridges, &c.

Books Received.

The Life of Thomas Telford, C.E. By SAMUEL SMILES. A new edition. London: Murray.

This is a revised and, in some respects, an enlarged edition, of the Life of Telford, originally published in the "Lives of the Engineers," to which is prefixed an account of the early roads and modes of travelling in Britain.

While the construction of the Highland roads was in progress the late Robert Southey, poet laureate, visited the Highlands in company with his friend Telford, and left on record an interesting account of his visit in a manuscript now in the possession of Mr. Robert Rawlinson, C.E., and of this MS. the present volume contains extracts.

The extent to which some of Mr. Smiles's works have been sold is extraordinary. The popular edition of "Self Help" has reached its seventy-fifth thousand, and the "Lives of the Stephensons" its thirtieth thousand.

The Art of Wood-Carving. By GEORGE A. ROGERS, Artist in Wood to the Queen. London: 33, Maddox-street.

This volume is intended chiefly for the use of amateur carvers. It gives a short history of the art, as well as practical hints and engraved patterns. The work is dedicated to those numerous ladies and gentlemen whom Mr. Rogers has instructed in his art. Wood sculpture or carving is one of the most useful and entertaining recreations that has for some years been admitted into fashionable circles; and when members of such circles who have learnt it as an amusement involuntarily descend to lower spheres of life, they will find such occupation not only amusing, but profitable. Mr. Rogers, the son of the well-known carver of that name, and a professor at the Crystal Palace Schools of Art, is a very competent teacher of the art.

On State Medicine in Great Britain and Ireland. By HENRY W. RUSSEY, M.D., &c. London: Ridgway.

This address, which is of importance in our province, as regards its sanitary aspect in particular, was read last August at the Congress of the British Medical Association held in Dublin. The objects comprehended in and constituting the main elements of the organization which is called "State Medicine" are, according to the author,—

"Not only for the public registration of all sickness attended at the public expense and in public institutions (which is the object of Mr. Hansome's Committee), but also, and mainly, to secure a more accurate and trustworthy determination of the causes of death, a more satisfactory performance of medico-legal investigations, a supply of more reliable medical evidence in coroners' inquests and courts of law, and to provide generally for scientific advice and aid to local authorities in matters of public health."

The author's present purpose is to call attention to some of the more remarkable defects

and anomalies of our public arrangements, and then to show how, under existing circumstances, the primary objects of preventive and legal medicine might be best attained.

VARIORUM.

CHRISTMAS ANNALS. Christmas numbers of serials, and Almanacs come flashing in upon us in all directions. One of the best of the cheap annuals is Warne's "Gold, Silver, and Lead," edited by Mrs. Valentine and contributed to by a whole host of writers and artists. It is certainly a marvel of cheapness.—"The Guest Meal" is the title given to the Christmas number of *Once a Week*, but really belongs only to a short but well-told tale, by Mr. Mark Lemon, with which the book commences, the remainder of the contributions, by Mr. Shirley Brooks, Mr. H. Kingsley, and others, all standing alone.—*Cassell's Magazine* has an extra quantity of amusing matter in the Christmas number. The writer of a paper in it on Fires says,—

"There is but one absolutely fireproof building in London—possibly in England,—and that is the new Record Office in Fenchurch-lane. Stone and iron are here employed, but the structure is entirely of iron within the building being more than 17 ft. by 25 ft., and 17 ft. high; consequently, if every fireproof room were to be set on fire simultaneously, so small would be the body of flames that it would have no effect upon the solid fabric. All these rooms are perfectly distinct from each other, opening into a vaulted passage by means of iron doors. They are in fact, large iron safes, and we may depend upon the absolute safety from fire of the papers entrusted to them. Why should our walls be allowed to remain the fire-inviting precincts of Doctors' Commons when absolute safety is thus procurable?"

—From the new number of the *Quiver* we take a useful exhortation,—

"Never mind a pinch, boy,
Never mind a pinch,
Set the wedge the closer;
Heroes never flinch;
Mind it fits the cleft, boy,
Firm, and tight, and strong;
N'er to worthy labour
Did idleness belong.

What if frequent effort
Frequent failure seem?
From narrow mountain springs
The mountain torrent streams.
Then lift the mallet high, boy,
Strike it like a man,
Never mind your marbles,
Labour while you can.

See, the rift grows wide, boy,
Deeper sinks the wedge;
There's your sturdy block, boy,
Split from edge to edge!
Then never mind a pinch, boy,
Labour while you can;
Fit your wedge the closer,
And strike it like a man."

—A writer in the new number of the *Broadway* gives a very mean view of Dramatic Authors. It is to be hoped he speaks from limited experience.—The Christmas number of *Bow Bells* contains a large amount of amusing literature, illustrated, for 2d.—*The Friendly Visitor* (Seeley & Co.) is intended for the aged poor, and printed in large type. The volume for 1867, just published, contains a number of very good woodcuts.—Amongst the Almanacs, the *British Almanac and Companion* for 1868 still remains supreme. *The Companion* includes papers on "The Periodical Meteors of November," by E. W. Brayley; "Royal Commission on Railways," by Arthur Locker; "The Economical Result of Trades Unions, considered in their relation to the Paris Exhibition of 1867," by John Plummer; "The Exhibition of National Portraits, 1867," by James Thorne; "Architecture and Public Improvements, 1867," by the same writer. We give a quotation from the paper on Trades Unions, touching the position of employers and employed on the Continent:—

"One of the most serious allegations made against trades unions is, that in this country at least, they have tended to embitter the relations subsisting between employer and employed. The affirmative evidence on this point is remarkably unanimous. In England the breach between the masters and the men appears, under the influence of the unions, to be perpetually widening; it ever increasing. Abroad, on the Continent, the advance tended to promote harmony of feeling between employers and employed; the beneficial results of which are observable in numerous ways. In the Paris Exhibition there might have been seen in the architectural section specimens of architectural ornaments and building bricks contributed by M. Drasche, of Vienna. The brick-making establishment belonging to M. Drasche, at Isidorhof on the Weineberg, employs about 4,000 persons, and produces the enormous number of 300,000,000 bricks annually. Here, unfettered by the restrictions of trades unions, capital and labour find their interests identical. The rate of wages is comparatively high for the district, but low compared with the rate paid in England. Yet the Austrian brick-makers are superior, both in intelligence and the possession of home-comforts, to the majority of their

English brethren. In connection with his extensive works, M. Drasche has established schools, hospitals, and relief funds, as mentioned by Professor Wilson in his report on Agricultural Exhibitions Abroad. Disputes between M. Drasche and his workpeople are almost unknown. What a contrast to the state of things in the brick-making trades of Lancashire, as shown by the evidence taken before the Manchester Trades Union Commissioners! In Belgium the works of John Cockerill & Company, at Seraing, near Liège, employ 7,000 men constantly. Mr. Cockerill, the founder of the firm, was an Englishman, and one motive which strongly influenced him in establishing the Seraing, was the absence of trades unions, and the comparative rarity of strikes in that district. The works of Krupp, at Essen, in Prussia, cover 450 English acres, and employ 10,000 men, who turn out not less than 100,000,000 pounds of steel per annum. Another great German factory is that of Borsig, at Berlin, which has built 2,000 railway-engines since it was first established in 1841. Other large establishments, employing thousands of patient, hard-working operatives, are also to be found in Bavaria, Württemberg, Hanover, and other parts of Germany. In all these there exists a far more kindly feeling between masters and men than in the case in England. Turning to France, we find the same encouraging development of amicable relations between capital and labour. At Mulhouse masters and men appear completely attached to each other, and in no part of the world, not even in America, are the artisan dwellings better or more comfortably lodged than in the neighbourhood of the Mulhouse operatives have, with the aid of their savings and the general advice of their employers, erected for themselves. Salthair, in Yorkshire, the workmen's town at Mulhouse; but at the latter, the houses belong to the employed, not to the employers. The printing establishment of Messrs. Mame, at Tours, employs about 1,000 hands, many of them women and children. Here, according to the Rev. W. H. Brookfield, which are utterly unknown. Disputes about wages, which are elsewhere a too frequent cause of altercation between employers and employed, have never yet disturbed the tranquillity of this establishment. There are Messrs. Mame, who also provide medical assistance gratuitously to the wives and children of the English trades unionist, is the rule in this place, the operatives belonging to which are characterized by the possession of skill, intelligence, elevated tastes, and habits of sobriety; drunkenness having been utterly extirpated from their midst. At Grauzo, 400, similar results are observable. Here nearly 10,000 workmen are employed by the firm of Messrs. Schneider & Co.; the total population of the town being 24,000."

—The *Chromolithograph* is a journal of art, literature, decoration, and the accomplishments, and intends to give for 6d. three coloured plates in each number,—a sufficiently remarkable feature if the promise be well kept, as there seems reason to believe it will be. Under the head of "Frozen Musical Notes" it is proposed to give notices of notable buildings, criticisms, and papers on the decorative arts. The heading is not quite the thing. Every one knows architecture has been called Frozen Music. "Notes of Frozen Music" (if the figure be desirable) would convey correctly what the writer wishes to say: "Frozen Musical Notes" means a very different thing.—*The Ecclesiologist* contains a letter from Mr. Gambier Parry on "Recent Architectural Colouring in French Churches." Mr. Parry says that throughout a tour of church painting he has been repeatedly struck by the absence of principle. He thinks we have not much to learn from France in this art.—The December part of the *Art-Journal* closes the twenty-ninth volume of that excellent publication. The catalogue of the Paris Exhibition will be continued through the greater part of the present number after O'Neil and Hook are very good.—"The Young Nile Voyagers." By Anne Bowman, Roundedge. In this a rather romantic expedition of two boys to Egypt, for the discovery of a friend of their deceased father, who had desired them to go to this friend for help at his death, is very well told, so as to bring in every now and then some useful information. It is illustrated by J. B. Zwerner, and will be read with great zest by the young, and especially by boys.—"How to Make Cakes in a Hundred different Ways" (Roundedge), is a seasonable "Household Manual," which is likely to be more useful than how to do some other things in a hundred different ways that we have heard of.

Miscellaneous.

A SCHOOL FOR WATERFORD.—Lady Esmond has bequeathed the sum of 30,000l. to the Board of Trinity College as trustees, for the purpose of building and endowing a classical school in the city of Waterford.

THE SANITARY INSPECTOR OF NOTTINGHAM.—With reference to a recent paragraph on the improved condition of Nottingham, we wish to say in correction that Mr. William Richards is the sanitary inspector of the town, and that the present rateable value of Nottingham proper is 270,000l.

EAST LONDON MUSEUM SITE BILL.—This Bill has passed through committee, and been read a third time and passed in the House of Commons. It is going rapidly through the other House.

THE NEW STATE HOUSE AT SACRAMENTO, CALIFORNIA.—This edifice will be a very imposing structure. It covers nearly 60,000 ft. of ground, and will be 226 ft. in height. The handsome avenue in the city leads from its front to the river.

THE ROYAL SOCIETY.—The annual meeting for the election of officers and to hear the president's address was held on St. Andrew's Day. The total number of fellows, including five royal and forty-eight foreign members, is 617. The receipts for the year were 4,932l.; the expenditure, including purchase of 600l. Consols, 4,436l.

ROYAL SCHOOL OF NAVAL ARCHITECTURE AND MARINE ENGINEERING, SOUTH KENSINGTON.—A scholarship of 50l. a year for three years (being the first yet awarded) has been gained upon examination by Mr. J. F. Cairns, of Chatham. The school now numbers forty-one students, fourteen of whom are sent by the Lords of the Admiralty.

A PAINTER'S GIFT TO CANTERBURY.—We understand that a house in St. Peter's-street has been purchased by Mr. Sidney Cooper, R.A., to be devoted as a school of art for the study of the youths of Canterbury, at a nominal figure; and that if the usefulness of the school is appreciated, Mr. Cooper contemplates handing it over to the corporation as trustees by a deed of gift.

CHILDREN'S PLAYGROUNDS AND DAY NURSERIES. A sub-committee has been appointed by the council of the Working Men's Club and Institute Union, 150, Strand, to consider the question of providing playgrounds and day nurseries for the children of the London poor. The hon. secretaries invite correspondence on the subject from persons who may have information to communicate or practical suggestions to offer.

DAMAGES FOR DEPRECIATION OF PROPERTY BY PUBLIC WORKS.—A law-suit has just terminated at Wicklow, in which the plaintiff, Mr. Tighe, obtained a verdict from a special jury for 12,051l. The object of the suit was to determine the amount of the depreciation of Mr. Tighe's mansion and estate of Rossana, in the county of Wicklow, by reason of the construction above it of the great reservoir at Roundwood, on the river Vartry, for the future supply of water to Dublin.

DRAINING A LAKE.—The lake of Nensiel, in Hungary, on the confines of Austria, is now completely drained and dried, and the land so obtained is about to be placed under cultivation. It contains eight square miles of virgin soil, and the belief is that it will prove extremely fertile. The land is given to the neighboring proprietors, and Prince Esterhazy and the convent of Heiligenkreuz will receive the largest share of it. This extensive tract of soil gained from nature lies close by the lines of railway from Vienna to Raab.

THE YORKSHIRE ARCHITECTURAL SOCIETY.—A general meeting of this society has been held in the Museum, York; the Rev. Canon Hay in the chair. The Rev. G. Rowe, one of the secretaries, announced the desire of an Architectural and Archaeological Society, which is about to be formed at Sheffield, to be received into union with the Yorkshire Architectural Society, which was agreed to. A paper, by the Rev. C. Kerry, "On the History and Antiquities of All Saints' Church, North-street," was then read by the Rev. G. W. Guest; after which the Rev. Canon Raine read a notice of some early monuments at Conisbrough, and the Rev. G. Rowe, a paper "On the Contents of the Associated Societies' Annual Volume."

THE BOATMEN'S INSTITUTE, Sale-street, Paddington, has been re-opened, last week, having been entirely reconstructed. It consists of a school-room on the ground-floor, 31 ft. by 23 ft. with class-room, 16 ft. by 11 ft., and a chapel on the first-floor, 45 ft. by 23 ft. In the basement is also provided a kitchen, coal-cellar, &c. The chapel has a light open roof, with trusses partly of wood and partly of iron, and is lighted by two large lanterns. The seats are open, fixed to Macfarlane's cast-iron brackets. The building is warmed throughout with Haden's apparatus. The works have been carried out, at a cost of about 1,000l., by Messrs. Scrivener & White, under the direction of Mr. T. Heggate Vernon, architect.

The Builder.

VOL. XXV.—No. 1297.

Position of Ecclesiastical Architecture in Germany.

E concluded a recent notice of ecclesiastical works now in progress in Germany,* with some observations upon the works of Vincent Staudt; and we shall now proceed to notice several of the churches designed by Professor Schmidt, of Vienna. One of the illustrations in our present number, represents the new Lazarist or Vincentian Church, at Vienna.† This church was completed in 1864, and is one of the best modern churches in the Austrian dominions. It is a large building (about 240 ft. long), and consists of a nave, with lateral chapels, transepts, with chapels to the

east, and a large chancel or choir, with an apse. Over the "crossing" is an octagon lantern, surmounted by a tall slate spire. The style is Early Decorated. Internally, the church is vaulted. The whole design is conspicuous for simplicity and absence of pretension; it is at the same time free from baldness or poverty. The material is brick, with windows and dressings of white stone, and stone columns within. The interior is polychromed.

The next illustration we give is of a church which is being built by the same architect at Fünfhaus, near Vienna. It presents a thorough contrast to the Lazarist Church, but is in its way equally good. The plan is very original: it consists of a large octagon, with transepts or square projections on six sides: the first and eighth sides are occupied by the nave and choir; the octagon is surmounted by a dome, which is a very successful attempt to combine this feature with a Gothic building. Most of the designed Gothic domes look as if they had no connexion whatever with the building upon which they are placed; but here the dome seems so natural and seems to suit the position so well, that we could imagine no kind of roof or covering so suitable in the position. It is 60 ft. in diameter, and very nearly 120 ft. high. Flanking the west end of the nave, which is only two bays long, are two towers, placed with their angles to the cardinal points of the church. Half-way up they are chamfered into octagon lanterns, crowned with low spires. These spires seem to us the weakest part of the design; in fact, we would sooner see them away altogether, as they appear to us to disturb somewhat the general harmony of the design and detract from the dignity of the dome. The choir ends in an apse, surrounded by octagonal buildings, which, we suppose, will be used as sacristies. The interior

is very plain in respect of the architecture, but a rich system of decorative painting is to be adopted.

Another very fine church is being built by the same architect on the Weiszgraben at Vienna. It is a larger and more elaborate building than either of the former churches. It consists of a nave and aisles, with a very singular western tower, transepts, and an apsidal choir. We do not, however, think it equal in merit to the two former churches, though it is undoubtedly a fine building.

We must not leave Mr. Schmidt without praising his excellent restoration of the Cathedral Church of St. Stephen at Vienna. We should like to see that restoration completed by the removal of the Rococo altars, and substitution of others more in harmony with the style of the building.

A large new Romanesque church, dedicated to SS. Cyril and Methodius, has been erected at Prague. It is a fine large church, and would be good were it not for the introduction of tracery into the windows, and the very modern look of the spires.

The Votive Church at Vienna, designed by Mr. Ferstel, is progressing rapidly. A view of this church, and particulars of other buildings by the same able architect, have been published in the *Builder*. The Votive Church is a noble building, but to some extent a copy of Cologne Cathedral. It is striking from its great size and pleasing proportions.

The new Protestant church, opened a few years ago, in Cologne, is a somewhat bald and uninteresting building, in the Early Romanesque style. The Protestant church at Denz has a pretty tower, copied from the eastern spires at Würzburg Cathedral, and which looks well at a distance. The rest of the church is like a miscellany, and thoroughly unecclesiastical in appearance.

The new Lutheran churches at Donauwerth, Aschfenberg, Bingen, and St. Goarhausen, are remarkable only for their badness. The two former are of no style of architecture, and the two latter are jumbles of every style. The same may be said of the new Roman Catholic church at Neustadt, in the Pfalz.

Two new churches of large dimensions have just been built at Ludwigshafen. One is Roman Catholic and the other Lutheran. The Catholic church consists of a nave and aisles under one roof, and a deep chancel; two towers, which are intended eventually to bear spires, flank the chancel, which terminates in an apse. The building is of brick: the style is Second Pointed, simple, unpretending, and very plain, but honest, and good both in design and construction; it is built by an architect of the name of Heobsch. The Lutheran church is exactly the opposite to this: it is very large, and externally is built in a kind of had Romanesque style, with most horrible detail, more resembling Saracenic than any architecture we know of. Internally, columns, roof, arches, and galleries are all of iron. Every portion of the church, externally and internally, is covered with poorly designed ornament, borrowed from every style that ever existed; in fact, it is one of the most pretentious and detestable buildings we have ever seen. As this church is built in what the Germans call the "Zukunft's Gothic," or "Gothic for the future," we must say a few words upon this style. We fear Munich was the cradle of this new architecture, and certainly some of its wildest vagaries are to be found in that city. Amongst these must be mentioned the Maximilian Strasse and the Maximilianann. This style is founded chiefly upon Florentine Romanesque and late German Gothic. In order to make this jumble more wonderful, Saracenic, Indian, and Chinese ornaments are stuck about the buildings in every conceivable position. The material in which this style delights is a bright glazed carrot-coloured

brick, and plaster which is usually painted pink; and this abominable jumble the Munich architects coolly tell us is the "Gothic for the future." Taste forbid!

It is sad that Munich, which was the first place where the revival of German ecclesiastical architecture flourished, should have fallen into such child's play. The new Protestant church at Freising is one of the least offensive examples of this style we know of. The Franciscan church at Passau is a restoration in which many of the absurdities of this style have been perpetrated, though it is nothing like so wild as most of the specimens we have seen. Nearly every thing in the building is iron or plaster, and the spire and pinnacles are worthy of Batty Langley. We will not, however, dwell any longer upon this disagreeable theme, but will make a few observations upon some of the works of restoration now in progress in Germany.

One of the finest restorations we know of is that of the St. Godehard's Church at Hildesheim, by the architect Hase, of Hanover. This noble Basilican church has been thoroughly restored, internally as well as externally. The fittings, which were in the Rococo style, have been replaced with others more in keeping with the building. A new high altar, entirely of bronze and marble, and of very good design, has been erected in the eastern choir. A pulpit of stone, the panels of which are inlaid with old Byzantine enamels, has been set up in the nave. The choir has been finely decorated by Wetter, of Cologne. A splendid corona of very similar design to the celebrated one in the cathedral has been made from a drawing by the same artist. The very elaborate mosaic pavement which forms the floor of the choir and sanctuary, and the stained glass, are also from his hand. We notice particularly in this church that the decoration, instead of forming a series of isolated pictures, having nothing to do with each other, is arranged in one scheme, and each separate figure or subject bears a relation to the whole. Most of the decoration is on a gold ground, and the style of the building, which is Early Romanesque, has been most strictly adhered to. The restoration of the cathedral at Speyer, which has now been completed several years, is also a noble work: its chief glory, however, is the magnificence of the decoration. It is impossible for us in England to imagine the effect of a cathedral nearly 400 ft. long entirely covered with decoration, and its walls ornamented with frescoes, every one of which is a picture of the high merit, grand in conception, noble in composition, and good in execution. When shall we in England see our public buildings decorated in such a manner? When shall we see anything to equal the frescoes by Illenbach in the church of St. Appollinarisburg; by Steinle, in the church of St. Giles, at Munster; by Hess, in St. Boniface, at Munich; or those in the cathedral at Mainz? Or, to speak of secular works, the frescoes by Steinle in the "Römer" at Frankfurt, and the museum at Cologne; and by Rehel in the town-hall at Aix-la-Chapelle? Why cannot we do these things in England? Our ideas of decoration seem to be confined to painting stars or conventional roses on a blue ground, or writing up inscriptions in Old English letters; and, if a figure ever is attempted, it bears more resemblance to a "Gay Fawkes" than a human being. The Church of St. Catharine, at Moorburg, has been restored and decorated, and the fittings which were old have been repaired, and those which were not in character with the building removed. The noble fifteenth-century high altar, for which this church is chiefly celebrated, has been restored. The decoration is rather too "cinque-cento" in character; but the general effect is rich and harmonious.

We have already spoken of the restoration of Ratisbon Cathedral, and have given illustrations of the church, showing the new spires and

* See p. 793, ante.

† See p. 900.

lantern, now being erected from the designs of Mr. Zingler.*

The cathedral at Augsburg has also been restored, and all the fittings that were not Gothic taken away and replaced by others in harmony with the building. The new stained glass is far from satisfactory.

The cathedrals at Halberstadt, Paderborn, Minden, and Ulm, are also at present in course of restoration, but our space does not permit us to give a description of them. We regret also that we cannot give an account of the works of restoration now being carried on in the following churches:—Cathedral at Aix la Chapelle, St. Patroclus's Church at Soest; St. Nicholas's Cathedral at Soest; the Weiss Church at Soest; the Cathedral, St. George's Church, and Holy Cross Chapel, at France; St. Mary's Church at Würzburg; St. Ludgeri at Münster; the church of S. Maria in Capitolio, St. Martin's, St. Gereon's the Minorite, and Protestant churches at Cologne. The Liebfrauen Church at Treves; the churches at Ecternach, near Treves; Main, Bishofsheim, Stadt Prozelten; Scotch Benedictine Church at Rathenow; the Liebfrauen Church at Worms; St. Margaret's at Salzburg; St. Martin's and the Cemetery Church at Landsluth.

Nor will our space admit of more than mentioning the following new churches:—Protestant churches at Hanover and Stuttgart; Jesuit Church at Aix-la-Chapelle; churches at Kreisbaben and Lechhausen, near Augsburg; at Sachsenhausen, at Harburg, at Berlin. New cathedrals at Gran, in Hungary, and Olmutz, in Moravia; church at Bedwitz, in Bohemia; church at Rosenberg; church at Wiesbaden; at Langerfeld and Mühlheim; and a convent church at Doering.

It will be seen from the number of churches we mention that ecclesiastical architecture is not at a standstill in Germany. It is true that so many new churches are not built in Germany as in England; but many of the German churches are much larger than any that has been done in this country. In addition to this, several churches that were desecrated at the Revolution have been re-opened; as, for instance, the "Nen Ban" church at Würzburg; the Franciscan church at Passau; Carmelite church at Andernach (Protestant); the church of the Abbey of Abdinghoff, at Paderborn (Protestant); St. Mary's, Rotenburg; and others. Another reason why we do not expect to find the same number of churches building in Germany that we do in England, is that the population of Germany has not increased so much as that of England. It must also be remembered that at the Reformation and Revolution, as a rule, the monastic churches were not destroyed, but were, in most cases, handed over for parochial purposes; and thus about fifty or sixty years ago, many small parishes became possessed of immense churches, which were far larger than required at that time, and for many years after.

Before concluding this article, we must point out what seems to us the great danger which threatens Ecclesiastical architecture in Germany, and that is the "new style," or what the Germans call "Zinkunfte Gothic." We have referred to this style before and described its peculiarities, and we feel sure that nothing can come of it but the destruction of anything like good taste and artistic propriety. It is impossible to invent a style for the future, on duty is to design for the present, and the future will take care of itself and invent its own architecture if necessary. In conclusion, we congratulate the Germans upon the great progress they have made in Ecclesiastical architecture, especially during the last ten years.

LABOURERS' DWELLINGS COMPETITION, LIVERPOOL.

We do not propose to lay before our readers a critical analysis of each set of plans. This would be an unprofitable task. As in all competitions there are certain groups of plans which may be classified, we must choose the simpler method, and mention one or more of a group. We feel keenly that we shall be unable to do full justice to the competitors from the system of espionage which the authorities have thought proper to adopt, and their prohibition of anything in the shape of written memoranda. Where one has to trust to memory, it will not be surprising if inaccuracies creep in. So long as they are not of a serious kind we must be satisfied;

* See pp. 591 and 609, ante.

but we feel it is due to the competitors to make this observation.

Since our last number the committee has selected ten plans, on which the engineer, the medical officer of health, and the town clerk are to report separately with regard to both financial and sanitary considerations, and the probable cost of each plan as a test of the estimates submitted. The three plans mentioned in our last are included in the ten selected, but the others are not marked, so we cannot point them out.

No. 64a, by John Birch, appears to possess many of the peculiarities of the dwellings of Alderman Waterlow. The buildings are in two blocks, facing the present streets, with baths and washhouses between. They are six stories high. The rooms are too low, being but 8 ft. from story to story. This architect supplies two separate arrangements, one marked A, the other B. The former is estimated at 24,000L, the latter at 21,000L. The plans are well drawn, and exhibit talent; but we think they are too expensive, cumbersome, and complicated for the site and purpose.

No. 1, by C. H. Howell, is quadrangular on plan. The lowest class of dwellings contains only one room and use of a general scullery; the highest class contains four rooms, scullery, and W.C. The plans are well put forth by their authors. Generally the dwellings are grouped one on each side of the staircase. The wings are, however, differently arranged. Cost stated at 20,000L. The buildings are very high.

No. 9, "Mulum in Parvo," contains fifty-four dwellings, arranged on the ordinary cottage plan; the site, with the exception of three transverse courts, being quite covered with the property—not arranged in flats.

Messrs. Lucy & Little's dwellings are decidedly peculiar in being divided into no less than nine isolated blocks of various sizes. Another peculiarity seems to be the branching off of small staircases from large central ones, the object of which arrangement we do not apprehend. The plan wants unity and connexion, and the estimate is shrewdly low.

No. 15 courts the attention of the members of the Society of Freemasons, by a Masonic device, and we shall leave it to them.

No. 12, by Isaac Ferrill, Dublin, is arranged in two quadrangles. The plan is decidedly original, each dwelling possessing a small yard, and water-closet in the upper flats constructed on balconies. The plan is to be commended from the evident desire to get rid of internal water-closets; its disadvantage, however, is the crowding of the back premises. The galleries to the flats are inside the quadrangles.

No. 49, by Reade & Goodison, is in the arrangement of the blocks similar to No. 59, described in our last. There are, however, four main staircases, which are open through into the inner quadrangle, and central cartways in addition. One of the peculiarities of the plans is the absence of sculleries, and the substitution of a sink, like that of a barber's pantry, with waste-pipe, mechanically ventilated in the living-room, which can be closed up and made a dresser when not in use. The bedrooms are commodious, and the smallest dwelling contains a living and bed room. A tender from a local builder is attached, stating that he is prepared to erect and complete the buildings for 17,000L odd. The rents seem to be extremely moderate, ranging from 2s. 3d. to 4s. 6d. The floors are fire-proof, and the plan is characterised by simplicity. The debatable point is the massing of the water-closets at the ends.

No. 23, "A Stroke for the Poor," is decidedly a bold stroke. We think, cubically speaking, that the buildings are the largest shown in the rooms, and the estimate is 28,000L. The playgrounds are on the roof flats. Most of the dwellings have three bedrooms.

No. 32, by Habershon & Pite, are incomplete. No analysis of the plans appears to be appended, and they seem costly.

No. 33, by Watford & Donkin, contain 108 tenements, of the Alderman Waterlow type. The plans are well got up.

In No. 65, by Thos. Mercer, the dwellings are grouped around the staircases, and face both inwards and outwards, and consequently are back to back; having, however, side doors to the staircases, there would be through currents of air. The estimate is too low.

No. 47, by John Reeves, is one of those plans that were stated to be in accordance with the Building Act and bye-laws. It only shows how indifferent plans may be, notwithstanding such conditions being fulfilled.

No. 42, by John Glover, is another of the plans mentioned as being in accordance with the Act, but much more ambitious in its pretensions than No. 47. The dwellings are divided into blocks by the staircases. There is a good deal of painstaking merit about the plans. The estimate, again, is too low.

In No. 38 are contained so many plans, schemes, and devices, that at first we were quite bewildered. There are no less than five systems exhibited, marked A, B, C, D, and E. We are not desirous of going through our alphabet again, so we must content ourselves with observing that the internal merit they possess does not appear to warrant the dilution the ideas of the author seem to have undergone in attempting to do too much.

No. 57, by Samuel Sharp, contains two transverse streets. The arrangement is not an economical one.

No. 60, by Adams & Longson, is crowded with courts and cottages. They are peculiar in having yards to all the houses.

In his explanation of No. 20, Mr. Rollet says he has brought forward his plans with considerable diffidence. We cannot help observing that a disagreeable person might say that the plans hardly justified him in that frame of mind, as they are of the mildest type. Forty-eight dwellings are all that are provided for, and the extreme simplicity of the elevation is almost ludicrous. They appear to be arranged in four transverse blocks, divided into two flats.

No. 48 adopts the strange device of a postage stamp. Is the object to show that he stuck to it when at work? Some merit is exhibited in the elevations, which are of a Gothic character. The plan forms a quadrangle surrounded with streets. The estimate is between 8,000L and 9,000L, which is absurd.

No. 44, by Mer, is very badly drawn.

Nos. 72 and 69, the former by Mr. G. Grayson, and the latter marked "Light and Air," (Mr. Moy) are very similar in arrangement. They are each estimated to cost 28,000L, which seems honest. Both are in flats approached by galleries on the sides facing the quadrangle. The position of the blocks on the site are similar to Nos. 52 and 49. "Light and Air" possesses six staircases, and No. 72 only two. They would have been much better if they had been opened through to the quadrangle. No. 72 is stated to be divided into 179 dwellings, about the largest number contained in any of the plans. No. 69 has 180 dwellings, which are shown on a large scale, and of which we are thus better able to judge than of those in No. 72. The arrangement of the sculleries and water-closets is good; the scullery forming a sort of passage to the other rooms. The living-rooms are large, 16 ft. by 13 ft.; the bed-rooms 10 ft. by 10 ft. There appear to be no four-roomed dwellings in No. 69. The two rooms are put down at 4s. per week, and the three rooms at 5s. The rents are too high. The probable return is stated at a little over 5 per cent. It is a pity that so good a plan should err in a financial point,—that is, as regards the high rentals; but, we think, if most of the other competitors had been as honest as "Light and Air," the returns they show from the stated rentals would be very much less than they wish us to believe.

No. 31, by John Brown, is covered with buildings, and the openings to the courts are very narrow.

No. 73, "Verie," possesses considerable merit. The arrangement of the dwellings in principle is somewhat like No. 65, by Thos. Mercer. The sinks and closets are built out from the stair-landings.

No. 16, marked "Economist," hardly bears out its title, being apparently costly and complicated.

The author of No. 38 appears to imagine, from the green bank shown between the blocks, that the site is a rural one.

No. 3, marked, "Vérité sans Peur," is original in having the blocks set a good distance back from the streets, and the central area enclosed with a glass roof. The plans display considerable ability; but we differ from the author with regard to the artistic effect of this arrangement. All such schemes must end in making the dwellings one huge house with many rooms, whereas the aim should be isolation and separation.

Having now touched upon the salient points of the exhibition, though in far from an exhaustive manner, we may remark that there seems something unsatisfactory in the way the competitors are being treated. Of course, where so

many interests are affected,—where one party in the town wish the houses built, and another equally strong try to strangle the scheme with the Building Act,—where the cottage-owners oppose, and lukewarm friends smother with faint praise—we may expect that everything will not go quite smoothly or straight; but we were not prepared to find a system of repression put in force, or so much appearance of hack-stair work as hitherto has characterized the proceedings. Again, an officer who has already prepared several plans which have been rejected, should not have been called in to sit in judgment upon the competitors; for the most honest mind is in danger of a bias, more especially if he feels aggrieved at the treatment he himself has received.

It seems doubtful whether the dwellings will ever get further than the plans.

DESTRUCTION OF HER MAJESTY'S THEATRE.

At ten minutes before eleven on the night of Friday, the 6th inst., the inhabitants of the suburbs saw the sky reddened by a mighty fire: at ten minutes to twelve all was dark again; and within that time Her Majesty's Theatre, in the Haymarket, with its fittings and pictures, its grand organ and chandeliers, its scenery, wardrobe, musical library, and irreparable scores, was utterly destroyed, nothing remaining but the enclosing walls. The well-known façade in the Haymarket, with its bas-relief of artificial stone, and its colonnade, remains, with comparatively few marks of disturbance, but behind it there is desolation. A visit to the spot on the return of daylight showed the whole area open, unnumbered only with a wet, smoking mass of remnants,—charred wood, half-burnt beams, a reeking heap of silks and velvets.

The first opera-house in England was built on this site by Sir John Vanbrugh, and was opened in 1705. Some of the newspapers have said the house was always called the King's Theatre till our present Queen's accession. But this is wrong, for Anne was reigning when it was built, and it was opened as The Queen's Theatre. Amongst the architects by whom it was altered from time to time were Robert Adam, and M. Novosielski; and when in 1789 it died the natural death of theatres, Novosielski obtained an increased area, and rebuilt the house very much as we now see it, so far as the interior is concerned. As the late Mr. J. B. Papworth observes, in an account of the theatre, with Illustrations, given in Britton & Pugin's "Public Buildings of London," the horseshoe form which Novosielski then adopted was at that time a novelty in British theatres, but was used by the Italians in their edifices. The exterior, as we see it, is due to Messrs. Nash & G. Repton, and was part of the improvements made under the New Street Commissioners in 1820. When this alteration took place the lessee was Mr. Holloway, and by him and his executors the sum spent was about 50,000*l.*, which apparently included forming the Arcade on the west side of the theatre on what was then known as Market-lane. The columns of the colonnade are of cast-iron; the entablature is of Bath stone. The body of the building is of brick, covered with Roman cement,—at a time when Roman cement was not rubbish. The bas-relief, which represents the progress of music, Apollo and the Muses forming the centre, was executed by Mr. Bubb. As left by Novosielski, the area of the auditorium of Her Majesty's Theatre was larger than that of La Scala in Milan, notwithstanding what is constantly said to the contrary. The length from the curtain to the back of the boxes in La Scala is 94 ft.; the width from the boxes in La Scala 75 ft., giving an area of 7,332 ft. In Her Majesty's these dimensions were 102 ft. and 75 ft., giving an area of 7,650 ft.; its height, however, from floor to ceiling, the highest part over the pit, was less, La Scala being 70 ft. and Her Majesty's 56 ft. The painting-room of Her Majesty's was in the roof, over the pit, and here, at the ventilator in years gone by, we have at times listened to Grisi and Lahlache, hearing everything distinctly in the intervals of a chat with the then chief of the scenic department.

Not long ago an alteration was made which somewhat lessened the area, by bringing the proscenium nearer to the house, to the extent, if we remember rightly, of two boxes on each side. This was done under the professional direction of Mr. Lee, and had its advantages both before and behind the curtain. If the comparison with the

Milan Opera-house were continued in the latter direction, the advantages would be found greatly in favour of the Italian house. The stage of our opera-house was most inconveniently small, and the accommodation generally was exceedingly bad. The wardrobe, for example, was up imnumerable flights of stairs at the top of the building. It was an excellent house for hearing and presented a noble expense, but in other respects was sufficiently abominable. The crash-room was insignificant, the approaches were poor. The staircases were of wood. Only the night before the fire it had occurred to us when passing up one of them to remark to friends as to what would probably be the fate of the occupants of the upper part of the house in the event of a fire occurring during a performance. Faith in stone for staircases has been recently lessened, and stone has been pronounced against as a fire-resisting material. By the new Building Bill before Parliament stairs of public buildings are required to be of "fire-resisting materials," and it would surprise some to find on looking to the list of fire-resisting materials that stone is not included. It appears certain that stone stairs are not to be relied on under fire: irregular expansion by heat is fatal to them. Still it must be remembered that they will not burn, and will afford safe means of egress to an overtaken crowd that with a wooden staircase would probably perish. What would have been the position of the occupants of the upper part of the house, had the fire at the Opera-house occurred during a performance? Escape would have been impossible: the loss of life would probably have been awful.

The recent fire, like others, has provoked an immense amount of warning and suggestion,—some wise and some otherwise. In a fortnight it will be forgotten, and if a new theatre were then built, not the slightest consideration would be given to what has been said, excepting so far as circumstances conveniently permitted. Look at the two new theatres in Holborn, wedged in amongst houses, as we have said before, in the most improper and unsuitable manner, one with a stage not large enough to swing a cat on. At the Queen's Theatre, Long-acre, the accommodation for those engaged, if we are not wrongly informed, is of the most unsatisfactory kind. Two members of the company, Mr. Clayton, comedian, and the leader of the orchestra, have already injured themselves by collision with a beam.

Look into the property-rooms and odd corners of most of our theatres: see what dust-heaps and rubbish-shops they are. It is scarcely possible to get at anything or to know what they contain. Why should the wardrobe be kept in the theatre? There should be a separate place close by, or, at all events, in a compartment enclosed with walls of its own, the connexion being shut off with iron doors. We must not be led, however, into observations on the construction and planning of theatres. These points we have before now treated of, on more occasions than one, and shall return to them. Certain it is, that the mode at present pursued is not a good one. Mr. Boucicault writes to suggest what he terms a very simple process by which theatres may be secured against destruction by fire. He says,—

"Above the stage, and co-extensive with it, there is a gridiron floor, from which hangs the pendent scenery; let the timbers of this floor, which is open-work, be laid on their under face, with lines of small iron pipes, forming a gridiron, pricked at every inch with holes; let this system be in communication with the water-main constant service. Let one lever which turns on the water be against the wall of the stage on the inside, another corresponding lever contiguous but on the outside, so that the water may be turned on by a person either outside or inside of the building. The effect of this operation would be to let fall a continuous and even deluge, more effectual in checking a fire than the jet from a hose, because it not only addresses itself to the seat of a fire, but to adjacent material. A similar gridiron process should be introduced under the stage; another on the rafters over the auditorium; and a fourth in all available places around the ceiling, so placed that the rain from such would fall on projected on the wood-work of the boxes and stalls. Each of these systems should have a separate main, so that each could be brought into operation separately; yet the whole might be under the operation of one master main, by turning on which the whole theatre, from the back of the gallery to the rear of the stage, could be deluged in a moment. It is of great importance that such a process should be as readily worked from the outside as from the inside of a building. I believe that the water companies supply what they term sealed mains; that is, the constant service of the street main is conducted into the building, and the lever is there sealed up; to treat this main is to confess the use of the supply. Such facilities exist, as I am informed; and if they do not, and the companies offer any impediment to their introduction, an Act of Parliament might be obtained to render such assistance obligatory."

The suggestion is not a new one. It has been made on more than one occasion with refer-

to warehouses (was tried at Drury Lane Theatre years ago), and, if we mistake not, some such system is patented; at any rate, it was submitted to us for our opinion four or five years ago preparatory to such a step. We did not advise the spending of any money upon it. Water so discharged, if discharged, would be sure to fall in the wrong place and be useless, or on some busy alarm would be made to do more mischief than the cause of the alarm. As a rule, however, the affair would be out of order, or the cistern empty, or the lever unapproachable, or the whole system forgotten at the moment of need. When Drury Lane Theatre was burnt down in 1809, there were in the upper part of it two immense reservoirs, sufficient to inundate the house: whether they were empty when the fire occurred, were forgotten, or could not be reached, they failed in their purpose. It seems, too, that a large iron curtain, which had been set up with the view of dividing the auditorium from the stage, in the event of fire, had been removed a few months previously, as it was found to be so rusty that it could not be worked. The enormous tank over the Opera-house is said by the architect to the theatre to have been full of water, and to have been used by the firemen in their ineffectual and mysterious endeavour to put out the fire before they sought for extraneous assistance. It is difficult to understand, however, how with the control of such a body of water as that reservoir would hold they could have failed to quench the fire if it were attacked at the outbreak. The best means of protection appear to us to consist in wise planning, with a view to the efficient division of the building into as many separate compartments as practicable, the use of the greatest possible proportion of non-flammable materials in the construction, water and appliances always at hand and in order for immediate use, and continuous watching by intelligent men. We want, as we said at some length a short time ago, a class of men, as watchers, of a superior character to those now usually employed.

The cause of the fire at Her Majesty's Theatre remains still unknown: a defective fire and spontaneous combustion have both been suggested; the latter a by no means improbable cause, notwithstanding the fact known to every one that oil is not used in scene-painting. An oily rag and some lamp-black, in a heap of shavings or in other rags; the accidental conjunction of some other materials in a heap of rubbish such as we have before now seen in theatres; or even a pile of rags or tow alone, would, under certain circumstances, produce flame. In the present case, however, we have no grounds to reason upon. The cause is at present wrapped in darkness, and will, perhaps, remain so. We venture, however, to throw out a suggestion that occurs to us.

The last incident that took place on the stage was the descent of Don Giovanni amidst fire and smoke to regions below. Can it be that a spark was then lodged where it enkindled and spread until heat sufficient was generated to produce flame, and the resultant destruction? It seems very desirable that a more strict investigation than we have yet heard of should take place, and that the watchmen should be made to give a much more precise account than is yet before the public of what they were doing during the whole of the evening, and of their proceedings when the fire was discovered. The coroner might do good service by opening an inquiry into the matter, and ought at once to interfere.

THE CONDITION OF ARCHITECTURAL SCULPTURE.

I BELIEVE every thoughtful man agrees with you that the result of England's visit to Paris this year is the belief that in nearly every branch of domestic and decorative art we are sadly deficient and stupid, when compared with the art-workmen of France and some of the minor states of Europe. Indeed, so wide seems the difference between us that the only thing left for us is to look earnestly towards making a better future. To this end I wish to make a few remarks through your influential columns; and, confining myself to my own particular branch of art-work, will endeavour to point out the defects in our system of working which have mainly tended to leave us in the rear of other nations.

It has been said that we are a cold and inar-

istic people. That, I think, many are prepared to deny. Indeed, I think the man who first made that assertion would not refuse to deny the existence of gold in quartz. The true metal, I believe, is here among us; but we bungle in refining it. The old masters of the Middle Ages found it in our rare pure enough, and glorious works they wrought with it. There were quick brains and bright eyes in those days, and cunning forms were invented, beautiful and new. No tiring, no flagging, no self-satisfied laziness: a style was worked up to its perfection; all was done with it that mortal hands could do. They worked with such love and healthy vigour that four hundred years afterwards we go creeping round their mighty structures with our eyes and mouths extended in astonishment! And who were these men? No one can deny that they were of our race and country. Then, is it to be supposed that the faculties they were capable of cultivating to such an artistic pitch are now dead among us? Such a day, I believe, would forbode evil for England. We may have become a hard-headed people;—giants in mechanism, children in art. This is merely the national result of a strictly mechanical age; and let us try to discover how this comes about.

I think we shall find that the canker may very easily be traced to our present system of competition,—I am, of course, writing upon architectural sculpture exclusively,—a competition which places one of our most interesting, and the most public of arts, on a par with brick-work and paving. There may be a few men who would take exception to this remark; but I contend that the exceptions are very few, and the practice very general. Is it not a general practice, in large provincial towns especially, to lump in sculpture together with all the mechanical trades required in building, and give it straight into the hands of the builder? And what is the consequence? The builder, of course, sends it round to half a dozen men until he obtains the cheapest. Now there are architectural sculptors who work for eightpence per hour, and there are architectural sculptors who could not be obtained for four times that amount: then how often, may we suppose, have the latter means of showing their skill under such a system? There is, perhaps, nothing so convincing as personal experience; and from that let me then take one little instance. Some time ago I applied to a gentleman for the carving in a church of his designing; he referred me to the builder, to whom I gave an estimate, which he said was in every way satisfactory. Time went on, and I wondered, in my innocence, why I had not been instructed to proceed with the work: I wrote for an explanation, and in return was informed that a person had undertaken to do the thing thirty per cent. under my price; and, thinking it would be useless to apply to me for such a reduction, they had signed with him to commence at once! In this thought they were wrong. The virtues of a Phocion would never suit this era. Indeed, I venture to say that if the self-denying old Greek had lived in our time he would have been voted an imbecile, incapable of taking care of himself, and in all probability given over to the mad doctors. Being a strong believer in Darwin's theory of existence, I should have undertaken that work at the reduced price, or even lower than that, and employed inferior men to do it: the profit accruing to me would have been relatively the same, the difference being in the price paid for skilled and unskilled labour. Perhaps this little confession may seem rather indiscreet, but it is best that the truth should be held up plainly to those who are too mentally blind to find it for themselves. This is not an accidental occurrence, a difficulty to be stumbled over once in a life-time; the same thing comes up to cramp the hands of a hundred others every day. Work done under this system might be tolerated if it could be confined within its own limits, but its consequences cannot be restrained; it is the one stone dropped into the lake, and its influence circles out and spreads over the whole surface of the art. Its natural sequence is a beggary, wretched, pitiful scale of remuneration even at the best, a remuneration which works the muscle of the arm but fails to engage the action of the mind.

I have read somewhere of a brainless wench, who, on the eve of her marriage, goes to buy some necessary utensils for the new home; she comes back laden with a lot of unnecessary pots and pans, not one of which is capable of holding water. But when her future lord points out the paltry nature of her purchase, she answers,

"Yes, my dear; but look what a lot for the money!" She is not the only simple innocent wandering about this world mistaking quantity for quality. It is, I believe, generally thought that the difficulties we have to surmount are but light. With part of this I quite agree. Our studies certainly are very light indeed, and I have just been trying to explain that we are only trained for the labour of the arm, and not for the working of the head. But the difficulties to be surmounted are quite another thing. Let us, for example, take a supposition's case. Tomorrow, perhaps, a man may receive orders to carve a church recently restored—style, thirteenth century. The next day one of the fifteenth; or he may be instructed to execute carvings for a Classical or a Byzantine building. A gentleman may write for him to attend to his villa, which is either Italian, Elizabethan, or that indescribable style which takes its rise—and often its fall—in suburban districts. Now, will any one think for a moment how much study is required to thoroughly master even three of these styles? Say, Early English, Perpendicular, and Renaissance; the easy grace and lovable forms of the first, the severity of drawing and modelling in the second, and the wide range afforded to fancy in the last. To work in these with a master-hand a man's remuneration should be sufficient to procure him the means for travelling to inspect the best examples of each; or allow him, at least, the means to purchase the best models to be obtained of them. But such a consideration seems never to be dreamed of, and all that is required from us is that the work should be done somehow for the money allowed for it in the builder's contract.

What can come of it but barrenness of thought and poverty of feeling? Starvation prices naturally bring forth unhealthy ideas stunted in their growth. I have often heard it stated that if carvings were not put in with the builder's general contract, in many cases the building committee would look upon money so expended as so much capital running to waste. That may be true; for it is generally, though quietly, whispered that building committees are generous enough not to monopolise all the wisdom in the world. But how is it that the system works so well in Scotland, and many parts of northern England, where every trade engaged sends in a separate tender? And why not here? We find that carvings are executed there; and well too,—for example, the British Linen Company's Bank in Edinburgh. Where have we, in London or the provinces, a modern elevation to excel that in its sculptured details? I have not the pleasure of knowing the sculptor's name, but his work proves that he has not been "economised" as we are.

Need we ask what has become of the spirit of symbolism, which was made to tell such wonderful tales in the old work that a carver could make the forms he produced read like a story-book. It has been cast aside, we know; but has anything better or more instructive stepped into its place? Again: let us examine some of the best carved of our modern Renaissance facades, and we shall find them, nearly without exception, empty and meaningless. There, to be sure, is that everlasting, undying acanthus leaf, twisted and tortured into cruel and unnatural shapes enough to make one listen for its shrieking. But where must we look for the graceful human and animal forms, or the fanciful grotesques, which alone give life and vigour to the style? Down with the other good things, sacrificed at the feet of the modern god *economy* and his unholy trinity *l. s. d.* It is all very well, and I have no doubt quite proper, that certain valuable gentlemen should let off high-stepping speeches every now and then about our want of enthusiasm; but let me ask, who made the conditions we all complain of? Who brought our art down to its present degradation? Slaves can seldom emancipate themselves when their masters are many; but I venture to say if the architects of this country—our masters—instead of hunting after the "cheapest," would only apply for the best models, or sketches, for the sculpture in their works, and let the best take it at something like a fair remuneration, they would soon find that English carvers would produce something good enough to win the admiration of those who now look upon them with contempt.

I fear I am trespassing too much upon your limited space already; but I cannot conclude without thanking you sincerely for the earnest efforts you have before made, and are now

making, to lift the minor arts of this country into a higher and nobler sphere. I do not despair that the end will be obtained; for I am buoyed, like many others, with the recollection that your valuable journal has taught men to recognise some of the greatest social truths, and successfully exposed some of the vilest social errors of modern times. With your powerful advocacy, men cannot be long blind to the fact that the finest and purest feelings of humanity can be as readily touched through the eye as the ear; and that everything endowed with beauty and purity of form must leave an unconscious though evident impress on every human heart. The more general such forms become, and the oftener they can be made to arrest the eye of the unrefined and vulgar, so often will society gain by the influence of their silent teaching.

My pen is far too feeble to hold up the full importance of this subject, or I would endeavour to use my strength in exhorting those who are near akin to us—the metal workers, gem engravers, embossers of silver and gold, the painters of domestic ware, and every man who by his art enriches the value of the raw material,—to take up this vital question as a common cause. I would urge them to mark out the errors, in their various ways of working, which cramp them down and hold the inventive talent of each in needless bondage. It has been wisely said that there is too much of *thinking in crowds* among us: wherever such is the case, individual thought and action are too often smothered by the dominant voice of a mediocre majority; for originality can never spring up without self-reliance and an untrammelled singleness of thought. Let us then look well among ourselves, seeking and casting out all that tends to weaken and impoverish art, even in common objects among us; and where the evils are too great for our unaided strength to subdue, let us drum them into men's ears until we compel them to stand and listen. When this is attained, and a proper liberal acknowledgment of skill is established among us, it requires no spirit of prophecy to foretell that the art-workman of this country will not be long ere he shoulders the best men now marching in the van of other nations.

