to weigh the subject of pay well before starting. The only branch of the public service in India that is really well paid is the Covenanted Civil Service; for we need take no count of the higher grades of the military services, which are only reached after spending the best portion of life in an inferior and most subordinate position. A young civilian on landing in the country is about the same age as the young civil engineer. Till certain examinations in the languages are passed he receives not more than 36*l.* a month. These over, generally in from six months to a year, he becomes assistant magistrate and collector, on 42*l.* a month. His duties are extremely light. He tries petty police cases, examines trifling revenue claims, issues stamp papers, and occasionally takes charge of the treasury. In three or four years' time he rises to be the head assistant, and receives 81*l.* a month, and disposes of business of a little more importance. When he has seen seven or eight years of India he develops into a sub-collector or sub-judge, on 120*l.* a month; and by the time he has been twelve years in India, he can look to securing 230*l.* to 250*l.* a month for the rest of his official life as collector, commissioner, or sessions judge. All this period his duties have been such as call for very little special qualification beyond a knowledge of the Indian penal code and vernaculars, a gentleman's classical education, and a ready wit. The prospects of an engineer are very different. He joins as assistant, on 20*l.* a month, has to pass two examinations in the native languages, and through two grades, to reach that of first assistant, on 40*l.* a month. During this time he has had most harassing and disagreeable work to perform very often, in consequence of being called upon to keep accounts as well as superintending engineering operations, and in the incessant travelling in a country not in the least civilized that making his payments and looking after his works demands. In seven years after joining the Department he probably gets elevated to the charge of what is termed an Executive Division, equivalent in extent to districts for managing which civil servants draw not less than 120*l.* a month, and usually double that sum. There are four grades of executive engineers, paid at 50*l.*, 60*l.*, 75*l.*, and 90*l.* respectively; but of all the executive engineers 5-16ths are in the lowest grade, 4-16ths in the next, 4-16ths in the next, and only 3-16ths in the highest; so taking the average an executive engineer only receives 66*l.* all through. As he is seldom promoted to the administrative rank of the Department before he is fourteen years in service, he is exactly half as well off as the civil servant of similar length of service. Nor has he anything approaching what they have further to expect. There are hundreds of appointments in the Civil Service worth above 200*l.* a month, whereas in the Public Works Department of the three presidencies together there are only five such prizes in existence. The common plan is to give a first grade executive engineer 10*l.* to 20*l.* a month extra, and dub him superintending engineer,—a rank that in status and responsibility is fully equal to that of collector and magistrate, who draws double the salary. The Public Works Department, then, which is forced into the most intimate connexion with the civil servants, does not receive fair play in the matter of remuneration, and while this lasts the Government cannot expect its engineers to be satisfied with their position, or the Public Works Department to be attractive to any who are able to make their way at home or in the cooler colonies. It is not at all just to compare the Public Works Department with the Indian Army. An ensign gets 21*l.* a month, and has no travelling except his regiment marches, and has his mess and agreeable society, and need not possess any scientific knowledge. He has opportunities of rising, and in twelve or fifteen years may command an irregular regiment on 100*l.* a month.

Intermediately, he certainly is not quite so well paid as a civil engineer, but then he has little or no personal responsibility, and, in time of peace, the easiest of all easy occupations. But an ensign, it must be recollected, also can join the army at the age of sixteen, whilst the civil engineer scarcely ever comes to India under one-and-twenty, and is often older than that. So to put his value at 20*l.* a month, shows that there is a mistake somewhere, and that a professional training does not count for much in India.

Mr. Macrone, writing in the *Builder* for August 4th last, gives the statement, that 40*l.* a month is the lowest sum upon which a young man can live with comfort, unqualified denial. Mr. Macrone, however, writes from Calcutta, and has probably had no experience of the other presidencies. In Bengal, Oude, the Punjab, and the north-west provinces, which are the fattest portions of India, prices have not risen in the unprecedented manner they have done elsewhere. It is possible that there 200, or 20*l.* a month might suffice for a young man just beginning life in the department, though that is only a few pounds more than his European overeaer begins with who gets 12*l.* a month as soon as he joins, after a ten months' superficial course at one of the Indian engineering colleges, being a full private in the army. In Madras, however, it is next door to impossible to keep up the appearance of a gentleman at 20*l.* a month if single, or on twice that amount if married. Bombay is worse; and the central provinces, Rajpootana and Burmah, are unhealthy to reside in, as well as expensive. What with the famines and cost of living, all Indian officials may be said, in those parts of the country at all events, to have been docked one-third of their incomes. On the Public Works officer high prices tell severely. He must have horses, or he is of no use; an assistant one, and an executive engineer a couple; and horses' food is generally the first thing dearth touches. If married, he must keep up two sets of servants, one to take out with him, the other to leave behind; and, besides having the disbursement of money, the rendering of accounts, and the management of gangs of labourers, he is constantly worried and perplexed in retaining at the lowest level rates that have a perpetual tendency to rise and upset his estimates.

Public Works officers have an additional claim to be respectably paid. They undertake not only the professional conduct of works, but also the duties of accountants. The latter is considered by most Indian engineers the least agreeable portion of their duty. It certainly absorbs an undue amount of their time. As a rule, perhaps full one-half of their attention is taken up with matters that do not necessarily appertain to their profession as engineers. This, in itself, is enough to disgust most men on first entering the Public Works Department; and, when they have been long in it, to render them less capable than if employed solely as engineers, and not half as engineers and half as accountants. This fact also accounts for the reluctance of the Government to increase the salaries of engineers to the civil service standard. If they did, unless the account work was shown under a separate head, the cost of their establishments would bear a ridiculously high proportion to the work turned out. At present, a very elaborate system of accounts is kept up at no expense, being debited to "construction" by the simple means of making the Executive Staff write them up. Even if it were fair to put down to "construction" the work of ascertaining what a building or road actually cost the State, it is scarcely so to make "construction" answerable for the sums being entered against one of the numerous budget grants, or twisted about into voluminous forms that are, when dis-

passionately examined, of no practical utility. There are no fewer than ninety-five different forms in current use in the Bengal Public Works Department. This is quite sufficient to show, without much further enlarging, what a difference would ensue in the percentage for establishments upon the cost of works, were all this Sisyphean labour paid for as a separate item, and not hid under the guise of "construction." It is well worth the while of the Government of India to see if their engineers cannot be saved much of this almost purposeless trouble which has to be taken at the expense of the work out of doors. It cannot be denied practical skill is at a very low point among the natives, who are, on the other hand, excellent accountants, though untrustworthy if underpaid. The system of accounts, according to high authority, is now "perfected," or, in reality, the departmental officers have been, at last, schooled into rendering whatever forms the Audit Office demands; and it is, we fear, not an exaggeration to say, that far more stress is laid upon punctuality in this respect than upon sound and creditable engineering, which is what India stands in need of. The management of the Department, then, is a thing which operates to deter competent persons from entering it.

But the Government may always rely upon candidates coming forward if their terms are liberal, seeing how easily ascertained defects of organization can be remedied; and as certainly may they make up their minds to see empty benches in the examination room if disposed to be the reverse. The East India Company were able to fill professional and scientific appointments at a very low rate, because they had an over-officered army, and a medical service held in great repute to draw from. The Secretary of State for India, on the contrary, must betake him to the open market. As far as we can judge, 20*l.* a month for a man of 22—an educated engineer—to begin upon in India, with nothing to look forward to except 66*l.* a month on an average till he has been fourteen years at the earliest in the service, and then to receive but half the remuneration of a civil servant of similar standing ever after, is not inducement enough to offer to men who have studied engineering to any purpose to cast their lot in such a hideous climate, and in such an artificial society as that of India. We are not far from the truth in asserting a shilling in England to be the exact counterpart of a rupee in India. An Indian family, on an income of 1,200*l.* a year, does not live one whit more comfortably than a family in Great Britain on 600*l.* a year, and not nearly so pleasantly. Besides, now that provident funds are abolished, engineers must resort to the Insurance Companies, who charge double premiums in India; they must also save money to enable them to send their families home for change and education, and for a holiday trip for themselves; so that after an executive engineer has paid his premium of insurance, laid by his quatum for a rainy day, and has paid for the keep of his two horses, he will not have very much over out of his 66*l.* a month; he will just have a bare livelihood. To counteract this weighty deterrent the Government should still further improve the position of their engineers. There is no justifiable reason for paying the men who improve and open up the country at half the rate of those who merely tax and enforce the law, in obedience to a rusty tradition. And if the complaint is rife that under the new system, which has substituted a delightful uncertainty for the solid advantages the East India Company always held out, the Civil Service of India fails to attract University men, and has to tap a lower stratum of society than that which used to yield civil administrators, who of any promise or experience in the engineering profession are likely to accept on very inferior terms a lengthy and most wearisome servitude?

If the higher grades of the Department were on superior allowances, we would not be disposed to quarrel with what the assistant engineers are valued at; but considering what is expected of executive engineers, and that in addition to their designing works they have to carry them out, and keep all the accounts, as things go in India, 50*l.* a month, the equivalent to 25*l.* a month in England, is too small a salary. If no executive engineer received less than 60*l.*, and there were but two more grades worth 80*l.* and 120*l.*, a pretty fair balance would be struck with the sister service. Superintending engineers should, according to all analogy, also have their salaries revised. One of the faults of the existing system also is, that this class is too few in number. Placed in

charge of enormous tracts of country, marching over which involves great loss of time and prolonged separation from home and family, hurried runs are frequently all that are made. The rest of the year superintending engineers are mere post-offices and auditors, and of much less real use than officials of their experience ought to be. The administration is one of the weakest points of the Department; but as intending candidates have it in their power to call for the information they require, they can each for himself pronounce a verdict upon the prospects of the Department, though they must be unfortunately in the dark as to the value of the Indian rupee until they cross the Isthmus of Suez, when its purchasing capabilities will dawn upon them all of a sudden. It is not so easy for them, perhaps, to decide what presidency to go to. On the whole, the Government of India which regulates the Public Works Department in Bengal, the Punjab, the North-west Provinces, Oude, Mysore, Rajpootana, the Central Provinces, Hyderabad, and Burmah, is the fairest and best. Promotion is maintained in a steady flow; and, except for the general low average of pay, there would be no call for complaint. However, prices are much higher in the central provinces, Burmah, Rajpootana, and Hyderabad, than in the other places, and that makes a serious hole in every salary. As a rule, perhaps, 1*l.* in Bengal goes as far as 30*s.* in the central provinces. The Bombay Government have an entirely distinct Public Works Department of their own. It is chiefly composed of Royal Engineers; and, as that presidency is the most like Europe of the whole, it is likely to continue to attract those military engineers who care to come to India. Madras, on the other hand, is a presidency both civil and military engineers should have nothing to say to, if they can help it. The Madras Civil Service detest the Public Works Department, and throw all their influence into the scale against it; and, as they have the practical control of the local finances, it fares hard with the engineers. The Madras Department of Public Works is being constantly reorganized, which gives an opportunity of reducing salaries and arresting promotion. A large number of military engineers have migrated in consequence to the territories under the supreme Government, and the conduct of the Madras Government has elicited strong remonstrances from the Civil Engineers in its employ, who have not been nearly so fortunate as their counterparts in Bengal. If it is possible to withhold a benefit granted by the Government of India, the Madras authorities, we are told, ordainance "inapplicable to their presidency;" and in other ways they endeavour to throw the Public Works Department into the background. A civil engineer will, we can assure him, rue the day he goes to Madras, where even military engineers sometimes prefer regimental duty with black troops to service in an underpaid and wretchedly managed Public Works Department.

It is a great pity, for the sake of the country, that the Madras Government shows such marked animosity to its engineers, going so far as to, when it can, not scruple to defraud them of their allowances; because it is the very part of India which owes most to its artificial irrigation, and in which, from the peculiarity of its revenue system and land tenures, the quickest profits can be gathered from State improvements.

We have not time to discuss the leave and pension rules the Secretary of State for India places civil engineers under, at any length: compared with those of the Civil Service they are one-sided and ungenerous, and better suited to natives of India than to Englishmen of science. The numbers who will compete in July for the twenty-five vacancies in the Indian Public Works Department will give a tolerable indication of the estimation in which the profession hold the pay and prospects of an Indian Government engineer, and many out in India will be on the watch for the list.

It may be well for the Government to give prompt consideration to the statements we have made.

GREENWICH HOSPITAL.—A movement is organizing among the London merchant shipping interest to induce the Government to devote the now half-vacant halls of Greenwich Hospital to an asylum for aged and diseased men belonging to the mercantile marine, who at present have no other refuge than the old *Dreadnought* hulk moored in the Thames.

THE "REVUE GENERALE DE L'ARCHITECTURE."

READERS of the *Builder* do not require to be told of the scope and excellence of Mr. Daly's handsome serial.* It has now reached the twenty-seventh year of its publication. As in former years, the number and quality of the plates, the cosmopolitan character of the subjects, and the amount of matter in the letter-press, are striking. The works illustrated by our Parisian contemporary in the recent months are the new Palais de Justice, by M. Duc et Dumoy; Asylum for the Insane, by M. J. Esquié, Braqueville (Hante Garonne); Tribunal of Commerce, Paris, by M. A. N. Bailly; a Priest-house for the parish church of the Immaculate Conception at Lyon (Rhône), by M. Bossan; a Maison de Commerce, by M. J. Cantagrel; a Jewish Temple at Lyon, by M. A. Hirsch; the Britannia Theatre in London, by M. G. Davioud; Siphon Bridge at Orleansville, Algeria, by M. Denfert-Rochereau; a Private Hotel, of the third class, Rue Balzac, by M. Azemar. These are all given with the fullest particulars; and besides these there are many sheets of minor objects, such as doorways in the Rue Saint Nicolas du Cardonnet, on the Boulevard Saint Michel, and on the Quai Voltaire; lucarnes, crosses in cemeteries, confessionals, balustrades, shops, magazines, a Strasbourg balcony, zinc coverings for roofs, gutters, and dormers, terminals in glazed terra cotta, details of St. Paul's Church, Paris, &c.

The restoration and aggrandisement of the Palais de Justice has been a work of time. M. Daly considers that the "Batiment des Assises" is without doubt the most important of its parts in a monumental point of view, and of this he gives plans of the first and second floors engraved on steel. Of the fabric generally our *rédauteur* writes:—"The works of the artists as eminent as the architects who have directed for so many years this grand enterprise of the restoration and enlargement of the Palais de Justice deserve to be long and maturely studied. It is but with prudence and circumspection that one is able to appreciate talents of an order so elevated as those of M. Duc, recently named a member of the Institute; and of M. Dumoy, his early and faithful collaborateur."

Although M. Daly has illustrated this important building in the exact and minute manner which distinguishes his "Revue," he announces in the same number that contains the plans the intention of M. le Baron Haussmann, prefect of the Seine, to publish a General History of the City of Paris, whence we may conclude that this building will be illustrated in a new form; and in connexion with the announcement of this important publication, M. Daly prints verbatim a remarkable letter of the Emperor, approving of the scheme. It is as follows:—

"Palace of Compiegne.
"My dear M. Haussmann,—I applaud the happy thought that you have of writing the general history of Paris."

This collection of monographs, of plans, and of authentic documents, destined to be augmented without ceasing, will permit you to follow across centuries the transformation of the city which, thanks to the intelligent concurrence of its municipal council and your indefatigable activity, is to-day the most splendid and the most salubrious of the capitals of Europe.

Receive, then, my felicitations, dear Monsieur Haussmann, and believe in my sentiments of friendship.

NAPOLÉON."

M. Daly adds,—The moment seems well chosen and most favourable. At the hour of the transformation, so to say, of our old Paris; at the moment when, once after another, those remains of the past which have resisted time, disappear, and the means which could yet, imagination aiding, reconstitute the successive physiognomies of the city in divers ages, and in the current of centuries, it appears to us good that the pen and the pencil should unite to preserve at least the remembrance of what was, and the trace of that which disappears so rapidly, so that from to-day to to-morrow the old city herself knows herself no more.

The Lunatic Asylum of Braqueville, near Toulouse, is illustrated by several plans and sections, and the nature of the institution fully explained in a practical manner, by two articles to the editor, on the subject, all by M. Esquié, the architect. The necessity for an increase in the number of these asylums in France is made

* "Revue Générale de l'Architecture et des Travaux publics; Journal des Architectes, des Architectes, des Ingénieurs, et des Entrepreneurs, publié sous la direction de M. César Daly, Architecte," etc. Paris: A. Morel, Libraire, 18, Rue Bonaparte.

apparent by the statistics given. In 1836 there was 1 asylum for every 3,024 inhabitants; in 1841, 1 to 2,465; in 1846, 1 to 1,965; and in 1851, 1 to 1,676. While the increase of the population in these fifteen years had been 6.68 in 100, the number of insane was augmented to a proportion nearly fourteen times greater; and although the proportion cured was 8.40 to 100, 13 in every 100 died, 1 dying in 44 of the inhabitants in the whole of France; the mortality of the insane had been, therefore, six times greater than in the population. The asylum of Bragueville can receive 500 insane of both sexes, and is classified in four distinct quarters appropriated to the wants and conveniences of medical treatment, according to the nature, form, and degrees of the malady. It is divided into two parts. The first is composed of buildings, or quarters, for the habitation of the insane of both sexes. The second comprises the buildings for the administration and general service, the latter being placed in the centre and at the entrance of the establishment. The buildings and dependences of the asylum proper are divided into quarters for the men and women, placed right and left of those for the administration, and include provision for the infirm, the idiotic, the epileptic, the insane undergoing treatment, the infirm, infants, and the aged, separate divisions being devoted to the violently mad (*malades agités*), and the destructively insane. Another portion of the establishment provides for imbeciles and the quiet insane (*aliénés tranquilles*). The construction, arrangements, and details of this establishment are thoroughly well studied, and merit attention on the part of those who are about to build lunatic asylums in this country. Full descriptions are given of the dormitories, single chambers (*chambres individuelles*), refectory (*salle de résum*), staircases à l'italienne, constructed between two walls, and with steps entirely of stone, windows, cells for the violent, baths, latrines, promenade gardens, warming, and ventilation.

The priest's house, or presbytery, of the parish church of the Immaculate Conception, at Lyon, by M. Bossan, is shown by three small plans of the three stories, and an elevation of the principal front on one sheet and a side elevation upon a second sheet. The style of the building is an odd mixture of French-Greek and French-Gothic, an enrichment being produced by the use of various building stones. According to the architect's statement, he had to fulfil the following programme:—To find in the same edifice space necessary for a boys' school; apartments for the curé; lodgings for the curates and for some of the *employés* in the service of the church. These requirements are provided for in the different stories in a thoroughly novel manner. The site of the building is parallelogramic. In the ground-floor the entrance is in the principal front, the staircase being on the left, and the porter, or *concierge*, on the right; a large class-room occupies the whole width of the house next to the entrance-hall and staircase, whence it is entered in the centre. Beyond this is a central corridor with two class-rooms right and left. The first-floor has a parlour over the *concierge*, entered from the landing of the stairs; the building is then divided by a central corridor, entered from the same landing, having successively on the right a spare bed-room (*chambre d'amis*), a salon and chamber for M. le Curé; and on the left, a dining-room, office, and kitchen *en suite*, the whole terminating at the end of the corridor with a room for servants and a staircase for the service of the second story. In the second story, a parlour occurs over the one below; and the central corridor divides the building again into apartments for four curates, right and left bed-room and sitting-room alternately, and a room for the curé and servants at the end.

The different apartments are well lighted, as the building is open on the four sides, but the central corridor on each floor has no light except what may be borrowed from the doors of each room, and there is an objectionable arrangement in the plan whereby the door to the servants' bed-room is in the same small lobby at the end as that to the room of M. le Curé. The architect gives the following account of his building, and we add the cost of it. "The foundation of the presbytery dates from 1860. The stones employed are of different natures and from different provinces. For the masonry, the stone of Couzon (near Lyon). The ashlar of the interior is in stone from Saint Fortunat. The basement of the edifice, the staircase, the

steps, the thresholds, and the pillars in the class-rooms have been executed in Villebois stone (Ain). The white stone of Saint Just (Drone) has been employed for the façades. The jambs, heads, and cills, and the uppermost cornice go through the thickness of the wall; the others have but 0.25 m. or 0.30 m. of thickness, and only form a lining. The millions of the windows of the first story requiring great resistance are made in stone from Crans (Ardeche). The stone has been placed rough (*bruts*) on the walls, and finished after being in position."

The expenses of the construction are:—

	£	s.
Masonry	15,073	0
White stone (St. Just)	10,279	0
Stone of Crans	930	0
Stone of Tonrais	188	0
Stone of St. Fortunat	792	0
Stone of Villebois	4,121	0
Carpentry	6,013	0
Joinery	10,355	0
Ironwork	9,498	0
Plastering and painting	9,675	0
Tin work	2,472	0
Mosaic	680	0
Bitumen	432	0
Rough plaster	2,162	0
Sculpture	4,955	0
	78,562	0
Honorarium of the architect calculated at 5 per cent.	3,827	0
Total expense	80,379	0

In the letter-press we get a general insight into the floating building news and talk in Paris, and note the importance given in it to some of our own public buildings. We are surprised, too, at the number of new hooks on antediluvian and Celtic subjects published in France and mentioned in the pages of the review. It would appear that nearly every *arrondissement* in France has its explorer zealously taking account of all pre-historic relics. And, not content with examining every stick and stone in *la Belle France*, French travellers lose no opportunity of adding from other countries to the general store of archaeological information. Thus M. Perrin, who is a general in the army of the King of Siam, and a mandarin of the third class, recently communicated to M. Daly an account of some extraordinary ruins at D'Ankor-viat, in the kingdom of Siam. Our editor prefaces this new and interesting information with a reminder that this is an age of scientific and historical discoveries. Ancient Egypt has become better known to us during the last thirty years than it was to the Roman empire; not only can we read its hieroglyphs, but we can examine by their aid, and that of cuneiform inscriptions, the ancient writings of Herodotus and Diodorus, and those of the Bible. We know Nineveh and Babylon, we examine the monumental history of the aboriginal Americans, and we familiarize ourselves with Indian antiquities in searching among the dead languages of the East, in their poems and their myths, as in their forests, their subterranean abodes, and their ruins scattered upon the soil; and now Siam presents us with ruins so vast and astonishing that to examine them is to open a page in a story in the thousand and one nights. And truly, the General's account of these ruins is marvellous. He says that none would believe the numbers of marble monuments, temples, palaces, columns, and staircases at D'Ankor-viat. "I assure you, believe me or not, that the most celebrated of ancient or modern monuments are but barracks near those I have seen here; our palaces, our basilicas, the Vatican, the Colosseum, are dog-kennels by the side of them." Marble was the material of all around. The natives informed the general that these magnificent ruins covered an area of ten leagues by twelve. He asks, "What city can this be? Of what empire was this the capital? I have seen temples in a good state of preservation, except the vegetation that has encrusted them, which do not measure less than a league around. They have forests of marble columns; the whole is of marble. All the walls are sculptured and ornamented. The first effect these monuments produced upon me was stupefaction. I wished to enter a temple which appeared well preserved. It had eleven flights of steps, and I know not how many flights such to arrive only at the first of the five *pristyles*!" Recovering, the General ascended the steps that led to a high tower, and then he ascended the tower, and thence surveyed the ruins, where he saw marble enough upon the ground, and below the ground, that could rebuild, in the fashion of giants, all the cities in the universe. He saw the leg of a statue, of which the toe measured eleven times

the length of his gun! This was also of marble like everything else, the only other stone visible being coloured stones used in borders, and for eyes of statues. The pedestals to some of the statues were pyramidal, higher and larger than St. Germain l'Auxerrois.

The educated natives know not to whom to impute this ruined city; notwithstanding that their literature goes several centuries back further than ours. In another part of the kingdom the General saw some enormously tall, massive, rude triumphal arches. They were made of seven huge roughly hewn square-edged stones of different sizes, so disposed as to form a tall central way through them, and a lower one on either side of it. Four enormous monoliths stand in a line, the two in the centre standing the full height; the huge monolithic lintel thrown over all; the other two standing two-thirds of that height; the interstice between them and the lintel being filled with another stone which, passing over the passage-way below, formed a sort of secondary lintel below the principal one. In a rough sketch which the General sends of this, an elephant is represented passing under one of the side openings, which is three times his height. He asked his escort who has made these monuments. Ten voices reply,—"Les Gai." What are these Gai, he asks? They reply, barbarous white people, come from the country of the blacks, tall as three Siamese men, and whose fingers of hands and feet had scarcely any separation between them. They had large horses double the size of ours, of which they find the bones. "Behold," says the General, in conclusion, "what has taken me by surprise, but which has not satisfied me. I put it to the *savans* of the country to illuminate this question."

In another part of M. Daly's work, the theatres of London are treated, and an illustration is given, by three plans, of the Britannia Theatre in London; but we purpose dealing with this subject on a future occasion.

EXHIBITION OF THE ROYAL SCOTTISH ACADEMY.*

MANY of the most important works exhibited are stated in the catalogue to be the property of individuals, and it is satisfactory to observe that an unusual number of the best pictures, not so designated, have, since it was compiled, found purchasers, so that there is no lack of encouragement to artists of merit. Indeed, it would appear that the public taste is keeping pace with the progress of the artists; mere studies and still-life subjects do not now meet with the attention that used to be bestowed upon them; but it must, at the same time, be admitted that many works, the merit of which consists in a meretricious prettiness, find many purchasers.

Of the latter class are the works of Mr. R. Gavin, Nos. 265, 278, 510, and 810, all single figures of girls—badly drawn in several instances—placed in landscapes, the natural features of which seem to have been subjected to a process of boiling. Mr. W. Douglas exhibits three pictures of a highly dramatic character,—No. 250, "The Whisper;" 351, "The Conspirators;" and 496, "Waiting for the Last Interview." We shall take up the last subject, which displays both his merits and his faults. It is a page from the history of the Civil Wars. In the recess of a prison cell a young cavalier is confessing to a priest; and through the grated window of the cell we catch a glimpse of a scaffold and assembled multitude. At the door of the cell stands the jailer, and beside him the wife or sweetheart of the prisoner. With an un-called-for degree of brutality the jailer is puffing the smoke of his pipe into the face of the lady; and this tendency of running into extremes is exhibited in the other pictures. The colouring is somewhat hard and flat, but the drawing is vigorous. No. 262, "Maid has a Garden of Roses," by Mr. E. Farren, presents a marked contrast to the foregoing, being painted with much delicacy and grace. Mr. Sam Bough is forcible, as usual, seeking after effects and ignoring details. No. 161, "Twas when the Seas were roaring," is, we think, the finest water-colour in the rooms, and, in parts, exhibits delicate touches, which do not detract from the general effect of a wild sea. The dashing waves are even grand, and the very wind seems to have been painted. No. 832, "St. Monance," a pic-

* See p. 186, ante.

uresque fishing village, with fishers preparing to launch their boats.—

"Into the mist,
Out into the west, as the sun went down,"—

is a large oil-colour, poetically rendered. No. 253, "Willie Baird," by W. MacFaggart, is a picture which appeals to the feelings of every beholder. An old man is reading from the Bible to a fine little boy, who anxiously asks if the dog he is carousing will go to heaven. The head and figure of the old man are finely rendered, and the innocent, earnest expression of the child is touching. The flesh-tints are warm and natural; but the background is a little too brown. No. 430, "The Murre of the Shell," where three children, amusing themselves on the sands, have discovered the mysterious tale of its shod told by a shell, shows a happy sympathy with and knowledge of the ways of children; and the same characteristics are exhibited in this artist's other three works, which are illustrative of childhood's sports. Mr. Keely Halswell is undoubtedly clever, but he is very erratic; his style is perpetually varying from year to year, and this year the transition is great as regards colour in his seaside studies of fisher-lasses, Nos. 288 and 438, which are rich, but subdued in tone, and remind us of the works of Hook. No. 863, "The Bargomaster," looks as if it came from quite a different hand, and emulates Petty in the production of broken colour and forcible modelling. No. 506, "Hawthornden, 1618.—Bon Jonson's Visit to the Poet Drummond," by James Drummond. The two poets have been strolling through the woods, when Drummond betrays himself of reading one of his poems to his visitor, who listlessly seats himself on the ground with his back against a tree, to be bored. The conception is poor, the execution indifferent, and the colour raw and crude. Mr. Drummond deserves credit as a steady adherent to historic art, and we presume it is for this reason that he is so liberally patronized by the Association, who have purchased this work at a considerable price, while there are many others of far greater merit on the walls which could have been had at smaller cost.

No. 396, "The Eve of the Deluge," by W. B. Scott, is a work that displays much thought and originality of conception. Seated on the roof of his house, under an awning, is one of the great antediluvians amidst his wives and attendants. Noah and his family are entering the ark, and some of those on the house-top are deriding them. The last sunset of the old world illumines the scene, and a square heavy portentous cloud is heaving up in the horizon, and this is only noticed by one of the attendants, who is wildly pointing to it. The principal group is characterized by an air of luxurious languor, and the semi-barbarous Oriental feeling is well sustained throughout.

No. 330, "The Grandmother's Crown," A. Tideman, represents a scene from Swedish life, in which an old woman is exhibiting to her grandchildren the marital crown in her possession, which she has taken from a chest, on the inside of the lid of which is pasted a print of a battle-piece and a portrait, leading to the conclusion that her husband had been a soldier engaged in active service. The technical qualities of this work are excellent, both as regards expression, drawing, and colour. Indeed, some of our artists might draw the lesson from it, that it is not requisite to harmony that the background in an interior should be devoid of lively colour, in order to give due importance to the figures, as seems to be the prevalent idea.

343, "Leonardo da Vinci at the Court of Ludovico Sforza, Duke of Milan," by Annibali Gatti, Professor of Painting, Florence, is a large picture with numerous figures, chiefly remarkable for the effect of light produced by two mandaloras; the higher and more important qualities of expression and colour are deficient to an extent that is not compensated for by mere tricks of light and shade, although these strike one at first sight as wonderful.

391, "Loch Marce, Ross-shire," Horatio MacCulloch. The scene is a fine one, embracing a great extent of hill and valley, with the lake gleaming in the middle distance. Similar to this, and yet very different, is No. 413, "Ardlui Lochmond," by Sir George Harvey, P.R.S.A. Mr. MacCulloch produces his effects by bold and strongly-defined lines of light and shade,—the president by broad generalising and softening of detail. The similarity lies in the prevailing hue of brown which predominates in both pictures.

264, "Drugged," George Hay. A courier has been dragged by his ostentatious, who is

eagerly perusing the despatches; the courier has fallen on his back on the floor, and upset a flagon of wine on the table. Through the open door is seen the alarmed figure of a butler, or other servant of the house. This figure, we think, would have been better absent, as it tends to distract attention from the main interest of the scene, and is not necessary to the understanding of the incident. The drawing is spirited, but the colour is somewhat weakly and sickly.

570, "Mountain Silence," John MacWhirter, reminds us of Mr. Peter Graham's picture of a blasted pine forest exhibited three years ago, in the general impression it produces on the beholder. Mr. Graham's picture was the product of his imagination; Mr. MacWhirter's is the realization of a scene from nature—Loch Corruisk, Skye. The gloom and silence of the lonely spot are ably rendered; the deep and aullen-looking lake lies surrounded by precipitous mountains, and the rays of sunlight are striving to pierce the overhanging mist and touching the sharp crags with spots of light.

612, "Young Girl of the Environs of Trieste," F. Portaels, from the collection of the King of the Belgians, is a work remarkable for beauty and softness of colour. The figure is arrayed in white, with red "facings" (the military expression conveys the meaning perfectly), and she is seated against a white marble wall; the prevailing colour, therefore, is quite relieved by small patches of red. A large bunch of blueish flowers stuck in the bosom of her dress forms a centre to the composition. The eyes are dovetailed in their upturned devotional expression, and the flesh tints delicate and warm.

ARCHÆOLOGIC ITEMS FROM ROME.

In the prosecution of the diggings in Trastevere, the buildings of the station for the 7th Cohort of Vigiles have been more extensively brought to light; and we are glad to hear that the Government has afforded pecuniary assistance to the parties who undertook those works, in order to provide means, which (it is said) were wanting, for their continuance.

Under the Republic, a special magistracy and a "Nocturnal Trimvirate," were charged with the duty of protecting Rome from the dangers of fires; the *Ædiles* being also responsible, and certain public servants stationed at the several gates to be ready with their implements wherever flames might break out in the streets. To systematize this body of firemen on better arrangement, Augustus created the seven cohorts of Vigiles, each of which had superintendence over two of the city's fourteen regions, and which were originally formed by *liberti*, perhaps emancipated expressly for enlisting, under tribunes, centurions, and a prefect; these cohorts being in their respective regions; an anecdote *appropos* of which practice is given by Seneca (Ep. 66). The prefect had jurisdiction over cases of simple theft, and such offences as the receipt of stolen goods; also over house-porters, and those runaway slaves who had taken the occasion of fires for flight, and whom he was bound, according to his ability, to restore to their masters; he had also to admonish householders to be careful against accidents from fire, and to keep water provided on every floor of their houses. By the time of Antoninus Caracalla, this fire-brigade had so far risen in respectability, that free citizens used to enrol themselves; and after the fall of the Western Empire, the force was still kept in existence, with its former duties, but now under the designation, *Muticarii*. Their several quarters are mentioned by the Regionaries, from whom we know the fact that one stood in the Transtiberine district; and the remains of their barracks, found in other parts of the city, were long since identified, in some instances proving rich centres of antiquarian curiosities. On the Coelian-hill was found, long since, among such ruins, the basement for a statue of Caracalla, with the inscribed names of no fewer than 1,000 soldiers of the Vigiles, one with the title "Balnearior," a proof that the bath was among luxuries allowed to those troops in their quarters. Among those ruins on the Coelian were traceable four great towns at the angles of a quadrate area, and in the midst a temple, with octagonal cellars and circular portico, presenting a perspective of porphyry columns,—splendours, however, no longer known to us in any extant remnant on the spot, but solely through the

description by Ennio Visconti, who tells of what he had seen as just discovered.

The works that have led to the discovery of the missing quarters in Trastevere were suggested to the two proprietors who undertook them, by their observations of a building in a wretched little court near the Church of S. Crisogono, supposed to be some classic antique, but now proved to be a Medieval remnant of some fortified mansion in brickwork,—perhaps belonging to the Anguillara family, one of whose gloomy brick towers, still called by their name, stands on the Tiber shore, not far from this spot. Hitherto, the most valuable details brought to light are the mosaic pavement of an ample area, apparently unroofed, overlooked on one side by a lofty structure in brick, of good, though not the best, antique character, with those constructive arches of large tiles, seen more or less conspicuous in all ancient Roman buildings of such material; this mosaic, in black and white, representing, on a large scale, figures of marine monsters and dragons, swimming in water, whose waves are indicated by horizontal black lines. In this open court stands, but not centrally, a hexagonal fountain with concave sides, its parapet-walls of the concrete known as *opus signinum*, quite unornamented, but showing that here also was the bath, an admitted enjoyment of the Transtiberine Fire Brigade. Along the walls of the brick front extends a wainscot of stucco painted deep red, 1½ metre high, covered with graffiti, or rude scratches, the amusement of the soldiers' leisure hours, but the purport of which, where coherent sentences are legible, is so curious that we may consider this series of scribbles in a barrack-court the best part of the treasure-trove hitherto secured on this site. They are in round letters, not Italics; some in Greek; and have served to enrich the language of epigraphy with a new term, yet unknown, *sebaciarium-sebaciaris*, i.e., tallow illuminations, such being recorded in most of the inscriptions here, in honour of the decennial or vicennial *vota* renewed in the tenth and twentieth years of reigning emperors, or to celebrate the creation of some "Cæsar," as adopted to the rank of heir presumptive by those who ruled the Roman world. Several are enclosed within a rough sort of cornice provided with triangular *ansæ*, or handles; and we transcribe one of the best written as follows:—*L. Passenius Rogatus Sebaciaris fecit Mense Junio Feliciter; on the ansæ, Fausto ut votis X—votis XX; i.e., "May the vicennial be as auspicious as the decennial vows."* But the most interesting for connexion with the moral facts of history is another, in the first line of which, after "Imp.," we see the mark where a name has been erased, by scraping the surface, followed by another, "Alexander;" and in which example we have record of the abhorrence entertained for the memory of Heliogabalus, after whose murder, we are told, all his effigies and all public epigraphs bearing his name were ordered by the senate to be destroyed. This graffiti tells of the illumination in honour of his virtuous cousin, Alexander, when raised to the rank of Cæsar, A.D. 221; and curious, indeed, is this instance of strict compliance, even in the barrack-room, with the legally-enjoined reprobation of that infamous Syrian emperor. On one wall of a chamber, for the greater part choked up with soil and *debris*, entered from this mosaic-paved area, are some remains of decorative paintings, now dimly seen by taper-light. Several fragments of painted stucco and wrought marble have been found, and among these some curious terra cotta vessels, shaped into grotesque little figures with large heads and hulging bodies, conjectured to be Penates, for the private devotions of the soldiery. The *signa*, or masons' marks, on tiles extracted, as usual in Rome, from among these ruins, are of the time of Hadrian. It may be doubted, however, whether such art-works as have yet come to light here can pertain to so good a period in artistic story.

In the formation of a road to the central railway station that runs along the valley between the Quirinal and Viminal Hills, have been opened, or rendered accessible, several small irregular chambers of brick-work in an extent of ruins along the Viminal slopes, supposed by Roman antiquaries to be the baths founded by the Empress Agrippina for her own sex. A few remnants of ornamental painting and stucco reliefs, on some of their walls, might faintly remind of Pompeii; and portions of mosaic pavement, in simple patterns, are also noticeable,—particularly one that covers a rather large

quadrangular area in a sort of kaleidoscope medley of coloured marbles on white ground-work, without any attempt at design. The works on the Palatine, ordered by Government, have been suspended, but to be resumed, and (we understand) about the present time. Those at Ostia, also carried on by Roman authorities, were recommenced, after long suspense, about, or soon after, the beginning of the year.

TUTBURY CASTLE.

THE high broken ground of Needwood Forest, contained between the Trent and the Dove, is brought to a termination eastward by the union of those streams upon the confines of the three shires of Derby, Stafford, and Leicester. About five miles above this confluence, upon the right or Staffordshire bank of the Dove, stand the town and castle of Tutbury, once, according to Leland, a residence of the Saxon lords of Mercia, and named, it is said, from the god Thoth, who presides over Tuesday, and is thought to have been worshipped in the inclosure of the castle. The etymology is supported by Wednesday; but however this may be, Tutbury was certainly an ancient stronghold, and possesses in that respect unusual natural advantages.

The castle crowns the head or northern termination of a considerable ridge of new red sandstone rock, which projects from the high ground of Hanbury and Needwood, and forms an abrupt promontory above the broad level meadows of the Dove. On the south or landward side the hill is partially severed from its parent ridge by a cross valley, within and about which is built the ancient town of Tutbury, celebrated from the days of John of Gaunt until the end of the last century for its attachment to the barbarous sport of bull-running.

The natural position of the castle is strong and well defined, and has been turned to account from a very remote period, and materially strengthened by Norman and pre-Norman art.

Upon its west, south, and eastern sides the head of the ridge has been further protected by a broad and deep ditch, which thus covers about two-thirds of its circumference. Towards the north, where the hill projects upon the meadows, the ditch ceases, and this front, rising steeply about 100 ft., has been rendered steeper by art, and is further protected by a wide expanse of wet land, traversed by a very ancient and broad mill-leat, and by the sinuous channel of the Dove.

Upon the east and north-east fronts, where the area of the promontory was inconveniently large, two extensive semicircular spaces have been left outside the ditch. They are, in fact, out-works upon a large scale, useful for pasturing cattle in turbulent times, somewhat lower than, and commanded by, the main works; covering the ditch, and scarped though not revetted towards the field. They are separated by a deep ravine, up which the main approach to the castle ascended from the north-east, the direction of the Dove bridge, and probably of an earlier ford. On this, the east front, the contents of the ditch have been thrown inwards, crowning the scarp by an artificial bank about 15 ft. or 20 ft. in height.

Upon the south-west and west side the earth has been employed to form a large mound, about 40 ft. high, and 70 ft. across at its truncated summit, and which renders this front almost impregnable.

The space between the east bank and the west mound, forming the south front, is occupied by the castle buildings, which, built upon the natural soil, crown the scarp of the ditch, and overlook the town.

Opposite, also from the bank to the mound, is the north front, almost precipitous, and defended, therefore, by neither ditch nor bank. The space thus enclosed forms the base court of the castle, and covers about three acres. It is in plan an irregular circle.

The best view of these magnificent earthworks is from the summit of the mound, which not only predominates over the court of the castle, to its east, but westward rises very steeply about 140 ft. from the meadows. The counterscarp of the ditch is here seen to terminate on the north-west, at the base of the mound in a sharply defined falconiform ridge.

The masonry which has been added to these earlier defences is composed of a group of buildings on the south front, flanked by curtains which run, on the one hand, westward towards

the mound, and, on the other, eastward, along the top of the bank by which that face is defended. This curtain is 6 ft. thick at the top of its plinth, about 6 ft. from the ground, to which level it is now reduced. There is evidence that it was about 20 ft. high, with a rampart accessible from its flanking towers, and by a double flight of open steps from within. At one point is the vault of a large *garde-robe*, marked in the "Vetusta" drawing by a bartizan turret. This east curtain is broken by a lofty rectangular mural tower, of which the interior wall with a square angle-turret only remains, and which faced the turn of the road up to the castle, on the opposite side of the ditch. The tower has been removed here, so that the lower is built upon the original soil, and its basement entered from the court on a level. This tower is Perpendicular in style, and has evidently been blown up by gunpowder.

At the north end of this curtain, at the north-east corner of the court, is the great gatehouse, a rectangular building pierced by a portal, and with lateral lodges. Above were other chambers of more pretensions and larger size. This gatehouse is almost all outside the wall. Its south face makes the ditch, and has a small projecting balcony at the first-floor level, communicating by a shaft with the basement lodge. Its north face looks towards the Dove; only its south and east walls remain. It had no flanking towers, the wall on one side of the gate being pierced by a loop. To it has been added, outside, flanking the gate, and blocking up the loop, two thick solid cheeks of wall, from the front of which the drawbridge fell, across the moat. The gatehouse seems to be of early Perpendicular date, but its window recesses have half-round heads, and a window above the portal has something like Decorated tracery still remaining, and rudely indicated in the "Vetusta" drawing. The portal has a flat segmental arch, and outside this is a low drop arch, part of the additions. The details of the drawbridge, to judge from the holes cut in the stone, were peculiar. Two porticulis grooves remain.

The masonry of the drawbridge has been removed, and the ditch here solidly filled up with earth. The road from below, to reach this gate, is continued for some way along the crest of the ditch, within reach of the walls. Lower down it is commanded by the two demilunes.

From the gatehouse westward the edge of the steep north front was crested by a curtain-wall, probably low and light, of which there are slight traces.

Upon the summit of the mound is a ruined round tower, evidently an erection of very modern times, probably as a summer-house, or an object in a view. There is said to have been an earlier building here, destroyed before the reign of Elizabeth, probably by John of Gaunt, and likely to have been a polygonal shell of masonry. It was called Julius Tower, a not uncommon name for such structures.

The castle buildings have been broken down, but what remains is as sharp and fresh as though lately executed. The outer wall and altered windows remain of the great hall, 61 ft. long by 29 ft. broad, and a group of state apartments at the east end. Here are two very fine crypts, no doubt cellars, entered from the court by handsome doorways and six or eight descending steps. They have been covered with harrel vaults, ribbed transversely and diagonally, with large carved bosses—fitting receptacles for the very best of drinks. Above these are handsome rooms, with flush flat-topped chimney-places, with mouldings set with flowers and the "hart lodged," and what may be a conventional pomegranate. These buildings are in the best and purest Perpendicular style, and the profiles and details of the mouldings are admirably suited to that fine but sometimes rather friable material, the new red sandstone, here of very superior quality.

In the court is a deep well, still in use. At the west end of the great hall is a brick building, probably the work of some Crown steward or lessee, about the time of Queen Anne or George I.

So far as can be observed, the castle exhibits no trace of Norman masonry. All the structures, walls, tower, gatehouse, hall, and apartments are nearly or quite of one date, and are probably the work of John of Gaunt, who resided here very frequently, and in regal state. This is very remarkable, because Tutbury is mentioned in Domesday, was the capt of a very important Norman honour, and the principal seat of the great Norman family of Ferrars,

earls of Derby, from the Conquest to their ruin towards the close of the reign of Henry III., since which time it has been, for the most part, in the Duchy of Lancaster.

Shaw, in his "History of Staffordshire," gives two most exaggerated drawings of this castle. Another, on a larger scale, a view from the east side, taken in the reign of Elizabeth, is engraved in the "Vetusta Monumenta," vol. i., pl. 39. This, amidst much absurd perspective, shows the gatehouse and east tower, what may be a chapel east window in the state apartments, and a round tower at the east foot of and built into the mound, besides a west curtain with three mural towers upon it.

Tutbury was held for the king, and taken by the Parliament in the wars of Charles I., and subsequently, by order of the House, reduced very nearly to the condition in which it is now seen.

It may be mentioned that an addition to both the defences and the resources of the castle has been provided in the last, in part only, an artificial channel, known as the Fleam, which leaves the Dove about a mile above the castle, is led beneath its walls, where it still works a large and very powerful mill, and finally returns to the river some way down, after a parallel course of about three miles.

Although the temporal evidence of the splendour of the house of Ferrars has disappeared, the memory, as usual, of their ecclesiastical beneficence has been preserved. The parish church of St. Mary, once the church of the Ferrars Abbey of Tutbury, still stands a stone's throw from the castle wall, and seems anciently to have been included within the outer defences. It was founded by Henry de Ferrars, in the reign of Rufus, and has a Norman nave, clerestory, and aisles; and its west end is one of the most perfect and richest Norman fronts in existence. This structure, which had been much misused, has happily fallen under the judicious care of Mr. Street, who is now engaged in scraping and restoring the Norman parts, and in the addition of a large polygonal apse or east end to the chancel. This is probably the chapel of St. Mary within the castle, in which (18 Ed. I.), Edmund Earl of Lancaster founded a special mass.

Mary Queen of Scots was imprisoned in Tutbury Castle, under the care of George Earl of Shrewsbury, then constable. C.

PROPOSED MANCHESTER TOWNHALL COMPETITION.

THE town council have issued the Instructions to architects intending to compete. As we have already intimated, from the designs sent in, not fewer than six nor more than twelve will be selected by the council, and the architects furnishing the designs so selected will be invited to send in finished and complete drawings in competition for the new townhall, upon the understanding that the author of the design eventually selected shall (subject to satisfactory arrangements being made) be employed as the architect of the building, and he paid the usual professional remuneration on the outlay. To each of the other competitors who may be so invited, and who may send in finished and complete drawings in the second competition, the sum of 300l. will be paid by the corporation. The council reserve to themselves the right to exhibit the whole of the designs for one month, either before or after adjudication, as they may see fit. Each competitor is to state the cubical contents of his proposed building, and to give an approximate estimate of the cost, based upon such measurement, it being understood that the such measurement, it being understood that the elevation to Lloyd-street is to be of a similar character to the elevation to Prince-street, and that the external walls are to be in ashlar stone from Yorkshire or Darley Dale, and the backing and internal walls of brick. It is probable that in the first selection of designs the council may seek professional aid; but, whilst reserving in their own hands the ultimate decision, the council wish it to be understood that it is their intention to seek professional aid and advice in the final selection of the best design, as it is the wish of the corporation to secure in the present important competition, so far as may be practicable, the full confidence of all competing architects. In the preliminary competition, the letter addressed to the mayor, together with the drawings, must be delivered at the townhall, Manchester, on or before the 1st day of July next.

ART, MODERN AND ANCIENT.

At the annual meeting of the Hanley School of Art, held last week, when several interesting speeches were made, Viscount Sandon, who presided, spoke of the value of the study of art as attaching men to their homes. The great foundation of society, he said, was the home feeling, and that being the case it was impossible for a right-minded man to see without regret the state of many of the dwellings of our town populations. It was almost wonderful that the love of home had not died out in the hearts of many, when they saw the wretched places to which large numbers of the artisan class were compelled to betake themselves when the toil of the day was over. He hoped that in the minds of the fathers and mothers of the future a higher taste was being developed, with a love for the pleasant picture, the graceful piece of furniture, and the elegant chimney-ornament; and that by the habit of self-denial from indulgence of the lower propensities of our nature, many things which might be almost called luxuries would come to be more generally possessed than at present. On this ground he felt that he was not doing a foolish thing in urging upon an audience composed in a considerable part of working people the cultivation of a love of the tasteful and the beautiful. Nor should it be supposed that the matter of female dress was a trifling one, for when a man got a more artistic eye he became more sensitive on this point, and it was a source of delight to a working man to see his wife prettily and neatly dressed. . . . One of the great principles to be borne in mind was that every article should be designed with special regard to its fitness for the use to which it was intended it should be put. To be very homely in his illustrations, a cup which upset the tea, a handle which it was awkward to hold, a spoon which poured badly, a plate from the rim of which the condiments ran into the gravy, were badly contrived articles; and, however richly they might be painted with birds, flowers, and butterflies, were mistakes and failures. Let a thing be first designed with true regard to fitness, and then decorated with refinement, and it was a good work; but to try to be fine before being useful, and to cover radical defects of design by gilding and painting them, were blunders. It had often been objected to the decorators of English porcelain that they were servile copyists of nature. There was no doubt they did copy natural objects admirably, but he was not quite sure whether this was the highest form of ceramic art. He was inclined to think that, in studying nature, the best course to take was not to imitate her servilely, but to see in a general way how she banded things,—to see how she combined beautiful colours, how she weaved geometrical forms in the boughs of trees, what beautiful lines she traced in the interior of pebbles, and in what a wonderful manner she harmonized the charms of landscape. The object of the decorator should be, not to copy line by line, but to throw into natural forms something of the human mind, something of man's creative spirit,—a course which would be found to be quite consistent with an observance of the harmonies of form and colour to be met with in nature. As a Staffordshire man he felt proud of the progress which had already been made in the special industry of the potteries, and was much gratified to hear that its productions were in increasing demand in foreign countries. Taking England as a whole, it was impossible not to feel that, during the last twenty years, the decorative arts had made substantial progress. Every house and every cottage bore evidences of the fact. The whole of the outside life of the people had become much more beautiful and graceful; for, while they could not be blind to the existence of much wretchedness in both town and country, it was impossible not to see that substantial progress had been made in the comforts and graces of life. That was surely a cause for rejoicing, and they might reasonably hope that the course of progress would continue. But when they imagined, as they sometimes did, that there never had been such a time in the history of the world as this nineteenth century,—that the conquests which in it had been made over the forces of nature, and the beauty of the works which it had accomplished had never been surpassed, it was well they should cast their eyes backwards and see what had been done in the far-off centuries of the world's life. Let them consider whether they could surpass the beautiful colours to be met with in Oriental porcelain made

hundreds of years ago, and preserved in some of our museums, and the result would be, that they would probably be less inclined than formerly to indulge in self-congratulation. He would ask them to accompany him in imagination to the tombs of Thebes, on the banks of the Nile, which he visited some five years ago. After descending for some time they came upon a series of chambers cut in the solid rock, and these they were enabled to examine by the light of torches. On the walls of one of these chambers they saw depicted in bright colours, laid on probably before the time of Joseph, but preserved to this day by the dryness of the atmosphere, the furniture of the period, with its carved arms, ornamental legs, and rich cushions and tassels. In these the puffed life of the Egyptians was portrayed even as in a similar manner the polished life of to-day may be illustrated. On the walls of another chamber the culinary utensils of the Egyptians were painted; on the walls of the third the arms of the period; and on those of a fourth the gardening of the period; and in all these cases it was impossible to help feeling that the life led by the Egyptians very closely resembled that led by Europeans of the nineteenth century. Egypt was evidently, in her way, pretty nearly as civilized as modern Europe, and the impression was confirmed by a visit to the museum at Cairo, in which was preserved a large and unique collection of jewelry which had formerly decorated the embalmed bodies of the dead. All these beautiful objects were fashioned long before Greece and Rome began their tale, and the same might be said of the beautiful sculptures of Assyria, in which the richness of the robes rivalled those worn by the nations of modern Europe. The same remarks would apply to the discoveries made at Pompeii; and all these facts together seemed to warn them against being over-proud of the advances which had been made in art and civilization by the present generation. Other men had worked, and the moderns had entered into their labours. They would find by diligent inquiry that, as far as art was concerned, mankind had in these latter ages invented little that was new, but had very often contented themselves with appropriating and adapting the ideas of bygone centuries, on which account he thought they should hold in reverence those illustrious ones who had preceded them, and to whom they were indebted for many of the beautiful forms and devices which now decorated their homes.

NEW NATIONAL GALLERY DESIGNS.

The following is the Report of the Judges appointed to consider the designs for a new National Gallery. It is addressed to the First Commissioner of Works and Public Buildings:—

"My Lord,—We have the honour, in accordance with the instructions conveyed in your Lordship's letter of the 17th ult., to submit the following Report on several designs for the National Gallery sent in by the competing architects.

Our first step was to obtain clear and definite instructions as to our duties, and we subsequently inquired whether, in the event of our considering it unadvisable to recommend any one of the competing designs for execution, it was expected we should specify which of the designs appeared to exhibit the greatest amount of comparative merit.

Our next object in examining these designs was to ascertain whether the competitors had in every respect complied with the instructions of the Office of Works conveyed to them in the circular dated the 15th of February, 1866; and with this view we obtained, through your Lordship, the valuable assistance of Mr. W. J. Gardiner, from whose report it appears, with one or two exceptions of minor detail, the instructions have been strictly adhered to.

We have minutely examined the several designs prepared under the two alternatives proposed in the circular above referred to, keeping carefully in view the relative importance of interior arrangement and architectural elevation; but while we readily acknowledge the architectural skill shown by the competitors, and the merit of the requirements in which many of the difficulties of these designs may be said to have been met, we are bound to say, after full and mature deliberation, that we are not prepared to recommend any one individual design for adoption by your Lordship.

We much regret that we are compelled to arrive at this conclusion, which, we may observe, is one to which we have unanimously assented.

At the same time we think it due to the competitors to state the design for a new gallery by Mr. Edward Barry, and to that for the adaptation of the existing gallery by Mr. Murray, as exhibiting the greatest amount of architectural merit.

Having thus far performed the duty assigned to us by your Lordship, we venture to submit for your consideration the following suggestions on the principles which ought to govern the building of a new National Gallery,— suggestions which we believe to be in accordance with the spirit, if not the letter, of our instructions.

We are of opinion that in the construction of a National Gallery the principle of simple and unobstructed light should be carefully observed. This, we believe, will be

most effectually done by lighting the principal galleries from the top, and by so regulating the space for the admission of light that it shall in no case be less than one-half of the superficies of the floor.

The height of these galleries to the ceiling light should, in our opinion, be equal to their width; and, as regards their length, long galleries without divisions appear to us to be inconvenient to visitors, and ill-adapted to a proper classification of the pictures exhibited.

We consider at the same time, that a National Gallery should contain one or more galleries of the width laid down in the instructions to the competitors, while other galleries might be constructed with a width of 30 ft. or 30 ft., which dimensions would be well suited for the exhibition of smaller pictures.

In these arrangements especial care should be taken that the higher galleries do not obstruct the light of the lower ones, and that the entrances should, if possible, be at the ends rather than at the sides of the galleries.

On the question of warming and ventilation, the appliances should be so contrived as to give out the heat in the centre of the room.

Bearing in mind the arrangements required for the upper galleries, we consider it a matter of great importance that such access should be provided as will admit of the lower rooms being lighted from both sides, so as to fit them for the exhibition of the Turner collection and other paintings.

The levels of the principal gallery floors should be so constructed as to admit of easy access by visitors. We would further observe that it is not, in our opinion, necessary or profitable to add to the difficulties involved in the requirements of a national picture gallery by appropriating large spaces to the exhibition of sculpture.

These suggestions are submitted for your Lordship's consideration in the reference to the arrangements.

As regards the exterior, the light conveyed through the glass roofs should be as far as possible unobstructed by towers, castles, domes, towers, &c. Any breaks, therefore, which may be introduced into the skyline should be subordinate to this practical consideration.

Provision should be made for the shelter of visitors entering or quitting the galleries, so as to give ready covered access to their baggage.

We have ventured to tender to your Lordship these suggestions as *desiderata* in the erection of a gallery suitable for the reception of the national pictures. We are, at the same time, aware that they must be subject to local considerations, to the space placed at the disposal of the architect, and also to the architectural effect required in a public building of the kind under consideration.

We do not wish it to be inferred from the above suggestions that the requirements have been generally lost sight of by the competitors. We have already acknowledged not only the talent evinced in dealing with the question of architectural effect, but also the ingenuity and professional skill which have been brought to bear upon the difficulties of the task assigned to them.

Having, however, come to the conclusion already communicated to your Lordship, we should have failed in our duty as a Committee of advice had we not expressed our opinion upon the general principles which should be observed in the construction of a National Gallery, and we are led to believe from the result of our investigations that such principles may be generally adopted, and be found not altogether inconsistent with those architectural effects which should characterise a building of such national importance.

With this view we beg to submit the above report to your Lordship's consideration.

Hardinge,	Richard Redgrave.
Elcho,	William Russell.
A. J. B. Beresford Hope,	T. Gambier Parry.
W. Foxall,	William Pitt.
David Brandon,	
London, Feb. 23."	

We have received a communication from Messrs. Banks & Barry protesting against the report of the judges in this matter, and urging that the "principles" laid down in the Report are exactly the "principles" on which they have framed their design. They say, in conclusion:—

"We see from the reply of Lord John Manners last night to Mr. Goldschmidt, that the judges having given so indicative a report, her Majesty's Government feel that the decision is, after all, permitted to them. We trust that that decision may be to remove entirely the present building, as the careful study which we, as competitors, have given to the subject has convinced us that any attempt to utilize the present building would be financially no less than artistically a failure, and any attempt to govern the design of a new gallery by the lines and levels of the present building would only too probably result in making such new building as unuseful as the present one is, on all hands, acknowledged to be."

THE ROYAL GOLD MEDAL FOR ARCHITECTURE.

The council of the Institute having been requested to take into consideration the rules as to the mode in which the gold medal shall be hereafter awarded, have reported that:—

"They are of opinion that, in the first place, all due regard should be paid to the intention with which the medal was originally bestowed by her Majesty; and next, to applying by its means the greatest possible stimulus to the progress of the art of architecture. These considerations seem to indicate the propriety of conferring the honour somewhat more liberally than heretofore, both on English and on foreign artists, or men of science, as well as on others, not being professional architects, who may be deemed worthy to receive the medal, as an analysis of the list of laureates shows that the tendency of the award has hitherto been to retain the medal somewhat too exclusively within the ranks of the profession. Of nineteen recipients, twelve have been English and five foreign professional architects; while only one English and one foreign architect (neither of them being a professional architect) have been honoured with the royal medal.

With respect to the rules, or practice, in accordance

with which the recommendation should be made, no other change is advised than the following, in regard to the order. It appears to the council that the rule most consistent with the principles just recognised would be to equalize the number of the English and of the foreign recipients, both professional and non-professional. The practical working of this arrangement would be, that once in four years honour would be paid,—

- 1stly—To an English architect;
2ndly—To a foreign architect;
3rdly—To an Englishman not a professional architect;
and 4thly—To a foreigner not a professional architect.

The council accordingly consider that the last two awards having been in favour of English architects, and the one preceding of a French architect the person to be designated by them for the honour this year should be a foreigner "not being a professional architect." The order of rotation would subsequently be,—

- 1868—An English architect;
1869—A foreign architect;
1870—An Englishman not being a professional architect;
1871—A foreigner not being a professional architect:—

the order being repeated so long as her Majesty may be pleased to continue her bestowal of the medal.

They have since recommended that, subject to her Majesty's gracious sanction, the royal gold medal for 1866 be awarded to M. Charles Texier, of Paris.

Sir,—I earnestly hope that the rules hitherto acted upon in the disposal of this medal will now and henceforth be abandoned. Hitherto the medal has been a sort of honorary diploma, considered as a thing belonging strictly to the Institute, to be handed round to its members in rotation; and many, no doubt, there are, though mere art-factors, who expect the medal to come to them as a sort of right, because they are Fellows of the Institute. Many men who have worked in furtherance of art,—Britton, Pugin, Parker, and another worker for years, for the benefit of art, as well as in the profession, whom you would probably not let get name in your pages,—men who have done good service, have received no recognition from the Institute. I hold it as a great disgrace to those who had the disposal of the medal that the two first-named men should have passed away without receiving the medal. They were, in my opinion, far more worthy than any who have obtained it. This, like other honours, will shine brightest by reflected lustre. The deeds of the men who receive it are what chiefly makes the honour honorable. And what have some of the recipients of this medal done? Several, in point of talent, are not one hit above the general run of practitioners. In looking over the names of past recipients two noticeable things strike me,—that, out of nineteen only one man, Viollet-le-Duc, can be strictly termed *Gothic*. Yet surely this is the style in which we have made greatest advance, and of which we have most reason to be proud. And only one English author is among them. The next men who ought to have the medal are the two I have indicated. For more than a quarter of a century have these men laboured ardently and unflinchingly as art-teachers, and to them architects owe a deep debt of gratitude. It may be necessary to say that personally I am a stranger to both of them.

P. E. MASEY.

ARTISTIC FURNITURE.

FOREMOST amongst the articles of furniture that have been prepared for the fast approaching Paris Exhibition, we must name those now completed by Messrs. Jackson & Graham, who, bent on maintaining the position they have long held in these tourneys of skill, have evidently applied themselves to the work, determined to come off victors. They send nine pieces in all, and these include an upright case of ebony inlaid with ivory, for works of art (part of the fittings of a room for Mr. A. Morrison, of Fonthill House), a charming little *dagère* (the capitals capitally carved), and a table of amboyna wood inlaid with other woods, and forming a lovely piece of colour. In the ornamentation of the upright case, the hand-writing of Mr. Owen Jones is obvious. Panels at the bottom, below the glass doors, are filled in with his conventional foliage, in ivory, around the initials of the owner A. M. Entwined.

The *capo d'opera*, however, is a cabinet in three divisions laterally, in the style of Italian works of the sixteenth century. This, like some of the other furniture mentioned, is of ebony inlaid with ivory, and includes a few plaques of jasper and lapis lazuli. The ornamentation is of the most elaborate kind, drawn, as well the griffins and human heads as the foliage, with great spirit, expression, and beauty.

The excellence of the inlaying, of the engraving on the ivory, and of the carving, is remarkable. Such metal work as there is, too, is admirable; and we are much disposed to consider the cabinet as a whole the finest modern work of its kind that has been executed in England. The entire credit of the design and drawing is given by the manufacturers to Mr. Lormier, who has been long connected with their establishment. The worth of the cabinet is understood to be 2,000*l.*, and it is satisfactory to know that it found a purchaser before it was finished.

THE PARIS EXHIBITION AND ART.

Now that the forthcoming Exhibition of all that the modern world can produce is taking up so large a part of public attention, I would ask you to allow me to say a few words about it, and on the *principles* on which it is based. A very few words will suffice; because when a great and leading principle of action is fairly at work, whether it is right or wrong, we see immediately by the results what its true value is, and whether or not it ought to be continued, and repeated, and persisted in. It must be borne in mind that this Paris Exhibition is the fourth great exhibition—the parents of so many other smaller ones all on the same principle of action and with the same aim.

All four exhibitions have had one common idea: they have divided themselves broadly into three divisions—*raw materials*, as grown or dug from the earth; *machinery* to mould these materials into useful forms; and *fine-art*, or art manufacture, to render these useful forms agreeable to the eye, and *mentally* useful; and the final idea of them, and, perhaps, the climax of the whole, the singling out and bringing into public notice, and in some way or other rewarding those who have personally brought about this last and final process—that of clothing the useful with the beautiful; in other words, the recognition of the work of the artist, and the artist himself. I say this has been the aim of these great Exhibitions, but it should rather be said it *ought to be* and *should have been* the aim of them. Unfortunately, however, for art and manufacture it has all resulted in almost the reverse of this true and legitimate aim: the artist has been completely lost sight of; the real producer of the work has been forgotten, and effectually hidden by the *shopman* or *seller*!

It is difficult to see how a greater iniquity and unfairness could or can be perpetrated, or one better adapted to crush out art action altogether. Indeed, has it not already accomplished its work? I will take, with your permission, sir, one single instance from the first of these Exhibitions, that of 1851; and a single case of art manufacture—that of the late Mr. Herbert Minton—and the china service manufactured by him for the Sultan of Turkey. Mr. Minton was, I consider, a fair and perfect type of our present race of art manufacturers; and as such, I think some of his opinions on art topics are worth recording: they will be found to bear, too, on the present vital subject. Minton often contended with me as a leading principle that it was now in the power of a country such as England is to enlighten and teach *artistically* every other country in the world, with the sole exception of France. He said, "with our vast *mechanical* means, and new *chemical* processes and new materials, and improved methods of going to work, there is something which I cannot understand, and which seems to me truly absurd in your *opinion* that we, with all at our command, have yet to learn of the barbarous Chinese." I quote this expressive sentence because it embodies that eminent manufacturer's opinions on art, and also because it is in reality the text of the Society of Arts and of these great Exhibitions. Minton did not, and could not, understand the old art action, nor the remains of it yet to be found in what are now called *barbarous* countries. I need not pause now to say what I urged in favour of that system; I will only mention the startling fact that Minton allowed, with great fairness, that in spite of all our immense advantages, all the means and skill of his factory could not produce a single square inch of common China ware,—I do not say equal to, but anything like, the specimen I showed him picked up for a few halfpence, and a mere piece of ordinary ware. Material, texture, colour, transparency, drawing, he fairly gave all up in succession. I mention these facts to show the position of the art manufacturer as an art judge of his own wares, and guide to those whom he employs, to bring them into existence.

Mr. Minton was an employer of art labour in all forms, but *he was nothing else*. He had no great taste of his own; he simply went with the world, and his trade instinct was so powerful as to completely nullify any real personal taste he doubtless naturally had. He was, of course, no draughtsman or painter himself. He was not a designer, nor was he a workman, nor could he, as is proved above, judge truly of the work of others. To use his own expressive language,—“I put it in the window, and the public advise me of the worth of it.” I say, therefore, distinctly that this fortunate employer of artistic labour, and out of which he made so large a

fortune and fame, was nothing whatever but a *shopman*: his artists and workmen, in cellar and garret, produced between them the art objects for sale, handing them to him, and he did nought but pass them to the customer, and take the money, to—drop into a till. Yet do we all know that for this very service, in the production of which *he took no part whatever*, Minton not only received the Council medal of the first Exhibition for “artistic merit” (the artists themselves never being thought of for a single moment), and the medals and honours of the Society of Arts, but he was made, as well, a member of the Royal Institute of British Architects!—a member of the Institute on a level with the highest; while the working architects, like Minton's artists, of whom I could say much, can find temporary home nowhere but in the basement of that Institute, cannot look upstairs, and are now haggling for books in a house full of nothing but books. Will the new Reform Bill alter this in any way—if not, what will be the good of it?

Sir, I name these curious things as facts, in the hope that some one will give them a few minutes' thought, and not at all to cloud Minton's memory. Some may, perhaps, be inclined to ask, why rake all this up, and what has it to do with the present business of the world, and the Paris Exhibition and art? I answer, because Mr. Minton is succeeded by others who are now running the same race he did, and will meet surely with the same rewards. 1867 is but a repetition of 1851. I, for one, though but one, protest against the way in which the art department of this Exhibition is being worked out, and against the broad and pernicious principle of exhibiting art objects under the names of those who have had nothing whatever *artistically* to do with their production, and who are themselves incapable of all work as artists or workmen, and who are hut sellers and advertisers. I think some one in authority, as the Institute, and who will be listened to, should publicly protest against such a system, and that the world should at least be made to know what the position of those are who figure in this year's show, and that the public should be made to understand that it is at the world's *shopmen* they are looking and admiring, and not at either its artists or its workmen.

One other phase among many of this great coming Exhibition. We are told that architecture is but very indifferently represented in it; that no adequate idea of the doings and capacity of British architects will be forthcoming. Why not? Indeed, in the absence of all that ought to be seen, a large section, 60 ft. high, of the 1862 Exhibition building will be visible, and will afford to the European public some sort of idea as to what English nineteenth-century architecture has culminated in. I say nothing against it. It seems to me to be fairly representative of modern British architecture! But it may just occur to some poor mortals why the real working element in modern architectural practice is not to be somewhere or other visible, say by the side of the working man's department. No common workman, it may be presumed, will venture to send anything,—if any workman exhibit at all,—that is not ready and as a matter of fact *his own work*, and not the performance of another man. If this be so, then this working-man's department will be the sole *true* spot in the whole building devoted to art. It may be rough, but it will be true. What a pity, therefore, it seems that the architectural assistants who supply these very workmen with their guiding drawings, and without which they could do nothing, should not have been encouraged,—may, called on,—to contribute to this world's architectural display. A capital of a column by an architect's assistant, and a capital carved by a workman, would show all that architecture is now made up of. Like a brick from the chimney, it would show what the house is made of. I do not see how art and architecture can sink lower than they are sunk.

One other 1867 marvel. Somebody once said there is nothing so great as greatness on a low level. It is quite certain that when imperialism condescends to notice and feel interested in common folk's affairs and wants, it is a very sublime spectacle. The Emperor himself is an exhibitor, and is to show to the world a model working-man's house, plans, sections, and elevations, and we may suppose perspective views. It is a very difficult subject indeed; everybody has failed to produce the right thing. His Imperial Majesty may succeed, and whip the world of cottage builders. But is it at all con-

coivable that Napoleon III. will actually take up a T square, and pencil, and compasses, and hang over a drawing-board, and puzzle his mind, and rack his body, over the mysteries of the arrangements of a labourer's cottage; calculate dimensions, and go into the question of materials, bricks, and timber, and plaster? Why, it seems nothing short of treason to hint at it even. What, then, is even majesty to do? for a cottage will not come together, though built on paper, without hands. We must depute it to somebody. The Minister of the Interior is said to have been consulted, and the Prefect of Paris, to whom we owe the New Paris, and the destruction of the Old. Will they try the square? The Imperial architect must be talked to, or the world would come to an end. Will he work? Who, then, will?—Why, his clerk? One cannot help almost pitying this unfortunate youth in his efforts to get at the proper dimensions of the working man's living-room, bed-rooms, how many are there to be,—any kitchen, and what good is a scullery, and how high are the rooms to be? And then, greatest of all, and deepest and highest of problems, what style of architecture,—English or French?—if Gothic, what phase of Gothic? One's head fairly aches. Unfortunate youth, when his Herculean labour is at last over, what is his next duty? Hand it to the master—from him to the prefect—thence to the minister—and finally into the hands of their Imperial Sovereign—to be exhibited to the astonished world. What next? Everybody is to be rewarded according to his deserts; and it is quite certain that his Imperial Majesty will be accorded by the Imperial Commission a ponderous medal, as big as a soap-plate, for this very cottage, thus brought into being. No one will doubt this, for such is present architectural practice. Has Napoleon considered this? Will he consider it? I hope he will, and that when the Imperial Prince hands this medal to the Emperor, he will in turn hand it at once to the above unhappy mortal who has been for weeks on the rack, body and soul, in trying to accommodate comfortably a working man and his family; and, simply, who has done all the work from first to last. There is nothing like Royal magnanimity, Shakespeare says. Surely the Emperor cannot retain that golden medal, in the face of Enrope, France, England, and facts! Again, then, what is architecture and art when emperors can find fame in one, so produced, and mere shopmen seize the other? Pray, sir, call public attention to it. C. B. ALLEN.

DWELLINGS FOR THE WORKING CLASSES IN IRELAND.

At a recent meeting of the Royal Institute of Architects of Ireland, Mr. Charles Geoghegan, architect, read a paper on the subject of dwellings for the working classes. In the course of it he gave particulars of some that had been built in Dublin.

"Each double house, having central staircase, affords four complete tenements, containing living-room, with bed recess, scullery, two bed-rooms, separate access being provided to all the rooms to admit of one or more being let off as may be required.

A yard or small garden having conveniences with ashpits provided for each block of building, the cost of each house being 320*l.*, or about 80*l.* each dwelling of three apartments and sculleries. They are all let at 4*s.* 6*d.* per week, the four returning 46*l.* 16*s.* per annum, from which sum deducting ground-rent, repairs, insurance, and all taxes, leaves 36*l.* 16*s.*, or 11½ per cent. on the capital invested. And when the employer himself becomes the landlord, the trouble, risk, or loss in collection of rents will not form an important item in the calculation. These buildings have all been executed within the past twelve months, of entirely new materials of proper quality, and present a cheerful and attractive exterior, available at all times for ordinary letting property or workmen's houses as may be found most remunerative, thus reducing the chance of failure in the speculation to a minimum.

The Industrial Tenements Company, Limited, for whom I have the honor of being architect, are at present actively engaged in erecting extensive and commodious dwellings for workmen on their property in Meath-street, the general plans being much similar to those already introduced to your notice, but having four stories in height in place of two, the ground being more

valuable in a crowded thoroughfare: thus enabling the company to obtain eight complete tenements under one roof instead of four, as shown on former plans. The whole building containing 124 rooms, for which, calculating a very moderate rental for each apartment separately, would yield a very fair return for the capital invested in the undertaking. Each staircase landing is here provided with under-shaft, water-pipes, and foul-water sinks discharging into drains. The lavatories, drying-room, ash-pits, and conveniences being situated in the extensive airing-grounds in the rear of the houses, common to all. The ground-floor facing Meath-street being let off for shops, which let well in connexion with tenement property in this locality.

A very able professional writer, when alluding to the necessity of providing homes for the London poor, recently declared that as yet they had not been able to erect suitable tenements for working men at less than 160*l.* each dwelling, 43*l.* per room being the average outlay on each room in Godden's-buildings, Bagnigge-wells, while our first attempt in Dublin has shown what can be effected at 80*l.* each dwelling of three apartments and sculleries; and for their suitability, comfort, extent, and appearance, a visit of inspection will amply satisfy the inquirer."

"In adopting concrete in place of masonry for the walls of workmen's houses, as has been most effectively done in Kent and in other parts of England, the advantage of economy, dryness, warmth, and solidity may at once be gained; and as this mode of construction may be executed by any ordinary labourer by the use of shifting frames of timber, the saving of skilled labour alone forms an important element in its favour: when concrete is used in trenches, or above-ground raised on a course of masonry above the influence of alternate wind and water, it will be found a most substantial and durable material for building.

In the south of France, building *en pisé*—a superior sort of mud wall, or rammed earth mixed with straw—is much used, and I have seen two stories frequently built in this manner in farm-houses and out-offices, although frequently the quoins are formed of roughly-squared stones or brick; and there is no reason why we should not resort to this mode of construction in this country for similar buildings. Walls thus made are perfectly dry, warm, and impervious to air and moisture; and, when the customary clauses of leases do not insist upon the use of brick or stone dwellings being erected, advantage may be taken of this simple and inexpensive means of providing comfortable homes at small rents."

Mr. Geoghegan commenced his paper with obliging reference to the efforts, early and continuously, made in the *Builder*, to obtain improvement in the dwellings occupied by the labouring classes, and traced to these the endeavours now being made in that direction throughout the United Kingdom.

THE WELSH CHAPEL, GROVE STREET, LIVERPOOL.

THE new chapel for Welsh Independents erected in Grove-street has been opened for divine service. The building is in the Byzantine style of architecture, adapted to the requirements of the present day and the mode of worship used by this denomination, the materials of the exterior being Yorkshire shuddies, with coloured bands and arches in other kinds of stone. The front has on the one side a campanile tower with heltry windows divided by stone shafts, forming a leading feature in the perspective of the street. On the other side of the gable finishing the roofs is the staircase with a row of narrow lights next its roof. The gable is filled in with a wheel-window, having round and coloured shafts in its tracery. Underneath this is the principal entrance doorway, having a round-headed, carved arch, and two polished red granite shafts on either side, with carved capitals. There are two gallery entrances also in the front, one being in the tower and the other in the staircase referred to. Internally the chief object is the large decorated rostrum or pulpit. The organ is decorated in colour with gilded ornaments; it was built by Mr. Rushworth, of this town. The rostrum is executed in pitch pine, varnished, and relieved with coloured panels. There is a gallery round three sides of

the chapel, having an ornamented wooden front relieved by red cloth: a number of iron columns with wrought-iron caps, decorated in colours, support the gallery. All the woodwork is lightly stained and varnished. The seats are all open, and of stained deal varnished. The extreme length of the chapel is 70 ft.; breadth, 48 ft.; and height from floor to ceiling, 32 ft.; and it affords sitting-room for 850 persons. Attached to the chapel is the residence of the keeper. There are also schoolrooms under the chapel. The total cost of the building and land is about 6000*l.*; the architect was Mr. C. O. Ellison, of Liverpool; and Mr. Evan Evans was the contractor.

THE SANITARY CONDITION OF LEEDS.

THE exposures made some years since in the *Builder*, for which we got much less praise than blame, are now again justified by an investigation which the editors of the local *Mercury*, urged by repeated statements, have caused their reporter to make into the sanitary state of some of the streets and courts lying to the north of Kirk-gate; and, as the editors in a leader commenting on the disclosures characterize it, a "horrible report" it is; which, had it appeared in the *Builder*, at least in few years since, would have set a nest of hornets about our ears for scandalizing the sweet town of Leeds. The evils recounted are, of course, precisely those set forth in the *Builder*—bad drainage, bad paving, overflowing privies and ash-pits, cellar dwellings, and so forth. A flood of corroborative correspondence has since set in, in the columns of the *Mercury*; and now that the town is being roused by such evidence *ab intra*, let us hope that the town council will be compelled to adopt efficient measures for the sanitary improvement of their town. Fever has of late been on the increase, and the summer is approaching: there is not a moment to lose.

THE BRIGHTON SANITARY ASSOCIATION.

THE annual general meeting of the members and friends of this association has been held at the Royal Pavilion, Mr. Douglas Fox in the chair. Owing to a heavy snowstorm, the attendance was not numerous; but the Mayor and several ladies, by whom the business of the association appears to be mainly supported by ladies, and established on similar principles to those of the metropolitan kindred association; having for its objects the spread of sanitary knowledge and the improvement of sanitary circumstances amongst the poorer classes, by ventilation, distribution of sanitary tracts, and anti-bike means. The report which was read showed that the association, though far too stinted as to funds, were doing their best to promote the objects in view, and had already done some public as well as much private good.

THE NEW STATION AT CREWE.

THIS new railway station, of which we have before spoken, has now been opened. In the new station the main lines run straight through the centre, as at Stafford, and they are open to the sky. The lines by which stopping trains approach the two platforms are roofed over, as are, of course, the platforms themselves, and which are 350 ft. long and 34 ft. wide, the roofs being about 65 ft. at each end uncovered. In addition to these—the main lines and platforms—two bays with double lines at each end and on each side of the station to receive trains starting from it or arriving there and not going on, form part of the plan. At present the bays at the north end are not made, it being necessary first to remove the old station, which occupies their site. Between these bays are platforms 270 ft. long at the south end, and which are to be 360 ft. long at the north end of the station. The goods traffic is to pass entirely at the back of the station, on the west side, and the goods station is to be erected on that side and south of the passenger station. The platforms are paved with haack and red quarries, the surface being considerably rounded to keep them dry. The roofs are very extensive, the main part 820 ft. long, whilst those which cover the south bays are 80 ft., and those across the north bays 70 ft.

span. They are supported by cast-iron pillars, on which rest cast trussed girders. From these the roofs spring. They are of wrought-iron with round tie-rods, and are painted in colours. They contain a very large surface of glass.

The station buildings extend from the bridge southwards for a length of 270 ft. on each side. The buildings are of white brick. The line of wall is broken, the chief features being two bay windows on each side. A stone cornice is supported by ornamental trusses in terra cotta, between which is a line of panelling alternately of buff and red in the same material. The windows are triple lights, the centre the widest, with semicircular cast-iron heads and columns. A segment arch of half terra cotta, with sunk panels, and alternate red bands surmounts the three lights. There are on both sides thirty-one rooms for various purposes. The first-class refreshment-rooms are large—55 ft. by 26 ft. on the down side, and the other only 2 feet shorter—and are lofty and very light. The second-class refreshment-room is 46 ft. by 20 ft. on the down side, whilst on the up side it is at right angles to the front, and is 26 ft. by 22 ft. These rooms are paved with tessellated quarries, and to avoid cold and damp they are laid on boards. Beyond a little place on the down-line, within one of the bay windows, and which will barely hold half a dozen chairs, there is, strange to say, no gentlemen's waiting-room whatever. Of course the large refreshment-rooms are available, but these by no means supply the want of a place in which persons waiting for trains may remain and spend the time in reading or writing.

The line is crossed, not by a bridge, but by an underground passage, which is reached from each platform by two inclines, instead of steps. It is 230 ft. long, 10 ft. wide, and 10 ft. high. A sub-passage has the advantage of diminishing greatly the ascent and descent, as it requires less elevation to pass under the line than a bridge must have for trains to pass beneath. The new station was designed by Mr. J. B. Stansby, assistant engineer, under Mr. Wm. Baker, the engineer-in-chief of the company. The work has been carried on under the superintendence, in the interest of the company, of Mr. George Jenner, of Stafford, as clerk of the works. The contract for the erection of the new station was taken by Mr. John Parnell, of Rugby, builder, now Messrs. Parnell, Son, & Bennett, and the amount was about 36,000*l.* The ironwork and the roof have been executed by Mr. P. D. Bennett, of Spon-lane, near West Bromwich; the terracotta has been supplied by Messrs. Gibbs & Canning, of Fazeley, near Tamworth; and the bricks were furnished by Messrs. Burton & Son, of Ironbridge.

WANTED, A SCHOOL OF ART FOR MACCLESFIELD.

REPORTS of a meeting of local ratpayers to consider as to the adoption of the Public Libraries Act of 1855, have been forwarded to us by Mr. Ford, the master of the local School of Art, at the request of the school committee. The ratpayers met in much stronger force to refuse the farthing per pound, which was all that their School of Art required, than they would have done to grant it; and when an amendment was moved to the effect that a voluntary subscription was better than a rate in aid, the glory of the ratpayers in supporting the amendment might have induced the simple-minded to believe that one and all were really anxious to become voluntary subscribers. The feeling of the meeting was so clearly against art, and for the retention of the farthing, that the resolution was withdrawn, and so the meeting ended. By what may be a coincidence, but much more probably with an appropriate significance, the *Macclesfield Courier* printed after its report an article quoted from the *Builder*, on "The Trade Value of Art," which reminds us that, while some of the more enlightened amongst the speakers at the meeting were appealing to the self-interest of the ratpayers as citizens of a town engaged in the silk trade, as well as in various other businesses in which a knowledge of art was of practical value, it was repeatedly intimated that the silk trade itself was so much on the decline that an Art School was not needed, and there would be no use for it soon. Now, we should like to have so intimate a knowledge of the causes of the decline of the silk trade in Macclesfield as to be able to judge how far the want, or the inadequate support, of a school of art has had to do with that very

decline. We are much mistaken if it has not had something considerable to do with it. It was not to the remaining silk manufacturers now in Macclesfield that the appeal seems to have chiefly been made, but to all and sundry connected with the trades of the town and interested in its general prosperity. One branch of the declining staple or silk manufacture, it appears, has been preserved and is in a flourishing state solely owing to the art and skill engaged in it; and out of a list of 23 subscribers to the School of Art 20 were connected with the silk trade. Nevertheless, out of 87 young men of the artisan class in the school only 6 were connected with the silk trade, a fact which seems of itself to throw a significant light on the decline of that trade; but which also goes to show that there ought to be other subscribers besides those connected with the declining staple trade of the town. Let us hope the ratpayers of Macclesfield now really mean to subscribe to their School of Art; and that, though "penny wise," they are not quite "pound foolish."

WHOLESALE MANUFACTURE OF OZONE.

It has long been an idea of ours that ozone might be manufactured on a great scale for the purification of close courts, and other cholera and fever haunts; and we pointed attention to the enormous electrical power of Sir W. Armstrong's electric hoiler, in order to show the possibility of this being done. It is interesting now to note, in connexion with our idea, that a sugar-refining firm in Whitechapel is setting up one of Wilde's extraordinary electric machines on their premises for the bleaching of sugar; and we do not despair of seeing the same power soon applied as we originally suggested. Wilde's machine has recently been exhibited to the Royal Society at Burlington House. It is worked by a 15-horse power steam-engine, and possesses wonderful power. The form is magneto-electric; and it has coils 4 ft. high and 10 inches thick, containing 14 cwt. of copper wire. The armature rotates 15,000 times in a minute. The intensity of the light produced by this machine is something almost appalling. It required, like the sun, to be gazed at through coloured glasses. By means of lenses the mere rays of light set fire to paper, and its heat could be felt 50 yards off. It melted the refractory platinum as if it were lead! Various uses for it are being suggested. The total cost of its light is said not to exceed 6*d.* or 8*d.* an hour, cost of the machine itself included. The same sort of machine is used in Manchester for photographic purposes, being preferable, it is said, to the sun for taking photographs! It can also, of course, be made available by night as well as by day.

OLD PARIS.

THE new Rue Turbigo, now opened out, has completely disengaged two ancient buildings of considerable interest, which we mentioned some time ago, expressing, at the same time, a hope that they might be preserved, viz., the Hôtel de Bourgogne and the Tour de Jean-sans-Peur. This tower, gloomy and dilapidated, concealed for so many centuries, and the existence even of which was unknown to most people in Paris, seems like some old stern giant suddenly risen from the ground. It was completely enclosed and hidden from view by lofty houses in the Rue Pavée, now demolished. Its style is of that peculiar character which reminds one strongly of the mediaeval castles and fortresses, and it is side by side and perpendicular to the Hôtel de Bourgogne. Its form is rectangular; it is roofed with bricks; and it has an embattled projecting platform. The height from the ground to the ridge of the roof is about 131 ft. The entrance into the court of the hotel and the corridors of the tower is through the porte-cochère of No. 23, Rue du Petit Lion. The ascent of the tower is gained by a spiral stone staircase of bold design and exquisite finish. There are 148 steps up to the top of the staircase, six landings on the way, and a chamber at each landing. That occupied by Jean-sans-Peur is on the second story. In the thickness of the walls there are issues communicating with subterranean passages. There are no windows, and the door is very low. Historians say that here Jean received the hoodman, Capeluche, and his faithful

men-at-arms. Facing this room is the door of the chapel, which has nothing remarkable but the height of its sole window and its ceiling; both are pointed. Some objects of art which were formerly in this chapel are now in the Museum of Cluny.

The Duke of Orleans, brother of King Charles VI., was assassinated on the 23rd of November, 1407, about seven p.m., in the Rue Vieille du Temple, as he was leaving the Hôtel Barbettes. That day Jean-sans-Peur shut himself up in this room with a gentleman from Normandy, named Raoul d'Occquetonville. He had been to hear mass at the chapel, and in the evening this gentleman, escorted by eighteen armed men, met the Duke of Orleans, whom he politely saluted by splitting his skull with a hatchet. Jean himself was the victim of a gracious reception at Montecorn on the Dauphin Charles, who granted an interview, which Jean had solicited, and then killed him. The Hôtel in the Rue du Petit Lion is a little older than the tower, having been built about 1320, whereas the tower dates from 1390.

The Hôtel de Bourgogne, the facade of which is exposed by the demolitions, is only half what it was when it bore the name Hôtel d'Artois. The Rue Française, under the reign of François I., cut off a portion in 1542, and the rest was used for theatrical representations up to 1783. Here Corneille and Racine played their best pieces; here the comedies of Marivaux, Favart, and Sedain, the comic operas of Gretry, Philidor, Montsigny, &c., were represented. The Hôtel de Bourgogne was afterwards transformed into a leather hall.

COMPETITIONS.

New Offices for the Sunderland Gas Company.—Fifteen designs were sent in, out of which the directors selected one bearing the motto, "Nothing venture, nothing have," by Mr. G. G. Hoskins, architect, Darlington, as entitled to the first premium. This design, which it is intended to carry out, is for a Gothic building of red brick, with stone dressings, and the building will occupy a site at the head of Fawcett-street, facing the railway-station and new extension park.

Baths: Birkenhead.—At the monthly meeting of the Birkenhead Commissioners, on the 5th instant, the report of the Baths Committee in reference to the new baths was presented. It appeared that Mr. W. H. Weightman, architect, of Liverpool, reported that, after examining plans marked No. 17, they could be carried out for the sum stipulated by the Board, viz., 8,000*l.* The proceedings, including the recommendation of the committee to award the premium of 100 guineas to plan No. 17, were confirmed by the Board. The designer was found to be Mr. Edward Holmes, architect, Birmingham. There were eighteen competitors.

Bangor Hospital for Infectious Diseases.—The Board have selected one of the designs sent in, under the motto "Avisé la fin." The architects are Messrs. Kennedy & O'Donoghue, of London, Bangor, and Glasgow.

Workhouse, Barnsley.—Messrs. R. K. & W. H. Blessey's plans have been, on the report of two architects called in by the committee, accepted by the Board of Guardians for the new workhouse at Barnsley, Lancashire.

PASTORAL STAVES.

THE two of which we give illustrations this week have recently been made by Messrs. Peard & Jackson, of High Holborn.

Fig. 1 was designed by Mr. A. W. Blomfield for the late Bishop Cotton, of Calcutta (whose melancholy death by drowning became known in this country just as the work was at the point of completion). The entire work is of sterling silver beaten from the sheet, parcel gilt and set with two onyx pendants; the Lamb in the centre is a beautiful ivory carving by Collettee, made movable by the bishop's desire, to be replaced by a jewel, because in some parts of his diocese the meaning of the emblem is liable to be misunderstood. Behind the lamb is a cross, enriched with ornament in lapis lazuli enamel, the cusping of the quatrefoil being set with crystals. Immediately under the crook is engraved a trilingual inscription, "Feed my Sheep; Feed my Lambs," viz., in English, Bengalee, and Hindustanee. The large boss beneath this is

* Pierre Carlet de Chamblain de Marivaux was very conceited in his style, hence the term *marivaudage* given to affectation in literature at the present day.

of sheet silver, overlaid with flageo work, parcel-gilt, and set with twelve stones, comprised of amethysts, garnets, cornelian, topaz, malachite, and chrysoptase. The knob in the centre of the stem has four richly-chased bosses, the eyes of three of which are enamelled, and the fourth bears a shield containing the arms of the late bishop. The stem is of ebony. We understand the late bishop's representatives have presented to the see of Calcutta this beautiful work of art, and that it has been taken out by his successor, Bishop Millman.

Fig. 2, made for the R. C. Bishop of Elfin (Sligo), was designed by Mr. George Goldie, who studied it for execution in Irish hog-onk. It is mounted with silver, parcel-gilt, and studded with precious stones. The cross is of silver, with a large malachite setting on each side; the arms being enriched with ornament in enamel, and the bosses terminating the arms of the cross are set with the same variety of stones as enumerated in description of Fig. 1. The crook is excellently carved as Celtic knot-work, by Hayhall, of Sheffield, the diaper-work of the stem being set with small crystals: the band of the top boss is also enriched with Celtic ornament in ruby and green enamel, intermediately with which are large crystal settings. The collar of the knob is set with cornelians and enriched with engraved ornament. Above and below the knob are engraved the arms of the bishop and appropriate inscriptions. Care has been taken in the execution of these designs to adopt the legitimate treatment applicable to metal work.

THE DESIGNS FOR THE LAW COURTS.

IN previous numbers of the *Builder* we have given a block-plan of the arrangement proposed by Mr. Edward Barry, and descriptive particulars of his design generally.*

The illustration in our present issue shows the front of his building towards the Strand. The architect has excluded all the Courts from this necessarily noisy thoroughfare, and has placed them, as before described, in the central mass of the building. Provision for the Wills belonging to the Probate department is made in the raised portion forming the base of the dome which surmounts the Central Hall. The angle octagon turrets contain staircases and lifts for this department. The four louvre turrets mark the staircases for the public, and the upper portions of the turrets are proposed to be used as ventilating shafts from the Courts. The side entrances in the centre of the wings are special entrances for the public only to their staircases leading to the public galleries in the Courts. The central entrance is reserved for the Bar, the professional public, and other persons whose business leads them to the Courts. New Temple Bar is shown on the right, in connexion with the clock-tower; and in the front of the latter an open staircase gives access to the bridge from Fleet-street. The open arches at each end of the front lead into the inner street, which separates the offices from the central building containing the Courts. This street is uncovered and open throughout, for the purpose of affording light and air to the interior of the building. Iron gates within the arches would secure its privacy, and its exclusive use by those frequenting the building. The side buildings at the extreme ends of the front contain the various offices, which are arranged on the outer side of the internal street, exactly opposite to the Courts with which they are connected. Bridges across the street give ready access from the offices to the Courts, and in all cases there is provided a private passage of communication for the judge. Thus, opposite to the Courts of Queen's Bench are placed the Queen's Bench Judges' Chambers, the Queen's Bench Master's Office, and the Associates' Office; and at the other side of the building each vice-chancellor has his court placed opposite to his chambers, with a bridge of connexion, giving a central corridor for the public, and a separate passage for the vice-chancellor. The central portion of the front contains the principal entrance (which might well be made more prominent), staircases, and the Bar accommodation, consisting of library, refreshment-rooms, robing-rooms, and so on. Jurors and witnesses would not enter by the central entrance, but would pass through the inner street, in which at different places they would find special staircases leading to their destination.

MODERN PASTORAL STAVES.

DESIGN FOR PROPOSED LAW COURTS.—By Mr. E. M. BARRY, A.R.A.—View to the Strand.

SOMETHING LIKE A CELLAR.

WE have just now looked into a large wine-cellar recently formed for a large seller of wine, Mr. Basil Wood, in New Bond-street, a situation where one would scarcely expect to find an opportunity for such a construction. The premises (numbered 34 and 35, New Bond-street) stand upon the site of a hostelry once famous as the "Black Horse." In excavating for the cellars the workmen came upon the remains of the conduit from which the neighbouring Conduit-street derives its name; also a number of land springs, not to mention adjoining cesspools, which must have greatly increased their salubrity. The red gravel having been removed to a depth of about 10 ft., 13,000 loads of clay were carted away to the Thames embankment, and cellars were formed which cover more than a third of an acre. A second story of cellars is formed above, covered with the "Dennet" arch; and over these is a large gallery, which will probably be taken as an exhibition-room, or by some society wanting a large meeting place. The subterranean premises are lighted with gas, and heated with stoves, so as to retain an equable temperature. The "lifts" for raising and lowering casks are worked by hydraulic pressure, supplied from the main, so that it is always "on." The cost is very small, the quantity used being regulated by meter. The bins are all of iron, and contain upwards of half a million bottles of wine.

Mr. Henry Christian, who was the architect, has adopted the Lombard style, giving next Bond-street a handsome porch with pillars of red granite from Mull, polished at Peterhead, surmounted by capitals of Bath stone, carved *in situ*, with appropriate devices (the fox and the grapes, &c.). Messrs. Jackson & Shaw were the builders, and have done the work very well, spending about 10,000l.

THE WORKS OF A WILTSHIRE BUILDING FIRM.

THE widow of one of the firm, Mrs. Daniel Jones, writes to us thus:—I consider it my duty to ask you to permit me to record in your ever-valued journal the close of a firm which has for the last forty years stood quietly and without ostentation, and has received the patronage of our noble families in Wiltshire and elsewhere.

The beautiful estates of Lord Lansdowne at Bowood; the Pembroke estates at Wilton; the Beaufort Badminton estates; Mr. Walker Long's, at Longleat; Savernake and Tottenham Parks, all contain monuments of the skill and industry of these three brothers, Messrs. Daniel, Charles, & Bryant Jones, who were men eminent for their strict integrity and good taste. Mr. Daniel Jones survived his two younger brothers, and the works, from after 1852, were wholly performed under his direction. November 27th, 1866, was the day of his departure from the scene of his labours, deeply regretted by all his workmen and all who intimately knew him.

1837. At Dorking, for Mr. Hope, his mansion at Deepdene.

1839. For the Marquis of Lansdowne, Derry Hill Church, Mr. T. H. Wyatt, architect; Churchill Obelisk; Caine Church; Stindley Church; Witton (Wyatt); Totturly; Newton; Bridgwater, for the Rev. Mr. Capes; Winsley Church restoration.

1841. Wootton Church (Wyatt); Infirmary, Salisbury.

1842. Christ Church, Bradford Wilts, Messrs. Manners & Gill, architects; Lansdowne Tower; Derry Hill Parsonage; Tarrant Hinton Church; Tarrant Gunville Church (Wyatt); Barbage Church (Wyatt).

1843. Newton Toney Church (Wyatt).

1844. Horningsham Church (Wyatt), for Lady Bath; Chittoe, Spye Park; Keevil Church; Root Ashton, for Mr. W. Long; Steeple Ashton Church.

1845. Coombe Church, near Salisbury.

1846. Hilperton Church (Wyatt); Wilsford (Wyatt).

1847. Melksham Market-place and Town-hall.

1848. Mansion at Frankleigh, for the Misses Salward, Mr. Clutton, architect; Upton Scudamore Rectory (Wyatt).

1850. Freshford Schools, Penally, near Tenby, Wales; Thatcham, Manners & Gill, architects, Bath.

1851. Savernake Church, for Lord Bruce, called Christ Church (Wyatt).

1853. Chippenham Church, Mr. Scott, architect.

1856. Mansion at Orchardleigh, near Frome, for Mr. Duckworth (Wyatt).

1859. Memorial Church, Tottenham Park, for Lady Ailesbury (Wyatt).

1861. Woodborough Church, for the Rev. Mr. Wyde (Wyatt); Lullington Church, Orchardleigh, for Mr. Duckworth (Wyatt).

1862. Longleat; Leigh House, Bradford-on-Avon, for Miss Poynder.

Appealing to Mr. Wyatt as to the correctness of parts of this list, that gentleman writes,—“I should be gratified if you would allow me to add my tribute to the worth of these brothers, as they worked for me for twenty-five years, without one misunderstanding, on the estates of the Duke of Beaufort, Lords Lansdowne, Ailesbury, Bath, and Pembroke, and built or restored eighteen churches for me.”

We are glad to have the opportunity of recording such an honourable career.

THE NEW NATIONAL GALLERY.

MR. J. GOLDSCHMID, in the House of Commons, asked the First Commissioner of Works whether the following statement, contained in a letter addressed to him by the architects competing for the New National Gallery, was not correct, viz., “We agreed to enter the competition on the distinct understanding with your lordship's predecessor, the Right Hon. W. Cowper, that one of the competing architects would be selected for employment,” and whether he did not therefore intend to entrust the erection of the new building to one of those gentlemen?

Lord J. Manners: I do not well understand the objects of the hon. member's question, nor in what sense he expects me to answer it. If he means whether I place implicit reliance on a statement made by ten gentlemen of high honour and great professional eminence, I answer decidedly in the affirmative, that I do place implicit reliance on their statement. But if he means to ask if I find in the records of the Office of Works any corroboration of that statement, I am bound to say that on looking at the papers I do not find any corroboration of that statement. With respect to the second question of the hon. gentleman, he is no doubt aware that the judges, in their report, do not give any recommendation as to the reconstruction of the existing National Gallery or the building of a new one. That question, therefore, is left to the consideration of the Government. It is now under their consideration; and I cannot, therefore, say what course may be adopted with respect either to the reconstruction of the old building or the execution of a new one. When that decision is arrived at, I cannot doubt that Government will give every consideration to the agreement stated to have been entered into with the right hon. gentleman opposite by the competing architects.

GAS.

At a recent sale by auction two of the 50l. shares in the Rochester and Chatham Gas Company realised the sum of 465l., or 232l. 10s. per share.

The Bromley Gas Company have declared a dividend equal to 7½ per cent. on their whole share capital. From the report it appeared that the gas rental had increased about 14½ per cent., as compared with last year, notwithstanding the reduction in the price from 6s. 3d. to 5s. per 1,000 ft. for the last three quarters. The directors recommended that 290l. 13s. 6d. should be added to the reserve fund.

The Boughton Bleas Gas Company have declared a dividend of 5 per cent. at their annual meeting, and the chairman said they proposed to lower the price of gas from 8s. to 7s. 6d. per thousand cubic feet, as it was time that they endeavoured still further to increase their consumption by reducing the price.

The Belper Gas Company have declared a dividend at the rate of 10 per cent. per annum. The Birmingham Gas Light and Coke Company have declared their usual maximum dividends. The directors congratulate the shareholders upon the continued increase in the consumption of the company's gas. Such increase they say must be attributed in a great measure to the improved quality and low prices of gas in Birmingham. They have contracted

for an additional gas-holder, No. 10, to complete the storage power of the works in Windsor-street, the tank for which is already constructed. They call attention to the present state of the reserved fund, now amounting to 27,219l. 9s. 7d., which they say is closely approximating to the amount limited by their Act of Parliament, and is still increasing from its accumulating interest and compound interest. The directors, therefore, contemplate the necessity of making further reductions in the prices of gas during the ensuing summer.

FAIR PLAY FOR THE LAW COURTS' DESIGNS.

WE have received a second letter from the Solicitors' Committee, signed by Mr. A. Bell, Mr. Cookson, Mr. G. Hume, and Mr. J. Young, repeating their statement that we were imposed on as to the position of the writer of the letter signed “A Member of the Solicitors' Committee.” As we have already shown distinctly that this signature was incorrect, and have fully exonerated these gentlemen from the supposition that any one of them was the author of the letter, it seems quite unnecessary to print their present communication. Acknowledging that we were to that extent imposed on, or, at any rate, misled, the facts remain uncontradicted, and have been repeated to us from four separate quarters since. The excellent secretary of the Commission had been led by excess of zeal to adopt a course that was not thought strictly fair to some of the competitors, and an outcry at once arose, to which we were bound to give expression in our pages.

POSTAL TELEGRAPHY.

A PAPER on “The Economy of Telegraphy as Part of a Public System of Postal Communication,” has been read at the Society of Arts by Mr. Edwin Chadwick, C.B., of which we may here give the conclusions arrived at:—

“They are, that cheap and complete telegraphic communication, with the speedy and punctual delivery of telegrams, next to the cheap, speedy, and punctual delivery of letters, is of the highest importance to the manufacturing, commercial, and agricultural service of the country, as well as to the service of the State, for the army, the navy, and the police. That the present telegraphic communication of the country is made unnecessarily dear, by the charges of several incomplete establishments, to perform a service that might be better performed by one. That there are in the United Kingdom ten thousand post-offices, and a service of twenty thousand persons engaged in the collection and delivery of letters, available for the collection and delivery of telegrams, as proved by the example of Belgium and Switzerland, and other well-governed continental states. That the private telegraph companies have only some nineteen hundred telegraph stations—a little more than one to five of the postal means of ready collection and speedy and cheap delivery. That, by reason of the charges for separate establishments, rents, and payments for separate services, with local taxes and extra charges, to which trading telegraph companies are subjected, they cannot adequately multiply their existing stations and means of speedy delivery except at double rates of cost, and at extra rates of charge, which are practically prohibitory to the habitual use of telegraphic communication by the great mass of the community. That, by the use of the existing postal establishments pervading all parts of the country, the postal service may—as is done by the postal establishments of foreign states—convey telegraphic messages at low rates of charge at a profit, which private companies can only convey at the same low rates, at a loss. That, by reason of the existing conditions of the burthens of multiplied and separate capitals, and of the restricted number of stations, and distant and dear portages, with consequent high rates of charge, and in many cases slow deliveries, the habitual use of telegraphic means of communication is largely confined to the few; to certain classes for large transactions, such as those of the money markets, to large manufacturers, bankers, and professional persons, and to domestic uses on extraordinary occasions. That telegraphic communication in this country has not been brought within the means of habitual use by the great body of retail traders, nor of the agricultural or middle classes, nor of labourers throughout the country. That it has not yet been brought into complete and proper use for the public by the police, by the navy or the army for the purpose of internal defence or for the action of the chief administrative departments of the State, as it is by responsible constitutional Governments on the Continent. That out of the economy of the charges of the separate establishments of separate private companies produced by consolidation, together with the increased traffic obtainable by telegraphic communication through the post at reduced tariffs, fair compensation may be made to the trading interests in public telegraphy which have been allowed to be formed, and that the proper responsible duties of the Government for the maintenance of the safe and free use of all public means of communication, as a service, may be advantageously resumed without direct expense to the revenue, and with large indirect advantage to it by the augmentation of the commerce and production of the country.”

In the discussion which followed Mr. Sandmore, of the General Post-office, took part. He said he might state that the officials of the Post-office had, some time since, proposed a plan,

which was now under the consideration of the Government, relating to this question, but he was not at liberty to describe it in detail. If the Government had come to a decision upon the subject, he would have been most happy to have submitted the full details to such a meeting as this. Though he had no claim to all the good words Mr. Chadwick had said in reference to the management of the Post-office, he thought they could do more to facilitate communication throughout the country than the existing telegraph companies were able to do. By being able to work with one establishment, with one set of electricians, and with one set of wires, and by reason of their having in every little village of the country an office at which some one must remain stationed throughout the day, he had no hesitation in saying they could do the work more effectually and more cheaply than any telegraph company could do, unless they incurred greater cost than they did at present. If the scheme now before the Government were carried out, he should be disappointed if towns with a population of 5,000 were to be the only places to derive the contemplated benefits. It was intended to go, without loss to the State, to much smaller populations than that; and he did not despair of seeing the time when, supposing the administration of the telegraph was handed over to the Post-office, the lines would be as closely extended throughout the United Kingdom as they were at this moment throughout the whole of London.

HENHAM HALL, SUFFOLK.

HENHAM HALL, the seat of the Earl and Countess of Stradbroke, lately burnt, is situated in Suffolk, near Langford, and about twelve miles south of Lowestoft. The old hall, which was built of red brick of the Elizabethan style of architecture, was burnt down about 80 years since; and the present house was built in 1793-1795, from the designs of James Wyatt, whose instructions seem to have been to design a comfortable house without any pretensions to architectural effect. The building, as left by Wyatt, consisted of a parallelogram 100 ft. by 70 ft. The interior arrangements are spacious, and the principal suite of rooms, which are on the one-pair floor, are handsome and stately. These rooms have lately been re-decorated at great expense. In 1858 and the following years some additions were made to the exterior of the house with a view to giving it some architectural character, from the designs of Mr. Edward M. Barry, who also laid out an Italian garden, with terraces and balustrades. Further additions have been projected in the shape of wings, and a tower at the north-east angle, but these have not yet been carried out. The damage done by the fire is confined to the south-east corner of the house, in which are placed the billiard-room, the state drawing-room, and a few bedrooms. These are entirely destroyed, and the parts adjoining are also injured, but it is hoped that the main walls of the house will prove to have sustained no serious injury.

LOCAL GOVERNMENT RETURNS.

A PARLIAMENTARY paper has just been issued containing returns in a tabular form of districts where the Public Health Act, 1848, or the Local Government Act, 1858, or both of them, are in force; of the date when such Act or Acts were adopted, and (as far as may be practicable) of the population according to the census of 1861, and of the rateable value in each case. The paper also contains returns of the districts or places where any public Act relating to such district or place, or any local personal or private Act, is in force, with the date of the passing or adoption of such Act, as the case may be; and the population and rateable value in each case. The return distinguishes those localities where the Public Health Act was applied by Order in Council, where by Provisional Order confirmed by Act of Parliament, where local Acts have been obtained which incorporate parts, at least, of the Public Health Act, and where the Local Government Act has been wholly or partially adopted. The paper, it will be seen, contains a large amount of useful information; and it comprises about 575 towns and districts. A few towns have refused to give information. They are Dresden (Staffordshire), Stockport, and Wallasey. Some of the Acts now in force are of considerable

age, Worcester being partially governed by an Act passed in 1704; Plymouth, 1708; Bridport, 1722; York, 1732; Guildford, 1759; Bath, 1766; Reading, 1767; Windsor, 1769; Barnsley, 1777; Wells, 1779. The Public Libraries Act, 1865, is in force at Burslem, Canterbury, Cardiff, Ipswich, Leamington, Norwich, Oxford, Sheffield, and Warrington. Barton-on-Trent and Kendal return the Bakehouses Regulation Act amongst the public Acts in force in those towns. There appears to be some misunderstanding on this point. The Act applies to all towns of upwards of 500 inhabitants, so that there is no question of "adopting" it. The only two other towns included in this return where this Act is to our knowledge carried out conscientiously are Bristol and Plymouth, who very properly do not include it amongst the special Acts in force in their towns.

COMPENSATION CASES.

LAST week, at the Mayor's Court, Mr. Thomas Chambers, M.P., Common Sergeant of the City of London, had before him a claim for compensation from the Metropolitan Board of Works in respect of a dwelling-house and warehouse situated in Aldermary-churchyard and Cannon-street. The premises were required by the Board for the purposes of the proposed new street from Blackfriars to the Mansion-house. The claimant was the executor of a wholesale stationer, who, in 1836, obtained a lease of the property from the parish for 31 years, at a rent of 180*l*. The testator, by his will, made in 1859, directed that his sons should be at liberty to occupy the premises (paying a rent to his executor of 40*l*. a year) "so long as they should continue to carry on the business of wholesale stationers therein." The sons had carried on the business together since their father's death in 1862, and they had made a separate claim against the Board of Works for compensation in respect of their interest in the premises. After the peculiar circumstances of the case had been explained to the jury, a verdict was taken for 322*l*. at the full value of the term vested in the executor, without reference to the interest taken by the sub-lessees under the will. Mr. Hawkins, Q.C., and Mr. Cowie represented the claimant, the executor; Mr. J. H. Lloyd represented the Board of Works.

PROVINCIAL NEWS.

Taunton.—The new place of business for the West of England and South Wales Bank, which is being erected in this town from a design by Messrs. Fosters & Wood, of Bristol, architects, is now nearly completed. The building is in the Italian style of architecture, and will cost about 3,000*l*.

Wellington.—The new Town-hall, completed by the Wellington Markets Company, has been inaugurated. A commodious room for public purposes has been a greatly felt want for a long time in the town. The space over the already erected market-house was taken into consideration, and the architect (Mr. Bidlake, of Wolverhampton) adapted his designs to this suggestion, thus saving the cost of a site and foundations. Entrance to the room and adjoining ante-rooms is obtained by a wide stone staircase. The ceiling is pannelled and decorated with coloured ornaments. The size of the room, clear of the orchestra, is 59 ft. 6 in. in length, 41 ft. wide, and 20 ft. 6 in. high. At the one end is an orchestra capable of accommodating nearly 100 performers. Below is a platform for lectures, concerts, &c. Beneath the gallery are retiring-rooms, which are approached by private stairs. These rooms will serve as retiring-room and robing-room for the use of the County Court Judges and advocates practising in the Court, the Courts being shortly to be held at the Town-hall. The offices in the basement are for the use of the Registrar and High Bailiff of the Court.

Malvern.—Owing to the number of new pupils at Malvern College, the present three masters' houses, each capable of accommodating forty boys, have proved insufficient for the requirements, and rendered the erection of others indispensable. Plots have been laid out for nine additional houses, two of which are now in course of erection. These new houses have been designed by Mr. W. J. Hopkins, diocesan architect, and are drawing near completion. They are situated upon rising ground, on the north side of the college, and are built of brick, having a few plain free-stone dressings. The buildings are plain in character. Each house is divided into three main compartments, one being appropriated to the servants, another to the boys, and the remaining one will be the masters' residence. The boys' compartment contains twenty private studios, a dining-room (33 ft. by 18 ft.), butler's pantry, matron's room, lavatories, wardrobe, box-room, bath-room, and dormitories, having separate sleeping apartments for forty boys. Both the

ground and chamber floor of the masters' residence are connected with the boys' compartment, so as to allow of easy supervision. The contract for the houses was 8,139*l*, exclusive of fittings. The contractors are Messrs. McCann & Everal, of Malvern; and the clerk of the works is Mr. Brayshaw.

Oldham.—For some time past a building has been in course of erection in King-street, at the expense of Mr. Henry King, who resolved to build an Assembly-room at his own cost. The work has been done by Messrs. Hellis & Lee, of this town. The room is about 65 ft. long, 24 ft. wide, and 20 ft. high; is a cloak-room forms part of the building, and other conveniences are also attached. At one end of the room is a gallery, capable of holding fifty persons, and altogether about 400 people may be accommodated with seats.

Wavertree.—The Wavertree Baths Company have recently erected a large plunge-bath, and a commodious lecture-hall, and purpose to add private baths in a short time. The hall has just been formally opened. Its measurements are 50 ft. long by 37 ft. broad, and about 30 ft. high.

Swansea.—The foundation stone of the new Hospital for Swansea has been laid. The architect, Mr. Graham, in the laying of the stone, explained the plan of the building, from which it appears that it will provide for 100 in-patients, and for a large number of out-patients. In connection with this latter department will be a bath establishment, the object of the institution (which is supported by voluntary contributions) "being to afford warm and cold sea-water bathing, and medical and surgical relief, to the sick poor from every part of the kingdom." The building may be considered as divided into four distinct parts, viz.,—the out-patients' department, the men's wards, the women's wards, and the administrative offices, communication being effected by a corridor on the ground-floor, and by an open terrace over, affording access to the wards on the upper floor direct from the matron's department. The ward arrangements are the same for men and women, and consist of a large and small ward under the same supervision. The cubic space per bed is 1,600 ft.; the floor space per bed, 100 ft.; the wards being 16 ft. high. The wards will be warmed by open stoves, placed near the wall, so as not to interfere with the symmetrical arrangement of beds and windows. The ventilation of the wards will be effected by inlets for fresh air placed near the ceiling, and by outlets at the ends of the wards, the shafts being carried up separately into the towers, and terminated by louvers. The wards will have ash windows, 5ft. wide, opening from 9 in. below the ceiling line to within 2 ft. 9 in. of the floor, the sashes being hung in two widths on account of excessive size and weight. They will have, externally, the appearance of French casements. There is a basement containing a kitchen and necessary stores. The upper story is appropriated entirely to dormitories for the nursing staff. The building will be constructed of coursed rubble limestone of the neighbourhood of Swansea, with dressings of Bath stone. The roofs will be of slate.

ACCIDENTS.

As one of the foremen employed by Messrs. Wheeler, of Reading, contractors, was passing in front of a house which is being erected at Wargrave, he was injured by a piece of timber thrown from the roof, which struck him near the right eye with such force that he fell to the ground incausable. Had the blow been a straight one it must have proved fatal.

An inquest has been held at Walsall on the body of a well-sinker, who came by his death at Field-gate. From the evidence of Mr. Hughes, contractor, it appeared that the deceased descended into a well, and was in the act of scraping away some sand, when witness, who was watching him, observed the brickwork giving way, and called to the man at the windlass, for your life to the windlass! At the same time the deceased called out, "Oh, Lord! Good God!" and grasped at the windlass rope; but in an instant the sides of the well fell in, and buried him at a depth of about 40 ft. The jury returned a verdict of "Accidental death."

At an inquest respecting the deaths of four men who were killed by an accident with a hoist, which happened on the 28th of January at the locomotive and carriage department of the Lan-

cashire and Yorkshire Railway Company, at Junction-street, Miles Platting, evidence was given by Dr. Fairbairn, who said the hoist was of the usual construction, and was very well constructed, so far as he could see; but the most important feature in hoists was that they should have self-acting catches. All hoists were now made with catches, and the one in question ought to have had five. He would earnestly recommend all railway companies to have catches put upon their hoists, as the catches were the great safeguards. The jury, after some deliberation, returned a verdict of "Accidental death," but severely censured the Lancashire and Yorkshire Railway Company for not providing other and better arrangements for the safety of the workmen.

RESTORATION OF THE CRYSTAL PALACE.

The directors, in their report read on the 14th instant, say,—

"That the full amount of 38,500*l.* claimed from the insurance offices, in respect of the portion of the palace destroyed by the late fire, has been received. The damaged materials have been disposed of by public tender on satisfactory terms, and it is probable that a sum of 2,500*l.* will be realised from this source. A new insurance to the amount of 20,000*l.* has been effected over the part of the building north of the centre transept, which was no longer covered by the previous policy. The portion of the building extending from the screen to the north end of the Alhambra and Byzantine Courts (which, though not only damaged but also destroyed, is being substantially repaired, and the courts themselves covered in. The timber screen alluded to in the recent circular has been completed, and the directors are confidently assured by Mr. Edwin Clark, the eminent engineer, that the nave is now perfectly protected against the attacks of wind and weather. The directors, having carefully considered the advisability of more effectually providing against the risk of fire, have determined, under the advice of Mr. Clark, their engineer, on the execution of certain protective works in the basement of the palace, consisting principally of substantial partition-walls of brickwork, filled in with earth, crossing the whole width of the building at four places in its length, and carried up from the ground to the under side of the floor. The centre transept will further be similarly divided into separate sections with the same object."

Specifications for the rebuilding are being prepared, and will be submitted at an early date to public tender. The directors applied to the House of Commons to suspend their standing orders, so as to admit of the deposit of a Bill empowering the company to raise a sum not exceeding 100,000*l.* by the issue of stock bearing a preferential dividend not exceeding 7 per cent. per annum, and ranking next after the existing debenture and preference stocks. The Standing Orders Committee have complied with the application, and the Bill will accordingly be proceeded with immediately after the sanction of the proprietors has been obtained.

A CHEAP ALARM.

I HAVE fitted an excellent alarm-bell to my bed-room clock, which I find of great use, and which I will describe, if you will allow me, for the benefit of any who may feel disposed to follow my example.

The clock is one of the old-fashioned kind, with long pendulum and chains, that necessitate its being hung up high on the wall; and the whole alarm apparatus consists of a bell, a stick, and a few nails. If the striking-weight is wound up at (say) ten o'clock p.m., it will be blown the wall about 2 ft. at five a.m.; then make a mark on the wall, level with the bottom of the weight, or half an inch lower. Here, a little on one side, drive a nail, with a stick (say 1.8 in. long) held on it as on a swivel, the nail working freely in its place, about 2 in. from one end. Your bell must be put together thus:—Nail one end of a steel stay-busk to the bell; bend the busk into a half-circle; nail the free end of it to a piece of wood 5 in. or 6 in. square; then nail this wood to the other wall (the clock being in a corner of the room, and with another wall to the one it is on running at a right angle with it). Let the bell be secured so as to be, when at rest, 3 in. or 4 in. below the short point of the stick, when the stick is horizontal; raise one end and hang it delicately on this point; then drive a nail over the long end of the stick, so as to counteract the tendency of the spring to cock it up, and the alarm is made and set. When the clock strikes (say) six, the striking-weight displaces the stick and so liberates the bell, which rings with a loud noise. This simple contrivance is, I believe, quite

original, and few things can surpass it for efficiency,—none for cheapness. It may, with a little adapting, be fitted to almost any clock, and set for any time (the time being regulated by the hour at which the weight is wound up over night), and, if properly gauged, will never disappoint. To use a homely simile, it is as gingerly set as a mousetrap, and a slight touch of the clock-weight sets it ringing while the clock is striking, and for some seconds after, emitting a thrilling noise that will awaken the soundest sleeper. J. GIBBS.

A NOISY CHIMNEY.

Sir,—I write to you for the purpose of complaining of an intolerable nuisance. I live in what is termed a quiet, genteel neighbourhood; but the party next door to me has recently put his chimneys into the hands of a professional "doctor," and the result is, in the first place a horrible gaunt serpentine figure, like a ghost with a broken back, superimposed upon our common gable. Perhaps I have no right to say a word about this distortion; but in the second place there has been a revolving funnel fixed to one of the chimney-pots, which, during a high wind, or almost any wind, twirls about and revolves with such speed, that it causes a screeching noise exactly like a railway whistle; and this noise lasts often the whole night; and not only does it keep me awake, but also terrifies my children from sleeping. I have already made a polite but ineffectual remonstrance. Have I no recourse under the law? AN ARTIST.

SUBMARINE RAILWAY TUNNEL ACROSS DOVER STRAITS.

Sir,—The subject of communicating with France by railway appears to gain ground in professional opinion, and eminent men are engaged in propounding plans for the great undertaking. Pamphlets have been published, Mr. Chalmers claiming as a novel idea of his the laying down iron tubes on the bed of the Strait as a practicable scheme. Now, Sir, may I ask the favour of a small space in your valuable columns, as I believe it can be proved that the first information offered to the public of iron tunnels for railway communication across rivers or straits as a proposition scheme originated with myself, and was published in 1841, when our then young Brunel was engaged in laying down Clegg's atmospheric railway tubes on the South Devon line as a main trunk to Cornwall and the Land's-end.

The Hamozzo harbour had to be crossed, and as far south as possible, connecting the two counties, and which that great engineer effected by erecting his celebrated bridge, at a point named Salrash, about four miles from Morrice Town and Torpoint.

Now, it was my proposal to cross the Hamozzo at these two points and towns, where the breadth of the river is about three quarters of a mile, and a sloping bottom to ten fathoms of water, a favourable river for my scheme, which appeared in the Independent newspaper of Devonport in 1841, and also again in 1856, and was noticed in your columns at the latter date, when M. de Mondéy, an eminent French engineer, was pursuing the object in question,—a submarine tunnel across the Dover Straits,—and published his scheme. I then claimed, as I claim now, all priority of iron tube laid on the bed of the Straits. A brief outline of my scheme is as follows:—

I build cast-iron tubes in about 1,000-ft. lengths, of 33 ft. interior diameter, and of a gravitating power to float when sealed at the ends. Some ten divisions or partitions in the whole length, forming as many compartments, as a means for prosecuting the design; and these bulk-heads, fitted with manhole doors and valves, admit of the intended operations of partly being fitted with water as a sinking weight, and of also being exhausted of water by pumps when sunk on the bottom of the strait or river, and the building in of some 3 ft. thick of brick walls in cement throughout the interior will give the necessary amount of gravity to the structure to keep it base. The removal of these bulk-heads in succession as the brickwork is proceeded with simplifies the practical part so far, and the workmen are made secure.

With regard to the jointing of the tubes, a very important part of the work, I see no difficulty, nor in securing the connecting parts

together; these lead to a matter of detail and mechanical engineering already considered of; and by simply making the tubing with its temporary load to sink only, it can be hauled on as required with little power. Anchors being laid down along the line on each side of the berth, and wire ropes used as guides, the tube could be adjusted with ease, and divers assist in the work; and those inside, the first part completed, can act on wire ropes working through stuffing-boxes on the drum-head, and be perfectly safe.

Ventilating towers form the greater difficulty—in that some engineering obstacles would offer; but it is possible they may be overcome: the lifting power of the water hydrostatically considered, the resistance to the sea, and the connecting the towers to the iron tube, almost exclude the practicability of air-shafts. Ventilation is, however, imperative; and a twenty-mile tube is a long one for the atmosphere to be pushed forward in, occupying an hour's trip, probably, in a single transit of the train. A better head than that on my shoulders may clear the difficulties connected with this point of the question. J. S. MORRIS, Engineer.

THE DON VALLEY DRAINAGE.

WATER SUPPLY.

I OBSERVE in your journal of March 2nd, that the authorities of Oxford, Tunbridge Wells, and other places, are making good progress in a plan for the disposal of the sewage of those districts, and I am glad to see they are sensibly alive to the importance of the subject, and have a whole-some dread of the law as laid down by Vice-Chancellor Wood, in the case of "Heath v. The Local Board of Health, Leamington."

It is very clear from that decision that local Boards of Health have no moro power or authority to turn sewage into the rivers to foul them, than they have to turn it into the drawing or other rooms of houses situated on their banks; and what is the use, I would ask, of Parliament making laws, if those who are intrusted to carry them out are permitted to make them a dead letter, or absolutely and unblushingly to violate their enactments?

It appears to me that more stringent measures are required on the part of Parliament to put down this one of the most crying evils of the present day, as pure water is a necessary of life, and the source from which it is generally derived ought to be placed beyond the possible reach of taint or impurity of any kind. Something more than heavy penalties would be required to meet the justice of the case, as few are disposed, like Mr. Heath, to fight the battle and incur the expense even of the difference of taxed costs in carrying them into courts of law, it being one that may be dealt with more effectually and promptly by imperial measures.

Sheffield and other towns still persist in making the river Don their outfall sewer, irrespective of all warnings and the consequences; and as it is more than probable that we may have a dry summer, and foul accumulations will again encumber the river, and line its scorching banks with black and fetid abominations. The last summer having been wet, the repeated floods cleansed them away, and aided thereby materially to preserve the health of the district through which it flows.

I observe that a gentleman connected with the Health Department of the Home Office is called in to advise with the Corporation of Doncaster as to the best remedy, and I cannot understand how it is that a salaried public officer can act professionally in such a case; and here let me enter a protest, on the part of the profession, against the system by which many men with fine "nest-eggs," in the shape of good salaries, are allowed to practise privately in this way, to the injury of their less fortunate brethren,—not because they are more expert or competent, for if you look through the list of engineers you will see very few of our leading men who have the opportunity afforded them of throwing any "new light" on the sanitary movement.

And this may account, in a great measure, for the difficulties that now prevail relative to the water-supply and the sewage of our towns: the beaten track is blindly followed, reckless of the results, and regardless of the consequence, landing us in a maze of doubt, uncertainty, inextricable confusion, and miserable failure.

There are but few of our towns in which the system of water-supply is perfect and incapable

of amendment, as the necessity of the new "Water Commission" demonstrates; and I think there is still less number of towns where the disposal of sewage is even now efficiently conducted; yet, in this state of bliss we have been floundering on for the last twenty years, with but little, if any, amendment; and unless bold steps are taken, and stringent measures adopted, we may remain in that happy state for another twenty years. Thus thousands of innocent lives, generation after generation, will be swept away, sacrificed by these "Juggernauts" that preside over the destinies of our unhappy towns.

B. B.

THE "BUILDER" FIRE.

Mr. F. W. F. WOODMAN writes.—Having read the recommendation of this grate by Mr. Recorder Warren, I told a poor man to get one, try it, and I would pay the cost (1s.) for it. He found it excellent. The plan I designed is, to cut a piece of paper $\frac{1}{4}$ in. smaller than the bottom of the grate; get a smith to make a plate of iron the size of paper pattern, of the thickness of a halfpenny, with three small holes in it the size of a straw. One hole in the middle and one hole 1 in. from each end: the burr to be filed off level. These holes prevent the plate from warping with heat, and being small, and covered with fuel, do not allow cold air to pass up, nor hot air below it to escape. On this principle wooden straight-edges have seven small holes bored in them, one in the middle and three holes in each end, to keep them from twisting. If in round wooden bread-plates a hole the size of a small pin were bored, they would always be flat.

WANTON DESTRUCTION.

STR.—There is a sense in which all boundary fences, walls, gates, posts, piers, iron railings, &c., may be regarded as public property. Each one is, as a rule, set up to please the eye,—with what success depends much on the taste and judgment of the beholder, whether he be the owner or a stranger from afar. It will therefore be conceded that the preservation, in its full integrity and completeness, of any one of the above named works, is to be desired not for its owner's sake only, but also for the sake of his neighbours. I had occasion lately to walk from Lower Norwood to West Dulwich. The south side of that road is bounded by the inclosing wall of Norwood Cemetery for a distance of about 400 yards. In this length there are fifty-seven massive brick piers, each one surmounted by a moulded cap; the piers are terminated at the offset by a splayed and mitred Portland stone, and above is a splayed and mitred surbase, also of Portland stone. Of the whole number of piers, one only has escaped the hand of the destroyer. In most cases, all the four mitres to each pier are more or less mutilated, and from my observation it appears to have been effected by a sharp instrument or edge-tool, such as a halving-hammer.

There are many minor offences of a similar character with which we are too familiar; but what I have stated may suffice to draw attention to this iniquitous and brazen wantonness, that henceforth, in addition to imprisonment, a little taste of "the cat" may be administered to the backs of the perpetrators. W. H.

BLACK BRICKS.

In answer to your correspondent "B. A." in a recent number:—

Never having met with any black bricks of a satisfactory quality, I have for years adopted the following system, which I have always found to answer well; and though I will not state positively that it is original, I believed it to be so when I made the experiment, and have now no cause to think otherwise.

Select bricks of even texture and smooth surface, and of true outline and sharp arris on the one face, according as they are required for "headers" and "stretchers." Place them with the selected face exposed round an open fire, and when nearly red hot dip each brick singly into a caldron of boiling coal tar, to a depth of about one inch from the face to be stained; hold it in the tar for a few seconds, and then place it to cool and dry with the stained face upwards.

If this be properly done, the surface will be found of a deep bright black, the stain will extend to a depth of half or three-quarters of an inch from the face, the surface will be without gloss, the stain will not rub off on to a dry finger with even strong friction, and the weather will have no effect on it. If, however, the brick is not hot, and the tar boiling, the stain will rub off, and in hot weather the tar will sometimes run. The success of the operation can always be tested by the appearance of the brick when cool.

Always reject those with a glossy surface, as they are only coated, and not properly stained. In jointing for ornamental work, the surface of the brick should only be wiped, and not touched up or painted with tar or any other medium. In axed or ganged work, the brick is, of course, cut to shape before staining. When no cutting is required, picked stocks can be used; but for good work a good kiln-burnt red brick is best, and for axed and ganged work it is best to use the same bricks as the other work is done in.

I do not agree with your correspondent in either of his hypotheses, that of coarse black bricks are the best, or that it is desirable to black the bricks when up.

Manufactured black bricks are, firstly, very expensive; and, secondly, they are so soft and brittle, that after loading, unloading, and stacking, it is difficult to find a true face in a dozen; and in cutting and rubbing for ganged work, there is great waste from the same cause, and when dressing and pointing are used, they generally smear and discolour the other work.

As to painting or staining when fixed, I should never allow it except in extreme cases to correct omissions or mistakes in the pattern. In such cases I use lamp-black, mixed with varnish and turpentine, and used thin; but to me such a process as a substitution is reprehensible in principle, and is sure to produce a hard, crude, and piebald appearance, and is one of a system of dodges which has brought coloured brickwork into bad repute, by producing a glaring, vulgar, and meretricious effect when new, and a sickly and washed-out appearance, when the newness is worn off. It also generally happens that these dodges are practised in combination with the worst taste in design and arrangement of colour, and have done much to debase ornamental brick treatment.

BASSETT KEELING.

CHURCH-BUILDING NEWS.

Whitburn.—A public meeting of the inhabitants of Whitburn parish has lately been held, at which it was resolved to enlarge and restore the village church, and also to build a chapel at Cleadon, to take the place of the small school-room, in which, on Sunday afternoons, divine service is now performed. Plans and drawings of the proposed alterations have been submitted to the committee by Mr. Johnson, of Newcastle, who has been appointed architect. The principal features of the scheme are the widening of the aisles, which will provide sittings for about 250 additional persons; the substitution of an open roof for the present white-washed ceiling; the replacement of the pews by open seats; the addition of a chancel arch and an organ chamber, and various other alterations and improvements. It is calculated that the cost of these alterations will be about 3,000*l.*, and that of the Cleadon Chapel about 600*l.* To these objects liberal subscriptions have been already proposed. It is expected that the improvements and alterations will not be completed before the summer of 1868.

Liverpool.—A new church, built at Everton, at a cost of 14,000*l.*, by Mr. T. D. Anderson, a local merchant, has been consecrated by the Bishop of Chester.

Kingswinford.—St. Mary's Church, Kingswinford, has been re-opened for divine service. The church has undergone great internal alterations, including the removal of the north gallery, and the substitution for the pews of open sittings. The only vestige of the really ancient church (a window in the chancel) shows that the style was Early English, and this has been followed in the restoration. The chancel is furnished with stalls and a stone pulpit has been placed on the north side, at the entrance into the chancel. The cost of the alterations will altogether amount to 1,650*l.*

Newcastle-upon-Tyne.—A short time ago it was announced that a movement had been originated amongst the butchers of Newcastle, to obtain funds for the purpose of erecting a new altar-railing in St. Andrew's Church. The efforts thus made have proved successful, and a brass railing has been fitted up. By a telescopic contrivance the rail is made to open in the centre, for affording access to the altar. The whole has been fitted up by Messrs. Mather & Armstrong, of this town.

Stanhope-in-Weardale.—The contracts for carrying out the restoration of the ancient parish church at Stanhope-in-Weardale have been let to Mr. George Graddon, builder, and Mr.

J. Thornton, mason, Durham, and the work will at once be proceeded with.

North Shields.—A new organ, built by Messrs. Hill & Son, of London, has just been opened in St. Peter's Church, North Shields. It is fitted with illuminated pipes and a stained lead case.

Brinsop.—The parish church here, which has recently been undergoing a renovation by Messrs. Welsh & Son, of Hereford, under the architectural supervision of Mr. W. Chick, also of Hereford, has been re-opened for public worship. Previous to the restoration the old building was in a deplorable state. The face of the masonry externally has been renovated and re-pointed. The stonework with which the windows had been partially filled up has been removed and the dressings cleaned and restored, thereby restoring the windows into their original condition. The roof is entirely new, and a new belfry has been also built, whilst the entrance porch has been restored. Internally, the walls have been cleared of all the old plaster and whitewash, except here and there where faint traces of ancient paintings have been discovered; these, together with some fragments of old stonework, and some ancient raised crosses, have been preserved on the walls. The flooring of the aisles has been re-laid with Godwin's tiles, as also of the chancel and sacristy. The floor of the nave has been raised to its original level. The old plaster ceiling of the aisle has been removed, and the roof restored to its original boarded state in union with the roof of the nave, the whole roof being covered with asphalt before the tiles were put on. The foundation of the triforium was in an unsound state, but has now been under-pinned and secured. Stained and varnished deal seats have supplied the place of the original old-fashioned pews, whilst the chancel is arranged with carved oak stalls moulded with cusped traceries and poppy-headed ends. The pulpit is entirely new, being of oak and shaped octagonally, having arched and cusped traceries panels resting on responds, with caps and faces and carved spandrels. The church is now warmed by Gunnery's stove, provided and fitted by Messrs. Bennett & Brown, Hereford. One thing wanting to complete the exterior of the fabric is the spire, and the erection of this the funds in hand would not allow of. The sum of 710*l.* has been expended up to the present time, and it is calculated that 250*l.* will be required to complete the work.

SCHOOL-BUILDING NEWS.

Worcester.—A new schoolhouse for the Queen Elizabeth's School at the northern entrance to the city is about to supersede the old and insufficient premises now used for this school close to St. Swithin's Church. The new building will be erected on a portion of the land at the White Ladies', Tything, having its frontage to the road, from which it will be separated by a strip of ground some 15 or 20 ft. wide, and a dwarf wall, iron railing, and entrance-gates. Mr. Perkins, the architect, has chosen the style of architecture which prevailed at the time when the school was established—the reign of Queen Elizabeth. The front elevation presents three three-light windows, square-headed, with stone mullions and transoms, and in each end wall is a large five-light window. Ornamented gables surmount the front windows, with a statue of Queen Elizabeth in a central niche. Stepped gables, with finials, are on the end walls; and on the centre of the crest of the steeply-rising roof is a characteristic bell-cot, which also serves for ventilation. The walls are to be of brick, with stone dressings. Entering by a porch at the south-west angle of the main building, a good-sized vestibule presents itself, on the right of which will be a class-room, with lavatory, robing-closet, and offices; on the left, the great school-room, 45 ft. by 25 ft., having an open-timbered hammered-in roof, resting on corbels. This roof will be a termination, looking from either end, to the great windows in the north and south walls, no part of which will be hid by the roofing timbers. This school-room will be readily capable of elongation should the circumstances of the school at any future time require it. At the back of the main building will be a five-cot, with offices; and surrounding the eastern side of the premises will be a large play-ground. The plans are before the Charity Commissioners for approval, but it is not yet known when the work will be commenced.

Yarmouth.—The new school of the Church

South-end Mission has been opened. The new building cost 500*l.*, including the boundary wall. The architect was Mr. J. T. Bottle. At present it may be described as a central block; the addition of wings is contemplated, in which boys and girls of riper years will be educated. The style is Gothic, red brick with red and white arches. Internally the walls are of red brick, with white brick bands and an open timber roof, lighted by four single windows on the south, and by ornamental dormers on the north, underneath which is an open arcade. The school will accommodate about 120 infants. The ground, about a quarter of an acre in extent, will be enclosed by a boundary wall. Mr. Howes was the builder of the school.

GRINDING MONEY.

Colman v. Minard.—The plaintiff, a joiner, residing in Crimscoot-street, Grange-road, Bermondsey, sued the defendant, a builder, of Eynsford-road, Camberwell, for the sum of 1*s.* 4*d.* for time for grinding tools.

Mr. Ody appeared for the plaintiff, and stated that his client has been employed to assist in the construction of some stairs in a house in the Albany-road, Camberwell; and that on a certain Saturday at noon he was paid off, and now sued the defendant for the sum in question, to which he was justly entitled, according to the custom of the trade, to prove which he had several witnesses in court.

The plaintiff and his witnesses then at great length stated the custom of the trade, some of them contending that if a man were employed but a single hour, he would be entitled to some compensation for grinding-time and tools.

The defendant said that the plaintiff worked for him only from the Thursday to the Saturday, and hence he considered that he was not entitled to grinding-money. However, the work upon which he was engaged did not require sharp tools which were ground.

His Honour remarked that cases of that description came before him frequently; and rather than confide in his own judgment, he had recently consulted some of the most extensive and influential building firms in the metropolis. The parties in that case desired him to determine under what circumstances that which was known by the name of "grinding-money" could be claimed by carpenters or joiners, and he had sought to discover which rule, if any, was now observed by the trade on this subject. The result was that there did not appear to be any fixed or established practice, but a different one in different establishments, more or less liberal to the men, both as to the amount and as to the conditions necessary to earn the allowance. Thus he found there were those who allowed, upon discharging their men, if carpenters and joiners, as much as a quarter of a day, or two hours and a half; others who allowed two hours to joiners and one hour to carpenters; others who considered one hour allowance sufficient in all cases; and others who contested the claim altogether. So also there was a difference of practice with regard to the length of employment necessary to justify a claim to this allowance. Under these circumstances, it was impossible to say that there was any certain custom or usage to be incorporated in the contract, and to regulate the rights and liabilities of the parties to it. When the question arose before him in a different form he should probably be prepared to decide that some allowance was ordinarily made, notwithstanding the prevalence of the hour-system; but in this particular instance, regard being had to the nature of the employment, and its duration, he did not think that the plaintiff had established his claim to any further allowance than that which he had already received. He could not foresee adding that it would be most desirable if employers took care to make known the system of their establishments, either individually to each man engaged, or generally, by means of shop notices, conspicuously displayed. He should rule judgment for the defendant in the case.

Books Received.

The Report of the Armstrong and Whitworth Committee, with a Letter thereon to Earl de Grey, and Appendices. By JOSEPH WHITWORTH, LL.D., F.R.S. Manchester: Jos. Thomsen & Son. 1866.

THE report of the committee "appointed to examine and report upon certain facts which require to be carefully ascertained before any satisfactory opinion can be pronounced upon the different descriptions of guns and of ammunition prepared by Sir W. Armstrong and by Mr. Whitworth," has been reprinted by the latter competitor. This report, or rather the record of the experiments which it contains, involves matter of too grave importance to be summarily dealt with. We trust shortly to give to a question so deeply involving the character of our land and sea defences, and the efficiency of both navy and army, the consideration which it merits. Meantime we call the attention of those interested in the subject to a record of facts, which tells a very different story from the easy-going accounts of the Shoeburyness experiments to be gleaned from the political newspapers. The committee have thought, it is charity to suppose, that the facts spoke so loudly that it was un-

necessary for the report to give a very definite utterance on some of the most important results of the trials. We intend to translate some of their principal facts into very plain English. The question of the character of the "dogs of war" to be employed, as the bonse and yard dogs of Great Britain, is not one to be bandied in kid-gloves.

Miscellaneous.

THE ORNAMENTAL WATER IN REGENT'S PARK.—In reply to a question in the Commons, Lord J. Manners has stated that it is proposed to commence the works at this water in the autumn, and it is calculated that they will occupy about six months.

THE HOLY SEPULCHRE.—The *Moniteur* says.—"The work of construction of the provisional protection under the great cupola of the Holy Sepulchre at Jerusalem has been satisfactorily accomplished. The first floor is finished, and all the ceremonies can now be performed without any danger either to the priests or the faithful. The workmen brought from Paris by M. Manss, the architect delegated by the Emperor, fulfil their task with a calm order and respect for the Holy Place which the clergy of all the worships unanimously recognise."

A TELEGRAPHIC PECULIARITY.—An endeavour to establish telegraphic communication with underground workings at a mine in Lake Superior, has disclosed a curious difficulty. Since the discovery that by placing each end of a telegraph wire in the ground the circuit is made as completely as when two wires were used, but one wire has been employed. The wire used in the Pewabic Mine is a 1-16th copper wire. After the line was set up, to the surprise of all, no signals could be transmitted; and though the operator of the line examined the wire, and tried numberless experiments, all was of no avail. So says our authority, the *Mining Journal*.

THE CHURCH OF ST. MARTIN, LEICESTER.—The Messrs. W. Neale & Sons, of Leicester, builders, have commenced the erection of scaffolding for the building of the intended spire to this church, without competition, the firm having done other works there. The summit of the spire, when completed, will be 203 ft. from the floor line of the church. Restorations at this church have now been going on at intervals for more than twenty years, under Mr. R. Brandon and his late brother, architects, and some 10,000*l.* have been raised by voluntary subscriptions, and expended upon them. Much yet remains to be done.

A STATE SYSTEM OF TELEGRAPHY.—At the monthly meeting of the council of the Liverpool Chamber of Commerce a special committee presented a memorial they had prepared, pointing out that in order to secure low charges and a full extension of the telegraphic system, it has become necessary that Government should take the control of the whole telegraphic system. They urge that such a course would be a great advantage to commerce; that in Belgium such a system has been very successful. They believe that under the control of one board a uniform rate of 6*d.* a message would yield a substantial profit.

PLASTIC SLATE.—Alluding to the application of plastic slate to render woodwork fireproof, Mr. A. Morehouse, writing to the *American Petroleum Standard*, states that the slate is better if mixed for some time before it is used, and observes that it may be conveniently made in old kerosene (petroleum oil) barrels, which are strong, and can be bought second-hand very cheaply. A specimen from a burned building was exhibited to the Farmers' Club, and, although exposed to the full action of the fire, it was neither consumed, charred, nor weakened. It was a soft mastic when the building took fire. Now it is strong, solid, and thoroughly petrified. The roof was upon a wooden lean-to against a brick building. It was so perfectly fire-proof, and so tightly joined to the brick, that it prevented the smoke rising to blacken the wall above the junction, while at the side of this roof and around the corner the big brick building was blackened clear to the top. The superheated steam and air could find no egress. The room was filled with most inflammable materials, yet with all the fire and heat none could escape through the roof. It blackened and stood until all support was burned away; when it fell it broke into large sheets several feet square.

A NEW FIREPLACE LINTEL.—"Gibbs's registered fireplace lintel," is a simple and useful mode of increasing the draught of a chimney so as to lessen the necessity for disfiguring buildings with zinc and other abominations on the roofs. It consists of an iron plate (in place of the ordinary chimney-bar), with an opening in the middle, narrowing the width of the flue when set in the brickwork. That such a plate must have a tendency to prevent chimneys from smoking seems obvious.

THE METROPOLITAN TRAFFIC REGULATION BILL. A meeting of ratepayers of the Holborn district has been held to consider this Bill, and the measures "to be taken energetically to oppose the same." The meeting was numerously attended, and it was resolved that in the opinion of the meeting the Bill then pending in the House of Lords, would interfere with the free trade of the metropolis to such an extent, that if its provisions were to be enforced, it would amount to a total prohibition of business in several instances; that the execution of the Act would place in the hands of the police arbitrary and unjust powers, and prove a step in the direction of centralization which could not be too strongly deprecated; and that whilst the meeting admitted the necessity for a measure for facilitating the traffic of the metropolis, they deemed it desirable that the execution of the law necessary to effect that end should be entrusted to the local authorities, in whom the management of the thoroughfares was already vested. It was then agreed that a petition should be presented to Parliament against the Bill.

APPREHENDED STRIKE OF TWENTY THOUSAND ENGINE-DRIVERS AND FIREMEN.—The entire engineering staffs of the London and Brighton, and the North-Eastern Railways have given notice of resignation of their posts in consequence of the directors not agreeing to their demand of increased wages and shorter hours; and the like result is feared on all the other lines of railway throughout the country. Associated as they all are with their clubs and societies, they have expressed their full determination to stand out, as they "ask for nothing that is unjust or unreasonable, but that to which they are entitled." The men require,—"That 10 hours a day, or a run of 150 miles, be reckoned a day's work; and that overtime be reckoned two hours and a quarter. That engine-drivers in London and districts receive, for the 1st six months, 6*s.*; 2nd six months, 6*s.* 6*d.*; end of twelve months, 7*s.* 6*d.* per day. Firemen: 1st six months, 3*s.* 6*d.*; 2nd six months, 4*s.*; end of twelve months, 4*s.* 6*d.* per day. Engine-drivers in country districts: 1st six months, 6*s.*; 2nd six months, 6*s.* 6*d.*; end of twelve months, 7*s.* per day. Firemen: 1st twelve months, 3*s.* 6*d.*; end of twelve months, 4*s.*; and after three years' service, 4*s.* 6*d.* per day. That firemen be promoted to be drivers according to seniority or length of service; and that Sunday work be paid as a day and a half." Other things are asked for in various ways on different lines.

THE NEW STREET TO THE MANSION HOUSE.—At the last ordinary meeting of the Metropolitan Board of Works, Mr. Tite, M.P., said he wished to ask the superintending architect, Mr. Vulliamy, what progress had been made in the purchase of the property on the site of the proposed street from Blackfriars to the Mansion House, and if there was any probability or prospect of that street being opened up before the Thames Embankment was finished. He should like to know, also, how many houses the architect had got hold of which he could pull down between the present time and Midsummer. The superintending architect said an order of the Board had been passed for the pulling down of 120 houses, and he had accordingly given instructions to Messrs. Pullen, Horne, & Eversfield to sell the property for that purpose; and he should soon be in a position to sell the whole of the property between Earl-street and Cannon-street, except the Probate-office and the Equitable Life Assurance building, which they had not yet got. He saw no reason why the entire line between Earl-street and Cannon-street should not be cleared by Midsummer next, with the exception of the two buildings named which stood in the line; and with regard to that portion between Cannon-street and the Mansion House, the Board had purchased the whole of the freeholds and nearly all the leaseholds, the remainder being in course of treaty for. By the end of the year the Board would be able to see its way clear to the speedy opening up of the entire line.

THE LATE VACANCY AT THE NATIONAL GALLERY. The vacant trusteeship of the National Gallery has been filled by the appointment thereto of Mr. W. H. Gregory, M.P., whose enlightened interest in art will render his selection highly popular, and, no doubt, advantageous.—Sunday Gazette.

NEW BRIDGE AT MYTON.—A cast-iron bridge is to be formed at Myton Ferry. The present circuitous route from Myton to Boro'bridge, viz. Helperry, will, by this arrangement, be curtailed from 9 to some 2½ miles. The plans for the bridge are being prepared by a London firm, by order of the proprietor, Major Stapylton.

ROMAN ANTIQUITIES.—In the Court of Common Council, upon the motion of Dr. Saunders it has been agreed that, a Roman hexagonal column having been discovered beneath the wall of Aldgate in 1806, and supposed to have been lost to the City, and being now found exposed in the open yard of the London Coffee-house, it be referred to the Library Committee to take immediate steps to receive the same for preservation in the museum of the Guildhall.

THE BRITISH MUSEUM.—In reply to a question of Lord Lyveden, in the House of Lords, Earl Stanhope said the statements which had been circulated as to intended new arrangements respecting the natural history collection at the British Museum were entirely devoid of foundation. The trustees had made no such recommendation. The recommendation they did make was made seven years ago, on the motion of Lord Palmerston, who was then an official trustee, and it was to the effect that it would be desirable to separate from the British Museum the natural history collection. To assert that any new arrangement had been come to in a contrary sense, or in any sense, was wholly unfounded.

THE MANCHESTER AND SALFORD EDUCATIONAL AID SOCIETY.—From the third annual report of this Society it appears that at the end of 1866, the total number of grants issued to schools since the commencement of the Society was 27,163; the number of grants current or unexpired at the end of December quarter, 20,915; and the number of children attending school, 9,490. The numbers in actual attendance at school were greater by 2,290 in 1866 than in 1865. The report says in conclusion:—

"It may seem but a poor return for all their labours that out of 21,000 grants current, barely one-half are in use. The thought is depressing, that among the poorer sections of the manual-labouring classes so little value is set on education, that even when offered free of cost it is in so many instances impossible to persuade parents to accept the gift. The Committee candidly admit that when they commenced operations they were wholly unprepared for such a result."

The Committee, however, state that "in place of losing heart, they are daily more and more convinced of the value and importance of the work in which they are embarked;" that they are sounding "depths of ignorance previously unexplored;" and that therein lies the true value of their researches.

DAVIS'S VENTILATOR.—This ventilator consists of two tubular portions, a "Perforator" and a "Perhanster." In the case of a room or office, the perforator requires to be fixed in the chimney-front, over the fireplace, and to enter the flue near the ceiling. The perforator must have one end entering the ceiling, so as to receive air from between the ceiling and floor above, or the ceiling and roof above; and the other end facing the perhanster. The ventilator requires a good chimney draught; and where this is not the case the chimney is to be "cured" by "contraction at the bottom, from as high as a mason can reach, down to the fireplace; and, if the wind is apt to blow down the chimney, by a Venetian chimney-pot, in addition, at the top." The manner in which the ventilator acts is explained thus:—"When an aperture is made in the ceiling of a room, the air between the ceiling and floor above, or the ceiling and roof above, being much colder, and therefore heavier than the air in the upper part of the room (particularly when gas is burning in it, or many persons are occupying it), rushes down into the room with great force. By means of the perforator, this stream of air is directed into the perhanster; and, while it prevents any smoke from coming out of the chimney, it helps to carry away impure air. The diameter of the perhanster is made larger than that of the perforator, in order to allow space for the air of the room to be drawn by the current of the perforator, and attracted with it, into the flue of the chimney."

A TEST FOR DAMP ROOMS.—A test of the dampness of rooms is suggested by Dr. Coffee. Place 500grms. of quicklime on a plate, leave it in the apartment, and if at the end of 24 hours this substance, which absorbs moisture very greedily, has not increased in weight by more than one-fortieth or one-fiftieth, the apartment may be considered fit to live in. In a damp or newly-built room it will increase in weight as much as 5 per cent.

PERMANENT PHOTOGRAPHS.—The very desirable requisite of permanent photographs is still exciting attention; and Mr. Ponney, of Dorchester, whose apparently efficient method was early brought before the public notice in the Builder, is still engaged in the promotion of his processes. At the last meeting of the Inventors' Institute, he read a very interesting paper on "Sun-painting in oil colours," illustrated with many highly thought of specimens of the applicability of his photographic prints and decorative art. The photographic prints exhibited were on paper, canvas, panels, copper, &c. The gradation of tone was considered to be quite as perfect as the finest silver photographs, while possessing over the latter the immense advantage of absolute permanence. In the course of his remarks Mr. Ponney went through the various manipulations connected with the process, explaining them as he proceeded.—

"The sensitive medium used is bitumen of Judea, dissolved in turpentine, benzole, or other hydrocarbon, with which is ground up oil colour of any desired tint. The paste mass is then brushed over a thin sheet of translucent paper, and dried in the dark. When dry the sheet is exposed under a photographic negative to daylight, or a strongly actinic artificial light, which hardens, or renders insoluble, those parts of the sensitive medium which the transparent parts of the negative have permitted access of light. After some minutes' exposure to light, the embryo picture is washed in turpentine, benzole, or any other solvent of bitumen. This dissolves those portions which have not been affected by the actinic rays, leaving the remainder of the pigment firmly attached to the paper, in a quantity proportional to the amount of light which permeated the different parts of the negative."

The picture is now complete, and may be transferred, as in the lithographic process, to cardboard, canvas, wood, stone, &c.; or, if ceramic colours are used, it may be transferred to "pottery's" "biscuit," and burnt in as usual. Mr. Ponney's process will now, in all probability, receive many commercial and artistic applications.

TENDERS

For rebuilding the Boatmen's Institute, Sale-street, Paddington. Mr. T. Hergate Vernon, architect. Quantities not supplied.—
Manley & Rogers..... £910 0 0
Cowland..... 913 0 0
Dove, Brothers..... 938 0 0
Patman & Fotheringham..... 947 0 0
Scrivenner & Horton..... 980 0 0
For house at Horseay, for Mr. J. C. Corbin. Mr. George Truefit, architect.—
Madgin, Jun. (accepted)..... £1,160 0 0
For a portion only of new church at Worthing. Mr. George Truefit, architect.—
Longhurst (accepted)..... £2,404 2 0

For alterations and additions to a dwelling-house at Worcester, for Mr. T. K. Goodwin. Mr. A. Coombe, architect. Quantities supplied.—
Wilson..... £398 0 0
Bishop & Grisman..... 306 0 0
Beard (accepted)..... 345 0 0
For the erection of offices, Chapel-road, Worthing, Sussex, for Messrs. Frise & Green. Mr. Henry Carpenter, architect. Quantities supplied.—
Thorne..... £1,577 0 0
Dove, Brothers..... 1,455 0 0
Hild & Fitching..... 1,433 8 0
Blaker..... 1,268 0 0
Howell..... 1,232 0 0
Garrod..... 1,225 0 0
Longhurst (accepted)..... 1,185 10 0

For the erection of a new wing, and other alterations and additions, to the oil-cake manufactory, Southmills, Blunham, Beds, for Mr. Charles Powers. Mr. John Usher, architect. Quantities supplied.—
Freshwater..... £922 0 0
Dickens..... 880 0 0
Twelvevrees..... 856 0 0
Hull..... 843 0 0
Horsman..... 780 0 0
Winn & Foster (accepted)..... 729 0 0

For alterations to the Horseshoe tap-house, Tottenham Court-road. Messrs. Mayhew & Calder, architects.—
Turner & Son..... £1,265 0 0
Oriel..... 1,226 0 0
Laurence..... 1,190 0 0
Easton & Chapman..... 985 0 0
Butcher & Son..... 978 0 0
Curtis..... 900 0 0

For building three shops, with workshops in rear, in Church-street, Bethnal-green. Messrs. Reeves & Butcher, architects.—
Langmead..... £1,173 0 0
Higgs..... 1,117 0 0

For rebuilding warehouse at Clay-corner, Tavell-street, Bethnal-green. Mr. T. B. Insell, architect.—
Deavine..... £1,550 0 0
Beale..... 1,486 0 0
Christoffer..... 1,385 0 0

The Builder.

VOL. XXV.—No. 1259.

The Age of Limited Liability.

E have had the age of reason and the age of faith: the bronze age and the stone age are also things of the past. When the history of the present century is written it will be possible to invent an epithet which shall correctly describe its prevailing feature, and, commercially, it may be described as the age of limited liability. It is this aspect of to-day which we propose to deal. Society is more deeply indebted to limited liability than is generally supposed. The Infants' Food Company takes care of us at birth, and when the drama of life is played out

we are provided for by the Patent Metallic Air-tight Coffin Company. At every step in life's journey limited companies are ready to supply our wants.

Amongst the last Parliamentary papers of the session of 1866 was a return giving the names, objects, number of shareholders, nominal capital, &c., of the limited liability companies registered from the 1st of June, 1864, to the 31st of May, 1866. The second paper issued during the present session was a return of the number of companies registered during the years 1864, 1865, and 1866, with the amount of capital proposed to be raised in shares. We propose to omit the consideration of the companies which existed previously to the passing of the "Companies Act, 1862," and afterwards registered as limited companies; and also the associations formed on the "unlimited" principle, and to confine ourselves strictly to the "limited" companies. From the last-mentioned return, we find that the total number of limited companies formed during the years 1864, 1865, and 1866, was 2,738, with a nominal capital of 510,000,000*l.*, in round numbers, or more than half the national debt. In 1864, the number of companies was 972; and the nominal capital, 234,600,000*l.*; in 1865, 1,011, capital, 201,500,000*l.*; in 1866, 755, capital, 73,800,000*l.* The rapid decline in the number of companies, and especially in the nominal capital during the last year, is very remarkable. It will be seen from our figures that the sum proposed to be raised in 1866 was little more than one-third of that asked for in 1865; and in all probability next year's return will show a similar falling off. The other return which we have referred to is a paper of more than 100 pages, of which we have taken the trouble to make an abstract, a task which should have been performed in the Registrar's office. The paper, as published, is a mass of facts conveying very little information. We have not attempted to form any estimate of the average life of a company, since winding-up petitions succeed each other so fast that an average cal-

culated up to one day would be materially modified by the proceedings of the next. Many limited companies do not seem to get beyond a door-plate, whilst some advance to the dignity of palatial offices and a large staff; but only to dwindle down as quickly as they rose up. The recently-appointed Select Committee will doubtless be able to collect some interesting particulars with regard to this and other parts of the subject.

During the two years included in the report now before us, no less than 1,931 limited joint-stock companies were established in Great Britain and Ireland, viz., 1793 in England, 83 in Ireland, and 55 in Scotland. The sum which was proposed to be raised amounted to the trifle of 331,721,000*l.*, in sums varying from 12,000,000*l.*, the capital of the General Bank for the promotion of agriculture and public works, and 180*l.*, the capital of the Wolverton Market Company. Between these two extremes we have the National Credit Mobilier with 10,000,000*l.*, four companies with 5,000,000*l.*, five with 4,000,000*l.* each, and twenty or thirty with 1,000,000*l.* odd and upwards. Financial speculations are far ahead of all others, both in the number of undertakings and the capital asked for, and no less than 146 companies of this kind were formed during the period under review. The total sum proposed to be raised was 108,299,000*l.* This includes the bumble office where the needy may be accommodated at twenty-four hours' notice with "loans without security," and "no inquiry fees," in such a pleasant, easy, and gentleman-like manner, at least on paper, that there is no longer any excuse for a poor man to trouble his friends. It includes also banks and "loan-offices" on a larger scale, where no applications are attended to unless the sums take at least four figures to write them down. These call themselves by the high-sounding names of "Mercantile Credit Associations," "Finance Companies," "Finance Corporations," or "*Credit Mobilier*," a title which has an unpleasant foreign sound to English ears. It is a curious feature of these undertakings that the smaller the capital the bigger the name; thus we have the International Bank, which suggests a million or two at least, proposing to commence business with the modest sum of 2,000*l.* The Mutual Bank of England might be taken as a sort of rival to the establishment in Threadneedle-street; but it is nothing more than a loan society with a capital of 2,000*l.* Another company, with the high-sounding title of London Bank of Madras and Southern India, undertakes the business of "banking generally in Madras and Southern India" with a like sum.

Thirty-eight companies for making railways, tramways, and roads were formed, the aggregate capital being 26,135,000*l.* The construction of a railway in this country requires, in most cases, the powers of an Act of Parliament, but we find that some of these companies relate to railways in England. Amongst them are the Charmouth and Bridport, Snowdon and Portmadoc, Isle of Man, and the Belfast and Bangor Railway Companies. The object of the last-named association is not, as might be supposed, to connect North Wales with Ireland, but simply to make a railway from Belfast to a place in the vicinity. Of foreign speculations the largest is the San Francisco and Atlantic, with a capital of four millions, the object being to construct a railway from the port of San Francisco to Roseville, California. Nearly six millions are proposed to be spent by three companies on Peruvian railways; and the public have been invited to subscribe to undertakings for making railways in China, Rome, Antwerp, British Borneo, South Australia, and Venezuela. Only one road company was registered, and that for the purpose of making a road between Pont-street and the Drompton-road.

British enterprise has not, however, stopped at the construction of railways abroad; for we find that thirty-four companies, possessing an aggregate capital of 19,385,000*l.*, have been formed for dealing in land and erecting buildings in various foreign countries. It is rather a significant fact that half the capital proposed to be thus invested goes to Italy. Thus we have the Italian Land Company, with a capital of a million and a half; the Public Works Credit Company of Italy, capital, a quarter of a million; the Italian Building Society, 280,000*l.*; City of Milan Improvements Company, 600,000*l.*; City of Florence Improvements Company, 2,000*l.*; City of Naples Improvements Company, 600,000*l.*; Anglo-Italian Public Works Company, 10,000*l.*; Naples Public Works Company, 1,200,000*l.*; and Florence Land and Public Works Company, 5,000,000*l.* The remaining companies undertake projects in France, Spain, Jutland, South Africa, and other countries.

In the United Kingdom the number of land and building companies amount to 296, the aggregate capital proposed to be raised being 29,758,000*l.* The details may, perhaps, be of interest:—

	Number of Companies.	Nominal Capital.
Lands and Building generally.....	89	£16,312,000
Miscellaneous Buildings.....	20	4,585,000
Chambers, Clubs, and Offices.....	24	3,882,000
Hotels.....	71	2,677,000
Halls, Exchanges, Markets.....	60	1,669,000
Theatres and Music-halls.....	20	509,000
Labourers' Dwellings.....	11	214,000
	296	£29,758,000

Amongst the miscellaneous building speculations are two Pantechnicons, two grand stands, six baths and washhouses, an auction mart, a horse repository, a racket-court, a working men's club, and a church spire above all other things. The last is rather a curiosity in its way, but when we know that the head quarters of the company are in Fermo, we cease to wonder. The title is the "Fermoy Catholic Parish Church Company," the object being to erect a spire upon the Roman Catholic Church at that place. The nominal capital is 3,000*l.*, in 5*l.* shares. We do not remember to have seen the name of this company in the share market, and we are at a loss to understand where the dividends are to come from. Shareholders, we suppose, are content to invest their money on earth, in the hope of receiving their dividends in heaven. Of the hotel companies the most ambitious are the Crystal Sanitarium Company, and the London, Windsor, and Greenwich Hotels Company, each of which proposes to raise a quarter of a million. Then we have the City Terminus Hotel, at the Cannon-street Station, with a capital of 140,000*l.*, and seven others with 100,000*l.* and upwards. The Emerald Isle has long enjoyed a reputation for hospitality, whilst the Scotch have, whether rightly or wrongly, we will not attempt to determine, been accused of failing in this respect. England occupies a position midway between the two. Let the lovers of statistics listen to this: one-ninth of the companies formed in Ireland were hotel or dining-hall companies. In England the proportion was about one in twenty-eight, whilst not a single hotel company was formed in Scotland. It is to be noticed, with regard to the speculations classed under the head of "halls, exchanges, and markets," that with the exception of two schemes for building an exchange at Manchester, one for the erection of a Hop Exchange at Southwark, and three others of 50,000*l.* each, they are all very small affairs. The six named companies absorb more than a million of the proposed capital. The titles of the companies are a little puzzling. What, for instance, is the meaning of a "Secular Hall," which appears both at Sheffield and Bradford?

The theatre or music-hall companies do not all belong to this class, inasmuch as some of them were only formed for the purpose of ac-

quiring existing establishments. One company wishes to "acquire and carry on the two Italian Opera-houses, and other theatres if found desirable," with a capital of 2,000.—hardly enough to pay the salary of the *prima donna*. In point of capital the music-halls are far in advance of theatrical speculations; but if matters go on as they are now, it will be difficult to establish a difference between the two. We should have been glad to see the number of companies under the next head very much larger. The names of the schemes are as follows:—Highgate Dwellings Improvement Company, capital 5,000L.; Southampton Improved Dwellings for the Industrial Classes, 10,000L.; Hereford Cottage Improvement, 30,000L.; London (City) Baths and Dwellings, 50,000L.; Croydon Labourers' Improvement, 5,000L.; Operatives' House Building, 100,000L.; Bournemouth Cottage Building, 5,000L.; Eton Society for the Improvement of Cottage Accommodation, 3,000L. Ireland had, then, done nothing in this way; while Scotland comes out very well with the Aberdeen Sanitary Reform Company, 2,000L.; Aberdeen Co-operative Building, 3,000L.; and the Dundee Working Men's Houses Association, 1,000L. Two other associations have also been formed with the same object in view, but, as they are on the unlimited principle, do not appear in our table. They are the Cleckheaton Building Association and the Liverpool Labourers' Dwellings Company, capital 25,000L.

Seventy-six companies were established for the purpose of promoting inland and marine navigation. The total capital asked for was 19,138,000L., and nearly the same amount was proposed to be raised by seventy-two life, fire, marine, and miscellaneous insurance companies. Amongst the latter class are no less than eighteen companies for insuring cattle against *rinderpest*, two are for insuring plate-glass, one with the singular title of the "Burglary, Robbery, Fraud, and Guarantee Insurance Company," one for the insurance of crops against damage by hail, and we are glad to see three boiler insurance companies. The National Boiler Insurance Company, which was registered in July, 1864, comes before the public with a capital of 100,000L.; the United Kingdom Steam Boiler Insurance Company, registered in September of the same year, has a capital of 2,000L. only; whilst the Boiler Insurance and Steam-power Company, which dates from February, 1865, proposes to raise a quarter of a million. It is not quite clear whether these companies make periodical inspections of the boilers insured, as the Manchester Association does, or whether they simply receive the premiums and leave the owners to work the boilers as recklessly as they choose. If the former is the case, we wish the companies good luck, and trust they may be the means of preventing many an "inevitable" accident.

The number of companies formed for manufacturing, dealing in, and treating textile fabrics and growing textile materials, amounts to 110, the nominal capital being 11,423,000L. The largest of these is John Crossley & Sons, Halifax, the capital being 1,650,000L., which is followed by the International Wool Company, with a million. Projects of this kind appear to find most favour in Ireland, where twenty-four (nearly one-third of the whole number of companies registered there) have been formed. Only four cotton-growing companies have been established, viz., in Bolivar, Greece, Africa, and Georgia, whilst three have been formed for spinning and growing cotton in foreign countries. A company established in Yorkshire, apparently for the manufacture of shoddy, is neatly described as the Leeds Woolen Extract Company. "Shoddy" has an awkward sound, but "woolen extract" is faultless.

Mines, especially foreign mines, have always had a mysterious charm for the speculator; but we do not find that they occupy a very prominent position in our list. One hundred and thirty-one companies, having an aggregate capital of nearly 10,000,000L., were established for the purpose of working mines, other than collieries and quarries, in the United Kingdom; whilst forty-four, with a capital of nearly 7,000,000L., related to foreign speculations. The locality of most of the English mining companies is Cornwall, thirty-three having been registered "at the office for the registration of joint-stock companies formed for working mines within the jurisdiction of the Court of the Vice-Warden of the Stannaries." Scotland and Ireland each furnishes one company. The foreign division includes speculations in Norway, Spain, Switzer-

land, Italy, South Anstralia, Russia, and America. The enormous mineral wealth of the New World still continues to dazzle the sight of those who wish to get rich in a hurry, much in the same way that it did in the palmy days of Spain. The largest of the foreign ventures is the Mexican Silver Mining Company, with a capital of 1,000,000L.

During the period under notice 60 colliery companies were formed, with a total capital of 6,541,000L., whilst 68 stone and slate quarries proposed to raise a capital of 3,985,000L. We have also engineering, iron founding, rolling, and working iron, 67, 9,737,000L.; trading, 30, 6,567,000L.; tea, coffee, sugar, and rice, 34, 6,470,000L.; smelting and refining metals, 27, 3,381,000L.; timber and saw-mills, 17, 1,686,000L. Nine telegraph companies proposed to raise a total capital of 5,892,000L. Three of these enterprises were for the purpose of connecting England and America. One hundred and thirty-four gas companies, with an aggregate capital of three millions and a half, were registered. Some of them related to foreign localities; and these, as a rule, possess the largest capital. The City of Moscow Gas Company, to whose operations we have referred several times, is the largest, the nominal capital being 875,000L. Next, we have the Rio de Janeiro Gas Company, with a capital of 600,000L.; and the Imperial Austrian, with 350,000L. The home projects do not present any remarkable features, and are mostly for small amounts. The number of water companies is small, amounting only to twenty-three, with a total capital of a little more than half a million. The disproportion between the number of gas and water companies is not to be wondered at, the manufacture and supply of gas being a comparatively simple affair, and not usually requiring the compulsory powers generally necessary to the establishment of a water company.

The supply of wine, beer, and spirits is the object of forty-three associations, with a capital of 3,747,000L. The rage for converting private firms into limited companies does not seem to have had much effect upon the great brewers of the metropolis, and we only find one of any note, that of Messrs. Goding, on the list. The most ambitious project is the Licensed Victuallers' Brewery Company, with a capital of a million. With regard to distilleries, neither Ireland nor Scotland does anything in the way of supplying the beverage for which they each enjoy so much renown. Twenty-two companies contend for the honour of providing provisions of all sorts. Amongst them we find the Australian Meat Company, which hails from Houndsditch,—a most unfortunate association. There is a good deal in a name, in spite of what the poet says, and no invidious tradesman would think of establishing a sausage-shop in Cateaton-street. Fifteen companies, with 732,000L. capital, were formed for trading in fish and oysters. As regards the commercial success of such undertakings, it may not be out of place to quote the opinion of the fishery commissioners on the subject:—

"Once in the year a acre of good land, carefully tilled, produces a ton of corn, or two or three cwt. of meat or cheese. The same area at the bottom of the sea, on the best fishing grounds, yields a greater weight of food to the preserving fisherman every week in the year. When we consider the amount of care that has been bestowed on the improvement of agriculture, the national societies which are established for promoting it, and the scientific knowledge and engineering skill which have been enlisted in its aid, it seems strange that the sea fisheries have hitherto attracted so little of the public attention."—(Report, p. xvii.)

Mineral oil has now become a very important article of commerce; and we find accordingly that it forms the subject of twenty-nine of the companies contained in our return, the aggregate capital being more than two millions and a half. The largest is Young's Mineral Oil Company, with a capital of 600,000L., established for distilling hydrocarbon oils from shale. Several others have also the same object; but some are for working natural wells of "ile" in Moldavia, Trinidad, Hanover, Italy, and Canada; and two associations have ventured to compete with native sharpness, in America. With regard to the continental deposits of petroleum, no sooner has the discovery been announced to the local Academy of Sciences by some learned professor, than a few enterprising persons draw up a circular embodying the paper, and straightway form a company for purchasing the concession. The *savant* may be well known, or not, it makes no difference, the company is formed, and it lasts just long enough to answer the purpose of the promoters. These remarks

apply to all companies in whose formation it is possible to use the name of a scientific man.

The fine arts, if we are allowed to include photography, have been encouraged by eleven companies, with a capital of nearly half a million. The International Society of Fine Arts proposes "to develop and encourage the fine arts," with a capital of 100,000L.; and the British and Foreign Modern Fine Art Exhibition erects "a gallery for the exhibition of pictures, &c.," with the same sum. Graphotype forms the object of two associations, with 75,000L. each; and photosculture of one with 50,000L. The Mutual Photographic Association might be taken every member's *carte de visite*. The object of the Blackburn Photographic and Fine Arts Company is "carrying on the photographic and fine arts business." The italics are ours. What the "fine arts business" is we do not exactly know.

No less than thirty-three associations have been formed for publishing newspapers and periodicals, the total capital being 228,000L. What sort of a life the editor of a "limited" paper must lead we can hardly realize. Under the most favourable circumstances—that is, where editor and proprietor are one and the same person—it is not always an easy thing to keep matters going smoothly. But where the editor is at the mercy of a board of directors, composed probably of printer, publisher, contributors, and a few outsiders, the poor man must become a cypher, and he content to see the policy of the paper vary with the opinions of the majority of the board. For a journal to consistently advocate any decided views, it is necessary that it should be conducted on autocratic principles. Unless the control be vested in one individual who is able to rule with somewhat absolute power, the result is generally a bloodless and homeless thing, which advocates one view to-day and the opposite one to-morrow, and heapsters the same author with mild or adulation, as the case may be. The largest of the newspaper companies, in point of capital, is the Yorkshire Conservative Newspaper Company, with 50,000L.; this is followed by the *Western Morning News* and the *Correspondent*, with 20,000L. each; next come the *Hampshire Advertiser*, with 12,000L., and the Hertfordshire and Bedfordshire Newspaper Company, *Northern Daily Express*, and the *Fortnightly Review*, with 10,000L. each. Following these we have the *Shareholders' Guardian* Company, 8,000L.; *Carlisle Conservative Newspaper* Company, 6,000L.; *Family and Servants' Newspaper* Company, 5,000L.; *Reader*, 5,000L.; *Weekly Advertiser*, 5,000L., and five others for a like sum. The most modest scheme is one with a capital of 150L. for publishing a weekly newspaper at Alcester, a small town in Warwickshire. The *Fortnightly Review*, by the way, is now a monthly publication; but the contradiction is in reality not much greater than in the case of a "weekly journal," since the word "journal" is strictly only applicable to a daily publication.

People who are continually regretting the "good old coaching days" may find a crumb of comfort in the fact that a company was formed for running coaches between London and Brighton. Nine companies were established for the manufacture of carriages, carts, and wagons, with a capital of upwards of a million and a quarter, and twenty-one for carrying goods and passengers by horse conveyances. Improving the breed of horses was the object of the Palmerston Association, the Boxthorpe Stud Farm Association, and of the National Stud Farm. Agriculture does not seem to have met with much favour, and only eighteen companies were formed for its promotion, including the three above mentioned. Only one appears to contemplate farming operations, the remainder being mostly for the preparation of manures, and the manufacture and letting of agricultural implements.

The recent Board of Trade regulations have called into existence six companies for testing cables. We find among the miscellaneous schemes a Dollar Recovery Company, which is not, as might be imagined, a Debt-collecting Association, but proposes to raise sunken treasure from wrecks. The Universal Company for the Promotion of Industry and Commerce, appears to be nothing more than a company for getting up other companies. Then we have a Merchandise Marks Registration Association for protecting trade marks under the Act of 1862, but it is not quite clear how the company proposes to effect its objects. We may take this opportunity of

correcting a very prevalent misconception, viz., that trade-marks may be registered at Stationers' Hall. It is true that the authorities receive trade-marks, but only when they are printed, and it is simply as printed matter, and not as trade-marks, that they may be registered. There is no office for the registration of trade-marks as such, although the Bill of the Act above quoted contemplated the establishment of such an office.

The names of some of the companies are amusing. Thus we have the Gothic Mining, Homeopathic Provident Assurance, Prosperous Life Assurance, Unpickable Lock, Galen Chemical Works, and Planet Assurance. The feeling which gave rise to the cry of "Ireland for the Irish" is also noticeable in the Irish joint-stock companies, inasmuch as they relate with only four exceptions to local undertakings. It is worthy of remark, that of the three companies formed for utilizing sewage, two are in Ireland. As a set-off we may mention that there are no water companies; whilst Scotland shows two out of a total of fifty-five companies of all kinds.

We have throughout refrained from entering into the merits of individual schemes. We will only remark that the passage from the cradle to the grave is in most cases singularly rapid. For the causes of this high rate of mortality we must refer our readers to the reports of winding-up cases *passim*. The brutal crime of infanticide appears to be no longer confined to the physical world, and in many instances the newly-born company is destroyed by the hands which should have fostered and protected it.

THE HEALTH OF THE IRISH PUBLIC.*

DR. MAPOTHER has just issued a second and enlarged edition of the course of lectures on public health delivered by him to the Royal College of Surgeons, in which is contained a large amount of information respecting the habits and condition of the population of Ireland. This eminent physician bases his views upon the conviction that every battle-field in Europe, the prairies of the West, and the Australian bush, prove that the physical type of the Irishman is inferior to no variety of our species, and that his powers of endurance, freedom from crime, and resignation to trials, entitle him to a cordial effort to raise the particular social and sanitary condition into which indifference has allowed him to lapse. Over this groundwork Dr. Mapother does not spare his lancet, but deliberately lays bare the causes of many Irish evils. These are identical with those in many another part of the world, overcrowding, impure water, imperfect drainage and sewerage, and the absence of either, choked intramural graveyards, insufficient ablutions, improper diet, and a general apathetic negligence as to the effects of external agencies on the health of the human body. In these particulars Ireland and the Irish are by no means desparingly behind other civilized communities. On the contrary, Erin has advantages that are not recognised to their full value. The green island knows no plague of toads and serpents, and her sons are nearly exempt from some of the distempers that rack the limbs and frames of other countrymen. Malarious and aguish diseases scarcely visit Ireland. Dr. John Brown has said,—"If an Englishman is ill, all the trouble is in his stomach; if an Irishman is ill, it is in his heart, and he is ill entirely; and, if a Scotsman, it is in his head!" But this seems scarcely true, for many Irish ill seem more to errors of understanding than of the heart.

According to the last census there are 89,374 mud or sod hovels in Ireland, containing only one room, and 487,668 mud houses with more than one room in them. In the large towns high houses in narrow streets, with every room let out to different families, furnish another type of Irish homes. Dr. Mapother thus describes a house in Dublin—56, Bow-lane, West:—

"Hall and stairs covered with 3 in. of crusted filth, first flight so rickety as to be unsafe; second without a banister; floor of second landing broken into two holes about a square foot each, dangerous to life and limb;

ceilings of both top floors broken, and let in rain; no lower sash in window of back room, so that it had to be covered with a petticoat nailed over it—such state would produce colds and rheumatism; filthy privy and back yard without a sewer—prolific causes of diarrhoea."

In Cork, from thirty to sixty human beings crowd into similar houses, which, when built, were destined for the occupation of a single well-to-do family. In Sligo there is misery of the same character. Dr. Tucker paints an Irish interior with a few bold strokes:—

"Some short time since, I noticed the homely hovel of a small farmer (the tenant of a noblemen), which may be taken as the prototype of many in country districts. It was about 12 ft. wide and 24 ft. long. The domestic circle, happy family, or menagerie, that dwelt therein, consisted of a sick man, his wife, four daughters, one son, three cows, one horse, two calves, two pigs, and poultry, all in one common undivided house—no partition. Generally, the pigs dwelt beneath the beds, the people in them, and the poultry over head."

In various parts of the country evictions and the demolition of cabins have driven agricultural labourers into the small towns, where they often find homes in lanes of cottages built back to back, without any sanitary accommodation; and whence, too, the men labour under the additional disadvantage of having to walk great distances before they can reach the scene of their long day's toil. Dr. Mapother owns candidly that in British and American cities the term "Irish" or "Irish town" is the just synonym for wretched and filthy, and that good houses in such places depress in value when let to his countrymen; but he considers the disregard of neatness and cleanliness to be the fruit of the neglected condition of the habitations of the poor, and that were the younger people to be differently educated the reproach would cease.

Acklow, in Leinster, is the picture of misery. The cabins there are usually back to back, and fittler and smaller than any seen by the doctor elsewhere. In one of these places, he records—12 ft. long by 5 ft. broad, with a roof slanting from 5 ft. to 8 ft. high—a woman gave birth to three children last autumn, and received "the Queen's reward." An old coach with a broken roof, drawn to the edge of an open sewer, formed the residence of another human being. The cholera took up its quarters here, as in too many other towns.

Irish graveyards are nearly all intramural; and no inquiry has yet been made into their state, although many of them are in a condition the very reverse of that which is required for the conservation of the public health. Dr. Mapother says he has visited the churchyards of a great many Irish towns, and has generally found them placed on the highest spot near the most central part, whence of course all percolations must descend into the wells. One churchyard he particularly describes, however, as differing from this site, for it lies so low that the water from the river overflows it in wet weather; notwithstanding which circumstance, from 80,000 to 40,000 people are supplied from it. Frequently he found these graveyards overcrowded, and the boundary-walls of others so imperfect that the bodies of infants buried near the surface have been uprooted by dogs. He pleads for the appointment of a public inspector, removed from local influences, who should judge of the suitability of sites for cemeteries with reference to their soil, drainage, and position with respect to prevailing winds. Evidence was recently given by the doctor and others before the Privy Council for the purpose of closing one such graveyard that had been in use 1,200 years, in which it appeared that the soil of it had been raised by interments to the second floor of adjoining houses, that half-decayed bodies were frequently exposed in it, and that coffins were only placed a foot below the surface owing to the number of interments. Need we add that fever and cholera raged round this death-bed?

Typhus is picked out by our author as Ireland's greatest epidemic enemy. He states that it is still four times as frequent in Dublin as in London, in proportion to the population, and that the class of residences of the persons attacked prove that it is defective sanitary arrangements, and not destitution, that cause it.

That this poison is more virulent when introduced into the system in impure water, is shown in the fact, that typhus fever prevails most intensely in towns watered by rivers, such as Limerick, Ennis, Boyle, and Sligo. How ledge of the means by which it can be eradicated from the ill to which the human family is liable, we may glean by observing how a typhus patient was treated in Irish cottage homes in a former epidemic. As soon as seized, that portion of the

cottage in which he lay was built off, and food and medicine handed to him through a small aperture left for the purpose. The Folkstone people of old time have gained immortality by proposing to throw a net over their town to prevent the importation of small-pox; this Irish mode of confining typhus is equally ingenious and calls for a division of honours. Wherever there is an Irish-peopled quarter, there, curiously, typhus occurs. He who would do good service to his fellow men should endeavor to disseminate knowledge of the causes of this arch-destroyer,—overcrowding and defective ventilation, impure water, bad drainage, personal dirt and squalor, and a low state of the system due to improper diet. This doctrine we have preached in these pages for a quarter of a century, and glad are we to see the word taken up in the sister kingdom by other voices. Different people with different sympathies have urged other requisites as of the first importance to health. Thus, John Hunter's receipt for rearing healthy children was, "plenty of milk, plenty of sleep, and plenty of flannel." The Duke of Wellington's first provision for the soldier was a good pair of shoes, the second a spare pair of good shoes, the third a spare pair of soles. The French physician's legacy to the public was a recommendation of air, diet, and exercise. Moses and Mahomet, in the words of Mr. Disraeli, made cleanliness religion. Benjamin Franklin considered that the colour of our clothing was not without influence upon our health; but it is noticeable that none of these things would be of avail to those doomed to live in an ill-conditioned house, or even in a clean house if it were situated in a town in which unsanitary conditions existed.

Although the Celt is attracted towards the West, with a power as strong as that which draws the magnet to the pole, and the wealthy in nearly all the principal European cities exhibit the same preference for the west end of them, the opulent residents of Dublin have taken up their position in the south and south-east portions. The chemical factories are at the east end, where cholera has prevailed in excess beyond other districts. The soil is gravel and strong yellow clay in the low levels, and calp limestone in the higher. A company has been recently established, called the Industrial Tenements Company (Limited), for the purpose of acquiring, by purchase or lease, old but substantial houses in the localities which fashion has deserted, and fitting them up as dwellings replete with every sanitary requisite for the working classes. There are 9,000 houses already let out in tenements in the city, but no provision whatever is made for the common decencies of life in many of them, and they are, moreover, let at exorbitant rents. Improved dwellings have also been thought of in other quarters, and a block containing 120 rooms was commenced in December, as recently recorded. Our author considers there are yet four things needful before dwellings for the poor can be improved to an extent likely to make any perceptible difference to the public health. These are, in his own words:—

1. The constitution of a complete controlling authority for directing local government and sanitary improvements.
2. The enactment of a comprehensive building code: the passing of local Acts, being expensive, is often avoided.
3. That our sanitary laws should be compulsory in cases of flagrant neglect; the permission to act is still very generally construed as permission not to act.
4. A generally diffused desire on the part of employers and landowners to provide for the healthful wants of their dependents; and this will grow according as the masses are educated in the knowledge of the laws which regulate the well-being of their own bodies."

Dr. Mapother agrees that there are seasons to diseases, and thus apportions them: inflammations of the breathing organs, rheumatism, dysentery, and scarlet fever to winter; these, with the addition of croup and whooping-cough to spring; bowel diseases, typhus fever, and small pox, to summer; and autumn he considers, with Tertullian, is the most fatal of all seasons. English statistics do not quite corroborate this theory, the three winter months appearing to be the most fatal to life. He is of opinion that consumption is more frequent in Ireland than in any other country. This affliction, scrofula, rickets, ophthalmia, and rheumatism, are all traced to the potato. It is generally allowed that the last-mentioned complaint is due to an acid in the blood; some authorities naming

* Lectures on Public Health, delivered at the Royal College of Surgeons, by E. D. Mapother, M.D., Professor of Hygiene, Honorary Member Antropological Association of Medical Officers of Health, Member of Council of Surgical and of Sanitary Societies, Medical Officer of Health, City of Dublin; Surgeon to St. Vincent's Hospital, Second edition. With numerous illustrations. Dublin: Fainin & Co. London: Longman & Co. 1867.

lactic, but by our author stated to be carbonic acid; which is the result of a long-continued starchy or saccharine diet. Seeing how our navy has been relieved from the fearful scourge of scurvy by the simple introduction of lemon juice, we cannot but look forward to a similar rescue from other diseases by a like attention to the deficiencies in the fuel with which the frame is supplied to maintain its powers. As one means of improving the diet of the labouring classes, Dr. Mapother advocates the use of Monte Video beef, when prepared according to Professor Morgan's plan, as an ingredient in the popular dish called Irish stew; and as another, the establishment of dining-rooms where working people can procure a cheap and well-cooked dinner. Eye-bread he recommends as containing twice as much lime and three times as much phosphoric acid as wheat, and banishing dyspeptic complaints, and at the same time doing away with all inducement to the use of alum, which produces dyspepsia and constipation. It was Cobbett's opinion that for every man who died of starvation, there were seven who died from overfeeding. Our author does not find this to be the case on his side of the Channel, but rather follows in the steps of Dr. Erasmus Wilson in advocating a much more liberal diet for children and young people than is generally believed to be necessary. The effect of good food upon the adult Irishman is seen in the extra physical power and mental quickness he displays when from home. If the agricultural labourer at home could live as he does in America, upon tea and coffee, fried pork and mutton, sausages, curds, buckwheat-cakes, fried vegetables and sour krait for breakfast, with similar choice and plenty for luncheon, at ten, dinner at twelve, and supper at five, he would be as efficient in Kilkenny as he is in Kentucky.

On the subject of baths our author gives new information. He says he has frequently asked the poor at hospitals when they had last bathed their whole bodies; and the answer was nearly always "never," or "not for years," the exceptions being young men who have taken an occasional plunge in the sea. He then mentions that the law agent of the Health Committee is the advocate of an endeavour to organize a system of female sanitary sergeants, who shall have power to enter humble houses and wash the women and children in them, whether they approve of such ablutions or not, as he finds the system of washing the boys admitted to a certain ragged school to have had the best results, the foul smell in the school-room being banished and contagious disorders checked in their ravages. Notwithstanding this perception of the benefits of bathing, there is but one institution in Dublin which places a frequent bath within the means of the poor man. Eighteen thousand persons avail themselves of the privilege per annum, a number which would be doubtless increased if there were more baths.

It seems almost a fashion now to take up the subject of sanitary reform as though it was quite a new idea, and that nothing has been hitherto done to help on the wheel of progress. We have seen works in which no notice whatever has been taken of previous labourers who have reclaimed the land and made it ready for others to plant. Discouraging, indeed, often, is the work of the pioneer, for he bears the brunt of the burden and yet may not stay to see the results that follow in his footsteps. But Dr. Mapother is not a writer who avails himself of the labours of others without acknowledgment: upon his pages may be found the names and words of most of our sanitary reformers. Neither is he one of those who think they can dispense with the experience, skill, and learning of the architect. Directly he approaches the domains of architecture, whether in the construction of hospitals, houses, or hns, he stops and points to the proper authorities. When we add to this acknowledgment of his candour and reticence that he has sprinkled his lectures with striking facts we shall have given our readers a fair idea of the way in which he has treated this department of Irish rights and wrongs.

LIVERPOOL ARCHITECTURAL SOCIETY.—At the eleventh annual meeting of the present session of this society, Mr. T. J. Kilpin, the president, in the chair, Mr. J. A. Pictou read a paper entitled "Notes of a Sketching Tour in France and Belgium, with illustrations." The paper was illustrated by reference to numerous drawings.

MANCHESTER FREE LIBRARIES.

AMONG the civic and municipal institutions, and educational agencies of Cottonopolis there is none that more brightly displays the enlightened liberality of the inhabitants, or that is more worthy of imitation by other communities, than the Manchester Free Libraries, now five in number, which were established in 1852, under Mr. Ewart's Library and Museum Act of 1850, since amended by the Act of 1855.

It is not our object herein to descant upon the glories of the inaugural ceremonies, although the subject is very tempting. The auspicious occasion brought together a brilliant galaxy of intellectual lights. Dickens, Thackeray, Bulwer Lytton, Charles Knight, Sir James Stephen, Monckton Milnes, Shaftesbury, Frank Stone, John Bright, Dr. Vaughan, the Bishop of Manchester, and numerous other distinguished men, "assisted" on the occasion with hearty good will.

In a characteristic speech, Mr. Charles Dickens referred, at the opening meeting, to the phrase, "the Manchester School," which had by that time become established in the national vocabulary, and which, he said, had very contradictory interpretations,—some persons maintaining that the doctrines of the school were very broad, and some that they were very narrow; and that the school was all cant, others that it was all cotton. "I have solved this difficulty," said he, "by finding here to-day that the Manchester School is a great free-school, bent on carrying instruction to the poorest hearts. It is this great free-school, inviting the humblest workman to come in and be a student—this great free-school, munificently endowed by voluntary subscriptions in an incredibly short space of time, starting upon its glorious career with above 20,000 volumes of books, knowing no sect, no party, and no distinction, nothing but the public want and the public good—that shall henceforth represent to me the 'Manchester School.'" Before proceeding to notice the "school"-houses of the Manchester free libraries, it may be mentioned that the 20,000 volumes with which the first free library was opened, little more than fourteen years ago, have quadrupled in number, there being now above 80,000 on the shelves of the Reference Library, or in the hands of readers in that department, or of borrowers from the lending libraries. The first library school-house has had four affiliated district libraries added. In three of these the business is carried on in buildings erected at the public cost, for the special purposes to which they are devoted, and the fourth branch is having a new house erected for it.

It is to be regretted much that a project so great and so deserving as that with which the Manchester Free Libraries' Committee have been entrusted should have been marred, to a considerable extent, and have been restricted in public usefulness, by serious mistakes from the first step—it may be truthfully added, to the last—in their provision for the housing of their noble institutions.

The nucleus of the Manchester Free Libraries was formed at Campfield, where the collection is still known as the chief library. This was the first library established under the Act referred to, and the first free lending library maintained at the public cost, out of local rates, opened in the kingdom. If the late Sir John Potter and his co-labourers in the grand initiatory steps could have anticipated the experience of the last fifteen years, we venture to think that the chief library would never have been located at Campfield, and that the temptations of a cheap, but ultimately dear, purchase, would have been resisted. Several considerations operated as instigations to the purchase of a site unsuitable, and of a building ill-adapted for a Central Free Library of Reference, and for circulation. The "Hall of Science," founded by Robert Owen and his disciples, was a large, hideous, unfinished brick building, in which various "educational efforts" were made on week-days and on Sundays, for the elaboration of a "new moral world." In its later days the educational efforts became degraded into orgies, indulged in by promiscuous dancing parties of boys and girls and young people—factory operatives chiefly. These were not satisfactory to the more punctilious inhabitants of the district, nor considered creditable to the general community. They were resorted to probably more as a means of meeting the liabilities of the concern than as moral agencies. The "hall" went a-begging for a buyer, and was bought for a very small price by the founders of

the Free Libraries. The site is anything but central, or suitable for the deposit of such a large collection of rare and valuable works for study and reference. It is quite on the outside of the business part of the city; and even as regards residential passers by, can scarcely be said to be on the road to anywhere. The grand unfinished building required more money for its, at best, imperfect adaptation, and has required more money since for its maintenance, than would have sufficed to have erected a new specially adapted building in a suitable situation. The structure had to be almost entirely remodelled; the window spaces were all re-adjusted, and the walls thereby greatly weakened. To gain an additional room, the walls were raised, and a heavy roof placed upon them,—much too heavy for their shattered condition. The side front of the remodelled building, which is in the Italian style, was faced with Portland cement, which is constantly shaking off, and necessitating repainting of the two fronts, side, and entrance, every few years, at a large cost each time. Heavy expenditure has also been incurred in the various attempts, under the most disadvantageous circumstances, to warm, ventilate, and light the rooms of a radically defective building. Notwithstanding all the disadvantages presented at the outset, the late Mr. Pickett, of the Architectural Department of the Manchester Corporation, contrived to plan and fit up a noble room for the purposes of the Reference Library. This apartment is above 80 ft. long by 54 ft. wide, and has a coved and panelled ceiling, the height being about 20 ft. to the spring of the cove, and to its top, 27 ft. It is lighted by twelve windows—six on each side, which are 15 ft. 6 in. in height, by 5 ft. 3 in. wide. The lower room, used as a free newsroom and lending library, is of the same area as the Reference Library, but considerably lower in the ceiling, and very difficult to keep sweet, crowded as it constantly is with newspaper readers and visitors to the lending library. The serious disadvantages resulting from the inconvenient situation and other causes of the Free Reference Library of Manchester, are likely to be remedied by the resolution which has been adopted by the city council, that accommodation shall be provided for the department in the new town-hall; always provided, of course, that the protracted discussions concerning the site and the extent of the proposed town-hall should end more tangibly and promptly than the lively debates and voluminous documents devoted a few years since to the new Post-office question, which ended in the Government order,—“As you were,”—and in failure to obtain upon either of the sites sought for a building worthy of the city.

The outgrowths of the chief library have been, in succession, a branch library in Hulme, for the use of the inhabitants of that district; another in Ancoats; a third in Rochdale-road; and, lastly, a fourth in Rusholme-road. With the map of Manchester before us, and noting the localities in which the branch libraries are planted, we conclude that one more, to serve the inhabitants of the Strangeways and Cheetham-hill district, on the north side of the town, will complete the system, and satisfy all reasonable requirements for some time.

With limited means at their disposal, the library committee, in opening the first two branch libraries, Hulme and Ancoats, adapted the most suitable existing buildings they could secure for temporary occupation. These premises,—ordinary shops and dwelling-houses,—were, as may be supposed, very difficult of adaptation to such special uses as news-rooms and libraries, and the accommodation so extemporized is not fairly open to criticism. The inconvenient occupation of these make-shift places had its use, however, in the negative sense of giving experience "how not to do it," as regards premises, and indicated the essential requisites that should be provided in buildings specially erected for free news-rooms and libraries. A wise use has been made of the experience thus acquired in relation to two of the new branch libraries that have been built by the committee, but it has been utterly disregarded in relation to two others, one finished and the other in course of erection. The two former are the new branch libraries at Hulme and in Rochdale-road, which were built to the plans of the late Mr. Richard, of the Manchester corporation; the others are the Rusholme-road branch, recently completed, and the Ancoats branch, in course of erection upon the plans of Mr. Waterhouse. Whether the architect had *carte blanche* from the library committee we do not know, but

the news-room at Rusholme-road is certainly ill-fitted for the uses to which the room is applied.

The sententious counsel once given, on the eve of battle, "Put your trust in God, my boys, but keep your powder dry," contains the essential elements of the instructions upon which the officers in charge of public reading-rooms require to act, "Have confidence in your visitors, but keep your eye upon them." All such places of resort, from the great reading-room of the British Museum—with its radiating desks all raked and commanded by the officials in the centre of the room—downwards, require to be under surveillance throughout their entire area. Even in the British Museum the abstraction of hooks, parts of books, and prints, maps, &c., is not an unknown crime. The news-rooms connected with each of the five free libraries of Manchester are open to all comers, absolutely free and without the necessity for introduction or qualification of any sort, other than freedom from an offensively filthy or an inebriated condition. It is no great detraction from the glory of these institutions, nor a thing to be wondered at, that papers are occasionally pilfered, partly through ignorant, partly through criminal, cupidity; neither is it to be wondered at that these offences should be numerous in exact proportion to the laxity of attention on the part of the officer in charge of the room, and to the hinderances that its construction and arrangements may throw in the way of his complete surveillance. The public room in Liversay-street, Rochdale-road, is the first new building which was erected by the Library Committee. The one public room, 42 ft. by 32 ft., serves for both reading-room and library, the lending books being shelved across one end of the room, with a short return of shelving within the librarian's counter on each side. The entire area of the room is constantly within the range of his vision. The library has a handsome dressed stone front, and, adjoining it, a rather shabby house—also built by the Corporation—and occupied by the librarian. The room has a lantern-roof, and is lighted at night—as are also, we ought to have said before, the rooms in the chief library, at Jampfield—by gas sunlights, with arrangements for carrying off completely the products of combustion, and the vitiated air exhaling from the visitors.

This branch serves its purpose well in all respects than this, that it is about half the size it should have been. A small fact this may seem, but it is worth being kept in mind in the discussions as to the first provision, and the expediability of the proposed new town-hall for the city.

The second new branch library built by the committee was for the important township of Hulme, in the Stretford new road. The accommodation here is on a much more extensive scale than at Rochdale-road. The library occupies the wing of the finest building in the township, the Hulme Town-hall. To the right of the entrance is the lending library, with an area of 29 ft. by 29 ft. within the counter. The news-room, to which there is a wide passage in front of the library counter, is a fine light and lofty apartment, 47 ft. long by 44 ft. wide. The plan is simple and unpretending, the result admirable. The arrangements for the shelving of the books in the library are most convenient; wings being thrown out from the walls carrying donkey-headed shelves. The division between the library and the news-room is by a partition, raised in the under part, by which the librarian can command a view of every visitor in the room. This he does by the help of the simple arrangements in the reading-room. Along the walls on one side and one end are reading-slopes for the accommodation of about forty papers. A main portion of the area of the room is occupied by four long and wide tables, with seats round them; such tables being covered with weekly newspapers, magazines, and other periodicals. This branch has worked very successfully from its opening; the success being largely attributable, doubtless, to the efficiency of the librarian, Mr. B. Chadwick, but not less so to constructional internal arrangements. The next branch library opened was that at Rusholme-road, a few months since, when Lord Shaftesbury and other notable men lent their aid to the occasion. In this building there may be said to be a way of art; bricks and stone, and boards, and skirtings, are certainly left to show what they are, but there has been retrogression as regards the fitness of the room for its particular use. It would seem to us that the

owners of the land upon which this building is erected might have made it almost anything within a reasonable limit in form and arrangement that they could have desired. It presents a frontage of about 80 ft. to the street. The lending-library, in the front part of the building, is 58 ft. by 30 ft. wide; and is arranged as regards shelving on a similar plan to the Hulme Branch. Above the library is a large room available for a district lecture, meeting, or concert-hall. With these provisions we have no fault to find. A hack building is run out at a right angle from the front block. This hack portion is the free news-room, and is 60 ft. long by 30 ft. wide. It is lighted in the day-time by ranges of clearstory lights, and by a seven-light wheel stained glass window in the gables. The walls are sufficiently lofty, 24 ft. to the wall-plate above the clearstory. The glass screen exists, as at the Hulme branch, between the lending-library and the news-room, but here the standing reading-boards are ranged across the room; and, unless the librarian can see through several files of readers, and as many deal boards, he can have no oversight of the occupants of the room. But this is not all. To the right and left of the clearstory wall are, on the ground-floor, series of alcoves recesses 9 ft. deep from front to hack. These are each fitted up with a four-sided reading-slope in the centre, and are seated all round; and are, it need not be added, quite out of the reach of the librarian's eye, and even, for the most part, out of sight of the occupants of the body of the room. In these recesses the wicked of the visitors may play all sorts of pranks without fear of detection. It should be mentioned here, in connexion with these institutions, that the visitors may not only read the newspapers, but they may also obtain books to read "on the premises," and returned to the librarian when they leave the news-room. Revisiting the room, after the gas is lighted, that is, when the room is most used, it seemed to us that the gas-jets, which are arranged round the walls in brackets, throw a fine light upon the principals and ties of the open timber roof, but put the papers, for the greater part, into shadow. The alcoves must either be bricked up, and the space wasted, or the main wall must be taken down and rebuilt to enclose all the area to be used as a news-room.

The new branch library at Ancoats is upon the same plan, in its main features, as that we have been referring to; but the committee have determined to give up the alcove arrangement.

We have dealt rather lengthily with this subject, from the belief that it is important that the municipalities which have adopted, and are adopting, the Free Libraries' Act, may have information that may be of use for their guidance in providing the necessary buildings.

AN EARLY ENGLISH DOMESTIC ARCHITECT.

JOHN THORPE.

In this well-encouraged age of architecture in England, when the Tudor or Elizabethan style is the prevailing fashion among the successors of Inigo, Sir Christopher, and Sir William Chambers, some account of the ablest architect who flourished in England, whose works are now again in fashion,—and of whom, unhappily, there is little known,—will not be deemed out of place. I trust, in the columns of the *Builder*. The skilled thousands who admire Wollaton Hall, near Nottingham, Hatfield House, in Hertfordshire, and Holland House, in Middlesex, will be pleased to have told them all that is publicly known:—

"How nothing's that"*

of the great High Priest of this old revived, patched, vamped, picturesque, and truly English style of architecture,—more especially so when what is retold is relieved with a little (however infinitesimal) that is new.

A certain John Thorpe (*one Thorpe?*), an architect and surveyor,—I may safely call him,—was largely employed in England during the latter years of the reign of Queen Elizabeth and the opening years of the reign of King James I. He practised,—if, indeed, he did not invent,—a Domestic style of architecture dear to the

hearts and hearths of England. Yet, oddly enough, we may safely assert that his name was unknown to Wren, to Vanbrugh, to Gibbs, to Kent, to the Earl of Burlington, and Batty Langley. His name escaped the diligence of George Vertue, and was only revived or resuscitated by an accident.

When (about the year 1772) Walpole was busy with his *Anecdotes of Art in England*, he then Earl of Warwick (a Greville), attracted by his book, considerably placed at his disposal for future use an atlas-sized volume of designs, elevations, &c., the work of one John Thorpe, of whose existence the diligent George Vertue was not aware (for he had collected nought about him), and of whom, a pains-taking inquirer like the Lord of Strawberry-hill (that romance in lath and plaster) knew nothing, or at least had thought to tell. And yet what nothings Walpole has preserved and set in gold by the minutiae artifices of his pen. "Pretty in amber," &c.

That Walpole valued the atlas-sized volume we may readily understand; that he coveted it we may safely assert; that he returned it to Lord Warwick is certain, for the volume was sold 10th April, 1810, at the sale (so Mr. Dallaway tells us) of the library of the Hon. Charles Greville, and bought by no less a person than Mr. Soane, R.A., afterwards Sir John Soane. Mr. Dallaway adds, that the fortunate purchaser "offered it to Lord Warwick for the price he had given, when it was declined with a merited compliment."

I have been fortunate enough to discover the price that Soane gave. It was *twenty-seven guineas and a half*. What would it sell for now? But our precious folio is past all human probability of coming again under the auctioneer's hammer. Collectors who annotate Walpole's "Anecdotes," should insert in ink, and neatly, the price that Soane gave.

Walpole's brief account of Thorpe may be in part transferred, with advantage, to the *Builder*. The words in square brackets [] are mine:—

[From Walpole's Works, vol. iii., pp. 144-5, 4to., 1798.]

"SUPPLEMENT.

By the favour of the Earl of Warwick, I am enabled to bring to light a very capital artist, who designed or improved most of the principal and palatial edifices erected in the reigns of Elizabeth and James I., though even his name was totally forgotten. I am empowered by the same condescension to point out a volume of drawings of that individual architect,

JOHN THORPE,

who has left a folio of plans, now in Lord Warwick's possession. There are not many uprights, but several ground-plans of some of the palaces, and many of the nobility, extant, erected, or altered at that period. Of some he names himself the author; of others he either designed, supervised, or proposed alterations; though, according to the negligence of that age, he is not circumstantial in particulars. There are ground-plans of Somerset House; of Buckhurst House, in Sussex, an immense pile; of Woolston [Notis]; Coptall [Essex]; Burleigh House [by Stamford town*]; Burleigh-on-the-Hill (the Duke of Buckingham's); Sir Walter Cope's, now Holland House, at Kensington; Giddy Hall, in Essex; Audley End; Amphil (now called Houghton); and Amphil Old-house [Beds]; another spacious palace in which Catherine of Arragon sometime resided, and of which he says he himself gave the plan of enlargement; and Kirby [Middlesex], of which he says he laid the first stone in 1570. . . . He appears also to have resided at Paris, and even seems to have been employed there; at least he gives alterations for the Queen-Mother's house, *Faber St. Germain*, which I suppose means the Luxembourg in the Faubourg St. Germain, and a plan of the house of Monsieur Jammet (Zamet).

There are several other smaller seats and houses in the book, some with the names of the gentlemen for whom they were built. One which he calls *Cannons*, is Father Lake's house [Cannons, Middlesex]; and another is a whimsical edifice designed for himself, and forming the initial letters of his name, I . . . T, conjoined by a corridor (which I have expressed by the dotted lines) and explained by this curious triplet:—

* These two letters, I and T,
Join'd together as you see,
Is meant for a dwelling-house for me,
JOHN THORPE."

* Tenynson.

* Ben Jonson of William Camden.
† Bishop Burnett's "one Prior" (the poet) and the epigram thereon must be in the ready recollection of many.

The volume, however, is a very valuable record of the magnificence of our ancestors, and preserves memorials of many sumptuous buildings of which no other monument remains.*

Of Thorpe I have a fact or two new to his biography to tell. He is referred to in print by Henry Peacham, a well-known and voluminous writer of the reigns of James I. and Charles I. See the last page of Peacham's "Gentleman's Exercise." Henry Peacham was a popular book-maker (not unlike James Howell, the letter-writer), of the reigns I have mentioned. Walpole has an account of him in his Catalogue of Engravers. He was Master of Arts of Trinity College, Cambridge, and travelling tutor to the sons of the Collector Earl of Arundel,—consequently no common man.

But to make good my promise of a fact or two about Thorpe new to his too brief biography. First of all, after a long and expensive search in the Prerogative Will Office of the Archbishop of Canterbury, I failed in detecting our architect. I found a John Thorpe—a likely one—and my cheeks flushed with hope; but this John Thorpe unhappily was a "mariner"—not a master-mason, a surveyor, nor an architect—and so my money was lost. That our Thorpe was a "surveyor" is evident from a short "survey" of his printed in the Parliamentary Reports of Fordyce of the Land Revenue Office. Others may still exist. Let me hope, therefore, that I may set others on the right scent for facts, however small, "touching" our great Elizabethan architect—our ablest architect in the Domestic and Jacobean from 1665 to the accession of Charles I., in 1625. His Strand front of Somerset House, in the Same volume, is fine, and well deserves to be engraved.

Before parting with our architect, let me hint how I more than suspect that the fine House of Loseley, near Guildford, in Surrey, is by Thorpe. In the Same volume is "Sir Geo. Moore's house." Now, perhaps, some skilled surveyor will kindly tell us if the happily still standing house of Loseley is identical with the design in Thorpe's volume?

Loseley is in the hundred of Woking. There is an excellent engraving of the drawing-room, with its rich chimney-piece, in the first series of Mr. Joseph Nash's "Plates of the Mansions of England in the Olden Time."

PETER CUNNINGHAM.

THE LATE HERBERT MINTON.

I FEEL deep regret that in your number for the 16th inst. Mr. C. B. Allen should have sought, in his advocacy of the claims of the artist and art-workman in the production of works of art to distinguished rewards, to depreciate ungenerously the claims which the late Mr. Minton had to the honours conferred on him for the works which his firm produced, and which Mr. Allen considers as an instance of great "ingenuity and unfairness." I know not on what authority he states that Mr. Minton considered it absurd to suppose "that we had yet to learn of the barbarous Chinese." From a close intimacy of many years with my late valued friend Mr. Minton, from many conversations with him on the subject of art as applied to manufactures, and inspecting with him different collections and objects of art, my impression is firm that he neglected no source of information and improvement, but sought out each with an acuteness of intelligence in reference to his own pursuit peculiar to himself; that he not only highly esteemed the skill and taste of the French, but that he held in the utmost value those of the Italians; and he instituted experiments upon tesserae of gold mosaic, given him by my friend the Signor Foscati, from the ceilings of the Mosque of Sa. Sofia at Constantinople, in order to understand their composition and manufacture. Your correspondent says, "Mr. Minton was an employer of art-labour in all forms, but he was nothing else." In this the writer is most unjust; for he was a man of great taste, and no one ever had a greater tact in appreciating the style of art and execution best adapted to his peculiar class of manufacture, a skill much beyond that of the mere artist or artisan. If he could not compose or draw, he knew how to direct the artist, both as to subject and treatment; for it rarely

* Compare Worren's Dalway's Walpole, p. 202, with Dalway's own Walpole, vol. i. p. 336. The woodcut of "Burligh House, Lincolnshire," is omitted by Mr. Worren.

happens that even a good artist, unless with great experience and practice, can know the special conditions, which belong distinctively not only to every class of art manufacture, but to the different objects themselves. This Mr. Minton possessed in the highest degree; and to the full extent of his powers he cultivated those qualities in the artists he employed, and thus rendered their talents available for his special purpose. He had a noble ambition, superior to the idea of mere profit or loss, for he was animated by the spirit of a master of the olden times, as of a Pallissy, to produce the best and noblest work of the kind, and to encourage all employed under him; as witness the hody of his men that were sent to the last Paris Exhibition for a week, at the cost of the firm, to instruct and improve themselves. All, therefore, should agree that Herbert Minton was a distinguished man, and deserved the honours that were bestowed upon him.

THOS. L. DONALDSON.

THE PRESIDENCY OF THE ROYAL INSTITUTE OF ARCHITECTS.

THE two years' term of Mr. Beresford Hope's presidency being now about to expire, we understand that the names of Mr. Tite and Earl Grosvenor are being mentioned for the office. We cannot possibly be wrong in expressing the hope that whatever nomination may be decided upon, the election will be kept clear of everything like contention, and especially of that kind of contention which becomes partizanship. With regard to the two gentlemen above alluded to, it may be said that on the one hand the members of the Institute cannot but remember gratefully the noble way in which Mr. Tite, on a former occasion, filled the office; while on the other hand, the distinguished credit which is understood to be due to Lord Grosvenor in respect of the architectural operations on his father's estate at Piccadilly may be held to entitle him to early honour at the hands of the profession.

If a single word may be permissible on "the Battle of the Styles," we would say that Mr. Beresford Hope's active presidency, and that of Mr. Tite, have both proved the utter groundlessness of all apprehensions of partiality founded on the mere personal tastes of whatever gentleman is entrusted with the honourable position of President.

PRIZES FOR ART-WORKMANSHIP.

A LARGE number of premiums will be again offered by the Society of Arts to carvers, metal-workers, bookbinders, painters on china, and others. A committee met at the South Kensington Museum last week, and selected a number of fresh objects for reproduction.

The Yorkshire Architectural Society, with a view to encourage the art-education of workmen residing in Yorkshire, propose to offer prizes, accompanied by certificates, to the producers of the best examples of stone-carving, wood-carving, modelling in clay, or metal-work. For the present year the prizes will be for subjects worked in wood.

CARDIFF LADIES' SANITARY ASSOCIATION.

A PRELIMINARY meeting has been held to form an association on the principles of the London Ladies' Sanitary Association at Cardiff. The Mayor occupied the chair; and Meior Page, for his sister, Miss Page, who convened the meeting, explained the objects of the association. His sister, he said, was induced some years since to take an interest in the proceedings of the London society, which had many branches formed in different towns in the kingdom. She thought that no better means of doing good were afforded her than by establishing a similar association in this town. It was at present proposed to limit the operations of the Cardiff association to the distribution of the admirable tracts published by the London society, which contained popular information on sanitary matters, and to the aid that would be rendered by Bible women and others who were interested in the matter. They had annual subscriptions for the present year which amounted to 40*l.* and 25*l.* in donations. He believed that they would be able to increase their donations to 50*l.*, and then they would be

enabled to accomplish a surprising amount of good. The meeting then proceeded to frame rules and appoint office-bearers, Mrs. Oliviant as president, and Miss Page as honorary secretary. Gentlemen of the medical profession and clergymen had offered their assistance, and a committee of gentlemen was appointed to aid the ladies, who also appointed a committee.

ENIGMA.

1. Aloft in the air, and beneath in the ground,
2. Both in fire and water I'm commonly found;
3. With women display'd, in old books, in a tree,
4. Wherever you gaze you may recognise me,
5. Look under a hood and examine a face,
6. My lineaments there you may probably trace;
7. In the reign of King John, though so gracefully framed,
8. A spiller of blood I was pointedly named.
9. With the Edwards I flourish'd, became very rich,
10. And rose under them to an eminent pitch.
11. In the time of the Tudors, though gaudily dress'd
12. And in capotted state, I was sadly depress'd.
13. Connected with Churchmen, with bishops, and peers,
14. Even seen with a monarch, yet often in tears,
15. Under me have been marshall'd the great and the good,
16. Yes, to me all the greatest and proudest have bow'd.
17. These wide-spread honours soon banish'd my fears,
18. My head being fill'd with the brightest ideas;
19. The brave and the royal I welcome, in short,
20. Do myself wear a crown, and can boast of a court.
21. Having once been a Roundhead, the king, you'll agree,
22. Was forced from a palace to prison through me;
23. In old Greece and old Egypt you'll seek me in vain;
24. At Rome, in vast heaps, you may find me again.
25. From shore to shore, far over the sea,
26. View my glorious form in its full symmetry.
27. On many a stage have I acted a part,
28. Still in shape bent, askew, rarely straight as a dart.
29. I am waggish and mirthful, yet sorely, like man,
30. It must be admitted my life's but a span;
31. In some cases my style may not be to your mind,
32. Without me and my capital at their command.
33. In groves and in arbours I oft vegetate,
34. Or inhabit a cavern, so varied my state!
35. In crowds I revel; without my support,
36. What would come to the Church, the Senate, or Court?
37. Broad-shoulder'd, and firm in the joints, be it told,
38. I can carry a load weighing many a stone.
39. With members so seemly, for one of my mould,
40. And rotund in my shape, every rib may be told;
41. No obstacles stop me, so well built and strong,
42. By spring after spring I am carried along.
43. Far removed from the base, it must now stand confest
44. That my friends may be rank'd with the firmest and best;
45. A wide sweep of adherents, of varied degree,
46. Whose very assistance is central to me.
47. United with such, ever close at my post,
48. Mine is clearly a proud elevation to boast.
49. To sustain the dignity, to enable the face,
50. To enlighten and edify,—this is my place.
51. On my work let no evil construction be laid,
52. While my course is so even, the rule well obey'd.
53. In stories my style may not be to your mind,
54. But for these lofty purposes was design'd.
55. The secret's unlock'd when my key is once grasp'd;
56. In a month you will certainly find me at last.

SOLUTION OF ENIGMA:—ARCH.

1. The vault of the heavens, &c.; tunnels, &c.
2. Furnaces, piers, bridges.
3. Archers; archives; lurch.
4. Iron-moulding; eyebrows; nose.
5. Lancet arches.
6. The Decorated style.
7. High-pitched roofs.
8. The depressed Tudor arch.
9. Archdeacons, archbishops, piers.
10. Monarch; tiers.
11. Low Gothic doors.
12. Stained glass.
13. Triumphant arches.
14. The Crown of an arch; the Court of Arches.
15. Circular Norman arches.
16. Through gates and doors.
17. Rainbow.
18. Building stages.
19. A skew bridge; straight-sided arch, or stones looked in a straight line on the principle of an arch.
20. The adjective, "arch."
21. Capital of pillars.
22. The shoulders of an arch; joints of stones.
23. An arch is said to "carry."
24. The members of an arch.
25. The ribs of vaulting.
26. The spring of an arch.
27. The basement.
28. Being bricks, the slang term.
29. Sweep of arch; at different angles.
30. Centre of arch.
31. The posts of an arch.
32. Elevation of a building.
33. With windows.
34. Course of bricks; the square.
35. Stories of houses.
36. The key of an arch.
37. March.

COMPETITIONS.

Bristol Assize Courts.—The Finance Committee have considered the subject of procuring plans for the new Assize Courts, now that the property in Small-street, intended for the enlarged site, has been secured. It is determined not to advertise for plans generally, but to send to the six previous competitors to request them to give designs. The mayor, as chairman of the committee, moved that they should refer to the council for fresh instructions before taking any important step, and Mr. Phippen seconded him; but the majority eventually decided to invite the six former competitors only. The plans are to be sent in by the 28th of May.

Schools, Liverpool.—In a local competition of nine architects, for schools, to be erected at the sole cost of a benevolent lady (Miss Wright, a member of the congregation of Holy Trinity Church), the designs of Mr. J. F. Doyle were selected.

Burnley New Workhouse.—Local critics have pointed out considerable deficiencies in the accommodation provided by the selected design, nor do the objections seem to have been successfully got rid of. However, the guardians appear to view the design as merely the groundwork for some architect now to work on, and we find in the local *Gazette* the following extraordinary advertisement:—

"The Guardians of the Poor of the Burnley Union are desirous of receiving Tenders from Architects willing to undertake the preparation of the detail and working Drawings, and the requisite specification of the new Workhouse, and also to superintend the erection thereof for at least two days per week, and give the usual certificates of work done or materials supplied by the respective contractors. Sealed Tenders to be sent in to me, endorsed, 'Architect's Tender,' not later than," &c.

This seems a new phase of competition. What was the object of the competition just closed, if not to obtain an architect? Who so fit to carry out the design as the designer? And if the design is not a good one, what business had the Board to select it? We shall be glad to have the names of the architects who "tender" under this precious advertisement.

ARCHITECTURAL NEWS FROM GERMANY.

Prussia.—The war of last summer, short though it was, could not fail to make a marked difference in all peaceful pursuits—in building operations amongst the rest. Large factories, iron-works, and builders' yards were partially, in many cases entirely, closed, in consequence of the conscriptions going on throughout Germany, in order to bring the various armies up to the required standard of a war-footing. That, under these circumstances, public and private buildings in course of erection should have been mostly stopped in their progress towards completion, was only a natural consequence of this wholesale calling-in of all able-bodied workmen. And even for months after peace was restored, and the men had been dismissed from the armies to resume their various vocations, the effect continued to be felt throughout Germany. Gradually, however, confidence was again restored, and at this moment most of the factories and other operative establishments throughout the kingdom, are in full swing again.—At *Berlin*, the new National Gallery is rapidly progressing towards completion, after-hours by gas being kept up throughout the building. This is, however, the only public erection of any general interest, now in progress in that city.—The annual prize of 750 dollars (about 100 millions) for two years, to be applied by the successful student in travelling, is this year open to architects: it is for Prussians only.—A new weekly architectural journal has appeared here, called *die Wochenblatt des Architekten-Vereins zu Berlin*.

It contains the proceedings of architectural societies, original articles on arts generally, notes and queries, Competitions, and other matter of special interest to the profession, and is edited by Baumeister Beckmann.—The city of *Breslau* intends to commemorate the late Prussian victories by the erection of a Hall of Arts and Sciences, the estimate for which is about 45,000*l.* They hope to raise two-thirds of local subscriptions, and propose applying to His Majesty for the other third.—At *Cologne* the tower of the Chancel of St. Maurice has been entirely rebuilt, reaching a height of 218 ft. The top of the spire is to be surmounted with a colossal statue of the patron saint,—a somewhat questionable proceeding, which reminds us of

St. George's, Bloomsbury, where, contrary to the good old Latin axiom, that the king is the head of the Church, he is made the head of the steeple. On clearing some ground not far from the Dom, and on the eastern side, the workmen engaged discovered an old Roman hab, octagonal in plan, and about 7 ft. across. The corners are vaulted, and two sides are longer than the rest to contain stone benches. It will be impossible to remove this relic to the Museum, partly from its depth (the top of the vaulting is 14 ft. below present street level), but chiefly from its constructive material, which seems to be brass, with a coating of very hard cement.—At *Frankfort* a competition for a large Gothic church has resulted in the adoption of a plan by Mr. Franz Schmitz, of Cologne. Mr. Schmitz was a pupil, and is the successor, of Professor Schmidt, an architect to the Cologne Dom.

Austria.—The eight marble groups intended to have been placed on the parapets of the Elizabeth Bridge at *Vienna*, should have been delivered in November last, but the course of events last summer delayed their execution, and we are now informed that they will be formally inaugurated on the 24th of April next, being the anniversary of the marriage of the present Imperial couple.—Count Wickenburg, formerly Minister of Commerce, is, by command of the emperor, engaged at the head of a committee to consider the most feasible method of executing a building designed to contain the different collections of objects of art belonging to the Imperial family, but now dispersed over many parts of the empire.—During his late visit to Prague, His Majesty gave 10,000 florins towards the rebuilding of the Bohemian Museum in that city, as also 5,000 florins in aid of the National Bohemian Theatre.—Mr. Fr. Stache, architect, of Vienna, has received the "gold medal for arts and sciences" from the King of Württemberg.

Northern States of Germany.—The palace at *Brunswick*, which, as our readers will remember, was almost entirely burnt down one cold winter's night, two years ago, whilst a court ball was going on, has been so far rebuilt that its completion may be expected next autumn. The central portion and the right wing are entirely restored, leaving only the left wing and the dome over the rotunda to be completed. Professor Howaldt, whose celebrated labour of ten years, the "Quadriga," melted in the flames, is busy on a second edition, which he hopes to finish in another two years. He has already completed one horse, and is far advanced with a second.—At *Bremen* the erection of a new hotel de ville has been determined on. The site is one side of the square called the "Domsbaide," in the rear of the statue of Gustavus Adolphus. This statue, by the way, had a little history of its own, before it found a resting-place amongst the Bremer. It was originally intended for Berlin, and was modelled and cast by Swedish artists about the year 1854. The ship which was to take it round from the Baltic stranded on the shoals of Heligoland, and sank. The Heligolanders fished it up, and, claiming the right of stranded goods, refused to give it up. Here we saw the great hero, fresh from the mould, lying prostrate on the beach, with his sword and one finger broken. Prussia refused to re-buy him, and so he was ultimately bought by the Bremer, and hoisted on a pedestal in their principal square,—the champion of Protestantism in a Protestant city. But, to return to the projected building. It is to contain two large halls for meetings, and eighty-two smaller rooms, and is to cost 280,000 dollars, or about 42,000*l.* The architect of the building, which will be Gothic in style, is Mr. Schröder, city architect.—At *Hamburg*, the Senate has voted another 62,000 dollars towards the completion of the "Kunst-halle," or hall of arts and sciences. This makes up, besides the free grant of the site, a total cost of 254,000 dollars, or about 38,000*l.*, of which some 20,000*l.* were raised by voluntary subscriptions.—The old round-arched Dom of *Lubeck* is terminated at its western end by two square towers and spires, each 400 ft. high. One of these towers has at last become dangerously unperpendicular, and is now surrounded by scaffolding preparatory to being partially taken down. The spire will be rebuilt when the tower is brought back to a vertical position.

Southern States of Germany.—The well-known influence held by Richard Wagner, the composer, over the King, has manifested itself lately in an order for the erection of a theatre at *Munich*, larger and handsomer than any now in existence in that city. The original idea was to place it upon some high ground, known as the Gasteig-

anlagen, on the further side of the river Isar, and to connect the building with the palace by opening up a new street and throwing another bridge across the bed "of Isar rolling rapidly." This plan has, however, been abandoned, and the new theatre will stand on the site of the present "Hogarten" barracks. Professor Semper, of Zurich, is the architect engaged; and the estimated cost is three millions of florins, or about 250,000*l.* The style will be Italian Renaissance, and one of its features will be the entire absence of galleries or balconies; the seats rising one behind the other, on the plan of the ancients. In its elevation next the street, the theatre will be flanked on either side by concert-rooms, &c.

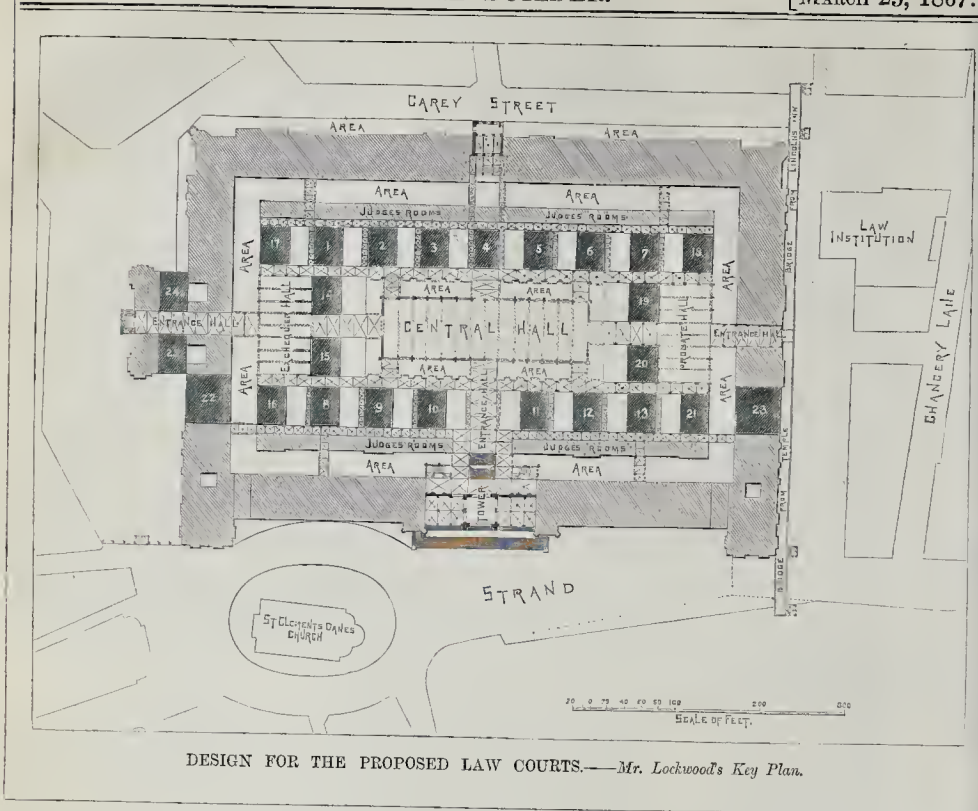

That indefatigable erector of statues, old King Ludwig I., has ordered three more. One of these is for *Regensburg*, in memory of his old tutor, Bishop M. von Sailer, and is to be 10 ft. high; Professor Widmann, of Munich, is now engaged upon the model: the casting is to take place next year. The other two statues are those of the two architects, Gärtner and Klenze, and are to be erected on the Gärtner-platz, immediately in front of the Volks Theatre, at *Munich*. The execution of both these figures is entrusted to Professor M. Widmann.—According to the audited accounts of the architects engaged upon the Minster at *Ulm*, the sum expended on restoration and repairs between 1844 and 1866, amounted to 305,500 florins, to which must be added a new organ and loft, which cost 60,700 florins more, making a total of 366,200 florins, or about 33,000*l.*, over a period of 22 years. About half of this sum was raised by voluntary subscriptions in 14 years, whilst the Government and city contributed the remainder.—At *Heidelberg* a Society has been formed having for its object "the preservation and right treatment of the ruins of Heidelberg and its neighbourhood, and study of their history and artistic value." We are glad to hear it.

BRADFORD EXCHANGE.

THE new Exchange for Bradford, the style of which may be called Gothic of the period, rather Italian than English, was opened on the 13th inst. The first stone was laid in 1864, on which occasion we gave a view and plan of the design.* The site upon which the exchange is erected is in the form of a triangle, with the narrowest point towards the principal front. The front hall is 80 ft. long and 56 ft. wide, and in addition has a large semicircular projection, on the north side. The room is divided into three those on each side being 10 ft. in width, and forming as it were an ambulatory round the room. The centre compartment is supported by eighteen large polished shafts of red granite, 2 ft. in diameter, with carved capitals. From these columns arches spring which are fitted with glass. The roof is entirely open, and the spars and timbers exposed. The principals or main supports are double, and fitted between with allegorical figures, bearing shields. There are large windows at each end, filled with tracery, and dormer lights in the roof. The walls of the hall are of stone work, with moulded plinth, above which, 3 ft. in height, is a lining of encaustic tile. The floor is also covered with tiles.

The great hall is lighted by ten large gaseliers in hammered iron and copper, illuminated in various colours and gilded. The news or reading room is 68 ft. by 28 ft., and is furnished throughout in oak. The front of the building in Market-street is divided into eight shops, with cellar and mezzanine floors to each. The first and second floors throughout are arranged in suites of offices. At the east end, and forming the principal entrance, is placed the clock-tower, which rises to a height of 150 ft. The windows in the principal front have coupled shafts of serpentine marble, and the building is crowned by an open and pierced parapet, terminated at each angle by corbelled turrets. On each angle of the tower are statues, on one side Bishop Blaize, the patron saint of woolcombers, and on the other King Edward, who granted the trading charter to Bradford. Between each of the large windows on the ground-floor are circular medallions, containing heads of those who have contributed to the commercial enterprise of the country and the prosperity of the town. The principal contractors are Messrs. Beauland, of Bradford. The building has cost about 30,000*l.*, and has been erected from the designs of Messrs. Lockwood & Mawson, architects.

* See vol. xxii., pp. 600, 601.

DESIGN FOR THE PROPOSED LAW COURTS.—Mr. Lockwood's Key Plan.

THE DESIGNS FOR THE LAW COURTS.

CONTINUING our selection from the designs submitted in competition, we illustrate in our present number Mr. Lockwood's project. It will be seen by the plan that in this design, instead of one vast hall, or the entire omission of such provision, three halls are made to form the nuclei of the different sets of courts. The objection is raised by the designer, whose own views we will set forth in these particulars, that if one hall he made the centre of the whole of the various departments of judicature, it would be so vast in extent that, for the purposes of a rendezvous, it would be perfectly needless. It is urged that by subdivision the courts are so arranged that the northern side of the central hall may be appointed as the place of meeting for all those who have business in the equity courts; and that the southern side of the same hall would form the rendezvous for the common law courts. The western hall, being that nearest Clement's-inn, is made the centre of the exchequer courts and the exchequer chamber; the latter being so placed as to afford private access to it for the Lord Chancellor. The eastern hall, being that next Chancery-lane, is the nucleus for the Probate Court, the Ecclesiastical Court, the Admiralty Court, and for a spare court, which may be used by any of the last-named departments, or for the purposes of common law. It is thought that this subdivision materially aids in classifying the departments, and in simplifying the arrangements; so much so that the merest indication on the part of a solicitor would direct a client or a witness to the immediate locality in which he should be found. If the area of these halls be calculated, it will be seen that they do not occupy so large a space as many single halls in other plans. To these halls there are three principal accesses,—the grand entrance in the centre of the south or Strand front; a second from the Clement's-inn or western end; and a third from the Chancery-lane or eastern end of the building.

Around the central hall is a continuous open court or quadrangle, to afford direct light to the windows of the central hall, and, at the

same time, to the corridors for the harristers and solicitors on the opposite side of it. These are 14 ft. in width, and, in addition, there are twenty-four bay windows, which give the means for retirement and consultation. The courts generally are arranged contiguous to, and on the outer line of, this corridor. Between the courts are the jurors' and the jurors' waiting-rooms, being one story in height above the level of the courts.

Still proceeding on the outer line are the judges' private corridors, out of which, immediately opposite their respective courts, are the judges' private retiring-rooms. The latter might be attached to the courts themselves, but this would necessitate the adoption of a skylight, and would produce what the architect considers would be a series of dull and cheerless rooms, giving the window, and outer air and light, merely to the corridor; whilst by the arrangement adopted in the plan, windows would open into a wide quadrangular street.

The consulting-rooms for the harristers and solicitors are immediately over the judges' rooms, so as to obtain the same cheerful aspect. Private staircases, of a single story in height, conduct to the court, the harristers' corridor, and the halls. The harristers' library, robing, and refreshment-rooms, are upon the same level, and are approached by corridors and grand staircases entirely appropriated to themselves. The witnesses' rooms are upon the floor immediately below the courts, and this department is entered by lateral corridors on each side the principal entrances. Easy provision is made for their access to the courts.

The general public (mere lookers on) are admitted by two arcways in the Strand front, and these give access to corridors and staircases leading to the galleries of the court. It is claimed that the spectators are thus precluded from entering the halls, or from making a tour of the courts.

The outer quadrangular area is surrounded by an outer shell or range of buildings, entirely appropriated to the offices of the various departments. Care has been taken to place the respective sets of chambers contiguous or imme-

diately opposite to the respective court or sets of courts to which their business immediately appertains; thus, the Probate Court is connected by a covered bridge with the Probate Department; the chambers of the Master of the Rolls are connected in the same way with his court; the Vice-Chancellors' chambers are closely connected in a similar manner with their courts, and this system of arrangement is carried out through the various departments.

The object sought to be obtained in this design is the avoidance of skylights, borrowed lights, and balconies,—of skylights particularly on a large scale, because, if of wood, they must be constantly subject to decay and repair; if of iron, to contraction and expansion, and consequent fracture of the glass; the cause of great heat in summer and of cold in winter, and always obstructive to the admission of light and air. Balconies have been avoided from the feeling that they are injurious to the light of the rooms below them, and that, from the number of persons traversing them, they would be productive of annoyance to those in the rooms on the same level.

This design provides for twenty-five courts and the several sets of rooms required in the Instructions. Of these, two courts are appropriated for the Bankruptcy department. They are placed at the western end of the building.

Looking now to the elevation, it will be noticed that the type of this design may be found in Flanders. It is decidedly municipal in character, as distinguished from ecclesiastical or feudal architecture. The general outline is good, and the unity and harmony sought to be attained in the plan have been observed in the outer forms.

DESIGN FOR THE PROPOSED LAW COURTS.—By MR. LOCKWOOD.—View to the Strand.

NARROW ESCAPE OF SANDON HALL.

SANDON HALL, the residence of the Earl of Harrowby, has narrowly escaped destruction by fire. The old hall was totally destroyed by fire eighteen years ago, and the present mansion was reared upon the same site, only a few months having elapsed since it passed out of the hands of the contractor. It appears that the flue from the furnace which heats the conservatory passes into the basement at the east end of the house, and then rises perpendicularly to the roof, passing through the small corridor and a bed-room immediately above, and it was in the latter room that the fire was first discovered. Lord Sandon was passing from the house to the conservatory, and on perceiving a strong smell of burning wood at once communicated his fears to a domestic. Upon removing the boards a large beam was found to be on fire, the end resting close to the flue being an incandescent mass. A good supply of water having been procured it was soon extinguished. Attention was at once directed to the floor of the corridor below, when a similar discovery was made almost identical with the other, the beam end next the flue having been completely charred, and upon its exposure to the air began to throw out sparks. When the fire had been extinguished workmen set about removing a casing from the wall near the flue in the corridor, behind which it was discovered that the wooden bricks which had been placed in the wall for the purpose of fastening the casing were also on fire. The fire was no doubt owing to the flue becoming over-heated, and the wooden beams, having been placed too near the flue, had ignited.

BRITISH ARCHAEOLOGICAL ASSOCIATION.

THE ROMANS IN ENGLAND.

On Wednesday, 13th of March, Mr. H. Syer Cuming in the chair, further arrangements were announced for the Ludlow Congress; and letters from the Duke of Cleveland, Mr. Mayer, and others, were read. Donations for archaeological purposes and excavations at Wroxeter were announced, and thanks returned.

The discussion on the assumed sacred monogram on the Cirencester Roman pottery was resumed. The discussion was continued by Mr. Levein, Rev. Dr. Giles, Rev. W. S. Simpson, Mr. J. W. Grover, Mr. G. M. Hills, and Mr. Roberts, but the conclusion arrived at was against the sacred nature of the stamp or incision, the information not being complete on that point.

Immense antiquities from London were exhibited, comprising, from Mr. Grover, two keys of the fourteenth century, found at the Foreign Office; also two keys from Hitcham Rectory, Bucks; from Mr. Wimple, a rare Roman lamp recovered from the Thames; Mr. Tennisswood, a Roman lamp of ordinary form (with the potter's mark of two sandals beneath) from Cannon-street; from Mr. Gunston, a Dupondius of Nero, counter struck with the S.P.Q.R. from the steel-yard; Mr. Gunston, four leaden brooches of the fourteenth century from the Thames; Mr. Blashill, a Nuremberg token and a medal of Frederick the Great, from Holborn Valley; Mr. Bailey, twelve daggers, fifteenth and sixteenth centuries, from Queen-lithe; Rev. W. S. Simpson, a minute of council of July 1st, 1675, relative to Saint Paul's, with signatures of Sir Christopher Wren, Sir Thomas Viner (Lord Mayor), Edward Stillingfleet, and others; two crucifixes, in bronze, of the thirteenth and sixteenth centuries; several hoop and serpent bracelets, and three rosary rings.

Mr. Planché presented a drawing, by Mr. Hillary Davis, of a thirteenth-century sepulchral slab, found beneath the pews of Aitcham Church since the visit of the Association. A paper by Mr. Bergeon was read on an important "find" of about 2,500 silver coins, six of which were exhibited as types. They were found near the old Roman-road in the parish of Washington, in Sussex, in a crock which was cut to fragments by the plough in breaking up an old pasture, one single piece only being preserved, and now, with 1,650 of the coins, in the British Museum. They appear never to have been in circulation; and, being all of a date prior to the Conquest, are conjectured to have been buried by the owner on the Norman invasion, and that he did not live to reclaim them.

They have all the moneyers' names on them, and show they were struck in the South of Eng-

land. The locality Stæng and Stæni on some serves to correct the error that has previously existed, that it was meant for Stamford, it now being clear it was Stening, in Sussex.

The six moneyers and coins are as follow:—
1. "Harold Be Ang," "Dermon on Stæni";
2. "Eadard Rex Anglor," "Anderboda on pinc." The others are of Edward, and the moneyers are "Norman on Stæng," "Godric on Lund," "Leoftrinc on Hæsting," "Ælfard on Lande."

Another "find" of coins was communicated by the Rev. E. Kell. They were discovered at the back of Netley Hospital, and Dr. de Chammond has catalogued 1,700 of them. These are all Roman.

ARCHITECTS' BENEVOLENT SOCIETY.

The following report, read at the general meeting held on the 13th inst., when Mr. Sydney Smirke, R.A., presided, will serve as an appeal for the assistance needed:—

"The council beg to submit to the general body of subscribers, the financial statement for the past year, and to report generally on the progress of the Society. In doing so, however, they regret not being able to congratulate the society on any very satisfactory progress. The number of members remains the same as last year; for although seven new members have been added to our list, a like number has been lost to us through death or otherwise.

The amount paid to applicants has been materially in excess of last year; for the cries of distress are ever increasing upon us, both in numbers and urgency. Hence, the balance remaining in the bankers' hands will be found to have become less than it was at the corresponding period last year.

The council have been able to relieve thirteen cases of severe distress, viz.—two architects of very great age, nine widows, and two daughters of architects.

These cases completely exhausted our means, and we have been enabled to invest nothing.

Thus, although in the midst of most urgent and distressing demands on our sympathy, the profession does not appear to be moved as it ought to be.

Great fortunes are being accumulated by the comparatively few who have drawn the prizes in the lottery of life, whilst penny and want continue to oppress the hapless throng who have failed to do so.

Why should the kindred societies, whose special aim it is to relieve the distresses and privations endured by the families of painters and sculptors, be hurried by the claims of a profession like our own, which probably numbers its thousands, and whose average means ought to place its members at least on an equality with the professors of the sister arts?

Let not the generous warmth that animates the painter and sculptor be for one moment supposed to be wanting in the architect! Indeed, the long, unceasing, unvarying, zeal of many of our members, both old and young, nobly vindicates us from such an unworthy imputation. Let us, therefore, never cease to urge the claims of this society upon our brethren, especially upon those practicing in the great centres of provincial industry. Surely we may be permitted still to indulge in the hope that ultimately a more cordial feeling will prevail, and induce those who still keep aloof from us to join our ranks in greater numbers. A very moderate enlargement of our circle would suffice to place the Architects' Benevolent Society in a position to do that amount of good which its complete organization and its long experience eminently fits it to do, and which it is our duty, as members of a liberal profession, to strive unceasingly to do."

THE TRADES MOVEMENT.

THE Trades Union Commission are now holding their meetings at 2, Victoria-street, Westminster.

At a recent meeting of this Commission, Messrs. G. Potter, Conolly, Kane, and Proudford, attended as a deputation from the Trades' Conference Committee for the purpose of expressing the dissatisfaction of the committee with the decision arrived at by the commissioners, not to allow any member of the trades' committee to be present while the witnesses were under examination. The deputation urged that such decision was disrespectful to the trades of the kingdom, who were on their trial. The commission having considered the subject consented to allow one member of the committee to attend, thus virtually acknowledging the committee.

There seems to be a likelihood that the threatened strike of engine-drivers and firemen throughout the kingdom will be averted. It appears that all the memorials have been sent in, and that deputations of drivers have been appointed to meet the directors of the various railway companies on appointed days, at the request of the latter. It is said that many of the companies are desirous to meet the men in the most friendly manner, and, if possible, to come to a mutually satisfactory settlement of the matters in dispute.

Birmingham.—At a special general meeting of masters and men employed in the building trade held in the Town-hall, Birmingham, under the presidency of the mayor, the following resolution was carried:—"That we, the employers and operatives connected with the building trade

of Birmingham, do mutually and severally agree to abide by, and conform to, all trade regulations which shall be made and agreed to by the delegates we are about to appoint, or which shall be settled by the casting vote of the chairman they may appoint." The following delegates were then unanimously appointed:—Bricklayers (for employers): Messrs. Hilton, Hardwick, Briggs, Naden, Wilson, and Smith. Carpenters and joiners (operatives): Messrs. James Lewis, John Michael, George Edge, John Price, James Thorneloe, and William Davis. Ditto (masters): Messrs. Jones, Jeffery, Wehh, Hardwick, E. Barnsley, and Cresswell. Painters and glaziers (masters): Messrs. Whitworth, Mann, J. Parker, Nicholls, Heape, and Hardwick. No plasterers being present, the masters only appointed delegates, namely, Messrs. Bassett, Hardwick, G. Holmes, Cresswell, E. Barnsley, and Pritchard. For the same reason, the master plumbers only appointed delegates, viz.: Messrs. Whitworth, Stokes, Nicholls, Edwards, Wilcox, and Hardwick. No operative masons were present, and the following delegates were appointed for the masters: Messrs. Jones, Cresswell, Hardwick, Barnsley, Smith, and W. Briggs.

The following letter, which had been addressed to the mayor, was read to the meeting:—

"White Swan Inn, Navigation-street, March 12, 1867. Sir,—I am instructed to forward you the following resolution, passed at a special general meeting of the Operative House Painters' Association, held this evening. The secretary read a circular from the General Builders' Association, calling upon us to attend a public meeting of the building trades to appoint delegates to arbitrate upon the proposed alteration of trade rules.—Resolved that we, having taken no action in convening, and filling to see the necessity of such public meeting, do not attend the said meeting; but that we are willing to appoint six operatives to meet six employers of our branch to settle the question, by conferring upon us the said rules, or by arbitration. I am, &c., THOMAS GRANT, Secretary."

York.—A long notice which had been given by the masters to their workmen of the various branches of the building trade, to the effect that future payments would be made by the hour, having expired, the masons, bricklayers, plasterers, and labourers have struck work. The joiners, however, have accepted the hour system, and the plumbers of the city, who had struck for an advance of wages, have gone in on the old terms.

OMITTED NAMES.

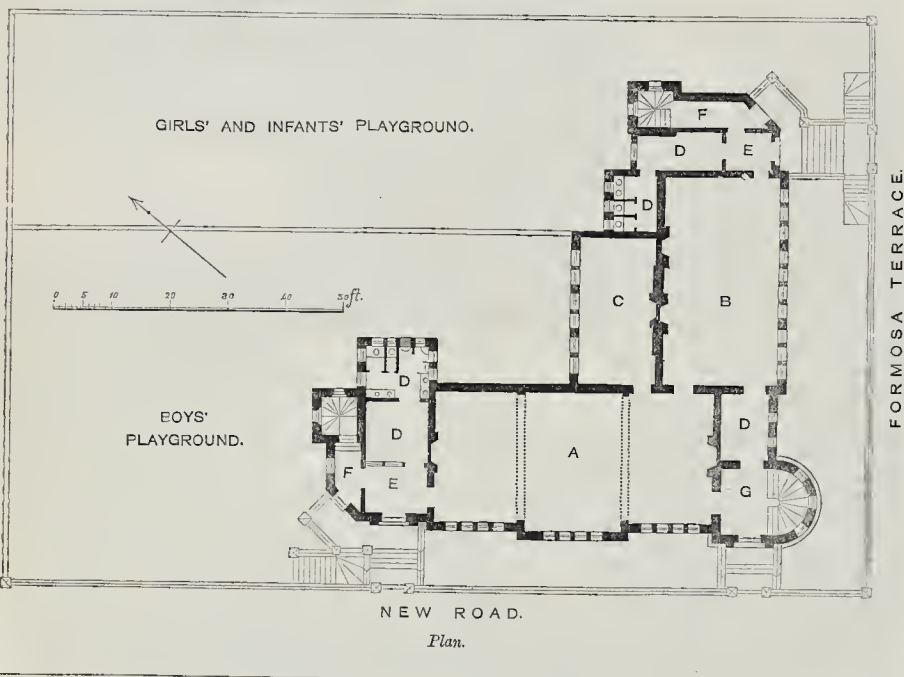

Our paragraph describing the Bond-street cellars made no pretence to a complete account, or we should have added, as we now willingly do, that the wrought-iron vine-bins with which they are fitted up are those of Messrs. Farrow & Jackson, to the goodness of which we are able to bear witness. These bins are adapted either for brick-arched vaults or cellars with flat ceilings, the mode of fixing in either case being so simple that they may be put up by any ordinary workman. The shelves are formed of plates of iron laid on bars, which rest on the cross-bars of lattice uprights, and are removable at pleasure. Then, as to the stone carving, we are asked to mention that the front was carved by Mr. L. T. Carter. The heads in the caps represent Ariadne, Bacchus, and Pan.

It is a curious fact, but a fact nevertheless, that it is only the persons connected with an event or building who are not mentioned in an account of it, who manifest any interest in what is said. The other day an architect wrote us a very serious letter to show the injury done him by the omission of his name in connexion with a building with which he had had something to do. It had been our privilege to mention this gentleman say once in six weeks for the last dozen years or more, and we had never before learnt, by word or sign, that this was of the slightest consequence. But, omit to do so, and—good gracious!—what scoundrels we are!

THE INTENDED PARISH SCHOOLS OF ST. SAVIOUR'S, PADDINGTON.

EVER since the formation of this parish, and of the church, there has been a difficulty in obtaining a site for schools. To some extent, schools of this kind are looked on as objectionable neighbours, and in this locality, where high-rented houses are built, and covenants against schools and trades are inserted in the ground-leases, the occupiers naturally desire to be free from the proximity of schools of this description. The committee have at length overcome the

INTENDED PARISH SCHOOLS, ST. SAVIOUR'S, PADDINGTON.—MR. EDWARD ROBERTS, ARCHITECT.

obstacles which have hitherto prevented their obtaining a site for the erection of a school-house, and, through the influence of the Bishop of London, an eligible plot of ground on the north side of Formosa-terrace, at the corner of the new road in continuation of Bristol-gardens, has been offered to them by the trustees of the Paddington Estate. It has a double frontage of 100 ft. on the terrace, and 150 ft. on the road, and affords ample space for a building, not only sufficient for the present number of poor children, but for any future increase which may take place. The trustees are willing to grant a lease for about ninety years, at a nominal rent, as soon as a suitable building shall be covered in. Plans and elevations have been prepared, and

they have been approved by the trustees. The building, when the whole plan shall be carried out, will be sufficient for 300 children, and will contain a boys' school-room, 48 ft. by 23 ft., and 16 ft. high, and class-room, 25 ft. by 13 ft.; a girls' school-room, 48 ft. by 23 ft., and 18 ft. high, and class-room, 24 ft. by 19 ft.; an infants' school-room, 36 ft. by 19 ft., 16 ft. high, and three or four rooms each for the master and mistress. The play-grounds will be in the rear. The total cost, including the roads and enclosures, is estimated at 5,000*l.*; but it is intended to complete, at present, so much only as will suffice for 200 children, leaving the master's and mistress's houses, the class-rooms, and some other portions, for future consideration. The

building has been studiously designed with a view to economy, and, although plain and inexpensive, is proposed to be of sufficient architectural character not to bring discredit on the parish. The estimate for this portion is about 3,000*l.*, including the roads, enclosure, and drainage of the whole ground. The building is to be of pale yellow bricks with stone dressings. The inside of the school-rooms is to be of similar bricks banded with red. Hitherto the teaching has been carried on under every possible disadvantage. The number of children attending the school is 200, and they have been from necessity crowded into rooms in private houses temporarily engaged, at a rent of between 80*l.* and 90*l.* per annum. These, from their inadequate

size, are close and ill-ventilated, and compel the distribution of the children in separate apartments, thus withdrawing a large number from the eyes of the master or mistress, and seriously interfering with the necessary discipline. Besides this it is found impossible to secure those accommodations which common decency requires. Now, however, the parishioners have the opportunity of at once removing all these hindrances, and of placing St. Saviour's district on an equality, in this respect, with the neighbouring parishes.

Mr. Edward Roberts, F.S.A., is the architect.

PRESENTATION OF TESTIMONIAL TO THE DEAN OF NORWICH.

As being connected with church news, the following account of a very interesting ceremony which has just taken place in Paddington may, perhaps, be considered not unsuitable for your pages, and is, therefore, offered by

A MEMBER OF THE CONGREGATION.

On Saturday, March 16, a large number of members of the congregation of St. John's, Paddington, assembled in the school-room of that church, to present a testimonial to their pastor, Dr. Goulburn, on occasion of his parting from them to enter upon his duties as Dean of Norwich, to which appointment he has recently been nominated.

The testimonial consists of a fine edition of the "Benedictine Fathers" together with "Baronii Historia Ecclesiastica, cum Continuatione," eighty-nine folio volumes in all; and a handsome tea-service of silver, by Garrard, which includes a very elegant urn and a noble salver, the latter bearing the following inscription:—

"To the Rev. Edward Meyrick Goulburn, D.D., Dean of the Cathedral Church of Norwich, this Salver and an accompanying Tea-service, together with sundry theological works, are presented by members of the Church of St. John, Paddington, on the occasion of his resigning the Incumbency of that Church, in token of their admiration of his great learning and ability, their deep sense of the value of his ministrations as Pastor and Guide, and in affectionate remembrance of the personal courtesy and kindness which so greatly endeared him to all amongst whom he laboured.
19th March, 1867."

A modified form of this inscription has been placed in each of the volumes, all of which are in an admirable state, and most of them still wear their original handsome binding. The dates of the editions range from about 1730 to 1740.

We could have wished that a little pains had been taken to make the schoolroom look more worthy of the occasion, by some endeavour to disguise the rampant ugliness of the bare walls, roof, benches, and floor. A very small amount of decoration, temporary or otherwise, would have been an immense relief to appreciators of the beautiful; and why should not moral and physical beauty be more frequently allied? Nothing could exceed the moral beauty of the scene; but the physical—so far, at least, as the room itself was concerned—was nowhere. Possibly the *comp. Wall* presented to the Dean of Norwich on his entrance, may have been very different from that which met our own offended orbs of vision when, after climbing up a narrow stone outside-stairway, in a driving storm of hail and snow, they encountered the bare, dirty-smoking chamber we have indicated. By the time of the dean's arrival, the bald interior had become filled with a well-dressed crowd, whose beaming kindly faces might well render any room beautiful, in the eyes of the good and worthy man whom they had assembled to honour. Still, a little decoration could not have detracted from the scene.

Dr. Goulburn has been deservedly beloved and appreciated by his parishioners, during the seven years he has laboured among them, and their

regret at parting from him is proportionately great.

Sir George Baker, churchwarden of St. John's, and chairman of the committee which had so admirably carried out the desires of the subscribers to the testimonial, read the valedictory address, in a sadly tremulous and tearful voice, to which Dr. Goulburn, in his well-known earnest tones, responded in a touching and affectionate speech, which evidently came, as he said, "direct from the heart." In spite of changing colour, and the biting of the lip to keep down emotion, he endeavoured to infuse a little fun into his remarks, so as to brighten up his hearers, if possible. "Your present of hooks upon the shelf," he said,—"though they shall not always lie upon the shelf, but shall be my esteemed companions on the table—may remind me that you expect a clergyman to be studious; and in giving me not a dinner—but a tea-service, I may understand you to suggest that a clergyman should also be temperate." After thanking his congregation for the never-tiring sympathy they had always shown him, and the loving manner in which they had borne with his "fallings" and excused his "abort-comings," in words of modest self-abnegation, all the more touching when uttered by one so universally admired and esteemed, and which went to the hearts of his hearers, he resumed his seat, and the proceedings speedily terminated.

Shortly afterwards we observed an enthusiastic lady step on to the platform, and producing a sheet of paper, petition the Reverend Doctor for his autograph,—a request which we need not say was at once granted; and then the crowd withdrew—but lingeringly, as if loath to look their last upon their revered pastor, their tender guardian, guide, and friend.

AN APPEAL TO THE CHARITABLE.

A FATAL accident occurred, a few days since, to an old and industrious parishioner of mine, a master bricklayer, named Charles Warr, of the Liverpool-road, Islington, who fell from a scaffold, opposite my house, and sustained such severe injuries that he died within two days. He has left a widow and nine children, many of them very young, entirely unprovided for. A committee has been formed for the purpose of raising a fund to enable the widow to enter into some business, for the support of herself and her large family. I can confidently recommend the case to the sympathy and benevolence of your readers, and I shall be happy to receive any contributions, as will also the chairman of the committee, Mr. Joseph Surr, 10, Milner-square, Islington, and the treasurer, Mr. D. W. Hill, 378, Camden-road, Holloway.

DANIEL WILSON, Vicar of Islington.
9, Darnsbury Park.

A RESPIRATOR FOR NOXIOUS FUMES.

SIR.—Can any of your readers inform me if a sort of respirator (especially constructed) and worn at some distance from the mouth, filled with a disinfectant, such as chloride of lime, would be of benefit to workmen engaged in the cleaning of sewers, &c. I have frequently found men suffer from such occupations, and as I am about to commence a work of this nature, would like to know if a protection could be provided in any way against the noxious gases?
W. J. M.

* Chloride of lime is out of the question. Animal charcoal might probably be usefully so applied.

THE SCIENCE OF MODERATION.

SIR.—In the notice you were pleased to bestow on my book, "The Science of Moderation," in the *Builder* of February 2nd, there are some misconceptions of its intent and scope, as well as of those of a former work, which I have no doubt you will allow me to correct.

The two books to which you refer are but portions of one design, and not exponents of two different doctrines. The one—"The Conformation of the Material by the Spiritual," was intended to trace the moral science revealed in the Scriptures; the other, "The Science of Moderation," the moral science revealed in phenomena, and show their perfect correspondence in a scientific point of view. In the former, moreover, I stated, to prevent misconception, that I believed a scientific code of morality to be inert, the dead letter, unless breathed into life by the Holy Spirit; these are my words.—But it has been many times confessed by philosophers that knowledge alone is insufficient to convert theoretical into active formative virtue. Hence the triumphant superiority of the Christian faith, which awakens a holy spirit in the soul of man, and quickens his knowledge. This passage, which appears in the preface, scarcely justifies, I think, the following remarks, "Ah! Mr. Thomas, there is a mystery here, the depth of which your 'mere' moral plummet of 'righteousness' cannot fathom."

"Let your moderation be known unto all men," is a Christian injunction, mine only by conviction and acceptance. I have merely attempted in "The Science of Moderation," to set forth the full and wide import of the moral measure which it discloses. We can only know the *now*, animus, or Holy Spirit of Truth, and Goodness, through His work; I have, therefore, not presumed to define how a man becomes possessed by the Holy Spirit, but I have attempted to determine the outward and immutable sign, or measure, of his working in creation, as

contradistinguishable from the outward signs and mutable measures of the working of evil.

That physical and moral perfection are simultaneously attainable is the logical sequence of the Scriptural doctrine of the conformation of the material by the spiritual; therefore, the very frequently received interpretation of some passages in Isaiah, viz., "There is no beauty in him that we should desire him," "neither form nor comeliness," "his face marred more than any man," is incongruous; "his face marred" more than any man, is inconsistent with the spirit of Christian teaching, erroneous, and one from which art on its best days revolted; besides being, as it is, at variance with numerous other texts directly favouring the opposite and more consistent view, viz., that the incarnation of the Word was not "marred" by holiness, but by sacrifice, by scourge, nails, thorns, and spear.

I believe, sir, my views are both orthodox and scientific, and that they appear to differ from those commonly held only because I have traced some familiar truths to deeper and more important conclusions than others will trouble themselves to do; and which, for this reason, must for some time appear obscure. "Per se mores!" "La causa va!"
W. CAYN THOMAS.

THE PARIS EXHIBITION AND LAW COURTS COMPETITION.

SIR.—It is a great pity that with two such beautiful collections of architectural drawings as those for the New Law Courts and the National Gallery, we should be so ill represented, as I fear we shall be, at the coming Paris Exhibition; and I consider that as these drawings cannot be sent to Paris, first-rate photographs ought to be taken of them, or at least of those considered the best, and sent, in order that foreigners may have some slight idea of what we can do. As one who has done much for English architecture, I appeal to you, and ask you to use your best endeavours, in order that architecture may be as well represented as possible in Paris. ADIEPHI.

CONCRETE FOR COTTAGES.

SIR.—I should be much obliged if any of your readers will inform me the proportion of cement, gravel, &c., necessary to make concrete suitable for the building of cottage walls, and the best mode of preparing it.
J. S. W.

MILDEWED HAIR.

It is to be sincerely hoped that the horrible new fungoid disease of the hair brought to notice by Dr. Beigel may not become prevalent in this country. It appears to be quite distinct from a similar parasite recently described by Dr. W. Tilbury Fox, under the name of *zoogloea capillorum*, and, of course, is in no way connected with the now notorious gregarinas of Russian hair. The new affection of the hair may be at once detected by a sharp eye without the aid of a glass, as the hairs are listless and apparently knotted; under a moderate glass they are irregularly swollen, and appear to be affected with mildew, which is really the case, as a veritable fungus has found a suitable matrix for its growth; and should it only prove as difficult to destroy as the fungi found infesting our vines, potatoes, &c., it may be a long time before we hear the last of it.

In the volume of the *Builder* for 1865 we published a list of the vegetable parasites peculiar to man and his habitation, and there we referred to an affection of human hair ("as a grim sequel to the dry rot in the house-roof.") The disease indicated was *Plica Polonica*, but it has been recently proved that though *Plica* supports a fungus (*Trichophyton*), it is really not of fungoid origin. It is just now not easy to say how long Englishmen and Englishwomen are to remain exempt from these and other botanical and entomological affections of the hair and head, common enough on some parts of the Continent, but, at present, rare or altogether absent here.
W. G. S.

THREATENED BLOT IN THE NEW STREET, BLACKFRIARS.

It is from a knowledge of the deep interest you take in all matters affecting our great and wonderful city, especially when relating to the improvement of its thoroughfares, that I am induced to bring under your notice the subject of the proposed new street from "Blackfriars" to the "Mansion House."

It is laid down on the plan to be 70 ft. wide (except a very small portion, as you will see on the plan forwarded herewith), and will undoubtedly form a fine entrance to the heart of the city from that quarter; but, Sir, I find, to my utter amazement, that (from some cause or other) it is intended to leave a block of buildings about 230 ft. long, and projecting about

22 ft. into one side of the street, standing in New Earl-street; thus not only diminishing the width of the street by nearly one-third, but actually perpetrating another Middle-row, Holborn, in the broad light of the latter part of the nineteenth century, with this very material difference, that in the one case it is "Mansion House-street," and, in the other, "Holborn." Surely the Metropolitan Board of Works and the City authorities must have overlooked this serious error in their scheme.

My professional engagements in connexion with New Earl-street have led me to make inquiries on the subject. The only explanation I can get, however, is, that New Earl-street, having been formed by the City authorities, is not scheduled in the present Bill, and neither the Board of Works nor the City authorities have any power to alter or interfere with it; though every one to whom I have spoken on the subject agrees in thinking that it is only a question of time, and, if left as it is for the present, it must sooner or later be widened, in deference to the outcry which is sure to be raised about it.

It is to avert this outcry, and to get the thing done properly, as well as to prevent "the ship being spoiled for a harpoon of tax," that I am induced to bring the subject before the public through the medium of your widely-read columns, and thus cause the question to be well ventilated.

JOHN TARRING.

DISSENTING CHURCH-BUILDING NEWS.

Sheffield.—The foundation-stone of the new Congregational chapel, in Garden-street, has been laid by Mr. John Crossley, of Halifax. The new structure will stand upon the site of the old chapel, but as the proposed building will be much larger than the old one, it will be brought nearer to the edge of the road. The new edifice will seat 1,020 persons, and the work has been let by contract for 1,685*l.*, which includes warming apparatus, ventilation, gas-piping and fittings, pewing, pulpit, boundary walling, and gates. The portico in front will have four arches, and the floor will be paved with coloured tiles. There will be double doors to the chapel, so as to intercept draughts. The pews will have monied frame-ends, close hoarding to backs and under-seats, hook-boards, and hat-rails. All the wood-work will be of red deal, varnished. The organ-gallery will be placed behind the pulpit, and there will be vestries, &c., for the minister and deacons. The pulpit will be an open platform, with a raised desk, which can be seen from every part of the interior. The gallery will rest upon iron columns. The interior of the chapel will be spacious and comfortable, and the exterior will be of coursed wallstone, with ashlar dressings, in the Gothic style. The architects are Messrs. C. J. Innocent & Brown, of Sheffield; and the contractors for the various kinds of work are the Masons' Co-operative Society (Limited), Mr. John Hayball, Messrs. Harrison & Chadwick, Mr. J. T. Taylor, and Mr. E. Langton.

Bromsgrove.—The newly completed Baptist Chapel for Bromsgrove, the foundation-stone of which was laid in April last, has been formally opened for divine service. The site is on the right of the new road leading to the railway station. The chapel is a Gothic building, of brick, with stone dressings. It is 70 ft. long by 38 ft. wide within. The front is supported by buttresses: at the north-west angle is a turret and spirelet 63 ft. high. Between the buttresses are three single-light windows, and underneath is the principal entrance. The sides of the chapel are each divided into five bays, with alternate single and double-light windows. There are side aisles, and the total accommodation is for 550 adults and children, including the north gallery, and when side galleries are added there will be accommodation for 750. A choir and organ apse is arranged at the south end, and a minister's vestry on the south-west. The carpenters' and joiners' work is stained and varnished, and the ceiling is stencilled in patterns. The architect was Mr. Bidlake, of Wolverhampton, and the work has been carried out by Mr. Thompson, of Kidderminster, builder, for 1,800*l.* The fittings were provided by Mr. Thomason, of Birmingham, and the heating by Mr. Blakemore, of Wednesbury.

Liverpool.—The English Presbyterian Church and Schools, Vauxhall-road, have been opened. The building is erected in the Gothic style, treated freely with brick bands and relieving arches of blue, white, and red bricks, the whole

facad with pressed bricks tuck pointed, and having stone dressings to doors and windows. The ground-floor contains schools for accommodating 350 children, allowing 80 cubic feet for the boys and girls, and a little less for infants. These schools are divided by movable wood framings, so that the whole can be thrown into one room for meetings or school parties, leaving a clear space of 68 ft. 9 in. by 31 ft. 6 in. Above the schools is a church 68 ft. 6 in. by 27 ft., and 20 ft. in height, with gallery at one end, the whole capable of seating comfortably 430 people. The end opposite the gallery is octagonal in shape, containing pulpit and precentor's pew. There is also a vestry, 10 ft. by 9 ft. The whole is lighted on both sides, and end fronting Vauxhall-road, and well ventilated. There is a playground on the basement for children, 41 ft. 2 in. by 27 ft., the ceiling of which is 4 ft. above the side street, from which air and light are obtained. There are latrines and conveniences also in the basement. There is a staircase fronting Vauxhall-road, leading to the church, and converted into a heltry above. All the schools are entered from the front street, the boys' school having a gabled porch thereto, 7 ft. 6 in. by 4 ft. The whole has been built by Messrs. Nicholson & Ayre, of Toxteth Park, under the superintendance of Mr. James N. Crofts, of this town, architect. The total cost, including gasfittings, &c., is about 1,900*l.*

states of manhood as "Sons of God" who can be "raised up" from the "very stones." In saying so, nevertheless, we do not mean to give any decided opinion, either *pro* the Vestigians, or *con*, the Scripturalists: we would only indicate how these opposing forces may perhaps finally come to terms in a peaceable and mutual understanding.—"A Dictionary of Chemistry and the allied Branches of other Sciences. By Henry Watts, B.A., F.R.S., F.C.S., &c. Longmans & Co.—This standard work, which we have often favourably noticed during its serial progress, has now reached the word "Stilbite," "Specific Gravity," and "Spectral Analysis" form a considerable portion of the 38th Part now before us.

Miscellaneous.

"BUILT TO SELL."—The following suggestive advertisement appears in the *Stoke Newington Observer*:—

"100,000 Carpenters and Bricklayers Wanted to Strike against 'Slop' or 'Dulling' building in the suburbs.—Apply to 'Built to Sell.'"

CONSBOROUGH PARISH CHURCH RESTORATION. Progress is being made in the restoration of this church. Several ancient windows exist in the nave, proving the antiquity of that part of the building; one occupies a position above the chancel arch, and will probably be re-opened. The floors under the seats were in a state of decay seldom equalled. Care is being bestowed in the removal of the whitewash, and none of the stonework will require to be recast. Several coins have been found, one of Henry VII., one of Elizabeth, one of James II., and others apparently Dutch.

DESTRUCTION OF WAKE'S OAK, STONY STRATFORD.—We learn with regret that one of the finest old oaks in England has come to the pitiable end of being burnt down by a party of mischievous schoolboys. This tree stood in Whitewood Forest, in the vicinity of the Duke of Grafton's seat, Wakefield Lodge. Its name, age, and situation made it extremely probable that it existed when Wao or Wake the Saxon possessed the domain. The tree was much valued by the people of the neighbourhood, and seemed likely to flourish for many a generation yet to come, although the trunk was hollow. A fire had been lighted inside, which completely dried up and set fire to the tree, and brought it down before the Duke's fire-engine could extinguish the flames.

CONSTANT WATER SUPPLY AT LYNN.—It was prognosticated that the attempt to convert the water supply to the constant system would be physically impossible and financially disastrous, but it turns out that the twenty-four hours' supply is being given with less than half the consumption of coals that used to be incurred in the ten hours' supply; that the profit in the shape of balance of rates over expenditure, is as great, or greater, than it was under the old system; and that the physical difficulties are all nonsense. Under these circumstances, Mr. Saddleton Marsters (to whom is due the largest share of the credit for having compelled the adoption of the constant service) has proposed to the town-council that they should lower the charge for water supplied by meter for manufacturing purposes to 7*d.* per 1,000 gallons—a reduction of 2*d.* per 1,000. The proposal was referred to the waterworks committee.

EDUCATION OF THE CLASSES EMPLOYED IN AGRICULTURE.—A deputation from the Council of the Society of Arts have met a deputation from the Council of the Royal Agricultural Society, in order to seek the co-operation of that Society in promoting the education of the working classes engaged in the cultivation of the soil. Mr. Chester said that the object the deputation had in view was to ask the Royal Agricultural Society to exert its influence for the improvement of primary education among agricultural labourers, and to induce the higher class of such labourers and mechanics to avail themselves of the advantages offered by these examinations. After a conversation, Mr. Thompson expressed, on the part of the Council of the Royal Agricultural Society, their willingness to consider what could be done to aid the Society of Arts in this matter, and promised that the subject should receive their most favourable consideration. The object sought is of the greatest importance. It is much to be hoped that some course of action will speedily be determined on.

Books Received.

The Year-Book of Facts in Science and Art. By JOHN TIMBS, F.S.A. London: Lockwood & Co. 1867.

This volume of Mr. Timbs's interesting summary of the year's progress in fact and science is preceded by a memoir of Professor Wheatstone, with a finely-executed portrait of him. The vignette is a bird's-eye view of the Paris Exhibition building. The volume, we think, is even more interesting than usual, and has less of the appearance of a mere compilation. By re-writing and condensation of the matter compiled, increased value is given to such a work as the "Year-Book of Facts."

VARIORUM.

"A New Idea for the Water Supply of Towns." By A. S. Ormsby, C.E. Metchim & Son, Parliament-street. The idea referred to in the title of this pamphlet is the construction of non-absorbing collecting grounds, to hold and supply natural and pure water for drinking and cooking purposes only. The pamphlet is in the form of a letter addressed to the secretary of the Royal Commission on Water Supply, and is worthy of their consideration.—*Fraser's Magazine* for March (Longmans) contains an interesting paper on "Costume in Sculpture" by F. G. Stephens.—"The Twin Records of Creation; or, Geology and Genesis; their perfect Harmony and wonderful Concord." By G. W. Victor Le Vaux. Lockwood & Co., Stationers' Hall-court. Although the idea that the six days of creation mentioned in Genesis may have been six aions or great eras, such as the geological, is not new, nor is the attempt to show how they harmonize so original as this author may imagine, the hypothesis is a convenient one for a renewed endeavour to reconcile the two records; and Mr. Le Vaux very feebly does so. The idea which he tries to work out is, that the first creative "day" was concurrent with the Cambro-metamorphic era; the second with the Silurian; the third with the Devonian, old red sandstone, and carboniferous; the fourth with the Permian; the fifth with the Liassic, oolitic, Wealden, and cretaceous; the sixth with the tertiary-pleistocene; and the seventh, or sabbathic, with the alluvial formations and the current period. The idea is ingenious, and there is much to countenance it in the order of the days and eras, in which there are certainly curious coincidences. We should not wonder shortly, however, to find the Vestigians and Darwinians crowning these coincidences by maintaining that the Scriptural intimations that animal life was made out of the dust of the ground, that the earth brought forth, and that all the lower animals were brought to the man, may really mean that during those long eras or days the lower orders of life were created by development from the mineral, and so brought, as a man-child in the womb of nature, by degrees, during successive eras, to the high

A MAN TORN TO PIECES IN A SAW MILL.—At the Wenlock Saw Mills, City-road, of which Mr. J. Shepherd, J.P., is the proprietor, a workman named, whilst unobserved, have gone down into the ash-pit, where the furnace of the boiler is fed, and in walking down the steps slipped, and fell against the cog-wheel of the drum, the result being that he was literally torn to pieces. The accident occurred at breakfast time, and was not discovered until the man's wife went to the mills, and was one amongst the first to learn her husband's sad end.

THE DESIGN FOR THE THAMES EMBANKMENT. A petition has been presented to the House of Commons by Mr. F. Webb Shields, C.E., praying that inquiry may be made into his claim to remuneration as the successful competitor in the plans, fifty-nine in all, sent in to the Royal Commissioners for the Thames Embankment. Mr. Shields sustains the prayer of his petition by extracts from the evidence given by Mr. Cabitt, M.P., then Lord Mayor, Captain Burstall, R.N., Mr. J. R. McClean, C.E., and Mr. H. A. Hunt, a member of the Royal Commission, all showing that Mr. Shields's plan was the basis and origin of the works as being executed. The petitioner states, with reason, that if he had supposed that he would neither have the carrying out of his design nor receive any remuneration for it he would not have competed. We gave a diagram of Mr. Shields's plan at the time of the competition. There can be no doubt that he is entitled to remuneration.

MACHINES FOR STONE-BREAKING.—Blake's stone-breaker, of which Mr. H. R. Marsden, of the Sobo Foundry, Leeds, is the English patentee, has been adopted by the Leeds corporation, for breaking up blocks of Skipton metal in suitable size for either macadamizing or ordinary road-making purposes. The machine, according to local papers, performs its work in a satisfactory manner. It is of a simple character, but its action is rapid, breaking from 20 cwt. to 26 cwt. in six minutes. The saving is estimated at 75 per cent. on the old process of breaking stones by manual labour. Every revolution of an eccentric machine causes the lower end of a moveable jaw to advance towards the fixed jaw about 2 in. and then return. Hence, if a stone be dropped in between the convergent faces of the jaws, it is broken by the next succeeding bite. The fragments then fall lower down, and are again broken. This process is repeated until the clipped stones are small enough to pass out of the hopper into the cart beneath.

MONUMENTAL.—A mural tablet to the memory of the late Sir Richmond Shakespear has just been erected in the cloisters of the chapel at the Charter-house. He was a Cartesian with Thackeray, the Havelock, &c. The tablet is of Carrara marble, in Gothic form, quatrefoil, and richly wrought and illuminated.—A duplicate tablet has been sent out to be placed in St. Ann's Church, Indore, Central India, where Sir R. C. Shakespear closed his career. The sculptor was Mr. Richardson, of Harewood-square.—In St. Leonard's Church, Shore-ditch, a monument has been erected to the late Mr. Appold, F.R.S., whose centrifugal pump in the Great Exhibition will be well remembered by many. The monument has been erected by the vicar, churchwardens, and principal residents in the parish. The inscription states truly that "he dedicated his intellect, time, and means to the application of the laws of nature, to important mechanical inventions," and adds that "he was ever ready to do good, but he would have no man know it."

WORKHOUSE INFIRMARY REFORM.—The *Lancet* Commission has again visited the different London workhouse infirmaries for the purpose of ascertaining the changes that have been effected in their condition since the commencement of the agitation. The improvements found are sufficient to show that giving publicity to the condition of the London workhouse infirmaries has been productive of much good; but the *Lancet* commissioners point out that in none of the infirmaries has the improvement effected been anything approaching to the amount of change which was really needed; and, worse than this, they state that some of the most flagrantly had infirmaries have not been altered at all. The story of the half-measures adopted by one set of guardian-boards, and the total inaction of others, affords the strongest argument which could possibly be offered for at least as comprehensive a measure of Poor-Law Reform as that which Mr. Hardy now proposes to Parliament.

THE LATE GALES.—A house has been unroofed at Haggerstone, and two persons much injured. A house in course of erection at Battersea was partly blown down; and a large stack of timber fell at Vauxhall.

THE PROPOSED CORN EXCHANGE AND COVERED MARKET FOR YORK.—The City Council have appointed a committee to consult with a deputation from persons desirous to erect a corn exchange at their own cost, as to a site, and as to the formation of a covered market adjoining the exchange.

THE PATENT FOOTLIGHTS.—With reference to a remark recently on the necessity for improvement in the new footlights as used in Liverpool, Messrs. Defries wish to state that in that instance they had scarcely time to make the necessary experiments previously, and that such drawbacks as became observable "have since been completely remedied." We are very glad to hear it.

DESTRUCTION OF NOTTINGHAM MECHANICS' HALL BY FIRE.—Nottingham has lost one of its principal public buildings by fire. Of the edifice in Milton-street, the Mechanics' Hall, nothing now remains but the roofless and windowless walls. Nearly all the extensive library, however, has been saved as well as the contents of the Museum, and other property, and the fittings of portions of the premises. At one time the Baptist chapel adjacent was thought to be in danger. Among the property destroyed was an organ worth 1,300*l.* It is supposed that the sum for which the building and its contents were insured will cover the loss.

CHATHAM DOCK WORKS.—The progress of the contract works at the dockyard extension in St. Mary's Island has been much retarded by the very wet and oozy nature of the soil in which the men have to work. The works now in hand are situated in what was the bed of St. Mary's Creek, a channel formerly used as a short cut by many of the vessels navigating the river Medway at high water. Attempts have been made to get rid of the water by cutting channels in the muddy soil, but the mud is so loose that the channels rapidly fill up by the ooze flowing into them. Wooden drains have been tried, but the soft soil would not sustain them. It is now thought of sinking a capacious shaft to collect the water, which would then be pumped by steam power into the river.

FOOT BRIDGES OVER THOROUGHFARES.—We have often urged the formation of foot-bridges over crowded and dangerous thoroughfares; and, although little progress has as yet been made towards so useful an improvement, we are glad to observe that the idea has been realised in the erection of one over Broadway, New York, by Messrs. Rich & Griffiths, at a cost of 4,000*l.* The bridge has been proved capable of sustaining 101 tons, and 100 men tramping over it at the same time produced no perceptible vibration. It stands where Fulton-street crosses Broadway. There is a space of 17 ft. 8 in. clear under the bridge, which is approached by four flights of thirty-four steps each, each flight having three landings. When is the Ludgate foot-bridge to be finished and opened? It was laid across Ludgate-street before the Broadway one was probably ever thought of; but nothing is being done towards its completion.

ROYAL ITALIAN OPERA.—So far from expecting with some that the Paris Exhibition will interfere with the goodness of the London season, Mr. Frederick Gye anticipates in his programme quite the reverse. Paris will this year be a centre of attraction to the whole world, and will doubtless present the most extraordinary assemblage of different nations ever congregated in a European capital. The continuity of London and Paris, and the ease and certainty with which the journey is now performed, he thinks, and with reason, will cause an influx of strangers, from all parts of the world, to the metropolis of Great Britain; as few of those who have travelled from distant parts to Paris will return to their homes without first having paid a visit to London. Accordingly, he is preparing at the Italian Opera-house to make it, as usual, one of the great attractions of the season. He has obtained the exclusive right of representation of Verdi's new opera "Don Carlos," and Gounod's "Romeo et Juliette," and retains Patti, Pauline Lecca, Maria Vilda, Fricci, Mario, Naudin, Graziani, and other old favourites, besides naming several new competitors for English approbation.

GREENWICH HOSPITAL.—In reply to a question put in the Commons by Sir C. Bright, Mr. Du Cane said the Government had sanctioned the loan of a portion of the unoccupied part of the hospital to the Seamen's Hospital Society, on condition that the Government should have power to resume it if the accommodation was needed for the seamen of the Royal Navy. It was thought that the mercantile marine had a strong claim for some share in the benefits of Greenwich Hospital, to the funds of which it had largely contributed. The Government would not be likely, however, to sanction a grant of any portion of the building as a hospital for sick residents of Greenwich.

MEMORIAL OF THE LATE HENRY HOARE.—Amongst various propositions, Mr. Joshua W. Butterworth writes—"What more pleasing, more permanent, more practical, more consistent memorial to the late Henry Hoare, could there be than the founding one or two fellowship-endowments for poor curates, in connexion with the Curates' Augmentation Fund, of 100*l.* a year each, bearing his name for ever? Say one for the diocese of Canterbury, and one for London, in each of which he resided, and by the prelates of which sees he was much appreciated. To use the quaint words of old Fuller, it would be a good name as ointment poured forth; if perpetuated in connexion with a work of such practical usefulness; and, moreover, one which, during life, had met with his distinct approval."

PROPOSED NEW STREET TO THE MANSION-HOUSE.—Mr. Tite, M.P., has received, in answer to a question addressed to the architect of the Metropolitan Board, an assurance that directions had been given to the Board's auctioneers to sell the materials of 120 houses in the first portion of the new street to the Mansion-house, between Earl-street, Blackfriars, and Cannon-street, with a view to their demolition; and that he thought, during the ensuing summer, the ground between these points, with the exception of the Will Depository in Doctors' Commons and the Equitable Insurance Company's building, at the corner of Earl-street, would probably be cleared; and that, as to the remainder of the line, from Cannon-street to the Mansion-house, the negotiations for purchasing the unsettled interest were being proceeded with as rapidly as possible, in order to clear the ground.

THE LONDON LABOURERS' DWELLINGS SOCIETY (LIMITED).—This society has held its half-yearly general meeting, when the report for the six months ending December 31st was presented by the secretary, Dr. Greenhill, of Hastings. From this it appeared that the capital had increased to 23,200*l.*, and that the net revenue for the half-year was sufficient to pay the members a dividend at the rate of 5 per cent. per annum free of income tax, which dividend was accordingly declared. The profit arising from a forced sale of some property to the East London Railway Company had been realised, and according to a resolution passed at the preceding half-yearly meeting carried to the reserve fund. It was unanimously resolved that 500*l.* of this profit be invested in the society's shares, and that the dividends be devoted towards the relief of the deserving poor tenants in times of special sickness or distress, and to the support of useful and charitable institutions in the localities where the society's properties are situated. After this transfer the reserve fund still amounts to 3,960*l.*

GALLERY OF ILLUSTRATION, REGENT-STREET.—Mr. W. Telbin has painted a charming view of the Piazzetta from the Dogana, for Mr. and Mrs. Reed's new entertainment, "A Dream in Venice." The water, the boats, and the buildings are all admirable; the sky on the left side might be improved.—It suggests mountains that do not exist. There is also a very pretty view of the Bridge of the Rialto, by Mr. O'Connor; and the dresses and general getting up are brilliant. The entertainment is written by Mr. Robertson, of "Ours," and cleverly written, too, though its story, a midsummer madness, will scarcely interest so many people as some previous doings in the Gallery. Mrs. Reed is excellent as an old lady, and, with Mr. Reed, Mr. Parry, and Miss Galton, sings admirably a number of opera airs with travestied words. Mr. Parry's appearance and personation of the doge is artistic in the extreme—it deserves to be called great. It is pleasant to be taken,—

"So swiftly to Venice, the land of the free,
Where the cabman's transferr'd to the gay gondolier,
And the stones of the streets are the waves of the sea,
And you feel when at home that you're out on the pier."

THE NATIONAL GALLERY.—Lord John Manners has introduced a Bill to make further provision for the enlargement of the National Gallery.

WESTMINSTER PALACE AND THE THAMES EMBANKMENT.—Notice has been given by Lord John Manners, of his intention to bring into Parliament a Bill to authorise the Commissioners of her Majesty's Works and Public Buildings to acquire lands for the purposes of the New Palace at Westminster, and to construct an embankment on the north shore of the river Thames, in the parish of St. John the Evangelist, Westminster.

LONDON PROPERTY.—The premises at the corner of Birch-in-lane and Lomhard-street, occupied for a period of thirty-six years by Messrs. Overend, Gurney, & Co., have been sold by auction at the Mart, for the sum of 29,500l., to Messrs. Glyn, Mills, Currie, & Co., the private bankers next door, to whose premises they will be forthwith added. The property is held under the parish of St. Edmund-the-Martyr, at a ground-rent of 600l. per annum, for a period of which thirty years are unexpired.

LEAD-POISONED WATER.—Dr. Lankester, medical officer of health for St. James's, Westminster, has reported to the vestry of that parish that he has analysed the water found in the huts and cisterns in various parts of the parish, and found a large quantity of the water to be rendered unfit for drinking purposes by exposure to the atmosphere and want of cleansing of the receptacles in which it is contained. Certain of the waters also gave indications of containing lead, and he warns persons against drinking such waters, stating, "I have no doubt but that this is one of the most common causes of obscure and unexplained illnesses in families."

CHESTER TOWN-HALL.—The works appear to have been set going again, Mr. Gargan, the clerk of the works, having at length been dismissed. For the last nine months he has been paid by the committee (though not allowed to do anything) a salary of three guineas a-week, and as a further testimonial of their favour and support he has been voted a gratuity of 50l. Mr. Gargan was at the expense of bringing his wife and children to Chester, and has had to remove again to his former place of residence in Ireland. The in-coming clerk of the works is an Englishman. The workmen, too, must have paid pretty smartly, we should think, for their refusal to work so long as Mr. Gargan was clerk of the works.

THE SANITARY IMPROVEMENT OF NEWCASTLE.—After a careful inquiry into the causes which may be supposed to have led to the excessive mortality amongst the population of Newcastle, the local public health committee have acquainted the council with the results of their labours, and those of the gentlemen who have been associated with them. Their report was a mere abstract of one of a very voluminous and comprehensive character, which they thought it probable the council would decide on printing, in order that all the data upon which the recommendations contained in the document are founded might be preserved in a convenient form. This mode of procedure was one adopted by Liverpool upon the occasion of a similar inquiry. This report has, in fact, now been submitted to the council, and ordered to be printed, with the report of the town improvement committee.