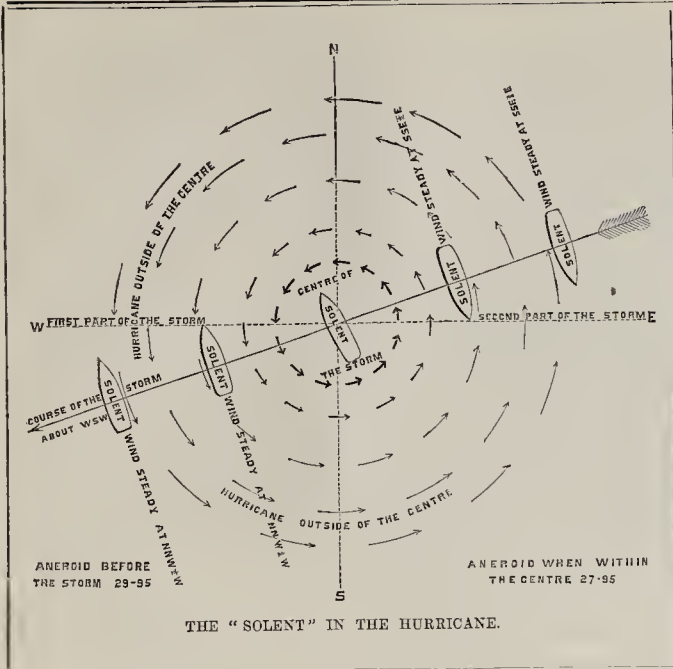

JOHN RODDIS, Carver.

THE VALUE OF CAREFUL BAROMETRICAL OBSERVATIONS AT SEA.

THE sad calamity at St. Thomas's, West Indies, now so fresh in the minds of all, which has brought such sorrow through the length and breadth of the land, and which now appeals through the channels of the press and the private influence of the charitable, gives evidence in the interests of science and those entrusted with the lives and riches of others, that their knowledge and conduct on such occasions should be rightly estimated, especially when derived from experience and the truthful indications afforded by that valuable instrument the barometer, whether aneroid or mercurial.

As a listener in the private circle to the description given by the commander of the Royal Mail steam-ship *Solent*, I venture, even at the risk of being tedious, to offer a few details which, doubtless, will be fully appreciated by those who know little of the dangers at sea, and whom such details may enable to more fully comprehend the graphic pictures that have appeared in the daily press, of those harrowing scenes now the substance of the past.

On the morning of the 29th ult. the *Solent* left St. Thomas's for Peter Island at about 6 a.m., to transfer to the *Rhone* her passengers, mails, and a million dollars' worth of specie, and a valuable cargo; the weather squally, aneroid at the usual height for that hour in the morning,—29.95. As the ship approached Peter Island, steering an easterly course, the barometer was observed to fall slightly, the wind freshening in squalls from the northward with much rain, though as yet giving no unusual indications of anything serious at hand. After reaching Drake's Channel, the *Solent* hove to under the stern of the *Rhone*, anchored off Great Harbour, Peter Island, about 9 a.m. Now friendly communications passed between the two commanders in reference to the weather; both looked forward to the coming of a strong breeze, and thought it advisable not to come alongside for the discharge of cargo, &c. The glass had now fallen to 29.84, and the late Captain Woolley, of the *Rhone*, at once thought of shifting his anchorage, supposing it would only be what

the barometers now rising as rapidly as they had previously fallen, the wind still steadily blowing from the same point, S.S.E. $\frac{1}{2}$ E. Towards evening, as the weather cleared up, the *Conway* was observed on shore near the town at Tortola, dismantled, and her funnel gone. Nothing of the havoc that had befallen the vessels in the harbour and the town of St. Thomas was known until the *Solent* wended her way into that port, the particulars of which are so painful and sad that we forbear to retouch on them here. To render this hurried sketch of the condition of a single vessel more correct and intelligible, we append a diagram of the progress and passage of the storm over the *Solent*, and for the correctness of which the writer is indebted to the commander, who has been invalided home in consequence of the injuries received.

Although the storm passed over the ship, the diagram represents it as if the ship had passed through the storm, the rate of its travelling being considered equal to twenty miles an hour.

THE TRADES UNION MOVEMENT.

In respect to the malicious damage to two stone caps at the Church of St. Mary Magdalen, Paddington, the Operative Masons' Society held a special meeting to disclaim the act as a unionist one. Mr. Dyer, the secretary of the committee, said that, as far as the society was concerned, they had only to fall back on their old charter. Their association had existed for thirty-three or thirty-four years, it numbered thousands of members, and the employers knew well that during its existence it had never been guilty of ratenng, or any similar crime. A long discussion then ensued, in the course of which every member who spoke condemned in the strongest terms the outrage which had been committed at Paddington. One of the speakers pointed out that their rules not only forbade ratenng or any similar crime, but even enacted very severe penalties against any person who used abusive language towards an employer. It was unanimously resolved,—

"That we deplore the outrage at Paddington, but deny most emphatically any complicity or knowledge of the affair; and we trust that public opinion, judging us by the past, will not assume that such a despicable outrage could at the present moment have been perpetrated by members of the Society of Masons; but should such prove to be the case, we shall be glad to hear of such unworthy members receiving such a severe punishment."

Two abominable outrages have been committed at Belper. For some time the workmen of Mr. John Watson, the largest nail manufacturer in Belper, have refused to work, owing to improved machinery being introduced that would assist the workman in his daily work. The Union stated that no horsenail-maker should work for Mr. Watson so long as he should continue using the machinery, he having commenced operations on a small scale at Wirksworth. Amongst the men who worked in opposition to the dictates of the Union, was an old man residing at Gorsev Hundred, Belper, the name of Nightingale. He was leaving his workshop at Belper one evening lately, having in his hand the nails that he had made during the day. After he had locked the door he was felled to the ground by a life-preserver from behind by some dastardly ruffian, and while on the ground his assailant dealt him other fearful blows. Nightingale had shouted "Murder," which attracted the attention of a woman, who came to his assistance, when the murderer's villain took to his heels; but not before the witness had a full opportunity of seeing his face, having a lighted candle in her hand, which, it is to be hoped, will yet shed a retributive light upon this diabolical deed of darkness. In the same town two nail shops have been broken into through the roofs, and several pairs of bellows destroyed, because the two men to whom they belonged were some trifle in arrears of the compulsory black-mail, called "contributions," to the Belper Nail-makers' Union. The police have used every exertion to find out the guilty persons; but such is the terror evinced, that some are afraid to state facts that have come to their knowledge.

The measures necessary for putting an end to the abuses of trades' unions formed the subject of a paper read by Mr. Frederic Hill, of the General Post-office, late Inspector of Prisons, at a meeting of the Jurisprudence Department of the National Association for the Promotion of Social Science, held at 1, Adam-street, Adelphi; Mr. William Overend, Q.C., chairman of the Trades' Unions Commission, in the chair.

is commonly called a "norther," or a steady gale blowing from the northward. The commander of the *Solent* steamed his ship to windward, and hove to for a little time to consult his chart, watch the aneroid, and consider what course to adopt. Finding this valuable and trustworthy instrument, of which there were two for guidance, still falling, and the wind inclined to veer to the westward, from his previous experience under similar circumstances two years ago that month, in the *Havannah*, where the centre of a hurricane passed over his ship, he determined on anchoring about a mile to the northward of Peter Island, so as to have the shelter of that island for the second or worst part of the storm, which he knew would be from the northward. About ten o'clock the aneroid stood at nearly 29.80, after which the hands could be almost seen to move, as the hands of a watch, rapidly falling. The starboard anchor had already been let go, according to the law of storms, the wind veering westerly. The port anchor was now let go, veering to the clinch on the starboard one, and to 75 fathoms on the port. All hands were employed securing boats, furling awnings, sending masts and yards down, lashing everything about the decks, and preparing for a very heavy gale. There was not, however, sufficient time to get down more than the fore-yard and house the main-topmast, before all were called from aloft to secure themselves from danger. The *Conway* had steamed away for anchorage about Reef Island; but the thick haze prevented seeing whether she reached that point. The *Rhone* had been seen making all due preparations to meet the emergency. On board the *Solent* steam was kept ready. At eleven o'clock the *Rhone* was seen rolling heavily at anchor. The storm increased, and at noon was blowing a fearful hurricane, wind steady at N.N.W. $\frac{1}{2}$ W. The aneroid had fallen to 27.95, indicative of 2 in. in the mercurial column in six hours; at 12.15 p.m. it fell a dead calm, with a considerable sea. The aneroid remained steady at 27.95 for the short period of twenty-five minutes (vide diagram) whilst the centre of calm was passing over the ship, when two light flashes of lightning, with indistinct thunder, were seen and heard. These, with the condition of the aneroid and the treacherous calm, warned the captain of the speedy approach of the most-to-be-dreaded part of the storm, though those less acquainted with these terrible visitations might have supposed all danger had subsided; yet he felt it was close at hand, and made further and due preparation to meet the

necessity. The sheet-anchor was got ready for letting go, in case of a cable parting, and the engines were set to the engines to work them with full pressure of steam if necessary.

An awful period of suspense was this dread lull. At 12.40 p.m. it became almost dark, and of a sudden a most fearful and terrific rush of wind succeeded from the S.S.E. $\frac{1}{2}$ E., and struck the ship upon the port broadside, heeling her over nearly on her beam-ends, blowing her fore and main masts and main-top mast out of her; this, though hoisted, went into three pieces, the port cable parting, although running out, when the sheet-anchor was let go, the engines being set going gently ahead, with the helm hard down, to bring the ship's head to wind. The vessel was now a scene of devastation; boats, seats, hen-coops, portions of the masts and rigging, broken skylights, &c., were carried overboard, endangering the lives of those who were at the post of duty during the fury of the elements. Unfortunately, the first and second officers were already disabled. The crew, consisting of blacks, were paralyzed with fear, and ran off deck below for security. The whole duty of now managing this vessel in her sad distress devolved on the captain and third officer, Mr. Duncan, who nobly stood by him, and together they managed to get the helm amidships by means of the relieving tackles, which judiciously had been hooked on ready, the ship now coming gradually head to wind, it being impossible to stand at the wheel from the force of the gale. Already the captain had suffered some severe blows and falls, having been blown down the fore-hatchway, and struck severely in the back by a nine-gallon breaker, which, out of nautical terms, is an iron-bound cask that had been fitted for an anchor-hooy, and came at him like a cricket-ball, throwing him many yards along the deck. After 1 p.m. the barometer began to rise, and about 1.30 p.m. the weather improved a little, but still blew furiously. The engines were kept gently going, easing the cables; and at 2 p.m. the barometer was rising rapidly, the wind still steady at S.S.E. $\frac{1}{2}$ E.

The Admiralty naval agent, Mr. H. W. Burnett, kindly gave his assistance at such a critical juncture, by watching and noting the changes of the aneroids and weather, to which it was impossible the captain's personal attention could be directed at such an hour. The judicious anchorage chosen by the commander, Captain J. M. Gillies, sheltered the vessel from the effects of the heavy sea. The weather gradually improved,

Mr. Hill commenced his observations by remarking that, until the appointment of the present commission, the country had no conception of the amount of tyranny and crime which trades' unions produced; of the thralldom in which a large portion of the best of our artisans are kept; of the harassing and mischievous interference to which employers are subjected; and of the injury to the public generally caused by the crippling of production. He did not, however, intend that this condemnation should apply to all trades' unions, nor to all the proceedings of some of the worst of them. But when trades' unions, not limiting their actions to legitimate ends, applied their power in coercion, whether of fellow-workmen or employers, in very many cases to terrorism, and in some to even maiming and murder, such unions became gangs of criminals leagued together for the establishment of a despotism wholly subversive of law and justice, utterly opposed to the spirit of English institutions, and absolutely intolerable. Under these circumstances it behoved every member of the community to do all in his power to abate this monstrous evil, and to unite in an energetic effort to procure the adoption of those remedies which afforded the best prospect of success.

By three measures—the lien on trades' union funds, so as to make them responsible at law for damage to property or person, the appointment of a public prosecutor, and the adoption of effective means for diffusing a knowledge of political economy, he thought the monstrous evil which they had to deal would soon be greatly abated and brought within dimensions no longer formidable enough to cause national alarm. Amongst the further measures which he would recommend was the appointment of local judges to try all matters not considered of sufficient importance to reserve for the superior courts; an object which might be obtained by giving criminal jurisdiction to county-court judges. His next proposal was to give to the Government such a general control of the police of the country as would secure, where necessary, especially in case of riots, swift and combined action. He would also earnestly repeat a recommendation, which he formerly made, as an inspector of prisons, to be called out whenever the ordinary police was insufficient. And the last measure he would venture to suggest was the appointment of Government auditors, who, on the application of any trades' union, should undertake, on proper payment, to examine the accounts and assets of the concern so as to give an opinion upon their solvency. Were those measures carried out, he thought they would go far to remove the evils which spring from the existence of trades' unions.

A discussion followed the reading of the paper, after which the chairman said he had derived a good deal of experience of the working of trades' unions from the Sheffield inquiry. He had seen a great many of their abuses, but he was nevertheless not blind to the advantages which might exist in connexion with the system. A working man was entirely in the power of his master, who could discharge him or reduce his wages at his discretion; and if, by joining with one, two, three, or more of his fellow workmen, he was enabled to protect himself against injustice, no one could blame him for doing so. It was a perfectly legal and legitimate act, and it was the only way in which, in many cases, men could get an increase of wages, which the masters were too often inclined to depress. Every man or body of men had a right to say to an employer, "We will leave your employment if you do not give us a certain rate of wages;" but unfortunately trades' unions did not stop at that. They sought not only to obtain higher wages for themselves, but they tried to prevent masters from employing others. They did more than that; they tried to prevent non-unionists from working for those masters who did not accede to their terms. His own opinion was that trade unions as at present constituted had a tendency to make their members resort to terrorism and crime for the purpose of enforcing their laws. That, of course, was a state of things which could not be tolerated in a civilised community.

THE METROPOLITAN STREET BARS.—A deputation from the Metropolitan Board of Works have had an interview with Mr. Gathorne Hardy, at the Home Office, relative to bars and other obstructions in the metropolis.

MANCHESTER ARCHITECTURAL ASSOCIATION.

The opening meeting and *convocazione* of the members of this Association were held on the 19th ult., at the Cathedral Hotel; Mr. L. Booth, the president, in the chair. The Hon. Secretary (Mr. A. Darbyshire) read the seventh annual report, which stated that continued success attended the operations of the Association, and during the year twenty-five names had been added to the list of associate members. The introduction of the archaeological and student elements had tended to increase the interest and usefulness of the Association. Papers had been read and discussions had taken place during the session, the principal of which was upon the amendment of the present unsatisfactory form of builders' contracts. The classes for students had been successful and were highly appreciated, and the Association were under great obligations to Mr. Delmar for his gratuitous assistance in the department of anatomical and figure drawing. A very interesting paper had been read by M. Ludwig Oppenheimer, of Vienna. Delegates had attended the meeting of the Architectural Alliance, in London, last September, and the Association had visited the Association in Liverpool, and inspected some of the more important buildings in course of erection there. The annual excursion was to Houghton Hall. The Chairman delivered the annual address and review of the past session. With regard to the competition for the new Town Hall, he said he saw no reason to complain of the manner in which that competition had been conducted. On the contrary, it might well be considered to mark the commencement of a new and improved practice. It was the most sensible and fairly conducted important public competition he had known.

THE ARCHITECTURAL ASSOCIATION.

The ordinary meeting of members was held on Friday evening, the 6th instant, at the Honse in Conduit-street; Mr. R. Phéné Spiers, president, in the chair.

At the previous meeting (held on the 22nd ult.) a resolution was proposed and, after some debate, an opposition, eventually carried, to the effect that it would be desirable to establish a class of honorary members, who should have the same privileges as ordinary members, with the exception of voting and standing for office, and a vested interest in the property of the Association. In order to give effect to this resolution, it became necessary to alter certain of the rules. A motion having now been made to this effect, Mr. R. W. Edis opposed any change in the constitution of the Association, contending in the first instance that sufficient notice had not been given of so material an alteration; next, that the opinion of the last meeting (composed of less than fifty members) could not be considered as a satisfactory representation of the feeling of a society consisting of upwards of 400 members; and that it would be undesirable to admit to the Association gentlemen who, declining to come in on equal terms with the other members, would, in fact, become patrons, and set themselves up superior to the rank-and-file of the Association. He also reminded the meeting that the Association had now among its members not only a Professor of architecture, but several Fellows of the Institute, and that it would be paying them a bad compliment to elect honorary members who would not come in upon equal terms with them. In conclusion, he moved as an amendment, "That no alteration as proposed be made in the rules."

Some discussion ensued, in which Mr. Pumb, Mr. Blomfield, Mr. Blashill, and others, took part; and eventually an amendment to the proposed amendment was moved, to refer the consideration of the subject back to the committee for reconsideration; the president observing that this would be the more respectful course, and that in all probability the question would be "shelved" if this suggestion were adopted.

On a division, however, the latter amendment was negatived. The amendment of Mr. Edis was then put, and carried by a majority of eighteen in a very crowded meeting. The following gentlemen were elected members of the Association:—Mr. Spencer, Folkestone; Mr. F. Edwards, Beckenham; Mr. E. Street, Islington; Mr. F. Fowler, Jun., Braton; Mr. H. Gimlet, Champion-hill; Mr. L. Day, Peckham; Mr. Reynolds, New Coventry-street; Mr. J. Stein, New Cavendish-street; Mr. A. Young, South Lambeth; Mr. A. W. Barton, Purfleet; Mr. James Weir, Great Marlborough-street; Mr. B. Evelyn, Cambridge-street; Mr. Middlemist, Sunderland; Mr. H. Pierce, Camden-town; Mr. Hurst Knight, Dalston; and Mr. W. Mills, Norwood.

A vote of thanks was passed to Mr. Heywood, the architect of the Holborn Valley improvements; and to Mr. Blashill, for his kindness in conducting the members over the works.

Mr. Tall then read a paper on "Concrete Dwellings," and exhibited his apparatus for the construction of walls, &c., in that material. Having explained the various experiments which he had made to perfect his apparatus, he described the manner in which he prepared the concrete, and the proportions of clay, gravel, shingle, slag, brick bars, clinkers, stone chippings, sand, &c., used up according to the

materials to be found in the neighbourhood of the buildings to be erected. In mixing the concrete it would be necessary to add more water in summer than in winter, and not to weaken the cement by putting in either too much sand or too much water. For his own part, he used as little sand as possible, but the best and purest cement he could find in the proportion of one of cement to seven of gravel. A great advantage in the use of concrete was that it did not require the use of skilled labour, with the exception of a single carpenter to superintend the whole of the building. The latter could tell where to put the chimneys and frames for windows and doors, fire-places, &c., as also the blocks for fixing the staircases. With regard to ornamentation, the necessary mouldings for doors and windows could be carried out in a thin coat of cement by aid of a wooden frame, which could be worked with ease and mathematical accuracy. He contended at some length that a concrete house was stronger and warmer than one of brick or stone, and that it did not absorb the moisture which buildings composed of those materials always did.

In reply to questions, Mr. Tall stated that the cost of concrete dwellings, as compared with that of brick and stone, depended upon the description of materials necessary for the manufacture of the concrete in the locality where the buildings were to be raised. In some cases the cost would not exceed one-third that of brick, but the average might be taken at one-half. There would also be a saving in the matter of rain-pipes, &c.

The discussion was adjourned until a future day.

The Chairman announced that on the next evening of meeting a paper would be read by Mr. W. White on "Systematic Proportion in Architecture."

ST. MARTIN'S SCHOOL OF ART.

The prizes awarded to the students attached to this school, as the result of the annual competition, were presented last night in the school-room in Castle-street, Endell-street.

Mr. Baresford Hope, M.P., occupied the chair, and gave the prizes. There were also present Mr. C. Landseer, R.A., Mr. H. O'Neill, R.A., Rev. Mr. Homphrey, vicar of St. Martin's, Mr. T. S. Watson, and others.

The Rev. R. G. Maul (the hon. secretary) made a brief preliminary statement, and observed that he had never met the students with more pleasure, for never had the school come out so well as on that occasion.

Mr. Bowler, the inspector from South Kensington, addressed the meeting, pointing out that the object of Government in establishing schools of art throughout the country was to produce a staff of designers for manufacturing purposes to enable England to hold her place in the markets of the world; but that the preliminary steps in the necessary course of instruction differed in no respect from such as would be taken with a view to acquiring proficiency in pure art.

Mr. B. Hope then addressed the students, turning his observations principally to the case of those who had not carried off prizes. They must not suppose that art-schools were merely places in which gold and silver, and bronze medals were to be won. Let them not degrade their noble study so much as to look at it merely in the light of a horse-race or a boat-race, where the honours were carried off by one competitor, and there was nothing in the shape of recompense left to those who were second in the race.

The commercial use of these schools had been cleverly and clearly pointed out by the preceding speaker, but it was not the whole case. Why was that room so crowded on that occasion? They were not all designers, nor had they all the idea of turning their art-knowledge to pecuniary purposes. Their object, he hoped and was persuaded, was higher than this; and he was so warm an advocate of these schools because, in this grinding, steaming, puffing, express train travelling age—in this age of smoky towns, narrow streets, and much distress, and of hard political debates, they wanted to have some thoughts and ideas above those low material interests. True education implied training as well as knowledge, and could never be considered as having successfully accomplished its purpose unless it left the mind clearer and sharper than it found it. The art-education offered in these schools supplied, to a great extent, the place of the lit-

ANDERNACH CHURCH.

FONT, LIMBURG CATHEDRAL.

It is to be regretted, as it seems to us, that our author has quoted this very weak simile of Mr. Ruskin's. That eloquent writer affords plenty of good things for quotation, but this is surely not of them. There is no likeness whatever between the things compared.

The western towers of Andernach, seen in the view, are noble structures, and there are other parts of the building that will repay careful study. The eastern apse is a capital example. The principal stage has a recessed arcade of seven arches, decorated with a roll moulding, resting on columns, which are much after the Corinthian type in proportion and treatment of capital. The open gallery above has, over each of these, a group of four detached columns, set round a square pier placed diagonally, and between these are two semicircular arched openings on a

pair of shafts coupled in the direction of the axis of the apse. Below is the ordinary tablet band, but unusually plain; and above, a cornice, which, for boldness of projection and richness of detail, exceeds any example, even those at Cologne.

The Font in Limburg Cathedral, our second illustration, is a remarkably elaborate work, at present covered with drab wash. The church, a fine one, is said to date from 1213 to 1242. Limburg, which is on the Lahn, deserves longer time than our author was able, the weather being very bad when the visit was made, to give it.

Two of the most interesting chapters in the book are those devoted to Schloss Elz and Schloss Ehrenburg; but we may not give more space to the subject. Many years have passed since,

trudging the banks of these rivers, sketch-book in hand, we arrived at the opinion now expressed by our author that "the simplicity and good proportions of German Romanesque work, and its effectiveness compared with the cost, as also its evident capacity for a higher development, which it was only prevented from achieving through its being interrupted by the rise of the Gothic style, are points which necessarily impress themselves upon those who examine it." We go, however, further than this.* Let us add, in conclusion, that "Ramblers in the Rhine Provinces" can scarcely fail to advance Mr. Seddon's reputation.

* In studying the works of this period, "An Historical Essay on Architecture," by the late Thomas Hope, should not be disregarded.

MODERN GERMAN CHURCHES.—HERR FRIEDRICH SCHMIDT, ARCHITECT.

Fankhaus Church, near Vienna.

The Lazaruskerk, Vienna.

[See p. 911, ante.

THE CHEAP FOOD MOVEMENT.

The first of several large markets for the sale of provisions which it is contemplated to establish in the various districts of the metropolis has been thrown open to the public. It is situated in the East-end. At a cost of 2,500l. Messrs. McCall, of Hondditch, have erected an extensive building at 272, Whitechapel-road, for the purpose of supplying meat and other provisions to the public at as low retail prices as the wholesale prices will admit of. Good-looking mutton was sold there on Saturday from 4½d. to 5½d. per lb., and beef from 5½d. to 6½d. per lb. Ostend rabbits were exhibited for 6d. per lb., butter from 10d. to 1s. 2d., hams 7½d., fowls from 1s. 6d. to 2s. 6d., tea 2s. and 2s. 4d. per lb., and sugar 4d. to 6d. Boots and shoes were shown equally low in price. The new establishment was extensively patronised.

The Holloway and Highgate Co-operative Society, got up chiefly by Mr. Heine, the chairman, has induced a salesman of Newgate Market to open premises in Upper Holloway, at his own expense and risk, for the sale of butchers' meat at prices somewhat similar to those just quoted.

How is it that a special and co-operative movement has been necessary to correct the competitive "haggling" principle? Tradesmen are themselves deserting the old principles and co-operating to keep up market prices; and the co-operative principle, wherever it has been gone into in earnest by consumers, has forthwith been followed by a speedy tumbling down of these market prices. Some one capable of doing so should make the present and prospective mutual relationship of the competitive and the co-operative principles their special study, and give the public the benefit of their reflections on this interesting subject. Co-operation seems likely to supersede competition altogether. Trades unions of all sorts are co-operative.

ACCIDENTS.

Destruction of a Church by Fire.—A fire has totally destroyed the parish church of Little Ellingham, Norfolk. The edifice had but lately undergone very extensive repairs to the roof, and a new apparatus was fixed for warming the edifice with hot air, and Sunday before last was the first time of its being publicly used. In the evening the roof was found to be on fire, and in a very short time the whole building was in a blaze, and the roof soon after fell in. A new stained-glass window was slightly scorched, and everything in the interior of the building was totally destroyed.

A House Blown Down.—During a recent gale of wind, a house in Ipswich, near "Spider's Hall," at the end of the path branching from the Woodbridge-road to Sidgate-lane, was partially blown down. The house had been built about five or six years.

Fall of a Viaduct.—A wooden viaduct has fallen, it is said, under the weight of a mineral train on the Vale of Neath railway. The alleged occurrence suggests the importance of attention to the state of these wooden bridges and viaducts, which are numerous in the West of England as well as in South Wales. Striding across the valleys and glens of Devon and Cornwall, looking like colossal centipedes on stilts, they give an idea of peril to the most experienced traveller. An engineer once remarked that, although compelled himself frequently to cross them, he would on no account allow his wife and family to do so.

Fall of a Building at Bradford.—Coppo Quarry, at the back of Brunswick-place, Bradford, is nearly filled up, but a chasm, upwards of twenty-four yards deep, is still open at the back of the buildings used as stables and coachhouse. The outer wall of a coachhouse on the brink of the gulf has fallen outwards into the quarry, bringing the roof down with it. There are other low buildings on the brink of this hole, which do not appear to have a very secure foundation.

Fall of a Harbour Shed at Greenock.—The entire framework of the roof and iron pillars, and part of the outside brickwall of the new shed being erected at the west side of Albert Harbour, Greenock, has fallen in. One man was killed, another seriously injured, and a third slightly wounded. A great portion of the wall will require to be rebuilt, and the whole of the frames replaced.

Fall of the Top Stone of a Spire with a Man on it.—A fatal accident, arising out of an act of foolhardiness, has just taken place at Plinznet (Oôtes du Nord). A seaman appeared suddenly outside the clock tower of the church, just as the people were leaving after vespers, and seizing hold of the lightning conductor, climbed up to the cross on the summit of the spire. He then commenced to gesticulate in bravado, when the stone to which the cross was fixed got loosened and fell to the ground, dragging with it the unfortunate man, who was dashed to pieces, having fallen from a height of 150 feet.

SANITARY SHORTCOMINGS IN BATH.

A SERIES of letters which have appeared in the *Bath Chronicle* seem to indicate that there are very good reasons why the city death-returns have not diminished like those of other towns where sanitary improvements have been wisely planned and energetically carried out. Since 1851, as remarked in the *Lancet*, in an article on this subject, there does not appear to have been any improvement in the health of the inhabitants, and the recurrence of epidemic disease has been distinctly shown to have resulted from structural defects of drainage, which, in addition to the practice of sinking cesspools into the porous oolite, have largely contributed to the pollution of the water supply.

The sufferance of slaughter-houses and pigsties in the crowded parts of the town, and the slow progress in substituting iron and stone-ware pipes for the old defective drains, are serious evils, which weaken the defences of the city against the attack of an epidemic. A map, shaded according to the death-rate, shows how remarkably constant is the relation between the greatest mortality and the localities where the slaughter-houses abound.

It was found in 1867 that one-third of Bath was dependent on surface-wells,—a fact which, taken in connexion with the nature of the soil, the imperfect drains, and the frequency of cesspools, becomes of the utmost importance, and helps to an understanding why the death-rate for some years past has averaged 22 per 1,000.

The writer of the letters in the *Bath Chronicle* (Mr. Smeade Brown) complains of the obstacles interposed in the way of reform by the delegation of all power of the Town Council in sanitary matters to a committee which is wanting in a sufficient infusion of the medical element to insure proper thought and knowledge concerning the hygienic requirements of the city. We are glad, however, to observe that among those who objected to the appointment of a medical officer (at 125l. a year, or just 25l. more than the inspector of nuisances, who besides receives a uniform suit of clothing) a more enlightened opinion now prevails. One of the committee last week, at their meeting, said that, although he was one of those who did not feel the necessity of a medical officer at the time of his appointment, he now most cordially rejoiced that they had such an officer and such an office.

PROVINCIAL NEWS.

Hemel Hempstead.—At a public meeting it has been resolved to pull down the remaining portion of the old Market-house, and erect a new one on the site; and the bailiff has been empowered to raise 2,000l. by loan for that purpose. A committee, consisting of ten of the inhabitants has been appointed to act with the bailiff.

Newcastle-upon-Tyne.—The foundation stone of the Abbot Memorial Building for Girls connected with the Northern Counties Orphan Institution has been laid by Mrs. Abbot, widow of the late Mr. John G. Abbot, of this town, on a site a short distance north of Brandling-place, Newcastle. The building is intended by Mrs. Abbot, who gave 5,000l. for its erection, as a memorial of her late husband. This, it may be noted, is a different building from the Abbot Memorial Schools lately noticed in the *Builder*. Messrs. Anstin & Johnson are the architects who have been selected by the committee to prepare the plans of the new building, which is intended to accommodate sixty children. There are to be large and lofty dining-rooms, school, and class rooms, with teachers' rooms, and the usual domestic offices on the ground floor. On the first floor there will be the dormitories, with teachers' rooms adjacent, and

the committee-room and apartments in connexion with it; and above will be rooms for play and other purposes. Hot and cold baths, lavatories, and all the usual appliances will be placed in convenient situations. Externally, the building will present the appearance of a mansion, in the style prevailing in the earlier years of the reign of James I. The principal front will have a gable at either end, having a bay window extending to the height of two stories; and the connecting curtain wall will be pierced by mullioned and transomed windows, a range of dormers giving light to the attic story. There will be a leading bellify, with a hell and vane, over the centre of the building; and an ornamental iron balcony will stretch across the whole front at the level of the first floor. In the rear of the building there will be a covered shed for the children to play under in bad weather. The buildings will be of red pressed bricks, with stone dressings. The grounds around, containing about two acres, will be laid out ornamentally, there being a light-iron palisading as a boundary towards the Town Moor, with walls on the other three sides of the site. The contract for executing the work has been let to Mr. Walter Scott.

CONVERTING A RAILWAY ARCH.

MR. SHEPPARD, provision merchant, having for some time occupied an arch in the south abutment supporting the large girder bridge spanning the main entrance to the London Bridge Terminus, has until lately been put to great inconvenience owing to the limited amount of frontage and height in which to display his goods in comparison with the internal size; and the constant overflow of the water draining from the bridge above running down the coloured cement work of the front imparting to it a dingy streaky appearance, and toning down the whole, so that it was a difficult matter to distinguish the shop front from the surrounding mass of dead wall. To remedy these defects, and to extend the frontage (so as to include two show-cases previously made within its limits), a façade of wood has been erected, giving a much holier appearance. To overcome the effect of the large extent of dead space surrounding the limited and stunted appearance of the old front, the whole has been treated in rather an exceptional manner. The line of arch in the old front forms the centre of the composition, and is supported on each side by circular-headed bays, with facias, cornices, &c., to enclose cases; the arches of bays are supported by carved panels,—the springings being on a level with the transom of the shop front, and the tympani filled in with plate-glass. The arches are enriched with cable moldings, and spring from engaged columns with carved capitals and polished mahogany shafts. An arading, with shafts as before, and with a background of decorated glass, is placed above the bays ranging with the crown of the main arch, and the whole surmounted by the main facia and cornice. In the decoration Pompeian green and buff are used for the main ground work, and relieved and picked out with positive colours. Mr. Emor is the contractor; the decorations were done by Messrs. Cowtan; and the carving is by Mr. Forsyth. Mr. C. N. McIntyre North was the architect.

DURHAM CATHEDRAL.

The western window of this cathedral has been filled with stained glass by Messrs. Clayton & Bell, at the cost of Dr. Waddington, the Dean of Durham. In the window, which is of seven lights, with foliated tracery in the head, both the ancestors and forefathers of our Lord are represented; the figures in the lights being twenty-one in number, or three in each light. Jesse occupies the lowest place in the centre light, and from his body spring branches of foliage, which, entwining themselves throughout all parts of the window, form, as it were, a framework in which the figures are placed, that immediately above Jesse, and those in the two lights next the centre, being kingly ancestors of our Lord, and those in the four outer lights being prophets who foretold Him; while in the top of the centre light He is represented sitting in His Mother's arms. Above, in the topmost portion of the tracery, is the "Agnus Dei," with adoring angels on either side, while below on the left is the "Annunciation," with figures of the Virgin Mary and St. Gabriel, with

the Dove descending upon her, and on the right the "Adoration of the Magi," with figures of the three kings presenting their offerings to the Infant Jesus, the "Star in the East" being figured in the opening above. Below these groups, and immediately above the twenty-one figures before mentioned, are four angels censuring. The ground-work of the lights is alternately a rich blue and ruby, while the foliage and great part of the figures are either white or of very light colours, thus taking away any tendency to heaviness of tone. The work has been carried out under the superintendence of Mr. C. Hodgson Fowler, architect.

THE LATE HURRICANES.

THERE has been a singular succession of hurricanes, cyclones, or typhoons of late throughout the world, accompanied with earthquakes and volcanic eruptions. By the terrible cyclone which recently occurred in Bengal, 1,000 lives have been lost at Calcutta alone, 30,000 native huts destroyed in the suburbs alone of that city, and 600 native boats and numerous ships destroyed in its vicinity. The crops of rice, jute, &c., in Bengal, too, have been sadly injured. Since the hurricane took place at St. Thomas's two earthquakes have occurred there, and it is believed that there was an earthquake during the hurricane. There have, within a short time, been more than one volcanic eruption in the ocean, and Vesuvius is in a highly active state. The recent severe gale in England is said to have been really a cyclone quite similar in its nature to that which has just passed over India. Professor Brande describes these destructive storms as follows:—

"Rotatory storms or whirlwinds, occur in the tropical seas of China, the West Indies, and round Mauritius, but never on the equator. Their diameter is generally about 200 or 300 miles, but sometimes exceeds even 500. The centre of the vortex (which is always calm) travels at a rate varying from two to thirty miles an hour. These storms are preceded by a singular stillness of atmosphere and a rapid fall of the barometer. They are, perhaps, the most destructive of all storms."

The question is an interesting and an important one, whether there be any essential connexion between hurricanes and earthquakes. It is not the first time their occurrence has been simultaneous, or nearly so.

THE INSTITUTION OF CIVIL ENGINEERS.

On December 3rd, the first paper read was—"Description of the Victoria Bridge, on the Line of the Victoria Station and Pimlico Railway," by Mr. W. Wilson.

It was stated that this bridge crossed the River Thames about 150 yards to the eastward of the Chelsea Suspension Bridge, at a point where the width of the water-way between the embankment walls was 740 ft. It consisted of four segmental wrought-iron arches, each having a span of 175 ft. at the springing, with a rise of 17 ft. 6 in., and a clear headway of 22 ft. above Trinity high-water level. At the northern end there was a land opening of 70 ft. span crossing the Grosvenor-road, and on the southern shore there was a corresponding opening of 65 ft. span, crossing the wharfs of the Brighton Railway Company.

In the first place, the gravel was dredged out of the bed of the river, down to the clay substratum, for a breadth of 100 ft., and extending across the entire width of the water. Cofferdams, constructed of two rows of whole timbers, waled and strutted in the usual manner, were then driven 4 ft. below the level of the intended foundation. When the inclosed area was cleared of water, the clay was excavated to a depth of 40 ft. below Trinity high-water level. The space to be occupied by the foundations was next surrounded by permanent sheet piles, driven to a depth of 8 ft. below the lowest foundation level. Within this sheeting a bed of cement concrete, 4 ft. in thickness, was formed, and on that the masonry of the piers was commenced, the concrete being afterwards carried up to the top of the sheet piles round the entire circumference of the piers. From the footings up to the level of 4 ft. below low water, the piers were built entirely of brickwork in lia mortar. Thence to high-water level they were faced with rock-faced Portland roach stone, with one through course half-way up. The core, or backing, was com-

posed of pavior bricks, set in lia mortar, and the cutwaters, caps, springers, and other masonry above high water, were of tool-dressed Bramley Fall stone. The width of the piers at the springing line was 12 ft. 4 in.; and from the extrados of the arch to the level of the cornice, the width was 10 ft.

The superstructure of each of the four principal openings consisted of six wrought-iron arched girders, springing from cast-iron bed-plates fixed to the masonry. Horizontal girders, resting on the piers and on the abutments, and riveted to the arch near the crown, formed the longitudinal bearers for the roadway. The spandrels, or intermediate spaces between the arched ribs and the horizontal girders, were filled in with a wrought-iron framework radiating from the arch; and between the horizontal bearers cross girders, for carrying the roadway, were fixed at distances averaging about 3 ft. apart.

The total cost of the bridge, including the land arches and abutments, was about \$4,000. The superficial area of the roadway, between the parapets, being 31,690 ft., the cost per square foot was 2s. 13s.; while the total length being 930 ft., the cost per lineal foot was 45s. 3s. Only twelve months were occupied in the erection of this important structure.

The works were designed by Mr. Fowler (President Inst. C.E.), and were carried out under his supervision by the author. Mr. John Kelk, M.P., was the contractor, and the ironwork was sub-let to Messrs. Bray & Waddington; the wrought-iron work was supplied by the Monkbridge Iron Company, and the cross-girders and angle-irons by the Buttery Company.

The second paper read was, "On New Railways at Battersea, with the Widening of the Victoria Bridge, and Approaches to the Victoria Station," by Mr. C. D. Fox. These works, which were three years in progress, comprised a length equal to nine miles of double line, of which five miles were on a viaduct, and had cost for works only, including the bridge over the Thames, the sum of \$10,000. The high-level line of the Brighton Company, which was entirely on viaduct, had cost, including permanent way, stations, and signals, and the numerous heavy bridges, 45l. per lineal yard of double line. The whole of the works had been executed from the designs and under the superintendence of Sir Charles Fox and the author; Mr. Edmond Wragge being the resident engineer. The contractors were Messrs. Peto, Betts, & Cramp-ton, Messrs. Lucas Brothers, and Messrs. W. & J. Pickering; Mr. J. Heywood, jun., executing the ironwork for the Brighton Company.

FROM SCOTLAND.

Edinburgh.—St. John's Episcopal Church is a structure erected in 1819, from the design of Mr. Burn, in the Perpendicular style of Gothic. For some years past it has been in contemplation to add to the accommodation and embellish the interior, and several leading architects have been applied to on the subject; but from the position of the building it has been found impossible to extend it except at an enormous cost. Some slight alterations have now been effected upon the exterior, and the interior has undergone a complete overhauling. The interior was fitted up with very high pews, covered with green baize, two small galleries flanked the altar, and a large gallery occupies the west end. The galleries at the altar have been entirely dispensed with, the high pews have been replaced by open benches of oak with carved poppy-head terminals, and the front of the west gallery has been considerably lowered. A reading-desk, of the old fashioned oambrous sort, has been swept away, and three stalls and reading-desks have been placed within the altar-rails, the space enclosed by which has been greatly enlarged. A new pulpit of oak, in keeping with the other features, has replaced one with an open canopy, not of the most elegant design. A reredos, it is expected, will also be provided. The walls have been lined with oak panelling to a height of 5 ft., and the space above and the ceilings decorated in colour. The wall decoration is far from satisfactory; upon a groundwork of stone colour an oblong pattern has been drawn in double lines of red, suggestive of brickwork. The ceiling of the nave, which is of mock fan-bracing with pendants,—as in Henry VII.'s Chapel at Westminster,—has been treated with a deep blue background, the moldings and pendants being brought out with gilding; the

shafts which run up the clearstory walls have red lines run up alongside them, and their caps are gilt. The aisles are treated in a similar manner, and the foliated capitals of the pillars are solidly gilded. Messrs. Peddie & Kincaid were the architects employed, and the decorations were done by Messrs. C. & J. Maxon.

A CISTERN FOR ROOF.

I AM delighted, as one of the public and a constant reader of yours, with the article at page 847, "On the Storage of Rainwater." Non-professional and ignorant as I am of the art of building, I have for many years entertained and pressed upon the attention of practical men the notion of forming the roofs of houses and buildings, generally, of cisterns for the collection and storage, and the simplest mode of distribution, for domestic and other services, of rain-water. In these days of iron so easily and cheaply worked into any form, why not substitute for slate or tile roof a cistern—say, from 12 in. to 24 in. deep,—with partitions, and having a roof of thin zinc, with a small incline from the ridge curled up at the edge or eave into a half circle, and perforated so as to lead the water into the cistern? Empty, a sufficiently stout cistern would be much less in weight, and would surely cost much less than an ordinary roof; and, when full, even the weight, I presume, would not be more than the walls of a well-built house would or ought to support. I will not bore you with any attempt at further details; but I must add, how pleasant it would be to have an abundant supply of soft rain-water in every room in the house by merely the turning of a tap. With a cistern for a roof a horse would be cooler in summer and warmer in winter, and in winter might be kept from freezing by a small steam-pipe from the top of the kitchen-boiler. A. Z.

THE GREAT BELL OF ST. PAUL'S CATHEDRAL.

In searching for materials with a view to compile an accurate account of remarkable bells, I have discovered many palpable errors in our topographical and other works, and am led to conclude that but very few books contain any trustworthy information on the subject.

Here is an extraordinary mistake, which ought at once to be corrected. It has been stated, over and over again, by numerous writers, from about the middle of the last century down to the present day, that the diameter of the great bell of St. Paul's is 10 ft.; whereas it is only 6 ft. 9½ in. We are further told that the bell was cast in 1716, and that its weight is 11,474 lb. The fact is, it was made in 1709, its weight being 11,648 lb., or 5 tons 4 cwt.; and it bears the following inscription: "Richard Phelps made me, 1709."

I may take this opportunity to mention that it has also been often asserted that the present great bell at St. Paul's was brought from Westminster, and that on a certain occasion the Cathedral clock struck thirteen upon it instead of twelve, at midnight. Now, this is altogether false. The bell came not from Westminster, but from the Whitechapel foundry. Nor did St. Paul's clock, which was made by Langley Bradley in 1708, ever strike thirteen times in succession, so far as is known.

Again, some persons say the present bell was cast "out of the metal of 'Great Tom' of Westminster." But this is likewise a fiction, as I will endeavour to show. It is true that a bell, which, from the reign of Edward I., hung in the clock-tower then standing opposite Westminster Hall, and which was at first known as "Edward," and afterwards as "Great Tom," was taken down and removed to St. Paul's about the end of the seventeenth century. That bell, however, was subsequently cracked, and then re-cast by Philip Wightman; but it proved so faulty that Richard Phelps was employed to make one of new metal; and this bell, on which the clock now strikes the hour, was delivered at the Cathedral before Wightman's bell was removed from that edifice. (See Sir Christopher Wren's "Answer to a Pamphlet entitled 'Frauds and Abuses at St. Paul's.'" 1712. See also "Fact against Scandal." London, 1713.)

With reference to the popular tradition, that a soldier whilst on guard at Windsor Castle, during the reign of William III., solemnly de-

clared that he heard the clock of St. Paul's strike thirteen instead of twelve, at midnight, and thus saved his life, when he was accused of sleeping upon his post, I will only say that the sentinel must have spoken of "Great Tom, at Westminster," for St. Paul's Cathedral had not then any public clock or large bell.

THOMAS WALESBY.

MOULDY SUBSTANCES IN ROOMS.

It has long been known that the presence of moulds in rooms is highly injurious to human health; and under certain conditions of dampness and bad ventilation it is no uncommon thing to see mildew run all over a large expanse of white-washed wall or ceiling. If this mould occur in a living room, and it be not destroyed, it frequently brings on a complication of painful symptoms in the human patient, or, in other words, the membranes and tissues of the body are known to offer a fitting habitat for the plant, and it is transferred from the original objects to the human frame. A weak solution of hypochlorite of lime has recently been recommended as a destroyer of moulds in rooms, and as their growth is both common and rapid in this country in damp and ill-ventilated situations the remedy is worth a trial.

R. S.

AN ADVERTISED COMPETITION: A WARNING.

Sir,—Two or three weeks ago an advertisement appeared, inviting architects to compete for a warehouse in Leeds, and stating that a plan of the site would be forwarded in a few days.

In consequence of what I heard, I requested a friend in Leeds to make inquiries; and he informs me that he can find no such firm as Messrs. Baxter & Co. (whose name appeared at the foot of the advertisement) at the address given.

G. E. G.

GIBRALTAR WATER SUPPLY AND FLUSHING.

Sir,—It is a mistake to suppose that labour and materials are much, if at all, in excess of English prices. In a place in which there are kept upwards of 5,000 soldiers in comparative idleness, there are several hundreds of skilled labourers, of numerous callings, who can be employed, as in laying down the gas-pipes, at 5d. or 1s. per day. Materials are chiefly on the spot, and can be obtained in the usual "Gibraltar way." A large profit will remain to THE CONTRACTOR.

COAL-PLATES AND GLASS FLOORS.

ALL I desired to say was, that glass, without being properly supported by an iron frame, was unsafe. Quite admitting the force of your note, that light is often very desirable, another question arises as to the position of coal-plates: are these necessarily to be in the centre of a footway; or could not proper shafts be easily constructed on side of footway, or clear of the same altogether? For the deplorable accident at the London, Chatham, and Dover Railway, from plate-glass flooring without adequate supports, let me caution and advise great care in the use of glass for floorings in interiors: as a roofing it is all that can be desired.

"CAVENDO TUTTI."

NOVEL MODE OF SELECTING AN ARCHITECT.

Sir,—At a meeting of the Board of Guardians of the Hoxton Union, held on the 25th ult., the following novel method of selecting an architect was adopted:—The names of three gentlemen practising in Oxford were written on separate pieces of paper, folded, and placed in a hat, and the one chosen whose name came out first.

I think, sir, this is a fact which should be known to the profession, not because shabby treatment of architects by public boards is uncommon, but because nothing but public exposure will convince such people that gentlemen practising in a profession deserve to be treated as gentlemen, and that such a use of their names is unjustifiable.

T. T. C.

WATER-PIPES IN FROSTY WEATHER.

A CLIENT has suggested to me the following plan for averting the miseries of hursting water-pipes:—He would insert in each service-pipe a small India-rubber tube, the idea being of course that the expansion of the water in freezing would be accommodated by the collapse of the internal tube instead of by the bursting of the enclosing pipe.

It is obvious that there is a limit to its application, for with certain lengths of pipe, and consequent pressure, the tube would be permanently compressed; but I should be glad if some of your scientific contributors would give their consideration to this suggestion for doing the public an appreciable service.

E. CROSS BELL.

*Another correspondent suggests, that under special circumstances, very small pipes containing water and returning to a boiler, might pass through the larger pipes and into cisterns.

THE LANGHAM HOTEL.

Sir,—I regret to trouble either you or your readers with any further notice of my action against Mr. Giles; but that gentleman, in his letter to you last week, states as he alone planned the building, so far as the basement, ground, and first floor were concerned, he retains these plans. This I am pained to say, is simply untrue. The above-named plans are the original working drawings furnished by myself for the erection of the building, and are signed the number ordered by the judge to be delivered over to me. Mr. Giles alleges I used influence with the directors. I neither knew nor had ever spoken to one of them; but I certainly felt I had a claim to be employed, after so eminent an authority as Mr. Sydney Smirke (who had been called in to advise the directors) recommending my designs to be adopted.

JAMES MURRAY.

* We have also a letter from the defendant's solicitor, contradicting the plaintiff's solicitor, but must decline to insert any more communications on the subject. A strange confusion of ideas seems to prevail.

RAILWAY MATTERS.

SOME damaging statements as to the Metropolitan Railway have appeared in the *Money Market Review*. The following figures are given as showing for the last seven half-years what the proportion of the net revenue has been to the dividends and interest paid:—

	Half-years.	Net revenue.	Dividends and interest paid.
December, 1864	£33,369 £28,950
June, " "	45,330 32,290
December, " "	52,290 36,520
June, 1866	68,104 47,249
December, " "	68,123 45,060
June, 1867	78,293 45,400
Estimated for Dec., 1867	75,000 46,000

Thus nearly half the dividends and interest on an amount of capital hitherto comparatively small has been paid out of capital in some form; and our readers will form their own judgment what proportion the traffic of the suburban Western Extension will bear to the necessity which will arise, when it is opened, for paying all dividends out of revenue, and that, too, on a larger amount of capital than has hitherto come in for dividend, whether from revenue or capital.

Estimating, however, the net surplus for the current half-year as above, at 75,000, the charges will stand as follows:—The interest on loans, including the paid-up proportion of the 600,000 new loan, amounts to 37,500, and the preference to 7,500, in all 45,000. This would leave a balance of 30,000, to pay dividend on 3,700,000 of ordinary stock.

If incorrect, this should be set right. If correct, it is time for the shareholders to look about them.

In reply to a question put by Lord Stanley of Alderley, the Duke of Richmond has stated that experiments had been made on different lines of railway, with a view to the establishment of a system of communication between guards and drivers. Those experiments would be continued during the winter, and the results would be laid before the Board of Trade, who would endeavour, if possible, to carry out the object they had in view.

CHURCH-BUILDING NEWS.

Worcester.—The parish church has been re-opened after its restoration. Last year the restored chancel was thrown open, and during the interval the restorations have been carried on throughout the whole of the church. By this means it now fairly indicates its original thirteenth-century features, in details which have long been hidden through had taste and neglect. Among these details, an ancient crypt, supposed to have contained the remains of the founders of the edifice, is prominent. It was, until these restorations were fully carried out, hidden by pews. The latter have been removed, so as to disclose a portion of the windows which lighted the crypt from the outside, as well as the interior arches, sixteen of which were originally built. Contrary to usual custom, the crypt was above the level of the floor. Over the arches now disclosed are two monumental figures, supposed to represent the founders of the church, whose remains are supposed to have been disturbed in the places beneath, for the sake of the lead of which the coffins were made. The crypt is in the north transept. The floor here is covered with seats, placed on a level with the remainder of the building. To show the remainder of the old arches and windows would entail an expenditure of about 200l., but would much increase the interest of this very interesting portion of the church. In the south transept the restorations have been carried out in a similar way, and exhibit some fine old window tracery, before concealed behind a thick coat of stucco. An interesting specimen of wall painting was by the same means kept in the dark till the present restorations displayed it. The large west window of the nave is no longer blocked out of view from

the inside by the sloping organ-gallery which latterly disfigured and completely hid this window from sight within. In making this restoration cart-loads of dust, the accumulation of centuries, were removed by the contractor (Mr. Groves). The re-pewing of the church now gives accommodation to 1,000 persons; formerly, only 860 could be located. The building is properly warmed by Haden's apparatus, combining the warm-water pipe system with that of hot air in flues. The cost of the chancel, heating apparatus, and other necessary additions, together with the commission of the architect, Mr. G. E. Street, is about 1,000l. Mr. Groves's estimate for the other restorations was 4,000l.

Haverhill.—The church here, after restoration, has been re-opened for divine service. The edifice was in a lamentable condition, and the old pews and square family boxes were not at all economic of space—a much greater number of far more comfortable sittings being now contained in the same area. All the woodwork of the church, including the roof and the framing in the tower for the bells, was destroyed by fire about 1655, when the greater part of the town, with the adjoining parsonage-house, was also reduced to ashes. This disastrous fire cracked and rent the walls in many directions, and funds are much needed to restore the tower, which is still in a very unsafe condition. Lord Churchill gave timber enough to repair the church, which was then patched up, and so remained until very lately, when the inhabitants determined to restore it as nearly as possible to its former condition, and employed Messrs. Elmslie & Francis, of Westminster (the architects of the cemetery, chapels recently erected at Haverhill), under whom the work has been carried out by Messrs. Mason & Green, of Haverhill, builders. A gallery at the west end of the nave has been removed, and the organ refixed in the chancel aisle. The new panelled ceiling of the nave and chancel roof has been decorated and painted by Messrs. Heaton, Butler, & Bayne. The entire cost of the restoration has been about 2,500l.