GAS EXPLOSION AT MANCHESTER.—At the Corporation Gasworks in Rochdale-road, an explosion took place last week. It happened in one of the purifiers. The men were engaged in changing the lime and other purifying materials. Of six men engaged, all were thrown down and more or less injured or harmed. The immediate effect of the explosion was to destroy the whole of the roof of the building, and to make a wreck of the foundry adjoining, the intervening wall being broken through, and the outer wall, fronting to Gold-street, being much shaken. Fortunately, occurring on Sunday, there was no one at work in the foundry. The bricks of the walls, the slates from the roof, and the machinery and appliances were laid in a thorough mass of ruin. All the doors and windows of the building were blown out, and in the adjacent houses in Gold-street the windows were broken. Engaged at the retorts there were twenty men, but all escaped without injury. The committee failed to discover the source from which the fire which communicated with the leak of gas proceeded. The buildings were old and doomed to early removal, at any rate.

TENDERS

For schools, residences, almshouses, &c., at Newington, for the Metropolitan Tabernacle Committee. Mr. James Cubitt, architect:—

Table with 3 columns: Name, In Red Brick, Less for Picked Stocks. Includes Quinell, Cols, Sawyer, Jackson & Shaw, Croaker, Downs, Coleman, Rider & Son, Terrant, Thompson, Hart (accepted), Wells.

For constructing a reservoir on Portsdown-hill, for the Borough of Portsmouth Waterworks Company. Mr. J. Quick, engineer. Quantities applied by Rake & Ranwell:—

Table with 2 columns: Name, Amount. Includes Light (Brothers), Lawrence, White, Furniss (accepted), Finco, Simms & Marten.

For building a residence at Hayward's Heath, Sussex, for Mr. Frederick Willard. Mr. E. J. Collins, architect:—

Table with 2 columns: Name, Amount. Includes Farr, Lockyer, Stuberfield, Harrison.

For the erection and completion of nine houses in West End-lane, Hampstead, for Messrs. Langridge & Streeter. Mr. John Butler, architect. Quantities supplied by Mr. W. B. Hays:—

Table with 2 columns: Name, Amount. Includes Francis & Sons, Lathey, Brothers, Neale, Johnson.

For erecting a new college, at Brecon, South Wales, for the Independents. Mr. T. Thomas, architect. Quantities supplied by Messrs. Curtis & Son, in conjunction with Messrs. Rake & Ranwell:—

Table with 2 columns: Name, Amount. Includes Williams, Watkins & Jenkins, Griffiths, Jones & Sons (accepted).

For rebuilding warehouse, 127, Aldersgate-street. Mr. W. Smith, architect:—

Table with 2 columns: Name, Amount. Includes High, Simms & Marten, Johnson, Nightingale, Newman & Mann, Bennett, Perry, Manley & Rogers, Mann, Kelly, Brothers, White, Henshaw (accepted), Stephenson, Webb & Sons, Crab & Vaughan, Nutt & Co.

* * * An erroneous statement of the selected tender was sent us last week and published. If we did not believe it was sent through misconception, we should state whence it came.—Ed.

For building the Falkland Tavern, Kentish Town, for Mr. G. E. Watson. Mr. J. Pennington, architect:—

Table with 2 columns: Name, Amount. Includes Hoare & Postlethwaite, Manley & Rogers, Ellacott, Edwards, Langmaid & Way, Mann (accepted).

For the erection of a villa residence at Barking, Essex, for Mr. Fill. Mr. J. W. Dennison, architect:—

Table with 2 columns: Name, Amount. Includes Martin, Stokes, Ashmole, Withers (accepted).

For the erection of a store for the Submarine Telegraph Company, Dover. Mr. Rowland Rees, jun., architect:—

Table with 2 columns: Name, Amount. Includes Hearn & Godden, Tunbridge, Fagg, Adcock, Matthews, Still & Co., Richardson (accepted).

For rebuilding the Donagel, Dover, for Mr. Alfred Kingsford. Mr. Rowland Rees, jun., architect:—

Table with 2 columns: Name, Amount. Includes Adcock, Tunbridge, Yenner, Fagg, Matthews (accepted).

For altering the Sarcos's Head Inn, Dover, for Messrs. Holmes & St. John. Mr. Rowland Rees, jun., architect:—

Table with 2 columns: Name, Amount. Includes McKenzie, Adcock (accepted).

For a new infirmary in connexion with the Newport Workhouse. Mr. A. O. Watkins, architect:—

Table with 2 columns: Name, Amount. Includes Francis, Whield, Williams, Richards, Griffiths & Thomas, Hoskins.

For the erection of Trinity Church, Hunnington. Mr. John Taring, architect, London. Quantities supplied:—

Table with 3 columns: Name, Estimate, Separate Estimate. Includes Dove, Brothers, Newman & Mann, Simpson, Saunders, Myers & Sons, Pattinson, Maile & Richardson*.

For the erection of a new Synagogue, Carter-street, Houndsditch. Messrs. Thomas Smith & Son, architects:—

Table with 2 columns: Name, Amount. Includes Enmor (accepted).

For national schools and master's house, Frimley, Surrey. Mr. T. Goodchild, architect:—

Table with 2 columns: Name, Amount. Includes W. & T. Swayne (accepted).

TO CORRESPONDENTS.

H. M. W. (shall receive proof).—W. R. (shall appear).—T. R. (no opportunity afforded).—Passenger (next week).—Atque labora nihil (next week).—E. W. T. (next week).—Judge Jeffrey (next week).—W. D. R. (write to publisher).—F. H. S. (too wide a question. Tell an architect the amount available, and let design be made in accordance).—A. & K. (we cannot "correct" contracts we believe to be correct already).—C. H. (write to J. Conduitt-street, for form 7).—H. B.—A. G. W.—W. J. P.—E. & Son.—W. R.—C. & V.—D. W.—A. J.—J. W. D.—R. J.—H. F.—The Rev. H. V.—P. W.—C. H. L.—W. H. C.—L. J. G. W.—S. E. T.—J. N.—H. H.—M. T.—R. & R.—T. H. D.—H. S. & L.—C. P.—E. F.—R. W.—A. R.—F. W. A.—L.—L.—A.—B.—T. G.—W. R.—W.—G.—A. T.

We are compelled to decline pointing out books and giving addresses.

All statements of facts, lists of tenders, &c., must be accompanied by the names and address of the sender, not necessarily for publication.

Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

Advertisements cannot be received for the current week's issue later than THREE o'clock, p.m., on THURSDAY.

The Publisher cannot be responsible for ORIGINAL TESTIMONIALS left at the Office in reply to Advertisements, and strongly recommends that COPIES only should be sent.

TO SUBSCRIBERS.

NOW READY, THE TWENTY-FOURTH VOLUME of "THE BUILDER" (bound), for the year 1866, Price One Guinea.

CLOTH CASES for binding the Numbers, price Two Shillings and Ninepence.

COLOURED TITLE-PAGE, Gratis.

SUBSCRIBERS' VOLUMES will be bound on being sent to the Office, at a cost of Three Shillings and Sixpence each.

[ADVERTISEMENT.]

CHURCH, TURRET, and STABLE CLOCKS. J. W. BENSON, having erected steam-power and improved machinery for clock-making, at the manufactory, Ladgate-hill, will be glad to furnish to clergymen, architects, and committees, Estimates and Specifications of every description of Horological Machine, especially cathedral and public clocks, chiming tunes on any number of bells. A descriptive pamphlet on Church Clocks post free for one stamp. Watch and Clock Maker by Warrant of Appointment to H. B. H. the Prince of Wales, and maker of the great clock for the Exhibition, 1862. 25, Old Bond-street, and 33 & 34, Ladgate-hill, E.C. Established 1749.

ADVERTISEMENTS.

TESTIMONIALS, REPORTS, and every description of PRINTING, executed in the best manner, with promptness and punctuality, and at moderate charges.—WYMAN & BONE, Oriental, Classical, Fine-art, and General Printers, 74-75, Great Queen-street, Lincoln's-inn-fields, W.C.

SCIENTIFIC BOOKS, published by ATCHLEY & CO. 105, Great Russell-street, Bedford-square, W.C., on ENGINEERING, ARCHITECTURE, SURVEYING, MILITARY, CIVIL, and MECHANICAL BUILDING, MACHINERY, and DECORATION. A new List sent free. If amount of books remitted, sent carriage paid.

NEW EDITION BY MR. WATTS PAPFORTH. On TUESDAY NEXT, the 28th instant, will be published, the Fifth Edition, in 1 vol. 8vo. price 2s. 6d. cloth.

GUILD'S ARCHITECTURE, Historical, Theoretical, and Practical: Illustrated with more than Eleven Hundred Engravings on Wood. Revised, with alterations and considerable additions, by W. G. WATTS, Fellow of the Royal Institute of British Architects. Authoritatively Illustrated with nearly Four Hundred Engravings on Wood, by O. Swain, and more than One Hundred other Woodcuts. London: LONGMANS, GREEN, & CO. Paternoster-row.

THE USEFUL WEATHER GUIDE, for Farmers and Gardeners, by W. G. WATTS, Esq. Six copies sent free by post on receipt of Two Penny stamps. Address, T. ROBERTS & CO., 5, Crane-court, Fleet-street, London.

THE MONEYS of all NATIONS, with their Correct Value in English Currency. Six copies sent free by post on receipt of Two Penny stamps. Address, T. ROBERTS & CO., 5, Crane-court, Fleet-street, London.

The Builder.

VOL. XXV.—No. 1260.

The History of Architecture.*

THE history of all architecture in all countries through all times, is a large title indeed, and to do justice to it is a daring undertaking for one man, whatever may be his accomplishments and

however abundant the materials at his command. Still it is by one man that such a work has to be

undertaken if at all; for the subject is essentially one and owes its highest interest to its unity, and must be taken in from a single,—the very best obtainable,—point of view, of course. Only thus were there a chance of obtaining a history, a much better thing if deserving the name, than a bundle of histories at cross purposes continually one with another, or still worse, so thoroughly under the discipline of overstrained editorship, as to be destitute of any resolute purpose or individual colour whatever. The work had to be done, and would have been done, though better left aside if grasp and independence were wanting; as it is, both students and lovers of architecture may hold themselves fortunate that the lot has fallen well. In these our days of constantly extending and accelerated intercourse, architectural contributions flow in from the ends of the earth, and the multiplication of explorers and the thickening footsteps of men who become explorers but by accident of leisure or of labour, cause the turning over of records that are recovered last for the very reason that they were covered up earliest. And architectural discovery is still running only a parallel course with geographical researches,—with geological, ethnographical, philological; is stimulated to exertion, encouraged in sanguine hopes by their successes, gathers hints of enterprise from their combinations, and still remains under no obligation that it does not amply repay. The tendency of all these studies has been for some time sufficiently declared to establish a sequence of development in art and civilization throughout the general human race, and a connexion of almost magnetic universality, by action and reaction, between its wide-spread families, such as aforesaid was contentedly traced only within the limits of independent sections. The age of concurrent expositions of the arts and industries of all nations as contemporaries, has curiously enough been the first to fully apprehend that even from the earliest appearance of our race, so an effective concurrence has been unconsciously proceeding, and thus the time has arrived when history may take in hand to review all lines of progress and make an estimate of general result and of what has been severally contributed,—to distribute her honours and honourable notices, and deduce if it may, encouragement no less than instruction for the future.

It is, therefore, with consistent philosophical appreciation of the scope and dignity of his theme, that Mr. Fergusson devotes the half of this Introduction that follows a sketch of "Tech-

nical Principles of Architecture," to an outline of "Ethnography as applied to Architectural Art." "The one great fact," he says, "which it is essential to insist on here is, that if we do not take into account its connexion with ethnography, the history of architecture is a mere dry, hard recapitulation of uninteresting facts and terms; but when its relation to the world's history is understood, when we read in their buildings the feelings and aspirations of the people who erected them, and above all through their arts we can trace their relationship to and their descent from one another, the study becomes one of the most interesting as well as one of the most useful which can be presented to the inquiring mind."

The conciseness, which is a condition of the whole work, presses especially hard of course upon an introductory section; but the characterization of the four great groups of building races is replete with happy combinations, and even the less convincing have a value in opening questions which it is almost as high a mark of intelligence to entertain as to answer.

For the races themselves, they are classified as the Turanian, the Semitic, Celtic, and Aryan.

In the separation of the Celts from the Aryans, and still more in their co-ordination, we see a divergence at once from the conclusions of the philologists, who bracket Welsh and Gaelic with Greek and Sanscrit as Aryan co-equals, without a hint of hesitation. Again, in subdivisions, Mr. Fergusson comprises among Turanians, not only the accepted Turks, Hungarians, and Finns, but the ancient Egyptians, who rank with the philologists as Semitics, to say nothing of his inclusion of the modern Chinese and Japanese. The Semitic division is thus left to the Arabian, the Hebrew, and the Phœnician.

In all this there is provocation enough for civil and for controversy, but the challenge is a fair and a frank one; the claim is no less than that architectural language should be taken in evidence on the same level with linguistic, and have a right to tender no less than to receive illustration; if this he disallowed, the philologist will not damage the value of his instrument of analysis; for the evidence will then be complete that the most interesting and important affinities of races have deeper roots than those of their language.

The world has had a long history, and most things that have happened in the last two thousand years happened several times before in the many two thousands antecedent. He were a shrewd philologist who should demonstrate the Celtic blood of the French nation from an analysis of Parisian language; but a comparison of the genius of the Gauls, as described by Cæsar, and as put in evidence by a file of last week's newspapers, is decisive, as decisive as Mommsen's acute parallel between the ancient Gauls and the modern Irish. The basis of Mr. Fergusson's argument, therefore, must be conceded, and we welcome the examples he provides throughout the work of its cogent application.

We cannot do better than speak here of the general tone of the work, and do so with unqualified commendation. He must, no doubt, have very callous architectural predilections indeed, who does not very frequently, as he goes through the pages, stop short to protest against a dictum, not to say a dogma, to appeal against a judgment, or even a principle; but there is always the satisfaction that the meaning is so clear that there is no difficulty in framing a counter assertion;—it is an assertion that has to be encountered, and not a shifty insinuation.

By distinctness of expression, absence of equivocation, by boldness, therefore, of the best kind and above all things, the author thus lays himself open to attack on all sides at the present moment, and by possibilities of future discoveries; but a bold conjecture is at least a

guide to direction of inquiry. Sometimes, doubtless, we are taken rather suddenly by a positiveness in assertion as a fact of what it would seem much to claim even as a plausible solution of an open question, but further reading usually shows clearly that this positiveness is no more than the author's way of giving the highest expression to his conviction; it is not an overbearing imposition of it on those who have fair claim to suspend their judgment, if not to be pretty positive the other way. Still less is the positive statement palmed off upon ignorance as an obligatory conclusion. It is positive in one clause, "almost certain" in the next, and "almost quite certain" very soon after; and it would be to be wanting in the amenities of interpretation to decline accepting the enunciation in its totality. In an age of so much timid self-mistrust, it is good to find a writer who is bold to be of his own, however seemingly paradoxical, opinion, and who elects to take the risk of sometimes proving wrong rather than be false to the pregnant suggestions of study, and cares less to be safe than he fears to forfeit the rewards of sagacity by half-hearted qualifications.

Probably the last words in the publication that were written were those that, below the vignette on the title-page, assert that in the manner so illustrated it was that the Greek temples were lighted. Should it prove hereafter most certainly that this was not the case, as we think it very easily may, no one who has read the book will be entitled to say, after the pages in which the subject is discussed, that the author's assurance went for more than his most settled conviction, with full notice of differences of opinion existing and recalcitrant, under recognition of the very same evidence.

On another subject of special predilection with the author,—the Christian foundation and design of the Dome of the Rock at Jerusalem,—he has certainly carried such independent judgments with him as at least to vindicate his pertinacity. Upon another point, which, as pertaining to technical military architecture, is not included in this history, Mr. Fergusson has lived to see the recognition, practically as well as theoretically, of his broad and bold anticipations.

Let the reader, then, be not merely indulgent, but by our advice he will moreover be alert, to what independent views he may find somewhat startlingly enunciated from time to time. It is open for him always to take them with whatever grains of salt he pleases, and he will find the salt in most cases placed conveniently to his hand.

The autobiographical notice,—we had almost said of the book,—that is found in the preface, is instructive enough. It may be said to have begun in the publication of a treatise on "The Principles of Beauty in Art," which, rejected by booksellers, and simply a pecuniary loss to the author, would be called a failure by those who are unaware of the lively reaction it produced among selecter students, or who decline to recognise the teaching of the teachers as compensation for loss in an attempt to supply the multitude with a text-book.

And so the project for a time died down; but the warmer sun that rises in Albemarle street revived the germ, and the result was the "Handbook of Architecture," in two volumes (fully reviewed in our pages at the time), that vindicated the value of its materials and the wisdom, if not precisely the skillfulness, of its plan, by a popularity, both with architects and the public, that all are familiar with. After this success it appears that there was no longer an obstacle to the author doing justice, with ripened knowledge as well as experience, to his own idea. We miss with pleasure the label of the Handbook, which in its purport is as inappropriate to volumes,—not unwieldy, it is true, but still of 800 pages,—as by its associations unworthy of the reach and copiousness of their contents.

* "The History of Architecture in All Countries, from the earliest Times to the present Day." By James Fergusson, F.R.S., M.R.A.S., Fellow Royal Institute of British Architects. 3 vols. London: John Murray, Albemarle-street. 1865.

The History has no cause to be ashamed of the Handbook from which it sprang, and sufficiently acknowledges this by what it retains, both literally and recast; but the recasting has been so extensive, the developments and additions so important, that the book is in truth a new book; and what we have now to say of it, after deliberate consideration, will be to the general effect that it is a very good one.

The supercession of topographical by historical sequence has been effected in part by the rearrangement of the singularly confusing order of the chapters of the Handbook, each chapter or book being, however, still restricted to a particular country; and then by adopting with more persistency an historical point of view, without the local limits. There was, in truth, no other way; the provincial development of styles, of which the leading features are most widely diffused, must have its historical acknowledgment; and the stories of different provinces have thus to move on, each upon its own ground; and the lines often quite distinct, often only irregularly parallel, must need be explored consecutively. The claim to first treatment belongs presumably to the first corner; but even history demands its dramatic interest, and must put in a privileged and conspicuous place the subject that is of highest interest by vigour, variety, and artistic import. It will thereafter be enough if the intelligence of the student is warned, is aided in keeping up from time to time his sense of the sympathy and note of the insouciance, local influences notwithstanding, of all the leading lines. The Doric architecture of Sicily had a local development that demands a history of its own concurrently with that of the happier development in Greece proper; and notwithstanding the active intercourse and personal interchange of Mediæval ecclesiastics, even the mighty stream of Gothic invention did not overcome all tarrying eddies and back streams. Salisbury Cathedral, as compared with Reims or Amiens, asserts its topographical distinction no less than, and even far more vehemently, than its historical synchrony.

On the whole, the questions of this class affecting distribution, that rose up to be arbitrated on, appear to have been decided with remarkable—as regards another class, we would say, with surprising—judicial discretion. The proportion of space to be devoted to various styles, and periods, and countries, is a consideration that mere impartiality might easily be at fault in, while it is of all others the most fatal trap and temptation for a writer who has enthusiasm enough for a partisan. Lined twigs spread themselves in every direction of this many-branched architectural story; but still, to the great comfort of those most interested, the bird flies free. It seems to be one of the advantages of the detailed study of a large range of contrasted styles—but given, we must add, a worthy student—that the virtues of those which are least after his own heart make themselves known, and make known, at the same time, the shortcomings of his own style of predilection. It will surprise some who read—as one is apt to do—the preface last, to find that the author recognizes the possibility that he may be thought cold towards the beauties of Gothic, which, in section after section, he has given such effective help towards understanding and appreciating. On the other hand, those who may be alarmed by some enthusiastic expressions lest the author's familiarity with the East and its monuments should have vitiated his taste and overloaded his chapters with elaborated deformities, will assuredly be comforted when they find that the space assigned to Orientalism is the very least that could be conceded to joint claims of novelty and real artistic value; that not one page is misapplied; and that the severest criticisms, even when most sweeping and unwelcome, of the structures of the West, in no case betray an alien relish that smacks repugnantly of tope, and mosque, and pagoda.

Of the three volumes which constitute the work, the third, published as it has happened first, contains the history of modern styles, including the revival, which was in many a better form and promise, a true development of classicism, and touches—not without some classic lines,—the revived Gothic, in which, sooth to say, the author finds more of archeology and manufacture than of art and architecture,—works that it is clear have, in his apprehension, but the same parity with their models that reputation, questionable at best, can claim to innocence.

The History in the volumes that number 1,

and 2 is divided into the three parts,—Ancient Architecture, under the four heads of Egyptian, Assyrian, Grecian, and Etruscan and Roman. In these the local transitions fall in readily enough with historical consecutiveness. But in this part, as it appears to us, a place should have certainly been given to the chapter on Celtic, or so-called Druidical architecture, which deferred for the second volume, was ultimately, by means of space, fairly hustled out of time; and stands over now with promise of a niche in a future reprint of volume 3. No antiquarian, and no historian, will assuredly date Stonehenge lower than the Colosseum, and it has an architectural value that makes a history of English architecture, which commences with no reference to a foregone account of it, strangely acephalous. Even to this day there have been those who have passed from restoring the missing and setting up again, in imagination, the prostrate masses on the lonely moor, with an impression of the majesty of the original conception, that has soon after seemed strangely to harmonize with the fundamental tones of Salisbury and ancient Winchester. At Winchester it may be that it is merely the sentiment for grandeur of mass that reappears; at Salisbury it would seem as if the artful gradation of projection and magnitude of the double transepts, and again subordinate porches, of nave and chapels, were designed by a master who had gone to school on the bleak plain, and had there learned the secret how the concentric circles and symmetrical trilithons gained scale and effect, by artfully accentuated progression. From the larger ethnographical point of view no less, the masterwork of a race which spread so wide upon the almost unoccupied map, and stretched so far, would fall into true perspective in the ancient section. Indeed, when we remember the wild theories of Draconia by Stukely and the rest, and then consider the analogy of Stonehenge with the monuments of the snake-worshipping Euseus, revealed in this very book, we marvel at the self-control that, from any consideration whatever, left the theme alone.

Part the second is devoted to "Christian Architecture," by no means an unexceptionable title, considering that, as currently employed, it excludes both Santa Sophia and St. Peter's, and as here employed it excludes the latter, to neither of which did any earlier non-Christian temple ever bear the slightest resemblance. But as usual, p. 76, the difficulty is candidly admitted. France takes of right the first place in the historical sequence of Gothic development, and books are given in order to Belgium and Holland; Germany, by a precedence due to her Romanesque monuments, that should have given her a place even before France, but for her less lively evolution, and Scandinavia; England commences the third volume, and is followed by Spain and Portugal, under many acknowledged obligations to Street,—Italy; and, lastly, Byzantine.

To this last collocation we again take serious exception—an exception not unanticipated, but, we think, by no means superseded. Byzantine architecture may, it is true, have lived down to the present century, but all its most important—all its really important—productions were anterior to Gothic, and even to Romanesque; moreover, after the fully recognized additions to our knowledge of the style by Texier and Pullen, it cannot escape us how importantly, by its inventions and adaptations, it entered as a factor into the novel developments that were familiar to Crusaders in the West, and carried along with them in their Eastern conquests.

Pagan architecture—or Oriental, as we would rather call it—occupies the last book of the volume last published, and this is a veritable mine of new information quite worthy of the number of pages devoted to it.

Saracenic, Eastern and Western,—and it is Oriental even in Sicily and Spain, occupies the first book of this part; followed by Persia, India, Hindu architecture, Indian Saracenic,—a section of the highest artistic value,—Naga architecture, of which more is to be said, China, and, lastly, Mexico and Peru.

This it is, indeed, to—

"Let contemplation, with extensive view,
Survey the world from China to Peru."

Panting space, so far as a reviewer can command it, if not time, must toil after such a contemplative philosopher in vain; sit we down and breathe and make some more special note of certain "things of fame that do renown" the regions we have been carried over. The review

of an encyclopedical book,—of any hook that ranges on a line with this, or claims, indeed, in such degree the honours of originality,—makes never, or only impertinently, a pretence to supersede it, and spare any worthy reader the necessity of studying the book itself: it was an hallucination of our younger days, induced by a prevalence of a different view, that only by some perversity of fate could it happen that it always seemed to fall to the lot of those writers to review hooks who, from their better knowledge of the subject ought to have written them,—the authors, as it were, having missed their function as reviewers, for which they might still, weak as they were, have been just sufficiently qualified.

Multifarious as the manifestations are of Asiatic architecture as contained in this half volume, it is marvellous how very few can be noted as simply harsh or by a term that fails of the dignity of the more appropriate term, Barbaric. We confess to a certain feeling of awe when we reflect on the shorthandedness—the subtraction,—though for the most part we must qualify it as the deserved, to which the races have fallen who were capable, we will not say merely of executing, but of conceiving such designs. When we look at these ruins we remember how Scipio muttered over the Carthage that his legionaries were burning, the Trojan anticipation of the day,—

"When Priam's sons and Priam's self should fall;"

and admitted to the Greek beside him that he was mistrustful, if not prescient rather, of the fatality of Rome. Whether as matter of art or of national prosperity, we read the moral, not alone of the accidents of history, but that of the incumbency of unremitting energy, vigilance, and a resolution which shall rescue the germ of life in fainting art by unsparing sacrifice of entangling routine,—of hardening tradition, by daring tolerance of innovation, when it is the innovation of genius. There is a superstition and a fatalism in art and architecture as in cult, and those of us in these our modern times and nations who cannot break through it will have to lament fruitlessly over formalism nipped in its untended bud, or unprofitable bloom, as infallibly as ever was the art of the mighty architects of Nakhon Wat.

And who were they, and what their works? In some five-and-forty pages of the second volume the extraordinary tale, so far as it has been recovered, is told by Mr. Ferguson.

Beyond the long Malayan peninsula, on the east of the Gulf of Siam, is a broader peninsula, of which the eastern seaboard is Cochinchina, and the central portion, traversed throughout its length by a great river, is Cambodia, and here, in a plain, about 103° 50' E. and 13° 30' N., are the ruins that have excited these reflections. Their date has still to be sought and settled, somewhere probably within the four centuries between 951 and 1357 A.D. This, however, is one of the many cases where questions of definite date will be better left aside until evidence to the point, which must come in, can be taken into account. The temple of Nakhon Wat is but one, though the chief, of several. Both in arrangements and ornaments it declares itself as dedicated to the snake worship, the eradication of which, by the sword or by conversion, or by both conjointly, explains their present desertion. The country lent itself kindly to the natural and artificial swamps, favourable to the objects of veneration; and the temple is a series of concentric rectangles, of which the central one, and also an intermediate pronos, was occupied by four tanks; while it is probable that even a large moat-surrounded area in which the temple stands was at least occasionally turned into a lake.

Of the scale of the works we will speak presently. Of their execution we read,—their walls are built of large stones, without cement, and so beautifully fitted that it is difficult to detect the joints between two stones; hence some pillars have been mistakenly described as monoliths, and junctions cannot be detected even in flaw-declaring photographs, until their known places are pointed out.

To masonry worthy of the best Hellenic times is added the Hellenic characteristic, that neither proper arch nor vault is employed throughout the buildings, but pure trabeation or the Pelægic arch of projecting stones always. Still further, the architectural members and details are so distinctly pronounced that an interpreter of architectural language will no more doubt their derivation from Greek and Romanized Greek models than a philologist doubts the historical dependence of Portuguese and Latin. The pillars, rectangular

though they be, have proportions of diameter, diminution, height, and spacing, that are as characteristic of such derivation as their details of base with its plinth, capital and abacus, and distribution, as well as details, of epistylia. The pillars are surmounted by a very proper architrave, a frieze, which within the temple receives elaborate sculpture, and a cornice, of which infinite rows and repetitions of seven-headed serpents only take us from Greece to remind of the cornices of disk-crowned asp in Egypt. To the wood-cuts, which reproduce photography with delicate veracity, it must be left to spare further description.* Let a few words be given to the extent of the remains. The rectangular walled enclosure of the temple measures 1,080 yards by 1,100 yards, and is surrounded by a moat 230 yards wide, which completes an outer rectangle of nearly an English mile each way. A splendid causeway across the western moat, adorned by pillars on either side, leads to the great gateway, itself a structure of five stories in height, and having, with its wings included, a façade of 600 ft. Beyond, a second raised causeway 370 yards long, leads to a cruciform platform, in front of the proper temple. "The temple itself consists of three enclosures, one within the other, each raised from 15 ft. to 20 ft. above the level of that outside it, so as to give the whole a pyramidal form. The outer enclosure measures 570 ft. by 650 ft." To this we must confine ourselves,—it has three portals on each face, adorned with towers, and externally is surrounded entirely by double open galleries or verandahs, more exactly peristyles. These have very much the relative proportion of a nave and aisle, the wider, 104 ft., being next the wall. The inner and larger pillars have elegant capitals, but no base. A design is carved on the flat at the lower part, and an incised ornament carried up the edge of the shafts; this is the case also with the outer pillar, which has base and plinth. Of such pillars there are 400 or 500; and we have not yet penetrated to the temple, where there are hundreds more. Moreover, the walls of the colonnade are sculptured, to the full length of some 2,000 ft. from top to bottom, and Mr. Ferguson estimates the number of men and animals represented from 18,000 to 20,000. His authority is the photographic collection of Mr. J. Thomson, to whom the revelation of these details is due. Numerous female statues appear on the pilasters, but no male; and as a last analogy we remember the caryatids of the Erechthium, where the Attic priestess tended the sacred serpent, of which Herodotus has so much to tell, and that is seen in the graceful bas-relief coiled round Minerva herself, and feeding from her hand.

There is a parallel appearance of *gusts*. Classic forms on Indian ground, comparatively insignificant in extent, in Cashmere, much nearer their original seat; but they are here employed with some faculty of adaptation, it is true, but with inferior taste, and seem to have been propagated from a baser stock, reminding of the degenerate style of a Roman Christian sarcophagus, or the bride's silver toilet set of the Blacas collection.

Further suggestions and elucidations will be found in the book; it is enough here to have adverted to an example of the strange power of diffusion in architectural ideas, and to the task which is set by its indications for the interpreters of language and literature to work out. The astonishing discoveries in Siam recently extracted in the *Builder*, announce that we are not yet at the end of our wonder or our history. For the rest,—of the snake-worshippers and their repulsive superstition, the world, no doubt, is well rid, so far as it is rid; yet it must be with a certain respect that we regard their strenuous resolution, and, indeed, success in making architecture with its accessories an exponent of their purposes and sentiments. Wherever the elements of their architecture came from, and by whatever road, they made it speak their own language, express their own thoughts, and spared neither labour nor expense in the endeavour; and so, though the thoughts may have been little worth, the dignity of the purpose remains. Our own civilization, which we hope relies on a sounder vitality, and boasts above all things to be rapidly and continuously progressive, may not disdain to emulate even Cambodians in prosecution of a mighty work, by developing both plan and elevations in subjection no less to purpose and to technical art, than to the most original characteristics and definite expression of the current time.

WANT OF HARBOURAGE AT NAPLES.

THE Bay of Naples is famous for its beauty. Second only, in the opinion of most who have had the opportunity of making the comparison, to the Golden Horn, when the domes of Constantinople first rise to view, its shores are the very cradle of classic romance, and of history more marvellous than fable. The syren's rocks recall the voyage of Ulysses, and the precipitous bluff of the "Salto di Tiberio" awakens the imagination to the truth, how little effect the lapse of eighteen centuries has had on the physical features of the landscape. The figures, the dress, the craft, of the sailors who navigate the bay are all alike things of the past. Except by the occasional presence of some Catholic emblem amid the quaint pagan representations painted as amulets on the prow, a *marinatio* boat on the bay of Naples might be a vessel either of the present day, or of one, two, or three thousand years ago. Basking in the sun so soon as their nets are drawn or their boats run on shore, the lazzaroni eat, and chatter, and slumber, beneath the very shadow of the canopy of smoke which escapes from the crater of Vesuvius, and denotes the constant activity, and the very close neighbourhood, of the mysterious subterranean fire. The giant moves at times, throws forth furlongs of red hot lava, showers of scoria, or clouds of fine ashes, obscuring the sky with a darkness more impenetrable than that of night, and which has been known to speed over the narrow peninsula and reach the Adriatic coast within less than two hours from the time that the eruption took place. Sharp shocks of earthquakes are not rare, and although the people of Naples are wont to console themselves when these are slight with the theory that it is only a disturbance of the volcano, and not a *real* earthquake, the movement at times causes sufficient terror to keep the whole population for three nights in the streets, and to crowd every church with the suppliants of St. Januarius.

For people who are exposed to the danger of volcanic eruption, and to the still more fearful peril of earthquakes,—people who live between the ruined cities of Pompeii and Herculaneum, and the cities of Cumæ, Posilippo, and Baia,—it might be thought that the feminine fury of the angry Mediterranean would have but little terror. The reverse, however, is the fact. So calm is the usual surface of the bay, that a very slight rise in the wind is sufficient to drive, or to keep, the mariners ashore. A steady Sirocco, the damp southern wind which blows most roughly over the bay, prevents both fishing and the daily passenger and parcel traffic which is carried on by open boats. The steamers lie snug at the pier if a water-spout is sighted. For a people who, in the hot weather, are semi-aquatic in their habits, it is wonderful to note how afraid the Neapolitans are of the sea.

It has just given some good cause for alarm. On the 16th and 17th of January, a hurricane, such as has been hitherto unknown in those waters, swept over the Bay of Naples. Curiously enough, the very day had been predicted, probably by the astrological almanac of *Barba Nera*, which has great popularity in Southern Italy, as the date of a great storm. An eye-witness gives a graphic description of the scene. The streets of Naples were in all the alarm, and presented many of the features, of the wildest revolutionary times. Barricades of boats arrested the passengers; the troops were under arms, and, with the National Guard, patrolled around the shore. The Prefect, the Quasitor, and other authorities were all on the scene, helpless in presence of the storm. Thirty vessels were dashed together, or drifted on the shore, under the very eyes of the excited populace. The road that skirts the bay from the quay of the Custom-house, past the lofty brick tower of the church famous in the history of Masaniello, stretching towards Portici and Torre del Greco, was covered with oranges, caruba, grain, and other portions of the cargoes of the driving and foundering craft. Nothing could be done to arrest the disaster. Authorities and people, seamen and landsmen, could only look on in helpless dismay at the fury of the storm.

It is true that the hurricane now recorded is exceptional in its violence; but the damage exceeds in degree only that which occurs from time to time with no inconsiderable frequency. While Europe, for good or for evil, has been going so fast a-head, Naples has, in this respect, been out of Europe. Africa, it might almost be said, commences at the Tronto. It is hardly credible that the port of Naples, now a city of

420,000 inhabitants, was constructed by Charles of Anjou, the first of the Angevin kings, who died in 1285. The people who look to Naples as their emporium and their harbour have been hitherto content with the arrangements planned by a monarch in the thirteenth century. Not content, perhaps—content is not a southern virtue,—but passive and acquiescent; talking incessantly about the want of a port; debating whether it were better to enlarge the old one or to construct a new one; expatiating on the magnitude attained by the city, on the requirements of its commerce, on the unsafety of the anchorage, and on the ample return which would be ensured on the capital invested in docks and piers; but doing nothing but talk; and, unfortunately, the Sirocco is not to be lulled by conversation, even when carried on with such gesticulatory violence as to leave the talkers no energy and no time to do anything but chatter.

So deficient is the accommodation afforded by the moles of Naples, and so exposed is the anchorage, that English ships of war, when at anchor in the bay, are accustomed to get up steam and stand out to sea when the wind gets up. From Civita Vecchia, itself an inaccessible port, round to the very heel of the boot, to Otranto and Gallipoli, there is not a single point of shelter. We have just seen what occurs at Naples. Amalfi, once the rival of Venice, is now reduced to a miserable village of a few scattered houses perched on a precipitous cliff. Salerno, the third city of the old Neapolitan kingdom, has no quay, no pier, no protection from the wind. The commerce of Italy can never thrive or prosper while the shores of the peninsula are thus devoid of any sort of shelter for sea-going or even for coasting craft.

One effect, we doubt not, the storm has already had. It has set all the tongues of Naples in motion, to the effect that now, at all events, the construction of the port can be no longer delayed. Another result we venture to predict, and that is that before long it will blow some Italian deputation, bankers, deputies, projectors of some kind, to our shores. So soon as the rise which is now fitfully indicated by the commercial barometer tends towards set fair, all sorts of kind and loving court will be addressed by foreign suitors to our disengaged English capital. We have before referred to the subject of foreign investments. We are far from wishing to say that at all times, and under all conditions, such investments are undesirable. Many projects of foreign enterprise might, if properly handled, prove highly remunerative. But certain precautions are absolutely necessary, precautions the importance of which has been learned by English capitalists at the cost of tens of thousands of pounds. The first idea of a foreign concessionaire is to obtain English capital to work his concession. For that purpose nothing that is fair and tempting, as far as promises are concerned, will be withheld. But when the capital is once obtained the tables are turned. If we say that English engineers or English architects, who are eagerly consulted, and, in the first instance, obsequiously deferred to, are apt, somewhat later in the day, to drift into the condition of the *tullehan* bishops in Scotland, or to feel that they have been used as the handle of a pump, neglected so soon as water has been drawn, we fear that neither the engineer of the Cavour Canal, nor the engineer of the Brindisi Railway, will be disposed to contradict us. We do not wish to make inviolable remarks,—to blame individuals for the result of centuries of misrule, and for the evil inheritance left by political and sacerdotal tyranny. But, be the fault their own or not, our Italian neighbours have not yet learned that honesty is the best policy; in fact, that old-fashioned virtue is regarded as senile and out of date.

The sole conditions, then, under which either a port for Naples or any other of the numerous public works which Italy so sorely needs can be aided by English capital without risk amounting almost to certainty of loss, are these:—The concession, charter, or grant from the Government, under which any such enterprise is to be carried out, must be originally made to English subjects alone, in their own names, and without any provision as to their merging any of their international rights in accepting the grant. Any association of native capitalists or shareholders must come in as subaltern to the English constitution of the society. An English engineer or architect must have absolute control of the works. Any municipal or local grants that may be requisite for carrying out the scheme must be guaranteed by the royal Government, so that the

* See p. 224.

directors of the company shall have no requisite official relations excepting with the minister of public works. Finally, considering the present state of Italian credit, the price of *rente*, and the little hope that even so able a financier as Signor Scialoja, one of the ablest and most upright men in Italy, held out of cutting down the greedy array of officials that are eating away the very entrails of the country, we should recommend that no Government guarantee be asked for, unless it takes the form of a grant of land, but that such security as to the right of imposing rates and tolls, and the mode of collecting them by the officers of the company, as may insure the permanence of the income earned by the expenditure incurred, be substituted for a State guarantee.

Under conditions such as these, openly and fairly stated in principle, and embodied in an agreement to be approved by an English lawyer acquainted with foreign law, we have no doubt that a fair and remunerative return might be derived from the investment of English capital in a Neapolitan port, mole, and docks, or from other similar undertakings. It is possible that other conditions would become necessary under special circumstances, but no one of the guarantees we have named can be disregarded with safety. Englishmen will be assured that it is the same thing to purchase a foreign concession and to receive one direct from a foreign Government. Englishmen who have tried know the difference, and bitterly to their cost have they acquired the experience. Foreign engineers, we shall be told, must know the resources of their own country, the run of prices, the rate of wages, the quantities of several kinds of work, far more accurately than a stranger can be expected to do. The estimates of such foreign engineers—foreign, that is, to us Englishmen,—native, and often wide awake in their own country—are therefore proposed as the basis of a contract. Any error in such estimates can be easily rectified. How such rectifications take place, there are men in London who would gladly have paid many thousands never to be learned by experience. In a word, if anything is left open, anything uncertain, anything to be rectified,—if any legally requisite formality is left at the charge of the concessionaire,—if there be any hole at which to creep out, we do equal justice to Italian astuteness and to English blundering good faith in saying that less more or less heavy will be the result. Our countrymen have a fertile country before them, the soil is virgin, the crops will be large; they will be asked to settle, to plough and to sow, they will have every facility afforded them for so doing—there is every rational probability that the crops will be large—the great point to make sure is, that they shall reap themselves, that they shall garner themselves, and that they shall keep the key of the barn. They will require early risers and sharp watchdogs to do this. It is to be done, and more than that, unless it is done we see no prospect of such a development of the great natural advantages of Italy as can alone prevent national bankruptcy, and, perhaps, the return of Southern Italy to a state of barbarous anarchy; but to do it well will require some of the hard-earned experience of the burnt dog who dreads the fire.

When the majority of the Chamber of Deputies voted for the imposition of an income-tax on the foreign holders of Italian *rente*, in spite of the contrary, in virtue of which that *rente* was issued; when they did this on the express plea that it was for the advantage of Italy to tax foreigners, it is not the fact that in the Senate there was found a majority of members sufficiently honest or sufficiently long-sighted to negative the iniquitous vote of the popular Chamber that will satisfy the prudent English investor. It is not without some good reason that people are not tempted by the very large return that a purchase of Italian *rente* at the present price seems to promise. The wisest of the Italian ministers are aware of these rocks ahead; but if this wisdom has descended very far in the innumerable grades of the official hierarchy it has made better speed than would have been expected. Sooner or later, no doubt, it will become evident that it is very costly to be unreliable. The sooner the Italian arrive at this conclusion the better for themselves and for all who have to do with them. Until such is the case, the best service that Englishmen can render to the Peninsula, in any commercial dealings with its natives, is to keep them out of the way of temptation.

HEALTH OF LIVERPOOL IN 1866.*

We were recently enabled by the publication of the Registrar General's Annual Summary of the Births and Deaths in London in 1866, to review the result of the ravages of cholera in the metropolis last year. Dr. W. S. Trench, the Medical Officer of Health for the borough of Liverpool, has just published an able and comprehensive report of the health of that town in 1866, and having naturally devoted a very considerable portion to the origin, progress, and decline of that epidemic in the borough, we are thus afforded the means of comparing the loss of life sustained from cholera in the two largest towns of England and Wales, which together contributed in the year 7,359 deaths, or more than half the total number referred to this cause throughout the country.

Liverpool has long enjoyed an unenviable notoriety among the large towns of the United Kingdom for an excessive rate of mortality, and consequent waste of life and energy; for a high death-rate is by no means the sole consequence of a disregard of those laws, only now beginning to be generally understood, which govern the public health. It has been calculated that there are at least five-six persons to every death; and sickness among the poor and labouring classes, the principal sufferers in an unhealthy town, not only produces poverty and swells the rates, but removes from the arena of activity the very sinews of our commercial prosperity. In Liverpool, in the year 1865, when the births registered within the borough exceeded the deaths by 2,077, the death-rate was 36.4 per 1,000 of the population, or 9.2 per 1,000 above the average rate in eleven large towns of the United Kingdom, with an aggregate population of above five and a half millions. During 1866 a still more disastrous mortality prevailed; Dr. Trench's report shows that 19,099 births and 20,198 deaths were, during the last year, registered within the borough of Liverpool; this gives an actual loss of population in the year, by excess of deaths over births, of 1,099. The annual death-rate to 1,000 persons living was 41.7, whereas the average rate in thirteen large towns of the United Kingdom for the year was only 28.6, showing an excess of 13.1 per 1,000 upon the average death-rate in more than six millions of our largest town populations.

Dr. Trench, in a note to the opening of his report, dwells at some length upon what he styles "the manifest unreliability of the hitherto record," with a view, in some measure, to account for the balance of deaths over births in Liverpool during 1866. This charge has often before been made against the completeness of our record of births, and there is little doubt but that through the want of a compulsory clause in the Registration Act for England, a certain number of births, more especially of illegitimate children, do escape the vigilance of the local registrars. The number of omitted entries has been at times largely exaggerated to serve the purpose of partizan statisticians, but, on the most trustworthy authority, it is estimated that the births which escape registration do not now exceed two or three per cent. of those duly recorded. The very fact that the general birth-rate of England is largely in excess of that in almost any other European nation, is alone strong evidence against any serious default; and the remarkable manner in which the birth-rate in our large towns (where the principal omission is supposed to take place) exceeds that of the rural districts, may also be taken as some proof of the correctness of our recorded numbers. Dr. Trench urges the fact of the large proportion of Roman Catholic residents in Liverpool, principally composed of the "unreliability" of the record of births in Liverpool; the principal inducement upon this class of persons may militate against the complete civil registration of births, but the charge is unsupported by satisfactory evidence, and although all must agree with Dr. Trench when he advocates a compulsory clause in the Registration Act, we cannot take for granted, that even in large towns generally, or in Liverpool in particular, any large proportion of the births is omitted from registration; the registrars in town districts, themselves most valuable witnesses in this matter, have often expressed their belief that very few escape them. That the record of births in Liverpool during 1866, should have been more incomplete than in

* Report of the Health of Liverpool in the year 1866, by W. S. Trench, esq., M.D., Medical Officer of Health for the Borough. Hewson & Procter, Liverpool.

former years, and thus have accounted to ever so small an extent, for the excess of deaths over births, is a thoroughly untenable argument. The birth-rate in Liverpool in 1866 was 39.4 per 1,000, or 2.5 above the average rate in the thirteen large towns, and higher than those which prevailed in London, Manchester, Birmingham, and several other towns in the list; it was, however, somewhat below the rate in 1865, as was the case in nearly all the other towns.

Cholera having been severely epidemic in both London and Liverpool last year, the fatality of this disease will not account for the large excess of mortality in Liverpool. Diseases of a zymotic character caused 7,720 deaths, or 15.9 per 1,000 persons living, whereas the number in London gave a rate of only 7.8, or less than half; those diseases affecting the respiratory organs, and including phthisis, were fatal in 4,983 cases in Liverpool, or at the rate of 10.3 per 1,000, while in London the mortality from the same causes was only 7.4. These two groups of diseases, therefore, account for 11 per 1,000, of the excess of 15.2 in the death-rate of Liverpool over that of London during last year; the rest of the excess being spread over the other classes of diseases, from which resulted the remaining 7,495 deaths. The number of deaths from the various zymotic diseases forms the most accurate gauge for estimating the comparative sanitary condition of a town; but all other causes of death are invariably affected more or less by those unfavourable conditions of the public health, and by lowering the general tone of the human frame, render it a more easy prey to the infinite variety of diseases to which it is liable. Space will not admit of our here examining in detail the results of any but one class of diseases dealt with in Dr. Trench's Report; we naturally choose the zymotic as affording the best index of that sanitary condition of so large a portion of Liverpool, which has long made that town notorious for its excessive mortality.

Of the 7,720 deaths which were last year referred in Liverpool to all classes of zymotic diseases, 1,782 resulted from cholera, 1,523 from typhus, 1,145 from diarrhoea, 991 from whooping-cough, 986 from scarlatina, 641 from measles, and 102 from small-pox. Of the two first of these diseases we shall speak presently; the deaths from diarrhoea scarcely exceeded those in the previous year, but the nearly a thousand deaths each from whooping-cough and scarlatina had been only 187 and 506 respectively in 1865; both these diseases were more or less epidemic throughout 1866, and whooping-cough was twice, and scarlatina three times as fatal, in proportion to population, in Liverpool, as they were in London. The 641 deaths from measles were nearly double the number returned in the previous year; but the fatal cases of small-pox had fallen from 459 in 1865 to 102 in 1866.

The most interesting, and at the same time the most valuable, portion of Dr. Trench's comprehensive report deals with the ravages of typhus and cholera, their origin, rise, and decline; and, for local purposes, invariably definite information is given as to the localities, streets, courts, houses, and even the very numbers of the houses, in which these diseases were most fatal. Here we can only touch upon a few of the more general features in his graphic description, which are useful in their application to the case of other large towns, which, from defective sanitary arrangements, have suffered from, or are liable to, the ravages of similar epidemics. We learn from the report that typhus has been constantly epidemic in Liverpool during the past five years among the over-crowded and indigent classes. From the 1st of January, 1862, to the end of December, 1866, it destroyed 7,620 persons, of which considerably more than half were between the ages of twenty and fifty, and, "therefore, in all probability the parents, props, and bread-winners of families." This gives us some idea of the amount of poverty, distress, and suffering which the actual deaths from typhus must have entailed upon the labouring population of this town, without taking into account the losses sustained by those families whose main support, although attacked by the disease and rendered helpless for weeks or months, eventually recovered. Dr. Trench appears to have over-estimated the number of attacked, when he places them at ten times the number of deaths; but this does not essentially weaken his picture of the desolation arising from the ravages of typhus during the past five years. In the report for 1864, Dr. Trench attempted, with apparent

success, to attribute the fatality of the disease in some measure to the commercial distress arising from the cotton famine, and indirectly from the civil war in America. Doubtless, anything which tends to lower the wages of the labouring classes, by impoverishing their diet and clothing, renders them more liable to the inroads of an epidemic, which their crowded and unhealthy dwellings at all times unfit them to rebut. The 1,523 deaths from typhus in 1866, although 461 above the corrected average of the previous ten years, were 815 less than the number in 1865. In 1862, the first year of the epidemic, the deaths from typhus were only 730; this increased to 1,304 in 1863, 1,774 in 1864, and 2,388 in 1865. The 1,523 deaths during last year give a death-rate from this cause alone of 31 per 1,000, whereas in London it was only 9 per 1,000. In support of the theory that the "epidemic causation of typhus is invariably to be found in the debased and indigent condition of the people," Dr. Trench gives the following significant facts:—of the 1,523 deaths from typhus in 1866, 1,433 occurred among that class of families dependent for their subsistence upon weekly wages, while of the remaining 90, 66 were of the families of master tradesmen, and only 24 of the mercantile and professional class. With regard to the localities which have during recent years suffered from typhus, it is remarked that there is a "wonderful unvarying identity in the districts, locks, and streets forming the fever districts."

We must now briefly notice the epidemic of cholera in Liverpool, which broke out almost simultaneously with that in London, and was of very similar duration. It resulted in a loss of 1,782 deaths, or 3.7 per 1,000 persons living; the 5,577 deaths in London did not exceed the rate of 1.8 per 1,000. The disease, therefore, in proportion to population, was more than doubly as fatal in Liverpool as in London. In May the outbreak of cholera on board the *Helvetia* and other emigrant ships, mostly German, in the port of Liverpool, filled the country with well-grounded alarm, lest the disease should take root in a town which the fatality of typhus proved to be in but too favourable a condition for its reception. Singularly, however, no case of epidemic cholera occurred among the townspeople by contagion from these ships; and from the 28th of May, when the *Helvetia* finally left our shores, to the end of June, although a few deaths were returned as cholera, Dr. Trench convinced himself that none of them presented the true features of the virulent Asiatic cholera, but mostly resulted from coarse and improper feeding. In one of the worst of these sporadic cases the deceased, a girl of 16, had, at a post-finneral supper, partaken heartily of "ale, pork, perrinkies, and greens." On Sunday, the 1st of July, at No. 2 Court, Bishop-street, occurred the death which Dr. Trench believes to have been the first of the real epidemic. Of the locality he says,—"It is one only too well known to the sanitary officers, being inhabited by the lowest of the Irish population, and situated in what may be justly described as the chief fever district of the parish. The court itself contained three straight up-and-down houses and one open midden. It was altogether so close, confined, and unfit for human habitation, that the grand jury had, in July, 1865, confirmed my presentment, and ordered the demolition of two of the houses, and the conversion of the common cesspool into a water-closet, and there only awaited some legal or other formalities, to have the order carried into effect." The houses were, however, reserved to form the nest in which was hatched the cholera epidemic of 1866 in Liverpool. Fully estimating the alarming consequences of contagion from a death bearing evidence of the worst cholera type in such a locality, Dr. Trench, as medical officer, and the relieving officers, used all their efforts to induce the relatives and friends of the deceased to allow the body to be buried forthwith; but they insisted upon keeping it until Tuesday morning, in order that a barbarous, and in crowded neighbourhoods a highly dangerous, relic of the customs of the Irish peasantry might be carried out. A wake was held on the Monday night, during which scores of persons smoked and drank, and many slept a drunken sleep in the room with the corpse. Is it a matter for astonishment that, before the end of the month, 48 persons "died from cholera within a radius of 150 yards from the court which had been the scene of the ill-timed revelry?" Such was the beginning of the cholera in Liverpool. In the week ending the 7th of July, 11 deaths occurred, and the numbers rose rapidly till they reached

their maximum, 193, in the last week of August, from which time, with some fluctuations, they declined until the middle of November, when the epidemic may be said to have ceased. The ravages of the disease were, as a rule, confined "to the lowest, dirtiest, most crowded, and most squalid streets of the borough." Of the 1782 deaths, 754 occurred in court houses and 910 in houses of streets where the families are, from occupation and social relations, in intimate communication with the residents of courts. The conclusions arrived at from the results of the cholera epidemic in London in 1849 were borne out in Liverpool last year, as all the streets in which the disease was most fatal are situated on the low-lying ground.

Much valuable information is contained in the report upon the subject of contagion. One fact alone, however, can find space here. During the epidemic no medical man, clergyman, or priest of the borough appears to have died from the disease, although Dr. Trench bears witness to the unfinching and zealous manner in which all three classes performed their duties in visiting the sufferers. With regard to the water supply of Liverpool it is stated to be free from "every possible source of sewer contamination;" and, although the supply of water to the houses is not constant, it appears to form a favourable contrast to the miserable scantiness of that in many parts of London.

On the whole, Dr. Trench's Report is a valuable contribution to sanitary literature, and that part relating to the cholera epidemic in Liverpool, is the most complete and exhaustive history of a local visitation which has come under our notice. The value of such a mass of information for the use of the local authorities cannot be over-estimated. Want of knowledge of those neighbourhoods which have year by year steadily contributed to the excess of mortality in Liverpool, and of the exact conditions which are most fatal to the health of the unfortunate inhabitants of those localities, can no longer afford any excuse for the delay in carrying out those wholesome reforms which are necessary, before the death-rate in Liverpool can be reduced even to the still too high level of the rates in other large towns.

It is gratifying to observe from the Registrar-General's weekly returns, that since the beginning of the present year the health of Liverpool bears favourable comparison with that of the same period in recent years. In the past eleven weeks of the current quarter, the death-rate in the town has averaged only 33.5 per 1,000, against 44.7, and 40.6, in the corresponding eleven weeks of 1866 and 1865. Moreover, the deaths from typhus, which had been 649, and 543, in the first eleven weeks of 1865, and 1866, have not exceeded 155, in the same number of weeks which ended Saturday, the 16th inst. It may, therefore, be hoped that the epidemic of typhus, which has raged in Liverpool with more or less severity for five years, is now dying out, and that the year 1867 may prove the first of a series in which the rate of mortality in this town will gradually decline more nearly to the healthy standard for town districts.

ON LEGAL QUESTIONS OF LIGHT AND AIR TO BUILDINGS.

We have on various occasions and in a recent number alluded to this very important and involved subject, which appears to call for some legislative interference, both as a question of law and procedure. In regard to law, the matter seems not likely just now to receive modification, after the opposition made by the Attorney-General to Mr. Goldney's motion in the House of Commons; but we see no reason why the present vexatious and expensive mode of procedure might not be prevented by a course which would not interfere with the legal rights of parties.

Last year Professor Kerr drew the attention of the Royal Institute of British Architects to the subject, and set forth a diagram by which he proposed to show geometrically the extent to which light might be affected in the erection of any object intercepting it. Professor Donaldson, at a subsequent meeting read a paper on "The Practice of Architects and the Law of the Land in respect to Easements of Light and Air," citing all the judgments recently delivered in the Courts of Law. He also mentioned the French regulations, which give no right to an owner of property to build nearer than 6 ft. from the boundary of his ground at the back, nor any

right over the adjoining property beyond 6 ft. on the other side of the boundary. A further investigation as to the measurement of obstruction occurred on the 19th of November. The whole subject was referred to a committee, to consider whether advantage could not be taken of the proposed Bill for the amendment of the Metropolitan Building Act, now under consideration by the Metropolitan Board of Works, so as to promote an equitable and less vexatious and expensive mode of adjusting the relative claims of owners on these points.

It appeared to the members that, inasmuch as such questions involved the rights of two parties in respect of light and air, in the same manner as those in regard to party-walls, provided for in Section III. of the Metropolitan Building Act, so a like series of clauses, *mutatis mutandis*, would considerably facilitate the settlement of light and air questions.

The committee had several meetings, and, with the advice of Mr. Overy, the honorary solicitor, submitted a series of clauses for a new section in the newly-proposed Metropolitan Building Act. It ran as follows:—

"Light and Air.

1. In the construction of the following provisions relating to light and air, the owner proposing to rebuild, add to, or alter his premises, shall be called the building owner; and the owner of any premises whose legal right as to light and air may be affected by such rebuilding, addition, or alteration, shall be called the neighbouring owner.

Rights of Building and Neighbouring Owners.

1. The building owner shall, before commencing the building, give notice in writing of his intention to any neighbouring owner whose rights of light and air shall or may be liable to be affected by the proposed building, and such notice shall be accompanied with a plan and elevation of the proposed building, drawn to a clear and intelligible scale, with the necessary measurements and dimensions figured thereon.

2. A neighbouring owner, who apprehends that any building proposed to be erected by the building owner will interfere with his legal right to light and air, shall give notice in writing to such building owner that he objects to the proposed building, and stating the grounds of his objection.

3. In the event of any such notice being given on either side, a difference shall be considered to have arisen between the building owner and the neighbouring owner, and the effect of the notice shall be to suspend any such erection, alteration, or addition, and no proceedings at law or in equity shall be commenced pending the reference hereinafter mentioned.

4. Unless the parties in difference shall concur in the appointment of one surveyor, they shall each, within one week after the giving and receiving of such notice, appoint a surveyor; and the two surveyors so appointed shall, within one week after their appointment, select a third surveyor; and such one surveyor, or such three surveyors, or any two of them, shall have power to determine the questions hereinafter mentioned.

5. If either party to the difference makes a default in appointing a surveyor within the time aforesaid, the other party may make the appointment in the place of the party so making default.

6. If the two surveyors so appointed shall not, within the time aforesaid, agree as to the appointment of the third surveyor, such third surveyor shall be nominated by the Metropolitan Board of Works, or the chairman thereof for the time being.

7. Such one surveyor, or such three surveyors, or any two of them, shall make his or their award within one month next after the appointment of such one surveyor, or within one month after the appointment of such third surveyor as the case may be.

8. Such award shall determine such of the following questions as the circumstances of the case may render necessary, viz.:—

1. Whether the works of the building owner will or will not injuriously affect the light and air of the neighbouring owner.

2. Whether the works of the building owner can be so modified in point of construction, as to prevent any such injurious effect; or whether it may partly be so modified, and partly compensated by a money payment.

3. Whether the injurious effect can be wholly compensated by pecuniary damages, and if so, the amount of compensation.

9. The award shall be taken up by the building owner within one week after notice that the same has been made, and such award shall be conclusive unless within fourteen days after the delivery of the award either party shall give notice to the other of them that he is dissatisfied with and intends to appeal therefrom.

10. If such notice be given, the parties shall be limited to their original rights, both as to law and in equity, but in any proceeding either at law or in equity, such award may be given in evidence; and if the result of any proceedings, either at law or in equity, shall be to confirm the decision made by the award, the party appellant shall bear the whole costs of the proceedings.

11. The costs of the award shall, unless thereby otherwise directed, be borne by the building owner."

These were forwarded to Sir John Thwaites, the chairman of the Metropolitan Board, and by him submitted to the committee who had under consideration the amendment of the Building Act. They "arrived at the conclusion that, as the question of light and air is one of common law, any attempt to introduce special legislation in an Act intended to apply solely to the metropolis would be sure to entail very strong opposition in Parliament, and in all probability jeopardise the passing of the bill." This decision of the committee is to be much regretted

and the grounds of refusal not to be understood; for the Institute did not contemplate any alteration in the common law of the question, nor the extension of the procedure beyond the metropolitan jurisdiction. As the Metropolitan Board have such vast powers for the regulation of the metropolis, and such confidence is placed in them, it seems strange that they should shrink from responsibilities, and not attempt to settle the difficulties and perplexities of such cases by a modification of procedure, which would doubtless be approved both by lawyers and surveyors, who are the main parties now benefited, as well as puzzled, by the proceedings in Chancery and at common law as at present conducted.

ON THE USE AND ABUSE OF ORNAMENT.

FEMALE SCHOOL OF ART, QUEEN-SQUARE.

On Friday, the 22nd, Mr. Digby Wyatt addressed a numerous assembly of the pupils and friends of this popular institution on this subject (illustrating his observations throughout with graphical formulae sketched at the time), and was listened to with the most earnest attention.

The following were the principal points of the address:—The abuse of ornament was held to arise invariably either out of excess or poverty of design. As the only safe check upon the use of ornament, therefore, its nature and functions must be fully understood. The nobler the theme the nobler must be the class of beauty in which it should be cast. Ornament should not merely be attached, but should arise out of or suggest use and purpose. The artist should conceive all things, great or small, which he may design, in their complete state; for we find that with all good designers, and especially amongst the Chinese and Indians the complete subject presents itself to their view as a concrete idea. When we contemplate their productions we cannot fail to recognise that ornament is of the very essence of those productions, and cannot be detached from them. Ornament is either conventional or imitative; but must in either case be borrowed from or founded upon nature. Conventional art is the result of education and observation of the expression of abstract form during long ages from the dawn to the noonday of civilization. It is essentially dependent upon geometry and variation of surfaces. Evidences of true principles of design are apparent in all the creations of nature, but varied in form, as in the hutterly, the strawberry, the fir cone, &c.

The lecturer mentioned with qualified approval Professor Semper's work on the principles of design, and recommended strongly the careful study of geometry, of which he elucidated many interesting problems;—amongst others one he had found in an old Spanish work on mensuration for sculpture and architecture, by Juan de Arphe y Villafane. In this the author gives the diagram of a circle the area of which, being intersected by seven lines mutually dependent, gives the division of the circumference into any number of parts for the ready construction of polygons and all their dominant angles.

Mr. Wyatt then graphically sketched many of the elementary original forms under which ornament may be classed, with their combination in harmony and contrast; the principles which ruled in the adoption of circular and square figures; and the necessity of subordination and relief in their application, with more or less intensity of light and shade or tones of colour. He then rapidly glanced at the characteristic and progressive development of the historical styles of ornament. He first noted that of the Egyptians, as expressive of great stability; and that, although ornament is most lavishly applied to all the surfaces of their edifices, yet, on the whole, a sense of repose predominates. Early Chinese art has very elementary, yet extremely interesting, forms. The direct reproduction of nature is a very late study of this remarkable people. The Indians, on the other hand, from the very earliest times, delighted in natural objects, mainly floral; and possibly this predilection may have been derived, through Persia, from Nineveh. The Greeks in their earliest periods commenced with the most elementary formality and primitive rigidity, progressing up to the most perfect forms of grace, harmony, and proportion, and ultimately attaining a most judicious union of the imitative with the conventional, and a combination of great repose and dignity, free alike

from violent emotion and insipidity. The character of the ornament of the Romans was that of great magnificence; but in their application of decorative features they departed from the simple severity of the Greeks, and erred in their apprehension of the function of forms. The late Roman and Byzantine styles evidently derived from the Persians new and vivifying sensations, and flourished, as it were, in a state of fermentation between the Classic and Gothic. New elements of ornament arose among the Celtic and Scandinavian races, derived from the osier and knotted work; until at length, influenced by religious sentiment, the generation of a new and living style was effected in the Middle Ages. It is difficult now to form an adequate conception of ornament as originally applied to Gothic buildings. They are merely ruined fragments of what once existed; but we may form, in studying the church of St. Francis, at Assisi, which is the one best architecturally preserved, and still possessed of its gorgeous colour-embellishment, some idea of the elaborate ornamentation with which every part was frequently covered. The history of art, like that of nations, is a history of declensions and revivals, but never in the same shape.—periods of incubation succeeded by periods of activity. In the Italian revival the artists acquired a mastery of handling and drawing, which led them from great excellence at first into the wildest extravagances of ornament at last; and by letting the dexterity of the hand outstrip the restraining judgment of the brain, they at last wrought their own ruin. The great principles to be followed now should be rigid selection, but from no narrow field of observation and study; and the adoption of all that is beautiful in form, proportion, colour, and sentiment in nature (and for which the female mind has naturally the happiest instinct), and from the relics of the past, not without discrimination, but in obedience to rational laws, quickened by invention and tempered by experience.

THE WEST LONDON SCHOOL OF ART.

The fourth annual distribution of prizes at the West London School of Art, Great Portland-street, was made on the 20th inst. Mr. A. J. B. Beresford Hope, M.P., who presided, said that he felt gratified in advertising to the great success which had attended the school from the time of its first formation in very humble premises in Wells-street. He well recollected the small, inconvenient place in which the school was first started. Since then there had been a revolution in art-schools in connexion with State aid, owing to a change in the Minutes of Council, which less assistance was granted to these schools; but still the West London School of Art had weathered through all the storms, and had waxed stronger and stronger day by day. This success had been achieved by the kind co-operation of the friends of the schools, one of whom (Mr. Peter Graham) he was glad to find present. He felt pleasure in recording that the school was now, in many respects, second to none. Of course, South Kensington stood first; then Birmingham, Glasgow, Leeds, and Liverpool. There were only two got a greater number of prizes on the inspection of works sent to South Kensington, which were Edinburgh and Glasgow; and only five schools sent a greater number to be examined. It was a most cheering fact that only two art-schools passed a greater number of students. These were South Kensington and Leeds. How was this? In the first place, the school had an able, zealous, energetic, and practical committee; but the chief success of the school was due to a gentleman of talent, and of single-hearted devotion to the cause of art,—he meant Mr. Macdonald Clarke. System and inspectors' reports might have done much; but the man who had the charge of the school was, after all, the one to whom they must chiefly look for its ultimate success. 492 students had passed through the school in the past year with credit to themselves. He would look at art studies in two aspects: one was the practical, business-like, money-making aspect; and the other was its moral value to those who were brought under its influence. The value of art studies could not be over-estimated, in whatever aspect we should regard them. It had been an old prejudice that England was not an artistic nation, and there was good foundation for such a belief, for this country was absorbed in the pursuit of trade, to the almost total exclusion of

everything else. Then, again, on the Continent art was fostered by artistic princes; whereas in England our system of self-government sadly interfered with the development of art. The practical value of the West London School of Art was incalculably great. It was true there they had no metal or ceramic manufacturers like Birmingham or Stoke, or even wood-carving like Tunbridge Wells. The district wanted a unity of concentration which provincial towns possessed; but still there were many secondary branches of manufacture carried on requiring the assistance of the artistic faculty. There were such firms, for instance, as those of Jackson & Graham, Hubert, Crace, and many others, which required that a high artistic taste should be devoted by those in their employ, and the students should therefore unite in endeavouring to give their district a high character. He was glad to find they had successfully done so. The fact that only two other schools passed a higher number was conclusive that hitherto the West London School had done well. It was most gratifying that whereas other schools only succeeded in passing one-half their students, their school had passed two-thirds. Mr. Hope concluded his speech by advertising to the moral effects of art studies in elevating the character, and by an earnest exhortation to the students to worthily use their talents for the benefit of their great country.

The distribution of prizes then took place. In the National Competition of best works from the one hundred schools of art in the kingdom, the following students received awards:—Miss Monro: Bronze medal, for figure modelling. Charles Henry: Silver medal, for figure modelling. John Pall: Prize of hooks for figure drawing.

Three senior students of the school obtained silver medals at the Royal Academy last December; this being the largest number hitherto taken by any school of art, excepting the Lambeth School; and two students have, during the past year, qualified in the school for admission, as students of the Royal Academy, and were admitted.

Mr. Godwin, being called on, briefly addressed the students, urging the necessity for perseverance, in order that practical advantages might result. It was very easy to desire knowledge and skill,—to wish to be clever; but something more than wishing was necessary: there must be resolute application. Time, too, must be given; they must not expect to become artists in "a quarter." The Schools of Art were beginning to produce results in many of our manufactures, though still many thousands of pounds annually were sent out of the country for designs. He concluded with moving a vote of thanks to the president, whose activity was remarkable even in this active age. Mr. Graham, asking further subscriptions from the inhabitants of the district, seconded the motion, which was carried unanimously, and the meeting separated.

THE QUESTION OF CUBIC SPACE IN METROPOLITAN WORKHOUSES.

The report of the committee to the president of the Poor-law Board on this question, has been printed, together with papers submitted to the committee, and presented to Parliament.

Upon the questions submitted to them the committee give separate replies, of which the following is an abstract:—

Question 1. "What amount of floor and cubical space should be allotted to the bed of each sick inmate in wards occupied both by day and by night; it being understood that fever and small-pox patients, idiots, and epileptics are for the future to be provided for in separate and distinct buildings?"

It is the opinion of the committee that there should be allotted to each sick inmate in metropolitan workhouses an air-space of not less than 850 cubic feet on an average, and in those cases where the height of the ward is more than 12 ft., such additional height should not be taken into account in calculating the cubic space of 850 ft.; that there should be allowed a clear space of 6 ft. across each bed, and that no bed should be placed on the middle of the floor.

In thus fixing the space which they consider requisite for the comfort and proper administration of the sick in workhouses, the committee have not overlooked the fact that it may be impossible (on account of the construction of the present buildings) to give immediately, in every case, the space recommended, and they feel that

a certain amount of discretion must be left with the administrative, in carrying into effect the recommendations of the committee; but it is their strong opinion, that, even under existing circumstances, there should in no case be allowed a less space than 3 ft. between the beds, and that no bed should, under any circumstances, contain more than one person.

The amount of floor and cubical space recommended by the committee is less than that which has been assigned, by men whose opinions command respect, as the requisite amount for hospitals generally. (Papers 3, 13, by Drs. Ackland and Sibson, are here referred to.)

The committee further recommend that cases which give rise to offensive smells should be placed in wards completely separated from the wards occupied by ordinary cases, and called "Separation Wards," and that an air-space of not less than 1,200 cubic feet on the average should be allowed for such offensive cases; the selection of these cases being left to the discretion of the medical officer of the workhouse.

To question 2, which is, "What amount for each bed in those wards which are partially occupied by day and night by the chronic and infirm, many of whom are usually able to leave these wards during a portion of the day for change of air in any adjoining yard or day-room?" the Committee answer—

That each of such wards should have the use of a day-room. This being provided, an average of 500 cubic feet for each bed will suffice.

To question 3, which runs thus, "What space should be allotted to each bed in those wards which are termed 'surgical'?" the Committee reply—

The same as has been recommended in the answer to question No. 1, it being understood that in workhouse infirmaries surgical cases of a serious character are of rare occurrence.

Question 6 is, "What for lying-in wards?"

A very large air-space, much exceeding 850 cubic feet, has been enjoyed, on an average, by each of the parturient women in almost all the workhouses. The comparative freedom of the lying-in wards from disaster may probably have been owing in part to the simpler air-space thus actually shared among the women, though the committee are conscious that much of the immunity was attributable to other causes. They recommend, therefore, that a rule should be laid down limiting the air-space to be allowed in each ward, for the future, as a minimum for these cases, to 1,200 cubic feet each on the average. (Papers 14, 15, by Mr. T. Holmes and Dr. Randall are here referred to.)

Question 7. "Do the Committee consider it essential for health that any addition should be made to the minimum space of 300 cubic feet, which is now required for each bed in wards occupied by night only by healthy adults or children?"

The committee recommend that whenever there is sufficient width in these wards to admit of more than one row of beds along their centre, the ward shall always be divided longitudinally by a spinal partition. They also recommend that in future the dormitories be so constructed as to contain two rows only of beds.

Question 8. "What course would the Committee recommend for adoption in the event of its being temporarily necessary under present pressure to retain cases of fever or small-pox in a workhouse until admission can be obtained at one of the hospitals specially provided for such cases?"

The committee recommend that, under the circumstances specified, such cases should be removed at once into a separate ward; or, if that should not be practicable, that a bed should be taken away on each side of every fever or small-pox patient lying in the ordinary wards.

Question 9. "What space would they recommend for each patient in special hospitals for fever and small-pox?"

The same space as is allotted in the existing fever and small-pox hospitals; or 2,000 cubic feet.

Question 10. "Can they offer any and what general recommendations on the subject of ventilation of existing sick wards; or as to the best proportions for arrangements, and ventilation of, new wards in any workhouse hospitals hereafter to be built?"

The question of cubic space is subordinate to the more important question of ventilation; by which the Committee mean the continuous renewal of the air within a given confined and inhabited space, of whatever shape, size, or surroundings, so that it shall be kept pure, or nearly pure, and shall vary within a few degrees only of moderate temperature.

It is plain that the complete and scientific solution of the problem of ventilation, thus understood, would govern and include the scientific answer to the questions of space proposed

by the Poor-law Board for consideration by the Committee.

The requisite space, when settled once for all, will need no further pains; deviations from the prescribed amount can scarcely escape notice. It is not so with ventilation; yet, if this be neglected, all regulation of cubic space becomes an idle care. The Committee, therefore, would suggest watchful and constant attention to this subject of ventilation; to its easiest, cheapest, and most effectual methods, and to the means of adapting them to the various forms and dimensions of existing rooms.

In respect of both present and future infirmaries, the Committee direct attention to a plan prescribed by one of the members of the Committee (Paper 9, by Captain Galton), as having been devised, and found practically successful in solution of the analogous problem—the ventilation of barracks and military hospitals.

In relation to the general subject submitted to their consideration, the Committee hold it to be most desirable that adequate day-rooms, well ventilated and lighted, and proper exercising-grounds should be provided for the papers who are not confined to their beds.

On the whole subject, the Committee observe that the problem to be solved really is, what is the amount of floor and cubical space which shall not be too little on the one hand, nor more than enough on the other—nor too little for the health and due comfort of the pauper inmates, sick or well, not pressing too much upon the means of the poorest ratepayer. It is fit that these houses be made safe, decent, and commodious; it is neither necessary nor expedient that they be made inviting.

In conclusion, the Committee say that while the space which they have recommended is in excess of the minimum space hitherto allowed, the increase has been suggested, both because the latter space is not, in their judgment, compatible with the rapid restoration of the sick to health, and because they think it insufficient for the purposes of ventilation, decency, and administration.

In the paper by Captain Galton, referred to in the report, diagrams of "the new pattern ventilating stove in use in barracks and military hospitals" are given. With its air-chamber, fire-lump lining, warm-air flue, and ventilator, &c., it closely resembles other ventilating and air-warming fire-brick stoves described at various times in the *Builder*. Captain Galton, of course, agrees with us in advising the adoption of the pavilion principle for workhouse infirmaries.

THE MANCHESTER COMPETITION.

In a few centuries England may see a rational architectural competition. The Manchester Corporation have already, in only the second millenary of their town's existence, discovered that it is best to call for preliminary designs on a limited amount of paper, from which to select a limited number to be finished, and all that are so finished to be paid for; that is, for the age and country, an immense innovatory stride. But they have not made it without an amusing oversight. After saying that the letters accompanying the chosen preliminary designs "will be opened by the mayor for the purpose only of ascertaining the names of the architects to be invited to send in" finished ones, they add, "Each of the designs sent in for the second competition must also have a device or motto marked on each drawing, and be accompanied by a sealed letter similarly marked, addressed to the mayor, giving the name of the author, it being understood that architects shall not adopt the same device or motto in the second as in the first competition;" [Are they to adopt the same ground-plan?] "such letters to be opened only after the final decision as to the best design has been come to."

The notion would seem to be, that it conduces to impartiality for the judges to be ignorant of the authorship of the works from which they are selecting. Undoubtedly it does so, especially when, as they promise will be the case here, professional judges are consulted. But now, pray, how are the corporation, who by supposition have already chosen out of twenty-six preliminary sketches,—whose devices we will call the letters of the alphabet,—the six marked A, B, C, D, E, F, and invited Mr. Smith, as the author of A, to finish it; Mr. Brown, the author of B, to finish that, and so on; when the finished designs are sent in, how are the corporation to

divest themselves of the knowledge that this design is Mr. Smith's, and that Mr. Brown's? In what conceivable way can the substitution of new "devices" of M, N, O, P, Q, R, assist them to this feat? Is Mr. Smith's design to become unrecognizable because it is marked with the device Q, instead of A?

If the corporation really desire to choose between works before knowing the authorship of each, the only possible way is to engage that no letters be opened till after the final decision; those who are selected being not invited by name to the second competition, but only by a public announcement that those who have used such and such mottoes are desired to finish their designs, and that all others may send and fetch their rejected ones away.

** We believe, for our own part, that the motto system is, as we have before now said, a delusion and a snare, and simply serves to give the jobber an advantage over the honorable competitor. The Manchester programme would have been a better one if it had required the competitor's name to every design.

THE DESIGNS FOR THE LAW COURTS.

Mr. Scott's design has been mainly founded on the paper read by Mr. Webster, Q.C., at a meeting of the Department of Jurisprudence of the Social Science Association, in November, 1865, which paper was sent, with their own instructions, by the Commission to each of the competitors. The system laid down in this paper is that of so-called "concentric circles." Mr. Webster's scheme represents the central hall as the "inner circle," the courts and offices immediately connected with them (as the retiring rooms of the judges and jury), as the "second circle," the space between the second and third circles as "a passage or corridor for communication with the courts and offices;" and certain other offices as "located between the third and fourth circles." Mr. Scott surrounds his central hall and certain areas for light, which the elevated level of the courts necessitates, by a wide and lofty ambulatory, which, in drawing the parallel with Mr. Webster's scheme, may be viewed as his "inner circle." The courts, with the retiring-rooms for judges and jury, form the second; a surrounding corridor the third; and offices for Bar, solicitors, officers, &c., the fourth "circle," these several circles being connected at frequent intervals by transverse passages.

All of these so-called "circles" are repeated on two, and the outer ones on three, stories. Thus there is a lower ambulatory beneath that already described. The witnesses' rooms, jury waiting-rooms, &c., are placed beneath the second circle; while the outer corridor, with the offices attached to it, is repeated both beneath and above the court level.*

Mr. Scott holds that by this arrangement the courts, &c., are brought together within a shorter range than by, perhaps, any other system; and that the ambulatory affords the most convenient space for the circulation of professional men from court to court, and for suitors and witnesses; while the uses of the corridor behind the courts will be limited to professional men and officers of the courts, that at the level of the court and the bench being mainly for judges and other official persons.

The public are understood to be excluded from the central hall and great ambulatory, as well as from the outer corridor and from the floor-level of the courts; but pass from the lower ambulatory by staircases of their own to the galleries provided for their accommodation; and the architect maintains that a still stricter exclusion of them from the range of business might very readily be effected.

The private apartments for the Bar, as their library, their refreshment-room, and sitting-room, are placed above the main ambulatory, where they form a vast suite of wide and lofty apartments. The robing-rooms (five in number) are placed, three of them on the floor beneath the court-level, where they would be reached by the barristers on their way up to the courts; and two of them on the higher level. Mr. Scott, however, states in his printed remarks that these arrangements can be readily modified.

The central block of buildings, which includes the courts, &c., contains on its lower stories the offices of the masters in the Common Law

* A block plan and further particulars of the design will be found at p. 70, ante.

Pillar of Porch.

Courts and other business departments, besides the entrance-hall, central staircase, &c.

This central block is surrounded on three sides by an enclosed street, beyond which is an outer range of building, in which those departments are provided for which do not necessarily adjoin the courts. These consist of the Judges' chambers (which have communication by bridges, &c., with the courts), the offices of the Accountant-general, the Registrar, the Taxing-masters, &c., of the equity courts; those of the Land and Middlesex Registrars, the Bankruptcy Department, the Admiralty Offices, the vast department of the probate and matrimonial business, &c. This department, which is by far the largest which has to be provided for, occupies the western portion of the group, where, availing himself of the liberty conceded to make irregular projections in that direction, Mr. Scott has advanced a second range of building westward of a portion of his main outer range. The intervening space (some 40 ft. wide) is closed at its ends by the Record towers, and being covered over in its lower story with a glass roof, is formed into a suite of reading-rooms for wills, ranging between the towers in which the wills themselves are deposited. These towers are of moderate height, the architect thinking (and we have given his views throughout this notice) that anything beyond this would render their uses impracticable, not only on account of the difficulty of mounting to a vast height whenever a will is to be produced, but because they would go beyond the range of hydraulic lifts.

The view which we give is that which best explains the whole range of the Strand front. It will be seen that on the street level there is a covered arcade for foot-passengers nearly from end to end, while the centre breaks forward in advance of this into a spacious carriage portico 150 ft. long. From this open the main portals of the south front. The Carey-street front also possesses a considerable amount of architectural character, while internally the chief artistic features (as we have before now described) are the Central Hall, of which there are two alternatives, the one a lofty domed structure, and a second, which is really the covering over of the entire space enclosed by the ambulatory with a glass roof.

View of Interior of Corridor.

* See p. 218, ante.

The architect, while recommending and giving a popular description of a system of warming and ventilating very similar to that at the Houses of Parliament, and suggesting that Dr. Percy's services should be secured for its direction, nevertheless argues, with some reason, that "in a competition of the present kind . . . a detailed scheme is not only superfluous, but un-

desirable, as, under ordinary circumstances, any one of the designs may be supposed to be equally susceptible of a perfect system as any other of those designs; and it seems, therefore, only hampering the competition with questions having no connexion with the merits of the designs for any one architect to commit himself to any specific system."

DESIGN FOR PROPOSED LAW COURTS.—By Mr. G. G. Scott, R.A.—View in the Strand.

W. & A. G. & CO. ENGRAVERS

ON EGYPTIAN ART.

At the last meeting of the Architectural Association, held on the 19th inst., Mr. E. P. Spiers read a paper on Egyptian Art, which he illustrated with a number of drawings taken on the spot, and with specimens of materials (granite, bricks, relics, &c.) collected during a tour in the East. He began by referring to the great antiquity of the monuments he was about to describe, noting the fact that the earlier the building or tomb the more perfect the art displayed in it seemed to be. As an introduction to the subject, he gave a slight sketch of the climate, geography, history, and religion of the nation and people to show their wants and requirements. He then proceeded to describe the monuments, dividing them into two classes, tombs and temples, taking the latter first, because of the greater antiquity of some of them. "The Pyramids," he said, "were gradually developed from the centre, and the ultimate size corresponded with the length of the king's reign who built them. Those of Gizeh were the largest and oldest monuments in the world; they were formerly covered with a casing of polished limestone, a portion of which casing is still visible on the summit of the second great pyramid." The lecturer specially eulogized the wonderful masonry of the interior passages and chambers of these pyramids, as also the temple of the Sphinx lately discovered, in which he said the joints were so small and accurate that only the difference in tone of the huge granite blocks, which lined the temple enabled him to see them. In noticing the excavated tombs, he called attention to the representation in them of the façades of the earliest temples, showing the wooden origin of all their features.

The Serapeon Mr. Spiers visited with Colonel Mariette Bey, its discoverer, and seventeen of their party sat down in one of the huge sarcophagi, in which the sacred bull Apis was interred. As to the Protodine columns at Beni-hassan, Mr. Spiers expressed his doubt as to these having been copied by the Greeks, because the earliest Greek Doric columns were more stumpy and squat in proportion, had an entasis, a considerable diminution in diameter between the top and bottom, and a wide projecting abacus and echinus moulding underneath. The Egyptian columns had no entasis, an almost imperceptible diminution in diameter, and an abacus the width of the column only. The segmental vaults of the interior of these tombs were copied from existing vaulted buildings. The tombs of the kings and queens at Thebes, and the excavations in Nubia followed next in order.

In describing the temples, it was remarked that there was considerable difficulty in distinguishing between temples and psalces, because the king, being chief of the religion, the temple might be his chief place of abode. Generally the sculpture indicated the destination. Luxor, and Medinet Ahi, at Thebes, were probably palaces; and a portion of the temple lately excavated at Abydos was probably used as a royal residence, hunting and fishing scenes being recorded on its walls. The earliest plans of temples, according to Herodotus and other historians, seem to have been similar to those of the second period, viz., from 1520 B.C. to 700 B.C. The architecture of them seems to have had a wooden origin; and Mr. Spiers instanced one or two façades of tombs near Sahkara that he had seen, which strengthened this conclusion. The plans of the second period of Egyptian architecture were very numerous, and their different parts seem to have been added one after another; and this peculiarity was noticeable even in those temples built during any one reign, the temples diminishing in size and height and increasing in gloom as we reached the sanctuary. The lecturer then sketched on the board the plan of an Egyptian temple, and remarked upon the detail of the various features, illustrating his remarks by the drawings on the walls,—the adromos of sphinxes sometimes half a mile in length, the obelisks on which the victories of kings were recorded, the seated or standing figures on each side of the doorway, the pylons erected as frontispieces to the temple, on which the victories of kings and religious scenes were depicted in intaglio sculpture; the niches and holes in the wall to hold flagstaffs. The central doorway had raking sides; but the interior of the jambs was vertical, the width of opening at top and bottom being equal.

The courts had colonnades round, and at Luxor and Karnac were two rows of columns, too slight

to support a stone roof, and therefore probably used to sustain emblems of religion on the top. The Hall of Columns was the grandest feature of an Egyptian temple. It would be impossible for him, with drawings of columns a few inches in height, to convey to the mind of those listening to him the impression which features a hundred times their size had upon the beholder, and still less to instil the awe that one feels in threading the various avenues of columns. Though called a hall, it does not impress us as such. By a hall, we mean a large open space, covered over and uninterrupted by supports, or with columns so slender that they do not intrude themselves; but the columns at Karnac are so enormous, and their intercolumniation is comparatively so small, that we can never see diagonally in any direction; only in the direction of the avenues does one obtain an idea of the immense size.

In the temples built under the rule of the Ptolemies, the hall of columns had no pylon directly in front, only a screen between the columns, and these latter are all of the same height, the central avenue only being wider. In the Theban temples light was admitted by clear-story windows, the columns of the side aisles being lower than those of the central avenue, and having above them pierced stone lattices. In the Ptolemaic temples the light penetrated the hall over the screens. The rest of the temple consisted of smaller halls, with columns cases were built in the thickness of the wall, and each tread was slightly inclined. The walls of these stairs were covered with sculptures, though in perfect darkness; and under the stairs were galleries, in which no light could ever penetrate, with the walls elaborately carved with religious figure subjects.

The most beautiful series of capitals ever designed, were those of the Ptolemaic period and Roman rule; the papyrus, lotus, and bulrush plants; the palm tree, and occasionally some leaves and grapes entering into their composition. And it was remarked that more perfect representations of nature, and yet more completely conventionalised, had never been executed. Of the Domestic architecture of the ancient Egyptians a few words were said, the probable similarity of the houses of the poorer classes with those of the "fellahs" of the present day being remarked.

The materials used in the temples were chiefly sandstone; the pyramids were built in limestone; red and grey granite and basalt were used for the obelisks, sphinxes, and colossal figures.

In the course of the discussion which followed,—

Mr. Ridge said he had not made Egyptian architecture his particular study, but comparing the columns of the Moderns with those of the Ancient Egyptians, he thought that hereafter such a column as that in Trafalgar-square would be regarded as an ordinary column, whereas those seen in Egypt would be recognized as intended to carry emblems from their usefulness for the ordinary work of columns. Mr. Spiers had pointed out, too, that certain columns which he saw in Egypt were not structural, because they were so far apart and so thin. He thought they had a very general lesson to learn from the paper which they had just heard, and from a contemplation of the drawings around them, and they could not but be impressed with a sense of all that was grand and majestic in architecture of Egypt. It was the fashion now-a-days for the student to devote himself almost entirely to the study of the architecture of the fourteenth and fifteenth centuries, while the wonderful monuments of the ancient Egyptians, whose style was peculiarly their own, and had been preserved intact from generation to generation, did not receive that share of attention which they deserved.

In reply to a question from the Chairman in reference to the machinery employed by the Egyptians for raising huge blocks of stone used in the construction of their temples, Mr. Spiers said it was a noticeable circumstance that in no temple which he had visited had he obtained any clue to the manner in which the Egyptians raised those enormous blocks of granite. He had seen several illustrations on the walls and columns of temples and tombs of the progress of the Egyptian edifices, but the slaves appeared in every instance to be collected in small groups. In some cases he had seen what appeared to be oil poured out on the roads for the purpose of greasing them, but it would seem certain that the greater part of the labour was performed by

brute force. Even at a comparatively late date we had no record of the way in which the blocks of stone—62 ft. in length by 12 ft.—were raised in the temple of Baalbec.

Mr. Potter said an impression was produced on his mind on looking at the illustrations in the room as to the common sense exhibited by the Egyptians in designing and planning. There did not appear to be anything inconsistent in what they did. He quite agreed as to the importance of the benefits that would be derived from studying Egyptian architecture, but he did not consider that we should go so far as to copy it.

ETCHING ON STONE.

An ingenious process has recently been published in Vienna, by Von Geissendorff, for photographing on stone, and etching the pictures thus produced. The stone is first coated with a sensitive solution of bitumen in chloroform; the picture or pattern to be transferred is next laid upon it, and covered with a glass plate, as in the ordinary process of photographic printing. In direct sunlight, half an hour or an hour's exposure is enough; but in diffuse light, five or six hours are necessary. At the expiration of this period the paper and glass are removed, and oil or turpentine is poured over the stone. When the picture commences to make its appearance, the stone is washed rapidly with water. The rationale of the process appears to be this:—The parts acted on by the light, that is, all those portions of the paper not occupied by the drawing, are softened, and are therefore attacked first by the turpentine. Those parts of the film of bitumen, which are protected from the action of the light by the lines of the supposed drawing, are harder and not so soon attacked by the turpentine. The success of the process depends, then, on stopping the action of the turpentine just before it commences to attack those parts of the stone which have not been exposed to the light. The stone is afterwards etched with acids in the ordinary manner; and, when the process is finished, the bitumen is removed by turpentine and ether. Colours may be applied to any part of the work if desired, in an alcoholic solution of shellac as a vehicle. When the varnish is beginning to harden, the inventor proposes to dust a small portion of the same colour over the surface, so as to avoid the glare. The process is stated to be particularly applicable to the production of running patterns, inasmuch as the work can be etched to the extreme edge of the blocks, which can then be built in the wall without any further dressing.

GLASGOW ARCHITECTURAL SOCIETY.

At the last monthly meeting of this Society, Mr. Alex. Thomson in the chair, Mr. Wm. Johnston, of the firm of Johnston, Fraser, & Co., of this city, read a paper on "Gas Lighting."

After sketching early experiments,—the first application of gaslight by William Murdoch in 1792; at Boulton & Watt's works, Soho, in 1798; and other places,—Mr. Johnston remarked:—Murdoch's discovery and practical application of gas-lighting in 1792 could not be kept secret. Nine years afterwards, one of the Watts being in Paris wrote to his brother at Soho,—

"If anything is to be done with Mr. Murdoch's gas, it must be done at once, as there is a Frenchman in Paris who has similar ideas, and proposes to illuminate that city by these means."

The first French patent,—that of Leban,—was obtained in 1799; and the first English patent,—that of Winsor,—in 1804. If Londoners will insist upon ignoring the facts as to Murdoch's invention, as they generally do, and date the invention from the date of the patent, then the French patent, being of earlier date, will give the priority claimed by France for Leban. Fortunately Cockneydom is not Britain; and fortunately the preserved records of the committee of the House of Commons, with the evidence of the Watts, the letter from Paris, of which I have just quoted a verbatim paragraph, and the evidence of others who knew of Murdoch's early experiments, have settled beyond power of cavil the claims of William Murdoch to have been by several years the first man to practically apply gas-lighting. Gas-lighting was first exhibited in London in 1803 (eleven years after Murdoch's house and offices had been lighted). This tendency of most Londoners and London writers to

ignore or undervalue anything not "Town," is a serious disadvantage to themselves, and may, I think, account for the fact that the people in London have to tolerate the most clumsy and ill-fitted gas appliances in their shops and houses—gas so foul and coarse, and street lamps of such imperfect construction as would not be tolerated in any third-rate town in Scotland. Why should escapes of gas, and consequent accidents be so common in London as compared with this part of the United Kingdom but from that conceit which tells a man he has nothing to learn from outside? and why is it that so many people in London decline to have gas in their rooms?

The various kinds of lamps having been freely commented upon in detail, Mr. Johnstone remarked, that as to the price of gas, there are few towns so well off as Glasgow, when the illuminating power is taken into account: 4s. 2d. per 1,000 for 30-candle gas is as cheap as London 12-candle gas would be at 1s. 8d. per 1,000 cubic feet, with no deduction for the smoke and dirt. The two Glasgow gas companies pay their shareholders a more than ordinarily good dividend,—in other words, they make a handsome profit by selling such gas at 4s. 2d. per 1,000 cubic feet. To send canal coal by ship to London would cost about 15s. per ton; and as each ton of canal coal produces, at the lowest calculation, on the average 12,000 cubic feet of gas, the London gas companies ought to be able to sell canal-coal gas at the rate of 5s. 5d. per 1,000 cubic feet, of a quality 2½ times better in illuminating power than the sort they now supply at 4s. to 4s. 6d. In conclusion, he submitted the following rules as an epitome of what he had by tests and otherwise explained:—For coarse gas, use No. 5 fish-tail burners, at a moderate pressure; for canal gas, Nos. 2 and 3 fish-tail burners; renew the burners frequently; check the pressure at the meter when it gets too strong; distribute the lights in one spot; bring the lights as near as convenient to the place to be lighted; use, in fitting, good full-sized gas-pipes; select lamps which offer the least obstruction to the light; above all avoid trashy, low-priced appliances for gas lighting.

A CENTRAL BODY NEEDED FOR SANITARY WORKS.

I HAVE read with much interest your notice of Mr. Austin and Dr. Hardwicke's edition of the Sanitary Act, 1866. Having had some opportunities of noticing the working of our sanitary laws in connexion with local government, inasmuch as the accounts of between forty and fifty unions and local Boards come under my notice periodically, I feel warranted in expressing an opinion upon the subject. It cannot be that a divided controlling authority at the fountain head, such as is described in the work, is a good thing; and when we consider there is one object to be obtained in one country, and under similar conditions, it is anything but reasonable that there should be the Poor-law Board with one set of instruments; the Local Government Department of the Home Office, with another set; the Burials Department of the Home Office with another, all to accomplish what must certainly be better and more economically effected under one head, and with one machinery. It is not only unreasonable, but, I think, an evil, which in the hands of an intelligent Legislature, ought to be remedied. At present, however, the evil is on the increase. We know that the highways of the whole country were under local mismanagement by many hundreds of individuals, called Surveyors of the Highway, each with a few hundreds of yards of roads to keep mended. Efforts have for many years been made to remedy abuses in this direction, which had become intolerable; but these efforts resulted in a wretched piece of patchwork;—these are Highway District Boards for a portion of a county, local Boards for another portion, the old order of surveyors of parishes, or parts of parishes, for another portion. Again, the accounts of the local Boards are revised by the district auditor; those of the highway districts by their respective Boards; and those of the surveyors practically by no one at all.

So in sanitary matters: the accounts of Boards of Guardians have a strict supervision, or rather review, by the district auditor, so far as the relief of the poor is concerned; but their committees for sewerage and nuisance purposes, may spend what they like, and, if they think

proper, keep no accounts at all, without any restraint or revision; whilst, on the other hand, the accounts of local Boards are examined, and the expenditure revised by the district auditor, unless the local Board happen to be also a town corporation, which circumstance, by a strange anomaly, entirely exempts it from control.

But a crying evil is this,—that a town may grow rapidly up around some new seat of manufacturing industry, and buildings in which an entire disregard to all sanitary conditions and common decency is seen, are erected as dwellings for the workpeople, without any let or hindrance; for, by one of the peculiarities of our laws, it is only when this population and the attendant evils have grown into such a magnitude that the high death-rate or the statistics of fever and small-pox become distinguished in the Registrar-General's returns, that the ratepayers have the power to adopt the provisions of the Local Government Act, and so make by-laws to restrain the future construction of fever-nests.

The promoters of the Public Health Act and Local Government Act had done probably what they could by means of these statutes, hampered as they are by permissive clauses, to remedy this evil; and it was possible for such a town as I have described, even in its embryo condition, to adopt the latter, and (with another object, it is true) they were doing it in many of the villages of Lancashire; but then it was found that this would interfere with the working of the new Highway Act,—a law which had, after a long struggle, been brought into existence to remedy a wide-spread evil. And so a Bill was hastily brought in, and as hastily carried, forbidding any place having less than 3,000 inhabitants to adopt the Act, which was, in effect, to forbid them to frame by-laws relating to the dwellings of the workmen and the poor.

Such is the state of confusion into which piecemeal legislation,—perhaps, I should rather say, legislation under difficulties,—has brought us.

Local government, of which so much is said, would be very good, if those men were selected to administer it who are distinguished in their respective neighbourhoods by intelligence, good sense, and administrative ability. Unhappily, however, this is not the case, and the ingredients which abound in local elected bodies are found so very distasteful to the upper grades of the middle classes that the latter, after a time at least, leave, if they have ever joined these local parliaments. And so it is not commonly found that the majority of the remaining members have very sound or enlarged ideas of their duties. Too often their meetings are scenes of vulgar squabbling.

Mr. J. S. Mill is reported to have said, in a recent debate on the Metropolitan Poor Bill, "Vestry government is hole-and-corner government; of course some of the vestries have suffered wrongfully for the deficiencies of those who had done worse, but it is the essence of hole-and-corner government to be comparatively irresponsible, inefficient, and jobbing, and carried on by inferior persons; objections which would not apply to a central board." These remarks are in a measure applicable to most forms of local government, and exhibit heavy counterpoises to their advantages.

However well these bodies may discharge some of their functions, there are some things which their very localisation renders it impracticable for them to do. For instance, the supervision of a great watershed, whose pervasion cannot, from the nature of things, be divided. And, again, a large system of sewers, with its proper out-let. These not being comprehended within the confines of a local Board, and the country not being a congeries of local-board districts which it might be supposed could work together, there requires some authority of a far larger jurisdiction to carry out these objects. The practical good sense of the people of England will, it is to be hoped, see the absurdity of the cry of centralisation, which has so effectually hindered the progress of large and far-seeing sanitary legislation, and substituted for it a series of imperfect, disjointed bits of law-making, to retrace which will one day be the herculean task of some vigorous independent mind.

Meantime the existing crying evils have called into existence what is intended to be a national sanitary association, under the somewhat objectionable title of "The Sanitary Reform League." Whether the projectors will find sufficient means or shall be joined by a sufficient number of

earnest men to effect much, I cannot predict; but of this I am certain, namely, that the interests of humanity, the demands of an increasing population, and the progress of civilization, require something far larger and more effective than can be accomplished by the bit-by-bit plans and operations at present going on.

WILLIAM REES.

MINTON AND FINE ART.

SIR,—Will you allow me half a dozen lines to reply in part to Professor Donaldson? I do not doubt for one moment that Professor Donaldson's friendly converse with Minton, whilst walking through art galleries, was infinitely greater than any I could ever have thought of or could even ask, and that consequently he knew much more of Mr. Minton and his art opinions than myself, and is, therefore, better able to speak accurately of them; but, alas! all my experience with that eminent employer of art-labour was of the most prosy and entirely business-like nature and character. What Minton said to me he meant, and what he meant he at once said in quite plain English. Minton was, without doubt, an eminent manufacturer. I once said to him, "Would you employ Raffaello to paint one of these dinner-plates if you could get him?" Minton said, "Yes, certainly, if I could get him cheap enough, and could find a liberal purchaser for the plate after it was done." I do not suppose for one moment that Minton would have ventured to make so practical a speech as this to Professor Donaldson in a noble gallery of ceramic ware, but he did so to me in a dingy little shop. What I said in my letter to you, sir, were Minton's own words. I could add to them, but forbear, for my sole object in referring to Minton at all was for the purpose of citing an example of a class of men through whom modern art-creation finds its way to the public—exhausts itself, and is quenched, and ruined.

But still one more word about Mr. Minton and his art successes. I once said to him, for we had a good many talks, "Of all modern trades the art-manufacturer's is the best, I think; for he always takes double profits." Minton said, "How?" I replied, "Because he gets not only the fair trade profit out of the materials and labour, but he takes away, as well, the art-credit of the work." Minton made no answer. Will Professor Donaldson consider carefully the significance of these few lines?

I must ask, too, with all respect, what does Professor Donaldson mean by "a mere artist?" Is "mere" a sign of weakness or strength? Raffaello was nothing but a mere artist. Had Minton employed him we should never have heard his name!

C. BRUCE ALLEN.

OBSTRUCTION OF OUR PAVEMENTS.

SIR,—Is there any regulation that limits the period that raking shores placed against a building may obstruct the public footway?

The pavement in Wellington-street, on the east side, has been occupied for more than three years by two such obstructions placed against the front of a building belonging, I believe, to the music-hall in the Strand; and foot-passengers are impeded on both sides of Ludgate-hill by similar obstacles placed against buildings adjoining the railway viaduct.

PASSENGER.

AN ARCHITECT AT THE ANTIPODES.

THE following interesting extracts are from a letter just received from an architect practising in Australia and New Zealand:—For myself I have been knocked about from place to place in an unmerciful manner, up one year, down the next, and scrambling for an existence the third. In Melbourne I was doing very well; in fact, had made my home there, and had a beautiful place about eight miles from town, and went backwards and forwards by rail every day to business. I did not do much in the building line then; I principally gave my attention to valuations, surveys, &c., and was making a first-rate thing quietly, and putting by a little money. One of my appointments was as surveyor to a savings-bank, which one day stopped payment, and I, being unfortunately one of the shareholders, had to sustain my share of the loss,

which amounted, on my part, to 4,000l.; and not only that, being connected with the bank as surveyor, I was looked upon (with the directors) as a swindler, and my business gradually dropped off. Hearing of an appointment in the Public Works at —, I thought it better to take it, although it was only 300l. a year, than stop in Melbourne and starve; so I left my family and went: when pretty well settled, I sent for them, and so we muddled on for some time. I then went in for competitions in my spare time, and succeeded in gaining seven, one after another. You may suppose this was a godsend. The last one removed me to —, and here I have tumbled into all the good buildings of any importance at a good salary, and am allowed to practise privately to a certain extent. So much for my life since I left England thirteen years ago to grovel in the back slums of Australia and New Zealand, where woden shantees and native huts are considered works of art, and a brick building is a gem. . . .

THE PRESIDENCY OF THE INSTITUTE OF BRITISH ARCHITECTS.

We are glad to hear that the council have determined to nominate Mr. Tite, M.P., for the presidency. We have received a letter from a Fellow of the Institute urging strongly the claims of another member of it to the presidency; but, not desiring to assist in raising controversy on the subject, we forbear to insert it. There is little doubt that the gentleman named has only to express his willingness to serve to be elected on a future occasion. The writer adds:—

"One word as to the honorary secretary. This appointment has always been an honourable and important one. It will be more than ever so now that we are only to have one honorary secretary, with a paid secretary to do the routine work. The announcement that one of the present honorary secretaries will be a Moderator at the approaching voluntary examination appears equal to a public declaration of his intending to cease to hold the post of secretary. It is a matter for the gravest consideration who shall be chosen to hold this post for the ensuing year; and upon a fortunate or unfortunate choice of this officer quite as much depends as upon the choice we make of a president. A FELLOW OF THE R.I.B.A."

THE ROUND TOWERS OF IRELAND.

MR. FERGUSSON, in alluding favourably to my theory of the similarity of the Round Towers with the *Fanaux* de Cimetières, in the second volume of his admirable "History of Architecture," has added a few objections, on which I would wish to make a few remarks. He observes that "it is, however, far from being a complete explanation, since many of these towers have only one or two very small openings in their upper story." This, however, only confirms their analogy to the *Fanaux*, as some of those structures have only one or two openings in their upper story. The *Fanal* at Fenionx has but one. He goes on to say, "There is also a staggering fact that this is not mentioned in any legendary or written account of them." He might have added the astonishing fact that the Round Towers are scarcely mentioned at all in any legend or written Irish annals. The towers mentioned in Irish annals as keeps or places of refuge were evidently, like most of the oratories and churches of the same period, of wood, from their being so frequently burned, and were not the Round Towers, which are built of strong masonry. Dr. Petrie admits that the custom of building oratories of wood was continued in Ireland even to the twelfth century; but, he adds, "the strongest evidences in favour of this conclusion, that the *dwirtheachs* were usually of wood, are those supplied by the Irish annals, which so frequently record the burning of this class of building by the Northmen, while the *damhlíags* escaped the flames." If we apply similar reasoning to the frequent burning of the *cloitheachs* (the so-called Round Towers), we must be led to the conclusion that they also must have been of wood.

He adds further, "They are frequently described as bell-towers," *Cloitheach* has been evidently wrongly interpreted bell-tower, for in the registry of Clonmacnoise of the fifteenth century, the *cloitheach* there is mentioned as a small castle or steeple built by O'Rourke, as a monument, and as a memorial of his own part of that cemetery." There is no mention of it as a bell-tower. Further, Mr. Fergusson, in his description of the monastery of St. Gall, notices

the resemblance of the towers there to the Irish towers, and observes no mention is made of bells. The *cloitheachs* mentioned in Irish annals were evidently, as shown above, built of wood, and were not the Round Towers which are built of excellent masonry. We may add, further, if the Round Towers were built for bell-towers, why do we find bellfries built alongside of them at a later period, as at Swords, and Lusk?

Mr. Fergusson seems inclined to lean to the view "that they were better adapted for treasures and places of refuge than for the purpose of displaying lights." Now it is an established fact that the Round Towers are almost always found in burial-grounds. Their invariable position in cemeteries, as at Monasterboice, Clonmacnoise, is therefore more in harmony with my view of their being like the *Fanaux*, beacons or lighthouses of cemeteries, and a strong objection to their being considered as treasures and places of refuge. If meant for these purposes, why are they always placed in cemeteries?

Dr. Petrie, when advocating his view of these being places of refuge, is of opinion that from a tower to eighty people could easily take refuge in a tower. But let us consider for a moment: fifty people shut up for a week, or even for a day, in a tower of about 8 ft. inner diameter, with the door shut, and the small quantity of light and air admitted through the very small windows in the stories of the tower: the Black-hole of Calcutta would be nothing to it.

Some would connect the Round Towers with the tower of Ravenna; but they do not possess a single feature in common. Who can see any resemblance between the lofty and broad Ravenna tower at St. Apollinare, in Classe, with its flat roof, its numerous windows, and its nine stories, and the slender Irish tower, with its conical roof, its four windows at the summit pointing to the four cardinal points, its small windows to light the stories, scarcely ever more than two, and its door at a distance from its base? HODDER M. WESTROFF.

DAMP WALLS.

M. L. F. requests to know whether there is any preparation before papering which would prevent the damp from exuding from the oolite stone of which houses are built in the neighbourhood of Bath? The house in question is said to have been built of stone taken from a sea-quarry, and the walls, when papered, are very soon greatly disfigured.

STREET RAILWAYS.

The attempt to introduce tramways on the main public thoroughfares of London being opposed, perhaps the amalgamation of the railway and tramway systems might be found to succeed; that is, to create a special line of thoroughfares for the cars by purchasing or renting slices of the backyards or gardens of the street houses parallel with the main line of traffic, or nearly so, working in and out among the houses to render the cost as low as possible. The rails would cross streets at their level, cutting through the lower portion of houses on each side by a *grate* new entrance or archway, where the pace of the cars could be slackened, and passengers set down or taken up. The advantages of this plan are the saving of cost of embankments, viaducts, cuttings, and stations, besides the destruction of valuable property, while passengers would be taken up or set down much nearer to their destinations than is usual by the railway system. The prospect of the backyards would certainly not be cheering, but it would surely not be less so than that of the chimney pots of some of the metropolitan lines, or the blackness or darkness of others. These lines might likewise be made available for the transit of goods from one railway station to another. D. M.

ARCHITECTURAL DRAWINGS FOR PARIS.

SIR,—Unwilling as I am to intrude upon your space with any matter which may be considered only of importance to the person immediately concerned, yet I should wish to draw attention to the following complaint. Having received a notice from the English Architectural Committee for the Paris Exhibition inquiring what space I should wish reserved to me, I filled up the notice for my drawings, giving their size according to the regulations. In due course, I received a second notice saying that a certain space (for two of the drawings) had been assigned me. At the time appointed I sent the two drawings to Kensington, and received a receipt for them. At the close of the preliminary exhibition I received an abrupt notice to remove the drawings, which I did; but there was no explanation given me, before or at the time, why they were not forwarded with the drawings of the other exhibitors to Paris. After waiting a short time for some communication I wrote to the official secretary (the receipt of which letter was only formally acknowledged) asking why they were returned, but although above a month has elapsed, having written on the 15th of February, I have had no communication whatever, or any explanation given why the space which had been allotted to me had been withdrawn, every regulation having been strictly complied with on my part. R. L. R.

COMPETITIONS.

Yarmouth Terrace, &c.—The Corporation have awarded the premiums as follows:—A terrace for first-class houses, 23 ft. frontage, cost not to exceed 900l. each, including the area, railings, and walls. Premium awarded to Mr. J. T. Bottle, Great Yarmouth, 20l. A detached marine villa, cost not to exceed 1,500l. Premium awarded to Mr. J. S. Dodd, Reading, 20l. A pair of semi-detached marine villas, cost not to exceed 2,000l. per pair. First premium awarded to Mr. J. S. Dodd, Reading, 20l.; 2nd premium to Mr. J. T. Jackman, Soho-squares, London, 10l.

Folkestone Competition.—Sir: According to the instructions to architects competing, Mr. Hyde, surveyor to the South Eastern Railway Company, to whom the drawings were sent on the 31st of December last, was to advise the directors respecting the award of premiums, and I with many others think it quite time his decision be made known, or some explanation given for the delay. EXHAUSTED PATIENCE.

SINKING HOUSES, LIVERPOOL.

SIR,—I have some houses which are built on a soft foundation, and they have sunk very much. There has been a stone quarry there, and it has, I suppose, been filled up with rubbish. I have had to rebuild one house. They still keep sinking. If any of your readers know of any means to prevent it, and will make it known, they will be doing me a favour. C. H.

* Get proper advice on the spot.

FIGURE DRAWING CLASS OF THE ARCHITECTURAL ASSOCIATION.

SIR,—Will you allow me to call attention to the advantages offered by the above class, and to state that a good opportunity is now afforded for the entry of new members. The class resumes its studies on Tuesday evening, the 2nd of April, and there are vacancies for at least a dozen additional students. The class meets in the large gallery of the West London School of Art, in Great Portland-street, on three evenings in each week, viz., Tuesday, Thursday, and Saturday, from seven o'clock to half-past nine. The studies are from the best life models, with draped and costume models occasionally, casts from the antique, and anatomical figures, and include time-sketches from the life, for the practice of rapid sketching. The studies of the class are conducted under the supervision of our able instructor, Mr. William Trego, and the class is under great obligations to Mr. Clarke, the headmaster of the West London School of Art, for the valuable advice and assistance he has always so courteously rendered to us. The class is not limited to members of our association. CHAS. H. F. LEWIS, Hon. Sec. of the Class.

CENTRAL COTTAGE IMPROVEMENT SOCIETY.

COMPETITION FOR DETACHED LABOURERS' COTTAGES.

SIR,—In your last week's issue I observed an advertisement, requesting tenders from builders to carry out the prize designs for the above. I am at a loss to conceive the object of the advertisement, when tenders have already been sent in (not exceeding the stipulated sum, viz., 100 guineas), from ten respectable builders to carry out the first prize design, and I am informed by the secretary, that as much had been done for the second prize design. What more do they want? Do they wish to shuffe out of the prizes altogether? It seems to me that that is the object of the society: why not say as much instead of going a roundabout way to do so. One tender I sent in was from a builder in the Vauxhall-road, who would erect one or fifty cottages, at 165l., to be built within three miles of the Vauxhall Bridge. The other tender was from a builder at Waltham-green, who would be willing to erect any number at the same price within three miles of that district. J. T. SMITH.

CHANGE OF NAME IN LONDON DISTRICTS.

SIR,—In your volume of the *Builder* for last year a correspondent laments the change in the names which the Metropolitan Board of Works has made in many of the streets of London. Perhaps he is not aware that the present is not the first time this has been done; but time after time one or another change has been made, in some cases to suit the present more refined ideas. Take the following as a few specimens where the old names have disappeared in and near the City:—Cow-lane, Petticoat-lane, Smock-alley, Bagno-court, Blowbladder-street, Pickaxe-street, Love-lane, Pig-street (as shown on a plan in my possession as at the west end of Old Bread-street), Grub-street, Duck-lane, the Stews, Rotten-row, Rag-fair, Tyburn (softened into Tyburnia), Out-throat-lane—many round London so

called—Ducking-pond-row, Cock-lane* (from the owner's name, or the fowl sold there), Knock Fingers, near Wellesborough, Aog-lane, Five-foot-lane, City, Fleet Ditch,† Holborn Bridge, Pudding-lane, where the great Fire of London began at a baker's, and Pye-corner, where it ended, names rather singularly associated together in one remarkable event; Willow-walk, one in Cray's-inn-road and one in Five Fields, Chelsea, are gone; while one near Old Street-road still retains its name, though not its character, which gave rise to it. Dog-row also still remains. Butcher-row, Chick-lane, Field-lane, Black Mary's Hole, Warner-street in the Hole, Hedge-lane, near Leicester-square, and Strumbelo, Chelsea, are among the number.

A. Z.

THINGS NOT GENERALLY KNOWN.

Things still unknown.—When the sinking of the caissons for pier No. 3 (the second from the Middlesex side) of New Blackfriars Bridge is to be commenced.

When the Metropolitan Board of Works will acquire all the property needed for New Earl-street.

Things known.—The works of New Blackfriars Bridge commenced on June 7, 1864, and were to have been finished in three years—namely, on June 7, 1867.

The Act of Parliament for new Earl-street (26 & 27 Vict. cap. 45), received the Royal Assent July 13, 1863—forty-four months ago!

ANIQUE LABORE NITE.

ST. JOHN'S CATHEDRAL, BRISBANE, QUEENSLAND.

THE new Anglican Church of St. John at Brisbane will be one of the most important ecclesiastical edifices in Queensland. The design selected by the committee out of various competitive plans, is that of Mr. D. W. Ryan. It embraces tower and spire, nave, aisles, transepts, apse, bishop's room, vestry, organ chamber, and sacristan's room. The length, in clear, is 208 ft., including chancel and transepts. The clearstory walls are 50 ft. from nave floor to wall plate; the height 80 ft. to ridge. The nave is separated from the aisles by an arcade of seven arches. The transepts and chancel have respectively moulded arches springing from worked columns with foliated capitals; the clearstory is pierced with seven double-light windows, with tracced heads; and the roof principals are supported on stone shafts and carved capitals. The chancel and porches will be paved with Minton's encaustic tiles. The church, when completed, will be capable of seating more than 2,000 persons.

CHURCH-BUILDING NEWS.

Hanley (Staffordshire).—After having been closed for about eight months, for extensive alterations and improvements, Shelton Church has been re-opened. The chief improvement is the chancel, for which the parish is indebted to the rector, the Rev. S. T. Nevill, and which will cost about 1,600l. The style of the main portion of the church is Early English, but the new chancel is Decorated Gothic. It is 35 ft. long by 29 ft. wide, and has an apsidal end. It is built of Hollington stone, and is surmounted externally by a pierced parapet, with pinnacles and finials. There are five two-light and two single-light windows. The roof is open, and framed with red deal, stained. The principals are moulded, and supported upon stone columns with carved capitals. The spandrels are filled in with tracery, and the ceiling in the apse is decorated with gold stars on a blue ground. The floor of the chancel has been paved with Minton tiles. There are stalls carved English oak, and on either side of the chancel, the ends of which bear carved emblems of the four Evangelists. The old pulpit has been removed from its station at the head of the nave, and has been succeeded by one of carved oak, which stands at the north side of the chancel. The pulpit is octagonal,

* The Cock-lane ghost made a sensation in London some eighty or ninety years ago.
† Houndsditch and Shoreditch still remain, and the latter as a parish will, doubtless, continue.

shaped, and is supported on a pedestal with moulded capital and base. The chancel is lighted artificially by three polished brass Gothic coronas. In the nave the whole of the pews have been removed, together with the wood screen which cut off one of the bays, and had the effect of forming a sort of second vestibule to the church. New oak benches, with inclined backs and moulded and carved ends, have been substituted for the discarded pews. Two bays have been taken out of the north and south galleries, at the ends nearest the chancel, and the organ has been removed from the west gallery to a chamber prepared for its reception on the south side of the chancel. It has been overlaid by Messrs. Foster & Andrews, of Hull, who have introduced some improvements. The decoration of the nave and the ceiling is elaborately marked, and the bosses at the intersections of the lines are picked out with gold. The arches are coloured, and the spandrels are filled in with passages of Scripture in scrolls, overlying foliage conventionally treated. The benches on the ground-floor will seat 900 persons, and the cost of the alterations in the body of the church will be about 1,500l.

Croydon.—St. Saviour's Church, which has been recently opened, has been about twelve months in building. In its present state it is incomplete, the addition of a tower and spire being in the original plan. At present, instead of the tower there is a small bell-tower. The whole structure is built of bricks. The bricks are of three colours, red, yellow, and black. The columns are of coloured stone, and rise from square bases, terminating with foliated capitals, not all carved at present. The arches are all of brick, relieved with stone facings. The clearstory windows over the arches are set deep into the brickwork, and there are two marble shafts, with carved capitals, to support the three small arches of the three lights. The chancel-arch rises from small marble shafts, supported by stained stone corbels. The roof is open-timbered, stained to represent mahogany, and that in the chancel is supported by two angels. The east window of the chancel is of three lights, at present filled with plain glass. The other two chancel windows, north and south, are filled with stained glass. A reredos is to be placed in the chancel (now in the hands of the Queen's sculptor, Mr. Theed), at the expense of Mrs. Newman Smith; and there will be side screens of stone to correspond. The reredos will represent the Last Supper. Most of the windows have been filled with stained glass, presented by members of the congregation. The architects are Messrs. Mullins, Lee, & Mullins, and the builders Messrs. Myers & Sons. The church has been prepared for the accommodation of 512 persons, at a cost of 4,600l, exclusive of stained-glass windows, marble shafts, pulpit, lectern, font, chancel-screen, encaustic tiles for chancel, and other special gifts; and at the present time a debt of 1,200l is owing to the contractor, for which the committee have made themselves responsible. The following are some of the details not yet provided for:—Side-screens of marble and stone for chancel, screens for vestry and children's chapel, glass for east and west windows, encaustic tiles for nave and aisles, alms-boxes, font-ewer, carving capitals, &c.

STAINED GLASS.

St. Mary's, Nottingham.—The gift of the banking family of Messrs. Smiths, erected in commemoration of the founder of the family, has just been completed by Messrs. Heaton, Butler, & Bayne, of London. The south transept roof and the stonework of the window and side walls have been restored. The subjects represented in the windows are, "The Parables of our Lord." Above them, in the smaller openings, are angels singing and playing instruments, and in the larger space on either side of these two rows is an angel with a scroll. Below are forty-eight openings, consisting of four tiers of twelve windows each, and as a rule two lights are given to each parable. On the opposite window in the north transept the Miracles are to be represented; but at present only the central compartment, occupying a third of the window, has been undertaken.

Benilton Church, Sutton.—The committee for the erection of some suitable memorial to the late founder of All Saints', Benilton, Sutton, has a memorial window now in process of

making. It is intended to fill in the large window of the chancel with stained glass. The subject to be illustrated is that of the Ascension. This will occupy the five lower lights; the canopy and base will be filled with wild foliage work. The tracery will contain the Lamb, Alpha and Omega, and other emblems, on grisaille work. The work is to be done by Messrs. Heaton, Butler, & Bayne, of London.

Cliffe Church.—Several improvements have recently been made in the architectural features of the Church of St. Thomas-a-Becket in the Cliffe. A new memorial window, in the perpendicular style, has been placed in the south aisle, by the Misses Hillman, to the memory of their parents. This window contains stained glass, representing, in one compartment, the "Resurrection," and in the other, the "Ascension of our Saviour." A second new window, of a similar character, has also been placed in the south aisle, by the churchwardens; but this, at present, is not of stained glass. The memorial window is the work of Mr. Wailes, of Newcastle. Messrs. Parsons, of Lewes, have done the stone work.

St. John's Church, Eton.—Another window has just been erected in this church, by the artists who have erected those already inserted, Messrs. O'Connor, of London. It is on the south side, and to the memory of Thomas, eldest son of Thomas and Ann Ingaltson, as recorded by an inscription on the glass. The subject in the centre apse is the "Raising the Widow's Son." On either side are emblems,—the burning heart, and the pelican, in allusion to the dedication of the church to St. John, "The Evangelist of Love," the whole groundwork being of grisaille and diaper.

Southern Church.—A stained glass window, by Messrs. Hardman, of Birmingham, and designed by Mr. G. G. Scott, consisting of five lights, illustrating the five principal events in the life of our Saviour, namely, the Nativity, the Worship of the Magi, the Crucifixion, the Resurrection, and the Ascension,—has been erected at the east end of the chancel of this church, to the memory of the late Mr. B. B. Colvin, of Pishiobury. In order to harmonize with the new window, the walls of the chancel have been cleaned, the ceiling painted, and the screen varnished and decorated. Inside the altar-rails the floor has been relaid with encaustic tiles of a rich pattern, and a new Communion service and altar-cloth added.

Books Received.

Our Schools and Colleges. By HERBERT FRY. First annual edition. London: Hardwicke, 1867.

This volume, edited by the author of "The Royal Guide to the London Charities," contains the principal particulars respecting endowed grammar, collegiate, proprietary, and middle-class schools, and other important institutions, where the young are trained for the naval, military, civil service, middle-class, and similar examinations; as also information respecting colleges and universities. It must be a useful volume to all engaged in the selection of educational establishments for their children.

VARIORUM.

"The Book of Knots, illustrated. By 'TOX BOWLING.' London: Hardwicke." This is a treatise on the art of cordage, illustrated by 172 diagrams, and showing the manner of making every knot, tie, and splice. It is both curious and useful, especially to sailors, and, accordingly, it is dedicated by permission to Prince Alfred. Among the multitude of knots, some of which would seem to be capable of hothing the builders' knot and double knot.—A neat little edition of "Gulliver's Travels" has been published by Mr. Tegg. It has three or four coloured illustrations, and is very well and clearly printed.—"Outlines of English History," by Henry Ince and James Gilbert, has been sold in hundreds of thousands, and will continue to be so. The new edition, just now issued (Kent & Co., Paternoster-row), is now matter to the extent of fifty pages. It is as full of information as an egg is full of meat.—"Engineering Facts and Figures for 1866" (Fullarton & Co.) is a reprint of useful articles from the *Engineer, Engineering,*

and similar publications. The contents, some of which are illustrated, are classified, and references are given at the end of each division to other papers and articles connected with it to be found in periodicals.

Miscellaneous.

THE CHESTER TOWN-HALL WORKS.—Mr. Gargan informs us that his removal from these works to others in Ireland was of his own choosing, and that he was not "dismissed" at all, as reported.

A FREE LIBRARY AND MUSEUM FOR NOTTINGHAM.—The town council have unanimously resolved, "That a committee be appointed to investigate the working of the Free Library and Museum Acts, and that it appears desirable to take measures for their being adopted in this town." The committee has accordingly been appointed.

INFIRMARY FOR BOLTON.—According to the *British Medical Journal*, Dr. Chadwick, of Southport, formerly a resident of Bolton, has offered 1,000*l.* towards securing a site for a new infirmary for Bolton, outside the borough; and, to utilise the present infirmary, he offers another 1,000*l.* towards converting the present building into a public library and museum. Alderman Heywood cordially agrees with these suggestions, and promises to follow in the steps of Dr. Chadwick.

PRESENTATION TO MR. GREATOREX, LATE CITY SURVEYOR OF COVENTRY.—At a dinner in the Castle Hotel, Coventry, Mr. Greatorex, late surveyor in this city, has been presented with some valuable testimonials of esteem and respect. These testimonials consist of a gold watch, a purse containing 150*l.*, and a silver cup. The watch and purse were subscribed for by the members of the corporation and other gentlemen of this city, and the cup by the men employed under Mr. Greatorex, while, for fourteen years, engaged as city surveyor.

MACCLESFIELD SCHOOL OF ART.—The mayor, as chairman of the school, convened a meeting of gentlemen, to confer with the committee as to the best means of carrying out the wishes expressed at the late public meeting of ratepayers. The number of those who had opposed the rate, but had expressed a willingness to unite in voluntary efforts, and had received circulars to attend, was very small. The meeting unanimously resolved "That an immediate canvass for subscriptions be instituted; and, further, to lend all possible aid in promoting the best interests of the school." It was announced that about 50*l.* had been subscribed, and it was agreed that the town should be divided into wards, and that members of the town council and others should be solicited to undertake the canvassing of the separate wards. Most of those present consented to become canvassers. In course of the proceedings, Mr. Ford, the master of the school, said about twenty students had been enabled to take up valuable situations in various trades, mainly owing to the art education they had received in the Macclesfield School.

ESTABLISHMENT OF A GYMNASIUM IN NEWCASTLE.—A meeting of those interested in the formation of a gymnasium has been held in Newcastle-upon-Tyne, to receive the report of a provisional committee, appointed at a general meeting held on the 27th of November. Major Spoor, N.R.V.C., presided. The Chairman said there was every reason to augur a favourable reception of the club by the people of Newcastle. In its establishment they had had the advantage of the formation of a similar club in Gateshead. He then read the report of the secretary (Mr. C. Neville Johnson) of the Provisional Committee; and it was resolved by the meeting that it was deemed expedient that a company should be formed (limited liability) having for its object the erection of a public gymnasium in the town, and that the meeting pledged itself to support the project. Matters of detail will be considered by a committee, and afterwards submitted to a committee for approval. Some gentlemen were then requested by resolution to act as provisional directors of the company, with power to add to their number. The plans for the proposed building, executed by Mr. Oliver, were laid upon the table at the meeting for inspection.

THE AGRA EXHIBITION.—The Exhibition of Works of Art and Industry got up by a committee representing the North-Western Provinces of India, has recently taken place at Agra with great success. It seems to have excited much interest among both natives and British. It only remained open, however, from Monday, the 4th February, to the Saturday following. Prizes were awarded by jurors. The exhibition was opened, in state, by the Lieutenant-Governor, Mr. Drummond; and the President of the Central Committee, Mr. Thornhill, addressed the Lieutenant-Governor on the occasion, who made an appropriate reply.

ANECDOTE OF HERBERT MINTON.—A china storekeeper in Boston, U.S., who had been in a London crockery shop, and knew Herbert Minton by sight, saw him one day enter the Boston store just before the "World's Fair" (as he thought, enjoying the glorious privacy which 3,000 geographical miles, as a rule, will afford even to a poripetetic potter). Taking up a beautifully modelled Parian figure of his own manufacture, he asked the *soi-disant* Bostonian, the name of the producer? The storekeeper came up close to him, and without any prelude, slapped him on the back, and replied, "It's one of yours, sir," and thus the mantle of *incognito* suddenly collapsed.—H. H. V.

LEOMINSTER WATER SUPPLY AND DRAINAGE.—The committee appointed by the local Board to consider the plans of Messrs. Gotto & Beesley for the water supply and drainage of Leominster, have recommended that a trial boring should be made as suggested by the engineers, in order to ascertain whether a sufficient quantity of water suitable for the town may be obtained by this means; and thus avoid the expense of filtering and interfering with the rights of mill-owners, as would be the case if the supply is taken from the river or other streams in the neighbourhood. The local Board has agreed to the recommendation of the committee, and the trial here is now being executed by Mr. F. C. Bngbird, of London, contractor.

A NEW AQUATIC FIRE ENGINE.—The second complete steam floating fire-engine which has been constructed in England (the first being now the property of the Metropolitan Fire Brigade), has been purchased for our Indian Government. Both have been constructed by Messrs. Shand & Mason, hydraulic engineers, Blackfriars-road. The new craft is 120 ft. long, and has a breadth of beam of 16 ft. It possesses four boilers. The principal objects of interest between decks are the engine, the pumps, and the propeller. The engine possesses 30-horse power. The pumps number six, and by means of them six jets can be charged at one time, at a pressure of 120 lb. on the square inch, which, at a height of 160 ft. It is estimated that the propeller, at 200 revolutions, can make the new floating fire extinguisher go at a speed of 10 knots, or 11-3/25 miles an hour. Satisfactory trials have been made on the Thames with the vessel, to test her speed and hydraulic power.

THE QUESTION OF WASTE IN BRASS CASTING. The right of a master to deduct from his servant's wages for extra waste of material, was brought before the local magistrates, at Wolverhampton, a few weeks ago, and decided by them in the affirmative, and has been again argued in another case there. The complainant, Edmund Pugh, brass-caster, summoned his employer, Mr. Charles Sale, for 1*l.* 0*s.* 4*d.*, which he alleged was due to him for wages. According to the custom of the trade the complainant was to be allowed 7 lb. to every owl for loss in casting. It transpired, however, that the loss of weight in casting was irregular. One witness stated that during eighteen years his average loss had been 8 lb. in the owl, yet the masters had never deducted for that loss which was over the usual allowance. In this case 12 lb. had been deducted over the usual allowance, and for this 7*s.* 4*d.* had been deducted, and the difference, 1*s.*, was refused. The magistrate was of opinion that the fact that the metal had been constantly weighed and a certain allowance made for waste during a period of forty years justified the defendants in deducting from the wages of their men for the amount wasted over the usual allowance. That the masters had not always enforced their right did not make it void. It would be injudicious to deduct in all cases, as the waste sometimes arose from bad metal or accidents; but great quantities might be wasted from mere carelessness. He was of opinion that the masters had acted rightly in making the deduction.

WORKMEN'S RIOTS IN FRANCE.—We hear from private sources that the riots consequent on the strike at Roubaix, near Lille, had much more serious consequences than have been spoken of in the newspapers. We hear of nine mills that have been greatly injured, if not destroyed.

THE ARTIZAN AND LABOURERS' DWELLINGS BILL.—Mr. McCullagh Torrens's Bill in relation to artizans' and labourers' dwellings, the same as that which was introduced last year, has been read a second time, and referred to a select committee. It provides for the demolition of buildings which are unhealthy, and, if necessary, the erection of new buildings by the local authorities.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.—On the 21st inst., Miss Edith Heraud read to the members of this society selections from "Macbeth." Miss Heraud reads with great discrimination and good effect. The abilities of this young lady should serve to keep her more continuously before the public than seems to be the case. The audience on the occasion in question were greatly pleased.

ACCOMMODATION IN THE HOUSE OF COMMONS.—We are asked, from as far off as Hayti, the number of members the English House of Commons will seat with comfort. We reply, on the best authority,—

On the Floor.....	258
In the Galleries.....	108
	366

The above calculation allows a seat of 24 in. wide to each member. A reduction of this allowance would, of course, give an increase in the number of members.

ARCHITECTS' BENEVOLENT SOCIETY.—The following is an abstract of the last balance sheet:—

1866.	
Balance ending year, 1865.....	£115 17 2
Received subscriptions.....	178 10 0
Beque donations.....	50 15 6
Dividends.....	98 10 7
	£363 11 5
Paid expenses.....	£55 19 9
Gifts.....	200 0 0
Robins & Barber, brokers ...	1 17 0
	257 16 9

Balance in banker's hands end of 1866..... £105 14 6
Out of the amount of 105*l.* 14*s.* 6*d.*, the sum of 30*l.* 13*s.* 6*d.* has to be invested, and there are bills to pay amounting to about 19*l.*

STRIKE OF ENGINE DRIVERS.—The Brighton and South Coast engine-drivers have struck work, but merely for a day. The strike is virtually at an end. "The only point at issue between the men and the directors," says the Society of the engine-drivers, "was the conditions on which the men should receive their promotion, and has been arranged by the authorities agreeing that if any men are passed over they will have the right to appeal to the board of directors, and their claims will be duly considered. The men ask no more than this; and the Brighton directors having conceded every other point, they have resolved to trust themselves to the upright dealing of gentlemen with whom they have no especial quarrel, and hope that their future relations may be both amicable and satisfactory."

COTTAGE HOMES FOR THE PEOPLE.—The Suburban Village and General Dwellings Company (Limited) has issued a prospectus, which states that the capital is to be one million, in 100,000 shares of 10*l.* each, with power to increase; and the first issue will be 200,000*l.*; 1*l.* deposit to be paid upon application and 1*l.* on allotment. The trustees are Alderman Lusk, M.P., Professor Fawcett, M.P., and Mr. G. Crnikshank. The company is established "to provide at the most rapid rate possible, healthy, pleasant, and comfortable abodes, for the overcrowded population of the metropolis. The company will purchase estates in all the suburbs near to and having direct railway connexion with London, and erect thereon complete villages. The houses erected will contain from four to eight rooms with every domestic convenience, each house to have a piece of garden ground. Educational establishments, &c., will be provided, as also a limited number of shops erected. A large estate has been purchased in close proximity to Brixton, Longborough-road, and Heme-hill stations. Improved dwellings will also be erected in London. The instalments paid in purchase of a cottage of four rooms, with a piece of garden-ground will not exceed (including railway fare) what is now paid for rent only of two rooms in our overcrowded localities."

REWARDS TO INVENTORS.—The Army Estimates for 1867-8 contain provision for rewards to inventors, to the extent of 22,800*l.* Of this sum, we believe 15,000*l.* will go to Major Palliser for the projectiles which bear his name, and 6,000*l.* to Mr. Fraser, of the royal gun factories, for the modification which he has suggested in the Armstrong system of gun building, with a view to cheapening the manufacture.

THE SEWERAGE OF REGENT-STREET.—The local sewerage of Regent-street has long been in a very defective condition, and liable to give way or to become choked up and overflow, and this has again taken place near to the houses Nos. 95, 97, 99, and 101, causing an overflow into the wine vaults of No. 95. Mr. Howell, the parish surveyor of St. James, Westminster, has submitted to the vestry of that parish four schemes for improving the condition of the sewerage of the street. The vestry, being in a difficulty as to the best scheme to be adopted, have called in Mr. Haywood, the engineer to the City Commissioners of Sewers, to advise them on the subject.

BURNING OF ST. ANDREW'S CHURCH, NOTTING HILL.—On Saturday evening, within the short space of an hour, this so-called iron church was reduced to a complete ruin. It was erected at a cost of 1,600*l.* or 1,700*l.* about four years ago, for the accommodation of the well-known Kensington Potteries. The building was left perfectly safe at five o'clock in the afternoon by the mission woman, who had been arranging the books, &c., for the Sunday Services. The cause of the catastrophe is at present unknown. The church was partially insured, but not sufficiently to cover the loss, which will fall heavily on a very poor district. It would be as well if the Metropolitan Board of Works, whose assent is necessary before such buildings can be erected, should insist on the framework being really of iron, and not, as is now usually the case, mainly of wood, with a few angle uprights and other pretences.

MORE ROMAN REMAINS AT GIRENCESTER.—The most recent additions to the Cornium Museum, which is becoming rich in antiquarian lore, comprise several objects of interest, some of which were not before represented there. In excavating at the new cattle-market, some stone coffins have been found, with three sepulchral urns, all in good preservation. In one urn, in addition to bones, a lamp was found; also a safety pin, on the same principle as those in use at the present day, a bronze brooch, a "tear-bottle," and four coins, three of them of a very rare description. The place where these remains were found is but a very short distance from the Quers, which, for many reasons, one being the irregularity of the ground, which is broken up into a number of mounds, having the appearance of tumuli, has been regarded by antiquaries as an ancient place of sepulture, and the recent discoveries confirm that hypothesis. By some the Quers is supposed to derive its name from the word cairn. Some further discoveries of Roman remains have been made in the New-road.

THE METROPOLITAN IMPROVEMENT RATE BILL. At the last meeting of the Metropolitan Board of Works a report from the Works, &c. Committee was read, setting forth the grounds on which the committee thought this Bill ought to be supported. Some misapprehension, says the report, has been shown to exist in reference to the present taxing powers of the Board, and it has been stated that the Bill will increase those powers and augment the burden of taxation. That opinion was entirely erroneous: under the Metropolis Local Management Acts the powers of the Board are unlimited, and they can raise any sums they deem necessary for the purposes of those Acts, their most important function being the improvement of the metropolis. The object of the Bill is the provision of funds for carrying out urgent and pressing improvements, and the relief of the heavily-burdened ratepayers of the metropolis by the readjustment of taxation. Mr. Freeman moved the adoption of the report, and a long discussion took place, when Colonel Hogg moved that the report be rejected, and that the solicitor be directed to draw up a concise answer to the objections made to the Bill. The Chairman agreed with Colonel Hogg in thinking that while members of Parliament would read and attend to a short and concise statement, they might not attend to the lengthy document the committee had drawn up. The report was finally rejected, and Colonel Hogg's amendment carried by a large majority.

ST. MARTIN'S HALL, LONG ACRE, will shortly be transformed into a first-class theatre. The works of alteration will be speedily commenced.

NATIONAL GALLERY ENLARGEMENT.—Lord J. Manners, in moving for leave to introduce his Bill to make further provision for the enlargement of the National Gallery, explained that its object was to carry into effect an arrangement entered into by the late Chief Commissioner of Works last year, and that it was rendered necessary by the existence of technical difficulties in the way of acquiring Archbishop Tenison's Library and the schools of the parish of St. Martin-in-the-Fields. It had been found requisite to schedule the property, and take compulsory powers for its purchase. Leave was given.

TENDERS

For building three warehouses and a factory in South-wark-street, for Mr. E. H. Moses. Mr. N. S. Joseph, architect. Quantities by Mr. Pearson. King & Sons (accepted).....£8,903 0 0

For alterations, &c., to 216, Upper-street, Islington, N. for Mr. Truman. Mr. W. Smith, architect:—
Warne.....£1,150 0 0
Perry.....790 0 0
Crabb & Vaughan.....780 0 0
Gienn.....780 0 0
Sabej.....750 0 0
Johnson.....690 0 0

For schools, at Brighton, in connection with the London Brighton, and South Coast Railway Company. Mr. H. C. Lansdowne, architect. Quantities supplied by Mr. J. N. Bland:—
Cheesman.....690 0 0
Simms & Marten.....683 0 0
Nightingale.....645 0 0

For new shop front, &c., No. 25, Hanscomb-street, Chelsea, for Mr. C. J. Fringie. Mr. H. J. Sloan, architect:—
Nightingale.....£103 8 9

For a pair of semi-detached six-roomed cottages, proposed to be built at Hounslow. Mr. William Tim, architect:—
Cole.....£376 0 0
Wilson.....370 0 0
Emmerson.....330 0 0
Walker.....298 0 0

For retraining St. Marylebone Parochial Schools at Southall. Mr. Saxon Snell, architect:—
Faulkner.....£335 0 0
Sparrow.....325 0 0
Crabb & Vaughan.....308 10 0
Hanson.....299 18 0
Proctor.....285 0 0
Tasker.....288 0 0
Cowley.....285 0 0
Wyan.....235 0 0
Pedley.....240 0 0
Gibson.....200 0 0

For alterations and additions to residence of Mr. Scott Stonehewer, J.P., Shoreham, Sussex. Mr. Horatio N. Gouty, architect, Brighton. Quantities supplied:—
Nightingale.....£692 0 0
Simms & Marten.....617 0 0
Simms & Marten.....617 0 0

For erection of Concert-hall, Brighton. Contract No. 1, foundations. Mr. Horatio N. Gouty, architect. Quantities supplied:—
Nightingale.....£1,010 0 0
Bland.....993 0 0
Simms & Marten.....860 0 0
Cheesman & Co.....890 0 0
Chappell.....879 0 0

For building a library and Turkish bath at the rear of No. 4, Adelaide-crecent, Brighton, for Mr. John E. K. Morley. Mr. Horatio N. Gouty, architect. Quantities supplied:—
Cheesman & Co.....£710 0 0
Simms & Marten.....628 15 0
Nightingale.....647 0 0

For alterations, &c., at Old Shot Tower Wharf, Commercial-road, Lambeth. Mr. F. G. Widdows, architect:—
Wheeler.....£1,196 0 0
Child & Son.....963 0 0
Ennor.....828 0 0
Richards.....770 0 0

For Swan Downers Schools, Brighton. Mr. G. S. Clarke, architect. Quantities supplied:—
Baker.....£2,335 0 0
Parker.....2,085 0 0
Barnett.....2,000 0 0
Nightingales.....1,823 0 0
Cheesman.....1,495 0 0
Simms & Marten.....1,680 0 0
Rirk.....1,649 0 0
Chappell.....1,669 0 0

For Holborn Valley Improvements, for the Corporation of the City of London. Contract "D." Mr. W. Haywood, engineer. Quantities supplied by Mr. D. C. Nicholls:—
Hill & Reddell (accepted).....£23,675 0 0

For two small houses, at Croydon. Mr. Henry William Broadbriggs, architect:—
Colliver (accepted).....£730 0 0

For a new house and shop, at Hitchin, for Mr. Thomas Chamberlain. Mr. J. Shilleock, architect:—
Buttrick & Seymour.....£387 10 0
Andrews & Foster.....346 0 0

For rebuilding No. 23, Lime-street, City, for Mr. James Thornhill. Mr. Charles Reilly, architect:—
Smith & Son.....£1,335 0 0
Carter & Son.....1,177 0 0
Pack.....1,175 0 0
Webb & Sons.....1,174 0 0

For a new house and shop, for Mr. T. Sanderson, at Stotfold-street. Mr. J. Shilleock, architect:—
Foster & Stapleton.....£825 7 6
Picken & Wislhere.....692 4 0
Redhouse & Brittain.....650 13 2

For a new house, for Mr. F. Levitt, at Arley, Beds. Mr. J. Shilleock, architect:—
Redhouse & Brittain (accepted).....£242 3 0

For new warehouse in Capel-street, Dublin, for Messrs High Moore & Co. Mr. W. Fogarty, architect. Quantities supplied by Mr. Gribbon:—
Roberts.....£9,150 0 0
Millard.....8,000 0 0
Moyers.....8,500 0 0
Cockburn & Sons.....8,450 0 0
Bolton.....8,000 0 0
Nolan.....8,000 0 0
Meade.....8,000 0 0
Crow & Sons (accepted).....7,837 0 0

For converting the Manor House, Upton, into schools, for the Guardians of St. Luke's:—
Alterations and Boundary wall additions, and lodges.
Simms & Marten.....£7,790.....£1,523
Morter.....1,688.....1,482
Sally.....7,518.....1,482
Estlin & Chapman.....7,481.....1,470
Rivet.....7,378.....1,393
Perry.....7,273.....1,383
Henshaw (accepted).....6,967.....1,393

For gas holder and tank at the Hastings Gas Works. Mr. T. G. Barlow, engineer. Quantities by Messrs. Pain & Clark. Tank. Gas Holder.
Cutler.....£3,918 10 0.....£3,373 10 0
Laidlaw.....6,354 10 0.....2,959 0 0
Newton, Chambers, & Co.....6,100 0 0.....3,125 0 0
Balfour (accepted).....4,970 0 0.....2,760 0 0
Cochraue & Co.....5,100 0 0.....2,995 0 0
Horton & Co.....—.....2,995 0 0

For new Congregational chapel, at Brighton. Mr. H. N. Gouty, architect. Quantities supplied by Mr. J. C. Chester Lansdowne:—
Cheesman & Co.....£2,576 0 0
Ansonbth.....2,570 0 0
Parsons.....2,370 0 0
Simms & Marten.....2,358 0 0
Chappell.....2,224 0 0
Bland.....2,210 0 0
Nightingale.....2,183 0 0
Kemp (accepted).....1,951 0 0

For a billiard-room, at Wimbledon Park, Mr. Robert J. McCabe. Messrs. Lee & Lee, architects:—
Stimpson.....£388 0 0
Nicholson.....800 0 0
Adamson & Robinson.....793 0 0

Reservoir, Portsdown-hill, Portsmouth.—The following corrected list of tenders has been sent us by Messrs. Simms & Marten:—
Light.....£5,000 0 0
Lawrence.....5,650 0 0
White.....5,400 0 0
Simms & Marten.....5,484 0 0
Edwards.....5,350 0 0
Furness.....5,195 0 0
Pineo.....5,030 0 0

Schools, Newington.—Sir: will you kindly allow me to say in reference to the statement of tenders for Mr. Sprague's "Schools and Newington," that I am not the person who heads the list. My eldest son, and, of course, he bears my name, priced the quantities, and arranged at the strange request, however, he but lately returned from Victoria, where a higher wage is given, and I suppose his calculations were based upon the assumption that he was still a resident in that state. I should be much obliged, therefore, if you would state in your next impression that Wm. Quinell, sen., of the above address, is not the person who tendered for the said works. Such a mistake is calculated to, and certainly will, confer upon me a great amount of injury, if not at once rectified.—W. QUINELL, Sax.

TO CORRESPONDENTS.

J. M. (We have no further information than has appeared in our Journal)—W. M. M. (sent as requested)—W. T. (under the mark)—B. E. (we do no service by inserting in private dispatches)—J. T. (re statement)—Decorator (not known with certainty)—J. T. (re statement)—H. H. R. P.—D. M. C. & V.—W. B.—E. L. R.—J. G.—Yarmouth.—H. H. R. P.—D. M. C. & V.—W. B.—E. L. R.—B. H. G.—P. L.—E. B.—S.—T. R.—N.—& Co.—J. J.—H.—W. H. S.—M.—T. M.—B. J. W.—W. H. P. We are compelled to decline pointing out books and giving addresses. All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, and necessarily for publication. Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

Advertisements cannot be received for the current week's issue later than THREE o'clock, p.m., on THURSDAY.

The Publisher cannot be responsible for ORIGINAL TESTIMONIALS left at the Office in reply to Advertisements, and strongly recommends that COPIES ONLY should be sent.

The Builder.

VOL. XXV.—No. 1261.

The Paris International Exhibition.

ON Monday last, precisely at two o'clock, according to arrangement, the Emperor and Empress of the French, full of smiles, entered the enormous building which has been erected in the Champ de Mars, and proceeded to make the tour of it. The sun shone, a green velarium powdered with hoes formed a covered-way of approach, a thousand flags fluttered, and, though the people of Paris had not made it a holiday, large crowds of sight-seers gave animation to the external scene. In the centre of the outer zone of the building, that appropriated to machinery and processes, a raised gangway is formed running all round; a capital feature,

and the only part of the building where a general view from above, of any portion of the Exhibition can be obtained. Ascending this on the French side of the chief entrance, which is next the Pont d'Jena, the imperial party and suite walked all round the building, representatives of various nationalities being presented to them on the way. They descended on the English side of the same entrance, and then passed through the central avenue to the Fine art zone, which they traversed in the same manner, making various stoppages for presentations. The Emperor must have been greatly astonished at the change that had been effected since his last visit. None who walked through the building on Saturday but those who know from experience what can be done in the last twenty-four hours in such undertakings, could have supposed that such an aspect could have been put on by Monday morning as was the case. Sunday did not there stop work, as fortunately it does with us; and, wherever, in fitting up courts and compartments, every one is doing his own work, it all goes on simultaneously, and completion of a certain sort comes everywhere about the same time. We are not advising our readers, however, now to visit it. It will be a month before it can be satisfactorily seen. In some of the sections the passages are not opened. Where the articles are set forth there are no labels, and, though the English Executive have got out a catalogue, a bulky red-covered volume not without sins, and including an account of previous exhibitions, and a general introduction in several languages, no figures of reference on the objects have yet been possible. Some of the buildings, moreover, in

the surrounding grounds, the most original and curious half of the undertaking, are but in carcass; though even here the rapidity and skill with which the French, by means of their plaster and the apparently unlimited command of decorative artists capable of drawing with much spirit and colouring harmoniously, are able to throw on a skin of heauty was singularly striking. When these buildings outside are finished, the palace and park of the Champ de Mars will be the world's marvel, and an object for universal pilgrimage. French, English, Belgian, Italian, German, Egyptian, Tunisian, Chinese, Turkish, Persian, Russian, Norwegian, and Babel know what other structures besides, are being erected and decorated at immense cost; and though, as we are disposed to believe, a very large amount of the work has been done by Paris hands, it was under native direction, and is faithfully characteristic. Some of the wooden buildings,—those of Russia notably, and to which we early referred, are beautiful specimens of workmanship. The cost of the Egyptian Temple has been immense, but the Crystal Palace has taken the shine off its novelty. Much money has been spent in fitting up and decorating the Egyptian section inside the building; and the story is,—and probably it is a story,—that France lent Egypt the money to do it with. The pavilion of the Emperor, on a turfed bank near the principal entrance, is light, elegant, and costly, including a plinth of marble, a wide projecting verandah all round, with supports and ornaments of zinc, and a balustrade below; inlaid marble steps, with bronzed eagles at the foot, and a stone pavement to terrace, with incised ornaments; while within there are mosaic floors of marble, and paintings on the ceiling. The covering is domical, and of zinc. Nearly opposite to this, on the other side of the path, is a building put up by the English Commission as a testing-house and for various experiments as to lighting and heating. This takes the shape of a Tudor cottage *enriched*, not in the highest style of architectural art, but still a type of much that is done amongst us. It is made, too, the means of exhibiting numerous building materials and processes. The roof is covered with various sorts of tiles and slates; some of the chimneys have ornamental brick shafts, others terra-cotta pots of known patterns. One window-frame is of terra-cotta. Some parts of the exterior are "half-timber," some are covered with cement, and others with tiles in varied patterns; while the cretching obligingly tells observers, in very large letters, that "This Ironwork was made by Cottam, Winsley-street." No mistake about that, at any rate. One face of the building is adorned in this wise:—being covered with plaster having a rough and coloured face, ornamental forms and patterns are cut out of it and filled in with white plaster, and having a smooth face. The drawing from which the workmen were doing this part of the decoration was signed E. J. Tarrer, architect. Within, where the roof is ugly, the walls are being lined with specimens of Keene's Cement in various patterns, Robinson's enamelled slate, and varieties of wall tiles. Altogether this Testing House, when finished, will have its value.

Close to it the terra-cotta monument, in memory of Mulready, designed by Sykes, is being set up. It consists of a recumbent figure of the painter on a tomb, and a canopy supported by ornamental columns. It seems to want refinement, but is not yet in a state to admit of a right judgment being formed.

In the English Boiler House, too, in this same part of the ground, terra-cotta is largely used in the shape of repetitions of the columns made by Mr. Blanchard, for the Royal Horticultural Society's gardens at Brompton. The story of this building is somewhat curious, but we have scarcely time to tell it fully. Under the wasteful mode that has been adopted of supplying power

to the machinery, the Exhibition building is surrounded with boiler-houses and their chimneys; there are, we believe, some fourteen or fifteen of them. The English Executive found that, besides generating steam for moving the British machinery, it was an object, in constructing the boiler-house, to exhibit several boilers contributed by exhibitors; and in order to induce visitors to inspect them without suffering inconvenience from heat, an open colonaded treatment was adopted (see p. 234). The general character of the design was furnished by a building in Ahmedabad, the capital of Guzerat, in British East India. This building was Syud Oosman's mosque, and is described in a volume on the "Architecture of Ahmedabad," of which we lately gave an account. This Syud Oosman, called Shumbee Booshanee, founded a suburb of Ahmedabad, on the west of Sahrmattee river, which is still called Oosmanpoor. He died in A.D. 1458, and two years afterwards his patron, Mahmood Begurra, built in his memory the tomb and mosque which are here represented. The tomb is 78 ft. square, and contains 80 pillars, of which 32 are double. The diameter of the centre dome is 38 ft. The minaret serves for the chimney. The details of the columns, it will be remembered, are not Indian. Some excess of strength has been given to the timber roof, and the domes, of which there are five, are unfortunately shams. We must not, however, stop longer in the grounds just now.

The form of the building, as most people now know, is an oval; or, to speak more correctly, it is described by two semi-circles connected by a straight line at each side about two-thirds of the radius in length. This oval is divided into concentric zones, each zone being appropriated, in theory, to special objects, and the centre is an open garden. The building is then divided into quarters, so to speak, by avenues running from the outer circumference to the inner garden, and these quarters, more to one and fewer to others, are given to the different countries. There is thus provided, on paper at any rate, the special classification and the geographical classification.

After the fullest consideration we can do no less than re-assert most positively, that the building is constructed on the plan originally published in our pages, and reprinted by us some time ago in juxtaposition with that of the French building as erected. Mr. Le Play, to whom plenty of credit may still be due, unwisely persists in refusing to admit this obligation. But the denial is useless. Put the lines on paper, and the fact is obvious. Let him paint an inch thick, as Hamlet says with a difference: to that admission he must come at last. It might be done, too, with less reluctance, inasmuch as in execution it cannot be deemed a complete success. We are not at all disposed to join in the cry that has been raised as to the ugliness of the building: its arrangement has several advantages, and the ease with which any part of it may be found by making for the central garden—itsself a charming feature—is admirable. Nevertheless, it is probably the last of its kind. The classification cannot be maintained: at any rate, it has not been maintained here, and the circular form presents many difficulties.

Quitting this part of the subject,—the main avenue leading from the principal entrance to the central garden has "France" on the left side, "England" on the right, and is lighted by a clearstory in which, at too great a height, are some of the best specimens of stained glass by the artists of the two countries. Some good examples of English work have been made to front this avenue. Thus, immediately after passing across the outer zone, or machinery department, are seen a capital pair of wrought-iron gates, by Messrs. Barnard & Bishop, of Norwich. These were designed for them by Mr. Thomas Jeckyll: his monogram will be found in one

circumstances required, but always persistently and determinedly. The space originally granted, and then considered too small, has been cut down twice or thrice, removed altogether to another part of the building, turned round, cut short, and in every way changed; but, after all, with such evident advantage to the position of the courts that little need now be said as to this beyond one word of regret that the committee did not at first know they would occupy such a conspicuous place in the sight of the world of visitors, and have to fill such an important part of the Exhibition.

It is more than probable that had they so known, greater efforts would have been made, and more special appeals addressed to architects themselves, to take care that their names should be represented in the Court of "Arts cognate to Architecture," as well as in their own special group, by designs and models.

The constitution of this committee, however necessary, was not favourable to the working out of any very elaborate ideas, and the general haze which seemed to envelope all the doings and the proposals of the Exhibition authorities made it very difficult for those few who had the actual carrying out of the details to see their way, or sometimes even to feel it. It should be mentioned that almost all the architectural and kindred societies of England, as well as the Institute of Architects of Ireland, joined the Royal Institute of British Architects in this enterprise, but in reality little or nothing has been done in the provinces; and the Irish Institute confined its interest in the matter to a timely donation towards the funds of the committee. The Scottish architects have preferred to stand aloof, and are not, that we are aware of, represented in the Exhibition.

Thus, it will be seen, the matter practically fell into the hands of the Institute; and the President, indefatigable in this as in other matters, gave what assistance he could personally, and always his strenuous countenance and support to what the sub-committees and their officers were able to attempt. Unfortunately, it happened that Mr. G. R. Burnell, one of the honorary secretaries, whose fitness for some of the special duties required to be fulfilled in Paris will be acknowledged by all, was smitten down by paralysis just at a most important juncture, and thus a loss to the architectural public generally fell heavily on this committee. As the knowledge of facts and correspondence connected with the Exhibition was difficult to be taken up by any newly-appointed officer, Mr. C. F. Hayward, the other honorary secretary, was charged with the whole duties; but with a gentleman who, though

corner, and they do him great credit. The bottom of each gate is filled in solid, and is ornamented, in *repoussé* work, with birds and branches, showing Spring, Summer, Autumn, and Winter,—hawthorn in bloom, the rose, the blackberry, and hawthorn with berries. Hammered-work foliage fills the part above, and the top rail, again, is ornamented with birds and flowers in *repoussé*. Near these is a chimney-piece by Messrs. Wedgwood, made of alabaster, from a design by Messrs. Nestlé and Shaw, filled in with sage-green jasper plaques. These include Flaxman's Dancing-girls, modelled from mural paintings at Pompeii; the story of Achilles, by Pacetti; and female figures from the Judgment of Paris. Although an interesting work, one is tempted to ask why the Messrs. Wedgwood should continue to live on the past. Minton's stand in this avenue is very fine. Here, too, are the exhibits of Jackson & Graham, Gillow, Copeland, the Department of Art, and others; but we run past them all to speak early, as in duty bound, of the English Architectural Court, which is found by turning to the right at the bottom of the avenue, just before reaching the fine-art zone.

The Paris Exhibition Architectural Committee, it will be remembered, began their labours early in last year, and put out their first invitations to exhibit in April; so that they have now been more than twelve months working, sometimes slowly and languidly through the heat of summer, sometimes urgently and with speed in the winter months, according as cir-

an amateur, has since done good service to the committee—Mr. G. B. Wood, assistant honorary secretary; Mr. Charles Barry acting as treasurer. Subsequently, the post of architect to the committee in Paris was undertaken by Mr. W. H. White, a resident there, who has acted in an honorary capacity with the energy of one enjoying a lucrative office, and has met the demands upon his time and attention at the Exhibition building with the utmost good humour. Others of the committee, including the honorary secretary, have also from time to time personally superintended the completion of some of the details.

The group under which architects' own drawings, designs, and models are exhibited is, of course, fine art (Numbered 1, Class iv.); but it was found impossible, we presume, to give space inside the actual fine-art galleries. So that these architectural drawings have been placed as near as possible to these galleries, and on the same walls, but on the side towards the general Exhibition. The beautiful French drawings for the "Archives des Monuments Historiques," are exhibited in the inner circle of all, open towards the garden; and there would have been room for English drawings in the same position, but it is certainly not a good place in all weathers for drawings on paper. At the same time, the "Arts cognate to Architecture" (forming "Group 3" in various classes, under the general head, "Furniture, and other Objects for the Use of Dwellings"), originally placed in the midst of other exhibitors, have been moved back to the same position as the architectural drawings, and in immediate connexion with Group 1; so that in one long line, occupying about 125 ft. of frontage, with passages, screens, and courts behind, can be seen at a glance (and the better as this is on the outer circumference of one of the curves) the whole British Architectural Exhibition.

Writing, as we do now, however, we may well say we fear the Group 1 will be cramped, for although those that are hung are very satisfactorily placed—not too crowded, nor too high or low, yet it is evident that a great deal more space must be found before the heap of drawings now in the corners of the court can be hung on the walls. We say nothing of the photographs, of which not one has yet been hung; not merely, as it would appear, from want of space, but also from want of hands to do the work; for some space appropriated to photographs of the Law Courts designs is still a blank, though a number of frames lie beneath it ready to show the very last phase of Gothic, and the last effort of British architects to their *compères* throughout the world.

As to these photographs we may observe, that it was not contemplated at first to exhibit any; but the British Executive, at the instance of this committee, accepted photographs as illustrative of the architectural designs comprised in Group 1, Class 4, of the French arrangements. By this concession, which entailed considerable additional labour and responsibility on the committee, a far better representation of architecture in England will be obtained than would be given by the drawings only; and by a happy coincidence there will for the first time be exhibited copies of drawings in two important competitions, one of which is but recently decided, while the other is still in a state of suspense. We believe this is the first time when, by a combination of circumstances, it is possible for a rational judgment to be formed of the comparative merits of a series of designs apart from the exhibition of the designs themselves. Mr. Bowler, let us add, has done excellent service in hanging the drawings.

It should be borne in mind that with regard to Group 1, the committee was appointed by the British Executive to select the drawings which should be sent to Paris (the photographs being added subsequently as above mentioned); so that all the care and responsibility, as well as the cost of packing and transmission to and fro, will be borne by the British committee. Also that in order to facilitate the labours of the committee, the galleries at South Kensington were offered and accepted for the preliminary exhibition, held in January last, of which an account was given in our pages at the time.

The drawings being selected, and a few others not available for the first exhibition being others, they remained at the disposal of the British Executive, who as yet have been unable to complete the task of hanging them. But with regard to the other court, Group 3, of which we have spoken, the committee were to act as a body of exhibitors associated together for a definite purpose, and as such were not entitled to any assistance or support.

They have had thus to act in a double capacity; and, for the sake of carrying out their ideas, it has been necessary for them to find the means, not only by charging the exhibitors in proportion to the space they occupy, but by distastefully subscribing amongst themselves. The heavy charges required to be met have necessitated the raising of a considerable sum of money; but it is hoped that, after all, nothing more may be required than has been already raised, though the committee were very careful in their earlier statement not to commit themselves to any definite amount. And in this they acted wisely; for, considering the amount of confusion, the difficulty of obtaining workmen, and of keeping them at work when so obtained, the various changes and difficulties in the way of carrying out the slightest work, an increase of expense must be entailed upon this committee as on every one who is an exhibitor to the extent of at least double the cost of similar work done at ordinary times.

Of the drawings it is scarcely necessary for us again to speak, especially as they are not yet all in their places; but we gladly notice one drawing, hung, we presume, as a memorial of one whom it was the delight of all to honour—the late Professor Cockerell, R.A. This sketch, by his own hand, of the sculpture in the pediment of St. George's Hall, at Liverpool, was lent by the corporation of Liverpool, to whom it belongs; and though it is but a slight *souvenir*, and the only exception to the general rule as to quite recent works, we are glad the committee have obtained it, and that it is among the first to have a locality assigned to it in the International Exhibition.

With the drawings it was intended to combine (according to the designation of the Class 4) architectural models. Of these one is of sufficient importance to take a prominent position, viz., Mr. Scott's model of the Prince Consort Memorial (which we understand has been presented by her Majesty to the South Kensington Museum), and this has been placed in a central position of the passage running through the adjoining group, and close to Skidmore's case of metal-work, which contains portions of the same as now being worked out, so forming a very appropriate and interesting object, as a connecting link, as it were, between the architect's actual art-design, and the manufacturer's actual art workmanship, and showing, we venture to think, that the "Arts cognate to Architecture" are appropriately placed in the position assigned to them. Of the design itself, we may remark that

THE GREAT ROMAN WALL.*

its grouping, though effective and necessarily grand, from its mere size, is, after all, hardly so full of vorticity—so suggestive of growth, one part out of another—which we have considered to be characteristic of monuments of this class,—as it might have been. And though we would not pronounce the composition from a model on such a scale as this, nor indeed from any model at all short of the real size, we cannot help thinking of the construction, and how in the name of truth all the upper part of the building can be carried with any direct bearings below. In all the Eleanor crosses, and other similar monuments, besides the spires of the Medieval times, this difficulty was in the simplest manner obviated and the eye as well as the judgment satisfied with a beautiful tapering outline, and gradually receding stages of construction.

Again, in finishing this important work, it is to be hoped all bizarre effect and all merely meretricious ornament may be subdued, and the detail carefully subordinated to the general grandeur of effect. And we say this because, from the colouring of the model, as well as from the original drawing (which, by the way, should be placed in close proximity to it), we fear the mass of coloured marbles, and gilded and painted metal-work, will only take off at first from the dignity of the whole design, and very soon indeed become dirty and distressing to behold. With all this, which of course will not be thought adverse criticism, we feel the noble character of the work as one worthy of the well-beloved Prince; and know that the Prince Consort Memorial is in safe hands, and will remain a great monument of the art and skill of nineteenth-century artists and workmen.

We may remark, by the way, that one of the metal pediments of the first stage is now being erected at the right hand or British side of one entrance through the great outer gallery (machinery), in a good position for judging its effect when completed. The objects exhibited in the Architectural Court we shall notice on another occasion. Touching expenditure, the Imperial Commissioners have not won golden opinions from their foreign colleagues. France, or rather we should say, a certain number of Frenchmen, are to gain everything; other nationalities are to pay. Helping in such an undertaking is a much more expensive affair than having an exhibition for ourselves and the world in our own country. It will cost the British Treasury say 150,000*l.*, at least, irrespective of the thousands upon thousands spent by the individual exhibitors. The Exhibition of 1862 cost 460,000*l.*, and brought back 460,000*l.*—that is, it really cost nothing; and the Exhibition of 1851 gave England a profit of about 200,000*l.*, besides many other good results. The difficulties under which the English have worked have been very great. Should Mr. Henry Cole, hereafter, have to tell the story, say in reply to a motion in the House of Commons, it will be found amusing. We believe, to give an example, it was four months before he could get a site for the terra-cotta columns and arch designed by Sykes for the South Kensington Museum,—a capital work executed by Mr. Blanchard; and these, together with a hay of the building (a specimen of capital brickwork and terra-cotta), were ultimately planted amongst the machinery in a very inappropriate situation.

To get down to the Strand of the River Seine, where buildings have been erected to display the Exhibition made by the English Admiralty and the French Admiralty, a tunnel was required, though a cheaper and more discoverable approach could have been made; and we were forced to pay 2,000*l.* or 3,000*l.* as a moiety of the cost of it, to say nothing of the expense of preparing the ground to receive the building, and the building itself. We could fill a page with similar statements; but it is an ungracious task; and, if it had not seemed to us right that the position of our Executive should be understood, we should not have pursued it even thus far.

The mighty "murus," or great stone chain, placed by the Romans round the neck of Britain, has shared the fate of other imperial relics. At the close of the Roman occupation, from being disused it became neglected; and every succeeding century found it more and more disregarded. Its stones furnished an acceptable and ready-fashioned material for Medieval builders, of which they freely availed themselves, and the high, broad stone wall became frayed, rained, and diminished under their hands. We know of a Saxon crypt that was built out of it; Medieval castles were built out of it; farmsteads were built out of it; and fragments of it are to be seen in various places built up in different buildings along its route. But, now stalking up hill and edging steep crags, now gliding down some precipitous hill or crag side, now and again crossed by our nineteenth-century railways, now crossing plains and taking further strides across moorlands and pastures, now lost sight of in a crowded town, or a field in which a coal-pit is worked, and coming into view again, perhaps, in a farmyard, there are still many lengths of it left. These are sometimes only a few stones high, at others several feet in height, though nowhere perfect; and again only a trace of the wall is to be seen, or, perhaps, the very foundations are exposed for miles, and formed into a highway, or into a bridle-path. Stretching across Northumberland and Cumberland, in a line where England measures but 74 miles from sea to sea, these bulky fragments of the old wall lie mellowing in the sun or bleaching in the winds, according to the shelter or exposure of their site. Occasionally we may still see the original formation of the ditches and embankments with which the military strength of the defence was increased. On the north side dives down a deep fosse; on the south is the vallum, consisting of three ramparts and a second fosse. Several of the stationary camps may be visited. The remains of some of the mile-castles are yet very considerable, although by far the larger number of them have quite disappeared.

The first question naturally asked when examining this august boundary, who built it? Considering that it is mentioned by various early writers, it would appear that to answer it satisfactorily would not be a difficult matter. A novice would reply, Severus built it. Another would be perplexed by a hazy impression that Agricola was concerned in it. Those who know all that has been said upon the subject would hesitate to give an opinion. A fourth class of respondents would aver that it was the work of Hadrian. The exact order of its formation, and the exact period when it was commenced and completed, are matters of conjecture, based upon the evidence of the wall itself, and that afforded by somewhat conflicting written testimony. At first we find mention of it at intervals of centuries, but as time passes on this occurs more frequently; for, curiously, as less could be said with certainty more was written. The most recent work upon the subject is a third edition of Dr. Bruce's description of the mural barrier. In this fine tome the author has gathered together every early allusion to the imperial rampart, and every description of it by more recent writers,—Stukeley, Gale, Horsley, Wallis, Hodgson, Hutton, Hutchinson, Gordon,—and supplemented them with a vast amount of information out of his own stores; and this in a manner so sumptuously precise that we may say the author has done justice to his theme. It is understood that the late Duke of Northumberland liberally opened his coffers to aid in the due perfection

of this work by furnishing a large number of the woodcuts with which it is illustrated, and further increased its comprehensiveness by allowing Dr. Bruce the free use of a survey of the wall made by Mr. MacLauchlan, with a reduced reprint of his map and the pick of a series of illustrations destined for another work on Roman northern antiquities. With this dual aid, and the sympathy and assistance of the Dean and Chapter of Durham and of several distinguished antiquaries, and among them the owner of large tracts of the wall, to whom the work is dedicated, the author has gone over the ground he trod in his first and second editions with new lights and new powers, and this third volume may be looked upon almost as a new work.

Those who may never hope to see the remains of the great Roman legacy themselves may gain a very clear idea of their present appearance as well as of the mighty barrier in the days when it was in use from the scores of illustrations, a few of which we are enabled to give (see pp. 242, 243). Sections from two points show the slight difference the wall presented in its enormous length, and also that there was some slight variation, which with the number of centurial stones found along its course, suggests that it was built in separate lengths at the same time just as our Thames Embankment has been, each century placing an inscribed stone at the beginning and end of the piece erected by it. It was evidently planned to resist foes on both sides. Dr. Bruce divides it into three parts—1. A stone wall strengthened by a ditch on its northern side. 2. An earth wall or vallum, to the south of the stone wall. 3. Stations, castles, watch-towers, and roads for communication and transmission of stores. One of these roads is for the most part placed between the stone wall and the earthen barrier, which are about 60 or 80 yards apart, except where the nature of the ground has called for a deviation from this rule. The companionship of the wall and vallum ceases for the longest length about midway between the two seas, where the wall mounts the hills and the vallum quietly continues along the valley. Here the two barriers are sometimes half a mile apart; and at Axeldunum, near Burgh-on-the-Sands, just before the vallum ceases, there is considerable distance between the two. It is noticeable that the wall is several miles longer than the vallum. The wall extends from Wallsend to Bowness, or from the Tyne to the Solway; whereas the vallum stops short of this distance about three miles at either end, beginning at Newcastle and terminating at Dykesfield. This fact deserves consideration, as it seems to favour the supposition that the two works were separate undertakings, with a long interval between them. In other respects the barrier seems to have been the design of one mind. It does not exactly pursue a straight line, as Bede says it does; for, whenever the wall approaches a height that is not quite on its route, it goes a little out of the way to ascend it, and whenever it makes these deviations they are always at angles. Sometimes, to avail itself of every jutting rock, the wall runs a course that is almost zigzag. But, dipping down into the gaps between elevations, and climbing one after another, the wall took every obstacle, and overcame it. At one point, indeed, close to the river Irthing, in Cumberland, there is a cliff upwards of 100 ft. in height, about which there is some doubt as to whether it baffled the builders. There is no trace of the wall on its face, but that is accounted for by the fact of its yielding stratum, which is in constant course of being washed away by the river. If, however, this was permitted to form no exception to the rule

[Scale 75 feet to the inch.]

Section of the Works half a mile west of Carran.

* The Roman Wall: a Description of the Mural Barrier of the North of England. By the Rev. J. Collingwood Bruce, LL.D., F.S.A. Third edition. London: Longmans & Co. Newcastle-upon-Tyne: Andrew Reid, 1867.

to climb every height, the doctor points out that the wall must have assumed the appearance of a leaning tower as it slanted up its steep side. All along the length of the barrier runs its fosse,

PRE-HISTORIC LAKE EMBANKMENT.—A lake has been discovered in the State of Iowa, in America, occupying a surface of 2,800 acres, which is between 2 ft. and 3 ft. higher than the surrounding country, and surrounded by a carefully-built wall 10 ft. or 15 ft. wide. When or by whom the wall, which is very old, was built none can discover. The stones of the wall vary in weight from a hundred pounds to three tons. There are no stones on the land within ten miles around the lake.

looking like a green groove on the north side of it, except where it has been hewn through rocks, and the great blocks taken out of it are strewn about. In some places it is deeper and wider than it is at others; but for a general idea of its dimensions, it is near enough to mention its average measurements as being 36 ft. in width by 15 ft. in depth. The vallum is on a similar colossal scale. Its aggers are still 6 ft. and 7 ft. high in some places, and its fosse is about 7 ft. deep. The stone wall is represented in the sections to show its site, though it does not exist at those points on the line (see last page).

The stations, or military cities, occurred at intervals of an average of four miles apart. They are quadrangular in form, and enclose a space varying from three to six acres, which in several instances is covered with the foundations of houses. Most of them were furnished with four gateways; and when they were not so placed that their northernmost wall was in a line with the great murus, they were situated exactly midway on its course, so that the wall came up to the north side of their eastern gateway, and departed from it again at the western entrance. The vallum as frequently came up to the southern boundary of the station, or formed a protection for the south side of the eastern and western entrances. This is not the only disposition known for these stations, as three of them are placed considerably to the south of both lines of barriers, and were probably constructed for special purposes of defence, as they stand near defiles; and Dr. Bruce shows that several of the stations on the wall were built before its erection, as places for the retreat of the soldiers employed in its construction. There is a certain Roman register of military and civil officers and magistrates that has afforded antiquaries a most valuable clue to the number and names of these stations. It is supposed to have been compiled about the year 403, and it contains a list of the prefects and tribunes under the command of the Duke of Britain; and among these there occur those who are stationed upon the "lineam vallis." When an inscribed stone is found in a stationary camp bearing the name of the cohort stationed there, antiquaries look to the *Notitia* in question to tell them the ancient designation of the city. This mode of ascertaining the forgotten names of the ruined cities is not without its uncertainties; and accordingly it is not surprising that authorities differ in the assignment of names to places and places to names. In fact, the identity of some of the camps has been disputed with as much tenacity as the questions whether the wall and vallum were two separate works or one scheme, and whether Hadrian or Severus built them or either of them. Dr. Bruce thus explains his test:—"At the station of Chesters, on the North Tyne, several slabs have been found, bearing the name of the second ala, or wing of the astures. . . . Now, as the *Notitia* represents this ala, or body of cavalry, to have been stationed at Cilurnum, the probability is that the camp on the west bank of the North Tyne is the Cilurnum of Roman Britain." When we add to this the fact that at the next station to Chesters a slab and altar have been found inscribed with the name of the cohort mentioned in the *Notitia* immediately after that stationed at Cilurnum, there seems to be no reason why we should refuse to accept the same guidance to the designation of this and all the other camps. There are, however, stations which have hitherto yielded no such confirmation of their identity.

The mile-castles have obtained that name from the circumstance that they are placed, as near as may be, at the distance of a Roman mile from one another. They are usually about 60 ft. square. Castle-Nick Castellum, of which we give an illustration, is rounded off at its outer southern angles. It will be perceived that the wall forms its northern boundary, and that there are entrances to it from the north and from the south. The existence of these gateways has only been ascertained recently, and altogether alters our conception of the purpose of the wall. If there had been, as was always supposed, no passes through the wall, or but very few instances of them, we might still follow the conclusions of former writers, that it was intended as a boundary; but, taking the computation of Horsley, that there were eighty-one mile castles, and eighteen stations, though the *Notitia* gives twenty-three of the last, we come upon a hundred gateways, one or two more or less, opening out to the north, which must force upon us the conviction that operations against the enemy were carried on to the north of it. The turrets or watch-towers are the next structures upon

the line. These have almost all disappeared now; but in Horsley's time there were still, here and there, as many as three to be seen in their proper sequence, which were sufficient to let us know that four of them occurred between each two mile-castles, as the spaces between each made that arrangement clear. They were about four yards square at the base. Sentinels placed in each were within call of one another; and hence there could have been no necessity for the supposed speaking-tubes with which fiction has furnished the wall. We may as well state here that neither the author's long-continued and minute examination of the various lengths still standing, nor Mr. MacLauchlan's practical survey, nor the almost microscopic search of the able delineator of the various inscriptions, Mr. Mossman, reveal the faintest trace of the existence of any such speaking tubes. Occasionally lengths of pipe have been found, both in lead and clay, in the stations, but they never formed part of the wall, and were clearly intended for no such use. Nevertheless, Drayton in his "Polyolbion," mentions the "hollow pipes of brass;" Sir Christopher Ridley, "a trunk of brass;" Grey, in his "Chorographia," "a pipe of metal betwixt the tower or sentinell houses;" and Camden also refers to the same tube; showing how easy it is to fall into error if writers trust to hearsay instead of ocular proof. Dr. Bruce calls this acceptance, a traditional fiction; and likens it to the tale told by Xiphiline, in his life of "Severus," about the towers of Byzantium.

The masonry of this series of walled stations, castles, and towers, and of the wall has been put together without the introduction of the rows of bonding tiles which mark Roman masonry in the counties where stone is not so plentiful as it is in the north. The facings on both sides are blocks of freestone, about 8 in. or 9 in. thick, and 10 in. or 11 in. broad, and the great mass of rubble between these surfaces is hedged in mortar. It is easy to pick out the quarries along the line of route whence the stone has been procured. Some of them have not been worked since the days of the Romans, and the quarrymen's names and other Roman inscriptions are to be seen carved thereon, with little punctures joined to one another by connecting links. So late as 1837, among the chippings in one such quarry, was found a bronze purse full of gold and silver coins of the time of Hadrian and some of his predecessors. And it is also easy to see that when a quarry close at hand has yielded only inferior stone it has been passed over, and others at the distance of seven or eight miles worked in its place. The innermost end of each stone slightly tapers as it runs into its bed of mortar. Dr. Bruce has treated the masonry very carefully, devoting several woodcuts to it. He shows four varieties of ornamental tooling with which some of the stones are dressed, forming lozenge, rectilinear, plaited, and cruciform patterns on them, which he considers later than the original formation of the wall, and probably due to leisurely reparations; and gives from Trajan's Column figures showing how the masons along each stone on their backs by means of rests, with ropes or wooden handles passed over their shoulders. The inscriptions in the quarries he is also very careful about. In the case of a series of fine inscriptions on the face of a cliff in Cumberland, made by the Roman quarrymen, a framework was erected, from which elevation the artist made a most accurate copy of them.

Neither wall nor vallum would have been of much use without roads. The Romans knew too well the importance of communications to neglect them; and they laid down their military way between the two great barriers, so as to be protected by both. It was about 17 ft. wide, being wider than the Appian Way outside the gates of Rome by 3 ft. or more, as measured by the author. It passed from station to station, and mile-castle to castle, following the wall except where it mounted some steep crag, when it took the straightest and most level route to the next station or castle. In doing this it was necessarily longer than was convenient to those going from one extremity of the barrier to the other. For the use of direct communication between the extremes there was a second road, south of the barrier, which ran from Cilurnum to Magna, a work the author attributes to Agricola. Those who contend that the vallum was a previous work to the wall, headed by Horsley, find a third road in the north agger of the first-mentioned work. Mr. MacLauchlan leans towards this opinion; but Dr. Bruce, who believes that vallum and wall were one scheme,

departs from these authorities. He finds that in those places where the vallum is most perfect the north and south aggers exactly correspond; and as it is unlikely there would be no difference between a road and a rampart, he declines to accept the suggested road as anything more than an agger. Wadding-street and the Maiden Way cross the wall on their way north, and branch-roads depart from them in directions which, as our author points out, enabled the Roman rulers to send troops from York to South Shields, Newcastle, Corbridge, Carvoran, and Carlisle, in any season, or beyond the wall direct to Berwick, Melrose, Bewcastle, Netherby, or Middleby. The construction of the road accompanying the wall deserves a word. Its crown is raised about 1 ft. or 1½ ft. above the surrounding soil, and its sides are bordered with kerb-stones; when it runs along the slope of a hill it is made level with extra-sized kerb-stones on the hanging side.

All along the line of barrier we are struck with the free use of its stones in Mediaeval and comparatively modern times. Following in our author's steps, who makes his way from Wallsend to Bowness, from milestone to milestone, we hear first of an altar discovered in the foundations of a conventual building in Tynemouth. Near the site of the first mile-castle after starting from Wallsend there is a farmhouse with several Roman stones in its walls, and a pond in the fosse. Further on Newburn Church has stones with "diamond hroaching" in it; Halton Castle and Halton Church are chiefly composed of Roman stones, and an altar is turned up and down in the churchyard; after passing one of the most remarkable points of the route,—Chesters,—an ostendat Sewing Shields shows no more stones used up; a centurial stone is inserted in the front of the gig-house, and the farm-house is entirely built of them; in a cottage at Chestorholm there are some coping stones, a centurial stone, and altars built up, besides a piece of sculpture; at Cowgap are some ruined cottages formed of the wall-stones; at Carvoran there are more relics built up; beyond the fine station of Magna there are the remains of Thirlwall Castle, altogether formed of Roman stones; many and many a garden has an altar in it, and many a swine-trough along the wall is formed out of the same relics; at Lanercost, an altar dedicated to Jupiter is built upon the clearstory of the priory church; at Walton there are cottages, and at Sandysike a barn made of Roman stones, the latter diamond hroached; and so on throughout the entire route. Added to this the gentleman's seat in the neighbourhood of any portion of the wall that is without its Roman relics is rare indeed. But more than with what has been taken away, we are surprised with the numbers of relics the wall and its component parts have yielded. The number of coins found is amazing, sometimes quite sharp and new, and preserved in wooden boxes as though hidden, sometimes in purses as though lost, sometimes singly as though dropped, and sometimes in the company of skeletons, as though their last owners had perished with them in their possession. We are enabled to give a representation of one of them bearing a fine impress of Hadrian, and showing what

manner of a man was the great builder. Articles of jewelry are more rare, but still, there have been gold chains and rings, and bronze ornaments found in sufficient numbers to have warmed the heart of the coldest Roman matron. Among the finds, perhaps, the most remarkable is the silver lance, 1 ft. 7 in. in length by 1 ft. 3 in. in width, found in one of the supporting stations south of the wall. There is an electrotype facsimile of it in the museum in the old castle at Newcastle presented by the owner of the original, the Duke of Northumberland. It has five full-length divinites on it in different attitudes, who are ranged above three animals placed in extraordinary context in a line below, the whole

being framed in an ornamental border. The meaning of this silver bas-relief work has not yet been satisfactorily made out, a fact we are free to mention as a refreshing set-off to the learning and patience that with almost a monotonous industry has unravelled the intent of every inscription and piece of sculpture that has hitherto come to light. The immense mass of relics, however, consists of altars, dedicatory tablets, funereal inscriptions, and central stones. Of the former we give an example ("an altar to many gods"), inscribed,—

TO THE GENIUS OF THE PLACE,
TO RETURNING FORTUNE,
TO ETERNAL ROME,
AND TO PROFITOUS FATE,
CAIUS CORNELIUS
FEBRICIUS,
TRIBUNE OF A COHORT,
FROM THE PROVINCE OF
MAURITANIA CESARIENSIS,
A NATIVE OF

The name of the place of which the tribune was a native is not legible. This altar was found at Maryport, and is now in possession of the Earl of Lonsdale. Like others, it consists of a base, shaft, and capital, upon the top of which is a cavity for the reception of offerings. The scroll-like ornament on either side of the capital, which is a feature in all Roman altars, Dr. Bruce thinks a representation of the fagots required to consume the offering. Many of the altars found along the line are dedicated to Jupiter ("best and greatest"), several to eternal Rome, Fortune, Mars, Silvanus; less popular deities to Silvanus occasion that it was erected by a prefect of the Sebastian cavalry "on account of a boat of an enormous size which many of his predecessors were not able to destroy," giving us a glimpse of the grand, real limits of those days. The vesica-shaped piece of sculpture, of which we give a representation, has a more remarkable story to tell than we might at first credit. Dr. Bruce gives a woodcut of a Roman capital which the Norman builders of Durham Cathedral have approached very closely in a doorway in the south side of the nave; but this early instance of the vesica more than foreshadows its frequent use in Mediaeval times. It was found in a Mithraic temple at Borcovins, at the west end, set up between two altars dedicated to Mithras. It is supposed to represent Apollo as the sun or Mithras, the head and front of a worship which, notwithstanding efforts made by Hadrian to repress it, was clearly popular along the mural line. Our author says: "In consequence of the cruelty and impurity connected with this Eastern form of worship, Hadrian passed decrees repressing it. Notwithstanding, it made rapid progress; and, according to some of the fathers of the church, rendered itself antagonistic to Christianity, not only by its rejection of polytheism, of which the world was tired, and the adoption of a rationalistic creed, but by the imitation of some of its peculiar rites." It would seem as though it also incorporated at least one of the symbolic forms used by the early Christians.

Dr. Bruce devotes a chapter to the vexed question, "Who built the wall?" and a very able and well-arranged chapter it is. Disposing of Gildas and Bede in a breath, he begins the discussion with enunciating Horsley's view, that Agricola was the builder of most of the stations along the line of wall; that the north agger of the vallum was his road with which communications were kept up between them; that Hadrian built the fosse of the vallum and its southern ramparts; and that Severus was the builder of the stone wall, with its ditch, mile castles, and sentinel towers. To this he demurs, and proceeds to assign to Stukeley the discrimination of being the first to start the theory that all three works were one design. Hodgson, the lamented historian of Northumberland, mentions that he had gradually and slowly come to the same conviction, and further, that the whole barrier was planned and executed by Hadrian; and to this our author agrees, seeing corroboration in various facts, especially in the circumstance that not a single inscription along the line mentions Severus; while the name of Hadrian is frequently met with. To the statements by Latin writers that the wall was built by Severus he gives single combat, and vanquishes one after another. The question would thus appear to have been settled if it were not that Mr. MacLauchlan, after making a careful survey with chain and rod, and hinging the advantage of professional acumen to the inquiry,

arrives at exactly the opposite conclusion. He is of opinion that the barrier is the work of three periods, points out two places along its route where the wall would have run into the vallum if it had not been purposely bent to avoid doing so, and to others where the two defences approach much nearer to one another than they would have done if one mind had laid down the scheme. So there the matter stands.

A supplementary chapter on the geology of the district traversed by the wall, elaborately illustrated with a geological map and section, by Mr. George Tate, opens out a vista that tells of changes before the advent of man, of land submerged and lifted up again after the lapse of untold ages, of volcanic power rending the earth into fissures, of molten rocks which filled up such chasms, of tumultuous action and upheavals followed by seasons of peace, when Northumberland became dry land, whilst Cumberland was still submerged beneath waters in which strange fish-like reptiles, the ichthyosaurus and plesiosaurus, disported themselves; and of further changes, in which mighty icebergs floated in the sea, and ice either covered the face of the land or hemmed it in before the hills, dales, and plains took their present form, or even the foot of Celt or Roman left its impress on the virgin vegetation. This branch of the subject is ably treated, and new information afforded which will have especial interest for many minds.

Hutton, the historian of Birmingham, walked from that centre of industry to Carlisle at the age of seventy-eight, for the purpose of examining the wall for himself. He walked from one end of it to the other, and then back again, before he turned his face homewards to write his history of it. Should any of our readers be fired with a similar enthusiasm for the mighty work, we may direct him to make his way first to Hexham, where he will find the Border Counties railway ready to convey him to the part of the wall where it is to be seen to the greatest advantage. Here, too, he would see the Saxon crypt formed of Roman stones, of which we show an illustration. Should he start from Wall's End or Newcastle, he would have to walk many miles before he came in sight of the wall. The first place where a stone of it lies above ground is at East Denton. The turnpike-road, in fact, runs upon its foundations for many miles, except where it arrives at a village where it makes a detour to the north, because the villages are usually clustered round the sites of mile-castles, the foundations of which often furnished the substratum for the principal dwelling in them. Cilurnum, better known as Chesters, offers the first condensed interest. Excavations have been carried on in late years at Borcovins, which Stukeley speaks of as the Tadmor of Britain, with very interesting results. The walls of this station are nearly intact, and the *murus* in its neighborhood, Housesteads, about eight courses high. Castle-nick is another centre of interest, for here the masonry stands about 5 ft. high, and the military way with its curb stones is in good preservation. The scenery around, too, is wild and grand. The largest station on the line has fewer remains than many others. The late Earl of Carlisle, however, writing of the supposed site of Troy, said he could give a Cumberland borderer a good impression of it by telling him that it wonderfully resembled the view from the point just outside this camp. He writes, "Both have that series of steep conical hills, with rock enough for wildness, and verdure enough for softness. Both have that bright trail of a river creeping in and out with the most continuous indentations." It is now called Birdswald, and is identified as the Amboglanna of the Notitia. The celebrated Maiden Way departs from it, and darts straight away midst Cambrian fells and dales to Bewcastle. It is pleasant to see men's work living so long after them. Little did the Romans think, when quarrying and shoudering the stones, punching out the inscriptions in the quarries and in the stones themselves, or wheeling away the soil out of the fosse, and throwing it up into embankments, that their work would have the fascination of a spell for men of learning 1,600 years after they had looked their last upon the heathery hills of the North; that the time would come when to have travelled from one end to the other of it, especially on foot or pony, with wallet on shoulder, was to have graduated as an antiquary; and that to give the magnificent account of it now before us to the public, a duke, a dean, and a doctor of divinity, would proudly associate their choicest stores.

Beyond the engravings to which we have referred, we are enabled to reproduce several others, serving to show as well the manner in which the hook is illustrated as the condition of Roman art in the North of England.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At the Special General Meeting of members held on Monday, the 25th of March, the Royal Gold Medal for the year 1866 was awarded (subject to her Majesty's gracious pleasure) to M. Charles Texier, of Paris.

The Pugin Travelling Studentship was awarded to Mr. Henry Walker.

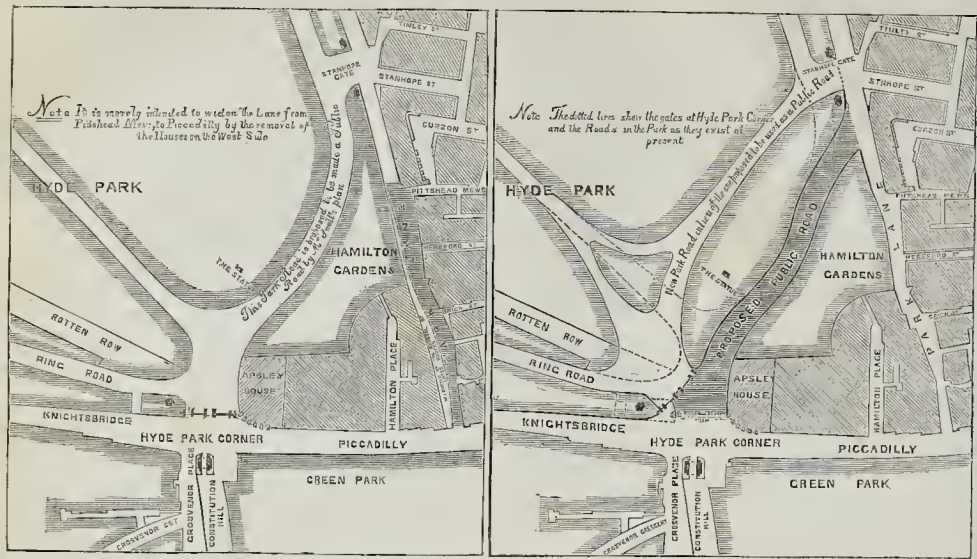

The Student's Prize was awarded to Mr. Wm. Howes.

The Institute Silver Medals—the Soane Medalion, the late Sir Francis E. Scott's Prize—and Mr. Tite's Prize, were not awarded, none of the designs and drawings submitted in competition for them having been considered worthy of premiation.

PARK-LANE IMPROVEMENT.

On more than one occasion reference has been made in our columns to Mr. Henry Saxon Snell's plan for the accommodation of the traffic between Hyde Park-corner and that portion of Park-lane lying to the north of Stanhope-gate. The traffic from the important district south of Hyde Park, to the equally important section of the metropolis north of Oxford-street and the Bayswater-road, is now filtered through a narrow neck of about 30 ft. in width, forming the southern entrance of Park-lane. The Metropolitan Board of Works proposes, at an expenditure of from 105,000*l.* to 150,000*l.* to widen this neck as far as the entrance to Pitthead-mews; but the Board does not propose to carry the widening any further to the north. The result will therefore be, not that the capacity of Park-lane will be improved, but merely that the block now existing at the Piccadilly corner will be transferred to a point 260 yards northwards. For this object the ratepayers of the metropolis are asked to contribute a very large sum of money, the bulk of which will be spent, not in work done, but in compensation paid for property destroyed. An alternative plan of the Board was to make a road through the aristocratic *culte sac* known as Hamilton-place. This would hardly have been an improvement at all, inasmuch as the available width of the roadway would have been no more than 33 ft. It was abandoned, however, not on this account, but because the gradient of the road would have been too great for ordinary traffic, and this gradient could not have been improved without a total destruction of the cellars in front of the houses, and without a proportionate increase of cost, which cost would have been further augmented by the compensation to be paid the tenants in Hamilton-place for spoiling the privacy of the street,—a point not so much as considered in the estimates of the Metropolitan Board.

Mr. Snell, taking the fact that at least nine-tenths of the Park-lane traffic are from or to the west, and that seven-eighths of this traffic go down or come up Grosvenor-place, asks himself the question, why it should not be carried more directly into Park-lane; and why a road, which is now available for every description of private vehicle, should not be used for the convenience of the public at large. He therefore proposes to form a public road from Hyde Park-corner to the south side of Stanhope Gate, without taking for this purpose a single inch of the park sward. He would make the exit into Park-lane through the northern end of Hamilton-gardens, which are public property, though now rented in and diverted from public use for the enjoyment of a few individuals. Even these would suffer no inconvenience, for the narrow strip of the gardens which Mr. Snell proposes to take is a thick and ugly plantation—a jungle on a small scale—into which nobody except a stray gardener ever goes. At Hyde Park-corner he would set back the gates now facing Grosvenor-place, in such a way that they would open directly into Rotten-row and the Lady's-mile; and while the approach from Piccadilly would be improved, the architectural features of the structure would be brought out fully, without the foreshortening which now detracts from the appearance of the

HYDE PARK CORNER, AS IT IS, AND AS IT SHOULD BE.

façade. Mr. Snell would, in lieu of the present private road, cut another park road to the west of the Achilles statue, thus forming a better access from the north to the Lady's-mile.

A month ago we presumed that the chief objection to Mr. Snell's plan would come from the Duke of Wellington, as owner of Apsley House; but, as was seen in the case of the new house built abutting on the Thames Embankment by the Duke of Buccleuch, the private wishes of an individual cannot be allowed to set themselves against a public improvement. The opposition of the Duke of Wellington, moreover, would be balanced by the probable support of His Royal Highness the Duke of Cambridge, who is now opposing the counter-proposal of the Metropolitan Board, which would take Gloucester House, the residence of His Royal Highness; and it may be assumed that the Marquis of Westminster would support Mr. Snell's scheme, inasmuch as it would produce the direct line of traffic from the Grosvenor property to the north of the Park. Nominally, the parks belong to the Crown; really, they belong to the public. If it be said that the rights of the Crown in Hyde-park would not allow the diversion of any portion of the Park to the accommodation of mere ordinary traffic, it may be retorted that not only has Birdcage-walk been opened for public traffic through a park, but in this very Hyde-park itself, at its western end; and a road of much less public utility was five years ago opened, which now it would be rather difficult to shut. The Crown and the public can have no really antagonistic interests here. No portion of the Park proper is destroyed or alienated from the public by this scheme; and we cannot conceive that the First Commissioner of Works, on due examination, would feel it his duty to oppose a scheme which, saving at least 94,000*l.* to the metropolitan ratepayers, offers to the public a benefit so great. The late First Commissioner of Works stated, with reference to the Hamilton-place scheme (and the argument holds with reference to Mr. Snell's plan), that "there are many precedents for what is proposed to be done," and that the Queen authorised him to give his consent "in case a public necessity exists for the new thoroughfare."

The Metropolitan Board, having given its assent to the scheme now before Parliament,

naturally objects to Mr. Snell's plan; but really the Board cannot consider itself bound by a decision arrived at on incomplete and delusive premises. If the Board thinks that the adoption of another plan would cast a stigma upon its judgment, we can only say that in our opinion the stigma would be justly cast, not by the adoption of a better plan, but by a blind refusal to consider the decisions of the Board anything but final. The resolutions of the Metropolitan Board cannot be like the laws of the Medes and Persians. It is not too late to take the matter in hand; but we understand that, if not the Board, at least some of its officials, have said that Mr. Snell's scheme, of which we give an engraving this week, is not original. This is one of those things which it is very easy to say. If the Board of Works, as it states in a communication to some of the vestries, and as Sir John Thwaites has declared, knows that Mr. Snell's scheme, first publicly proposed in our pages, has long ago suggested, the least that it can do is to quench Mr. Snell's claim, once and for all, by producing this scheme of long ago. But the plan itself must stand on its own merits, whoever may have been the originator. We are assured, however, that the assertion is entirely a mistake. The Board has stated in a public document that only three schemes were laid before it. One was that which it now proposes to carry out; another was the Hamilton-place plan; and the third was a proposition that the light traffic might use the existing park road, under certain conditions, in the day-time. This last proposal is very different from Mr. Snell's.

We are glad to see that a large number of the vestries have instructed their representatives at the Metropolitan Board to press for a reconsideration of the scheme now before Parliament. The Marylebone vestry has gone still further. It has passed an unanimous resolution, "that the vestry approves in the main (without pledging itself to the exact detail), of the plan submitted to it by Mr. Saxon Snell, for the improvement of Park-lane, as the most convenient, practical, and economical of any plan now before the public; and it begs to request the consideration of the Metropolitan Board of Works to Mr. Snell's plan with a view to its adoption." We do not think the Metropolitan Board can afford to disregard these appeals.

THE LAW COURT DESIGNS.

No one who visits the designs for the proposed new Palace of Justice, now exhibiting in Lincoln's Inn-square, can fail to be struck with the amount of skill shown in the arrangement of the plans, the beauty of the drawings, and the mastery over the details of Gothic art which they all display. Probably no similar exhibition in recent times has given evidence of so high and uniform a degree of merit as this one displays. With all this the effect produced on my mind by the examination of the drawings is one of extreme despondency as regards the position and prospects of architectural art in this country, and as the subject is one of public interest, I should like an opportunity of explaining how this feeling arises in the presence of so much real ability.

The first question that occurs with regard to this subject is to ask why architecture alone of all the arts and sciences of the present day should be the one which is not only unprogressive, but actually retrogressive? In literature, in painting, in engraving, and generally in all the imitative arts—I dare hardly include sculpture—men are all trying to express nineteenth-century ideas by the best and most direct methods that are available. In all the arts of construction, in everything that concerns manufactures or furniture, progress is the law; in the sister art of engineering, precedent is thrown overboard, and the best mode of accomplishing a given object is alone thought of. Every science is progressive, and is consequently adding daily to the triumphs of mind over matter. In fact, in every art, or in every science, when good has been done, it has been by gradual aggregation of experience, and by steady progress towards a well defined aim. Why architecture should be an exception to this rule remains to be explained, if it is capable of explanation. It certainly was not an exception in Greece or in Rome, and least of all, was it so in the middle ages. Nothing, indeed, is more remarkable in Gothic art than the exulting progress that marks every stage from the eleventh to the sixteenth century, and which transformed the rude architecture of our Saxon forefathers into the over-elaborate architecture of the Tudors.

It is easy to see that our present admiration of

Gothic art arises from a reaction against the still more absurd classical art of the last century. When, in the sixteenth century, all the world went wild in admiration of classical literature and classical art, architecture naturally fell into the same trap; and the system of education in our universities and public schools has done all that could be done to perpetuate the delusion to the present day. The classical system has broken down at last, but substituting one falsehood for another does not, unfortunately, make a truth; and if it were absurd to attempt to restore the arts of Italy as they existed about the time of the Christian era, it is scarcely less absurd to suppose that the arts of the feudal system in the Middle Ages are suited to the wants of civilized England in the nineteenth century.

So long as men only knew of five orders of architecture, and did not believe in the possibility of the existence of any others, there seemed no escape from the slough into which architecture had fallen. The case, however, is different now, when we know that instead of five there are 500 orders of architecture, and that any one of them is as good as any other of the remaining 499, if it is as appropriate to the purpose to which it is about to be applied, and is used with discretion and good taste. But, more than this, the fact that 500 orders or styles have already been employed in the infant world proves that there are not only 500 but 5,000 still remaining to be evolved by the inventive faculties of mankind, and only waiting to be evoked that they may appear.

But to turn from these generalities. It may be asked where is the escape from the present difficulty? An immediate cure to a malady of such long standing is of course impossible; but supposing the commissioners had inserted in their instructions a clause to the following effect:—"We do not pretend to dictate the choice of style to the competing architects, but no pointed arches and no classical pillars will, under any circumstances, be tolerated." Or suppose the judges were now to say to any of the eleven, "We accept your plan, and approve generally of your elevation, but we insist that wherever you have put a pointed arch you shall turn a round one." This might necessitate some but not any great alteration in the design, and it would not effect all that is required; but it would do this, it would get rid of the masquerade of Mediaevalism. The griffins and gurgoyles, and all the nighman figures would take flight to the realms where they were created. There would be no longer any reason why modern art and modern elegance should not be introduced. The nineteenth century might be acknowledged, and the architect, freed from the trammels of archaeology, would far more easily suit his design to the purposes for which it is required. No doubt he would cry out lustily, at first, that his design was spoilt. In ten or twenty years hence, when the Gothic mania has passed, with crinolines and chignons, to the limbo of all nutcrack fashions, he would rejoice that he had been saved from what all probably will then acknowledge to have been an absurdity.

It may be asked,—If this is so, why did not the competitors see it, and some of them, at least, try what common sense could do in the preparation of a design? The answer is only too easy. If any man undertakes the enormous labour and anxiety involved in such a competition as this, he is bound to use every means in his power to insure his success. In the present instance it was known that some of the judges had a sentimental veneration for the Middle Ages, and that others were so entirely innocent of any knowledge of the subject they were appointed to decide upon, that they would be led away by any fashionable cry or influenced by any enthusiast who got access to them. The competitors knew that Gothic was the prevailing fashion of the day, and the one most likely to win, and Gothic consequently all the designs are.

An architect would simply be throwing away his chance, or, on entering on such a competition as this, would set himself down to think only of how he could best arrange his design according to the principles of common sense, and then how he could most appropriately ornament it so as to express its purpose and its age. Who is then to appreciate each thoughtful conscientiousness? On the other hand, the public have within the last thirty or forty years learnt the rudiments of Gothic design. They have reached that schoolboy stage of knowledge which considers a correct copy the highest intellectual attainment, and are proud of showing their

knowledge by saying this feature is correct, or there is no authority for that detail. Common sense and progress are words that have long ago dropped out of architectural parlance; but they are the fundamental principles of design in all styles, and were most especially so in Gothic, and, till they are restored to their supremacy, there is little chance of any improvement.

Among much that is discouraging there is one circumstance connected with this competition that seems to afford a ray of hope. No one is quite satisfied with it. In spite of all the talent displayed, and the beauty of the drawings, it has been impossible to get up any enthusiasm about it in any quarter. The lawyers do not like it. They feel that they are men of the nineteenth century; that they have been working hard to bring law and the practice of their courts into harmony with the feelings and advancement of the age, and they do not wish to be taken back to the thirteenth century, and try to make them look like the wisecracks whose portraits appear in the last volume of the "Archæologia." The general public, too, feel uneasy. They can recollect the enthusiasm which hailed Barry's design for the Parliament Houses, and cannot help feeling that if they are so soon tired of Tudor, they may as soon tire of Edwardian or Italian Gothic. This feeling of "mal aise" on the mind of the public with regard to the competition, is most hopeful. So soon as educated men begin to think about it, the battle is half won. When men ask why architecture alone should stand still, and retrograde in an age of progress, and find that no satisfactory answer can be given, they will demand something else. When they demand it, it will be surely obtained. There is abundance of talent in the profession; but, till the public are convinced that Gothic spires and Grecian porticoes are both and equally absurdities when erected in the nineteenth century, they must be content with such imitative shams. It will be easy to do better things so soon as there is taste sufficient to appreciate a good thing when done. Let us hope that the day may not be far off when this may be the case.

JAMES FERGUSON.

THE CRADLE OF ARCHITECTURE.

In the exhibition of designs for the new Courts of Law we trace a promise of something even better than the future completion of a worthy palace of justice. That such will be one result we cannot doubt, but more important than the erection of such a building, however great its merit, would be the formation of a school, and a style, of English architecture fitted for the requirements of the nineteenth century. Of this we think that the little barrack in New-square, Lincoln's-inn, contains more than an indication. A certain harmony of thought pervades the great majority of the designs. They are not so remarkable, probably not one is so remarkable, for originality, as for the evidence they afford of patient study of the problem to be wrought out in the plans, and of a general consent as to the kind of effect to be produced by the elevations. In almost every instance the idea present to the mind of the designer appears to have been the modification of some actual type of structure to the wants of the day. One striking interior, for instance, was neither more nor less than a church, a lofty and noble cathedral nave, and, therefore, most unfortunately, quite inappropriate for the purpose in view. For the rest, the outlines of St. Paul's Cathedral, of the Westminster Palace, of the Façade of the Tuilleries, and of the Crystal Palace (or, rather, of the newer wagon-roofed Terminal Railway Stations), or, best of all, of the noble hall of William Rufus, seemed to form the *font* of the designs. In this, if there is not what those who are greedy of novelty would call striking originality, there is, it may be, something better. Such an exchange of the expression of patient, conscientious, successful labour by our leading architects is a boon to the whole profession, and is no unworthy offering to the genius of architecture.

It is instructive to glance from this, the latest effort of our day in the tectonic art, to the relics of the earliest forms of human habitations, and to inquire from what earlier type were developed the aisles of Westminster and of St. Onen, the towers and spires of Windsor and of Oxford, the arches of the Coliseum and the Cloaca Maxima, and the time-defying taper of the Pyramids.

More especially is such an inquiry of interest at a time when the science and the art of building are undergoing the throes of revolution, having at once to modify the active disposition of all military and of much civil architecture, and to make use of a material which, as at present employed in construction, is entirely new. Massive and frowning fortresses are replaced by low casemates and earthen glacis. The fort that was formidable in the wars of the Empire is now a helpless target to the monster siege-gun, and, in a military point of view, hardly more tenable than an Irish round tower or an Apulian dovecot-turret.

On one hand is the power of projectile force to crumble the firmest masonry; on the other hand is the power of the steam-engine to forge and to roll planks and beams of iron and of steel. Military structures, which shared with churches and monasteries almost all the attention of our earlier builders, are now becoming less impressive features of landscape; on the other hand, the increased value of land in towns and cities, the dense crowding of the ever-increasing population, is leading to the rebuilding of wide districts, which are to be covered by lofty palatial terraces and squares, while the large spans that the improved manufacture of iron enables the engineer to throw over road and river, lend a novel, if not always a graceful, character to our new metropolitan architecture. Again, the combination of glass and iron for roofs of wide span, to which the erection of the Exhibition building of 1851 gave the first impulse, although the application of this convenient form of shelter is yet in its infancy, cannot fail to take a prominent place in the cities of the future. In our own time we have seen the spontaneous condemnation of the effort to introduce in our climate the peristyle that is so grateful as a shelter from the Italian sun. The piazza at Covent-garden gives a sensation of damp discomfort, and that in Regent's Quadrant has actually vanished from over the stilled shops. But the glass shed outside the departure-platform of the Great Western Railway, although evidently designed for comfort rather than for show, so evidently fulfils the purpose for which it was constructed, that it is matter for wonder that it has not been more frequently repeated in our streets.

While buildings in metal and in glass, as the invention of our own times, are the marks of an entirely new era in architecture, we are enabled by the recent labours of meritorious travellers to trace back to their very starting-point the history of those diversified styles which owe their origin to the mason and to the joiner, and which represent the progress of art in dealing with stone and with wood. In the square boxes, pierced with the least possible number of the smallest practicable openings for light, the rapid growth of which is due in great measure to the operation of the window-tax, we trace, indeed, the decadence of building, and a marked return towards the original wigwam. But even the typical form of structural ugliness, the square, caveless, offensive meeting-house, in which some of our respectable nonconforming ancestors were wont to hug themselves over memorials of bygone persecutions, are now becoming everywhere replaced by decent, or even stately, places of worship. The critic who believes that architecture, to be permanent and noble, must above all things be true, does not fail to regret that, in employing their increasing wealth on the adornment of their chapels, the Nonconformists have not sought to raise structures consistent with their rite of worship, and that they should have borrowed the transepts and the chancels which have a historic as well as a symbolic meaning that they entirely ignore. The noble Vandois temple at Turin, built in part by English money, is an example that might be well followed in England. Among the Romanist churches of the bright little city it stands as a visible confession of a simpler rite. No stranger can take the Vandois church for a Roman Catholic edifice. But the stranger who strays into many a Dissenting chapel among us comes out with a feeling which a vulgar and irreverent man expresses by saying he has been swindled. He thought he was going to church!

Our recent information as to early stone structures, is derived from the beautiful photographs of Jerusalem, now publishing, as the fruit of the Ordnance survey of Palestine. There is no spot on earth where the super-imposed work of successive generations can be so distinctly traced. Beneath the rubble of the present day, we discover the rough masonry of the Crusaders, built

as by those who wrought with their weapons by their side. Hard by are sacred relics of Saracenic architecture, marks of labour lavished on their holy places by those who read the second commandment as it was written, and to whom the representation of animal forms was as unlawful as to the Jews themselves. We trace the works of Julian and of Adrian in their unsuccessful efforts to rebuild the Holy City. One photograph shows us an inscribed stone that appears to have formed the base of a statue to the former emperor, and which has been worked, upside down, into a wall repaired by the latter. Then come the distinct marks of Herodian times, the regular masonry by which the magnificent Idumean restored, though he could not rival, the massive ashlar of the great founder of the Temple. Not at Jerusalem alone, but at Hebron and at Herodim we can recognise beyond doubt the workmanship of the energetic sovereign who resisted the blandishments of Cleopatra, and who was friend alike of Anthony and of Augustus. We fail, as yet, to find any certain sign of the hurried work of that pious Jew and naïf and yet reverent autobiographer who rode out alone by night to examine the ravages committed on the broken wall of Jerusalem; who tells us that he put not off his clothes while he stood from sunrise to sunset on the growing wall, save that he put them off for washing;—that builder girl with the sword by whom stood he that sounded the trumpet. But if Nehemiah's work escape us, there can be no mistake as to that of Solomon. Vast blocks of channelled limestone, some as much as 5 ft. or more in thickness, and attaining seven times that dimension in length, still remain to explain how it came to pass that Eastern tradition holds that monarch to have been served by the geni; and even underlying Solomon's work, marked in some cases by false joints so as to harmonise with that noble architecture, are still more gigantic relics of the earlier builders of Zion, the Rephaim from whom the valley took its name. We attribute the prodigious scale on which the buildings of Solomon were designed to the desire of the royal mason that his work should not be dwarfed by comparison with that of the giants.

We know that the ancient walls of the Jebusites were such as to prove impregnable even to the warlike David, until, like Alphonso of Arragon, at Naples, 2,500 years later, he succeeded in the stratagem of effecting an entrance by the covered channel of the aqueduct. In the few remaining gigantic blocks of date anterior to the channelled ashlar, in the continuation of a quasi cyclopean style, in the known strength of the ancient stronghold, and in the yet lingering local names, there is, we think, evidence to connect the more ancient walls of Zion with those of Tyrys and of Mycene, with those wonderful cyclopean structures that seem to mock the puny labour of human hands, and that yet record, in different spots of Italy, of Greece, of Asia, and of America, that there were, in old times, "giants upon the earth."

The massive shade of the Egyptian temples, and the conventional form which architecture had assumed at so remote a date as that of the foundation of the Pyramids, carry us to the earliest recorded or determinable dates of masonry; but in the absence of historic evidence, if we rely on the internal testimony alone, we should conclude that the regular levelled steps of the pyramidal structure betray a later phase of art than the polygonal-fitted blocks of the later Cyclopean masonry; and still more so, of course, than the filling up of the vast boulders of the earliest and rudest walls.

Another remark of extreme interest as regards the great antiquity of masonry occurs to the student of the most ancient Hebrew record that is held to refer to the founding of the Mesopotamian cities. This record appears to describe the use of brick as subsequent, not to the employment of wood, but to that of stone. The halls and terraces of Nimrod and of Babel are not spoken of as developments of the mud hut or the sod wall, although the material was similar to that of our navigators' huts. They were reared, it is intimated, by builders accustomed to the use, not only of stone, but of cemented masonry. Men who, if they came down from the Median hills and found the ordinary building material altogether deficient in the great alluvial valley of the Euphrates and the Tigris, behought themselves of the use of fire, or at least of the torrid rays of the sun, to harden their simple substitutes for squared stones. "And they had brick for stone, and slime had they for mortar."

It is in Italy that the builders in stone first come into fellowship with the builders in wood. In India, indeed, we find that the architecture of temples, and even of sculptured caves, is but a representation in stone of not only the idea but the details of earlier wooden structures. Thus the principle was permanent, although the material was changed. But in Italy we find that combination to which we owe all Gothic work. The arch (with the kind permission of Niebuhr) is of the age of the Roman kings at the very latest. The Cloaca Maxima is of the age of the water-courses of Hezekiah, and of the mural sculptures of Sennacherib. The arch is traced with probability to the date of the twelfth Egyptian dynasty. It is certainly as old as the eighteenth dynasty,—that is to say, as old as the Exodus. By the time of Ancus Martius a true vaulted structure had replaced the stepped, receding, triangular roofs yet to be seen in the Oceanic tombs. The Roman builders hended this prime secret of masonry with the use of the columns and entablatures that were clearly of wooden origin,—glorified posts and beams. When the waters began to settle after the flood that overwhelmed Imperial Rome, the mingled style of stone and wooden design, the Romanesque blending of column and of arch, fell into the hands of men who by blood and by habit were workers in wood. The Teutonic tribes are essentially wood men, joiners, and shipwrights. Thus, as the groins and intersections multiplied with the increase of architectural skill, ribs and columns assumed a form which we should have believed, but for the sure testimony of architectural history, to have been taken at once from wooden structures, and to have represented bundles of posts and carved ribs, or even the intersections of a trained and pruned avenue, such as that which is such a glory of the park at Cassiobury. In this instance, indeed, we find a simulation of architecture by nature, which is, so far as we are aware, unique. Lord Essex has two avenues which intersect nearly at right angles. The one which points to the house is clipped and trained, and resembles a lofty Gothic nave; the other, of untouched trees, recalls a Saxon aisle.

The very earliest use of wood, which has thus eluded and tantalized the student of Gothic art, and of which we have such certain traces in the rich carvings of the Jain temples, and in the triglyphs, entablatures, and columns of the regular architectural orders, has just been brought under our notice by a traveller who, while second to none in enterprise, has been almost first in misfortune. The howl of discredit with which the first great discoveries of M. du Chaillu were received in certain quarters without even the poor excuse of ignorance, may indeed not be reckoned by him, still less by ourselves, as an unmitigated misfortune. It has stimulated him to another effort, and it has fixed his fame as a discoverer in spite of the only half-sounded snarl of his old assailants. The verdict of all candid readers of his two works is unanimously in his favour. But the loss of his stores of specimens, of his photographs of scenes and figures as new to us as if they had existed in the planet Mars, is one more easy to be deplored than to be repaired. The sketches with which he has endeavoured very imperfectly to supply the reproductions of African scenery which the camera promised to afford, though of no moment in an artistic point of view, are yet of great value if considered as diagrams, so to speak, illustrative of his descriptions. And here, separated from the dome of St. Peter's and the Victoria Bridge, not by the lapse of time, but by mere geographical distance, we find the earliest type of human abode constructed of wood.

Passing by the description of the negro villages of the Apogoo and Ishogo tribes, which might be readily taken for railway huts as to outline and dimensions, although walled in by bark instead of by sods, and roofed with palm-leaves instead of with slabs or slates, we come to the account of abodes more primitive than any that have previously been presented to European notice. These abodes are of two kinds, and the wide interval that separates the builders will not be readily guessed from the amount of art displayed in the construction of these dwellings. One sort of hut or bower is found on the soil of the forest, in irregular groups of ten or twelve together. They are formed of flexible boughs of trees, plucked with the leaves on them, stuck in the ground at each end, and bent over so as to form a sort of arched bower, the longest branches being in the middle, and the others successively shorter, the whole being covered with large

leaves. They are of a low oval shape, like a gipsy's tent, or rather like that sort of dwarf tent, supported by half-ropes, which may still occasionally be lighted upon in some of our wilder country lanes. The highest part was about 4 ft. from the ground, the greatest breadth was about 4 ft. also. The furniture consisted of three or four sticks on each side, for the occupants to sleep upon, and the remains of a fire lay in the middle of the floor.

In the presence of this primitive form of structure it is to be detected the most marked distinction between these dwellings and others discovered in the same forest, which, however, were constructed, not upon the ground, but upon trees. They are formed at a height of 20 ft. or 30 ft. from the ground by bending over and interlacing a number of the weaker boughs, so as to form a bower, under which the builders can sit, protected from the rains by the masses of foliage thus entangled together, some of the boughs being so bent that they form convenient seats; on them were found remains of nuts and berries.

It is a fact not gratifying to those who would make the distinction between man and beast to depend directly on zoological characteristics, that the latter kind of bower, of which M. Du Chaillu tells us that he has sent two specimens to the British Museum, is the work and the abode of the Nshiego Nkendo, or yellow-faced chimpanzee,—a new species of anthropoid ape discovered by our equatorial explorer, and that the former kind of huts, those on the ground, are the homes of a new race of dwarf wild negroes, also discovered in the same journey. The fire-places, or at least the use of fire, is decidedly in favour of the terrestrial bower-builder. The twisted seats on which remnants of food could be found seem far in advance, on the other hand, of the few sticks placed on the ground for the man and the woman to sleep upon. When we reflect that the opposable thumb in the hinder members of the ape, which makes them more at home on trees than on the ground, is an anatomical difference fully adequate to account for the difference in level selected for the building in either instance, we must confess that we have arrived at a primitive style of architecture in which it needs microscopic eyes to detect the boasted superiority of man.

We are not writing, nor does M. Du Chaillu write, with any *malice prepense* against the negro, or any desire to trace the descent of any human family from a quadrumanous origin. Into views of this nature this is not the place to enter; we need only say that, if we had occasion to express our own opinions on the subject, they are at once very definite, and very much opposed to such a theory. Nor will it be forgotten that in animals zoologically as well as cerebrally the most remote from man, we find displayed building powers of a much higher order than those evinced by even the more civilized negro tribes. The chapter that tells of homes without hands—of the textile nests of the social birds, and of the earthen structures of hymenopterous and of neuropterous insects, has, indeed, been largely enriched by M. Du Chaillu. But we have confined our notice to houses built by hands, by hands of more or less delicacy, but in which a grasping set of fingers, with true opposable thumbs, have been purposely and systematically employed in the fabrication of shelter from the elements out of portions of vegetable material. This is the commencement of architecture. Improve, embellish, increase as you may, in the tropical bower is to be seen the simplest, earliest form of intelligently constructed abode, and in this according to our present information, the skill of the arboreal tribes which, in our belief, no attempt at education can modify, is strangely parallel to that of the human treaders upon earth, to whom, weird and ape-like as they appear, we cannot be wrong in attributing a large, if not an unlimited, capacity for education and for progress. Of those marks which have been dwelt upon by moralists as proofs of the difference, not in degree but in kind, that exists between man and beast, two are strangely obliterated by M. Du Chaillu. One, indeed, remains—the capacity to kindle fire. Strange stories are told on this head, but, as far as we can verify, the power of kindling, or even of maintaining fire, has never yet been evinced by those inferior animals who rejoice in its warmth and seek its blaze. But the building of the Obongos differs little from that of the Nshiegos, while, in the cry of the Kooloo, or Kooloo Kamba, the third anthropoid ape discovered by M. Du Chaillu, we have something quite as closely resembling

human articulation as does the constant monotonous call of the little brown lazzaroni, who swim and dive about in the sun-heated waters of the gulph of Naples,—“Ashcar,”—which, rendered into the nearest Italian, would be “aspettate,” and means “wait for me.” The Obongo would seem not to have very long to tarry to be overtaken in the actual, if not in the potential, state of their civilization. That ancient wisdom which hints at what fashionable modern writers call the “solidarity” of man and beast, receives a frequent comment on many a page of the journey to Ashango land.

MOORISH TOWERS IN ALGARVE, PORTUGAL.

A JOURNEY through the old Moorish kingdom of Algarve is interesting in many respects, historically and otherwise. Like Portugal in general, it possesses very few ecclesiastical buildings of any note; here and there scattered about the country may be seen a few old churches, said to have been converted from mosques to their present uses. In many cases this opinion is open to dispute; but it is no doubt true in some of the quaint old cities. They, however, possess little architectural interest, and very rarely yield any distinctive trace of the old Moorish taste and fancy. The churches generally, even those aspiring to the rank of a “se,” or cathedral, are mostly very plain, rough, and solid in the exterior; and offer little or no display of art in any shape in the interior worth attention. They are large, lumpish, masses of wall, with squat, heavy towers, with little or no attempt at decoration. The openings for windows are mostly small and unornamented, so that the general effect of the interior is dark and gloomy, fully realising the poet's dream of “a dim religious light.” These observations apply with equal force to the two old cathedrals of Faro and Silves, both of which are stated to be converted mosques; of which change, however, they show little trace; no, doubt, the tradition is true in the main.

Nearly all the old towns in Algarve possess some remains of Moorish antiquity in the shape of walls, towers, and entrance-gates, all more or less in a state of decay, though many of these remains are better preserved than might reasonably have been expected from the effects of time, war, and the more rude assault of earthquakes; from all of which these relics of the past have very severely suffered. Many of these towns are still surrounded by their old walls and towers; and some yet retain their citadels and old castles sufficiently intact to give an idea of their mode of construction and various uses. It may be said however, at once, that few or none of these remains display any trace of the distinctive characteristics of what is generally recognised as the Moorish style of architecture.

Those who look for horse-shoe arches, and the fanciful details of buildings like the Alhambra, or decorations like the fine old tower of Belem, will be disappointed. I have never met with a single trace of anything of the kind among the various towers and castles which have fallen under my notice. Walls, towers, and castles are plentiful enough in Algarve, and in general there is little or nothing to distinguish them in any remarkable degree from similar remains of feudal ruins in other parts of Europe.

The Pisanese and Genoese towers scattered about the islands of the Mediterranean, bear as strong a likeness to the Moorish towers in Algarve as the famous brothers Dromic bore to each other. These towers are mostly in a venerable state of dilapidation, but often from the hand of man than the gradual wear of time. They have been used as quarries, to supply stones for the erection of modern buildings. It may be said, *sotto voce*, that the Portuguese are not famous for preserving their antiquities; but as this compliment may be returned and apply with equal force to England, the least said will be soonest mended; for are not the worthy burghers of Tenby about to dismantle their feudal gates, and pave their streets with their antiquities?

These old walled towns may not inaptly be likened to Carnarvon or more especially Conway, in Wales, when in their prime, with flank walls, projecting towers, strong gates, and the castle or citadel, and many of them are placed near rivers.

As a general type of these specimens of fortification, the old city of Silves—the ancient Moorish “Chelb”—may be taken as an example,

for it still possesses gates, walls, towers, and a castle. It once had the honour of being the capital of the Moorish kingdom of Algarve, and has witnessed many a fierce encounter between the doughty champions of the Crescent and the Cross.

It has borne the brunt of many a siege, has been taken and retaken by Moslems and Crusaders, and suffered much in consequence; it was terribly shaken by the great earthquake that ruined Lisbon, and but twenty houses were left standing in the city after that fearful shock. Although nearly all the houses of the old city crumbled into dust and ruin, the walls and towers still stood their ground, and still remain to attest their strength,—yet they were but walls of concrete faced with ashlar.

This old city stands on the summit of a hill of moderate height, in the middle of a long narrow valley, which, with its accompanying river, runs down to the sea at Villa Nova Portimao. It is a conspicuous object when seen from the neighbouring hills and high grounds which block up the valley in the direction of Sa. Bartolomeo. There is a fine view from the towers of the rugged sides and cloud-capped heads of the Sierra de Monchique, the wildest and most lofty mountain in Algarve.

The town at present extends in a westerly direction down to the river, where it may be said to have outgrown the walls, but in every other direction it is free from suburbs or outbuildings; nor can any of the buildings in the town be seen from outside the walls except to the west, all the rest being quite inclosed, as in the “good old time” of Moorish rule.

The river which meanders close by the foot of the hill on which the city is now sadly shorn of its former glory, only practicable for small boats; yet in times of yore larger vessels came close up from the sea: the old heavy iron rings in the rocks still remain to show the ancient mooring-places.

The great peculiarity of the Moorish fortifications of this old city is, that the towers are all detached from the general line of walls,—standing alone by themselves, but connected to the walls by a stone vault or bridge, nearly on a level with the top or platform of the tower, the distance from the wall to the tower being small, not more than 8 ft. or 10 ft.

Why these towers are detached from the main walls I cannot say; nor have I ever met with anything similar in any of the many old castles and walled towns which have passed under my notice.

These towers are in general about bow-shot distance from each other, but not equally spaced; they adapt themselves to the accidents of the ground.

No doubt when these towers were perfect, the little bridge which connects each to the walls was furnished with protecting parapets, or covered way; none, however, now remain. Nearly all these bridges still exist, except where one or two of the towers have been destroyed, where they have shared in the fate of the fallen towers, to which they formed the communicating links.

These towers may be called solid blocks of concrete, covered on the external face with coursed stone; for the only things that can be called rooms are very small, and never more than one in any tower. The top or platform was of course flat, sheltered by battlements and embrasures, none of which remain at the present time.

In one or two of the towers the connecting bridge appears to have opened into the room, but in most it led direct to the platform.

The concrete of which these are formed has been built up apparently in layers, in the same way in which the Portuguese peasantry still build their mud walls for their houses, and possibly the thin ashlar casing may have been carried up at the same time. The quantity of lime employed in this ashore, or concrete, is small, but the material remains very hard and firm, even where it has been exposed for some centuries,—and in all cases the ashlar has been wantonly stripped. Although this mode of building may appear fragile, it must be borne in mind that these almost isolated towers have withstood the shock of earthquakes, when almost every other building in the city encumbered, except the stout walls of the venerable cathedral, once the Moorish mosque.

The gates, a prominent feature in these old cities of Algarve, where they still exist, are very massive, and simply, in the case of Silves, consist of two square towers, with an arched gateway between

them; the two flanking towers, like the rest, being detached, but connected to the main walls by an arched bridge or vault. The gateways at Silves in form are similar to the two square towers at Faro, but the latter formed a joint portion of the wall, and were not detached; at present they are little better than mere mounds of crumbling concrete.

According to Verolles, the great wall of China is “built of brick, or rather it consists of a mass or long embankment constructed of mud, and faced at each side with a continuous range of bricks, forming a frontage for it.” So these Moorish walls are built of mud, mixed with a little lime, and faced with stone in courses.

The Castle of Silves still retains its walls and entrance towers; the outer walls forming part of the general line of exterior defence of the town.

All internal arrangements have long since disappeared, and the inclosure now offers nothing to view but a rugged plat of grass, with one or two openings into the capacious vaults below; for all the granaries and stores appear to have been underground.

The feature most worthy of note is a noble underground cistern, a magnificent work, erected by the Moorish founders of the castle to contain their supply of water during the stormy times of siege and trouble. It is said to contain 5,712 hogsheads, but upon what authority this is based I cannot state. It is covered in by a double row of arches, supported on columns, and ventilated by one or two small openings from the exterior, which admit sufficient light to see the clear water in the bottom. It has been restored, and may, perhaps, be considered one of the most perfect things of the kind in Portugal. It is approached from the castle-yard by a flight of steps, which descend into the interior. Tradition says that this noble old cistern was fed by springs, but how far this may be true I have no means of knowing.

This old city was taken by some crusaders on the 3rd September, 1189; it was, however, speedily retaken by the Moors, and remained in their possession until captured by the Christians in 1266, under the command of D. Paio Peres Correa, who finally conquered the ancient kingdom of Algarve, and expelled for ever the crescent from its romantic valleys.

J. LOCKWOOD.

THE QUEEN'S INSTITUTE AT DUBLIN FOR THE TRAINING AND EMPLOYING OF WOMEN.

THE fifth annual report of this useful Institute has been printed. It is maintained to assist gentlewomen of limited means, by training them to the pursuit of suitable professions and occupations; as by opening classes in which educated women can receive instruction in such arts and occupations as offer a reasonable prospect of remuneration to skilled industry; by procuring work for pupils; by maintaining a Registry for pupils and employers; and by collecting a library of books of productive industry.

The Institute claim to have now attained a position of usefulness. In the past twelve months the work of the business departments and the progress of the classes have been satisfactory. An increase of 25 pupils is shown by the returns; 175 having attended the classes, besides 23 who were registered.

Forty-five clerks, trained at the Institute, have received appointments in the service of the Magnetic Telegraph Company.

In all fifty-two new pupils have been drafted into situations and employments; and, notwithstanding the still comparatively limited sphere to which the operations of the Institute are confined, it is enabled to find work with regularity for forty-two ladies engaged in embroidery, various fancy works, plain sewing, &c.

Subscriptions may be forwarded to 25, Molesworth-street, Dublin. The Lord Lieutenant is the President of the Institute, and Lord Brougham and Lord Talbot de Malahide are the vice-presidents. Mr. A. B. Corlett is the secretary.

SOUTH KENSINGTON MUSEUM.—Visitors during the week ending 30th March, 1867.—On Monday, Tuesday, and Saturday, free, from 10 a.m. to 10 p.m., 9,696; on Wednesday, Thursday, and Friday (admission 6d.), from 10 a.m. till 5 p.m., 1,568; total, 11,264.

THE ROMAN WALL AND ROMAN ART IN BRITAIN.*

The Mile-Castle, Casterke-Nich.

In Wilfrid's Crypt, Heshom.

Altar to Momy Gods: found at Meryport.

Altar to the Unknown God, Antiochensis.

Sun Worship. Apollo as Mithras.

* See p. 235, ante.

The Genius of the Camp.

Altar erected by the Fourth Cohort of the Gauls.

ANCIENT ROMAN STAMPS.

An interesting article by M. Sichel, a well-known oculist, appears in a recent number of the *Annales d'Oculistique*, on the stamps used by Roman eye doctors for impressing their *collyrii* or tablets of eye-salve. These stones have been discovered amongst Roman remains in this country, France, Belgium, and Germany, but not in Italy. They appear to belong to the second or third century of the Christian era, and generally bear the name of the doctor, and a few words descriptive of the virtues of the ointment. M. Sichel gives a description of no less than sixty-nine seals, one of which is inscribed as follows. The italics show the parts which have been supplied:—

"*Cœli Dædemonis ambrosium
Ad caliginem et claritatem*"

which may be freely rendered, "Cæus Dædemon's ambrosial ointment for removing dimness and restoring clearness of vision." The characters are reversed, so that when the seal was impressed upon the cakes or tablets, the inscription, "without which none are genuine," as the quacks say, appears the right way. Some years ago, some fragments of *collyrii*, together with a stamp and a collection of surgical instruments, were discovered at Rheims. On analysis, the ointment was found to contain a large quantity of lead, iron, and copper; the same astringents, in fact, as are now used for such purposes. One of these stamps has recently been presented to the Royal Museum of Antiquities at Brussels. It belonged to a Roman oculist, named Junius Macrinus, and bears four inscriptions, each on a separate face, two in Greek and two in Latin. It was discovered in the neighbourhood of Maestricht. One such stamp, if we remember rightly, was found at Wroxeter.

SOCIETY OF BRITISH ARTISTS.

The forty-fourth exhibition of the Society of British Artists is in no respect inferior, by comparison, to its most immediate precursors. Pleasing and cleverly-executed pictures, others of better promise than performance, with some few of particular merit, present an aggregate as attractive as usual, and quantity as its present level-quality will in a degree condone the want of something more superlative to concentrate attention.

If in the multiplicity of its items—1,075, including water-colour drawings and sculpture—all tastes are not administered to, it will be the one appreciation of Mr. Baxter's ideal so inseparable from the recollection of long ago. Mr. J. J. Hill, who sometimes rivals him in creamy complexion, soft eyes, and dark or light brown hair, with generally a flower in it, has but one specimen, and not of this kind, but of another equally well known—see "Fishing Girl" (170). Mr. F. Y. Enrlstone also confines himself to a single contribution, "A Peasant Girl of Alcalá de Guadaíra, Andalucía" (186), whose dark face is set off with some very bright draperies of red, orange, and emerald dye. Mr. A. J. Woolmer only poses his pretty model—who, in a defiance of time, looks as young as ever, if not quite so fresh—and does not pose any one else this year by leading them into the dark mysterious caves in which it has been his wont to announce himself at home; or to pace with him interminable and labyrinthine groves, or tread rich gelatinous pavements through vistas of fantastic architectural forms,—arcsades that only echo the painter's name, and are of "such stuff as dreams are made of." "The Gardener's Daughter" (21) and "The Messenger" (358), where the same fair lady is enlisting the services of a sympathetic dove to convey her *bill-doms*, represent him well, though they bring with them "A Thought about the Past" (218).

The mutability which Time has the credit of possessing as a special property, and of dealing out to all who are engaged in playing this little game of life, can be but partially distributed after all, for there are things that never change. Let the cards be shuffled ever so thoroughly there are those who always hold a blank hand, and playing the best are the worst losers; there are those whose only hope exists in a belief that there must be change presently—that nothing can go on in the same way for ever; if they find this credulity unavailing, they had better not look to some of our painters for encouragement, unless

it be to learn how to remain satisfied with things as they are. But the Society of British Artists is not a singular exception to the influences of change and progress any more than its annual exhibitions can be cited as an illustration of the uncertainty supposed to attend most human proceedings; for every one knows what to expect when they recur, and few are disappointed.

Mr. E. J. Cobbe's rustic, whether standing or sitting, are all alike, motionless as motionless, without expression, and nicely done. In "Gossip by the Way" (93), there is no talking but going whatever, for the damsels who, it might be supposed, ought to appear as if engaged in vivacious colloquy, are all mutely intent on having their portraits painted. "The Fish-cart" (206) by Mr. J. Henzell, with more lively occupants, has the same artificial appearance of colour that has deteriorated from many of his former pictures. Mr. T. Roberts is not so successful in depicting the effects of "A Tedious Sermon" (33) as he has been with more patient listeners in "Family Pews," and this may be regarded as fortunate if it helps to put aside a subject that threatens to become as prevalent as "Sleeping-stones." Mr. Haynes King treats ordinary incidents of everyday occurrence with unobtrusive skill: his boatman lover asking his chosen one "An Important Question" (54) has most naturalness to recommend it. "My ain Fireside" (60), at which the matter-of-fact old lady is sitting, and seems to know the comfort of; with a similar situation, but a dissimilar sitor, who is young and visionary, and sees "Faces in the Fire" (883), are small works, that have high finish, without showing the means by which it is attained.

There is much character and expression in Mr. W. Hensley's "Village Postman" (86), as he is examining the addresses of his budget of letters to satisfy the solicitous inquiry of an evident victim of a first-love, just of the age when all thoughts of hardbake become loathsome, and hard hearts, only hair, ornamental, mournfulness, and moonshine form the delicious jumble of distraction destined to tone the memory of very young ladies, and help them to forget some of the long lessons they have learned, and prepare them for others more difficult and less easily forgotten.

What opportunities the village postman must have of creeping into confidences, indulging in conjecture, and gleaning knowledge with stray inferences! else how should he have guessed that the interested letter—with which papa is grimly retiring to his study, where he will frame a little speech for the benefit of Rose (she looks like Rose) presently—was from whom it was? His "Nothing, I'm afraid, this morning, Miss," must have sounded very like "You are too young for this kind of thing," had she had the discernment of a metropolitan coeval; but it is evident she has not. Mr. Hensley is clever and suggestive in treatment of this incident, and it is not a hackneyed one.

Mr. E. C. Barnes, comparatively speaking, a new member, is a great acquisition; and the more so by reason of the evidence he gives of being on the improving list. "The Beau's Stratagem" (115), his largest picture, but not his best, is chiefly remarkable for the executive ability it displays. A gallant, in the costume of Elizabeth's time, is diverting the attention of an amorous governante by making obvious love to her whilst he is surreptitiously handing a note and making an assignation with her ward. The humor of the situation is rather broadly conveyed; and the story would have been better told, or would have appeared better worth the telling, if its importance had not been overrated and so large a scale adopted for its enunciation. Far superior to this is the romance of "The Woman in Grey," who, with no name, is the heroine of a sensation tale, the last chapter of which is headed with Tennyson's lines—

"Break, break, break,
On thy cold grey stones, O Sea!"

There is more pathos in this cold, grey composition—more direct appeal to sympathy—than in all the attempts to effect such a result that are to be found in its neighbourhood put together: there are three volumes of trial, at least, in that pale face, though little is to be seen of it; and its expression now is one of weariness and hopelessness. As an instance of the variety and force obtainable from a limited employment of colour, this eloquent little work is admirable and instructive. "The Emigrant" (188), by the same, is also entitled to praise.

Mr. J. Collinson has elaborated a very simple

episode, "A Sister of Nazareth and Blind Woman" (154), or one of an institution of nuns practising the kindly offices of charity. The hands, and several parts of the picture, have been thoroughly studied, and there is much of exquisite manipulation throughout. Mr. T. Heaphy goes back to the Cavalier and Roundhead period for inspiration, "General Fairfax and his Daughter pursued by the Royalist Troopers" (238). It is recorded that during the fight from their pursuers, they took refuge in a barn, when the general's embarrassment was considerably augmented by the repeated swooning of the little girl, to so severe an extent as to threaten her with death, though she lived to become afterwards the Duchess of Buckingham. The arrangement is too theatrical to imply probability; though there is much good workmanship; but the dresses and accessories are all too new-looking and clean, evoking the wish, in common with so many of the costume pictures here, that the value of dirt and the effects of wear and tear, are not better understood by English painters. "The Arrest" (39), by Mr. C. Rossiter, is a good incident for a telling illustration of the same period; with the Puritans for the oppressors. A Royalist family are disturbed whilst celebrating a christening ceremony. Both skill and painstaking are evinced in the elucidation of the story, though the method of exhibiting them is somewhat dry and hard, and the same objection applies to Mr. A. A. Hunt's "Margaret of Brankome" (113), though only a single well-studied figure.

To note others, "The Last of his Race" (164), by Mr. A. J. Horsford, an invalid child heir to unnumbered acres, into whose tenure will be shortly reduced to a very few feet, is watched by his mother. "The Ballad Singer" (155), by Mr. W. M. Hay, conveys another story based on family affection, though there is some ambiguity in relating it. A girl, gaily dressed in the streets at night, is listening to a wretchedly clad ballad-singer, in whom she recognises her sister; the moral of this appears to be, that "you must be naughty if you would wear nice clothes," though there may be a store of conflicting emotions raging beneath the nice polka jacket, stirred by such recollections as the song of "Home, sweet home," may be supposed to awaken for a retributive drawback. This is solidly and well painted; and the same may be said of Mr. W. Holyoake's young ladies of reputable conduct, in "Our Party at the Derby" (142); of Mr. A. Ludovic's procession of school children, who hush their play as they are about to glide through the solemn shadows of the cloister; and of more that shall be mentioned next week.*

BRITISH ARCHAEOLOGICAL ASSOCIATION.

At the meeting on the 27th ult., Mr. H. Syer Cuning, Vice-president, in the chair, after the new members had been announced, and thanks returned for presentations, it was stated that the council had had under consideration a letter in the *Times* of the 25th ult., signed "H. C." in which the restoration of the tomb of Henry V. in Westminster Abbey was urged. The council did not think, however, that the time had arrived to enter any protest. The Rev. Dr. Giles gave some account of a German portion of the Puginian Tables, presented by Mr. Kirokhof. It is a sort of Road-book, with maps. Mr. H. Godwin, F.S.A., said that the English portion is appended to Richard of Cirencester.

The Rev. W. Sparrow Simpson, F.S.A., read a paper on "Æneid-Greek Portable Icons," which are of three forms,—tritychs, diptychs, and square plaques. The Greek Church does not admit of green images, and even a painted face, if in a carved frame, comes within the objectionable list. The icons are of various dates, but their antiquity is doubtful. Mr. G. H. Wright suggested that earlier designs and costumes had been copied or retained, showing a stationary state of art. The paper was illustrated by many specimens belonging to Mr. C. Brent, Mr. Cato, Mr. Waron, Mr. Gunston, and the writer. The chairman exhibited one, circular, differing in form from the others. The earliest appeared to be of the fifteenth century, the other of the seventeenth. Mr. G. M. Hills and Mr. G. Vere Irving spoke of the unchanging nature of the art in the Greek Church for centuries.

Mr. Vere Irvine produced some coins, said to

* To be continued.

have been found in a stone cyst in Lesmahago Churchyard: they, however, were not farthings, not earlier than Lonis XIII, showing that deception in "finds" was not limited to the south of the kingdom.

Mr. J. L. Irvine forwarded two drawings; one of a crucifix said to have been found in Ludlow Castle, and of the thirteenth century; the other of Saxon work, on the north side of Diddlebury Church.

Other exhibitions followed: by Mr. Brent—the triangular fan of a pair of scales, erroneously called "money of necessity;" Mr. Cuming, a Roman lamp, with a sandal as the potter's mark; Mr. Lookhart—a merchant's mark of the fifteenth century, showing a combination of Roman and black letter; Mr. Morris Jones—drawing of a font, formerly a carved capital, in Buttington Church; the Rev. James Beck—part of the crock in which the Washington "find" of 2,500 coins was buried; also part of a green cementitious substance which it contained, and some broken parts of coins cemented together by it. This gave rise to an interesting and animated discussion, the green coating having been believed to be the result of the decay of a leather bag. It was tried in the room by fire, and proved not to be wax. Mr. Bailey undertook to have it analyzed by next meeting. The pottery is softer than usual, and is of a material unknown in manufacture, and it was thought to be sun-dried. Keys were exhibited by Mr. Grover and Mr. Kettle, and drawings of keys by the Rev. Hugh Ingram, found at Steyning.

THE ARCHITECTURAL ASSOCIATION.

The ordinary meeting of the Architectural Association was held on Friday evening, the 29th ult., at the House, in Conduit-street.

Mr. H. Ambrose, of Brompton, and Mr. E. Locke, of Saiton, Surrey, were elected members of the Association.

The Chairman stated that a number of the members had, on the previous Saturday, visited St. Alban's Abbey, where they had been received in the most courteous manner by the Rev. E. C. Hawkins, the rector; and where they were met by Mr. E. W. Godwin, who kindly accompanied them over the building, and read a most interesting paper descriptive of its ancient history.

A vote of thanks was subsequently passed to those gentlemen for their kindness on this occasion.

The Chairman called attention to the Architectural Association sketch-book. It was, he said, proposed to form a club among the members of the Association for publishing drawings and sketches of ancient buildings, or other objects of architectural interest. In his opinion, the proposal was well worthy of the support of the Association, and he hoped that as many members as possible would join the club.

The Rev. M. E. C. Walcott then proceeded to read a paper on the arrangements of St. Alban's Abbey; the details of which he pointed out upon a ground plan, which, he stated, had been prepared after much careful examination on the spot. He also pointed out on another plan the errors into which he believed previous antiquaries and archaeologists had fallen, and contended at some length that the arrangements of the monastic buildings formerly in connexion with the Abbey Church were those which in all probability belonged to a Benedictine church, such as that which flourished at St. Alban's.

At the conclusion, the Chairman observed that the paper which they had just heard read was extremely interesting and useful as opening up a knowledge of those antiquarian subjects which were of so much use in the study of architecture. All who had heard Mr. Walcott might not be disposed to agree in the conclusion to which he had arrived. He (the Chairman) for one, could not say that he entirely agreed in all that the reverend gentleman had said; but they were all much indebted to him for having read his paper, and for having prepared the plans which he had exhibited and explained. It appeared to him that according to architectural indications in the north wall of the Abbey, over the south aisle a stranger's dormitory had originally existed at that place. He asked whether it were true that the coffer of the old shrine containing the relics of St. Alban was now to be found in a monastic building at Cologne.

Mr. Birch stated that the late incumbent of St. Alban's, the Rev. Mr. Nicholson, had distinctly traced the coffer to which the chairman

referred as that belonging to the shrine of St. Aluin, not St. Alban, the former of whom could not have been an English saint.

A vote of thanks having been accorded to Mr. Walcott,

The Chairman announced that on the next evening of meeting a paper would be read by Mr. C. Aldridge on the Architecture of Northern Italy.

LUDGATE, NEWGATE, AND MOORGATE.*

The changes in the manner of warfare, the increase of commerce, and the altered conditions of the people have caused the ancient walls of the City and the gates which stood upon them to be removed, and, before long, the last of those barriers—Temple Bar,—which, although not one of the old defences of the City, so much stops the way will be removed.

The railway passes close to where the gate which was called after the mysterious King Lud formerly stood. Here, says Geoffrey of Monmouth, there was a gate built by the British king, about sixty years before the birth of Christ,—so reports tradition,—and to this we are bound to pay that degree of deference which it deserves. Other historians say that "this name is, with much greater appearance of probability, derived from the rivulet Flood—Flud—Vloat—Vloete, or Fleet, which ran into Fleet-ditch, and was very probably called Ludgate instead of its original name of Fludgate. To leave these hazy ideas, it is clear that in 1373 the gate here was constituted a prison for poor debtors who were free of the City, and it was afterwards greatly enlarged by Sir Stephen Forster.

The history of this gentleman is so romantic; for when the management of the prisons rendered it necessary for those who were confined to beg at the gates or windows of the prison, this Stephen Forster was standing at the gate, asking for help, when a rich widow, passing by, inquired what sum would procure his discharge: on his answering twenty pounds, a sum much more considerable in those times than in the present, she advanced the money, took him into her service, where he was so indefatigable in his attention to business, that he gained his mistress's favour, and married her. After great success in trade he became Lord Mayor of London, and obtained the honour of knighthood. In the midst of his prosperity Sir Stephen did not forget his old prison-house. His lady and himself, to enlarge the prison, caused several of the houses near the gate to be pulled down, and in their stead erected a strong square stone building, containing the following rooms, viz., the porch, the paper-house, the watch-hall, the upper and lower lumberies, the cellar, the long ward, and the chapel. In the chapel there was the following inscription:—

"This chapel was erected and ordained for the divine worship and service of God, by the Right Hon. Sir Stephen Forster, late Mayor, heartily pray; And Dame Agnes, his spouse, to God consecrate, That of this house made for Londoners in Ludgate, So that for lodging and water prisoners here nought pay, As their keepers shall all answer at dreadful doom's day."

These lines show a curious phase of the old prison life. The founder provided an income for the chaplain, and ordered that all the rooms in the additional buildings should be for ever free to all unfortunate citizens; and that they, on their discharge, provided they found their own bedding, should pay nothing for lodgings or chamber rent. Notwithstanding the good intentions of the founder, and the threatening in the inscription, the provisions of Sir Stephen were neglected. When the gate was removed, the prisoners were removed to the London Workhouse in Bishopsgate-street. As one of the curiosities of the past, the provisions made by the prisoners is worthy of note. For the sake of preserving order, the master, keeper, and prisoners chose from amongst themselves a reader of divine service, an upper steward, called a master of the box, an under steward, and seven assistants, by turns daily; a running assistant, two churchwardens, a scavenger, a

chamberlain, a running post, and the criers or beggars at the gate, who were generally six in number.

The reader, besides attending to the prayers, was obliged to ring the bell twice a day, and also for the space of a quarter of an hour before nine o'clock, to warn all strangers to depart the prison. The salary of the reader was two shillings and eightpence a month, a penny of every prisoner at his entrance if his garnish amounted to sixteenpence, and a dish of meat out of the Lord Mayor's basket. All the prisoners kept the master of the box in equal esteem with the reader, and to him was committed the several orders of the house, with the accounts of cash received upon legacies, and the distribution of all provisions sent in by the Lord Mayor and others, and the cash received for garnish and heging at the gates, which he used to expend weekly in bread, candles, and other necessities. He likewise kept a list of all prisoners; as well those who were upon charity as those who were not; to each of whom, by the aid of the assistant of the day, he used to deliver his share of bread and other provisions; it was also his business to receive the gifts of the poulterers, fishmongers, and other market-people, sent in from the clerk of the markets, by the running post, for which he gave a receipt, and afterwards, in the presence of the assistant of the day, exposed all for sale to the charity men in a fair market, and the money arising therefrom was deposited in the common stock. This officer, with the under-steward, assistants, and churchwardens, were elected monthly by the suffrages of the prisoners; the election of the other officers was conducted in the most orderly manner, and no doubt the best of men in the prison were selected for those places of trust. The officiating assistant was invested with the power of a magistrate, and could commit a prisoner to the stocks or shackles for abusing any person. His business was also to see the cellar cleared at ten o'clock, for which he received 6d. out of the charity-money,—2d. of which was for the upper steward, 2d. for the running assistant, and 2d. for himself.

The running assistant was to attend to the criers at the gate, to change money, to open the boxes, to put candles in their respective places, to look after the clock, &c.; his salary was 4s. 8d. a week. The business of the churchwardens, who were selected from amongst the younger prisoners, was to call to prayers after the bell had done ringing, and to do some other trifling duties; the salaries of those officers was 4d. a month. The duty of the scavenger was to keep the prison clean, to fetter offenders, to put them in the stocks; he had a fee of 1d. for each culprit, and a salary of 5s. 8d. a month.

The chamberlain took care of all the bedding and linen belonging to the prison, appointed lodging for new comers, furnished the prisoners with sheets, and gave notice to strangers to leave at ten o'clock.

The business of the running post was to fetch in a basket the broken meat from the Lord Mayor's table, provisions from the clerk of the market, from private families, and the charities given in the streets; which, when so inconsiderable as not to admit of being divided among them all, were publicly sold; the salary annexed to this office was 4s. a month, 1d. out of each man's dividend, and 1d. out of every 1s. 4d. garnish. Two of the criers begged daily at the gates; he who stood at Ludgate-street was allowed a fourth of what was given, and he on the Blackfriars side, one-half of the money collected there.

Notwithstanding this complex machinery for the management of the prison, corruption seems to have crept in. On the Monday following every election the accounts were audited and passed, and the balance divided; but if it amounted to 3s. 4d. a man, the keeper of the prison, without the least right or reason, used arbitrarily to extort 2s. 4d. from each prisoner, the remainder being placed to the account of the prisoner, to be paid at the time of his discharge.

The prisoners were also obliged to pay the turnkey 12s. a month, for no other service than that of opening the door to admit gifts and charities sent to the prison, which frequently amounted to little more than he received.

The fees must have been a sad trouble to prisoners. At the coming of every prisoner 1s. was paid to the turnkey. The prisoners had to pay 3d. for the best lodgings; for the second, 2d.; and the third, 1d. Notwithstanding the provisions which had been made by Sir Stephen

* These notes have been in type several months.

Forster for the provision of clean sheets, they were charged 8d. a month; if the prisoners found their own beds, the keeper still charged 3d. a week for bed-room, or 4d. at the most; and not above two to lie in a bed.

If the prisoner by his inability could go no further than a couch, he had to pay only 1d. per week for chamber-room, and 1d. per week for lamps and candles. A freeman of the City, on being arrested for debt, could insist upon being carried to the Ludgate Prison; but a fee of 4s. or 5s. was extorted by the bailiffs, the due being but 2d.

For entering his name on the prison books each prisoner had to pay 1s. 2d. and his fellow prisoners demanded 4s. for garnish, 1s. 6d. for sheets and 1s. 6d. for coals and the use of the house; and if these charges were not paid the clothes of the poor prisoner were privately taken from him and not returned until the money was paid. He was, however, allowed to go abroad on giving good security to return at night or for a consideration, in the charge of a keeper: for the latter he had to pay 2s. 6d. to the head turnkey, and 1s. 6d. to the keeper who attended to him.

On being discharged, the prisoner had to pay 2s. to the master keeper, 1s. 2d. to the turnkey, 1s. for every action entered against him, and if he was taken in execution 2s. 6d. for every action. Often the fees came to more than the debt, and prisoners have been kept in this and other prisons when the charges against them have been withdrawn in consequence of the want of sufficient funds to discharge their debt. Hungry and at times almost naked, the poor debtors lay in those unsanitary dens until death mercifully relieved them from their sufferings. There was a gift to this prison, called Nell Gwynne's Dole, which used to be distributed to prisoners every ninth week.

Such are some of the memories of the ancient gate, which before the Great Fire was a time-worn weather-beaten object. So far as we know, nothing but some of the old figures which were fixed upon it now remain, and the wayfarer this way no longer hears the tinkling of the little bell and the voice repeating, "Pray, pity the poor debtors." The locomotive whistle sounds shrilly as the trains rattle over the site, and the tide of busy human life rolls on from morning till night.

Newgate.

Bad as was the condition of Ludgate as a prison, Newgate was, in this respect, infinitely worse. As early as 1218, this edifice was a common goal for felons taken in London City, and so lately as 1457, Newgate, and not the Tower, was the prison for the nobility and great officers of state. To go back, however, to a more remote date: in 1241, the Jews of Norwich were hanged for circumcising a Christian child, their house was pulled down and destroyed, and Aaron, the son of Abraham, a Jew, who lived in London with several more of that people, was sentenced to pay 20,000 marks, at two payments, within a year, or otherwise to be kept perpetual prisoners in Newgate or other prison. In 1252, one John Offrem, who was committed to this prison for having killed a prior, found means to make his escape, which so much displeased King Henry III. with the City, that he sent for the mayor and sheriffs to come before him to answer for the consequences. The mayor blamed the sheriffs, to whom the custody of the prisoners properly belonged, whereas he was permitted to depart, but the sheriffs were sent to the Tower, where they remained upwards of a month. On the Tuesday after Palm Sunday, in the year 1431, for reasons which we do not find stated, the prisoners were removed from Ludgate to Newgate, and on the 13th of April, in consequence of a false complaint made by the keeper of Newgate, eighteen freemen were taken to the Compters and chained as if they had been felons; but on the 16th of June, the City debtors were again removed to Ludgate.

In the year 1612, Robert Dow, merchant tailor, appointed the hellman or sexton of St. Sepulchre's to pronounce two solemn exhortations to persons condemned to death; for which, and for the ringing of the passing bell as the criminals were being carried to execution, he left 1l. 6s. 8d. for ever. The exhortation was not to be pronounced upon such as had committed murder; it began with,—

"You prisoners that are within,
Who, for wickedness and sin;"

* Chamberlain.

and ended with,—

"All good people, pray heartily to God for these poor sinners, who are now going to their deaths, for whom the great bell doth toll," &c.

In some articles on the old London wall in a previous volume, we referred to the partial destruction of this gate at the time of the Great Fire. It was repaired in the year 1672. The appearance which it then presented was unchanged until its demolition. The west side was adorned with three ranges of Tuscan pilasters, and their entablatures; and in the intercolumniations were four niches, in one of which was a figure representing Liberty, having the word *libertas* inscribed on her cap; and at her feet lay a cat, which was said to have been an allusion by the sculptor to Sir Richard Whittington, who was a benefactor to the prison. On the east side there were also a range of pilasters; and in three niches were the figures of Justice, Mercy, and Truth. Nearly a hundred years ago it was observed of Newgate, that, considering it as a prison, it is a structure of more cost and beauty than was necessary, because the sumptuousness of the outside but aggravates the misery of the wretches within; but as a gate of such a city as London, it might have received considerable additions both of design and execution. The gate of a city, erected rather for ornament than use, ought to be in the style of the ancient triumphal arches; and it must be allowed that hardly any building admits of more beauty or perfection.

Before John Howard's days, Newgate must have been a shocking prison: the debtor rendered unfortunate by the vicissitudes of trade or sickness, and other causes, was pent up with the most abandoned and determined villains; and in the vilest parts of the metropolis of this time we could find no scenes so horrible, so vicious, and depraved as were daily to be met with within the walls of Newgate. We may attempt to imagine the pictures which were there presented, but fear that the reality was far worse than anything which the imagination can conceive.

Those only charged with offences, who had not been tried and convicted, were put with the worst refuse of human society, corrupted in morals and poisoned in matters of health by stench and nastiness, and by those pollutions which, arriving at a climax, caused outbreaks of distemper and pestilence.

On the top of old Newgate, as shown by the views taken just before its removal, there is to be noted a windmill: this is an example of an early attempt at ventilation. "For," says Chamberlain, in 1770, "a contagious disease, called the gaol distemper, has frequently destroyed great numbers of prisoners, and even carried its contagion into courts of justice when trials were held. To prevent as much as possible these dreadful effects, a ventilator has been placed on the top of Newgate, to expel the foul air and make way for the admission of such as is fresh; and during the time that the sessions are held herbs are also strewed in the court of justice, and in the passages leading thereto to prevent infection." Newgate, at the time of its demolition, was one of the most picturesque of the City gates; notwithstanding, we must rejoice at its removal, for what would be the condition of the thoroughfares in this direction—towards the City—if the barrier had been still left standing.

Moorgate.

This gate is not of any great antiquity, for in the year 1415, during the mayoralty of Thomas Coleman, the wall of the City was broken near Coleman-street, and a postern built, which was since called Moorgate, from its vicinity to Moorfields. In 1511 this postern was restored, the ground levelled, and made more commodious for the citizens to pass to their adjacent fields and gardens. The gate which was built here after the Great Fire was one of the most imposing of those along the City wall. It was erected in 1674, and consisted of a lofty arch and two posterns. Maitland says that the central arch was built higher than usual, for the sake of allowing the City trained bands marching through it with their pikes erected; it is, however, far more likely that the additional height was intended for the better convenience of the carts and wagons loaded with hay coming to the City, a design having been formed at that time to make a haymarket in Little Moorfields, but this design was not carried into execution. The upper part of the gate was

adorned with Corinthian pilasters, supporting an entablature, and a pediment, in which were the City arms. The apartment over the gate was appropriated to the use of the Lord Mayor's carvers.

Cripplegate.

This gate, so called from the large number of cripples who assembled there, was of very great antiquity. John Lidgate, the monk of Bury, says, that in the year 1010, the Danes ravaging the country of the East Angles, Bishop Alwin caused the body of St. Edmund the Martyr to be conveyed from Bury St. Edmund's, through the kingdom of the East Saxons, and into London by the way of Cripplegate, where it is pretended that miracles of the most extraordinary kind were performed.

The antiquity of this gate also appears from the charter of William the Conqueror, confirming the foundation of the college in London, called St. Martin the Great, in which are these words,—"I do give and grant unto the said church, and canons serving God therein, all lands, and the Moor without the postern, which is called Cripplegate, in other part of the postern." This gate was also used as a prison, to which debtors and persons charged with trespasses were committed. Anything more unwholesome or unsuitable for the incarceration of unfortunate offenders could not be easily conceived than those buildings which had been erected for the purpose of warlike defence.

1244. This gate, says Chamberlain, was rebuilt by the company of brewers of London. 1483. Edmund Shaw, mayor of the city, bequeathed by his will 400 marks, which, with the remains of the old gate, were to build a new one, and which was actually performed in the year 1491.

The gate was repaired and beautified—so ran the words of an inscription which was upon it—in the reign of Charles II. It was a plain, solid edifice, void of all ornament. The rooms over it, at the time of its demolition, seem to have been occupied by the water-bailiff of the City. There was only one postern.

Maitland thought that this, in 1010, was the only gate in the north wall of the city, and that it was erected over the Roman military way which led from London to Hornsey.

JUDGE JEFFREYS AND HIS ARCHITECT; WITH A WORD ON THE NEW LAW COURTS.

THAT because a thing has been done in a certain manner or style ever so long ago, it is a safe guide to follow ever so long after, though doubted by some audacious innovators who suggest the exact contrary, is, we all know, quite sufficiently recognised by learned lawyers and architects. This fact is strikingly manifest from the show in the shed at Lincoln's Inn, demonstrating the strict consonance of the free, scientific, and remarkably enlightened Middle Ages with the London of the passing hour. Any apparently absurd incongruity is due, neither to the style of artistic expression appropriate to the thirteenth or fourteenth century being totally unsuited to the nineteenth, nor to the slightest deficiency of originality or truthfulness in the architects; it is simply because the whole course of modern civilization is radically and lamentably wrong, for it ought to be such as would be faithfully reflected by Gothic architecture, which therefore has been most sagely adopted. Besides, the style, though of foreign origin, became naturalized, and thus quite as English as Chaucer's spelling, the burning of witches or heretics, and trial by ordeal,—all which, like the contemporary architecture, would have been revived long since if the philosophical views of the modern Medievalists had haply more generally prevailed.*

Precedents then being so highly esteemed, the following one in professional practice may be interesting, if not sufficiently Medieval to be

* The hopeless confusion of ideas on the subject of art-architecture, as distinguished from manufactured architecture, is naively illustrated by one of the competitors, who, as mentioned in this journal, has virtually adopted a thirteenth-century cathedral for his type, but actually claims to have proceeded as he "believes the old architects would have done, if it (the courts) had been built in their day,"—ignoring the principal fact bearing on the matter, that they did not copy buildings erected six hundred years previously, but designed in an original style peculiar to their own time. While all else advances, architects are pelted and propped to wearily retrograde, one touch of true art or unpsychic nature being rare indeed.

authoritative or suggestive for future legal contingencies. And although (as seems probable in the National Gallery competition) modifications of such unjust treatment have since frequently befallen our architects, the grim setter of this precedent may, by his shameless example, deter its further adoption in any phase or degree. I found it in the *European Magazine* for 1795, p. 248:—

"Amongst the many scandalous appointments of trust during the profligate reign of Charles II., calling up Jeffreys to such high situations as he possessed was one of the most notorious. In addition to his well-known character of a libertine and a servile courtier, he was that of a dishonest man and a shuffler in his private dealings, as the following anecdote (never before published) will evince. Having obtained a grant from King Charles II. of a lot of ground on the east side of St. James's Park, he employed an architect to build him a very magnificent house there, with a private chapel, &c. As soon as the building was completed, the architect, of course, called upon him for payment, but was put off, he called again and again, but never could see him, and was often repulsed from his gate by the porter, with rudeness and ill language. The general character and despicable quality of Jeffreys prevented the architect from taking any legal steps in the business, till Jeffreys's power began to wane upon the first flight of King James. He then made his way into Jeffreys's study, saw him, and pressed for his money in very urgent terms. Jeffreys appeared all humble and much confused, made many apologies for not settling the matter before, said he had many weighty affairs pressing on his mind at that time; but if he would call the Tuesday following it should be finally settled. The architect went away after this promise; but between that and Tuesday, Jeffreys, in endeavouring to make his escape from England, was found out, reviled, and much abused by the populace."

Part of the then "magnificent house" is No. 23, Duke-street, with passage and steps leading to the chapel and park. There, after the terrible judge's sudden fall, as Macaulay tells us, the exultant rabble congregated, and read on the door, with shouts of laughter, the bills which announced the sale of his property. Hard by, in the National Portrait Gallery, Jeffreys's smooth, calm, handsome features, such as flattery saw them, stand out from the brilliant canvas of Kneller. Perhaps Mr. Cunningham or Mr. Papworth could favour us with the name of the persistent architect.

Sheridan's analogous treatment of Henry Holland, albeit distinguished from the British canning of the alternately blustering and whining Chancellor by a playful connotation of misigned genius, is related in the *Builder*, vol. xiii., p. 423.

EDWARD L. TARBUCK.

NOTES IN THE HOUSE OF COMMONS.

The New Law Courts.—End of last week Mr. Launoy asked the Secretary of the Treasury whether it was the intention of the Commissioners of the New Law Courts to accede to the request of the competing architects, to the effect that two professional men, selected by the competitors, be added to the judges. Mr. Hunt said the Lord Chancellor had received a letter from the competing architects, asking that the two gentlemen who had been acting as assessors might be appointed judges, together with a third gentleman, to be named by themselves. The Lord Chancellor had asked the opinion of the Government upon the subject, and a reply had been sent that at this period it was not desirable to alter the arrangements.

Art-Unions.—Mr. Beresford Hope inquired of the Vice-President of the Committee of Council on Education whether he was prepared to bring in a Bill, during the present session, to place Art-unions under the Department of Science and Art. Lord R. Montagu pleaded overwork, and said that as soon as he had leisure he hoped to think about the subject.

Mr. Shields and the Thames Embankment Designs.—Mr. Lowe moved that Mr. Shields's petition he referred to a select committee to inquire and report. Lord John Manners contended that an invitation to compete issued by the Royal Commission was a very different case from one issued by the Government itself. In the advertisement referred to, he urged, no mention was made of any premium or remuneration whatever. He could not admit that Mr. Shields had any claims to compensation, with every respect for his ability. Mr. Cowper also thought there was no case. There was no definite engagement, he said, for compensation entered into, and the Commission declared in the first instance that they did not adopt his plan. Mr. O'Beirne insisted that a gross piece of in-

justice had been perpetrated, and that a case had been made out for an inquiry. Mr. Ayrton was opposed to the committee, on the ground that if Mr. Shields was entitled to remuneration every one of the forty-nine other competitors was likewise entitled. The motion was lost by a majority of 49 to 29.

The Plantagenet Statues.—The Foreign Secretary, in reply to questions, has explained that the Emperor of the French had offered the Plantagenet statues at Fontevault to her Majesty, and that that offer had been accepted with gratitude; but that since then the state of the case has altered. Legal objections were taken to the removal of the remains, which objections, it was thought, could only be overcome by legislative action on the part of the French Chamber; and independently of that consideration, in the locality where these memorials are, when it was found that they were about to be taken away, a strong feeling was excited against their removal. Her Majesty, therefore, at once released the Emperor from his promise, and a communication to that effect had been made to the French Government, and a hope expressed that now that their value had been appreciated in the locality to which they belonged, some means would be taken for their preservation, and that they would not be left in the neglected state in which they undoubtedly had been for some time.

Bunhill-fields.—Leave has been given to Mr. Crawford to bring in a Bill for the preservation of Bunhill-fields burying-ground as an open space, and for other purposes relating thereto.

Burlington House.—In reply to questions put by Mr. Layard, Lord J. Manners said the building intended to be erected for the use of the London University would not be part of a group in connexion with Burlington House, and it would not be in the same style as Burlington House, but in Italian Gothic. He had no objection to direct that the elevation and plans of the new building should be placed in the library. The elevation itself was now being tinted in order to be photographed. There was no truth whatever in the report that Mr. Pennethorne had protested against the use of Italian Gothic, as he had himself proposed a plan in that style. Colonel French asked what was meant by Italian Gothic, and was referred to Mr. Layard, who sat next to him. Both the alternative designs of Mr. Pennethorne, Lord John Manners added, would be placed in the library.

THE NATIONAL GALLERY COMPETITION.

On the motion for going into Committee of Supply in the House of Commons, on Friday last, Mr. Goldsmid called attention to this competition. He said he had no communication with the competing architects, but was actuated solely by a feeling of fairness towards those engaged in the competition. He reminded the House that there were spoken conditions as well as written ones, and that the architects had intimated to the First Commissioner of Works that they had agreed to compete on the distinct understanding with Mr. Cowper that one of the competitors should be selected for employment. He had Mr. Cowper, in a letter to the secretary of the Board of Works, last month, had said it would be unfair not to decide which of the designs was the best, and would establish a precedent injurious to the success of future competitions for public buildings. The main cause of want of success in the designs was, that complete and accurate instructions were not given to the architects. The fair course to pursue now would be to select one of the competing architects, to give him proper and definite instructions, to call upon him to furnish designs, and then to place those designs before the judges. He thought that if this was not done public faith would be broken, but if it were they would have a fair chance of securing a creditable building.

Mr. Gregory said, he grieved for the architects, the judges, the trustees of the National Gallery, but, above all, for the real sufferers, the public, who were astonished at the weakness and vacillation with which the question had been treated during a series of years. The hands of the present First Commissioner were unfettered, and he trusted the noble lord would see the necessity for having a new building, and the impossibility of making anything that would be creditable or suitable out of the present structure.

Mr. Cowper said he agreed with his hon. friend that a lamentable amount of vacillation and change of purpose had been exhibited in connexion with the subject, but he entirely dissented from his views that it had been occasioned by any act of the executive Government. Committees had been appointed, who made reports opposed to each other, arising from art jealousies or the peculiar notions of individuals. There had been no want of definiteness in the instructions. The number of rooms required could not be settled, and no man could even now state that; but that was not a material point. The size of the rooms and the mode of lighting the galleries were left to the discretion of the competing architects, except that the rooms were to be 55 ft. in width. They were told that the space in the map given to them would have to be covered, and they were to make their arrangements accordingly. They could not tell the competing architects what pictures would be exhibited in the gallery. The competition had been of use, for he

thought that valuable materials had been collected which would prepare the way for an ultimate decision, and he hoped that the time had arrived when this long delay and vacillation would come to a close. He felt confident that the solution of the question had been greatly assisted, and not retarded, by the course adopted last year, and he thought it would be competent to the noble lord to propose a measure which would meet with the general approbation of the House.

Mr. Beresford Hope was sorry, he said, that the right hon. gentleman had not touched upon that branch of the subject which was important, namely, the question between the past and present Chief Commissioners of Works, the judges, and the competing architects. The architects thought that they had been ill-used by the judges, but he must remind the right hon. gentleman that the judges determined not to proceed in the matter of selection without written instructions from him. They had the instructions to the competitors before them, but they were singularly vague, and only referred to the housing of pictures. The instructions were no doubt true so far as they went, but they were needless to any man who was worthy of the name of architect. The judges, having refused to act without instructions, wrote to the First Commissioner as to what they were to do; and the instructions they received stated in the last paragraph that they were to be at liberty to refrain from recommending any one of the designs of the competitors. The First Commissioner said he did not pledge himself to accept any of the designs, but if any one of them should be recommended by the author of it would be selected to carry it out, with the usual commission upon the outlay. Well, the judges examined the designs, and found in them great architectural merit, ingenuity, fancy, and ability, and they also found that the architects had not been able to grapple with all the difficulties in reference to the site and the incompleteness of the instructions. They broke down and failed, and consequently the judges could not recommend any one of the designs for adoption, and they reported to the First Commissioner accordingly. The memorial of the architects said that they had agreed to compete upon a distinct understanding that one of the two would be employed. That was a mistake, for there was nothing distinct about the whole matter. He trusted that his noble friend would come to a proper understanding with the architects, and would have a building made to house our pictures which would be an honour and a credit to the country.

Mr. Tite said there could be no doubt but that the competition was intended to end with the election of one of the competing architects. The result had been unfortunate, but the question now was what the Government ought to do in the matter of a national gallery. The choice lay between altering the present building or erecting a new one; he preferred the latter, and he saw little difficulty about the matter if Government would only take competent men into their councils.

Lord Elcho denied that there had been any breach of faith with the competing architects, seeing that the Commissioners distinctly declined to bind themselves to accept the successful design. He should be inclined to ask the two most successful competitors to compete again, having regard for their guidance the most recent instructions of the Commissioners. He concurred in the suggestion for a new building, but would not recommend any expenditure until the proper plans had been obtained.

Sir C. Bowyer and Captain Gridley made some remarks, and Mr. Cowper said it had been his intention to select the successful competitor, and he had so stated it in an incidental conversation. He had, however, made no official memorandum to that effect.

Lord J. Manners said the multitude of councillors had tended by the variety of their advice and suggestions rather to bewilder his mind than otherwise. He did not at all approve of inviting all the architects to try again. The ground on which the building was to be erected would probably not come into the possession of the Government for a year or a year and a half, and therefore no immediate decision on the plans was required. A valuable suggestion had been made, namely, that they should consult the trustees of the National Gallery before they decided on the adoption of any plan. He intended to follow that advice, and doubted not they would eventually have a building worthy of the object to which it would be devoted, and entirely satisfactory to the country.

OPENING OF THE BURY IRRIGATION WORKS.

The Bury St. Edmund's experiment has been tried upon twenty-five acres of land, in the parish of Fornham, leased by the local commissioners for the purpose.

The various street-drains empty themselves into an intercepting sewer, which extends from a point near Stamford Bridge to Bell meadow, on the Fornham-road. At the terminus a tank was constructed for carrying out a system of desodorizing, but, as the annual cost was found so considerable (far exceeding that of the irrigation works), and the income derived from the sewage was almost nominal, the surveyor hesitated on financial grounds to encourage its continuance, and recommended the Board to adopt the irrigation plan. The sewer, however, was in the direction that the sewage must be carried, whatever means of ultimately disposing of it were to be adopted, and a tank was equally required for the purposes of irrigation. At a short distance from the tank, engine and hoiler-houses and coal-sheds have been built, and it is further proposed to build a cottage adjacent, as a residence for the engine-man. These buildings are so constructed that without alteration duplicate machinery may be placed therein if required. The motive power employed is an eight-horse horizontal high-pressure engine, manufactured by Messrs. Turner, of Ipswich, driving a double crank, by which are worked two 9-inch horizontal double-acting pumps. The

* The quotation is attributed to Mr. Seward, in Dr. Barrett's scarce "Essay on the Earlier Part of the Life of Swift," published 1808.

boiler is fitted with Barret's patent damper, to economize fuel and produce a uniform pressure in working. A 12-inch cast-iron suction-pipe extends from the pumps to the well in the tank. The pumps are provided with an air vessel 12 ft. high by 2 ft. 6 inches in diameter, the object of which is to promote ease in working, by providing a "cushion" of air above the level of the sewage, to prevent the pipes receiving the force of the blow occasioned by each stroke of the pumps.

The main is continued underground, and about 3 ft. below the bed of the Lark, to the field-tank, situated at a distance of about 300 yards, and at the highest part of the land, being at an elevation of about 45 ft. above the level of the ground on which the pumps are erected. The field-tank is dug out to a depth of several feet, and furnished with a brick floor 55 ft. by 10 ft., and is further enlarged by a raised bank of clay, &c., so as to give a total depth of about 12 ft.; and the walls are of clay, sloping down to the floor at an angle which gives a length of 78 ft. and a width of 33 ft. at the top of the bank. This tank is of ample capacity to receive an entire day's sewage, which is pumped into it from the rising main; and by means of valves the sewage is conveyed away for the purpose of irrigating different parts of the land. The land at the disposal of the Commissioners, it is expected, will absorb the whole of the sewage of the town; but arrangements can doubtless be made for treating some of the adjacent lands in a similar manner.

The sewage produced in Bury is stated to amount to something like 60,000 gallons daily; and in case it should be found necessary to cease pumping an entire day, the receiving-tank will contain this quantity. The pumps, having a 2-ft. stroke, working at 25 strokes per minute—to accomplish which requires 94 strokes of the engine—will throw (theoretically) 33,000 gallons per hour, or, deducting one-fifth as waste, the actual quantity would be in round numbers 26,000 gallons; consequently 2½ hours' pumping per day will be sufficient to convey to the field-tank an entire day's sewage.

The whole of the works, including the erection of the buildings, have been designed by, and carried out under the superintendence of, Mr. Croft, the town surveyor, and are now in operation.

THE ARTIZANS' AND LABOURERS' DWELLING BILL.

MR. TORREN'S Bill came up from the Select Committee with a variety of amendments grafted upon it. It only purports to deal with buildings, and not to regulate the overcrowding of their inmates. In cases where contagious diseases exist, or have frequently existed, in any dwelling-house or premises, and where such premises are in a state calculated to engender such diseases, the owner or landlord is to be required to cleanse, alter, or rebuild the same, in such manner as to remove the evil in question, or else to sell the premises to the authorities constituted under the powers of the Bill, who will then undertake the necessary works themselves. In case the owner do not elect to part with the property, but neglects to perform the necessary works, the authorities may cause such works to be executed themselves, and the owner will be liable for the cost. The substance and object of the Bill is comprised in these provisions, and the powers it gives are sufficiently guarded against being arbitrarily or unnecessarily exercised. The local authorities, charged with carrying out the law, are defined by the Bill. In the metropolis, exclusive of the City, they are to be the Metropolitan Board of Works. The officer of health to be appointed under the Act is to report touching the condition of dwelling-houses when in a state to be unfit for human habitation, when the local authorities are to cause the necessary improvements to be made. Also four householders may give notice in writing to the officer of health of the existence of contagious disease in any premises in the neighbourhood, or that the premises in question are unfit for human habitation; and he shall thereupon be bound to inspect them, and report forthwith to the local authority, which is then to take action in the matter, first giving notice in writing to the owner of the premises to be dealt with. The next step is to lay the report of the health officer before the grand jury, who shall make such a presentment or order thereon as the exigencies of the case may require. When the presentment is made, the local authorities

shall cause the premises to be surveyed and a specification of the necessary works to be prepared. Notice of these proceedings is to be given to the owner, in order that he may forthwith cause the works to be done. If, however, he should object to the specification, he may within a fortnight give notice thereof, and the dispute is to be settled within ten days by amicable arrangement, or else by two justices. Power of appeal is also given to the owners of premises to the Quarter Sessions, or the borough magistrates—the new law being applicable to the whole of the United Kingdom.

When the presentment has become final and complete, either through the decision of the court of appeal or through the absence of exception to it, the owner of the premises will have three months to make up his mind whether he will do the works himself, or require the local authority to purchase. If he elect to retain the premises and execute the works himself, he will have two months more in which to commence them, and they must be finished within the time limited by the specification, or, upon default, the local authority may cause them to be done, and the owner will have to refund the cost. In case of sale there is a provision for the valuation of the premises; and, in case of dispute, the amount is to be settled by a jury. When total demolition and not mere improvement is requisite, the owner is to be entitled to compensation. These are the chief provisions for carrying out the object of the Bill, namely, to provide, by the construction of new buildings or the repair and improvement of old ones, suitable dwellings for the labouring classes; and also to provide for the opening out of closed or partially closed courts and alleys, by pulling down such buildings as may be necessary in order to make them healthy.

HOUSES FOR THE WORKING CLASSES IN BELGIUM.

THAT the working population, not only of the metropolis, but also of all manufacturing towns, is lodged in a manner prejudicial to health, regardless of comfort, destructive to morality, and insulting to decency, will be at once admitted. A very little has been done in mitigation of this great evil, and very much remains to be done before it can be said to become alleviated, much less removed. It would be a fallacy to imagine that ours is the only country that has suffered its working classes to be badly cared for, or rather not cared for at all. The same serious contingency has occurred in nearly every country where the ratio of population to area has reached the same amount. Thus, in Belgium, which has an equal if not greater population per unit of area than we have, the same important subject has lately attracted considerable attention, and the same difficulty has been experienced in attempting to provide a remedy for the evil. There, as with us, a distinction must be made between the working population of a metropolis like London, and those of smaller provincial towns, where a large agricultural element prevails.

In the vicinity of mines and large works, in Belgium, there have been two systems adopted of building workmen's dwellings. The one consists in erecting a regular little town, with long streets of houses, precisely identical in size and appearance; and the other, and the preferable one, in our opinion, comprises the erecting of houses in small groups of two, four, or at the most ten together. This latter system affords a far better circulation of air around and about the houses. If a man, after being all day in a confined unhealthy locality, comes home to a small house surrounded on all sides, and regularly hedged in by others, it is no better than "out of the frying-pan into the fire." He experiences no relief, and feels not a breath of pure fresh air, for which his lungs have been pining, for perhaps the last twelve hours together, but appears to be in the same atmosphere as he was when at work. As might be expected, the latter description of dwellings is eagerly sought after; they are well built, healthily situated, provided with a small garden and yard, let at moderate rents, and repaired when necessary by the proprietors, who are usually a company or a firm. The existing dwellings in the Belgian village are of a somewhat antiquated character, and could be rebuilt with advantage. They are, nevertheless, infinitely superior to the ordinary lodging-houses for working men that are to be found in cities, especially in those which until lately were closely

surrounded by fortifications. The destruction of these relics of ancient warfare, the erection of boulevards, and extensive means of intercommunication, new streets and wide thoroughfares, are a step towards facilitating the erection of a better class of dwelling for the artisan class. When a workman can, for the same or less rent, exchange an old dilapidated dwelling or lodging without a yard, garden, or even the conveniences essential to decency, for a new house, built in accordance with the idea of modern architecture and comfort, and provided with a small garden where he can cultivate vegetables and other useful products, he will not hesitate long about the choice. The great question in Belgium, as with us, is how to erect a large number of these dwellings with a rapidity commensurate with the wants of the community at large. It is exceedingly questionable whether private influence, even if it were unanimous, could effect the desired result. It is true that in parts of Hainaut, Charleroi, and others, building advances with extraordinary rapidity; but the houses built are erected by those intending to occupy them, who have greater resources at their command than mere working men. The question is, will anybody build workmen's dwellings on a large scale; for it is only on a large scale that they will prove of any real utility, upon pure speculation. The truth of the matter is, that with us there are thousands of persons who would be willing enough to invest their whole fortune in a scheme which simply promised ten or twenty per cent., although at the same time its failure might place them in the Bankruptcy Court; but these very persons would rather run the risk of the latter contingency than invest in a scheme which would give small but certain returns. In other words, they are ready enough to place insolvency in the one scale and wealth in the other, but turn a deaf ear to the suggestions of prudence, which would point out the true *avereum medium*. It is a complete error to rely upon the influence of generous or philanthropic opinion to accomplish so urgent and vast a measure as the transformation of the dwellings of the working population.

The direct interference of the local and provincial authorities in this matter is considered in Belgium to be, for many reasons, undesirable; but an indirect influence so exerted is believed would prove most advantageous. This is probably the bearing of the case with us. While, on the one hand, it would not be desirable that the whole onus, and consequently the whole authority, in so vast a scheme should be invested in the Government; yet unless something tangible is effected by the Legislature in behalf of the class in question, it is impossible to expect that an evil of a nature so serious and so increasing can be successfully grappled with.

K.

THE MANCHESTER TOWN-HALL COMPETITION.

SIR,—A short time since you appended to some notice of a competition a query of your own as to how long the profession would be content to undervalue their work by responding to such invitations; but so long as the system of offering every building of public importance to public competition is continued, it is difficult for any one with the natural ambition to obtain such commissions, to refrain; and the system being accepted, it is useless to complain of it, although notoriously as unsatisfactory in its results to the tempters as to the tempted; but as the modification of it put forth by the Manchester Committee is novel, it is desirable to consider the proposal to the profession made by it.

At first sight, as remarked in your last number, it sounds fairer than usual; and the idea of a preliminary competition of lighter character, in order to choose a certain number of architects, to compete again, has the apparent advantage of economizing the time of those not so chosen; but in this case, so many drawings of so finished a character are required as quite to negate any such advantage, and leave without palliation the extraordinary disadvantage of asking all the competitors to expose their hands. I really believe that if the Manchester Committee knew what they were asking, they would have hesitated before they entailed so heavy and useless a tax upon the architectural profession.

Months of thought and drawing, necessitating an outlay of probably not less than 10,000*l.*, are what they have demanded, in the first instance,

without the offer of a sixpence in the shape of remuneration. The only premium proposed is the being chosen to compete against eleven picked men, who are to be paid a sum (300*l.*) which cannot cover a fourth of their expenditure in this double competition, without considering their own time in the least. Truly this is a positively frightful tax to be levied upon the profession to enable the Manchester gentlemen to make up their minds, if they have any to make up, or if they were not made up long ago, and the whole a farce as well as a tragedy combined. At least let the matter be received in the true light, and not thoughtlessly accepted as a boon to be grateful for. Had one plan and one elevation been asked for in the first instance it would have been different. But had the committees sought an architect who had proved he could build what they wanted, or chosen one from a number by an examination of works done, it would have been better still. As it is, winning spurs in the architectural profession is like holding the belt of the Prize-ring, and having to fight for its retention, at the cost of far more kicks than halfpence. Q.

THE TRANENT MINER.—AUTHENTICATION WANTED.

In books of philosophical experiments it is stated that you may fire from a loaded musket a candle-end through a board of considerable thickness placed stationary. Something very analogous with a live human body for a projectile, is stated to have just occurred. The *Weekly Dispatch* of March 24th describes from the *Huddington Courier* the extraordinary escape from a fearful death of a coal-miner at Tranent. Messrs. Durie and Nisbet, coal lessors there, have availed themselves of an old and disused shaft, 276 ft. deep, containing a considerable accumulation of water, to open a communication with an adjacent new pit, by fixing at 176 ft. deep a strong and firm staging of 2-inch deals, to which the miners are lowered by rope and windlass. Down this shaft a young man, named Mylne, rather than wait to be lowered, and against the dissuasions of his comrades, proceeded to slide by means of the rope, sailor-fashion; but had hardly left the pit-mouth ere he let go his hold, when immediately was heard the crash of his body on the stage. Those above, on descending to secure his mangled remains, found him alive on the water at the bottom of the shaft, keeping himself afloat by means of some wooden fixtures, having by the velocity of his descent, passed through the 2-inch staging, "as neatly as if his person had been a rifle-bullet," and sustained, in the way of personal injury, only a scratch on the chin; so that, after some repose, he is now able to walk out of doors again.

Deeming that, in the interests of science, this remarkable statement should not be allowed to rest as it is, I take the liberty of questioning its veracity. J. Wn.

CONCRETE FOR COTTAGES.

In reply to J. S. W.'s inquiry respecting the proportions of cement and gravel for forming concrete walls, I have found that 10 parts of clean sea shingle or fine beach, mixed with one part of Portland cement, make very good work; but common gravel requires these proportions to be altered to 8 and 1, and even to 6 and 1, in consequence of the loamy matter it contains; much of this can, however, be got rid of by sifting.