Louth.—Mr. Charles Clark's tender for taking down the old porch and building a new one to the parish church, according to the plans made by Mr. R. J. Withers, architect, has been accepted. The following tenders were sent in:—Mr. Ryall, 515l.; Mr. Muxey, 482l. 5s. 6d.; and Mr. Clark, 443l. The sums are exclusive of carved stone-work, painted windows, iron gates, &c. The whole cost will be borne by Mr. C. Parker.

Husband's Bosworth (Leicestershire).—The parish church of Husband's Bosworth, Leicestershire, which has just undergone a restoration, has been re-opened for divine service. The works which have been executed under the present contracts are as follow:—The elliptic arches of the arcade have been removed, and a series of Gothic arches, with clustered columns, now occupy their place: these arches are for the most part executed in Bath stone, the arches having alternating portions of Kenilworth red stone; the caps of the pillars are carved, each pillar varying, but all having natural foliage, with slightly conventional stems. One of the easternmost caps is the passion flower in clusters, the other the rose. The other six caps are, respectively, the ivy, the oak, the geranium, the baywort and convolvulus, the artichoke, and the pop. These arcades and pillars have been introduced without disturbing the roofs or the clearstory walls. The aisle roofs have been improved by the introduction of additional timbers and corbels, and the nave roof, which was very sound, but of the meanest character, has been caued. Spandrel piers and corbels have been introduced against the wall under the tie beams, and the ceiling decorated with stencilling, by Lee, of Lutterworth. New stone windows of Decorated character have been introduced throughout the church, the tracery of each varying in design. Four of these have been filled with stained glass as memorial windows. The body of the church has been re-seated with low open seats, executed in pitch pine, all facing the east. The boundary wall of the churchyard has been rebuilt, and new gates have been placed at the south entrance. The promoters of the work and the architect were desirous of carrying the works further, by the reconstruction of the present modern porches, the restoration of minor portions of the stonework. These, together with other works necessary to be done before the whole structure can be said to be completely restored, are unavoidably postponed. The cost of the restorations, including those executed in 1861, and the chancel, will be

about 2,500l. The works have been carried out from designs and under the superintendence of Messrs. E. F. Law & Sons, architects, Northampton; and have been executed by Messrs. Law & Sons, builders, Letterworth.

Grittleton.—The north aisle of this church has been re-opened for divine service. Two years ago, Sir John Neeld, bart., M.P., restored the tower and nave and rebuilt the chancel; and this year he has completed the work, and rebuilt the north aisle. The designs were by Mr. A. Blomfield, and the work was executed by masons and carpenters in the locality. There have been five Early English windows inserted, three in the north wall, and one in the east and west respectively. A high-pitched roof has been divided into bays by ribs, the bays being boarded in the inside of the rafters, and the ribs springing from corbels upon the walls. The old seats have been cut down, and the panelling reworked into low open seats. The organ, which previously stood in front of the west window, has been considerably lessened, and is now placed against the north, admitting a great increase of light. The walls are faced inside with hammer-dressed freestone, pointed, and left without plaster.

ROMAN CATHOLIC CHURCH-BUILDING NEWS.

Chester.—The ceremony of consecrating a new Roman Catholic chapel in Chester has been performed, with the usual ceremonial. The new edifice is attached to the Deo House Convent of the "Sisterhood of the Faithful Companions of Jesus," and is intended for the use of the inmates of the convent, and the members of the Roman Catholic persuasion resident in the immediate vicinity. The building is from the design of Mr. F. Kirby, formerly of Chester, but now of Liverpool.

Attercliffe.—The foundation-stone of the new Church of St. Charles (of Milan) has been laid at Attercliffe. The church is intended to supersede the present mission chapel, and stands on a plot of land near Heppenstall-lane, the gift of Mr. Wake. The Duke of Norfolk has contributed 500l. towards the work, and Mrs. Wake and family give a like amount. The church is estimated to afford accommodation for 400 persons. The site lies to the left of the turnpike road near to Heppenstall-road, on a piece of land which is being laid out for streets. The church will be built entirely of stone, in the Gothic style, the west front presenting a lofty gable, with two two-light tracery windows, between which a deep buttress is formed into a canopied niche, containing a figure of St. Charles, and is continued upwards to support a bell-turret over the centre of the gable. There are two side porches, baptistry, transepts, chancel, two sacristies, &c. All the floors are laid with encaustic tiles, except where boarded for seats. All the woodwork inside is varnished, and the roof decorated. A house for the resident clergy is included in the contract, and schools are to be built immediately after the completion of the church. The buildings will together form a large group. Mr. John Milner is the contractor, and the estimated cost is 4,700l. The architects are Messrs. Innocent & Brown, of Prior-court.

STAINED GLASS.

Kington Church.—The window at the west end of the nave of this church has been filled with stained glass by Messrs. Clayton & Bell. This window, at the restoration of the church, was filled with fluted white glass, but the light was obstructed from entering by the organ and gallery being placed directly in front of it. Upon the removal of the organ this window was thrown open to the church. The window is a four-light one, of the Early English style. The window contains representations of the four great prophets, Isaiah, Jeremiah, Ezekiel, and Daniel; also of the four evangelists, Matthew, Mark, Luke, and John. In the two centre parts above there are representations of two angels, bearing scrolls containing the word "Sanctuary," repeated three times. The groundwork of the window is of a cream colour, filled up with white tracery work. The window is given by Mr. Arthur H. Wall, of Burghill House, near Hereford, in memory of his father, the Rev. J. Wall, late vicar of this parish.

Barlestone Church, Leicestershire.—An east

window for this church has just been completed. In the tracery and upper compartments of the window are the emblems of divine power and dominion. Emblems of Divine Providence are introduced in the crockets and in various parts of the tracery, &c. The subject of the left-hand opening is Mary Magdalene in the house of Simon, at the feet of our Saviour. The centre opening represents the descent of the Holy Ghost in rays of fire, and in the likeness of tongues. These proceed from the Cross (which is surmounted by a rainbow of three colours). The subject of the right-hand opening is our Saviour's charge to Peter, after His Resurrection. Above these subjects are canopies with crockets, in harmony with the general design of the window. The window on the south side of the chancel has also been filled with stained glass. The subject of the right-hand opening of this window is the example of Jesus Christ in His works of mercy. The left-hand opening represents the Good Samaritan. These subjects are surmounted by floriated canopies; and in the upper compartments an Angel of Mercy, with tracery. The glass in both windows was designed and executed by Mr. William Holland, of Warwick.

Thornthwaite Church, near Harrogate.—A two-light stained-glass memorial window has been erected in this church. The subjects, which are represented in panels, under canopies of the Early English period, are "The Good Samaritan," and "The Acts Deeds of Dorcas." The artist employed for this work was Mr. J. W. Knowles, of York.

Trinity College Chapel, York.—A stained-glass window, executed by Mr. J. W. Knowles, of this city, has been recently erected in this chapel, as a memorial. The subjects are "Christ blessing little Children," and "Christ teaching Humility." These subjects are depicted in panels, above which are canopies of the Decorated period. The tracery is filled in with ornamental work of the same period.

Durham Cathedral.—It has been decided that the *Deo Devon* window in this cathedral shall be filled with stained glass, in memory of the late Archdeacon Thorp. The work will be done by a London firm, the estimated cost being 600l.

St. John's, Turncroft, Over Darwen.—Several stained-glass memorial windows have just been erected in this church. The windows erected are three in number, having two lights each, in the apsidal chancel, and the south transept window containing four lights, and several tracery openings. Besides these, the north transept window, also having four lights, but larger than those in the south transept, and two small windows of two lights each, in the north-east chapel, have been filled with stained glass by the Rev. P. Graham, at his sole expense, the whole forming a memorial of his late wife. The windows have been made by Messrs. Lavers & Barraud, of London and Manchester. The work is treated more in a modern than in the old conventional style. The three windows in the apse contain subjects illustrative of the life of our Lord, in the following order, arranged in two tiers, so that each window contains four subjects:—The Annunciation, the Nativity, the Offerings of the Wise Men, the Presentation in the Temple, Our Lord among the Doctors, the Baptism in the Jordan, the Sermon on the Mount, the Transfiguration, the Agony in the Garden, the Crucifixion, the Resurrection, Our Lord's Appearance after His Resurrection to the Two Disciples at Emmaus. These subjects are placed in canopies on a ground of mosaic, and in the tracery above the centre window is the Lamb, and above each of the side windows an angel. The north transept window has figures of four holy women in the Old Testament, viz., Sarah, Hannah, Ruth, and Queen Esther, under canopies. In the large tracery opening is a representation of Our Lord bearing His cross, attended by the holy women, to Calvary. The south transept window has figures of four holy women of the New Testament, viz., St. Mary the Virgin, St. Mary Magdalen, Dorcas, and Eunice, also under canopies, with an angel in the tracery, bearing a scroll with the word Alleluia. The subjects in the two windows in the north-east chapel represent instances of faith and devotion in women, and are as follow:—Our Lord in the house of Martha and Mary at Bethany, Mary sitting at His feet and bearing His Words; Our Lord teaching the Woman of Samaria at Jacob's Well; the Syro-Phœnician woman entreating Our Lord to heal her daughter; the woman with the issue of blood touching our Lord's garment.

Holy Innocents', Liverpool.—A memorial window has recently been erected in the Church

of the Holy Innocents, Myrtle-street. The design is intended to illustrate the verse in the 90th Psalm, "In the morning in flourisheth and growth up; in the evening it is cut down and withereth." It consists of two landscapes. In the background is a range of mountains. One compartment represents a palm-tree in full vigour, and a parterre of flowers in luxuriant growth and beauty, where the lily stands conspicuous. On the other half is a leafless tree, and the same flowers cut down and withered. In a small lozenge-shaped compartment, which forms the apex of the arch, is a copy of Titian's "Ascension of Our Saviour." The whole was designed and executed by a Liverpool firm.

Hereford Cathedral.—Eight windows have just been filled with stained glass in the Lady Chapel of this cathedral, in memory of various members of the family of the late Canon Morgan. The artist has designed these windows in accordance with existing examples of the thirteenth century, for at that period this chapel was built. The new windows are of the mosaic class, composed of a multitude of small pieces of every possible colour. They are treated with the utmost variety of patterns and shapes of medallions consistent with the style of the architecture. Each window consists of three medallions, divided by a rich pattern or boss: the whole is surrounded by a border, and an inscription in Old English forms the base of each light. The whole of the eight windows have been fixed with iron rods and cement, and protected externally with galvanized iron guards. Two of the windows are made to open without interfering with the patterns or subjects. The artist was Mr. Gibbs.

SCHOOL-BUILDING NEWS.

Kingstead.—The architects of the school recently opened here were Messrs. Wadmore & Baker, of Great St. Helen's. In these schools earth-closets have been fitted up: we shall be glad to hear how they answer, after they have been some time in operation.

Bootle.—New National Schools, in connexion with St. John's Church, have been opened with a bazaar, in aid of church repairs. The building just completed contains accommodation for 600 scholars. The infants' school is a room with open timber roof, 58 ft. by 25 ft., and 30 ft. high to the ridge. The boys' and girls' school-rooms are each respectively 59 ft. 6 in. by 20 ft., placed side by side, and 16 ft. 6 in. high. The whole are so arranged that they can be thrown into one for public meetings, with a clear and uninterrupted view from every part. There are five large class-rooms, two lavatories, and all the other necessary accommodation, with separate entrances for each section. There are two good-sized play-grounds, containing 326 superficial clear yards each. The contract for the schools was 1,900l., and carried out by Messrs. James Burroughs & Sons, under the superintendence of Mr. James N. Croft, of this town, architect. We may here mention that a new parsonage-house has also lately been completed in Balliol-road, in connexion with St. John's Church, and in which the same architect and contractor were employed.

Taunton.—St. Mary's Central National Schools, Taunton, have recently been completed. They are situated in the street to the south side of St. Mary's Church. Some old school-buildings existed on the same site before. The new schools comprise, on the ground-floor, a boys' school, 40 ft. by 32 ft. 6 in.; infants' school, 36 ft. 6 in. by 19 ft.; and class-rooms for the latter, 21 ft. by 17 ft. 6 in., with separate play-grounds for the boys, girls, and infants, with covered corridors, hat and cloak rooms, &c. On the floor over the infants' school and class-room are respectively placed those for the girls. There are no rooms over the boys' school, which has a stained fir roof, open to the rafters. The front to the road is the only side of the building brought into prominence, as houses adjoin the school at the two ends. The boys' school has a gable towards the road, with a large five-light window, having transome and plate-tracery head. Its roof is surmounted by a bell-turret set diamond-wise, and covered with cleft oak shingle. The girls' school has two dormer windows, of somewhat similar character to that for the boys'. The general material of the walls was local stone, with Ham-hill for the window and door dressings, &c. The total outlay amounted to about 1,500l. The works have

been carried out by Mr. Henry Davis, of Taunton, builder, under the superintendence of Mr. Ferrys, of London, architect.

Westminster.—An important addition has just been made to the Wesleyan Training College, Horseferry-road, in the shape of a new wing, comprising thirty bedrooms; lecture-hall, 60 ft. long by 27 ft. wide; gentlemen's day-room, same size as lecture-hall; two spacious class-rooms; and book-room, on basement, for the supply of books to this and kindred institutions. The building is of picked stocks, with plain Gothic Bath stone windows, and occupies a frontage of 93 ft. in New Peter-street, Horseferry-road. The entrance is, however, only obtained through the College; a new York-stone staircase, giving access to both old and new buildings. The desks throughout are arranged for two students only at each, and the masters can readily gain access to every student without the usual objectionable mode of passing behind the seats. The building throughout is warmed with hot water, and lighted with gas. Ornamental star-lights are used in the lecture-hall, day and class rooms, with very good effect. The cost of the whole is about 7,000*l.* Messrs. Wilson & Wilcox, of London and Bath, were the architects; Mr. Hobson, of the Adelphi, was the builder.

Newport (Salop).—New schools have been opened at Salter's Hall, Newport. Mr. J. F. Cobb was the builder; and Mr. Edmund Kirby, of Liverpool, the architect.

is to give for a shilling a month two compositions for the piano, and two for the voice. It is edited by Mr. Lindsay Sloper, and has begun very well.—"Young England's Almanack and Naturalists' Calendar for 1868" (Tweedie). "First follow nature" is an excellent rule in many things, and in none more so than in the fine arts, whether painting, sculpture, or architecture. We know that Titian, Poussin, and our own Stothard, in his rambles in the fields, observed carefully every flower, and often brought home for present or future use. Smeaton, from contemplation of the hole of an oak-tree, devised the first Eddystone Lighthouse of any duration, and which has now braved the storms for above a hundred years. It is not likely that any one beyond middle age will take up the study of natural objects; but all the young may be induced to enter on that agreeable pursuit. When Mr. Lowe's advice is followed, we may substitute the study of *things* for that of *words*, and so gain practical knowledge while the faculties are *awake*, or *educated* in the true sense of the word. Valuable aid towards this end may be found in the very useful almanack now before us.—"The Laws and Principles of Whist," by "Cavendish," is a book known to those who study that game, and all we have to do is to mention the publication of a new edition, the eighth, with numerous additions. Like all the works that come from Messrs. De la Rue & Co., it is handsomely produced.

MARKETS FOR LONDON.—The Food Committee of the Society of Arts have this subject under their consideration. At their last meeting it was determined to collect information on this head, with a view to promote the establishment of additional facilities for the supply of food to the metropolis.

MARBLE.—We have seen some specimens of artificial marble, termed by the inventor, Mr. Guelton, "marzo." It is manufactured in the form of slabs, mouldings, table-tops, &c., and imitates every variety of marble. The colours and veining are traced on large surfaces of plate-glass, and the cement, or material composing the artificial marble is run over it: when set the slabs are removed from the glass. The surfaces are then polished by friction, in the same way as those of marble. The material is suitable for internal decoration. It is fixed to walls by the methods usually employed for facing walls with marble. It appears to have advantages over scagliola.

ROAD STEAMERS.—A new locomotive for common roads has been patented by Mr. R. W. Thomson, and successfully tried in Edinburgh. It has an upright boiler, and weighs 5 tons; but its chief feature is that the tires of the wheels are covered with indiarubber, which is said to have a singular effect in increasing the grip of the wheel on the road without doing damage either to the road or to the indiarubber, while it enables the locomotive to run either upon rough macadamized roads on the one hand, or on soft turf, or even ploughed land, on the other, without making much impression on the surface. On turf the traces of the wheels, it is said, were scarcely visible, and on soft soil a walking-stick was readily thrust into the rut. If this be the case, the importance of indiarubber tires to steam ploughs must be very great, and must tend to promote immensely the use of steam-power in agriculture.

LIABILITY FOR INJURY BY DIMINUTION OF LIGHT.—In the case of *Engle v. The Charing Cross Railway Company*, the company had, by the execution of their works, occasioned a diminution of light to the plaintiff's premises, which were consequently rendered less convenient and suitable for the requirements of the plaintiff's business of a wool warehouse keeper (carried on therein) than they otherwise would have been. The Court of Common Pleas held that this was "an injury to an interest in land," within the meaning of the Lands Clauses Consolidation Act, and that the plaintiff was entitled to compensation. An injury to the light of a house was an injury to the house itself, and, although on a sale for some purposes its value might not be diminished, yet the plaintiff had a right to keep the premises, if so minded, for the carrying on of his accustomed business, and for that purpose the premises were deteriorated by deficiency of light.

THE MANCHESTER FREE PUBLIC LIBRARIES.—The report for 1866-67 of the Manchester Public Free Libraries Committee, prepared by Dr. Crestadore, the chief librarian, has been issued in a printed form. It states, that during the year ending September 6th, 1867, a new Branch Lending Library, with news-room attached, was opened in Rusholme-road for the districts of Chorlton and Ardwick; and a new capacious building for Ancoats has been completed in Every-street, where the Lending Library and News-room of that district are now removed. Since the last report the aggregate annual issues have advanced from 432,498 to 673,432. Out of this total number of issues, 193,349 volumes were given out to readers and students in the Reference department; 59,563 volumes were issued in the reading-rooms attached to the branch libraries; and the remaining 420,520 volumes were borrowed in 385,755 times. Numerically, this amounts to the whole of the shelves of five lending libraries being emptied, and their contents taken home, read, and returned more than nine times by as many armies of readers in the course of one year! The horrors, as represented by their cards, have, during the year, numbered 21,539. In the libraries and news-rooms there have been about 1,882,000 visitors, inclusive of horrors, as compared with 1,387,530 during the preceding year, being an increase of more than 35 per cent. The number of volumes and pamphlets added to the libraries during the year was 6,225, of which 2,213 volumes and sixty pamphlets were acquired by purchase, and 3,200 volumes and 752 pamphlets by donation.

Books Received.

Wonderful Inventions. By JOHN TIMBS.
London: Routledge.

This work is of a different class from some of Mr. Timbs's numerous and useful volumes,—containing fewer of the words of others. It gives an interesting and complete *resumé* of the history and nature of many celebrated inventions,—from the compass to the cable, as Mr. Timbs remarks; and is well adapted for purchase as a Christmas gift to young people, and for reading, by old as well as young. The book is illustrated with numerous engravings.

VARIORUM.

"Schnick Schnack: Trifles for the Little Ones," is a book full of little coloured sketches, some of them remarkably good of their kind.—notice, for example, the quaint little rogne on the title-page reading a book, with spectacles and a red cap on, or the group illustrating "Brother is Sulky." We do not find any artist's name. If we remember rightly, they are by Oscar Pletsch, and have appeared in a German edition.—The publishers of the last-named book (Routledge & Co.) have also issued a larger volume of coloured sketches, under the title, "Routledge's Coloured Scrap-book," some of which are very funny; as, for example, "Jack and Gill" by Mr. H. S. Marks. Mr. Harrison Weir contributes several of the drawings, and they are accompanied with stories and anecdotes, forming a book that will be taken up again and again in "the children's hour." "Little Boy Blue," and "Cinderella left at Home," are exceedingly good plates of their kind.—"The Little Oxley's Sayings and Doings," is one of "Sister Ellen's Nursery Stories" (Routledge), and is intended for very little children.—"The Story of Papa's Wise Dogs," is another of Routledge's books for children; the merit claimed for which consists in the circumstance that all the anecdotes it contains are true.—Stern's "Sentimental Journey" for 6*d.*, would seem to be cheap enough; but Messrs. Routledge add for that sum a large collection of the wit's letters.—"The Treasures of the Earth," by William Jones, F.S.A. (F. Warne & Co.), is a nice little book, giving in a pleasant style an account of mines, minerals, and metals, to which are added some anecdotes of well-known men connected with mining.—The year's volume of the "Children's Friend" is a very good one, full of cuts; and the same may be said of "The Infants' Magazine," and the "Servants' Magazine," all published by Partridge & Co.—"Blackwood's Shilling Scribbling Diary" is this year interleaved with blotting-paper, which increases its value. A postal district map of London on the inside of the cover is a useful adjunct.—*Hanover Square* (Ashdown & Parry)

Miscellaneous.

THE MONUMENT AT DRUMCLOG.—The monument erected some years ago, in commemoration of the memorable Battle of Drumclog, in the west of Scotland, having for a considerable period been in a very dilapidated condition, a movement was lately originated in the Hamilton district, for the construction of an entirely new one of more durable material; and workmen have been engaged in the necessary preliminary operations. It having been arranged that the new monument should be of granite, designs and estimates were procured from the leading granite companies. A number of designs were received by the committee; and the one sent in by Messrs. Macdonald, Field, & Co., of Aberdeen, was unanimously selected. The execution of the work was undertaken by Messrs. Cruikshank & Son, of Glasgow. The monument is an obelisk, supported on a pedestal, consisting of a base, dado, and cornice, resting on a projecting base and surbase. The details are treated in the Grecian style. The obelisk measures 15 ft. 6 in. in height. The whole height of the monument, from the base to the apex of the obelisk, is 23 ft.

CENTRAL COTTAGE IMPROVEMENT SOCIETY.—The annual meeting of this Society has been held at the Whittington Clmh-house, Arundel-street, Strand, Mr. R. Dimsdale, M.P., in the chair. The report stated that one of the first duties devolving upon the council after the last meeting was to take measures for procuring a first-rate single cottage with three bed-rooms, to be erected at a cost not exceeding 100 guineas. The result was a most interesting exhibition of plans. No less than 150 architects competed, and many admirable designs were sent in. The first plan selected was found to be the work of Mr. William Habershon, a pupil and nephew of the honorary architect; but as the advertisement had stated that the honorary architect would not himself compete, that gentleman offered a third prize at his own cost, which was then awarded to this particular plan. The next two in the scale of excellence according to the judgment of the council were those of Mr. Smith and Mr. Gregory Gill, and to them were awarded the first and second prizes, subject to the condition that they could be erected under ordinary circumstances for the sum specified, viz. 100 guineas. The council, however, had not been able to bring this matter to such a conclusion as would enable them to issue the plans of Messrs. Smith and Gill as plans approved of by the Society, and issued with its *imprimatur*, for the simple reason that so far as at present ascertained they could not be built for the sum specified. The council, considering the great demand there is for a single cottage-plan, proposes to issue one as soon as possible, with a well-arranged interior and a neat elevation, which can be erected in any ordinary locality for 100 guineas. The report was adopted.

MANSION HOUSE, LONDON.—The sum of 2,850*l.* is to be expended in decorating the Egyptian Hall and the saloon at the Mansion House.

A TESTIMONIAL.—A meeting was held on 4th inst., at Belvidere-road, of the members of the Sick and Accidental Fund, among the workmen in the employment of Messrs. Lucas, Brothers, on the occasion of the resignation of Mr. J. Williams, their secretary, who has accepted a situation in the works of the New St. Thomas's Hospital. The committee presented him, on behalf of themselves and the members, with a timepiece, as an expression of their regard to himself, and appreciation of the great perseverance and tact he had displayed in the formation and management of a fund which, during the six years it has been established, has conferred great benefits on its members.

THE AMENDED NEW STREETS ACT.—The new Act to amend the Metropolitan Streets Act, which received the Royal Assent on Saturday, has been issued. The 6th section, as to costermongers, is now amended in respect to the deposit of goods in the streets. It is not to apply to costermongers, street hawkers, or itinerant traders, so long as they carry on their business in accordance with the regulations from time to time made by the Commissioners of Police, and so much of the 6th section in the recited Act as refers to the surface of any space that intervenes in any street between the footway and the carriage-way is now repealed. The only question is disposed of by a clause stating that no regulation is to be made in respect to the carriage of lamps by hackney carriages in respect of the 17th section, except with the approval of the Secretary of State. The only other provision is that the statutes are to be construed together.

SILT IN THE THAMES.—The correspondence has just been presented to Parliament which took place between the Thames Conservancy Board and the Metropolitan Board of Works, relative to the formation of certain deposits of mud near the outfall of the Main Drainage sewers. Mr. Bazalgette, in a report dated the 21st October last, says:—

"It is a well-known fact that the point on the north side of the river half a mile above Barking Creek was always subject to accumulations of mud prior to the opening of the Main Drainage works; and on both sides of the river the mud-banks, known as the 'Saltings,' are rapidly washing into the stream by the action of the tide and steamboat traffic; and from Woolwich downwards the authorities of the Royal Dockyard have recently, by means of a newly-invented mud-distributor, been washing the deposit which has accumulated in their docks into the river. These circumstances lead to the inference that the accumulations shown upon the conservators' sections cannot be fairly attributed entirely to the Main Drainage outfalls."

In testing this point the Board's surveyors came to the conclusion "that alterations have taken place in the bed of the river, but that there has been only a very small increase in the total quantity of deposit." Mr. Bazalgette recommended that a conference should take place between the Board and the Thames conservators, in order to discuss the subject together.

PROPOSED MEMORIAL OF HENRY KIRKE WHITE.—An effort is being made, according to the *Nottinghamshire Guardian*, to raise a memorial to the excellent and gifted Kirke White. Is it not a reproach to his fellow-townsmen of Nottingham, and to his admirers, that he should have been allowed to lie so long in his grave without there being even so much as a stone set up to his memory? In his lines on Wilford Churchyard, he says:—

"This is the spot
Which I have long mark'd out to lay my bones in."

Kirke White was not hurried in Wilford Churchyard; nevertheless, the fact of his having marked out the spot for himself, and that spot being well known, renders it the most suitable place in the county, more especially as he also wrote,—

"Grant, Heaven, that here my pilgrims' way may close.
Yet, if this be denied, where'er my bones
May lie Yet still my spirit
Shall wing its way to these my native regions,
And hover o'er this spot."

What the mover in this case, the Rev. E. Davies, proposes to do is to place a small but handsome stained-glass window in the church, and beside it a neat tablet, with a suitable inscription, surmounted by a medallion bearing his profile. He has already received considerable encouragement, and hopes the needed amount (about 100*l.*) will soon be forthcoming. Subscriptions are received at Smith's Bank, Nottingham, or by himself at Wilford Rectory.

SEAFORD, SUSSEX.—A committee has been formed under the Sanitary Act, 1866, for the purpose of carrying out a new and complete system of drainage, channelling, and other improvements in this town; and Messrs. Gotto & Beesley have been engaged to prepare the necessary plans and estimates for the works.

LANCASHIRE BRIDGE, STOCKPORT.—For a length of time the stability of this erection has been a debatable question; so much so, indeed, that the attention of the Local Board has been drawn gravely to it; and, after a professional examination, it has been declared insecure, and will require to be taken down at an early date.

LEICESTER CLOCK TOWER AND MEMORIAL STRUCTURE COMPETITION.—One hundred and six designs from local and other architects have been received by the committee, and are now open for public inspection in the picture-gallery of Messrs. Vice & Moon, Market-place. Some few are very good, but the majority are otherwise.

THE FEMALE SCHOOL OF ART.—The distribution of prizes is fixed to take place at Burlington House, this Saturday, the 14th inst. Sir F. Grant, P.R.A., will preside. At the Royal Academy, a young lady, Miss Louisa Stair, has carried off the Gold Medal (1) and Scholarship of 60*l.* from her male competitors! a remarkable sign of the times.

EXTRAORDINARY ERUPTION OF COAL AT WEST HARTLEPOOL BEACH.—It will be remembered that last winter, immediately following a north-east gale, the poor of Hartlepool were presented by the waves with an immense amount of treasure trove, in shape of Spanish dollars, which had been buried for forty years. This winter, not less than 1,000 tons of coal have been cast up on these same sands, and nearly every cart in the town has been called into requisition to carry away the treasure. The poorer inhabitants turned out *en masse* with harrows, baskets, sacks, &c., and every description of receptacle was improvised for the occasion.

FROM LAMBETH.—The dilapidated houses at the corner of Stamford-street are at last "To let." Twenty years of squabbling, forcible entry, and violent ejection have passed since the last tenants left dust and decay to work alone in their ruin.—It is proposed to make a new street from the New Kent-road, across the Dover-road, Kent-street, through St. George's New-town, into Tooley-street. This will break up a colony of the most desperate thieves and other birds of prey at a cost of nearly 20,000*l.*, to be borne by the parishes of St. George-the-Martyr, St. Mary Bermondsey, and St. Mary Newington.—The clock of Old Lambeth Church, after 200 years' service, is about to be replaced by a modern successor; and the window commemorating the existence of "the pedlar and his dog" to be enriched by the addition of coloured glass. The cost is to be defrayed from a grant of 250*l.* out of the proceeds of the Pedlar's Acre estate.—*South London Press.*

NEW THAMES TUNNEL.—An engineering project, for which the necessary Parliamentary sanction has not yet been obtained, is in contemplation, namely, a tunnel or subway intended to be driven under the Thames between London Bridge and the Tower. The present project has the sanction of the Tower authorities, and arrangements for the Surrey side approach have been already made. The old tunnel is about 1,250 ft. between the shafts. The proposed subway will be about 1,320 ft. The one cost above 450,000*l.*; the other is estimated to cost the comparative trifle of 16,000*l.* Mr. Peter Barlow, F.R.S., who is the engineer of this project, proposes that the descent and ascent to the tunnel shall be by hydraulic lifts, similar to those in use in the large new hotels, and that the passengers shall be conveyed from one shaft to the other in light steel omnibuses of perfect workmanship, and driven by manual power upon a system of accumulating force. The friction will, it is expected, be so much reduced by the exactitude of the fittings and the excellence of the materials and workmanship employed, as to make the power of one man amply sufficient for working an omnibus. The bottoms of the shafts will be on the same level, and the subway will dip in the centre, to give speed and to accumulate force for the last half of the journey. Mr. Barlow recommends his scheme as applicable to the relief of the crowded streets. He gives full particulars of it in a pamphlet privately circulated, "On the Relief of London Street Traffic."

TECHNICAL EDUCATION.—The Council of the Society of Arts are arranging for a Conference, which is to be held on Thursday and Friday, the 23rd and 24th of January next, to consider and suggest what measures may be taken to promote the industrial and scientific education of the various classes of the community.

SELF-ACTING TRAIN SIGNALS.—A scheme of self-acting train signals, invented by Mr. R. F. D. Campbell, surveyor, was noticed in the *Builder* in the autumn of 1865. Our opinion was that it was rather too delicate in its details for practical use, an opinion with which the inventor now says he entirely concurs, and he has since simplified and improved the scheme. His signals can be either worked through pneumatic, electric, or mechanical power. Without diagrams we cannot briefly or clearly explain the system. It gives notice of various contingencies, such as the breaking of a coupling, a carriage off the line, fire in a carriage. There is also an arrangement for use by passengers if assailed, &c.

GAS AND AIR PURIFIER.—A paper, containing a description of a revolving washer for removing certain impurities from gas in the process of its manufacture, and applicable to the purification of air, and for other sanitary purposes, was read before the Royal Scottish Society of Arts, by Mr. John Reid, the manager of the Edinburgh and Leith Gas Company, and has been issued in a printed form. The leading idea of Mr. Reid's improved washer is to employ a horizontal instead of a vertical passage for the gas while being submitted to the action of the shower of water, whereby it should undergo a thorough shower-bath from a copious stream of water jets, falling some 20 inches, in an elongated horizontal chamber, instead of 30 ft. in height; and that this should be effected without in any way presenting obstruction to its free passage, or throwing any back pressure on the retorts. He also proposes, by aid of his apparatus, to purify air for sanitary purposes, by means of Condry's fluid, otherwise known as "ozoneized water."

ROMAN REMAINS AT APPLETON-LE-STREET.—About the commencement of November, a mere accident—the ploughing up of the upper stone of a Roman mill—induced examination of a field situated on the globe farm in the township of Amotherby and parish of Appleton-le-Street. The explorer, James Robertson, of Appleton, is the explorer, and this gentleman has laid bare a series of large paved floors, varying from 6 in. to 2 ft. 6 in. below the surface of the land. The place is very near the supposed junction of two great lines of Roman road—one from Derwenton to Isurium, the other from Eboracum to Prætorium. The field in question has been tried in various places, and pavements have been found over a wide area. So far no trace of walls or foundations have been found: they are simply pavements. These are irregular in outline, and varying in size, one being 150 ft. across it. Some are detached, while others have paved pathways as connexions. Of implements none have been found of metal, but a remarkably fine red-flint long "scraper," a flint "drill," and some other flints, have been picked up, with a "spindle whorl" of Samian pottery, and another similarly formed (pierced) of stone.

NEWCASTLE-UPON-TYNE TOWN SURVEYOR'S REPORT.—The report of Mr. Thomas Bryson for 1867 has been printed. Under the head of public health the reporter says:—"It is a matter of serious concern that, notwithstanding the strenuous efforts made by the committee to improve the sanitary condition of the borough, a high rate of mortality still prevails. In connexion with those questions underlying that of public health, which come within the range of my department, I may remark that, although a great deal has been done in the way of sewerage and house drainage, still much remains to be done in the ventilation of sewers, and in the paving and surface drainage of the extended parts of the town, especially in the neighbourhood of Scotswood-road and other places. While, however, these improvements are all good as far as they go, still it is my conviction, that until better accommodation be provided for the working classes, the death-rate will not be very materially reduced. If some of those schemes of street improvement through Pandon and the lower parts of the town were carried out, they would be of immense service in this direction, and in addition to opening out sites for such a purpose, would afford great relief to the commerce of the Quay."

The Builder.

VOL. XXV.—No. 1298.

The Echo
of the Clerkenwell
Explosion.

OUR readers and all England have heard that on Friday, the 13th, a barrel of gunpowder, nitro-glycerine, or some other explosive material, was fired near the outer wall of the House of Detention in Clerkenwell, knocked down some 60 ft. or 70 ft. of that wall, as well as several houses in Corporation-row, and killed and wounded frightfully a multitude of inoffending, unconcerned persons, with the object of possibly furthering the escape of two persons under arrest as members of the Fenian conspiracy. Knowing this, however, and having read the full accounts that have appeared in the newspapers, they will still be unable to realise, without a visit to people and place, the havoc done by that one explosion: they must walk through street after street, they must enter the wards of hospital after hospital.

The English have been happily characterized as a law-abiding people. In one respect they are eminently distinguished from most, if not from all, other nations, namely, in their reverence for human life. The wider are the limits of our foreign travel, the more cause do we see to be content with this portion of the national character. From the statesman who devotes more anxious hours to the consideration of the propriety of mitigating a capital sentence, than some Continental rulers would be disposed to give to ensure the preservation of a whole district from military execution, to the humblest peasant, the same feeling is found predominant. And those soldiers and those generals who are the readiest to encounter the imminent peril of battle at the call of duty, are, even more than their civil brethren, taught by the code under which they are organized, the criminality of needless exposure to danger, or of needless waste of blood.

For a barrel containing a quantity of gunpowder, sufficient to breach a wall for 60 ft. or more, and to shake to their foundations an entire street of houses, to be exploded in the midst of London, without a word of warning to protect even the casual passengers, is therefore a crime likely to be regarded amongst us with a feeling of startled and half-incredulous indignation that requires no prompting from the press. It is no breach of the rule which closes our columns to the discussion of any other political subjects than those which are free from the bias of party feeling, to point out the lesson which has been thus loudly given to every household in our metropolis and large towns. Since swords were disused as part of the necessary equipment of a gentleman, we have laid aside much of that vigilance which characterises the ruder states of society. We have been content that the law should watch for us. Unarmed, we have become also unalarmed,—secure in the

Latin rather than in the English sense of the word. War itself has become to some extent civilised: due warning to non-combatants has for the most part become a feature of its assaults, and we have almost taken it for granted that a man can come into peril of life or limb only by his own fault or folly.

It has, however, become but too apparent that there exist amongst us miscreants who, for no adequate result, perhaps for no result but the mischief itself, do not hesitate to confound old men, women, infants,—those indifferent persons whom war to a certain extent protects,—in the very worst peril of war. A mine is precisely that which the bravest soldier most dreads,—we do not say fears,—but looks at as a somewhat diabolical and unfair mode of attack. The spirit which, in the creation of our volunteer force, has, in the opinion of many competent to judge, alone saved our shores from insult, will, we doubt not, give no uncertain reply to the echoes of the Clerkenwell explosion. But our word of caution is to the householders. It becomes their duty to exercise an amount of vigilance not hitherto requisite within the memory of Englishmen. Every cellar, every outbuilding, every obscure and sheltered portion of the domestic premises, should receive the attention of the master's eye,—no questionable fact should fail to be promptly investigated. A barrel in a street without explanation has, in a fearful manner, explained itself. To-day it may be powder; to-morrow it may be fire; the next day it may be sudden personal assault. Whatever the Legislature may hereafter do, whatever municipal authorities may more speedily effect, whatever may be the increased vigilance of the very respectable force pledged to maintain order and protect life and property, it is the duty of each head of a family to do, what no one can so well do for him, to look to the safety of his own premises with a wary eye; to see that no neglected access, or tempting pile of combustibles, or concealed space where mischief may be directed on himself or on his neighbours, is left unvisited to afford a shelter to the enemies of society. No man so humble exists among us but that he may, by a tacit but constant vigilance, and the exercise of good sense, aid the population of our cities to protect themselves from wanton, malignant, unscrupulous attack.

Yet another warning may be gained from the catastrophe of the 6th, followed by that of the 13th, of December. Let the managers of our public buildings be on their guard. It would not be a more fruitless or a more difficult matter to fire the British Museum or the National Gallery than to blow down the walls of Clerkenwell gaol. The question *qui bono* is no longer one on the triumphant posing of which respectability can now afford to go to sleep. Accident has often found us unprepared: fire-proof buildings have been turned into furnaces, as in the cases of the Crystal Palace and of the two iron churches at Bayswater last winter. Let not crime meet with similar supineness. With men among us ready to emulate the crime of Erostratus without even the excuse of his insane and miserable vanity, it behoves those responsible for the protection of all public buildings to be on the alert.

It is much to be desired that a commission or committee should be organised, containing men accustomed to the duties of the fire brigade, of the police, and of the detective force, to draw up a code of instructions for the safe guard of public and of private property. Hints to householders, and to the guardians of public buildings, from those whose experience has taught them how to detect the ordinary signs of premeditated outrage, would be of great value. In the absence of any such official aid each man must depend on common sense, and must regard as an indication of possible danger any unusual and inexplicable movement.

It has been often stated that the life of any man is at the disposal of any other man who is prepared to throw away his own for the sake of taking that of the former. The history of attempted regicides, to which the remark was intended to refer, happily does not altogether bear out its truth. However determined, and even however fanatical a murderer may be, there is a *something*, whether it be conscience or not, that usually unnerves his hand at the critical moment. The want of practice in the use of firearms, the usual implements of the modern assassin, has been urged as an explanation of that failure, which is happily rather the rule than the exception. But in cases where steel has been resorted to the same tremor has been evident. The chasseur who charged King Ferdinand of Naples with his bayonet, was not much more successful than the assailant of the Emperor Alexander in Paris, although he actually penetrated the skin, and a foot further advance, or a pound weight added to the blow, would have pierced the king through the body. It is not for us at all times to detect the subtle mode in which Divine Providence prevents the uncommissioned agent from executing the work of death before a summons had been issued from an irreversible tribunal.

But the dastard whose only risk consists in lighting a squib at a moment when no one looks on, and running round the corner while it burns, is less amenable to the emotions of fear than the more open assassin. On such a criminal the law may, if it can arrest him, indeed inflict retribution; but such retribution is no restitution of the wrong inflicted by the crime on the helpless and on the innocent. If the whole Clerkenwell conspiracy be brought to light, and the conspirators adequately punished, small will be the satisfaction thus afforded to the numerous sufferers, in life or person, or to the alarmed and injured inhabitants of Corporation-row. Law may avenge where it has failed to awe, but it cannot restore. It remains, then, for every one of us to look to his own safety, and to prevent, by vigilant care, irreparable evil.

Modern society has, by tacit assent, assigned to the law the care of personal safety. Against those who put themselves out of the pale of such assent, society must protect itself. We are not recommending an appeal to Lynch law. We should consider such a social change amongst ourselves as a surer and a darker sign of the decadence of Great Britain than any discovered or invented by the unfriendly ingenuity of Ledru-Rollin. Nor are we advocating the adoption of arms for personal defence. If we are driven to such a step, it will be by the acts of men who play with the tools of the soldier, while ignorant of his honour and his courage. But it is the duty of all honest and prudent men to aid and to maintain the execution of the laws which we are unwilling to change. Individuals must watch over any menace of individual safety. Citizens must watch their habitations. First, by due vigilance, must they disconcert the projects of the enemies of society. Secondly, by full information must they aid the officers of the law. Thirdly, in the interest of the very existence of society, are all good men bound to keep a pointed and sleepless watch on the words and actions of those who have of late, under what pretext soever, whether of quibbling special pleading, or of sentimental sympathy with the perpetrators rather than with the victims of crime, done their best to baffle and discredit the course of the tribunals of the country, and to muffle that sword with which alone, and that perhaps somewhat too tardily and gingerly, the present race of Englishmen has been wont to meet the criminal and the assassin.

Attention, moreover, cannot be too loudly called to the extreme impropriety of such a construction and arrangement of our prisons as

shall allow their yards to be commanded, and their inmates seen and signalled to, from the "top stories" of adjoining houses. Such a neglect of the most obvious precaution seems at any time inexplicable: its continuance would be altogether inexcusable.

We have never been alarmists in the ordinary sense of the word; but caution is the only sure preventive of panic. Alarm, in its primary sense of *à l'arme*,—to arms,—is the cry, not of cowards, but of brave men at the first symptom of danger. The wholesome application of the "cat" put a stop at once to the recreation of garrotting, which had become far more ordinary than agreeable. The same promptitude of action will, no doubt, have a similar effect on those who amuse themselves with the murderous employment of gunpowder. In the mean time, no man can afford to neglect such a warning as has been echoed from the shattered wall of Clerkenwell prison; and we all shall do well to bear in mind the proverb,—Forewarned, forearmed.

Our daily contemporaries are loudly calling on the Government. It is not so clear to us what they ask the Government to do. The law is, or ought to be, able to vindicate itself; and all that Justice requires is, that those who, by recent sympathy with the perpetrators of the Manchester murder, have encouraged the perpetration of that at Clerkenwell, should cease to cumber her path. Our own appeal to each household to look to his own premises is, at all events, susceptible of a much more speedy response than any application to the Home Office can receive. But there is one point which we are anxious to bring to the attention of the Government, and of those independent members of Parliament who can devote leisure and capacity to the preparation of well-considered remedies for proved abuses. An explosion like that at Clerkenwell would hardly have been possible in any capital but our own. In Paris, in Florence, in Vienna, in St. Petersburg, men would have been unable either to wheel a beer-barrel full of powder about the streets, or to purchase, without leaving good marks of the transaction, such a quantity of that dangerous material. Free trade in the implements of death is hardly a necessary part of social freedom. Slowly enough we have come to accept that truth as regards poison. Perhaps we shall now learn that the supervision of competent authority is necessary for the public safety in all cases where it is sought to obtain speedy and certain means of death or destruction. It is no part of the function of an organized state to allow of the preparation, within its bosom, of the warlike implements and munitions of treason. Powder lies close. A gallon measure will contain more than 150 lb. of such powder as is used for military demolition. A thirty-six gallon beer-barrel, if full, would therefore contain the means of even greater damage than that done on Friday afternoon. With a means of destruction of such fearful capability, it is clear that some check should be imposed on its ready purchase and sale; and that the responsibility which we admit to attach to the vendors and purchasers of poison should *à fortiori*, be made to apply to all those who handle, or seek to handle, any of those yet more terrible engines of human destruction, the unscrupulous use of which may in a few seconds render a populous city a heap of ruins, and convert a whole population into victims and mourners.

HOMBURG.

The town of Hombourg-ès-Monts may be said to consist principally of one main thoroughfare about a mile long. This is full of houses, shops, and hotels, in the rather meagre Italian style affected by Germans in their modern street architecture. At the extreme eastern end—for it is built due east and west—is the railway, and at the western extremity is the Schloss. It is as though the old town had once nestled under the protection afforded by the neighbourhood of the castle, but becoming celebrated and thronged with visitors, had extended itself westwards. Several short streets depart right and left of this main artery, and emerge upon two newer lines of thoroughfare running parallel with it, on either side. One of these—the Ober promenade—is lined on one side with villas, nearly all let out in furnished apartments; the other only passes in the rear of houses; but, doubtless, at no distant date, will add to the rivalries of

the active touters of the villas in the first-mentioned. Lying due east and west, one side of the main street is, for a great part of the day, in deep repose in shadow, while the other is in bright sunshine, and the lined hotels and shops, in its flanking with awnings and gay with balconies, with their decorations of flowers and creeping plants. The building material in most frequent use is brick covered with compo, tinted of a light colour. The sash and comparatively small cost of renewing the coat of colour annually aids in preserving a pleasant, refreshing air of clearness. The chief feature of all the houses, which are plain enough in other respects, is their balconies. These are generally very wide stone slabs, moulded on the edge, supported by massive stone brackets, and furnished with very light ornamental iron grilles, which, like the houses, are painted a light colour, such as salmon colour, cream colour, &c. The graceful Gothic patterns of these, and their pale tints, produce a very different effect to those we may call our Baker or Harley Street patterns, or the sombre-coloured heavy articles Thames-street furnishes for our modern villas. What with the striped awnings drawn over them, and the numbers of creeping plants trained about them, and displays of flowers here and there, they form very pleasing features. Some of them are on two stages, rising from the ground on light iron columns, and pass before the two principal floors, the same awning serving for both. In some cases a single window has a strong stone balcony with an iron grille to itself. In others the balconies assume a verandah form, supported on corbelled brackets, and are gracefully twined with creepers. Loggias, too, are not wanting. Here and there are houses having one or more of their upper stories set back, so as to form a loggia. The footways are very narrow, and the roadway paved with stone. These leading characteristics strike the eye on first entering the town.

The avowed attraction to Hombourg consists in the sanitary properties of its waters. The gouty and the rheumatic fly thither in hope of ridding themselves for a time of an enemy to whom they know they must eventually succumb. They hie thither now just in the same fashion as the lieges of George III. flocked to Tunbridge Wells and Bath; and those of George IV. to Brighton; and those of William IV. to Cheltenham and Leamington. There are, however, other attractions, which cause the newly-fashionable spa to be regarded with favour by the hale and hale, young and fair. These are the well-known facilities for gambling afforded at the Kursaal; and the constant round of entertainments given there by the tempting directors; and the ever-changing and ever-brilliant throngs of company.

About three-quarters of a mile down the main street, from the railway, facing a line of shops, stands the far-famed Kursaal. Like its less imposing neighbours, this German-Italian edifice is built of brick, with a coating of compo, but it exceeds the generality of them in the possession of an introduction of the bright red sandstone of the district in the quoins, pilasters, cornice, and windows. In size, of course, it overtops them all. The block form of this structure might be roughly compared to the letter E, as in Elizabethan mansions, if it possessed the central projection, which is here absent. It will be thus seen that the body of the edifice is recessed, and that it has two advancing wings. The fronts of these are in a line with the houses on either side. They are occupied by the theatre and the administration respectively. The space between the wings is laid out as a fore-garden. A very handsome corridor, 240 ft. long and 30 ft. wide, lighted by windows which face the forecourt, forms the approach to the entrances of the various parts of the structure. The principal apartments consist of a restaurant 130 ft. long by 50 ft.; a ball-room 96 ft. by 50 ft. with cloak-rooms, two reading-rooms, opening one from the other, and the three spacious gaming *salles*, with their lobby and a row of cabinets. All these are blocked together in this manner.—The restaurant occupies the whole depth of the building, where it adjoins the eastern wing, the windows of one end looking into the front corridor, and those at the other into another corridor in the rear. The access to this is from a central corridor, in which the visitor finds himself, on emerging from either of the wide and long entrance ways. On either hand of this eastern-most entrance is a cloak-room, and immediately before it is the ample doorway of the ball-room. This hall-room has a second entrance from the corridor in the rear of the house, and when not in occupation as a ball-room is used as a way

through the building from the street to the grounds behind. When required for a hall, its separate entrances and cloak rooms admit of its being completely shut off from the other apartments. The westernmost doorway opens from the corridor into a similar wide way into the same central corridor, where, in the opposite direction to the ball-room, a large lobby or vestibule gives access to the reading-rooms on the one hand, and the gambling saloons on the two others. The largest *salle*, 130 ft. in length by 42 ft. in width, corresponds, at this end of the structure, with the restaurant at the other; and *en suite* with it, extending westwards, is the gorgeous Gold-saal, or *salon doré*. This is 57 ft. long by 40 ft., and has two semicircular bays, one on either side of its length, exactly opposite to one another.

The Gold-saal takes its name from the profusion of gilding employed in the decorations, not from the purpose to which it is dedicated. On setting foot in it the eye is met by a blaze of gilding and mirrors, to which, at night, the chandeliers, with their hundreds of sparkling pendants, add more glitter. The immense mirrors reflect the lights over and over again, and of course, add very materially to the dignity and lustrous effect of the *salle*. The sides are regularly divided by pilasters into large panels of the same size, some of which are the window openings and others the mirror spaces, each space being enriched by additional pilasters on either side, which are carried up to the level of the frieze above. The pilasters, the ornaments over each panel, the frieze, the cornice that divides this height of the chamber from that which rises above it, with a similar treatment, and terminates in a coved ceiling, are all painted of a very light-brown tint, and richly fioriated with gilded ornamentation. A handsome gilded French timopiece stands on a mantel-piece near the entrance-door. The windows have crimson draperies and white curtains. In the centre of the apartment is a large oblong card-table, covered with the conventional green cloth. About twenty chairs, with red cushions, are ranged about it, and all round the room are covered benches, or settees, placed against the wall in every available space. The floor is of parquet. Such are the constructional and ornamental features of the Gold-saal. The company who sweep to and fro in it, or stand idly looking on, and the wondrous varieties of gamblers who crowd round the table, are not for us to describe.

The largest hall, where there are two tables, is treated in a more Raffaellesque manner, the decorations being in the natural colours of the flowers and foliage represented. Here we may read of the paternal solicitude of the Administration for the pockets of the frequenter. This notice is framed upon the wall:—"Le maximum des mises par une chance au trente et quarante est fixé à quatre mille florins, et le minimum à deux florins." The maximum stake was, however, fixed in 1850, at 5,000 florins, at which sum it still remains. Below the above notice there follows:—"Mise en banque au trente-et-un, 1,500 francs; à la roulette, 60,000 francs."—signed, "L'Administration." In the reading-room there are more instructions for the public: "Avis. On est prié de ne pas porter les journaux hors du cabinet de lecture, et de ne pas y faire la conversation.—L'Administration."

The panels of the reading-room have a mauve ground of flock paper, with wide stripes of a deeper mauve and powdering of alternates large and small gold bouquets of roses, embossed, cut out, and laid on. The stiles of the panels are buff; and there are gilt and buff raised mouldings bordering the panels. The curtains to the windows are in rich Oriental patterns, made of a woollen material, with deep horizontal stripes of chocolate and mauve, and gold hues, alternately with a stripe of the ground colour of pinkish drab. The floor is parquetté with a very large pattern. Before leaving the interior of the building, we may note another precaution to maintain order and prevent complaints. A table is stuck up containing a schedule of the current relative value of all foreign coins.