The better plan would be for your correspondent to test these quantities, and not accordingly. BENJAMIN ADKINS.

* * * A proper proportion of sand must be included.

THE THAMES EMBANKMENT.

Sir,—Any one that takes the trouble of looking carefully at the embankment works will see that at least two years must elapse before they are finished, although we are within four months of the time stipulated in the contract for their completion. I do not either the receipt of information nor the desire to enter into the question of who is to blame for the delay; my object is simply to offer a suggestion, which, if practicable, would to some extent conciliate public opinion and enable the ratepayers to enjoy benefit from the vast expenditure already incurred. Refer now more particularly to the sections between Westminster and Lambeth Bridge on the south side, and Westminster and Hungerford on the north side. The energy of the contractor on the Lambeth side contrasts favourably

with the other, both being in about the same stage of advancement; and with fine weather and the same energy these two sections might be finished within three months, at least, so far as the river wall and footway are concerned. Now my proposal is, that so far as the footway or pavement of the public should have the use of them on these two sections, a connexion being made by a planked walk with the end of Northumberland or Arndel-street, in such a way as would not interfere with the construction of the Hungerford steam-boat pier, which will be considerably behind the other part of this section.

I think it is to be regretted that polished red granite has not been used to some extent in the parapet wall facing the river; the blocks, for instance, with one side polished, or at the pier an open parapet, with plain rounded shafts of that material, in the Venetian balcony style,—perhaps something might even now be done in that way,—and as supporting the lamps which will crown the parapet blocks. I also incline to think that a grille, of appropriate design, 6 in. or 10 in. in height, on the coping, would improve the appearance and prevent boys from walking on it, as they undoubtedly will unless some such contrivance be provided. J. W.

DRIPPINGS FROM CORNICES.

THESE are many grievances and troubles in this changeable climate of ours, but I think the most uncomfortable and objectionable is the thaw following a heavy fall of snow; and this brings me to the matter to which I desire to direct your attention, and that of your readers. One of the most tiresome features of a London town is the constant and almost incessant dripping upon the pavement, from the cornices and projections of the houses. How easily could this be remedied. Instead of allowing the cornices to drip, to waste it in the gutter and let the water escape by occasional outlets, through the parapet or blocking course, into the gutter, and so on to its legitimate ending, the down pipe. If this were done the nuisance would be entirely avoided, and when a shower stopped, it would leave off raining, which certainly is not the case at present. In all buildings that I have erected, I have followed the rule mentioned, and the consequence is an entire prevention of the nuisance. ARCHITECTS.

CENTRAL COTTAGE IMPROVEMENT SOCIETY.

COMPETITION FOR DETACHED LABOURERS' COTTAGES.

Sir,—The advertisement in your impression of the 23rd ult., which Mr. J. T. Smith writes that he is "at a loss to conceive the object of," became a necessity from difficulties raised by the two builders he had named as willing to carry out his plan. The advertisement has, however, announced the object of the Council, and arrangements are now pending which will doubtless result in the erection of the cottages. H. MARTIN, Secretary.

NEGLECT OF NOTICE

TO DISTRICT SURVEYOR UNDER THE METROPOLITAN BUILDING ACT.

ON Thursday, the 28th ult., a summons, taken out by the district surveyor of Bow and Poplar, against a Mr. George Hinch, the occupier of a beer-shop, situated No. 273, High-street, Poplar, was heard before Mr. Partridge, at the Thames Police Court.

The defendant had illegally altered a kitchen-shed and workshop, a two-story building, at the rear of his premises, by converting it into two dwelling-houses; and by excavating the ground and under-pinning the walls had formed three stories to each, without giving two days' notice, as required by the Act.

The dwelling-houses, besides being irregularly constructed in other respects, can only be approached by a narrow passage, about 15 ft. wide, through the house, fronting the High-street. The magistrate having asked the defendant what he had to say to the charge, and finding he had no excuse to make, remarked that it was a bad case, and convicted him in the penalty of 5*l.* and costs.

SANITARY PROCEEDINGS IN PADDINGTON.

At the Marylebone police-court, before Mr. Mansfield, magistrate, a decision has been given in reference to sanitary measures in Paddington, under the Metropolitan Management Act, 1855 and 1862. Mr. Leaver appeared to the complaints of the vestry, "to show cause why the penalties (20*l.*) and the costs, inflicted by the magistrate on the 25th day of July, 1866, for non-compliance with the orders issued by the vestry for certain sanitary improvements, and not carried out by the defendant within the time stated for the execution of the same," should not be paid.

Mr. W. H. Sullivan, sanitary inspector, and inspector of nuisances for the parish, proved the service of the vestry orders, and their not being complied with, and that the penalties had not been paid to the vestry. Mr. Altman appeared for the defendant, stating that for the same premises (6, Poplar-place and 14, Caroline-place), the defendant had been previously convicted, and had paid the penalties. He was instructed to state that all the vestry, the medical officer of health, and the inspector required had been well and beneficially carried out to their satisfaction, and also the improvements of the defendant's property. He then stated the benefit that as the defendant's time was most seriously unwell, and as all the works were satisfactorily executed, the magistrate would consider his former decision previously to deciding in the present case.

The magistrate called upon the inspector, who corroborated all the defendant's solicitor had stated. The magistrate then remarked, that it was well for the public to be aware, that if the owners of property are affected to carry out improvements such as those in ques-

tion, he had the power to inflict the penalties now under consideration, and to a much higher sum. In the present case he believed the vestry of Paddington, or their officers, were not desirous of seeing the penalties enforced; and under the circumstances, he would order the defendant to pay the cost and expenses, which was at once complied with.

REVISION AND CONSOLIDATION OF THE SANITARY LAWS.

A DEPUTATION of the National Association for the Promotion of Social Science, consisting of the following gentlemen:—Sir J. Kay Shuttleworth, bart., Mr. H. W. Rumsey, Dr. Hardwicke, Mr. Gaal, Rev. W. L. Clay (secretary), Dr. A. H. Jacob (of Dublin), Dr. Lankester, F.R.S., Mr. James Beal, Mr. Charles Hawkins, Mr. Layard, M.P., Mr. Rendle, Captain Clode, Mr. Pocock, Dr. Stewart, and Colonel Sykes, M.P., waited on the Duke of Marlborough at the Privy Council Office, on Wednesday, to present a memorial on the consolidation of the sanitary laws.

The conclusions of the memorialists were as follows:—

1. That the laws of public health require to be revised and consolidated, with plain and specific enactments on sanitary matters.
2. That permissive enactments are generally taken to be permissions not to act, and that therefore the most useful provisions should be made peremptory.
3. That the constitution of sanitary authorities should be more uniform; their areas of administration more extensive; their powers and functions more comprehensive; and that some provision be made for the addition of members possessing other and higher qualifications than those now required.
4. That the inefficiency of the administration of the health laws by the local authorities is in part due to the absence of a central power, which could be appealed to without reference to the courts of law, and could by means of judicious advice, and, if necessary, by legal compulsion, cause the local authorities to do their duty."

Mr. Layard, M.P., introduced the deputation, and Mr. Rendle, Dr. Lankester, Mr. Rumsey, and Dr. Stewart addressed the Duke.

In reply, the President said he was much indebted to the gentlemen of the deputation for the manner in which they had represented the facts. Of the provisions of the Sanitary Acts, several were of a tentative character, and others of such a confused order that it was impossible for him then to give an opinion as to their consolidation. Of the late Sanitary Act nothing could be expected so early as to its working. Some time must be allowed to ascertain its weak points before consolidation. The Act ought to be carried out, and he thought it would be. Other Acts might be improved by further legislation. The consolidations of areas and other details would be a matter of great consideration, and without pledging the Government either one way or the other, he would take care that it had their very best attention.

CHURCH-BUILDING NEWS.

Southwold (Suffolk).—The scaffolding which has long hidden the chancel-roof of the church has been removed, and the painted roof exposed to view. The design is a copy of the original painting, which, although far gone, was in sufficiently good preservation to enable a transcript of it to be produced, both in form and colour. The principals, purlins, cornices, hammer-beams, and other members, are picked out in various colours and patterns, the prevailing one being a chequered roll moulding, in some parts red and white, and in others red and black,—a very common ornament in the time of Henry VII., at which period the original painting of this roof was executed. The panels, with the exception of those in the last bay to the westward, are blue, powdered with gold stars. The westward bay, under which the roof-loft originally stood, is more highly ornamented than the rest, all the panels being filled with angels holding scrolls or emblems. The woodwork of both nave and chancel roofs has been restored in oak, and re-covered with lead, the clearstory windows made new and glazed with cathedral glass, and the original battlements restored and continued along the nave. A new four-light east-window has also been inserted. The outlay up to the present time amounts to between 1,600*l.* and 1,700*l.*, but much more remains to be done to render the restoration complete. The works have been executed principally by Southwold tradesmen,—Messrs. Allen & Son doing the stonework, Messrs. Naunton, Prestidge, Strowger, Forder, and others, the carpenters, joiners, plumbers, and glaziers' work respectively. The painting of the chancel-roof was done by Messrs.

J. & J. King, of Norwich, and the whole has been done under the direction of Mr. Phipson, architect.

Ipsley.—St. Peter's church is now undergoing restoration. The work is being done by Mr. Espley, of Fresham. The chancel will be almost all new, with a new arch, new reredos, a small stained-glass window, and a large window with Bath-stone dressings. The other stonework is mixed Bath and Bromsgrove stone. The nave will be re-pewed to seat about 100. There is an apparatus for heating, the furnace being almost in the centre of the nave: a patent flue runs up the aisle towards the chancel.

Bromsgrove.—The little chapel of the Grammar School requiring enlargement, many friends subscribed for the work, the expense of which was to have been about 400l. Mr. Hopkins, of Worcester, was the architect selected. The chapel has been elongated 18 ft. at the east end, giving 40 extra sittings, and forming a chancel for the choir, and a sanctuary. Two acutely pointed arches, resting on corbels, support the new open roof of the chancel. The arches are constructed of Bromsgrove stone of two colours. On the south side of the chancel are two couples of lancet lights, each couple being under one moulded arch. One of these lancets has been filled with stained glass by Mr. Wallis, of Newcastle. In the little chamber, where the organ is now deposited, is a minute lancet light, which contains the figure of St. Cecilia, the patroness of music. This was the gift to Mrs. Collins of Messrs. Lavers & Barrand, the glass-painters. The old east window of the chancel has been re-adapted; it consists of three cusped lancets, painted by Mr. Wallis, and contains some of the principal events in the life of our Saviour.

Holt.—It is proposed to restore the old parish church of St. Chad, Holt, in accordance with plans submitted by Mr. Douglas, architect. Its present state, according to the *Chester Courant*, is very bad. An appeal is being made. The cost of the proposed restoration will be 1,500l.

Footon Courtney, Somerset.—The church has, during the past year, been considerably improved, reseated, and repaired. A modern and very rude upper stage to the tower has been replaced by an Early English superstructure, with ridged roof in consonance with the ancient fabric. The perpendicular windows of the nave and north aisle, which were in a ruinous state, have been reconstructed, and new windows inserted in the north aisle. The east window of the aisle is of stained glass, and gives representations of the Holy Family. It was the gift of Miss Hole, of Alcombe. The chancel east window has the Crucifixion and two Sacraments. The two south windows of the chancel are memorials to a daughter and son of the rector, Bishop Chapman. These are all the work of Messrs. Hardman & Co. A lofty west gallery has been removed, and the church reseated in red deal, with tracery in the bench ends. The reading-desk, pulpit, and chancel seats are of wainscot. There is an oak reredos, of five ogee-crocketed canopies, the panels being occupied by emblems in medallions and diapers, and this, as well as the decoration of the chancel roof, which had been previously renewed, is the work of Mr. Hansell, of Taunton. The cradle roofs of the nave and aisle, the latter rich in bosses of great variety, have been strengthened and repaired. The works have been carried out by Messrs. Shewbrooks & Son; the freestone work by the late Mr. C. Stagg; the carving by Mr. Seymour, all of Taunton. Mr. Ashworth, of Exeter, was the architect.

Busbridge (Surrey).—The Church of St. John the Baptist, Busbridge, near Godalming, has been consecrated. The church owes its erection to Mr. John Ramsden, of Busbridge Hall, at a cost of 4,000l. It is built in the Gothic style, from designs furnished by Mr. Gilbert Scott, and the contractors were Messrs. Moon & Son, of Godalming. The church will seat 220 persons in its interior, which consists of chancel, nave, and single aisle. The exterior walls are of Bargate, quarried in the neighbouring park, and the interior walls are lined with chalk slabs, obtained from and prepared at Puttenham. The roof is an open one. The church throughout is paved with Minton's encaustic tiles. The large east window, and the smaller window on each side of the chancel, are coloured in Powell's quoins. The seats in the chancel, intended for the use of the choir, are of oak, carved by Mr. Farmer, of the Westminster-road, who we understand also executed the stone carving throughout the edifice. The pulpit was made after a design by Mr. Scott and is constructed of Bath stone and

chalk. The font was also designed by Mr. Scott. It is made of Forest of Dean stone. The seats in the church are all free, and consist of chairs. Attached to the back of every seat there is a kneeling cushion, to be unfastened from a hook when required. The church is surmounted by an oak shingle spire. The roof is pointed, and red tiles are used in the covering. The whole of the ironwork of the church was prepared and supplied by Messrs. Filmer & Mason, of Guildford. The design on all the keys and locks is the Busbridge crest, namely, a fish, an idea of the contractors. The church is situated on a gentle elevation at the extremity of the village, and a few minutes' walk from the town of Godalming.

Hallow.—The foundation stone of a new church has been laid at Hallow, on a new site. This is a field called "The Reens," near the entrance to the village from Worcester, and was given by the trustees of the endowed school in the parish. Mr. Hopkins is the architect, and the contractors are Messrs. Inwood & Osborne, of Malvern. The church is to consist of a chancel, nave, north and south aisles, vestry and organ chamber, south chapel for the school children, south porch, and western tower; but owing to the want of funds the tower and spire will not be erected at present. The nave, 60 ft. by 20 ft., will be divided from the aisles by arches, supported by circular columns. There will be a steep-pitched roof, the thrust of which externally will be counteracted by flying buttresses. The chancel will be 32 ft. by 18 ft., with lofty timbered roof. There will be an east window of three lights; a west window of five lights; circular clearstory windows; and two two-light windows in the aisles. A tower and broach spire will rise to a height of 143 ft. The style is Early Decorated. The Earl of Dudley has given the stone, and Earl Beauchamp a reredos. The late Earl Beauchamp, as lay proprietor of the parish, gave one year's great tithes (between 3000 and 4000) towards the work.

SCHOOL-BUILDING NEWS.

Gorton (Manchester).—A new school in Gorton-street, Gorton, has been opened. The school belongs to the Openshaw Methodist Free Church, and is a plain commodious building, consisting of one large room and two vestries, with other appurtenances, and stands at the back of a plot of ground which is reserved for a chapel. The school is fitted up for day-school purposes, but will at present be used only for Sunday-school operations and divine service. It will accommodate 250 scholars, or it will seat 200 adults. The cost, including fittings, furniture, and school requisites, is 450l. This is the second school commenced and completed during the past twelve months in connexion with the Openshaw Methodist Free Church—the first being the Cobden Memorial Schools at Openshaw, which cost 900l.

Sibford.—The new Parochial Schools in this village have been opened by the Bishop-Coadjutor of Edinburgh, who for seven years was in pastoral charge of the parish. The schools, built from designs by Mr. Enckerridge, of Oxford, will accommodate 120 children, and have cost about 600l.

Haddiscoe.—The new school, with teacher's residence, for the parishes of Haddiscoe and Toft Monks, the erection of which commenced in September last, has been opened. The total expenditure has been 580l. The building was designed by Mr. J. B. Pearce, of Norwich, architect, under whose superintendence the work has been carried out by Messrs. Jackson & Rounce, of Blundeston.

Grantchester.—The new school has been opened. It is in the Gothic style, from a design by Mr. William Fawcett.

Books Received.

The Poor of Edinburgh and their Homes. By WILLIAM ANDERSON, Reporter, *Edinburgh Courant*. London: Simpkin, Marshall, & Co. 1867.

The truthfulness of Mr. Anderson's narrative, and it is a very painful one, is spontaneously certified by the Rev. Dr. Guthrie, an excellent authority. The volume is a reprint of a series of reports to the paper with which the

author is connected. These reports make no pretension to sanitary or other arrangement, although the sanitary aspect of the subject is kept steadily in view: the sketches have also social and moral interest as well; and they are ably and graphically written, and contain, occasionally, anecdotal remarks of touching interest as to the social and sanitary condition of the poor of Edinburgh, among whom there is a fine field for philanthropy. The volume is dedicated to the ladies of Edinburgh, who are doing much on behalf of their poor. A Ladies' Sanitary Association might do great good in a methodical and effective way in aid of so desirable an object as the raising of the social and sanitary position of the poorest class of these citizens.

VARIORUM.

The *Science Review* for April contains a fuller account than has before been printed of the curious phenomena of sensitive flames. Mr. W. F. Barrett, lecturer on natural science at the International College, who first noticed these phenomena and drew Dr. Tyndall's attention to them, is the author of the paper, which is illustrated by diagrams. This popular and ably-conducted Review sustains its varied interest in other respects; and, indeed, it forms a monthly compendium of facts in science, as well as of original papers on many subjects.—"The Penny Guide to Paris, and popular London, Cbatham, and Dover Guide," and "The Penny Guide to Paris and popular South-Eastern Railway Guide." London: 24, Bride-lane. These are useful guides, and contain not only all the requisite railway tables and "a Concise Guide to Paris by an Englishman long Resident in that City," but also maps of the routes on this side the Channel and of Paris, as well as of the Exhibition building. A penny guide to Paris, however, is rather too cheap, and we think is a mistake: no one going would grudge sixpence, and for that sum a much better guide might be prepared: as it is, the wind has been taken out of the sails of those of a better class by these cheap issues, and some of them, we believe, have in consequence been suppressed.

Miscellanea.

HOSPITAL STATISTICS.—Of every 1,000 deaths in London in 1866, 62 occurred in one or other of the metropolitan hospitals; and of every 1,000 of population in London, about 1.5 were inmates of these institutions. Taking 10 large metropolitan hospitals; the average mortality to every 100 cases treated in 1865 was 11, the mean term of treatment being 34 days. As regards the duration of cases, the *maximum* and *minimum* were attained in the two hospitals for special diseases; the mean term of treatment being 71 days in the Consumption Hospital, and 25 days in the Fever Hospital. If by the adoption of sanitary measures the duration of cases in the general hospitals can be reduced, the ability of the hospital will be increased, so far as its funds are concerned. While the annual mortality of the general population of London was 25 per cent. in 1865, the average mortality of the sick population in ten large metropolitan hospitals was 118.7 per cent. In 1861 the proportion was 99.4 per cent. The mortality of the inmates in 1865, who were all suffering from disease, being 47 times as high as the general mortality of London. With the exception of the London and the Fever Hospitals, the number of deaths to 100 constantly sick has increased since 1861. It is to be feared, even in the present day, that patients after having undergone any serious operation often die of hospital pyæmia, or purulent deposit, which is generally supposed to be caused by some defect in the sanitary arrangements of these institutions. The deaths in England from pyæmia have increased from 159 in 1863 to 202 in 1864, and the increase of this disease is a matter which calls for serious attention. The classes of cases which are admitted into particular hospitals differ largely, so that the investigation of the effects of ventilation and other sanitary arrangements requires great care and skill. It has been recorded that after the wing of a large hospital had been well ventilated and put into good sanitary condition, there was a marked and continuous change in the amount of disease, and an abolition of those secondary diseases which so frequently occur in hospitals that are under bad sanitary arrangements.

THE HERTS. ARCHÆOLOGICAL AND ARCHEOLOGICAL SOCIETY.—A special evening meeting of the members and friends of this society has been held in the Townhall, Hertford; Mr. J. C. Hawkins, rector of the abbey, in the chair. Mr. Pollard, of the *Herts. Guardian*, read a paper, entitled "Leaves from an Archæological Note Book." The subject of the paper was the Saxon and Danish fortifications near the village of Great Amwell, on the river Lea, in Herts. The Rev. O. W. Davys, M.A., rector of Wheathamstead, read a paper on "The Choral Arrangements of Churches;" and the Rev. Canon Gee, M.A., vicar of Abbot's Langley, and rural dean, one entitled "Another Peal of Bells."

THE JEFFCOCK MEMORIAL CHURCH.—Shortly after the explosion at the Oaks Colliery, in which Mr. Parkin Jeffcock lost his life in a brave and noble endeavour to save that of others, a project for a memorial church, at Mortomley, was started by a few of his personal friends, to whom he had mentioned his wish to do something towards erecting such a building. The plan has received a gratifying amount of support, although up to the present time it has not been brought before the general public, owing to the wish of the committee that it should not, in appearance even, clash with the General Memorial Fund. The trustees are the Earl Fitzwilliam, Lord Wharfedale, and the Rev. William Micklethwaite.

CARVED REREDOS.—A carved oak reredos, from designs by Mr. G. J. Baguley, has just been erected in Christ Church, Sheffield. It is divided into seven compartments, three of which form the triptych or altar-piece, and on either side the corn and paten, and the vine and chalice, surrounded by texts. The other portions are filled up with the Lord's Prayer and Creed, illuminated, the capitals alternately gold and colour. Above the reredos, and corresponding with it, are tablets of the Ten Commandments, also illuminated. The whole has been painted on zinc by Mr. Baguley. The lower portion of the reredos is arched, the wall behind being diapered on a green ground. The woodwork, supplied by Mr. Dobson, harmonizes with the carved screen already in the church.

AN AERONAUTIC SOCIETY.—At the last meeting of the members of the Royal Institution a lecture, "On the various Modes of Flight in relation to Aeronautics," was delivered by Dr. J. B. Pettigrew. One of the objects of the lecture appeared to be to bring into notice the newly-formed Aeronautic Society, the president of which is the Duke of Argyll, who sat on the right hand of the chairman, Sir H. Holland. The lecturer thought that if the art of flying be ever accomplished, it must be principally by the application of mechanical force, the muscular power of man, however applied, being quite inadequate for the purpose, and balloons alone not presenting the means of guidance through the air. He considered that the invention of flying was not more improbable than many others that have been accomplished, and that it might be looked forward to as the grand achievement of the age.

PRESCRIPTIVE PATHS: ACTION AGAINST LORD DERBY.—At the Manchester Assizes, a gentleman named Winterbottom brought an action against the Earl of Derby for obstructing an alleged public footpath in the township of Pilkington, thereby putting the plaintiff to expense in removing the obstruction. It appeared from the arguments and evidence on both sides that this was a dispute as to the public or private character of a certain footpath. For the plaintiff it was stated that the path had existed for the use of the public so long as living memory went, and witnesses in support of this assertion were called, varying in age from 70 years to 90. Three years ago Mr. Statter, Lord Derby's agent, had stopped the pathway. The plaintiff had expended 4*l.* or 5*l.* in removing the obstructions put in the pathway. For the defence it was urged that certain public trespass had been allowed by the person who had leased the property, but on the lease falling in the owner was not bound to recognise the practice allowed by the tenant. It was also urged, as a legal objection, that no individual member of the public could maintain an action for the obstruction of a public highway unless he could show that he had sustained some particular damage by the obstruction. The jury found a verdict for the plaintiff, with 4*l.* damages, leave being given for the defendant to move the Court of Exchequer on the point previously mentioned.

DONATION TO THE NATIONAL GALLERY.—Captain Hans Busk has presented to the trustees of the National Gallery a work of art by Nicolo Pousin. It is in excellent preservation. The picture was painted in 1641, and was purchased some years since from the Barberini Gallery for 600 guineas. It was considered one of the gems of the collection of the late Mr. Hans Busk, who died in 1862.

STONE IN KEYSTONE.—Some years ago part of an old building, originally a lepers' hospital, was pulled down, and in the keystone of the arch of a low doorway was found a *white stone*. The keystone was in two parts, carefully fitted together; and a middle groove had been chiselled out of the middle of each part, forming a hollow just large enough to admit the stone, which is the size of a large marble, and unpolished. I shall be glad if any of your correspondents can explain this circumstance.—*Notes and Queries.*

MAGNETIC SPIRALS.—If an iron wire be twisted during or even after the passage of a voltaic current through it, the wire, it is said, becomes magnetic. When the wire is twisted in the manner of a right-handed screw, the point at which the current enters becomes a south pole; in the opposite case it becomes a north pole. If, during the passage of the current, the wire be twisted in different directions, the polarity changes with the direction of the twist. Some light will doubtless be shed upon the phenomena of vegetable spirals by these curious facts.

DAMP WALLS.—An Ipswich correspondent says:—In reply to "M. L. F.," I have just effected a complete cure from damp exuding from a brick-wall, upon which no plaster, much less paper, would adhere, on account of its having been several times saturated with sea water. I have done so by using "Italian plaster." If your correspondent will try it, I feel certain he would meet with equal success. The cost is but little more than that of Portland cement, and may be papered upon forty-eight hours after being used, without any risk of damp or discolouration.

NEW BUILDINGS AT BURLINGTON HOUSE.—The site of the new buildings for the Royal Academy, in Burlington-gardens, is now being excavated, and before the end of summer in next year it is thought the Academy may remove from Trafalgar-square to its new abode. As our readers already know, Messrs. Banks & Barry have charge of the buildings intended for the learned societies; Mr. Sydney Smirke is the architect of the Academy, and to him is due the improvement of the aspect of Burlington House, by the addition of a story to it; and Mr. Pennethorne is the architect for the London University.

THE CATHEDRAL FOR BERLIN.—According to a Cabinet order, published on the eve of the king's birthday, the long-promised Cathedral of Berlin is now to be undertaken in good earnest. The late Privy Councillor Stüler has supplied the drawings. Independently of the entrance-hall, the body of the building will be 240 ft. square, and 140 ft. high. Above this will rise a cupola, 190 ft. high, surmounted by a spire and cross, 70 ft. in height. This gives a total altitude of 400 ft., or just 4 ft. less than that of St. Paul's. The columns of the portico are to be Corinthian, it is said, and the general character of the building that of a vast basilica.

EXPLOSIONS.—These have been rather numerous of late. A mixing-house at the Faversham powder works has been demolished by an explosion, and four men killed and one severely injured. A gas explosion has seriously injured four persons at Scott-street, Leeds. Gas from a defective main had accumulated in the cellars of a house, and a candle was as usual stupidly taken down to see where the leakage arose. The house and shop were very much damaged. A curious explosion in a kitchen-oven has occurred at Belgrave, near Leicester. A hottle of water, with a tied cork, was put into the oven to heat, and forgotten till it exploded, killing one person and seriously injuring two others, and destroying the oven, the fragments of which injured those in the kitchen. Strange to say, the very same sort of accident had already occurred in the same village. A small steam-boiler connected with a chopping-machine in the ground premises of a shop at Barnsley has exploded, severely injuring two persons and seriously damaging the premises. At Stepney an explosion has taken place in a private dwelling, from a stock of parlour fireworks that were there manufactured.

MR. RUSKIN.—This gentleman has been appointed by the Vice-Chancellor of Cambridge to the office of Sir Robert Rode's lecturer for the ensuing year. He will deliver a lecture in the Easter term.

THE CHARGE OF THE PARKS.—The metropolitan police are henceforth to take charge of Hyde Park and the Green Park. The carriage-gates of Hyde Park will be kept open till twelve o'clock at night instead of ten, as hitherto. The magazine barracks in the centre of the park will be used as a police-station.

THAMES SUBWAYS.—The Board of Trade have reported to Parliament on the Bill proposing to give power to a company to construct subways under the Thames from Pimlico pier to Nina Elms; from Temple pier to Dilke-street, Lambeth; from Tower Dock-wall to Fickle Herrings-stairs, Southwark; and from Wapping Old-stairs to Cherry-garden-stairs, Bermondsey-wall. The Board make several suggestions relating to clauses in the Bill; and submit that it may be a question whether the benefit to the public would compensate for the inconvenience and danger to navigation likely to be caused by the temporary works required for the construction of the subways of Tower-dock and Cherry-garden-stairs.

THE RESTORATION OF THE OLD ROMAN AQUEDUCT.—The Anglo-Roman company for restoring the Marston aqueduct, and bringing again into the city the copious and salubrious water for which it was constructed 2,000 years ago, are about to set to work. The surveys being completed, the works are to be commenced immediately with 500 labourers. Above Tivoli, along the upper valley of the Anio, the stream will be conveyed along an aqueduct, and across the Campagna to Rome in iron mains. About eight miles of the ancient aqueduct above Tivoli have been uncovered and examined to see whether the conduit could be made serviceable again; but it appears that it will have to be reconstructed entirely.

MONUMENTAL.—The bronze statue of Mr. Cobden recently cast in London, of which Mr. Marshall Wood is the sculptor, has been placed on its granite pedestal in St. Ann's-square, Manchester, opposite the front of the Exchange. The pose of the figure represents Mr. Cobden, with hand uplifted and finger pointed, in the act of addressing as in the House of Commons.—The Town Council of Liverpool has before it a proposition to place a statue of Mr. Mayer in one of the niches of St. George's Hall. A resolution in favour of this method of acknowledging the great benefits which the originator and collector of the famous Museum of Antiquities which bears his name has conferred by his gift of the collection to the town, was adopted at a meeting held in the Mayor's parlour; and there is no doubt the Council will unanimously accept the suggestion. The statue will be a suitable companion to that of William Brown, the giver of the building containing the Free Library and Museum.

THE GLIDING OF PORCELAIN.—A coating of gold, which is brilliant without burnishing, may be imparted to porcelain, observes the *Scientific Review*, by means of a mixture prepared as follows:—Thirty-two parts of gold are to be dissolved in aqua regia, containing 138 parts nitric, and the same amount of hydrochloric acid, heat being applied. When the solution is complete, one and one-fifth part tin, and the same amount of butter of antimony, are to be added; and, after heat has been applied, the result is to be diluted with 500 parts water. Also sixteen parts sulphur, and the same amount of Venice turpentine, are to be gently warmed until they form a tough uniform dark-brown mass, which is to be thinned with fifty parts oil of lavender. The solution of gold is poured into this; and the mixture being kept warm, it is to be constantly and gently stirred until a uniform liquid is obtained. On cooling, the water and excess of acid separate; and the resinous mass thus obtained is to be well washed with water, and dried, then thinned with sixty-five parts oil of lavender and 100 parts oil of turpentine; and, having been heated until it becomes of a uniform consistence, five parts basic nitrate of bismuth are to be added to it; after which, it is to be left at rest till it is quite clear. The clear portion may then be poured off, and is ready for use. It dries quickly on the porcelain, and the gliding is brought out by the application of a high heat.

A NEW YORK THEATRE BURNED.—The Winter Garden Theatre, at New York, has been burnt down.

SOCIAL SCIENCE PROGRESS.—A Social Science Association for the Bonmahy Presidency has been formed at the suggestion of Miss Carpenter.

THE MAHOGANY TREE IN INDIA.—Dr. T. Anderson has reported to Government that great success has attended the introduction of the mahogany-tree into the Calcutta Botanical Gardens. Several of the trees, originally introduced in 1795 from Jamaica as young trees, were destroyed in the cyclone of 1864, when they were seventy-one years of age. They had attained a very large size, averaging from 12 ft. in girth at 4 ft. above the ground. The wood is in great demand at high prices in Calcutta. Dr. Anderson believes that the mahogany-tree might as easily be spread over all parts of Bengal as the larch has been in Britain.

THE NATIONAL EXHIBITION OF WORKS OF ART AT LEEDS.—This exhibition, which is to be held next year, promises to be a great success. The promoters have already obtained the special encouragement of the Queen, and the energy with which the project has been taken up by the leading families of Yorkshire, who have already subscribed a guarantee fund of upwards of 100,000*l.*, affords proof that its promoters and friends are in earnest. The promoters look forward to the formation of local galleries of paintings and sculpture as among the results of the forthcoming exhibition. An influential London committee of advice has been formed, and Mr. J. B. Waring has been appointed chief commissioner, and Mr. W. Bedford assistant commissioner.

THE ANCIENT RECORDS OF THE CORPORATION OF LONDON.—An important contribution to the history of England is about to be made by a corporation, who have at length resolved, on a report from the Library Committee, to engage Mr. H. T. Riley, M.A., to compile a volume of extracts from certain of the corporation records, at an estimated expense, for 750 copies, of 550*l.*, 300*l.* of which will be the cost of editing, and the remaining 250*l.* will in all probability be repaid by sale of extra copies. Precedents are not wanting for this movement on the part of the London Corporation. They gave permission to the Master of the Rolls to publish "Liber Albus," "Liber Horns," &c., and the Camden Society to publish "Chronicles of London." The great value of these records has been recognised by many writers of eminence, both British and foreign, from Stow, in 1598, to M. Delpit, in 1843. The time comprised in the extracts proposed to be published will extend over a period of nearly 200 years, viz., from Edward I. to Henry VI., whereas the "Liber Albus" extended over only 100 years, viz., from Edward I. to Richard II.

THE BUILDING TRADES MOVEMENT.—The joiners and quarrymen in Barnsley and neighbourhood have struck work for an advance of wages and a reduction in the hours of labour. Notices were some time since delivered by the men to the effect that on and after the 1st of April the joiners would require 1*s.* per week advance and a reduction of one hour per day, viz., from ten to nine hours, while the quarrymen required an advance of 2*s.* per week. The masters agreed to give the extra 1*s.* per week to the joiners, but declined to concede any reduction in the hours of labour; with regard to the quarrymen, it was agreed to advance their wages 1*s.* per week. The wages of the joiners at present vary from 22*s.* to 27*s.* per week, and those of the quarrymen from 21*s.* to 24*s.* The masons also threaten to go out next month on the question of time and wages.—About 400 joiners have gone on strike at Hull, in pursuance of resolutions passed at the meetings of the Operative Joiners and Carpenters' Society. It appears that some time ago the operatives gave their masters notice that they should demand the Saturday half-holiday, commencing on the first week of April, without any deduction from the ordinary rate of wages. The masters' reply to this was, that they were quite willing to grant the half-holiday if the men would accept payment by the hour. The men refused to accept the masters' terms, and gave notice that in the event of their request not being complied with they should strike work on the 1st of April. In about a dozen shops where the masters have work pressing the half-holiday has been given, but in the others it has been refused, and the men have accordingly turned out.

THE LEICESTERSHIRE ARCHITECTURAL SOCIETY. At an ordinary meeting of this Society, recently held at Leicester, office-bearers were elected, the mayor for the time being was elected. Various objects of interest were exhibited, and the Rev. John Fisher read a paper upon "Armorial Bearings, Grants of Arms, and Laws of Heraldry."

"THE PARIS EXHIBITION AND LAW COURTS COMPETITION."—A correspondent on this subject says that while he thinks it is very desirable that our architecture should be well represented at the Exhibition, and commends "Adelphi" for calling attention to it, he is of opinion the result will not be obtained by sending the limited competition designs of the New Law Courts and National Gallery. He thinks it would be better to send the designs of some general competition.

BURSTING OF A CANAL.—The Wakefield and Barnsley canal, near Barnsley, has burst its banks. The water ran off for a considerable distance. Several collieries were consequently set down, and a large number of men thrown out of employment. The canal burst at the aqueduct, and the water flowed on to the low lands beneath, and considerable damage was the result. The point where the canal burst was the same at which a similar accident occurred more than once during last year.

THE TRADES UNION COMMISSION.—This Commission is now holding open sittings at Park Prospect House, Westminster, Sir William Erie presiding. Office bearers and others connected with trade societies, such as the London Bricklayers' Society, the National Association of Plasterers, and the Masons' Society, have been examined in regard to the rules of their respective societies; as also Mr. G. Potter in regard to his individual connexion with the London Working Men's Association and the Progressive Society of Carpenters.

BUSINESS NUISANCE.—The Court of Chancery will grant an injunction to prevent a business being carried on so as to be a nuisance, where the annoyance caused is such as materially to interfere with the ordinary comfort of human existence, and will not require proof of specific injury, such as, for instance, the destruction of vegetable life. Smoke alone, or bad smells or offensive gases alone, or noise alone, are sufficient causes for the interference of the Court by injunction. The Master of the Rolls thus held in the case of *Crump v. Lambert*.

TENDERS

- For rebuilding the Crown Inn, High-street, Peckham, for Mr. Henry Hobbs. Messrs. Finch Hill & Parrise, architects.—
Shapley & Webster (accepted).....£1,700 0 0
- For proposed works at the Churn Schools, for Mr. R. Tabor. Messrs. Slater & Carpenter, architects. Quantities not supplied.—

Kelly, Bros.....	813 0 0

For ten six-roomed houses, with additions, Lordship-road, Sticks Newington. Mr. Herbert Ford, architect.—
Cole (accepted).....£4,900 0 0

TO CORRESPONDENTS.

Black Beetles.—A Constant Reader wishes us to ask "correspondents as to the best means of getting rid of the nuisance of black-beetles or cockroaches, which infest the basement, and more particularly the kitchen, of the writer's house." We have occasionally replied to this query ourselves in the *Builder*, but will be glad to know if anything new can now be suggested by our correspondents.

Bugs.—An inhabitant of an old West-end house wishes to know how to get rid of bugs in the walls of a room which was thoroughly cleaned, searched, and fumigated last autumn, but already gives signs of insect life. As the bugs seem to "make their way through crevices and cracks," he would recommend the method of filling up these; failing which, perhaps, some form of the pyrethrum powder or Persian insect-killers might be tried; those in puff-ball form would be most easily got into crevices. Keating, of St. Paul's-church-yard, however, has one of these powders, which he said to be useful in killing such insects.

W. K. J. B. W. J. G. Jun (we have no time to refer)—**S. K. L. Y. N. J. P. R. A. Justice**—**J. B. E. R. W. E. L. J. E. B. D. X. G. D.**—**R. O. Vo. to Salve**—**J. E. W. B. R. E. P. F. A. H. E. P. F.**—We are compelled to decline pointing out books and giving addresses.

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

Advertisements cannot be received for the current week's issue later than **THREE o'clock, p.m., on THURSDAY.**

The Publisher cannot be responsible for ORIGINAL TESTIMONIALS left at the Office in reply to Advertisements, and strongly recommends that COPIES ONLY should be sent.

The Builder.

VOL. XXV.—No. 1262.

The Paris International Exhibition.

CONSIDERABLE advance towards a good state of things has been made since our last notice; and though there is yet an immense deal to be done, and those who go later will examine the collection with more ease and completeness than they would be able to do now, there is, nevertheless, much more to be seen than any ordinary sight-seer would be likely to accomplish. There is more room to see it in, too, than there will be, for the accounts that have reached foreign countries from the Imperial Commissioners have done all in their power to render sharp, have not yet led to any invasion of the gay capital; so that many of the hotels are not half full. Mr. Cole and Mr. P. C. Owen have done all they could to afford facilities to English writers, and the result is that the newspaper readers of Eng-

land really know more of what the Exhibition comprises than the inhabitants of Paris. It will be a marvellous collection of things useful, beautiful, and curious; that is quite certain: and it will be for this country to get out of it the greatest amount of information possible by examination and contrast of the materials afforded.

In one of our own special departments, architecture, Professor Donaldson, we understand, is deputed by the Department of Art to report on the architectural drawings, especially those of foreign countries; and we may, of course, take this as an indication that in all the various branches of art and manufacture there illustrated, competent persons will, in like manner, be appointed to examine what is exhibited, to inquire into our position relatively with foreign countries, and point out the weaknesses and deficiencies that we should strive to remedy.

The French architects have not been cramped for room, as was the case, unavoidably doubtless, with their English confrères; and such of them as have exhibited have set forth their designs by plans, sections, and views, on enormous frames. One architect, and an able one, J. Henard, has a large number of large drawings. The French pictures, of course, form a prominent feature of the Exhibition, and will be talked of hereafter. Of German pictures there is a fair collection. Russia sends some important paintings, by Simmler, Flavitsky (woman in a dungeon, to which the water is entering by the window), and Peroff, whose three children dragging a sledge in the snow have faces touchingly expressive. The Belgian pictures are not yet hung, and will have a building to themselves in the park.

The English pictures have been hung most conscientiously and satisfactorily by Mr. Samuel Redgrave; and though the absence of many important names is observable, — MacIiso, Herbert, Dyce, Creswick, — and of large canvasses, treating large subjects, the collection makes a fair exposition of the condition of English art. It comprises 129 paintings

in oil, and 90 water-colour drawings, including good works under the first heading by Ansdell, Armitage, Boxall, John Burgess, Calderon, E. W. Cooke, Cope, Desanges, Dobson, Egg, Elmore, Faed, Frith, Frost, F. Goodall, Grant, Hayllar, Hook, Holman Hunt, J. P. Knight, Leighton, Landseer, John Lewis, Linnell, Millais, O'Neil, Emily Osborne, Paton, John Phillip, F. R. Pickersgill, Poole, Stanfield, Henry Wallis, E. M. Ward, Mrs. Ward, Watts, Wells, Yeames, and other able artists.

The proportions of the galleries, as we understand, were fixed from lines laid down in England, and light is admitted from continuous openings in the centre of the ceilings. In the English gallery this arrangement remains; but in the other galleries a solid false ceiling has been formed, running down the centre, under the light, at the level of the blinds, the effect of which *per se* is not agreeable. We shall be anxious to know what decision experience will give as between the two modes after some of the brightest days of summer. At present there is certainly not a bit too much light in the English gallery. The walls in this gallery, we may mention, are coloured sage green (as are all the columns and other ironwork in the parts of the building appropriated to England), while in the foreign galleries the tint of the walls is a Pompeian red. The distinctive green colour, by the way, given to the English portion of the building, contributes greatly to the convenience of visitors.

Our glass comes out supereminently well: the stands of Dobson, Green, Dofries, and Pellatt, are objects of general admiration. Amongst the jewellers, Hancock, Emanuel, and Hunt & Roskell, hold their own.

Messrs. Doulton & Co., of Lambeth and Paris, make a fine exhibition of useful pottery, including a still and a large jar of excellent quality.

The Belgians have a very large, indeed enormous pulpit of carved oak, with double flight of steps to it, and a lofty canopy, somewhat top-heavy. This is the work of the Messrs. Coyers, of Louvain, and the carving shows skill, but it is all, unfortunately, sand-papred down to the smoothness of a cast. There is a carved wooden altarpiece near it, liny and poor in design. The name of the exhibitor of this has become illegible in our notes, and no clue to it can we discover in the catalogue. In fact, this first edition of the "Complete Official Catalogue, English Version," beats "Bradshaw" by chalks. We have found it useless. The French works of fine art are not discoverable in it at all, and the English paintings and architectural drawings are given as an addendum.

In the French department there is a large plan, in relief, of the Cathedral of St. Denis, showing all the monuments, — a model, in fact, of the cathedral to a certain height above the floor. It is exceedingly well made, and an interesting object. The number and variety of the monuments, true and false, in St. Denis, are remarkable, and make it a place for study.

America is greatly behindhand, but promises to make a good show. In fact, this is already done in the fine-art department and in the annex for agricultural implements. In the court, John Shuster, of New York, exhibits some marble chimney-pieces, chiefly remarkable for the material. One is of California marble, which has the appearance of polished tortoiseshell, with many gold specks. In the design—seventeenth century it may be called—the endeavour appears to have been to get in as many angles and small panels, and raised mouldings as possible. With half the labour a better effect might have been produced. The work is very well done, and the price asked is 4,000 dollars, say 800*l.*, an enormous sum considering, moreover, that there is no carving. The owner, however, believes the chimney-piece to be unique, as to material. A second chimney-piece of similar

design is perfectly white, without speck, and comes from Rutland, in Vermont. This is priced at 360*l.*

Looking into the machinery and processes zone, where all sorts of things are now being set up, we see a remarkably fine piece of red terra-cotta and brick construction from Lanban, in Prussian Silesia, exhibited by A. Augnstin. It is in the shape of an archway, with griffins in a panel above, and a parapet, and for soundness, correctness of form, and evenness of colour, is not surpassed, if it be equalled, by any similar production in the Exhibition. Some terra-cotta shields, also from Silesia, fixed at the entrance to a court in the machinery zone (where a trophy of gilt and coloured agricultural implements is being set up), are excellent. A Gothic window-frame, and pinnacles at the side, with group of figures in the head, from Ernst March, of Charlottenburg, near Berlin, is also a noticeable work. The figure of a brick-layer on one hand and a carpenter on the other serve as corbels under the columns at the side.

Being in the machinery zone, we would say that the painted blinds in the English portion of it must be considered successful. The idea is an excellent one; and though, in two or three cases where figures are introduced, the blinds are open to adverse criticism as works of art, it is sufficiently well carried out on the whole, and is made to convey much valuable information in various languages. Thus, on one blind, we have the first Carding Machine, dated 1769; on another, Watt's first Sun and Planet Engine, 1788; and, on a third, Arkwright's first Spinning Machine, 1769. The Liverpool blind contrasts the town as "Liverpool," in 1655, with the Liverpool of 1867. Staffordshire goes back to an early mode, and gives a curious symbolical outline representing a manufactory, a railway, ships, and two miners at work. Here, however, let us stop. We are but recording desultory reminiscences. By and by we shall endeavour to get more fully such precise information as we may from special departments.

CONCRETE CONSTRUCTIONS IN FRANCE.

The advantages which concrete, under some circumstances, possesses as a building material, have already been so fully demonstrated, that it seems superfluous to reiterate them. It is, perhaps, a matter of surprise, these advantages considered, that this material is not more often adopted, particularly in the construction of dwellings for the working classes. One reason for this, we think, is, that although such use of concrete is by no means new, as the concrete walls of the old Romans testify, its economical and other qualities are not known, or appreciated by the general public. Moreover, until recently mechanical difficulties stood in the way. These, however, have been lessened by the apparatus and scaffolding lately patented by Mr. Joseph Tall, by which the walls of buildings in concrete may be carried up to any required height. Excepting some houses erected by Mr. Tall, at Bexley Heath, and others, including a church and a farmhouse, neither of them very favourable examples, however, by Lord Salisbury, at Hatfield, at the instance of the late Captain Fowke, very little has been lately done in concrete construction in England. In Paris the use of concrete is rapidly extending. The well-known invention of M. François Coignet, called "Blooms Agglomérées," described on more than one occasion in our pages, is being largely used for buildings and public works in the French capital, in every instance with the most satisfactory results. This artificial stone is produced simply by a mixture of any kind of sand with a small quantity of hydraulic lime, to which occasionally is added a trifling quantity of cement. No new material, we believe, is employed in the production, and notwithstanding the great proportion of the sand used, an artificial stone is obtained which is harder, more lasting, and better able to withstand the change of climates, to resist frost, heat, drought and moisture than many natural stones. By employing superior materials, a stone is ob-

tained equal to granite or jura-stone. It can be moulded into the most delicate forms of art, and has the advantage of hardening instead of softening in the air, according to the well-known law of mortars and concretes. Among the more recent constructions with Bétons Agglomérés may be named the supporting wall of the Boulevard de l'Empereur, measuring 13,000 cubic mètres, with ornamental staircase 7 mètres wide; the vaults (12,000 cubic mètres); the underground drains (12,000 mètres), and the water and river works (20,000 mètres) at the new Exhibition Building; about thirty-one English miles of sewers, barracks, and numerous other works for the city of Paris. Indeed, Parisian engineers and architects hold that this material cannot be surpassed in applications for underground and foundation works. It is equally well adapted for buildings of great height, as may be seen by the church at Vesinet, of which we have given illustrations. The bell-tower of this church is 40 mètres high, and we are assured that it has not suffered in the least from vibration or sinking. At his manufactory in St. Denis, M. Coignet has succeeded in producing stones that surpass natural stones in homogeneous formation, and in the power of resistance against breaking, frost, drought, or moisture, at a cost of 50 per cent. less than the ordinary material.

Some time ago specimens of the cheaper concrete were submitted to the Emperor of the French, and his Majesty, recognising the importance of economy in this class of construction, ordered forty workmen's houses to be built with it. A piece of ground was obtained in the Avenue Dumensil, and the dwellings are now being executed from the Emperor's own designs by Mr. W. E. Newton, C.E., of Chancery-lane. About half the number, we believe, are already finished. They are double houses of three stories in height, each furnishing accommodation for six families, each family being provided with three apartments,—namely, a sitting-room, 4.50 mètres by 3.47; bed-room, 3.70 mètres by 3.47 mètres; kitchen, 3.47 mètres by 2.02; with cellar, water-closet, &c. A small inner court affords light to the hack rooms. The doors, windows, and stairs have been made by machinery outside of Paris, the woodwork consisting of deal, sycamore, and oak cills. The bed and sitting rooms will be furnished with marble chimneys—which can be had at a cost of 23 francs a pair—and with stoves, the kitchen with a cooking apparatus. Water and gas will be laid on; and the water-closets are to be fitted up in the English fashion, in compliance with the orders of the Emperor. The floors are of concrete and iron; the chimney flues round and smooth internally; and, in short, the entire tenements are built on the ordinary concrete principle. The design shows no architectural ornamentation, but is plain, neat, and substantial. Besides Mr. H. E. Newton, the residential architect, and an English foreman, no skilled labour has been employed in the building, the entire work having been done by ordinary French labourers at 2 francs 50 cents a day. The cost of each double house—accommodating six families—will be about 500l., exclusive of the land, which was obtained after considerable difficulty, and on rather high terms. The whole outlay is borne by the Emperor, but in what way it is intended to dispose of the dwellings is not known. We are, also, unable to say at what rent the dwellings will be let. Sufficient ground has been marked off for a block of sixteen additional tenements. The concrete used by Mr. Newton consists of 4 measures of large gravel stone, 4 measures of sharp sand, and 1 measure of Portland cement, mixed in the usual way. The walls contain about 40 per cent. of conglomerate. We may mention that Mr. Newton has also in course of construction a number of two-story houses in concrete, intended for dwellings for the workmen of the Société Anonyme des Forges et Fonderies, at Montmartre, a few miles from Paris; and likewise one or two private villa residences. The Emperor of the French has here set us a good example. It is agreed on every side that one of the most pressing questions of the day is how to provide suitable homes for the poor. To some extent the question has been practically met, but only partially, and not so well as it might have been. Concrete constructions, it can be shown, are cheaper, healthier, and safer, and therefore better than ordinary houses. The objection in a sanitary point of view to all the common brick and lath and plaster constructions, in their absorbercy of moisture, and in closely-crowded habitations their absorbercy of

miasma. Concrete is not by one quarter so absorbent of moisture and damp as brick, while it gives a washable interior surface. Its great economical quality is that concrete costs about one-half the price of brickwork. The Waterloo model dwellings, which I have traced out the most remunerative of their kind, pay about 5½ per cent.; but had concrete been used at the building material instead of brick, we believe these houses would have yielded 7½ per cent. Labouring-class tenements, built of brick, on the most economical plan, will cost 100l. for living-room, bedroom, and scullery; the same thing can be done better in concrete at a cost of 75l. for each separate dwelling. We say better, for the walls and roof, besides being stronger, will be nearly impervious to wet or damp; the interior walls will be washable, the dividing walls less pervious to sound, which in close tenements is a great comfort, and the whole will be fireproof, for there will be nothing but doors and windows to burn. We hear that a number of gentlemen, including several well-known sanitary reformers and architects, convinced of the great advantages which this material offers in the construction of improved dwellings for the poorer population, at lower rents than has hitherto been possible, are endeavouring to form a company, with the object of erecting houses of this class in the metropolis, and generally of making capitalists and others better acquainted with the merits of concrete for building purposes of every kind.*

RAILWAY PARALYSIS.

The debate in the House of Commons on the motion of Mr. Crawford deserves to be attentively considered. It is perhaps more remarkable from the "masterly silence" of those who might have been expected to speak than from the mastery of the subject displayed by any of the actual speakers. It seems hardly credible that on a question affecting the character of more than a fifth part of the capital invested in railways not a single clear, commanding, intelligent voice should have been raised on behalf of the owners and creators of a property which now exceeds in amount the half of the national debt. Speakers on the contrary, seemed anxious to disclaim any right to speak as representatives of the railway interest, and the honourable member who, from his position and his ability, would have been most naturally regarded as a railway authority, carefully avoided expressing a decided opinion. The upshot of the debate was, that railway property is immeasurably and irrationally depreciated from the constant vagaries of legislative action, and from the total want of unity, or even of harmony, among those to whom the management of railways is committed. So people are to wait with patience for the forthcoming report of the Railway Commission. If that report presents a clear and masterly delineation of the state of the question, legislation may follow; and if such legislation should not happen to be in direct opposition to the conclusions of the report, we shall have reason to think

* With reference to a recent discussion on the subject at the Society of Arts, Mr. W. E. Newton writes,—"As some of the gentlemen who spoke after me appeared somewhat sceptical as to the strength of concrete and its applicability for the construction of buildings, and seemed to think that the advocacy of this material was an "amiabile weakness," it may perhaps be interesting to state the nature and composition of the concrete which has been successfully used in constructing the Emperor's "Maisons Ouvrières" in the Avenue Dumensil, Paris, and also that used by me in the works I have carried out here. In Paris we used one part of Portland cement (C. Francis & Sons) to five parts of large gravel stones, varying in size, from the size of pearl barley to that of peas. The fine sand is sifted or screened out, put on one side, and used for making stucco for facing the work. At this place I find it more economical to use burnt brick earth, or "brick ballast," as it is called, from which I sift out the very fine, and add 1 of Portland cement to 8 of ballast. This makes a very hard and strong concrete, and reduced the cement to 1 in 10 with perfect success. I burn the ballast myself, and it costs me under 2s. per cubic yard. Therefore, if we take 1 yard of ballast at 2s., and 2 bushels of cement at 1s. 1d., we shall have a cubic yard of concrete for 6s. 7d., to which add 2s. 3d. per yard for labour, and we shall find we can put up a superficial yard of 9-in. work for less than 10s. One gentleman ventured to question the possibility of building a wall 9 in. high in 9-in. work. I only say that this has been done by Mr. Tall, and the houses so constructed have been sold by him at a very large profit. From the numerous experiments I and others have made in concrete constructions, I have no hesitation in offering the following challenge to the sceptics, viz. that they shall build a wall of any dimensions in common brick and mortar, with or without Tyeerman's bond, and I will build one in concrete; and if the concrete wall does not sustain a greater weight than the brick wall I will forfeit to them 50s., and the cost of the wall, they undertaking the same liability to me should the brick wall not stand an equal test."

matters are somewhat improving. The general admission that no one knows what to do, is most humiliating.

The maxim that a prophet is without honour in his own country was regarded of old as a reflection rather on the incredulous listeners than on the disregarded counsellor who addressed them. In late times, however, incredulity has had somewhat the heat of it, as the only universal attribute of modern predictions is their non-fulfilment. Talleyrand laid down a memorable canon when he said, "*Ce qui arrive toujours est l'improbable.*" We are not, therefore, about to urge any claim to having foretold the present unprecedented continuance of public distrust. We have on more than one occasion pointed out that the course of events that would follow the financial shocks of 1866 must be one of a new and unprecedented character. Such was a natural consequence of the unprecedented nature of the convulsion. But that such a course should develop itself into a state of permanent and hopeless gloom, sapping the springs of enterprise, throwing doubt on all the relations of business life, and menacing, in the fears of some, still worse disaster, no public writer could have anticipated, or would have been justified in leading others to expect.

To inquire into the complex causes of this continued public gloom, to trace each disturbing element to its source, and to attribute to each the true and the false measure of its importance, is the duty rather of the historian than of the journalist. We shall not now further refer to this investigation than may be necessary for a practical purpose. It cannot, however, be denied, that the chronic panic now affecting the London money market is but a "case" of a state of distrust and despondency that is of far wider range. It is not confined to our own capital or provinces, it is not merely financial in its nature. It embraces every country of Europe, and shows itself in almost every instance where social action is called for. It is political, no less than financial, and moral, or even religious, no less than political. In France it is evident in the large accumulation of hullion in the coffers of the Bank, in the tone of the discussions in the legislative chambers in spite of the jealous care with which all occasions of debate are restricted and controlled, in every fresh act originating in the Imperial administration. In Russia it is to be found in the tenacity of relation between the noblesse and the autocrat, and in the features of the social revolution, so little understood in this country, in the position of the serfs. Of Germany it is needless to speak. The new appearance in Europe of the kingdom of Hungary, an event that at another time would have filled all men's mouths with wonder, is now hardly thought of in the press of our own affairs. But over all Central Europe confidence and security are as yet distant, if not promised blessings. We see Spain under the terror of martial law and wholesale deportation. Italy, having acquired Venice, and lost the great bond of a common object and a common enemy, is now at the threshold of her troubles, ministry and chamber throwing on each other the stigma of faction and of incompetence, and each with very good reason. Helplessness is at its apogee in Italy. Not that those who read the debates that occur in a certain hall in Westminster have much occasion to boast of the superiority of English constructive wisdom at this particular moment. The events of the day seem to grow beyond the control of the men of the day; and the want of cool heads to counsel and to plan, and prompt and ready hands to execute, is every day becoming more apparent. The habit of living under pressure, of doing all things at railway speed, of conversing and almost thinking by telegraph, is producing an effect which is aggravated by the perusal of that which, while far from being an immoral, is yet a demoralising literature. But the great master-eve underlying the whole framework of European society, and amply sufficient in itself to account for this general lapse towards chaos, is the untruthfulness of almost all public statements. Effect must be produced, and the price of effect is truth. In every political programme, in every Royal proclamation, in every prospectus of a public company, in every statement of party views, a certain amount of morality is claimed, which is to be found in words alone, and has no relation to actions. Swindlings cloaked under the guise of benevolence; and every crime which we have learned to reprobate in the history of the violence and falsehood of what we call darker ages, is perpetrated in the full blaze of the nineteenth century, and in the name of the Almighty.

Now, the point which presses on us at the moment,—for our political and intellectual chaos can only be incidentally alluded to,—is the particular manner in which the plague of universal distrust is now threatening our great railway property. Of the causes which have deteriorated that property we have not infrequently spoken, the main fact being that legislative apathy or connivance has allowed private rapacity to enrich itself at the cost of the railway proprietary in general. Notwithstanding the large sums unfairly added to the capital account of railway construction in Great Britain, we still have in our system of internal communication a property of immense value, and one that only requires rest, and moderate care, to become, perhaps, the finest property in the world. The annual intake from our railway traffic exceeds 8 per cent. on the whole 456,000,000. expended up to the end of 1865. The working expenses, at the same date, were about 48 per cent. of the receipts; so that a net earning of from 4 to 4½ per cent. over the whole paid and borrowed capital was actually distributed, in very unequal proportions, among the proprietors of railway shares, stock, and debentures. Of these various forms of ownership or lien the shareholders proper, or proprietors of the capital originally subscribed, and supposed, at the time of its subscription, to be sufficient to construct the lines now in operation, compose less than half,—ordinary capital representing 220,000,000. out of the 456,000,000. of total. The holders of preference capital and debenture stock represent 30 per cent. of the total proprietary, or 138,000,000. out of 456,000,000.; while rather more than 20 per cent. of the entire capital, or a sum of 98,000,000., is represented by mortgages, or debenture bonds, issued for a term of years. This mortgage capital is not, however, a mere temporary loan. It is as legitimate a part of the capital account as either of the two larger items. Its present anomalous form has arisen from the attempt to facilitate the raising of the requisite capital, and the scheme proved not unfitted for the purpose. But it possessed the radical defect of requiring the constant renewal of the loan or re-borrowing of the sum lent. It sends the railway proprietors into the money market as annual borrowers to an extent of perhaps from 20,000,000. to 30,000,000. It is true that the money borrowed with one hand is paid away by the other, but it has to be borrowed first, no matter for how short a time. In times, therefore, of commercial pressure, or of financial panic, the companies are placed in a false position. They have to borrow money when it is scarce, and that not to complete their works, or to aid in any way their earnings, but merely in consequence of the fact that they have committed, and the Legislature has sanctioned, the error of making them dependent on a hand-to-mouth renewal of permanent capital. It was another form of the very error that ruined the finance companies. Apart, therefore, from any sources of distrust peculiar to certain lines, the whole railway interest, perfectly solvent as it is, earning a net return of 4½ per cent., which is annually increasing, and which only requires time to augment and perhaps even to double, is subjected to periodical disquietude and possible heavy loss from this distinct cause of the terminable nature of debentures.

If this simple fact be kept in view, it cannot be impossible to find a remedy. The case is not that of a spendthrift who would borrow on his hopes; but that of a landed proprietor who seeks to renew a mortgage, the interest on which amounts to only a seventh of his rental. The condition necessary to give confidence is that the security should be a prior one on the whole estate, and that a receiver should be appointed to collect the interest direct from the income of the property. This might, we suggest, be arranged somewhat on the following plan:—

1. A new consolidated railway 4-per-cent. stock to be created and issued to the public under the following guarantee:—

2. The several railway companies to be allowed to underwrite this consolidated stock to an amount in no case exceeding a sixth of their expended capital.

3. This, however, to be allowed only after an independent examination of the debenture issues of the several companies, and verification of their perfect regularity.

4. Three months before the date of the payment of each half-yearly dividend of 2 per cent. on the consolidated stock, the entire traffic receipts of each line to be handed over to the trustees, to be appointed as hereafter mentioned, until the amount of 2 per cent. on the stock

underwritten by the directors of such line be paid to such trustees.

5. The trustees to be three men of adequate ability, and known integrity, who shall devote their whole time to the duties of the post at an adequate salary, and who shall be appointed, one by the written suffrages of the directors of the subscribing railway companies, expressed by their respective chairmen, one by the directors of the Bank of England, and one by her Majesty's Government.

6. A general secretary, a consulting engineer, and an accountant, or audit secretary, to be appointed to attend the trustees, with such further staff as might prove needful.

7. The payments received from the subscribers to the consolidated stock to be rateably applied by the trustees to the paying off of the mortgage debentures of the subscribing companies as they mature, a general statement of the whole of such mortgage debt, and of the periods at which it will mature, having been drawn up in the first instance as a guide to the proceedings of the trustees.

8. Power might be given to any holder of existing debentures to verify his documents on the payment of a fee, and to ascertain how far they would be covered by the engagements of the company that had issued them, in reference to payment from the trustees.

By the adoption of this plan, some eighty millions of a guaranteed stock, fully equal in its claims on public confidence to Consols themselves, would gradually replace an equal amount of what in fact are only long-dated promissory notes. Each company would be relieved from the greater portion of the anxiety and expense attending on the constant renewal of debentures. A sixth part of the railway capital of the country would be permanently settled at a rate of interest somewhat less than the mean net earnings of all the railways noted, so that the original owners would benefit by the certitude of payment, as well as, in most cases, by a slight reduction in the rate of interest. No interest would be interfered with. A perfectly safe form of investment would be offered to the public, and that without augmenting the public loan. And the directors of every railway, when freed from a harassing and unretributed portion of their anxieties, would be able with a better heart to devote their attention to their proper functions of facilitating and developing traffic. The great cause of chronic distrust would be removed from the market of railway securities, and a revival of confidence must eventually follow so great an increase in the stable character of railway property.

SANITARY MATTERS.

Condition of Newcastle-upon-Tyne.—The two reports bearing on the sanitary state of the town already alluded to in our columns have been published under the auspices of the Corporation, and are now under their special consideration. One is a report by the sanitary sub-committee of the Town Improvement Committee; and the other by the Public Health Committee. The former document gives an abstract of the measures taken by the Town Improvement Committee acting as the sanitary authority, and contains suggestions which the Town Improvement Committee unanimously recommend for the careful consideration of the council. The sanitary sub-committee state that they instituted a system of inspection, the results of which they embody in a table. Of 23,566 rooms inspected, about two per cent. of which, 408, were uninhabited, and the rest occupied by 55,366 people, or nearly one-half of the population within the borough; the result is that about one-eighth of these houses had not, at the date of the inspection, in the opinion of the inspectors, the means of good ventilation; that one-eighth of the houses was without water supply, either from the Water Company or other legitimate sources; that a fifth of these houses were without any privy accommodation; that the drainage of two-thirds of the houses only was good, and that, of the remaining third, more than a third, or an eighth of the whole number, was without any drainage; and, lastly, out of 55,366 persons, 7,779 persons lived in rooms under 300 cubic feet for each person, or about one-seventh, while the remaining six-sevenths, or 47,587, had above 300 ft.; but 37,012, or two-thirds, had above 400 cubic feet. The Town Improvement Committee recommend the adoption of the "Labouring Classes Dwelling Houses Act, 1866," and the "Labouring Classes

Lodging Houses Act, 1851," incorporated therewith, and that it be referred to the Town Improvement Committee and Finance Committee to negotiate a loan from the Public Works Loan Commissioners, for the erection of dwellings for the labouring classes under the first Act; and further, that the committee be authorised to prepare plans for such purpose on a site the property of the corporation, or to be otherwise acquired, and to submit the same to the council for their approval. The Public Health Committee travel over similar ground to that traversed by the Sanitary Sub-Committee, and they arrive at virtually the same conclusion. To the reports are added appendices, in which some valuable statistics are given.

Longton.—Several summonses—the first of a series—against persons for crowding houses so as to make them nuisances and injurious to health, have been heard at Longton Police Court by the sitting magistrates. The Town Clerk was the complainant, by direction of the Town Council. The charges were brought under the 18 & 19 Vic. c. 121, s. 27, and were proved by Mr. Allen, surgeon, one of the medical officers of the borough. In the first case, Mr. Allen said he visited the house (in Short-street) on the 10th of March, and found a man and his wife, both ill, and two children, in the living-room on the ground floor. Upstairs, in the bed-room, he found four adults—a man and his wife, and two women—and six children. The room was 12 ft. by 14 ft., and 7 ft. high, allowing 117 cubic feet of air to each inhabitant. Mr. Allen said the house had been more crowded than when he visited it—one family having removed from it; and there had been fever and small-pox in the house. In some of the cases orders were made for the abatement of the nuisances in fifteen days, and in the others the defendants undertook to comply with the law. The wife of one of the defendants appeared and said she and her family were living in their present wretched abode because they could not get a better place to live in, owing to the scarcity of houses. In addition to getting rid of some of the inmates of their houses, the defendants were ordered to cleanse them.

The Mephitic Atmosphere of the Underground Railway.—The attention of men of science and philanthropy is called by the *British Medical Journal* to this subject. A measure of air taken from the Underground Railway station at the Portland-road or Gower-street station, says the writer, would be pronounced by the physiological chemist a very villainous compound to be used as a respiratory material. The passenger who waits there a few minutes for a train feels an unpleasant choking in his throat, a smarting of the eyes, and is unpleasantly conscious of an objectionable and sulphurous odour. He is thankful to get out of the close chamber in which he is confined; but the unfortunate porter who shuts the door of his carriage is left behind. Instead of a two minutes' inhalation of poisonous vapours, he has a day of it; and in his behalf the directors of the company are asked to improve the ventilation of their stations. They should regard these stations as like the stoke-holes of a man-of-war; and, from the system of ventilation adopted on board an iron-clad ship, learn how to draw down from above a decent supply of air sufficient to displace, or greatly to dilute, the potency of the poisonous exhalations of locomotives which at present accumulate at these stations.

Death in a Night-soil Tank at Bradford.—The deputy coroner has held an inquest on the body of Abraham Maxfield, aged twenty-four, who died in a tank on the premises of Messrs. J. & W. Garnett, worsted spinners. James Maxfield, his son—Abraham Maxfield,—and William and John Anderson, were engaged in emptying this tank of night soil, received from eight privies connected with a shed on the premises of Messrs. Garnett. The tank is beneath the ground, was 7 ft. deep, and was reached through a manhole. They had been engaged for some time in lading the night-soil out of the tank with ladles which had long handles, and when the soil had been reduced to about 2 ft. in depth, Abraham Maxfield entered the tank in order to expedite the process by filling a bucket, for his associates to pull up through the manhole by means of a rope. He had not been down more than two minutes before he was heard to stamble. William Anderson, then in apprehension, immediately entered the tank in order to rescue Maxfield, but, though both were heard apparently on their feet, they soon fell in the tank. Anderson was dragged through the manhole by a rope, and it

was thought that Abraham Maxfield had laid hold of him, but Maxfield fell down dead in the night-sol. The body was recovered by a coal-rake. Death had been caused by the sulphuretted hydrogen gas at the bottom of the tank. James Maxfield also attempted to enter the tank in order to make an effort to recover his son, but was fortunately prevented. The witnesses said that no one had ever before entered the tank for the same purpose, that they had authority to do so, and that the deceased entered of his own accord. The jury returned a verdict of "Accidental death."

Howden.—This town has for some time past suffered from a severe visitation of fever, caused, it is supposed, by the unclean state of the Old Derwent, which is used as a town sewer. The Wesleyan day-school, which abuts on the drain, has been closed in consequence of the epidemic. The master of the school and a number of the pupils have died, and a great portion of the remainder have suffered severely, one medical man having had thirty-seven cases under his care at one time.

Wrexham.—A number of cases of typhus fever are reported from Wrexham, some of which have terminated fatally. It is believed that want of proper drainage has been the chief cause.

Cheltenham.—The improvement Commissioners of this town, who are forbidden to continue to pour the sewage into the Chelt, have resolved to lay 120 acres of land for irrigation at Boddington, two miles from the town, and to borrow 17,000*l.* to pay for the land, which will cost 10,000*l.* and for the necessary works. Landowners representing 400 acres have signed an agreement to take the sewage upon their land, paying 10*s.* per acre, and it is only intended to irrigate the land proposed to be purchased when the sewage cannot be applied to the adjoining land.

News for Miners and Others.—A little instrument, called a box respirator, has been invented for safely breathing smoke or other noxious vapours, at fires, in mines, wells, tunnels, or any underground workings. The inventor is Dr. Clement King, who has for many years been advocating the sanitary inspection and the more healthy working of our coal-mines. Messrs. Shand & Co., Upper Ground-street, Blackfriars, are said to be able to show the invention to any who may be interested in its use.

SOCIETY OF BRITISH ARTISTS.

If it were not for the difficulty of selection, or rather of election, to represent the constituency with a proper regard to parity, it would be scarcely necessary to extend the short list of pictures given last week from the Exhibition of the Society of British Artists; for they must favourably answer this purpose in some opinions, at all events.

The collection is unusually bare of principal points,—a want that suggests the question, Why is the corporation making no efforts to strengthen the ranks of its members? Unless they have resolved that the Institution shall die with those who are its present representatives, the managers appear to be very blind to certain consequences. Co-existent with the rarity of new talent, devoted to the interests of the community—the rarity of new names even to swell the list—is the dearth of good pictures contributed by casual exhibitors, a source of assistance that must sooner or later fail completely, if the vast absorption by special patrons of the arts and artists of everything saleable or that would be likely to continue year by year. It becomes less easy to account for the little distinctiveness that successive collections at these galleries bring with them; less easy to do more in noticing them than by an abstract comparison with what they too closely resemble to afford a chance of remark that would not be a repetition of, if it is not to stultify, a former one. On the present occasion it is only necessary to say that there are many such productions of the class already indicated, and much of the customary description of landscape composition,—deeds by which Messrs. J. B. Pyne, A. Clint, J. Syer, J. B. Pettit, and others, have been wont to proclaim tenancy of the respective grounds on which their several reputations are based.

It is by recollection of what Mr. Pyne, and the few that may be associated with him, have done in the long practice of their art, that a contrast of the present with the past aspect of these

walls is made visible: all honour to him and his like.

Mr. G. Cole is conspicuous; for, with some present and always clever instances by which he denotes his preference for the glowing sunset effects of hot summer and autumnal evenings, he proves that he can be equally happy in other seasons; and appears invigorated by the change to a cooler and more hazing atmosphere: see "Spring Time" (171), so welcome to all—when banks are spread with clustering purple and primrose blossoms, and hark-strippers are at work upon the felled oaks, for sometimes spring is very like winter. The agreeable freshness of this production is one of its many merits; years have elapsed since English pastoral, and a more comprehensive illustration of Nature's varying charms, used to be themes dilated on by many of the Society's earlier and ablest supporters; but this was before innumerable railways cut up broad expanses and made hard lines for the painters of panorama on large canvasses, without taking them to "fields and pastures new." The landscape department has no longer the predominance of former times, or it becomes less effective from monotony. Success appears to heget eternal progenies of its first causes; and if it attain its usual level of excellence even of later years, there is little to evoke a new form of eulogy.

Returning to the figure subjects, Mr. W. Bromley's scene from Shakespeare, describing the interview between Queen Katharine and Cardinals Wolsey and Campeius—"King Henry VIII," act 3, scene 1 (9)—entitles him to acknowledgment of his labour in a good cause, though he has not perfectly justified his choice of so difficult an undertaking by the result of it: the action of the Queen, is totally out of propriety with the text, and all the actors want dignity, and to become habituated to the clothes they wear. Another, an explication of Hamlet's report, of how "Young Arthur's death" had affected the people, exciting apprehension and dismay, is far more satisfactorily rendered, though with no great evidence of such inspiration as the living words of the poet would account for so readily. With good colour to recommend it, it wants dramatic expressiveness, for it is almost as tame in this respect as Mr. J. H. S. Mann's depiction of placid enjoyment of an "Afternoon at Chioggia, Italy" (348), with a hurdy-gurdy-man, etherialized into a minstrel by the aid of a verse from Byron's "Beppo," to assist. This is a carefully-studied and well-painted composition, but somewhat insipid in matter as well as from excessive softness in the method of its execution.

"The Morning Walk" (360), by C. W. Nicholls, though the lady engaged in it is of the most modest and unobtrusive appearance, is very attractive for its good painting; and there is something to repay a look at "Nanman's Wife and her Helweg Maid" (408), by Mr. A. W. Bayes, putting aside the objection that there is nothing Hebrew about either of them beyond what is nominal.

Mr. J. Ritchie can reproduce broad open daylight effects with some of the fidelity of a camera. It is to be regretted that he could not have invested his "Scene at the Hustings: the Contested Election" (198) with more vitality.

"The Despatch" (219), by Mr. A. H. Tourrier,—a terrace in Spain; "The Duenna and her Charge" (227), by Mr. W. M. Hay; "A Surrey Lime-kiln" (237), by Mr. A. Frazer, R.S.A.; Mr. W. J. Montaigne's episode from history "London, A.D. 1715; Rebel Prisoners from Preston" (225), noticeable more for promise than performance; "The Sicilian Vesper" (349), by Mr. P. Priolo; and Mr. R. Dowling's "Incident in the Siege of Gloucester, 1643" (566), a good characteristic subject that offers wide opportunities for an apt enunciation, though here but partially represented, are attractive for some quality or other. In noting more of those likely to be popular, Mr. J. C. Waite's domestic incident of "Pleasing the Bairn" (192), a family group of cottagers, with the baby master of the situation, must not be omitted; nor Mr. T. Gray's "Sleeping and Waking" (375), wherein the little sister, placed to watch at the cradle of a younger child, has succumbed to quietude and fatigue and is asleep, whilst her charge is very wide awake indeed, clapping at the sunbeams for amusement; and Mr. J. Locker's "Fairy Tales" (471), also pretty and naturally arranged. But neither of these, or their kind, has the brilliancy and force of Mr. A. H. Burr's capably painted boy, "Nursing Baby" (580), that make it so conspicuous an item, and, though composed of

the simplest materials, one of the best works in the collection.

Mr. J. Hayllar's book-learned child, who is administering homeopathic doses of moral philosophy to a gaunt old gardener who "Never had no Learning" (430), is the only at all interesting point in a dark and flat picture; and though the incident is a pretty one, it is not agreeably told.

The water-colour drawings are an exhibition to themselves; with such works as Mr. W. W. Gosling's "Winter" (700), and "Hoar-Frost Evening" (856), to lead in the section of landscape; and Mr. J. D. Linton's "Georgione" (948), though rather hack in its elaborated finish, entitled to a similar distinction to head the figure department.

LONDON "REVISITED."

"Our first visit was to the Lions."—*Addison, "The Freeholder," No. 47.*

Who has not read and re-read, and has by heart, like our inspired Poet Laureate,—Wordsworth's "Yarrow Unvisited," his companion poem, "Yarrow Visited," and the triumvirate tripartite poem of "Yarrow Revisited"? The poet of Rydal and all time has suggested the above title—will our readers kindly be attracted and lend willing eyes to what we are about to tell?

In a self-chosen exile from London, of some six or seven years, we of course had all but forgotten the capital of the world, and were about to turn to a "Gazetteer," or McCulloch's "Geographical Dictionary," for some account of "London as it Is,"—when we hethought ourselves that we would see London again for ourselves. What, we asked, is there new there to attract us? Madame Tussaud, or the tombs in the Abbey; the ball of St. Paul's, the Thames tunnel; or that great incentive to our forefathers and to ourselves when young, "the Lions in the Tower." Alas! the Lions in the Tower, and "Martin," that all-attractive bear, are no longer to be seen. "The Queen's Bestia" are now, in 1867, all heraldic,—imaginary like the Scottish unicorn. But London we must re-see, and London must be re-visited for the sake of Edwin Landseer's Lions, and Theodore Hook's immitable lies:—

"They cut his throat, from ear to ear,
His brains they batter'd in;
His name was Mr. William Weare,
He dwelt in Lyon's Inn."

But our thoughts carry us to the year 1824, and this is 1867—just 300 years since A.D. 1567, when, miraculous to say! as a certain author records, "only fifty-eight Scotchmen were found in London." There were no metropolitan police then in Scotland-yard. London in 1567 was without a Superintendent Sir Richard Mayne, or an Inspector Tanner. Hardly a Bow-street Townshend then, though Dogherry's did exist.

"To gae to Lon'on's na a walk," an old song tells us, much a favourite with Robert Burns. To London, therefore, we must go, not on foot, but by train: "London must be re-visited." What is London like? We were almost born—certainly lived for full six years—within the sound of Bow bells. We love Gresham's grass-hopper, and the dragon on Bow Church; have more than a liking for Temple Bar; and well remember when the Northumberland House lion looked in a different direction, and showed a true respect to glad chairs, warm furs, and unmistakable Mansion House *twirl*.

Convinced of the necessity of re-visiting London, we set off *via* "the Great Northern," for our modern Babel. Having and cultivating a lady's longing for novelty, we made our way from Pugin-famed King's-Cross to Trafalgar-square, and all to see "the Lions." What Lions? Why, Sir Edwin Landseer's lions, and Baron Marochetti's bronze. We are "well up" about lions,—as good as Mr. Gordon Cumming, a Van Amburgh, or Lord Lyon King-at-Arms himself. We are "up" like a herald painter or publican in all kinds of lions from red to black, from "The Great" to "The Little." What interest must we therefore take in Sir Edwin's handy-work. Great were our expectations. We looked to find one lion at the very least, resembling the famous description in Mr. Pope's "Bathos,"—

"He roar'd so loud, and look'd so wondrous grim,
His very shadow fear'd to follow him."

But Landseer's lions, with all their cleverness, fail to frighten or surprise nursery-maids and children. Some of our contemporaries are too

hard upon Sir Edwin for his lions. They affect not to see any merit in them,—write of them as maids of thirteen talk of puppy-dogs, and would inflict upon the artist the punishment which Lord Cadogan said was due to Bishop Atterbury when a prisoner in the Tower. "What shall we do with the man?" was asked—"Why, fling him to the lions," was the answer.

The court newsmen kindly informs us that our beloved Queen has "perambulated" the Landseer lions; but what her Majesty thought of them we are only suffered to conjecture. This is to be regretted, for her Majesty, it is well known, is skilled in art, and the true British lion, as Addison's Tory fox-hunter assures us, knows at a glance the legitimate from the pretender. But Sir Edwin Landseer's lions are fine; not to be matched, we fear, in animated art, with the "Parian Dog" of Alcibiades, now at Duncombe Park, or the "Eagle," once at Strawberry Hill, that delighted Walpole and inspired Gray.

We well remember the time when the Nelson monument in Trafalgar-square, in London, was first started. Sir Francis Chantrey was then alive (he died in 1841), and was on the look-out for "the job," as it has proved. Designs were sent in—original designs were asked for—and few would compete. Chantrey, of course, would not risk his well-earned reputation. The designs were barren of invention or of meritorious reproduction in the noble art of sculpture. The Committee of Taste (so-called or self-called) were all but unanimous in selecting Mr. Railton's column with Mr. Baily's standing statue of Nelson, formed of two stones from the Granton quarry. The capital is of bronze, cast from cannon recovered, by Pasley and others, from the unfortunate *Royal George*, rendered immortal in verse by the muse of Cowper (not him of Panshanger and the Woods and Forests in Whitehall-place). The statue was set up on the 4th of November, 1843; and the lions were wanting to complete the monument until the last anniversary of the execution at Whitehall (immediately in front of them) of King Charles I.

Unfortunate Trafalgar-square! It is the most ill-used square in London—Leicester-square not even excepted. We well remember when the Mews and the migratory menagerie of Mr. Cross (late of Exeter Change) occupied its northern or National Gallery side. Then, after a long interval, came the memorable fountains, recalling, to immense disadvantage, Versailles and the real Alhambra. Then Chantrey's equestrian figure of George IV., designed for the migratory Marble Arch (meant for Buckingham Palace) was set up; then came Dr. Jenner and Sir Charles Napier, and Sir Henry Havelock; but Jenner has been banished among the nursery-maids and children of *Lower Kensington* and *Upper Paddington*. Mr. Marshall's statue of a great benefactor to the human race deserved a better fate. Some of the largest subscriptions to its erection came from abroad—from Russia in particular. This should be better known.

Several quotations have been applied to the Landseer lions. We remember two that are not inappropriate:—

"And calm the terrors of their claws in gold."

But their claws are pacific enough, though they cost a fair share of Australian gold. The second, from Pope, we have already given.

In my next contribution I shall have something to say about the great buildings now erecting, or on the eve of erection, in London. What a golden age for English architects. What with Government offices, chambers, law courts, hotels, railway stations, private banks, &c., &c., our builders, if they lack originality, invention, and utility, do not lack either employment or good pay.

PETER CUNNINGHAM.

ELECTRIC LIGHT.—A French company has purchased the right to use Wylde's great steam electric machine in France, and will try it first in the lighthouse on Cape Griznez, whence, as is said, the light will radiate not only all across the Channel, but some distance into the southern counties of England.—Mr. Siemens has suggested the lighting up of buoys and beacons at a distance from the shore, by sending a current of electricity to them, through a submarine cable. In that way he proposes to employ the electricity generated by his machine. His method has been approved by the Commissioners of Northern Lighthouses, who intend to apply it to light the buoys and beacons that mark the most dangerous spots round the coast of Scotland.

TELEGRAPHIC PROGRESS.

It is stated that the scheme before Government for taking over the management of the telegraphs only waits till the Reform Bill is out of the way. The capital at present involved in telegraphs amounts to nearly 3,000,000*l.*, and the Government scheme contemplates an expenditure of 10,000,000*l.* to be devoted to the buying off of the present shareholders and debenture-holders, and the development of a scheme of postal telegraphs in all parts of the kingdom. Among the improvements which have been suggested at the General Post-office are the opening of numerous sub-offices in postal districts; the lowering of rates to an almost nominal sum, and rendering them uniform; the issue of telegraphic stamps; the provision of efficient staffs; and frequent periodic as well as express deliveries.

There are eighty places in England and Wales containing each upwards of 2,000 inhabitants with no telegraphic accommodation. This contrasts unfavourably with the Belgian and Swiss systems; for in these countries telegraph offices are abundant, so that in Belgium there is one office for every 15,000, and in Switzerland one for every 10,000 inhabitants. This is effected by a combination of postal and telegraphic administration.

There is now on trial at the chief office of the London District Telegraph Company, in Cannon-street, a telegraph printing instrument, producing letters printed in ordinary type by means of pressing small keys bearing the respective letters. It is worked by a combination of clock-work and electricity, and has now been in use for some weeks, it is said, without a single derangement.

The actual receipts from the working of the Atlantic Cables from the 28th of July last to the present date have averaged 813*l.* per day, including Sundays. The reduction of the Atlantic Telegraph rates from 20*l.* to 10*l.* for twenty weeks improved the revenue. A further reduction of prices is under consideration. Mr. Cyrus W. Field left England on board the *Great Eastern*, after having completed a contract with the Telegraphic Construction and Maintenance Company, for the manufacture of a cable to be laid between Placentia (Newfoundland) and Cape Breton. The successful completion of this additional link to the chain of connexion now existing between the Old World and the New, will, in time of peace at least, insure absolute security and certainty of communication between the two continents.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

On Wednesday, the 10th of April, Mr. Godwin, V.P., in the chair; numerous interesting objects were exhibited by Lord Boston and others, including a photograph of the portion of a stone cross recently exhumed at Kelsø, and probably one of the four named in the charter of David I. as bounding the abbey sanctuary. It was thought to be of the tenth century. Mr. Gmston exhibited three medals of Elizabeth's reign, two of pewter and one of brass, with a remarkable bust of the Queen. The Chairman commented on the superiority of the productions of the medallists of former times over those of our own day.

Mr. E. Roberts exhibited a fac-simile drawing of the inscription in iron, dated 1687, on the poor-box in Bride Church, Sussex. The letters are many of them coupled, and some are smaller than the others. The inscription is,—

"SERVE THE LORD AND REMEMBER THE POOR."

The Chairman drew attention to the vast number of remains from the Sussex forges to be found, and especially memorial slabs in churchyards; and inquired if any similar iron slabs were known in London; but no one appeared to be aware of any.

A paper on "Pre-Angustin Christian Symbols" was read by Mr. Grover; and he produced drawings of several instances of the *Cirò* and other marks, which he conceived were Christian, and were certainly of Roman date. One on a pewter stamp, found in the Thames, was of the time of Valentinian. In the discussion which followed, the importance of the subject was fully acknowledged. Mr. Thos. Wright considered, however, that the marks called Christian did not necessarily imply Christianity. Dr. Giles said that Angustin did not find Christianity in Eng-

land, but in Wales, and the English derived it from the Scots in Ireland. There was no Christian in Britain for 200 years after Christ, nor in England, to any extent, for 400 years. Mr. Hills said that accounts of Christianity in Ireland were authentic only from 450, in the time of St. Patrick. Dr. Todd's life of that saint showed that the Irish were heathens before his time. The close communion of Wales with Ireland was, he thought, evidenced by the fact that St. David of Wales is one of the chief Irish saints.

A perfect seal of the Commonwealth was exhibited by Mr. Gmston. Surprise was expressed that it had escaped the customary breaking-up, on the termination of the Commonwealth.

Mr. Syer Cuming exhibited a new batch of forgeries in zinc, belonging to the Rev. Mr. Simpson, Mr. Bailey, Mr. Brent, and Mr. Mayhew. They are all of fresh forms, and more calculated to deceive than the leaden forms. They consist of arms, gannets, legs, ampulle, helmets, bottles, &c. Mr. Bailey said he had been informed that some thousands were being exported to Germany. The chairman thought that it could not be too generally known that these manufactures were being continued and varied, so that the unwary might be warned against purchasing them. They exhibited much misplaced ingenuity. Mr. Cuming also read a paper on Cetacean Bones found in London, and produced several specimens, one belonging to Mr. Bailey, being a bone of an enormous fish, perhaps 100 ft. long. In answer to inquiries Mr. Cuming said these were all found in similar beds of gravel, and with them bone pins. The question chiefly was, whether these bones were articles of commerce, or whether the fish were natives of British waters. Dr. Giles said that Juvenal referred to the British whale (though it might have meant a porpoise).

The Chairman, in thanking Mr. Cuming, referred to his energy and knowledge, displayed on almost every archaeological subject; and in announcing the adjournment of the meeting took occasion to mention that it was not generally known what was intended by the section, "History of Labour," in the Paris Exhibition. It would be a collection of specimens and illustrations of handiwork of all ages, and he expected that it would be one of the most marvellous expositions of archaeological subjects ever brought together. The Rev. Mr. Simpson said that he understood the Irish academy was fully aware of the importance of the Exhibition, as they were to send all their gold ornaments.

CANAL PURIFICATION AT MANCHESTER.

At the recent assizes for the Salford Hundred, when an application was made to postpone the trial of the indictment against the Bridgewater trustees for fouling the water of the canal, it was mentioned that the trustees had employed Mr. Cawley, C.E., of this city, to carry out certain works which it was expected would abate the nuisance and prevent its extension. The works planned with that object are intended to cut off the river Medlock water from the Bridgewater Canal by means of a new lock, which has been constructed a little below the Egerton-street bridge, and to supply the canal exclusively with water from the Rochdale Canal. The considerable difference in the levels of the two canals makes this alteration comparatively easy, as from the Rochdale Canal to the Bridgewater Canal there is a fall of 8 ft. From within the Castlefield lock an iron pipe of very large diameter is taken through the rock and under the bed of the canal to beyond the new lock, a distance of about one-third of a mile, and every time the water in the lock has to be lowered it is let out through the pipe into the Bridgewater Canal. With respect to the river Medlock, the larger portion of the water was many years ago diverted from the original course of the river (which now forms a reservoir or basin for the Bridgewater Canal), and passes, by means of a tunnel, to a point beyond where the canal begins to follow the track of the Altrincham railway. A portion of the Medlock water still supplies the head of the canal, but none of that water passes beyond the new lock, which has been constructed for the especial purpose of turning back the Medlock water through a culvert into that river near its junction with the Irwell, and provision has been made to prevent any rise of the Medlock water. Owing to this, and to the increased body of water in the other portion of

the canal, derived partly from the Rochdale Canal and partly from the abolition of water-wheels, the set of the water is rather towards Manchester. The end attained by the works, which have been executed at a great cost, is that the unfouled water of the Rochdale Canal is prevented from mixing with the Medlock outflow, and so contaminating the Bridgewater Canal.

It is to be hoped that this may be effective, and that Brindley's great engineering work, a canal on one level for above a score of miles, may be made as pure as it was when first formed.

THE FEN DISTRICT INUNDATIONS.

In the Nisi Prius Court, before Mr. Baron Martin and a special jury, the case *Peck v. The Marshland, Smeeth, and Fen District Commissioners* has just been under trial. The plaintiff complains of the fact that, after making certain drains under various Acts of Parliament, they (the defendants) took upon themselves the making of it, and did then forthwith maintain it; that the plaintiff occupied land near it; and that the defendants so negligently and improperly maintained it that the sluice burst, the drain overflowed, flooded the plaintiff's crops, and injured his lands; and the defendants pleaded "Not Guilty," and denied that they assumed to themselves the duty of maintaining the sluice.

In opening the case to the jury Mr. O'Malley said that the main question for the jury was to decide whether that of the negligence of the defendants and the points raised by the pieces, for as regarded the question of the amount of damages, that would be settled in the same way as was done in the case of "*Coe v. Wise*," by an arbitrator.

The plaintiff was called, and in the course of his evidence said, that on the 4th of May, 1862, the Middle Level sluice burst, in consequence of which the lands were flooded. After that more water came up with the tide. Mr. Wright, the chairman of the Marshland and Smeeth Commissioners, then gave directions that some piles should be driven against the north side of the sluice. These were driven in, and the effect of which would be to disturb the silt and in carry it more easily away. No engineer was present while the piles were driven. On the night of the 4th of October, 1862, the sluice of the defendants' drain blew up. The drain held the water that came up that night, as it was a low tide, but on the 8th it overflowed and flooded the plaintiff's land. The overflow continued for three days, and the water was not off the land for six days after that.

In the course of his cross-examination this witness said that the banks on both sides (close to the spot where the inundation took place) had been pared away by the defendants and the Commissioners of Sewers for brick-making, admitting that had they not been so pared away his lands would not have been inundated.

Mr. Arthur Saunders, a district surveyor and engineer, at present engaged in engineering works at Sandringham, said that he had been called in to inspect the sluice after the accident, said that the cause of accident was a hole in front of and in the sluice, which hole ought to have been filled up. The effort to avert further danger by driving in piles as protection only increased it, as this driving in shook the sluice.

Mr. Keane, in opening the defendants' case, went on to say that he should call skilled engineers to show what was done in the efforts to cure the evil we see the right thing—viz., pouring down sluice and driving in sheet piling; that the hole was filled up and protected in the proper manner, there being a solid invert at the bottom of the sluice, and so long as this was sound the hole spoken of was of no consequence.

Sir John Rennie said that he built the Marshland sluice in the year 1832. The sluice was built upon a very strong principle, having a timber floor with piles; then there was an inverted arch filled up with hydraulic lime. Between the invert and the second floor there was a concrete, this second floor forming a flooring running right through the sluice. On either side there were doors to keep back the water. I have heard, said the witness, that three planks of the roadway have been removed, and that a hole appeared; but I am quite satisfied that nothing could have damaged the invert. The water may have leaked in between the two floors, but I am sure it did not get in through the real floor below. In my judgment the efforts made to correct the mischief were proper. Driving in sheet-piles and filling up the hole with "clunch" was, in my judgment, the right method to be adopted. Clay might do in some cases; but where there is likely to be swell or current it would be likely to heave and be washed away. I was called in after the Middle Level sluice had failed, by the landowners in September, 1862. I examined this sluice among others, and saw nothing calling for immediate action. There was then no indication of its requiring a dam. My attention was not called to the bank. I did not see the hole; it did not seem to me, from what I have heard, to be anything serious. It seems to me that all was done which reasonably could be done.

In cross-examination Mr. O'Malley put a letter into the witness's hands, dated October 8, 1862, addressed to the solicitor for the present plaintiff, in which he said, "I had the Marshland sluice been properly looked after, this measure had been discovered," and that the accident must be necessarily attributed to the neglect of proper precautions.

The letter, which was a very long one, and contained other expressions leading to the inference that Sir John was impressed with a notion that there had not been sufficient care and precaution in the protection of the sluice, was written in a copying-machine, and corrected by Sir John himself.

Mr. Pews, a civil engineer in King's Lynn, of considerable experience and large business, who had been engaged in the building of the Marshland sluice, said that, from what he heard during the plaintiff's case, all that was done to avert the damage was correct, and there was no danger to the flooring from concussion in driving the piles. He also said that a hole 6 ft. deep in front of the sluice was not dangerous.

His Lordship summed up the evidence to the jury,

leaving to them one question only, viz.—Did the defendants use due and reasonable care in viewing the sluice in repair? The other question, whether the defendants were under any responsibility to the plaintiff was a legal one, which would have to be considered by the Court of Exchequer, and probably by the House of Lords. He then stated the facts, going through the evidence given on both sides, and in reading the letter written by Sir John Rennie to the plaintiff's solicitor, Mr. Wilkin, above noticed, said that it was most unfortunate to see letters of this kind, as their effect was to throw don't upon all such evidence as that intended to be given by these skilled and expensive witnesses.

The jury immediately found a verdict for the plaintiff, expressing their opinion that there had been great negligence.

DRAINAGE OF THE FENS.

In treating of the Witham out-fall, Mr. Wheeler says:—

"After a thorough consideration of the whole subject, I am led to the conclusion that the present defective condition of the drainage of the Fens is entirely owing to the state of the outfall, and I have no hesitation in saying that the evil will increase at a very rapid pace, unless some remedial measures be at once taken."

The whole subject may be thus summarized:—That the fens have been this winter in a deplorable condition, owing to the defective state of the drainage.

That such defect is attributable to the deterioration of the outfall, caused, principally, by the gradual encroachment of the sands on the sea, and the consequent silting up of the estuary.

That no works of interior drainage can prove of any benefit until the outfall is improved.

That the improvement of such outfall can best be obtained by pushing the channel forward, as the sea retires.

That the work immediately required, is the training of the waters by fascine work, for a distance of about two miles and a quarter below Hobb-hole sluice.

That the benefit derived will be the immediate lowering of the water in the upper portion of the river to the extent of 4 ft., a general improvement of the channel below Hobb-hole, and the formation of the shifting sands, which now encumber the river, into agricultural land.

That the cost of this will be about 12,000*l.*, the annual charge for which will be 600*l.*

That the money required can be raised, and rates levied, without the expense of obtaining an Act of Parliament, by the formation of an Outfall Board, under the powers of the "Land Drainage Act of 1861."

THE RECORD OFFICE, FETTER-LANE.

The central tower of the Record Office, which is now nearly completed, is to have on each of its four sides a statue, under a canopy that stands above the parapet—the Empress Matilda, Queen Elizabeth, Queen Ann, and Queen Victoria. The execution of these statues has been entrusted by Mr. Pennethorne to Mr. Joseph Durham, A.R.A. The statue of Queen Victoria was the first placed in its nook, and the Empress Matilda has just now been erected. Queen Ann will be there before the 20th of April, and Queen Elizabeth by the 18th of May; and thus the tower will be completed, and all scaffolding removed, by June.

The statues, which are admirably executed, are above the size of life, a fact that would scarcely be guessed from below.

RAILWAY ACCIDENTS IN 1866.

The Board of Trade have issued the concluding part of their reports on railway accidents for the past year. It appears from this document that thirty-seven accidents took place during the last seven months of 1866, and that fifteen persons were killed and about 250 injured. The most important accident was that which occurred on the Cambridgeshire railway on the 6th of September to an excursion train, in consequence of the presence of some material between the point and stock rail, by which the points were prevented from closing. The train was thrown off the line and six persons were killed. The line had never been opened for passenger traffic, and the company were guilty of an illegal act in conveying passengers without the Board of Trade certificate. It does not appear, however,

* "Remarks on the State of the Outfall of the River Witham, with Suggestions for its Improvement." By W. H. Wheeler, Surveyor to the Corporation of Boston. Dingwall, Boston.

that any steps were taken by the Board to punish the offenders, as they have power to do under their Act of Parliament. In the present case, nobody seems to blame except the company, and the pointsman had no notice of the return of the train. The permanent way appears to have been in good order, and the points at which the accident took place had only been put in about a fortnight before. Referring to other accidents, the officers recommend that where possible the points should be locked in connexion with the signals, so as to prevent the signals indicating "all right" when the points are in reality all wrong. They insist in several places on the importance of this. One of the practices followed by many railways is strongly condemned. We allude to that of detaching carriages at stations where the train does not stop. An accident occurred at Tunbridge from this cause on the 30th of September, which "appears to have been the result of a hazardous system of working, and the inexperience of the guard of the detached portion of the train." Major Rich says further, "The system of detaching parts of trains is objectionable, as it must at all times be attended with risk, but particularly when the points have to be altered so as to turn the detached portion of the train on to another line immediately after the front part of the train has passed, as was the case at Tunbridge." In spite of this the South-Eastern Company still continue the practice. The same officer also protests against the objectionable system of running goods-wagons with passenger-trains, and particularly when the goods-wagons are placed in front of the passenger-carriages. A large number of these accidents were due to the neglect of signals and disobedience of orders; but when men are kept on duty for twenty-two hours, as was the case with the driver and fireman concerned in an accident near the Bramley Station, who can be surprised that their attention should flag a little? "Their ordinary duty," says Captain Tyler, "extends over sixteen or seventeen hours." There is sometimes a difficulty in dealing with cases of neglect, in consequence of the previous good character of the delinquent. It is right that a man should be punished in some way for inattention, but when a servant has for twelve years performed certain duties without a single complaint against him, it seems hard that he should be dismissed from the company's service, especially when, to quote Captain Tyler, the oversight was "one which might have been expected, sooner or later, from any man placed in such a position and with such appliances; and I consider that the real cause of the accident was the want of a locking apparatus in connexion with the points and signals at the junction." In cases of an important accident most railway companies are anxious to "do something," and this desire either takes the form of "giving every possible facility for obtaining an insight into the cause of this terrible calamity," or else of discharging an old and valuable servant as a sort of propitiatory sacrifice to the god Public Opinion. This is beginning at the wrong end, and if companies would follow out the recommendations of the inspectors oftener than is now the case, Colonel Yolland, Major Rich, and Captain Tyler's duties would, at all events, be very much lightened.

THE DRAINAGE OF GREAT BERKHAMSTED.

A COMMITTEE having been appointed by the vestry of Berkhamsted to consider the subject of drainage and reported, have recommended drainage on the principle of separating the rain-fall from the sewage, at a total estimated cost of 5,500*l.*, of which 3,751*l.* would be required for the construction of drains and works as per engineer's plans and report. The method of separation advocated by Mr. Menzies, and of which we have ere now spoken, is that recommended by the committee. The vestry having considered the committee's report, requested the reporters to make inquiries as to the earth system and again report. This the committee have now done. They state that they cannot recommend the application of this system to Berkhamsted, and append a report by Mr. William Longman, who is the churchwarden of Berkhamsted, containing a series of objections to the earth system as applied to a town; such as the enormous quantity of earth required, and the impracticability of using such earth as suggested, several times over, as householders

would revolt against such a practice; the necessity still for drainage to carry away slops of all kinds which could not be sent through the surface drains to pollute the streams; the ponderousness and impracticability of carrying out such a system at all except in isolated localities; and the intolerable nuisance and source of disease which it would inevitably become. In all this we fully agree, as our readers know. The application of the Local Government Act to the parish is advised.

GAS.

The gas movement, as no one can deny, was exclusively originated and carried on for years by the *Builder*, against the high prices and the bad gas of the gas companies, both in London and the provinces, so that our concern for the public interests in this matter cannot be doubted; but we must protest against the attempt which is now being made to reduce the maximum dividends of gas companies from 10 to 7 per cent. per annum. The gas companies have not kept faith with the public: their gas is abundant, and their prices are still too high: they have juggled with houses and maximum dividends, in order to frustrate the end which the Legislature had in view of reducing prices for the public behoof, and therefore they have brought down this attempt to reduce their dividends upon their own heads; nevertheless, we must record our opinion that this is an injurious and uncalled for interference with the property of shareholders, who are not seldom widows and orphans, or persons entirely dependent on the profits of gas companies. Injury to these is what we cannot be justly charged with: our successful endeavours to reduce the prices of gas, and improve its quality throughout the whole country, ever tended, as we always insisted they would, to improve the dividends of companies as well as to promote the interests of the public; and at length it became quite common for directors themselves to propose reduction in price for the very purpose of raising their dividends; and they seldom if ever failed to raise them by doing so. In reducing their prices, however, and improving their gas, so as to hold forth strong inducements to the public to fill private dwellings with cheerful gas lights, by all means let the companies earn the profits they have heretofore been allowed to earn; and 10 per cent. per annum cannot be regarded, in commercial transactions, to be anything like usurious interest in return for public services. Though the gas which the Imperial gas company supplies the Londoners with is now most shameful stuff, we regret to observe from statements in the papers that the price of their shares has fallen from 55l. to 63l. in consequence of the threatened Bill now in Parliament, and that the shares of other companies have fallen in proportion. Sir S. Northcote, who introduced the Bill into Parliament, has expressed his willingness to substitute another Bill for the present one, leaving in blank all figures as to price and standard quality of gas, but he does not seem to have alluded to the threatened reduction of maximum dividends. Of course Sir S. Northcote's object is that all surplus may more stringently than heretofore be applied to the reduction of price to the public: we hope, however, that he will think better of it, and not insist upon the reduction of dividend; more especially as the public are not only interested in a reduction of price, but also in an improvement of quality. Much better give way on the point of dividend than on that of standard quality.

The price of gas is about to be reduced at Birmingham to 2s. 6d., 2s. 7d., and 2s. 9d. per 1,000 feet, the rate varying according to the quantity consumed.

The directors of the Faversham Gas Company have commenced making extensive alterations at their works, in the construction of a new tank and gasholder (the latter capable of storing upwards of 50,000 cubic feet of gas), erecting new retort-house for forty-six retorts, new coal-store, and other buildings. It is understood that the whole plant and works will be remodelled under the direction of and from plans prepared by the company's engineer, Mr. Darney. These alterations have been found necessary in order to meet the increasing demand for gas in this town, and also to enable the company to manufacture their gas with greater economy.

Professor Frankland, in the course of the last of a series of lectures on "Coal Gas," which he

has been delivering at the Royal Institution, said he had just had the illuminating power of the gas supplied to different large towns tested by the standard sperm candles, and now holds written and signed certificates in his possession of the result as follows:—Berlin, 15.5 candles; Paris, 12.3; London, 12.1; Vienna, 9.0; Edinburgh, 28.0; Manchester, 22.0; Liverpool, 22.0; Glasgow, 28.0; Aberdeen, 35.0; Greenock, 28.5; Hawick, 30.0; Inverness, 25.0; Paisley, 30.3; Carlisle, 16.0; Birmingham, 15.0. Thus the gas supplied to Edinburgh and Glasgow gives more than twice the light of the gas provided for London. The above shows the average light given by the gas furnished in London; but, in particular instances, it only equals nine candles. The gas of London, also, he stated, is richer [fouler?] than it ought to be in the sulphur compounds, and in burning gives off too much poisonous sulphurous acid and other gaseous vapours injurious to health and property. London gas is now worse than it was many years ago, although its methods of manufacture have been cheapened by the discoveries of science, all new inventions in this direction having been eagerly taken up by the gas companies, who, so far as is known, have not adopted a single invention which would benefit the consumer. The lecturer concluded by saying "gaslight should have an illuminating power of twenty candles, below which no gas is fit for household use!"

The Anglo-Roman Gas Company has just signed its new contract with the municipality for the illumination of the remaining part of the city, more than half of which is still lighted with oil-lamps. A great development of resources will be required for carrying out this plan, which has been facilitated by the Government having granted permission for the cast-iron tubes required for the purpose to be imported duty free. On the first establishment of the gasworks, the import duty on cast-iron pipes in the Papal States was 200 per cent. on their value.

THE TRADES MOVEMENT.

Wolverhampton.—To the carpenters and joiners and to the plasterers are now added the bricklayers, who have agreed to arbitration between themselves and their employers when differences arise. A first court of arbitration between six delegate bricklayers and six delegate builders was recently held, under the umpireship of Mr. Rupert Kettle, in a committee-room of the Town-hall. An application for an increase of wages of a farthing per hour was granted; and it was arranged that while the masters should not interfere with the men's union, unionists should not interfere with the employment of non-unionists. Arrangements were made for the drawing out of a code of rules which will provide for any future alterations, either in wages or arrangements, by arbitration. The masons and labourers are now the only two branches in the building trade here who have not yet adopted this wise and satisfactory mode of settling disputes; but it is believed that the latter will soon follow the example of the bricklayers. The masons have given notice for an increase of 3d. per hour, and change of rules, and the masters offer to submit the questions to arbitration; to which, however, the men are very much opposed.

Blackburn.—The corporation laborers are at present out on strike. Their dissatisfaction, we hear, is due to the refusal of some of their demands relating to the Saturday half-holiday. The painters who for a long period have discussed with their employers a re-adjustment of wages, have failed to come to terms; and the notices of the men having expired without a settlement, that branch of the trade is suspended. At a general meeting of the Blackburn branch of the Defence Association of master engineers, machinists, &c., it was unanimously resolved that as the various works in the town have a sufficient supply of men for all present requirements, this meeting stands adjourned for two months from the present date. The nine-hours movement in the joinery trade is the subject of negotiation between masters and men. The movement commenced six months ago, when the men demanded a reduction of hours from fifty-five to forty-nine hours per week, the weekly wages to remain without alteration at 28s. Notices were served at the time, a period of six months being the customary term for projected alterations in the terms of working.

The Railway Employés.—The engine-drivers and firemen employed on the Great Eastern

Railway have sent a memorial to the directors, requiring an increase of their wages to the same scale as that agreed to by the Brighton Board. The firemen ask that, when promoted to be drivers, they shall rise to the highest position at the end of three years. They do not ask this rise to be at the end of twelve months, as in this case of the Brighton men. The whole of the engine-drivers of the Darlington section of the North-Eastern Railway, in connexion with the mineral and goods department, have struck work.

The engine-drivers on the Scottish railways are agitating for an improvement of their present position in respect of wages and hours of labour. At a recent meeting held in Glasgow it was resolved that ten hours should be submitted to the employers as a fair day's work; and with regard to wages a scale was agreed to, ranging from 5s. to 7s. 6d. per day for drivers, and from 3s. 6d. to 4s. 6d. for firemen.

The whole of the English navvies at work on the Midland Railway, at Somers-town and St. Pancras-churchyard, left their employ last week, the ostensible reason being that about 100 Belgian navvies had been introduced by Messrs. Waring, the contractors for that portion of the line. The foreigners work at much lower wages than those paid to the English labourers, and this, it may be remembered, last year caused great disturbances near Caterham and Horsham between the two parties. Immediately the men, about 400 in number, came out with their shovels and picks, they held a meeting on the ground that is intended for the Midland Station. A chairman was elected, and several persons spoke, and it was proposed and carried, with a loud cheer, that all the men should be fetched off the works, and not again resume work until the Belgians had been discharged. Pickets were sent up the line, numbering about 150, to inform the men at Agar-town and elsewhere of what had occurred, and to fetch the gangs off the works. Fears being entertained that the navvies would proceed to attack the Belgians, information was given to the police, but fortunately their aid was not required. The foreman of the Belgians was warned to leave the works.

A Parliament of Workmen.—The Emperor of the French has, it is said, sanctioned a curious experiment. A Parliament of workmen, consisting of 302 delegates, elected by all the trades in France, is to assemble in Paris during the Exhibition, to discuss all kinds of questions connected with their work. Official rooms have been assigned them, and they are to be allowed considerable freedom of debate.

The Eight Hours Movement in America.—Illinois is the first American State that has adopted the eight-hour system, but Illinois has made the exceptions greater than the rule. By the law recently passed in that State, it is provided that from the 1st of May eight hours of labour between the rising and the setting of the sun are to constitute and be a legal day's work in all mechanical trades, arts, and employments, and other cases of labour and service by the day. But the Act is not in any way to apply to farm-labour (Illinois being a great agricultural state), nor to labour or service by the year, month, or week, nor to prevent parties from agreeing for as many hours of work as they think proper.

IMPORTANT TO ENGINEERS.

A CASE of importance to engineers was heard at the Liverpool Assizes, before Mr. Justice Mellor, in which the administrator of the late Mr. W. Stubbs, C.E., Liverpool, sought to recover a sum of money, alleged to have been due to the deceased as salary, from the Holywell Railway Company. It appeared that at the construction of the Holywell Railway the deceased had been engaged as engineer for fifteen months, to receive 500l. as remuneration. The money was to be paid quarterly by instalments of one-fifth. At the end of the first quarter the money was paid, with 10l. as travelling expenses, according to previous agreement. No more money was drawn, and at the end of the third quarter Stubbs died. It was therefore now sought to recover two quarters' salary and travelling expenses. For the defence it was urged that the deceased was engaged to do certain specified work, but he had died before the most important part of the work was done.

Witnesses were called on both sides, and while on the one hand it was contended that Stubbs's

MODERN FONTS.—MESSRS. FRANCIS, ARCHITECTS.

St. Mary's, Acton.

Christ Church, Mayfair, London.

services were worth 300*l.*, on the other it was urged that the 110*l.* already paid fully compensated him. A verdict for the plaintiff was returned for 160*l.*, 10*l.* being for expenses. Leave was given to move, but his lordship thought the defendants had better let the matter rest.

THE NEW PUBLIC PARK FOR CHESTER.

This park is being laid out and decorated with ornamental shrubs by Mr. Kemp, landscape gardener, Birkenhead, and it is generally understood that the Marquis of Westminster intends to present the park to the city for the use and recreation of the inhabitants. In November, 1865, a subscription was originated by his lordship's tenantry and by the citizens of Chester, for the purpose of raising a testimonial to his lordship. Upwards of 5,000*l.* were very soon contributed, and it was ultimately resolved that the testimonial should take the form of a statue and be erected in a prominent place in the new park, the formation of which at that time was just commenced.

The site of the park is on the south-east side of the city, on the banks of the Dee, commanding fine views. Immediately facing the river-front of the new grounds is Queen's Park, which is approached by a suspension bridge some distance lower down the river.

The new park, as described in the local *Courant*, is enclosed partly by a stone wall, and partly by wrought-iron fencing on a low stone plinth. The main entrance, opposite the new City-road, is from Foregate-street, and consists of a large pair of gates in the centre, with a

smaller gate on each side. The gate-piers throughout the park are each worked out of a single block of Irish granite; the chief pair of the main entrance measuring 10 ft. 6 in. high. To the right-hand side of the Foregate-street entrance stands the Lodge, which is built in the timbered style, in accordance with the ancient character of the city of Chester. The gables are enriched with carvings in oak, the most prominent features of which are the figures of William the Conqueror and the seven Earls of Chester. The tiles with which the roofs are covered are glazed ones of special manufacture, and were made by Mr. Peake, of Tunstall, Staffordshire. The woodwork in the gables, roof, &c., of the Lodge are of oak. In addition to the living accommodation for the keeper of the park there is a hoard-room provided for meetings of the committee; also other offices for the use of the public.

There are two main walks, or avenues, 15 ft. wide, leading to, and intersecting at right-angles, the site upon which the statue is to be placed. At the bottom of the hill is the well-known "Billy Hobby's Well," over which has been erected a cover, with sixteen shafts of polished red granite, having carved capitals and bases.

Mr. Douglas, of Chester, is the architect of the buildings, which have been executed by Messrs. B. & O. Owens, of Chester, with the exception of the river wall and other masonry, which have been done by Mr. Henry Wignmer. Almost the whole of the ironwork (with the exception of the entrance gates and railing between the park and St. John's Churchyard) has been executed by local tradesmen, in accordance with the desire of the Marquis of Westminster.

MODERN FONTS.

ST. MARY'S, ACTON; CHRIST CHURCH, PICCADILLY.

The parish church of Acton having been rebuilt, it was necessary that the whole of the fittings should be made to harmonize with the new structure. Most of the more prominent fittings were the gifts of friends or parishioners, either as memorials, or as showing the individual interest taken in the work. The font we illustrate was presented by a parishioner to replace a very meagre specimen of modern work in the old church. The materials used are Caen stone for the upper portion, and Bath stone for the base; the small shafts supporting the arches being in polished Devonshire marble. The shields in the trefoils contain emblems of the Passion, surrounded by foliage, with monograms of our Lord and the Virgin Mary alternating below, the church being dedicated to St. Mary.

The font in Christ Church, Mayfair, represented by the second engraving, was presented to the new church in Down-street, Piccadilly, by the widow of the first incumbent designate, the late Rev. A. B. Whatton, who died from the result of an accident in Hyde Park before any steps had been taken to erect the permanent building. The material, as in the former case, is Bath and Caen stone, with Devonshire marble shafts to base. The shields in trefoils around the bowl are in alabaster, and contain suitable emblems, alternating with the monogram of Mr. Whatton,—A. B. W. A brass inscription on the wall above records the memorial character of the font.

Both these fonts were executed by Mr. F. G. Anstey, of Alpha-road, Regent's Park, from the designs of Messrs. Francis, architects.

SMITHFIELD MEAT AND POULTRY MARKET: CENTRAL ROADWAY.—Mr. HORACE JONES, ARCHITECT.

SMITHFIELD MEAT AND POULTRY MARKET, LONDON.

The preparatory works for the new Meat Market in Smithfield have so far advanced that the "first stone" is to be laid almost immediately. Many of its brick arches, iron girders and columns, which will form the floor of the market, are turned, and the basement walls for the four towers, at angles, are in course of execution.

At the close of our last volume we gave a view of the market externally, a section of the roadway, and descriptive particulars of the proposed building.* We now add a view through the central roadway, which depends mainly for effect, as we before mentioned, on the screen of oak framing, filled in with cast-iron scroll-work, which is carried up to the spring of the roof-timbers, and on the dressing of the curved principals. Our readers may remember that the building is being erected under contract by Messrs. Brown & Robinson, under the superintendence of the City architect, Mr. Horace Jones.

The money has been raised by the issue of City Debenture Bonds at par, bearing 4½ per cent. interest, and redeemable in 10 years, secured upon the rents of the markets, as well as upon the general estates and property of the Corporation.

PROVINCIAL NEWS.

Cambridge.—The London and County Bank premises, of which we gave a view and plan in the *Builder* for last year (p. 426), have been opened. The building has been erected at the corner of Trumpington and Bene's streets, and is in the Tudor style, and built of white brick with Bath stone dressings. It is 60 ft. in height, and has a frontage to Trumpington-street of 49 ft., and 85 ft. in Bene's-street, the main entrance being at the corner of the two streets. In Trumpington-street, on the first and second floors, are two oriel windows, with gurgyles on the top of each, the shutters being Bunnell's iron rolling ones. The architects of the building, which is estimated will cost about 10,000*l.*, are Messrs. Francis, Brothers, of London; and the builders, Messrs. Myers & Sons. The staining has been executed by Mr. H. S. Cray, of Cambridge. The main entrance is of carved stone, with encaustic tiled floor and stained oak doors. The banking-room in dimensions is about 39 ft. each way. It is lighted by four large windows, and has a paneled stained roof ornamented with bosses and leaves, varnished. The floor in front of the counter is inlaid with Minton's encaustic tiles, of the star pattern, and the fireplace is built of Corsham stone, with marble columns and shelf. The manager's and waiting rooms are similarly fitted up. In the basement of the building is a fire-proof room, 19 ft. 6 in. by 18 ft. 6 in., built of fire-proof bricks, with double iron doors, fitted with Hohle's patent locks. The manager's house is situated over the banking-room. Adjoining the manager's house in Bene's-street, a private house forms part of the whole building. The whole of the roof has an iron cresting. The chimneys are stone capped.

CONSECRATION OF ST. PAUL'S CHURCH, CHARLTON, S.E.

The church of St. Paul, Charlton next Woolwich, consists of nave and aisles, chancel, north and south transepts, organ chamber, vestry, two north porches, south porch, and vestry porch. There will be a tower and spire (190 ft. high), at the south-west angle, standing external to the church, and containing the south porch, but from want of funds this is not yet built. There are no galleries. The accommodation is for 8,896, and the cost has been about 5,500*l.*, including lighting, heating, reredos, font, &c. The style is Gothic, of the Decorated period. The internal dimensions of the church are,—Nave, 84 ft. by 24 ft.; aisles, 14 ft. 2 in. wide; chancel, 35 ft. by 24 ft.; and transepts, 19 ft. by 17 ft. each. The height from floor to ridge is 60 ft. The nave is separated from the aisles by an arcade of five arches on each side, supported on Hollington stone shafts and responds, with moulded bases and carved caps. The chancel is

separated from the transepts by similar arches (two on each side), shafts, &c. The clearstory above is pierced with ten double-light windows, with traceried heads. The aisles and transepts are lighted by three-light windows, with heads filled in with tracery; and the west window, of seven lights, and the chancel window, of five lights, have elaborately traceried heads. The principal north porch has clustered shafts, of Lizard Serpentine marble, carved caps, and moulded stone archivolts and hases, similar marble being used for the vaulting shafts to the chancel arch. The tower is to be of four stages, the lower containing the south porch, with heltry over, and two light windows in the upper stage, with marble shafts, traceried heads, &c. The church is of brick and stone, the interior being faced with Suffolk white, red, and blue Staffordshire bricks, in bands, devices, &c.; white brick arches to the nave and chancel, and coloured bricks to the rear arches of doors and windows. The brick decorations are elaborate, and the details display care in the arrangement of colour. The roof is open timbered, with carved principals, the rafters being exposed, and hoarded on the upper face. The principals are supported on stone caps (carved), stone shafts, &c. The walls to the chancel are of oak, with carved oak standards, and oak fronts with traceried panels. The other seats are of deal, with wrought-iron, and moulded standards. The whole of the woodwork, save oak, is stained and varnished. The paving to the chancel is of Minton's encaustic tiles, and to the gangway of nave, &c., of blue and red quarries laid in patterns. The reredos is designed of stone, with marble shafts, carved caps, crockets, finials, &c., and is partially inlaid with marble. The centre panel contains in alto-relievo the conversion of St. Paul, the figures being two-thirds full-size. The side panels will be filled in with the Commandments. The sedilia is of Caen stone, with black marble shafts. The canopies are carved, and in the head of each are carved coats of arms of the sees of Canterbury and London, and of the patron, Sir T. M. Wilson, bart. The sedilia was the gift of the architect. The howl of the font is X shaped, the angle of the cross being filled in with carving, and is supported on a cluster of eight serpentine marble shafts. On the faces of the howl are quatrefoil panels, with emblems of St. John, &c. The carving is emblematical. The contract for the church was taken by Mr. Robert Abraham, of Poplar. The reredos, font, and carving were executed by Mr. S. Sansom, of Lambeth. The architect is Mr. W. Wigginton, under whose superintendence the work was carried out. Mr. H. Fulman was clerk of the works.

CONSECRATION OF THE BOROUGH NEW SYNAGOGUE.

The Jewish community resident on the south side of the Thames have erected, in Albion-place, Walworth-road, a new synagogue, which has just been consecrated. The building is in the Italian style, the front being a portico of the Doric order. The vestibule is floored with ornamental tiles, and flanked by stone staircases leading to ladies' galleries. Two doors from the vestibule give access to the floor of the synagogue, which will accommodate 200 or 250 persons. In the centre, occupying the whole breadth between the aisles, is the platform on which the service is performed. This is enclosed with an ornamental iron railing, and at the back are seats for the choir, the reading-desk being placed in front. The desk is covered with an embroidered cloth of purple velvet, and the smaller desk placed upon it is fringed with amber silk. In front of the desk on the floor of the synagogue is the pew of the wardens, beyond which are seats for the congregation reaching up to near the steps leading to the sanctuary. These steps are of polished marble, and form the approach to a semi-octagonal recess, flanked by Corinthian pillars and covered by recessed arches, on the outer of which is the inscription, "Know before whom thou standest," in Hebrew. The interior is roofed with amber glass, which sheds a mellow light in front of a curtain of purple velvet, on which is embroidered a wreath of gold surrounding an inscription in Hebrew embodying a prayer that the Lord would hear worshippers in the house, the whole being surmounted by a jewelled crown. The galleries which run along the two sides and the western end of the building are appointed by

light iron pillars, and, like the platform, are surrounded by an ornamental iron railing in a framing of varnished deal. The ceiling is divided into coffers by ornamented beams, which are supported on trusses. The central coffers are furnished with gaslights. The galleries will accommodate about 200 ladies, the whole synagogue thus affording room for about 450 persons in all. Adjoining the synagogue, which is placed diagonally on its plot of land, are houses for the ministers, and a school for 150 boys, with suitable accommodation for teachers, &c. The whole work has been designed and superintended by Mr. N. N. Collins.

RAILWAY MATTERS.

Communication between Passengers and Guards. Matters are moving at last towards the point so often urged by us. Experiments have been made on the Great Western line between Paddington and Windsor, as to the practicability of carrying out a union of Mr. Spagnoletti's electrical communication with a "safety-cage" for railway guards, invented by a Mr. Baker. A number of gentlemen, including the Duke of Sutherland, Captain Mangles, and the inventors, Messrs. Spagnoletti and Baker, accompanied the train. The electrical communication, on the pulling of a handle in a carriage, ignited a coloured light and rang a bell in the guard's van. The safety-cage (respecting the merits of which special plan of moving along a train we know nothing personally as yet) consisted of an iron framework, having two grooved wheels at the top and two at the bottom, running on an iron guide-rail fixed on the outside of the carriages, extending the whole length of the train. The groove of the top wheels also ran along close under a guide-rail fixed on the top of each carriage to keep the cage-frame steady. The guard on entering the cage attached to the movable frame could, by pulling or pushing, propel it along the sides of the carriages until he came to the carriage from which the signal was given. By means of this invention the guard could at any time during the running of the train make an inspection of the whole of the carriages, thus preventing the necessity of stopping the train to ascertain the cause of the signal. The inventor, Mr. Baker, on receiving the signal from a first-class carriage, issued from the guard's van several times during the trip, placed himself in the cage, and propelled himself along the side of the train, visiting the compartments from which the signals had been given, with, it is said, the greatest ease and safety. But what of bridges and tunnels? some of them, we fear, would not admit of such a cage traversing the trains in transit.

Metropolitan District Railway Company.—At the fifth half-yearly general meeting of this company a report from the engineers was read, giving a description of the present state of the works. It appeared from this report that the works and line between the West London Extension Railway and the Kensington and Clonchester-road joint stations were so far advanced that this part of the railway may be opened for public traffic within a few months of the present time. The stations in the inner circle of the line at Kensington, Clonchester-road, Sloane-square, and Victoria (Picnic) were now being roofed in. The railway works at Westminster were completed before the opening of Parliament. On the portion of the line between Brompton and the Broadway (Westminster) the works were in progress at several points, and a considerable part of the whole work of construction was finished on the 1st hand. On the west side of the Fulham-road the retaining walls had been built to their full height for some distance, and the remaining property was now being cleared to the Brompton station. At Sloane-square the excavation and arching of the railway and the ironwork for the Ranelagh Sewer were being actively carried on. Between Sloane-square station and Upper Embury-street nearly 200 yards of retaining wall and arching had been finished with the requisite girder covering and sewer crossings. Between Belgrave-street South and Buckingham-row a length of 850 yards was nearly completed, including the crossing of the King's Scholars' pond Sewer, by an iron tube of 14 ft. diameter, and other important sewer works, gas and water mains.

Traffic Receipts.—The traffic receipts of railways in the United Kingdom for the week ending March 22, 1867, upon a mileage of 12,537,

* See vol. xxiv., pp. 855, 857.

amount to 632,529*l.*, being equal to 56*l.* 9*s.* per mile. For the corresponding week of last year the receipts were 640,325*l.*, the number of miles open 12,364, or 51*l.* 1*s.* per mile. A comparison of the two weeks shows a decrease in the aggregate receipts of 7,796*l.*; and an increase in the number of miles open of 173.

Railway Fares and Charges.—We hear that the railway companies are thinking of raising their rates and charges to the public. The subject, it is said, has been mooted amongst the leading companies during the last couple of months, and such of them as are under their Parliamentary powers will, it is probable, shortly advance their rates. Some, however, already charge to the utmost allowed them, save in return tickets.

The Moscow Railway.—It is said that the Russian Government is in negotiation with a private company for the sale of the Moscow railroad, and that the price demanded is about 12,000,000*l.*

Canada.—Our Parliament, by a majority of 247 to 67, has guaranteed a loan of 3,000,000*l.* to the new dominion of Canada, to enable the great inter-colonial railway to be constructed.

THE BURLINGTON HOUSE SITE.

IN the House of Commons, on Friday, the 6th, Mr. Layard called attention to the buildings now in course of erection on the site of Burlington House, especially with reference to the pledge given to Parliament last year; and moved for copies of correspondence between the First Commissioner of Works and the London University, relating to the buildings in question. Burlington House, he remarked, was to be cut, and made a sort of portico to the buildings to be erected behind it. The colonnade, which was a very important and interesting feature of Burlington House, would altogether disappear, and what was proposed round about Burlington House would be something like marrying a short man to a very tall woman. It was proposed, therefore, to add a story to the present building, and, to give it something like strength at the base, a colonnade was to be erected, uniting the two ends of the building. As the house itself was entrusted to Mr. Smirke, the facade in Piccadilly to Messrs. Banks & Barry, and the buildings behind to Mr. Pennington, it might have been supposed that these gentlemen would be required to consult together, in order that one architectural idea might be carried out; and 809 people out of 1,000, if they had been asked what style should be followed, would have said,—"The style of Burlington House." Mr. Pennington proposed its elevation in the Palladian or Classic style, as any one else would have done; but a change had taken place in the Government, and the noble lord who had become First Commissioner of Works having unfortunately an attachment to Gothic, a design was sent in by Mr. Pennington in the Italian Gothic style. He was puzzled to know what was meant by Italian Gothic. Was it the chaste Early Franciscan order, the style of Milan Cathedral; or what? Mr. Pennington was directed to retain the plan of the building, but to convert it from Classic into Italian Gothic, which was an absurdity, because the interior arrangements that would suit a Palladian building would probably not be suitable for a Gothic building. The London University appeared not to have been consulted in the matter. After making several attempts to induce the noble lord to withdraw this Italian facade, he passed another resolution on the 25th of March, to the effect that, having regard to the design, the modern style of architecture would be preferable either to Medieval or Italian Gothic. The answer they got was something like telling them to mind their own business, and that the design was to be carried out as a whole. He had seen the elevation for the additional story to Burlington House, and for the wings and facade in Piccadilly, and he admitted that they were very handsome, and that Mr. Smirke had done all that he could to improve the building. On the whole, this grand entrance in Piccadilly, and the lofty ornamental buildings in the Palladian style, did great credit to Mr. Smirke and to Messrs. Banks & Barry; and he trusted that when members saw the plans, as they would do, in the library of the House, they would meet their approval. During the discussion respecting the enlargement of Burlington House, there was a distinct pledge given that no more money would be asked for until the plans had been submitted to the inspection of hon. members. These pledges had been violated, although 20,000*l.* had been voted, on the distinct understanding that the House of Commons was to have the power to approve or disapprove of the plans. It appeared now that the noble lord held that the head of a department was not bound by the pledges of his predecessor; but if that theory were to hold good there would be no confidence in any department, and some explanation were not given he would certainly move that the vote be rejected, and the building stopped until the House had the opportunity of inspecting the plans.

Lord J. Manners said, he had never desired Mr. Pennington to make a design in any particular style; but when he found that the House had voted 2,000*l.* for building the university, and when the Chancellor of the Exchequer said it was desirable that the works should commence at once; and when, further, he found that his predecessor had instructed Mr. Pennington to prepare specifications, his clear duty was not to stop the works, but to take the necessary steps to carry them on to completion. What blame could be attached to him for carrying out the wishes of his predecessor he was at a loss to know. The hon. member said that there were important documents at the London University to show that he had instructed Mr. Pennington to design a Byzantine facade; all he could say was that he had never seen those documents and knew nothing about them. The Royal Academy were to erect a gallery in the rear of Burlington House at their own expense. What style did the hon. member think would be adopted for that building? Did he expect it would be Palladian? [Mr. Layard.—"I hope so."] That style was entirely unsuited for the exhibition of pictures, which was all that the Academicians had in view. No one would

ever suggest that every house in the street called Burlington Gardens should be in the same style of architecture. All the arrangements were now complete, and plans would be placed before the House prior to any fresh vote being given.

Mr. Cardwell said, he did not believe that if the elevation which it was proposed to erect in Burlington Gardens for the University of London had been exhibited in the library before the vote was taken, the House would have contributed a single shilling. The noble lord thought it absurd to suppose that because the Royal Academy was to be in a certain style the University of London should be in the same style. The House might possibly entertain a different opinion. It appeared to him that there was a great deal to be said in favour of harmonising the buildings upon one site. He should be glad if the noble lord would state what amount of smart money would have to be paid in order to get rid of the present elevation, and to substitute another; and, as there had already been two plans prepared, he hoped that a third would be obtained, and at no very distant date adopted.

Mr. Beresford Hope said the present discussion had shown how ill advised the House was in the last Parliament when it threw over what would have been a consistent, easy, and cheap scheme, namely, that of building the National Gallery on the site of Burlington Gardens, so that the nation might have had one uniform and harmonious structure. A distinct promise, he remembered, was given to lay the plans and elevations of the contemplated buildings before the House. With respect to the proposed building for the London University, he was of opinion that it ought to be treated entirely upon its own merits, and not in relation to Burlington House. Whether Mr. Pennington's plan was better or worse, he thought that it should be examined, and what was bad in it rejected or altered, but if so it should be corrected upon its own merits alone.

Mr. T. expressed an opinion that a building after the model of Somerset House was admirably adapted for all such purposes as the proposed building was intended for. He suggested that an elevation should be prepared as well as plans, and laid upon the library table, so as to give hon. members some idea of what the front would be like.

Mr. C. Bentinck thought that if the building was to be erected they should endeavour to make one design. He trusted that the First Commissioner of Works would give directions that the building should not be proceeded with until the designs were in the library of the House.

Lord E. was also of opinion that the works should be stopped until the designs were produced.

Mr. Cowper admitted that the undertaking referred to had been given, and was still of opinion that the plans and elevation should be in the library.

With respect to this discussion, Lord John Manners has since stated to the House that, regarding the works of the London University, it has now been decided that the works shall be proceeded with without prejudice to the style of architecture; and he added that the probable extra cost of changing the style would be between 7,000*l.* and 8,000*l.*

DAYLIGHT IN THE MINES.

A MAGNESIUM hand-lamp has been made on the principle of Mr. Larkin's; and, as we have seen and examined it, we may here briefly describe its peculiarities. The magnesium is not applied to the light in wire or ribbon form, requiring something like clockwork in its management. The metal is in the form of a granular powder, either alone or mixed with sand, and is merely supplied by a tap through a tube to the flame of a spirit-lamp, which ignites it; and the instant that the magnesium smoke is formed, it passes off through a funnel or chimney, which meets it at the spot where it is formed. The lamp or lantern, therefore, is kept almost entirely free of smoke, and the light is in no degree obscured by it. Much of the smoke is arrested in the chimney, and a condenser is being applied to it, whereby this may be still more effectually accomplished. The magnesium powder, though considerably cheaper, we are told, in use than the wire or ribbon, is still rather costly, being 5*s.* an ounce; but, manufactured on a large scale, the price would be much less; and we would suggest that experiments should be tried with lime, a mixture of which with the magnesium powder might, perhaps, economise the expenditure, by yielding a light equal to the magnesium light with half the quantity of the metal. The phenomena of the lime-light, though produced upon a different principle, and those of lime, indeed, even in the crucible on the fire, certainly give feasibility to such a suggestion. The lime, no doubt, should be anhydrous, and not the soft and clinging slaked lime.

The light given by Larkin's lamp is splendid, and in its power of displaying colours closely resembles day light. It is now proposed to apply this very portable lamp in the exploration of the roofs of coal-mines, every crack and crevice of which could be seen by its means, so that where any danger existed lives could be saved;—and the lives lost in mines from roof-falls is said to be as three to one lost by explosions. Railway tunnels might thus also be examined, and cavernous spaces, generally, explored. The lamp is not much heavier than an ordinary Davy, and the light can be raised and lowered instantaneously by the mere turning of the tap, so that

it is completely under control, and need not be used a single moment except when wanted, as the spirit-lamp, when lighted and screwed on, sets fire to the magnesium as fast as it is supplied to it through the tap. The management, therefore, is both simple and economical. We should think this lamp very suitable for photographic use, if, as is said, portraits can be taken by means of the magnesium light.

ANCIENT CANOPIED SANCTUARIES.

THE parish churches of Brilley and Michaelchurch in this county (Hereford), lying on the north bank of the Wye, between Hereford and Hay, the former of which has been, and the latter is about to be, restored, under my superintendence, contain in their chancel arrangements a peculiarity of infinite beauty, which, so far as my experience goes,—having never met with a similar example,—is by no means usual.

Neither of these churches ever had chancel-arches, but both have had chancel-screens and roof-lofts. That of Brilley had lost its chancel-screen, but not the timbers sustaining the roof-loft. The chancel of each is some 30 ft. long or thereabouts. In each case the sanctuary or altar end has been enclosed by a screen eastward of the choir, advanced about 10 ft. from the east wall or reredos.

I now come to the peculiarity I wish to mention. Against the east wall are carved oak posts, corresponding in position to similar posts, forming the support to the sanctuary-screen; others are placed along the north and south sides, and together uphold an enriched cornice and a canopy formed of panelled work, with oak moulded ribs, the intersections in the case of Michaelchurch being concealed with carved heads. Each canopy is of the width of the chancel, and extends from east to west from the chancel-wall to the sanctuary-screen. These canopies are much below the chancel roof, the timbers of which are seen passing over them. Doubtless this arrangement has its prototype in the canopy-covered altars of the ancient basilicas; but it is so unknown to our experience that I draw your attention to it in the hope that examples of a kindred nature may be brought to notice; and I should be much obliged to any incumbent or churchwarden, aware of such examples, who would inform me of them.

No similar instances of a canopied sanctuary, as exemplified in these churches, are known to me, either from personal observation or from works on the architecture or ancient ritualistic arrangement of the chancels of this country. Sanctuary screens are in themselves by no means common; there being, as I believe, but one solitary example left, at the present day, that in the cathedral of St. David's; but evidences are to be found in some parish churches of their previous existence.

The effect of what I have been describing is exceedingly impressive, and very much enhances the interest attaching to these otherwise rude, though characteristic, country churches.

J. NIEMTSOON.

FREE TRADE IN ARCHITECTURE.

SIR,—Will you allow me to say a word on the all-important subject of architectural competition, and the new Manchester Town-hall that is to be. To my mind there seems only one way for the future, and it is indicated in the terms of this very competition; but, unfortunately for architecture, only *half* indicated. If the Royal Academy consider it enough for the finding out of the capacity of a proposed student that he should produce one *plan*, one *section*, and one *elevation* of a building, these three drawings on a single sheet of double elephant paper ought to be enough to guide any Town-hall Committee in its selection of a competent architect, or architects to do its work. But, and this is why I trouble you with this note, this drawing or drawings should be *photographic*—the work of the architect himself, his own personal architectural handwriting, and not merely that of his clerk, or improver, or pupil, as is now pretty nearly always the case. Whatever is done afterwards by assistants, these first *signatures* should be genuine, and truly descriptive of the art mind, and hand of the artist who exhibits them.

Mr. Fergusson says there is no modern architecture. Of course there is not, and never can be while the present system lasts; for surely it is not in the working out and elaborating a design that progress, i.e., individual mental movement, takes place? Another of your correspondents suggests that in all cases it would be well if some few well-recognised architects were to be at once fixed on: a process, to my mind, at once fatal to art; for what is it but protection in its very worst form? It is simply selecting some half-dozen architects to do everything, i.e., through their clerks, from the well-thumbed books of precedent! It may surprise your correspondents to be told so, but there never has yet been an architectural competition at all in its true sense by architects. The Law Courts competition, with an exception or two, is a competition between clerks and pupils and water-colour draughtsmen: the "magnificent signatures" are theirs, not their masters'. An architectural competition and exhibition of architectural handwriting has yet to be; and until we see it, neither Mr. Fergusson nor any one else is or can be competent to determine what the true state of the architectural capacity of the present time and middle of the nineteenth century really is. One single drawing, I contend, by the architect himself, is and must be worth a thousand by his clerks, however able they may be; for it is his own, mentally and manually and progressively. The beginning has yet to come, but the public must feel for it.

C. B. A.

CHANGE OF NAME IN LONDON DISTRICTS.

Sir,—In the insertion which you were good enough to make in the *Builder*, page 229, of "Change of Name in London Districts," there are three slips; and, although I am quite aware that they are more owing to my indistinct writing than to the want of attention in your compositor, I feel it desirable for the sake of accuracy to request of you the kindness to notice them. "Old Bread-street" should be "Old Broad-street" (where Gresham House stands); "K. Knock Fingers" should be "Knock Fergans;" and "Aog-lane" should be "Hog-lane." To my former observations I may add the following, leaving you to notice them or reject them as you may deem best—most of which I do not find on any modern map, though some may possibly still exist—viz., Red Cow-lane, now Cleveland-street, White-chapel; World's-end, Stepney; Ducking-pond, Whitechapel; Half Farthing, and Half Farthing-lane, Stepney; somewhat analogous to Farthing is public-house in New-road, Marylebone, and warbling Pie, turnpike-gate, long existing in front of St. Castle-yard, Holborn, now Castle-yard; Cony-court, now Gray's-inn-square, in the Inn of that name. Of Out-thro-lanes, referred to in my last, I remember several others, popularly so called, though not so marked on maps,—indeed, most of the retired narrow lanes round London were so denominated. This reminds me of what a friend, now dead, told me many years ago, viz., that his father informed him it was common for parties wishing after dark to walk from the City to Islington and adjoining parts to wait at the outskirts until, by a accession of persons arriving, a party was collected sufficiently numerous to enable them to defend themselves from attack, and thus to prosecute their journey in greater safety as a body. I notice two, viz., one at Shadwell, and one by Lion House, Brentford; while there was Coody Bridge, at Knightsbridge; and Thivinge-ree, at Ealing; and Gaggie Goose-green, at Shepherd's Bush. Petty France, Westminster, is disappeared, and York-street is substituted; the Little Britain, City, still holds its own. I propose out of compliment to our country. Rag-cree, and Hockley-in-the-Hole, Clerkenwell, were Warner-street (referred to in my last with like ending) is also situated; Cod-Pieco-row (*sic*), close by these, now Coppice-row, I think, is a mistake of the engraver. The latter name is far more likely of the two to have been the original (could the engraver have been studying Scotch armour?). The Devil's House, Hornsey, with Swill-lane (since called Duval's-lane, and now, believe, Hornsey-road), leading to it, must, I presume, have been his Satanic Majesty's summer residence; since I observe Bottomless Pit, near Regent's (sic) Marsh, by Tooting Common (I suppose a warmer place for his winter quarters). I will only add the foregoing are all recognised names, and taken either from Rocque's Map of

London, 1748, or Gibson's, of 1769; and very probably more equally curious names might be gathered. I am the more disposed to believe this because I feel assured I have in some map seen "Blowbladder-street," as marked at the south end of St. Martin's-le-Grand, between Newgate-street and Chapside, though I do not observe it on either of the two above named.

A. Z.

Sir,—If your correspondent "A. Z." will walk to Snow-hill, he will find *Cock-lane* running into *Giltspur-street*; and he will also find *Pye-corner* at the corner of *Cock-lane*, with an inscription over the door of "The Portene of War" public-house referring to the stopping of the Fire of London. He will also find *Pudding-lane* running from Eastcheap to lower Thames-street, and containing thirty-five houses, mostly orange merchants'. There is a manifest connexion between *Cock-lane* and *Giltspur-street*.

P. P.

MINTON AND FINE ART.

Sir,—Minton had acquired a high standing in fine art manufacture; and the distinctive title of "Minton's ware" like that of Wedgwood's, was by the public accorded to him, ere the honours were bestowed upon him, which he so well deserved. And yet Mr. C. Bruce Allen would now *posthumously* seek to lower him in the public estimation, for the sake of enhancing his own theory, as to the relative merits of all the parties concerned in the production. This is both ungenerous and unwise, and particularly when, upon the authority of his own memory, and without the attendant circumstances in explanation, he quotes a here and there casual sentence of the man whose reputation he seeks to lower from confidential converse. I presume that Mr. Allen is unaware that our late friend was indebted to the Baron Marchetti and other distinguished men for some of his most successful designs of vases, &c., and was ready to give any sum to any artist who would produce him a design calculated for his class of manufacture. Mr. Minton was a man most shrewd, playful, and witty in his conversation and remarks, and I can easily imagine that the expressions quoted had a higher significance than was appreciated by his assailant.