Behind this palace of pleasure is the Kur-garten, which is a garden taken off the public grounds in which the wells are situated. It is trim and pleasant, with neatly clipped hedges and straight tuft-tipped trees growing in large tubs full of sunshine and company, with gay groups of little children playing about in a central walk in a full-dress manner, if we may say so, to express a certain formality.

Looking at the rear elevation of the Kursaal from this point of view, it presents the aspect of a large oblong building, having two wings, one higher than the other on either side of it. The most important feature of the facade is a long light, iron and glass verandah, running from one end of the building to the other, on a terrace raised above the garden. The facade of the body of the Kursaal, as seen above the verandah, is divided by two pilasters into a centre, with four large semi-circular-headed windows in it, and two ends, each having one pedimented window. It is covered with slate, and ornamented with many pinnacles. Flights of steps, at the centre, and at the ends of the terrace, permit of easy descent to the grounds below. A good band plays here every afternoon, in an orchestra, that deserves a word. It is in the form of an alcove, and is large enough to seat forty performers. The front is ornamented with a semi-circular open-work large-board cresting, of a light and tasteful Gothic design, painted salmon colour. The parapet railing below consists of a row of quatrefoils, finished off with a series of cusps. A number of green plants climb up the ironwork, and convert the orchestra into a hower. It is an isolated building, well shaded by neighbouring trees, but additional shelter is contrived with the aid of an awning stretched above it, from trees to trees.

The five elevated wells are known as Louisenbrunnen, Kaiserbrunnen, Stahlbrunnen, Elisabethenbrunnen, and Ludwigbrunnen. The property of the place depending upon these to some extent, they are all carefully maintained. We may see that the original wooden fencing with which each was at first surrounded, is being superseded by more costly and substantial parapets, made of the bright red sandstone of the district. They are all in the same locality, a sort of public park, laid out as ornamental grounds, though far enough apart, with the aid of trees, to be out of sight of one another. The company stand round the ornamental boundaries of the wells, whilst the attendants hand up the water in glasses from below. The vicinity is made as enjoyable as possible by broad walks, avenues of trees, shady seats, and occasionally by the exhibition, at small, tasty stalls, of small objects, suitable for souvenirs of the place. A Swiss stall is particularly tempting among them. Partly hidden among the trees in the immediate neighbourhood of each well, is an isolated building, containing several privies, cleanly kept. Over the Louisenbrunnen, which is a small circular opening into the earth, surrounded by an ornamental iron railing at sufficient distance from it to admit of the movements of the attendant, there is a pavilion-like canopy, supported on light iron columns. These are placed at the edge of a broad circular walk around the railings: so the visitors waiting for the healing waters to be handed to them in their turns, are under the shelter the canopy affords. The sun is the object against which shelter is sought, not the rain. All the avenues, the seats, the verandahs, the disposition of most people's time, in fact, are dictated here by the sun. The Elisabethenbrunnen, is now in course of transition from the primitive railed space to a handsomely walled in well. As there is a constant dripping and spilling of water going on as glass after glass is passed to and fro from the well over the parapet to the throng of visitors standing around it, it has been found expedient to make the top rail of the parapet hollowed. Here, within a few paces of the waters, there is a long light open colonnade leading up to a large greenhouse, up and down which the company parade out of the glare of the sun. From seven a.m. to eight a.m. a band of thirty performers on stringed instruments discourse music to the promenaders, who are of both sexes, all ages, and all nations. The Stahlbrunnen is approached by a broad circular walk, from which depart paths leading to the magic waters. This well is enclosed with ornamental ironwork supported by heavy red stone pillars at the internal and external angles of its form, which is that of an elongated cross with canted angles. A descent of several steps has to be made to the water source. The Kaiserbrunnen is handsomely built of red sandstone. It is of a circular form, with a square-headed recess in it, and, like all the rest, is sunk below the level of the surrounding grounds. A flight of steps leads down to a stage where there is a smaller enclosure surrounding the actual source of the water. Wide avenues of trees, low chestnuts and limes with their lowest branches lopped off, radiate from it. The Ludwigbrunnen is

surrounded by a broad umbrageous circular walk, from which descends a steep sloping bank on the side nearest the well. A flight of stone steps built into the bank gives access to the space below, where there is another ringed walk around the octagonal railing that surrounds a deeper descent in which the water is found. There is a summer-house of an ornamental character to be seen in the avenues close by. It is built of wood in a Swiss chalet style. The rafters overhang, and are moulded fantastically on the edge. The front principal rafter projects boldly forward on brackets, and all the timbers are stop chamfered and have ornamental turned ends. The central king-post terminates with a floriated finial, and a rich barge-board cresting leads up to it. The sides and back are formed with stop chamfered stiles and rails, and are close-boarded between.

The building material chiefly used in Hombourg is, as we said before, brick. We observed a different mode of raising the bricks than the carriage by hod-load as practised by us. When a building is in progress and a load of bricks is brought to the site, the whole process of building is stopped, and every whole process of building is stopped, and every bricklayer, as well as a labourer, places himself in a convenient line so as to permit of the handing of the bricks from one man to another, from the ground to the height where they are required, till there are enough placed ready for use on the scaffold. The scaffolding, too, differs in some instances from ours. Put-logs are thrown out when scaffolding is required and planks laid along them, by which means the ground is kept quite clear.

The slates in use are very light and thin, and scalloped at the edges. The valleys are formed of the same slates as are used for the roofs, by curving them, which their thinness makes an easy task. The Hombourg housewives have the smoky-chimney nuisance to contend against, as well as other folks. We note a contrivance used to cure this evil. Over the orifice of a chimney-flue an iron plate is placed upon four little iron columns, about 6 in. high, one at each angle of the chimney, and the plate is weighted by a conical cap of mortar put upon it. The spaces between the columns admit of the smoke passing freely in either direction, while the plate held over the flue would have the effect of preventing much of the down-draught.

The Schloss, or castle, is, as we have said, at the end of the town most removed from the railway. It has lately changed hands, owing to the accessions of territory made by Prussia; and a sale, at which the King of Prussia was a large purchaser, has recently dispersed the museum and some of the choice works of art deposited there. It possessed portraits of several members of the royal family of England, and is, moreover, associated with English sympathies, as having been the residence of the daughter of James I., the Princess Elizabeth. Her apartments are stated to have remained undisturbed since her decease.

The effect of the aspect of their dwelling-houses upon invalids is fully acknowledged by the Hombourg physicians. A northern aspect is that which is deemed most pernicious by them. The owners of the handsome villas facing this aspect, on the Ober Promenade, endeavour to make the best of their sites by throwing out balconies and forming loggias wherever it is possible to catch the sunshine.

We shall be of some service to the frequenters or future visitors to Hombourg, in drawing attention to misdirected letters and to irregularities in the post-office. There are no less than four different Hombourgs in Europe, and one Hamburg, and for want of proper direction letters go astray; in the height of the season, too, the post-office is so inefficient and deficient, that hundreds of letters are distributed among the various hotel-keepers, to find owners as best they may. Letters should be distinctly directed to "Hombourg, Rhine, North Germany."

WORKMEN'S DWELLINGS AND THE LATE CHOLERA EPIDEMIC.

We recently had reason to point out a few of those groups of town districts which especially contributed to the general excess of mortality in our urban population. One of the most conspicuous of these groups was that part of South Wales having for centres Swansea, Cardiff, and Merthyr Tydfil, and in which the vast majority of the population are engaged in the production of coal and iron. We have before us a pamphlet, recently published, entitled, "A Sketch of the Cholera Epidemic at Ystalyfera, in the Autumn of 1866," by James Rogers, surgeon. Now, we must confess that we never before had heard of this place, described as a village, and our search for it in various maps, and even for a mention of it in various volumes, has been alike unsuccessful; but the outbreak of cholera, in its direct bearing upon the manner in which its inhabitants were housed, is important as further evidence of the ease with which nearly every local visitation of cholera can be traced to the almost wilful neglect of the most ordinary sanitary precautions.

The precise locality of Ystalyfera matters little. It appears to be a village in the Neath union, not very far from Swansea, and to take its name from, or give its name to, some large works (either coal or iron works), at which nearly all the inhabitants earn their living. It seems probable that the aggregation of the inhabitants through the establishment of these works has been very rapid, or the village would have found a place in the census of 1861. On these points, however, the pamphlet, intended, no doubt, principally for local circulation, gives us no information, and we will proceed to notice a few of the points which possess a general interest, more particularly in those neighbourhoods where the establishment of any large works or factories causes the temporary or permanent aggregation of a new population.

The village in question is stated to be "built upon an abrupt hill side, as the fancy of each proprietor indicated, without any drainage, with very few privies, nearly all being on cesspools, many of them on higher ground than the neighbouring houses, and becoming loathsome nuisances, percolating their contents into the soil below them." Many of the houses had two stories below the level of the road, and two above. The back walls of the lower tenements were inevitably damp and slimy from contact with the earth, especially in wet weather, from percolation of roof-water, there being a practical absence of eave-troughs. Even where the houses were of a better kind, the back rooms were necessarily dark from the height of the earth above them, and "there being no area or retaining-wall to the bank, the earth had dribbled down and obstructed the course of the rain-water from the roof." To add to these unfavourable circumstances, a considerable number of the houses appear to have been built close to a canal, the percolation from which, Mr. Rogers says, "made the back walls damp, and when the houses were closed for the night, the miasma from this cause affected the air of the whole house, and, in spite of the other conveniences, the general cleanliness and thrift of the people who lived in them, their sober, steady habits, with an abundant supply of very good water, nearly every household was more or less affected." The very first case of cholera during the late epidemic occurred in a house where the pavement of the back premises had become "spongy" from a combination of damp caused by the natural drainage from the high ground close to the house, contaminated by the percolation of the overflow of the cesspools of other houses situated higher up the slope. Such were the drainage and sewerage arrangements of Ystalyfera at the time of the cholera epidemic in the autumn of last year.

The inhabitants of this village were but little better off in the matter of water supply. Although many of the houses are described as being supplied with abundance of excellent water, it is evident that a very large proportion of the tenements were not so well off. "The water supply was very scanty in quantity, and uncertain in quality, being little better than surface water, percolating through shale tips, and the drainage of coal and mine seams, and colliery workings: so scarce was the water in the works that it was a common practice with the men to drink largely of the canal water, which was conveyed in pipes through the various departments for the purposes of the works. This water received the surface drainage

THE PALMERSTON STATUE IN PALACE-YARD.

A commission for the statue of Lord Palmerston, to be erected near the Houses of Parliament, has been entrusted by the committee of subscribers to Mr. Thomas Woolner. The site which has been fixed upon is at the corner of the new inclosure in Palace-yard, immediately opposite the Peel monument. The work is to consist of a single colossal figure, 8 ft. in height, and is to be commenced immediately.

of nearly all the houses in the village." And from further evidence in the pamphlet, it is clear that with the surface drainage, the canal also received a considerable contribution of sewage in the shape of the overflow of cesspools, especially after heavy rains. It need not be a matter for surprise that many of the cholera cases were directly traced to drinking this water, and that a very large number of those who suffered were first attacked with premonitory symptoms while performing their daily task at the works. One particular case is mentioned, which bears both upon the source of the water supply and upon the beighted ignorance which appears to have prevailed in sanitary matters among even the better class of the inhabitants of this village. The landlady of an inn, who is described as "one of the most cleanly women in her house," fell an early victim to the disease. At the back of the house there was a yard less than 30 ft. square, in which were two pigstyes, two privies on cesspools, fowl-houses, and a well; the yard being wholly undrained. An open gutter, running from this yard into an adjoining field, and along a hedge, in front of a row of houses, gave off a most noisome stench; and several virulent cases occurred in these houses.

As if to render these terrible sanitary shortcomings of the village of Ystalyfera, as to drainage and water-supply,—aggravated by the ignorance and apathy of both the owners and occupiers of the houses in such matters,—"window-sashes unhung, and the top sash fixed, no provision for any sort of ventilation, were characteristics of more than half of the cottages." Thus these Welsh villagers lived in a continual miasma arising from the defects of drainage, the exhalations of cesspools, exaggerated by a chronic and thrifty predilection for pigstyes and wash-tubs within the shortest possible distance of their doors.

We have no means of ascertaining the precise extent of this village either as to houses or inhabitants, but the author of this pamphlet gives us some clues to the ravages of the disease. He states that during the epidemic, at its worst, forty new cases occurred in one day, 27th August; and further, that in his own practice, there were "in round numbers, 1,000 cases of choleric disease." That not more than ninety-five of these proved fatal seems to show either that the form of disease was not invariably of a virulent type, or that this practitioner was most fortunate with his mode of treatment. A portion of this treatise is devoted to the medical aspect of the question, which, although foreign to our present purpose, renders it a valuable contribution to the now somewhat voluminous literature relating to the elucidation of the mystery of cholera and its medical treatment.

It is more than probable that, but for the awakening of a kind of sanitary activity in this village previously to the outbreak, the consequences would have been still more disastrous. Mr. Rogers, in concluding his sketch of this local epidemic, states respecting the deaths which came under his immediate notice, "of these ninety-five it is not too much to say nearly all died of local circumstances,—the effect of avarice, or ignorance, or neglect of sanitary precaution; in short, given a case of cholera, in a foul dwelling—death; in a healthy dwelling—recovery." A medical friend of the author having demurred to this sentence as "too strong," he was asked to point out a fatal case where the house or the surrounding circumstances did not completely bear out the statement. The medical friend, who knew the neighbourhood, parried this question with another,—"Where in Ystalyfera will you find a really healthy workman's dwelling?"

We fear there are many other "large works" districts, the sanitary condition of which is even now little better than was that of Ystalyfera, in the autumn of 1866. How long will it be before all these out-lying districts shall have been brought within a comprehensive system of sanitary supervision? We certainly do not yet possess a machinery equal to the task, and it appears that the proprietors of "large works" cannot always be trusted to see that their labourers are housed in such a manner as not to be liable to decimation from a cholera epidemic. The labourers themselves are too ignorant and too careless in these vital matters to be left to themselves. There is, therefore, almost but one consideration which leads to hope for the speedy cleansing away of such blots upon the sanitary intelligence of the present day as the condition of Ystalyfera. This is that when Boards of Guardians begin to understand how intimate a

sympathy exists between a high rate of mortality from epidemics, and heavy poor-rates, caused by the large proportion of heads of families and bread-winners, who invariably fell victims to these diseases; then may we expect them to come to the conclusion, that an effective sanitary supervision, and the judicious expenditure of a little capital, in drainage, sewerage, and water supply, are cheaper in the long run than an epidemic. Furthermore, as proprietors of "large works" are among the largest contributors to poor-rates, the same conclusion may not be entirely lost upon them.

THE DANGERS OF THE VIRGIN ISLANDS: THE PACKET STATION.

OUR article on the dangers of the Virgin Islands has attracted notice, and is likely to produce good fruit. We understand that on the assembling of Parliament, the matter will be brought on, fully ventilated and discussed, and possibly may lead to a safer and more convenient station being established, that will prove advantageous to the Royal Mail Company, and to the great numbers of our fellow countrymen who travel, or whose business or pleasure leads them that route.

We are gratified to see that the late severe calamity that occurred at St. Thomas's and the other islands, has evoked a considerable amount of public sympathy, and handsome contributions are rolling in to swell the noble tide of benevolence that is set in to relieve the misery and distress occasioned by this happily rare and unprecedented catastrophe; but we learn with regret that no professional person is to be employed to superintend the repair and restoration of the churches, public buildings, &c., injured or destroyed by the hurricanes, but it is to be left to "native talent," both white and black, to expend and distribute the money so liberally and generously contributed.

A harrister has been sent out to distribute the funds, and to direct the tide of benevolence into proper channels; but it appears to us that this duty could have been quite as well or better carried out by an architect or engineer, who could at the same time have aided them with his professional ability and skill in the restoration or reconstruction of the many structures destroyed. We would advocate the employment of properly qualified professional men in the expenditure of public money, so that the full advantage may be derived from the outlay.

We will now point out a few of the prominent advantages attending the removal of the Central Packet Station in the West Indies, from St. Thomas's to Falmouth, Antigua; and, in the first place it is nearer Great Britain by three degrees than St. Thomas's, and the mails and passengers could be delivered to the leeward and windward islands from thirty to forty hours earlier than if the present central station were retained; and the approaches to the Antigua harbours are unattended with those risks and dangers that closely beset St. Thomas's, as the latter island is surrounded with several small islands and reefs. A few years ago the company lost a most costly and superb vessel, the *Parametta*, on the Anagada reefs, and now the unfortunate and ill-fated *Rhone* has gone to pieces; and upwards of eighty other vessels have shared the same fate (many of which were attracted by the Packet Company's business there), on the several islands and reefs in the proximity of St. Thomas's, on the late occasion (October 28), and several previously.

The harbours of Antigua are like St. Thomas's, perfectly land-locked, and are well sheltered by high lands from heavy gales of winds or hurricanes; but the lands are not so high as St. Thomas's, and the creeks in the mountains permit the cool refreshing trade winds to circulate over the harbour, while at St. Thomas's the high lands exclude the breezes and render that harbour insufferably close and hot at certain seasons much hotter than we have experienced at Falmouth. The extreme range of the thermometer at the latter harbour was from 70° to 90°; the average from about 76° to 86°.

From a careful survey of Falmouth Harbour there has been found a large area of deep water for deeply-laden steamers, and equal to the draft of her Majesty's men-of-war, and this capacity is larger than the whole of either the Liverpool or the London Docks. The deep water of this harbour could be easily extended by a judicious

system of dredging; and if we look at the very large and magnificent fleets of ships that now throng the docks alluded to, surely a harbour of larger dimensions could afford suitable accommodation for the comparatively small fleet of the Royal Mail Steam Packet Company. To facilitate the entrance to these harbours it was proposed to remove all impediments, such as rocks and shoals, that rather endangered the passage of vessels; to throw out a breakwater that would protect the shipping lying there during heavy gales of wind; and to form a pier at a point where it was deep water, close alongside where the largest steamers could lie to load and discharge; and this is a very urgent and necessary convenience, as it is a general complaint throughout the West India islands that they have no proper piers at which to embark and disembark passengers, and frequently lives are lost, or placed in jeopardy by this very serious default.

The other harbour (English) has an area equal to more than half the size of the Liverpool Docks, and this is where H.M. ships of war take shelter during the hurricane season; and this harbour could be readily connected with Falmouth Harbour by means of a ship canal, that would add materially to the convenience and advantage of both of them, and the trade that would frequent them; and the former harbour could be used for the colliers, and for depôts of coals, the very excellent and substantially constructed wharfs that exist there being very well adapted for it.

There are many good houses a little above the level of the harbour and the surrounding heights, suitable for the residences of every grade of officers and men employed by the company, from the superintendent downwards. Many of the houses were used as officers' quarters when English troops were stationed there; but now they are generally unoccupied, and fast going to decay.

There are, also, many other large buildings,—barracks, stores of large size, block-houses, canvas sheds, &c., &c., in fact, every building and convenience necessary for a dock-yard, besides smiths' and engineers' shops and many artisans' cottages.

There is too a fine hospital on Shirley Heights overlooking the harbour.

This station has also the advantages of being well supplied with water, which could be easily conveyed by means of pipes to the harbour; besides at the north side of Falmouth Harbour there is a fresh-water spring capable of yielding 50,000 gallons of good water daily, which could be stored up and rendered available for ships' use.

There are other springs to the east of English Harbour, that could be dammed up in the ravines that descend the mountain sides, where reservoirs could be made of any capacity to hold water to supply the shipping; so there cannot be a doubt that an unlimited supply of water could be collected in the neighbourhood of these harbours for the shipping; and this is a very important consideration in any country, much more so in a tropical one, though perhaps it might not be considered a strong or vital question by steam ships' companies, as they can condense the sea water for their own purposes, and really the water is not had when cooled with a pure and crystal-like lump of ice, rendering it agreeable and refreshing. In a former article we strongly recommended the connexion of the central depôt of the packet station in the West Indies with the other West India islands by means of submarine telegraph, and we again draw attention to the subject, as we believe it to be one fraught with great advantage to trade and commerce, the general and internal government of the islands, and the telegraph might also be usefully employed in conveying meteorological and other information most useful to shipping, and which system has proved so advantageous in this country as developed and carried out under the late Admiral Fitzroy.

We have now fairly launched this momentous subject on the sea of public opinion, and shall feel ourselves disappointed if it do not return to us freighted with a large amount of benefit to the country; and as this question has been now in agitation and under consideration for many years, we trust it has arrived at that position that will lead to a complete and permanent settlement of it, bearing forcibly in mind that by the adoption of the plan recommended we should benefit an old, deserving, but not over-prosperous colony of our own, and, at the same time, secure our central depôt for the mails in the West Indies on our own territory.

A LONDON WEST-END STREET WITHOUT A TURNING.

In the second and last edition of my "Hand-book for London" (published in April, 1850, and now wholly out of print), is the following account of a London West-end street, without a turning on either side. Sackville-street, Piccadilly, is a long and wide street, and a fashionable and useful, though not a much-frequented, thoroughfare—

"Sackville-street, Piccadilly, the longest street in London of any consequence without a turning on either side. Built circa 1673, but why so called, I am not aware. Sir William Petty, the earliest writer on political economy in this country, lived in the reigns of Charles II. and James II., in the corner house on the east side, opposite St. James's Church. Dr. Joseph Warton had lodgings here in 1792."†

To this account I propose to make a "Chapter of Additions," promising that the pedigrees of Shelburne and Lansdowne are held by the descendants of this Sir William Petty, the circumstance of whose residence at the corner of Sackville-street I derived from the valuable MS. rate-books of St. Martin's-in-the-Fields, in which parish Sackville-street was, when first built,—not, as now, in the parish of St. James, Westminster.

Sackville-street, Piccadilly, consists of forty-four houses, well-built of brick, and derives its name, I see reason to believe, from the Sackvilles, Dukes of Dorset, or the Sackville-Wests, Earls De-la-Warr.

Sackville-street, in Dublin,—the finest street in Ireland,—was so called after Lionel Sackville, seventh earl and first duke of Dorset (died 1765, over a century since), twice Lord Lieutenant of Ireland. He was born in the reign of King James II., and was the holder of high offices of state under Queen Anne, King George I., King George II., and King George III., a tenure of political power without parallel (I believe) in English history. Though no more than seventy-eight years of age at his death, it was the Duke's lot to live in more reigns than any other person lived that I can call to mind. "Old Parr," who never knew the pills which bear his name, being excepted, as a matter of course.‡

The first "Boyle's Fashionable Court and Country Guide and Town Visiting Directory" I possess is that for the year 1802. It contains, its title-page tells us, "An Alphabetical Arrangement of the Names and Places of Abode (in Town and Country) of all the Ladies and Gentlemen of Fashion;" and its host on its title-page is that it contains, "for the use of porters in the hall, servants, &c., a separate register of all the fashionable streets, set down in a numerical manner, that the reader may see at one view and become acquainted in an instant with the names of the various persons of fashion, according to the numbers in each street."

Lolling, porter-like in imagination, in a large leather-covered, brass-nailed, sentry-box of a chair, in No. — (where the best wine-cellar doubtless was, and a French cook must have been kept), we fancy (James of Buckley-square-like) that we are a footman at the best (in plush), or at least a well caponed and vintaged porter in the hall of No. —, Sackville-street, Piccadilly, revolving "the sad vicissitude" of houses and names in "our street," as it has passed from 1802, the forty-second year of King George III., to A.D. 1867, the thirty-first year of the reign of King George's granddaughter, her most gracious Majesty Queen Victoria, "whom God long preserve."

In the year of our Lord 1802, pleasantly placed, Sackville-street, Piccadilly, London, was thus inhabited—

Nos. 1, 2, and 3 are passed over by courtesans Mr. and Mrs. Boyle.

No. 4, Colonel Whetham.

No. 5, was in 1819 the residence of Charles Kemble, the celebrated actor.

No. 9, Dr. Wright; afterwards, 1843, S. Cartwright, jun., surgeon-dentist.

No. 10, Lieut.-Col. Sharpe. This house succeeded by Mrs. Boyle in 1843.

No. 19, A. Frere, and of "Stamford Brook, Hammersmith," we are told in the *hoody* of the Guide. Was he any relation of Whistlercraft Hookham Frere?

No. 22, I find inhabited by Benjamin Charles

Brodie, the famous surgeon, afterwards Sir Benjamin Brodie, hart.

No. 24, James Mitchell. A Scotsman had got into the street. Was he any relation of the Sir Andrew Mitchell who had so much to do in Prussia, when Frederick the Great was king?

No. 27, William Leake. In 1843 Mrs. Boyle records a No. 27a.

No. 28, Dowager Duchess of Rutland, and (we are told in the body of the book) of "Croxted Park, near Belvoir Castle." In 1843, "Henry Donaldson, John Robinson, and Stephen Esclavier" lived here.

No. 29, Lord Hawkesbury, M.P.; and, the same authority adds, of "Rochampton, in Surrey." This house was afterwards inhabited by the Earl of Barrymore.

No. 30, Everard Home, afterwards Sir Everard Home, the famous surgeon.

No. 31, Hon. Mrs. Bland; and of "Isleworth, Middlesex."

No. 32, Arthur Young, of "Bradford Hall, near St. Edmundsbury, Suffolk."—I presume the Arthur Young of English agriculture.

No. 33, Dr. Bland.

No. 34, J. Weyland.

No. 35, Whished Keene, and "Richmond, Surrey."

No. 37, Mrs. Lanchester.

No. 38, Charles Hawkins. From 1810 to 1814 the house of Dowager Lady Ponlet.

No. 39, Edmund Wigley, "esq., M.P.; and Chexeniat, Worcestershire." In 1809 the house of Sir Herbert Jenner, the Sir Herbert Jenner First of the Prerogative Will Office, Doctors' Commons.

No. 40, John Spottiswood. In 1840 the house of Dr. Prout, the famous physician.

No. 43, Joseph Ashley Partridge, and "Breckspa, near Airedale [Harefield?], Middlesex."

In our time, men and women who remember the deaths of King George IV. and King William IV. and the accession of the beloved Queen who now reigns "over us,"—this Sackville-street, Piccadilly, was famous for its dentists. On more than five occasions we have dropped in willingly, and reluctantly too, to see either Mr. Clark or Mr. Rogers at No. 5, Mr. Cartwright at No. 9, Mr. Nasmyth at No. 18, or Mr. Parkinson at No. 36. Our teeth ache as we write at the recollection of what we suffered, and our heart leaps light when we think of the pains we were freed from by the skill of more than one surgeon-dentist in Sackville-street, Piccadilly.

The following letter will be read with interest. There can be no need of telling the readers of the *Builder* who Lionel Duke of Dorset was:—

"Lionel Sackville, Duke of Dorset, to Henrietta Hobart, Countess of Suffolk.

Dublin Castle, Nov. 9, 1731.

MADAM,—What shall I say for not returning you my hearty thanks—sometimes for your kind remembrance of a poor Irish friend? I think it is best not to trouble you with excuses, for I can make none that are good. I will not add to my impertinence by making you the messenger of my compliments to Mr. Pope, when I see that I will make them myself, in the best manner I am able, and at the same time I hope he will grant me a free conference upon the subject-matter of the epitaph. [Pope's on the Earl of Dorset?] Your newspaper talk of nothing but the great guest you have in England [the Duke of Lorraine]. I cannot but say I wish he had seen a little of our finery upon the Birthday [of the king]. I believe more rich clothes were never seen together, except at St. James's, and some of them so well chosen that one would have sworn a certain countess of my acquaintances had given assistance upon this occasion. I should not do justice to Captain Pearce's genius if I did not give you some account of the ball-room that he fitted up for the night's entertainment. The usual places was thought too little, and therefore it was resolved to make use of the old hall, which had been long disused and very much out of repair; however he so contrived it that I think I never saw a more beautiful scene. I am sure you won't think that an improper expression, when I tell you the walls were all covered with canvas, painted in perspective; the space was a large one, but it was so contrived as to make it look as big again; there were your boxes, your galleries, your orchestra, and pillars of all orders and denominations;—in short, there were all those things that your fine folks talk on now-a-days; and the lights were so perfectly well disposed, that upon my word, it had a most surprising fine effect. Some jokers were of opinion that our room might be better than our company; but they were perfectly convinced to the contrary, when they saw how it was filled. Newspapers, you know, are not always to be depended upon, and therefore I dare say you will believe me, when I tell you that it was infinite pleasure to me to find by your letter the king was so much better; my concern upon that head I believe you think goes somewhat further than merely the duty of a loyal subject towards his Master. I take it for granted this letter will find their besties settled at St. James's for the winter, and I hope both of them in perfect health. Her Grace desires her best compliments may be made to you; and that you may get rid of your head-aches, face-aches, and all other your troublesome companions, is the hearty wish of—

Yours, &c. DORSET."

I have no more to add to this account of pleasant Sackville-street, Piccadilly, London.

PETER CUNNINGHAM.

LABOURERS' DWELLINGS, LIVERPOOL.

The Health Committee have recommended for the approval of the Council the plans No. 47, prepared by Mr. John Reeves, of Liverpool. We have examined the design, which consists of two blocks of terrace houses in flats, divided by a court, 30 ft. wide, and facing two transverse streets, from Sylvester-street to Ashfield-street, also 30 ft. wide. The other portions of the site east and west of the proposed streets are covered with two-story cottages, twelve of which contain, each, cellars, parlour, kitchen, and three bed-rooms; and the remaining eight contain living-room, kitchen, and two bed-rooms. They are of a type very common in Liverpool. The two blocks of terrace-houses contain in all forty-eight dwellings, having each a kitchen, scullery, W.C., and two bed-rooms; the end houses have each a small additional bed-room. The estimate is 6,600*l.*, without the land. Only eight of the dwellings are proposed to be let at 3*s.* per week, 1*s.* and 5*s.* being the general run of the rents. The return on the investment is stated at 7 per cent.

It is quite a mystery why this plan should have been selected. The engineer's estimate of the cost far exceeds that by Mr. Reeves. There is no use musing the matter: it is impossible for it to be carried out for the sum stated, and the award would be unfair on that ground alone. We reckon that, at the rents stated, the corporation would receive about 4 per cent. on the outlay. It becomes more likely every day that none of the plans will be adopted. The next thing we expect to hear, if the houses are to be built at all, is, that the "engineer be ordered to make new plans."

We cannot conclude without remarking, that should the selected plans be adopted, labourers' dwellings will still remain to be built; and also, that the plans are not within the bye-laws, the terrace houses being 33 ft. high at one end, instead of 30 ft. throughout; so much for the statement in the local papers, that "the committee soon found out, when they began the task of selection, that the question they would really have to consider was, not which was the best plan, but which was most in accordance with the conditions of the competition."*

BIRMINGHAM AT THE PARIS EXHIBITION.†

The sub-committee of council of the Birmingham Chamber of Commerce requested an able and competent townsman, Mr. W. C. Aitken, the author of various publications connected with the art and industry of Birmingham, to accompany the local artisans selected, to visit, examine, and report on the works exhibited in the French International Exhibition; also to furnish a general report on those special industries which referred more particularly to Birmingham. The resultant reports by Mr. Aitken and the local artisans, however, are due to the scheme originated by the Society of Arts in London, to facilitate the visit of "foremen and skilled artisans to Paris," and to inspect and report on the contents of the Exhibition. Mr. Aitken is himself a member of the Society of Arts' committee.

The Exhibition, says Mr. Aitken, in his general report, demonstrates not the decadence of English inventive skill, industry, or perseverance, but that other nations, availing themselves of the experience gained in previous international exhibitions, have entered the industrial arena in those fields of industry in which we have hitherto reigned supreme. It bears evidence also, he remarks, that up to the present time the element of art is more generally known, understood, and intelligently introduced into manufactures on the Continent than in England. It also shows that the chief and direct advantages of an international exhibition are more particularly received by the country in which it is held; that practically the examination of objects by, and the decisions of, juries as to the merits of the objects exhibited are not to be depended upon; and that henceforth the farce

* Mr. Birch wishes it said, with reference to our notice of his design, that his plans and estimate provide for a height in the rooms of 4*ft.*, from floor to ceiling.

† Report presented to the Council of the Birmingham Chamber of Commerce, on Manufactures of a similar kind to those of Birmingham, as represented in the International Exhibition held at Paris, 1867; with Remarks on the Necessity for increased Facilities for Art Education, Science-teaching, and Technic Instruction, &c. By W. C. Aitken. Birmingham: Billing & Co., Printers.

* Rate-books of St. Martin's-in-the-Fields.

‡ Dr. Young, the poet of "Night Thoughts," lived in the same reign as the Duke of Dorset lived in, and died in the same year the Duke died in. Doctor Young (Doctor Old?) was, at his death, four years older than the Duke.

of juries and their awards may be considered at an end.

England, he continues, is placed at a disadvantage as regards the exhibition of heavy machinery, tools, and raw or partially manufactured materials, more particularly railway appliances; and judgment is given against her in consequence. Of the last it is stated that 300 contributions are the number exhibited: 152 of these are sent by France; while our country, which has done so much, and was the earliest to introduce and perfect the railway system, sends only twenty-one examples, the remaining contributions being made up by other exhibiting countries; but even the limited contributions of England are said to contain by far the noblest example of a locomotive. He points out that the distance, and consequent expense in transit, no doubt materially operated in limiting the English display. It may, however, be questioned whether the fact of sixty locomotives having been ordered for English railways from foreign engineering establishments, as also others for our railways in the East Indies, should not have induced a greater number of locomotives to be exhibited by our great engineering firms.

In raw produce also, as, for example, in iron, the cost of carriage no doubt equally operated, and our immense supplies of that metal, indicated only by a few English exhibitors, is by no means a fair representation of our gigantic industry therein; some idea of the magnitude of which, as contrasted with that of other countries, may be gathered from the consideration that we produce annually 4,500,000 tons, against not more than, at most, 400,000 tons, which it requires all the collective power and energy of every European nation united together to smelt and produce, from the purest and rarest known ores and charcoal; and which, after being made, cannot be sold at much under double the price of our most esteemed brands. The general excellence of English iron is admitted by every country, and its low cost is proved by the extent of our exports in that metal; but while there are abundant examples to show what the French can do in the production of iron in its manufactured state, as sheets, bars, girders, &c., we have no idea as to at what cost the examples shown were produced. The French, in getting up works for exhibition purposes, are notoriously regardless of cost; and there is every reason to suppose, that on the present occasion they have been equally so.

That labour may be cheaper and aid the Continental ironmaster, is true; but so long as we have our immense supplies of coal and iron, the iron industry of this country will, and must, survive and flourish. In coming time the wages of the foreign artisan will be approximated more nearly to those of this country at the present time, and this must react in favour of the English ironmaster. Moreover, it must not be forgotten that the means which have conduced to the development of the manufacture of iron in other countries, and created that mighty industry, are all our own.

Iron is especially a metal of the Birmingham district, and the merits of the exhibits in that metal, with the opinions expressed as to it, have induced Mr. Aitken to place before his constituents the implied opinion as to the competition in that metal they are likely to have in other countries. He does so because the elements introduced into the discussion as to the true state of that important industry in England are essentially those which affect other branches, which are more particularly examined in this report. That other countries must and will advance in the manipulation of iron, is to be expected; and that they will take, and are taking, advantage of every appliance and discovery made in England to aid them in making these advances is natural. Progress is the law of creation. Continental nations are jealous of this country: in the majority of those countries and states they are arming for the contest: they are educating their youths in trade schools. One moment's consideration will, however, show that by a greater attention to technic and general education among the workmen, coupled with our immense supplies of iron and coal, and a somewhat less infusion of mere speculation, the iron trade of England will practically again place itself in a healthy and comparatively impregnable position.

The space asked for by intending Birmingham exhibitors was 8,000 ft. It was cut down to 4,000 ft. This led to the withdrawing of at least one-third of the applicants. The total number of exhibitors from this town, including

those from Dudley, Bromsgrove, Stourbridge, and Redditch, was only eighty-five, as opposed to 120, the number from Birmingham who exhibited at Paris in 1855. On the present occasion one of the chief firms in the brass trade had their exhibits so crowded together as to render the inspection of their most complete display impossible.

Despite the want of space at command, according to Mr. Aitken, there is, on the part of manufacturers, a growing dislike to these exhibitions, arising out of their too frequent recurrence, the expense, and the hindrance to business caused by the preparations for exhibiting. These considerations, coupled with the want of space, in the case of Birmingham, resulted in several important trades being totally unrepresented; and in those trades that were represented, the number of exhibitors was so few as to afford no idea whatever of the importance or magnitude of the trade so imperfectly illustrated.

The general conclusion to which the reporter has arrived is that English manufacturers have suffered from lack of sufficient representation; that in the useful and substantial England holds her place; but in ornamental art, as applied to manufactures, she is behind. Still even in the "substantial" he sees the necessity for increased exertion, for other nations are making rapid strides in this direction; the whole face of French industry is changed, has advanced, and is rapidly advancing. At every succeeding exhibition he has marked the progress of France; and other nations, as Prussia, Belgium, Austria, and even the small states of the Zollverein show signs of increased industrial activity.

Scientific and technic instruction, Mr. Aitken remarks, is absolutely necessary. If it is admitted "that a greater number of new and successful combinations have been made by foreigners during the last ten years, than by the people of this country," and if "our trade suffers from want of art-education, as is generally thought by those who understand the matter," it is time that we besite ourselves, cast from around us the mantle of egotism in which we have hitherto been enveloped, tear from our eyes the delusive spectacles which exalted everything English, and diminished everything which was or is not. Industry formerly, unaffected by foreign rivalry, contented only with small portions of its own nation, and then the competition was small. But free trade has thrown down the barriers; and the world is now one mighty universal market. To be successful in this competition, our nation must therefore put forward all its energies to educate, in technic and other schools, the present and coming generations. If we fail in taking advantage of the lesson taught us by the exhibition, viz., that great progress has been, and is being, made by other countries, through artistic and industrial training; and if we neglect so to educate and train, it may truly be said of us, "Miserable is that nation which, after this exhibition, comprehends not the necessity for progress."

OBLIQUE ARCHES.*

AN "oblique" or "skew" bridge is one in which the roads passing over and under the arch cross each other obliquely. The angle which a perpendicular to the axis of the roadway passing under the bridge makes with that of the roadway over it, is called the "angle of obliquity."

Before the introduction of railroads it was usual for the engineer in laying out a road across a country, when he came obliquely on a stream, to turn his road on each side of it, so as to enable him to cross by a bridge thrown over at right angles to the direction of the stream. But this plan could not be adopted in forming a railroad, in which sudden turns must be carefully avoided, and the greatest possible straightness obtained. Hence, in making lines of railway, it frequently becomes necessary to build very oblique bridges of considerable span, and the voussoirs of the arch must be so constructed as to secure the greatest stability.

An oblique arch is a portion of two concentric semi-circular cylinders, cut obliquely by two planes, which form the face of the arch, the intrados and extrados lines of the two faces

* "A Treatise on the Art of Constructing Oblique Arches with Spiral Courses." By W. Donaldson, M.A., Assoc. Inst. C.E. Spon, London, 1867.

being generally ellipses. The solid contained between these two cylinders is cut by a number of similar screw-surfaces described about their common axis; and these are intersected at right angles by another series of similar screw-surfaces. The whole arch is thus divided into a number of equal and similar solids, which form the voussoirs of the oblique bridge. The dimensions and angles of the voussoirs can only be found accurately by trigonometrical calculation. As all the joints and beds are in spiral lines, it follows that the two faces of the arch should also be spiral; but when the span and angle of obliquity are great, this is scarcely feasible; for the wall and parapet over the arch being straight, the faces must be worked off to the same plane, so that the arch must have the appearance of being elliptical. Bridges may be safely built with as great an obliquity as 65°; but in arches of wide span and a high angle of obliquity, the direct section should be a flat segment of a circle in preference to a semicircle.

The earliest writer who appears to have discussed the question of spiral courses is Mr. Chapman, the engineer of the Kildare canal (Ireland), who is the author of the article on Oblique Arches in "Rees's Cyclopaedia" (published 1819); but he seems to have considered that it would be very difficult to get a mason to work the courses in stone, and advises the soffit to be built of brick, and only the faces of the arch to be of stone.

Mr. Nicholson, in his treatise on "Stone-cutting" published in 1828, also pointed out the true method of building oblique arches with spiral courses; but he did not enter much into the details of the art.

In 1836, Mr. Hart, a mason, working on railways under Mr. Stephenson, published a practical mode of finding templates for the spiral courses by a mechanical process, which gave tolerably accurate results. But this method, besides being laborious, is not sufficiently exact to satisfy the scientific engineer; and in 1839, a very complete treatise on the subject was produced by Mr. Buck, an engineer largely engaged on railway work, who found algebraical formulæ by which the dimensions and angles of the templates can be calculated. This work was re-edited in 1857, by Mr. W. H. Barlow, who added to it a method of making the requisite calculations without the use of trigonometrical formulæ, so that an intelligent foreman could direct the masons employed in building the bridge how to work the stones.

Mr. Donaldson has brought his high mathematical attainments to bear on the subject, and by means of the elegant modern methods of analysis, for which the University of Cambridge is justly celebrated, has obtained formulæ of great accuracy. He has also described a more exact mode of constructing the templates than those usually adopted; but we question whether the practical engineer will prefer this very elaborate process to the simpler though perhaps less accurate methods given by preceding writers on the oblique arch.

HEALTH AND WAGES.

Dr. J. H. STALLARD, at the Society of Arts, on the 4th inst., read a paper on the relation between health and wages, from which we may quote a few passages.

What, he asked, are the conditions essential to successful labour? They may be divided into three categories. Firstly, the power or physical ability to work. Secondly, the mental and moral qualifications, viz., the will to work and industry to work honestly, these being united with more or less of intelligence and skill. And lastly, the opportunity of working, which depends locally on the demand for labour and the profit which it yields. Taking the world at large, this opportunity is given to all who have will, intelligence, honesty, and strength, a combination of which will inevitably lead the possessors to seek the best market for their labour, and to rest satisfied with none which does not enable them to gratify the reasonable wants of an independent life.

Now, although the immediate object of this paper is to point out the intimate relation between health and wages, it must not be forgotten that the essential conditions of labour are most closely mixed up together, and react one upon the other with the most complicated results. Thus in a depressed state of trade, want of employment and privation lead inevitably to

exhausted health, and to the many consequences of exhausted health to be noticed presently. Moreover, it drives the labourer to tramp the country in search of work; it unsettles his ordinary mode of life, and brings him into collision with a class of wanderers whose habits he gradually acquires. One of the saddest features in the present state of society is the extraordinary increase of vagrancy which is now observed throughout the entire country. A week of such a life breaks the health and destroys the energy of the best intentioned labourer; and although he may be glad to escape the first or even the second time, the final result will be that he gradually loses health and energy for work—that he will adopt the shifts of the class with which he is thrown, and cease altogether to be a productive member of the community. So, again, whilst skill can in many cases supply the want of strength,—and we shall see that it has a constant tendency to do so,—yet it may be taken as a rule that both are associated together, a feeble community being ignorant, not because they are deficient in natural intelligence, but because they have neither the means, nor the time, nor the energy, to acquire knowledge. In the agricultural labourer we have the best example of strength without intelligence. In the population of the East of London we have intelligence without strength or knowledge to supply its place.

Lastly, it is clearly possible to have knowledge and strength without honesty or the will to work—the want of which equally prevents the employment of the labourer and leads eventually to the destruction of his health.

We arrive, then, at the conclusion that power or physical ability forms the basis of all kinds of labour. No man can work who is physically incompetent, and, *ceteris paribus*, the degree of strength determines the quantity of labour which a man can perform and the wages he can earn.

The first effect of physical degradation is an augmentation of productive power. The poor have more children than the rich. The more perfect the individual, the more refined his habits, the greater the difficulty in propagating the species. Nature makes up in numbers what she lacks in power; and so with inferior resources the poor have more mouths to feed. Physically these children are less healthy than their parents, from whom they inherit the seeds of debility and disease. The poor have thus a burden which the rich are not called upon to bear; the former have to bring forth, tend, and bury a mass of infantile humanity, and the expense of doing so must be a serious tax upon their scanty resources, and materially interfere with the rearing of the surviving children.

I have the written opinion of the most distinguished members of the medical profession, an opinion which must be endorsed by all practical philanthropists, that a very large proportion of the debility, deformity, disease, and premature death amongst the children of the London poor, as well as the want of stamina observed in after-life, is owing to insufficient, irregular, and unwholesome feeding during the period of growth.

A fertile source of degraded physical health amongst the labouring class is the waste of adult male life incidental to the occupation, and more prevalent in large towns, where the children are even more dependent on the father than they are in the country districts.

The struggle of bare existence is harder for the physically feeble than it is for others, and with an empty stomach and exhausted frame, the poor crossing-sweeper plies his occupation with an activity and perseverance prompted as much by habit as despair. Look at that ragged archin turning somersaults; he works hard enough, God knows, for the scanty pittance thrown him by the passers-by. Watch the pertinacity of the news-boys and the sellers of fuses. Turn to the cooper, and ask him how many miles he has to walk to realise a shilling. The more feeble he is, and the less his stock, the further he has to go.

The public ought to provide industrial institutions that the entire labouring class might be participants in the advantages of skilled labour according to their intelligence and strength. In this advantage capital will derive a double benefit, first by diminishing the monopoly of the artisan, and then by diminishing the expense of the pauper class. It is proposed to form public schools for the technical education of the artisan class; much more is it necessary to have industrial schools for the indigent class; and to feed them whilst they learn. Any excessive power of production will right itself, since an

intelligent labourer will certainly emigrate to other lands if he fail to supply his reasonable wants here.

Having shown that physical health is the basis of individual labour, it remains only to observe that what is true of individuals is also true of communities and nations.

In conclusion, I will add a few remarks on the remedies for the state of things I have described:—

1st. A review of the Poor-Law system, with the object of replacing the present repressive measures by an active system of judicious help to those whom sickness and misfortune drag down to the class below them, and eventually to pauperism.

2nd. A more perfect organization of charities, whereby the destitute and deserving poor may be supplied with what is necessary, without having recourse to the system of begging, inseparable from the present multiplication of charitable institutions.

3rd. The necessity of supplying relief to the children of the indigent class in the shape of wholesome food. That industrial training should be a condition of all relief to the children of the poor, and that such training should occupy the first place in the education of a class which depends on labour for independence; moral and religious instruction being from the necessity of the case secondary thereto.

4th. By a system of seven years' apprenticeship, with food and clothing at the public cost, that a certain number of children may be raised from the indigent to the artisan class, with the view of breaking down the monopoly now enjoyed by the latter, and filling up the hiatus which sickness and misfortune constantly make in the ranks of the artisan.

5th. By taking measures to transfer as many children, orphans, and others, to the country districts where, as in Scotland and France, they may be cheaply and healthily brought up in the villages to which they naturally belong. By this means the physical degeneration inseparable from town life would be combated, and the tendency to pauperism in the cities, now becoming general on account of the facilities of transit and the attractions of large towns, would be greatly diminished.

6th. That it is the duty of Government to provide a register of labour through the instrumentality of the Poor-Law, and reform the tramp wards, that a stop may be put to vagrancy, and the destitute labourer may travel with safety, and with a reasonable expectation that he may obtain work.

Lastly, These objects can only be secured by a reform in the present system of doing charity by proxy, and the efforts of philanthropic persons require to be organised and supported by a staff of officials, which might be properly provided at the public cost, with the certain result that charitable persons would give more liberally, because they would have confidence in the executive. The rates would then be only used to supplement benevolence when the latter fails, and the rich would thus relieve the lower order of ratepayers from the undue pressure to which they are now subjected. In fact, State charity, to be efficient, must be kept as much as possible out of sight.

GLoucester School of Art.

THE annual distribution of prizes to the pupils of this school has taken place at the Tolsey. The admission tickets were a shilling each, and the room was crowded by the pupils and their friends. The mayor (Mr. C. F. Innel) presided. The report said:—

The number of students who attended the Gloucester School of Art during the year happens to be exactly the same as that of last year, 546; that the return of the year does not show an increase is, we believe, chiefly ascribable to the nature and position of the building occupied at our School of Art. In the annual examination of last March 48 persons sat for examination, against 45 the previous year. Of these 23 were successful, against 21 last year. The students whose works were sent to the Devonian competition, this year were 54; last year were 48. The numbers successful were—this year 24; last year 32. This year, in the Elementary Section, 12 students were successful; last year, 25; in the Advanced Section, this year 12 again were successful, against 7 last year. Of these 12 students, the works of 5 were chosen for National Competition, against those of the 7 last year, which were all chosen. In the National Competition we have no successes to show this year; last year we obtained a bronze medal. Reviewing this statement, we find an increase of successes in the Advanced Section, a decrease in the Elementary one. This is simply owing to a shifting of the standard of success by the South Kensington authorities, and not to any falling off in the quality of our work.

Mr. Gambier Parry addressed the meeting, and in course of his speech he referred to the subject of beauty and use in art. This school, he said, is for the benefit of the operative, working, artisan class—using that expression in a very wide sense—to enable them to utilise their fingers for the benefit of their lives. Therefore, the great thing to demonstrate is, that beauty is of use. I believe that of late we have to a certain degree come to acknowledge this in our designs for manufactured articles of cotton and furniture, and things of that sort. But still, in our highest manufactures in which art appears the French have outdone us completely. I was sorry to find that in one art we cannot approach them at all—that bookbinding—and most refined art of chiselling metal work, which requires the finest eye and the steadiest hand, and in figure drawing also they have certainly gone far ahead of us.

Mr. Komp, the master, said no one was better aware than he of the inferiority of England to

France in matters of art, and no master impressed the fact more strongly upon his pupils, or strove more to do what he could to remedy the defect. "We are a very long way behind the French in this matter," he said. "We have to make a beginning; they do not seem ever to have had to make a beginning. What are ten or fifteen years in comparison with the centuries of experience the French have had; and what also the extent of our little island as compared with France, with its treasured works of art scattered all over it? The odds are fearfully against us; but I trust that our British nation will soon make them equal. One of our divergencies to the right or left, whichever it may be, is the exclusive striving after accuracy. Now, a merely accurate man is one of the most disagreeable people in the world, and if accuracy is beauty, the best thing we can do is to cover our walls with photographs and fill our libraries with Blue-books. We want not only accuracy, but poetry and spirit, and liveliness, and a spark of originality amongst our pupils."

In subsequent remarks, Mr. Parry drew the mayor's attention to the effects of the inadequacy and inconvenience of the present building used as the school, and implored him, as forwarding a really good moral purpose, to aid them in remedying the defect. The real scheme to answer would be to have one building inclosing the School of Art, the museum, a public library, baths and washhouses, and so forth, with at the back a space for the Gymnastic Society; the washerwomen and the athletes would form very nice studies for the art pupils. But, appealing to the military Englishman, he was perfectly confident that it would pay. He hoped the mayor would signalise his year of office by forwarding this scheme.

GREY-TOWERS, NUNHOPE.

THIS mansion, for Mr. W. R. J. Hopkins, which has been in progress about two years and a half, is now approaching completion. It is situated about seven miles from Middlebro'-on-Tees, and amidst some of the finest scenery in Cleveland. The building is faced with blue flint stone, from quarries in the neighbourhood, and the dressings are of a warm yellow local sandstone. The principal staircase is of oak, and the chief rooms on the ground-floor have panelled wood ceilings; that to the main staircase being enriched with carved and moulded ribs, shells, &c., and surmounted by a lantern-light glazed with richly-cut glass. The whole of the building has been carried out in a handsome and substantial manner, and the arrangements for water supply, heating, and ventilation are very complete. There are in all about thirty bed-rooms, including dressing-rooms. We give a view of the south and east fronts, and the ground plan. The mansion has been erected by Messrs. Oliver & John-on, contractors, Middlebro'. The clerk of the works is Mr. W. Freeman. The architect is Mr. John Ross, of Darlington.

GARRY-TOWERS, NUNEHAM HOUSE.—Ground Plan.

GREY TOWERS, NUNTHORPE.—MR. JOHN ROSS, ARCHITECT.

THE CO-OPERATIVE MOVEMENT.

A MEETING of farmers and others interested in agriculture has been held at Islington, convened by the Agricultural and Horticultural Association (Limited). The council of this society includes the Right Hon. W. Cooper, M.P., and Mr. T. Hughes, M.P. Mr. Greening, the managing director, stated that the operations of the association, so far as they had done, had been crowned with complete success. The members were supplied with the best description of implements, manures, cattle-food, seeds, &c., at trade prices, without the intervention of agents' profits; but, in addition to their securing good and unadulterated articles, the whole of the profits, minus the small charge for working expenses, which did not average more than 4 per cent., would find their way into the pockets of the members. They would receive a dividend of 7½ per cent. on the capital and the profits upon their purchases, minus the working expenses, the amount returned in the average of existing co-operative associations being 6-7ths of the profits. At present the manufacturers allowed a commission of something like 20 per cent. to the agents who sold the goods, and in the event of the farmers availing themselves of the advantages of agricultural co-operation, that commission would be saved, and would of itself form a large source of profit. Extensive adulterations in cattle-food would thus also be checked.

In addressing a meeting of the Peckham Industrial and Provident Society, Mr. Hughes, M.P., observed that the co-operative principle had extended itself in many ways. He instanced the case of the Messrs. Briggs, the great coal-owners of Wakefield, who had resolved to put an end to the strike and look-out system by giving their men a share in the profits. Previously their collieries never paid more than 7 per cent., whereas under the new system not only was there 10 per cent. paid for capital to the Messrs. Briggs, but a sum of 1,800l. in hard cash was divided among the working people. In the second year the 10 per cent. was also paid, a dividend of 3 per cent. was declared, and 2,000l. divided among the workmen. The principle thus carried out made these men partners, and of course more careful; and hence it was that a vast amount of expenditure was saved, and an enormous success attained. The movement was only just beginning, but he was strongly of opinion it would eventually succeed and put an end to those terrible struggles between labour and capital which brought so much misery and ruin on hundreds and thousands of families among the working classes of this country. He exhorted them earnestly and sincerely to persevere in their good work, and not be discouraged by any opposition which might be thrown in their way.

SAVE THE CHILDREN.

THE REFUGE for HOMELESS CHILDREN now includes a house, No. 8, Great Queen-street, Lincoln's-inn-fields, for 100 boys; the Training Ship, *Chickster*, with another 100 boys; and two homes for girls, one at 19, Broad-street, Bloomsbury, and the other temporarily located at Kilburn. These refuges afford home and training for the inmates, who are received into them all the year round.

The Report for 1867 describes the good result of the supper that was given to 200 boys from the Casual Wards in 1866, and the establishment of the training ship.

The industrial element still continues to be an important branch of the training in this Refuge;—without it no permanent good could be accomplished among the boys. The trades taught are carpentering, firewood chopping, shoemaking, and tailoring; occupations which are all useful to the lads whether they emigrate to the colonies, go to sea, or obtain situations at home.

The result of the industrial work for the past year is as follows, viz. :—

Work done for customers and goods sold	£807	5	0
Value of work done for the Boys and Girls	548	15	2
Refuges	209	5	6
350 pairs of new boots in stock, value	141	0	11
Earned boys' work	35	9	4
Earned by boys at hay-making			
	£1,438	15	11

Being more than was earned last year by 500l. We learn that 2,031 pairs of new boots and shoes were made; 2,224 repaired. 1,170 new articles of clothing were made in the tailors' class; 2,727

articles repaired. 29,752 bundles of firewood were cut, made up, and sold; 2,420 for the use of the Institution. 42 mattresses were made; 20 repaired.

The payments for supporting the inmates of the three refuges, maintaining the five day and evening ragged-schools, and for completing and fitting the ship, clothing for the first fifty boys, &c., were 5,727l. 3s. 1d.; invested in Bedou's Annuities, 5,111l. 9s. 6d.; on deposit, 800l.; total 10,038l. 12s. 7d.; the payments left in hand, 640l. 12s. 4d.

What is wanted is, that the Government will forego the claim of 2,000l. for the masts, sails, boats, and other materials, drawn from the dockyard, to complete and fit up the ship; so that the funds required for paying that debt could be devoted to the support of more boys on the ship and in the refuge. Should the Government still require payment for the materials the committee will, of course, be bound to pay, and that being the case, the work would be retarded. The committee, however, hope that when the Government see that the ship is now in working order, and that there are 100 boys on board, being trained for a seafaring life, they will at once discharge the committee from all liability in respect of the materials referred to. We hope so too: the work is a good one, and must be looked upon as of a national character; for whether it is viewed as a means for rescuing the waifs and strays of this great metropolis, or as a means of supplying the diminution of seamen so generally felt in every port, the work which is thus established must prove beneficial to the country at large.

THE FEMALE SCHOOL OF ART.

THE meeting-room of the Royal Society at Burlington House was filled with a pretty audience on the 14th inst., to hear the Report and see Sir Francis Grant, P.R.A., present the prizes to successful competitors. He was supported by Professor Donaldson, who read the Report; by Professor Westmacott; Mr. O'Neill, R.A.; Mr. Landseer, R.A.; Mr. Lewis Pocock; Mr. Bowler; Mr. Redgrave, R.A.; and many other friends of the school. It appears that there are now 107 students on the books, being 34 more than at the same date last year. At the close of the summer session the number was 130, and the committee have little doubt that, as the advantages offered by the school become more extensively known, a very short period will suffice to raise the number from 150 to 200 students, which it can easily accommodate. At the annual second-grade examination in March, 1867, 36 students presented themselves for examination, 25 passed in one or more of the papers, and 13 prizes were taken. At the annual national and local examination of the drawings at South Kensington last April, one national silver medal was awarded to Alice Elfrida Manly, and one national bronze to Margaretta Clarke. Ten local prizes No. 1, and four prizes No. 2, were awarded; and three students obtained honourable mention. Two prizes for design offered by Miss Bell, of Alton, have been awarded, the first prize to Sarah M'Gregor, the second prize to Emily Austin. The first gold medal given by her Majesty, to be competed for annually by the students of this school, has been awarded to Alice Elfrida Manly for three groups of flowers in tempera from nature. The Report dwelt upon other circumstances connected with the working of the school, and concluded with a congratulatory reference to the circumstance that the gold medal of the Royal Academy and a scholarship of 60l. had this year been won, as we mentioned last week, by Miss Louisa Starr.*

The President read an excellent address, and in the course of it said:—One day last week he had had the pleasure of going over the school, accompanied by its excellent superintendent, Miss Gann, and was highly gratified. He found there numerous students receiving a sound and valuable education, and saw many young ladies displaying great ability in drawing from the antique, from the life, from the flat, or from model. He was especially struck with one beautiful painting in monochrome, from the antique, and upon inquiring by whom it had been executed he was infinitely surprised to find it was the work of Miss Manly. It was very extraordinary to see such varied excellence in

* We understand there were six male and three female competitors.

such different departments of art; and having already admired her remarkable drawings of flowers, he could not but prognosticate a brilliant future from so successful a beginning.

Referring to the progress made by ladies, he said,—We men may well tremble in our abscs when we see this great "storm wave" of female talent and enterprise rolling rapidly forward and threatening to overwhelm us; but while I shall ever be the advocate of an open field, fair play, and no favour, I trust the result will be better art, and a friendly, peaceable, and even affectionate rivalry.

Professor Westmacott afterwards briefly addressed the meeting, and Mr. Redgrave moved a vote of thanks to Sir Francis Grant, which, being seconded by Mr. O'Neill, was passed by acclamation, and the meeting was dissolved.

We would direct the attention of those who are interested in the progress of industrial art to Mr. Walter Smith's "Educational View of the Paris Exhibition," which we printed recently.* With the greater part of his suggestions we fully agree.

ACCIDENTS.

THE parish church of Letwell, near Worksop, Notts, has been totally destroyed by fire. The cause of the fire has not been ascertained, but it is supposed to have originated, as usual, from the overheating of the apparatus for warming the church on Sunday morning. The building was restored and fitted with open benches in 1864.

A shocking accident has occurred at the parish church, King's Norton. A new peal of bells, subscribed for by the parishioners, has just been cast by Messrs. Blews & Son, of Birmingham, and the largest bell was being fixed, when, from some cause at present unexplained, it fell, cutting in two the organ, and fatally crushing the head of Mr. Arthur Longmore, a young gentleman who has shown much interest in the work.

An extensive fall of earth has occurred in a deep excavation near Bolton, on the new railway line between Horwich and Hindley, completely burying four or five of the men. One of them has since died.

The jury who sat on the body of William Watt who was killed in Sunderland Docks by the falling of a bridge, have returned the following verdict:—"That the deceased was accidentally killed by the fall of a certain archway leading to No. 13 drop at Sunderland Dock, and that the fall of the said archway arose from the want of a proper repair of the abutment or east wall of the archway, which wall, in the opinion of the jurors, from its defective state, ought previously to have been repaired; and they strongly censure the Commissioners for not having acted upon the report of Mr. Meik."

In a café, Rue Galande, Paris, the beams and joists which sustained the first floor gave way and fell, killing three masons, and more or less injuring three or four other individuals in the shop below.

THE SEWAGE QUESTION, GLASGOW.

A MEETING of the Association for the Consideration of the Sewage Question, and others interested in that question, was held on the 16th instant. Mr. Hugh H. MacInre, C.E., read a paper on the sewage question, more especially as concerning Glasgow. He explained that his proposal was simply to deal with sewage in the state in which it was found in the common sewers, and to apply a practical combination of the outfall works in the Thames with the simple and effective irrigation works adopted, and in daily use at Edinburgh, Croydon, Worthing, Carlisle, and elsewhere. The main covered intercepting sewers he proposed should be carried to stations some little distance beyond the present buildings and suburbs of Glasgow; thence through the agricultural districts on both sides of the Clyde, by open sewage canals, these canals terminating on each side of the river, in large receiving tanks, situated on the margin of a mile below Dalnair. The tanks would be capable of containing the sewage of the city for a period of twelve hours. He could not disguise the difficulties and expenses connected with the large quantity of low-level sewage. The difficulty could only be

* See pp. 867 and 893.

met by collecting, by means of a tunnel under the Clyde, the contents of those sewers into a well on the south side at Govan, and pumping them up into a receiving tank situated at the north side of the Glasgow and Paisley Railway, near Craigton. Mr. Maclure went on to meet objections which might be made to open canals and other parts of his scheme. The cost of it, including works, land, and contingencies, would be 332,031*l.*, to which must be added 4,130*l.* per annum for pumping, independent of management and maintenance of works. He mentioned that the land available for irrigation on the north and south sides of the Clyde below Partick was, in all, 6,540 acres. The sewage of Glasgow would irrigate 4,740 acres.

THE SOLWAY VIADUCT.

MR. R. S. NORTH, C.E., had, it appears, charge of the erection of this viaduct, subject to the control and direction of the agent of the contractors; and the conditions on which he undertook this charge were something like the following:—That the cost of erection was to be 8,000*l.*; that the time for completing the viaduct was to be eighteen months; that Mr. North's salary was to be 1,000*l.* per annum, or 1,500*l.* for eighteen months, and if the work was finished in less time he was still to receive 1,500*l.*; that if the viaduct occupied a longer period than eighteen months, Mr. North was to forfeit 100*l.* for every month beyond eighteen it took to complete it; and that, if the viaduct should be erected for less than 8,000*l.*, the saving was to be divided between Mr. North and the contractors. The erection of the viaduct was commenced in the summer of 1855; and Mr. North conducted the operations until October, 1866, when he was dismissed. Mr. North has since raised an action in the Scottish Court of Session, claiming 526*l.* 6*s.* 3*d.*, for salary due, with interest thereon; 88*l.* 18*s.* 7*d.*, for salary due for the period of his unexpired services, with interest; and 5,000*l.* for "loss of profits and injury to his character, credit, and feelings." The contractors, on the other hand, have brought a counter-action, claiming 3,000*l.* damages for breach of agreement, in improper construction and delay; and 1,000*l.* damages for allowing the plant and materials to be injured and destroyed.

MEDALS FOR HOUSE IMPROVEMENT.

We have pleasure in recording the award of a gold medal to the Society for Improving the Condition of the Labouring Classes, by the International Jury of the Paris Universal Exhibition. This society has been engaged in its important work, under the presidency of the Earl of Shaftesbury, for nearly a quarter of a century. And whilst we could wish for so useful a society still greater support, it will be gratifying to the many friends of the movement to know, that in respect of plans and designs for working men's homes, the English are found to occupy a foremost place.

We understand that a similar medal has been awarded to the Metropolitan Association for Improving the Dwellings of the Industrious Classes.

THE SANITARY FIGHT.

I HAVE perused with interest the article in your number for the 23rd ult. on the preservation of rain-water in towns. The subject deserves attention, as every day's experience shows that the question of water supply to towns and cities is becoming of more and more pressing urgency. There are, however, one or two points to which I will, with your permission, briefly advert.

In every building, from a cottage to a mansion, provision could no doubt be made, and space found, for a cistern in such a situation in the attic or roof, as in no way to interfere with the beneficial occupation. Rain-water so stored should, however, be filtered before use; and at no time should it be used except when perfectly fresh, saving only for inferior purposes, such as the supply of w.c. For this and other like purposes it might be found very convenient, and would save, at least in part, the great drain there is upon our waterworks systems for these

and similar conveniences; besides, the cistern would on many occasions afford a supply when other sources are frozen up or temporarily cut off. So, by the storage of rain-water, no doubt some good might be done; but, as a rule, all tubs, tanks, cisterns, and other receptacles for the retention (and possible stagnation and putridity) of water for domestic purposes are objectionable. As to the rain-water being of service in flushing systems of sewers, there is no doubt of its great value; and the beneficial effects of the periodical cleansing of town surfaces and sewers by rainfall, must, I think, be admitted by all. It would, indeed, be a calamity rather than an advantage to cut off from the sewers all the rainfall.

As to dilution of town sewage by rain, and consequent increase of bulk to be dealt with, that need not be a source of trouble where there is a well-devised system of storm outlets for the discharge of the rainfall into the natural water-courses; and as to increased volume at the outfalls, this difficulty is easily disposed of, for when the sewage is much diluted with rain-water it may, in most cases, be safely turned direct into the adjacent stream, and so be carried off in the increased and dilute volume. This works well also in another way; for where the sewage is used for irrigation at times of heavy rainfall, when the diluted water is discharged direct to the stream, the land is charged with the rainfall, and least able to receive and pass off the extra quantity of moisture which the addition of the sewage dilute with the rainfall would give.

Sewers properly devised are not intended for the conveyance of stormfalls of rain; the natural streams are open to receive these, and into them they should go. Besides the convenience of this process, and the consequent diminution of expense in constructing sewers adjusted for sewage only, there is another very important consideration; that is, that in the manufacturing districts, especially, every drop of fresh water is required for trade purposes; and there is no need why sanitary improvements should not, so far as they can properly do so, preserve trade privileges and rights unimpaired. Sanitary works may, in isolated cases, affect prejudicially trade interests, but for one such instance there will be a thousand preponderating tendencies to good.

At the present time a great onslaught is being made upon the hitherto impassable barriers, and we are heset with the besiegers so closely that there is no escape. Let us take a look over the ramparts and see the assailants who are besieging our smoke-begrimed and murky, muddy-rivered city. We hail them and demand their terms upon which we may surrender. "You ought not to cast any dirt, or dye, or refuse, or sewage, or any other like grievous thing into your river;" so say the rivers' pollution preventionists. "You must utilize your sewage, and count every pound or pint of refuse as worth so much;" so say the sewage utilizers. "You must burn your smoke;" so say the urban air purifiers. "You must build decent habitable dwellings for your workers, and let them out of the dark dreary alleys, close courts, and cellars of your city;" so say the improved dwellings philosophers. "You must educate, educate!" so say those who see that it is dangerous to put the weapons of power into the hands of untrained men. And then, there is a general cry for new hospitals where disease can be treated, and where grim death can be battled with; new workhouses, where the poor can live in luxury approaching that of model prisons; new asylums, where imbecility can be won back to reason, or, if not, can be coaxed into harmlessness with music and kind words; new parks, baths, and playgrounds. In short, a new and improved lease of life for the tolling millions in this workshop of the world. It is a strong barrier which interposes betwixt us and all this good, but it must come down. To restore so far as can be the purity of our streams will be to the advantage of everybody, whether he be trader or dweller by the once clear brook where the "speckled trout" abounded, but where now, alas! no living thing can exist. To burn the smoke from the thousands of chimney-shafts will be to give us air fit to breathe, and to save annually thousands of tons of coal. To improve the dwellings of the industrial classes will be to elevate them mentally, to improve them physically, to make them better workers, sounder thinkers. To fertilize the earth with the waste products of our cities and towns will be to turn a present curse into a blessing; for whatever that is offensive to us we cast into the lap of mother

earth, all-bounteous Nature will return us out of her great laboratory tenfold in food for man and beast. So every other upward struggle to what is right and good will bring a sure reward if we faint not. As yet, the public mind is but very partially willing to accept these truths in their full force. We look over the old, old barrier and treat the innovators as foes, and refuse to surrender the citadel of our time-honoured prejudices. The day is dawning, however, and the barrier shows signs of giving way,—friendly glances are exchanged with the foes (?) outside, and, if not we, at least the next generation will, we trust, witness marvels of conquest of progress over prejudice, and see wonders in the conversion of waste and want into profit and plenty.

J. B.

ARCHITECTURE IN GERMANY.

HAVING seen a good deal of German architecture a few years ago, I read your able leader of last week with much interest. You are very right when you fear that Munich was the cradle of that *soi-disant* "Gothic of the Future" which is running riot in some parts of Germany, especially in the south. It is known as the "Maximilian Style" in all their schools; and the style, to which this name is given is very weak Romanesque, with Classic, Gothic, and all sorts of other details. Munich was the cradle, and the Architectural Colleges of Stuttgart, Karlsruhe, and Hanover were, and still are, the nurseries. At Berlin, however, and throughout the North of Germany, this style has had no chance, thanks to the memory of Schinkel, and the teachings of Stubler and Strack; and, as the study of Ecclesiastical architecture is more and more revived, we may soon hope to see the last of this nineteenth century Rococo. To the list of buildings enriched with frescoes you might have added, the Museum at Berlin (Kamhach), and the Palace at Stuttgart (Schnorr); also the Pompeiurum at Aschaffenburg, and the Trinkhalle at Baden. I ask with you, sir, "Why cannot we do these things in England?"

ALFRED STRONG.

Steile's "Emperors" in the Römer, at Frankfurt, are, I believe, executed in oils on canvass, and affixed to wood panels.

THE POSITION OF THE BRITISH WORKMAN.

I HAVE just read in the current number of the *Builder* the letter headed "The Condition of Architectural Sculpture," and signed "John Roddis, Carver."

It is admirable, so far as it goes; but Mr. Roddis has altogether overlooked the most material bar to excellence in workmanship in England, which is trade-unionism, *alias* trade-terrorism. Did the proprietors of houses being built, did building committees, did architects ordain that one scale of wages should be paid in building trades to skilled and unskilled workmen alike? No; but the workmen did. Suppose an architect or his clerk of the works engaged a few first-rate hands, and paid them whatever remuneration they chose to ask, what would ensue? *Rattening!*

In this land of boasted liberty, a workman may not use the skill and energy with which God has endowed him, and by means of which he would often gladly earn a little extra money wherewith to purchase some comfort, it may he for a sick wife or a dying child, because, forsooth, some lazy fellow-member of his "union" has neither the will nor the skill to keep pace with him; and therefore has framed these wicked "rules" to drag every one else down to his own low level. This is the great bar to progress in England.

And while on the subject of trades unions, their necessary consequences, "strikes," naturally rise to mind; and, *à propos* of them, I wish to say to their originators and abettors, "Behold in the unparalleled distress already prevailing among the poorer classes, though winter has scarcely commenced its terrors as yet, the worthy fruit of the seed sown by you! When there was work in plenty to be done, and at fair wages too, you drove out shipwrights, bricklayers, tailors, workmen of all trades and grades, and much of the present destitution and misery lies at your door, and you will have to account for it hereafter, if not here.

I confess, though I am not hardhearted nor

uncharitable, that the appeals for "help for the starving" never seemed to me to come with so bad a grace as now. Workmen have ruined themselves and ruined their employers by refusing to work; and the very class to which those employers belong must further impoverish itself by feeding and clothing the hungry and naked wives and children of those men who have so deeply injured its members.* Well, so mote it be. At this particular season of the year we will not forget Who said, "Do good to them that despitely use you." R. F. H.

THE LAMPS IN HYDE PARK.

Sir,—I have another grievance, those complete failures—the new lamps in Hyde Park! That stupid circle of corrugated glass or metal, put midway in the otherwise good-looking lamp-globe, divides it into a steamy half-lighted semicircle, and an obscure fog-red second semicircle over. What is that corrugated plate for? It does not reflect the light, nor allow it to pass through, but simply absorbs it.

The burners, again, are not good, and the result is a dim, dingy, yellow light, just like a badly trimmed oil-lamp, as may be proved any evening all along Hyde Park. Why were not two or three of the lamps put up and experimentalized upon, before we were committed to these failures, at, of course, some considerable expense? Once up, there is very little hope of getting rid of them, unless the *Builder* raises its breath, and blows a blast strong enough to drive them away. The lamp-poets, too, are too far apart: there should be at least half as many, if not quite as many, again. While "lighting the park," why not have lighted it? Now the lamps simply serve to make the surrounding darkness more visible.—I am, your

ENRAGED CORRESPONDENT.

MARKET AT HOUNDSDITCH.

Sir,—You some time ago threw out some valuable suggestions as to building markets. I have just finished a market for Mr. McCall, of Houndsditch, the well-known preserved-provision manufacturer. It is close to Whitechapel Church, and has cost about 3,000*l.* I saw it opened, and, judging from the prices asked for meat, and the great number of buyers, I should say it will be a great boon to the poor, and also to all who can avail themselves of its advantages, as I saw excellent shoulders of mutton sold for 5*d.*, and legs at 5*d.* per lb. It is intended, also, to sell soup and all kinds of cooked meats; also butter, cheese, groceries,—in fact, if possible, to enable a poor man to go to his Saturday, and buy all the provisions of any kind he may require, and that at the lowest possible price, and in a warm and well-lighted place, instead of wandering about from shop to shop, sometimes in the snow and wet. J. P. WATERSON.

WAGES IN NEW ZEALAND.

Sir,—In your number, June 15, 1867, you state,—"Bricklayers in New Zealand earn 1*s.* per hour; plasterers have as good wages, &c." The figures you give are, no doubt, very high, especially when compared with the majority of the wages for similar tradesmen in Britain, but yet they are very far below what is actually paid here.

In Dunedin (the chief town of the province of Otago, and also the most flourishing town in New Zealand), the following have been the wages paid for some years: before that, and during the first rushes to the gold-fields, they were much higher:—

Masons and bricklayers, 12*s.* to 15*s.* per day.
Bricklayers' labourers, 10*s.* per day.
Carpenters and joiners, plumbers, painters, and, in fact, all other tradesmen, 12*s.* to 15*s.* per day.

In the towns on the gold-fields of this province, in Hokitika, Greymouth, and other towns on the west coast, the wages are always much

higher than they are here. The eight-hours system is the rule all over New Zealand and Australia. In the monthly summaries of the *Otago Daily Times*, you will always see lists of wages prevailing here; so that you need never be led astray, as these lists are to be depended on.

I have been in active practice here for the last six years, and as I am therefore in a position to know what tradesmen's wages, &c., are, I have taken the liberty of sending this statement.

Dunedin. DAVID ROSS, Architect.

LANGHAM HOTEL PLANS.

Sir,—I must really trespass upon the courtesy of yourself and readers to be allowed to say again that Mr. Murray never saw the plans of the principal floors of the hotel until I had completely designed every arrangement in them. My clerks and my own diary can establish this fact sufficiently.

I never alleged that Mr. Murray had influence with the directors; I knew that his friends did so.

As regards the conclusion of his letter, I can only quote the report of the directors, as follows:—"The directors, having taken the plans of the hotel, selected the design of Mr. Giles."

The plans I mentioned are in my possession. The Judge struck them out of the list when I proved them to be mine, and they remain with me. JOHN GILES.

* * * We depart unwillingly from our determination to admit no other letter on this subject; under the circumstances we could not refuse insertion to the above.

"AN ADVERTISED COMPETITION."

Sir,—In answer to a paragraph headed "A Warning," the *Builder* of the 15th in the office of the agent, and temporary office of Mr. Baxter, where all reasonable information can be obtained. The gentleman in question is now abroad forming a company to build large premises in this locality, or abroad according to cost; the warehouse is intended for the sale of their own goods.

As Mr. Baxter does not wish to have any misunderstanding, any competing architect wishful to withdraw from the same can have the fee returned. J. BROWN, Architect, Queen-street, Leeds.

* * * The fact that we have received five other letters to the effect of that from "G. E. G.," shows that, at any rate, the affair has not been well managed.

RADIATION FROM IRON PIPES.

Sir,—I have just basted my office with steam, but find the (cast) iron pipes do not part freely with their heat, but carry a good percentage of it out into the waste draft, when it is useless except for the purpose of driving the rats away. Can any of your readers tell me how I could promote the radiating properties of the pipe? H.

HER MAJESTY'S THEATRE.

Sir,—I believe there is no cause from which so many fires originate as from warm air-stoves. The fact is, work-people are allowed to cut a building about in all directions, without proper superintendence from the architect or otherwise. The consequence is, they either cut away timbers, or place the stoves in conjunction with them or boarding. The result is, the stove is too often overheated, the timbers and boarding become so dried and heated a state as to cause spontaneous combustion. At Her Majesty's Theatre the fireman on duty smelt fire, which smell must have continued, although he named to his companion all was safe, when, in fact, the mischief was increasing, instead of representing it to proper authorities; and this was probably from an over-heated apparatus. A SUBSCRIBER.

INDIGNATION MEETING OF WORKMEN.

On Wednesday evening a meeting of the whole of the men at present employed by Mr. Fiske, of Dowling-gardens, was held at his works, to express the views of his employes, nearly 400 in number, on the recent attempt to burn down by means of Greek fire his property, No. 4, Grosvenor-square. The general clerk of works, Mr. Terry, was elected chairman, and in opening the meeting said they were met to give expression to their opinion as to the dastardly deeds perpetrated by the so-called gentians, especially in reference to Mr. Fiske's house at Grosvenor-square. He considered that those who could so wantonly endanger the property and lives of those who had never done them any harm, murdering poor women with little children, and causing misery and many households, were not worthy the name of men; they were rascals, utterly reckless of the property of the rich or the homes and lives of the poor.

The following resolution was proposed and carried unanimously:—"That this meeting of men in the employ of Mr. Fiske, having been convened by themselves to enable them to express their opinion on the late wishful outrage at Clerkwell which has caused such destruction of life and loss of property, and also on the dastardly attempt to destroy No. 4, Grosvenor-square, the property of our employer, do hereby declare that they can have no sympathy with such inhuman wretches, who disgrace the name of man by such devilish actions, and who have now by their attacks on private property brought us to our own firesides, and we can no longer remain passive spectators to the action of

such diabolical agencies, by means of which our wives and little ones are threatened with destruction."

A motion said their employer's interest was their interest,—that if his buildings were destroyed they themselves would suffer by being thrown out of work. He wished all to know that the working man's interest was bound up in the interest of his employers, and he thought that they ought to bind themselves into a committee to watch their masters' interest.

A resolution was then proposed and carried with acclamation that the working men should form themselves into a voluntary watch corps to protect the property of their employers, and in doing so protect their own tools.

A vote of respectful sympathy with their employer was passed, and the chairman was requested to convey the same to Mr. Fiske.

The spirit of the meeting, the views expressed, and the ability shown were in the highest degree gratifying.

CONSPIRACY AGAINST ARCHITECTS.

In the case (Manchester, before Mr. Justice Stoes) of James McMaster, joiner and builder, Adam Hanning, and Thomas Slater, operative joiners, who were charged with conspiring to defraud Messrs. Fenington & Brighen, a solicitor, Essex-street, Manchester, on 15th, the jury returned a verdict finding the defendants guilty of conspiracy, but recommending them to mercy on account of their previous excellent character.

Mr. Justice Stoes, in passing sentence, said the jury had come to a very right conclusion. There could be no doubt that the prisoners did conspire to make the prosecutors pay more money than they admitted to be due. The prisoners took a course which seemed to have been well calculated to coerce the prosecutors into doing what they did not think they were bound in justice and fairness to do. They brought to bear upon the men the probable hostility of a trades union; but it appeared that their combination had not the remotest connexion with their schemes. He would mitigate the sentence, in consequence of the recommendation to mercy; but he could not do less, in such a community, than sentence each of the prisoners to nine months' imprisonment.

METROPOLITAN BUILDING ACT.

WINDOWS IN PARTY WALLS.

At the Marylebone Police Court on Friday, 13th, the district surveyor for St. Pancras preferred a complaint against Mr. George Ashley, builder, Madia-vaile, for not complying with the Metropolitan Building Act, through neglecting to erect a certain party-wall to the Lichfield Ale Stores, Frederick-street, Hampstead-road, for Mr. B. Taylor.

Mr. W. F. Potter, architect, stated in answer to the summons that a party wall already existed, against which it was proposed to construct a lean-to roof; but inasmuch as there were certain windows in the said party wall, an application had been made to the Metropolitan Board of Works to allow the erection of an iron roof, so as not to obstruct the existing windows, which could not be done with, and which application had been refused.

The district surveyor demurred to this arrangement as that did not get over the difficulty of the party wall.

Mr. D'Eyncourt, the magistrate, said the question was whether the Metropolitan Board of Works had the power to grant the application.

Mr. Potter contended, under the 56th section of the Building Act, the Board had the power to grant applications of this nature in exceptional cases, and this was an exceptional case.

Mr. D'Eyncourt ultimately, after a lengthened controversy, dismissed the summons.

THE EFFECTS OF OVERCROWDING IN PADDINGTON.

FROM time to time some of the members of the Paddington vestry have called attention to the rapid increase of overcrowding in the parish, particularly in Clarendon-street, Woodchester-street, and Cirencester-street, the property of which is alleged, of one or two vestrymen. Nothing was done by the vestry; but the matter has been painfully revived before the guardians of the poor of the parish. Dr. Markham, Poor-law Inspector, who was present, asked for an explanation of the great and rapid increase in the number of medical orders given to the poor in one portion of the parish as compared with the other. Mr. Goslett, junr, said there was no difficulty in answering the question. In the one district there were Clarendon, Woodchester, and Cirencester streets, which were so overcrowded that diseases of every type rapidly germinated and spread amongst the inmates. This was the reason why in that district 1,250 medical orders had been issued last year; whilst only 212 had been granted in the other division of the parish. Mr. Goslett, senr, corroborated his son's remarks, and added, that last month only one crowded division supplied 115 parish patients, whilst the other district only supplied 27. Mr. Hartree, the relieving officer, was questioned. He said the three streets named were in a most deplorable condition. The houses were let to poor people, who had to crowd every room in them with separate families, in order to pay their rents. The Board would be astounded at the number of persons living in one house, which in some cases exceeded thirty. Only one water-closet was found to each house. From his own knowledge of the district he was not at all surprised at the number of medical orders required. Mr. Ellis, churchwarden, said the houses on the north-west side of Clarendon-street were built close to the canal, and the latter was actually 10 ft. higher than the basements, where human beings had to exist. He strongly suggested that the matter be referred to the sanitary committee, which was agreed to. Dr. Markham, at the close of the conversation, said he was quite satisfied with the reasons given for the great preponderance of sickness in one part of the parish as compared with the other.

* For particulars, see p. 841, ante.

* Perhaps this sentence needs some explanation. I am of opinion that feeding our destitute poor should be matter for public legislation, and should not be left to private benevolence, which, in other words, means that the generous members of the community shall overtax themselves to relieve distress, while the parsimonious give nothing.

BATHS AND WASHHOUSES. MARYLEBONE AND WESTMINSTER.

At the last meeting of the Marylebone vestry, an application was read from the commissioners of the parish baths and washhouses, asking permission to excavate under the Marylebone-road, for the purpose of adding to the convenience of the throngs of frequenters to the swimming-baths. Mr. Carr, one of the commissioners, said it was highly gratifying to find the establishments so excellently patronised as they were. The commissioners were so pleased with their efforts were appreciated by the public, that they were about taking steps to reduce the prices still lower. After some congratulatory remarks on the excellent manner in which the baths and washhouses were conducted, and the handsome revenue which they yielded to the parish, the request was unanimously granted.

At St. James's vestry meeting on the same day, the baths and washhouses of that parish were referred to, but in a different strait. The Hon. Frederick Byng complained in strong language that the usefulness of the establishments was almost stopped by the irregular water supply of the Grand Junction Company. On the previous Thursday the supply suddenly, and apparently for no earthly reason, stopped, and the place had to be closed. The next day the supply was resumed, and again stopped. Next day, Saturday, was the busiest day in the week, but no water could be had. All that was done that day was a little mangling and ironing. The vestry had gone to great expense to make the place worthy of public patronage, expending last year no less than \$600 in steam apparatus; but all was of comparatively little use, owing to the negligence or the incompetency of the water company. Several gentlemen endorsed the last speaker's remarks, and the vestry clerk was directed to write to the directors of the Grand Junction Company, and report the result to the vestry.

ACTION FOR NON-FULFILMENT OF CONTRACT.

PEARL AND ANOTHER v. BAUGH.

THIS was an action in the Queen's Bench for a breach of contract, to which the defendant had pleaded about twenty-four pleas.

Mr. Anstey was counsel for the plaintiff, Mr. O'Malley, Q.C., and Mr. Pease represented the defendant. The plaintiffs are metal workers, in London, and the defendant is an enamel iron plate manufacturer, carrying on business in Birmingham. The original contractor for the completion of the ornamental drinking-fountain at Westminster having failed to complete by a given time, his contract had to be rescinded, and a fresh one was entered into with the plaintiff. Before they completed it they applied to the defendant, who has a patent for enamelling iron tiles, to know by what time he could furnish the required number for the fountain, and upon his representation plaintiffs undertook to finish the work. Defendant failed to supply them within the specified time, and consequently the plaintiffs were unable to complete the work within the time contracted by them, and hence this action. The case principally depended upon a voluminous correspondence, and occupied the court until its rising.

BUILDING CONTRACTS.

In the case *Blake v. Isard and Others*, touching building contract, construction of, interest of owner of land in material brought upon the premises to be used in the construction of the houses, and bill of sale, it appeared, that by a building contract it was agreed that all materials brought on the land by the intended lessee should become the property of the intended lessors. The intended lessee entered and commenced building, but obtained no lease.

It was held that the materials brought on the land by him vested in the intended lessors, and were not liable to be taken in execution by a creditor of the intended lessee, and that the agreement was not a bill of sale.

The case is stated in vol. xvi. *Weekly Reporter*, p. 108.

CHURCH-BUILDING NEWS.

Harkstead.—For some time past the chancel of the church here has been closed, it having been restored as a memorial of the late Rev. Ralph Berners, formerly rector of the parish, and it has been re-opened for divine service. When it was determined to restore this part of the church, the rector, the Rev. Hugh Berners, placed the matter in the hands of Messrs. W. Slater & B. H. Carpenter, of London, by whom plans were prepared, and the work was undertaken by Mr. W. G. Cannold, of Ipswich, who has carried it out. The old roof has been taken off, and a new one of the same height as that of the nave (from which it is distinguished externally by an ornamental ridge) substituted. The roof is a hammer-beam roof, the principals and purlins being of oak, and the remainder of deal. The chancel roof is divided into three bays, and there being no chancel arch, the westernmost trans has been made to form a quasi arch. The wooden braces spring from carved stone capitals, below which are small columns of Irish green

marble, with bases and annulets of stone. The east window is new. It is in the Decorated style, and has three lights, with geometrical tracery under moulded internal and external arches, resting on carved capitals, supported on detached shafts, those inside being of red Cork marble. There are two other windows in the chancel, one in the north and the other in the south wall; each has two lights and tracery, and is set in a deeply-moulded reveal. During the progress of the work the ancient piscina and sedilia were discovered. The vestry, which stood on the north side has been pulled down, and not at present rebuilt, but a stone doorway has been made in anticipation of a vestry. The floor is paved with Minton's encaustic and plain tiles, arranged in various patterns. Externally, the walls have been refaced with black flints, chopped to a face and set in cement. The buttresses and string courses have been rebuilt with Ancaster stone, and the gable is surmounted by a stone cross. The priest's door has been restored. The stonework has been executed by Mr. J. Frewer, of Ipswich; and the carving by Mr. Forsyth. The cost of the restoration is about 600l.

Llanenradd.—The church here, which has been in ruins for a considerable time, has now through the exertions of the incumbent, again been made suitable for divine worship. It is an interesting structure, and is delineated in the "Archæologia Cambrensis." The approach is over the fields, which occasionally causes considerable inconvenience. The church comprises a nave, chancel, and north transept. Messrs. Kennedy & O'Donoghue, were the architects employed in the restoration.

Aberffraw.—The church of Aberffraw, North Wales, was partially repaired some thirty or forty years ago. But as the arrangement of the interior was then left unfinished, and repairs of an extensive nature being required, the present incumbent has instructed Messrs. Kennedy & O'Donoghue to prepare plans, and has entered into a contract exceeding 1,000l., the whole of which he purposes defraying at his own expense. The church consists of a nave and north aisle of equal lengths. The chancel, formed at the end of the nave portion, is divided by a series of arches and columns, the bases of which had been harried. By lowering the church floor as intended, these will be brought to their proper proportions. There is at the west end a richly ornamented Norman arch, in excellent preservation; this arch is supposed to have been the access to a tower, formerly attached to the church. A new robing-room and porch are to be added.

Llanarmon.—The state of the church here having for some time been such as to require repair, the incumbent has had plans and specifications from Messrs. Kennedy & O'Donoghue, and is actively employed in raising funds for the work.

Bryngwran.—The church of Bryngwran has undergone a repair, and partial re-arrangement, and has been provided with a new pulpit and reading-desk. Messrs. Kennedy & O'Donoghue were the architects consulted.

Llanfaglan.—The present parish church, which is placed at an inconvenient distance from the hulk of the population, is to be kept up as a place of burial, and plans for an entirely new building have been prepared by Messrs. Kennedy & O'Donoghue. The edifice is to be placed so as to afford the requisite facility for attendance to church-goers in this parish, as well as in a neighbouring populous district, which forms part of the parish of Llanlechligr.

Redgrave.—The old church of St. Botolph, at Redgrave, has recently undergone a renovation. A new open timbered roof of Memel fir, supported on principals, with carved collars and braces, resting on carved stone corbels, representing various angelic figures, has been erected. The interior boarding of the roof is stained and varnished, and the exterior is covered with slate. A brick parapet on the south side has been entirely removed, the new roof being carried over the walls, and terminated with moulded gutterings. The south wall, which presented a very modest appearance, being patched with plaster and mortar, has been restored and re-pointed. The stonework of the windows has also undergone a renovation, and the chancel floor has been re-paved with Minton's tiles. The work has been executed by Mr. C. Bishop, of Diss.

Ranswell.—The church of this parish has been re-opened for divine service. The whole of the interior, excepting the roof, has been renewed, by design of Mr. F. Chancellor; and the work has been carried out by the contractor, Mr. James

Baker, of Chelmsford. The main features of the alterations are the removal of a gallery which blocked up the tower arch and also a window at the west end in the tower; the substitution of open benches, all of pitch pine, with carved heads, in place of the old pews. There is also a stone pulpit, furnished by Mr. Wrey, of Chelmsford; and an oak lectern, reading-desk, and stalls in the chancel; also a fine ancient oak screen, with tracery work tolerably perfect, which has come out well, the paint, &c., having been rubbed off. The space within the communion rails is paved with encaustic tiles, and the other parts of the church with blue and red Staffordshire tiles laid in cement on a 6-in. bed of concrete, with which the floor of the church is covered throughout. The carved heads of the benches, each of a different design, have been executed by Mr. Polley, of Coggeshall.

Trent (Somerset).—The Seymour Chapel, which forms the ancient chantry chapel of this parish, but now connected with the church, has been restored, at the cost of Mr. H. D. Seymour, M.P., as a memorial of his late father. The ancient work is of a beautiful Early Decorated type, but there are remains of the original Early Pointed work. The north wall has been rebuilt, and has a series of coupled windows, under richly moulded internal arches. Under these windows are two moulded recessed tombs, one of which has a magnificently sculptured figure of a knight in full armour, of Edward I.'s time. The other is a figure of a civilian of about the same date. The roof is of oak, and of a pointed form, with moulded ribs dividing it into panels, with carved and sculptured brackets under. The floor is laid with Poole tiles. The architects were Mr. W. Slater and Mr. R. Herbert Carpenter; and the contractor, Mr. Clarke, of Bratton; the clerk of works being Mr. J. Farrall.

Harwell.—The church here has been restored and re-opened. The estimated expense of the restoration are calculated to be 1,500l. The main features of the work consist in the removal of the old-fashioned deal seats; and the substitution of low-backed stained deal seats; new oak pulpit, lectern, and reading-desk; the removal of the organ from the gallery, and the placing of seats for the choir in the chancel. The removal of the organ-gallery displays the Norman arch of the ancient belfry. The interior and exterior of the edifice have been renovated throughout, and further improvements were contemplated in the chancel.

Rousham.—The chancel in Rousham Church has been re-built. The east and side windows were the work of Mr. C. Blackmore, of London; and the chancel is floored with Minton's encaustic tiles. The double piscina has been replaced, and a credence-table, copied from it, placed on the opposite side.

Thorne and Hatfield.—The foundation stone of a new church has been laid at Sykehouse. The ancient chapel of the place had become so ruinous that it was a matter of necessity to take it down, with the exception of a brick tower, which had been added to the chapel about 100 years ago, and which will be made to harmonise with the new structure by the introduction of windows of a better character, the addition of a spire, and some other details. The plans of the new church have been furnished by Mr. C. H. Fowler, architect to the Dean and Chapter of Durham.

Kendal.—The reredos at the parish church, a contribution by Mr. F. A. Argles and Mrs. Argles, has just been completed. It is of Caen stone. The centre part, from the floor to the bottom of the east window, consists of nine Pointed Gothic arches, surmounted with a cornice and crest. The arches are supported on pillars, the shafts of which are of polished Kendal Fell marble, of dark brown colour, with the exception of the two arches immediately behind the altar, which terminate in bosses. On each side of the window rising to a considerable height is a pillared niche surmounted with a carved canopy. A fretwork of foliage, fruit, and other imagery interlaces the various parts of the screen. The colour of the stone differs little from that of the walls of the church, alongside of which the erection runs. The architect was Mr. J. S. Crowther, of Manchester; and the work was executed by Messrs. Ellison & Hinchcliffe, of Manchester. The cost is supposed to be about 300l.

Fulwood.—A new pulpit, of Early Decorated character, has just been presented to Fulwood Church by Mr. Henry Isaac Dixon, one of the churchwardens. Its plan is polygonal, and it is constructed of oak, with handed shafts of black

oak at the angles, the caps embellished with conventional carving, and the cornice enriched with carvings of low relief. It stands upon a moulded base of Elyam-moor stone, and has been executed by Mr. Arthur Hayball, from a design by Mr. J. B. Mitchell-Withers. The church is now lighted by artistically-wrought gas standards, manufactured by Mr. Thomas Brown, of Birmingham, and other improvements are in contemplation.

Saffron Walden.—The parish church has just been embellished by the decoration of the east wall of the chancel, and by the addition of a carved reredos, executed in Caen stone by Mr. J. Forsyth, of London. This reredos extends the whole length of the chancel; but the centre portion has five canopied spaces, in which are introduced sitting figures painted on a background. In the centre panel our Saviour is represented with the right hand in the act of benediction, and the left holding the orb. The figures of St. Matthew, St. Luke (the good physician), St. John (the beloved disciple), and St. Mark, occupy the panels on either side. The figures and the wall decorations are the work of Messrs. Ward & Hughes, of London, by whom also the stained glass in the east window was recently executed. The designer of the reredos and also of the decoration was Mr. William Smith, of London; and the whole has been carried out under his direction. The whole is a memorial of a lady named Mrs. Taylor, deceased.

GLASGOW ARCHAEOLOGICAL SOCIETY.

THE ROMAN INSCRIPTION.

The annual general meeting of this society was held on the 16th inst. Mr. Sheriff Strathern occupied the chair. On the tables around the room were a selection of interesting objects from the valuable collection of Mr. Adam Sims, including the key of the Glasgow Tolbooth, the tongue of the old bell at Biggar, the cap and handkerchief of King Charles I., &c.

The Chairman, in the course of a few introductory remarks, said it was wonderful, in this great community, how few really took an interest in the science of archaeology.

Mr. John Buchanan afterwards read a paper on "Inscriptions upon Stones found in the Old Roman Wall between the Clyde and Forth," particularly on a slab recently discovered near the Castlehill Station, a few miles north of Glasgow, of which he exhibited a cast. Mr. Buchanan said that there was some risk that the slab might not be allowed to remain in Scotland, its proper home, but sent to America. Its discovery was quite unknown to the Glasgow public till within the last few weeks [probably through our pages], so no active steps were taken towards having it deposited for preservation in some public institution here.

We trust the society will now take steps to prevent the removal of the slab.

Books Received.

The last edition of the old original "Boy's Own Book" is published by Lockwood & Co. It has been revised and considerably added to, so as to bring it up to the level of the present day. For nearly a quarter of a century it has held its own, and seems likely to do so for years to come.—"What's his Name" is the title of Cassell's Annual for Christmas, 1867; in other words, an extra part of "Cassell's Magazine." It contains stories by a dozen writers, with cuts, and all for sixpence.—"Dietrichsen's Royal Almanac," in its 31st year, continues to present us very large amount of official and other information. Its lists of governing bodies of colonies, of fairs, the British consular service, &c., &c., give it value.—"The City Diary" (Collingridge), in addition to the matter ordinarily given in a diary for the desk, contains a considerable amount of official information with regard to the City, carefully compiled and well arranged. It is a complete guide to the various business offices of the Corporation and City generally. The space for daily entries might usefully be a little larger.—The Messrs. Letts, who received a silver medal at the late Paris Exhibition for their Diaries and Account Books, send us two or three of their publications, part of a very considerable series. The "No. 12 Enlarged Diary," though a small book, gives plenty of

room for each day's entry, and is otherwise remarkably recommendable.—Gutell's "Register and Almanac" has now reached its twenty-seventh year.—"The Railway Almanac for 1868," on a sheet, presents especially a Directory of Railway Officials.—"The Publisher's Circular," for December 10 (No. 725; Low & Co.), contains specimens of a large number of the new illustrated books of the season, and forms a remarkable pamphlet, buyable for a shilling. It shows, one is forced to say, the dead level of mediocrity to which woodcut illustrations have fallen, and the knowledge thus enforced may not be the least of the advantages resulting from the publication of "The Circular."—Recent Marine, Hydraulic, and Sanitary Engineering in Scotland: an Address to the Royal Scottish Society of Arts, November, 1867. By George Robertson, C.E., F.R.S.E., President of the Royal Scottish Society of Arts. Edinburgh, printed by Neil & Co. In this address the progress of various engineering and sanitary works of late years in Scotland is reviewed, such as the Loch Katrine water supply of Glasgow; the Granton and Leith Docks, near Edinburgh; the Dundee Dock improvements, &c., and sanitary improvements in various towns; to most of which engineering and sanitary works we have already from time to time adverted in the *Builder*.

Miscellaneous.

ARBITRATION IN TRADE DISPUTES.—The members of the Amalgamated Carpenters' and Joiners' Society at Manchester, have passed a resolution in favour of the adoption of arbitration in the settlement of trade disputes, and of appointing delegates to the proposed court of arbitration.

THE LIVERPOOL MASTER BUILDERS' DINNER.—The members of the Liverpool Master Builders' Association held their first annual dinner on Wednesday last week, in the Liverpool Limited Restaurant, New Exchange-buildings, under the presidency of Mr. Thomas Haigh. About 100 gentlemen sat down, and among the number were Messrs. Samuel Holme, jun., and A. Parker (vice-chairman), Messrs. Landale, W. Jones, jun., Urmsou, Radcliffe, Pickin, Goodall, Bromley, A. Holme, W. Witter, Tomkinson, Tanner, Roberts, Hughes, and Lyon.

THE CHESTER NEW WATER SUPPLY.—The Chairman of the Water Works Company, the Mayor, two directors, and Mr. Dugdale (resident engineer of the company), have inspected the reservoir for the new supply, and the building recently erected opposite Huntington Brook, beneath which the river water enters into the new pipes, which are carried to the old works at Barrel-well. The water, in the first place, enters into the well beneath the building, at the higher source, through gratings of copper, and is conducted by large pipes, as we have before stated, to the Barrel-well works, from whence it is afterwards pumped for the use of the city. The Mayor turned on the supply.

PORTSLADE CHURCH.—A movement was recently made to restore the parish church of Portslade, or to make certain alterations; and the vicar, the Rev. F. G. Hollrooke, obtained subscriptions, amounting to 402*l*. Estimates were submitted; and a vestry meeting was called to determine what should be done, when the whole scheme was resisted, by Mr. William Hall, of Shoreham, who is owner, as trustee, of the Rectory and Manor of Portslade. An amendment against the alterations was proposed by Mr. Hall, and the result was: for the amendment, 37; against, 66; majority for the amendment, 31. The restorations are, therefore, abandoned for the present.

INCOMBUSTIBLE WOOD.—According to M. Schattennan's experiments, says *Galignani*, there is an easy and cheap way of rendering wood incombustible: it consists in coating it with chloride of lime [chloride of calcium seems to be meant, which is a different thing from chloride of lime]. It is true, he continues, this will only protect the surface, but it will prevent the flames from spreading. The operation [with solution of the chloride] should be repeated twice with a common white-washing brush. The cost is at the rate of about 5*fr*. per 100 square metres, the liquid costing 1*fr*., and the rest being the man's wages. Where chloride of lime cannot be had, it might be made by treating chalk with hydro-chloric acid.

CANDLES FOR THE GATHERING.—A wax myrtle grows in Louisiana from which berries enough may be gathered in a day to make 8 *lb*. of tallow, which is much harder and purer than common tallow.

NEW BRIDGE ACROSS THE TYNE.—Contracts have been advertised for the erection of a new bridge across the Tyne, at Redhugh. It will more closely connect the west of Newcastle with the west end of Gateshead.

CHESTER CATHEDRAL.—The nave of this cathedral has, for the first time within memory, been made available for divine service. The cathedral had been closed for some weeks in order that the preparations for the service, which has now taken place in the nave, and some necessary internal refittings, might be accomplished. The Dean announced in his sermon that the Chapter had expended in fitting up the nave for these services the whole of the funds which had been saved in past years for the much-needed restoration of the cathedral.

RE-BUILDING OF HOLY TRINITY CHURCH, DORCHESTER.—The designs have been exhibited at the Town-hall, where they have been inspected by a large number of persons interested in the scheme. There are in all twenty-five sets of drawings now before the committee. The committee met in the Council Chamber, when half a dozen of the most likely designs were selected and examined. There seems, however, to be a difference of opinion existing in the committee as to the style of building which it is most desirable to provide. The final selection was to take place at a subsequent meeting.

A LIFT AT THE HIGH LEVEL BRIDGE, NEWCASTLE-UPON-TYNE.—A meeting has been held in Newcastle for the purpose of carrying into effect a proposed "lift" to the High Level Bridge from the Close. The "lift" is intended not only for passengers, but also for horses and carts (loaded and unloaded), and cattle of every description. At present the heavy hills leading to the upper part of Newcastle make severe work for horses. The tolls will be one penny per person, 3*d*. for each carriage or vehicle, 4*d*. each for oxen or other large animals, 1*d*. each for pigs, sheep, lambs, or other small animals, 4*d*. per cwt. for goods, and so on in proportion. The company, it is expected, will receive extensive patronage.

THE CANTERBURY DRAINAGE WORKS.—The contractors for the new system of drainage in this city (Messrs. Dickenson & Oliver, London), are making efforts to complete the work by next spring. Operations commenced in the marshes alongside the Broad Oak-road, where filtering works have been erected. The building is 168 ft. long, 60 ft. wide, and 7 ft. deep, and into it will be conveyed the whole of the sewage of the city. The liquid manure will escape by an outfall drain into the river below Fordwich, and the residue, utilised with approved apparatus, will form a source of revenue. The outfall sewer has been carried across the marshes into the Sturry-road, and is to be continued to the outfall point on the river beyond Fordwich. Working back to the city, a brick cemented sewer has been laid in St. Stephen's-road, and workmen are engaged in draining St. Peter's-lane, &c.