THOS. L. DONALDSON.

** Here the correspondence may end.

THE PROPOSED ROAD FROM HYDE PARK CORNER.

Sir,—In the article in last week's *Builder* on "Park-lane Improvement," and in Mr. Snell's plan for the accommodation of the public traffic between Hyde Park-corner and Stanhope-gate, it is stated you "understand that if, at the Board, at least some of its officials, have said that Mr. Snell's scheme is not original." What the Park-lane Improvement Bill was before the Committee of the House of Commons, with the Night Hon. W. Monsell as chairman, in 1855, I suggested to some of the officials of the Metropolitan Board of Works scheme almost identical with that now proposed by Mr. Snell; and, at the same time, Mr. Blackburn, then M.P. for Strigingshire, also produced a plan somewhat similar, but I was rather at a loss to know what ought to be done with the Hyde Park-corner gates. Of course, they would have to be moved; and I thought, as the traffic in and out of the Park is very great at that spot, that in any alteration of the entrance at Hyde Park-corner, gates should be made to allow at least four carriages to enter or leave the Park at the same time. The present gates afford but two entrances for carriages, and only one exit; so I suggested either that the present gates should be reconstructed with that object in view, having the two centre gates opposite Grosvenor-place, or that new and more convenient gates be erected there, and the present structure be moved to Stanhope-gate or to some other place where there is less traffic than at Hyde Park-corner. I think, however, that the position of the altered gates, as proposed by Mr. Blackburn and Mr. Snell, is better than what I suggested.

In calling your attention to this subject, I have no wish or intention to bring myself into notice respecting these plans, or to detract in any way from the merits of Mr. Snell's proposition. My object is to inform you that some, at least, of the officials of the Board were aware that such a scheme was suggested in 1855; and also to join you and Mr. Snell in calling the attention of your readers to the great simplicity and obvious convenience of the plan, which could be carried out at a very small expense, and would undoubtedly be much more satisfactory to the public than any possible widening of Park-lane could be.

* Not certain. The name of Giltspur-street is supposed to have had some connexion with the Knights and the Tonney Ground, Smithfield.—Ed.

In alluding to the Hamilton-place scheme, you state that it was abandoned on account of the bad gradient of the road. That scheme was put forward as an alternative plan to the Park-lane Improvement Bill by the opponents of the Bill before Mr. Monsell's Committee. Mr. Pennethorne, in his evidence for the Bill, stated that the worst gradient in Hamilton-place was 1 in 34 for 69 yards, and that part of Park-lane is 1 in 31; but that he considered that the gradients in Park-lane were very far superior to those in Hamilton-place, because the steeper part of the inclination is much further removed from Piccadilly; but neither of these gradients is such as to interfere with any ordinary traffic.

The committee were unanimous in rejecting both schemes, and the chairman further intimated "that it was possible that a third scheme might be better than either the one which was contained in the Bill or the one which had been suggested by the opponents of the Bill." He evidently had in his mind some such scheme as is now suggested by Mr. Snell.

W. M. M.

Oxford and Cambridge Club.
* Mr. John Murray, Whitehall, states that he sent a plan almost identical to the Office of Works about two years ago, and that it was acknowledged by Mr. Cowper.

WIRKSWORTH'S WONDER.

Sir,—Allow me to call your readers' attention to a new style of architecture, or rather the combination of several existing styles in one. The Independents of the above place are erecting a large chapel, at a considerable cost, which it was hoped would be an honour to the denomination, and a credit to the town. When you have read the following remarks you will see how far these I opes have been realized.

The doors and windows are the simplest Early English, disguised by most abstrusely small hood-mouldings. The coping of the main gable of the principal elevation is a decided Grecian moulding. The angles of the chapel are ornamented with Roman rusticated quoins.

When we fondly think that art-education is making progress in this country, and that the perpetuation of architectural monstrosities belongs to the past, it needs but such a fact as the foregoing to painfully undeceive us. I believe an architect was employed in the first instance; but his design has not been acted upon. Whether he was not sufficiently facile to carry out ideas which should embody the several tastes of the gentlemen on the committee I am unable to say. Certainly it is no easy task successfully to blend the Early English, Grecian, Roman, and nondescript in one harmonious whole.

A RUSTIC.

GIVE EVERY ONE HIS OWN.

Sir,—May I ask you to make public the circumstance of the so-called "Pugin roof" and its origin. A letter in the *Standard* of April 11th has called attention to the design for the Franciscan Church, Peckham; and on visiting this building I find the roof to be a repetition, slightly modified, and highly carried out, of an original form of roof which I designed in 1859, when competing with Mr. Pugin and others for the Catholic Cathedral at Cork.

We have seen and heard so much of the adoption of other men's conceptions that the above, I submit, is worthy of notice.

S. J. NICHOLS.

PLASTER DECORATION.

Sir,—Will you allow me to state that the work on the Testing House at the Paris Exhibition, in connexion with which you have mentioned my name in your number for last week, is a revival of an ancient treatment, which is, as far as I know, disused at the present day. I hope shortly to have an opportunity of laying it before the profession and the public; and in the mean time shall be most happy to give any information to which you have seen and liked it at Paris.

E. J. TAYLER.

"ARCHITECTS AND PROVISION DEALERS."

Sir,—Permit me to contribute the unjoined "Card," from the *Thames Guardian*, to the amusing list given in the *Builder* a few weeks ago under the above heading. I have altered the names. I would remark that it is well understood in the place that the nominal partner has no existence at all, and that the "offices" are in rear of the "residence," and are, therefore, practically one and the same thing.

[A Card.]

COMPENSATION CASE, DERBY.

Mr. Barton Borough and The Midland Railway Company.—In this case the company sought to take 37 acres of land belonging to Mr. Borough, near the London-road Bridge, Derby, for the purposes of the new curve. The land required by the company is next to Mr. Eichen's Park, but the front part nearest the turnpike-road is not included in the purchase. The company availed themselves of the compulsory powers of the Lands Clauses Consolidation Act, but did not make an offer. Mr. Charles Sanders was the arbitrator nominated by the company, and Mr. Richard Baylis acted in that capacity for Mr. Borough. Mr. H. A. Hunt, of London, was appointed umpire. The first meeting was held at the Midland

Hotel, Derby, in November last. Mr. Lloyd (barrister) appeared for the company; and Mr. Field, Q.C., and Mr. Day, were counsel for Mr. Borough. Mr. John Shaw, Mr. E. S. Gibson, Mr. Edwin Thompson, Mr. Wm. Pool, Mr. W. S. South, Mr. John Pochin, and Mr. Thomas Adsett were called as witnesses for the claimant, and their valuations ranged from 28,000l. to 30,000l. An adjournment took place to the company's offices in London, when Mr. Alfred Wills (of the Midland Circuit) appeared for the company, and Mr. Leech continued the case for Mr. Borough, and called Mr. Thompson (borough surveyor), and Mr. E. S. Norris, of Nottingham, as further witnesses. The case of the company was then opened, and Mr. Gratton (the company's surveyor), Mr. Benjamin Wilson, Mr. John Bromley, Mr. Wood (builder), Mr. Matthews, of Birmingham, Mr. Cowley, of Manchester, Mr. Thomas Mabley, and Mr. Jeffrey Etches were called as witnesses for the company. Their valuations ranged from 14,000l. to 18,000l. The arbitrators being unable to agree upon the amount of compensation, Mr. Hunt (the umpire) was called upon to decide it, and he has just made his award, giving Mr. Borough 24,200l. for his land, the company paying all costs.

A QUESTION OF WAGES.

G. Leslie v. Marsland.—At Southwark County Court, before Mr. C. S. Whitmore, Judge, the plaintiff, a plasterer, who resides in Garside street, Lambeth, and the defendant, a master builder, who conducts his business in Walworth-road, Walworth, for the sum of 5s. 2d., for wages due and money paid.

The plaintiff stated that he was in the employ of the defendant on a job at Godstone Park, Surrey, at 8d. per hour. On a few Saturdays since he was paid off, and that without any previous intimation. In consequence, he claimed for half a day's wages, time lost, and his railway fare from Godstone to London Bridge Terminal.

His Honour, addressing the plaintiff,—"When does your week end?"

The plaintiff replied, at one o'clock on the Saturday. It was customary for the men to have their railway fare paid to and from the country by the masters, and the lodging money also. The defendant, on his discharge, gave him 2s. 2d., the charge of third-class fare from Godstone to town. But as there was no train until long after eight o'clock in the evening, he paid excess and returned in a second-class carriage.

The defendant said that he paid the plaintiff 8d. per hour; and on his going down to Godstone he paid his railway fare, and during his being there his lodging money was paid also. When he discharged the plaintiff he paid him his fare back to town. He contended that he was not bound to pay the return fare, inasmuch as, whenever a man is discharged in the country he is not allowed to. He had been in the trade during the whole of his life, and could vouch for the fact that no such allowance was ever made. At Christmas he paid the railway fare of all his workmen to and from town, in order to allow them a holiday with their friends.

The Judge remarked that he could not see that the plaintiff had any claim on the defendant. The payment was not by the day, but by the hour, and for some time the rate of wages had increased until 8d. per hour was reached. As to the service of trains with third-class carriages, they could not be fitted to suit every person in the country at any particular hour. There was no corroborative evidence on the part of the plaintiff to prove that the fare should be paid at all when a man was discharged in the country. There was no pretence for wages. He should give judgment for the defendant. The costs were not applied for by him.

DEAD.

M. Hittorf, Architect.—The artistic world has sustained a great loss by the death of M. Hittorf, architect, of the city of Paris, and member of the French Institute. He was a native of Cologne.

Mr. Baddeley, C.E.—The death is announced, after a long illness, of Mr. Baddeley, C.E. He was the inventor of the patent canvas now used by the fire brigade, the patent hose reel, the farmers' fire-engine, and was for years connected with the *Mechanics Magazine*.

Mr. C. H. Bennett, the Artist.—Mr. Bennett's first sketches appeared in *Diogenes*, and were signed in the corner with the figure of an owl. To *Punch* he contributed numerous sketches. After a very short illness, Mr. Bennett died in the 38th year of his age.

CHURCH-BUILDING NEWS.

West Camel (Somerset).—The re-opening of West Camel church has just taken place. The church has been restored at a cost of about 1,100l., according to plans prepared by Mr. E. Christian, architect.

Middleham.—As a memorial to the late rector, the Rev. J. A. Birch, it has been resolved to erect a new pulpit for the parish church.

Urmston.—The Lord Bishop of Manchester has laid the foundation-stone of St. Clement's Church, Urmston, a village near Stretford. Accommodation is provided in the new church for 360 persons to begin with, and a future north aisle will hold nearly 200 more. The plan now being carried out gives a chancel, with the fittings such as are now usual in most new churches, including provision for seating a choir. The south chancel aisle will be given up to the

school children: the north one is to serve as organ-chamber and vestry. The body of the church comprises a nave and south aisle, divided from each other by an arcade of four arches borne by pillars, with different flowered and moulded capitals. The church is approached from the north side, towards the western end of which is an inclosed timbered porch. On the same side are three large traceried windows, one of three lights, and two of two lights each. The belfry is hexagonal, and stands in the corner that is formed by the west wall of the vestry and the north wall of the nave. The lower part is of stone. Then comes an open wooden story, in which the bell hangs, and the whole is capped by a slender slated spirelet, terminating with a gilt vane. There is one gabled clearestry window of the south side. The west gable of the nave contains three tall windows, that in the middle being of two lights, flanked by a single light on each side. The whole of the external walls are faced with stone, three colours being used to give relief. The roofs are slated in two colours. The architect is Mr. J. Modian Taylor, and the style Geometrical Decorated Gothic. The contract has been taken by Mr. M. Fogget, for 2,125l.

Forden.—The new church for the parish of Forden, near Montgomery, in the diocese of Hereford, was together with an addition to the churchyard, consecrated on Tuesday, the 19th, by the Bishop of Worcester, who officiated for the Bishop of Hereford. The church is in the Early Decorated style of architecture, and consists of a nave, north and south aisles, chancel aisle, vestry, and organ-chamber, and a detached south-western tower. The cost has been about 3,000l., but the spire is not yet added to the tower, and forms no part of this outlay. The architect was Mr. Thomas Nicholson, of Hereford, the diocesan architect.

Leyburn.—At a meeting of the committee for the erection of a church at Leyburn, Lord Bolton in the chair, it has been agreed that the plans of Mr. Wray, of London, be carried into effect, and that the contract of Mr. Jones be accepted.

Birmingham.—A lady well known for her thoughtful benevolence, says the local *Journal*, has placed at the disposal of the Bishop of Worcester the magnificent sum of 10,000l., for the purpose of church extension in Birmingham.

Thornton-Hough.—The foundation-stone of a new church has been laid at Thornton-Hough, in the parish of Neston. Mr. Joseph Hirst, the purchaser of Thornton House and the domain around it, purchased the site, and is to build, at his own cost, the church and parsonage, and a school and school-house, and endow the same. The style of the church is Gothic of the thirteenth century. The edifice will consist of nave, chancel, and transepts, adjoining to which will be the organ-chamber on one side, and vestry on the other. At the south-west corner there will be a tower and spire. The nave will be divided from the chancel and transepts by five arches, supported by circular pillars and corbels. At the west end there will be a large five-light window. The chancel and transepts will each have a three-light window. Those in the nave and chancel will be of two lights, filled in with tracery. The whole will be erected of stone from the neighbourhood; the walls of red sandstone, and white ashlar for the dressings, from Stourton quarries. The roof will be an open one, constructed of red deal, stained and varnished. The pulpit, reading-desk, screens, and rails will be of oak, all the rest of the woodwork being pitch-pine varnished. The whole will seat 450 persons. The architects are Messrs. Kirk & Sons, of Huddersfield and Dewsbury. Near to the church, the parsonage, schools, and teacher's residence are in course of erection, in the same style of architecture as the church, and of the whole (exclusive of the ground) will be 7,000l.

Aughton.—The foundation-stone of a new church has been laid at Aughton, a rural district in the neighbourhood of Ormskirk. The new edifice, which is being erected from designs by Messrs. W. & J. Hay, of Liverpool, architects, is to be the Flowing Decorated style of the fourteenth century. The estimated total cost is about 6,000l.; but as only two-thirds of the required amount have yet been collected, the church will not in the first instance be completed. As a whole, it will present a chancel, nave, and aisles, and a massive tower occupying a central position at the west end, terminating with a quatrefoil balustrade, pinnacles rising at the angles, the south-east corner having, however, an octagon stair-turret, terminating

with a pinnacle. The north side of the chancel will be occupied with a vestry and organ-chamber, having separate entrances. The materials used in the structure are local stone, known as "pitch-faced conersers"; the interior being lined throughout with ashlar. The seats which will provide accommodation for 500 or 600 persons, will consist of moveable open benches. The chancel, which will be large in proportion to the other parts of the church, being 40 ft. long and 23 ft. wide, the dimensions of the entire edifice being 75 ft. by 58 ft., will be reserved for addition at a future time when sufficient funds have been provided. The work is being carried out by Mr. Harris, of St. Helen's.

Leicester.—The building hitherto known as the Collegiate School has been opened as a place of worship, after being altered and adapted to its present use. Accommodation has been provided for 600 persons. The building is in the Tudor style, with open-framed hammer-beam roof, and mullioned and traceried windows. A system of heating has been introduced by Mr. Gimson, and the gas-fittings have been supplied by Mr. Webb, both of Leicester. The architect for the alterations was Messrs. Billake & Tatton of Wolverhampton and Leicester; and the general contract has been carried out by Mr. Roberts, of Leicester.

STAINED GLASS.

Lytham Church.—A stained-glass window had been put up in this church. It consists of two openings, and contains two representations of the Virgin mother, with the inscriptions, "Mater dolorosa," and "Stabat Mater." The detail consist of canopy work and borders,—style thirteenth century. This window is erected by the Rev. W. Selve, rector, in memory of his late wife, and is from the works of Messrs. Edmundson & Son, Manchester.

Parish Church of Bolton-le-Moors.—The teachers connected with the Sunday Schools in this church have erected a window to the memory of the late Canon Slade. It is in two lights, which are filled with figures of the "Good Shepherd," and the "Charge to Peter." The decorative portion of the window is filled with foliated work, and inscriptions and the armorial bearings of the canon are introduced in the tracery opening. The work was executed by Messrs. Edmundson & Son, of Manchester.

Redenhall Church (Horleston).—A stained-glass window has recently been put into one of the chancel windows of this church, to the memory of the late Mr. and Mrs. James Aldous. The subjects of the window are intended to represent Christ's Sermon on the Mount. The window was designed and executed by M. Baillie, of London.

St. Oswald's, Durham.—A stained-glass window to the memory of the late Mr. George Wilkinson, of Oswald House, has just been erected in the parish church of St. Oswald, Durham. The window contains two lights, the upper one representing "Christ blessing little children," and the lower one "The good Samaritan." The window was executed by Messrs. Clayton & Bell, of London.

DISSENTING CHURCH-BUILDING NEWS.

London.—The memorial stone of a new chapel to be called the Barbican Congregational Church has been laid in the New North-road. The new building is intended to supply a vacancy in the number of Congregational places of worship caused by the appropriation of the site of the chapel in Barbican to the purposes of the Finsbury extension of the Metropolitan Railway. A peaked gable, of Gothic design, will front the road, and in the centre of the facade will be constructed a large window, also of Gothic design, and interspersed with carved stone-work. The entrance will be in unison with the general style, an oaken door opening upon a porchway leading to the interior of the building. The interior fittings will be chiefly of Mediaeval design, the numerous sittings being open, and of varnished timber. The chapel proper will accommodate 900 persons, 427 on the ground floor, and 473 in the galleries; and besides the space thus appropriated there will be room set apart for two vestries. The basement floor will contain a lecture-room, or school-room, for 600 children, two class-rooms for 40 scholars, and two infant

class-rooms for 100 infants. Messrs. Landell & Sedells are the architects; and the builders are Messrs. Brown & Robinson.

Kettering.—The New Wesleyan Chapel in Silver-street will soon be completed. It is in the Italian style of architecture, and built of red bricks: the front and sides are faced with Bath stone carved. The interior will seat about 700 persons. Mr. George Woolhouse, of Bolton-le-Claydon, Lancashire, is the architect; and Mr. John Watkin, of Northampton, the builder. The entire cost is about 3,000l. Mr. John Torloff has announced his intention of supplying an organ, free of cost, in addition to 1,000l. already given.

Forest Hill.—A new Congregational church, in Stanstead-lane, was opened on the 2nd inst. The walls are built of Nutfield stone, in random courses, with Bath stone dressings. It is a Gothic building, without tower or turret; but portions of the front gable are recessed, and the centre pierced with a large five-light tracery window. The church will seat nearly 500 persons, and has two tiers of windows on each side, in anticipation of galleries being required in a few years. The ceiling is semi-sexo-decagonal in shape, and is boarded diagonally in panels. Iron arched ribs are used to strengthen the spaces of the roof. Mr. H. Fuller was the architect employed, and his designs have been carried out by Messrs. Staines & Son, builders, of Great St. Helen's. The cost has been somewhat over 1,000l.

Miscellaneous.

INTERNATIONAL ARCHITECTURAL CONFERENCE.—It has been determined by the Society of the Architects of France to invite architects of all the world to an international conference, to be held in the month of July next, to take into consideration the methods in use in architectural education, and all questions connected with the subject, and especially to inquire into the tenacity of the modern architecture of all nations.

MANCHESTER ARCHITECTURAL ASSOCIATION.—An ordinary meeting of this Association was held on Tuesday evening, April 2nd, the president, Mr. L. Booth, in the chair. After the reading of the usual business, Mr. Ludwig Oppenheimer, of Brunswick, read a paper on "Architrecture, its application and manufacture." The paper was illustrated by a large collection of specimens, many of which exhibited considerable nicety of workmanship.

WORKMEN'S DINNER AT THE PRINCE CONSORT'S MEMORIAL, HYDE PARK.—Last Saturday, Mr. G. G. Scott gave a dinner to the men engaged at the Memorial, in token of his satisfaction as to the way in which the work is being done. Mr. Coad, who inspects the work under the architect, took the chair, and a pleasant afternoon was spent. The health of the architect, and that of Mr. John Kalk, were drunk with great warmth. Mr. Cross, the manager of the works, the Chairman, Mr. Chinchin, Mr. Wheeler, and others concerned, were also toasted with heartiness. We are glad to see that progress is now being made in setting up the prepared work; the main arches are being turned.

FIRE-PROOF FLOORING: CUNNINGHAM'S PATENT.—Several methods of fire-proof floor-construction have been patented by Mr. J. Cunningham, of Liverpool, architect and civil engineer. Iron plates, weighing 42 lb. per lineal foot, and having a bearing of 30 ft., are placed 7 ft. apart, and carry sheet iron joists; this strength of materials is carrying 2 tons per superficial yard. Plaster is applied direct upon the underside of sheet iron joists; and if a tiled floor is wanted, the same can be bedded in concrete or cement, as the case may be. If a deal floor is necessary, battens can be fixed in the concrete to carry the flooring boards. Under the heading of "Advantages," the patentee says:—"In the case of schools, offices, houses occupied in flats, by different families, or buildings in which numbers of people are occupied, or live, fire-proof floor is of great importance. With the patent iron flooring there is:—1. No transmission of sound; 2. Great strength, with little weight; 3. No lateral thrust; 4. No dry rot; 5. No harbour for vermin; 6. Gypsum plaster laths for ceilings below, and a rubber flooring can be laid on battens, fixed in concrete or cement." The additional cost between an ordinary wooden floor and Mr. Cunningham's patent iron joists is stated to be but 9s. 6d. per superficial yard.

TRAMWAYS.—The promoters of tramways, who had projects before Parliament this year for London and Liverpool, have failed to carry their Bill, through technical errors in matters governed by the "standing orders" of the Houses of Parliament. The promoters of the Dublin tramways guarantee cheap and rapid communication, combined with personal safety, no matter how defective the state of the thoroughfares; and they promise an ultimate considerable saving in the cost of repairs to the streets. There are many portions of the suburbs of Dublin very inadequately supplied with means of transit to the city, which could be materially improved by a system of tramways properly carried out.

TREDINGTON CHURCH SPIRE, SHIPSTON-ON-STOUR.—In June last, during a thunder-storm, this spire was struck by lightning, and much damaged. The Vestry received tenders for its restoration, and the contract of Mr. George Frith, of Coventry, was accepted. Mr. Frith ascended the spire, which is 180 ft. high, by means of pulleys and ropes, drawing himself up with ease, and, upon reaching the top, he took hold of the cross-bar of the weather-cock and sat upon it. Afterwards, with two of his men, he ascended, taking up hewlows and forge, and the spindle of the weather-cock being out of the perpendicular, it was soon heated to a white heat and made all right. The operation, it is said, was accomplished as readily as it would have been at a blacksmith's forge.

BRECON INDEPENDENT COLLEGE.—This college is to be built at Snny Bank, close to the town of Brecon, and above the railway. The ground was purchased from the Marquis Camden, and is situated in a beautiful spot having a south-west aspect, upon a gravelly soil, about three acres in extent. Mr. T. Thomas, Swansea, is the architect. The quantities were supplied by Messrs. Curtis & Son, and Messrs. Rake & Ranwell. Seven contractors were invited to compete for the buildings, and the following four completed:—

Williams Bros., Brecon	£8,950 0 0
Thomas, Watkins, & Jenkins, Swansea	8,550 0 0
John Griffiths, Brecon	8,400 0 0
Jones & Son, Gloucester	8,000 0 0

THE KENSINGTON AND OTHER IMPROVEMENTS.—At a recent meeting of the Metropolitan Board of Works, it was resolved to adopt a report of the Finance Committee, recommending the acceptance of an offer of 150,000l. at 4½ per cent. from the Bank of England, for the purposes of the Kensington improvements; the money to be advanced in three instalments of 50,000l., in April, July, and September. Mr. Dalton, in moving the adoption of the Finance Committee's report, expressed a doubt whether the money would be wanted even in September; and if the Board did not get on faster than with the Whitechapel Improvement, it would not be required for two years. Mr. Newton said, with regard to the Holborn Improvement, if he understood the present arrangements correctly, the whole of the property there was to be paid for by June next, and was to be put into the hands of Messrs. Pullen, Horne, & Eversfield at Midsummer-day. With respect to the Whitechapel Improvement, there were two or three cases under arbitration now, which, when settled, would cost that Board some thousands.

PARLIAMENTARY OUTLAY ON ARCHITECTURE AND ART.—The estimates for the current year on buildings for what may be called artistic purposes comprise the following sums:—For completing the Clock-tower and works in New Palace-yard, and approaches, including the erection of the arcade, 12,196l. Raising of Parliament-square, 6,000l. St. Stephen's Crypt, Royal Gallery, and Robing-room, 5,140l. Works of art in decoration of Parliament House, 4,600l., which is thus apportioned: Mr. Herbert, for the "Judgment of Daniel," 1,000l., part of 4,000l.; Mr. Ward, three pictures, 600l. each, with augmented amount on completion of whole, 800l.; two statues of sovereigns in the Royal Gallery, 800l., out of 1,600l. New Foreign Office, 8,500l. (no further sum will be required for this building). 33,500l. are now asked for furnishing the same, decorating the grand staircase, removal, &c., the total estimated cost of which is 40,200l. Besides these sums, 7,000l., out of 12,836l., are asked this year for the completion of a quadrangle. The original estimate for this building was 233,516l. National Gallery enlargement, 32,000l. (nearly 39,000l. have been already spent on this head). Westminster Chapter-house, 10,000l. of total estimate of 25,000l. National Gallery of Ireland, repairs of building, 347l.

FAIRLOP OAK IN ST. PANCRAS CHURCH.—It may not be generally known that the pulpit and reading-desk in St. Pancras Church, in the Easton-road, are made out of the celebrated Fairlop oak, which gave its name to Fairlop Fair in Epping Forest, and which was blown down about fifty years ago.

SHEFFIELD SCHOOL OF ART.—The annual *conversazione* and exhibition of this school have been held. There was a large attendance, and an address was given by Dr. Gatty, who distributed the prizes to the students. Among the works of art exhibited was a large collection of those of the late Mr. Godfrey Sykes.

REMOVAL OF ANOTHER CITY CHURCH.—A scheme has been prepared for the removal of the Church of St. Mildred at the eastern end of the Poultry. For many months past it has had no congregation. By the removal of the church a large space will be obtained for the improvements which have long been required in that neighbourhood.

THREE MEN BURIED ALIVE.—At London-derry, a number of workmen are at present engaged in razing a block of old buildings on the east wall, adjoining the shambles, to make way for the new market premises which are about to be erected; and while employed at the side wall of one of the houses it suddenly gave way, burying three of the men. One of them is not likely to recover.

ACCIDENT IN ELLAND CHURCH.—On Sunday night, intense alarm was caused in this church, during divine service, by the falling of one of the clock-weights, of 26 cwt., in the church tower. A part of the screen near the tower was forced down and the whole building shaken. The impression appeared to prevail that the tower was falling. Something like a panic immediately took place; but nobody was hurt.

THE KNIGHTSBRIDGE BARRACKS.—We are glad to learn that a committee of gentlemen, headed by Earl Grosvenor, are getting up a petition to the Secretary of War for the removal of the tumble-down cavalry barracks at Knightsbridge, with their concomitant public-houses, dancing saloons, and brothels. The sweeping away of these barracks, as a disgrace to the locality, was long since, and repeatedly, urged in the *Builder*.

PROPOSED EXHIBITION IN COVENTRY.—The use of the new market-hall has been formally granted to an exhibition committee at Coventry. Various sub-committees are now actively engaged in making necessary arrangements; and the proposed exhibition is receiving support not in Coventry alone, but from Birmingham and other large towns, so that success is considered as well nigh a matter of certainty. An office has been opened in the arcade of the new market-hall, and there exhibitors will be able to obtain any information they may require.

WORCESTER CATHEDRAL.—On the north side of the cathedral cloisters the figures and other ornaments in groining have been well brought out by the process of cleaning away the plaster and whitewash, and many figures that were not known to exist have been shown. In May, 1863, one of the bells in the second peal at this cathedral was missed. It was then ascertained that thieves must have broken up the bell (which weighed over 5 cwt.) before removing it, but all that was left to support this supposition was a large crowbar. Rewards were offered for the discovery of the thieves, but nothing was heard of the missing bell till a few days ago, when the workmen engaged in restoring the tower found under a beam in the hefly a large piece of bell-metal, which, upon examination, proved to be a portion of the stolen bell.

LODGERS IN THE METROPOLIS.—The following returns for each borough in the metropolis, moved for by the Earl of Shaftesbury, have been ordered in the House of Lords:—1. The estimated adult male population; 2. the number of adult male householders; 3. the estimated male adult population who are not householders. To the following, also moved for, the Duke of Buckingham objected, on account of the difficulty and cost of obtaining them, and they were therefore not ordered:—4. Reports from the overseers of each parish, stating, so far as can be ascertained, the proportion of lodgers who pay for unfurnished rooms 4s. a week or upwards, and the proportion who pay less than 4s. a week; 5. such reports to state the lowest weekly amount per lodger paid by any considerable number of lodgers within each parish.

CHURCH BELL FOUNDRING IN BIRMINGHAM.—The first church bells founded in Birmingham for upwards of a century have just been run into their moulds at the manufactory of the Messrs. Bews, in New Bartholomew-street. All other kinds of bells have long been made in Birmingham, by tens of thousands yearly. They are sent out into all parts of the world.

TENDERS

For alterations and repairs, 40, Oxford-street, for Messrs. Perry, jewellers. Mr. H. Ashton, architect:—Longmore & Burge £739 0 0 Mashman 690 0 0 Tracey, Southall, & Watson 543 0 0

For building residences and stabling, Patney-hill, for Mr. J. Truman, Messrs. Lee, architects:—Tracey, Southall, & Watson £3,392 0 0

For taking down and rebuilding nave and porch, and restoring tower of Parish Church of Wentworth, near Ely. Mr. Frederick Preedy, architect:—Freeman, Brothers (accepted) £781 10 0

For decorations and repairs, 32, Westbourne-terrace, for the Metropolitan Railway Company. Mr. F. B. Wells, architect:—Clomence £389 0 0 Starkis 203 0 0 Tracey, Southall, & Watson 370 0 0 Montrie 291 0 0

For building new wing and porch to Addison Lodge, Kensington, for Mr. J. Hogg. Quantities not supplied. Messrs. Wade & Leonard, architects:—

Table with 2 columns: Item, Amount. Porch. Bywater £1,185 0 0 Sapwell 1,659 0 0 Richardson 940 0 0

For alterations &c. to the Falcon Tavern, Fetter-lane, City. Messrs. Bird & Walters, architects:—M'Lachlan £315 0 0 J. Brown 910 0 0 E. Brown 895 0 0 Newman & Mann 895 0 0 Ebbs & Sons 884 0 0 Williams & Son 874 0 0 Kelly, Brothers 813 0 0

For rebuilding the Crown Tavern, Tufon-street, Westminster. Messrs. Bird & Walters, architects:—Stimpson £2,131 0 0 Brown 2,130 0 0 Newman & Mann 2,167 0 0 Williams & Son 2,197 0 0 Betty 1,998 15 0 Fox 1,970 0 0 Kelly, Brothers 1,831 0 0 M'Lachlan 1,830 0 0

For villa and stable at Shortlands, Kent. Mr. Banks, architect:—Collins (accepted) £1,300 0 0

For the erection of chapel, Cliftonville, Brighton. Mr. H. N. Gonley, architect. Quantities supplied:—Cheeman & Co £2,792 0 0 Ancombe 2,570 0 0 Parsons 2,370 0 0 Simms & Marten 2,368 0 0 Chappell 2,244 0 0 Bland 2,210 0 0 Nightingale 2,185 0 0 Kemp (accepted) 1,851 0 0

For alterations at a house, Beckhurst-hill, Essex. Mr. J. H. Rowley, architect:—Rivett £893 0 0 Boyet 873 0 0 Burrows (accepted) 840 0 0

For the erection of five houses at South Norwood. Mr. J. W. Dennis, architect:—Hollidge £1,442 0 0 King 1,423 0 0 Bell 1,363 0 0 Fincher & Martyn (accepted) 1,100 0 0

For two villa residences, with offices, boundary fences, &c., in York-road, Tunbridge Wells, for Mr. C. R. Fletcher Ludwiga. Mr. Wm. Bond, architect. Quantities supplied by Mr. A. Vicars:—Perigo £4,777 0 0 Edwards & Walker 4,792 0 0 Walker 4,646 0 0 Winniford 4,600 0 0 Mercer & Camfield 4,437 0 0 Pink 4,439 0 0

For alterations and additions to house, No. 5, Cecil-street, Strand, for Mr. R. Laundy. Mr. J. T. Highland, architect:—Gotts & Blyton £314 0 0 Pinfold 210 0 0 Fowler 205 9 9 McVicar 169 10 0 Lacey 160 0 0

Accepted for The Congregational Church, Clifton Down. Messrs. Charles F. Hanson, & Son, architects. Quantities by Mr. J. A. Clark:—

Excavator, Waller, Bricklayer, and Mason's Work. Wilkins & Sons £3,227 0 0 Plasterer, Slater, Painter, and Glazier's Work. Lewis & Sons 772 0 0 Carpenters and Joiner's Work. Davey, Brothers 1,943 0 0 Plumber's Work. Tuckey & Son 110 0 0 Smith's Work. Williams 170 0 0

For Hill's Almshouses, Clifton. Messrs. Chas. F. Hanson & Son, architects. Quantities by Mr. J. A. Clark:—

Part 1.—Excavator, Bricklayer, Mason, Tiler, and Plasterer's Work. No. 1. Ornamental Brickwork. No. 2. Hanham Stone. No. 3. Local Stone.

Table with 4 columns: No., No. 1, No. 2, No. 3. £, £, £. Part 1. Stephens 2851 2362 2185 2385 2370 2274 2450 2189 2150

Part 2.—Carpenter and Joiner, Plumber, Glazier, Painter, and Ironfounder's Work. Lewis £927 0 0 Eastbrook & Son 883 0 0 Harris 880 0 0

For the whole in the various materials above stated. King 3900 3700 3675 Heal & Marsh 3900 3569 Diment 3718 3499 Warren & Son 3629 3329 Davis & Son 3550 3470 Part 1. Bevan & Son } accepted. Part 2. Eastbrook & Son } 3358 3008 3038

For the erection of offices, warehouses, and worksheds, for the Royal Porcelain Works Company, Worcester. Messrs. Scrivener & Son, architects. Quantities supplied:—Wood & Sons £3,501 0 0 Hilton 2,495 0 0 Beard 2,495 0 0 Dixon (accepted) 2,394 15 7 Wainwright 2,350 0 0

For the erection of hoarding and party-wall of new chronic wards at St. Marylebone Workhouse. Mr. H. Bacon St. Hill, architect:—

Table with 2 columns: Item, Amount. Crockett £345 0 0 Stephens & Watson 335 0 0 Nightingale 321 0 0 Johnson 298 0 0 Brown 287 0 0 Crabb & Vaughan 253 0 0 229 0 0

For the addition of new south aisle to, and reseatng of, the Parish Church of Bathers-ton. Mr. Frederick Preedy, architect:—

Table with 2 columns: Item, Amount. Long & Jones £1,050 0 0 Bussell (Jac.) 1,745 14 0 Bladwell 1,742 0 0 Mealing 1,934 0 0 Bussell (Wm.) 1,867 0 0 May 1,550 0 0 Rawlings 1,549 0 0 Barth & Son 1,532 0 0 Morgan & Lovell 1,460 0 0 Mercer 1,458 0 0 Hibbard & Long 1,439 0 0 Newman & Silver (accepted) 1,423 0 0 Greenman & Son 1,349 0 0

For building new billiard-room, &c., Walton Lodge, Banstead, for Mr. H. J. Nevill:—Tracey, Southall, & Watson £414 0 0

For partially taking down, rebuilding, and enlarging Church of St. Luke, Headless-cross, near Redditch. Mr. Frederick Preedy, architect:—

Table with 2 columns: Item, Amount. Repley £1,690 0 0 Scriven (accepted) 1,311 0 0

For warehouse, Cherry Tree-court, Aldersgate-street. Mr. William Smith, architect. Quantities by Messrs. Pain & Clark:—

Table with 2 columns: Item, Amount. Nightingale £3,146 0 0 Perry 3,050 0 0 Simms & Marten 2,991 0 0 Sabey 2,970 0 0 Ebbs & Sons 2,877 0 0 Abraham 2,729 0 0 Rigby 2,715 0 0 Henham 2,714 0 0 Langmaid & Way 2,649 0 0 Johnson 2,589 0 0 Hall 2,585 0 0 Eaton & Chapman 2,560 0 0 Wells 2,555 0 0 Warne 2,550 0 0 Crabb & Vaughan 2,329 0 0

For two houses at Eltham, Kent. Mr. D. Bland, architect. Quantities supplied:—Crabb & Vaughan £1,260 0 0 Nightingale 1,176 0 0 Walker 1,100 0 0 Thorpe 1,067 0 0 Day 1,043 0 0 Soper 1,033 0 0 Wise 800 0 0 Greene 751 0 0

For alterations and additions to the Congregational Chapel, Staines, Middlesex. Messrs. W. G. Habershon & Pitts, architects. Quantities supplied:—Witcox £2,794 0 0 Oader 2,447 0 0 Nightingale 2,345 0 0 Nye 2,196 0 0 Cowland 2,163 0 0

For house at Woking, Surrey. Messrs. E. Habershon, Brock, & Webb, architects:—Bird £5,450 0 0 Nightingale 5,184 0 0 Simpson 5,018 0 0 Carter & Son 4,601 0 0 Sabey 4,680 0 0 Patman & Fotheringham 4,936 0 0 Wallis 4,750 0 0 Harriet 4,400 0 0 Day 4,160 0 0 Manley & Rogers 3,917 0 0

For a new mansion at Welcombe, near Stratford-on-Avon, for Mr. Mark Phillips. Mr. H. Clutton, architect. Quantities supplied by Messrs. Crocker and Newby:—

We are compelled to decline pointing out books and giving addresses. All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, &c., not necessarily for publication. Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

GOOD FRIDAY.

NOTICE.—"THE BUILDER," for the week ending APRIL 20th, will be published at TWO p.m., on THURSDAY, 18th inst. Advertisements for insertion in that Number must therefore reach the Office before THREE p.m., on WEDNESDAY, 17th.

TO SUBSCRIBERS.

NOW READY. THE TWENTY-FOURTH VOLUME OF "THE BUILDER" (bound), for the year 1866, Price One Guinea.

CLOTH CASES for binding the Numbers, price Two Shillings and Ninepence.

CLOTH READING CASES, price Half-crown.

COLOURED TITLE-PAGE, Gratis. SUBSCRIBERS' VOLUMES will be bound on being sent to the Office, at a cost of Three Shillings and Sixpence each.

[ADVERTISEMENT.]

CHURCH, TURRET, and STABLE CLOCKS. J. W. BENSON, having erected steam-power and improved machinery for clock-making, at the manufactory, Ludgate-hill, will be glad to furnish to clergy, men, architects, and committees, Estimates and Specifications of every description of Horological Machine, especially cathedral and public clocks, chiming tunes on any number of bells. A descriptive pamphlet on Church Clocks post free for one stamp. Watch and Clock Maker by Warrant of Appointment to H.R.H. the Prince of Wales, and maker of the great clock for the Exhibition, 1862. 25, Old Bond-street, and 33 & 34, Ludgate-hill, E.C. Established 1749.

ADVERTISEMENTS.

Fifth Edition, now ready, in 1 vol. 8vo. price 2s. 6d. cloth. CWILTS ARCHITECTURE, illustrated with more than Eleven Hundred Engravings on Wood. Published by WEALE, 25, Old Bond-street, London. Edited by W. FAIRBROTHER, Fellow of the Royal Institute of British Architects. Additional Plates of Five Hundred Engravings on Wood by O. Jewitt, and more than One Hundred other Woodcuts. London: LONGMANS, OBERN, & CO. Paternoster-row.

MANUAL OF HYDROLOGY. BY N. BEADMORE, CR. Edition L.—Hydrometry and other tables for computing the flow of Water, Qm, and other fluids through pipes; with descriptive method. Division II.—On Rivers and Volume of Water; on Percolation; on Wells and Springs; on the Flow in Sewers, and Water Supply, with Filtration and other characteristics of their hydraulic condition. Division III.—On Tides, Tidal Rivers, and Estuaries; showing the condition assumed by tides where there is the bore, and where the tide waves vanishes; on the Effect of Improvements in Tidal Rivers, with Tables of tidal curves, sections of rivers, coastal lines, &c. Division IV.—On Rainfall and Evaporation—containing Tables of Rainfall at every elevation throughout the British Isles, France, Germany, Italy, Russia, North America, Australia, and India, with the best experiments on evaporation in various climates. A new issue of this work now ready at the reduced price of 2s. Published by WATERLOO & SONS, 45, Pall-mall-east, Westminster, and may be had of STAMPIN & CO.; WEALE, F. & SON; WILLIS & SOUTHBRAN; or through any Booksellers.

PERFECTION IN BOOK-KEEPING.—Builders desiring a really good system can have a set of Models for Builders, Books by Dumble-Entry, to which was awarded the first gold medal in "The Builder" of last September, and which has been adopted by many large firms. Also a modified arrangement, by Single Entry, suitable for small Builders.—Address, E. A. & St. George's-road, Regent's Park.

The Builder.

VOL. XXV.—No. 1263.

The Paris International Exhibition.

DAY by day the works progress, and completion is nearer. The Paris public are beginning by degrees to believe and to go. Once or twice there has even been an inconvenient crowd at certain points. The flooring of the building, we have omitted to mention, is for the most part of *beton*, on the ground; and there are small pits at intervals, with gratings over them, to receive the dust. It seems to have been the best arrangement possible under the circumstances of the site. A boarded floor on joists would have increased the cost greatly. The flooring is wetted overmuch in the morning for walkers with thin boots: but the right course in this respect

will be found out anon. Of the extent to which *beton*, by the way (a hot-water, hand-made, and concrete, so to speak), is used in France, we spoke last week.

Entering from the Pont d'Iena, on the left-hand side of the avenue, will be seen a Gothic chapel of brick, stone, and cement, with vari-coloured roof, ornamental lead work, and terminal statues. This has been erected at the instance of Charles Lévêque, glass-painter, of Beauvais, and originated in the same desire that produced an English architectural court,—a desire to bring together in a prominent position specimens of the various art-works required in architecture. In M. Lévêque's case it is confined to ecclesiastical art, and the idea has been carried out very fully, no fewer than seventy-five individuals and firms,—sculptors, metal-workers, glass-painters, tile-makers, chasers, enamellers,—having co-operated to bring about the result. The organiser had entertained the intention for some years; and when the present exhibition was first talked of addressed a memorial to the Imperial Commission proposing the erection of a fitting up of a larger and more comprehensive building than in consequence of difficulties that intervened was ultimately put up. He had finished, in the first instance, that the building should display the various styles of architecture, and occupy a large area of ground. He was granted of land, however, was gradually obtained, and the building took its present shape. Externally it is very amenable to the reverse criticism. Internally it has been fitted up in a costly manner; the floor displays various descriptions of pavements, the columns and wall-paintings are coloured, the window openings are filled with stained glass; each chapel has an altar of elaborate and in some cases elegant design; metal grilles enclose the sanctuary, and carved woodwork, enamelled figures, polychromed statues, candelabra, seats, organs, fonts, and other church fittings fill up

every available site. On another occasion, when the interior is more complete than was the case when we saw it, we may give opinions on the taste and skill displayed by the various exhibitors. For the present suffice it to say that M. Lévêque is entitled, as it seems to us, to great praise for the energy and persistency he has shown in carrying out his scheme. His chief aim is, as he says, to raise the character of the arts applied in the service of the church. About 200,000 francs (8,000L) have been spent upon the chapel, we are told, but the greater part of this will come back, as all but the shell will, of course, be useable elsewhere.

The Tuscians must have spent a great deal of money upon the handsome and characteristic structure they have erected in the Park. It is good both in mass and in details. Within the Exhibition building they have an apartment with its furniture complete, pipe-racks, divan, finely embroidered saddle, and other accessories. Near it are some modelled characteristic groups, including a dromedary and its load.

The copy of a Mexican temple that has been put up has a flight of twenty-eight external steps to the main apartment, and is painted all over with Mexican gods, or devils,—they are much the same. The walls of the upper chamber are covered with figures in high relief (moulded in paper), which are Egyptian, not Mexican. The whole has a made-up and apocryphal air.

The end of the Park next the *École Militaire* must by no means be left unvisited. Here will be found an extraordinary assemblage of conservatories, garden buildings, summer-houses, and rock-work. One conservatory, with rock-work approach, is particularly ingenious. To the summer-houses formed in cement, in imitation of stems and branches of trees, we will not give any praise, cleverly as the thing is done. The Venetian blinds covering whole conservatories, from top to bottom outside, are worth notice. There are, we suppose, arrangements to protect them against the effect of wind.

Russia has come out remarkably well. The pictures sent by her and her wooden buildings, we have already alluded to, but we may add a few words as to the latter. The walls of the houses are constructed of round timber, simply stripped of the bark and trimmed with the axe. The ends of the side wall timbers project through those of the front wall. Each piece of timber is halved to receive that which lies across and above it, and has two mortises below to receive the tenons in the halving of the piece below. The halving, the tenons, and the mortises are all produced by the axe alone. On the outside the timbers are left round, but within the rooms these are cut down until only a V-shaped joint is left between the adjoining pieces. No nail or spike is used in the whole construction.

According to a writer in the *Engineer*.—

"The building of a peasant's house of the plainest kind does not cost, in the neighbourhood of Moscow, Toul, and other great towns, more than 80 to 140 roubles; that is to say, from 12s. to 20s., materials, labour, furniture, and stove, all included. The furniture, it should be explained, consists simply of one large table, and benches which stand round the room in the daytime, and form two put together with a hard mattress on the top—the beds of the family at night, except in the coldest season, when father, mother, and children find a warm corner on the top of the stove, which is nothing more than an oven composed of bricks and faced with ornamental tiles. To explain this extraordinary cheapness the price of wood must be stated. A plank of best fir wood, 21 ft. long, 8½ in. wide, and nearly 2 in. thick, costs 50 copecks, or 17s., and oak is only worth from 2s. 3d. to 3s. 4d. the cubic foot. The wood is very carefully seasoned, being built up in stacks with interstices, and submitted to the action of steam, and is full of turpentine and resinous matters."

The walls of these houses are caulked like the deck of a ship, either with the large moss of Russia, or, where that is not to be obtained, with oakum, and this is driven in with an iron instrument specially adapted to the purpose, and the caulking is dressed with turpentine. Finally the angles are filled in with a cement composed of lime, cow-dung, and coarse flour or meal.

Within the building the Russian domain is marked by a screen of woodwork, similar in character to that seen at the Isbah and other structures in the Park, and suggests Tunbridge ware and the interlocking wood puzzles of our boyhood. Within the Court will be found a very fine and large piece of mosaic work. The design, two groups of the saints of the Russian calendar, is by Professor Neff, of the Academy of the *Beaux Arts* of St. Petersburg; the mosaics are in enamel, and the effect of the work is truly admirable. The expression of the heads is good, and the colour most harmonious and agreeable. Nothing of the kind equal to it was elsewhere opened when we were there. Some cabinets with the raised mosaic work decorations in which they excel, flowers and fruits, are also very fine: and they send some first-rate photographic portraits, and a mass of malacite in its natural, sluggy state, said to be the largest ever discovered. This looks about 7 ft. long and 3 ft. in diameter in the centre: a portion of it has been polished since it was set up. At the Russian Restaurant, by the bye, where their tea is in great demand, the waiters wear silk tunics of bright colour,—one red, one yellow,—and white trowsers. At some of the restaurants a great business, we may mention, is being done. According to the proprietor's own statement at the French establishment (*Gonsse*) on the Sunday preceding the opening, 7,000 dinners were served, and on the opening day a larger number still. The kitchen is found much too small, and is wanting in ventilation.

The screen put up in the building by Italy is elegant of its kind, and must have cost a considerable sum of money. So with many of the other nations. The style of that erected by Portugal is their strange mixture of Gothic and Italian. In the machinery zone that country has an enormous trophy of the same character formed of wood and plaster, and rising high into the air.

The productions of *Sèvres* and *Gobelins*, china and tapestry, have a court to themselves, and make a splendid whole, though we fail to observe the slightest advance in either; in fact, we can scarcely avoid impression of an apparent decline. We did not observe anywhere, except in the machinery zone, that France has made much advance during the last ten years. Nevertheless, her artistic furniture and other works of luxury maintain a high place. *Christoffe & Co.*, for example, have a wonderfully fine centrepiece of silver, for the city of Paris, similar in character, but superior in result to one they exhibited in 1852. A ship in the centre has four figures, carrying a fifth that typifies the city of Paris; and there are other figures at the end, with tritons and river gods. The modelling is of high character. This work was executed from the designs and under the direction of Mr. Baltard, architect, eight sculptors and modellers co-operating. In this way a fine thing may be produced.

It seldom happens when a model of a building is adopted by a manufacturer to show his wares, that the result is enduring. In the case, however, of the trophy set up by *Waters & Co.*, of Manchester, displaying reels and balls of cotton, and which takes the shape of the Manchester Albert Memorial, the spire somewhat enlarged, we have, thanks to the cleverness of James Thomas, their joiner, with help from the architect and a copy of the *Builder*, in which we gave a view of the Memorial, a very agreeable result; so agreeable, indeed, that it has been brought forward by the Executive near to the Norwich gates, so as to be seen from the principal avenue. We can praise both form and colour.

It is but just to say that Messrs. Clark & Co. have completed very satisfactorily their engagement to fix their self-coiling steel shutters to all the entrances to the building; and we may add, as another piece of personal glorification, that

the Emperor has bought from the stand of Messrs. Deffries & Son a service of engraved glass. More than one of our manufacturers have already received praises from the imperial lips.

REDEMPTION OF RAILWAY PROPERTY.

THE House of Commons was engaged the other evening in what we cannot call the performance of a comedy, for the comic element was wanting, and there was a deep tragic interest underlying the subject of discussion, but in a display which bore the same relation to farce that humour bears to wit. The honourable member whose name is most intimately connected with the history of the unfortunate and "irrepressible" London, Chatham, and Dover Railway, after having been for some time strenuously urged on in the daily newspapers, at last brought forward a motion for inquiry into certain matters of public notoriety in this sad case, and the business-like unanimity and good feeling that seem to pervade all discussions connected with railway property were evinced by an attempt to fix such a tag to Sir S. M. Peto's motion as should throw a slur on certain other honourable members for their connexion with a perfectly different, though unfortunate, enterprise. The form of the motion was such as to leave little room to reply to the objection raised by the Chancellor of the Exchequer against a proceeding that would afford a precedent for a further extension of the omnifarious occupations of the House of Commons. The temper of the House was such as to evince that every latitude would have been given for a full and detailed personal vindication, had such been attempted, or had such been possible; but the occasion for such a mode of satisfying his friends was not seized by the proposer of the motion. The debate had little result except to show that Torre del Greco is not the only place where people can make merry over the slumbering fires of a dangerous volcano.

While there can be no doubt that any effort to extend the too numerous functions of the House of Commons should be steadily resisted by all who prize the constitutional character of that assembly, and who deprecate its gradual transformation into the likeness of a constituent assembly or a caucus-smothered congress, we yet see cause to regret that no single voice was uplifted, during the course of the debate to which we have referred, to say what most present must have thought, or to point to what all ought to have laboured to do. Whatever amount of blame may be due to any individual in reference to the wanton depreciation of railway property, there is at least one greater culprit, and that is the legislature itself. Common honesty will condemn the men who have induced others to subscribe to railways of which the sole and exclusive object was to enrich the projectors at the cost of the public; but in the eyes of the English commercial morality of the day, which is different from common honesty, such men but act as sharp men of business. But when, to enable projectors to carry out their schemes, the grave sanction of legislative action is required, and when this action, the most responsible duty with which Englishmen can be entrusted, is so freely placed at the command of speculators as to supply them with an Act of Parliament for every five miles of a duplicate railway, the prostitution of legislative power can not be too strongly reprehended. It would have been more becoming for honourable members, in presence of a great calamity, bitterly felt in many a ruined family, to have acknowledged their misdeeds in having created by the laws which they voted a state of almost hopeless confusion, and to have taken the best means in their power to seek to discover a remedy, than to pass lightly over so grave a case even if somewhat irregularly brought before them. "*Amicus Peto—amicus Petrus jucundus—sed major amicus veritas.*" was the resolution passed by the House, with the omission of the four final words.

In presence of the helpless indifference of the House of Commons, and of the unquenched party animosity of the leaders of the railway world, the only hope of improvement in the present condition of railway property depends on the exertions of the press. For some time past this fact has been acknowledged with more or less distinctness. It would be idle to speak of the "morning instinct" of railway proprietors; but, unless the common sense of the great body of owners of railway property be aroused

to check the policy of the boards of direction, there is little hope of improvement. We have just seen a memorable example of a check being given by the good sense of individual members of a party to the inconsiderate party spirit of their leaders. In all governments, from the vice-royalty that rules with more than regal pomp (as things go in Europe) over 120,000,000 dusky Asiatics, to the pettiest railway or parish board, the policy of aggression and of extension seems to be normal. One governor-general after another was sent from this country to Calcutta in the earlier days of Indian rule, with express instructions rather to restrict than to extend the limits of English empire; but, as surely as he took his seat in the Government house, did the new-conquer carry out the course of conquest that seemed inspired by the air of the place. So it is with railway warfare. Dissident shareholders have made themselves conspicuous at half-yearly meetings by opposition to the policy of the directors. As individuals, or sometimes en masse, they have replaced those whose proceedings they have condemned, but whose policy they have continued to carry out. Unless the real, sound, commercial interest of the dividend to be earned be regarded as a more important question than the rivalry of contending boards, dividends will continue to dwindle and disappear, and directors will continue to congratulate their hungry constituents on important victories.

It is in this state of the case that an influential City authority has urged a scheme of railway federation, and calls out in extremity for "even a Hudson." That sooner or later, under the pressure of Government, or by some caprice of the Legislature, or even by the slowly-awakened conviction of railway shareholders, some scheme of consolidation will be carried out, we have never doubted. That it can be at once, and now, carried out, we fear to be impracticable. So great a step can hardly be taken without previously testing its practicability by some tentative process. It has been, therefore, with a distinct view towards future unity of interest and of action that we suggested the scheme for consolidating the debenture debt that was published in our last number. To that scheme, after mature deliberation, and consultation with men able to form shrewd opinions on the subject, the objections that withstand the execution of more complicated and more sweeping measures, do not, we think, apply. The trustees of the consolidated debenture stock would form a nucleus for consultation and for co-operation, but would not so menace the existing authorities with extinction as to insure their hostility to a man. A step would be taken in the direction of unity; but it would be a step not too precipitate in that direction. The practicality and the advantage of common action would be tested, but no secretary would be swamped, no chairman would be unseated, no existing powers would be annihilated; union would be gradually effected; and unity, if approached, would not be enforced with the strong arm as now suggested.

It has been since the scheme which we suggested was prepared, although before its publication in our columns, that an important portion of its outline has been adopted by several companies, and that with signal success. The result of setting apart a distinct portion of revenue as primarily applicable to the payment of debenture interest, has been most satisfactory. When this plan has been adopted by individual companies, the result has been to facilitate the renewal of their debentures. As to the rate at which such renewals have been effected we must wait to be informed; but, in times like the present, renewal at all, on any terms, is a godsend. If such be the effect of a single part of the scheme, applied only to gain temporary relief, what may not be expected from the permanent benefit to be derived from the adoption of the whole, and from the consequent abandonment of the system of the renewals of loans almost *in toto*? It cannot be too distinctly borne in mind by railway proprietors, that their present earnings, properly handled, are enough to give a very fair return on the money. Stop all profligate expenditure, avoid Parliamentary conflict, husband existing resources, and replace the floating debenture debt by permanent $\frac{1}{2}$ per cent. stock, and the result would be this— $\frac{1}{2}$ per cent. for the new stock, 6 per cent. for all preference shareholders, and 3 per cent. for all original shares. This, of course, is a mean. To make it so, not only as matter of figures, but as matter of fact, requires no further outlay of any capital, except of that

which is so rare,—the stock of patience and of common sense.

Connected with the future revenue of railways—for as yet we have only spoken of their actual earnings, gross and net—is the important question of the proper character of branch lines. It is in the construction of branches that the greatest loss has been incurred, and that the greatest want of foresight has been shown. It is clear that a town or village deprived of railway accommodation is cut off, to a great extent, from the world. Property in such places is depreciated to a great extent as compared to the value of land in more accessible localities. The country, therefore, demands branches, and each trunk railway, naturally and properly, desires to supply such part of the demand as consists with their own system. But the fatal error has been here. In almost every case the extending company has made, not a branch, but an extension. No traveller, nay, no engineer, not familiar with the district through which he is travelling, can tell whether he is on a main line or a branch. The permanent way and the works of art that are required for the safety of a rapid and heavy through traffic are repeated on the merest country branch—with, perhaps, the sole exception of the use of a single instead of a double track. This great and useless waste of capital is incurred by one simple fault. The class of engine fitted for the one case is used in the other. The expense of a railway as far as way is concerned, and to a great extent as far as works are concerned, is a function of the weight that is put on the driving-wheel of the locomotive. Limit the weight on the driving-wheel to the weight placed on the carrying-wheels, securing adhesion by a proper adaptation of the locomotive, and a branch becomes a question of 3,000, to 6,000, per mile instead of three times the amount, and a well-considered extension of the system will bring at once lucrative traffic to the railway companies and adequate accommodation to the public.

TILES AND TERRA COTTA.

THERE is an accessible mine, conveying very useful information concerning various building materials—such as building stones, marbles, woods, glass, metals, cements, plasters, manufactured ceramic wares, fireproof floors, bricks, asphalt, slate, &c.,—which appears to us to be little known, or, at all events, but little used. This is in the terra-cotta court and the long gallery by which it is approached, in the South Kensington Museum. We may call attention to this collection as a regular architects' and builders' gallery, full of building contrivances, appliances, and inventions. Many of the objects exhibited in it have been on view for some time; but there are some recent acquisitions in terra-cotta which we are about to mention, the more especially as it is at all times a matter of difficulty to find full information as to the extent to which manufacturers have developed the capabilities of this material. Every manufacturer, of course, is ready to forward his price-list on application; but he is not to be expected to furnish any information concerning the wares of his rivals; nor, doubtless, is he aware of the extent of the world-wide competition with which he is surrounded. In this court and gallery there are numerous specimens of English, French, Italian, Danish, Swedish, Austrian, and Australian terra-cotta; some glazed, some enamelled in colours, others left *au naturel*; and besides these, there are fragments showing the material in different periods of antiquity, in examples of Old English, Italian, and ancient Roman date.

The capabilities of terra-cotta are so elastic that it is scarcely too much to say that "everything and more" might be made of it. Full-length statues, groups of sculpture, busts, and lofty columns are among its triumphs; while mouldings, panels, trusses, archivolts, medallions, friezes, fountains, stores, candleabra, tracery, shafts for mullions, brackets, finials, chimney-tops, cornices, balustrades, and string-courses, are some of its every-day uses.

The principal difference between ancient and modern terra-cotta seems to consist in the fact that the ancients dried their clay in the sun, whereas the modern manufacturer bakes his in kilns at a high temperature. It is, perhaps, needless to say that the term *terra-cotta* of the Italian, or *terre cuite* of the French and Belgians, means earth, or clay, baked; and that the modern mode of dealing with it makes it more durable than that pursued by the ancients. To

the potter's clay are added fine sand and pulverized potsherds, all of which are well mixed together with water. At this stage it can be either modelled or cast, the latter process requiring that the consistency of the mass should be reduced to that of thin paste, and that the moulds used should be sufficiently porous to absorb the water. The objects are then dried in the air before being placed in the kiln. When Wedgwood first re-discovered the art of producing ornamental works in clay, it was expected that a large use would be made of this facility to beautify our streets at a moderate cost. The end, so far, has not justified the expectation,—perhaps, to some extent, from the want of the precise information we are now about to offer. We must premise that we shall not be able to give the exact prices of all the articles now manufactured in English or foreign terra cotta, on account of their fluctuation. Foreign and native firms sending specimens have sometimes submitted prices, but when they have received orders after the lapse of three or four seasons, there has been such a considerable variance between those they quoted at the time and those of the present market, that they have discontinued the practice. The exact cost of any of the articles we shall particularize can, of course, be ascertained by communicating with the firm that manufactures them.

The ancient foreign examples serve best to impress us with the nobility of the material. There are several of these in the Museum, in the small cloister courts leading out of the main courts, in the immediate neighbourhood of the fountains. A Florentine group of the Virgin and Child, executed in the second half of the fifteenth century, standing beneath a niche of floriated architecture, 5 ft. 8 in. high and 3 ft. wide, for which those intrusted with the responsibility of purchases did not refuse to disburse 300*l.*, is a fine example of the exaltation with which terra cotta may be treated. Another Virgin and Child, by Jacopo della Gherardina, 1420, from the Gigli-campagna collections, illustrates the same power. Nor is it the fact of the artist being a celebrated master that in any way leads to a high price being set upon this class of work, for the best portrait of an unknown Flemish gentleman, wearing a flat cap with a doublet of figured damask and a robe hordered with fur, by an unknown sculptor, in the early part of the sixteenth century, was acquired at the large cost of 48*l.*; while the head of a saint, in terra cotta, 1 ft. 8 in. high, second half of the fifteenth century, partly enamelled, a portion of a large composition, the work of Andrea or Lucca della Robbia, cost but 2*l.* There is to be seen here a work in alto relievo of great firmness and delicacy, representing the birth of John the Baptist, ascribed to Lorenzo Ghiberti, 1381-1455; and we may also mention as worthy of note a bas-relief, 2 ft. 4½ in. high and 1 ft. 7 in. wide, of the Virgin and Child, of fifteenth-century Florentine work, which cost 25*l.*, in the manner of Desiderio della Settignano; an alto-relievo of the same subject, in its original wooden frame, of fifteenth-century Florentine workmanship; and a full-sized bust of our Lord, with the drapery and crown of thorns enamelled, ascribed to Lucca della Robbia. The facility with which the last-mentioned artist embodied his thoughts in this material is further shown in a bas-relief of a monk writing. In the great south court, beneath a richly ornamented marble-arched shallow recess, are four figures, full-sized, representing the Pietà where the dead Christ on his mother's knees is shown in a manner of grace touching and masterly. This group cost 150*l.* Of classical and general subjects there are numerous examples of groups intended for fountains; two amorini bearing dolphins, 2 ft. 1½ in. high, of sixteenth-century workmanship, purchased for 10*l.*; and two nude boys of the same period being noticeable among them. The fine massive head of a Hon, of fifteenth-century workmanship, ascribed to Andrea del Verrochio, indicates quite another field for the use of the material. The great name of Michelangelo has also fallen upon terra-cotta. A colossal hand, known as Michelangelo's hand, 10 in. high, has been acquired from the Gherardina collection, and several of the great master's works have been reduced, by his admirers, in this material; as in the instances of the group of the Pietà, a contemporary Italian reduced copy of the original, in St. Peter's, Rome, purchased for 6*l.*; and a statuette model of his figure of Jeremiah in the Sistine Chapel. Bassi relievo in terra-cotta were much used in the cinque-cento and preceding centuries. To Geo. Bologna is

attributed a sketch of the "Rape of the Sabines," 2 ft. 10 in. wide, by 2 ft. high, which may be seen in one of the cases of the richly-stored courts whose contents we are now mentioning as evidences of the versatility of the material. The very delicate manipulation of a full-length figure of St. Catherine having a nimbus with a legend on a scroll upon it, holding in her right hand a wheel and in her left a sword, 1 ft. 3 in. high, by 8½ in. wide, presented by Mr. G. K. Moreland, sends into strong contrast the hold manner of such busts as that of the Duke of Lorraine, 1 ft. 6 in. high, of eighteenth-century workmanship, which was valued by its last owner at 18*l.* Delicacy of treatment has its admirers as well as the more powerful mannerisms, as we may note by the prices given for the objects which exhibit it with any degree of superiority. A small French statuette, by Clodion, most minutely treated, of a fawn running away, only 17 in. high, of the second half of eighteenth century workmanship, cost 42*l.*; another, 2 ft. 6 in. high, of St. Sebastian, date 1490, 8*l.*; and another of St. Jerome, 1 ft. 6 in. high, Italian seventeenth century, 6*l.* Around the principal innermost courts is a series of modern brackets, fixed to the pillars of the arches, on which are placed busts, all, until minute examination is made, of similar merit and of equal antiquity, but in reality of curious difference in value,—one of an aged emaciated man costing 2*l.* 15*s.*, and another as much as 68*l.* Another terra-cotta bust, not in this series, deserves especial mention for the curiosity of its subject, which is that of an immensely stout lady, belonging to the Lupari family, 1461. It is painted.

Beginning now, however, at the foot of the ladder with the humble modern pantile, we perceive that foreign manufacturers are in the field armed *cap à pied* with enterprise and taste. It is needless to say that the clumsy, heavy pantiles that cover so many of our homesteads with red ripples are not their models. From force of long association of idea, some people have arrived at a conviction that the ruddy clay ripples in question are picturesque; but they have only to look upon the foreign ones to unsettle their minds on this point; or, perhaps, we should say, receive a directly-contrary impression. The nearest in form to them, though not in tint, are the pale, and-coloured Spanish tiles manufactured by Wickman & Co., Seville. These are 9½ in. wide, and 1 ft. 2 in. long, and are placed in rows forming similar corrugated lines to the English pantile; but the difference in colour, and the addition of conical caps 1 ft. 7 in. in length, tapering from a base 7 in. wide, clearly mark their foreign origin. The Belgians have a curved tile something like this, only of a smaller size, which is used with the recurrence of the conical caps at intervals. *Tegole Belges* are also made in black, red, and coarse grey colours by M.M. Jossan & De Langes, Niel, d'Anvers. A spade-formed tile, pointed at its base, with a raised ridge down its centre, having a sort of terminal raised arrow-head as an ornamentation, measuring 1 ft. 3 in. in length, and 11 in. wide, is manufactured by them in black, and in a greyish black, as well as in red, at an expense of 70 francs le millier; and the same ogee-formed tile measuring 11 in. by 7½ in. is made both in black and red for a price of 40 francs the thousand. A convex pantile, measuring 11 in. by 8 in., with straight lines at the edges, is also made in the three colours mentioned above, the black, weighing 2,030 kilos, the thousand (price 75 francs per thousand); the red, 1,780 kilos, (price 100 francs per thousand); the coarse grey, 1,900 kilos, (price 50 francs per thousand). A concave tile, measuring 1 ft. by 9½ in., is also manufactured by the same firm in black and in red; as also *tuyaux fontaines*, or ridge-tiles, in blue and mixed tints.

A Neapolitan manufacturer, Sig. P. Carafa di Noia, Naples, exhibits in the long gallery of building materials a set of tiles showing the differences between those of England, France, Belgium, Rome, Italy, and Naples. He selects a plain square tile as a specimen of our English make; and chooses from Belgium varieties that which nearest approaches our common curved and scrolled pantile. The Italian tile has the angles of base scalloped, and measures 1 ft. 4 in. by 7 in. The Neapolitan tile is corrugated and rolled; and the Roman flat and rolled. Sig. Carafa di Noia does not supplement his otherwise comprehensive and interesting display of nationalities in *tegole* with a price list. He is not the only Neapolitan manufacturer. Sig. F. G. Colonese, Naples, exhibits an ornamental roof tile of what he calls a French pattern, 1 ft.

3 in. in length by 9 in. in width, which is furnished with a bold ridge at one side with which to overlap its neighbour, and a boldly-raised diamond ornament on the centre. The angle of the base are scalloped off. A Parmese manufacturer, Sig. P. Rondaini, Parma, shows us a graceful cream-coloured tile, 1 ft. 3 in. in length by 9½ in. in breadth, which has a raised flat ridge to each with which to overlap each other; it is scalloped on the edge and has a boldly-raised ridged lozenge-formed pattern on the centre of each. Signori Leoncini, Brothers, Rotta, Pisa, contrast this with some large flat red tiles which overlap each other at the joints vertically, 1 ft. 5 in. long by 1 ft. 2 in. wide, furnished with tapering rolled caps, 6½ in. wide at the base; and show a ventilating dormer projecting from one of the flat surfaces. As these specimens were originally sent to this country as samples only of Italian manufactures for the International Exhibition they have not been selected with any view to their fitness for this special climate, nevertheless there are many purposes for which they would be useful as well as ornamental. The roof of the training-school attached to the museum is covered with an Italian tile manufactured by Brown, of Sarthon. It consists of vertical rolls, like draining pipes, alternating with flat tiles, somewhat resembling those of Signori Leoncini. There is no ridge; and it has the appearance of the rolls of a lead roof, recurring much more frequently, and being of a larger size. The present effect as to colour suggests that they are somewhat porous, as they are reddish with a green tinge here and there as though with lichens. The sides of the dormers in this roof are covered with small flat tiles with ornamented edges.

The French manufacturer who exhibits the most specimens is M. A. Courtois, 148, Rue St. Lazare, Paris. One of his tiles bears his own name, and is known as the "tile courtois." The effect of it, when grouped in its place, is at once simple and pleasing, having the appearance of a series of diamond-shaped scales. He states that each one weighs 45 lb., and 180 of them are required for a square of 100 superficial feet, making a weight of 810 lb. for that amount of covering, the expense of which is 4*s.* It is a flat tile, 1 ft. 4 in. square, placed cornerways, having a raised rim round two sides of it, and a turned-up clip between them, and a turned-down edge to the other two sides, with a turned-down clip at the angle between them, by which a hold is gained by each tile upon the next. A lozenge tile manufactured by M. Bardin, of Lyons, is highly ornamented. It is thin and light, the single tile weighing scarcely more than the "tile courtois," though more complicated in form, and ornamented by a rib along its centre, and a tongue formed. A square weighs 770 lb. It is made, however, in three dimensions, running 150, 250, and 350 tiles to the square, and costing 6*s.*, 3*s.* 12*s.* 6*d.*, and 3*s.* 4*s.* the thousand tiles, according to those sizes; or 18*s.* the square for the first two, and 22*s.* 6*d.* for the smallest. The colour is a dull red. M.M. E. Muller & Co., of Paris, engrave upon the manufacture of tiles a system of ventilation. They not only provide a covering, but they make provision for the introduction of open and fixed ventilation tiles and skylights, and manufactured tiles as a flashing to chimneys. To describe their tiles in the words of its exhibitors, it "has the fillets or flanges along its lower edge slightly returned parallel to the face of the tile; this return being locked into a corresponding recess in the tile next below it, more effectually secures it from the action of the wind, and at the same time gives a watertight joint without the necessity of a high pitch. The longitudinal joint is formed by two small fillets on the face of the one tile fitting into two grooves in the reverse of the next, thus being secured by three edges lapping over two." 150 of these tiles go to cover a square, which weigh 850 lb. The roof of the Sheepshanks Gallery is covered with the "tile courtois."

There is a scaly tile made in plates, having nine scales upon each tile, which is manufactured by Faconnet, Chevalier, & Co., 52, Rue de Transit Vauregard, Paris. Each tile is flat and diamond-formed, the scales standing up about a sixteenth of an inch; and the measurement is 1 ft. 3 in. in length and 1 ft. in width. They are made to hook on to the roof, each tile being simply rabbeted into each other and hedged in mortar; they are 1½ in. in thickness. There are few purposes for which these would be preferable to those that overlap; but they are, doubtless, intended as an improved mode of procuring the effect of miniature tiles. M. Gastellier, Montan-

faust, Seine et Marne, manufactures a flat red tile pierced with two holes, with a slightly raised ornament on it. An Austrian tile shown exhibits the peculiarity of being glazed on half of its extent, the half that is covered by the tile that is destined to overlap it being left unglazed for economy's sake.

There are three makes of ridge tiles, besides their immense variety of pattern; the first and most general of these being cast in the solid in lengths; the second having the ornament only cast into lengths, which fit into grooves prepared to receive them; while the third provides sockets, into which each upright ornament on the ridge is inserted. As the latter would be liable to be loosened in windy weather, it seems that either of the former would be preferable, except for the facility with which those placed in sockets could be replaced without any disturbance of the ridge in case of injury to them. R. Langley, East Cowes Park, Isle of Wight, manufactures, in red and yellow, lengths of ridge tiles having three well-formed fleurs-de-l'ys on the apex, in the solid. He also manufactures the small 11 in. by 6½ in. tiles with ornamented edges, which are thinner and therefore lighter than the usual make. The grooved ridge tiles for ornamental purposes are manufactured in red, green, and terra-metallic, by Robert Brown, Surbiton, as are those in which each ornament is placed in a separate socket. Thomas Peake, Tilerie, Tynstell, Stafford, makes a strong ridge tile, having little pyramids on its summit, cast in the solid. He also makes lapped and grooved varieties.

Passing on to objects more removed from the sky-line, we will indicate some of the specimens of these to be seen in the modern terra-cotta court. In the centre of this compartment stand two lofty ornamented columns, examples of those used in the south arcades of the Royal Horticultural Society's Garden, on either side of a fountain, with a group of sculpture on a pedestal, rising out of the tazza, by Minton. A second fountain, with a group of two boys holding up a cnp, by A. Carrier, Paris, price 50*l.*, is another striking object. Around are grouped some fine statues, notably a beautiful Bathor, of a yellow tone, for which 52*l.* 10*s.* was not withheld; a bust of Rossini, by M. A. Carrier, Paris, priced 32*l.*; another of Newton, with some disparity, or by some good bargain, priced 10*l.*; and a full-sized erect and draped figure of Galileo, in the usual reddish tint of the material, by Sig. Boni, Milan; and close by is an enormously large slab of Dura marble, which serves as the base of a case containing small fine, delicate specimens of works in terra-cotta. Of these a lovely little statuette of Night, which cost 15*l.*, deserves special examination. On the front of the gallery which crosses one end of the court are two medallions, representing Summer and Winter, by Devers, Paris. On the walls, and on the ground-space immediately in front of them, are displayed productions in terra-cotta by manufacturers from most European countries, those of our own makers, a handsome vase from Australia, and numerous examples of Chinese work.

Some of the Swedish clay used for terra-cotta is white, and this, when glazed, very much resembles the effect of porcelain. There are some fine examples of it in the court. The colour of Danish terra-cotta is similar to that of our own. Several objects, especially some ornamental capitals by C. Vidal, Forsight and Rensing, illustrate this resemblance. Prussian terra-cotta is represented in a Corinthian capital, 1 ft. 8 in. high, by E. March, Charlottenberg, Berlin. It is of a lighter colour than the Danish. M. Boni, Milan, has made very successful attempts to produce highly ornamental work in this material, which a panel for a pilaster, priced 25*s.*, a good-looking twist-moulding at 20*s.*, the yard, trusses, fragments of friezes, and samples of archivolts, illustrate. Stoves made in terra-cotta are improvements in appearance for green-house purposes to those in cast-iron. Signori Purlani & Co., Florence, show stoves of a pedestal form, ornamented with wreaths, on square bases, about 3 ft. high, which are priced at 25 francs. Ferries have been thought of by English manufacturers in connexion with terra-cotta; and a red brick, 18 in. square, with a hollow in the centre with a drain in it, called the Watsonia brick, for growing ferns and building ornamental works for ferries, is shown by F. & G. Rosher, Swan Wharf, Chelsea. The same idea is produced in a smaller brick of a Gothic pattern by the same makers. The hollow is destined to receive earth and the root of the fern. Terra-cotta flower-boxes for window-sills are shown by Clay & Co., Bishop Waltham. To

return to indoor objects, candelabra come out well. A fine specimen in this court, by Blashfield, looks worth its cost, 15*l.* 15*s.* Chimney-pieces are good vehicles for the material, some of the French samples being magnificent works. The Renaissance style is very bappily compassed by terra-cotta. A copy of an antique chimney-piece in this style, by M. Virebent, Toulouse, is admirable; and the doorway leading into the court, with caryatides, is another fine specimen of the capabilities of his manufactory. An ornamental window, with cornice and string-course, indicates resources as complete in the possession of M. Garnaud, Paris. The whole of the tracery of a double-light window is shown, in four different patterns, in one casting, by Louis Thomson, Wisbeach. The Chinese samples consist of tiles and caps, with ornamented glazed ends, parapets and ridges glazed, balcony fronts glazed and unglazed.

Two medallions in terra-cotta, by Wedgwood, bought at the De la Rue sale for 5*l.* and 5*l.* 10*s.* a-piece, have been quite recently added to the contents of the Museum. The first of these has a group, in high relief, of a Centaur and Bacchante; and the second a group, also in high relief, of Cupid on a dolphin, bearing a letter to Polyphemus. Both are after the Heronlanem fresco. After looking at larger works for constructional purposes, these curiously exemplify the extremes of boldness and exquisite delicacy with which it is competent to treat this durable and not costly material. Under a glass case in the South Court are some additional works, without mention of which a notice of the capabilities and realizations of terra-cotta would be incomplete. These are some minute objects of modern English manufacture of great finish:—A vase and cover; Diana and Actæon, diameter 5½ in., priced 3*l.* 3*s.*, modelled by Willis, Brothers; and a group of Titania and Bottom, by the same artists, 5*l.* 5*s.*, which compare not disadvantageously with the last-century work by Clodion, of a fawn running away, which we mentioned above as a sample of fine finish, purchased for 42*l.* Terra-cotta as a medium for grand and minute ornamental works is not yet sufficiently understood.

STRIKE,—BUT HEAR!

The large suburban population whose daily occupation depends on the more or less punctual service of the Brighton Railway have cause to rejoice that the state of open warfare between the directors and the engine-drivers of that line was not allowed to extend beyond forty-eight hours. We should gladly join in the congratulations that are pouring in on all sides but for the single consideration,—why should such a state of things have been allowed for even a single day? What new light upon the justice of the demands, or the propriety of their concession, has been derived from a dislocation of all arrangements depending on the locomotive service of this line for so short a period? Did the directors disbelieve that the men were in earnest, without this definite and costly proof? Did the men find one black Monday enough to send them back, as repentant prodigals, to their engine-sheds and their coke-ovens? Or was there, on either side, a point of honour involved, as in the Italian campaign? Did either party think it necessary to look the other in the face on a stricken field before consenting to treat? These questions are more likely to be multiplied than to be answered; but that a strike so terminated in a day should never have been allowed to occur,—that the ultimate settlement would have been all the more satisfactory if it had not taken the form of an *ultima missum*, there can, we think, be no room to doubt.

We were silent on the subject of the dispute between managers and drivers while it was in progress for more than one reason. The rapid course of events, the doubtful state of probable results from day to day, were less suited to be treated of in the pages of a weekly journal than in those which never allow a topic to come cold before the public. And then the interests concerned were so grave, the disputants on either side had so much to say for themselves, that it seemed hardly permissible to treat the subject without devoting to it as much preliminary care and study as if we had been dealing with it in the character of an umpire.

Now, however, that all matters of dispute seem for the time, at least on this line, happily adjusted, it may be useful to call atten-

tion to some of those more important features of the case that are left to be lost sight of in the hurry of fight, or in the rejoicing attending reconciliation. A heavy price has been paid by the metropolis for the experience gained that Monday. What use is to be made of that experience? What are we to have for the price? The general, and we think, the correct opinion on the case, before the stoppage, was, that most of the demands of the men were reasonable. On the other hand, the idea of not yielding to menace is native to the English character, and long may it remain so. And the position taken by the men as to equality of pay, at the same time that they hinted that an inequality might be maintained by raising the maximum, was at once indefinite and threatening. "Settle your disputes between yourselves," was the verdict of the public; "the real amount of divergence is not so great as to render friendly arrangement impossible; but do not make us pay the penalty of your misunderstanding. Do not let us witness the resort, by a skilled and educated body of men, to that weapon which reduces all who make use of it to the level of the idliest and least skilful of their body. Do not lose public sympathy by causing public inconvenience."

Now we are not ashamed to own to a very strong sympathy with the men. It is unnecessary to say that we do not sympathize with a strike. It is urged—what else can we do? We think much else can be done, and that with, instead of against, public sympathy. A strike is a very terrible weapon. It is a two-edged instrument, cuts both ways, and infallibly injures those by whom, as much or more than those against whom, it is employed. It gives a blow that is difficult to parry, and that is certain to injure by recoil. When once resorted to it leaves a sense of soreness in the defeated party, and a feeling of might being more than right in the victorious party, that are likely to prove prolific sources of future disputes. But above all other evils of this kind of warfare, we rank the injury inflicted on the men of most skill and eminence in their calling, who voluntarily reduce themselves to the ranks, and throw into the common fund of aggression all that naturally would place them at the head of their fellow-craftsmen. A successful organisation, resting on the power and the threat to strike, invokes the permanent degradation of the best workmen to the level of the worst.

In the case of the men to whose care is committed the active conduct of the traffic of the country, there are peculiar features. They are men who must possess for the proper discharge of their duties qualities of no mean order. Vigilance, sobriety, and presence of mind; strength of hand and clearness of vision; acquaintance to some extent with machinery, at least as far as the details of the locomotive are concerned; and sufficient strength of memory and perspicuity of thought to read complicated signals at a glance and at full speed,—all this must be had, and is had,—we must say cheap,—at the rate of 40*s.* to 45*s.* per week. Then the actual physical exposure is at times very severe. Ten hours' work in blinding sleet, or in parching sun, with no shelter for the head, with a fierce fire within a few inches, with no possibility of withdrawing the attention for even a short rest without danger; service of this kind by night as well as by day; the eye, the most delicate part of the organization, constantly on the stretch, and liable to constant irritation from the dust of the coke,—all this is no sinecure. Gentlemen who are fond of driving, and who think the post of engine-driver rather jolly, should spend a week's worktime on the foot-board; and they would find the salary that came in on Saturday night very fairly and very hardily earned.

Now, if we go to a body of men of this description,—men who do public service by day and by night, with their lives in their hand (for in any case of accident the engine-driver is the most likely victim),—with the argument that would hold good against a more numerous body of workmen, naturally including those of every degree of industry and of skill, we are met with a ready answer. There are, or there ought to be, no inefficient drivers. Every man to whom so responsible a post is intrusted must be fit for that post, or the consequence is far more than the debated 6*d.* or 1*s.* per diem. Here, then, we think the men have the best of the argument—the best, but not altogether the correct view of the case. Every man intrusted with the control of a locomotive ought to be a man of capacity and of character, deserving a very good rate of

wages. We are not attempting to fix that rate: call it five shillings or call it seven, it is the same for our argument. Let us say that any engine-driver has a right to expect a high minimum pay; and that no employer, who values his own character, would seek to engage a driver on lower terms.

But there are differences in the demands made upon the drivers. Much is demanded of every one; more is demanded of some. All qualities of alertness and endurance are more put to the test in the conduct of very swift trains than of slower and more ordinary traffic. All such qualities are more called for by night service than by daily duty. Both additional demands are made on the drivers of the night mails. That certain services, then, should be more highly remunerated than others, and that those services should be performed by the men whose claims were not alone those of seniority, but of seniority combined with greater aptitude for the task, is to the interest alike of managers and drivers; and by keeping in mind this view of the case, the question of permanent rate of wages can be justly and satisfactorily decided.

Then, again, as to the firemen. It is alike to the interest of the drivers and of the managers that the firemen should be apprentice engine-drivers. No one, in a perfectly-organized railway system, should be admitted to the tender, except in preparation for the future management of the engine. In any case of accident to the driver, the stoker has to supply his place. This necessary education should be systematised. Young men employed as firemen should be educated to some extent at the lathe and at the bench. The privilege might be given to engine-drivers of a certain seniority to take apprentices. And so soon as it became understood that such was the natural future of the stoker, the question of minimum pay would cease to be that of the utmost importance in his eyes. He would be content with a moderate present that ensured a definite future.

By placing matters on this footing, that degree of satisfaction and content would be established among the men that arises from a sense of being justly dealt with. The case should be that not of order, but of office. No officer expects an extra majority to be attached to his regiment because he has distinguished himself. Good service is the best claim to promotion, when vacancies occur, but not to the creation of brevet posts. Night-mail drivers, express drivers, and drivers of whom any unusual amount of vigilance or of endurance is expected should have adequately higher pay, as the pay of these superior posts, and that graduated scale of remuneration which is the life of all good service would thus be established on intelligible principles, and with justice to all parties.

There remains another consideration, and one as to which it is marvellous to reflect that it has been lost sight of by the numerous daily commentators on this memorable strike. Those men succeed best in their conduct of affairs who enlist human nature on their side. Managers are too apt to forget this. Discipline must be maintained, they say. The word of command must be given sharply. That is true under arms. But in dealing with Englishmen in civil capacities a soft word goes a long way. Kindness and consideration on the part of a manager will go further than many extra shillings tossed at the pay-table like bones to hungry dogs. But we mean something far more positive than this. The rate of the locomotive expenditure of a company is to a great extent in the hands of the drivers and firemen. The difference between a fair ordinary rate and a carefully economical rate of locomotive cost is one that would be distinctly felt in the half-yearly accounts.

From a fairly-paid and justly-contented staff the companies have a right to expect, and no doubt will receive, the fair attention to duty that will avoid extravagant cost. To do more than this they must interest their staff in effecting economy. Cases are of daily, and even of hourly occurrence, when the engine-driver has to choose between ease and economy. He may save the fuel and stores of the company, but he does it at the cost of his own fatigue. In all such cases the ordinary action of mankind is to save their own labour at the cost of their employers. It is a part of the privilege of employment, and is so regarded, more or less, in all services. The patient, retiring, self-sacrificing vigilance, that makes so much difference in the rate of constant expenditure, is not to be had without some direct inducement. So much, more or less, you may have from conscientiousness. Much more than

this, however, is to be obtained, but there must be some direct stimulus applied to obtain it. Now, this constant and wholesome stimulus to the maximum amount of care and of economy is only to be certainly obtained by giving the workman an interest in the results.

The problem which it should be the unconscionable effort of his whole day to solve should not be how to get the most out of his employers, but how to earn the most for his employers, while participating to some extent in the gain. We do not seek to enter into the details of the mode by which the account is to be regulated. The principle once adopted, the details will readily follow. A certain rate or proportion of expenditure must be regarded as normal. By all redaction on that expenditure the servants of the Company through whose exertions it is effected ought to benefit in participation with their employers. If this principle be clearly laid down and fairly acted upon, and if the locomotive staff be placed on the same footing with respect to seniority and promotion that a military locomotive superintendent, were such an officer in existence, would naturally arrange, not only will the public have no need to fear any further engine-drivers' strikes, but it will have received an equivalent for the loss, the inconvenience, and the alarm of the 25th of March, 1867.

VITAL STATISTICS: LONDON AND PARIS.

THE extension of the limits of the city of Paris to the fortifications on the 1st of January, 1860, has somewhat interfered with the comparison of the vital statistics of recent years with those recorded before the alterations in the boundary. The following results, however, which have been deduced from the "Statistique Générale de la France," from the monthly bulletins of M. Haussmann, prefect of the department of the Seine, and from other authentic sources, may be relied on. The Bulletin des Lois, which records the results of the recent census of France, states that the population of the city of Paris in 1866 was 1,825,274. In 1861 it was 1,696,141; the increase in the five years being at the rate of 1.48 per cent. per annum. The estimated population of London in 1866 was 3,037,991. The increase of population in the ten years, 1851-61, was at the rate of 1.73 per cent. per annum. The population of Paris is distributed over 19,280 English statute acres (7,802 hectares), the density of population in 1866 being ninety-five persons to an acre. The population of London, extending over an area of 77,397 acres, gave thirty-nine persons to an acre in 1866. The proximity of the population, upon the hypothesis of equal distribution, was 7.7 yards in Paris; while the inhabitants of the English metropolis were 12.0 yards asunder. As the results of sanitary reform only become apparent after an improved system of hygiene has been in operation for some time, the full effects of the alterations in the water supply, sewerage, street-ventilation, and house reform, commenced some years ago in Paris, have only been recorded of late years in a marked decrease in the rate of mortality.

In the two years 1857-8, the average annual rate of mortality to every 1,000 persons living was 27.3; in the three years 1859-61, it was 26.5; and in the three years 1862-64, it was 25.0. The annual rate of mortality per 1,000 of population in each of the two capitals, Paris and London, was 25.3, and 22.5 in 1860; 25.7 and 23.2 in 1861; 24.6 and 23.6 in 1862; 24.7 and 24.5 in 1863; 25.3 and 26.5 in 1864; 28.5 and 24.6 in 1865; and 27.0 and 26.5 in 1866. The cholera epidemics interfere with the comparison between the two capitals, in the years 1865-6, but looking at the results as a whole, it may be said that more people die in Paris than in London, in proportion to their respective populations. As far as the hygienic conditions of the two capitals are concerned, the inhabitants of London have the advantage of their Parisian neighbours. Much has been done of late years to improve the sanitary condition of the French capital, but it still labours under the great disadvantage of retaining in cesspools, for a certain time, the refuse which should be allowed to pass away by a system of sewerage; the underground drainage, which has been carried out on such a grand scale, being almost exclusively confined in its application to surface drainage. With regard to the improved system of water supply in the city of Paris, it may be

stated that, as the service is seldom carried higher than the first floor, the occupiers of the upper stories of the houses are but imperfectly provided with water. The poorer classes draw largely from the filtered waters of the Seine, from which also the *porteurs d'eau* derive their supplies; but the quality is objectionable, as the water is exposed to much contamination. In 1860 Paris received only 32,503,028 gallons of water per day, and a considerable deduction was made from this quantity for municipal purposes. This summer the quantity will be increased to 47,000,000 gallons per day, and when the works in progress are completed, Mr. Bunnell states that the supply will be increased to 105,000,000 gallons per day. London is now supplied with 100,000,000 gallons per day. Not only do deficiencies in the drainage, and in the water supply, may the slight excess in the mortality of Paris over that of London be attributed, but also to the dense overcrowding of the population that obtains in some parts of the French capital. The area of London—with a population not amounting to twice that of Paris—is four times as large as that of the French capital. The improved hygienic condition of the latter city in recent years, as compared with that of former periods, is, doubtless, partly owing to the removal of buildings that were injurious to health; but, nevertheless, some parts of the capital are too densely populated. The number of births per 1,000 of population in each of the capitals, Paris and London, was 30.37 and 34.80 in 1864, and 30.63 and 35.51 in 1865. The proportional number of illegitimate births in 1864 to every 1,000 children born was 288 in Paris, and 44 in London. The marriage-rate in 1861 (persons married to 1,000 of population) was 18.4 in Paris, and 21.4 in London.

NEW STYLE.

WHY is all this hankering after a new style? this dissatisfaction with a resuscitated architecture? this condemnation of new forms clothed with ancient graces? In fact, what is it that these learned writers want? They advise the study of old art, and at the same time condemn the use of it as a precedent. Truly this is not sound criticism, or language fails to express what it is they desire, and we need from them something more than words, some explanation with the pencil of the point of their meaning; yet I deem it difficult for them to give this. Do they really intend to affirm that the great revival that is in progress is all wrong? that the looking at old things has warped the imagination, and caused the wreck of common sense? Nay, rather is it not that those who disregard the great things of our forefathers, and either work upon their own resources, or passionately introduce novelty as the panacea of art are the men who produce nothing noteworthy or something that may be designated as architecture gone mad? I can have no sympathy with these restless incoherent ideas, for they seem to me to belong to a phase of criticism that is deficient in the encouragement of excellence and abundant in detraction. Where would have been the Roman style if it had not grown out of the Grecian that preceded it? Where would have been the Medieval Gothic if it had not gradually arisen out of the weary periods of Romanesque? Where would have been the Italian Renaissance without a maternal precedent? and where, I will say, will be the English,—ay, the European development,—if the present active and varied exertion, founded on a knowledge of former deeds, were to be nipped in its spring by an unwise hypercriticism? We have in many new buildings a great attainment of excellence, as exhibited by their vigour, their originality of treatment, their beauty of form and detail, their suitability to their purpose; and, though it is true that none of them show a style that is wholly and solely Modern English, or Modern European, I fail to perceive that such a marked character is as yet either needful, or desirable, or possible. Let me, by negative and affirmative, look at our requirements. We do not want actual copies of any thing that has existed before, either in the mass or in particular parts. We do not want ill-contrived arrangements, nor anything that is insuited to its use. We do not want extravagance or parsimony. We do not want a rejection of anything that science or knowledge may contribute towards the formation of a good building; but we do want walls, windows, doors, roofs formed with decorative fea-

tures, and having proportion, symmetry, variety, harmony, grace, colour, expression; and the attainment of these is practicable, and has been effected in a considerable degree in many modern structures that have no direct resemblance to former works, beyond the fact that they are the offspring of master-minds imbued with the principles and feelings that actuated other master-minds that have preceded them. It will not do to reply that these works have round arches, or pointed arches, or any other peculiar feature of a kind used before, and therefore that they have no originality, no new style, none of the excellence that should distinguish the architecture of the nineteenth century, an era which, in the eyes of some, appears to be one of wisdom, of enlightenment, and of purity, beyond all former precedent. Surely the assertion that architecture is in a retrograde state is a cruel libel; I thought it to be quite the reverse of this; and who that can remember its condition thirty or forty years ago, when it was emerging out of timid puerility and emaciness, does not think so too? But I ask again, what do the writers want? If they expect that a new style is to start up fully grown and equipped, like Minerva from Jupiter's brain, they are surely the persons who disregard common sense, and architects are the men who make use of common sense to develop the art of design out of former experiences. It has always been thus since the creation of the family of man. No art was ever developed at once; all has grown out of something that went before, and all has partaken of some of the feeling whence the now work has been derived; and no attempt has ever been made to cast aside precedent. But again I say, let them show us what they want, and then we will tell them whether their new style has common sense combined with beauty or not. It must be easy to do this if there be 5,000 new styles in prospect, but I altogether demur to this enumeration. E. N.

INQUISITION AS TO THE CAUSE OF FIRES.

A COMMITTEE of the House of Commons has been sitting for some time under the designation of a Fire Protection Committee, and has already placed upon the record a large mass of valuable evidence, upon all branches of the subject of fire insurance, fires, and their causes. Last week Mr. Smith, secretary of the Scottish Union Insurance Office, was examined at great length: his prolonged experience in connexion with fire insurance enabled him to give evidence on numerous points connected with the subject. The witness considered that the insurance-tax, imposed about 1702, was originally, and had always been, a war tax, which he considered it impolitic and unjust to continue in time of peace. He had computed the value of the property insured against fire at about 1,500 millions of pounds sterling about 1855, but the property insured now was much greater in value. Fires had increased in a much higher ratio than the increase in insurance business. He attributed many of these fires to incendiarism, and believed that at one time there had been, if there were not at present indeed, organised gangs of incendiaries in different parts of the country, and that the number of fires the origin of which could not be satisfactorily accounted for had been progressively on the increase for many years past. The insurance business was in consequence decidedly bad; some offices paying dividends to proprietors, but many others paying no dividends at all. Greater caution was being exercised by almost all offices in the acceptance of risks (his office refused many), and the number of fires, and value of the property destroyed by them, had been considerably diminished by attention to the construction of buildings and the storage and classification of goods insured. Some great fires he believed might be attributed to warehouse-thieves, who resorted to this means of concealing their depredations. Many others were doubtless attributable to culpable carelessness. The remedies he suggested for these evils were, that authority should be given for judicial investigation into the causes of fires, and he considered that the coroners of England and the procurators fiscal of Scotland would be competent officers to conduct such investigations.

He also recommended that the insurance offices should have a common defence fund, as bankers had, for their protection against unfair claims, as at present the offices never prosecuted

for arson, and would rather let a criminal escape than risk the reputation of being litigious, or the character of being disposed to resist the payment of claims. He quoted figures relating to Baltimore, U.S., showing that the appointment of a fire-marshal had reduced the number of fires in that city to a small fraction of what it was before criminal investigation into the causes of fires was authorised. He had no doubt that, if the Salvage-corps of London, a comparatively modern institution, which was composed of the most intelligent men selected from the Fire Brigade, were authorised to investigate, or to initiate the investigation, into the causes of fires, they would speedily greatly diminish the number of conflagrations, especially of those accounted for by the term "spontaneous combustion,"—a phrase rarely, if ever, heard of forty years ago;—pointing to an important fact nevertheless, say we.

GROSMONT CASTLE.

GROSMONT is one of five strong places disposed along the right or south-west bank of the Munnow river, the others being, below it, Skenfrith, and above it Oldcastle, Longtown, and the fortified house of Perdin. Monmouth Castle, and the town beneath its protection, occupied the junction of the Munnow with the Wye. These are some of the fortified buildings scattered broadcast over the Welsh marshes, and especially abundant in the county of Monmouth, and the remains of which, always picturesque, are often tolerably perfect.

In the rear of these castles on the Munnow were those of Brocknock, Tretower, Crickhowell, and Abergavenny, upon the Upper Usk, and over the whole of that country there is scarce a hill-top or point of vantage which is not occupied by some defensive earthwork, showing the importance attached to it by each of the several races, Celtic, Roman, Saxon, and Norman, who in turn either attacked or defended this devoted soil.

Grosmont, about four miles above Skenfrith and five below Oldcastle, is placed, like the former fortress, upon the high convexity of a sharp bend of the river, about a hundred yards from its margin. Very near to it is the fine old cross church, which, having shared in the prosperity of the castle, has escaped its decay, and still remains in tolerable repair, although requiring a few subtractions and restorations at the hand of a judicious architect.

The castle is composed of a court or ward of irregular plan, more or less rectangular, with projections upon the south side, the wall of which contains a space of 110 ft. by 70 ft., strengthened on the south by a larger and a smaller three-quarter mural tower, having a gateway upon the east face, and on the west traces of a building exterior to the curtain wall. The north side is occupied by a hall, also exterior to, or rather replacing the line of, the curtain, three of its four walls forming a part of the exterior defences of the building.

The whole is placed within a ditch of great depth, and, indeed, the earthworks generally are of so laborious a character as to make it probable that they are earlier than the present building, or than any other work in masonry. The actual platform occupied by the walls and contained within the crest of the ditch, is about 150 ft. in diameter.

Outside the ditch, to the east and south, and covering the entrance of the castle, is a large demi-lune, or platform of earth, scarped towards the field, and upon which are traces of walls and a defence of the nature of a barbican. The main ditch, now traversed by a modern embankment, was evidently at one time crossed by the usual bridge, of which a part lifted. The gatehouse, if such it can be called, presents two lateral cheeks of wall, projecting on either side of the bridge, and thus forming a covered way, from each side of which a cruciform loop is directed along the ditch. The pointed vault of the entrance is broken, but there remain the ragged grooves for the portullia, and the two holes which received the large wooden bar confining the gate.

Entering, on the right, is the shell of the hall, 80 ft. long, by 27 ft. broad, out of all proportion to the area of the defences. The floor, of timber, was laid 6 ft. above the level of the court, so as to give height to a spacious basement store-room or cellar, into which, however, has a large fireplace in its east wall. The hall has windows at each end, and four in each side, but probably

only the six to the east belonged to the hall, the other two lighting a wide sawing-room. The position of the fireplace on the north side seems to mark the centre of the hall.

On the left of the entrance the curtain extends to the south-east or smaller drum tower, and probably supported a spacious lean-to roof marked by the corbels or bearers for the upper wall-plate. This south-east tower seems to have been massive, but low, and to have been altered and enlarged at the gorge, on the side towards the court, which now projects inwards in a rectangular form. When this addition was made the tower seems to have been raised to three or perhaps four stories, and near its summit is a bold cordon.

A strong curtain extends from this to the south-west drum tower, of larger dimensions, and broken down towards the court. The floors of these two towers were of timber. Between them, and parallel to the curtain, seem to have been some buildings, probably barracks.

The buildings outside of and built against the west curtain projected boldly into the moat. They are in great decay. Here was the fireplace, the base from which, wrought out in the substance of the curtain, rises above it as an elegant octagonal chimney shaft, the summit of which is crowned by the elegant lantern or spiracle which has so often been drawn, and is so well known.

Grosmont, as it now appears, is of moderate size and much mutilated; but its towers and walls, though stripped of their ashlar, are still standing, and the earthworks are large, bold, and well defined.

Whatever may be its primeval history, the present building presents nothing earlier than the reign of Henry III. The additions seem to have been in the Earlier Decorated style, and, probably, are of one date, that of the reign of Edward I. After the S. Welsh conquest, Grosmont was one of the numerous De Braose castles, and passed by inheritance to the Cantelopes. It then fell into the possession of Henry III., who granted it to Hubert de Burgh. In the well-known war waged by the Welsh and Richard Mareschal, Earl of Pembroke, against Henry III., it was besieged by Llewelyn and relieved by the king, who occupied it as head-quarters during the latter part of the campaign. After De Burgh's fall, Henry re-granted the castle to the Earl of Lancaster; and it has since, with the somewhat earlier castles of Skenfrith and Whitecastle, remained attached to the duchy. Henry, Crouchback's grandson, was here born, and hence styled Henry of Grosmont. Probably he was the author of the principal additions.

The adjacent church contains a late Norman font, with cylindrical base and octagonal bowl; and the pier arches of the central tower are also Pointed Norman. Most of the remainder of the church is Early English, and probably of the date of the castle; but there is a Decorated north porch, and some other parts in the same style, which may have been the work of the artist who completed the additions to the castle, and its elegant chimney shaft and finial. C.

LOCAL BOARDS.

THE evils sustained by the public at large from the utter insufficiency of local Boards and other corporate bodies to meet their desired ends, cannot be too strongly agitated. To do this effectually, the means afforded by the powerful influence of a scientific public journal like the *Builder* are of inestimable value; and there can be little doubt that the letter of Mr. Rees, published in your issue of March 30, will have been read with interest by the majority of your readers. And it is to be trusted that the insertion of Mr. Rees's statement, taken in conjunction with the deliberately uttered and weighty judgment of many eminent authorities, like Mr. Hawkesley, pronounced upon the corporation control of engineering matters, will lead the public to a proper consideration of its interests. One urgent need is a thoroughly-searching investigation by select commission into the history of the manifold important enterprises affecting public health and convenience, whose sole control is vested in the hands of the divers public bodies composing the municipal government of this country. Let such an end be resolutely and persistently pursued; and, once attained, it cannot be doubted that then, and not till then, may we expect to see so gross a combination of official ignorance and jobbery deprived of the

absolute sway which forms its present privilege.

Having in common with numberless others of my profession suffered from the injustice of lying estimates in engineering schemes, winked at or overlooked by local Boards, I suggest, in the name of the public good, which, in nine cases out of ten, is sacrificed to the interests or prejudices of the authorised Boards, if he requested, by some considerable member of the House of Commons, that a return be made from every town and district in England of the actual cost of their respective works for water supply and main drainage, together with their original estimates and present efficiency for their destined purposes, and that means be taken to ensure the rigid accuracy of such return.

I have not an unbounded faith in the practical business genius of the Briton in aught relating to that Old Man of the Sea who haunts him in the shape of the mayor and corporation of his borough, extracting heavy toll with a remorseless hand which stretches forth to take, but which never yields back. But I believe—nay, I am sure—that the rays of light so directed would disclose so infinite an aggregation of shameless imposition upon a long-suffering public, that a continuance of the like would be impossible in the future. Without some such remedial step as this, we cannot in reason hope to avoid reaching the condition of corporate management recently exposed in New York, if, indeed, in some of our towns we do not already rival it.

At this present moment the town council of this borough (Leeds) are on the eve of committing the ratepayers to the final adoption of a gigantic addition to their existing system of waterworks. The brief history of this scheme is as follows—Mr. Filler, the borough engineer, constructed during last year a certain scheme for the supply of water. Of the details of this scheme I will say nothing, save that, having been professionally engaged over every foot of his gathering-ground, I know of none more certain to supply water impregnated with peaty essence. The scheme was laid before the Board, and it being, as usual in this borough, a Whig and Tory question, the former party procured its adoption. The estimated cost was £50,000; upon the strength of which powers from Parliament were applied for. The ratepayers were assured that this estimate was in excess, and that the consulting engineer would certainly reduce it. That gentleman (Mr. Hawkinsley), however, having no desire to compromise his public reputation for the sake of private interests, has estimated the same work at £20,000; and to this must be added 30,000, since it appears that certain lands valued at 15,000, or 16,000, are to be paid for to the tune of 46,000, part of this latter sum being, I suppose, in settlement of opposition; so that, in spite of its deficiencies, the preamble of the Bill has been proved.

Possibly we may term this a more gross and flagrant instance of public credulity than usual. In appearance, granted that it is so; in reality it will be found no uncommon example of local misgovernment. It may be asked, what motive can a reputable body of men have in so pillorying their incompetency, or worse?

In reply, I would ask, what motive can a man, unscrupulous and powerful, with private interests to serve, with no official responsibility, with strong personal resentments, and with inflated party bias, have in serving those interests, in using that irresponsibility, in gratifying those resentments, and in furthering the views of his party? I do not hesitate to state a well-known fact, that all these disturbing ingredients are component parts in the constitution of our various bodies corporate, who, like Judas, "carry the bag."

Without any inclination to trespass unduly upon your space, I will, under sanction, give another instance where it would appear that public scrutiny is needed. The commissioners of Leytonstone, in Essex, have recently invited competition for the drainage of their district, stating that information would be supplied by Messrs. Houghton & Wragg, 15 A, St. Helen's place, London. On applying to these gentlemen, by letter, I received no answer. I again wrote, and was told I had intruded my attention to what was not worth my while, and that I could get information, by applying in person, at their offices. Once more I requested some particulars, and again I was informed I could get them on personal application.

What I wished was, of course, to ascertain whether it was worth while to take the matter

in hand or not; but such knowledge I could not obtain. Since then a friend, also an engineer, has applied for particulars, and has received no reply. In this place I would ask these gentlemen if the appointment was made prior to the advertisement that it was deemed a waste of time for any one else to take the matter into consideration?

One illustration is weightier than many arguments, and the foregoing faithfully represent, in most instances, the value of those unpaid public servants who, without let or hindrance, exercise the functions of purse-bearer and pry-er-general to the public. Is there any specific reason why the supply of water to the public should not be regulated by private enterprise with unlimited competition? It is certain that no private company would be biased by personal regard in favor of professional advisers, no matter what their virtues. Your engineer or contractor might be after your own heart in politics, might attend your own place of worship, or might be married to your own daughter; but, my good common-councilman, alderman, or mayor, your ear would be deaf to all these potent qualifications when opposed to professional capacity, if you, and not the public, were to reap the profit and loss.

M. P.

HILLINGDON CEMETERY CHAPELS, MIDDLESEX.

THESE new chapels have been recently completed; that for the Episcopal Church having been consecrated by the Bishop of Rupert's Town on March 13. The latter has a polygonal apse and a bell gable turret. The Dissenters' Chapel is situated near the Episcopal one. There is also a massive gate-house and entrance-archway to the cemetery. The general material of the walls is Kentish rag, with Bath Box-ground stone dressings. The roofs are covered with plain red tiles. The works have been carried out under the superintendence of Mr. Ferrey, F.S.A., at a cost of about 1,800L. The contractors were Messrs. Fasnidge & Son, of Uxbridge.

"THE CONTRACTOR AND THE WORKMAN."

A MILLIONAIRE mason, in a story told in the *People's Magazine*, explains how it is that he is better off than the mass of the companions of his working days. A discontented working mason is the narrator:—

A large case occupied the end of the room, divided into compartments, and each labelled, and on a bureau were heaped bills and estimates. The contractor stopped before the great table, and showing me a water-coloured plan, said:

"This plan requires modifying. They want to reduce the building three metres, but without diminishing the number of rooms, and you must also find a place for the staircase. Sit down and make a rough sketch of the thing."

I looked at him surprised, and told him I could not draw.

"Then examine these measurements for me, and see if the estimates are correct."

I answered that I was not up in such work as estimating prices and verifying measurements.

"You can at least tell me," continued the contractor, "what necessary legal forms I must comply with, in regard to the three houses I am about to build?"

I brazenly answered, "I was no lawyer."

"And as you are also not a banker you are, without doubt, ignorant how to arrange your payments, and what interest you ought to receive on your capital to avoid bankruptcy. As you are not a merchant you would find it difficult to tell me where the best materials are to be procured, and the proper time for purchasing, and the most economical means of transport. As you are not a mathematician it is useless to inquire whether that crane, of which you see the model, is likely to save labour, and therefore expense. As you are not a mathematician you will in vain attempt to judge of this new system of bridge-building I am about to try on the Lower Seine. In short you know nothing but what a hundred others among your companions know: you, like them, are only fit to handle the hammer and the trowel."

I was completely disconcerted, and I twisted my hat instead of replying; indeed, I had nothing to say.

"Do you understand now why I live in a fine house, while you inhabit a garret?" continued the contractor, elevating his voice. "It is because I exerted myself; it is because I have learnt all you have neglected to attain; it is in consequence of voluntary study I am become a general utility you remain among the recruits. By what right do you demand the same advantages as your superiors? Ought not society to reward each according to the service he renders? If you desire that society should treat you as she has treated me, do as I have done: deny yourself even bread to buy books; spend the day in work, and the night in study. Be ever on the look-out for instruction, as a merchant looks out for profit; and when you have shown that nothing discourages you, when you shall have learned rightly to understand and value things and men, then, if you still remain the inhabitant of a garret, come and tell your tale, and I will listen to you."

ROCKHURST, WEST HOATHLEY, SUSSEX.

THERE are few places within thirty-five miles of London possessed of so many natural charms as is the estate now known as Rockhurst, on the East Grinstead line of railway, including, as it does, pasture, trees, rocks, and water; and here the owner of it, Mr. Charles Hill, F.S.A., has recently built a not large but compact residence, from the designs of Messrs. G. & H. Godwin, architects. We give a view of the house, showing particularly the entrance-front, and we add plans of the principal floors.

The walls are constructed of sandstone quarried on the estate, with brick inside, a space of 2 in. being left between the stone and brick. Galvanised-iron ties at short intervals keep the two together. Some hands of Mansfield stone are sparingly introduced, and there are a few ornamental coloured tiles in the window-heads of the garden front. The arches of the carriage-porch are ornamented with carved honeysuckle, and in the cornice is running ivy; executed, as was all the other carving, by Mr. Jaquet, of Stamford-street. The contractors were Messrs. Fuller & Longley, of Worth.

The plans show the accommodation afforded on the ground-floor and one-pair story. There are besides offices in a basement formed below part of the house (gained through the slope of the ground), and half a dozen good servants' rooms in the roof.

The dining-room has been fitted up with some old carved oak panelling, and has a panelled ceiling.

The capitals of the various columns at the entrance-doorway and elsewhere, and the bosses ending the string-courses, are enriched with stone carvings of the ferns found growing in the grounds, or in the immediate neighbourhood. Abounding as the situation does with chalybeate springs and sandy rocks, few places offer such a fitting habitat for these favourite plants. In a semi-natural, semi-artificial fernery on one side of the house, and completely overshadowed with trees, is a large collection of British ferns and shade-loving plants growing in the greatest luxuriance. Amongst the most noticeable, perhaps, of the latter in this ferny hollow is the one complete green carpet at the bottom, of golden saxifrage (*Chrysoxiphium oppositifolium*).

The well from which water is supplied to the house is about 80 ft. in depth. The stables are at a short distance from the residence, near the old house originally occupied by the owner of the estate.

The new building is erected on an eminence commanding the fertile grounds, which form an undulating valley of pasture and woodland. In the dense plantations of the latter are many large well-grown trees, principally of oak, fir, and larch. The view from the house is varied and superb, terminating with the fine range of Sussex Downs, embracing Chantebury and other well-known eminences. Towards one boundary of the estate, and overlooking an ancient and now dried-up river-bed, is a long series of colossal, rugged, and toppling sandstone rocks, irregularly stretching, side by side, or one over the other, for a great distance. These huge stones are undermined, piled upon each other, thrown down, or balanced in apparently the most dangerous and fantastic manner, and by our forefathers have been variously inscribed and tattooed, many names and dates upon them being more than 200 years old. The side of one dark and frowning cave, more within the estate, bears an ancient inscription, telling the spectator it is the veritable "CAVE ADVLLAM," but perhaps the most astonishing of all the rock groups is one that has been known for centuries in the neighbourhood as "Great upon Little." In this we have an enormous sandstone rock, weighing some hundreds of tons, so nicely balanced upon an infinitely smaller stone, that to all appearance the slightest touch would displace it. In the dry river-bed below, are to be seen many half-hurled stones that have evidently been displaced from the parent rocks above.

A botanist would probably find no end of rarities amongst the cryptogamic and other plants that abound on these huge masses of porous sandstone, covered as they are with ferns, scale-mosses, and liver-worts. Among many other species, may be noticed growing on the wet shelving ledges of some of the subterranean caverns, the Tunnidge Fern (*Hymenophyllum Tunbridge*), and on the humid, dripping sandstone rocks are many luxuriant liver-worts.

THE NEW ASSEMBLY ROOM, BRIGHTON.

The stables of the Pavilion Palace have now been converted into an Assembly-room, and a trial of its acoustic properties has been made, the result, it is said, being satisfactory. The dome, and chandelier of 1,300 gas jets, are the chief features of the Assembly-room. The area under the dome is 80 ft. diameter in the clear of the columns supporting the gallery front, and the site of the former stables is 22 ft. on each side, thus making the extreme diameter 124 ft. The dome is composed of twenty-four bays. The whole of the old glass, and great part of the lead work, have been replaced with new; and the sixteen larger bays have been filled in with a boarded ceiling, in which are the stained-glass windows that light the room during the day. The windows are composed of circles, &c., variously grouped, and the design of the glass is also varied to suit each case. The panels have arabesques in chocolate on a buff ground; those of the eight narrow bays are filled with richer arabesques on blue ground; and the decoration of the dome is completed by the principal ribs being painted with alternate panels of a running pattern of suitable design. The gallery front, which retains more of its original form than any other part of the building, is decorated with a warm chocolate ground, and the cusped fillets of the arches are all gilt. The lower part of the dome, where the stables stood, have been greatly altered: the fronts, partitions, and fittings have been entirely removed, and the timber uprights cut away, and iron columns and brackets have been substituted for them; these columns are coloured in maroon, and the capitals and brackets are gilt. The orchestra is on the south side of the room, and occupies the width of three large bays of the dome. The front forms an arcade of three decorated arches of Moresque design, supported by slender iron columns. The detailed drawings and specifications were prepared by the surveyor, and in September last the tenders were accepted for the performance of the work, as under:—

For the builder's work, Messrs. G. Cheeman & Co., Brighton	£3,710
For the decorator's work, Mr. T. Dury, of Warwick	1,420
For the gas-fitter's work, Mr. H. Green, Pavilion-buildings	426

PROVINCIAL NEWS.

Birmingham.—The unoccupied space at the corner of New-street and Stephenson-place is about to become the site of a public improvement by the erection of a building for the Midland Bank, which has outgrown its present accommodation in Union-street. The piece of land obtained by the directors (on a ninety-nine years' lease from the governors of the Free Grammar School) has a frontage, according to our authority, the local *Journal*, of about 60 ft. to New-street, and of about 150 ft. to Stephenson-place. The whole of the space, however, will not be occupied by the bank buildings. Part of it, near the bottom of Stephenson-place, and having a frontage to the new street proposed to be made into Pinfold-street, will be reserved for the erection of offices; and by arrangement with the corporation, the angle of New-street and Stephenson-place will be rounded off, and the building line fronting New-street will be slightly set back. The bank will also be erected within a railing, designed to protect the basement story. The style is described as Classical, the front towards New-street being arranged in three, and that to Stephenson-place in eight compartments, divided on the ground floor by Ionic rusticated pilasters, resting on a plain basement; and on the first floor by attached Corinthian columns, with coupled pilasters at the angles. Each division will be pierced with a window of suitable design. Above these will be an enriched cornice, surmounted by an open balustrade, carried higher at the angles, and finished with coupled pilasters. The principal entrance will be in New-street, and will be distinguished by a portico, with four detached columns, of the Ionic order, the shafts and bases being of polished granite. The main fronts will be executed in Portland stone. The interior of the building will consist of a room (the "bank" proper) 92 ft. long, 49 ft. wide, and 30 ft. high, lighted by nine semi-circular headed windows, each 18 ft. high, and also by a dome or lantern, 37 ft. by 18 ft. On the same floor there will be private rooms for the managers; and on the first floor will be a board-

room (fronting New-street), private rooms, and living and sleeping rooms for the resident clerks and porters. In the basement provision is made for dining and cloak rooms and lavatories, for the clerks; and also for store-rooms, especial attention being paid to "the hullion-room," which is to be defended by triple walls of great thickness, and a strong iron lining. The whole building will be warmed and ventilated on Van Hecke's plan.

FROM SCOTLAND.

Glasgow.—A new tidal basin which has been constructed on the south side of the Clyde, about half a mile below Glasgow Bridge, has been placed in communication with the harbour. The basin occupies an area of five acres and a third, and is surrounded with quays, on which sheds for the reception of merchandise are about to be erected. It is to be dredged to a depth of 22 ft. below high water of spring tides.

Dunfermline.—A report by Dr. Stevenson Macadam on the water of seven of the public wells in Dunfermline has been sent to the managing committee of the parochial board by the town-clerk, on the instruction of the Police Commission, as the local authority. Dr. Macadam reported that the specimens of water sent to him presented a good appearance, and were devoid of colour; but that the water differed materially in composition. Two of the samples contained organic matter, accompanied with nitrates, and which, along with other peculiarities, indicated contamination of the water with decomposing organic matter of animal origin, such as might be derived from house cesspools, surface street drainage, or imperfect sewers. After some conversation on the report, the meeting instructed their law-agent to take the necessary steps to close up Strachan's Well. It was agreed to procure samples of water of the private wells in the parish, for the purpose of having them analysed. The Lord Provost, who presided, submitted to the committee meeting a statement of the rate of mortality for the past month, which showed that in the royal burgh there had been five deaths out of a population of 8,401; in the Parliamentary burgh, nine from a population of 5,103; and in the landward district, seven out of a population of 7,448. In submitting the statement, the Lord Provost said it was for the interest of the ratepayers to look into the cause or causes why there was so great an increase in the rate of mortality in the suburbs, and it was resolved that the committee should inquire into the causes of this great increase of mortality in the district, and how it could be remedied.

Leith.—The Public Institute building, which is situated about the centre of Tolbooth Wynd, has now been completed, and inaugurated. The Institute is a brick building, with a doorway of stone. On the ground-floor is a reading-room, 48 ft. by 26 ft. Adjoining the reading-room is a committee-room, 15 ft. by 12 ft. From the lobby, a staircase leads to a gallery, which has been fitted up with shelving sufficient for 10,000 volumes. Of this number, nearly 8,000 have already been acquired. For works of reference, a room has been specially set apart, measuring 23 ft. by 14 ft., which is entered from the gallery. At the further end of the reading-room, a stair leads to hagatelle and smoking rooms, which occupy the back part of the building. The roof is open-timbered with large windows. The architect was Mr. James Simpson, the assessor for the burgh. The whole structure, together with its furnishings, has been reared at a cost of somewhat less than 1,300l.

The Wallace National Monument at Stirling. Since we drew attention, in October last, to this memorial, and inserted a subsequent letter from Mr. Burn, a member of the building committee, the workmen have been making such progress as was practicable in the winter season. The building committee have lately issued a report, in which they say:—"The great tower has now reached the height of 175 ft., including a portion of the open crown, and what remains to complete this, the chief portion of the design, consists in closing this crown, which, if necessary funds are supplied, may be done in the course of the approaching summer, when the tower will appear in all its contemplated amplitude and symmetry. It also appears, as the result of a very careful calculation by the architect and experimenter, that, even at such enhanced prices, a further sum of 1,200l. will suffice for this purpose; after which, all that is required to complete the original design is the erection of

the warden's house, by which the base is broadened and rendered effective, the foundations having been already laid: this, according to the same careful estimate, will cost the sum of 1,400l. The total expense has turned out to be greatly in excess of the original estimates and contract. But the committee state, with confidence, that this has not arisen from anything under their control. At present they have on hand funds sufficient for about two months' operations."

New Lighthouse on Dhuhcartach Rock.—The Commissioners of Northern Lighthouses, according to the *Scotsman*, are about to commence a work of no ordinary difficulty,—the erection of a lighthouse tower, from the designs of their engineers, Messrs. D. & T. Stevenson, on Dhuhcartach Rock, lying fifteen miles to the south-west of Iona, and exposed to the full fury of the Atlantic Ocean. It will light up the gap between the Rhins of Islay and Skerryvore, and lead vessels clear of the Torrinn Rocks and into the shelter afforded by Colonsay. The rock on which the tower is to be placed is a rounded mass, about 240 ft. in length, and 130 ft. in breadth, and is surrounded on all sides by deep water. The landings are likely to be attended with much inconvenience, while the distance from land (being about one-third greater than in the case of the Eddystone or the Skerryvore) will further tend to increase the difficulty. The tower, which is to be a parabolic shaft, rising to the height of 101 ft., is to be surmounted by a first order fixed dioptric apparatus. The dwellings for the light-keepers and crew of the tender are to be on Earraid Island, in the Sound of Iona; and the cost of the works is estimated at 56,900l.

Leith.—A young man employed at the new docks, while working a travelling-crane used for raising and lowering stones required for the erection of the quay wall, accidentally lost his footing and fell to the ground, whereby he has been seriously injured. Besides other injuries sustained, his right arm was fractured in two places, and the arm has been amputated.

STRIKES.

Cardiff.—The whole of the carpenters of this town have struck for an advance of wages. They want 30s. per week, being an advance of 3s. The masons have given notice that after the 1st of next month they intend leaving off work at one o'clock on Saturdays. The Cardiff Builders' Association have issued a broad sheet, in which they give the public an explanation of the circumstances. They state that "a demand was made in October last for a rise in the rate of wages of 6d. per day, to commence on the 1st of April, the wages at that time being 4s. 6d. per day. After interviews with the carpenters' deputation, in which attempts were made to settle the dispute, the Builders' Association felt obliged to refuse the demand. They, however, proposed to compromise the matter by offering 6d. per hour, and payment by the hour, which would have amounted to 28s. 9d. per week. The men refused to accept this offer, but made a counter proposition of 4d. per day rise, payment by the day, with a promise by the masters of 2d. further rise twelve months afterwards." Among the reasons stated for their refusal to give the advance demanded, the masters state that, "The Carpenters' Union have singled out the house-builders for attack, leaving the Taff Vale Company, the Rhyney Railway Company, and the Bute estate, unmolested, thus making a cat's-paw of them and their men;" and that "the building trade is at present in a depressed state, both in Cardiff and the surrounding district, and they think it their duty to prevent the men forcing the wages by combination above the market rate." The present rate paid by the town builders, they say, is 15 per cent. higher than that paid by the Taff Vale Company, and equal to that paid by the Bute estate; and it would be 25 per cent. higher in the one case and 10 per cent. higher in the other, if the advance were granted.

Barnsley.—The strike of joiners at Barnsley has, we learn, come to an end. At a meeting of the masters and men, after a short discussion, the masters agreed to grant the hour per day reduction in the working time, and to give 1s. per week more money than was paid prior to the strike.

Railway Employés.—The engine-drivers and stokers on the Darlington section of the North-Eastern line of railway have struck work for an

advance of wages, a reduction of the hours of labour, and a general redress of grievances formerly complained of. The directors say that the men have struck work without giving any formal notice beforehand; but the men explain that they only struck work after many vain endeavours had from time to time been made to avoid such a course; and that it was only after they found that the directors would do nothing to redress their grievances that they struck work. The drivers and stokers on other sections of the North-Eastern have also struck, and the directors have endeavoured to obtain a decision of the magistrates against the men for breach of contract; but the case selected was dismissed. The traffic on some of the branch lines has been discontinued; but the directors, it is said, are obtaining new hands, and gradually restoring the traffic, both on the main line and on the branches. That the drivers and stokers have grievances which ought to be redressed, especially as regards overtime, seems evident. A metropolitan meeting of engine-drivers and firemen have resolved to support the men of the North-Eastern line.—The Great Northern engine-drivers and firemen having memorialized their directors for a reduction of the hours of labour and an increase of wages, have had their claims granted so as to leave no cause of complaint. In future, ten hours will constitute the day's work; and for all time worked beyond, the pay will be reckoned at eight hours per day. The drivers will have 5s. 6d. a day for the first year, 6s. for the second, and 7s. for the third; while the firemen will have 3s. 6d., 3s. 9d., and 4s. respectively. For Sunday work, time and a half will be given; and a nine hours' interval will be allowed after day's work, except on urgent occasions.—The strike which took place of the navvies employed on the extension of the Midland Railway at Somers Town, &c., for an increase of wages from 8s. 9d. to 4s. a day, is said to have had no connexion, as rumored, with the introduction of Belgian navvies. The men, about 400 in number, were paid off by the contractors, who it is said will have no difficulty in supplying their places with others at the old rate of payment.

THE TRADES UNION COMMISSION.

This evidence already taken has been very voluminous. Some of the more important witnesses have been the secretaries of the various societies. Among these was Mr. E. Coulson, secretary of the Operative Bricklayers' Society, of London. He said the society numbered 5,700 members, and had 50 branches. The increase of members was 700 last year, and the funds, up to December, were about 3,200l., in hand; and the income for the previous year was about 2,700l. The objects of the society had reference to trade purposes, and burial and travelling relief to the members. The amount for men travelling about the country was very small, and the money expended for strikes during a year would amount to not more than 300l. or 400l.; it had not gone beyond that since 1851. Where lodges had recently been established they had, in consequence of the organisation of the men, succeeded in obtaining a satisfactory advance of wages without any protracted strike. No member of the society in any district could enter on a strike without the consent of the whole of the members of the society—that was to say, of the majority of the members. The executive in many former instances have prevented strikes taking place in districts, considering that it would be perfect madness on the part of the men to enter into these contests. . . . The cause of strike in recent years had been that the employers had endeavoured to force upon the men rules that were considered objectionable by them, with reference to the hours of working and the rate of wages. The men in each district determined what was the proper rate of wages, proceeding upon the principle of the prices of food, house-rent, &c. An equivalent in wages was decided by the general average of the number of bricks a man could lay in a day; if the work was inferior, he could lay more; if superior, less. Not the slightest objection was made by the men to hard work. Mr. Roebuck: Do they object to bricks made by machinery?—No. . . . So that if persons have taken out a patent for making bricks by machinery, you have never known of the trade refusing to use those bricks?—Not in the London district. . . . Therefore, it is totally untrue that a patentee has been ruined, because his bricks have not been accepted, and would not be received by any portion of the London trade. Totally untrue in the London district. . . . Have you ever known it in any other?—I do not know it in any other. There was a high moral feeling against the practice of scamping men, and trades unions had caused the work to be done in a manner superior to what it was before; decidedly a more honourable feeling had been promoted by trades unions. There were secret rules, and the by-laws were in conformity with the general rule. In Edinburgh, Coatbridge, Burslem, London, Newcastle, and other places, there were rules which had been agreed to between the masters and the men, and these rules were found to prevent the occurrence of disputes. . . . Mr. Harrison: It is said that the society has a rule forbidding a member to put down his trowel and lay bricks with both hands. Is there any such rule in existence?—There is no such rule in existence, and no such custom. . . . On being asked by Mr. Matthews—Is there any restriction laid upon the clerical workmen as to their rapidity with which they shall work?—The witness replied in the negative. You have no restriction then in your society such as they

have in the Stonemasons' Society, against what is called "chasing"?—No such rule at all. . . . There would be no objection to a clerical man laying bricks by the thousand if he wished to do so, and there would increase his daily wage. The society had an objection to piece-work, believing it made men slovenly and careless, but there was no rule against it, and there would be no objection to work with a man who was working by piece. If men struck for such a cause the society would not support them in the strike. There was no rule against working overtime, and no objection had ever been made to any number of apprentices when they were legally bound to the employer. The society objected to a labourer being taken from the hod and put to the trowel. The masons opposed any setting of stone by bricklayers, and masons' society felt that their own men were inexperienced in stonework, and therefore could only set the stone in a very careless way; but as to putting on stone coping or odd jobs of stonework, they could do it as well as the masons, and the latter would have no power over that. On railways witness had known a man put down his hod and side walls instead of bricks. . . . The Chairman: They all try to get as much money as they can for as loose work as possible, you think?—Yes. . . . Sometimes the eyes of the clerks of the works were shut purposely. The society did nothing to encourage these practices. . . . Mr. Harrison: Does it do anything to oppose them where the work would not meet with any encouragement from the employers if we did it? . . . There was more reality and honesty in the old work than in the modern; in an old piece of work the mortar was hard and sound, but all kinds of rubbish and mortar was used to make mortar, and in a few years it crumbled to pieces. This did not arise at all from a superior knowledge of making mortar, but from the men using the same material, and they could do anything. As general rule, work was better done in the last century than now. . . . Mr. Roebuck: And that in spite of the existence of the trade unions now?—Yes. . . . You are happy to do the work as well as possible, but we often have no encouragement to do it as well as it might be, done. Bricks were superior now to what they used to be, but the mortar was worse, and the work was not done so honestly done. A great deal of time was saved by making inferior mortar, besides the saving of material. Witness knew for a fact that in a certain house which he once worked there were 20,000 bricks, when there ought to have been 37,000. All the bottom part of the house was filled up with the old foundations of other houses that had been built there; then, pockets of places in, by 9 in. and 14 in. square, which should have been filled in with brick, were carried up in the top part of the house within four feet of the roof. These "pockets" were left with the knowledge of the masons. This job was sub-contracted to the men, so that they got nothing by the pockets being left. . . . Mr. Roebuck: You say this occurred not in piecework, but in daywork?—Yes. . . . Therefore this roguery took place under very circumstances which you say are sought by you for the purpose of preventing requery?—In that instance it was so, but you cannot compare a public work and speculative buildings to which I have referred; those houses are simply erected to sell; it is not quality that they want there, I repeat. . . . By Mr. Harrison: The cause of this "scamping" was the desire to erect the building as quickly as possible, merely to sell, and nothing that the union had done affected it in any way whatever. Mr. Richard Harriot, secretary of the Society of Operative Masons, said that the society had 278 branches. The income of the society from November 30, 1865, to November 30, 1866, was 17,748l. 4s. 11d., and there was a general or reserve fund of 100,000l. and he was about 10,000l., besides a little in the various lodges. There were branches in England and Wales, but none in Scotland. The society numbered 40,000 members. The objects of the trade society were to protect the members from all encroachments by employers, as well as to maintain the rate of wages generally. When a branch wished to give notice of resignation to the society of the society had to be obtained. If the society granted the application, then the employers received a notice of resignation, and the notice was to be given to the society of the society had to be obtained. If the society granted the application, then the employers received a notice of resignation, and the notice was to be given to the society of the society had to be obtained. If the society granted the application, then the employers received a notice of resignation, and the notice was to be given to the society of the society had to be obtained. . . . The object of the society was to secure a sufficient number of men to perform their work. . . . If a master took more apprentices than the men in the shop thought was right—and the number was regulated according to each shop—not according to the number of men employed complained to the lodge, and the lodge to the society. Generally a delegate went from the lodge to the master, and if he refused to redress the grievance, the witness supposed there would be a disturbance on the part of the workmen. . . . There never had occurred throughout the whole trade any suspension of labour in consequence of the employment of apprentices. . . . Mr. Roebuck: What is the advantage which you expect from a reduction of the hours of work, rather than from increased wages? . . . It is considered that it causes more men to be employed; there is work for an increased number of hands. . . . If men and women were allowed to take lower wages, at a rate agreed upon, but not as skilled and able workmen. There was no maximum of wages fixed. There would be difference between a highly-skilled man and a common man, but men, both being what are called competent men.—Mr. Roebuck: Do you know any distinct money difference between the two men?—No, I do not. Mr. Harrison: Supposing the case of a man who is stronger than most

men, who is also more careful than most men, and who can with perfect ease to himself produce more stonework and better stonework, say in a day, than most men can, and can do so without intentionally momentarily exerting his strength, do you think it would be right to work at or not? Certainly it does. This rule the witness considered to entice efficiency. He said it was only introduced at the last revision, and very probably might be expunged at the next. You would fine the good man and the better workmen because he was a good man and a better workman? According to that rule.—Mr. Matthews: Supposing the same man having the same strength, and the same reliable and good workman, therefore I will employ him notwithstanding that he has been exceeded by another workman, would the union men in that case strike till that man was discharged by his employer? Yes, as far as that man was concerned they would do so. A mutual code of rules had in many cases been found to work well in promoting harmony and preventing strikes.—Sir D. Gooch: You do not allow a bricklayer to lay stone at all, do you?—No.—Mr. Matthews: So that if a bricklayer were to lay stonework and there were other work to be done on that particular job by masons, they would make him undo that work before they would go to their work; and that would be consistent with your regulations, would it not? Yes; but, on the other hand, I may remark that our men do not interfere with brickwork. The Chairman: Has not your experience led you to know that in every country place in England you will find the same man having the same strength, and the same qualities, or a brick wall to a house with stone quoin, do not think that it would be so except in some small country places.

THE THAMES EMBANKMENT AND THE METROPOLITAN DISTRICT RAILWAY.

At the last meeting of the Metropolitan Board of Works, the Works and General Purpose Committee brought up a report in reference to the construction of the Metropolitan District Railway along the embankment and new street to the Mansion House. The Committee had received from the company's solicitor a communication embodying the terms of the arrangement proposed by the company, and recommended as follows:—

"That with a view to hasten the works on Blackfriars to Cannon-street, to prevent further disquietude in the district, the Board should now agree to suspend taking any immediate steps for payment of the sum of 200,000l., the minimum sum required to be in the dist. section of the works in 1864, or for one year from this date; that interest on that sum be demanded by the Board during that year; that the company bind themselves by an agreement to proceed as rapidly as the Board shall require with their works between Blackfriars and Cannon-street, and that the company without delay find the funds for this purpose, the 200,000l. being paid to the Board at the end of the year, and, in any event, interest at the rate of 5 per cent. per annum, to begin to run from the end of the year until the 200,000l. is repaid; that this arrangement shall be no avation of the powers of the Board, under the Acts of 1862 and 1864, or either of them, and that the company shall be bound, not later than one year from this date, to proceed practically with the works along the embankment, in view to their completion by the time stipulated by the existing Act of 1864."

The report was unanimously adopted.

THE METROPOLITAN FIRE-BRIGADE REPORT.

CAPTAIN SHAW, the chief officer of the fire-brigade, some weeks ago laid his annual report before the Metropolitan Board of Works. It states that the number of calls received during 1865 was 1,543; of these 103 were false alarms, 102 proved to be only chimney alarms, and 1,338 were fires of which 326 resulted in serious damage, and 1012 in slight damage. The fires of 1866 show a decrease of 164 as compared with those of 1865; but taking an average of 30 years, there was an increase in last year of 457. The proportion of serious to slight damages was 34 per cent. in 1865, but in 1866 only 25 per cent. The strength of the brigade on 1st January, 1867, amounted to 2 floating steam fire-engines, 7 large land steam fire-engines, 14 small land steam fire-engines, 64 manual engines, and 230 firemen. Since the reconstitution of the brigade there has been an increase of 49 engines and 101 men. The stations have also been increased from 19 to 41. The cost of the brigade service for 1866 was about 53,000l. The treasury contributes 10,000l.; the fire-insurance companies, 11,255l. 14s. 8d.; and the several parishes (by a rate of a half-penny in the pound), 31,750l. 13s. 9d. The premises which took fire in 1866 were, private houses, 216; lodgings, 107; tenements, 18; offices, 10; hotels, club-houses, victuallers, and beer-shop keepers, 77; grocers, 29; bakers, 13; coffee and chop houses, 14; boot and shoemakers, 27; bookbinders and stationers, 17; printers, 10; milliners, 19; carpenters and cabinet-makers, 41; clothiers, 15; drapers, woollen and linen merchants, 39; cord chandlers, 11; chandlers, 12; furniture brokers, 12; green-

grocers and fruiterers, 19; laundries, 12; oil and colourmen, 17; rug merchants, 12; stables, 29; tailors, 16; tannery and braziers, 10; tobaccoists, 12; and houses being built and under repair, 20. There were also 2 at firework-makers, 2 at gasworks, 1 hospital, 5 lucifer-match makers, 3 match-box makers, 8 marine-store dealers, 1 music-hall, 2 newspaper offices, 1 powder-mill, 8 schools, 1 tar distiller, 5 warehouses, 8 wine and spirit merchants, and 3 work-houses.

Of the 1,338 fires, the causes of 569 were unknown, and 7 doubtful, leaving 742 ascertained causes, amongst which were,—candle, 171; sparks from fire and chimneys, 82; gas, 139 (including 58 from escape of gas, 2 from seeking for escape of gas with lighted candle, and 2 by heat from sunlight burner); airing bedding and linen, 14; children 27 (including 19 playing with lucifers and 8 playing with fire); lucifers, 17; fires blocked up, foul, over-heated, or defective, 78; hot ashes and cinders, 23; lamps, 21 (including 14 paraffine accidents and 1 cat up setting a lamp); stoves—over-heating, had pipes, and defective wiring, 39; smoking tobacco, 17; light thrown down area, 10; boilers, coppers, furnaces, and ovens, 20; crinoline, 2; fireworks, 2; fumigating lugs (in ledgings), 2; fuses, 3; incendiarism, 4; lime-slaking, 6; naphtha (exploding and upsetting), 2; paraffine, 1; spontaneous ignition, 6 (1 at a marine-store dealer's, 1 at a rag-merchants', 1 at a printer's, and 1 at a newspaper-office); and wax-tapers, 2.

Fires do not appear to occur especially at any particular seasons of the year.

BRICK PATENTS.

APPARATUS FOR MANUFACTURING AND PRESSING FIRE BRICKS.—C. J. Condrace *vs* J. Field. Dated 17th January, 1866.—Upon the main driving-shaft of the machine, which is driven direct by a steam-engine of suitable power, is keyed a bevel wheel, which, by means of a similar wheel keyed upon a vertical shaft, drives a pair of grinding stones mounted upon a horizontal axis carried by the said vertical shaft. These stones roll upon a circular bed, and are for the purpose of grinding up the clay or other material, which then falls into a receiver beneath. From this receiver the ground clay or other material is carried up and deposited in the pug or puddling mill by means of an endless travelling chain of buckets passing over rollers and driven by toothed gearing from the same main driving-shaft. The clay or other material is kneaded and brought to a proper consistency by means of knives or paddles fixed to a vertical revolving shaft driven by a pair of bevel wheels. Beneath the pug or puddling mill is a cylinder, into which the clay or other material passes by gravitation, the lower end of the cylinder being contracted and furnished with plates which slope towards a square receiver, the bottom of which is divided into two openings, each of the form and size of a brick. Below this receiver is a sliding frame provided with two pairs of moulds, and caused to slide backwards and forwards by means of a chain actuated by a mangle-wheel and pinion driven from the main shaft by a pair of bevel wheels; or the sliding motion may be obtained by a crank. At each side of the pug-mill is a press driven by a crank shaft or an eccentric, in such a manner that their action is alternate, and takes place at the precise moment when the sliding frame is at the full extent of its movement in either direction, and before its motion is reversed by the mangle wheel or crank. The distance between the two pairs of moulds is the same as the distance between the receiver and either of the presses, so that, whilst one pair of moulds is being filled with clay, the other pair is under the action of one or other of the presses, and *vice versa*. As each pair of bricks is successively pressed, they are elevated from the moulds and placed upon endless travelling belts by means of an elevating apparatus driven by a crank or eccentric actuated by the same crank shaft which drives the presses.

BRICK-MAKING MACHINES.—J. H. Johnson. A communication. Dated 29th June, 1866.—This invention relates partly to certain improvements in the brick-making machine for which letters patent were granted to G. Haseltine, 8th July, 1863, and has special reference to that class of machines wherein bricks are made from untempered clay; also to a peculiar arrangement and combination of machinery or apparatus for controlling or stopping and starting brick-making

machines. According to this invention it is, among other features, proposed to place inside the inclined hopper which supplies the granulated clay to the reciprocating mould-plate or frame, a movable partition, vibrating on a fixed centre in the hopper, and actuated by means of a rod and vertical lever, which derive their motion from the reciprocating mould-plate. The object of this arrangement is to change periodically the direction of the current of clay from the set of filled moulds to the set of empty or partially-filled moulds in the mould-plate. The pistons or followers, together with the bricks contained in the moulds, are slightly elevated or started preparatory to expelling the bricks by causing the lower ends of the piston-rods to pass on to fixed inclined planes, whilst the mould-plate is moving in one direction or the other. Heads or flanges are formed on the lower ends of the piston-rods of the two sets or groups of moulds in the mould-plate, and these heads or flanges, as well as the two fixed inclines before referred to, are divided in the direction of motion of the mould-plate, one-half of the contact surfaces being raised or made to project slightly beyond the other half, the raised surface in the head or flanges of the two sets of piston-rods and their corresponding inclines being on opposite sides, so that when the heads of one set of piston-rods traverse over one side of the said inclines, they will be slightly elevated thereby, but will remain depressed whilst traversing over the other incline. At the higher end of each of the fixed inclines there is situated a wheel or pulley of two diameters, the periphery of the larger diameter projecting slightly above the level of the raised side or half of the incline, and being in a direct line therewith, whilst the smaller diameter coincides with the sunk portion or half of the incline. Now as the heads or flanges of one set of pistons pass in succession over this pulley, they will each be still further elevated, causing the corresponding piston to compress the clay in the mould against the under side of a fixed plate which extends across and is in contact with the surface of the mould-plate. There are two of these fixed plates, *viz.*, one just outside each side of the hopper, and, if desired, they may be made hollow, so as to be heated by the introduction of steam therein. After passing over the wheels or pulleys above referred to, the several heads or flanges of one set of pistons enter the groove of a lifter, which serves to expel the bricks from the mould by elevating the pistons flush with the surface of the mould-plate.