UTILIZATION OF THE WEST HAM SEWAGE.—A scheme has been proposed by Captain William Russ, and approved of by Messrs. Lucas & Wilkinson, of Westminster, engineers, for the utilization of the sewage of the West Ham district, which is at present discharged into the Lea at Blackwall, causing a considerable nuisance. It is intended to carry the sewage to Hainault Forest, where land has already been secured for the discharge and utilization of the whole of the sewage; and as the promoters would only be bound to give a certain quantity, market-gardeners, who abound on the route, could also be supplied with the surplus when they require it. As the matter stands, a farmer at Hainault has agreed to give 2*l*. per acre for 300 acres the first year, and for 600 acres thereafter for twenty years, and to take any residue that may be given. The estimated cost of the proposed works is as follows:—

About seven miles of forcing main, including composition and laying, at 4,500 <i>l</i> . per mile.....	231,500
Additional engine-power, &c., say	8,500
Legal engineering, and contingencies	5,000
Total	245,000

On this outlay 9 per cent. per annum is calculated on, in addition to the saving of the entire cost of the present pumping into the Lea.

KIDD'S SAFETY APPARATUS FOR PIPES.—The object of this arrangement is to prevent the bursting of water-pipes by pressure or frost; the pipes are emptied automatically. A description and blocks have been forwarded to us, but we cannot afford space for them.

DIRECT REVENUE OF PARIS.—The annual report issued by Baron Haussmann, Prefect of the Seine, shows that the total direct revenue of the city of Paris amounted during the year ending 30th September last, to 39,238,752 fr., divided as follows:—Land-tax, 10,995,702 fr.; furniture-tax, 6,424,989 fr.; doors and windows, 17,298,587 fr.; and licences to trade, 17,298,587 fr.

UTILISATION OF COKE OVEN GASES.—An attempt to utilise the gases given off in the process of coking has been made at the works of Messrs. Carver & Co., of St. Etienne. The gases are collected and drawn off through pipes, and cooled, when the tar, ammoniacal liquids, &c., are condensed. From these condensed liquids benzine, naphthaline, sulphide of ammonia, artificial manures, and a number of dyestuffs are made. The gas remaining after condensation of the liquids, and which is, of course, ordinary illuminating gas, can be used in the usual manner.

POLLUTION OF WATER.—When a well is supplied with water which percolates through the earth, and does not flow through any defined channel, although the owner of the well is not entitled to the water until it actually enters his well, the occupier of adjoining property will be restrained from using a cesspool therein in such a manner as to pollute the water coming through his property and supplying the well. This was the holding of the Master of the Rolls, in the case of *Womersley v. Church*, which was a suit for an injunction to restrain the use of a cesspool upon the defendant's premises (near Norwich) in such a manner as to pollute a well belonging to the plaintiff.

THE PROPOSED EQUALIZATION OF METROPOLITAN RATES.—A deputation on this subject from the Metropolitan Asylum District Board, has had an interview with the Poor-Law Board. After listening to the remarks of the deputation, recommendatory of a more equitable mode of rating throughout the metropolis, and as to another and temporary question relating to the Asylum Board, the Earl of Devon said the importance of the question of rating could not be exaggerated, and it was receiving the closest attention of the Poor-Law Board; but he would not express any views hastily, and could only assure them that the question would continue to receive the utmost attention of the Board.

EAST LONDON MUSEUM OF SCIENCE AND ART SITE BILL.—We have received a letter from M. Antonio Brady, one of the promoters of this Bill, in which he explains that there was no such difficulty as that supposed which led to the throwing out of the Bill, inasmuch as by Royal Charter of 27 Vict., the Department of Science and Art have authority to accept any trust for the furtherance of science and art; and that all that the Bill was intended to do was to enable the three gentlemen named in it to make over the site in question to that department for the purposes named. The promoters and the Government, in pressing the Bill forward, had hoped to provide labour during winter for many working people now idle. On the re-assembling of Parliament the subject will be again brought forward.

ADVANCED EDUCATION FOR GIRLS IN PARIS.—An association has been formed to afford an opportunity to the female children of Paris to obtain secondary education, the members being professors of the universities or of public or private schools, including M. Milne Edwards, and other members of the institute, to whom are added M. Viollet-le-Duc, the architect and inspector-general of historic monuments, and one lady, Madame Pape-Charpentier, directress of the normal classes of the Salles d'Asie. The courses, which occupy three years, will include literature, history, geography, domestic economy, the elements of jurisprudence, natural sciences, physics, and some branches of mathematics. There are to be two terms per annum between the 1st of December and the end of May. In the three years the pupils will have gone through nearly the whole course of instruction given at the Lycées, and may obtain on examination the same diploma as is given to the young men who have finished their education at a lycée in a satisfactory manner.

TRANSATLANTIC ITEMS.—In St. Paul, Minn., 410 buildings have been erected during the past year, at a cost of 712,860 dollars.—Nearly 500 buildings have been erected at Davenport, Iowa, during the last twelve months. The total expenditure in buildings and improvements is estimated at 1,207,950 dollars.—A Yankee speculator has bought an island in the Ohio river and stocked it with black cats, to raise the animals for the sake of their furs. What will he do with the carcasses? Sell them as American rabbits?

SOCIETY OF ENGINEERS.—At the ordinary meeting of this society, held on Monday, the 16th inst.—Mr. W. H. Le Feuvre, president, in the chair,—a paper was read by Mr. James Gresham, "On the most Recent Improvements in the Injector;" after which a discussion on the paper took place. The president announced the names of the president, vice-president, and council for the ensuing year. The names of four candidates for election as members were announced. Council, 1868:—President, Mr. B. Latham; vice-president, Mr. F. W. Bryant. Members of council—Messrs. J. H. Adams, W. Adams, D. K. Clark, J. Hendry, C. J. Light, W. Macgeorge, W. Naylor, V. Pendred, F. C. Reynolds, and W. Wilson. Mr. A. Williams, hon. sec. and treasurer. Mr. P. F. Nursey, auditor. Mr. G. W. Harris, secretary.

ARTESIAN WELLS.—Mr. G. A. Shufeldt, jun., by whom the Chicago Artesian Wells were bored, states, in the *Scientific American*, that the wells are now 711 ft. in depth; they commenced filling with water at a distance of 10 ft. from the surface, and continued full all the way down; whence he asks—Why did not the centrifugal force throw this water out? and why was no water discharged until the drill had penetrated a particular subterranean stream? Before this point was reached there was plenty of water in the wells, and we could pump out an abundant supply; and this is true of hundreds of other artesian wells scattered throughout the country: they do not discharge the water above the surface, but plenty of it can be obtained by pumping. He adheres to the opinion that water, in flowing wells, comes from a higher source, and is not thrown out by the earth's centrifugal force.

REMOVAL OF HOUSE FIXTURES BY BUILDERS ON LEASEHOLD LAND.—Neal Sanders, builder, South Norwood; Joseph Neal, bookkeeper, Mile-end; and Benjamin Cooper, builder, Addiscombe, have been committed for trial, charged with unlawfully and maliciously removing certain fixtures belonging to houses on land in Birchencher-road, Croydon, of which Mr. John Jones, of Emmore Park, South Norwood, is the freeholder. One portion of the land had been let on lease to Saunders, who had erected, or was erecting, twelve houses on it, and on this property money had been advanced by Mr. Jones and another gentleman: from these houses a considerable portion of the fixtures had been removed. Neal had six houses in course of erection, and money had been advanced on them: these had been levelled to the ground. Cooper had also some houses on the land, and these had been torn down and parts removed. Mr. Jones claimed an interest in all the houses not as freeholder only. A false report, it was said, had got abroad that Mr. Jones was bankrupt.

PHOTOGRAPHY ON PORCELAIN OR GLASS.—The following curious method of transporting photographs on to ceramic surfaces has just been patented by M. Grune. The usual negative on glass is coated with a fusible glass by the heat of a common expelling furnace, and the image is thus protected and positives are got from the negative by collodionising the image side of the negative in a dark room with iodised collodion; and after it is developed it appears in reduced silver. Before the collodionised surface is quite dry, a sharp point of a needle is run all along the borders, and the plate is then immersed in water containing 5 per cent. of glycerine. The film of collodion soon floats on the liquid. The film is taken out when wanted, and its silver surface changed to gold by chloride of gold, or to the appearance of steel by chloride of platinum, &c., after which it is dipped into a solution of metallic salts, which, by the action of fire, will yield certain colours according to the operator's wish. The film is now carefully laid on the porcelain or glass to be adorned; and it sticks by means of diluted glycerine and a soft brush. It is then coated with a vitreous flux, and becomes permanently fixed in the furnace.

WORKING SURVEYORSHIP.—There were sixty-seven candidates for this office. Ultimately the Board elected Mr. John Ellis, late town surveyor for Harrogate, Yorkshire.

DESTRUCTION OF ST. PAUL'S CHURCH, CLIFTON, BY FIRE.—At midnight on Sunday last, St. Paul's Church, in the very centre of Clifton, Bristol, was totally destroyed by fire, the only things saved being the registry book, the communion plate, and the vestry furniture. The incumbent estimates the damage at upwards of 5,000. The fire originated from the chamber of the heating apparatus being overheated.

PARTIAL DESTRUCTION OF A CHURCH.—The coast at Hunstanton, St. Edmunds, has been visited by a very severe gale from the north. The whole of the gable of St. Edmund's Church has been blown down, leaving about 6 ft. of wall standing. The church, which has been built about two years, consisted only of the chancel, and was intended, as soon as funds would allow, to be completed.

DISTASTROUS EXPLOSION OF FIRE-DAMP.—An explosion of fire-damp has occurred in a coal-mine at Blangy (Saône-et-Loire). Two galleries, in which some men were at work, behind the spot where the disaster occurred, were obstructed by the debris. Eighty dead bodies had already been got out. The Emperor, on hearing of the disaster, forwarded 10,000 fr. to be distributed amongst the families of the victims.

THE THAMES EMBANKMENT.—At the last meeting of the Metropolitan Board of Works tenders were opened for making and erecting wrought-iron trussed girder bridges for the Thames Embankment and steam-boat piers. Fourteen tenders were opened, out of which the offer of the London Engineering and Iron Ship-building Company to do the work for a sum of 2,359, 2s. 4d., was accepted, subject to the usual inquiry.

MOSAIC PAVEMENTS.—The widow of the late Dr. Woolston has presented to the Art Library of South Kensington Museum a valuable series of drawings of Greek and Roman mosaics to be found in Spain, France, Pompeii, Prussia, Hali-carnassus, Switzerland, Rome and Italy generally, Constantine, Carthage, and also in various counties of England, which had been executed for Dr. Woolston. We are glad to have been personally instrumental in leading to their deposition at South Kensington.

LUCIFER MATCHES.—The following particulars concerning matches are gleaned from a paper lately read to the Société des Ingénieurs Civils, by M. Pégibot. It has been calculated that the number of matches consumed in France is about six per head per day; it is eight in England, and nine in Belgium. Taking the French average as a basis, the number of matches consumed all over Europe in a day is about 2,000 millions, representing upwards of 600lb. of wood. The kinds of wood chiefly employed in manufacturing them, viz., aspen and poplar, are sold by the cubic metre (35 cubic feet). Allowing for waste, this quantity does not weigh more than 500lb.; so that in Europe alone the number of cubic metres of wood thus burnt amounts to 400,000, being equivalent to 14 millions of cubic feet English measure. To this quantity should be added that of the stearine matches commonly called vestas, the consumption of which has of late increased very considerably.

TENDERS

For house and offices, Elephant-buildings, Newington, for Mr. E. H. Rabbitts, Mr. Witherden Young, architect. Quantities by Mr. Nicholls:—

Colls & Son	£2,370 0 0
Tarrant	2,276 0 0
Higgs	2,273 0 0
Rider & Son	2,269 0 0
Thompson	2,269 0 0
Bird	2,248 0 0

For Female Training College, Cheltenham. Mr. J. T. Darby, architect:—

Broom & Son (accepted)	£4,474 0 0
------------------------	------------

For Ventrals Main Sewerage.—Contracts No. 5 and No. 6.—Mr. John G. Livesey, C.E., engineer. Quantities supplied by Mr. Augustus F. Livsey:—

Contract No. 5.		Contract No. 6.	
Phillips	£538 9 0	£318 5 0	
Wainwright	510 0 0	899 0 0	
Moses & Waller	500 0 0	370 0 0	
Mason	485 0 0	295 0 0	
Frayne (accepted)	478 9 0	294 10 9	
Bevis & Son	470 0 0	361 0 0	
Tharrah	450 0 0	390 0 0	

The Builder.

VOL. XXV.—No. 1299.

*Something of what
has been done
in 1867.*

TOGETHER, the year that has but a few more days to run has been a busy one. It would almost seem that as the world gets older it is beginning to make better use of its time. There appears to be a

wider-spread, more serious, more hearty determination to improve the condition of

things generally. Acceleration of pace in all things is the tendency of the day. The great human family is getting so large, requires so much food, so much clothing, so much housing, that the time for taking things quietly has gone by, and incessant activity, or co-operation in some form, is required on all sides. Instead of a thousand years being as a day, a day must be as a thousand years with us. Let us look back upon some of the year's work. Altogether, as we have said, it has been a busy year. Satisfactory, fruitful, initiatory work has been done in it. We sent out representatives to the Great Exposition, Paris; to the Congress at Antwerp; to the Sanitary Conference at Weimar; we had great gatherings of our own at Belfast and Dundee, for the consideration of social and scientific matters; we received the Belgian volunteers, the Sultan, and the Pacha of Egypt; the old-acquainted Eisteddfod was held at Carmarthen; divers architectural and archaeological societies moved hither and thither, in prosecution of their studies; various minute investigations into causes that affect the public health have been made by Government officers; we have had some trial of the working of the new Sanitary Act; several towns that have hitherto held out against the adoption of constructional sanitary works have complied with this great necessity; we have had a second essay of a Natural Portrait Exhibition; and several important public buildings have been designed, while progress has been made with those in hand.

It has been a year of especial attention to workhouses and their infirmaries, not bestowed, as we have often urged, before it was crying needed. The Clerkenwell guardians of the poor determined to erect a supplementary establishment at Holloway; those of St. Martin-in-the-Fields commenced to carry out their intention to build a similar retreat for 400 old men and women at Wimbledon, at a cost of 25,000*l.*; and those of Marylebone have built new casual wards. St. Pancras, too, has taken steps towards building an infirmary at Highgate. The Bangor and Beanmaris Union resolved on a new hospital; handsome prizes were offered for designs for a new workhouse at Penkridge; Hertford set about accomplishing a new workhouse and infirmary; Burnley Union resolves upon a new workhouse; men have been employed the live-long year over a new workhouse at Morpeth; Durham has stirred itself to enlarge and improve its workhouse accommodation; Newport Union has thought itself of an infirmary; Darlington has issued an offer of prizes for designs for a

new workhouse, having previously offered a small sum for designs for the extension of present premises; among other cases, the guardians of Gravesend and Milton are also putting their poorhouse in order. Lewes Union is far advanced in a project for a new workhouse; the Bristol guardians are busy over a new hospital for their union-house; Brentford is busy building additional casual wards, as is the City of London Union; Birkenhead intends new schools for High Tranmere workhouse; Whitechapel Union has building works on hand.

It has been a year, too, of some private munificence for public objects. The Mayer Museum, rich in Medieval works in gold and silver, gems, Anglo-Saxon antiquities, and illustrations of Wedgwood, has been presented to Liverpool. The Marquis of Westminster has presented a park to Chester; and Preston is also indebted to a liberal giver,—the late Alderman Miller,—for one of its three new public parks. At Stockwell, Mrs. Hillyard laid the foundation-stones of three homes for fatherless boys, towards the cost of which she contributed the sum of 20,000*l.* A museum has been given to Salisbury, by Mr. William Blackmore. Admiral Kelly bequeathed 80,000*l.* for the establishment of a college in Devonshire. Baron Ferdinand de Rothschild has taken the preliminary step of purchase of a site for a new hospital in South-wark Bridge-road. The Earl of Dudley has given a fountain to Dudley. Mr. M. T. Bass presented a recreation-ground to Derby. Mr. Alfred Harris gave 3,800*l.* for the foundation of a fever hospital at Bradford; and many open hands have given round sums of 1,000*l.* each for various building purposes of a charitable basis.

The borough of Liverpool wisely laid out 200*l.* in stimulating the thoughts of trained minds towards the production of good dwellings for the labouring classes; though how it may result is not yet certain. On the other hand, at Wigan, fifty cottages were put up for competition—plans and tenders indiscriminately—without any attempt to make good use of an opportunity seldom occurring. Labourers' dwellings, we perceive, are now incorporated, very properly, as one of the features of flower-shows. What could be a prettier object in a nobleman's garden than a model cottage for his head gardener, or a dozen model cottages for his dozen labourers? We suggest, here, by the way, that designs for lodges, drinking-fountains, garden-seats, and so on, should occasionally vary the list of objects. The project of growing fruit upon glass walls might be tested by offers of premiums, and sums might be apportioned for the trial of experiments likely to result in any increase in the production of fruit or vegetables, such as the cordon system. These institutions might be made more useful than they are.

There have been several important competitions in the course of the year. The public interest in the competition designs for the National Gallery extended into the early part of the spring; the competition for the New Law Courts, in London, belongs exclusively to it. We have also had competitions for the London Orphan Asylum; for Manchester Town-hall; for the Middle-class School, Bedfordshire; and there have been others for the laying out of several estates,—Sefton Park among them. The protection of the headland at Harlepool has been thrown open to the profession; the ferry landing-stages and steps of the Wallasey and Liverpool ferries have also been submitted to competition; and suggestions and plans for the disposal and removal of snow have been sought by the offer of premiums. Among the miscellaneous works for which competitive designs were invited were the parish church of Ryde; the Corn Exchange, Luton; the Plait-hall, Luton; the Town-hall, Grantam; Dorchester Church; new offices for the Board of Works, Poplar; offices and vestry, West Ham; the clock tower, Leices-

ter; the Orphan Asylum, Worcester; the cemetery chapels and lodge, Biggleswade; the Memorial of the Countess of Ellesmere; the new chapel for the County Asylum, Derby; and some other churches and chapels. Besides these a very large number of new works have been executed from designs that were not selected from public competition. Thus, we note Coventry is to have two more churches, albeit, it has already "three tall spires; Tannton is to have a college school; Armley, Leeds, is compassing a new church, as are Cassop-on-Quarrington and Coxhoe, near Durham; Marsden, near Huddersfield; Worksop, near Nottingham; New England, near Peterborough; and Ramsden, near Basingstoke, among other places. Rochester is to have a cattle market. Schools, too, have been building in quiet little villages and busy manufacturing towns,—at Barfreston, in Kent, famous for its delightful little Norman church, and hustling Birmingham, to wit. Doncaster, Woldham in Kent, can also boast progress in new schools. And the work of restoration of ancient churches has by no means been standing still. With regard to the character, management, and results of some of the competitions of the passing year, there has been the usual amount of dissatisfaction. Those that are thrown open to the profession with the promise that professional advice will be sought to assist in the selection of the prize designs; those which are limited to a certain number of architects, with the understanding that the author of the selected design shall carry it out; those in which equal sums are offered to a limited number of competitors from whose designs one will be selected for execution,—all give a certain amount of vexation; but those thrown open to the architectural public with no promise or intention of taking any professional advice in the selection of the premiated designs give still more. With the first-mentioned class there is, however, but little real cause of complaint. Provided that it is a national work, perhaps there is not a better plan than to permit any one to enter the lists who chooses to do so. It is open to all to measure their own strength, and refrain from competing, if it be not of an order that justifies the so doing. The certainty of fairness and acumen in the selection divests competitors of any grievance. Those who do not win may be assured that those who have done so have either complied more strictly with the instructions or are more skilful in their art. The second class is not so satisfactory as the third. An invitation to a limited competition is a special call upon an architect to leave his ninety-and-nine sheep to look after this one. It appears therefore only reasonable that a fixed sum should be offered to such competitor as some recompense for the trouble that must be the cause of neglect to other work. These classes have only the disadvantage that an outsider, be he ever so talented or acquainted with the description of building with which the competition deals, has no chance of affording what might be a really better design than the chosen competitors could furnish. It is, however, on the score of the third class that we continue to receive note after note, chorus after chorus, of dissatisfaction. The tenor of most of the communications addressed to us on this score runs in this way:—Nothing can be too bad to say of it. To comply with its terms is to be deluded and disappointed. When there is no professional advice sought, there is no accurate knowledge of the question present at the councils that are to judge it, and it becomes little more than a mere matter of personal favour who is to have the premiums. This is, of course, most strikingly the case in the matter of country competitions. Is it a Tappington Butts competition? Then a Tappington Butts man will get the prize. If there be more than one architect in Tappington Butts, then he who has the

largest number of friends in the body offering the premium will get it. Are there more prizes than one? Then the "local man," as he is familiarly called, will get the best of them. And so on through every phase of the question. Sometimes, moreover, justly; the local man knowing best what is wanted.

There has been but little said of late about baths and washhouses, but that little has been eminently satisfactory. St. Pancras has laid out some 10,000*l.* on a new building, with every appliance of the most modern description. This establishment will be opened in a week or two, and promises great advantages to that extensive parish. The Marylebone baths and washhouses have not only paid their own expenses, but yield an income of a thousand pounds per annum to the parish. Here is a profitable field for philanthropic speculators, not to say for those who have an eye for profit solely.

The places that have set themselves to the task of re-arrangement upon a sanitary basis, as far as constructional works are concerned, are Winchester, Kidderminster, Little Hampton, Chatham, Much Wooten, Leytonstone, and Bedford. Waterworks have also been executed in several places. The startling facts ascertained in the course of the Governmental inquiry into the effects upon the public health of efficient sewerage and water supplies, will, doubtless, cause a great acceleration to these movements for the next few years. Now, that it is shown that cholera, consumption, diarrhoea, measles, small-pox, and typhus fever, are disarmed by these measures, and rendered much less dangerous invaders of our homes, we may expect a general movement in their favour. Few bodies of men will care to incur the responsibility of refusal to take steps so important for the well being of the communities they represent.

In the metropolis the progress that has been made consists more in the continuation and accomplishment of works commenced in former years than in new undertakings. The new *quartier* rising on the site of *St. Mary's*; the increased height of the pyramidal webwork of scaffolding encircling the national men-of-war of Albert the Clod; the open lengths of the Thames Embankment on the north side of the river; and the invasion of men, horses, carts, machinery, and all sorts of building materials and contrivances on the south side; the continuation of underground and above-ground metropolitan railways; the suburban extension of the great Babylon east and west, north and south, are all instances in point. We seem to have taken no leaps either in the dark or otherwise, but to have pressed stoutly, steadily, confidently forward. Among items that are, however, new, are three that carry us back to very old times, and set us thinking of a land flowing with milk and honey, of forests of cedars and almsg-trees, and camel-trains laden with gold and precious stones. These are new synagogues. One has been built in the Walworth-road; another for 700 German Jews in New Broad-street, City; and a competition for a third at the corner of Upper Berkeley-street, Edgeware-road, has been decided, and some preliminary steps taken towards its accomplishment. It is to be regretted that this last will yield nothing towards the beautifying of our street architecture. It will be quite out of sight behind the line of houses, where no Queen of Sheba could possibly observe it.

This is but a faint outline of some of the work done in one particular department in 1867. Everybody has a little world of his own full of details, from which he can fill up the picture for himself. One man's path leads to the right and another to the left, and each sees different objects; they are, however, but part of the whole. The general view is fairly satisfactory; and gives us fresh courage with which to greet the new year. Continental progress is so swift, and competition so keen, it behoves every one to put his best foot forwards. An enormous work is before us, and of this we will talk in good time.

NEW MUSEUM IN PRUSSIA.—The museum at Sigmaringen, founded by Prince Charles-Antoine, has been inaugurated in presence of the King and Queen of Prussia. It includes pictures by German masters of the fifteenth and sixteenth centuries, and objects of art of all kinds. The *Revue Artistique* says it is an imitation of the Musée de Clugny, and is a proof that the travels of foreign princes in France are not altogether needless in the progress of civilization.

PHYSICAL ENGINEERING, FROM CHEOPS TO SAID PACHA.

THE *Notum Organum* commences with a reference to the position of man as "the minister and interpreter of Nature." That ministry has had a wonderful expansion since, and in no slight degree in consequence of, the labours of Bacon; but amid all the advance of the past century there are two occupations which may claim, in a special manner, to be those of the assistant of nature. They are those of the physician and of the engineer.

In the case of the physician, it is best known to those who have had the most frequent need to consult the most eminent members of the profession how much, how almost entirely, they depend on the *vis medicatrix nature*. Certain known species are afforded by the pharmacopoeia; certain disorders have their crises and their courses, which experience, aided by the knowledge of the individual constitution, may with much accuracy predict. Beyond this, it is chiefly the youngest and most sanguine members of the profession who are most confident in the efficacy of prescriptions, while the number of ingredients which still at times go to make up a single medicament is in itself a proof how far the man of art is feeling in the dark after, if not the nature of the disease, at least the mode of cure.

Side by side with those regular practitioners, who, while they more or less tacitly confess the empirical and conjectural state of the art, in spite of the constant illumination sought from dissection, and the instructive whisperings of the stethoscope, is a smaller, more confident fraternity, who believe that they have laid at least the foundations of a real science of therapeutics. Accused of treating symptoms only, they reply that each symptom is the mute appeal of nature for a specific remedy, and that the law of healing is *similia similibus curantur*. A rigid regimen, and a belief, founded they say on experience, in the effective power of infinitesimal doses of pure, carefully-prepared, medicaments, form the chief features of this new heresy, which, at the present moment, seems often to be held to by those, when in tolerable health, who in graver cases fly to the established mode of treatment.

But however marked may be the advance of the knowledge of the veins and arteries, the nerves, muscles, and sinews, and the whole vital mechanism of the human frame, between the time when Homer gave such accurate descriptions of wounds and the date of the practice of Nelaton and of Peget; or that of the acquaintance possessed with the secrets of organic chemistry, if we compare the knowledge of Bichat with that of "Pison, physician of the gods," the humbler student of mechanics has distanced his elder brother. Brunel is more a head of Dardanus than Jenner is in advance of Esculapins. Nature seems to have yielded not only her secrets but her powers to the modern mechanic, and the subject of a train weighing a hundred tons, propelled with the steadiness of a mule, but at the speed of a swallow, would have appeared to the builders of the Pyramids to hold to the supernatural. The chief energy of the inventive mechanic has been turned, for the last five or ten years, chiefly to the improvement of machinery for the destruction of human life; but at the same time how much has been done in the improvement of machine tools, that department of practical mechanics which endows engines that consume coal and vomit steam almost with the vitality of reproductive species.

While mechanical engineering, notwithstanding the present excellence of much that it produces, may be considered as only at the commencement of its brilliant triumph over brute and manual labour, that other branch of the science of the engineer which more directly consists in the imitation of nature, and in the control and adaptation to human service of her great wondrous forces, may be thought to have erected nobler monuments in the past than in the present era. The field of the labour of the engineer has, indeed, been widely extended by the demands of modern civilization. The masonry and earthworks which during the last thirty-three years have, in our own country alone, been constructed for railway substructure, would, if they could be brought within the compass of a bird's-eye-view, appear of formidable magnitude. If we look at the railways of the Continent a similar remark is applicable. Nor are railways the only work of the past century,—canals, roads, sea hours, docks, all attest the care and the skill of the engineer, although any single work

or system of works of our time sinks into insignificance when compared with the mighty labours effected at the bidding of some of the ancient kings of Egypt. Egypt is the home of engineering. There the forces of nature, displayed in a mode which, so far as our geographical knowledge extends, is unique, produce effects of portentous and unrivalled magnitude. There, in past times, have been executed the most stupendous works ever designed by man; and there, at this present moment, is being carried out an engineering work which may justly rank among the wonders of the world.

Since we called the attention of our readers to the line of route to India, and to that great and little-understood undertaking which was designed as the counterpart to the piercing of the Alps, further information has reached this country as to the state of the Suez Canal, and as to the work yet remaining to be executed in order to the completion of that singular enterprise. Not only does this information confirm, in every particular, the truth of the views we ventured to express, but the mind of the reporter seems to have been impressed with a conviction very similar to that under which we wrote. The works in progress, we are told, are stupendous, but the enterprise is not one which would have been entered on by men of business. A brief summary of what is actually going on cannot fail to interest our readers.

Entering from the Mediterranean under the protection of a long sea-wall or jetty, which threatens to be a source of no slight trouble from the constant displacement and accumulation of sand, the Suez Canal, after passing through the narrow strip of land on which Port Said is situated, runs for some twenty miles through the large shallow lagoon or salt-water lake, named Lake Menzaleh, into which the sea enters freely by several inlets, and the depth of which varies from 1 ft. to 10 ft. Eleven miles of solid cutting succeed, through ground from 15 ft. to 30 ft. above the sea level. A second small lake,—Lake Ballah,—is then crossed, and a further distance of eleven miles intervening between this point and the third lake,—Timsah,—contains cuttings of from 30 ft. to 85 ft. in depth. A distance of three miles across Lake Timsah brings us to a third heavy cutting of eight miles in length, varying from 30 ft. to 62 ft. in depth. The canal then passes through the Bitter Lakes, where only from 6 ft. to 9 ft. dredging is estimated as necessary; and the last cutting, which leads to Suez, is for a distance of 12½ miles, of from 20 ft. to 56 ft. in depth. Thus, out of a total length of 90 miles, 42½ miles are through cuttings of from 41 ft. to 85 ft. the section of the canal itself being 26 ft. in depth, while the width at the surface-level, rendered necessary by the loose character of the soil, and by the abandonment of the original design of pitching or walling the sides, is of the enormous dimension of 112 yards. In forming even the roughest estimate of the prodigious bulk of excavation requisite for the completion of this scheme, it is necessary to bear in mind the great difference in the labour necessary for merely shovelling away loose sand and in that for executing earthwork such as occurs in our own experience. But in the heaviest cuttings this advantage vanishes. In the eleven-mile excavation between lakes Ballah and Timsah occur both clayey and agglomerated sands. The general slope of the cutting is one and a half to one, giving a width at top in some places of 519 ft., the deepest point being 87 ft., near which, for a quarter of a mile in length, the sand is cut perpendicularly for 30 ft. in height. It is evident, therefore, that in the heaviest portions of the work excavation means excavation. About a third of this prodigious quantity of earthwork is now executed.

Any English engineer would consider a line of railway, the construction of which involved a constant or an average excavation of the depth of 26 ft., to be unusually heavy in point of earthwork. The water section of the Suez Canal has, as before stated, this vertical dimension, and, as the width at the water-level is 336 ft., every mile of canal cut through a flat level country *à fleur d'eau*, may be estimated as equaling in its cubical contents of excavation ten miles of railway. If to this displacement of earthwork necessary for the formation of the canal itself over the terrestrial portion of its route, we add the contents of the 40½ miles of cutting at from 15 ft. to 85 ft. above the surface-level of the water-level, we shall be far within the mark if we double the above quantity, so that the excavation for that portion of the Suez

Canal which has not to be dredged so much below the bottom of the lagoons, is equal to that requisite for 1,200 miles of railway. To this have to be added 50 miles of dredging, the long sea-walls or jetties at Port Said, and that important and valuable work, the fresh-water conduit. It is clear that the aggregate estimate can be no trifle.

There is one point in the conduct of this gigantic undertaking which reflects the highest credit on the skilful French engineers who direct the works, and on the indomitable courage and energy of M. de Lesseps. Our readers may remember that, soon after the actual commencement of the works was announced in this part of Europe, it became matter of suspicion, or indeed of evidence, that the Egyptian Viceroy was imitating his great predecessor Necos not only in the object, and in the magnitude, of his attempt, but also in the mode of its execution. In other words, the canal was being executed by forced, if not by altogether unpaid, labour. Diplomatic representations were made on the subject at Constantinople, and the result was that the compulsory labour was prohibited. With that prohibition, many of us thought, the doom of the undertaking was pronounced. Not so thought M. de Lesseps. His able staff seized on the occasion to replace the naked human strength of the Arab by the untiring toil of the steam engine. Machines altogether new to science were designed, were constructed in the factories of France, sent out piecemeal to Egypt, and set to do navigators' work in the deserts of water and of sand intervening between the Mediterranean and the Red Sea. Powerful dredging-machines were constructed for deepening the harbour. Steam barges were built for carrying out to sea the silt and sand raised by the dredging machines, and for discharging it through trap-doors. A contrivance called a *coulôir*, being an iron trough of large area some 70 yards long, is applied to catch the contents, which the buckets of the dredging-machines raise to a height of 40 ft. above the water level, and to conduct them into the discharging barges by sea, or over the banks of the canal by land; the flow of the wet sand down the *coulôir* being aided by a stream of water pumped up by the engine, and discharged on the buckets as they empty into the iron trough.

The framework supporting the *coulôirs* rests on an iron trunnion, fixed on an iron barge, so that the direction of the great discharging troughs can be as readily changed in azimuth, as their vertical angle can be altered by appropriate tackle. Where the bank of the canal exceeds the height of 20 ft. above the water level, a second invention comes into play, a sort of translation into steam of the horse-rail familiar to the English "navy," for running the contents of deep cuttings into "spoil." A railway is laid by the side of the canal, on which is propelled a strong iron frame, supporting an incline reaching from near the water edge to some 50 ft. in elevation above it. The barges used in this portion of the work contain movable compartments, into which the sand is run, and these compartments, suspended by chains from gear on the incline, like the cages of a mine, are wound up to the top by the engine, and then tipped over the bank. The whole of this machinery is so arranged as to require the least possible amount of manual labour. Each elevator and each dredging-machine is estimated to raise 1,500 cubic metres daily,—a duty which, if performed by human labour, would take the efforts of above 500 men. How many Arabs would go to one "navy" is a sum in reduction depending on many contingencies.

As the work advances from the borders of the lakes, and the cuttings become deeper, the use of the "elevators" is discontinued, and the contents of the excavation are either conveyed in barges to the nearest lake, or run out to spoil by temporary railways, as in a civilized cutting. Locomotives are employed to draw the trains of sand, but the use of manual labour to fill the wagons has not been superseded; and here the Arab learns the meaning of the term "piece-work," and the use of the shovel and the harrow. The absence of any unnecessary clothing, and the firm hold which the naked feet take of the planks, are great advantages to the wild tribes, whom the vigorous will of M. de Lesseps is thus actively "civilizing."

The engineer must look with pride at this noble effort of his art in a country where the ancient works of man were of a magnitude elsewhere unknown, and where the mighty operations of nature yet distance his most efforts. The dimensions which Herodotus gives of Lake

Meris, a vast reservoir, which the kings of the twelfth dynasty of Egypt, 4,400 years ago, constructed, in order to economise the precious supply which the Ethiopian rivers discharge, on the arrival of the summer solstice, to swell the perennial stream which the great equatorial lakes pour into the Nile, approach the fabulous. The Great Pyramid, built by the second king of the fourth dynasty, who reigned, according to the most reliable chronology, that of Brugsch, a thousand years earlier than Amnes II., the constructor of Lake Meris, contains nearly three and a half million cubic yards of masonry. Such are the results of human labour in this marvellous country. But Nature asserts her pre-eminence. The whole of Lower Egypt has been formed by the Nile. The delta, formed of mud brought from the mountains of Abyssinia, is still annually driving back the Mediterranean. The untiring, undaunted resolution of our honoured countryman, Sir Samuel Baker, has cleared up that which was the greatest mystery in the engineering of Nature. He has, of his own knowledge, confirmed the statements of Claudius Ptolemy, that the Nile issued from two great inland seas, and the researches of Bruce as to the rush of the water brought by the heavy tropical rains to the mountains drained by the Athara, along a deep channel, which is dry in summer, but filled with a torrent 30 ft. in depth in a single night. But he has done more than confirm and explain ancient tradition and later discovery: he has unlocked the whole secret of the system of the Nile, and has shown how a constant stream of sufficient volume to reach the sea, in spite of the immense loss which it sustains in its course from evaporation, is supplied by the feeders of the Albert and the regular fluxes of the Athara, following and overflowing the channel of the Nile, brings the annual blessing of the inundation to Egypt.

The movement of our troops, wisely accompanied by men charged with the duties of scientific observation, to this interesting region, promises to give us yet fuller details of its wonders. Already it is proposed to "tap" the inundation at its source, to divert part of the great torrent of the Athara, to fertilise further districts of the desert, and to win new Egypt from the barren sands. The simple plan of obtaining water by driving an iron pipe into the earth is to be tried whenever our troops need a supply. With water, in the tropical climates, comes instant vegetation; and, with the growth of trees, comes change of climate. It is quite within the limits of possibility that, between the artesian wells of Algeria, and the irrigation possible, and in a measure even commenced, in the neighbourhood of the Nile system of perennial and of solstitial flow, the face of nature in Northern Africa may be more changed within the experience of a single generation than has been the case since the dawn of history. However that may be, the name of M. de Lesseps must ever be connected with one of the grandest efforts of modern engineering; an effort remarkable in design, and still more wonderful in the progress which it has made towards execution, even in the country which contains the most stupendous works of antiquity. Nor, convinced as we remain of the non-commercial character of the undertaking, would we hear without regret and vexation of the abandonment of the noble works of the Suez Canal.

We have omitted to mention one of the most novel and striking features in the engineering of the Desert. The demons who were non-placed by the Scotch wizard, when he ordered them to make ropes of sand, appear to have obeyed on the shore of the Mediterranean a mightier enchanter, who has not only bidden them to give cohesion to sand, but shown them the way to execute his commands. By means of gigantic pug-mills, or machines similar to those used for mixing mortar, the sand of the desert is mixed with a proper quantity of lime, and then cast into great blocks of concrete. Thus the engineer not only emulates nature in the formation of water-concretes, but rivals geological action in the creation of rocks.

ARCHITECTURAL UNION COMPANY.—At the annual general meeting, recently held, a dividend at the rate of 5 per cent. free of income-tax, was declared, leaving (in addition to 32l. belonging to the auxiliary donation fund) a balance in hand of 25l. 18s. The payments included a donation to the Architectural Museum of 25l.

ARCHÆOLOGIC ITEMS FROM ROME.

The diggings in Trastevere, undertaken by private speculators last winter, that led to the discovery of ruins identified as a quarter of the "Vigiles," have been already reported of in our pages; and we are glad to find they have been continued, after some interruption during the political troubles, with further results of interest. It is known that, in the time of Republican Rome, a special magistracy and civic triumvirate existed, charged to protect the city against fire, and send assistants, who were stationed at the gates, whenever a conflagration broke out, for the fireman's task. But this police gave place to a better organized one under Augustus, who instituted the so-called "Vigiles" as a fire brigade, divided into seven cohorts, each 700 strong, originally formed of *liberti*, perhaps emancipated expressly for this service, and subsequently recruited from a higher class, as in the time of Antoninus Caracalla free citizens used to be enrolled among their ranks, under the command of tribunes, centurions, and a Prefectus Vigilum, whose office was important. Their ordinary duty was the patrolling of streets throughout the night; and their chiefs had jurisdiction over cases of simple theft; or of the offence of receiving stolen goods; over house-porters and fugitive slaves, which latter they were bound to bring back, if possible, to the legal masters. Under the Greek empire this organization was still maintained, but instead of the ancient designation, *matricarii* was the name given to the same corps. The *Regiones* mention their barracks-quarters,—one for each cohort, and within modern date, no have been discovered remains of several: one under the Savorelli Palace, near the Corso; one on the Cælian, near the Villa Mattei; another on the Aventine Hill—the Cælian rains the most remarkable, for there, as reported by Ennio Visconti, were found four towers at the angles of a fortified area, with walls 4 ft. thick, and a temple with octagonal cella and circular portico with porphyry peristyle—all now vanished from that site!

The spot chosen for the Trasteverine works is near a pile of Mediæval brick building, probably belonging to some haroul castle. Soon were reached walls in a good style of antique brick-work, inclosing a quadrangular area, that seems to have been a central open court; and, at the depth of about 20 ft., more or less, a pavement, in black and white mosaic, representing large figures of tritons and marine monsters floating on the sea, whose waves are rudely indicated. At one side, far from the centre, the portal of a pentagonal wall, in the concrete known as *opus signinum* (from the town of Signia, now Segni), no water, but heaps of marble and terra-cotta *debris* being found in its cavity. The walls around this quadrangle have a dado 1½ mètre in height, of stucco, painted red, in many parts covered with rudely-scratched proper names and other improvised records of proper soldiers amused their leisure, the most curious and frequently-repeated being in reference to tallow-candle illuminations, here called "*sebacaria*" (a new word to enrich our knowledge of the Latin of Imperial Rome), got up in honour of the decennial and biennial *nota* for reigning emperors or the creation of new Caesars. Most interesting amongst these *grafitti* is one recording such a spectacle, where the name of Antoninus (or Hellogabalus) has been erased, at least intended to be so, in order to comply with the senatorial decree for the effacing of all memorials of that infamous prince after his murder, the occasion for the military *note* here noticed being the appointment of the Emperor's cousin, Alexander, to the rank of Cæsar, A.D. 221. Other dates indicated in these *grafitti* correspond to years from A.D. 227 to 230. During the last spring was discovered a portal, opening off outside of the open court, with arched doorway, two Corinthian pilasters, and triangular pediment, the cornice and mouldings, as well as all other details, in terra cotta, altogether a most interesting and graceful specimen of architecture in such material. This doorway leads into a chamber, or (as conjectured) a *locarium*, the interior of which is still filled with soil and *debris*; but the inner walls and arch of that ingress, now fully brought to light, display paintings in Pompeian style, and not without hearty figures of men, birds, dragons, enclosed within red borders; the most spirited, two naked warriors, holding spears; the most graceful, a Cænis, with large wings, on the keystone. The latest discovery, within the last few weeks, is another set of wall-paintings, in

similar style, in a chamber reached by another doorway, opening from the same court,—this being without architectural details,—where we cannot yet explore far, nor examine the decoration from a proper point of view, owing to the soil that still obstructs progress; but the floating figures, with the several red borderings, now visible on these walls, give the idea of a pleasing treatment, alike Pompeian as are the others. At another side of the court we enter a narrow chamber between parallel walls, roofless, that seems the boundary of the buildings at the south-west. Masons' stamps, signs of the usual antique character, found among these ruins, indicate dates of the reign of Hadrian; and the singular elegance of decorative details suggests periods under the Antonine emperors. Since last May the excavations have been taken from the hands of the private proprietors and carried on by Government, a notification of which intent appeared in the official paper (28th May, 1867), announcing also the purchase of the ground and the decreed demolition of several paltry houses that stood above the area, and some of which, we see, have been thrown down since we last visited this spot. The most noticeable features and the richest of taste manifest in the adornment of buildings destined for nothing nobler than a barrack of firemen, leading us to conclude favourably for the predominance of artistic feeling in Rome at the period to which they are referable.

MALTA.*

Five questions are now agitated at Malta, and have been the subject of discussion in the public press of the island,—namely, educational reform; a civil instead of a military governor; a legislative assembly freely elected by the people; municipal institutions; and improved dwellings and sanitary measures.

Having for many years devoted a considerable amount of attention to these subjects, Dr. Casolani publishes the results of his reflections, with the view of drawing public attention in this country to the subject of promoting the welfare and prosperity of the island.

Of the fifth and last of the proposed measures we may give some idea, as these come more especially within our province.

The present sanitary establishment in the island consists of a board of health, a quarantine physician, and police. These Dr. Casolani proposes shall cease, and the duties of the establishment be performed by—1st, a standing sanitary committee, to consist of a medical man, a civil engineer, and a lawyer; 2nd, of a deputy sanitary commissioner for each of the seven districts of the island, who shall be directly responsible to the sanitary committee; 3rd, of a board of health, consisting of the committee, assisted by a military medical officer, a naval medical officer, and two lay gentlemen conversant with sanitary matters [the preliminary work of the board of health shall be that of devising a plan for a Sanitary and Building Legislative Act, by which authority will be vested in the committee for the performance of their various duties]; 4th, of inspectors of nuisances, an inspector of police in each district, under the orders of the deputy sanitary commissioner, to assist him and render all necessary aid in the inspection of nuisances and in the enforcement of all sanitary measures.

The public work department, as a branch of the collector of land revenue department, shall cease, and a separate department be created, with a civil engineer at its head, to be called the superintendent of public works, who will also act gratuitously as one of the managing members in the sanitary committee.

The works that will be required for some time at Malta for sanitary and other objects will be such as only an English engineer could execute, as the natives as yet have had no experience in designing works of sewerage, water supply, laying out of new towns, and improved buildings, or providing graving-docks and warehouses with mechanical appliances, &c.; and the convenience, comfort, and health of the people demand that such works should be no longer postponed.

The extension of the great harbour; the annexation of the French creek to her Majesty's dockyard; the prospective extension of the

naval establishments, which will necessitate the appropriation by the Admiralty of buildings and dwellings now occupied by the civil population; the overcrowding of the fortified towns; the enforcement of Building and Sanitary Acts, with a view to improve the condition of buildings according to modern requirements, especially the dwellings of the working classes and poor;—all these considerations, taken in a military, naval, and civil point of view, would require the action of Government, it is suggested, to provide or encourage the formation of a new town, well removed from the fortifications, and built under the most stringent regulations as to sanitary arrangements.

The fortified towns, Valetta and Floriana, with the three Cottonera cities, when originally planned were not intended to contain the very dense population they now hold. The houses, particularly in Valetta, during the existence of the Order of St. John were spacious, with ample quadrangles, consisted in many cases of one ground-floor, did not generally exceed the height of one story, and were thus healthily inhabited. They are now so changed and papered that often they are left without any court-yard at all, and are divided and laid out in ten or more unhealthy and separate tenements, each having an independent entrance. Often each house is turned into a so-called "carraja" (lodging), or tenement house, in which twenty or more rooms are separately let to as many families, with but one privy in the cellar for the common use. The cellars, too, are converted into human habitations, sometimes into filthy stables.

The fatal influences and evils arising from this overcrowding, which must necessarily increase every year on account of the towns being enclosed within fortified walls, thus rendering impossible any extension of building area, are sufficient to neutralise whatever in other respects may be attempted for the improvement of health.

What Dr. Casolani proposes is to obtain a tract of land well removed from the fortifications and naval establishments, and there to build a town, having easy access by an American tramway to all parts of the mercantile establishments along the harbour and to Valetta. The most desirable site for this purpose, he thinks, is the land extending from near the new extension of the Great Harbour to the gentle slopes surrounding the beautiful plain of the Marsa. Such a town, he remarks, should be ultimately complete in itself, having its own model drainage (without contaminating the sea) and utilizing the sewage in the surrounding country, water-works (supplying water at high service), gas-works, and places for worship. Public baths, wash-houses, race-courses, playing-grounds, and such like gymnastic institutions, might also be provided. The plain he would convert into a park.

A Building and Sanitary Act should be previously passed by the Government Council, which should be so enforced that the buildings might be erected upon the most approved modern system, with stringent specifications to ensure proper sanitary arrangements and appliances.

The only means, in Dr. Casolani's opinion, to improve in a sanitary point of view the present dwellings in Valetta, where building space is so valuable, is by altering the plans now existing, and building large blocks in "flats," not only for the working classes, but also for those in a superior position of society. Two such dwelling-houses have been lately built in Valetta upon his plans and under his direction,—one in Strada Mezzodi, consisting of four flats, with a house adjoining (built in the style of the Belgravian houses); and the other in Strada Mercanti, called "Camerata," a large block of building, consisting of 103 separate and independent apartments (with twelve more apartments not yet completed), and twenty-one store-rooms. They are both arranged with attention to sanitary principles, and have already, it seems, given most satisfactory sanitary results.

The formation of a commercial dock is one of the suggested improvements.

MUNIFICENT GIFT OF EARL SOMERS.—The castle grounds, so beautiful in themselves, so full of historic interest, and so desirable from their position, are, by the liberality of Earl Somers, to become the property of the town of Reigate.

THE COURTS OF LAW COMPETITION.

OUR readers have been kept fully informed on this subject. They knew before Mr. Hunt replied to Mr. Beresford Hope's questions in the House of Commons, as to the appointment of an architect, that the Treasury received a communication from the judges, stating that they had been unable to arrive at a decision that any one design was the best; and had recommended the appointment of two gentlemen for the joint preparation of a final plan. The reply of the Treasury was, that that recommendation was not such an award as they had expected that the judges would have made, and they referred the matter back to them, in the hope that they might be able to agree in selecting some one architect to recommend to the Treasury. On the 25th of November, Mr. Hunt went on to say, a further report was received from the committee, stating that they adhered to their original conclusion, and that under these circumstances the Treasury proposed to do what the law prescribed, namely, to seek the advice of the commissioners.

On the 10th of December the Treasury did accordingly forward the report from the judges to the commissioners, who met to consider it on the 13th inst., and directed the following reply to be returned by their secretary:—

"I am directed to acknowledge the receipt of your letter of the 10th instant, transmitting to me the copy of a communication from the chairman of the Committee of Judges of Designs, in which the judges state their regret that they could not agree to make such an award as was contemplated in the Treasury minute and the instructions to the architects.

You do not acquaint the Commission with what object (except that they may be informed of what has occurred in the matter) is made to them; but their attention has been called to the reply given on the 29th November last, by their Lordships' financial secretary, to a question in the House of Commons, in which Mr. Hunt stated that in this matter the Treasury propose to do what the Act of Parliament laid down, and to seek the advice of the Commission. The Commission accordingly conclude that the letter from the Judges of Designs is sent to them in order that they may advise the Treasury upon it.

The Commission desire me to observe that in strictness the Courts of Justice (Building Act, 1865, section 4, only requires the advice of the Commission as to "the plan upon which the buildings shall be erected, and the necessary arrangements for the proper or convenient accommodation of all the courts and offices to be provided for therein and for proper access thereto." The selection of the architect rests with her Majesty's Government. And the arrangements under which the concurrence of the Commission with the Treasury, in this and other preliminary steps for preparing the plan, was entered, are based on the Treasury minute of the 23rd December, 1865, adopted by the Commission on the 15th January, 1866.

In advising, therefore, the Treasury, at the present juncture, the Commission are not acting under their statutory powers.

I am, however, to state that it appears to them most desirable that the selection of the architect should be made in accordance with the terms of the memorandum which forms sec. 56 of the instructions to the competing architects, signed by Lord Grosvenor on the 17th April, 1866, and the opinion of the Attorney-General, by whom all questions which may arise on the interpretation of the memorandum are to be determined, should be taken whether the decision of the seven judges should be recognized as naming Messrs. Barry & Street the two equally successful competitors, so that they may be jointly employed accordingly, if prepared to accept such employment, and to share the architects' commission on the conditions already settled."

Here the matter now rests. The Instructions to Competing Architects, referred to, commence thus:—

A payment of 80% to be made to each competitor, except the successful one, who is to be employed as the architect of the building.

The architect employed shall receive 5 per cent. commission on the amount of the contract or contracts, and on any extras the amount of which shall have been distinctly and previously authorized by the Treasury."

These instructions evidently contemplate the selection of one of the competitors as the architect to be employed; but, as it seems to us, they say nothing which should prevent the selected competitor from associating with himself by arrangement another of the competitors, and there would probably be no real difficulty in making the recommendation of the Judges of Designs perfectly in accordance with the memorandum. Under the circumstances, this is the arrangement we hope will be carried out. Candidly, we shall not be contented with Mr. Street's elevations, nor will the public be. We should prefer to that Mr. Barry's design carried out in its integrity. But the actual design, in consequence of the conjunction, must necessarily be a new one, and if the abilities of the two gentlemen named be brought to bear upon it, with all the light that time and discussion have given, we shall have little fear as to the result. A second competitor is out of the question: such a step would destroy confidence in all future Government competitions.

It may be worth mentioning that Mr. W. J.

* Suggestions with regard to the General Administration and Internal Affairs of Malta. By Charles Casolani, M.D. London: Lane, Strand 1867.

* This building, which is constructed of solid stone, is the first instance in which the stone has been hewn, and the mouldings turned entirely by machinery, in Malta.

Gardiner, the surveyor appointed by the Treasury to test the estimates of the several competing architects, has added to each of them from 200,000L. to 600,000L., with the exception of Mr. Waterhouse's, to which he has made but a slight addition, 1,421,430L. instead of 1,419,842L. Mr. Barry's, sent in at 1,277,571L., he puts at 1,610,966L., including subways: Mr. Street's, called 1,330,510L., at 1,523,273L., subways not included; and Mr. Scott's, sent in at 1,277,326L., he brings to 1,726,494L., including subways, but not the glass roof over Bell-yard, or stables. The insufficient evidence on which the commissioners fixed the probable cost of the necessary buildings is strikingly shown by the fact that in the case of half the designs the cost is estimated at nearly a million of money more than the sum named, 750,000L.

THE PLAY-SCENE IN "HAMLET."

This is the engraving produced by the Council of the Art-Union of London, for the subscribers of the current year; and the latter may be congratulated on the opportunity of becoming possessed, by the outlay of a guinea, of a work which no publisher could sell for less than double that amount. Virtually, in fact, they get the print for half that sum, the balance being banded to them to lay out in pictures and other prizes.

The original picture by Daniel Maclise, R.A., is always a great point of attraction at South Kensington; and, for dramatic conception and powerful treatment, it is amongst the finest works of the British school. The picture is one that will repay long and close study, as, besides the broad and prominent features which at once catch the eye,—the intense earnestness with which Hamlet watches the effect of the play on his uncle, the convulsive clutching of the fingers of the latter, and the angry and suspicious glances of the soldiery, amongst whom there has doubtless been much speculation on the sudden death of the old king,—there are many minor points which come out by degrees, and show how carefully the artist has aimed at making all the canvas conducive to an illustration of the main purpose. Note the figures of Justice and Mercy on either side of the proscenium, while the tapestry is seen to represent on one side the Offerings of Cain and Abel, and the Death of Abel; and on the other, the Temptation, and the Expulsion from Paradise.

The picture has been powerfully translated into black and white by the burin of Mr. Sharpe, with a fine bold sweeping line worthy of the old English masters in this manner, combined with graceful and delicate finish. It may be worth observing how very little people in general know about the time required to produce such a work as this. The mixed style, or chalk method, as it is technically called, requires a much shorter period for the production of a plate, and, with mezzotint, is now almost exclusively adopted by the publishers of engravings.

The plate now in question was begun in September, 1860, and finished in December, 1865. The printing has been proceeding ever since the latter date, for a great part of the time by night as well as day, the work being constantly carried on by relays of workmen at the press—only about twenty-six impressions being produced in twenty-four hours. It is stated that the issue of copies to the subscribers will begin in February next.

The compact little almanac of the Art-Union contains information on the several art-institutions of the metropolis, and meetings of scientific and literary associations—not to be found in a combined form in any other work—in addition to other artistic memoranda and the usual matter given in almanacs.

BATH ABBEY RESTORATION.—A public meeting has been held in the council-chamber at Guildhall, Bath, for the purpose of receiving a report from the committee who are superintending the restoration of the abbey. The attendance was not large, but the meeting was a satisfactory one. The report urged the desirability of further subscriptions for the completion of the ceiling decoration, which would require 2,200L. more to finish it as it ought to be. Resolutions in accordance with the tenor of the report, and pledging the meeting to renewed exertions, were passed, and the committee re-appointed.

STABILITY OF ARCHES.

The analytical methods by which the thrust of an arch is calculated, and the necessary strength to be given to the supporting pier, involve a considerable amount of algebraical formulae, by which those who are able to apply them have the power of calculating the thrust of any given arch to the greatest nicety. To the practical builder, however, these very accurate calculations are not essential, and he is quite satisfied with some easy rule-of-thumb by which he can obtain something approaching the true result.

The following is an approximate method of measuring by scale the thrust of any given arch, and of finding the necessary thickness of pier to enable the structure to stand without rupture.

The section of the half arch must be drawn (as in the figure) with the thickness proposed to be

given to the pier or abutment, and the height of the surcharge. I here suppose that the arch, pier, and surcharge are built of the same material, and have the same specific gravity. The tendency of the arch, when the pier is too weak and the surcharge too heavy, is to fracture by the crown sinking and the joint opening at C, so that the pressure of the opposite half acts at D: this causes the reins to spread out, and the joint EF to open at F; so that the whole arch breaks up into four pieces; the other joints being kept from opening by the adhesion of the mortar. In the semicircular arch, which I take as the simplest example, the joint EF, one-third of the distance from B to C (so that EO makes an angle of 30° with OB) is found to be the weakest, or that at which the thrust from the other half-arch has the greatest effect.

When the arch is about to break, the thrust of the other half-arch acts horizontally at D, and its moment about E is equal to the moment of the mass HFECI (acting at its centre of gravity, G) about the same point, E. If we call N the thrust at D, Em (y) is its vertical distance from E; then N . y is its moment about E. Also, if P is the weight of HFECI acting at G, Em (z) is the horizontal distance from E of a vertical from G; and the moment of P about E is P . z. Then, just before fracture,—

$$N \cdot y = P \cdot z, \text{ or } N = P \frac{z}{y}$$

Hence we can calculate the value of N; and, by the principles of mechanics, we may now suppose N and P to act at E, in directions parallel to their original ones. The weight of HFECI can be very nearly measured by taking CK = 1/3 CD, and drawing FK; then the weight of the trapezium HFKI is sufficiently near that of the figure HFECI for all practical purposes. To find its centre of gravity, draw HK, dividing it into two triangles, HFK and KHI: bisect HF in L, and take Lp = 1/2 LK; then p is the centre of gravity of HFK. Similarly q is the centre of gravity of KHI. Join pq, and divide pq so that pg : gq :: KI : FH (by Euc., bk. 6, prop. 10). Then G is the centre of gravity of the trapezium HFKI. The weight (P) of the

trapezium is the sum of the weights of the two triangles, namely,—

$$\frac{1}{2} HF \times HI + \frac{1}{2} KI \times HI.$$

Draw the perpendicular, Gm, and the horizontal line Em (z). The horizontal line Em being the direction in which N acts, draw the perpendicular, En (y): then—

$$N = P \frac{z}{y}$$

In the figure OB=10 ft., AB=1 1/2 ft., DF=2 1/2 ft., ET=10 ft., HF=8 ft. 2 in., HI=10 ft., IK=3 ft. 6 in., Em=x=3 ft., En=y=6 ft. 6 in., Sw=4 ft. 10 in.

Therefore, P=8 x 5 + 3.6 x 5 = 58.4,

$$N = \frac{58.4 \times 3}{6.6} = 27$$

Now, consider Pand N, having the above values, as acting at E parallel to their original directions. The force tending to overthrow the pier is N x Em. In the figure Em=15 ft.; so that, the force to be resisted is 27 x 15, or 405. To find the resisting forces, first let TS be the thickness of the pier (3 ft. 6 in.); then the forces are P at E multiplied by Sw, and the weight of SH multiplied by 1/2 ST; that is

$$58.4 \times 4.10 + 24 \times 3.6 \times 1.9 = 429.$$

This being slightly in excess of the moment of N, the structure will be just in a condition of equilibrium, and any slight additional weight laid on the arch would cause it to thrust out the pier.

Hence it appears that in a permanent structure where stability is required, the pier must be much more than 3 ft. 6 in. Now, take RT=6 ft. as the thickness of the pier; Rw=7 ft. 4 in. The moment of N remains the same, as the height of the pier is unaltered. The sum of the moments about R of the resisting forces is

$$58.4 \times 7.4 + 24 \times 6 \times 3 = 860.$$

This is rather more than double the overturning force, and therefore the pier would be amply thick enough to insure permanent stability to the structure. By this method the stability of any pier supporting an arch can be calculated without the use of algebraical formulae.

The problem of finding the exact thickness that must be given to the pier, whose height is known, can be easily solved by means of a quadratic equation.

Taking the dimensions in the figure, and calling t the thickness of the pier, Sw=t+1.4, if ST is the thickness of pier when the structure is just in equilibrium; then the equation for equilibrium is—

$$58.4 (t + 1.4) + 24t \frac{t}{2} = 405$$

$$\text{or, } 36t^2 + 175t - 996 = 0$$

whence, t=3.36 ft., very nearly 3 1/2 ft.

To insure permanent stability, we must multiply 405 by 2 the coefficient of stability, and then the equation is—

$$36t^2 + 175t - 2211 = 0$$

whence, t=6.82 ft., or nearly 6 ft.

The same methods can be applied to Gothic arches, only the joint FE will vary according to the pitch of the arch, as shown in my paper on that subject in the Builder, March 31, 1866; in the equilateral arch the angle EOB being 16°. Also in Gothic arches it will be necessary to take the point K considerably below C.

E. WYNDHAM TAYN.

THE DEATH OF THE TOWN SURVEYOR OF NEWCASTLE.

Mr. BRYSON, the town surveyor of Newcastle-upon-Tyne, has expired from the effects of the injuries sustained in the attempt, of which every one has heard, to get rid of a quantity of blasting powder, or nitro-glycerine, which had been improperly stored in the town.

This has been a sadly mismanaged business altogether. The mere exposure of such a substance even on an open moor was by no means a safe way of getting rid of it, as any unfortunate who might have happened to walk across the moor would have found to his cost. Sinking it out at sea with weights attached would have been better; but surely chemists could have pointed out some way of safely destroying it.

Very different opinions appear to be entertained as to the manageableness of nitro-glycerine. The *Chemical News* says that methylated spirit renders it quite explosive till required for use, when water separates it as good as ever, and that wood naphtha also renders it harmless in a similar way; but in frosty weather there is danger of it crystallizing even then, when it becomes explosive as before. Mr. J. L. Bell, a chemical manufacturer, was a witness on the subject, and said that nitro-glycerine, particularly if impure, is liable to spontaneous decomposition at ordinary temperatures. The gases given off, if confined to the vessel containing the nitro-glycerine, exercise pressure on the remaining liquid, which is then liable to explosion under the least shock or slightest movement. Again, if this substance is brought from a cool place and exposed to a temperature of from 68 degrees to 75 degrees Fahrenheit — all these being very common temperatures — decomposition takes place, pressure ensues, and explosion may be the consequence.

The thirty canisters stored in the town, he said, if they contained two gallons each, would hold 960 lb. Had this been pure glycerine it would have been equal to 4½ tons of gunpowder! and it was stored where percussion, motion, or a moderate temperature might have caused explosion. Comparing the effect of such a quantity of pure nitro-glycerine with the effects stated to be obtained in the pamphlet issued by the Nobel Company, of Hanburg, by whom the compound in question appears to have been manufactured, it would have been sufficient to have blown down 115,000 tons of solid rock. Mr. Webb, the chief agent of this company, alleges that nitro-glycerine is not so dangerous as gunpowder, which seems to be rather a stretch of trade tactics. He says he carried 10 lb. weight of it on one occasion to France in his pocket. This must have been a pretty large pocket-parcel. Accidents in his quarries, he said, had diminished in number since he began to use nitro-glycerine, and it was constantly used now in slate quarries. It was the way in which it was handled, Mr. Webb says, that led to all the mischief in Newcastle. In all seven persons have been killed in this affair; the sheriff himself, who had the management of it, amongst the number. It is said he was acquainted with chemistry.

The jury returned the following verdict:—

"That death has been caused by the explosion of nitro-glycerine accidentally; and the jury are unanimously of opinion that the law in reference to the storing of nitro-glycerine has been grossly violated in this case."

The jury would not allow any of the nitro-glycerine canisters to be brought into the room, and a clergyman who had a piece of slag with him was ordered to take it out, as it was supposed to be nitro-glycerine.

ON ART, ESPECIALLY SCULPTURE.

UNDER this title Professor Westmacott is delivering an interesting course of lectures, under the Cantor bequest, at the Society of Arts. In the course of the second lecture he gave a rapid review of the different schools of sculpture from the most ancient period. The monuments of Egypt probably mounted up to not less than 2,000 years before the Christian era. The sculptures brought from Nineveh and its neighbourhood, exhibited a comparative perfection of workmanship that showed long practice; yet we know that the wonderful city from whose ruins they were exhumed, was utterly destroyed above 600 years before Christ. This comprehended a period of nearly 2,500 years, and many of the sculptures must have been executed long before this event. At about 450 years before Christ, sculpture, hitherto treated without reference to any excellence, began to be practised on a new basis. It was then not only used to illustrate the religious myths and heroic deeds of the Greeks, in the rude style of the earlier time, but the principle was introduced that these noble subjects should have their expression in the most perfect forms. Then began an entirely new phase of art, most important in its history, which made Beauty a condition of its practice. The school which ranked highest in this noble achievement was that under Phidias and his contemporaries, when the most sublime subjects were represented under the most majestic and dignified forms. To this succeeded the school of Praxiteles, who, departing from the more severe and pure treatment of the previous artists, made

beauty itself the object and end of art. This, though the subjects were still religions, introduced a sensuous style, in works of exquisite and attractive execution. It was a downward step in art, because it made its appeal to the eye and sense alone, and not to the pure and more noble sentiments. After this came the school of Lysippus, which still further deteriorated from the high standard of the greatest masters. He was the favourite sculptor of Alexander the Great, and it was under their ambitions, self-glorifying monarch that portrait-sculpture was first introduced. Here individual character and details were studied, instead of the larger general type of form seen in the most perfect works of nature; and, although productions of great merit were supplied by the sculptors of that period, and for some short time after the death of Alexander, the most perfect style of art ceased to be the object of study. The time during which sculpture, in its finest form, flourished, was comprehended in the comparatively short period of 200 or 250 years. The lecturer then traced what he called its downward course to later times—to its existence among the Romans, where, owing to the peculiar character of the nation, what was termed fine art, as it had been practised in Greece, excited little or no sympathy.

The third lecture (December 20th) included a review of the Mediæval and more modern schools to the close of the eighteenth century.

THE ROYAL HIBERNIAN ACADEMY AND STATE AID.

A MEETING of this society has been held (Sir Thos. Deane in the chair) to consider its position and the best means of promoting its interests. On the motion of Mr. Mulvany, a resolution was passed complaining of the retention of their report from Parliament by the Department of Science and Art, and stating further "that in assuming to be the 'official superiors' of the Academy, the Department is not sustained by any known or implied relations between it and the Academy, nor by any bye-law."

A second resolution was passed to the effect that in the interest of art the Royal Hibernian Academy is as fully entitled to State aid as the royal academies of England and Scotland.

Mr. J. H. Foley, R.A., in speaking to this resolution, said,—I do so in the full conviction that the aid hitherto granted by the Government to the Royal Hibernian Academy, namely, 300*l.* a year, is wholly insufficient for the successful working of the institution, and I cannot but contrast the support it thus receives with the support accorded to the Royal Academy of London, of which I have the honour of being also a member. The latter-mentioned institution has been designated a self-supporting institution, but I beg leave to differ from those who deem it such. From its infancy the Royal Academy has been provided by the Throne or the Government with a home, and I cannot but consider the value of that home at some thousands a year. The gift of Burlington House and portion of adjoining land may be fairly estimated as a gift of 80,000*l.* which sum, if funded, would produce an annual income of 2,400*l.*; and I am strongly of opinion, considering the circumstances of this country, that the support given by the Government to the Royal Hibernian Academy should be even greater in proportion than that given to the Royal Academy of London.

A deputation was appointed to see the Chief Secretary for Ireland on the subject.

FROM MELBOURNE.

A DEPUTATION from the provisional committee of the proposed Museum of Industry and Art, waited recently upon the hon. the treasurer for the purpose of being put in funds for initiating the project. It was explained by the deputation that a very large and valuable collection of specimens of raw material was already stored within the Exhibition buildings, and it was most desirable in order to keep faith with those who had presented them, that steps should at once be taken to make the collections accessible for inspection. To do this, money would be required to provide suitable cases, as also the necessary attendants, before the Museum could be open to the public. Mr. Verdon expressed himself favourable, but could not at present do more

than keep the scheme afloat. He hoped, however, that in the next session of Parliament a Bill would be introduced which would embrace the objects contemplated.

The Gipps Land Hospital, at Sale, was opened on 20th August last. It originated with a small society for the relief of casual cases of sickness or accidental injury among indigent strangers, who were then frequently coming into Gipps Land in search of employment on public works or at the mines. Funds were collected, plans invited, and eventually that of Mr. Anderson, a local architect, was adopted. The site is a reserve of five acres upon the plains, on the limit of the township of Sale, and immediately adjoining a reserve, of similar extent, for a benevolent asylum, and another laid out as a botanic garden, which last the borough council are now improving. The external appearance of the building (which is of brick) is picturesque, as shown in a very fair engraving in the *Australian News*. The front door leads to an octagonal hall, having on the right a consulting-room, and on the left the dispensary. The hall will be used as a waiting-room for out-patients. Passing through folding doors into the passage beyond, on either hand are long wards, for male and female patients respectively; and behind these are closets and bath-rooms. Up-stairs is the operating-room, well lighted from above, several small wards, and the apartments of the matron and steward. The nurses' rooms all open into the general wards to which they are attached. The same provision is made on this floor as on the lower one for baths, &c. The plan is one that admits of additions being made to the building from time to time should they be required.

MURAL DECORATIONS.

PAINTINGS AT WALLINGTON, NORTHUMBERLAND.

At a recent meeting of the Royal Institute of Architects, Mr. W. B. Scott laid before the members examples of the paintings with which he has recently decorated the mansion of Sir Charles Trevelyan, at Wallington, as before now described in our pages, and read a paper descriptive of the undertaking. We avail ourselves of a portion of it, and of a few of the illustrations accompanying it.

The house was built about 130 years ago, at a time when a fashion prevailed of dispensing with lobby, hall, or ante-room, the principal entrance opening directly from the lawn or drive into the central and principal room of the house. At Wallington the central room of the front is the drawing-room, and the principal entrance still remains there, now only used occasionally. The plan of the house, which is very large, was a quadrangular mass of building the inner wall (to the quadrangle) being pierced with windows lighting a corridor on the ground-floor all round three sides, a similar corridor above also all round three sides, the fourth side giving light to the great staircase. The entrance being as already described, the great staircase was altogether apart from it,—could, indeed, only be reached through the principal rooms of the house. Besides, the quadrangle enclosed by the high blank walls, was a damp inaccessible court. To change the plan and convert this court into a saloon was intrusted to the late Mr. John Dobson, of Newcastle, who obtained his object by taking the entire inner wall on three sides down, and in its place making two arcades, the lower one of solid stone piers and arches, the upper supporting a ceiling of the form called, by an Italian phrase, a *scalfo*. Besides being covered on four sides at the well line, it is divided by the beams into square coffered panels, in the centre of each of which are large hemispherical glass lights, specially cast in one piece by Messrs. Swinburne. These being very thick and heavy have obviated the constant trouble, in a wet and windy climate, caused by too glazing of any description involving sashes and putty. They are globular, like watch-glasses, slightly obscured in the making, and insure all the year round an equable shadowless light as long as day lasts, showing the decorations and pictures in an unexceptionable manner. Here for once, Mr. W. B. Scott thinks, the difficult problem of lighting picture galleries has been solved,—whether applicable at a lower height and other circumstances he cannot presume to say. The fourth wall, that protecting and partly supporting the great staircase (the south side) Mr. Dobson treated in a way to preserve the unity of the apartment. The lower part necessarily re-

maining intact, he faced it with solid stone pilasters and arches, and built up the arcade on the side opposite (the north side) to correspond. Thus the saloon had, on the ground floor, two sides, each showing four panels or recesses, inclosed by stone pilasters and arches, admirably adapted for painting, and out of this grew the scheme of decoration now being referred to—namely, eighteen illustrations from the old ballad of "Chevy Chase," fitted for the angles and spandrels of the upper series of arches. The section shows their position.

The house being a Border mansion, the decoration was treated with reference to Border history. The eight panels were fitted with a series of pictures, the subjects of which began with the Roman Wall, which ancient fortified barrier passes not far off, and ends with the Industry of the Tyne—four ancient and four modern incidents in history:—

1. The Building of the Roman Wall.
 2. King Egfrid offering the Bishopric of Hexham to Cuthbert, Hermit on Farns Island.
 3. A Descent of the Danes on the Coast.
 4. Death of the Venerable Bede.
- And on the opposite side, the later subjects,—
5. The Spur in the Dish,—the Sign to the Moostrooper that the Larder was empty.
 6. Bernard Gilpin taking down the Gage of Battle in Rothbury Church.
 7. Grace Darling and her Father saving the Shipwrecked Crew.

5. "Iron and Steel,"—the Industry of the Tyne. The stone pilasters dividing these pictures, and the solid piers corresponding to them on the two arcaded sides, are partially decorated. The stone is of a very light-coloured close texture, very agreeable in tone, and the experiment of painting foliage in ordinary oil paint without any preparation or "grounding" whatever has been completely successful. Such grounding would, of course, hide and lose the surface of the stone, which it is so desirable to retain in its natural state; and there is no difficulty in doing so. There is, indeed, a little difficulty in getting the paint, laid on with an artist's small sable brush, to overcome the grit and show a uniform surface; but the difficulty is only one involving a little more time, and it may be safely affirmed such painting is unchangeable, and, as to its duration, will assist in preserving the stone itself. In the spandrels above surmounting these pedestals, the surface being plaster and the decoration to be done by degrees by various hands, the painting was executed on prepared linen cloth, which was cut exactly to fit the shape of the spandrel, and applied by a mixture of glue and paste, the plaster being previously well saturated with oil and paint.

The subject, as we have said, is the old Border ballad of Chevy Chase, and is divided into four parts, each part to occupy a side of the apartment. It is the history of a day and a night, from sunrise to sunrise, the angle at which the last picture joins the first happily coinciding with the period of the morning and the aspect of the sky in both. The period of twenty-four hours affords all varieties of aspect,—morning, noon, evening, moonlight, and dawn.

In No. 1 we have the Departure, seen from the Battlements; in No. 2, Earl Percy parting from his Wife; No. 3, the Retainers trotting away; and so forth. Then comes the Hunting, one of the illustrations of which, the Battue, we give. In No. 10, tidings are brought of the approach of the Scots, and the battle begins. The two compartments showing the advance of the English Bowmen and the Scottish Spearman closing in we reproduce (Nos. 11 and 12). After other incidents of the battle come those of the next morning, ending with Percy's Body found by his Wife, and the Return with the Dead to Alnwick.

At the close of the paper,—
Mr. Seddon said,—The decoration of architecture by painters of eminence, such as Mr. W. Scott, was unfortunately a rare occurrence in these days. Members would therefore gratefully hail this series, in which the subject was most poetically conceived, and the difficulty of adapting the designs to the forms of the spandrels was very happily overcome.

Professor Donaldson.—All must be aware that the Border regions are particularly rich in the minstrelsy of those parts which describe the forays and attacks both of Scottish and English passing each other's borders, and the meetings of large bands of brave warriors nourishing the deepest hatred to each other, and the desire to avenge previous unsuccessful incursions. Therefore the mixing up of such illustrations of history

is peculiarly interesting in buildings in that part of the country. I recollect that, when I had the honour of visiting Alnwick Castle with the Duke of Northumberland, in company with the Cavalier Canina, Mr. Salvin, and the late Professor Cockerell, we were debating together on this subject of pictorial decoration, and his grace subsequently directed a series of paintings to be executed for the decoration of the walls of the castle; and the result has been a pictorial illustration of a succession of very remarkable historical incidents. It occurs to me that the mural paintings as we find them in Italy are particularly well suited to this style of decoration, and copies of some of those great pictures have been produced in a very admirable manner in Stafford House. It shows how painting allies itself to architecture, and gives a deep interest to all the styles described. It is the more happy when it records the history of the country in which such buildings are situated. There is one question which arises in my mind as to the mode in which this work has been carried out. At Mr. Hope's house in Piccadilly, which I built, we had canvas glued on to the plaster of the wall, of a very rough texture indeed,—so rough, in fact, that you could see the grain through the ornamentation. This ornamentation was painted on a ground of gold, of light diaper pattern. The effect of the texture of the canvas and the gold is an extremely rich surface. It was mentioned in the paper that the texture of rough canvas would not look well, but in this case it does; and the same thing is carried out very much in France, and in other places in England it has been adopted. There is much practical experience yet to be learnt in the mural decoration of buildings: first, in the mode in which it is to be carried out, and next in the selection of historical and interesting incidents for illustration, as has been done on the walls of Sir Walter Trevelyan's house.

Sir Charles Trevelyan, in the course of an address, stated that the three sister arts of architecture, sculpture, and painting, all contributed to the decoration of the room; and, although on a small scale and in a humble way, they stood there in the relation in which they ought to stand to each other. In the centre was a group by Woolner, representing a Christian mother teaching her child to pray, as the highest type of modern civilization. The pictures by Scott commenced with the building of the Roman wall, and ended with the High Level Bridge at New-castle. The wild flowers of Northumberland had been painted on the plasters by many an affectionate and friendly hand, and the whole were connected by the stirring and affecting incidents of the hunting of Chevy Chase round the spandrels of the arches.

Mr. G. B. Street said, the architect owes an immense debt of gratitude to the painter who will undertake to paint anything to decorate a wall. If there is one difficulty more than another which stares us in the face it is that of persuading a painter to look upon such work as this as anything but a picture to be hung on a wall, and not to assist in effect the architecture of the place which is best seen when adorned in this way. We therefore owe immense thanks to Mr. Scott for what he has done. If this experiment answers, and if the effect of the light is such as enables you to see these oil paintings without glare and as satisfactorily as distemper on the face of the wall, it will solve one of the great difficulties which one has now to encounter in getting an artist like Mr. Scott to do work in out-of-the-way places. Very few painters like to leave London to do their work. If Mr. Scott can execute this work here; if it is not damaged by damp; if it is to be well seen, and the effect of the colour is *fat* enough to be seen, it will be an enormous advantage to have the chance of seeing some of these buildings decorated in a way which, without sub assistance as Mr. Scott has given, we are hopeless of seeing.

Mr. Burgess.—I agree in the opinion that it is of importance to get painters of eminence to decorate walls, but I must say I think these are treated too much like oil pictures. I think they would have been better done in distemper or fresco, and in much brighter colours. It also appears to me that a more uniform tone is required. If we are to have the assistance of artists like Mr. Scott decorating the walls of houses or churches, I would express a hope that we shall have less of the Venetian school and more of the Tuscan than we have had hitherto.

Mr. M. Digby Wyatt.—One word on the point just alluded to with respect to uniformity of colour in any series of pictorial subjects, com-

bined with the different architectonic parts of any apartment decorated throughout in polychromy. I think the last speaker should have made the following distinction,—the necessity, or the contrary; for any such uniformity is, I believe, dependent on the relative importance and extent of the surfaces decorated respectively pictorially, or in conventional colour only: provided in any apartment you cause the leading portion of all the surfaces to be decorated in strong colours, repeating themselves with simple regularity, the eye will be satisfied whether such dominant portions assume the form of pictures or of architectural parts only. If you have obtained, any how, your symmetry in the major, you may dispense with it in the minor. Hence it is obvious that in cases where the main polychromatic effect is dependent upon the colouring of a series of paintings (as, for instance, in the "Stanza" of the Vatican, or the Scuola di San Rocco, at Venice). There, I agree, you must have uniformity in the scale of convention of any such series; but in cases where the pictures are secondary, and the architecture primary (as, for instance, in the Galerie d'Apollon, of the Louvre, or in the Loggia of the Vatican), the painter may be left to vary his style of *chiaroscuro* colour and handling at his own good pleasure. Thus it becomes the duty of the decorative artist to study all the conditions of the building he has to decorate. Where he sees its leading architectural parts are thoroughly good he should keep his work down, where they appear unsatisfactory he must put out all his strength to win the eye for his own department. If the architectural parts are good, but monotonous, he must run into and break them up; if, on the other hand, they are but "*disjecta membra*," he must tie them together and harmonize them with his decoration. I believe these to be the correct principles on which decorators should act in such matters: it is that which was adopted by Raffaele, Giotto, Lunni, and Pinturicchio, who were perhaps the most harmonious mural painters whose works remain to us. With regard to applying canvas to wall and ceiling surfaces, I would warn artists who have it to do not to employ glue or paste. The best mode of attachment is to paint the surface to which you have to make the canvas adhere well with white-lead and oil, getting a good body on it, and while still tolerably green put on a thick coat of white-lead with a little gold size, which makes it set very hard; then paint the back of the canvas with white-lead with a little gold size, and rub it well down, so as to cause it to adhere evenly: the fibrous texture of the canvas causes the fresh white-lead to adhere well to the canvas, and the green white-lead adheres well to the white-lead applied to the wall or ceiling surface shortly before pressing the canvas up in its place. The sticking medium being mixed with oil, damp has little effect upon it. If glue or paste be used the canvas will expand and contract according to the condition of the atmosphere, the paste or glue being affected hygroscopically as well as the fibre of the canvas, and in time will detach itself. When Mr. Alfred Stephens was so good as to paint for me a reproduction of Raffaele's ceiling of the Camera di Segnatura, for the Italian Court of the Crystal Palace, and Mr. Smallfield one of Perugino's ceiling of the Saladi Cambio, at Perugia, both were done upon separate pieces of canvas, and put up in the way I have described. At the present time neither has become detached in the slightest degree. This being a practical matter, I take the present opportunity of mentioning it. I would also call the attention of architects and artists who desire to use oil paint in this way, to a very excellent material prepared by M. Binant, of the Rue de Clerly, at Paris. He makes canvasses larger than 20 ft. by 20 ft. in a single piece, on which the whole of a ceiling can be painted in the studio for subsequent application elsewhere. He sells it ready prepared for the painter's use, grounded in any graduated tints which may be required. It is a very handy material, and is light and of a nice surface. One word as to the peculiarity of the texture of canvas used for decorative purposes. The reason only rough canvas has so good an effect for mural painting in oil, is because it is in fact the only means by which the usual glitter of oil painting can be overcome, excepting, of course, by such an alteration of the vehicle by the admixture of turpentine, wax, or gum damms, as scarcely leaves the picture what is usually called an oil painting. If canvas, fine in texture, evenly grounded with a non-observant ground, smoothly primed down, be painted with colours

MURAL DECORATIONS AT SIR WALTER TREVELYAN'S, WALLINGTON.

Section through Corridor.

No. 7. The Battle.—The Archers posted for Shooting.

No. 12. The Scottish Spearman closing in.—A Douglas! A Douglas!

No. 11. The English Bowmen advance.—A Percy! A Percy!

ground in oil, and with nut or linned oil as a medium, the surface of the picture will be so flat, that when it reflects light it will reflect it as from a luminous sheet. With canvas in large granulation painted even with the same vehicle, light will be reflected from every minute elevation of the canvas in tiny scintilla or pencils, but the corresponding depressions will be all in deep colour—i.e., colour either in shade or in shadow. That is why oil paint applied upon a coarse canvas produces a better effect for mural decoration than it does when applied to a perfectly flat surface of fine canvas. The old Venetian paintings were usually executed upon canvas, the texture of which is quite obliterated

by the heavy grounding, and much varnish has been used in the finishing; the consequence is that they glitter most disagreeably. The preparation used habitually by French and German historical painters, produces a dead or "mat" effect, partly by the nature of the preparation, usually a hasty-encastic, and partly by the coarse granulation of the canvas upon which it is applied.

Mr. W. B. Scott said, I fancy we shall never take to fresco again in this country, unless it be on very carefully prepared interior walls, and after an apprenticeship on the part of the painter it might be tried with success. But I look upon it that the silica process has superseded it, and,

apart from that, the introduction of oil pictures; canvas pictures, planted on walls, are almost the only chance of getting interior decorations well carried out. The danger and difficulty of getting the walls painted without having the works done in the studio, and applied to the walls, are so great that we are rather chary of it. The only difficulty, as it appears to me, in using canvas pictures, is in the matter of lighting. If they have no shine, the whole advantage of the canvas picture and oil painting is obtained. Oil painting stands the climate of England better than any other kind of painting; and if it has no shine it appears to me the best adapted to this description of decoration.

THE NATIONAL STANDARD THEATRE, SHOREDITCH.

THE NATIONAL STANDARD THEATRE, SHOREDITCH.

THE National Standard Theatre was burnt down in October of last year, and for some time the site remained unoccupied. In July, 1867, however, the first stone of a new theatre was laid, and last week the building was opened to the public. It is large and lofty, and we now give a view of the interior, produced under some difficulties. The ground upon which the old Standard stood has been considerably enlarged for the new theatre by the purchase of adjoining property. The site was originally that of the old Curtain Theatre, one of the most ancient playhouses in the metropolis. This theatre is mentioned as early as 1578, in a sermon at St. Paul's Cross. Ben Jonson exhibited his abilities here both as an actor and an author. Upon this ground Mr. Douglass has erected his new theatre. The main building is 167 ft. in length and 60 ft. wide. The height of the interior, from the pit-floor to the top of the dome, is 84 ft. Within this space four tiers of boxes and a gallery are constructed, each one receding from the other, the lowest circle being 54 ft. in width, the highest one 86 ft. There are no columns visible in the front of the house. The first tier is a balcony of cushioned arm-chairs, covered with crimson velvet. Behind is a circle of comfortable little private boxes, fitted and lighted in a convenient manner. The shape of the interior of the building is a horse-shoe. The theatre is to be lighted by a massive crystal sunlight, by Messrs. Defries & Sons. All the staircases are of stone. The gallery staircases and the two at the side of the proscenium are carried the whole height of the building. From the main entrance in Shoreditch a double flight of stone steps conducts to a spacious lobby, where they break off to communicate in separate flights with the several tiers. This lobby is surmounted by a dome, rising 40 ft. The box saloon is large. An iron bridge spans this room, forming the main entrance to the third tier of boxes. Above the saloon, and running nearly the whole length of the front building, is a spacious room, which will make a concert or billiard room. There are ninety private boxes in the theatre. The decorations are mostly of *papier mâché*, coloured and gilt. The stage at the proscenium is 44 ft. wide, and from the footlights to the back wall it is 70 ft., and to the front of the first horse-shoe 66 ft. To the barrel-loft the height is 94 ft.; hence the greater part of the stage working will be in the flies, the scenery consisting chiefly of cloths. The act-drop has been painted by Mr. William Telkin. It is partly shown in the view. The curtain is composed of crimson silk velvet, arranged in folds and embellished with golden fringe.

We may take another opportunity to speak of the merits or demerits of this new place of public resort when we have seen it filled with persons.

THE IMPROVEMENT OF WORKHOUSE INFIRMARIES.

At a meeting of the Health Committee of the Social Science Association on the 18th, an address was delivered by Mr. Ernest Hart, "On a national Scheme for the better Organization and Management of Workhouse Infirmaries." Mr. Edwin Chadwick, C.B., presided. The speaker said the number of workhouses throughout the country, excluding those in the metropolis, was about 600, and within these there were about 40,000 acutely sick people; and these were not confined to a few houses, but were scattered over the whole number. Now at present there was no medical authority at the Poor-law Board to technically deal with these persons. There was a medical officer at the Poor-law Board so called, really a district inspector with a double title; but the real work was done by certain district inspectors, who, in fact, possessed no technical knowledge upon the subject upon which they were called to report. Each inspector had about fifty workhouses on an average, and his duty consisted in inspecting the houses about twice a year. Giving a summary of the heads of his general scheme, he would say that it should first include the adoption of a series of general principles in reference to the infirmary portion of the workhouse; that the space for sick should be regulated at 850 cubic feet; and that these wards should be kept entirely distinct from those devoted to the able-bodied paupers. He further

suggested that the medical officers should have a life appointment, and should be more adequately remunerated, and that their dismissal should be subject to the approval of the Poor-law Board. There ought also always to be trained nurses, and he should like to see it laid down that visitors, under proper regulations, should not be liable to exclusion. A provision should be made for the opening of these houses, under proper regulations and at proper times, to visitors. The two great changes in the Poor-law Board and its staff which he would enforce were first the appointment of a limited staff of technically educated inspectors; and, secondly, the establishment of a hospital or medical department at the Poor-law Board.

An interesting discussion ensued, in which the chairman, Mr. Hugh Williams, Dr. Stallard, and others, took part.

On the motion of Mr. Godwin, seconded by Mr. B. Baker, it was resolved, that in the opinion of the department the scheme was such as would in its broad features tend to improve the management of the country workhouse infirmaries, and that it be referred to the council to lay it before the Poor-law Board, and request their best consideration for the same.

THE O'CONNELL NATIONAL MONUMENT.

The sketch-model for this work, by Mr. Foley, R.A., has just been exhibited in Dublin, where its unique beauty at once secured for it the unanimous approval of the committee and the public. The design comprises a base, supporting four winged victories of Patriotism, Fidelity, Courage, and Eloquence, as typical of the qualities of mind exhibited in the labours of O'Connell; a pedestal, enriched by groups of figures of all classes, assembled to hear Eriu's proclamation of their newly-acquired liberties; and a statue of O'Connell surmounting the whole. The cost of the finished work, which will be executed in bronze and granite, and above 40 ft. in height, is anticipated to exceed 10,000l.

THE LIVERPOOL FREE PUBLIC LIBRARIES.

The 15th report, for 1866-7, of the committee on the Liverpool Public Free Library, Museum, and Gallery of Arts, has been presented to the town council and printed. It shows that the number of books issued in the reference libraries for the past year, has been 578,774; and in the lending libraries, 420,282; in all 999,056, or in round numbers, a million of volumes of healthy literature have been distributed amongst the working and middle classes of Liverpool during the past year! We believe this issue is unprecedented in any library in any country, and it must hold an important position in relation to the question of general education now so much talked of. So with the Manchester libraries, which, however, only issued 600,000 volumes during the same period. The Liverpool report states that the erection of the Gallery of Arts is now in a fair way of being proceeded with; that the property required for the site has been scheduled under an Act passed during the last session; and that the borough architect is preparing plans for the intended building. The main feature of the year, besides the astounding issue of books, had been the acquisition of the magnificent collection of historical art treasures given to the town by Mr. Joseph Mayer, F.S.A.

LOCAL MUSEUMS IN INDIA.

The demand for local museums of industry and fine arts which is now so active throughout Europe has extended to India. The Governor-General, as we said some time ago, has appointed a commission to report on the conservation of the ancient architecture of India, and the best means of obtaining casts of the finest examples. The Lieutenant-Governor of the North-West Provinces has also organized a committee of action for his district, and has laid down the principle that a museum should be established at the head-quarters of each revenue division, and that the chief museum for the North-Western Provinces should be at the seat of Government. Collections of diagrams and drawings illustrating frescoes and works on decorative art have been ordered to be sent from England.

The main objects of local museums are defined to be:—1. The improvement of manufactures; and, 2. The preservation of modern art. An official memorandum states that, "in order to prevent natives from thinking that European designs were desirable as copies for ornamentation, it would be necessary to procure many modes of illustration from different parts of India and the East generally," and that it is not in the modern art manufacture of India that the means can be found to give new life to the native designer. It is in the architecture of the country that purer and more original ideas can be found.

SCHOOLS OF ART.

The Reading School.—The distribution of prizes has taken place in the town-hall. The audience was small. The report said:—

"The committee of the Reading Government School of Art, in presenting their seventh annual report, have much pleasure in being able to record the prosperity of the school, which, from its foundation till now, has continued steadily to increase. The examination this year was held on the 12th, 13th, and 14th of March, when 73 pupils attended. Of these 37 were successful—10 taking prizes, the remainder cards of merit. Fifty-eight works were sent to South Kensington for national competition, six of which were selected. One national medal was awarded, and 10 third-grade prizes. The total number of pupils who have attended has been 107, showing an increase of 11 over the previous year."

Mr. Havell said that there were only 90 medals circulated throughout the country, and therefore they had a fair share in receiving one; and the local prizes were supplemental to the prize given by Government, and were purchased by the committee from the prize fund. He had always considered that the instruction in elementary schools was of great importance. Previous to 1865, the management of the grants given by Government was entrusted to the art-master, who received a slight pecuniary advantage. In 1865, the number of pupils under instruction at Reading and the branch school at Henley, was 638; but during that year a new motto was issued, and the management was taken out of the hands of the art-master and placed in the hands of managers of schools. He questioned at the time whether the course was a wise one, and the result had shown that it was not. One manager objected because a subscriber did not approve of the new-fangled notion, and another could not afford it. To meet this latter objection he (Mr. Havell) gave instruction for nothing, and then they said that they could not purchase the materials, and he supplied the materials for nothing,—and then they accepted. The number of pupils now was 152, against 538 in 1865. Mr. Levevre distributed the prizes.

The Southampton School.—In pursuance of resolutions adopted by the borough council, in which they accepted an offer made by the committee of the School of Art, to transfer that school to the council, that it might be carried on as a branch of the Hartley Institution, the Hartley council have had under their consideration certain regulations for the management of the school, and for the specification of the duties of the master, which they recommended the borough council to adopt. The Hartley council have received from Mr. W. J. Baker, the present master of the school, a statement of his concurrence in these rules, and of his willingness to hold the office of master in conformity with them.

The Stourbridge School.—The annual meeting of this institution has been held in the school-hall. There was a tolerably good attendance. The Hon. C. G. Lyttelton presided. The report stated that there was again an increase in the number of those attending the school, and for the last ten years an increase had been steadily maintained. In the study of colour there was a marked improvement, and, as the effect of colour was gradually being more considered in works in glass, it was hoped the result would be that to the superiority of manufacture for which English glassmakers had always been famed would be added a reputation for colour, in which, hitherto, Continental glassmakers had surpassed them. Of the students examined, twenty-six had passed satisfactorily in the second or higher grade; six passed, and their papers were marked "excellent;" six received prizes; and two received full certificates of having passed in every subject in the second grade. Fifteen out of the thirty works submitted for national competition were passed as satisfactorily executed, and awarded prizes. The income of the school had been sufficient to meet the

expenditure. It was hoped the Government would give assistance in regard to securing the building in perpetuity for the use of the school, provided a sum of 400*l.* could be subscribed. A report was also read from the master of the school (Mr. Bowen) touching the progress of the students during the year, and other matters connected with the interests of the school.

The Bradford School.—The annual public meeting and distribution of prizes in connexion with this school took place in the High School, Hallfield-road. The admission was by ticket, and the number of persons present was rather larger than the room could comfortably accommodate. The walls were hung with the art-productions of the pupils. Alderman Godwin, the chairman of the Committee of the School of Art, presided. The chairman said, that in all respects, the school seemed to be in a healthy condition, and had in it some principle of vitality which seemed to ensure success. One passage in the report made reference to technical education. The annual report stated that during the past year the progress of the school, though not very rapid, has been satisfactory. There are now 89 students on the books—75 evening class and 14 ladies' class—against 78 in 1866, 61 evening class and 17 ladies' class. Mr. Forster, M.P., addressed the meeting, chiefly on the subject of technical education.

The Lincoln School.—The distribution of prizes to students in connexion with the Art Treasures Exhibition which has been open during the past month in Lincoln, took place in the School of Art, in which the exhibition had been held. There was a numerous attendance. The mayor occupied the chair. The report of the school committee announced the steady success of the school. The position it attained in the first year of its existence was such as to astonish all connected with such institutions, but this success had been improved upon every year, the last competition being very satisfactory.

ANNUAL MEETING OF THE INSTITUTION OF CIVIL ENGINEERS.

In the report read at the meeting held on the 17th of December, Mr. Fowler in the chair, it was stated that many circumstances beyond the control of the council had prevented a satisfactory conclusion being arrived at as to the plans that ought to be adopted for providing additional accommodation for carrying on the business of the Institution.

The establishment of a class of students, to be attached to the Institution, but not to form part of the corporation, in lieu of the old class of graduates, was touched upon; and the mode of admission to and the privileges to be enjoyed by this new class, as set forth in the by-laws adopted at a general meeting of members in June last, were detailed. Although not specifically mentioned in the rules, it was contemplated to organize supplemental meetings for the reading and discussion of papers by the students, and possibly, also, for the delivery to them of lectures upon special subjects.

During the past session 48 members and 79 associates had been elected, while the deceases, resignations, and emigrations together amounted to 33; leaving an effective increase of 94, or at the rate of 7.02 per cent. on the present number of members of all classes. There were on the books on the 30th of November last, 18 honorary members, 659 members, and 826 associates, making a total of 1,433, exclusive of students.

"With respect to the sources of income, and the way that income has been disbursed, a brief summary of the statement of receipts and expenditure for the year ending the 30th November, 1867, showed that the subscriptions and fees (exclusive of the Building Fund fees) had amounted to 4,513*l.* 6*s.* 6*d.*, the interest on investments on the general account to 94*l.* 5*s.* 8*d.*, and the miscellaneous receipts to 148*l.* 7*s.* 4*d.*, making together 5,556*l.* 10*s.* 6*d.*; while the Building Fund fees and dividends had realised 843*l.* 1*s.* 7*d.*, and the Trust Funds 374*l.* 1*s.* 4*d.*, bringing up the gross receipts to 6,774*l.* 1*s.* 6*d.*. In the same period the disbursements, including the payments on account of the arrears of the minutes of proceedings, had been 4,560*l.* 8*s.* 8*d.*, and for premiums under trust 104*l.* 10*s.* 3*d.*, the sum in hand at the same date last year, making up the difference between the two sides of the account, as presented in the foregoing analysis."

The following gentlemen were elected to fill the several offices on the council for the ensuing year:—Charles Hutton Gregory, president; Joseph Cubitt, Thomas Elliot Harrison, Thomas

Hawksley, and Charles Vignoles, vice-presidents; James Abernethy, William Henry Barlow, John Frederic Bateman, Joseph William Bazalgette, Nathaniel Beardmore, Frederick Joseph Bramwell, James Brunles, George Willoughby Hemans, John Murray, and George Robert Stephenson, members; and John Horatio Lloyd and Captain Henry Whatley Tyler, associates.

THE EXPLORATIONS AT JERUSALEM.

CAMBRIDGE ARCHITECTURAL SOCIETY.

At the third meeting of the Cambridge Architectural Society for the Michaelmas term, the chairman called on the Rev. T. G. Bonney for his communication on "The recent excavations made by the Palestine Exploration Society at Jerusalem."

Mr. Bonney, after a few words of introduction, said the authors who had written upon the position of the ancient Temple enclosure at Jerusalem might be divided into two classes;—those who considered it to occupy a square of about 606 ft. in the south-west angle of the present Haram; and those who supposed it, with the fortress Antonia, to extend over the whole of the Haram. One of the most prominent defenders of the former theory was Mr. Fergusson, who, in addition, had started the notion that the Dome of the Rock was the church which Constantine was by him imagined to have built over the Holy Sepulchre. For this there was not a tittle of evidence. The excavations made at the southeast angle had proved that undisturbed masonry of the age of Herod the Great could be traced down to the rock, about 55 ft. below the present level of the ground. They had also traced the wall of Ophel from its junction with the Haram wall, to a distance of about 300 ft. south-south-west, and had found a passage running for about the same distance under the Haram area. They had also traced the same masonry down to the rock at the south-west angle to a depth of 95 ft., and had discovered that a deep ravine, some 40 ft. wide, skirted the Haram wall on the west. This was formerly spanned by the arch known as Robinson's Bridge; and further excavations in the Tyropoeon valley had discovered traces of a colonnade which had apparently formed part of an approach to it. The question, therefore, of the extent of the temple area was now settled in favour of those who had supported the second theory.

Mr. Williams said, as to the discoveries made by Lieutenant Warren about the Temple area, he confessed that he did not attach so much importance to them as others had done, because he never could feel the force of the arguments by which it had been attempted to place the Temple area in the south-west angle of the present Haram enclosure. From the fact that Mr. Fergusson, Mr. Thripp, and Mr. Lewin had all adopted this theory, he saw that there must be strong arguments in favour of it; but he had never been able to accept them, because it seemed so clear to him that such a situation was directly opposed to the testimony of Josephus, who certainly represented the Temple as occupying the summit of the hill; whereas this modern theory would hang it on the hill side, which would be an impossible position for a fortress—such as we know the Temple was—commanded as it would have been by the raised platform on which the Dome of the Rock now stood. It had, indeed, been proposed by some authors to place the fortress Antonia on that raised platform; but that again was directly opposed to the testimony of Josephus, who placed the Antonia at the north-west, not the north-east, angle of the Temple area. The chief satisfaction which he derived from these discoveries was this, that they served to vindicate Josephus from the charge of exaggeration, so often unjustly brought against him. His description of the view from the top of the walls at the extremity of Herod's cloister, along the south of the Temple area, had been ridiculed as absurd, but was now found by these recent excavations to be nothing more than sober truth. Mr. Williams acknowledged that he had been obliged to modify his views of the southern limit of the Temple area. All that met the eye in the substructures along the south wall, in the vaults at the south-west angle, in the double and triple gateways, belonged clearly to a late Roman period, and he had accordingly assigned to them the date of Justinian, who had built a church of St. Mary on the present site of the Mosket-Aksa, and in connexion with it a large hospital for the sick and a hospice for pilgrims. He was now convinced that the Haram enclosure was identical with

that of Herod's Temple; unless indeed the recent discovery of a fosse cut in the rock a little to the north of the raised platform, not yet fully described, should require us to modify our views still further. Mr. Williams, in speaking of the Church of the Holy Sepulchre, adduced some further proofs of the identity of its site with that on which Constantine had erected the Martyry of the Resurrection, which was a question altogether distinct from the authenticity of the site itself. He then described the discovery of the northern and southern apses of the rotunda of the church, which he believed to be such *exactly* as are described by Eusebius, in the cloister that surrounded the open court to the west of the Basilica, in the centre of which court the Sepulchre itself stood. These two apsidal recesses had been strangely omitted in Captain Warren's plan of the church, published by the Ordnance Office, although they had been inserted in earlier plans, as *en* in that of Mr. Scoles, published by Professor Willis, in the second edition of Mr. Williams's "Holy City." These two apses he had again identified last year, and had made a discovery in the southern one which he considered to be of great interest and importance, as identifying the actual site with the ancient one. He exhibited a drawing of an ancient tessellated pavement, which he had found on the floor of this apse, and which he believed to belong to the original court of Constantine's Church, as he could assign no later date to its execution. He had admitted it to a friend of his in the South Kensington Museum, who had obtained the opinion of men learned in such matters there and at the British Museum, and the result of these inquiries was, that it might very well be a pavement of the Constantinian era, executed by local workmen. In conclusion, he thought that, as the theory of the cave under the Dome of the Rock being the true Holy Sepulchre had been entirely exploded by recent discoveries, and the identity of the Sarcenic Mosque with Constantine's Church of the Holy Sepulchre had been disproved, all would be glad to acquiesce in the old conclusion that the present Church of the Sepulchre stands in the same position in which Constantine originally placed it.

METROPOLITAN BOARD OF WORKS.

The report of this Board for 1866-7 has been issued. The subjects of which it treats have already been mostly noticed in our columns as they came before the Board at their various meetings. The main drainage of the metropolis of course occupies a considerable share of the report. There are also reports of the Thames Embankment and other metropolitan improvements, utilization of the sewage, the gas question, removal of Middle-row, Holborn; open spaces, parks, &c.

The results of the sewage-utilization experiments by the company to whom the concession of the northern sewage was granted are considered to be most satisfactory. The crops raised from land manured with the sewage have exceeded the most sanguine expectations. The principal crop grown, as our readers know, is Italian rye grass; and it is stated that, on one place which was sown in August, 1866, and which has received about 4,000 tons of sewage per acre, the crops were as follows:—Eight tons per acre early in April, ten tons in the middle of May, and about twelve tons in the week ending the 22nd of June. On other pieces the crops were even heavier. It also appears that great success has attended the growth of mangolds, potatoes, flax, lucerne, cabbage, celery, and strawberries. The most promising experiment, however, was the wheat crop, on which the sewage was poured four times during the early growth of the crops.

The removal of Middle-row, Holborn, was estimated to cost 61,152*l.*, but it has been effected below that amount. The claims up to 31st March last were 52,006*l.*, whilst the settlements amounted to 43,308*l.*

The widening of Park-lane will be done by setting back the Park boundary fence, at a cost of between 3,000*l.* and 4,000*l.*

As to the gas supply, the report adverts at great length to the exertions in Parliament to obtain for the public a cheap and pure supply of gas; but they had not been successful.