IMPROVEMENTS IN THE MAKING OF BRICKS.—H. A. Bonnevillie.—A communication. Dated 2nd July, 1866.—This invention relates to certain improvements in the manufacture of hollow bricks for the construction of ceilings in rooms and apartments. To attain this the bricks are provided at each end of their extremities with a projection, which, when they are placed between the beams that support the flooring, rest upon and are maintained by pits which run along the sides of the beams. The lower part of each brick is so disposed as to cover about half the interior side of the beam, so that when all the bricks are fixed and placed together, their lower surface presents one uniformly plane superficies which forms the ceiling.

MACHINERY FOR MANUFACTURING BRICKS.—D. Nichol and W. B. Leachman. Dated 4th July, 1866. The object of this invention is not only to form or mould the brick of the required size, but likewise to press the clay during the operation of forming or moulding, and thus to deliver it a pressed brick. For this purpose, on two strong and suitable side-frames, placed parallel to each other, the patentees mount transversely, and on the same horizontal line, two crushing rollers, set at convenient distances apart for the admission of clay, which is furnished from a hopper placed over the rollers, and screwed to the side frames. The rollers may, if desired, have smooth peripheries, but the patentees prefer to have them slightly grooved spirally and in opposite directions—that is, right and left-handed, in order to produce a superior crushing effect when foreign matter is mingled with the clay, and also to prevent the caking of the same. On the front part of the frame they mount the driving shaft, which may be either put in motion by ordinary gearing, or by belting. On this shaft they place a double-grooved cam. In the one groove they place a pin connected to a die rod, which has a reciprocal motion, and works horizontally underneath the crushing rollers, the die being of the same dimensions in length and depth as the required brick. The groove on the opposite side of the

cam has a pin connected by means of a guide rod and pin to a horizontal lever, which in turn is connected to a knife working in half grooves horizontally over the die. The knife cuts off or separates the clay in the mould from that which is in the space between the rollers and the mould. The mould is formed of fixed and movable pieces, the latter being the sides and top of knife. The horizontal lever above named, which is connected to the knife, carries also a pin, which works on the slotted shorter arm of a lever hinged to a cross shaft between the frames. The longer arm of this lever is connected by means of a rod to a bell-cranked lever at the delivering or back part of the machine. The upper arm of this latter lever raises or depresses a door, which forms one of the sides of the mould.

THE BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

A LIST of subscribers and donors to the 31st of March has been issued, from which we are glad to learn that fair progress is being made towards the complete establishment of this Institution. The Committee have already 600*l.* in hand, and a numerous list of annual subscribers. If all who ought to exert themselves were to do so, as only a few have hitherto done, the first annual meeting in August might carry everything before it in a very remarkable manner; and we hope that all interested will rouse themselves to a sense of what they ought to do towards an end so important to the widow and orphan as the establishment of this benevolent institution.

THE INSTITUTION OF CIVIL ENGINEERS.

On April 2nd, the paper read was "A Memoir on the River Tyne," by Mr. W. A. Brooks. It contained a description of the tidal phenomena of the river, in its condition previous to being placed, in 1842, under the charge of the author for its improvement, as contrasted with the phenomena which were found to exist after the completion of the river works. These works consisted, mainly, in the first instance, of timber jetties, subsequently connected by river walls, formed of rubble mixed with ships' ballast, which was brought into the harbour and discharged into the line of the river works, affording an example of how much good might be effected in a port by the judicious application of available materials. The whole of the works, on both sides of a navigation of 10 miles in length, forming what were locally called "The Tyne Improvement Works," were executed out of a revenue applicable to them, not amounting to more than 5,000*l.* a year, or to 80,000*l.*, spread over a period of about sixteen years. Northumberland Dock, including a reclamation from the river of above 70 acres, and the Tyne Piers, had been, or were being executed, out of separate funds.

Much of the interest of the paper consisted of a dissertation upon the cause of the formation of bars at the mouths of rivers, and the means available for their amelioration, according to the well-known theory of the author, that "Bars owe their existence to the conflict which takes place between the current of the early flood tide and that of the ebb, where shoals exist, preventing the free drainage of the backwater during the proper period of the discharge of the ebb."

"GIVE EVERY ONE HIS OWN."

SIR,—Your correspondent, "Mr. S. J. Nichol," has endeavoured to play a part, which I venture to believe he will hardly be equal to sustain. He appears in our pages as the injured originator of a style of roof, the principle of which I have adopted at Peckham and elsewhere; and I have no hesitation in saying that had his memory been better, or had he looked further, he would have said less.

The facts of the case are these:—In 1859, Mr. Nichol, myself, and several other architects, completed for the church of St. Peter and Paul, Cork. My original drawings, which were exhibited both in Cork and at the Architectural Exhibition in London, show the design now called in question. This fact, I humbly submit, is sufficient to clear me from the charge of "plagiarism." The first time I saw Mr. Nichol's drawings was some months after the competition had taken place, when both designs appeared in the same exhibition. I was then somewhat struck at seeing that the same principle had been adopted by Mr. Nichol; but knowing him to be an architect of some original power, I imagined at the moment that we had both hit upon the same idea. It never occurred to me that he might possibly have seen my church in Eldon-street, Liverpool, which was designed two years previously, and actually

carried into execution towards the end of 1858, almost two years previously to the competition. In order that there may be no misunderstanding, I transcribe copies of two letters from the builders, who tendered for the church, alluded to, both of which bear out and verify my statement.*

After your readers have perused the above, probably, I shall be the only person who will not be led to the conclusion that Mr. Nichol simply describes his own *modus operandi*, whilst most unjustly attaching it to my name.

E. WELBY PRYOR.
P.S.—With regard to the insinuation that I was the author of the account of the opening of Peckham Church, I beg emphatically to deny it.

MEPHITIC ATMOSPHERE OF THE UNDERGROUND RAILWAY.

SIR,—The reason of the deleterious state of the air to which your quotation from the *British Medical Journal* refers is, that the condensation of the visible smoke only has been aimed at, and not the removal of the source of evil. The engines are said to consume the smoke, but this is no more than rendering it invisible without lessening its really injurious action on the lungs. What is required is the complete removal of the products of combustion; this could be accomplished by erecting ventilating shafts near the middle of each length of tunnel, and establishing an upward current. Hot expansive steam and smoke would ascend these much more readily than condensed vapours, and the additional expense of the new form of engine might be saved.

A. J. B.

"GIBBS'S FIRE-PLACE LINTEL."

SIR,—There is a short notice of this invention in your number for March 16, p. 197.

The lintel is of cast iron, would a district surveyor allow its use in London? The Building Act, s. 20, r. 3, states that "an arch of brick or stone, or a bar of wrought iron, must be built over the opening of every chimney to support the breast thereof." E. W. T.

RAIN THROUGH PORTLAND CEMENT.

THE rain comes through Portland cement on one part of the front of my house when the wind blows very strongly. Is there any wash which will render this no longer possible? and of what does it consist? or will painting be necessary? C. B.

THE ROAD FROM HYDE PARK CORNER.

SIR,—It has often occurred to me that Mr. Snell's plan of opening a public road from Hyde Park-corner to Stanhope-gate is at once the most obvious, simple, and economical mode of diverting the traffic from the narrow portions of Park-lane. As explained in a recent number of the *Builder*, and as shown on the plan, the proposed road would, I think, be rather an improvement than otherwise to the park itself. I should not presume to suggest a further improvement, were I not encouraged by the approval bestowed upon it by his Royal Highness the late Prince Consort, when named to him some years ago.

By opening out and levelling a small corner of the Green Park, and the unsightly length of road which runs parallel with Grosvenor-place, a thoroughfare on the east side of the gateway might be obtained, and the latter would stand an elevated triumphal arch in the centre of a handsome place, out of which the road to Constitution-hill would pass, at a right angle. The gateway, as it now stands, is an obstruction to the stream of traffic: its awkward position and the narrowness of the gorge leading into Hyde Park-corner, will at once be perceptible to any one approaching it from Grosvenor-place.

I venture to think the suggestion, if worked out by an architect of taste, might contribute still further to make Hyde Park-corner what "it should be." R. E. EGERTON WARBURTON.
Arley Hall, Northwich.

CHURCH-BUILDING NEWS.

Washington.—The parish church of Washington, near Storrington, Sussex, has been restored. About eighteen months ago the church consisted of a nave, with north aisle, of Early English date. Attached to the west of the aisle was the remnant of an Early English tower; whilst alongside of it stood a tower of the fifteenth century attached to the end of the nave. The chancel was a modern building. The south side of the nave has been greatly modernized, and the roof of the nave and aisle, as well as the north aisle wall, were in a ruinous state. This aisle and the nave have been

rebuilt, with the exception of arches at the side of the nave, and a new aisle has been added on the south side. The modern chancel has been wholly rebuilt, in keeping with the rest of the edifice, the style followed throughout being that of the thirteenth century. The chancel is enriched with a carved reredos of alabaster and marbles of Ippeperre and Galway, and with a stained glass east window (by Messrs. Lavers & Barrand). Both the reredos and window are the gift of Colonel Sandham. The fittings are of stained deal, varnished, and the pavement is of Portland stone, divided into patterns by hands of Minton's tiles. The masonry is of Scamell-hill sandstone, with the carving and mouldings in the native grey chalk. The architect employed was Mr. Gordon M. Hills, of London; and the builder, Mr. Bushby, of Littlehampton. The total cost of the restoration is about 2,500l. The new schools, which stand at a short distance from the church, have been erected at a cost of between 700l. and 800l.

Carlisle.—The new church of St. John the Evangelist has been consecrated. It has been erected upon a plot of ground in London-road, which formerly formed part of nursery gardens. In 1863 the Dean had succeeded in raising among friends at a distance from Carlisle nearly 1,500l.; and a competition among architects resulted in forty-one designs being submitted to the committee. Most of these were in the Early English style; and the successful competitors were Messrs. Clarke & Son, of Nottingham. The original estimate of the cost of the building was about 3,313l., the contract being let for that amount to Messrs. C. & J. Armstrong, of this city; but the sum did not include certain contemplated extras; and the additional expenses involved, for architect's commission, salary of clerk of the works, and other expenses incidental to the work, swelled the total cost to a little over 5,000l. The progress of the work was much delayed in consequence of the strikes in the building trade. The church is built entirely of white stone, from the Fairloam quarry of the contractors. A bell turret at the eastern side of the nave, with a stone spire, surmounted by a vane, gives a character to that side of the fabric. Interiorly the aisles are separated from the nave by pointed arches; the pulpit and reading-desk occupy similar positions at the opposite sides of the church; and a pointed arch spans the entrance to the chancel. Above the nave arches, and forming a feature of the interior, is a clerestory, with triple lancet windows in each bay. The large window at the west end is plain, but the east is filled with stained glass. To the north of the chancel is a vestry-room, 14 ft. by 10 ft.; while on the corresponding part of the building on the south side is an organ-chamber 16 ft. by 14 ft. The vestry communicates with the north aisle by an arched doorway; while the organ-chamber communicates with the aisle and chancel by low arches resting upon solid columns. The dimensions of the nave, it may be added, are 87 ft. by 24 ft.; the aisles 87 ft. by 13 ft. each; and the chancel, 37 ft. by 22 ft.

Worcester.—St. Nicholas's church has been reopened. The alterations consist of the partial renewal of the roof, which was in a bad state: the high pews have been substituted by open sittings, with kneeling-boards and book-boxes: additional accommodation has thus been obtained. The tall prayer-desk and pulpit have been done away with, and a low reading-desk and new pulpit, in keeping with the other alterations, have been substituted. The high gallery front has been replaced by an open one—an oak arcade, ornamented with wrought-iron work, executed by Messrs. Skidmore & Co., of Coventry, who also supplied similar decorations for the open work of the pulpit and new Communion rail. The chancel and aisles have been laid with encaustic tiles supplied by Messrs. Godwin, of Lugwardine. The side windows have been replaced, the small diamond-shaped panes substituted by larger panes, which it is intended eventually to surround by a border of coloured glass. The building is lighted by means of bracket burners and a central sunlight gas-burner, and is warmed by Haden's hot water apparatus. The ventilation will be obtained by means of the sunlight burner. The contractors were Messrs. Wood & Son, and the amount of their contract was 2,000l. Mr. J. W. Hopkins was the architect employed.

Haggerstone (*Shoreditch*).—The church of St. Augustine, the first of the three new Haggerstone churches, has been consecrated. The style of the church, which is from the design of Mr.

H. Woodyer, of Grafton, Guildford, is Middle Pointed, and it is constructed to accommodate 936 persons. The building has cost about 9,000l., the site having cost in addition 2,000l. A parsonage and boys' school have also to be erected, for which funds are required. The organ is erected by Mr. Willis, a portion only of it being put in the church of the value of 300l., towards which only 100l. have been raised. Most of the ornamental part of the church has been omitted, to be added at a future period, when funds can be raised for the purpose.

Books Received.

The International Horticultural Exhibition and Botanical Congress, 1867: Report of Proceedings. Printed by Truscott & Co., Suffolk-lane, City.

The International Horticultural Exhibition, held in London from May 22nd to May 31st of last year, was excellently well conducted, and a decided success. The subscribers have had good reason to congratulate themselves on the result, and now they will be presented with a voluminous and valuable report of the proceedings, including various papers on cognate subjects, read at the Congress, and here printed in full. The volume contains between 400 and 500 pages of matter, imperial octavo, and is illustrated by engravings.

VARIORUM.

THE April No. of the *Art Journal* contains, as promised, the first part of the Illustrated Catalogue of the Universal Exhibition, with a wealth of engravings, some of them beautifully executed,—gems of wood engraving. On Sunday last, Mr. S. C. Hall had the honour of presenting the first number of the catalogue to the Emperor, at the Tuileries. We are not surprised to hear that it was most graciously received, his Majesty observing,—"It will be a wonderful work, when completed." The whole number, including the catalogue, for half-a-crown, is a marvellous specimen of cheap goodness.—The *Quarterly* has a clever paper descriptive of Westmoreland, and a paper on Railway Finance, which falls short of completeness.—Dabrett's "Illustrated House of Commons, and the Judicial Bench, 1867," (Dunn & Son) is a worthy companion of the "Peerage and Baronetage." It includes short biographies of all the members and their armorial bearings.—The April number of the *Revue Artistique et Littéraire* gives an account of the *Union Centrale des Beaux Arts appliqué à l'Industrie* established in Paris, and shows that it will have a wide scope and is destined to play an important part. The number is altogether an interesting one.—"Byron," for sevenpence, and sixteen illustrations (Dicks). It would be preferable at a shilling with better paper. Those who want the complete works must go to Mr. Murray.—The completion of vol. I. of "Scientific Papers read before the Royal Irish Academy," and published in its proceedings (Gill, Dublin, printer to the Academy), has been issued. It contains the title-page and table of contents, with papers on the construction of ancient galleys, by Lord de Ros; on armour-plated ships of war, by G. C. Garnet, M.R.I.A., and others, with plates illustrative of some of the papers.—"Journal of the Bath and West of England Society for the Encouragement of Agriculture, Arts, Manufactures, and Commerce," 1866 (Ridgway, Piccadilly). This volume contains various papers of more or less interest, on disinfectants, application of sewage, management of ponds and wells, the Gloucestershire Bacon-curing establishment, the culture of fruit in n-hatched glass structures, and others, with an account of the machinery and implements at Salisbury in the Show of 1866.

Miscellaneous.

THE INVENTOR OF THE READING MACHINE.—At the Haddington Farmers' Club lately, the chairman stated that he had received about 700l. towards a testimonial to the Rev. Patrick Bell.

THE NEW EXCHANGE BUILDINGS, LIVERPOOL.—The large new room in the new west wing of the exchange, of which we have already given engraved views, has been completed and opened.

* It is unnecessary to print these.—Ed.

WATERWORKS FOR KIDDERMINSTER.—An inspection of the neighbourhood is being made with a view to finding the most eligible part for obtaining a water supply in case waterworks are established here. The estimated cost of the works is 20,000l. The income anticipated is 2,850l.; working expenses and collection, 733l. This, with 1,300l. for interest, would make 2,033l., leaving a surplus profit, as estimated by the mayor, of 817l.

MEMORIAL OF THOMAS GRAY, THE POET.—It is proposed to erect in the church of Stokes Pogis a memorial window in honour of Thomas Gray, who lies buried in the "country churchyard" hard by, which he immortalised in his verse. A subscription has been commenced, and the committee for carrying out the proposal includes the Duke of Leeds and the Bishop of Oxford. Contributions may be sent to the Rev. Vernon Blake, Stokes Pogis Vicarage.

ST. THOMAS'S SCHOOLS, ISLINGTON.—The new schools of the district parish of St. Thomas, situated in Hemingford-road, Islington, have been opened. Earl Granville presided at the ceremonial. They have been erected from the designs of Mr. Coldwell, and will accommodate in the three chief rooms, independently of classrooms, 600 children in attendance, and so practically provide for the education of about 1,000 children. The total cost of site and buildings is estimated at 4,200l., towards which the Bishop of London's Fund has supplied 1,500l.; the National Society, 185l.; and the Privy Council, 680l. The subscriptions have amounted to 1,355l., leaving a deficiency of about 500l.

THE LATE FINE ART AND INDUSTRIAL EXHIBITION AT YORK.—The guarantors of this exhibition have carried into effect the scheme foreshadowed for the disposal of the surplus which accrued from the Exhibition. They have resolved that the amount shall be invested, and be allowed to accumulate until it shall reach such a sum as, when added to expected donations, will be sufficient to erect a permanent gallery of art and industry in the city of York, and at the same time provide a home for the York School of Art. Nine or ten thousand pounds, says the local *Herald*, will probably be required before the committee will feel themselves justified in erecting any building; but, with some 2,000l. as a nucleus, many years ought not to elapse without the completion of the project, and we venture to say that such will be the fact.

DISTRIBUTION OF AWARDS AT THE INTER-COLONIAL EXHIBITION, MELBOURNE.—The order of procedure at the distribution was, first, the reading of a report upon the work undertaken by the jurors; then, a short reply by his Excellency, the Governor of Victoria; and, finally, the presentation by the jurors of their several lists of exhibits. This was to conclude the regular business of the day with reference to the Exhibition, but the opportunity of the presence of his Excellency and a distinguished company was taken to make a presentation of prizes to the successful competitors in the late Rifle Association matches. The commissioners of the Inter-colonial Exhibition have issued a circular, addressed to the various exhibitors, requesting their assistance in "forming the nucleus of a collection of objects, adapted to further the formation of a museum." The South Kensington Museum is to be taken as the model on which it is desirable to form the projected Melbourne Industrial Museum.

ENGLISH REFRESHMENT DEPARTMENT, PARIS EXHIBITION.—The English Refreshment Department for Messrs. Bertram & Roberts, of the Crystal Palace, Sydenham, has just been completed. The interior decorations, which have been done by Messrs. J. & W. Saunders, of Guildford-street, are in the Italian Renaissance style, and the whole of the work has been executed by English workmen. The most important feature is a wall-screen, 66 ft. long by 24 ft. high, which is divided into five bays of arches on coupled columns decorated in black and gold. The bays between the columns are formed with inlaid mahogany, and filled in with panels of embossed glass, which is relieved from the mahogany by gilt mouldings. The archivolt is composed of black and gold intrados and extrados mouldings, panelled between with mahogany, inlaid with ebony and satin-wood. Over the arches a series of inlaid panels run the whole length of the screen, which is crowned by a frieze and cornice of simple design. The work was designed by Mr. W. Young, of Pimlico.

RAILWAY RETURNS.—The traffic receipts of railways in the United Kingdom amounted for the week ending March 30, on 12,745 miles, to 672,704l., and for the corresponding week of last year, on 12,498 miles, to 703,516l., showing an increase of 247 miles and a decrease of 30,812l.

PROPOSED PUBLIC HALL FOR SHEFFIELD.—A meeting of gentlemen favourable to the scheme for erecting a public hall in Sheffield has been held in the Cutlers' Hall, the mayor in the chair. The scheme has been considered by the committee and members of the Choral Union. They propose that the hall shall be in a central situation, and capable of accommodating 3,000 persons, and to cost 15,000l. This sum they propose to raise on the building society principle—500 shares of 30l. each nominal value, payable by instalments, or at the option of the shareholder. The letting of the hall, it is calculated, will realise at least 1,000l. a year. A committee was appointed to put the scheme into such a shape as would justify them in seeking the assistance of the public. One-fifth of the capital required would be contributed by the members of the Choral Union.

THE MAYER MEMORIAL, LIVERPOOL.—At the last meeting of the town council the proceedings of the library, museum, and education committee were read, comprising a recommendation to adopt the following resolutions, viz.—

"That the munificent donation by Mr. Joseph Mayer to the town of Liverpool of a collection of art treasures of great value, and in many respects unrivalled, requires at the hands of this corporation such an acknowledgment as shall not only mark the present public appreciation, but which may commiserate to future generations the taste and liberality which could accumulate such a collection, and the generosity which could devote it to the public benefit."

"That for this purpose a statue of Mr. Mayer be erected in St. George's Hall at the expense of this corporation, and that the library, museum, and education committee be authorised to take the necessary steps for carrying out this resolution."

Mr. Picton delivered an able and interesting speech in support of the resolutions, which were agreed to by acclamation.

A TIMBER-BORING INSECT PLAGUE IN AUSTRALIA.—A new and extraordinary insect plague is mentioned by the *Wood's Point Leader*. It says that a small species of beetle, of a most peculiar construction, arrived in myriads at the Alpha Brewery a few days before, and set to work riddling the beer-barrels. The proboscis forms an excellent gimlet, with which the little insect penetrates the hardest wood in an incredibly short time, while the hinder portion is shaped like a shovel, and is employed in getting rid of the sawdust. They make clean holes through the staves; and some of the full barrels are leaking in fifty places. In a wine-cellar thousands burrow into the wine and spirit casks. As soon as they get nearly through the wood, the liquor begins to ooze out, and the animal, of course, gets killed. Every description of box or barrel is full of them, also the doors and timber in the building. Almost every store in the township is infested with these mischievous insects. The head is red, with a proboscis somewhat resembling a parrot's bill; and the body is like a small black glass bugle broken off at the end; the whole length, one quarter of an inch.

THE ABBOT MEMORIAL SCHOOLS, GATESHEAD.—Ten sets of competitive plans for the erection of the Abbot Memorial Ragged and Industrial Schools, at Gateshead, have been on private view in the Hall of the Gateshead Mechanics' Institute. The competition originated in the offer of Mrs. Abbot to erect a ragged-school building, in memory of her late husband, and his father (of the Gateshead Iron Works), at a cost of about 2,000l. The sub-committee to whom the matter was entrusted offered a premium of 25l. for the best design,—the building to include accommodation for educating, boarding, and lodging 35 boys and 25 girls, with day schools for 300 boys and girls, master and matron's residences, work-rooms, and other necessary appliances of Ragged and Industrial Schools. It was understood that no money would be expended on ornamentation, and the outlay was limited to about 2,000l. The lowest estimate in connexion with any of the plans sent in is, however, 2,500l., and it is believed that it would take double that sum to erect a building from some of them. Nearly all have resorted to various modifications of Gothic. The competitors are Messrs. Austin & Johnston; Robert Fairbairn, of Gateshead; W. L. Moffatt, of Edinburgh; John Johnston, Thomas Oliver, S. Oswald, J. G. Varley, A. Swan, and J. E. Watson, all of Newcastle-upon-Tyne.

THE LAW COURTS DESIGNS.—Several correspondents inquire if the designs can still be seen. The exhibition is, strictly speaking, now closed to the public; but we have reason to believe that persons applying would not be refused admittance.

INDIAN JOINT-STOCK COMPANIES.—It appears from a return recently printed in the *Calcutta (Official) Gazette* that eleven joint-stock companies were registered in Bengal during the past year, with an aggregate capital of 1,164,000 rupees. During the same period twenty-four companies, possessing a total capital of 20,216,500 rupees, were wound up. Three of these latter were steam-tug associations, and a like number were established for the purpose of promoting steam-navigation.

THE WELLINGTON MONUMENT FOR ST. PAUL'S. In the Commons Mr. J. Goldsmid asked the First Commissioner of Works when the Wellington statue for the erection of which in St. Paul's Cathedral 20,000l. were voted in 1853, was likely to be finished. In reply Lord J. Mansers said this was more than a mere statue, and, when finished, would be one of the largest monuments erected in any church in England during the present century. It was now in a state of satisfactory progress, and there was every reason to hope that it would be completed in about two years from this time. We have, privately, a good account of this model.

SERVANTS' CLUBS.—A prize of 5l. is offered, through the medium of the Working Men's Club and Institute Union, for the best essay on the subject of servants' clubs. The points to be kept in view are,—1st. A history of the clubs from their commencement to the present time—their rules, and general mode of operation; 2nd. a statement of the evils resulting from the present system of carrying on these clubs; and, 3rd, suggestions as to the best means of placing them on a better footing, for the benefit of the large class of persons directly interested, and for the promotion of a more satisfactory relation and understanding between employers and domestic servants; reference being made to working men's social clubs. The Earl of Shaftesbury, Mr. Hodgson Pratt, and the Rev. Henry Solly are to act as adjudicators.

PUNNING MOTTOES.—Looking over the pages of "Debrett's Illustrated Peerage," the number of families who introduce the family name into the motto borne with their arms is very noticeable. For instance, we have the Duke of Devonshire, whose family name is Cavendish, taking for his motto "Cavendo Tutus" (Safe by caution). Lord Lyveden (Vernon) takes "Vernon semper viret" which may be translated as "Vernon always flourishes;" or it might be written, *Vernon semper viret* (Spring does not always flourish). This motto is also Lord Vernon's. Then we have Lord Byron, "Crede Byron" (Believe Byron); Lord Lyons, "Noli irritare leones" (Do not rouse the lions); the Duke of Buckingham (Temple), "Templa quam dilecta" (How beloved are thy temples); Earl of Ellenborough (Law), "Compositum jus fasque animi" (Law and equity); the Earl of Clan-carty (Le Poer Trench), "Dica puer la Trench; qui couteur?" (God for the Trench; who is against him?); Earl Fortescue, "Forte scutum salus ducum" (A strong huckler is the safeguard of generals). This motto is said to owe its origin to a Sir Richard Forte (from whom this family claim descent) having protected William the Conqueror at the battle of Hastings, by bearing a strong shield before him. The motto of Lord Fairfax is "Fare fac" (Speak and act). The barony of Fairfax, one of the oldest in the Scottish peerage, is involved in much obscurity, the residence of the present peer, as well as his brothers and sisters, being unknown. The late peer seems to have been a clerk in the Supreme Court of California. One of the best family mottoes is that of Earl Mansvers, whose family name is Pierrepont, which is thus written in the motto, "Pie-repone-te" (Repose in pious confidence). In Lord Montagu's motto the pun is on the title, the family name being Spring Rice, "Alte fert aquila" (The eagle mounts with me on high); Lord Fermoy (Roche), "Mon Dieu est ma Roche" (My God is my Rock); the Earl of Enniskillen (Cole), "Deum cole, regem serva" (Worship God, serve the king); the Earl of Abergavenny (Nevill), "Ne vile velis" (Form no mean wish); the Earl of Hopetoun (Hope), "At spes non fracta" (But my hope is not broken); the Earl of Westmorland (Fane), "Ne vile fano" (Disgrace not the altar).

THE BATTLE OF LIFE.—A clerk being needed in the office of building surveyor to the Corporation of the City of Manchester, the applicants, we are told, were 123 in number.

HOUSES FOR THE LABOURING POOR.—Mr. Ayrton having charged the Corporation of London with objections to this Bill, a notice of motion has been given for a "Return of the number of houses or dwellings for the labouring poor erected or adapted by the Corporation of London in the last ten years; the amount laid out in respect of the same; and the returns in the way of revenue up to the date of making the return." It will be shown by this return that the Corporation has already provided three blocks of buildings of this nature.

MOSAIC WORK, FULHAM PALACE.—The new chapel in Fulham Palace has just received a mosaic picture at the east end. The cartoon was made by Mr. Alexander Cibbs, of London, under the direction of the architect, Mr. Butterfield. The mosaic was executed by Salviati & Co. The subject represented is "The Adoration of the Shepherds at Bethlehem." It is treated throughout as a surface, without any attempt at perspective, so as not to interfere with the architectural idea of a solid wall. The centre figures are those of Our Lord in the manger, the Virgin Mary, and St. Joseph. The Shepherds occupy the space on either side. The drapery is in most instances diapered or fringed with gold, or colours, in a manner which adds considerably to the appearance of finish. The background is blue, studded with gold stars, and relieved with horizontal lines.

PROJECTED PUBLIC WORKS IN BRISTOL.—A correspondent, signing himself "W. H.," sent an interesting communication to the *Times* and *Mirror*, relative to works of a public character which have been projected and are likely to be prosecuted in Bristol. After briefly referring to the various projects, he summarised their probable cost thus:—

New joint terminals	£100,000
Street improvement schemes	200,000
New Theatre Royal	15,000
New Literary Institute and Library	10,000
Improvement of river and docks	300,000
New Avonmouth Docks	200,000
New railway (under the Down)	169,000
Harbour Junction Railway	115,000
New wharf at Wapping	50,000
New Post-office	10,000
New hotel in Broad-street	35,000
Cathedral restoration, &c. (say)	15,000
New Congregational "Cathedral"	8,000
Total	£1,224,000

or, with the extras which attach, the sums "intended to be spent by Bristol in large and important works amount to a million and a quarter." Then, in addition to these public works, a thousand houses are being or about to be erected on Hyde-hill; a hundred houses are proposed to be built at Ashley-hill; and at Russell Town, Lawrence-hill, hundreds of houses are springing up in every direction.

THE TIME AT THE BOAT RACE.—Every one has heard by this time that the time occupied in the Oxford and Cambridge Boat Race, the other day, was taken by Benson's chronograph, but they may not know what the chronograph is. Well, then, it consists of an ordinary quick train lever movement on a scale sufficiently large to carry the hands for an 8-inch dial, and with the addition of a long seconds hand, which traverses the dial, instead of being, as usual, just above the figure six. The peculiarity of the chronograph consists in this second hand and the mechanism connected with it. The hand itself is double, or formed of two distinct hands, one lying over the other; the lower one at its extreme end is furnished with a small cup or reservoir, with a minute orifice at the bottom. The corresponding extremity of the upper hand is bent over so as to rest exactly over this puncture, and the reservoir having been filled with ink of a thickness between ordinary writing fluid and printer's ink, the chronograph is ready for action. The operator, who holds tightly grasped in his hand a stout string connected with the mechanism peculiar to this instrument, keeps a steady look out for the fall of the starter's flag. Simultaneously with the start of the race the string he holds is pulled by him, and the upper hand immediately dips through the reservoir in the lower and leaves a dot or speck of ink upon the dial. This is repeated as the boats or horses pass the winning-post, so that a lasting record is afforded by the dots on the dial of the time, exact to the tenth of a second, which is occupied in running the race.

REBUILDING CHAPELS.—Where property is held by trustees to be employed in the repairs of a chapel, and any surplus is to be distributed among the poor of the parish, the trustees are not authorised to rebuild the chapel, instead of merely repairing it, although it is in a very dilapidated condition, and unequal to the wants of the inhabitants, and the trust estate has increased very largely since its first institution. This was the decision of Vice-Chancellor Wood upon a question raised under "The Booth's Charities Act, 1846," containing provisions for the repairs and maintenance of Trinity Chapel, Salford.

VALUE OF LAND, SOUTH KENSINGTON.—Mr. Humphreys, the Middlesex coroner, and a special jury, have settled a compensation case, "Lord Kensington v. The Metropolitan Railway," for a piece of freehold land—the sixteenth part of an acre—at Cromwell-lane, Brompton. On one side the value was said to be about 2,000l., and on the other side about 800l. Mr. Hawkins, Q.C., and Mr. Morgan Lloyd were for Lord Kensington; Mr. Lloyd and Mr. Holloway were for the company. The assessor reminded the jury that the value put on it on the part of Lord Kensington was about 30,000l. an acre, and his lordship had sold to the railway property to the amount of 150,000l. at the rate of 4,500l. an acre. The jury awarded 1,350l., after an hour's deliberation.

PUBLIC-HOUSE CLOSING ACT.—From a parliamentary paper just issued, it appears that fifty-four towns have adopted the Public-house Closing Act, 1864. This Act it may, perhaps, be remembered provides that no public-house or refreshment house shall be open between the hours of one and four o'clock in the morning, unless by special permission from the local authority. The Act is compulsory within the limits of the Metropolitan Police district; but clause nine gives the power of adoption to corporate boroughs and improvement commissioners. Manchester was the first to take advantage of clause nine; and it was followed by Preston, Great Yarmouth, Birmingham, Drighlton, Salford, and Liverpool. By the end of the year it had been adopted by sixteen towns. In 1865, thirty, and in 1866, eight towns took advantage of it. The Act does not apply to railway refreshment rooms.

LOCAL BOARDS OF HEALTH.—The question in the case of Hattersley v. Burr arose upon a conviction under the Local Government Act, 1858. A local Board had, under the 34th section of that Act, made a bye-law requiring a person intending to erect a new building to give a month's notice to the Board of his intention, and to deposit plans; and a person who had given notices commencing to build within the month, and without approval of the plans by the Board, had laid an information against him for contravening the bye-law, upon which he was convicted. The Court of Exchequer held, upon these facts, that the Board had no power to make such a proceeding an offence by their bye-laws, and that the person so giving notice had a right to commence building when he pleased, subject to the Board's right to pull down or alter his building, if built in contravention of their bye-laws.

TENDERS

Accepted for villa residence at Elloughton, Yorkshire. Mr. William Kerby, architect:—

<i>Bricklayer and Plasterer's Work.</i>	
Kirby	£350 0 0
<i>Mason's Work.</i>	
Wilson	125 0 0
<i>Carpenter and Joiner's Work.</i>	
Curtis	200 0 0

We are compelled to decline pointing out books and giving addresses. All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

Advertisements cannot be received for the current week's issue later than THREE o'clock, p.m., on THURSDAY.

The Publisher cannot be responsible for ORIGINAL TESTIMONIALS left at the Office in reply to Advertisements, and strongly recommends that COPIES ONLY should be sent.

The Builder.

VOL. XXVI.—No. 1264.

Easter at Westminster.

HERE is no place nor room for sermons in our columns, not even for those with which stones are said to be vocal. Other stones than those of Venice may be full of a significance higher than that of art, but it is our task only to present to the mind the features of the outward form, leaving the inner lesson, when there is one, to become clear by its own light; as Æsop was wont to lay before his auditors the brief

outline of ancient fable unnumbered by the one-sided "moral," and the yet more obnoxious "application" by which his admirers have made his memory to rot. It is not as indulging in an exception to so wise a rule that we refer for a moment to Easter morning at Westminster, an occasion which few who had the privilege of witnessing it can lightly forget. It is neither of the worship, perfect as was its rendering of that most perfect of earthly liturgies, the full choral cathedral service, nor of the sermon, as regarded in its religious or moral aspect, that we wish to speak. But those who love the most noble of our ministers must rejoice to feel that Westminster has found a tongue. Dean Stanley, though apparently in feeble health, read with a low clear voice so suited to the pitch of the building,—to the acoustic state to which the performance of daily service seems to have educated the very echoes of the place,—that hardly a word was lost even by the distant auditors. On a former occasion, to which we referred at the time of its occurrence, when a meeting was held in the Chapter-house, with the object of promoting its restoration, under the presidency of the very reverend Dean, a somewhat hesitating and uncertain manner very much marred the force of his remarks. But in the pulpit this defect entirely disappears. While nothing can be further from a dramatic style of reading than are the tones of Dean Stanley, nothing can be more appropriate to the spot, nothing could more fully command the breathless attention of a large and reverent congregation. To those of us who can remember what the service at Westminster was twenty or thirty years ago, the improvement is both a wonder and a delight. Language simple and precise, but full of picturesque colour, breathed the very spirit of the spot. One or two references to Jerusalem, by the simple use of appropriate—exclusively appropriate—adjectives, told those who knew to what the words referred that the speaker had been himself a pilgrim to the Holy City; but it was in the few yet stirring references to our own history, to the saints and kings who had founded and restored the walls, to the great names of which the memorials are sculptured around, to the long line of English monarchs crowned in that sacred spot, that the Dean unwittingly told how his dreams had been haunted by the genius of the place, and how his

thoughts and his affections were hallowed by the shadow of the cloisters. We are promised a history of the Abbey from his pen. The purely historic tone of a portion of his address—the quiet enunciation, without one controversial word, but with a weight sufficient to silence controversy, of those portions of the history of the Eastern and Western Churches that bore upon his subject,—the references, on such points, to the history and custom of the Abbey itself, all these were given in a tone which, if maintained in the promised history, will make it worthy of the subject, and the noblest of monuments for its author.

There is, perhaps, no spot on earth so deservedly dear to those of us who believe that the present is the issue of the past, as is the Abbey Church of St. Peter's at Westminster. Dating its consecration in the very year of the Norman Conquest, it is the last gift of the Saxon dynasty to the English people. The quaint and mutilated carvings illustrative of the life of the Confessor have more reality as representations of a past and almost forgotten national life than are readily to be found elsewhere. The characteristic form of arch identified with the second founder of the Abbey, carries back the imagination to the time when our kings first became truly and exclusively English sovereigns by ceasing to be French peers. The very helmet and shield of the Victor of Agincourt rest high above his tomb. The architectural and social revolution of the days that preceded and prepared for the union of two hostile sceptres in the fated hands of the House of Stuart, is represented by one of the finest buildings in the world, which, gem as it is in itself, yet harmonises with the more ancient structure. The features of Elizabeth, calm, clear, and noble, seem to bear incontrovertible testimony to the fact that the estimate of her character that lingers in the tradition of the people is more true, as well as more exalted, than that which is to be formed from the perusal of the pages of her latest historian. Above all, the sacred stone that forms the seat of the coronation chair, if no longer regarded as a palladium, is yet a relic of unrivalled interest, connecting us, on the one hand, with the shadowy line of kings reaching far beyond the memory of the "gracious Duncan;" and on the other with the pride of the present and with the hope of the future. A fitting "History of Westminster Abbey" would be a grand book in the English language.

So much has been done for the Abbey of late that we are hopeful in wishing for something more. The carved work of the choir has assumed tints and echoes suited to the harmony of the building. Colour is creeping over the windows. The organ, removed from its obstructive position between choir and nave, fairly rivals that at St. Paul's. The noted irreverence of the service is a thing of the past. Vergers and boatles are more reverent, more intelligent, and more civil than in earlier days. The exhibition-air of the building has vanished with the surrendered twopenies. At the close of the choral part of the service on Sunday morning, when old associations led one to expect a rush to the doors, hardly an individual stirred, unless it were to gain a step or two towards the pulpit. And the reredos, with its richly-carved cedar table, and its lace-like canopies of tabernacle-work, is a noble screen. We do not wish to pause to criticise now this addition to the adornment of the Abbey, but we cannot pass the occasion to remark that the little scenes in the Gospel history which are represented on the frieze are hardly worthy of the material or of the position. Reproductions, no doubt, in taste, if not actual copies, of wood carvings of a very low style of art, they would have been tolerable, perhaps admirable, if they had illustrated the life of the Confessor, and replaced those inimitable groups which are crumbling in

the chapel of the founder, and which ought, if only from respect to the memory of a great man whom the present age is too busy to appreciate, to be perpetuated by the sculptor. As it is, they tend, in our judgment, to spoil the screen, and this illustrates that which we wish to suggest. Cannot the funds of the Abbey or the liberality of the public support a special curator of the monuments,—a man who should be, not a verger, but an artist? The preservation of the memorials treasured in the Abbey is a subject in some respects requiring different treatment from the care of the fabric itself. The question of preserving the statues from the corrosion of accumulated dust is not altogether simple. On the one hand, it seems undeniable that great injury, first to the colour, and then to the texture, of the marble, is caused by accumulated dust, and in the more delicately-wrought statues the ill effect is the most marked. We can point to one, by no means of this class,—the effigy of the Duke de Montpensier,—in which the purity of the colour of the marble is rapidly departing. On the other hand, the removal of the dust should be entrusted only to artist hands. The ill-directed energy of a single broom might do more injury than a century of neglect. It is not from the process of cleaning, however, that the most observed piece of sculpture in the Abbey, the terrible "Death" of Roubillac, has been deprived of its jaw. It seems to have been the sacrilegious hand of some casual visitor that inflicted so great an outrage. Is it not the intention of the authorities to take the best advice as to restoring so essential a part of this wonderful figure? For such, and similar questions, it would seem that the presence of an artist as curator of the monuments is demanded. No less important would be the counsel of such an officer in case of fresh applications for room for monuments. Full as Westminster is, we are not so convinced of the degeneracy of the day as to hold that the list of great names to be commemorated on its walls is closed. It is impossible to look at many existing monuments, which rather disfigure than adorn the walls, without a painful impression of the injury to the effect of sepulchral statuary which results from a want of rapport between the sculptor and the architect. The former may design a group or a cenotaph, worthy of admiration in his studio, and simply distracting when fixed in some chance location in the Abbey. As to the past, it is, perhaps, unsafe to attempt amendment; but, as to the future, offences against taste may be avoided, although they can only be avoided by establishing a relation between locality and design before the latter be carried into execution. Especially do such remarks apply to those monuments which are not works of art, properly so called, but simple memorials. With the exception of the very noblest triumphs of the sculptor, such simple slabs appeal most powerfully to the imagination. If the Argyll "Eloquence" be the finest instance of embodied poetic imagination in the Abbey, the second place must be given to the epitaph of Spenser. Now there can be no reason why space should be wasted, architecture should be outraged, and the sense of awe and of reverence should be put to flight, by the vagaries of the stonemason. A bas-relief of a sarcophagus, with an urn on the top, an unmeaning canopy—a hideous cherub, serving only to give prominence to an epitaph,—such efforts to call attention, injure alike the taste of the living and the memory of the dead. The usual style of mural tablets resembles the violent efforts by which the advertiser covers neglected buildings and decorates railway stations, rather than seems to be the result of a feeling of love and honour for the departed. What reason is there that memorial slabs should not be inlaid into the walls of churches as part of the original design, to be inscribed, as occasion demands, with the names of the loved

and honored ones whose ashes are laid to rest beneath the shadow of the sacred building? Serial inscriptions of this kind, like those of the names of benefactors to be found in some of our older churches, would harmonize with the character of the place. Quite sufficient distinction could be given to each name by a proper regulation of type. Each new epitaph would take its rank among the memorials of departed worth, or virtue, or beauty, in honourable fellowship, instead of endeavouring to protrude its recent grief by violent and inharmonious ugliness. Our churches would gain in every way; the memory of the departed would no longer be turned into an offence against the taste of the living; and those who, being dead, yet speak from the walls of minster and of cathedral, would speak in a tone of grand and consistent harmony.

ARCHITECTURAL ARTS COURT, PARIS INTERNATIONAL EXHIBITION.

On the general show of art-workmanship we would speak at present with some reserve, as it is in somewhat of an incomplete state; and recollecting the labours of the committee, we wish to speak with due consideration. We know what unforeseen obstacles have over and over again started up, and had to be overcome by their perseverance—how some who promised to contribute have failed at the last, and have but blank spaces to show;—but, in fact, while we congratulate these gentlemen on what has been accomplished, we console with them (and we are sure they will accept it all in good part) with what has not been done. For there are names in all the classes undertaken to be represented by this committee which are altogether wanting, and the owners of which we feel sure will in the end regret that they did not bestir themselves in time to secure a place in the Architectural Arts Court.

For whatever may be said of the building itself, or the particular arrangements of the whole, there can be no doubt that this year will be an epoch in the history of nineteenth-century industry and art, and that the Exhibition of 1867 will remain as a fact—and perhaps no one yet knows how important a one—in the minds of at least the present generation.

To particularize, however, we may commence by stating that of the workers in metal we have Hardman, Hart, Skidmore, Benham, and Barnard, Bislop, & Co., all good and well-known names, and these will be found in the special catalogue for the British department, under Group V., Class XL., "Mining and Metallurgy," with the exception of Hardman, who is to be found under Group III., Class XXI. This will show at once how scattered would have been the British architectural art-workmanship in metal had they not been grouped in this manner [a reference to each name is made in this catalogue, to the Architectural Court, though there seems to be no reference special to this court in the index, &c.], and also how rigid, to use no stronger word, the classification must be which admits of only one notion with respect to a material, viz.—its origin, which idea is in effect lost entirely when the material is so wrought by the hand of man as to become a work of art. It would show its absurdity to carry this classification one step further, and range oil paintings amongst the obnoxious productions of the earth. There are four exhibitors of encaustic and other tiles, viz.—Minton, Maw & Co., Godwin, and the Architectural Pottery Company, at Poole. Of these Messrs. Minton & Maw have an equal space, and fill it very well, but only small spaces, and these with not especially good specimens, are filled by the two others mentioned. All these in the official catalogue are placed under Group VI., Class LXV., "Civil Engineering, Public Works, and Architecture."

Ransome's patent concrete stoneware, Blashfield & Puller's terra-cotta, the stone carvings of Foryth & Seymour, and the mosaics of Jesse Rust & Co., come also under the same class and group, as also do the "prize objects in art-cognate to architecture," exhibited by the Architectural Museum, but which, however, we have not yet discovered, although they are mentioned in the official catalogue.

The Group III. of the general classification, which had been supposed to include the foregoing works as articles of "Furniture and other objects for the use of dwellings," will be found to include the rest of the works exhibited in this

court, though under various classes, and in the first of these, Class XL., appears only the name of the Hon. Secretary himself, Mr. C. F. Hayward, who exhibits a carved cabinet, designed by himself. We shall best progress with our description if we mention at once that it is of oak, elaborately carved by Baylis, and seems a very far from giving a flimsy effect, as is so often the case. The ends of the cabinet are decorated with paintings by Dante Rossetti, but are so carefully subordinated to the whole that they retain completely their purpose of decoration, and are not too obtrusive. It is a great thing to have obtained the work of so good a painter, and we congratulate the designer on this as well as the more mechanical, but still excellent, execution of the top, which is of enameled slate, by Magnus, of Pimlico. Having said this much, we need not refer to this class again, in connexion with this Architectural Art Court, although some of the objects to be hereafter described would seem more appropriately included in this class, which is otherwise composed of the works of our chief well-known furniture manufacturers, who, though not exhibiting in connexion with the Architectural Committee, show some excellent work, which might well be placed in their court. Under the head of "Decorative Work," Class XV., we find Messrs. Clayton & Bell exhibit their cartoon for the mosaic picture, since executed by Salvati, and probably seen by most of our readers last autumn, in the Jerusalem Chamber at Westminster, awaiting the necessary preparations for fixing it as part of the reredos for the Abbey. This is hardly the place to criticise the design, so we pass on to mention the names of Harland & Fisher, and Heaton, Butler, & Byrne; also in the same class, under the head of "Church Furniture, &c.," we find Jones & Willis, Cox & Co., and the Rev. Robert S. Baker, who most unaccountably heads the list of Architects and Architectural Drawings, in Group I. of the official catalogue, with the very same object—a carved lectern! but to bear him company in this anomalous position we notice the name of Woolmans (W. H. & Co.), who exhibits some special paper decoration, designed by Mr. Digby Wyatt and others.

Class XXVI., with the general title, "Leather-work, Fancy Articles, and Basket-work," has a separate division of "carvings," and herein we find the names of Baylis, and Kendall of Warblington, both well-known wood-carvers; the one exhibiting his skill in the working out of Elizabethan ornament to a clock-case, and the other in natural ornamental foliage, &c., in panels. The incongruity of this classification is evident.

To complete our abstract list we ought to have mentioned before the names of Strode & Co., and of Prichard (Llandaff),—or rather, Leaver, of Maidenhead, whose work in metal, from the designs of that gentleman, we shall speak of hereafter, but whose names are altogether out of their proper places in the catalogue. Of late years, and under the special guidance of those architects who practise chiefly in the Medieval styles, no branch of art development has progressed further or more vigorously than metal-work. The art of the smith is essentially one of strength, and the idea of human power as well as skill is indissolubly connected with works in iron and brass, from the time of Tubal Cain down to Quintin Matsys, and to the present hour. And we are happy to know that what we see of exhibited cunning workmanship in these materials, is but a tithe of what may be found and is cultivated everywhere in England. The village carpenter may show little taste, and the village painter less, while the country carver but seldom rises to any special skill, notwithstanding the opportunities of study in the objects around him; but the village smith is seldom wanting in sturdy honest work, and is very frequently capable—when directed—of the highest art cultivation. We are not surprised to find, therefore, seven metal-workers to four carvers—including stone and wood—exhibitors in this court, though each exhibitor takes his own peculiar line. Messrs. Benham might have done more than exhibit a single specimen, showing rather their capability of work than their special skill. We do not admit their brass eagle lectern as a whole, nor the eagle itself in particular. The painting of the base is no improvement to the form adopted. This, by the way, is but one of many eagles which seem to have found a nest in this court, and to such an extent do they flourish that there is some chance of the whole group being re-

tained in France to add to the necessary stock of that bird required to be produced at the shortest notice. In truth, however, it has been remarked that it is complimentary of British architects to exhibit no many specimens of the "national" birds. Messrs. Barnard, Bishop, & Co., of Norwich, have a case of delicate wrought-iron work finished in black. One specimen, forming a small toilet-table, with frame at the back for a looking-glass, is of small iron bars, bent when cold; but, though very like an imitation of basket-work, the colour is not so favourable, and gives an unfinished look to what should be a very finished article of furniture. A stand for a vase, with a thin stem ornamented with beaten-out leaves, is very delicate in treatment, and, like many other articles in this case, is from the designs of Mr. Jeckyll. When a base or foot is made as this is, however, of two pieces or scrolls of wrought work not welded together, but connected with a wrought hand, however "truthful" the construction, we may be sure it will become loose before long, and the stand be unsteady. Altogether we commend the works of Messrs. Barnard. We have already spoken of some elaborate gates exhibited by them in another part of the building, which show their skill in other and more important works, and are a great improvement on what they exhibited in 1862.

Of course Messrs. Hart & Son make a fine show,—they always do; and always some new combination of good workmanship. Here is an important work in the shape of a candleburn, 14 ft. or 15 ft. high, wrought out in the most conscientious manner, and built up, coloured, and painted on the spot by the designer, a young man named Rice, in Messrs. Hart's employ. Then we have besides a variety of iron and brass work; a considerable show of church plate and articles of domestic use not calling for special remark, as we are so well acquainted with them at home, but which will be doubtless objects of great interest where they now are.

Some portions of Messrs. Skidmore's work, which would have been of the greatest value in this court, and which would have adorned the model of the work they are intended to adorn, viz., the Prince Consort memorial, are, as we have previously said, exhibited elsewhere, owing to the actual want of space—height and width—in this portion of the Exhibition Building; so they will be seen amongst the machinery, and we trust they will not be found to be too appropriately placed there, but in truth they are specimens of art-workmanship on a very large scale. We prefer examining the smaller articles of more delicate and refined skill, as shown in the case bearing Messrs. Skidmore's well-known name and upholding their well-earned reputation. Messrs. Strode are not largely represented, but they exhibit a standard light, or the central part of a larger standard designed for the Duke of Cornwall Hotel at Plymouth, composed of beaten brass work and decorative glass balls. The design seems adapted to the purpose, and is reasonably simple, though there is no novelty in the use of glass bosses or balls; but, as specimens of artistic metal work applied to gas-fittings, they are creditably designed compared with what we have seen with regret adopted in most of our large metropolitan buildings of this class, as good enough to adorn a standard light of very different character, with pendants or coronas, are shown by Mr. Prichard, architect, as his design, executed by Leaver, of Maidenhead. To our surprise Messrs. Hardman exhibit but one specimen of plate, and no object of any kind besides this.

Perhaps the most important, if not the most interesting "exhibits" are those of terra-cotta, a material connected intimately with artistic construction in former times, and capable still of an indefinite development. To see what is being carried out in this substance, however, it will be necessary to visit several departments of the Exhibition; and we have already referred to the great example of terra-cotta work executed for the new building at South Kensington, and which is so large that it had to be placed in the great machinery zone, and to some of the foreign specimens of it in the same zone. We will first bespeak attention to the examples sent by Mr. Blashfield, of Stamford, to exemplify how far he has progressed in the manufacture. Blashfield's name is well known to be a guarantee for excellent workmanship, and a peculiarly wise and intelligent application of scientific information is brought to bear on every work taken in hand by him. Two win-

to be erected at the new Dulwich College, and designed by Mr. Chas. Barry; the other a copy of those already erected in the tower of the Duke of Cornwall Hotel, Plymouth, designed by Mr. C. F. Hayward,—are built into the walls. These form very prominent features in the court, and we venture to say both of them show a great novelty in design, at least, to our *confrères* in Paris. Both are combined with granite, though in an entirely different manner. That for Dulwich is set in a red brick wall; while that at Plymouth is combined with grey granite jambs, set in limestone walling. Each is a round-arch two-light window, with a central column; but the one has an enclosing arch, deeply recessed, in the tympanum of which is a richly-moulded circular panel, containing projecting head or bust; the other, without any enclosing arch, is so formed that the mass of terra cotta should work in with the walling itself, and the round arch of each light is capped by a pointed one, the spandrel resulting between them being decorated with flatly-treated foliage. The specimen for Dulwich College is altogether the more elaborate, and has jamb shafts, as well as a central engaged shaft of polished red granite; while the Plymouth example has a shaft of terra cotta itself, with a beautiful and sharply-moulded cap, decorated with foliage of Early English style. The former is, of course, the more costly and important piece of work; but the latter shows a constructive application not generally met with; while the simple manner of its use in combination with ordinary materials, so that no special workmen are required to fix it, is highly commendable. How much further the design in this material is to be carried in the case of Dulwich College may be understood from a model exhibited close by; and we learn that the Plymouth specimen shown is but one of a series of windows in the tower, and all the first-floor and second-floor windows are of a more elaborate and studied character. Indeed, one of the columns of a two-light or three-light window on the first-floor is also exhibited, built up of five pieces, base-shaft in two pieces, with hand between, and cap. Such a combination to carry the weight here put upon it, requires to have the hollow spaces, filled in the shafts, &c., and, indeed, all the hollow portions, filled in solid with broken terra cotta and Medina cement. Dowels also are required of any hard material or metal,—but iron, for reasons very well understood.

Another window-head is shown as a specimen of those used at the Sun Fire Office, Charing-cross, designed by Mr. Charles Freeman; also some examples of spandrels very richly decorated with foliage made for the Ornamental Screen, Victoria Garden, Bombay, and designed by Messrs. Scott, McClelland, & Co. Some small figures in panels (though not novelties) show the higher art which we know at one time was the chief end and aim of this manufacturer; and we regret that some more important high-class sculptural objects have not been sent to be set beside the utilitarian works. Nevertheless, a few vases of pure classic shape, and of even colour—unglazed, though very highly finished—attest the capabilities of the manufacturer and the material in an entirely different direction.

There is also an interesting and highly ornate—perhaps too rich and delicate—specimen in the form of a chimney-piece, for the new India Office, designed by Mr. Digby Wyatt, after the Renaissance, with pendant “swags” of fruit and foliage. This is of red terra cotta, while the exterior work of the windows, &c., is all of a peculiarly creamy or warm stony tint, though we believe this is not on account of any difference in the texture of the material or wear of the colour.

Messrs. Henry Doulton & Co., of Lambeth, exhibit also some terra-cotta heads; but the only other important exhibitor is Mr. Pulham, of Boxbourne, who has a specimen of a window, with reveals, sills, heads, &c., shown as it would be built into the brickwork of the wall. Also a large and a small column, with caps, and a large cornice for the top of a building. The moulding of these is very good, and the hardness seems equal to other similar works; but when such objects are placed in a position sufficiently elevated to show,—as they should do,—their general effect in position, it is difficult to get near enough to judge accurately of the closeness or hardness of the material.

Mr. Pulham also considers terra cotta a suitable material for founding houses with instead of stone, as certain “diamond building blocks,” which he exhibits, attest. We wish, indeed, we

could have found the prices and other particulars attached to these, and the curator of the court ought to be furnished with them if any comparison is to be made. At any rate, one thing is certain, that as to stone of all kinds is so perishable in our climate, anything which offers so good a substitute, and seems so likely to endure, should be thoroughly investigated, and all its qualities, good and bad, made known, as well as any peculiar advantages or disadvantages attending its use. Perhaps the catalogue, which, we understand, the Committee are about to publish, will afford this information. We must not omit to mention that Mr. Pulham exhibits, near the “Testing House,” Mulready’s tomb in terra cotta, of which we have previously spoken; the credit of the manufacture of which, and not the modelling, belongs to his name. It is curious that this is the only exhibit of Mr. Pulham’s mentioned in the official catalogue; his name is omitted from the list of exhibitors in this Architectural Court. Other objects of a more ornamental character, such as vases, terminals, a small fountain, &c., complete our list; and now, before we leave this special subject, we must record our regret that the desire of the committee to make their collection complete was not more warmly responded to; and we cannot but think that Blaichard, the Coalbrookdale Company, and others, might have spared some specimens to place beside those we have been describing, and that some of the disadvantages of not doing so must accrue to those who were backward in responding to the invitations sent out.

In close connexion with the foregoing are specimens of Ransome’s patent stone, a material now recognised as applicable to all styles of architectural design. We find columns and chimney-tops executed for, and designed by, Mr. J. P. Seddon, as well as portions of a circular wheel-window of Gothic design, with specimens of balcony panels and ornaments in Elizabethan, and balusters, key-stone ornaments, and so on, of a more classic character. The best application of this process is in the thin, flat, diaper slabs—for internal (or, indeed, if required, external) wall decoration,—a real “wall test,” to use Mr. Ruskin’s phraseology. For this, bearing in mind the comparatively small cost at which it can be supplied, it ought to commend itself to architects. The colour generally might be improved, but we need not say anything as to the design. It now seems understood that it is of the utmost importance to have the form of even the specimens of any material properly designed by architects, who take the trouble to study the peculiarities of the manufacture, and to adapt it to the wants of their art; in fact, to place each in its proper place in relation to the rest of the materials with which it may have to come in contact.

THE LATE SIR ROBERT SMIRKE.

The English school of Classic architecture has lost an able architect. Sir Robert Smirke has passed from “temples made with hands,”—in plainer language, from among men,—at the ripe age of eighty-seven. He died at Cheltenham on the 18th instant.

His father Robert Smirke was an eminent painter, and member of the Royal Academy of Arts in London. He was born in 1752, and died January 5, 1845.

Smirke, like Sir William Chambers, was not a church architect. The only example we have of his skill in this way is the Church of St. Anne, at Wandsworth, in Surrey, completed in July, 1822, but not consecrated until the 1st of May, 1824. Smirke’s extreme love of Greek and Roman architecture forbade his becoming acquainted with the resources of the Gothic. He sinned in this way with a greater man,—with Sir Christopher Wren.

It was the good fortune of the elder Smirke to live to see three of his sons eminent in their callings. First, Sir Robert; then Sydney Smirke, an able architect, whose works are known and deservedly admired; and Edward, whose skill in Old English records,—and their bearings on history,—and biography, commands the approbation of scholars.

Five architects, juniors in election to Smirke, have been taken by death from the ranks of the Royal Academy since the date of Sir Robert’s election in 1811. Let us name them:—Sir Jeffery Wyattville, elected in 1824; Wilkins, elected in 1826; Cockerell, elected in 1830;

Deering, elected in 1838; and Sir Charles Barry, elected in 1842.

I have no intention of asking space in the *Builder* for any remarks of mine on the merits and defects of Sir Robert Smirke as an architect. His career as a follower of Sir William Chambers, of Dance, and the elder Hardwick, affords a rare illustration of what he lived to see done to and done with one of his own works. The Carlton Club, in Pall-mall, of Sir Robert’s design (and it had many merits), has been totally effaced by the loftier and slier work of his younger brother, Mr. Sydney Smirke, R.A. Let us hope that it will be very long before the College of Physicians and the Union Club-house (the whole west side of Trafalgar-square, and of Sir Robert’s designing) are pulled down for the work of some “Ripley with a rule.”* Illustrations Sir Christopher Wren, what has been the sad fate of your College of Physicians, honoured by the frequent visits of a Radcliffe, a Sloane, a Mead, an Arbuthnot,—

“And then a long *Et Cetera?*”†

The *Builder* has always exhibited an interest in the London residences of eminent men. The London homes of Sir Robert Smirke deserve to be chronicled. Mr. Tite will probably be pleased to be reminded of them.

In April, 1807, then in his 27th year, he was living in the Albany, Piccadilly, No. 1, H—that is, he was in fashionable chambers, and possibly unfitted with an aim, having, by fits, a longing to be a great actor; and, happily, a still greater longing for the reputation of an architect, and to become “*what’er Vitruvius was before.*”‡

From the Albany he removed, in 1809, to No. 13, Berners-street, Oxford-street; led thither, we may pleasantly suspect, by the recollection that Sir William Chambers, the architect of Somerset House, had lived in that street. His house in Berners-street was two doors from the house of Henry Bone, the famous enameller. Bone’s house was No. 15.

His next “fitting” was (1815) to No. 3, Upper Fitzroy-street, whence he moved (1821) to No. 5, Stratford-place, Oxford-street.

The father of Sir Robert Smirke died at No. 30, Osnaburg-terrace, Regent’s Park, on the 5th of January, 1845, in his 93rd year. His son, it was thought, would have reached the same great age. When Wilton the sculptor died, in 1804, the father of Sir Robert was elected by the Academicians to succeed him; but the election was not confirmed by King George the Third, and Fuseli was appointed. The principles of the elder Smirke were “revolutionary!” so, at least, the good king had been taught to believe.§

In one great respect, as an architect, Sir Robert was unfortunate. He lived to see the Covent Garden Theatre of his building destroyed by fire, and a new one of a very different kind stand “in its stead.” There were many merits about Smirke’s Covent Garden Theatre. It is well represented by six capital plates in Britton’s “*Edifices of London.*”

The mother of Sir Robert died at No. 3, Upper Fitzroy-street, Fitzroy-square, on the 12th of January, 1824, aged 67. The mothers of able men deserve to be remembered. Since Sir Robert was chosen a Royal Academician, in 1811, there have been seventy-seven new members elected, very many of whom are dead. P. C.

THE LATE M. HITTORFF, ARCHITECT. ||

JACQUES IGNAZ HITTORFF was born at Cologne, August 20th, 1792, and was early taught, after the old German manner, to prepare himself for his future career by handling the mason’s tools. In 1810 he went to Paris and pursued his studies under the architect Belanger, a very able master and kind friend, who constructed the glass dome of the Halle au Blé, to cover the vacant area of the Central Court as originally left. He continued to attend the schools of the École des Beaux Arts, where Percier recognised the abilities of the young architect, and over and over proved his constant

riend. Upon the return of the Bourbons to France in 1814 Monsieur Belanger was confirmed in his appointment of architect of the public fêtes and ceremonies, which he had previously filled, and he appointed his young friend Hittorff as his assistant inspector, having for his colleague M. Lecoq. This public appointment influenced materially the future professional life of our friend, for ever after we find him constantly employed by the public authorities in connexion with the public ceremonies, in the municipal buildings and embellishment of the open spaces of the French metropolis, and in the erection of the places of amusement and recreation.

With his colleague, M. Lecoq, he designed and superintended the funeral pomp and burial of the Prince de Condé, of the Duc de Berri, and of Louis XVIII., as also on festive occasions, the marriage of the Duc de Berri, the baptism of the Duc de Bordeaux, and at Reims the coronation of Charles X. They also reconstructed the interior of the Salle Favart, and in eight months rebuilt the English, a part of the North of Germany, the South of France, Italy, and Sicily. In his journey to the latter country he was accompanied by his pupil, Herr Zanth, and his friend, Herr Stier, and returned enriched with a fine collection of sketches and drawings of the several monumental buildings of those parts. The lamented Zanth, you will recollect, gentlemen, as one of our honorary and corresponding members, when architect to the King of Wurtemberg, and who, on his death, bequeathed to us one of his beautiful drawings of Monreale in Sicily; and Herr Stier became the eminent professor at Berlin.

In 1826 M. Hittorff published, with M. Zanth, the results of this journey in the "Architecture Moderne de la Sicile, fol. Paris, 1835," and in the "Architecture Antique de la Sicile, fol. Paris, 1837." I must first call special attention to the work on Modern Sicily, which, for variety of subjects, exquisite drawing and tasteful illustration, offers a rich collection of novel ideas for the architect in the churches, hospitals, convents, palaces, Saracenic remains, and for the number and decorations of the public fountains (in which Sicily is unrivalled). The work on the Ancient Architecture of Sicily is the first volume of an intended series, illustrating only a portion of the ancient monuments of that country, and is executed with the conscientious precision and with the enlarged intelligence, which previous works on Greek antiquities afforded to minds so inquiring as those of the authors. The restorations of the temples of Segeste and of Selinus were drawn out to a large scale, and with the usual artistic distinctness of the French school; and the exhibition of them before the Institute of France at once procured the approval of its distinguished members. It would ill become me to draw a parallel between the publications of previous or subsequent writers, such as St. Non, in the "Voyage Pittoresque," the volume of our own Wilkins, or the more recent tomes of the Duca di Serradifalco; but the experienced professional intelligence, the more profound acquaintance with antique monuments, and the artistic feeling of M. Hittorff and his companions, invest their publications with more than ordinary importance. I am happy to inform you that the concluding volume on the "Sicilian Antiquities" was just completed by M. Hittorff for publication. All the plates are ready; and I learn from his son that he was, at the decease of his father, engaged upon the revision of the last part of the text, so that we may soon expect its appearance. It will be a most interesting section, as it contains the total restoration of a Greek Doric temple in all the integrity of its minutest parts, and many of the vexed questions will be solved according to his views, with the reasons elaborately explained.

You who are so well acquainted with M. Hittorff's predilections of classic taste, and his immediate subjects of study, will readily understand how these special researches in regard to such remains as those of Pompeii and Sicily, which contain profuse evidences of colour as an essential feature of the decoration of the edifices of antiquity, made a deep impression upon the mind of our late colleague, excited by the essays and pamphlets which had appeared already in Germany, France, and England, upon the subject of polychromy, as practised by the ancients in their works of art. All these influences concentrated with immense effect upon his artistically

impressible susceptibility; and whether in the ruins of edifices, in the fragments preserved in museums, in the vases, tiles, pottery, Etruscan tombs, or other sources of evidence, he sought to discover the principle which guided the Greeks or Romans in the application of colour. Seconded by the erudition of his learned friend Leirnon, he enlisted the evidences of all the ancient authors, who had even by mere indirect expressions alluded to a subject, which, recognised as it doubtless was by all antiquity, required no more direct allusion as witness to the universality of its practice. This noble work on the polychromatic architecture of the Greeks, or restoration of the Temple of Empedocles at Selinus, concentrates all the evidence procurable on the subject, and sums up the results to be derived from them. The careful elaboration of the design and the exquisite execution of the coloured plates, with the learning of the essay, which minutely justified each step in the elaborate investigation, placed his work as the climax of proof and reasoning on the subject, and exhibited the extent of his antiquarian knowledge, and the practicability of its application to some of his own buildings.

In 1832 M. Hittorff published with M. Olivier, the celebrated architectural engraver, a French edition of the English work on the "Inedited Antiquities of Attica," in order to complete the series of translations of the English works, which up to that period had appeared on Greek antiquities, as "Stuart's Athens," and the previous volumes of the Dilettanti Society upon the monuments in Asia Minor. He dedicated this work to his old master and friend, M. Percier, in a few touching words of grateful affection. The plates, which in the original are shaded, are in this edition in outline; several restorations were added, and notably one very useful plate containing a parallel of all the monuments drawn to the same scale, affording the opportunity of a comparison of their relative sizes and designs, and many judicious notes were given in further explanation of the text.

Hitherto I have briefly dwelt upon some of the studies of the scholar and the productions of a brilliant author, rather than upon his other more immediately practical labours as an architect; and it might be imagined that such publications would fully engage the whole time of a professional man. On the contrary, they were (I might almost say) the relaxations of an elegant mind amidst other absorbing matter-of-fact occupations. I think his earliest work in the Champs Elysées must have been the circular Pantheon, built in 1838, equal in diameter to the Pantheon at Rome, and the roof of which he supported in a most original manner on the summit of twelve iron cables, and which admitted the uninterrupted passage of the light upon the picture of the circumference. It was described in July, 1842, at one of our ordinary meetings. From that time to this the Champs Elysées have been the arena on which he has exercised most happily his fertile imagination in the erection of fountains, restaurants, caffè chantants, and other constructions for the amusement of the people, the most important, however, of which is the Grand Cirque Olympique, now called of the Empress, built in 1839. This is well known to all who have visited Paris as a sixteen-sided building, capable of holding 4,000 spectators, for equestrian exercises, above 134 ft. in diameter, and covered by a roof without a tie beam, the stability of which depends upon the circular or polygonal curb against which the feet of the rafters rest: attached is stabling for the horses of the troupe.* The decorations are conceived in the best taste, so that the vastness of the area, without any central pillars, and the elegance of the ornamentation, place it in the same rank with the large and most costly productions of the like nature of the times of the ancients. M. Hittorff mentioned to me an incident, most gratifying to himself, that occurred in the erection of this responsible work. His employer left him *carte blanche* with the obligation of completion within a certain period. The construction was so difficult on account of the nature of the soil, and the whole matter so novel in every respect, that M. Hittorff spent several hours every day upon the spot; and he observed in like manner that his employer was always there, critically observing all the operations. At length M. Hittorff asked him the reason of his close surveillance, to which the reply was, "I have felt naturally anxious, both

as to the progress of the work and the outlay, and I was determined myself to be witness of what was going on. M. Hittorff, I have seen the unwearied attention you have bestowed on your work, which I feel will be as advantageous to me as it will be honourable to you. I have proved that there is no need of my presence to urge on all concerned, or to induce a careful economy, and you will not see me here any more till the conclusion." The success of the whole was, in fact, so complete, that the circus was opened at the period named, and a very few years sufficed to pay off the necessarily considerable cost of the erection. In 1851 a larger and a more sumptuous circus was erected on the Boulevard des Filles du Calvaire in nine months, with increased reputation to the author, and enriched, as was also the other circus, with the sculptures of the eminent Pradier and Duret, and the pictures of M. Berrias. M. Hittorff assisted in the erection of the obelisk of Luxor, in the Place de la Concorde, and designed the pedestal. His inquiring mind was not satisfied with the rude condition of the rough, and, as it were, fractured apex, and it occurred to him that it could not have been left so exposed by the ancient Egyptians, all of whose works are finished off with such precision, regardless of labour or expense. At length it occurred to him that there must have been some artificial finish to the summit of the monolith, and further research proved to him that it must have had a bronze gilt capping, or pyramidion, a conclusion which he fully justified in a pamphlet that he published at the time; but his suggestion was not carried out, and the apex still remains in its fragmental state.

To M. Hittorff's graceful taste is due the design for the colossal fountains in the Place de la Concorde, combining sculptural and architectural forms in an admirable manner, and the jets casting forth volumes of water, more abundant than those even of St. Peter's at Rome, and in magnificent contrast with our squirts in Trafalgar-square. He also materially modified in other respects the original conception by Louis of what may be considered the most magnificent Place of all Europe, surrounded as it is by the gardens of the Tuilleries and of the Champs Elysées, the Garde Meuble, the portico of the Old Chamber of Deputies, with the avenues commanding views of the Madeleine, the Arc de Triomphe de l'Etoile, and the Tuilleries Palace.

M. Hittorff was associated in the erection of the Basilica Church of S. Vincent de Paul, near the station of the Chemin de Fer du Nord, with the estimable and accomplished M. Le Père,* father of Madame Hittorff, with the latter of whom, through all the varied joys and trials of professional life, he passed a happy wedded union of above forty years, in tastes and feelings most congenial, and which rendered the domestic hearth the happiest of homes. I know not to what extent the conception of this great church was due, respectively, to the genius of one or the other of its architects, but the death of M. Le Père occurring in the course of the work, the completion was necessarily directed wholly by his son-in-law. The Basilica of the Romans was a favorite theme of M. Hittorff, as we know by his published restoration of the Basilica of Fano from the text of Vitruvius. On the present occasion he sought to realise some of his early impressions, reconciling them with the special purposes of a Roman Catholic place of worship. The nave and side aisles, divided by a line of columns two stories high, with a gallery and flat roof, and a bicycle at the altar end, have a very grand effect, and Christianise, as it were, the heathen elements of such a disposition. The whole of the details and embellishments symbolically treated, and the colouring and gilding are of the most refined Greek taste; and notably are to be admired the magnificent series of stained-glass windows, and the decorations of the podium between the upper and lower ranges of columns, consisting of a procession of the saints, male and female, of the Roman Catholic Church, painted by the imitable and lamented Flandrin, the first of ecclesiastical painters of the present period. The church lies on the sloping side of a hill, which required a magnificent flight of steps to reach the portico, and this is realised by a

* M. Le Père, born at Paris, 1761, deceased 1844, was member of the Scientific Expedition to Egypt, and prepared many important drawings for the large work on that country. He was joint architect with Gondouin for the bronze column of the Place Vendôme, and subsequently contrived a most ingenious scaffolding, fixed on the capital, for raising and placing the statue on the monument.

* Illustrations will be found in the *Builder*.

series of divisions of easy ascent and varied plan, ranked by balustrades, forming a grandiose basis to the church itself. M. Hittorf had contemplated the decoration of the walls of the portico with paintings, as shown in one of the plates of his work on Polychromy, illustrating subjects from the Old and New Testaments, to be executed on enamelled slate or stone, in the general adoption of which enduring process he took great interest, as being peculiarly adapted for mural decoration of public buildings. These paintings were partly executed, but did not seem to meet with public favour, and have since been removed.

The notice of this church leads me to observe one of the peculiarities of Paris in regard to its religious edifices. The whole city is divided into arrondissements, with a like ecclesiastical distribution. In each municipal division there is (or intended to be), a central basilica, of gigantic proportions and cathedral-like arrangement, such one at a cost of one or two hundred thousand pounds, or even more, subordinate however to the metropolitan cathedral. Of this class on the north side of Paris are the Madeleine, Notre Dame de Lorette, S. Vincent de Paul, and the churches in the Boulevard Malesherbes, and in the quarter of the Chaussée d'Antin, now nearly completed, and forming so many ecclesiastical centres grouped around the mother church of Notre Dame.

The municipality provides a like class of offices for the local civil administration of each arrondissement, consisting of a mairie, carried out in the like sumptuous way; for happily our neighbours are not satisfied with the erection of their buildings, intended for public purposes, in a humble and niggardly economical manner, as in our police offices, but require that they should add to the dignity of the metropolis. These mairies combine various functions for daily and occasional use, and they thus afford the opportunity of considerable architectural effect. M. Hittorf executed one on the Place du Panthéon, the staircase of which is a very striking feature; and he completed the suite of buildings opposite the eastern façade of the Louvre and close to the Church of S. Germain l'Auxerrois, by a communal school, distinguished for its arrangements; a presbytery; and a mairie for the quarter, in the Renaissance style; repeating some of the leading features of the adjoining church. This, however, cannot be cited as one of his successful compositions. He enlarged and completed near the Barrière du Trône, for the Majesty the Empress, an institution for the reception and education of 300 daughters of workmen; and he carried out a distribution of art of the Bois de Boulogne, in conformity with an original sketch by the Emperor, which once showed me as one of the curious features of his study. He designed the circular series of edifices surrounding the place of the Arc de l'Étoile, and from which radiate various boulevards to different parts of Paris and the suburbs.

Time would fail me to recite all the works which our late colleague either designed or executed during his long and active life of professional experience. In Paris alone, whether to the north or south, to the east or west, or very centre, we find monuments of his skill and taste profusely scattered. I have not dwelt upon their distinctive merits, nor have I paused to analyze their disposition or arrangement, the styles he adopted for each, or the more or less success of his effort; I address myself to his professional brethren, who are fully capable of forming their own judgment, and who require no critic to lead them to a conclusion. It is enough, in such a rapid notice as this, to indicate the most notable that the history of our art cannot fail to record, and which are the best tests of his various powers, and which procured his reception in the Imperial Institute of France in 1853, the award of our Royal Gold Medal in 1856, the election in numerous foreign academies, and crosses and honorary distinctions from various continental sovereigns.

The last great work of our friend, and which is in effect a colossal one, is the terminus at Paris of the Great Northern Railway of France. This propylon, as it were, of the Egyptian and Greek type,* consists of three circular-headed archways of the Ionic order and tetrastyle treatment, each crowned with a pediment and gazing in size, and with intervening Doric colonnades, the whole consisting of purely

Greek detail, and enriched with sculptures of the highest class. I must own that, impressed as I was when I first saw it, I felt staggered by the audacity with which all the usual canons of art were disregarded in the general composition, and yet bringing on the mind a most imposing, and, it may be said, colossal effect. I have stood at periods before it to study the elements of the design, and how the like impression could be produced by any other more severe treatment, but in vain; and I could not but render homage to the genius of the architect who, by a most capricious mastery of his subject, could successfully render himself independent of the ordinary conventionalisms of his art. This is a most striking instance of the different treatment with which such stations are handled in France and England. With them, it is to be a monumental object, to impress the stranger with the imperial greatness of the capital of France, and to develop its taste for all the resources of architecture and the sister arts; with us it too often results in a huge magazine or shed, or an enormous refuge of a colossal hotel to receive the wearied traveller.

I have also mentioned his larger publications as an author,* but his pen and fertile imagination were unceasingly at work, embodying in memoirs from time to time the practical results of his own observations upon the passing topics constantly arising in such an artistic circle as that of the French metropolis, and among numerous biographies one of our distinguished colleagues, the late Sir Charles Barry, in 1860. Another of his most recent essays read before the French Institute drew attention to the analogy existing between the fresco decorations of the Roman baths and of Pompeii and the rock-cut façades in the valley of Petra, showing a complete identity of the two, and that the wall-paintings of the Romans were not merely capricious exercises of the painter's fancy, but actual, and therefore valuable records of existing buildings. The decease of our late friend is the more to be deplored, as in him we lose the sole surviving earnest disciple and most able exponent of pure classic art.

We have thus briefly considered our late colleague as an architect and artist, as also as an author; and we have seen how accomplished, learned, and profound, and ready he was with his pencil and pen. These impressions were confirmed if you saw him in his elegantly-arranged study, there even from early morn, surrounded by exquisite drawings, choice marbles, terra-cottas, casts, library of rare and costly books and other memorials of the finest monuments of all ages and in all countries, from ancient Egypt to modern Europe,—himself the refined, the rare interpreter of their excellences, and of the hidden mysteries of design and treatment, which render the architecture of the past the types for future generations to study and emulate. Follow him into the inner recesses of his home, itself an atmosphere of art, adorned almost exclusively by portraits of those near and dear to him, by his valiant and venerable friend, the illustrious Ingres, whose decease preceded his own by only a few months. In this home you saw the tender husband and parent, the warm, devoted friend. In public life he was the generous competitor for fame and honours, the encourager of the youthful aspirant in science, art, or letters; in fact, he was a man by whom it was a privilege to be known and esteemed, and a bright example besides for imitation.†

* He wrote many articles in the "Encyclopédie des Arts et Métiers" treating on architectural history and on the Sphylacton or moulding in repoussé work in metal, as practised among the ancients and moderns, and as applicable to colossal statuary; on artistic journeys in the Pygæ, Basilicata, Caucasus, Persia, Greece, &c. The catalogue of this Institute contains the titles of most of his works.

† The official programme of M. Hittorf's titles and distinctions is as follows:—
Membre de l'Académie des Beaux Arts de l'Institut de France, Architecte du Gouvernement, Officier de l'Ordre Impérial de la Légion d'Honneur, Chevalier de l'Ordre pour le Mérite de Prusse, décoré de la Grande Médaille de la Reine Victoria, Commandeur des Ordres de l'Aigle Rouge de Prusse, de St. Grégoire le Grand, d'Albert le Valeureux de Saxe, du Mérite de St. Michel de Bavière, du Sauveur Grèce, Chevalier de l'Ordre de la Couronne de Wurtemberg, Membre Honoraire et Correspondant de l'Institut des Architectes Britanniques, Membre des Académies des Beaux Arts de St. Luc, de Berlin, de Vienne, de Munich, de Belgique, de Copenhague, de Milan, d'Amsterdam, de Rio Janeiro, de New York.

See also the "Biographie universelle et contemporaine" and "Mémorial," and M. Bancellet's "Biographical Account of J. L. H." and the eulogy by M. Lehmann, vice-president of the Imperial Institute of France, delivered at the tomb on the occasion of the interment, published in the *Moniteur* of the time.

THE FRENCH OPERA AND THE THEATRE ROSSINI, PARIS.

Great efforts are being made to push forward the works of the New French Opera-house, with sufficient rapidity to render the façade of that magnificent structure one of the most conspicuous features among the monuments of Paris at a period while visitors of all nations will be still flocking to the Universal Exhibition. It is now calculated that at the present rate of progress the whole of the front will be completed by the middle of August. The external design is very striking—even picturesque—and yet does not transgress the bounds of that due severity and purity of style which ought always to characterize a great national monument, especially such a one as the home, or rather temple, of French Opera must be considered, when it is recollected what vast sums are lavished on the culture and display of that branch of national art. The chief effects of the façade are obtained by means of strong contrast of light and shade; and also, by the introduction of powerful, yet sober, contrasts of colour. Broad and deep shadows are obtained by means of the recesses of a magnificent loggia, which forms a kind of massive covered balcony to the grand saloon; and the picturesque character of this striking architectural feature is aided by the abundant enrichments which display unusual beauty of design. The contrasts of colour are obtained by the profuse and yet judicious introduction of richly-coloured marbles, the full tones of which relieve with great brilliancy the soft cream-colour of the stone which forms the main body of the structure. The marble columns, of various kinds and colours, in the façade, and in the entrance-hall and staircase, will exceed 150 in number, and the rich effect produced by such a profuse introduction of rich colours and polished surfaces may be readily conceived. The external steps and the entire pavement of the great hall are also of marble, and are said to have been so judiciously managed as to have cost less than stone—their cost being estimated at about 143,000 francs; while stone for the same purposes, at the ordinary rates of material and labour, would have amounted to 150,000 francs. The columns in the front of the loggia are of a soft, but full and rich violet tone; and those of the great approaches of a warm, ruddy-brown tint. The pilasters of the interior staircases are of the Vosges and Morvan marbles, while the lateral staircases have pilasters of the Jasper of Mont Blanc, which, since the annexation of Savoy, may also be deemed a national product. The saloon is to have a number of columns of the beautiful native marble of Campan. The hand-rail of the great staircase is to be composed of Algerian onyx, a colonial product of the French empire. The employment of these rich and truly monumental materials, to the exclusion of the lath-and-plaster work which but too often forms the basis of the internal structure of our own national monuments, indicates the scale of munificent expenditure which the French Government is applying to the erection of one of the great national theatres. The nearest approach is, perhaps, the entrance-hall to the lecture-rooms in Trinity College, Dublin; the noble columns of which consist of specimens of marble from different parts of Ireland, among which the most conspicuous for their great beauty are those from the quarries of the celebrated mountain range known as the twelve-pins, in Galway. That marble is of a light and brilliant apple green, and when obtained in masses large enough for entire columns is unrivalled in the world for brilliancy of effect in architectural combination. It will, however, be somewhat approached in colour by the beautiful *vert de Suède*, which is to form the balustrades of the great staircase of the French opera.

Even in its present incomplete state the façade already attracts daily a crowd of spectators, in spite of the floating cloud of lime and stone dust that always envelopes the scene of operations, and the occasional fall of small but dangerous fragments of stone, the warning for which, "*Gare en bas!*" is generally heard a few seconds afterwards. An accident occurred the other day, which is related in the following manner.—A spectator on joining the observant crowd, whose curiosity quite overpowered their sense of prudence, perceived a well-dressed man moving his head rapidly and throwing up his arms, as though in great agony. The new spectator inquired the cause of his seeming pain. "Lime, lime! a quantity of lime has fallen into my eye as I was looking up, and the agony is

* The total length of the front is 218 ft., and the total height, to the top of the statue of the City of Paris, is 115 ft. The lofty columns of the interior, and other cast-iron work, were executed in Glasgow.

extreme."—"What can I do to relieve you?"—"Lift the eyelid gently—gently—and blow upon the surface of the eye,—it is the only sure mode of relief. Yes, yes—the relief is immediate. But, go on. Ah! *merci!*—a thousand, thousand thanks: you are the preserver of my eyesight; another moment and—"—"Oh! pray do not mention it; I only did what every—" But the person he addressed—the poor grateful sufferer—had disappeared, and along with him the watch and portemonnaie of the new spectator, a very respectable gentleman from the provinces. It is said that a precisely similar accident occurred to the poor sufferer from the lime-dust at the still incomplete building of the Great Exhibition only the very day before. "Some men are destined to be for ever pursued by evil fortune," was remarked by a cynical moralist on the occasion.

The interior of the French Opera, which at one time it was hoped might be the scene of a series of magnificent performances during the great period of the Great Exhibition, will not, as now stated by the architect, M. Garnier, be completed in less than three years from the present time, if all details be wrought out on the scale of splendour desired by the Emperor, who takes much interest in every step of this important structure. It is planned to contain 2,181 spectators, while the old house, in the Rue Le Pelletier, is only capable of containing 1,837.

The new theatre at Passy, which appears to be intended for operatic performances, in conjunction with those of a simply dramatic character, is but a miniature structure when compared to the vast edifice destined for the seat of the National Grand Opera, but is by no means so when its dimensions and aspect are considered purely on their own merits. The appearance of its facade is at once grandiose and severe, and is well worthy of a work of its class. The interior is entirely different in style, and when the spectator enters the theatre, still impressed with sober elegance, amounting to a certain kind of grandeur, of the exterior, he is, at first, somewhat disagreeably struck with the gaudy contrast of colour and trenchant prominence of the ornamentation of the interior. The eye, however, soon becomes accustomed to this somewhat glaring style of treatment, for the *salles* is both spacious and lofty, and the abundant space is soon felt to lend a softening influence to the decorations which a little time and use will probably subdue into a more harmonious whole. All the approaches to the different parts of the house are most convenient and ample, and the space allowed to individual seats, as in the new opera, is greatly beyond that esteemed sufficient in the older theatres, which in Paris (as in London) are miserably inconvenient. This is necessary accordance with the demands of the age for a greater amount of comfort. Those who have become accustomed to the space and comfortable adjuncts of a first-class railway-carriage, for instance, would never return to the "six-inches" arrangements which were deemed all-sufficient in the old coaching days.

It has been observed that the only fault of the Théâtre Rossini is, that it is too big for the locality, and that even on the festive solemnity of the "first night" it was but scantily filled. The applause, however, from an audience comprising a pretty large section of the *élite* of the Parisian press was unmistakably cordial, and it is thought, at all events during the excitement of the Exhibition, that the Théâtre Rossini will prove a remunerative speculation. In the absence of the great Maestro, whose name has been bestowed upon the Opera-house of Passy, his husband was, of course, in *travaux* fashion, crowned with appropriate laurel, and much display of enthusiasm. The venerable Maestro himself, who resides in the immediate neighbourhood, had notified that early hours form an essential part of his present *régime*.

NEW OPERATING THEATRE, GUY'S HOSPITAL, LONDON.—The old theatre at Guy's being insufficient for its purposes, a new one has been built from the designs of Messrs. Newman & Billing. The old theatre was taken down, so much of the surrounding parts of the hospital added to the old site, as to render the superficial area of the new theatre about twice the size of the old one, additions being made where necessary to the lobbies and passages adjoining. The area is considerably enlarged, giving ample space for the attendants, visitors, staff, and dressers in the respective places allotted to them.

MULREADY'S PROJECTS FOR IMPROVEMENTS TO HIS HOUSE IN BAYSWATER.

When it was announced that Mr. Creswick had purchased Mulready's house, and intended to retain the great modern painter's painting-room as he left it, every one felt that this was a graceful homage rendered to one artist by another. Every foot of ground in London being precious, this retention is not likely to have been made by anyone who was not an enthusiast in art-matters, or a sorrowing friend of the departed painter. The rest of the house has, indeed, been transformed. The curious in such things have had an opportunity of seeing the sketches made by Mulready when he was conning over his scheme to build, for they have been placed in one of the rotatory stands in the South Kensington Museum. Here they may have seen how this lord of colour would have dealt with the little narrow strip of land that Londoners deem themselves lucky to possess; how he turned from his gorgeous canvas to dip a pen into the faintest ink, and draw the tiniest plans and sections, and make the most prosaic calculations; how he intended his *maisonette* should be furnished; and, finally, how he plotted out the small spare space for a garden. His designs are minute drawings, some in faint ink, and others in pencil, with marginal explanatory notes. Each sheet contains six, seven, or eight sketches, and notes written in small writing, and mounted uniformly with the drawings. Among his queries are the following:—"What should be the rent of the house? What would the improvements cost? What additional taxes and rates would they cause? What term of years, and what yearly rent should I agree to in consideration of my money sunk in improvements?"

One sheet consists of seven minute, faint, pen-and-ink sketches, mounted with a gilt-edged *passa-partout* to each. The first of these, 6 in. by 8 in. in size, is a sketch for the construction of a square hip roof; the second, the dimensions of which are but 1½ in. by 2 in., is a section of a staircase; the third, 3½ in. by 4 in., shows the construction of a double doorway without a pillar; the fourth, 1½ in. by 2½ in., a double fireplace; the fifth, 1½ in. by 2 in., a longitudinal section, showing four rooms; the sixth, 1½ in. by 4 in., a plan; the seventh is another small section. The principal curiosity among these is the third, in which Mulready has pondered over the possibility of making a double doorway,—one half formed by a straight lintel and the other by an arch,—support itself without a central pillar. He indicates that he thinks this may be done by making the thrust of the arch fall upon slanting bricks over the lintel along its whole length, the last one of all receiving the full weight of it. So stationed, he divined the arch would hang without support from below.

Another sheet, consisting of five sketches, likewise mounted with a gilt-edged *passa-partout*, contains quite a different plan, showing that the whole were projects, rather than designs, that he had determined to carry out. These sketches are also minutely drawn, partly in pen and ink and partly in pencil, but they contain neither reference nor explanation. The painting-room seems to have been, in each instance, his first care. On another sheet he shows the smallest plan that he would build upon. He says:—

"The professional parts are as good in this as they are in the others, putting the closets attached to the painting-room out of the question. It would be put upon a plot of ground with 30 ft. in breadth by 80 ft. in length. The whole would secure me against any building directly in front of my painting-room, for the body of the house would stand upon 48 feet of length. The outer office of the kitchen might occupy 10 ft. beyond this, and leave 28 ft. for garden drying-ground. A house as good as any of the others, considered with itself, might be built upon this plan by a slight modification of the kitchen offices."

Again, he shows an oblong block plan divided into three compartments, the third, 10 ft. wide and 26 ft. long, being apportioned for a painting-room. This, he adds in a note, is something narrower than he likes, but it enables him to retain two useful rooms besides.

Another sheet of eight sketches treats of furniture, and is dated 1831. Here he shows a desk with Doric columns for legs, a sofa with Greek guilloché ornament about it, a bookcase, and a brass and mahogany fire-screen. Not less interesting than these are his sketches for the block plan of his house close against one of the long boundary-lines of his site, so as to leave

as much space at the other side of it as possible, and then he raises up a rockery, lays out paths and indicates with horticultural precision the position of every tree and its kind.

Linden-grove, Bayswater, is a somewhat shadowy, gloomy *cul-de-sac*, noiseless and chill with a leaf-strewn aspect, as though Autumn had gone into it and had been unable to find his way out again. Here Mulready lived for thirty-seven years, holding an art court, as it were, in his painting-room, to which the rest of his private and dismal house was counted by his admirers as but an ante-chamber. His plans were never carried out in their integrity, and no interest was attached to any part of the house but the painting-room, which Mr. Creswick has so feebly incorporated into the much larger lighter building he has erected for his own occupation. Mr. Stephens, the biographer of Mulready, states, "The space of a generation in time passed over his head, and but little was done for the fruition of such devices (improvements). Something, however, was, in the first instance attempted. Messrs. Loddiges, of Hackney, the horticulturalists of the day, supplied choice plants, shrubs, and flowers, which were placed and ordered in the garden, and interior arrangements were at least partially made to correspond with the design. Some of the furniture that was sold at the dispersal of his effects had been wrought in accordance with his own designs at this period, and for a time, at any rate, disposed according to his intentions." Like other men, the great painter found it easier to build castles in the air or upon canvas, than upon *terra-firma*.

INTERNATIONAL STATISTICAL CONGRESS.

DR. MAESTRI, chief of the statistical department of Italy, has recently submitted his report on the programme of the forthcoming International Statistical Congress, to the Organization Committee. The congress, which is to be held in Florence, will extend from the 27th of September to the 5th of October of the present year. It is the sixth session of the Congress, and his Royal Highness the hereditary Prince Humbert of Savoy, Prince of Piedmont, has consented to become president. Dr. Maestri has invited the co-operation of his statistical colleagues in different countries, in preparing a list of subjects of general interest for discussion. The following heads of sections, however, are submitted as a basis for the programme. 1st section—Theory and technicality of statistics. 2nd section—Topographical statistics. 3rd section—Agricultural statistics. 4th section—Statistics of the commune. 5th section—Financial statistics. 6th section—Moral and judicial statistics. 7th section—Military statistics; and, 8th section—Educational statistics.

The main object of the congress, in its first conception, was to bring the statistical information about population, property, agriculture, industry, commerce, and administration of civilized states, into forms, in some respects identical, and always admitting of strict and ready comparison. The utility of statistics, after long experience, is universally felt; and statistical inquiries are now instituted in every state in Europe. It has been suggested that a general statistical Board should digest the national statistics of a country, so as to exhibit the principal facts and their relation to each other in a small compass. The more detailed statistical returns, and reports of the several departments, as well as those called for by the Houses of Parliament, might be thrown into good, well-considered forms, the trouble of consulting and using them being greatly diminished by the publication of the necessary calculations. In England the blue books, issued by the Board of Trade, which contain a mass of useful information, are tabulated somewhat on the principle recommended by the Congress; and Lord Stanley, when presiding over a section of the British Association, at Birmingham, called attention to the little yearly volume, entitled "The Statistical Abstract." He described it as being "full of useful information, packed into the smallest compass, and arranged with a careful rejection of trifling and unimportant details." But he stated that he should be glad to see the scope of that publication extended, and references added, so as to include the principal results of all official inquiries, showing in a tabular form where fuller details on the subjects dealt with might be found.

Dr. Maestri states in his report, that the sitting of the International Congress will extend over a period of six days, but the official delegates are expected to assemble some days before the discussions in the different sections commence, in order to confer about the important subject of organization, a question which was not decided at the last Congress, held at Berlin, in 1863.

CENSUS OF NEW YORK.

A ponderous volume of 869 pages, containing the results of the recent census of the State of New York, has just been issued. The population in 1865 amounted to 3,831,777, including 44,708 coloured persons. In 1860 the population was 3,880,735, showing a decrease in the five years of 48,958. The enumeration of 1866 shows an excess of females over males of 61,586; while in 1860 the excess was only 3,681. The relative decrease of males has resulted in a great measure from the late war, which was followed by the emigration of young men to the south-western and western States. The number of males living at ages 45-50 are overstated, and the numbers living at ages 20-35 are evidently understated. These mis-statements have resulted through fear of enrolment for military service.

A sad result of the late war is observable in the returns of the conjugal condition. The proportional number of widows to 100 of population in 1855 was 2.75; in 1865 the proportional number was 3.67. The population of the city of New York was 618,669 in 1860, and 726,850 in 1865, showing a decrease of population in the five years of 11 per cent.

A curious return relating to families shows that 25 per cent. of the families living in the State of New York were without children; 19 per cent. had one child; 18 per cent. had two children; 14 per cent. had three children; 9 per cent. had four children; 6 per cent. had five children; and 3 per cent. had six children. There were 4,611 families each with eight children; 1,630 families each with nine children; 454 families each with ten children; 136 families each with eleven children; and 35 families each with twelve children.

An Appendix records the particulars of the deaths of 23,294 New York troops who were engaged in the late war. An official report of the Provost-marshal states the numbers for New York who were killed, or who died afterwards from wounds, at 14,445; by disease 17,407; total, 31,852. The total number of troops belonging to the loyal States who were lost through the war, was 280,420. The number of men furnished under all calls, reduced to the three years standard, was 381,496 for New York, and 2,154,311 for the United States.

THE SUEZ CANAL.

THE INSTITUTION OF CIVIL ENGINEERS.

On April 16th, the paper read was on "The Suez Canal," by Col. Sir W. Denison, K.C.B. It was stated that the scheme of the Suez Canal might be said to comprise two distinct undertakings. The first, and principal, was the construction and maintenance of a broad and deep water channel on one level, between Port Said on the Mediterranean, and Suez on the Red Sea. The second, preliminary in point of time, and indeed essential to the construction, as well as to the beneficial use of the canal, was the maintenance of a supply of fresh water sufficient for the wants of the population congregated along the line of canal, and specially at its two extremities. The arrangements for the last-named undertaking had been completed and were described. The opinion arrived at by the author, based upon what he saw and heard during a visit to the canal, and upon a consideration of the correspondence between M. de Lesseps and the late Mr. R. Stephenson, and of the report of Mr. Hawkshaw, dated February, 1863, was—First, that (subject, of course, to the condition that the relative levels of the Red Sea and the Mediterranean were as stated by the French authorities), there would be no extraordinary difficulty in carrying an open salt-water channel from the Mediterranean to the Red Sea of the depth proposed, namely, 8 metres. Secondly, that no special difficulty in maintaining this channel need be anticipated. Thirdly, that it would be necessary to modify the section proposed by the French engineers, making the side

slopes much more gradual. And, fourthly, that the cost of maintaining the above-mentioned depth of water would be found at first to be largely in excess of the amount estimated. Eventually, it was by no means impossible that means might be found to fix or check the drift of sand, or to shut it out from the canal. But for some years it must be expected that the ordinary action of the atmosphere, which had filled up former excavations made in this dry desert, would have the same effect in the new canal. Looking at the work as an engineer, there did not appear to be any difficulty which a skilful application of capital might not overcome.

THE RUINED TEMPLES OF CAMBODIA.

ARCHITECTURAL INSTITUTE OF SCOTLAND.

At a meeting of this Society on the 11th inst. Mr. James Gowan said, Mr. Thomson having been kind enough to offer to exhibit his photographs of these temples, I undertook to make some notes which might draw out discussion upon the probable origin of buildings so interesting to such an institution as ours. The feeling I had when I first saw these photographs was that not only of admiration, but wonder as to the origin of a style of building so classic and Greek-like in its detail, seeing that the country in which they exist has no history extending further back than a few hundred years which can be relied upon. From the Greek or Roman appearance of the structures, one is inclined to ascribe them to models derived from either of those two countries; and a hypothetical supposition from history may be raised in this way, by giving the credit to the followers of the Macedonian Alexander, who fought his way into India just at the time that the Greeks had attained to the highest excellence of their architecture. The seeds of a Greek model may have been sown in this way; and this view of the architectural origin of these buildings is one that, at first thought, agrees with the popular belief we have in this country of the derivation of all styles of building. It is no doubt true that the architecture of a people will extend beyond the limits of their geographical boundary; but if you find buildings such as these of Cambodia, so far distant from the examples which they resemble, and which must have been erected at a time when intercourse between one people and another was so difficult, I am inclined to fall back upon the theory which I brought before the Institute many years ago as to the geometric basis of all true styles of architecture. I have, since I read my first paper, repeatedly advocated this principle; and I am not weakened in my views when I come to consider the probable origin of these buildings. If setting aside the copying or imitation idea, and resting upon the geometric, we at once see how such buildings could be designed by people without having intercourse with those who, on the opposite side of the globe, it may be, were raising up structures almost identical. The requirements of architecture are utility, stability, and true proportion of parts, so as to give beauty, and these are altogether dependent upon geometric principles: there are geometric lines which regulate the use of stone, iron, and timber, in a constructive sense; and if a people apply the geometric lines which belong to stone structures, they should arrive at the greatest possible stability, as well as architectural feature, so that acting upon this principle there may be spontaneous styles of architecture altogether independent of copying or borrowing from any one. And, perhaps, I may be allowed to repeat what I, at a former time, stated to you as to the origin of the Greek and Gothic styles—the former, as well as the latter, being based upon geometric figures, which symbolised as truly as figures could their religious beliefs; the cube and the circle, with its elliptical development, giving the Greek, while the circle and the equilateral triangle gave the Gothic; in the case of the Greek these figures symbolising the unknown God whom they worshipped, while the circle and the equilateral symbolised to the Christian the Triune or Three in One. Architecture in all countries seems to have reached its crowning point in the erection of religious structures, the Cambodian, the Buddhist, the Athenian, and the Christian all culminating at the same point, and very naturally and properly so. Mr. Thomson has kindly given me some figures which show the proportion, and from these I am inclined to think that a careful study of the building in its

details would give a scale of proportion as accurate as that which we have for the Greek or Roman style. I find that the figure 7 predominates throughout the entire building of the great temple. Having these views, I have made the following note of points for discussion:—1st. The view which a copyist would have as to the origin of these buildings. 2nd. The view which an advocate for geometric origin would maintain. 3rd. Copyist's Views.—1st. Wonder as to their origin, and who the mighty architects could be. 2nd. People barbaric. 3rd. No ancient history to be depended upon. 4th. People evidently snake worshippers. 5th. From detail of buildings, inclination to ascribe them to Greek or Roman models. 6th. Question—Whether Greece borrowed from them, or they from Greece? 7th. Many examples of Indian architecture, Classic in style. 8th. Alexander the Great's followers, when he fought his way into India, may have sown the seeds of this style of architecture. 9th. Egypt said to be the source of Greek architecture, why not China? 10th. Judging from a copyist's point of view, the Roman Doric seems to have been the model, although the pillars are rectangular, and not circular.

Geometric View.—1st. Evidence that the designers worked upon a geometric basis. 2nd. A people working on a geometric basis may create a new and true style of architecture. 3rd. The civilization of a people does not necessarily carry with it a true style of architecture unless they work from a geometric foundation. 4th. Hence purity of architecture is not to be altogether depended upon in an ethnographic sense. 5th. The religious belief of a people, whether English, Greek, or Cambodian, influences the character of their architectural designs—next the material with which they have to deal, whether stone, iron, or timber. 6th. The want of the arch principle is no evidence that the builders were unware of it; the corbeling principle which has been adopted was necessitated by the serpent-like form of the roof. 7th. The ornamentation is very geometric, and all of one type.

Some discussion followed the reading of Mr. Gowan's papers. Messrs. J. Dick Peddie, and David Macgibbon, architects, objecting to the geometric views, and ascribing the buildings to Asiatic origin.

Some illustrations of these buildings were given in the *Builder*, p. 224, ante.

LABOURERS' DWELLINGS AT AMIENS.

The Amiens Industrial Dwellings Company have issued the particulars of a competition for designs for labourers' dwellings. The competition is open to architects of all nations. Designs will not be received later than May 31st of the present year. The conditions may be obtained from the secretary, M. Charles Noyelle, 17, Place Longueville, Amiens.

REREDOS IN CHRIST CHURCH, MAYFAIR.

The reredos of which we give an illustration is placed in the church lately erected in Down-street, Piccadilly, and called Christ Church, a building in the French Gothic style, from the designs of the Messrs. Francis. We gave a view of the font recently. The reredos is well carried out in all its details, by Mr. F. G. Anstey, of Alpha-road, Regent's Park. The length of this screen is 22 ft. 6 in., and its height 12 ft. 6 in. It is executed in Caen stone, and consists of five bays, with ribbed arches springing from carved caps, supported by Derbyshire marble shafts. These bays are subdivided into two smaller bays, arched, and having a central shaft also of Derbyshire marble. In the heads of the main arches are shields, with emblems of the Passion. The spandrels of the arches are filled with angels carrying a band with suitable legends. The six centre panels are filled with subjects, the six acts of Morcy. The table immediately below these panels is supported by marble columns, enriched with carved caps. The bays beneath and at the back are filled with, or rather will be filled up with encaustic tiles. We believe this reredos and the window of stained glass are intended as memorials of the late Mr. Henry Thomas Hope, of Deepdene, Surrey, by his widow, at whose cost they have been placed in the church.

PEREDOS IN CHRIST CHURCH, MAY FAIR, LONDON.—MESSRS. FRANCIS, ARCHITECTS.

THE DESIGNS FOR THE PROPOSED LAW COURTS.

The design given in our present number is by Mr. Raphael Brandon, known as well by various creditable executed buildings as by his "Analysis of Gothic Architecture," and other published works.

The principal objects, according to the architect, sought to be secured in arranging the plan of this building were to provide separate and convenient accesses to the various courts for the judges, the legal profession, the suitors, witnesses, jurors, and the public. For this purpose the judges have three entrances, two in Bell-yard, and one in Clement's-inn; the bar and attorneys, two entrances from the streets, one in the Strand and another in Carey-street, besides two others on the court-level, by means of bridges from the Temple and Lincoln's-inn; the suitors, witnesses, and jurors have two entrances, the one from the Strand, the other from Carey-street; and the public have two entrances from the Strand, whence they can reach the spectators' galleries in the various courts, by means of separate staircases, exclusively for their use.

The judges from their entrances have private access to their respective courts and means of intercommunication with their various rooms and chambers. They could also enter their courts and rooms, if desirable (as on state occasions), from the Central Hall. Their rooms are all on the Bench level, and in most cases their retiring-rooms open from the Bench.

The legal profession have their rooms on the level of the Central Hall, and in every case the various members of it have their separate entrances into the different courts; the lobbies forming the entrances to their different seats

being *outside* the courts, and thus obviating the necessity of having passages in the court.*

The witnesses and jurors can reach their rooms, and thence the courts by separate staircases, without the necessity of using the Central Hall. Thus each department of the business public has its own separate entrance and approach to the courts, without interfering with that of others, and the spectator public is kept entirely distinct from the business part.

The designer claims that the Central Hall may be kept (if desired) exclusively for the use of the legal profession and the suitors, though the witnesses in waiting for causes coming on might, he thinks, with advantage be allowed access to it.

Special attention has been devoted to the lighting of the various courts and rooms, all enjoying good window light, without the use of sky or horrowed lights.

The dimensions of the large Central Hall may be stated as 365 ft. long by 130 ft. wide. This space is divided into a central chamber 250 ft. by 60 ft. wide (from the centres of the shafts supporting the clearstory and walking), round this runs an ambulatory 17 ft. wide from the centres of shafts, and from this ambulatory the corridors between the courts are reached by lobbies 25 ft. by 17 ft.; between these lobbies areas of about 23 ft. 6 in. by 16 ft. 6 in. are formed to give light to witnesses' corridors and other accommodation below the court floor. In these areas are placed the staircases for the public spectators and all parties not engaged in the suits: they may be approached either from the Central Hall, or from the lower part of the building; but, as we are disposed to think, with

* This was made a stipulation in the instructions; but has not been generally complied with.

this design, it would be scarcely possible to enclose this portion of the public from the large Central Hall. The weight to be attached to this fact the judges will have to determine.

The two Record towers for fireproof accommodation, and the clock-tower, stand detached; the former extending westward (75 ft.) from the main block, and the latter at the south-eastern angle of the line of the Strand boundary of the site.

The other projections from the general line of the building are in reality buttresses, the main structure being advanced between them in a line with their outer faces, and thus made available for accommodation. The north-eastern, north-western, and south-western angles of the plan are rounded off, and with these exceptions the building is a parallelogram in form, with comparatively very small projections so as to make all the space available, the architectural effect being produced principally by the skyline. The buttresses already alluded to, and which, as has been described, are rendered useful for accommodation, serve a still more important purpose, as by means of them the walls being carried up above the roofs and all the openings in them internally being shut with double iron doors, the building is divided into fireproof compartments, so that supposing any part of the offices to take fire, the possibility of its spreading would be prevented. There are sixteen of these fireproof towers, each of which would be furnished with a large water-tank in the roof, from which any part could be instantly deluged with water.

We have already made some general observations on the design and need not therefore repeat them.

The estimated cost is 1,414,913*l.*

DESIGN FOR THE PROPOSED LAW COURTS.—By MR. KAVDAEL BRANDON, ARCHITECT.—The Strand and West Fronts.

ASPHALTE PAVEMENT.

EXTENSIVE works are now in progress on the west side of the new railway station in Broad-street, in the City. A monster goods station is slowly developing itself from a vast chaos of bricks, stone, iron, and timber. Huge columns of iron stand like giant sentinels in stately rows, and ponderous girders lie prostrate on the ground and seem to defy all the efforts of mechanical science to raise them. Several of these enormous girders, however, are already lodged on their lofty resting-places. A long series of arches presents to the eye a striking effect of perspective, and affords platforms for the rapid loading and unloading of merchandise. These platforms are now nearly finished, and like everything around them, they are large. Their surfaces are as smooth as marble and as hard as granite, being covered with Pyrimont Seyssell Asphalt, laid on a bed of carefully levelled concrete. They are in every way similar to, and for the same duty as, those that have been in constant use for many years at the Great Northern and North-Western depôts for goods at King's-cross and Camden-town. The adoption of asphalt at all these places arose from its use at Messrs. Pickford & Co.'s depôt in Wood-street at the time it was erected in 1843. The whole of these works have been confided for execution to Mr. Jay, the well-known railway contractor.

The extensive use in Paris of Asphalte for roadways suggests the inquiry if it could not more often be usefully so employed in this country.

CATHEDRAL RESTORATIONS.

Gloucester.—The Dean of Gloucester some months ago started a proposition for the raising of 50,000*l.* for the restoration of Gloucester Cathedral. Reparations have been going on at the expense of the chapter for some years, but this was to be a special and exhaustive effort. Mr. Scott, architect, has embodied the results of a survey he made in a detailed report he has just presented to the dean and chapter. He proposes reparation and restoration, the estimated cost of which is 45,000*l.*—17,000*l.* for external, 22,000*l.* for internal works, and 6,000*l.* for incidental expenses. The estimate includes 1,000*l.* for gas lighting. "My main aim," he says, "is the limitation of the works of restoration in such a degree as to render them as conservative as possible of ancient work. I should earnestly desire not to renew a stone which is not so decayed as absolutely to demand it, and to decide all questions which occur with a leaning to conversion rather than to restoration or removal." He suggests the substitution of an open screen for the not very old one now in existence; and two pulpits should, he thinks, be provided, one for the choir and one for the nave. It would be possible to place the organ above the screen, as at Overwessel, on the Rhine, or to erect it beneath the arch of one of the transepts. Mr. Scott gives in detail a list of the restorations. The stonework of the choir must be cleaned; the screens, and many monuments and chapels restored; all mutilated stonework to be repaired; and so on. The reredos should be untouched. If anything is done with reference to stained glass, he strongly recommends that the work should be given to Mr. Hardman, of Birmingham, some of whose windows in the north aisle of the nave are mentioned as the most successful restorations of fifteenth-century glass he has ever met with.

Worcester.—A circular has just been issued by Lord Lyttelton, in which he says:—

"I ventured, as Lord-Lieutenant, to invite the attention of the county to the restoration of Worcester Cathedral. The restoration at that time, under the auspices of the Dean and Chapter, had made considerable progress. Upwards of 30,000*l.* had been expended from Caputary Funds, mainly in the external restoration of the fabric east of the tower, the repair of the nave, and the repair of a new window in the north-west transept; and, internally, in removing plaster, &c., repair of the vaulting, and renovation of the chapter-room. The new work then designed, externally, consisted of the restoration of the nave and north porch, a new west window, and the repair of the cloisters; internally, of the repair of the floor of the nave, a new lighting and warming apparatus, a new choir screen and reredos, reconstruction of the organ, and entire remodelling of the choir. The cost of these works was estimated at about 22,000*l.*; to which, by vote of the general meeting, was added the external restoration of the tower, raising the total sum required to 30,000*l.* Large sums have been, in the three years that have since passed by, great progress has been made in the undertaking. . . . The result is that the above works have been completed, with some unforeseen extras, that need not be specified, except the floor, the

lighting, and the remodelling of the choir, including the organ and screen. But the last item—that of the choir—is by far the most important part of the internal work, and the most costly. The present subscription is more than exhausted. The estimated sum now required for full completion is 15,000*l.*"

The Joint Committee to whom the work was entrusted called a public meeting to be held at the Guildhall, Worcester, on April 25, and the circular solicits support at the meeting. The plans were to be exhibited before the meeting, at the Guildhall; they are by Mr. Scott, and have the approval of the Joint Committee. It is proposed, adds the circular, that the subscriptions shall be payable in five annual instalments.

Ely.—A new stone pulpit is progressing in Ely Cathedral. The enlargement of the organ is also proceeding. Another panel has been added to the Old Testament series of reliefs in the canopies of the choir-stalls.

THE MONUMENT ROOM, TRINITY COLLEGE, CAMBRIDGE.

ONE competent to judge says,—A scheme is on foot at Trinity College, Cambridge, which should not be allowed to pass without protest. It is proposed to abandon the old Monument-room, in King Edward's Tower (which has been used for the purpose for centuries), and to convert the room in Queen Mary's Gateway into a Monument-room. Now, it may be safely affirmed that there is not a drier or more secure place for preserving valuable documents in the college, than the old room. The proposed room is in a narrow lane, which is known by a name the unsavouriness of which cannot be repeated to polite ears, though we believe it was once whispered to the late Prince Consort; on the opposite side of which are the kitchens and hall of another college, in which a fire not very long since broke out. It is contemplated to make the proposed room fire-proof, but however feasible the construction of an entirely new building which shall be fire-proof may be, it is simply absurd to suppose that that object can be effected in the present instance. Besides which it is impossible to say what will become of this ancient gateway if it is pulled about in the way which is intended.

Upon the whole, I cannot point to a more foolish proposal, except the plan proposed last year by the same author for constructing a room for holding the college archives behind the chapel, where damp and darkness would soon have rendered it unnecessary to have any Monument-room at all.

It should be known that the proposed change is contrary to the wishes of the most experienced persons who are interested in the matter, and would probably have been summarily rejected but for the absence of one of the members of the Board.

FROM SCOTLAND.

Perth.—The Circuit Court-house for Perth and Fifo shires has been completed and officially opened. The exterior appearance of the old building remains almost unchanged. Internally, however, the whole building may be said to be remodelled. The hall is now lighted by a large cupola, the ceiling being divided into square compartments or panels. Access is obtained from the hall to the several apartments by wide, well-lighted corridors right and left, and to the galleries of the Court and upper floor by the old broad double stair, improved to suit the new arrangement. The judiciary court-room is situated immediately behind the hall, and on the site of the old court-room; but the relative position of the bench and audience have been reversed. Instead of the old semi-circular court-room, with its narrow passages and accommodation for only about sixty jurymen, there is now a court-room about 45 ft. long by 35 ft. wide, capable of accommodating upwards of 170, and having free access to the corridors on the right and left of the court, and separate doors for the magistrates, jury, counsel, witnesses, and public. The ceilings of the two court-rooms and of the two principal retiring-rooms are all panelled, that of the judiciary court-room having the stiles and moldings enriched, and the walls decorated. A new block of buildings has been erected on the opposite side of South-street, for the accommodation of the procurator-fiscal, clerk of supply, county police, &c. These new offices form a termination to South-street,

with a return towards the river in the line of the now projected Tay-street. The whole buildings have been furnished chiefly in oak and morocco. The court-rooms, corridors, and record-rooms, &c., are all ventilated, and warmed by hot water. The improvement and extension of the buildings have been planned and carried out by Mr. D. Smart, architect, Perth, at a cost of about 14,000*l.* The following are the contractors for the work, viz.—Mr. D. Brand, Montrose, mason work; Messrs. Brand & Wadie, Montrose, joiner work; Mr. D. Donaldson, Perth, plumber work and gasfittings; Messrs. D. & P. Reid, Perth, glazier work; Mr. Jas. Annan, Perth, plaster work; Messrs. John Bryden & Sons, Edinburgh and Perth, bells, blinds, &c.; Messrs. Taylor & Finlayson, Perth, and Mr. Wm. Imrie, Perth, grates and ironmongery furnishings; Messrs. Stalker & Boyd, Perth, painter work; Mr. H. Purnell, Glasgow & Edinburgh, warming and ventilation; Messrs. Robertson & Son, Perth, furniture, &c. Mr. George Wells acted as clerk of the works.

Glasgow.—The large common sewer now in course of construction in Glasgow-green is progressing. The cutting is about 20 ft. in depth in some places. The workmen have been digging out a huge oak tree, found in forming the sewer. It was embedded nearly 20 ft. beneath the surface. Although the track of the sewer is mostly through a bed of sand, two embankments of clay have been come upon, and the formation of these is such as to lead to the belief that they were constructed by men's hands.

Prehistoric Building in Orkney.—At a recent meeting of the Society of Antiquaries of Scotland, a notice, by Mr. George Petrie, of Orkney, of ruins of ancient dwellings at Skara, Bay of Skail, Orkney, recently excavated, was read. Mr. Petrie's paper, which was illustrated by plans and drawings, gave a detailed account of these remarkable ruins, which have been dug out of great accumulations of sand and refuse by Mr. William Watt, of Skail. The general plan of the building at Skara is described as a group of chambers and cells, arranged on both sides of an opening into a long zigzag or winding passage, which runs nearly parallel with the line of beach. In some of these, central hearths were defined by flags on edge, and were filled with ashes and burned bones. In others, stone beds were inserted in the walls; and the external walls appear to have been coated over with clay. A human skeleton was found in one of the apartments, doubled up. In the ruins and a relative kitchen midden of great depth, many bones of animals and fish were found, with manufactured implements of stone and bone of great variety of type.

FROM MELBOURNE, AUSTRALIA.

THE "Guide to the Intercolonial Exhibition" gives some interesting comparisons between the present and previous Exhibitions. At the first colonial Exhibition, held in Melbourne in 1854, there were 428 exhibitors, principally of imported goods. At the next Exhibition there were 703 exhibitors. The receipts for admission at that Exhibition, for the ten weeks during which it was open, amounted to 3,400*l.*, the gross number of persons admitted being 67,405. At the present Exhibition, the gross cash receipts for admission, including season tickets, from the 24th of October to the 8th of December, a period of forty days and evenings, amounted to 6,268*l.* 17*s.* 3*d.*, and the number of registered admissions was 122,843; the highest number on any one day and evening being 9,586, and the lowest 1,293. A comparison is also made between the number of exhibitors at the last Exhibition and the present one, as under:—

Victoria	542	1,470
New South Wales	470	273
South Australia	77	103
Queensland	33	36
Western Australia	68	198
Tasmania	118	738
New Zealand	113	88
New Caledonia	211	35
Netherlands India	211	3
Mauritius	211	6
Totals	1,611	2,965

Collins-street Independent Church.—The foundation-stone of the new Independent church, in Collins-street, has been laid. The architects of the building are Messrs. Reed & Barnes; and Mr. John Young is the contractor for the work. The *Australian News*, a spirited local paper,

gives a good engraving of the edifice, with a description, from which the following particulars are gleaned. The style of architecture adopted is the Lombardo-Romanesque, and the walls are to be built of ornamental brickwork, standing on a high plinth or subbase of bluestone. The basement of the tower will be of cube bluestone, and that of the main building of first-class rubble-work of the same material. The general exterior surface of the walls is to be constructed with dark-coloured bricks from Hawtorn, while the quoins, arches, and ornamental devices introduced in various parts of the work will be of white and bright red bricks, from Brunswick; and the excellent Omarr stone, from New Zealand, will be employed in the parapets, pinnacles, copings, cills, columns, and other dressings. The whole of the exterior is to be tuck-pointed, and the roof-slates will be arranged in ornamental patterns. The general block plan of the building is nearly a square, measuring 91 ft. 6 in. by 91 ft. 6 in., and 43 ft. high, from the ground to the top of the parapets; 65 ft. 1 in. to the apex of the gable; and 160 ft. high to the top of the tower. The plan is designed much on the same principle as that adopted for theatres, with such variations as are necessary to meet the requirements of a place of worship.

COMPETITIONS.

Abbot Memorial Schools, Gatheshend.—At the last meeting the committee resolved,—“That the plans of Mr. Oliver and Mr. Swan be referred back to their authors, with instructions to amend them so as to reduce the cost to 3,400l., and that the premium be awarded after the receipt of the amended plans.”

Grantham Townhall.—The second premium was awarded to Mr. R. W. Edis, of London, architect.

Selson Park, Liverpool.—The site of the proposed park lies a little way beyond Prince's Park, and is bounded on the east by Mossley-hill, on the south by Mossley Vale, on the west by the Aigburth-road, and on the north by Ullet-lane. Three hundred and seventy-five acres of land were purchased from the Earl of Selkirk for a quarter of a million of money, and of these about 200 are to be appropriated to the park, the remainder being sold as sites for villas, and by this means it is hoped a great portion of the outlay will be recouped. Plans were sought for in November last, and it was then decided, upon the recommendation of the Improvement Committee, to offer two premiums for the best plans of laying out the parks—one of 300 guineas, and another of 200 guineas. The following are the names of the competitors, and the sums at which they estimate the work indicated in their plans can be carried into effect:—

Competitors.	Cost.
1. William Wortley, Liverpool	£92,168 1 8
2. Edmund Andre, Paris, and Lewis Hornblower, Liverpool	85,000 0 0
3. William Henderson, landscape gardener, and J. H. Walker, architect, Liverpool	123,500 0 0
4. Gay & Swallow, Bradford	75,000 0 0
5. R. W. Barnes, Manchester	89,504 0 0
6. Hans F. Fries, West-coast-super-Mare	100,000 0 0
7. Rev. James Bateman, Congleton	62,488 6 8
8. Alexander Black, Falhirk	27,286 0 0
9. François Davillers, Paris	29,000 16 3
10. Rogers & Marsden, South Lanelandshire	88,160 18 0
11. A. Stansfield & Sons, Todmorden	37,516 19 2
12. Henry May, Beadale, Yorkshire	18,062 0 0
13. Charles Eastwood, Ludenden foot	67,000 0 0
14. Thomas Mercer, Liverpool	126,687 0 0
15. Thomas D. Barry, Leamington	109,850 0 0
16. Reinhart Johns, Liverpool 1st plan	48,929 0 0
(Two plans) 2nd plan	37,919 0 0
17. Alexander McKenzie, London	110,192 8 0
18. J. S. Tyerman, Liverpool	97,978 1 0
19. Maurice Young, Godalming, Surrey	62,262 15 5
20. J. A. Mason, Burton-on-Trent	25,000 0 0
21. J. Hart, Bradford	51,000 0 0
22. John Barnett, Shifnal	66,045 0 0
23. J. A. Hall and George Middleton, Liverpool	98,289 16 9
24. J. H. Hirst, Bristol	100,000 0 0
25. J. W. Cottee, Chelmsford	128,835 0 0
26. Joseph Newton, London	54,069 4 10
27. John Gibson, jun., London	55,961 4 9
28. D. Breda, London	108,880 0 0
29. Edward Milner, Sydenham	122,500 0 0

No. 2, the joint production of M. E. André, of Paris, and Mr. Lewis Hornblower, is a good design, illustrated by a large number of plans, drawings, and sketches, showing the park on the flat and in perspective, and the various matters of detail. An excellent proportion is observed between the space devoted to the park proper, and to the portions for building. The general arrangement of the park is such that from the principal entrance in the Prince's Park-road

vistas open out in several directions with pleasing effect. The “Rotten-row” is here, and is of considerable extent. No. 26, by Mr. Joseph Newton, is amongst the best of the designs exhibited. The designs for the conservatories and botanic gardens are liked. This plan includes provision for a hotel and sanatorium. In No. 27, Mr. John Gibson, jun., of London, exhibits a creditable plan. No. 29 is sent by Mr. Edward Milner, Sydenham, and deserves mention. No. 18, by Mr. J. S. Tyerman, of Liverpool, receives considerable attention. The committee have the advice of Mr. Robson, the borough architect and surveyor.

Calne.—Designs having been invited for a new Free Church in a limited competition, those sent in by Mr. W. J. Stent, architect, were selected, and the work will be proceeded with at once.

Bedfordshire Public School.—Several assertions are made as to doubtful circumstances in this competition; but we cannot publish mere rumours.

Ellesmere Memorial.—Sir: While restricting architects to a memorial costing 8000l., the committee have selected three designs for the decision of an eminent architect, two of which would, without doubt, cost more than double that amount. It was hoped that the connexion of the monument with the noble family of Ellesmere would have insured fairness in the decision, and the restrictions would have been abided by.

ARCHITECT.

THE GOVERNMENT SAVINGS BANKS, INSURANCES, AND LIFE ANNUITIES.

The Savings-Bank return for 1866, just issued, shows an increasing transfer of accounts from the old savings-banks to those of the post-offices. At the close of the savings-bank year, ending November 20, 1861, there were 1,550,359 individual depositors in the old savings-banks, and their deposits amounted to 38,697,205l.; and the deposits of charitable institutions and the smaller friendly societies (not keeping their account direct with the National Debt Commissioners) brought the total up to 41,546,475l. In September, 1861, the first Post-office banks were established; and in five years, by November, 1866, the deposits in the private savings-banks had fallen off to the extent of more than 5,000,000l., and the Post-office banks had obtained deposits amounting to 8,000,000l. The friendly societies keeping a direct account with the commissioners had 1,799,648l. in their hands in 1866; in 1861 they had upwards of 2,000,000l. But these decreases are more than counterbalanced by the 8,000,000l. of Post-office bank deposits, the growth of the same five years. Under Mr. Gladstone's scheme of 1864, at the close of 1866, 1,150 insurances had been effected with the Government, through the post-offices, for sums payable at death, amounting together to 86,593l.; 282 immediate annuities, amounting to 6,423l., had been purchased of the Government, and 107 deferred annuities, amounting to 2,119l.; charges for management, 636l. This was business done in about twenty months. In 1866 there were also 5,944 life annuities payable, amounting to 123,141l. a year, purchased of the Government through the private savings-banks and parochial societies, and fifty annuities for terms of years amounting to 890l., besides 460 deferred annuities, amounting to 9,914l., not yet become payable.

PROVINCIAL NEWS.

Birmingham.—The Birmingham and Midland Banking Company are about to build new premises in New-street. The site has a frontage of about 20 yards to New-street, and about 50 yards to Stephenson-place. The style of the buildings will be classical, the front towards New-street being divided into three, and that towards Stephenson-place into eight compartments, divided on the ground floor by rusticated pilasters, having Ionic pilaster caps on a plain basement. The first-floor will have three-quarter attached columns of the Corinthian order, with coupled pilasters at the angles. The upper cornice will be proportioned to the total height of the building, and will be crowned by an open balustrade, the angles being carried higher and treated as coupled pilasters, with separate caps and cornices. The public entrance will be in the centre of the New-street front, under a portico having four Ionic detached columns, the shafts and bases of which will be of polished granite, each in one piece. The banking-room will be 92 ft. long, 49 ft. wide,

and 30 ft. high, lighted by nine circular-headed windows, each 6 ft. high, and by a lantern light in the centre of the roof, by 18 ft. 6 in. The private entrance will be in Stephenson-place, and the board-room and ante-rooms on the first floor. The rest of the upper portion of the building will be occupied by private rooms for managers and apartments for the resident clerks, porters, &c. The strong rooms are all far removed from the external walls, and have double doors; and the billiard-room, in addition to the system of construction which has been adopted for the walls, ceilings, and floors of the strong rooms generally, will have an inner lining of wrought-iron, half an inch thick. The books, billiard, &c., are to be raised by means of a hydraulic lift. It is proposed to erect the main fronts in Portland stone, and the interior walls and decorations of the bank and principal rooms will be executed in Martin's cement. The fittings will be of polished mahogany, and the bank and other principal rooms are intended to be warmed and ventilated by Dr. Van Hecke's system, introduced into this country by Mr. W. W. Phipson, C.E. As soon as the remaining old buildings are pulled down, the works will be commenced.

Newcastle-upon-Tyne.—The foundation-stone of the “Exchange New Buildings West,” about to be erected at the foot of the Side, has been laid. Mr. Matthew Thompson, of Newcastle, is the architect for the buildings; and the contractor is Mr. Walter Scott. The buildings are intended to be in the Italian style. They will be composed of shops, warehouses, and offices, the whole, when finished, occupying a frontage of 166 ft. This is the first of the town improvement schemes, and it is intended to widen the street materially.

THE TRADES' UNION COMMISSION.

The examination before the Royal Commission on Trades' Unions of Mr. Coulson, whose evidence on the building trade was given in the *Builder* of last week, was followed by that of Mr. George Howell, also a bricklayer, and at present the Secretary of the Reform League. This witness had heard the evidence given by Mr. Coulson, and corroborated that evidence. He said there was a general objection on the part of bricklayers to working with persons not qualified to work at the trade, and they showed that objection in other ways than by sending to Coventry the persons, inasmuch as they struck against them. He had never been a party to any measures which would occasion distress to a man beyond bringing to speak to him, and though accusations had been brought against the union men of using violence, none of these had been supported. The wages fixed by the society were the minimum of what a skilled man ought to receive; but, there was no objection to a man doing as much work as this payment, and might give as much more as they liked, yet they seldom did so, unless it was to make a man a “bell-horse” to lead his fellows on to do more work than they properly could, a form of “chaining” as it was termed among the masons. A foreman might give a good and more than ordinarily skilled man an extra hour a day, but this was, he said, an underhand way of paying a man. There was no objection to a man doing as much work as he could; but the men decidedly objected to the “chaining” principle, and they also decidedly objected to the union men's arbitrary exclusion as a non-society man who received less than the minimum wages. The evidence seemed further to point out that there was not much objection to the arbitrary exclusion as a man work as among the masons, and one pleasing fact came out. Mr. Hoebuck asked, “Supposing that a man were sick and entitled by bad health, but still a very good workman, he could not do perhaps so much as other men. Supposing he were to ask for work and to take less wages, would you object to that?” Witness.—“Yes; but in such a case, this is what the men would do. In the first place, the foreman, if he were a foreman of any judgment whatever, would put him where his skill would be made available without any great injury to his health. In the next place, there are but few men who would not feel pleasure in adding a brick each to enable that man to do the ordinary amount of work. Supposing five workmen were working on what is called a line, those five men would divide the whole length of the building into five spaces, and if one man was known to be ill or feeble, the other four would, as a rule, leave him the smallest portion of that work. But naturally and without any special hesitation.” The witness stated, further, that the union had increased wages, lowered the hours of labour, and tended to decrease drunkenness among the men.

Mr. Thomas Connolly, upon whose evidence before the commission the *Times* made some remarks, offers the following explanation of a passage in which it was said, “It appeared to think it commendable proceed in putting a workman on his knees without actually putting a faulty stone in a building.” Mr. Connolly replies, “To explain the relation of owner, contractor, and workman, let me take, for example, one of those stone buildings now erecting in the City. The proprietor employs an architect to design it, and draw up a specification; the architect, on behalf of the owner, enters into a contract with a builder to provide all materials and execute all workmanship necessary for the due completion of the works. When the works are commenced, the architect employs a clerk of works to see that his designs are fairly carried out, and that the materials are equal to the description in the specification. The stone is generally sent worked from the builder's yard, and masons are sent to fix it or build it in. If a stone is not equal to the description, the clerk, he orders the mason to take it out of the wall; the workman calls his foreman, and if he says it must be taken out the workman does so at once; the

sance or Classic style, but those which were of the Gothic or Mediæval period. He divided the subject into two sections, viz., secular and ecclesiastical. In the first he included such buildings as town-halls, exchanges, palaces, castles, piazzas, and domestic work; and in the second, cathedrals, churches, baptisteries, campaniles, pavements, mosaics, frescoes, stained glass, &c. The town-halls in the Lombard cities were all more or less interesting as examples of Mediæval civic architecture in the days when every city had its own parliament or assembly. The Broletto was consequently the most important building, after the cathedral, in every city of Northern Italy. That at Como was a charming specimen, built as it was of coloured marble from the neighbouring quarries. Having described the brolettos at Bergamo, Brescia, Verona, Padua, and other cities which he had visited, he pointed out the difference between the architecture of Venice and that of other Lombard cities. In domestic architecture the balcony formed a desirable and necessary appendage to every house, providing a delightful means of enjoying the cool of the summer evening. These balconies contrasted favourably with the long rows of hideous ironwork which formed such an eyesore in a London street. Travelling in a southerly direction from Venice, it would be found that in Bologna and Florence another style of architecture prevailed in the public buildings. That of Venice was light, elegant, and almost profusely decorated with ornamental details and rich marbles; while the other was severe and simple, resting mainly to the great size of the buildings and their consequent imposing appearance. Passing to the ecclesiastical architecture of Northern Italy, the earliest examples were the churches of S. Ambrogio and S. Estorizio, at Milan; S. Michele, at Pavia; and S. Mark's, at Venice. S. Mark's, at Venice, like few other churches in the world, stood alone and unique in its peculiarity and style, and it might be said that no architect had ever ventured to copy it in its entirety. Having described in detail many of the best examples of the round-arched Lombard style, and the Gothic architecture of Bologna and Florence, noticing the early brickwork applied to ecclesiastical purposes, Mr. Aldridge concluded with a few general remarks and criticisms on the peculiarities to be noticed in Italian Gothic architecture, and as to the lessons to be learned from those peculiarities, more particularly with regard to their adoption in this country. First, with respect to secular architecture, he thought most simplicity were the ruling elements, more particularly as exemplified in the town-halls and public buildings. It was true there were some notable exceptions to this rule, particularly the Ducal Palace at Venice, and the Palazzo delle Razioni at Padua, which exhibited signs of weak construction, necessitating the use of iron ties and such-like additional means of gaining strength; but these were cases in which the architect had departed from the beaten track, and had either attempted a novel mode of construction, or else had tried to introduce too much ornament at the sacrifice somewhat of his construction. Putting these exceptions, however, on one side, and studying carefully the general rules adopted by the Mediæval architects in their secular work, he thought they were entitled to credit for honesty, both as regards construction and ornament. The construction was rarely concealed, and was generally capable of performing its object. The ornament, or else sufficiently ornamental materials were employed to do away with the necessity of much extra ornament. With regard to ecclesiastical work, and more particularly brick churches, the architects were not in all cases entitled to so much credit for honesty, as there were too many sham west facades with low pitched gables covering the roof and aisles, and looking the reverse of handsome. Modern architects had, he thought, many valuable lessons to learn from the works of the Italian architects of the Middle Ages, and particularly with regard to ornament and colour. A study of their works suggested whether we should have in England cheap decorative ornament badly copied from Mediæval examples at home or abroad, building our churches like small models of cathedrals, or else adopting a more economical mode of construction, and expending the money thus saved in decorating the interiors. In his opinion, exterior ornament, and more particularly carving,

should be less frequently employed in this country (where we had such a trying climate), but rather let us use an honest mode of construction in the exterior, the ornament consisting chiefly of decorative material and good mouldings, reserving all colour and carving for the interior; and he still hoped to see the day when our churches would glow with colour and paintings, done with a true feeling of religion and art, although not by the hand of Giotto or Fra Angelico.

ARCHITECTURAL EXHIBITION SOCIETY.

THE Architectural Exhibition in Conduit-street will be opened on Tuesday evening next, the 30th, with a *conversazione*, whereat the President, Mr. Hope, will deliver an opening address. In conjunction with the Architectural Museum four lectures are to be given on every alternate Tuesday, beginning with Tuesday, May 14th. The price of a season ticket, admitting also to the lectures, is so small that a large number ought to be taken.

RAILWAY INTELLIGENCE.

A NEW line of railway was opened last week, about twenty miles in length, connecting the towns of Grantham and Lincoln, by a direct route, and thereby bringing the latter city one hour nearer to the metropolis. It is an extension of the Great Northern system, and has five stations. Fourteen villages lie on the line of its route, with a large grazing country on the west, and a corn-growing one on the east. The line is double throughout, with fish-jointed rails, 22 ft. long, and creosoted sleepers, 2 ft. 6½ in. apart; 35 lb. chairs, keyed inside, and rails supported on oak cushions. The crossings are of cast-steel, and switches from Bessemer steel rails. There are twenty-eight bridges on the line, one of which at Leadenhay, carries a road that is banked 12 ft. above the land level, and at the same point the railway is in 32 ft. cutting; besides traversing it at an angle of 45 deg., the road rises 1 in 15, and the railway in passing under, 1 in 133: it is therefore a peculiarity of construction, and is built of coursed masonry. The arches are all of Portland cement. The signals are of iron (Stevens's patent).

The station buildings are of red brick, with blue bands of Staffordshire. One station is of coursed stone, roofed with Taylor's patent tiles. The construction has been under the superintendence of Mr. Bower, the resident engineer. Messrs. Kirk & Parry were the contractors.

LONDON POSTS AND PAVEMENTS.

In the "History of Signboards," by Larwood & Hotten, recently published, I find (at p. 29) the following passage:—

"With the signboards, of course, went the signposts. The removing of the posts, and paving of the streets with Scotch granite, gave rise to the following epigram:

"The Scottish new pavement well deserves our praise:
To the Scotch we're obliged, too, for mending our ways;
But this we can never forgive, for they say
As that they have taken our posts all away."

The covert allusion of this epigram lies evidently in the double meaning of the word *post*, as in the epitaph (1736) on the Lord Chancellor King's carpenter, at Ockham,—

"*Posts oft he made, yet ne'er a place could get,*"

and I can easily believe that the epigram is of the time of Lord Bute's ministry, when so much jealousy was entertained of his patronage of his own countrymen. But I imagine that the authors of the "History of Signboards" have very much misapprehended the more tangible or primary meaning of the lines. I think they bore no allusion either to "Scotch granite" or to the signposts. I think the change to which they relate was not in the roadway, but the foot-pavement. I remember being shown by a relative, between forty and fifty years ago, some remains of a peculiar curb-stone to the foot-pavement, much narrower than our present curb-stone, but descending deeper into the soil, and that curb-stone, he told me, came from Scotland. It existed in Westminster, and perhaps was coeval with the formation of Parliament-street (circa 1756). It was, I suppose, when this curb-stone was adopted, that the posts, either of stone or timber, that had been previously

erected for the protection of foot-passengers and are to be seen in many old views of London streets, were no longer considered necessary. At the moment I am now writing such stone posts (intended to protect the foot-passengers) are lying prostrate, ready to be carted away, in St. James's-square, where they have remained up to the present time, but are dismissed upon the foot-pavement he extended to greater width.

I should be glad to have my ideas confirmed by any more positive memorials of the "Scottish new pavement" introduced into London in the middle of the last century. And when a Scotch granite first adopted for the roadway
J. G. N.

MEPHITIC ATMOSPHERE OF THE UNDERGROUND RAILWAY.

THE removal of the noxious air would, indeed, be a desideratum; but the suggestion "A. J. B." would, I think, hardly meet the case. Ventilating-shafts from the crown of the tunnel would be inconvenient above, while they would most probably fail to effect the object of their erection, the foul gases being so much heavier than the usual mixture of common air. A more likely plan appears to me to be the reverse syphon principle; the shorter end of the tube terminating in large gratings between the metropolis and the permanent way, while the longer end might be continued indefinitely under the pavement, &c., and rise in convenient out-of-the-way spots, where fans and gas-jets might be used to promote the efficiency of their action. A heavy air would thus be drawn or *drained* from below, while dilution would be going on from the influx of fresh air from the ordinary street openings at the road-level above. An apparatus of this kind would, I think, be nearly self-acting.
THOS. GOODCHILD.

FLATS FOR THE MIDDLE CLASSES.

I AM extremely glad to see you in your interesting periodical stirring the useful subject of residences for the middle, and, I hope, the upper middle classes. I am myself acquainted with many cases where, perhaps, two individuals live together,—mother and daughter, two sisters, brother and sister, or even an elderly married pair, who might be extremely well pleased to find themselves able to rent two or three large handsome rooms, and a moderate accommodation for one or two servants, in place of a small eight or ten-roomed house, with one or two-thirds of the rooms unoccupied, and one room of comfortable handsome dimensions. I think if in attractive spots, where there is so much beauty of scenery, and within easy reach of a good town, a house or two, with handsome exterior and good rooms, divided into several residences under one roof, and surrounded some ornamental ground, were built, the separate tenements would let quickly. The widows, officers, of the better provided clergy, of small incomes, &c., would find a separate portion of handsome house, standing in ornamental ground, greatly preferable to a many-roomed small house in a petty garden. There should be a little kitchen, and one or two small rooms for servants in the same parcel, with two or three handsome rooms.
X. Y. Z.

P.S.—Such spots as the close vicinity Torquay, Bath, Cheltenham, London (or two or three miles from London), &c., should be chosen.

PLAQUE PITS IN UNDERGROUND EXCAVATING FOR SUBURBAN RAILWAYS.

Sir,—I think this subject is well worthy attention. It is not long ago that a road at Lewes was obliged to be diverted owing to the surveyor coming across a burial ground. The road was laid out in the usual way, the making of a plaque-pit at Whitechapel Woodhouse, making a sewer;—and I this day read ("History of Paris 1832") that on the opening of the vault of the ancient French kings at St. Denis by the French Directory in 1799, the corpse of Francis I. and others of his family in all, buried about 1547, emitted so intolerable an odour after a lapse of twenty-five years, as to be highly offensive; but those that were buried in another vault, from 1627 to 1761, were in many instances no so dangerous as to exhale a black, thick, infectious vapour, and workmen were seized with diarrhoea and fever; but no one of them died, owing to the blasting of gunpowder in the vaults to dissipate the foul air. I believe in 1834, the plague in Malta was communicated from one parish another by the slyly throwing a rag containing money pay wages from one person to another across a stream

WORKMEN'S EXCURSIONS TO THE FRENCH EXHIBITION.

The Council of the Society of Arts have resolved to raise a fund to be employed in aiding a limited number of English workmen to proceed to Paris for the purpose of studying the present French exhibition. One condition is, that every man so assisted shall, on his return, make a report to the Society of what he has observed during his stay, in reference to the special industry in which he is engaged; and another is, that one-third of the amount be retained until his report shall be supplied to the society. In order to raise funds the Council have determined to appeal to the members of the Society for subscriptions for the furtherance of the undertaking, and they have voted 100 guineas from the funds of the Society towards that end, and have also been making arrangements in Paris for accommodation and food at reasonable rates for those who go under the Society's auspices.