The total receipts of the Board in 1866-67 were 3,148,112*l.* 7*s.* 3*d.*, and the total payments 3,090,045*l.* 1*s.*

After mentioning other topics of minor im-

portance, the report concludes.—“Foremost amongst the improvements effected by the Board must ever be considered the main-drainage system, the beneficial results of which are evidenced by the improvement in the general health of the metropolis, and especially in that of the low-lying districts.” It calls attention to the improved condition of the Thames, the formation of new broad thoroughfares, the embankment of the river, and the formation of parks for the people; and mentions that means are urgently required for making other improvements which are greatly needed, and suggests that these means should be raised by a tax levied on the owners of property.

A PROPOSED CANAL.

AN Act is to be applied for in the ensuing session of Parliament, by some of the landowners and others interested, for powers to construct a canal from the River Thames at Wandsworth along the valley of the River Wandale to Wimbledon. The embankment of the Thames has so reduced the wharfage space along the river above Blackfriars Bridge that extra accommodation is said to be eagerly sought after.

The Wandale valley is teeming with paper mills and other manufactories, which at present are without the facility of either railway or canal accommodation. The probable cost of the proposed undertaking, as estimated by the engineer, Mr. Hamilton Fulton, amounts to the sum of 120,000*l.* The proposed undertaking comprises also a roadway, tramway, and sewer. The tramway would give, at small cost, a connexion between the Brighton and South-Western Railway systems and the proposed canal. The Wimbledon and Merton drainage is greatly defective as regards the outfall, and it is believed the construction of the proposed sewer would afford efficiently the desired facility to these low-lying districts, and also to the houses and factories bordering on the River Wandale. It is intended to purchase a certain depth of land along the site of the proposed road, and after the road is constructed to sell off the land at an enhanced price in building plots.

CIVIL ENGINEERS IN INDIA.

SIR,—I inclose an extract from a recent Government of India Gazette, which makes public property of matter that was circulated by itself throughout the Public Works Department a short time ago.

That you may see at a glance what is the actual difference in the scale of pay, I append to the extract a list of those grades in which a difference exists.

In the Covenanted Civil Service of India, entered by competition and open to all, no attempt is made to arrange salaries, or, rather, to lower them down to the level of native candidates. If a native can enter, he gets the same pay as his European *compères*. It is not at all surprising that the difficulty felt by Government did not “occur” to the commissioners. They would never guess that civil engineers sent out from England were underpaid because native candidates were usually waiting in strength of character. The commissioners are men of practical Indian experience, and know what a farce it is inviting native young men on the present system to join the upper engineer service.

If you will consult the classified list of the Public Works Department, you will see there are only two or three native engineers in the whole of it, though they have had the higher branch of service open to them for the past ten years or more.

In Madras, not very long ago, the authorities declared they had no institution capable of affording the advanced education necessary to enable natives to enter the Public Works Department as assistant engineers. They might have added, with truth, that there were no youths of sufficient social standing likely to come forward. The natives of Madras are not nearly so wealthy, nor, in many respects, so civilized, as those of Bengal.

In Bombay there is only one native executive engineer; and, as there all the cleverest natives can make large fortunes in trade, candidates are not likely to come forward very freely.

The natives who come to Indian colleges are not, as a rule, of the best families. These at least despise British institutions; but poor Brahmins, sons of clerks, and inferior employes in Government offices, and those who feel that, to get a living, they must conform to European modes, repair to them. Further, the educational institutions are not widely spread, and draw their students from the large Presidency and other towns. If they knew they were to be employed as engineers in their own neighbourhoods, perhaps good men would be eager to go into the service; but none but those induced to do so by sheer stress of circumstances, will care to be liable to be moved from Burmah to Hyderabad or Central India, or even to distant places in their native province.

Further, there are physical peculiarities in natives of India which cannot be ignored. Generally speaking, those highly intelligent young men the Government allude to as able to pass the highest theoretical tests are of exceedingly delicate make. It is not so much strength of character as strength of body that they want. On the other hand, the natives of swarthy build, and of whose warlike prowess we so often hear, have little or no headpiece at all. For some reason or other sedentary occupations, particularly those which call for great and sustained intellectual labour, are in India very weakening to the European constitution, especially to a robust constitution. And so it will be found that those classes of natives who have set themselves aside for sedentary pursuits are not strong enough to do much out-of-door engineering work, or the effort is such a tax upon them as to prevent success.

This evil of weakness is not so apparent in the natives who are employed as subordinates. They are tolerably active, and decently intelligent as well; but their qualities are not of the highest order, and their social standing is similar to that of such parties in England.

Natives of good family, who combine ordinary talent with personal energy, and who would turn out promising engineers, are very rare. If such go into the public service, they choose the revenue or judicial branches, which are much thought of, well paid, and which, it must be said, present numerous opportunities of illicit aggrandizement, which cannot be said of the Public Works Department, with its numerous checks.

If at the beginning of this century the Company's civil servants took bribes and presents freely till their pay was raised, and no less an authority than Sir Thomas Munro gave it as his deliberate opinion that they would always do so if their salaries were below a fair rate (see Gleig's “Life of Munro”), it is improbable that native Government agents would now be found proof against the temptations which are enormous in the courts and cantonments.

Natives, in addition to observing no opportunities of augmenting their salaries by left-handed means, see the repute in which the Public Works Department is held. Most people make a laughing-stock of it. Even the engineers in it occasionally join, so absurd is the mass of routine they have to maintain. Besides, they notice that, as the Government say, the pay is just the same as other staff employ which calls for nothing like the same theoretical knowledge. It is also a department all through paid one-half as well as the civil service, and only entered by staff corps officers who have insufficient influence to secure a more dignified and comfortable situation.

The fabric has hitherto, in fact, only been kept together by the East India Company's military engineers, who took great pride in Indian public works, and lost sight of material advantage in the engrossing details of their duty. It even escaped them to notice how easily officers from the infantry were put into many of their good appointments. But as a body they were poorly paid and slowly promoted. The Indian engineers are now left to gradual extinction,—vacancies are not filled up, and Royal Engineers who care to come out can claim withdrawal at the end of seven years. As at the end of seven years an officer can hardly expect to be more than executive engineer (fourth grade), he will be only 10*l.* a month the richer in salary than when he first came out; and, having had a disagreeable time of it in a rough, uncivilized country, will be glad to be quit of it and of the Public Works Department for the remainder of his period of service.

Nothing can render India popular but high pay and liberal furlough rules. The maxim hitherto has been the lowest possible pay and to

allow no one to leave the country unless he is sick.

During the last few years the price of provisions has advanced from 50 to 150 per cent. This is probably due to the heavy cash expenditure upon railways and cotton, and corresponding neglect of irrigation and agriculture. Salaries keep to their old level notwithstanding the depreciated currency.

A visit to Europe is, on the score of health alone, desirable after five or at most seven years' residence. The Government do all they can to hinder leave being taken even after ten years. They know their service is underpaid, and, perhaps, fear lest many should quit in disgust upon revisiting their native country too early.

Higher pay could be readily afforded if Government were to employ fewer engineers and give them larger powers. As it is, a highly scientific officer cannot buy a set of tools or plant, costing say one-third of his own pay, without referring to some superior, and pointing out minutely the necessity for the article. If whitewashing a room costs 5*s.*, when it has been estimated at 3*s.* 6*d.*, he has to afford lengthy explanations—that the walls were smoked and bad to be sized, or that he used glue instead of rice water, or the like—in a letter that takes an hour to write may be. And, after all, he is informed that this wasteful expenditure cannot be allowed in future.

Again, nothing is commoner than for a superintending engineer to order an executive engineer, 4th grade, to prepare plans and estimates for difficult and costly works really beyond his powers and experience. He wastes a deal of time and thought over them, sends in the best sort of project he can, after reminder and reminder from the superintending engineer that he is waiting for what, under a proper system, he, as a well-paid experienced officer, should have drawn up himself. The project is found, of course, deficient in many points, scored over with pencil-marks, and returned, with caustic reflections on the young executive's want of skill.

The waste of engineering ability in India, through the distrust there is of everybody as to fitness, and we might almost say integrity, is only second to the money wasted in badly-performed work and the keeping up of a complicated system of accounts suitable only to harrack construction and to a highly civilized country.

You will do the profession great service by bringing forward such considerations as those I have lightly touched upon, but I am afraid nothing short of a Parliamentary inquiry will put things on a decidedly better footing. At present, it is almost a mockery on the part of the authorities styling an engineer a “professional man,” since he is not trusted or treated as such.

A FORMER CORRESPONDENT.

In the supplement to the official Gazette of India, dated October 12, 1867, appear the following remarks on the recommendations of the Commissioners on the income of 1866, in Bengal and Orissa:—

III. Irrigation generally.

A reconsideration of the system under which civil engineers are got out from England for service in India, is recommended in paragraph 58, page 168. The commission was evidently not aware of the very full consideration this subject has already received from the Government of India, nor of the difficulties with which it is beset.

The commission notes that, even after the changes made in 1865, there is still a difference between the salaries of civil and military engineers in the lower grades, and recommends a higher standard of examination and higher rates of pay for the successful candidates for employment as civil engineers.

It does not seem to have occurred to the committee that the difficulty of arranging the matter of salaries arises out of the difference between European candidates for employment in the department, and those who are sons of natives of India, and to whom the line of employment is equally open. The latter will often pass easily the highest test in theoretical examinations, and yet prove useless as engineers from want of practical energy and strength of character. With the former, these last are so seldom found entirely wanting, that the examination tests alone are almost sufficient to ensure the requisite qualifications. It has always been considered impossible to make a distinction between Europeans and natives in the tests to be laid down for admission into the service as civil engineers. This being so, the scale of qualifications and pay cannot be fixed, as if all the candidates were to be Europeans. There are no means of testing practical energy and strength of character, except by putting the person to actual work or business. This, in order to eliminate a number of unqualified native young men, without driving away such as are qualified, it is necessary to admit civil engineers who enter on theoretical examinations only, at a low scale of pay, and to let them advance by promotion as soon as they are found to possess the other requisite qualifications. The only alternative is to insist on some length of approved professional experience as civil engineers, and to admit the candidates so qualified in higher grades of assistant engineer. This is done to some extent.

With Royal Engineer and Staff Corps officers there are no such difficulties. Their college and military service, before they enter the Public Works Department, suffice to

make known to some degree their capacity for business and their character, so that they can be admitted at once at a rate of pay that could not be offered to a native candidate of untested powers in these respects; while, at the same time, other departments of the staff and civil employ, which do not require such severe theoretical tests, are open to Staff Corps officers at pay as good as that of the Public Works Department. These are the reasons why the pay of military engineers cannot be lower, nor that of civil engineers higher, in the lower grades of the service. The discrepancy is, however, greater apparently than actually, because the number in the lowest grade where the difference is greatest, is small.

ENGINEERS.	Maximum Monthly Salary.		Difference.
	Military Officers.	Civil Officers.	
	Rupees.	Rupees.	Rupees.
Chief, 3rd class	1,550	1,750	100

SOUND IN HER MAJESTY'S THEATRE.

I VENTURE to ask space for a few lines relative to a subject to which the appropriation of the building lately destroyed by fire to musical performances of the highest class lends an exceptionally great importance, but which has escaped notice in the correspondence published relative to the building, so far as I have seen it.

In almost all the "obituaries," as one may call them, of Her Majesty's Theatre, which have recently appeared, some such statement as this occurs—"The acoustic qualities of this building were unequalled in Europe." This, no doubt, was strictly true. Music, both orchestral and instrumental, sounded more brilliant in tone and was more uniformly well heard in that house than elsewhere; and artists are understood to have used their voices and instruments there, notwithstanding its vast size, with greater ease and comfort than elsewhere. But to this statement has been added, in more than one quarter, that these qualities were the result of accident rather than design; so that it is to be feared the building, when rebuilt, may not possess them. This representation I venture to call in question.

The mere fact of a building designed for musical performances proving suited to them, goes far towards proving that the success was due to design; and I venture to address you in the hope that, whenever this Opera House comes to be rebuilt, perfect suitability to musical performances may not be overlooked as one of the essential requirements of the structure; for I maintain that, by using the same means which Novoselski used seventy years ago, the same results may be again attained.

The acoustic qualities of Her Majesty's Theatre were due partly to the forms and proportions adopted, partly, perhaps, to the existence of certain cavities, and very largely to the material employed.

Without going into any analysis here of the mode in which the shape of the building was adapted for the successful transmission of sound (some such analysis will be found in the volume on Acoustics in Wenley's elementary series), it may be sufficient to say, that as the forms and dimensions are capable of being reproduced in a new house exactly, whatever was due to them may, of course, be in that way recovered. I am, however, of opinion that considerable variation, if desired, might be introduced in parts of the house, without at all lessening its perfection as an auditorium.

But it is the fact that all the interior faces of the building—those against which the vibrating mass of air impinged—were of resonant material, i.e. of dry wood in as long lengths as possible and fixed at as few points as possible, that the very remarkable acoustic qualities of the old house were mainly due. Nor is there, so far as I am aware, any possibility of securing this advantage with incombustible materials.

If it were at all feasible so to construct a theatre that nothing in it could by any possibility burn, it might be a question whether the attempt ought not to be made, regardless of the risk of having a "dummy" quality of sound as one result but things being as they are, I trust that

precautions against those fires which can never be wholly guarded against will not be carried so far in the reconstructed house as to rob it of this, which was perhaps the most remarkable and, to a lover of music, delightful property of the old one. Let the surrounding corridors, the backs, and even the floors and ceilings, of the boxes, and the very floor of the pit, be as fire-proof in their construction as we know how to make them. Above all, let *very numerous*, spacious, and thoroughly safe fire-proof staircases be provided; but let the inner shell of the auditorium, i.e. the ceiling and the box fronts, be constructed as they were before, or the loss by the fire will be, to the musical public, virtually irreparable, however splendid or however convenient the house may ultimately prove to be when rebuilt. T. R. S.

NOTE FROM YORK.

A CORRESPONDENT writes,—The old George Inn, Coney-street, is now being pulled down. This inn was formerly the place in which was held a Guild of St. George (about the year 1,500), which was, I believe, for commercial purposes. It was afterwards the town house of the Duke of Buckingham, of the time of King Charles II. A very beautiful room in this old inn, called the "Apollo," and in which Francis Drake, the antiquary, who wrote the "History and Antiquities of York," used sometimes to take his sojourn, had the arms of King Charles II. and the Duke of Buckingham, in painted glass of the period. This room is engraved in the Abbotford edition of the "Waverley Novels," in which the Duke of Buckingham is mentioned. The Duke of Buckingham had a house in Skeldergate, in the city of York, where he practised chemistry; on the site of this house is now a street, called after him, Buckingham-street. His estate at Helmsley, to which Pope alludes, was sold:—

"And thou, proud Helmsley, Buckingham's delight,
Sold to a scrivener and a city knight."

This scrivener was Duncombe, banker to King James II., who, when James applied for his money to him from St. Germain's, replied, he might come and get it. The beautiful Gothic doorway of this old building, with the "Pelican in her Piety," and other carvings, engraved by Halfpenny in his "Remains of Old York," is highlighted by Mr. Gatch, a gentleman living in the neighbourhood of the city.

THE CONDITION OF ARCHITECTURAL SCULPTURE.

I FIND in the *Builder* of December 21st a communication, signed "R. F. II.," referring to a letter of mine published in your number dated December 14th.

I beg to quote one paragraph from it: with the tenets promulgated in the latter part of that letter, it will be seen, in the position I have taken up, I have nothing whatever to do. I will quote the writer *verbatim*:—

"I have just read in the current number of the *Builder* the letter headed 'The Condition of Architectural Sculpture,' and signed 'John Roddis, carver.' It is admirable so far as it goes; but Mr. Roddis has altogether overlooked the most material fact to excellency in workmanship in England, which is trade-unionism, *alias* trade-terrorism. Did the proprietors of houses being built, did building committees, did architects ordain that one scale of wages should be paid in building trades to skilled and unskilled workmen alike? No; but the men did. Suppose an architect or his clerk of the works engaged a few first-rate hands and paid them whatever remuneration they chose to ask; what would ensue? Rattening!"

These italics are not mine. In answer to this, I beg to state that such a thing as an equalised scale of remuneration has never been recognized among us; and further, I may add, that no society has ever been formed by architectural sculptors to attain so undesirable an end, for the simple reason that we do not allow that nature has organised a certain standard of talent which cannot and must not be exceeded. In the letter referred to by "R. F. H.," I stated that there were "architectural sculptors to be obtained for 8d. per hour, and others who could not be obtained for three times that amount." This in itself should have been sufficient to show that they rate their value simply by ability, and not by number; and I think I may venture to say the same of every other branch of art-workmen. "R. F. H.," asks, "Suppose an architect or his clerk of works engaged a few first-rate hands, and paid them whatever remuneration they

chose to ask, what would ensue? Rattening!" That I deny. He should have blotted out that word, and written *excellency*, while writing upon architectural sculpture. That is the very thing we crave—time for study. A remuneration that will pay, not for physical labour alone, but for a little thinking also. Your correspondent has mixed up the mechanical trades with those essentially artistic. How far those trades benefit themselves by handing together like so many vast human machines, striking down all the talent nature may have distributed among them into one mediocre level, is a problem time is fast solving for me. I feel what I consider to be the errors of such a system as keenly as "R. F. H.," and I am under the impression that I have endeavoured to show that what we mainly complain of is this system of *levelling* having been imposed upon us by the architects; rating all men alike, giving art-work a quoted price in the market, like so many yards of concrete, or so many tons of pig-iron. I reiterate here what I have said before, that English art-workmanship has been tried in Paris and found wanting, and I hold that this system is mainly to blame for it. The *Builder* of last week, reports Mr. Gambier Parry to have said at the Gloucester School of Art, "In all our highest manufactures, in which art appears, the French have outdone us completely." These are the words of a gentleman not only of very high standing in art matters, but of one personally engaged upon the English commission in Paris; and therefore carry a weight of truth with them which should engage the most serious consideration of every English art-producer. I will not trespass further upon your space, but in conclusion beg to thank "R. F. H." for affording me an opportunity to clear away an error respecting the union system and architectural sculpture. JOHN RODDIS.

STRIKES v. TRADES UNIONS.

Sir,—I read with much interest the reports and letter, which appeared in the last three issues of the *Builder*, on the above important question. As most of the writers on it are either opponents or eulogists of unions, who press every point in their favour, and try to make them beautifully white, whilst the others state that everything connected with them is of the darkest hue; and as the *Builder* is an impartial medium of communication between employers and employed, I hope you will grant a small space for a workman's view of this at present national and important matter. I am not, however, entirely dissent from some of the leading doctrines of the unionists, such as the limitation of apprentices, and I have up to the present held aloof from unionism, believing that a neutral force of workmen should be sufficiently strong to curb the irrational acts of unionists and employers. It seems to me that anti-union writers are always trying to make the world believe that employers are the most honest and just people in the country, and taking their stand-point from that premise, they claim that the masters alone shall regulate and fix the remuneration of labour; and that the workmen, not understanding the question, shall take any price which the employer in his wisdom may think fit to offer. I differ entirely from the conclusions arrived at by these writers, and from a lengthened observation and a practical experience in various parts of England, I have found that the masters' love of honour and justice is not of that character which would warrant the workman in subsmissively trusting to it.

The writers in the *Quarterlies*, "British Almanac and Companion," and other publications of that description, are aware that, as a rule, the working men but rarely see or read their articles. It, then, must be evident that they write for a class altogether different from that most interested in the approval or disapproval of the sentiments they promulgate; and they thus have a total immunity from the criticism of the working classes. For instance, Mr. Plummer states, "there is not that antagonism between masters and men on the Continent which exists in this country." And there is an entire immunity from strikes and their consequences to the capitalist; but, if I recollect aright, strikes do sometimes take place in these Elysiums of the capitalist. And Mr. Roddis ought to have known that the public journals of this country have given fearful accounts of strikes which have taken place during this year in Belgium and France. And even in Berlin there is now an agitation for various objects, one of which is to reduce the hours of labour. It is well known from the history of trades unions in this country that they have gone through many phases to arrive at their present state; and that the history of our country, masters and men were more nearly allied in social position. The master was not above being seen chatting with a group of his workmen. His business was to a large extent known to them, and he took for granted a part of their duties to him. It is related by our elders that the employer was once not above smoking a pipe or taking a social glass with his men. The ambition and love of adulation and position which characterise the present age had not then hold upon the mind which they have now attained.

But, now, a twopenny builder, or any other like employer, must stand upon his dignity, and in the estimation

of his class be would lower himself by now and then meeting his men in social reunion. If the employer now condescends to speak to a workman, it is something better than a growl, and a growl, to know how long it is before the piece of work he is engaged upon will be done. And in the large firms everything is done through the foreman or manager. The matter, to all intents and purposes, is a stranger to his workman. He knows but little, and cares less about them. As soon as they have done his bidding, or a slack time comes, they are turned away at an hour's notice and without a moment's consideration of their services; and the belief is general that they are less cared for by the employer than are his horses and machinery.

One thing is certain, that the employing class of this country are striving for position; that is, if they now occupy a semi-detached villa, and drive a brougham, they are discontented because they cannot remove to a mansion and set up a carriage and pair. I am not one of those who condemn that ambition when kept within proper and legitimate bounds; but I do say, that when the end alone is considered, and the means to fairly and honestly attain it thrown aside, it is not to be expected that those through whom they expect to attain it will have much respect or kindly feeling towards them; and there is but little doubt that it is the selfishness of this class, and the treatment which the workmen have received from them, that have been one of the principal causes of the formation and success of trades unions. I intend to touch upon several other points in this question; but I find I have already trespassed too far, and must leave piecemeal and the present claims of their statements, and the breach to have any influence with the working classes, must treat it in a broad and impartial manner, or the workmen will turn with contempt from their statements, and the breach which now exists between the two will be still further widened.

JACK PLANE.

DISFIGUREMENT OF THE TRAVELLERS' CLUB HOUSE, PALL MALL.

I SHALL feel obliged if you will allow me to call the attention of members of the Travellers' Club, many of whom claim the character of men of taste, to the recent disfigurement of their club-house. This has just been effected by the removal of the ornamental stone balustrades from the balconies of the garden front towards Carlton-terrace, and the replacement by common bulging iron railings, of a design which I can only describe as Baker-street-venusular.

The effect of this unfortunate change is that the iron balconies not only attract attention to their own inelegance, but most seriously and injuriously affect the architectural character of the whole building.

The stone balustrades were designed in conformity with the rest of the front, of which they formed an essential portion. By their removal the elevation is not only mutilated of an important member, but the iron-work, by allowing more of the principal windows to be seen from below than the architect intended, materially injures their proportion. Moreover, the balconies themselves, being designed to support a stone balustrade, appear altogether inconsistent now that they have only to carry a nondescript erection of light iron bars.

The only advantage that can have been obtained by this ill-considered alteration is the gain in a rarely-used balcony of a few inches of space, being the difference in thickness between the old stone balustrade and the new iron railing. The price paid for this doubtful gain is the destruction of the charms of symmetry, finish, and beauty of proportion, which have always caused the garden front of the Travellers' to be considered one of the best works of Sir Charles Barry.

On hearing a rumour of what was intended, I tried by communication with the secretary, before the iron railing was put up, to avert the threatened mischief. Having been unsuccessful, it only remains for me to appeal through you to the members of the club and the public. Fortunately, the remedy is simple; it will be very easy to remove the iron railing and refix the original balustrade. In order that no objections of expense may arise, I can only say that, if the club will allow this to be done, I shall be happy to make them a present of the cost of the restoration, rather than see their beautiful front permanently defaced.

EDWARD M. BARRY.

PIPES EXPOSED TO FROST.

SIR,—I noticed a letter engaging the insertion of a tube of India-rubber in water-pipes to keep them from bursting, but I think by the constant pressure of the water the India-rubber would get too hard to expand. Now, it has occurred to me since reading the letter, that if in some positions the lead-pipe were covered with an India-rubber tubing, it would assist to keep the pipe warm, and at the same time supporting the pipe did burst, it would prevent the water from flooding the house.

J. K.

BELLS AND BELL RINGING.

THE music produced by the ringing of a good peal of bells, at proper times, and in moderation, is truly pleasing to the ear. And at this particular season many persons will be reminded of the words of Charles Lamb, who says, "Of all sound of all bells—(bells, the music might bordering upon heaven)—the solemn and the peal which rings out the old year. I never heard without a gathering up of my mind to a concentration of all the images that have been diffused over the past twelvemonth; all I have done or suffered, performed or neglected, in that regretted time."

Now, the following arrangement, which has been adopted for many years at some of our churches, will show how to do it.

"Ring out the old year, and ring in the new,"

in an appropriate manner:— On New Year's Eve a muffled peal is rung from 11.30 till 11.55, to mark the departure of the old year. At 12 o'clock its knell is sounded by twelve strokes on the tenor bell. After which the muffles having been removed from the clappers of the bells, the new year is ushered in by a merry open peal.

THOMAS WALEEY.

ELEVATION OF TOWNS ABOVE THE LEVEL OF THE SEA.

PERMIT me through the medium of your columns to suggest that a chart, showing the heights of our chief towns above the sea-level, would be a desirable publication, not merely to satisfy curiosity, but valuable as a reference upon many occasions, especially in connection with sanitary questions.

Popular opinions upon this subject are often very erroneous, of which none is a more remarkable example than the belief, all but universal, that the city of Salisbury is built in a very low situation compared with other cities. Having ventured to question the ground for that belief, I have obtained an answer inducing me to advance an opinion directly contrary, namely, that the site of Salisbury is really higher than the sites of the majority of cities and larger towns in England.

I found this opinion upon the authority of the Ordnance Survey, wherein it is shown that the Close, itself slightly lower than the city, is 150 feet above the level of the sea. The knowledge of actual levelings enables me to claim this elevation as being very much, even 110 ft. higher than London and Westminster, and the general metropolitan level; 60 ft. above Islington; and 70 ft. above Paddington. Without actual levelings, general observations justify me in pretty confidently stating that the height of Salisbury exceeds that of all the twenty-six cathedral cities, with two or three exceptions; also, that the whole of Salisbury is higher than the whole or greater portion of all towns of more than 6,000 people, in the South of England, with, perhaps, two or three exceptions; and that it is higher than any, much higher than most, of the larger towns in the eastern counties.

Of course, forming the chart, only actual levelings, or most accurate barometrical observations, could be relied on; and as the surfaces in many towns varies much, I would suggest that the mean of several heights be given, or if one height only, that should be the highest, rather than that of the churchyard, because churches are often built in the highest parts.

A. B. MIDDLETON.

THE SENTINEL AND THE CLOCK.

SIR,—MR. WALEEY alludes to the anecdote of the sentinel at Windsor Castle, and the recasting of St. Paul's bell. I therefore venture to refer him to "Memorials of Westminster," 1819, p. 193, where he will find some additional particulars, which I gleaned from the parish-books, and I remember even now from a newspaper after a weary search.

MACKENZIE E. C. WALCOTT.

"STRAW PLAIT DISTRESS."

SIR,—Having made a humble effort on the above subject by the kind permission of the *Builder*, on the 8th Nov. ultimo, I was not surprised to see my statements confirmed. The following *distresses* says:—"The poor people of Leighton Buzzard, Luton, Newport Pagnell, Tring, and other towns and villages, especially the females, have already begun to experience much distress; and the application to the local boards of guardians for relief have materially increased within the last fortnight, and are sure in a short time to be so numerous as to severely test the capacity of the several workhouses, and the existing funds of the different unions. The distress, I have heard, in the interim, from very worthy neighbouring authority, that 'many of the women are gone to Manchester, and other large towns, to learn the weaving business in order to save themselves from starvation.' Even that, however, does not seem to have remedied the distress above spoken of, and humbly appears to me even doubly regrettable, as the women are not only 'stiffly 'stocked' already; and their own was as little encroaching on others as could well be imagined. How thankful they must prove to their countrywomen from the other side of the water, that they are not the way they would take up their cause, in unmerited decline. Oh, that I had 'means to offer 1,000 straw plaits,'—if coarse ones, and to be 'given away in charity,' as a hint of relief and hope at their distresses, on Christmas of 1847."

A CAMBRIDGE MAN.

Native of the Quarter.

ST. JAMES'S TOWER, TAUNTON.

THE vestry had a meeting to receive and accept tenders, &c., for the taking down and rebuilding of the tower, in accordance with the order of vestry given on the 10th of December last. Three tenders were received: one from Mr. Davis, Langport, 3,666l.; Mr. Davis, Taunton, 3,610l.; and Mr. Woolfrey, Taunton, 2,396l. Mr. G. Webber proposed, and the Rev. W. D. Bedfern seconded, that Mr. Woolfrey's tender be accepted. It produced a lengthy discussion took place, on a proposition of Mr. Small's, that Mr. Spiller's former tender of 2,860l. be received. This was objected to by the churchwardens, on the ground that he had not tendered on the present occasion, consequently it would be unfair to those who had. Mr. Coker then proposed that the subject be deferred until after Easter, to enable the parish to put in churchwardens in whom they had confidence. The chairman objected, on the ground that the expense ordered by vestry must be paid during the current year; when Mr. Coker, consisting himself, and Mr. Coker, and put his proposal, and produced read various letters and certificates from practical men, showing that his drawings were incorrect. The question fell to the ground in consequence of no proposition being made, and Mr. Coker's tender was accepted. Mr. Small then proposed as an amendment to Mr. Webber's motion that Mr. H. Davis's tender be accepted, which was seconded and lost, and the chairman declared the resolution that Mr. Woolfrey's tender be accepted carried. Upon a motion that a three-penny rate be made,

extending over a period of twelve years, to defray expenses already incurred, and the rebuilding the tower, a stormy discussion ensued, but the motion was eventually declared carried. A proposition was then made, to the effect that the tower should be taken down and entirely rebuilt from the ground, at an extra expense of 153l., which was agreed to.

THE BUILDING LINE IN THE EUSTON-ROAD.

FOR several years past there has been a contest carried on between the parochial authorities of St. Pancras and Mr. Bauman and other builders as to the line of frontage and elevation of houses erected on the forecourts of the houses in the Euston-road, between Hampstead-road and Osnaburgh-street; and the matter, having at length been referred to the determination of the Metropolitan Board of Works, that Board has decided to adopt the plan of Mr. Williams, superintending architect, showing an improved line of frontage, by which any buildings to be erected on the northern side, between the points indicated, are to be kept to an extreme general line of from 10 ft. to 11 ft. back from the outer edge of the curb to the foot pavement, and on the southern side of the road the foot pavement is to be in like manner kept to a uniform width of 11 ft. As in other cases where extended lines of frontage have been settled with a view to future operations, a formal application will still be required to be made to the Metropolitan Board of Works for each building, in order to secure a uniform arrangement, and to obtain an opportunity for reconciling the interests of the various owners.

THREE MEN KILLED BY FOUL AIR IN A WELL.

THE local press throughout the country ought rarely to din into the ears of the ignorant everywhere the simple means whereby wells may be cleared of foul air, as well as the greatness of the danger of descending into any well till simple tests be applied in order to show whether the air be foul or not. Wherever a candle will not freely continue to burn, human life cannot continue to subsist. If a candle goes out, therefore, either immediately or after a while, when lowered into a well, something ought to be done to get rid of the foul air before any one descends. The most effectual as well as simple way of clearing the well of foul air is to throw down the draught tubing of a garden or other hand-pump, lengthened, if need be, to the occasion, till its open end nearly touch the water without dipping into it. By the working of the pump the foul air can then be pumped out just as if it were water; and it will flow away as water would do; for foul air, or carbonic acid gas, is so heavy, as a gas, that although it is invisible, it may even be poured into a vessel, and out of that vessel into another, just as water can. The man who recklessly plunges into the foul air of a well, therefore, may be said to be going into a fluid over head and ears which will drown him, though he can neither feel nor see it. One of the innumerable cases of drowning by foul air which are ever and anon taking place, has just occurred in Fareley-street, Birmingham, where, as usual, one poor ignorant fellow followed another to his fate with the kind intention of saving life, till three of them were all doubly drowned in foul air and in water together. In this case, even the precaution of a rope tied round the body was not used except in one of the instances, and it is believed the one who was so tied removed the rope to put it round one of the dead bodies, but became a dead body himself before he could do it. The first man had actually descended while no one was at hand to help at all.

AMUSEMENTS.

Haymarket Theatre.—There are two excellent scenes in the new burlesque here, "A Par-version of the Brigand," one a pass in the mountains with the sun tipping their tops and gradually descending,—the other an Italian ball-room with double light of steps in the centre at the back leading to the upper floor. These do considerable credit to Mr. O'Connor the painter of them. The piece, wanting in plot (as most burlesques are now-a-days) is smartly written by Mr. Gilbert A'Beckett, Mr. Compton, Mr. Kendal, and Miss Ione Burke have the principal parts. A new drama, "A Wife well Won," will be played here on Monday.

St. George's Opera House, Langham Place.—The new comic opera, by Mr. A. Sullivan and Mr. Burand, *The Contrabandista*, includes some very agreeable music, is lively in plot, and altogether amusing; a neat corps de ballet, and sufficient chorus, completing the ensemble. *Puss in Petticoats*, and Offenbach's *Chère-Chère*, fill up the evening very agreeably. Nevertheless,

and we now speak with only one desire, the success of the undertaking, if Mr. Reed would have it take the position it should, and we have every reason to believe it would take, he must obtain assistants who can act and sing. At present the company has too amateurish an aspect to command a great success. There is another hint we would give him. The draught from the Regent-street entrance must be prevented. At present, even in the halls, it is intolerable. At many of our theatres this nuisance is unbearable, and keeps many persons away.

The Polytechnic Institution.—The new lecture which Professor Pepper has prepared for the holiday season, "Faraday's Discoveries and their Results," involves matter more erudite than is usually administered here—matter, too, of very great interest. There are few people who, when they have heard there was a fault in the submarine cable, and it was about so many miles from shore, have not asked how it was possible to determine this latter point. The description in this lecture of "Wheatstone Bridge," as it is called, answers the question. Some amusing optical deceptions in the moving of tables and raising of Tobin are also shown; but to set these forth as any answer to the so-called Spiritual Manifestations of the day is a great mistake. They do not touch the matter at all, and would simply give the "Spiritualists" an easy victory. Electricity is receiving considerable attention just now at the Polytechnic, and the directors contemplate setting up a machine that will give a shock capable of killing off a man.

CHURCH-BUILDING NEWS.

Selby.—The church of St. James, at Selby, has been consecrated by the Archbishop of York. The building is being finished by the executors of the late Mr. James Andus, in whose lifetime it had been commenced, and who had agreed to be at the sole expense connected with the work. The tower is still in process of construction, and some external ornamentation to be carried out. The building has been constructed from designs by Messrs. Newstead & Low, of York and London, and consists of a nave, with aisles, chancel, and organ-chamber on the south side and vestry on north, and tower with spire at the west end. The total length of the church is 122 ft., the width 50 ft., and the tower and spire will rise to a height of 165 ft. The lower part of the tower is for use as a baptistery. The style is of the Early Geometrical period. It is built upon a plinth of Sheffield blue stone, and the external walls are fenced with Bradford sets with Ancaster stone dressings. The aisles are divided from the nave by five bays, the arches of which rest on single polished red Isle of Mull granite columns, each shaft being one piece, and having carved capitals in Ancaster stone. A variety of stones is used in the building internally, as well as externally. The chancel arch is carried on clustered haunched shafts of red Devonshire marble, with carved capitals and stone bases. An eastern window is filled with stained glass, which has been executed by Messrs. Heaton, Butler, & Bayne, of London, and contains the following subjects in the five lights.—The Call of St. James, the Raising of Jairus's Daughter, the Transfiguration (centre light), the Agony in the Garden, and the Martyrdom of St. James. The east wall, on either side of the reredos, is ornamented with a moulded and cusped arcade, supported on Italian Bardilla and Spanish-Narceta marble columns. A sedilla has been introduced. The roofs are open and of stained timber, and the beams rest on carved corbels. Maw's encaustic tiles, in many different patterns, have been used to pave the church. The reredos is constructed mainly of polished Derbyshire alabaster, enriched with carving. It is divided into three panels, by coupled and single polished green serpentine shafts, with moulded arches, and surmounted with a moulded and carved cornice, with a cresting inlaid with bosses of polished Derbyshire spar of various colours. The lectern takes the conventional eagle form, but has been modelled for the architects from studies made by them at the Zoological Gardens. The organ has been built by Messrs. W. Hill & Son, London. The sittings are entirely free.

Newington.—The Bishop of London has consecrated the new church of St. Matthew, in the New Kent-road, near Newington-batts. The edifice, which, externally and interiorly, is of a light character, has been built within seven

months, Mr. Henry Jarvis, a local architect, and Messrs. Myers, the contractors, having been engaged in its erection. Mr. Robert Stephen Faulconer, of Waltham, and Mr. Whitehead have given large sums, the former about 5,000*l.* and the latter 1,000*l.* towards the cost.

Norwich.—St. Andrew's Church has been undergoing some further restorations. The present work has been to scrape and clean the stone-work; to restore the mutilated columns, the bases of which require to be nearly rebuilt; to banish the old square pews, and to substitute open benches. The scrapings of the columns brought out the warm colour of the stone which had been hidden beneath coats of whitewashing, and the walls have been tinted with a corresponding colour. The side passages are so arranged as to show freely and in full prominence the bases of the columns, without interfering with the arrangement of the benches. The material of which the old pews consisted has been employed in the new benches, the ends of which, towards the centre aisle, consist of deeply-recessed panels, made of the old oak, surmounted with tracery. The architect was Mr. William Smith, of London; and the contractor, Mr. Burrell, of this city.

Bury St. Edmunds.—St. Mary's Church has had the pews replaced by open benches, and the organ enlarged and rebuilt, and placed in the north aisle of the chancel. During these and other alterations, the edifice has never been entirely closed.

West Bromwich.—The new school church, which has just been erected in the Wednesbury-road, in All Saints' district, West Bromwich, has been formally opened. The foundation-stone of St. Andrew's Church was laid in June last, by Mrs. T. Jesson. The building is in the Domestic Gothic style. Mr. Somers Clarke was the architect. At the east end are the altar and super-altar. The church is built to hold 400 people, and when not in use as a church will be appropriated off into schools.

Firle.—The parish church of West Firle has been re-opened after extensive restoration and repairs. A little longer delay, and the whole church would have fallen down. With the approbation of the landowner of the parish, as well as of the vestry, the services of an architect were obtained.—Mr. Gordon M. Hills; and under his direction the works were undertaken; Mr. Davey, aided by Messrs. Parsons, of Lewes, being the contractors; and Mr. H. Weller, of Firle, acted as clerk of the works. The west walls of the two aisles were rebuilt, the roofs of the two aisles replaced on walls raised to the original height, the main roof of the nave strengthened, and the plaster ceiling replaced with a wooden lining. The modern windows in the clerestory were taken out, and six windows of the ancient form inserted, and a window in the east wall of the nave, which has been blocked up, re-opened. The arcade on the south side of the nave was underpinned and placed on a sound foundation. The gallery, which blocked up three arches, was removed, accommodation for the school children and inmates of Firle union house, who used to occupy it, being found in the body of the church. Outside, new buttresses have been built to support the fabric. In addition to these repairs, which were undertaken solely at the expense of the landowner, Viscount Gage, aided by a rate; the vicar, assisted by his friends, undertook the renewal of that part of the building especially set apart for the due and orderly celebration of the services of the church. The chancel and sacristy have been paved, and a reredos erected, of tiles furnished by Messrs. Maw, from designs by their agents Messrs. Tompson & Sons, of London.

Dilwyn (Herefordshire).—The parish church has been restored and re-opened. Mr. G. C. Haddon, of Hereford, was the architect employed, and Messrs. Lewis & Day, also of Hereford, were the contractors. The cost of the restorations is about 1,300*l.*, including the Powell Memorial east window, by Messrs. Heaton, Butler, & Bayne. The reredos is the work of Mr. Forsyth, of Worcester, and is in marble, Caen, and Painswick stone. The east window consists of three lights. The centre window contains the "Crucifixion," with the sun and moon darkened over the cross, and St. John and the two Marys grouped around its foot. The north light has the "Nativity." On either side are the shepherds and the Magi, the whole surrounded by the star of Bethlehem. In the south light the "Ascension" is represented. The head of the window is filled with the sacramental emblems—wheat and grapes—and the paten and chalice.

Books Received.

Abyssinia and its People; or, Life in the Land of Prester John. Edited by JOHN CAMDEN HOTTEN, Fellow of the Ethnological Society, &c.; with a new Map and eight coloured Illustrations, by MAL. VIGNARD & BARRAT. London: Hotten, Piccadilly. 1868.

THE most useful knowledge we can have at this moment in regard to Abyssinia is not so much what the most recent traveller through the country has to say, but what all Abyssinian travellers have said of it, including the most recent; and this is precisely what Mr. Hotten gives in a considerable portion of his very interesting volume. Considering the stereotyped and almost unchanging habits and character of Eastern peoples, much of what old travellers have told us of this people holds good to the present day; and indeed not a little of what was said in former times, but doubted by some readers, more modern visitors to the country have only confirmed. A book giving us the pith of all that has been said of our semi-savage foe—if we can call the Abyssinian people our foe—is therefore the most acceptable gift that could be presented to the public on this subject in this gift season.

The volume is divided into five parts;—on the country as seen by early and recent travellers; Consul Plowden's excellent description of the people and their country; the story of the British captives; suggestions for an expedition, with routes; and a bibliography of all the known works relating to Abyssinia.

VARIORUM.

ADDRESS to the members of the Historic Society of Lancashire and Cheshire. By Joseph Mayer, F.S.A., &c. Liverpool: printed by Thomas Brakell, Cook-street. Any remarks by Mr. Joseph Mayer on archeological or antiquarian subjects merit attentive consideration, and they are sure to receive it. The first subject treated of in this paper is the kitchen-midden folk of pre-historic times. The era when this race of men existed appears to be to a certain extent identified by the remains of the caperculize, a bird which feeds on pine buds. The pine era of Denmark preceded its oak era, and that its heath era. If there was a pine era in this island at the same time, here is a proximate fixture of the geological era when the kitchen-midden people flourished. The era was a very ancient one, perhaps ten thousand years since, or even much more, and when the climate was much colder than it now is, but by no means so ancient as the era of the glacial drift, in which traces of still more ancient man have been found. Many of the kitchen middens accordingly occur along the present coasts, but not all of them: some are miles inland. Mr. Mayer considers the question of migration; as to which all we shall say is that we have never seen any allusion made to the facilities afforded to extremely ancient migrations, at an era even subsequent to the glacial, but when the climate was colder, by the freezing of the ocean surface farther south than now. Thus, for example, there certainly was a time, after the glacial era had waned, when Britain and the Continent were united every winter by a frozen sea. The wandering Esquimaux, and the Lapps, are probably remnants of ancient races whose fields of migration have only been narrowed by the milderment of climates in the juxta-arctic region, which had not retreated so far to the north as now. Thus, amongst the Esquimaux and the Lapps, we probably have the likeliest state of mankind to that of the aborigines of this island—the earliest Britons and Prets, but especially to the glacial drift races. An account of the Lapps and Esquimaux, written by the light of these views, and of the glacial drift, flint implement, and kitchen midden phenomena, might shed a reflex light of great interest on the probable state, habits, and customs of our extreme ancestors. Mr. Mayer next treats of the time of Hadrian's wall across the island, which he is of opinion was built to resist—not the comparatively few northern savages alone, but an alliance of these with the far more dangerous pirates of the North Sea. But irrespective of the fact that the plague of these rovers, as Mr. Mayer admits, was not heard of for nearly a century later, would not the alliance of the pirates with the savages have only

rendered the building of a wall across the island less probable, and of less avail than if it were intended to exclude the savages exclusively? "The lost letters of the English tongue" forms the last subject treated of by Mr. Mayer. It is rather a startling one, but perfectly correct as he shows. Thua there are thirteen distinct vowel sounds in the English language, and to denote these, we have only the five vowel letters of the Latin alphabet, which our ignorant forefathers were persuaded to adopt from the Romans. On this account we have in a manner lost eight of these vowels as recognised alphabetical characters.—"Rain: How, When, Where, and Why it is Measured." By G. J. Symon, F.M.S. Stanford, Charing-cross. Of late years the subject of rain has increased in interest. For some years a fear seemed to prevail that the rainfall was permanently diminishing; but these fears were succeeded by a new series in which it has been on the increase. The solution of the question whether the rainfall in this country was increasing, decreasing, or stationary, was the primary object of the researches of Mr. Symon, a very competent investigator. He has collected nearly 12,000 records of rainfall, which he has arranged, tabulated, corrected, corresponded about, travelled and searched for, besides organizing a system throughout the British Isles for observations on its distribution, entailing a vast amount of labour and no little expense. To a small extent, as to expense, his labours have been recognized and aided by the British Association. The records collected extend from the year 1677 to 1867; and one of the chief results appears in a tabular and diagrammatic form, which shows that about the middle of last century, for a series of years there was far less rainfall than there has ever since been; and that the greatest amount of rainfall during all these years was in the middle of the present century. The diminution between 1820 and 1850 was by no means so great as that of nearly the whole of the previous century. The wettest year of the whole series was in 1852, and the falling off after 1854 has ceased. The general result, as Mr. Symon remarks, "appears to indicate great steadiness in the supply if any considerable number of years are taken together, the principal exception being in the middle of the eighteenth century, when the observations indicate a remarkable and prolonged drought."—Casell's "Illustrated Catalogue for 1868," folio size, contains illustrations from thirty-five works, the chief of them by Gustave Doré. It makes a book worth preservation.

Miscellaneous.

MANCHESTER CERTIFIED INDUSTRIAL SCHOOLS' The annual meeting of this institution has been held at Ardwick-green. The report stated that the committee had been placed in a position of difficulty from want of dormitory accommodation, and they had thereby been induced to appeal to the public for a sum of money to build additional dormitories and workshops. The appeal was liberally responded to. The spare ground at the back of the schools was examined, and plans for additional buildings to give the necessary accommodation prepared. The building had been commenced. It was thought desirable to purchase an additional piece of ground to enlarge the playground, and this, with the cost of heating apparatus and fittings, would involve an expenditure of 300l. or 400l., which had yet to be raised. A donation of 300l. had been given by the Manchester Corporation towards the building fund.

PURIFICATION OF THE THAMES. — The conservators of the Thames are able to report that they have given the requisite thirteen months' notice for the removal of all sewers above Staines which emptied themselves into the river, or into any tributary stream within three miles of the river; and at a later period in the current year they gave like notices with regard to drains below that town. They have also served notice upon the proprietors of paper-mills requiring the discontinuance of the flow of sewage or other offensive matter from their mills. For the purpose of further preserving from impurity the waters of the Thames above the point of the water supply, the conservators employ a steaming- to pass up and down the river, with a view to the removal of all dead animals and other polluting substances, and all the lock-keepers have instructions to remove all such nuisances.

FATAL FALL OF A CHURCH.—An accident has occurred at St. Paul's, Astley Bridge, near Bolton, by which one man has been killed and two others severely injured. The edifice was being widened, and, for the purpose of carrying out the extension, the workmen had sprung some arches, and it was noticed that one of these was fast giving way. The breach became so great that one of the needles or uprights supporting the key-stone of the arch slipped from under, and a tremendous crash followed. The roof of the church and the greater part of the building fell in. Three of the men were caught by the falling walls, and several others narrowly escaped.

A CORK GASOMETER.—The Cork Gas Consumers' Company have completed their new gasometer, which is said to be the largest in Ireland. It is a plate-iron cylinder, 154 ft. in diameter, by 25 ft. deep, and has involved many thousand cubic yards of excavation, and an amount of masonry and other work, which for the past nine months has kept about 120 tradesmen and labourers of the city at daily work. Mr. Anderson, the engineer of the company, furnished the plans for the work, and it was carried out under the personal direction of the manager, Mr. Still. The entire staff of the works, about 200 in number, dined in it the other day.

GREAT FIRE AT NEWCASTLE.—The dreadful explosion of blasting powder has been followed by another misfortune in the loss of property worth from 40,000l. to 60,000l. by fire from an unknown cause. There is no evidence, however, that Fenianism has had anything to do with either calamity. The buildings in which the fire occurred form a block of the most valuable and finest stone buildings in the town. Of recent years nearly the entire range of buildings along the Quayside, at Newcastle, has been rebuilt, the old rickety erections, chiefly of brick, being supplanted by massive ones of stone. The improvements extended to Queen-street, King-street, and Akenside-hill, all in the immediate rear of that part of the Quayside next to the Guildhall. The fire broke out in a ship store, and destroyed a large portion of the block of buildings in which it took place. Unfortunately, the water supply was deficient in force.

FRENCH HOSPITAL.—A dinner was given on Saturday evening in aid of a London hospital open to all foreigners speaking the French language, when the chair was taken by M. Devaux. A French dispensary, established in 1861, has rendered gratuitous medical aid to more than 7,000 sick and indigent persons; and last year it was determined to found a hospital, in order to complete the work commenced in the dispensary, and to offer to those speaking the French tongue the succor which the Germans have for many years provided for persons of that nation. The French Government promised an annual grant, and the appeal to the French in London was so generously responded to that the committee felt justified in beginning operations at once, by hiring a commodious house at the corner of Lisle-street and Leicester-place, in the centre of the French quarter, where patients are attended by two French physicians. It appeared from the statement of M. Rimmel, the hon. secretary, that the hospital and dispensary are under the same roof.

THE PROPOSED NEW TOWN-HALL FOR WOLVERHAMPTON.—The approval of the resolution of the local public works committee, sanctioning the plans of Mr. Bates for a sessions-house, town-hall, magistrates' court, and public offices, and directing him to complete the working drawings, and deciding that the committee should advertise for tenders, have been formally voted in the town council. The estimate of Mr. Bates, that his plans could be carried out for 17,000l., was, it is said, guaranteed by Messrs. Warburton, builders and contractors, at Manchester, and was accompanied by tenders from tradesmen in their respective branches of the trade—the latter amounting in the aggregate to several hundreds of pounds less than the estimate of Messrs. Warrington; and since the plans had been amended, on the suggestions of various officers of the corporation, Mr. Bates had written, assuring the committee that they could be carried out for the amount stated. It had been stated that the council were going to spend 30,000l. on the buildings. A 1½d. rate will produce sufficient to pay off the outlay and interest in thirty years.

SUBSTITUTION OF ARBITRATION FOR STRIKES.—A lecture has been delivered in St. James's Hall, by Mr. A. J. Mundella, president of the Nottingham Chamber of Commerce, and chairman of the Council of Conciliation, on the substitution of arbitration for strikes in cases where differences arise between employers and their workmen. The meeting for the delivery of the lecture was convened under the auspices of the Reform League, and the chair was occupied by Mr. Samuel Morley. Mr. Mundella, we believe, has risen from a humble position to be the managing partner of a firm employing from 3,000 to 5,000 workmen.

EDUCATIONAL CONFERENCE.—A conference of the friends of national education (supported by local rates under local administration), to discuss the principles and provisions of the Education Bill introduced into the House of Commons last session, will be held in the town-hall Manchester, on Wednesday and Thursday, the 15th and 16th of January next. The time has arrived for a settlement of the question on such a basis as shall as little as possible disturb the existing machinery, but yet shall give scope for extension and development where needed, and shall provide instruction for the whole of the children of the poorer classes of the population.

"THE SEVEN CHURCHES OF ASIA."—An exceedingly interesting series of photographs, showing the remains of the seven churches of Asia, of the Revelation of St. John (Smyrna Ephesus, Laodicea, Philadelphia, Sardis, Thyatira, Pergamos), and the adjacent sites of interest; Monument of Sesostris, Niche of Mount Syllus, Magnesia of the Meander, Aphrodisias, Hierapolis, are now on view in the rooms of the Arundel Society, 24, Old Bond-street. They are the first photographs of these places produced, and were made by A. Svoboda, artist of the R.A. of Venice. Amongst the most interesting are those of Laodicea, including views of the Great Theatre, the Stadium, with the pyramidal petrified aqueduct, by the effects of the waters of the Lycus; the incrusting waterfalls, Hierapolis; and the Piontium. At the foot of this temple is the water exhaling the deadly vapour mentioned by Strabo. Apart from the great interest of the sites, the photographs are very charming specimens of the art.

TENDERS