A COMMITTEE of the Metropolitan District Association of Working Men's Clubs and Institutes have for some time past been making arrangements for the visits of large bodies of artisans and others to the Paris Exhibition. Mr. Hodgson Pratt, vice-president of the Association, has just returned from the French capital, after obtaining from the Imperial Commission the concession of a Government building, with beds, furniture, &c., for the exclusive use of those visiting Paris under the auspices of the Association. This will enable the committee to provide accommodation for at least 200 visitors per week from the 1st June until the end of October. Arrangements have also been entered into with Mr. Cook, Excursion Manager of the Newhaven and Dieppe route, for the transit of the excursionists to and from Paris. According to a circular just issued by the committee, the expense of the journey both ways, and lodging for one week, will be only 37s. As regards the cost of living in Paris, Mr. Pratt has supplied information showing that the daily expenses of an artisan need not exceed from 3s. to 4s., while an Exhibition weekly ticket costs 6s.; so that 3l. would defray the expense of a visit from London. Through the liberality of Mr. Henry Hoare, the treasurer, who with great public spirit has offered to advance the funds necessary to carry out the arrangements, the committee are able to offer accommodation of a superior kind, including a good meat breakfast, at a cost of 4s. 6d. for the return journey. Including dinner, tea, and admission to the Exhibition, the total expense of a visit under this arrangement will be less than 4l. Mr. Layard is the president of the committee, and has taken the warmest interest in promoting this undertaking.

The fire does not appear to have arisen from the flies, but from the stove itself igniting the wood-work, though the flies were dangerously heated. The damage is roughly estimated at about 200l. The church of the commune of Mantoux, in France, had been for several months past in course of reconstruction, and only the nave had been preserved for divine service. Recently, while a considerable number of people were assembled, a loud cracking was heard, and the scaffolding and roof of the building, composed of tiles and wooden rafters, fell in to the extent of 18 yards, burying many of the congregation in the ruins. Four persons were killed on the spot, and twelve others received contusions, more or less severe. Two stables in Chapel-place, Brompton, with living-rooms over them, fell on Saturday morning at about half-past nine. The party wall gave way, bringing the flooring and roofs with it. The rooms were occupied at the time: one woman was hurt and taken to St. George's Hospital. Two horses, after some trouble, were liberated. From the appearance of the remains, the wonder is they had not given way before. The premises here generally should be at once examined, as many look to be in a dangerous state. The same observation would apply to many buildings in London and the suburbs at the present time.

Books Received.

VARIORUM.

THE Gazette des Architectes et du Batiment (No. 1, for 1867) contains some interesting speculations on the country and the works of Wilars de Honcourt. The writer, M. P. Boudard, arrives at the belief that the choir of the church of St. Quentin is the work of Wilars.—Messrs. Rosser & Russell, as heating engineers, have issued a very useful Trade Book, calculated to assist architects in deciding upon the relative applicability of various modes of warming buildings.

Miscellaneous.

THE POLYTECHNIC INSTITUTION.—There are striking novelties here, especially a new optical illusion. The lecture by Professor Pepper illustrating popularly Spectrum Analysis is very interesting.

ART-UNION OF LONDON.—The annual meeting for reception of the report and distribution of the funds will take place at the Adelphi Theatre on Tuesday next. We shall, as usual, give full particulars and the official list of prizeholders.

INTERNATIONAL ARCHEOLOGICAL CONGRESS.—The Archeological Congress that was to have been held in Antwerp last year, and was postponed, will be opened there on the 25th of August next, and will close on the 1st of September.

PROPOSED PUBLIC HALL FOR HADLOW.—It has been resolved at a public meeting held at Hadlow to open a subscription-list towards the erection of a public hall for the town. The building is to cost about 800l., and the architect is Mr. Friend.

THE ROYAL MICROSCOPICAL SOCIETY'S SOIRÉE. Amongst the many remarkable objects exhibited at King's College, on Wednesday evening last, we especially noticed the singular globular bodies recently discovered in coal-ashes; they are almost invisible to the naked eye, but the microscope displays them as metallic granulated spheres of various sizes; they are agitated in an energetic manner on a magnet being placed near them. Living creatures belonging to the animal kingdom were abundantly displayed, for we had "human fleas," "cat's fleas," water-fleas, cheese mites, and snails, as well as fish-hatching. The circulation of the blood was shown, in the tongue and foot of the tadpole. The vegetable kingdom had representatives in living desmids, and the cell circulation was shown in the American weed, and other plants, of our rivers and watercourses, now must we omit to mention in connexion with the "lively fleas" above referred to, several excellent preparations of the so-called "gregarines" on human hair. The rooms were crowded with men of science, and the exhibition of first-rate microscopes was unusually

PROPOSED NEW BRIDGE AT CARLTON TERRACE, PADDINGTON.

The inhabitants of the western portion of the parish of Paddington, and the adjoining districts of St. Luke's, Chelsea, and Kensington, have for some months past been agitating for the construction of a bridge over the Grand Junction Canal at the commencement of Kensal New Town and Carlton-terrace, by which means thorough communication will be made between Maida Hill and Kilburn on the north, and Westbourne Park, Bayswater and Kensington on the south. At present persons are either obliged to take a circuitous course of two or three miles in passing from north to south, or to trust themselves to a frail boat, in which a lad takes passengers across for a consideration.

The subject was discussed at the Paddington vestry on Tuesday, when it appeared that the cost of the proposed bridge would be 4,000l. Mr. Vigers said he had obtained promises from Sir John Neell of a subscription of 2,000l. towards the erection of the bridge, and from the Deas and Chapter of Westminster of a similar sum. Mr. Philip Wilkinson had also promised 100l. Under these circumstances he would make a proposition to the vestry that he would build and complete in all respects a bridge 40 ft. in width between the parapets, with such span, height above water, and water-way as shall be approved by the Canal Company, and from the designs and specifications of the vestry engineer, provided the vestry contributed 2,000l. towards the cost of a bridge. In order to secure a due performance of the work, he proposed that a sum not exceeding 5 per cent. on the total cost of the bridge should be deducted from the vestry contribution and applied towards the payment of the engineer and superintendent of works, or let the vestry give him 1,750l. and pay their own offices.

After a lengthened discussion, it was resolved by a majority of the Board that the vestry do contribute 1,000l. and that application be made to the Metropolitan Board asking them to contribute another 1,000l. towards the 2,000l. required by Mr. Vigers to complete the bridge.

ACCIDENTS.

A FIRE has occurred in St. Martin's Church, near Oswestry. The fire raged with great violence for some time, until the doors at the entrance were entirely burnt; the woodwork in the entrance, under the belfry, was also burnt, and the fire soon forced its way through the helly-floor. The fire, however, was got under before it reached the interior of the church, which entirely escaped. The mischief, of course, as usual, originated by overheating the stove on Saturday night. The stove is in dangerous proximity to the woodwork around it.

running water (notwithstanding cordons sanitaires); and all authors coincide that plague is easily communicated by mere touch, and is the same effect of miasma during continuance of hot, dry, vapoury weather, combined with distant atmospheric influences for two or three successive summers, as attended in the old Latin work of John Constant Palmer, who practised during the Great Plague of London, it is worthy the attention of the Legislature whether any of the suburban railways pass through the site of any of the old pits wherein the dead were buried in 1666, during the Great Plague. Infection may be the consequence, very widely spread in London, being communicated by the navies' clothes.

ONE WHO HAS READ MADDEN AND OTHER WORKS ON THIS SUBJECT.

THE SPARROWS ON THE CHURCH TOP.

PERHAPS no portion of her Majesty's domains contains a greater number of sacred edifices than the good old city of "St. Mango." Upon the cornices and projections of one, birds have been in the habit of congregating and building their nests. An impudent sparrow,—let us hope it was a young and ignorant one,—made a deposit upon the garments of an elder of the kirk. "Great events from little causes spring." There is now no "jutting frieze, butress, or cogen of vantage" but bristles with pieces of broken glass, as objects of terror or torture to any "temple-loving merlet" who dares presume there to make his pendant bed and procreant cradle. It is enough to make the ghost of Charles Westerton rise from his grave, and denounce broken crystal being put to such a use by those who forget "there is special providence even in the fall of a sparrow."

MANCHESTER BUILDING SURVEYOR.

SIR.—In your issue of the 29th inst. I observe, under the heading of "The Battle of Life," you state that being needed in the office of building surveyor to the corporation of Manchester, the applicants were 123 in number. The appointment was that of "building surveyor itself," and, after advertising for applicants, the committee appointed a clerk from the office of their own city surveyor.

CREMORNE GARDENS: CHELSEA SANITARY BOARD.

The summer heats are approaching, and it may not be amiss to inquire as to whether proper drains exist in connexion with closets; and also, whether water is laid on whether cesspools prevail, and privies exist without water supply. If the latter, no time should be lost in laying drains, and in securing a water supply.

SUN-DIALS.

CAN any of your readers give me a simple rule for finding the angle of the gnomon of a sundial for a house; also, to divide the hours properly? G. W. T.

LONDON-BRIDGE TRAFFIC.

INSTEAD of widening this bridge, as seems now contemplated, has the erection of a story over foot-traffic, similar to that of the temporary scaffriars-bridge, ever occurred to you? Such story, by leaving the whole width of the present bridge for horse traffic, could be made at once most useful, practically and surely, also, effect a satisfactory result. H. FIELD.

BUILDERS' TENDERS.

The Harrow Local Board of Health received following tenders for the proposed works certified in the Builder, namely to lay down 50 ft. of 15-in. pipe-sewer; take up 1,200 ft. 12-in. and 9-in. sewer pipes; provide and read 100 yards of gravel; and other work, at and within the district of the said Board:

Table with 2 columns: Name and Amount. Includes Young & Fussell, about 2000 0 0; Chapel 581 0 0; Snellett & Farnham 553 0 0; Avers 518 0 0; Bloomfield 500 0 0; Burgess 458 0 0; Parker 450 0 0; W. Woodbridge 439 0 0; Hubbard 427 0 0; Bolton 395 0 0; Vos 320 0 0; Kendall 285 0 0.

WILLIAM SMITH, Surveyor to the Board.

* Given in per lineal yards.

TESTIMONIAL TO AN ARCHITECT.—On the 23rd inst. a handsome silver cup was presented by the builders of Torquay to Mr. H. H. Bridgman, architect, who is about to leave the town. Many strong expressions of respect and good feeling were used by those who had been connected with him in business. It is a creditable incident in a young architect's career.

THE NEW PALACE OF WESTMINSTER.—Two more frescoes by Mr. C. W. Cope, R.A., are now being placed in the peers' corridor. The subjects are—"The setting out of train bands from London to raise the siege of Gloucester," and "Speaker Lenthall asserting the privileges of the Commons against Charles I. when the attempt was made to seize the five members."

THE CHELTENHAM SEWAGE QUESTION.—By a majority of fifteen to eleven the town commissioners have rescinded the resolution previously come to for the purchase of land for sewage irrigation. The plan was to purchase 120 acres of land at Staverton, for 10,000*l.*, and to distribute the sewage thereon, the total cost of the land and works being estimated by the surveyor at 17,000*l.* The land selected was considered to be not nearly large enough for the purpose; the cost disproportioned to the results; and many of the farmers in the neighbourhood had withdrawn their offers to take the sewage over their land. By carrying the sewage further into the country, it was urged, land cheaper and of greater extent would probably be obtained, and the neighbouring occupiers would be disposed to take the refuse with greater readiness and on more remunerative terms.

PROPOSED MEMORIAL FOUNTAIN IN LEAMINGTON.—At a public meeting it has been resolved, "That the esteem and regard entertained towards the late Mr. Hitchman by his fellow-townsmen and friends, for his long untiring energy in promoting the interests and prosperity of Leamington, and his benevolence and kindness to the poor, render it incumbent that some public memorial of him should be established in the town; and that a public fountain or some other ornamental structure bearing his name would, if found practicable, be an appropriate memorial." The cost and decoration of the structure will be regulated by the amount of subscriptions. As to the site, the open space fronting the Holly Wall has been suggested as the most suitable, or, if the authorities purchased the Avenue-walk, in Dormer-place, then it could be erected there. A committee was appointed to carry out the object of the meeting.

THE ANTIQUITIES OF BATH.—A memorial has been presented to the Bath town council by the Bath Royal Literary and Philosophical Association, and the Bath Natural History and Antiquarian Field Club, expressing a hope that all the discoveries of Roman or other ancient buildings in excavating, will be carefully recorded as to site on the large corporation map of the city, and drawings made of such remains for preservation, while such relics are also carefully preserved. The memorial was referred to the Borough Property Committee, leaving them to consider the best means of carrying out the suggestions it contained. A similar application has been made to the Grand Pump-room Hotel Company, who have instructed their architects, Messrs. Wilson & Wilcox, to take proper care for the preservation of any Roman remains that may be found in the course of the excavations on their property.

ROYAL ITALIAN OPERA, COVENT GARDEN.—The subscribers have had every reason to be satisfied with the opening of Mr. Gye's season in respect both of variety and excellence. Madame Vilda has well sustained the remarkable position she took as the new *Norma*; Signor Mario is singing with renewed freshness; and Madlle. Lucca has delighted her audience in "L'Africaine" (gorgeously mounted) and "Fra Diavolo." A new harytone, Signor Cottogni, made a very favourable impression in the first of these operas, acting as well as singing with discretion and power. On Tuesday evening Graziani re-appeared, and contributed greatly towards a most admirable representation of Verdi's "Un Ballo in Maschera," an opera that, like other works by the same composer, makes friends as it grows older. Madlle. Fricci sang the part of the unhappy *Amelia* with great pathos, and the *ensemble* was perfect. Madlle. Nau, who, as the page, made her first appearance, is at present wanting in dash, and her voice is somewhat thin, but it has much flexibility, and her appearance is good.

USEFUL AMERICAN INVENTIONS.—At the Franklin Institute, Philadelphia, some new mechanical contrivances, or new applications, have been exhibited, one or two of which are worth notice. A national lifter, as it is called, or portable crane, is so constructed as to be easily movable from place to place, and set up by one man, and yet is capable of raising at least ten tons. A pulley with cam-wheel, if the rope should break during the hoisting, immediately clamps the rope, and so prevents the fall of manufacturer in Massachusetts having observed that his workmen lost 12 per cent. of their time in screwing up and unscrewing the vice at which they worked, has invented a vice in which that defect is obviated, and the jaws can be opened or closed with a single pull or push, and the article operated on is held as tightly as in an ordinary vice. The mechanism of the vice comprises a rack with ratchet teeth, and a nut with teeth on its under side to fit into those of the rack. This nut rises when the vice is to be opened or closed, but drops into its place when the piece of work is inserted, and then one turn of a screw suffices to tighten up. This is an invention which locksmiths and instrument-makers will doubtless take advantage of.

TENDERS

For the erection of house and stables, 10, Grosvenor-street, for Dr. Weber. Mr. E. A. Gruning, architect. Quantities by Messrs. Parker & Elger:—
Patrick & Son £5,690 0 0
J. & C. Parnson 5,626 0 0
Rider & Son 5,568 0 0
Gawland 5,559 0 0
Ashby & Sons 5,496 0 0
Piper & Wheeler 5,490 0 0
Simpson 5,417 0 0
Trollope 5,343 0 0
Smith & Taylor 5,280 0 0
Higgs (accepted) 4,948 0 0

For new stables, lodge, laundry, and new roof and alterations to house, for Mr. J. P. Flemish, Allen House, Roxhampton Park. Mr. E. A. Gruning, architect. Quantities by Mr. H. Gritten:—
Tracy, Southall, & Watson £4,784 0 0
J. & C. Parnson 4,464 0 0
Trollope 4,475 0 0
Myers & Son 4,432 0 0
Mansfield, Price, & Co. 4,393 0 0
Brass 4,280 0 0
Nicholson 3,280 0 0
Higgs (accepted) 3,068 0 0

For additions and alterations to two houses, at Beley Heath. Mr. W. B. Finhey, architect:—
Payne & Balding £1,918 0 0
Osborn 1,607 0 0
Nightingale 1,613 0 0
Butler 1,482 0 0
Soper 1,458 0 0
Elms 1,288 0 0
Maswaring 1,341 0 0
Walker 1,300 0 0
Wise 1,259 0 0

For additional wards, Essex and Colchester Hospital. Mr. Horace Darken, architect:—
Taylor £315 0 0
Shepherd, Brothers 310 0 0
Carlo 294 0 0
Les 283 0 0
Everitt 275 0 0
Dobson 259 0 0
Eade (accepted) 258 0 0

For shop and machine-rooms, for Mr. Alfred Higgs, Colchester. Mr. Horace Darken, architect:—
Crowe £276 15 0
Shepherd, Brothers 220 0 0
Taylor 615 0 0
Eade 615 0 0
Everitt 614 0 0

For vicarage house, at Bisham, Norfolk. Mr. J. S. Benest, architect:—
Papes £720 0 0

For house and shop, exclusive of glass and shop-front, opposite the Guildhall, Norwich. Mr. J. S. Benest, architect:—
Downing £284 0 0
Lacey 870 0 0
Hood 650 0 0

For building a rectory-house, at Bodham, near Holt, Norfolk. Mr. J. S. Benest, architect:—
Harrold £1,152 1 9
Youngs 1,980 0 0
Gornat 1,070 2 9
Chapman 837 0 0
Nelson 815 0 0

For new national schools, at Rhyader, Radnorshire. Mr. B. H. Lingen Barker, architect:—
Mason £599 0 0
Wooley 499 0 0
Edward 469 0 0
Evans 357 0 0

For new church of St. Andrew, Plaistow. Mr. J. Brooks, architect:—
Henshaw £4,785 0 0
Foister 3,620 0 0
Colls & Son 3,369 0 0
Hill & Son 3,639 0 0
Hill, Kedell, & Co. 3,847 0 0
Higgs 3,314 0 0
Very 3,247 0 0

For warehouse, for Mr. Jaques, in Gow-cross-street. Mr. S. G. Capes, architect. Quantities applied:—
Ashby & Son £3,431 0 0
Pattison, Fotheringham 3,298 0 0
Wagstaff 3,259 0 0
Newman & Mann 3,256 0 0
Piper & Wheeler 3,230 0 0
Webb & Sons 3,187 0 0
Poster 2,986 0 0
Scrivener & White 2,913 0 0

For new bedroom and new fossil-room to the Norfolk and Norwich Museum. Mr. J. S. Benest, architect:—
Lacey £533 0 0
Downing 469 0 0
Balls & Son 469 0 0
Wiseman 472 0 0
Hood 465 15 0
Rice 410 0 0

For addition to the Adelphi Theatre, for Mr. Benjamin Webster. Mr. Joseph Lavender, architect:—
Fozley £1,837 0 0
Smith & Son 1,715 0 0
Green 1,620 0 0
Palman & Co. 1,599 0 0
Webb & Sons 1,543 0 0

For rebuilding No. 23, Lime-street, for Mr. J. Thornhill. Mr. Reilly, architect:—
Webb & Sons £1,335 0 0
Carter & Sons 1,177 0 0
Pask 1,175 0 0
Webb & Sons 1,174 0 0

For St. Luke's Infant Schools, Globe-road, Mile-end. Messrs. Hamnack & Lambert, architects:—
Williams & Sons £2,790 0 0
Webb & Sons 2,557 0 0
Ennor 2,442 0 0
Gibson, Brothers 2,387 0 0
Hedges 2,339 0 0
Newman & Mann 2,338 0 0

For sundry alterations, at No. 4, Mincing-lane, for Messrs. T. Daniel & Co. Messrs. McMurdie & Rust, architects. Quantities supplied:—
Hart £3,400 0 0
Adamson & Sons 3,335 0 0
Henshaw 3,107 0 0
Nixon 3,098 0 0
Newman & Mann (accepted) ... 2,656 0 0

For sewerage works, Cranford, Middlesex. Mr. Charles Innes, architect:—
Lodge £1,100 0 0
Adamson & Sons 829 0 0
Thirst & Co. 822 0 0
Crockett 809 0 0

For the restoration of Stotessdon Church, Salop. Mr. Blashill, architect:—
Owens £2,260 0 0
Smith & Son 1,320 5 1
Nevell (accepted) 1,677 0 0
* Without allowing for old materials.

Accepted for Leicester Lunatic Asylum. Mr. E. L. Stephens, architect:—

Brickwork, Slating, Plastering, &c.
Osborne, Brothers £3,190 0 0

Stone Work
Osborne, Brothers 2,819 0 0

Carpenter and Joiner's Work
Eagle 3,890 0 0

Plumber and Glacier's Work
Norman & Underwood 1,130 0 0

Painter's Work
Whitmore 376 13 0

Topographer's Work
Pegg 1,430 0 0

Gasfitter's Work
Webb 324 0 0

Steam-engine, Boiler, Washing Machine, Cooking, Venting, &c.
Haden & Son 914 18 0

For the erection of a block of model dwellings for the working classes, on the Blagrove Estate, Reading. Messrs. W. & T. Brown, architects:—
Lovett £3,328 0 0
Sheppard 3,139 0 0
Kendell 2,900 0 0
Carter 2,873 0 0
Simonds (accepted) 2,700 0 0

For a fire-brigade station, at South Parade, Chelsea for the Metropolitan Board of Works:—
Day £601 0 0
Sims & Marten 648 0 0
Fish 630 0 0
Wilcox 623 0 0
Cooper 594 0 0
Wignand 598 10 0
Nutt & Co. 668 0 0
Mann 625 0 0
Rigby 624 0 0
Higginbotham 498 0 0
Pattick (accepted) 498 0 0

TO CORRESPONDENTS.

"Italian Masters."—So many correspondents have inquired what this material can be obtained, and for evidence of its value in public notices, that we depart from our custom to ask these questions. Concrete.—In reply to five or six correspondents, who request elementary information as to the nature, composition, and history of concrete, we refer them to the Essay on the subject by the conductor of this journal, published in the fifth volume of the Transactions of the Institute of British Architects. Request.—We have reason to believe that some of our correspondents well considered.—P. E. N. (plan is an engraver's band)—W. M. (know of no limits to pecuniary reward that would follow the discovery of the problems named)—M. A. R. (justness).—Mr. T. (we are by no means prepared to assist in the delusions made

stance of his birth in Ireland, for whose benefit "he did by the king's licence inoffit that great prelate, Anthony Beke, Bishop of Durham and Patriarch of Jerusalem, in the Castle of Alnwick and divers other lands, with trust and special confidence that he should retain them for the above William de Vesey, born in Ireland, at that time young, until he came of full age, and then pass them to him; which William derived no benefit from that trust; for the hishop, being irritated by some slanderous words which he had heard the bastard had spoken of him, by his deed bearing date Novmber 19, 1369, 3 Edward II., sold the Castle and honour of Alnwick to Henry de Percy, a great man of the north, from whom the earls of Northumberland, still possessors thereof, are descended." They were threatening and unsettled times; and it is quite possible this wrong might have passed unheeded among more pressing and public calamities. That the Percies were not quite satisfied as to the legality or equity of the transaction we may assume from the fact stated by Mr. Tate that in 1324 the natural son of William de Vesey having been slain in the battle of Bannockburn, the son of Henry de Percy obtained a release of his rights to the barony of Alnwick from Sir William Aton, the heir-at-law, by payment to him of seven hundred marks sterling. The purchaser of Alnwick, however, did not wait for this settlement of the question before he began to build. He lived but five years after acquiring the stronghold of the De Vesecies; but in that time he materially enlarged and strengthened it. Much of his work is still standing, a marvel of stateliness, strength, and perfection of masonry, as we have elsewhere related in our notices of the recent restorations. The history, pedigree, and heraldry of the Percies naturally take up a large portion of Mr. Tate's volume; but there are not vain repetitions, for, though obliged in matters of history to follow in the beaten track of facts, he takes original views as to the relative worth of the successive lords of Alnwick. Hotspur, from his daring valour, has hitherto borne away the palm from a race in which every individual was eminent. Mr. Tate says he likes better the second baron and the second and tenth earls, for the former was gentle and kind-hearted in days when men sorely needed such an example; the second was faithful, brave, and wise; and the third a religious and conscientious man, who did his best to promote the good of his fellow-men by securing for them a constitutional government.

The Percies, however, are not all in all to our author. His sympathies seem to be more absorbed in the town than in the castle; and he shows that the earls of Northumberland have not been the great benefactors to the former that they are supposed to have been. The Percies were in possession of Alnwick Castle for more than 120 years before the town was protected by a wall; notwithstanding that it was frequently entered, ravaged, and burnt. It is true that the licence granted by Henry VI. to enclose, wall, and embattle it mentions the name of Henry Earl of Northumberland as well as the burgesses, their heirs and successors; but it is also clear that half a century elapsed before this work was completed; proving that he could have rendered but very little assistance towards its prosecution. When finished the wall was 20½ ft. high and 6 ft. thick; and it was, moreover, furnished with four strong fortified gateways, — Bondgate Tower, Clayport Tower, Narrowgate Tower, and Pettergate Tower. It enclosed a space not much exceeded in size by the present dimension of the town. As we have seen, in the De Vesecies' time the leading streets were formed, although left open to the depredations of the lawless borderers and Scots. The wall enclosed these, as well as the market-place, Pottergate, which then was called Barredale, Fenkle, the Corner street, and Parkes-street, or Hale. Beyond the mural boundary, by the river's edge ran, as now, Walkergate, where the walkers or fillers dwelt; and before the castle barbican lay Baileygate, which gave access to Cannongate, the road that led from the town to the principal entrance to Alnwick Abbey. There are a few of the houses that were within the wall still standing; they are small and low, not exceeding two stories in height, and often consisting of only one, with mullioned windows, and thatched roofs. One, pulled down within the last ten years, was vaulted with stones like the pele towers of the county. Most of them had gardens or crofts. Mr. Tate extracts from the records of the Augmentation Office, a statement that in

1545, there were "of housing people in Alnwick, 1500, within the same parishes," and explains that *housing* or *housesynge* people were persons who were of age to communicate at the Eucharist, the term being derived from the Anglo-Saxon, *husian*, to give or receive the sacrament. This gives, on the assumption that the people over sixteen years of age, would be about two-thirds of the inhabitants, a population of 2,250, and, compared with Gateshead and Sunderland, which only possessed 1,000 *housing* people, shows the relative importance of the "canny" town. In the three hundred and twenty years that have elapsed very little ground has been gained, Gateshead and Sunderland, have prospered and multiplied exceedingly, while Alnwick has contented itself with an average annual increase of sixteen persons. The records of the heronial courts furnish the names of the burgesses. Of 200 mentioned as paying quit-rents in the reign of Elizabeth, Mr. Tate remarks it is doubtful whether either of them, except Thew and Foster, have a single descendant in the male line now living in the parish. He reckons that there were in those days about 300 persons possessed of real property in Alnwick. Besides these there were in the barony 300 copyholders—small landed proprietors who cultivated their own land, subject to a few feudal impositions. Not one copyhold now exists, all having been absorbed. Our author, regretting the independent yeomanry who owned them, says, "The history of their extinction has not been written; perhaps it is now irrecoverable, though there were traditions of the unfair means—chicanery, misrepresentation, threats—used to sweep them away." Every man in this little community was often called upon to do his part towards maintaining peace and defending aggressions; for when the sixth earl of Northumberland died, twenty years elapsed before his nephew, the seventh earl, was enabled to take possession of his estates, owing to the attainder of his father, which was not pardoned till the lapse of that period. During this time, and for many years besides, the borders were in a state of almost incessant warfare. Mr. Tate computes that not less than 2,000 men must have been employed in a complicated system of day and night watching that the constant surprises from over the border rendered necessary. He says, "The night watches were set at the day-going, and continued at their stations until the day was light. The day-watches began their duty at day-light, and continued until the day was gone." It was the duty of every watch, on observing the approach of an enemy or suspected person, to give the alarm by blowing of horn, by shout or outcry, and all men were bound, on pain of death, to arise and follow the fray with hue and cry, on horse or on foot. Whoever captured offenders was rewarded; and goods rescued from thieves were restored to the owners on paying for their rescue. No man could harbour or help any rebel, fugitive, felon, murderer, whether Englishman or Scotsman, upon pain of death; and no subject could even speak with a Scotsman without licence from the warden." The castles and peles were important places in those days, and walled towns of the greatest value; if they had not furnished numerous retreats for the inhabitants upon signal of danger, it is probable that the border would have been despoiled; as it was, the northern portions of the county enjoyed no more security than a vast camp, for there were the Scots before it and the lawless Moss troopers of Tyne-dale in the rear. Musters were occasionally made of the able-bodied men, such as are now made of the volunteers, though with very different equipments. Holders of small plots of land were bound to appear, with horse and armour. Men on foot were armed with helmet, coat and plate, and bow or bill. Upwards of 1,500 men thus accounted have mustered on Alnwick Moor. Alnwick was the head-quarters of all this complicated organisation for the defence of the borders; and there a warden court was held with all the solemn formalities observed in the superior courts of the realm, for the trial of offenders against March law; and often, indeed, criminals condemned in this court were executed at Alnwick." A Scottish minister, James Melville, passing through the country, thus writes of the 2nd of August, 1584: "We came that night to Alnwick and lodged in the house of a widow, whose son-in-law, guidman of the house, was lyaed seek of many deadlie wounds, giffen him be the Scottes thieves on the Bordar."

After the union of the English and Scottish crowns, Alnwick seems to have prospered. For

150 years the Percies rarely visited the castle, and never resided in it; and, thus left to itself, the town developed its resources, till there were ten incorporated companies in it. It was governed by four shambles and a council of twenty-four burgesses—a body Mr. Tate considers as equivalent to one-tenth of the leading inhabitants. The property over which they presided was considerable—a great moor stretching away for miles towards the purple heathery hills west of the town; a river frontage, or stretch of land bordering the river, for a mile past the castle walls; the market-place, with the shambles, cross, stocks, pillory; the town-hall, or tolbooth; the clocks; the pumps, with large stone tanks of running water in front of them, fit for horses and cattle to drink from; coal mines; limestone and sandstone quarries; and, moreover, the ancient grammar-school and the patronage of the church. Being, as a petition to Lord Burghley sets forth, "in the midst of the country, and therefore of greatest repaire and concourse of people," the market days and fairs days were great gatherings on which a large amount of business was transacted. In these latter days, as many as sixty carriers' carts are to be counted, drawn up in lines, on these occasions, like so many hatching-machines gone astray, gradually unrolling and refilling as their imports and exports change places; but in those there were doubtless more. Whatever was going on in the country the Alnwick people took part in. In the rebellion of 1745 they seem to have been particularly active in the Hanoverian cause, the corporation hiring volunteers, sending out scouts and special messengers to watch and report progress of the enemy; and the streets resounded with trumpet-calls, the beating of drums, and playing of fifes, as troops mustered in the market-place or passed through the town. But a great law-suit in comparatively recent times seems to have paralysed the body that presided over the prosperity that reigned so long, and they parted with possession after possession, and permitted the locking up of several ancient roads and footpaths. Our author notices that people used to take advantage of every public occasion to enjoy themselves; and that amusement formerly formed a larger item of existence than it now does. The Alnwick folks had their lord of misrule, a fool, waits, to say nothing of the more reprehensible sights, hull-haiting, cock-fighting, and horse-racing, all of which are swept away. The lord of misrule, who reigned at Easter, was deposed in 1677; the "fools" is last mentioned in the corporation accounts in 1612, when three yards of "whit" for him cost 5s., and the "dying and making of it 2s. 6d." The last of the waits survived till 1845, as a monument in the churchyard records; while the caller, or crier, who accompanied them on their tour through the town, still survives, at a very advanced age, having seen five Percies in possession of the dukedom, if we may call the handsome, clever, dashing Sir Hugh Smithson a Percy. It was the business of the waits, accompanied by this caller, or his predecessors, to paraphrase the streets of the town early in the winter mornings, beginning at Martinmas and ending with January. They wore a showy blue livery, trimmed with silver lace and silver hedges bearing the town's arms. Our author can remember what he calls these wonderful voices of the night calling "Good morrow, masters all! half-past three o'clock in a frosty morning." Once or twice a week, he says, the householders were called upon by name. "Good morrow, Mister Turner! Good morrow, Mistress Turner! half-past two o'clock in a cloudy morning;" and on Christmas morning a further variety of call was made upon the mistresses of families—

"Dame! dame! get up and bake your pie,

And let your lazy maids lie

On Christmas day in the morning!"

The corporation suppressed the waits in 1521. But Alnwick has yet one instrument left with which it is annually enlivened. This is a peculiar and elegant modification of the bagpipe, called the Northumbrian pipes, on which the tune of Chevy Chase is played by the Duke's piper, as, clad in dark blue broadcloth, with a shepherd's plaid draped across his shoulder, and a silver crescent on his arm, he heads the procession from the castle to the market-place, to proclaim the principal fair of the year. The same dirge-like strain, with its wild bursts of triumph, we may note, is also played on these delicate pipes by the same musician, at the periodical court-leet dinners of the lord of the manor.

Our author has subdivided his work into

departments. He assigns to other pens two important chapters. The first of these is an archaeological and architectural description of the castle, by Mr. F. R. Wilson; but as we have fully and freely, from time to time, noticed the past and present aspect of this celebrated structure, we refrain from going over the ground again. Suffice it to say, that this account of it is illustrated by an original and accurate bird's-eye view of it, by the same hand, which gives a good insight into the leading features in its configuration. The second epistolical chapter treats of the pedigrees and early heraldry of the lords of Alnwick. It is written by the first authority in the north on the subject, Mr. W. H. D. Longstaffe. It leads us to many objects that we should scarcely suppose to be invested with heraldic interest. The Liber de Melros, of the Ballantyne Club, pointed out that the vetches upon the seals of the De Vescies are probably puns upon their name. The cross patonce, as shown upon the shield of the Archangel Michael on the town's arms, has been supposed to be a coat of arms arrangement of these vetches, but Mr. Longstaffe thinks that imagination has run riot here. However, the cross in question in his hands gives us an interesting clue to the whereabouts of the tomb of William Vesci of Kildare, among other interesting facts. A fine cross-legged effigy of a knight, with a very thin mentled dexter over a cross patonce on his shield, mentioned in Drake's "Eboracum," as being in an old wall near the Haberdashers' Hall, Whitegate, and now preserved in the museum near St. Mary's Abbey, in that city, he thinks likely to be a portion of the tomb of the illegitimate heir of the last De Vesci owner of Alnwick. The cloisters of Canterbury, and a window in the cloisters of York Minster, contain heraldic acknowledgments of favours received from the same family. Mr. Longstaffe traces this name as Vescy, Vasey, Vesey, down various branches, and ultimately to Marshall Vesey, a well-known bookseller of Newcastle. Salley Abbey, Whitley Abbey, Fountains Abbey, Petworth Church, Alnwick Abbey, Hulne Abbey, Beverley Minster, and Westminster Abbey afford heraldic testimony of the munificence and piety of the Percies. The Northumberland House lion has two *fac-similes* in Alnwick,—one on a bridge spanning the Alne within stone's-throw of the castle; and the other on a tall column built by the Percy tenantry as a recognition of their landlord's leniency at a particular crisis; but the crescent is to be seen on every cottage-door on the duke's estate. Percy hedges confront us on the founts of Ingram and Alnham churches, on the capital of a pillar in Alnwick Church, on stone panels inserted in a pole north of Alnwick, on another in front of one of the ancient hurgages in the town, on the only ancient gateway standing, and many other unexpected places, besides where we should look for them, as on the barhioans and towers of their castles, signets, and documents. Their motto can never be found too often,—*Esperance en Dieu*.

Thus, from the first inhabitants of the district who have left any evidence of their existence, with their camps, huts, corn-térries, implements, ornaments, and *débris*, through the occupation of the country by the bronzed legions of Rome, the settlement of the Saxons, the Normans, and the successive ownership of the barony by the De Vescies and Percies, Mr. Tate brings down the history of the town to the present day, not omitting details of the most important public movements of the last century. Hereafter he means to go farther back than this, and furnish an account of the geology of the district, as he has recently done of that upon which the Roman wall is built. Moreover, Alnwick and Hulne Abbeys, the venerable parish church of St. Michael, the modern St. Paul's, containing the famed Munich window, St. Mary's Chantry, the Grammar School, and other institutions, require mention at his hands, and call for a second volume.

THE DRINKING FOUNTAIN MOVEMENT.—At Darlington, during the past winter, Mr. Joseph Pease has caused to be constructed, entirely at his own expense, drinking-fountains for Houghton-lane, Cockerton-lane, Coniscliffe-lane, Durham-road, and one near the Cemetery. Several others will shortly be erected. These additional fountains are of cast iron, and are placed in the main entrances to the town, and in places most frequented by strollers.

THE ART-UNION OF LONDON.

ON Tuesday last the members of this corporation and their friends met in the Adelphi Theatre to receive the annual report, and distribute the amount subscribed. In the unavowed absence of the President, Lord Houghton, Professor Westmacott, R.A., took the chair; and having briefly opened the proceedings,—

Mr. Godwin, F.R.S., read the following REPORT.

Immediately after our last annual meeting, the Parliamentary Committee appointed to inquire into the operation of the Art-Union laws commenced their work, and after examining ten witnesses made a report to the House of Commons. This concluded with the recommendation that the administration and enforcing of the Art-Union laws should be placed under the charge of the Privy Council Department of Science and Art, and that a code of regulations should be adopted which seem to be, with-out exception, substantially copied from the regulations drawn up by your Council for the government of the Art-Union of London. Evidence was given of the fraudulent working of various so-called Art-Unions, the result, not of the operation of existing laws, but of the lax administration of existing powers to prevent the abuse of them. It might perhaps be complained that though this Association is throughout the evidence cited and model, and of its excellence of its management admitted by even hostile witnesses; and though the Committee were made aware that this Association could not be dissolved by a repeal of the Act, the Art-Union Act, standing as it does on the Statute-Book, they have not separated it, as they might have done, from the other Art-Unions, which the term "Art-Union" has been wrongly applied, or recognized in its services of the body of gentlemen who, unpaid and wholly uninterested, have for years conducted it. It seems desirable that the facts of the statements made should here be briefly examined.

The Report says that "the tendency of Art-Unions has been to foster the love of chance and speculation rather than to encourage high art." The Committee oddly insisted throughout the examination on the object of the Legislature had in view in sanctioning Art-Unions was the encouragement of "High Art." Such a term had really no place in the original programme of the Art-Union of London, which was chiefly the means of obtaining the Act. Our object was and is, primarily, "to promote the knowledge and love of the fine arts," and, secondarily, "to stimulate and encourage its professors by creating an increased demand for their works, and an improved taste on the part of the public." The statement that the Art-Union has fostered the love of speculation is not borne out by the fact that the great body of members subscribe but one guinea annually, and continue to do so year after year, as they would to a book-producing society, contented with what they receive, and simply taking their chance of what benefits may occasionally fall to them in the annual distribution. It is asserted in the Parliamentary Report, that the assistance given to artists is very in-adequate; while it was shown on the part of the Association that it had purchased 172,000 worth of pictures and sculpture, and expended 90,000 in the production of some 350,000 engravings and 100,000 sets of illustrations. Witness, a Royal Academician, asserted that the subscribers obtained only low-class pictures, and fostered mediocrity, at the moment when, by a curious coincidence, a prizesholder was purchasing at the Royal Academy subscribers were selecting the works of many equally well-known excellent artists, and the Council were, literally, the act of handing a cheque for 2,100*l.* to Mr. Macgillivray for "Death of Nelson," and entering into engagements with engravers for the reproduction of this and other great works to the extent of 11,500*l.* The Committee were told it seldom occurred that prizesholders gave more than the amount of their money, and we put in a statement showing that the sum of 15,110*l.* had been thus added. Another witness, greatly opposed to the system, had looked through the list, and had come to the conclusion that the supporters of the Art-Union of London are of the lower middle class, for the most part in country towns, and said that out of 10,000 subscribers he had found but one bishop, a few peers, two members of Parliament, seven baronets, and only twenty-one persons whose names were at all well known. To the extent to which this statement is correct, it simply serves to show that the Association has precisely achieved the desire with which it set out in 1836, namely, "to increase the number of those who take an interest in the advancement of the fine arts, and who look to them for their most permanent enjoyments." It was early urged that the Art-Union would bring together a large mass of subscribers, many of whom, without such a system of association, would never have taken interest in the progress of the arts; and the statement of how the witness question, supposed to be damaging, would be completely answered, has been fulfilled. The Committee were told by one gentleman who was examined, that the public had arrived at the conclusion that the chances of winning in the Art-Union are very bad, and the Committee were led to say in their report inadvertently, that "the chance against winning a prize in the London Art-Union is 99 to 1." This, if true, would not be at all correct way of putting it. Every subscriber receives a work of art, and the chance of winning more (as in the case of "The Ancient Mariner," "Claude Duval," or "The Norman Conquest") to go no further back), and the amount distributed in the shape of prizes, may be viewed as the sum saved by means of co-operation in the production of these works of art. In the case of engravings now in progress, "Hamlet," "Wellington and Blücher," and others, the cost of each impression, in ordinary commerce, would be at least two guineas. In truth, however, the statement in question is gravely incorrect, for looking to our report of last year, or the year before, it will be seen that there was one prize to every 11 subscribers,—10 to 1, instead of 99 to 1.

The friends of this corporation have every reason, nevertheless, to be satisfied with the result of the inquiry. Facts were given in evidence by one of your hon. secretaries (Mr. Godwin), and a member of the Council (Professor Donaldson), that went to prove beyond controversy its value and importance. It was shown that the list of artists whose works have been bought or engraved by the Association includes the names of Crawley, Copley, Fielding, Dye, Macnee, Uwins, Ward, O'Neil, Cole, D. Cox, Callow, Lee, Erill, Alured, Callcott, Webster, Stanfield, Landseer, Turner, Hilton, F. Taylor, Haghe,

and many others; that the Society had produced a series of sixteen commemorative medals of artists, and is keeping alive in this country the art of medal die engraving, the practice of which had nearly ceased; that it had materially aided in reviving the production of artistic bronzes; that it had given the first impetus to the now extensive distribution of fine works of art in Paris, statuary, employing the firms of Minton, Copeland, and Brown-Westhead, who stand foremost as successful art manufacturers; and, amongst other productions circulated by its means, had spread over the country and its dependencies some thousands of copies of the finest antique busts, besides specimens of the work of our best sculptors, Flaxman, Westmacott, Bell, Foley, Lawton, Lewis, Calder Marshall, Thornycroft, Wyon, Durban, Lawler, and others: it was shown that our operations extend to quarters both at home and abroad, which other art-agencies at work do not reach; and that the Association possesses a hand of honorary correspondents penetrating Africa and Asia, and circling the globe. Mr. W. P. Frith, R.A., gave most emphatic testimony to its great importance to the public, and its beneficial effect on the public. The encouragement this Association affords, he thought most valuable. "It was to me," he continued, "for I sold one of my first pictures to the Art-Union. I felt great encouragement from that, and probably some of my success afterwards may be attributed to it." Agreed being asked if he concurred in the prevalent opinion that an appreciation of art was rapidly increasing in this country, he said, "Yes, and I attribute a great deal of it to the Art-Union of London."

Coming now to the business of the year, the Council have to announce that the amount subscribed is 11,345*l.* 5*s.* The country has been afflicted with a great commercial disturbance; panic has lowered the value of some descriptions of property to the extent of millions; companies have collapsed, and large numbers of persons have been injured in circumstances of various kinds. In the face of these and other antagonistic occurrences, it is matter rather for congratulation that so large a sum should be forthcoming than for surprise that it is less than on some previous occasions. The cost of the engraving which is in course of distribution to all subscribers, "Fity," engraved by Mr. H. Lemon, after a picture by Mr. Le Jeune, A.R.A., not being so large proportionally as that of some of the works of art presented in other years, the amount available for prizes is not so much affected as would otherwise be the case. Every subscriber for the ensuing year will receive an engraving by Mr. Sharpe after Mr. Macgillivray's picture, "The Play Scene, Hamlet," one of the finest works of the British School. The moment represented is that when watching the effect upon the king of the mimic murder Hamlet is about to say, "He poisons him in the garden for his estate. His name's Gonzago; the story is extant, and written in very choice Italian."

It is difficult, in looking at this remarkable picture, to avoid feeling the same absorbing interest that agitates the groups depicted. There is excitement everywhere, and the spectator shares in it. Every part of the picture is made to assist in telling the story; even the thimble, when examined, is seen to represent on one side the Offering of Cain and Abel, and the Death of Abel; and on the other, the Temptation, and the Expulsion from Paradise.

The engraver of this plate, Mr. Sharpe, having executed his task entirely to the satisfaction of the Council, they have entered into an engagement with him for the production of a fine engraving in the highest style of the art after Mr. Macgillivray's picture, "The Death of Nelson," in the Royal Gallery in the Palace of Westminster, an undertaking of no ordinary magnitude, and which will occupy six years. The plate will be executed to correspond in size with "The Meeting of Wellington and Blücher" now in progress. The Council are sanguine in their hope that they will thus provide for the subscribers a pair of noble engravings of national importance commemorating events and persons in whom all are interested, and worthy alike of the painter and the country.

For a future year the Council have arranged with Mr. Jeans for the production of an engraving in line from the picture by Mr. Armitage, A.R.A., "The Parents of Christ Seeking Him," which was exhibited last year. Mr. Christ has completed a reduced copy of his statue, "The Wood-Nymph," to which the Council had awarded a premium. Examples of this in Parian will be distributed to-day.

The dies for the medal by Mr. G. G. Adams, commemorative of the late William Dyce, R.A., have been successfully finished. Impressions from these will also form part of the present distribution, as well as a number of the medals in-stands in bronze and sets of photographs from the Society's prints. The Gibson medal and the Leslie medal are advancing towards completion.

The Council, if may be mentioned, have recently presented a complete set of the medals struck by the Art-Union of London to the Royal Academy. The number of bronzes, Parian statues, and other works of art produced for the Association is now large. To meet the wishes of subscribers, constantly expressed, increased facilities have been afforded for obtaining such of these as may be desired, in lieu of the annual prints, by payment of increased subscription, and otherwise.

The following is an abstract of the receipts and expenditure. The detailed account, which has been duly audited as usual, will be printed with this report:—

Amount of subscriptions	£11,345 5 0
Amount allotted as prizes	6,680 0 0
Cost of plate, printing, &c., "Fity"	1,882 5 11
Printing, advertising, salaries, collectors' and agents' expenses, &c. &c.	2,802 19 1
	£11,345 5 0
The amount available for the purchase of works of art from the public galleries by the prizesholders themselves will be divided in the following manner:—	
20 works at	£10 each.
20 "	15 "
16 "	20 "
12 "	25 "
12 "	30 "
12 "	35 "
8 "	40 "
4 "	45 "
10 "	60 "
8 "	69 "
5 "	75 "
3 "	100 "
3 "	150 "
1 work	200 "

There will also be distributed,—
 200 Statuettes, "The Wood Nymph,"
 40 Medallion Bronze Inkstands,
 100 Busts in Porcelain of her Royal Highness the Princess of Wales,
 80 Sets of Photographs from the Society's Plates,
 30 Silver Medals, Commemorative of W. Dyce, R.A.

There will, therefore, be, with the Parisian busts given to all who have subscribed for ten years consecutively without gaining a prize, 792 prizes, in addition to the engraving received by every member.

On the plan followed on other occasions, the smaller prizes will be allotted by numbers drawn from the wheel, in the same manner as the pictorial prizes; but as the drawing of these would occupy more time than the business of the theatre would allow, the drawing will take place at the office to-morrow morning, at ten o'clock, when any members desirous of being present are invited to attend.

The reserved fund now amounts to £13,567. Amongst other matters of regular occurrence it must be stated that the works of art selected by the prizeholders of last year were exhibited to the members and their friends, and for part of the time to the public free, without any limitation whatever. This took place in the gallery of "The Institute of Painters in Water Colours," Pall Mall, with the kind permission of the body.

It should not be forgotten that the Art-Union of London gave the metropolis a free exhibition of pictures when such a thing was rare, that, as it was, when indeed, it was held by many that collections of works of art could not be safely opened to the public without limitations. Our experience for many years showed the error of that hasty opinion, and doubtless the advantage of not obtaining the greater facilities in this direction that are now afforded. The tillers and sowars are seldom thought of when the harvest is being gathered in.

Amongst various undertakings for the future, the Council are now arranging to produce a volume of engravings from original drawings by Flaxman, in the possession of University College. The reputation of great artists grows greater than themselves, "as shadows do than substances at daylight." So it is, and will be with Flaxman, one of the greatest artists England can boast.

At the International Exhibition, now on view in Paris, the Council has sought that the Art-Union should be represented. A few of the engravings most lately issued were sent, and two of the bronzes selected by the British Executive. Through accident these are not set forth together so as to characterize the Association; still they are there, however distributed, and go towards making up the creditable whole which represents Great Britain in this remarkable gathering in the Champ de Mars,—the most remarkable of its kind yet made,—England holds her own in painting and in architecture, though not in sculpture; few works in that department of art having been sent from this country. There is much to learn in the every quarter. The wonderful skill in ornamentation,—the power of blended colours possessed by some of the Eastern nations, for example, is strikingly noteworthy. They seem born with a natural appreciation of the value and use of colour, or they work under an approved formula, the result of long experience.

Some of the furniture exhibited in the English section is excellent, and shows the good result of that Wedding of Art to Industry, the importance and necessity of which have been uniformly proclaimed by the long series of Reports annually laid before the Association and circulated far and wide. Even the mercantile trader, when he finds that art may be made to improve trade, must see that it is his interest to encourage its study and bring about that junction. There is still a want of regular instruction in art for the public. Few know anything of it on sure grounds.

It has been said with emphasis by a statesman that olives do not grow in the Champ de Mars. Spite of the antagonism in sound, we would fain think otherwise. There the nations are communicating and feeding each other, for Art speaks all tongues,—addresses all hearts and minds: there all countries may see how much they may learn and gain from each other,—how closely their interests are connected,—how much they all have in common.

Much of course may be gained by our artists from a study of the paintings of other countries; and we are glad it will be well if the public recognize a truth oft enunciated in our reports,—that the thought set forth in the work of the painter or sculptor is of more importance than mere exactitude of material representation,—the superiority of mind over matter:—

"For of the soul the body form doth take,
 For soul is form, and form the body make."
 Shakespeare.

We want art wide and universal, addressing itself constantly and freely to the masses in the meeting-hall and on the highway. The science of painting and sculpture with architecture, as before now urged, is indispensable as well to the perfection of monumental art as to the desired universality; and to bring about this alliance should be the aim of those who desire to see art permeate and contribute to the enjoyment and the elevation of all classes of the people.

GEORGE GOWEN, 7 Hon. Sec.
 Lewis Pocock, Secy.

The Chairman, in moving the adoption of the report, dwelt at some length upon the value of art, and thought it was much to be regretted that at our public schools and universities attention was not paid to the study of aesthetics and a knowledge of form and beauty. Information on such a subject was of the highest importance. Referring to the statement which had been made to the committee, to the effect that the tendency of art unions had been to foster the love of chance and speculation, he contended that such was not the case, but that they were a great encouragement to art. The speaker then referred to the position and prospects of the institution, and to the general interest which attached to works of art in this country, and urged that the Art Union of London tended, to a great extent, to encourage and develop a knowledge and appre-

ciation of the fine arts. In his eulogium of art he said, as Dryden has it:—

"The Poet is confined in narrower space,
 To speak the language of his native place;
 The Painter widely stretches his command,
 The Pencil speaks the tongue of every land."

Mr. Bodkin, the Assistant Judge, having seconded the motion, it was carried unanimously. Mr. Joshua Bateworth, F.S.A., proposed, in an earnest speech, and Sir Walter Stirling, Bart., seconded a vote of thanks to the honorary secretaries, which was carried unanimously. Those gentlemen having returned thanks, a vote of thanks was passed to Mr. Benjamin Webster for the use of the theatre, and also to Mr. Kinloch, his acting manager. Miss Emily Roberts and Miss Caroline Roberts having undertaken to draw the prizes, and Mr. J. D. Arnold and Mr. J. G. Picher to act as scrutineers, the distribution took place.

LIST OF PRIZEHOLDERS.

- 200.—Holland, E. W., 10, Belvedere-crescent.
- 150.—Bunney, W., Maldon-crescent; Ford, W. J., Danvers-square, Quelling, B. Dyes.
- 100.—Oodke, T., Goolwa, S.A.; Perin, T., 43, Great Tower-street; Roberts, E. W., 15, Fish-street-hill.
- 75.—Joseph, A. A., Baywater; Leoch, Rev. W. J., 8, Eastwood; Munro, H. B., Grosvenor-street; Perry, G. H., Wolverhampton; Sherwin, J., Loughton.
- 50.—Black, C. H. M., Halifax, N.S.; Brown, J. R., Langton-chambers, Cooke, F. S., Dundee; Mining, N. W., Walsby; O'Connor, Major-General, Jamaica; Pease, T. R., Beverley; Poole, Mrs., Old Burlington-street; Thorne, C., Millbank.
- 25.—Carters, J. St. Paul's-road; Clay, Miss, Kendal; Ferguson, W., Stock Exchange; Herbert, J. T., Hythe; Jeppard, H. L., Ringwood; Luby, G. A., Birmoonds; Naylor, W., Paddington; Savill, R., Euston Station; Sewell, E. H., Winchester-hill; Strong, Mrs., New Kent-road.
- 15.—Bago, Hon. A. W., Rengely; Bruce, T., Calcutta; Euse, H., Bedford; M'Laren, J., Dunfermline; Russell, W. A., St. Albans; Tyrwhitt, Rev. R., Kesteven.
- 10.—Bailey, J. A., Boston, U.S.; Begby, J. C., Coleman-street; Bennett, W., Melbourne; Harrison, —, King's-road, Brighton; Harvey, J., Yokohama, Japan; Jopp, C., Edinburgh; Nelson, John, Dalos-in-Farness; Stevens, H. S., Carlos-square; Thomson, Miss, Alderbury; Wilkinson, F., Melbourne.
- 5.—Dumas, B., G.N.R. B. Dyes, W., Ballarat, Victoria; Forde, J. M., Melbourne; Hughes, H. P., Basingball-street; Marchant, T., Lewisham; Peters, B. L., St. John, N.Z.; Saby, P., Fric; Soward, Mrs., Governor-street, Hongkong; Smith, Mrs., Wilkes; John Wood; Wood, Mrs., Chestow-road, Newport; Woodward, T., Kennington.
- 3.—Carr, E., R. Kennington; Carter, Mrs., East Greenwich; England, E., Melbourne; Lockyer, M. B., Camden Town; Moore, E., Barbadoes; Rigby, Sam., Warrington; Saunders, E., George-street; Schumacher, C., Copenhagen; Smith, Mrs., St. Helens; De, Nelson, N.Z.; Slanley, Mrs., Marden; Thomson, B. R., Hornsey-rise.
- 23.—Berridge, J., Bishopgate-street; Browne, R., Oporto; Biddall, Jas., jun., Baxendy; Chabot, C., Albert-square; Clay, T., Halifax, N.S.; Colrym, Miss, H., Tower; Day, H., Galce; Dunstan, —, St. Colman; Friday, G., High-gate; Fenn, Capt. H., Azeval, Woolwich; Hendry, R. B., Rumsey; Jennings, F. W., Leek; Knight, J., Caedonin-road; Sleightholme, W. B., Gainsborough; Thomas, J. W., Halifax; Young, A., 15, St. Peter's-street.
- 20.—Blake, Miss S., Brighton; Brattan, J., Birkenhead; Cadmore, D. H., Kougals, S.A.; Da Costa, D.C., Barbadoes; Edwards, E., Leeds; Fyfe, R., Glasgow; C. E., Barnbury; Gooder, R. D., Adbourne; Evans, R. J. S., Canterbury; Headley, K., Stapleford; Leeming, T., Princess-street, Manchester; Levy, Mrs., Westbourne-terrace; Louth, A., Adelaide; Macdonald, J. D., Douglas, Isle of Man; McNaghton, S., Southampton; Needham, C., 1st Life Guards; West, W., Newport, Monmouth.
- 15.—Beechaw, Rev. H., Canterbury, N.Z.; Barketin, H., 261, Regent-street; Bishop, A. J., Maidstone; Darby, F., Adelaide-road; Esp, E., Newport, Monmouth; Evershed, A., Amphill; M'Queen, W. H., Shepherds Bush; Martel, Mrs., Minister; Milson, Mrs. T., Halifax, N.S.; Mountain, G., Kennington-lane; Oliver, Mrs. G., Treickenham; Peckover, D., Colverly; Perry, Juno, Stratford; Kosomon, Miss, Harely; Seamer, G., Mill-street; Stewart, J., Greenock; Stratton, J. H., Halford; Tommas, R., Birmingham; Webb, W. H., Halifax, N.S.; Williams, Rev. Tring Park.
- 10.—Anderson, F. B., Hestle; Andrews, F., Lincoln; Beveridge, J., Dunfermline; Brigham, Jas., Toll Gable; Dunlop, J., Glasgow; Fisher, Oxford; Gray, H. B., Lambeth; Hatley, Mrs., Clitheroe; Healy, E., Westbourne-road; Masey, F., Adelaide; Bath, J., D. D., Newbury Port, United States; Parmatin, J., Jerez; Paoing, T., Winchester-hill; Price, W. E., Great Torrington; Riddle, Mrs., Repton; Roberts, Stewart, Geo., Rosebrook, Victoria; Stratton, W., Sparsholt; Young, Geo., Bristol; Williams, C., High-street, Boston; Young, H., 56, Warwick-street.
- 5.—Beech, Mrs., 2, Victoria-street, Brixton; Acworth, A., Strood; Adams, John, Ware; Arlis, W., St.okehouse; Atkins, J., Birmingham; Andrews, J., Varnington; Auquard, H. J., Shorters-court; Ayres, —, Red Lion-square; Baker, H., Gower-street; Banks, J. D., Western; Bates, W., Haverrhill; Bellied, H., Castertown, New Zealand; Berkeley, Miss E. C., Nottingham-hill; Birseball, Col. J., Kingston-hill; Bird, H. B., St. Pancras; Bishop, Meior, R.H.A.; Blackie, R., Glasgow; Bell, M. F., Glasgow; Booth, Mrs., Emersall; Bortwick, J., Gresham-street; Bridge, T., Halyburte-terrace; Brown, A., Conington; Brown, R., Glasgow; Bruce, E. H., Singapore; Brunrid, J., Runcorn; Burke, J. St. G., Sudbury; Burton, Capt., R. H., Chorley; Carrington, A., Port Elizabeth; Colver, B. H., Devonian; Carr, W., Macclerfield; Carter, O. J., St. Andrew's; Chubb, H., St. Andrew's Exchange; Charlton, Mrs., West Britons; Christie, W., Walsall; Clutton, Lady G., Ranby-hall; Clutton, W., Bungay; Cole, G., Keenington; Cooke, W., Warwick;

- Cooper, J. R., Canterbury; Cooper, M. W., Bridlington; Corbet, Miss, Camden-road; Critchley, R. J., Bailey; Cross, Rev. E. H., Avenue-road; Dana, T., Geelong; D'Almeida, J. L., Nelson; Newell, W., Wray; Dwyer Holloway, J., Broad, C. St., Cornhill; Davies, D., Adelaide; Davis, Miss J., Clapham-rise; Davies, Rev. D., Westpool; Deane, W. A., Bideford; Deney, Mrs., 14, St. James; Denton, H., Walsby; Dibley, W. G., Rutland-gate; Doust, W. H., Teddington Lock; Dunn, Samuel, Casanbury-enne; Dunns, Mrs. Cork; Duryen, D. C., New York; Earl, G. F., Hill; Evans, W., Newport, Monmouth; Eyles, T., Ballard; Farthing, E., Chesapeake; Ferrari, A., Gloucester-terrace, Hyde Park; Firkins, G., Pershore; Forge, T., Beverley; Forrest, A. R., Derby; Fletcher, W., Cheltenham; Flint, John, 19, Coleman-street; Freeman, J., Wigmore-street; Fuller, W. B., Boston, United States; Gardner, Jas., Greenock; Gibson, Rev. M., Boulogne; Gilbe, J., London, Brighton, and South Coast Railway; Giles, H., Mount Pleasant, South Australia; Goode, Miss R. E., Midhurst; Goodstadi, A., Kurrachee; Greener, T., Darlington; Greaves, W. H., Bradford; Gridley, W. G., 9, Duke-street; Grundy, E., Liverpool; Gudgey, M., Bedford; Gudgey, Mrs. Miss, Lowestoft; Harland, J., Bradford; Harris, G., 28, Gower-street; Harrison, W., jun., Dudley; Hart, J., Coventry; Harvey, G. E., Larkfield; Hastings, J., 12, St. James; Heald, T., 12, St. James; Heald, 12, Camden-street; Henning, R. C., Cape Town; Herse, H., Westbourne-square; Hickman, N., Southampton; Hignett, Mrs., 16, Clarendon-street; Hodges, John, South Australia; Holz, R. J., Kingston Hill; Houlter, A., Leadenhall-street; Holroyd, J., Leeds; Hoggood, F. B., Boston, United States; Hoie, J. B., Great Northern Street, London; Hogg, R., Brighton; Salis, C., Rochester; Rev. G., Haslar; Jefferson, R., Queenstown; Jenkins, J. J., Swansea; Jentgen, W., Creffield; Jones, G. O., 3, Lyall-place; Jordan, J., Driffield; Joseph, R. W., 10, St. James; Kirby, J., Porchester-terrace; Leadham, C. H., Kennington Park; Linzell, J., Tottenham; Livingstone, W. J., Damerata; Long, R. B., Dogal-street; Mackay, M. L., 4th, Bradford; M'Queen, J. H., Tottenham-court-road; Main, H. S., Greenock; Mason, J. E., Sidney-street; Maxey, T., Louth; May, James, Adelaide; May, South Australia; McEwen, J., 13, Clarendon-street; Samuel, Birmingham; Menzies, J., Kincairdine; Merchant, Capt., Leadenhall-street; Moore, McQueen, A. C., Barnes-street; Moore, W. G., Fenge; Morgan, C., jun., North-road; Moseley, G. W., Colman-court; Murray, Mrs. E., Queen Anne-street; Needham, W. E., King-street; Newham, Samuel, Nottingham; Oliver, V., Bunhill-row; O'Mahoney, Capt., 10, Regent-street; O'Shea, J., Penola, Mechanics Institute, South Australia; Piggott, J., Ross; Picher, H. D., 34, Russell-square; Quincy, Rev., North-road; Rees, H., Melbourne; Robinson, W., Sutton; Rivington, J., Lower Seymour-street; Robinson, J. M., St. John, New Brunswick; Rowles, J., 61, Peasod-street; Romans, G., Halifax; Nova Scotia; Ross, Peasod-street; Ridd, G., Boston; Ridd, G., Boston; Sarsons, H., Birmingham; Scannell, H., Great Northern Railway; Scrimgeour, M., Adelaide; Searle, J. H., Rotherhithe; Shand, A. G., Liverpool; Sharp, W., North-road; Sells, G., Chesterfield; Sibley, T., Taunton; Silla, F., Brighton; Simpson, W., Springfield; Sherman, J. C., Waltham Abbey; Smart, E. K., 60, Peasod-street; Smith, G., Rotherhithe; Smith, J., Bishopgate Within; Smith, J., Alderney; Snook, T. J., Maastricht-road; Soul, J., Islington; Sparrow, Rev. W. G., Ludlow; Stacey, E., Sta. Martha; Steel, J., Rotherhithe; Stirling, W. G., New Bond-street; Strick, R., Liverpol; Strickland, C. H., 25, Albert-road; Sugden, W., Howden; Taylor, H., Geelong; Taylor, J., B. W., 45, St. James; Thompson, J., Malden; Tomlinson, G. A., Petermartzberg; Toye, E., Exton; Townsley, C., Wickham; Vrexbam; Turner, T., Longton; Turnbull, Capt. S., 15, St. James; Upton, J., Belvedere-road; Vrexbam, T., Victoria; Unicorn, J., Cranbrook; Ward, B., Pearly; Watnough, Mrs., Pocklington; Watson, J., Durham; Whisson, H. P., Holloway; Whisson, H., Ealing; White, J., 11, St. James; White, H., 11, St. James; White, —, Methy; Witham, T., Huddersfield; Wood, C., Westbury-road; Wood, T., Leeds; Worley, R. J., Maidstone; Wright, M., Leeds; Young, W., 11, St. James.
- 5.—Beech, Mrs., 2, Victoria-street, Brixton; Acworth, A., Strood; Adams, John, Ware; Arlis, W., St.okehouse; Atkins, J., Birmingham; Andrews, J., Varnington; Auquard, H. J., Shorters-court; Ayres, —, Red Lion-square; Baker, H., Gower-street; Banks, J. D., Western; Bates, W., Haverrhill; Bellied, H., Castertown, New Zealand; Berkeley, Miss E. C., Nottingham-hill; Birseball, Col. J., Kingston-hill; Bird, H. B., St. Pancras; Bishop, Meior, R.H.A.; Blackie, R., Glasgow; Bell, M. F., Glasgow; Booth, Mrs., Emersall; Bortwick, J., Gresham-street; Bridge, T., Halyburte-terrace; Brown, A., Conington; Brown, R., Glasgow; Bruce, E. H., Singapore; Brunrid, J., Runcorn; Burke, J. St. G., Sudbury; Burton, Capt., R. H., Chorley; Carrington, A., Port Elizabeth; Colver, B. H., Devonian; Carr, W., Macclerfield; Carter, O. J., St. Andrew's; Chubb, H., St. Andrew's Exchange; Charlton, Mrs., West Britons; Christie, W., Walsall; Clutton, Lady G., Ranby-hall; Clutton, W., Bungay; Cole, G., Keenington; Cooke, W., Warwick;

Emitted each to a Bust of I.R.H. the Princess of Wales, the following names were placed in the list:—Mr. J. Andrews, W. J., Clipping Norton; Aste, Mrs., Hampstead; Baker, C., Melbourne; Basham, W., Cambridge; Beardmore, Miss, Depford; Beech, T., Dresden; Becher, H., 18, St. James; Bicknell, Mrs., 18, St. James; Bill, J., jun., Coventry; Bird, W. F. W., 6, Gray's-in-square; Bishop, J., Wimbledon, South Wales; Bourne, G. B., Bowen, Bromo, E. 21, East Grove; Brown, R. S., Azeval, Nova Scotia; Brown, T., Hanover-street, Glasgow; Bryan, M., Kobe, South Australia; Butcher, Thomas, Tring; Chestall, W., M.D., Col. E., 11, St. James; Chubb, H., St. Andrew's Exchange; Col. E., Princess-gardens; Clarke, Mrs., Knedington; Collin, W. H., 7, Tomlin's-grove, Corner, J. S., Boston, United States; Daniel, J. W., Mount Pleasant, South Australia; Davidson, D., 25, St. James; Deane, W. A., Chiswell-street, E.C.; Deasly, 41, 20, Holland-place; S. Drew, Thomas, Kooringa, South Australia; Farebrother, J., Charing-cross; Fisher, J., Dudley; Frankland, J., 11, St. James; French, H., 11, St. James; Fryer, N.; Galletly, J., Geelong; Gilbert, J. C., 60, Leadenhall-street; Gill, E., Stourport; Gillett, A., Winchboro; Grigoux, W. K., 201, Piccadilly; Hackford, J., Wath-on-

Desrue; Haines, W., Maidstone; Hasler, J., The Plough, Lewisham; Hayes, J., Oeolung; Hayward, R., Ongar, Essex; Haywood, H., Dover; Hussey, C., Stalybridge; Hutton, G., Montreal; Kinnell, J., Croydon; Lester, J. L., Okehampton; Loftus, W., M. D., Victoria; Long, T. W., Tottenham-street; Lowe, A., Mount Brian, South Australia; Lowther, W., Royal Exchange-buildings; Luton, J. S., Springton, South Australia; Mackie, J., Kadina, South Australia; Martin, W., Folkestone; Martin, J., 14, Berkeley-square; Matthews, E., Berwick-street; Meredith, W., Carlisle-buildings; Misses E., Halifax; Miller, F., Bishop's Stortford; Morris, James, Adamscottage, Durban; Morris, J., Mains, Dundee; Nath, W., Greenwich; Owen, G., Portmadoc; Parson, T., Willenhall; Peckover, W., Wisbech; Phipps, W., Northampton; Percy, Mrs., Bank of England; Powell, H., 179, Euston-road; Ranken, P., Blackheath Park; Redinghuis, J. H., Cape Town; Riley, S., Plaitow, Essex; Roberts, D., 285, Old Kent-road; Roope, L., Hobart Town; Rosejo, J. B., Batavia; Rushton, T., Denmark-hill; Saunders, W., Derby; Sharp, J., Nelson, New Zealand; Sherring, W., Fairfield-road, Bristol; Spencer, J. J., Barbadoes; Stanwell, F., Boston, Lincolnshire; Stapleton, Mrs. H., Wexford; Struve, W. P., Carnarvon; Tomlinson, W. D., Newark; Tomson, B. R., St. Neot's; Vacher, A. B., Nottingham; Ward, J. B., Clapham-road; Warren, F. C., Croydon; Waters, H., 29, Regent-street; Waymouth, G., 12, Moorgate-street; Wetmore, E. E., Halifax, Nova Scotia; Whillier, E., 64, Coleman-street; Whiteway, R. C., Buncom; Wilkinson, F., North Ferry; Williams, F. N., Tern, Wexford; Wilson, G., Wortman, Finsbury; Wilson, H., Bury St. Edmund; Wortman, W., Burton-on-Trent; Young, H., Moorgate-street-buildings.

Entitled each to a Silver Medal, commemorative of T. Dyer, Esq., F.R.S., Blackheath-road; Bassam, G., Battersea; Brat, J. T., Alms-hill, Maidstone; Beugham, T., Newcastle-under-Lyne; Colborne, W., Chippingham; Cook, S., Henrietta Villas, Bath; Cresswell, O. E., 51, Edwards, A., Dresden, London; Fane, W. D., Southwell, Notts; Fisher, Mrs. S., Coleshill-street; Griffith, W., Melbourne; Guy, Miss, 49, High-street, Portsmouth; Hadden, T., Gosport; Hewitt, H., Singapore; Hooper, A., Broad-street; Huxley, E. B., Victoria; Huskisson, W., Mecklenburg-square; Mullaney, J. R., New York; Newton, E. H., Scarborough; Nicholson, W., 2, St. Andrew's, London; O'Connell, W. B., D., Southwell; Pilefer, E., Walbrook-buildings; G. C. Smith, E. S., Havestock-hill; Stewart, Capt., Newcastle-under-Lyne; Sully, F. M., Derby; Taylor, J., Gas Office, Oldham; Thomas, E. B., Bronre, Sicily; Webb, W., Burton Lodge, Lewisham.

Entitled each to a Set of Photographs from the Society's Trips.—Adams, Mrs., Falcon House, Croydon; Alexander, A., Bristol; Allen, C., 69, Basinghall-street; Allford, S. O. J., Blackfriars; Alford, R. B., Gosport; Ashford, H., 11, Hampstead-road; Barr, General, G. 23, Charing-cross; Casan, G., Blanyddol, Breanod; W. H., Bristol; Clark, W., 15, Highbury Park; Cobby, W. T., Malton; Croft, G., 11, Gloucester-place; Crofton, F. M., Bristol; York; Copp, K. Ross, Herefordshire; Dais, Mrs., Edinburgh; Drake, A. J., Sierra Leone; Dunlop, Miss, G. Torrington-square; Eastley, M. K.; Sutton, J., Ekeott, H., Clevedon-villa, Horsey; Eynald, W. S., Valetta, Malta; Fell, Alfred, Hotel St. James, Paris; Field, J., Mauldings; Gierck, E. J., Canterbury, New Zealand; Giblin, J. J., Geelong; Giblin, Chas., Judd-street, Bristol; Greening, Miss, Regent's Park; Herman, Dr. J. Z., Cape Town; Hill, Mrs. E., Croft Hall, Weyfleet; Hodges, O. H., Leicester; Horrymouth; Humphreys, N. E.; Hudson, G., Monkwearmouth; Hurst, E., Wakefield; Irons, C., Blackfriars; Jones, J. S., Bolton House, Taunton; Lamb, H. W., Oreat Malvern; Lane, E. B., Baldwin-street, Bristol; Latensche, Lawrence, W., East Keswick; Long, F., Cranwell; Lupton, W. R., Melbourne; Mann, T., Windchore-hill; Mansel, F. R., Doncaster; Mayo, W., Friar Whaddon; Money, J., Doncaster; Mowbray, A., 77, Lombard-street; Morris, J. W., Buckhurst-hill; Mortimer, Rev. R., Sunderland; Mould, J., Leeds; Nicholson, Miss E., B. D., Great Northern Road, Epsom; N. S., Collington Park; Rees, R., Barbadoes; Rosenbusch, T., Sierra Holborn-hill; Smith, J., Goswood, near Selby; Spindler, W., Powis-street, Woolwich; Stewart, G., D. D., Alton; Flantz; Sweet, F., 5, Gray's-inn-passage; Taylor, Brighton; Taylor, W. W., Norwich; Tharazza, E., 24, Mark-lane; Thompson, S., 24, Leadenhall-street; Timperley, R., Post-office, Darwin; Todd, J., Helton-le-Hole; Wallace, C., Wote-street, Basingstoke; Ward, Dr. M., Markham-square; Wood, E. J., Fenge-road, Newwood; White, E., New Bond-street; White, E., Melbourne; Yardley, Miss L., Blandford-square; Yate, F., Gosdaming.

Popular convictions are too often only popular delusions, but the influence of the various vicissitudes of temperature and weather upon health, can scarcely be over-estimated; although our information as to their various conditions, which tend to raise or lower the general mortality, is still very incomplete. The aocial problem to be solved is so to frame our manner of living as to counteract the effects of the elements over which we have no control. The weather during last quarter, if we may judge from the result, was not, in spite of its severity, particularly unfavourable to the public health. Almost unprecedentedly severe during the greater part of January, with two of the most rapid thaws ever known following throughout the country rose rapidly, but the thirty-five days following the second thaw, which occurred on the 29th of January, were the warmest series experienced at that time of the year since 1778, and the temperature averaged a daily excess of 7° Fahr. Under the influence of this weather the death-rates decreased, and although they were somewhat raised again by the cold weather in March, the mortality for the last two months of the quarter was considerably below the average.

The first, or, as it is styled in the Registrar-General's returns, the winter quarters of the three years 1864-6, were all excessively unhealthy, the annual rate of mortality per 1,000 in England and Wales being respectively 27.7, 27.2, and 26.5. In the first quarter of this year it was 25.5, agreeing exactly with the average rate in the corresponding quarter of the ten years 1857-66, but still in excess of the rates prevailing between 1857-63. The difference between the town and country death-rates during last quarter was much as usual. The town districts include all the chief towns and an enumerated town population in 1861 of nearly 11,000,000; but the death-rate last quarter was 27.3, against 28.8, 28.8, and 27.7 in the years 1864-6. In the remaining districts of England, comprising all the small towns and rural parishes, and a population in 1861 of rather more than 9,000,000, the death-rate was 23.2, against 25.1, 25.2, and 22.5 in the same period of 1864-6. In comparing a long series of years, it is in the death-rates of town districts that the greatest fluctuations are to be observed; and it is beyond doubt that the death-rates of towns can be more easily controlled from the possibility of carrying into effect such sanitary necessities as main drainage and a wholesome water-supply. In the series of ten years, 1857-66, above alluded to, 1866 was by far the most unhealthy year, but the entire excess was confined to large towns; for, whereas there the mortality was 2 per 1,000 above the average, no excess appeared in the rural and small town districts. Bearing this in view, we shall now principally confine our notice to the table in the Registrar-General's Quarterly, which furnishes the vital statistics for the quarter, relating to thirteen of the largest towns in the United Kingdom, estimated to contain in the middle of this year a population of something more than 6,000,000 of persons. One succeeded in permanently reducing the death-rates in these large towns, and not only will the general average rate in the whole country be thereby reduced, but the sanitary energy and intelligence which will be brought into play before that effect can be produced will stimulate the rural and country districts to similar efforts, which cannot fail to bear fruit in a higher standard of health.

In the first thirteen weeks of the year in this population of six millions, comprising thirteen large towns, including London, 59,951 births and 44,528 deaths were registered, showing a natural increase of population by excess of births over deaths of 15,423. In the same period of 1866 the births were 1,400 less, while the deaths were more numerous by 1,924, showing a balance of births over deaths less by 3,324 than in the quarter recently ended. The annual birth-rate per 1,000 in the whole of England and Wales last quarter was 37.1, but in these thirteen towns it was 38.9. In the different towns it varied from 36.5 and 37.2, the lowest in Edinburgh and Manchester, to 42.6 and 43.5 in Glasgow and Leeds. The birth-rate in Dublin is returned as only 28.1; but there is too much reason for believing that in that city the registration of births is still far from complete; no reliance can, therefore, well be placed upon it. The death-rate for 1,000 in the thirteen towns was 28.9 per 1,000, against 25.5, the general rate in the whole of England and Wales, and 27.3 in the entire urban population of the

country. In the same thirteen towns, the rate during the first quarter of last year was 30.5. In London, which includes just half this population of six millions, the death-rate last quarter was almost the same as in the first thirteen weeks of 1866; and Glasgow, Newcastle-upon-Tyne, and Dublin were more unhealthy last quarter than in the same period of 1866; but in the nine other towns the improvement was very marked, and was greatest in Liverpool and Leeds, which were the two towns that had suffered most severely from their neglected sanitary condition.

The thirteen towns are arranged below in the order of their rates of mortality during last quarter, from the lowest, showing also the rate in the corresponding quarter of last year:—

	Annual Rate to 1,000 living in 1st Quar. 1867.	Annual Rate to 1,000 living in 1st Quar. 1866.
Hull	25.2	27.8
Birmingham	25.4	30.7
Bristol	25.5	32.3
London	26.3	26.7
Sheffield	27.3	33.4
Leeds	29.4	36.9
Edinburgh	29.5	30.1
Salford	31.4	33.3
Liverpool	33.3	45.9
Glasgow	33.4	31.4
Manchester	33.8	37.8
Dublin	34.6	30.5
Newcastle-upon-Tyne	37.1	31.6

The cholera epidemic of last year, although far less generally fatal than previous visitations, assumed grave proportions in many of our large towns, besides the east end of London, and made its presence felt in many parts of the country far into the late autumn, and even into the confines of winter. Observers of the course of previous epidemics argued from this that we should in all probability have to combat a renewed appearance of the disease in the ensuing summer. An outbreak of cholera during last quarter in the St. Nicholas sub-district of Durham, which was fatal in thirty-five cases, appears unfortunately to give great additional weight to this prognostication. Our large towns, therefore, both those which suffered last year, as well as those which, through having then escaped, may thus be inclined to presume on a fancied security, should take warning in time, before we have the hot weather upon us, both fully to carry out the sanitary improvements to which they were last year stimulated, and by an effectual system of visitation to discover and remedy any of the causes which are at work to produce the low standard of health in their most crowded neighbourhoods; these are the hotbeds which force zymotic diseases into epidemic.

No one without a knowledge of the sanitary movements in our large towns during the past year can fail to feel a satisfactory conviction, if such a conviction had before been wanting, that in no cases have the expenditure of energy and money upon the sanitary improvement of our large towns, taken place without a reduction in the death-rate. Liverpool, from its previous deplorable condition, shows the greatest improvement; there the measures adopted during last year were not only successful in preventing a greater loss from cholera, but in the first quarter of this year the death-rate was 33.3, against 45.9 last year. This important decrease is due in a great measure to the subsidence of an epidemic of typhus which had prevailed in Liverpool for several years; this disease, which carried off 729, and 630 deaths respectively in the first three months of 1865 and 1866, was only fatal last quarter in 175 cases; this was, however, still in proportion to population double the mortality from the same cause in London. We recently, in noticing the medical officer's (Dr. W. Trench's) annual report on the health of Liverpool, had occasion to dwell upon this typhus epidemic; there is every reason to believe that, under the same sanitary activity, it will continue rapidly to decline. Leeds, which for the first time last year appointed a health officer to superintend its sanitary condition, and during the year had nearly twenty miles of new main-drainage laid down in the town, can only have to regret that these measures were not taken sooner, for the death-rate which in the first quarter of 1866 was 36.9, fell to 29.4 in the past three months. Bristol and Hull in their low death-rates testify to the success of their sanitary arrangements, which are well organized and efficiently carried out, although it does not appear that the latter possesses an actual officer of health. Birmingham is naturally one of the healthiest towns in England, and there is little doubt but that with the same sanitary activity to which less favoured towns have been stimu-

TOWN DEATH-RATES IN THE FIRST THREE MONTHS OF 1867.

With very few exceptions the rate of mortality in the first quarter of the year, but especially in town districts, may be taken as a reliable index of the mortality for the whole year. During the ten years 1857-66, the annual rate of mortality for each year invariably followed an increase or decrease of the death-rate in the first quarter. The information, therefore, to be derived from the quarterly return of the Registrar-General, just published, relating to the health of the large towns of the United Kingdom, during last quarter, is of special interest; and it is satisfactory to find that, unless the present year form an exception to the rule above laid down, it will produce a lower death-rate than has prevailed in our town districts for several years.

lated, the death-rate might be reduced nearly to the healthy district standard. Of the English towns, Manchester and Newcastle have yet much to do. The latter town has for more than six months suffered from an unusually fatal epidemic of scarlatina, which carried off in that time more than 600 children, in addition to a considerable mortality from typhus and typhoid fevers, and whooping-cough. The registrars, in their remarks appended to their returns, draw a picture of the condition of certain parts of the town which completely destroys any astonishment at such a fatality. One of the registrars states that "in the parish of Christchurch alone there are seventeen un paved streets, together with a large number of back lanes, &c., although some of the streets have been built for upwards of twenty years;" and further on, that in some of the streets which had suffered most severely from scarlatina, "there were no less than 7 or 8 in. of standing water and liquid filth in the cellars or underground-kitchens; the upstairs-rooms being occupied by four or five families in each house." The local press has proved itself thoroughly alive to the importance of the terrible waste of life which has of late taken place in the town, and as a proof of their acknowledgment of the only remedy likely in such neighbourhoods to prove satisfactory, one of the most influential newspapers in the north of England has offered premiums for the best essay upon the method of improving the dwelling-houses of the working classes. A public-health committee exists in Newcastle, and they appear to have been unremitting in their exertions to improve the condition of the town; but we fear that with the limited power which they possess, the state of things is too serious to be altered materially by ever so active a removal of nuisances, in the ordinary acceptance of the word.

In glancing through the registrar's notes for the quarter, two things attract attention which are worthy of notice: the first is an increasing prevalence and fatality of smallpox in almost all parts of the country, and a consequent conviction of the unsatisfactory working of the present Vaccination Act. The second is of a far more encouraging nature; it is, the general activity which is at last beginning to be shown, by parishes, townships, and even villages, through their local health committees, in examining their sanitary condition, and insisting upon its improvement. These efforts are now, in most instances, well supported by the ratepayers and residents, instead of being met by that active opposition, or stolid indifference, which has so long rendered them ineffectual.

On the whole, the quarterly report upon the present sanitary condition of our large towns, besides showing a lower rate of mortality to have therein prevailed than from the severity of the weather might have been expected, presents many encouraging features; and by conclusively showing the benefit that many towns have already reaped from more active sanitary supervision, will, it is hoped, stimulate those towns who now find themselves at the bottom of the list with excessive death-rates to imitate their example. There is therefore little reason to fear that the year 1867 will form an exception to the rule mentioned above; and we may trust that, following the reduced mortality of its first quarter, the whole year will prove, more particularly in town districts, the healthiest we have had for some time.

THE ARCHITECTURAL EXHIBITION.

At the opening conversations of the Architectural Exhibition, Conduit-street, on Tuesday evening last, Mr. Beresford Hope made an address, in which, after some prefatory words, he said: To-night we represent two societies rolled into one. The Architectural Exhibition Society, which, as you know, has thriven and increased, and widened and deepened its roots, has every year given a course of lectures. Another body, which is now vagrant and wandering over the world—the Architectural Museum—has also given its course of lectures. On account of the Architectural Museum being unlicensed, and offering no prizes this year, it has agreed to combine with the Architectural Exhibition to give a joint course of lectures. That joint course will be given in connection with this Exhibition, and this evening starts the season—a season which we all hope will be full of pleasurable recollections and of much utility to the development of architectural art. The com-

mittee must allow me to congratulate them on the goodly show we have in these two rooms; on this collection of drawings that we see on our walls; on the crowded collection in the next room, embodying the great competitions of the past year; and on the many very interesting sketches from the School of Design in connection with the Architectural Association. I believe I may add that if our wall-space had been greater than it is, the number of drawings produced would have been more numerous. I do not want to-night to dwell on the old common-places which we all know so well—on old worn-out—I do not mean to say worn-out in practice, but in preaching—principles of art. I would rather to-night invite all those who are present to do what in commercial language is called "taking stock" of what they know and what they do not know of architecture. I am now addressing those who are not architects nor artists—the visitors here to-night. We come every year to exhibitions like this: we see some drawings that are very pretty and others that we do not like, and we are apt to pass a very hasty and ill-considered judgment upon them. I wish to call upon you with one heart and one mind to recognise and appreciate this fact, that an architect is not a landscape painter; that the pictures you see upon these walls, though they may give you very telling, very pretty, and very dashing impressions of buildings, are in no sense, of course, the buildings themselves, and in still less a sense are they those types and models of buildings of which they stand in lieu to those who wish to ascertain what they are. The mere sky-line, the outline, the decorative form, is very important; but unless these are obtained with a due regard to the utility and all the conveniences required in the internal structure, they are but as the sounding brass or the tinkling cymbal; and therefore I call on every one here present who is not an architect nor an artist, but who is a friend and a visitor, to deal with all architectural designs that may come across you in a more forbearing and a broader spirit than is often the case. I do not tax you with the absence of either of these qualities, but I do call on those of you who are not architects to realize how much there is in the architectural profession which never meets the eye—how much boring under ground, how much dexterous arrangement of the walls, how much dexterous arrangement of materials, and how much dexterous arrangement of the chimney-stacks. You may perhaps say, "Why on earth was such and such a building carried out in that way, when such and such another form would have been much better, more graceful, more convenient, and more picturesque." This is all well and good: it might have been all that you say, but then the price at which you would have purchased all the picturesque which you require would probably have been that there might have been a chimney-stack which would either have brought the house down with a run, or else have set it on fire. So, again, with many other arrangements—arrangements of rooms, the distribution of floors one above another, the arrangement of attics and the arrangements for intercommunication from one room to another. I point these things out to you because, looking round this room, I cannot help imagining that there are many people present who, with a sincere love of architecture as a pictorial art, have not yet learnt fully to appreciate or to realize the troubles and difficulties of the architect as a practical man. Upon this point many persons are in a somewhat similar position to that of a young lady who is about to be married, and who cannot understand why those stupid lawyers are hothering so long over the settlements, and keeping her waiting meanwhile; or they are like a patient who, expecting to get well, abuses the doctor if every successive dose does not produce a perceptible advance towards health which he wants to attain. The architect is no more master of time or space or material substance than is the lawyer or the doctor, or any other professional man. And now I will turn to our architectural friends, and as I have invited the public to-night to appreciate with a broader and more forbearing consideration what the difficulties of architects are, I must call on the architectural world to realize also on its part the great breadth and extension of the intellectual and critical outside public. A hundred years ago or more there were no exhibitions. We have ourselves started these exhibitions. There was then no art journalism; we have ourselves started

art journalism; but having ourselves started both exhibitions and art journalism, we are bound to acknowledge that that which we have started is an exacting, and I trust not an unjust—I trust taken generally, taken all round, not an ungenerous taskmaster. However, it is a taskmaster, as I have said, that we have created for ourselves, and therefore it is a taskmaster we are bound to recognise, to respect, and to obey. I repeat, it is well for us that things should be so—it is well for us that there should be that criticism. Formerly, in the days of the Athenian School and downwards, there was a small narrow self-satisfactory few who laid down the rules of all art and all proportion, and who confined, so to speak, the science of architecture to the shuffling of a small pack of cards, within a very limited number of figures. That, however, has been dispensed. We have seen that form, beauty, proportion, consistency with local requirements, exist in other styles, and are indigenous more or less in every civilized land. Carrying out this idea, we have created this school of criticism and of outside judges for ourselves. If we had not done so, if we had developed our own free ideas, and yet had used those free ideas as a sort of advanced shibboleth of our small clique, as a sort of higher order of Freemasonry within the existing masons,—what would have been the result? We probably should have run into fantastic developments and incurred novelty. I am speaking as from the stand-point of our generation, as one who has sympathized, and who will continue to sympathize most deeply, with that movement, which is known as the Gothic movement of our day, yet who does not fail to recognise all that is good and beautiful, and old and true, in that classical school with which it is contending now for the mastery. If we had not that outside public, we should have run wild in fantastic novelty. As it is, we are bound to be original and to combine, we are bound to develop and not simply to throw up new and strange forms because they are strange, and to fancy that their novelty and strangeness should be merits in the eyes of the present generation. This I say, to us who are mixed up in architecture, is the benefit of an Exhibition like the present. Novelty in an Exhibition like this should be duly placed. Newfangledness should be placed on its own level. There may be some forms which none of us ever dreamt of, but which when we see them may cause us to say, "How can it be that we should never have thought of them before?" It is possible we may say, when we see them, "We never saw them before and we hope we may never see them again." It is in these Exhibitions that things are brought to bear the test of one or other of these two criticisms, and so we shall go on. The contest between the two schools—the Gothic and the Classical—is fairly set on its legs, and cannot be settled on either side. The only method of obtaining a triumph on one side or the other is that each style shall work out all its own merits to the utmost, and where it finds a point in which it is deficient it shall not be ashamed to borrow the developments of the other. The old school of architects, whatever may have been their defects, travelled and studied, read and thought. The new school of architects, no doubt, do the same; but let neither school believe that it has read and studied and thought so much that it may sit down content to eat the lotus of its own garden of self-indulgence. It must think and study, and travel, and work more and more. Convinced as it may be of its own merits, it must show its conviction by an ample realization of the merits it finds elsewhere. To take the question of this Gothic development. No doubt, some of the earliest and most eloquent writers on that side spoke with vigorous one-sidedness. They were right in doing so. No leaders of movements ever produce an impression without being vigorously one-sided; but the time comes when you must be equally vigorous and yet two-sided. That time has come now, and in this Exhibition we see the contest of the two schools. One side may have to learn more than it has learned before of the advantage, the dignity, and the beauty of well-ordered regularity; the other side may have to learn the infinite grace and variety of a broken and aspiring sky-line—the advantage of the style in which outside follows suit to inside, and inside is taught to carry out the regularity of outside. None of us, I hope, are so faint-hearted that we do not from time to time form some idea of a perfection that may ultimately be realized, when all differences may be at an end, and when there

will be some grand and beautiful, some wide and broad development of art, such as the world has never yet known, which will unite in itself all the beauties of every antecedent style, but none of their defects. I do not say that this great idea will be attained. Perfection may never be reached in this world; but that man's heart heats slow, and that man's blood runs thick and heavy, who does not at least sometimes set up this great ideal before him. Then I say to you, Work up to that ideal. One of you may think he is working up to that ideal in adopting the Gothic; another may think he does it in adopting the Italian, or the Grecian, or the Renaissance. I say, Let all of you work up to that ideal; and if you do work up to it with a true heart, an honest conscience, and an earnest endeavour, you will more and more develop all that is good in your own style, and throw out all that is weak and defective; and as you do so, although you do not know it, you will work nearer and nearer to each other. If you attempt to make a sort of fictitious picture, with a piece stuck in here for one thing and pieces stuck in there for something else, merely to produce a pattern design, so that you may say, "See how independent I am, because I am so eclectic," you may be eclectic enough; but you are not independent. You will be merely walking about in a parti-coloured coat of shreds and patches. But if every one works up to his own ideal, and in the belief that he is carrying out that ideal, anything he takes from any other style is not a surrender to an opponent, but is a usurpation unto himself of what he saw good elsewhere, an enlargement of his own boundaries, a deepening of his own foundation. I say that whether the style you work in be the right or the wrong style, you will be right and you will more and more approach to the consummation of all art—the prospective unending of that ideal which may never be unveiled to us in this world, but towards which we should never cease to strive. I ought perhaps to apologize for having run on so long in this strain; but I felt that on an occasion like this I ought not to enter into anything like a criticism of drawings upon the walls, because it would have been a one-sided, unfair, and hasty criticism. If I had done so I might have praised this—and there is a good deal to praise—or I might have found fault with the other, because of course the designs are unequal, and in doing so I should either have given pain, which I do not want to do, or I should have given praise, which would have been hasty. I will therefore run on with a few ideas which refer no more to this Exhibition than to the Royal Academy or the Exhibition at Paris, or to any other place where the drawings of living architects are hung on the walls. We live in an age of great study, of real learning, and of more deep archaeological investigation than any other age, on the one side, and of more free and unfettered fancy on the other side. We live in an age of great hopes and expectations, on the one hand, while on the other hand we live in an age when we are beset with great dangers. We are either to be the most sublime inventors or to make a terrible *fiasco*. I hope and trust it will be the first, but I do not set myself up as a simple praiser of this generation. I see our merits, but I see that they are akin to certain faults and dangers, and I have therefore endeavoured to speak without having any single individual in my eye. I might have talked more intelligently, and more to the purpose if I had tried to be personal, but I have not tried to be personal; I have shot over all your heads, and have referred to certain great ideas and great dangers, endeavouring to encourage you to the attaining of certain great advantages to this generation. I believe that Exhibitions like this one must help on the good cause. We see what is well done, and we praise it. We see what is not well done, and I trust that we deal kindly and indulgently with those whose intentions may be better than their performances. We meet together and exchange ideas; we criticize, we plan, and we praise. Praise is, after all, criticism and friendly advice; but all this tends to the development of art—of that art and that science which we have made our own. All this tends to the belief that those of us who may live a few years longer may see many wonderful developments; and here, perhaps, you will allow me to quote an anecdote which I heard last night within these walls. The narrator of this anecdote was my friend Professor Lewis. He was presenting some relics in connection with Rickman, and he said that forty years ago Rickman had designed a Gothic window for a church at

Birmingham. That window had to be modelled there full size, and sent down to Birmingham and there executed in cast iron, because, in the first place, there was no one in Birmingham who could understand a working drawing forty years ago, and, in the next place, there was no stone carver who could have carried it out. When we see what has been done in London in the Houses of Parliament and elsewhere, and remember what cause have we not for hope and exultation for the future of architecture in England,—if only we reserve our power in proportion as we feel ourselves strong,—if, refusing to be strong, we determine to be moderate,—if also we determine to be original but not fantastic, earnest but not breathless, truthful but not ecstatic,—above all things seeing that beauty is utility, and that everything that is useful ought to be beautiful. Ladies and gentlemen, I welcome you to the opening of the Architectural Exhibition for this season.

On the motion of Mr. Lamh, seconded by Mr. Edis, a vote of thanks was given to Mr. Beresford Hope for presiding.

SIR GEORGE HOWLAND BEAUMONT,
BART., PAINTER, POET, PATRON.

At a time when the nation is busy about a National Gallery for its rich and increasing stores of pictures, a page or two about the greatest benefactor our gallery has had will not be out of place. Prime Minister Lord Liverpool was induced by a bribe to buy for the nation the Angerstein Collection of pictures. "Buy Mr. Angerstein's collection, and I will give you mine," said Sir George Howland Beaumont, Bart., painter, poet, patron.

In the transaction of obtaining the Beaumont Gallery for the nation, the late Lord Dover (then Mr. George Agar Ellis) was the moving spirit. What part Mr. Agar Ellis played in it we shall allow him to tell in his own words. His autograph communication to Allan Cunningham on the subject is as follows:—

"One of the objects Sir George Beaumont had the most at heart was the establishment of a national gallery for pictures. He was constantly, during the years 1821, 1822, and 1823, talking to me on the subject, and urging the various reasons which rendered such an institution desirable in this country, in all of which I concurred. He frequently begged me to speak to Lord Liverpool, then Prime Minister, about it, and always assured me that he would give his own pictures to the nation as soon as he saw a place allotted for their reception. I, in consequence, took several opportunities of mentioning the subject of a national collection of pictures to Lord Liverpool, who always received the suggestion favourably, but generally ended by either throwing cold water upon the project, on the score of expense. I also frequently urged the same point to Lord Aberdeen and Lord Farnborough, and Sir George did the same; but still, nothing was done. At length Mr. Angerstein died, and it was understood that his pictures were on sale. This was in the year 1823, and great fears were entertained that either the King of Bavaria or the Emperor of Russia would buy them, and that they would be lost to this country. Upon this Sir George again spoke to me, and we agreed together that now was the moment to press for the gallery. I again urged Lord Liverpool, but nothing was done.

At length, towards the end of the session of 1823, I determined, with the concurrence and as all other means had failed of bringing Ministers to a favourable decision, to mention the subject of the Angerstein Gallery, and of the purchase of money; as I thought that if the temper of the House declared itself in favour of the acquisition, the Ministers could not, for very shame, avoid it. I did not mean to say that they were not favourable themselves to the plan, but that they were so timid and frightened at Home, that they could not bring themselves to a decision. Accordingly, on the 1st of July, 1823, I took occasion to vote for money for the new library at the British Museum, to state how anxious I was to see a national gallery of pictures established. It then alluded to Sir George Beaumont's promise of giving his collection to the public, and eulogized his conduct, and afterwards gave some account of the Angerstein collection, and of the danger there was of its being taken out of the country;

and finally gave notice that if Ministers did not in the meanwhile purchase it, I would myself make a motion to that effect at the commencement of the next session of Parliament. Mr. Stuart Wortley (now Lord Wharfedale), Mr. Alexander Baring, Mr. Hudson Garvey, Mr. William Smith, and, I think, one or two others, spoke in favour of my proposition. The feeling of the House was so evidently with me that the point was gained."

Lord Dover thus continues:—

"During the recess the Government bought Mr. Angerstein's pictures, and the National Gallery was established. I have gone into this detail in order to explain Sir George's letters, which are written subsequently to the discussion in the House of Commons, and which show his great anxiety upon the subject. I am indeed quite certain that without his persuasions and encouragement, and the permission he gave me to announce formally the donation of his collection to the nation, I should never have had the heart to do what I did,—so discouraged was I by the delays and vacillations of the Government. I have been anxious that you should know the part Sir George had in this transaction respecting the National Gallery, first, because it is highly honourable to him; and, secondly, because it is something of an event in a life of such amiable and retiring tranquillity as his was."

His lordship concludes with "something about Garrick:—"

"His allusions to the prints of Garrick relate to two engravings of Garrick which were executed by Reynolds* under his inspection and correction, and which he was anxious to have engraved because he considered them the two best likenesses of that great actor extant. They are after Dance and Zoffany, in the characters of Richard III. and Ahel Dragger. You probably know them.—"

I may here observe that we have no other such inimitable painters of theatrical scenes as Johan Zoffany and George Clint were and are. Zoffany is on his throne at Lord Carlisle's Castle Howard, in Yorkshire; and Clint on his throne in the Charles Mathews Gallery, at the Garrick Club. Zoffany lies at Kew; Clint, at Kensal Green; both with monuments.

Sir George Beaumont was the intimate friend of Wordsworth, of Southey, and of Coleridge, of Wilkie and of Chantrey. He was the first to foresee and encourage Wilkie's talent. He had the taste and luck to secure the inimitable "Blind Fiddler" of the boy in London raw from Scotland. He encouraged Haydon; and had that wilful, headstrong man allowed him, would have shaped a different destiny to the star (as seen but by himself) which led him astray. Beaumont was the first to foresee and to patronise the rising genius of Gibson, the sculptor.

What Southey thought of him he has told in a letter to his schoolfellow Wynn:—

"Sir George Beaumont's death deprives me of one who had been for many years more than a mere acquaintance. Indeed, ever since I came into this country [Kewick] I have kept up an intercourse with him from time to time; and if my habits had led me much from home, or my occupations and circumstances allowed of absence from it, there are few houses at which I should so often have been a guest as at his. When we parted last year [1826] at Lowther, his life might have been deemed a better one than mine, notwithstanding the disparity of years; for he had no one infirmity of age, and seemed likely to have been as long lived as his mother, who was much beyond ninety when she died. Few men have been so happy in all respects; he had never known any serious affliction, and was in full possession of all his faculties and capacities of enjoyment at the moment when the stroke came, which produced stupor, insensibility, and in a few days death, without any consciousness of struggle."

Chantrey's very fine bust of Wordsworth was a commission from Sir George Beaumont. The poet, whose vanity is well known, was proud of the bust, and gave or applied for so many for his friends, that the Chantrey price of casts of it was reduced, through the intercession of Allan Cunningham, from five guineas to three guineas. My father's sharp and well-selected cast of the bust is in the room in which I write.

Portions (only) of the following letters have

* S. W. Reynolds, the master of Samuel Cousins, and the engraver (in small—but in a great way) of Sir Joshua's works.

appeared in print. They are here in their integrity:—

Sir George Beaumont to the Hon. Geo. Agar Ellis, afterwards Lord Dover.

"Cole-Orton Hall [Leicestershire],
Nov. 1, 1823.

My dear sir,—I thank you most sincerely for your very kind letter, which was, in the first place, most acceptable as a mark of your remembrance of me, and also because it gave me the first intelligence of the progress of our little tribute to the memory of Garrick. For Reynolds, although he faithfully promised not only to write but send me a proof, has never sent me a line. However, I have known him long enough to be aware keeping promises is not in the list of his favourite virtues. But he is a clever fellow, and, if we can keep him up to the collar, I have no doubt we shall be satisfied. You have proved yourself so sincere a friend to the arts that I dare say you have heard a report that has reached me that Lord Hertford is in treaty, and likely to purchase Angerstein's pictures; but that, if he finds the nation will buy them, he will give up his claim. I hope the latter part of this report is true, and that the country will purchase. You manifested such sincere and laudable zeal to bring this about that I have great hopes you will carry your point; certainly, I had rather see them in the hands of his lordship than have them lost to the country, but I had rather see them in the Museum than in the possession of any individual, however respectable in rank or taste. Because Taste is not inherited, and there are few families in which it succeeds for three generations. My idea, therefore, is, that the few examples which remain perfect can never be so safe as under the guardianship of a body which never dies; and I see every year such proofs of the carelessness with which people suffer these inestimable relics to be rubbed, scraped, and polished, as if they were their family plate, that I verily believe that if they do not find some safe asylum, in another half century little more will be left than the bare canvasses.—I am, my dear sir, your obliged and faithful

G. H. BEAUMONT."

From the same to the same.

"Cole Orton Hall, Jan. 27, 1824.

My dear Sir,—Our friend Knight has informed me Parliament has resolved upon the purchase of the Angerstein collection. This, I am sure, gives you pleasure; and, as I shall always consider the public greatly indebted to your exertions on this occasion, I hope you will pardon my troubling you with my congratulations. By easy access to such works of art the public taste must improve, which I think the grand desideratum; for, when the time shall come when bad pictures, or even works of mediocrity, shall be neglected, and excellence never passed over, my opinion is we shall have fewer painters and better pictures.

I think the public already begin to feel works of art are not merely toys for connoisseurs, but solid objects of concern to the nation; and those who consider it in the narrowest point of view will perceive that works of high excellence pay ample interest for the money they cost. My belief is that the 'Apollo,' the 'Venus,' the 'Laocoon,' &c., are worth thousands a year to the country which possesses them.

I have heard nothing of our Garrick plan from that not gay, but sad deceiver, Reynolds, except what you were kind enough to communicate, although he promised to send me proofs in every state; but as you have seen the proofs, and are satisfied, I am not much concerned.—Excuse this trouble of zeal, and believe me to be, my dear Sir, much obliged and sincerely yours,

G. H. BEAUMONT."

From the same to the same.

"Cole Orton, Feb. 9, 1824.

My dear Sir,—If I have been fortunate enough to hit upon anything which has lighted up a train of thoughts in your mind, I need hardly say the slight hint is completely at your service. I am only afraid your adoption of it will be more likely to make me vain than to displease me, and I should have written to tell you so by the return of the post, but I waited, rather, I confess, from the hope than the expectation of receiving the prints from Reynolds,—the faithful Reynolds, whose saints, I am charitably bound to believe, are all sad sinners, so that I suppose he absolved himself from the crime of perjury as the man did who slyly kissed the *Monthly Review* instead of the Testa-

ment. Be that as it may, although it would have been a gratification to me to have seen the prints, yet, as they have been executed under your eye, and I know he can do them justice if he pleases, I am quite easy on that ground. Your remark on the wonderful power of change in the countenance of that Proteus, Garrick, is excellent. I believe Shakspeare and Garrick are the only persons who have had it in their power to make it impossible for their admirers to decide whether their tragedy or comedy was most excellent. Garrick is before me at this instant. I see his quick eye, and hear the electric tones of his piercing and rapid utterance. Other actors are men of slow proceedings, but he was like the lightning. It is quite impossible to form an idea of the sensations he conveyed, whether he chilled you with horror or convulsed you with laughter. Other actors may be compared, perhaps, to Orway or Rowe; but Garrick alone was Shakspeare.

I am indeed rejoiced to hear of the complete recovery of our friend Jackson,* whose life is as good as his works. I have known him from his onset; and I verily believe no human being ever was more free from envy, hatred, malice, and every bad and unkind passion than he is.

There is something mysterious in the delay of Lawrence's Exhibition: it is certainly impolitic; there must be some impediment we are not aware of.—I am, my dear sir, with much regard, yours truly,

G. H. BEAUMONT.

Have you seen [Payne] Knight's late acquisition of *Claude's drawings*; it is the most numerous of any collection, except that of the Duke of Devonshire, and he writes me word they are of the first quality."

From the same to the same.

"Cole Orton, March 13th, 1824.

My dear Sir,—I cannot say how much I feel obliged by your very, very kind attention, and I hope soon to tell you so in person, to which I look forward with great pleasure, when I come to London.

I always quit the country with regret: it snits my time of life better than 'the busy haunts of men'; and were it not for a few but very kind friends I could be content to pass the time that remains to me almost entirely in retirement. As you have interested yourself so kindly in Coleridge's behalf, I cannot refuse myself the pleasure of inlosing a sonnet of his, made almost extempore many years ago at the house of Bowles, his brother poet, after hearing one of the Linleys play on the violoncello. Perhaps you have never heard it, for I rather think it has not been printed, and I hope this 'taste of his quality' will not diminish the pleasure I am sure you feel for having been his friend on this occasion. It will be his own fault if this timely aid does not enable him to pass the remainder of his life in peace and comfort.

Again a thousand thanks.—Ever yours,

G. H. BEAUMONT."

I have said that Sir George was a poet. The fact was unknown to Allan Cunningham, or he would not have let such lines as these escape his commendation:—

"EPITAPH ON MY MOTHER.

The dreadful hour is come,—'tis come, 'tis past;
That gentle sigh, dear mother, was thy last;
And now, diffused among the bliss above,
Glews the pure spirit of maternal love;
Tinged by whose beam my very failings shone,
Graced in thy eyes with something not their own.
No more affection shall thy fancy cheat;
Or warp thy judgment when again we meet;
But every action in its native hue,
Rise undisguised and open to thy view.
May every action then be duly weigh'd,
Each virtue cherish'd, and each duty paid;
That when my trembling soul shall wing her flight
Through Death's dark valley to the Realm of Light,

I may expect where no false views beguile
The approving look of that accustom'd smile,
Ere I smile, becoming her sublime abode,
And harbinger of pardon from my God."

These lines are to be seen in the church of Great Dunmow, in Essex. He who wrote them did not associate idly with Coleridge and with Wordsworth. P. C.

LIGHTHOUSES.—We understand that the Government are about to undertake the construction of eleven lighthouses on various points of the Japanese coast, at the request of the Tycoon.

* John Jackson, R.A. See his Life by Allan Cunningham.

THE IRON PAVEMENT OF THE DOCKYARDS.

SOME time ago, being at Portsmouth, and noticing the fact that the dockyard was paved with iron pigs, we commented in various quarters on the costliness of such a pavement. If not *propter hoc*, at any rate *post hoc*, the matter speedily got attention, and a return was ordered by the House of Commons of the quantity so used, with the price originally paid for the iron, the quantity sold at various times, together with some other particulars. From this return it appeared that 31,011 tons were used as pavement, and the statement gave rise to considerable discussion, both in the House of Commons and out of it. On the one hand, it was stated that the iron was of the very best quality; whilst others maintained that it was almost valueless. We have insisted in a previous article* that any argument as to the value of a material based on the market at the time of purchase, must lead to erroneous conclusions. The first contract on record is dated March 29th, 1771; the next is dated July 15th, 1801; and the third and last, December 20th, 1815. The price under the last contract was 57. 8s. per ton for the eastern, and 57. 9s. per ton for the western, yards. No purchase has been made since 1826, from which we infer that a purchase was made in that year; but the Hon. Mr. Dundas states that it cannot be ascertained whether any ballast was supplied under the contract of December, 1815. It is certain that a large quantity was supplied some time in 1815, since the firm from whom it was obtained "repurchased from the Crown 1,000 tons of that which they then (1815) supplied." To make confusion worse confounded, Mr. Childers stated in the House of Commons, on the 3rd of August last, that some of this iron was bought during the Crimean war.

In spite of the show of candour with which these returns are made out, the Admiralty cannot, or will not, furnish definite particulars of any purchases of ballast. The return of May, 1866, implied, although it did not absolutely say so, that a certain quantity of this iron cost 57. 8s. to 57. 9s. per ton; and, as we showed in our former article, this was far below the market price of iron during the first quarter of the present century. But it is by no means *certain* how much, if indeed, any at all, was purchased at this rate. We believe that the true explanation of the supposed inability of the Admiralty to furnish detailed returns is, that about 50 or 60 tons of Admiralty papers have been removed to the Public Record-office, where we have no doubt the required information might have been obtained.

The dockyard authorities are of course very anxious to make out a good case, and to do this the director of works has drawn up an estimate of the cost of several descriptions of roads and tramways used in the dockyards. The one that finds most favour in his eyes is an "old pig-iron ballast-tramway, 3 ft. wide each rail (without concrete foundation), with granite pitching between rails," at a cost of 27. 11s. 8d. per yard run. On the other hand a way of "cast-iron tram-plates, 1 ft. 9 in. wide each, with granite pitching between, including concrete foundation," is estimated at 37. 15s. 8d. per yard run. This looks well, but on investigation it turns out that in the estimate for a tramway of old ballast, the iron is only charged at 11. per ton, whereas its average selling price, from 1860 to 1866, was 27. 7s. per ton. It is true that the director shelters himself behind an order of the Board, directing that old ballast issued from the Store Department to the Works Department, should be charged at this rate, but he has no such excuse for a subsequent statement in his report. He refers to his previous reports on this subject, dated July and September, 1865, in which he recommended the use of old ballast, "at its fair selling value, then averaging 11. 10s. per ton (net), provided it was transferred from the storekeepers to this department." Unfortunately for the director's figures, we find from the return of May, 1866, that 309 tons of ballast were sold in 1865, and that 7357. were obtained for it, being at the rate of 27. 7s. 6d. per ton.

In a previous memorandum, dated July 26, 1866, the director had given 41. 4s. as the cost per yard run of a tramway laid down with old ballast, or 19s. per yard more than the cost of granite. He urges in justification of the extra expense of ballast tramway, that the granite has

* *Builder*, vol. xxiv, p. 610.

hitherto required removing and redressing once in about seven years; and since the adoption of heavy armour-plating for ships, it needs renewal more frequently. On the other hand, the iron ballast does not shift, is not so easily displaced from its foundation, and the effect of wear and tear upon it is so slight as to be nearly inappreciable. To this it must be added, that the traction is much less over an iron than over a granite tram. There is no doubt truth in these arguments, but they are not strengthened by the director's delusive estimates. It was no doubt a clever piece of official cookery to order this iron to be charged at 1l. per ton to the Works Department, when it was being sold at 2l. 7s. 6d. to the marine-store dealers. But why 1l., why not 10s., or 5s. per ton? It is obvious that in this manner an estimate might be made to prove anything, according to circumstances.

An important part of a report recently issued is an account of trials made by Messrs. Ryland, of Birmingham, on samples of the ballast. These gentlemen state that the iron is of very varying quality, a fact which nobody doubted. In the case of the pigs sent from Devonport, there were no less than seven different sorts. They entertain no doubt of the superior quality of the iron, but at the same time they are of opinion that a very small proportion only is adapted for foundry purposes. It must be borne in mind that before any use can be made of this iron, it must be assorted, the quality of each pig being ascertained separately. This can only be done by breaking, which reduces its value at once to that of broken ballast. Messrs. Ryland do not furnish any estimate of the cost of this operation, nor are they prepared to make any definite offer, but simply propose to act as agents for the Admiralty, charging a commission of 5 per cent. on the sales, and to select the iron for re-manufacture, under the direction of the dockyard officers. The last proposition has evidently hurt the dignity of the Hon. Mr. Dundas, store-keeper-general. He views the intrusion of outsiders "for the instruction of the professional officers of the dockyards" with a proper amount of official coldness. Messrs. Ryland have had samples of the ballast converted, and the wrought-iron thus obtained is stated by them to be of very good quality; but they have not thought it worth while to back their opinion by any experiments on the metal. Portions of the iron were offered for sale at the Birmingham ironmasters' quarterly meeting, a week or two ago; but the prices asked, 4l. and 4l. 10s., were considered too high, and we believe that few if any sales were effected. It is unfortunate that Sir John Pakington did not accept the offer of Mr. Platt, the member for Oldham, who was willing to pave the yards with anything the then First Lord liked to name, and give 100,000l. for the ballast.

On the whole, the evidence is hardly enough to convict the Admiralty of very gross extravagance, for it must always be recollected that the iron is still in their possession. Mr. Seely has, however, done good service in repeatedly calling attention to the general management of the dockyards. The articles which figure annually in the accounts as "miscellaneous old stores" will bear a good deal of investigation. As an instance, we may mention a recent bargain, by which a fleet of six screw frigates and three screw line-of-battle ships, with their machinery and stores, were sold for 68,000l. This may be economical in the long run, but at first sight it looks very much like a case of "positively given away."

ON A COUNTRY HOUSE.

THE ARCHITECTURAL ASSOCIATION.

The ordinary meeting of members was held on Friday evening (the 26th ultimo) at the house in Conduit-street, Mr. R. W. Edis, the president, in the chair.

The following gentlemen were elected members of the Association: Professor T. Hayter Lewis, Mr. H. Jervis, Mr. Sydney W. Lee, Mr. W. White, and Mr. Alexander Paynter.

A vote of thanks was passed to Mr. E. M. Barry for his kindness in allowing the members to inspect the new railway hotel in Cannon-street, and for his courtesy in accompanying them over the building.

The Chairman stated that among the subjects to be discussed at the next general business-meeting would be the Address of the "General Builders' Association" and the minutes of the last meeting of the Architectural Alliance.

Mr. Florence announced that the water-colour class had been filled up with one exception, and that the first out-of-door meeting of the season would be held on Saturday, the 11th of May.

Mr. Henry Curzon then proceeded to read some practical notes on the erection of a country-house. He observed, in commencing, that he would not presume to lay down what should be the style of a country-house, or even what should be the arrangement and plan of the rooms, and so forth. Such matters had already been made the subject of elaborate comment and instruction in the works published by Mr. London, Professor Kerr, and other persons more or less experienced on the subject. He would admit, therefore, that the design and arrangement were already agreed upon. This portion of the scheme for the country-house being disposed of, he would recommend the student of architecture to take care that his drawings were complete, and the sections ample. Personal experience showed him that many sets of drawings left the office of the architect and were given to the builder to carry out, with the sections in a very incomplete and unsatisfactory state. In making the sections, it would be desirable to show the position of all down pipes, soil-pipes, openings for doors, places for hells, air-bricks, the position for the bedsteads in the sleeping-chambers, the hearths, the footings, the drainage-pipes, &c. Presuming, then, that the drawings were complete, and the sections ample, the next thing to do in order to insure the satisfactory construction of the building would be the employment of a competent clerk of the works. Upon this subject he wished to make a few observations. The clerk who was always at war with the constructor, made a great mistake, as temper and forbearance were quite as much required as a knowledge of the practical details, and of the art of construction. It was, he thought, desirable to employ, whenever practicable, local materials; but this, of course, could not always be done; for instance, the chateau of the Emperor of the French at Biarritz was built of English bricks. It was desirable, if the work was of sufficient importance, to make the bricks on the spot; and he recommended a thinner brick than that in ordinary use, as they worked up better, and presented a more agreeable appearance. Having referred to the different characters of bricks used in the Midland and Home Counties, Mr. Curzon observed that the Kent and Sussex bricks, which were generally of a porous description, might be used to advantage in exposed situations by using hollow bricks for the inside of the walls. He also recommended as a general rule that country-houses which might be at a distance from towns and fire-engines should, whenever possible, be of fireproof construction, and that, when that was not possible, a large water-tank should be erected on the top of the building, with a hose constantly laid on, with some simple machinery for directing the water in case of accidents. With regard to shutters in country-houses, he did not think they were of much use as a means of defence, while they were often expensive to make, and occasionally occupied room which could ill be spared. Plate-glass was, he thought, quite as good a protection as box-shutters, and was very little, if any, more expensive. He also recommended in cases where the establishment was at all large that provision should be made for the manufacture of gas, which could now be done with very simple machinery, and which would prove a great desideratum in the basement of large houses, stables, passages, &c. Having again referred to the importance of careful drawings, with numbers well defined and the sections complete, Mr. Curzon concluded by reminding the student of architecture that it was as much his business to build as to design, and that a short experience in the capacity of clerk of the works would best enable him to obtain a practical knowledge of the science of construction.

Mr. Perry inquired what Mr. Curzon meant by fire-proof construction in country-houses. Mr. Curzon said he would use the Dennet arch, or Fox & Barrett's principle, with an iron support when necessary.

Mr. Perry thought that as a rule wooden supports would be found to last longer in case of fire than those of iron. He had had considerable experience in surveying after fires, and he always found that wood had more endurance than iron.

The Chairman observed that in the houses on the cliff at Bournemouth, which were 150 ft. above

the sea level, and in a very exposed situation, the hollow Jennings brick had been used with great advantage, so as to resist not only storms of rain from the south-west, but sea spray also. With regard to the hedging of tiles (for roofs) he considered it to be most injudicious to hedge them in mortar, as the latter occasioned the pegs to rot and the tiles to come off. In Sussex he found the general practice was to hedge the tiles in straw, and he considered it a very good plan. He quite agreed with Mr. Curzon in the necessity of enforcing the greatest care in the preparation of drawings, specifications, and sections; so as to insure good work in the first instance, and to prevent alterations and misunderstanding afterwards. Leaky roofs and smoky chimneys (the abomination of all clients) might be avoided if care were taken in this respect; and the same attention would also prevent the wretched question of "extras" (which so often made the architect unpopular with his client) from cropping up.

PROVINCIAL NEWS.

Mallock.—The foundation stone of a new market-hall has been laid at Mallock. Some time ago a company was formed, called "The Mallock Hotel and Market-hall Company," for the erection of the building. The cost of the hall and hotel will be 10,000l. Mr. Hill, of Northampton, is the architect; and Messrs. Stone & Wildgoose, of Mallock, are the builders.

Aberdare.—The works in connection with the People's Park are all progressing favourably. The drainage is nearly completed, drives are being formed, and planting is begun.

LIVERPOOL PAROCHIAL INFANT SCHOOLS.

The Industrial Schools of the parish of Liverpool contain about 1,200 children. It has been determined by the vestry to erect separate schools for about 500 infants.

The building, of which we give a view and plan, is now in course of erection, from the designs of Messrs. J. A. Pictou & Son. The material is brick, with white stone dressings. The collection together of so large a number of young children into one establishment requires special care to preserve a uniform warm temperature, combined with free ventilation. For this purpose the corridors running the length of the building are made to constitute warm air-chambers heated by hot water. The ventilation is to be carried out on the principles of Mr. C. Watson, of Halifax.

The site is elevated and salubrious, in the suburb of Kirkdale, open to the sea breezes, and adjoining the present Industrial Schools.

The contractor is Mr. John Westminster, of Liverpool; and the cost of the building will be about 20,000l.

THE NEW LAW COURTS.

The design we illustrate in the present number is that of Mr. William Burges, known as the successful competitor for Cork Cathedral and several other buildings.

The desire of the architect has been to produce a simple plan, with ample light, quiet and distinct entrances for every person engaged or likely to have business in the building. He has ignored the central hall system, which was left an open question by the instructions provided for the guidance of the architects. We have already given particulars of the design and a key-plan,* and on the present occasion set forth the architect's intentions. The whole of the courts in this design are on one floor, the judges' rooms

* See p. 90, &c.

NEW INFANT SCHOOLS, KIRKDALE; FOR THE PARISH OF LIVERPOOL.

MESSRS. J. A. PICTON & SON, ARCHITECTS.

being situated on the level of the bench of the courts, and separated from them by a judges' private corridor, by which arrangement the architect considers the air of the rooms would be kept purer than in the case where the rooms open out of the court. The judges approach their rooms and courts by means of private staircases which are provided in the centre of the building, and they are also supplied with small private staircases at the four internal corners of the zone. By referring to the block plan of this design already given, the reader will better comprehend the arrange-

ment. On the other side of the courts, that is, nearer the roadways, and parallel with the judges' corridors, is a corridor devoted to the barristers, attorneys, and suitors, approached by a hall at each corner of the building. The jury have a distinct staircase to their rooms and court, as well as the witnesses, while the public are also accommodated with a staircase to the gallery of each court, thereby preventing any chance of a collision between a juryman, witness, or a mere lounge.

The large portion devoted to the records is situated on the western side of the building

facing Clement's Inn, in immediate communication with the Probate and Divorce Court, and by this means it is kept entirely distinct. The massive tower at the south-west corner is intended to receive the original wills, while another fireproof building is provided at a safe distance in case of fire for the registered copies.

The site in this plan has been adhered to, and the curved piece of Picket-street, in the Strand front, has been made of use in breaking up the long elevation of 700 ft., as well as to secure a carriage-drive for the use of the building.

DESIGN FOR THE PROPOSED LAW COURTS.—BY MR. W. BURGES, ARCHITECT.

MONUMENTAL.

Statue of Mr. Peabody.—A first list of subscriptions has been published towards erecting in some public place a statue of this American benefactor to the London poor. The list is headed by the Prince of Wales for 25 guineas, and the total reaches considerably over 1,000l.

The late Earl of Carlisle.—A movement is at present on foot in Cumberland to raise a memorial to perpetuate the memory of this distinguished nobleman. A meeting of the committee, comprising a large number of influential gentlemen, was recently held, and it was decided to issue a circular to the public, embodying the resolutions passed at the meeting, together with other information relative to the proposed memorial.

The Cobden Statue at Manchester.—This statue has been inaugurated. The site is in St. Ann's-square. There was a grand procession, with music, banners, &c. The figure is 10 ft. high, and stands upon a lofty, square pedestal, in each face of which are large slabs of polished granite. The face of the figure looks towards the front of the Royal Exchange. Mr. Marshall Wood was the sculptor, and the cost was 2,500l.

Memorial of the late Dean of Hereford.—Preliminary steps towards erecting a memorial of the late Dean of Hereford have been taken at Hereford. A committee has been appointed and a subscription list opened, and 400l. were subscribed at the meeting. The Dean and Chapter have given 100l. The nature of the memorial will depend upon the amount of the subscriptions.

FIRE PROTECTION.

As doctors differ and lawyers disagree, so do also experts in other professions. In the *Builder*, recently, p. 274, reference was made to the evidence given before Mr. McLagan's Committee of the House of Commons, appointed to take evidence as to the number and causes of fires, and the means of fire prevention, and to report thereon to the House. Mr. Smith, secretary to the Scottish Union Insurance Office, stated pointedly, that for many years fires of more than suspicious origin had been largely on the increase, and he strongly recommended as a check that there should be a judicial investigation authorized as to the causes of all fires, such investigation to be conducted by coroners in England, and by the public prosecutors in Scotland, or by such other authorities as might be thought worthy the most competent and convenient. At a subsequent meeting of the committee, Mr. Charles John Bunyan, general manager of the Norwich Union Insurance Office, was examined, and the leading questions were repeatedly pressed upon him touching increase in the number of fires, and the expediency of instituting a judicial investigation as to their causes. He declared that he had no reason to believe that incendiary fires are increasing; in the country the number of fires had been less numerous for several years past than they were formerly. He decidedly objected to giving the coroner a new jurisdiction, by empowering him to inquire into the causes of fires; such an inquiry conducted by the Board of Trade would involve costly and cumbersome machinery. It would be an unwise measure, in his opinion, to empower the Metropolitan Board to appoint a special officer to investigate the causes of fires. He did not think it at all desirable that there should be a judicial inquiry into the causes of all fires. The knowledge of such inquiry, he believed, would be more likely to lead to the escape than the detection of criminals; if any inquiry was to be made at all, it should be conducted by the fire-brigade and the police, under the direction of the chief constable of the district. The witness considered the arrangements in this country, for the prosecution of crime generally, to be very defective, including cases of wilful fire raising. Mr. Bunyan gave some interesting evidence on the law as affecting fires: common law held a man responsible for a fire, but statute law protected him, if the fire was accidental. Railway companies were responsible for fires caused to growing crops by sparks from locomotive engines; if the crop was insured, the owner could either apply to the company, or to the insurance office, who, in the last case, would take the place of the owner, and apply to the railway company, which might defend successfully if it could be shown that all proper care had been taken as regards construction of the engine, mode of firing, &c. He considered the Metropolitan Building Act, and

certain other local Acts,—that of Liverpool, for instance,—which contained stipulations respecting the construction of warehouses and other buildings, and the storage of dangerous substances, with a view to prevention and limitation of the extent of fires, to be very salutary in their operation. Mr. George Persé Ivy, who had had twenty years' experience as a district manager for fire insurance companies in England and in the Australian colonies, was of opinion that the increase in the number of fires in this country was greatly in excess of the amount of property insured. A number of cases of the most suspicious character, both of applications for policies, and of actual fires, had come within his own knowledge; of these he gave the particulars of one case at Swansea, and of another at Cardiff. He strongly recommended a legal tribunal to investigate the causes of fires in this country, as was done at Victoria, where the coroner had all fires reported to him, and gave judgment before the insurance offices were required to pay the claims. He was certain that the coroner's inquiry kept down the number of fires, and prevented wilful fires for fraudulent objects. In Melbourne they had the best water supply in the world, and very ready means of subduing fires. They had a number of watch towers in various parts of the city, upon which men were stationed day and night, and by a wire communication signalled to the detachment of the fire brigade on duty below the direction of the fire. The water could be thrown to a height of 150 ft. by pressure; there were numerous volunteer fire brigades in the suburbs. There was now a law in force in Melbourne against the erection of wooden houses. They had occasionally very large fires: at one, with which he was connected, at Sydney, a general warehouse, the loss was 40,000l.; the extent of the damage having been attributable to the defective water supply. He repeated his decided approval of a judicial inquiry.

FOUL WATER SUPPLY AT LIVERPOOL.

At a recent meeting of the local water committee of the corporation, Alderman Bennett explained a model, showing the principle on which water-closets were supplied with water, and that when the service-pipe in a street was partly or wholly empty, and the cock of the water-closet left open, the foul smells of the closet in all cases went into the service-pipes, and where the pipe of the closet was too long (and he had seen many such), the feces, too, were drawn into the services, and frequently contaminated the mains as well. Coffee-grounds represented feces, and the smoke from brown paper represented gas, and the model in operation presented a very disgusting state of things.

Mr. Newlands said there was no doubt the model represented a state of things that must occur in accordance with all physical laws, but it could not occur if the cock were closed. Mr. Duncan said, if the pipe in the closet were not made too long, it would not draw the feces into the services. The remedy was to put up a cistern, and so cut off the direct supply from the street service to the closet.

Alderman Bennett, after the discussion had lasted an hour and a half, moved a resolution, affirming that the committee felt the importance of giving a supply of pure water to the inhabitants; that the present arrangement of the service pipes between the street water-mains and the trough and other water-closets was highly objectionable; and that the water engineer, after conferring with the borough engineer, should report as to what he considered the best remedy for the evil.

The motion was agreed to unanimously.

LOWER SLAUGHTER CHURCH, NEAR MORETON-IN-MARSH, GLOUCESTER. SHIRE.

THIS new church, built principally at the expense of Mr. Charles S. Whitmore, Q.C., the Recorder of Gloucester, of Lower Slaughter, has just been completed. The old church which it represented was in so dilapidated and ruinous a condition, that it became utterly unfitted for divine worship, and the present edifice was then commenced. The only parts of the old building which had any archeological or architectural interest was a Transition Norman open arcade and a piscina, which have been preserved in

their integrity in the new church, where the former separates the nave and north aisle. The plan of the church comprises a nave, 40 ft. 3 in. by 15 ft. 3 in.; north aisle, 11 ft. 6 in. wide; chancel, 21 ft. by 13 ft. 6 in.; and a tower surmounted by a lofty spire. The general character of the building is Early Decorated, although the chancel belongs rather to the preceding style. The walls are built of local stone, lined with white ashlar internally, the groins, window, and door dressings, &c., being of Farnlinton and Bath Corsham Down stone. The nave and aisle have open stained fir roofs, and the chancel a polygonal panelled ceiling, having enriched bosses at the intersection of the ribs. Externally the roofs are covered with the stone slating of the neighbourhood. The eastern triplet-window has serpentine shafts, and is filled with painted glass by Clayton & Bell, the gift of Lady Brownrigg. The chancel-arch also has serpentine shafts supporting it. There is a peal of six bells, three of which are old, the new ones being cast by Messrs. Warner & Son. The chancel has a handsome encaustic tile pavement, and the passages of the nave and aisle are paved with black and red tiles.

The architect is Mr. Ferrey, and the contractor Mr. Oliver Estcourt, of Gloucester.

At the entrance to the church-yard is an oak lych-gate covered with ornamental tiles.

BRIGHTON.

At the suggestion of Mr. Lockwood, the borough surveyor, the corporation determined, some time ago, to erect on the east side of the Fish-market groyne, a new groyne of concrete, the object being to form a permanent barricade for the retention of the beach along the whole west front of the town. The new groyne is now about to be laid. It will run parallel with Ancombe's groyne, or the Fish-market groyne, and will extend from the coping of the Junction Esplanade for a distance of some 240 ft. southward. The top of the groyne will be some 9 ft. in width throughout its whole extent; and for a distance of 200 ft. will be slightly rounded, with an inclination to the southward of 1 in 8; the remaining 40 ft. at the south end being formed of a series of steps, the top one of which will be about 2 ft. 9 in. above the mean tidal level, and the bottom one reaching down to the low-water level, at spring tides. A considerable portion of the top of the groyne at its upper end will be always above water, as the high-water level, at spring tides, does not reach up to above one-half of its extent; and at this upper end of the groyne, leading from the Esplanade, there will be a post and rail fencing, extending down, on both west and east sides, some 40 ft. or 50 ft. The base of the groyne will be chiefly on the chalk rock, about 25 ft. below the surface of the beach; the width at the base will be about 20 ft.; and the "batter" of the eastern face from the base to the top will be 1 in 2. The blocks, which will form the eastern face of the groyne as well as the steps, are manufactured of different material from that of the "heating" (ordinary concrete), viz., of flints imbedded in the best Portland cement. The blocks are of immense weight: some of the "heating" blocks weigh within a fraction of four tons. Holes are made in each block for the purpose of lifting them and of placing them in position; and this is effected by means of Lewis rods, of iron, attached to the traveller.

Though costing but little more in construction, the concrete groyne is expected to be of much more durable character than the ordinary wooden groyne. The test blocks, which have been exposed for a lengthened period to the action of the beach and sea, do not show, as yet, it is said, any signs of wear and tear.

The new baths of Brill's Brighton Bath Company, recently opened, are second-class swimming and single baths, and will form only a part of the whole scheme of the company, by whom the whole block of buildings at the bottom of East-street, Pool-valley, and Junction-parade, has been purchased, with the view of erecting and establishing baths of various kinds adapted to the different classes of residents and visitors. The portion now opened stands in that part of the property immediately adjoining the Ladies' Swimming Bath, at the bottom of Pool-valley, and below the White Horse Hotel. The temporary entrance is at the upper extremity of the building in Pool-valley. The building is of a nearly elliptical form; and the interior dimen-

the right of settling the rate of wages, without allowing the master to have any scope at all in the matter? We do not assume any right at all; we allow the master to have full scope. I can assure the Commissioners that our men would be well satisfied in a man to pay the wages we ask, and our union does not seem to have the tendency to assume hostile attitudes. We operate a good deal by passing on the moral force, and think that others should do the same.—Supposing that a master had been so instructed as not to employ an inferior labourer, but to employ a superior painter, and that superior painter had thought it worth his while to work at lower wages than others, would your society have objected to that? Yes.—So that they would have objected to you, or any one in your position, making what he thought the best of his abilities? Yes, they would have objected to a man who was worth 6d. an hour working for 5d., the tendency of that being to reduce those who are getting 6d. to the 5d. But in that case you interfere with the man in his judgment as to his own work? And he interferes with me, I have as much right to refuse to work as he has to work; that is all I do in resistance to his encroachment upon me. I say to every man that goes and sells his labour below the market price, that he is not only injuring himself, but that he is injuring every individual in the trade. No law of political economy can deny that. He is, in fact, doing the best he can to reduce the rate of wages. With 2,000*l.* of capital, the witness said he could before long reduce the wages in Manchester 20 per cent., provided he could break up the union; and, therefore, he believed that the union kept up a fair rate of wages, he had no further action taken towards a "sabotik," than to refuse to work with him. Mr. Mathews: Have not the masters a voice in the employment of these inferior workmen? We have no objection, only we think that the price of provisions, but on the demand and supply of labour. When many labourers are looking out for work wages will fall, and they will rise when many employers are looking out for labourers.

libitation of piecework remove all stimulus to exertion, and a man loses self-respect and becomes demoralised. Secondly, to the Employer.—For the number of apprentices being restricted, he is not free to select his own men; the amount of work to be performed, and the remuneration to be paid, are not regulated by competition, but are dictated by the executive of the Unions. The use of machinery is frequently prohibited; or where a large sum has been invested in it, it may be at any time become unproductive by a sudden strike of the operatives. The employer is thus prevented from calculating with certainty the cost of his productions, is liable for broken contracts, and subject to serious losses. Thirdly, to the Country.—For what is a loss to the artisan and his employer cannot but be a loss to the country. The skill and industry of the workmen are not fully developed; the energy of the employer is crippled, and his capital not employed to the greatest advantage. The cost of his commodities is thus increased without any equivalent; and the British manufacturer finds himself unable to compete with the productions of other countries whose labour is free, and whose trade is carried on under less oppressive restrictions.

In discussing the action and results of 'Trades' Unions, the employers desire to recognise and adopt the following principles:—

1. Free Trade in Labour. Every workman has the right to sell, and every employer to purchase, his labour on such terms as they mutually agree upon. Labour should form no exception to the law of free trade, which is sufficient to regulate the price of all other commodities.
2. The high or low rate of wages depends not upon the price of provisions, but on the demand and supply of labour. When many labourers are looking out for work wages will fall, and they will rise when many employers are looking out for labourers.
3. That all combinations, whether of workmen to force up, or of employers to keep down, the price of labour, are injurious, and should cease, because they interfere with the natural price of the production of labour.
4. If these principles be correct, and were carried out, then it follows that every workman would be at liberty—
 - 1.—To work, without joining any combination or trade, for such rate of wages as the demand for his labour at the time enabled him to obtain from an employer.
 - 2.—To work any number of hours which his desires or necessities led him to undertake.
 - 3.—To work at any kind of employment, within reach of his skill and experience, which was at the time in greatest demand, although differing from his own particular branch of trade.
 - 4.—To work 'piece' or contract work, and by so doing increase, in proportion to his skill and industry, his weekly earnings, and share with his employer the profits of his labour.
 - 5.—To embrace any opportunity for improving his individual position, or of obtaining increased remuneration for his services.

The result of all this would be—
 1. That each workman would find his own level. The skillful and industrious workman would receive his just reward, whilst the incompetent and idle would be left in the rear. A greater amount of work would be done in the same time and at less cost, and thus the wealth and prosperity of the country greatly increased.

CASES UNDER METROPOLITAN BUILDING ACT.

EXEMPTIONS.

ON Monday a summons came on for hearing at the Mansion House, before Mr. Alderman Rose, involving a question as to the construction to be put upon certain provisions of the Metropolitan Building Act. The summons had been issued at the instance of Mr. John Young, the district surveyor of the eastern division of the city of London, against Messrs. Plucknett and others, the present representatives of the firm of Cubitt & Co., the eminent builders of Gray's-inn-road; and the process stated that the defendants, being builders engaged in executing a certain work in Harrow-alley, Aldgate, did wilfully neglect to give to the district surveyor, appointed under the Metropolitan Buildings Act of 1853, notice of the particulars of the proposed works two days previous to the commencement of the said works.

Mr. Interwick, barrister-at-law (instructed by the Metropolitan Board of Works), opened the case, and stated that it would be perhaps remembered that, in the month of September last, a tremendous fire broke out in the extensive premises of the London and North-Western Railway Company, known as the Haydon-square depot of that company, which destroyed an extensive range of the warehouses, some of which were undertaken by the railway company to Messrs. Gooch & Cousens, the wholesale wool-staplers, and Messrs. Alsopp, the eminent Burton ale brewers, and other persons. To restore the premises the railway company entered into a contract with the defendants, Messrs. Cubitt, and the works proceeded with a view to accomplish that object. In the early part of the present year the operations of reconstruction commenced, and in February last the complainant, Mr. Young, the district surveyor, wrote to Messrs. Cubitt, the defendants, intimating that he had not received, as district surveyor, the usual notice required by the provisions of the Act of Parliament. The reply to the summons was made to the effect that the company was exempted from the necessity of giving the notice suggested, under the provision of the 6th section of the said statute. The real question was whether under-compliance could prevail under the facts he was prepared to put in evidence.

Mr. Young was then called, and deposed that he remembered the facts of the fire in the Haydon-square depot of

the London and North-Western Railway Company, in the month of September last, in which the premises occupied by Messrs. Gooch & Cousens, the wool-staplers, and those of other under-tenants of the company, were wholly, or their contents, destroyed. On finding that the reconstruction of the edifices was in progress, he wrote to the railway company, intimating that he had not received any notice pursuant to the statute, and requiring the same; to which he received a reply to the effect that the company were exempted under the 6th section of the Act; and, as he had received no notice, the present summons had been issued.

In his cross-examination by Mr. Littler, the witness stated that the entrance from Aldgate into the yard had a hoard inscribed "London and North Western Railway, Haydon-square Depot."

In the re-examination the witness stated that he was aware that the carriers, Messrs. Pickford, were now erecting buildings on land granted to them by the Great Eastern Railway Company, and that Messrs. Pickford had given him the required notices.

Mr. H. F. Vallance, Solicitor to Messrs. Gooch & Cousens, produced two leases granted by the London and North Western Railway Company to the premises, for a term of 7, 14, or 21 years, determinable at a month's notice, and containing certain special covenants reserving to the company exclusive rights with reference to the exclusive use of the premises, and confining the lessees to the occupation of the demised premises for any other purposes than their legitimate trade.

Mr. Littler said, on behalf of the defendants, that the special provision on which he relied was that any buildings given notice to any canal, dock, or railway company, and used for the purposes of such canal, dock, or railway company, under the provisions of any special Act of Parliament, should be exempted from the necessity of giving notice, as suggested by the summons. He might mention that it would be just in order to say that the refreshment-rooms at the Ludgate-hill station, or those at Euston-square, which were used by out-visitors, denuded the railway company of their entire exclusive privilege of under-letting, as that the sittings led to divers coal companies by the Great Northern Railway Company at King's-cross deprived them of the actual position they held as freeholders of the premises.

The evidence showed that the constructions now in course of formation, with the tramways, lifts, and other appliances, showed that they were destined and intended to increase the traffic of the railway company, who possessed the power to terminate the tenancy of the lessees on twelve months' notice. On these grounds he (Mr. Littler) submitted that the summons must be dismissed.

Mr. Alderman Rose said that during the progress of the case his mind had been much divided; but on looking at the concurrent circumstances which had been proved in evidence, he was of opinion that the evidence disclosed that the new construction was designed for the purposes of the railway company within the exemption provided by the Act of Parliament, and therefore he would dismiss the summons, but without costs.

SANITARY PROCEEDINGS IN MARYLEBONE.

LAST week, at the Marylebone Police Court, Mr. George Simpson was summoned at the instance of the Marylebone Vestry for allowing the premises, No. 8, Fitzfield-terrace, to become a nuisance and injurious to public health. George Windle, one of the inspectors of nuisances for the parish, deposed that there was an open drain on the premises, which conveyed sewage to the neighbouring houses. Repeated representations had been made, and a vestry notice was served on defendant on the 1st of April, but he had done nothing whatever to abate the nuisance. Dr. Whitmore, medical officer of health, corroborated the inspector as to the exceedingly filthy nature of the drain, and said that a new pipe-sewer ought to be constructed. Defendant denied his liability to do anything to the premises as he was not the owner. He was simply a trustee of the property, and collected the rent. Mr. Knox said the collector of the rents of a property could be summoned, in case of nuisance, and they could charge the owner of the premises with the expense of having the necessary improvements carried out under a magistrate's order. He should make the requisite order upon defendant, and also compel him to pay the whole of the costs, 13s. 6d.

THE WINCHESTER DRAINAGE COMPETITION.

SIR,—In the latter end of last year the newly-formed Local Board of Winchester advertised for plans for the drainage of their city, offering 150*l.*, 100*l.*, and 50*l.* respectively as premiums. The profession being then, as now, very slack, and having had great experience in town drainage, I, contrary to my usual practice, turned my attention to the competition, the premiums were tempting, and the city highly respectable. I went down, and found the Local Board possessed of neither maps nor level. They required competitors to prepare plans on the absurd scale of 50 ft. to the inch, although we all protested against so large a scale for competition where no plans existed. However, being assured the competition was the "fairest thing out," I went in, put up at a hotel, took the levels, made the plans, spent many weeks of my own and assistant's time, and some 30*l.* in hard cash, and deposited my designs.

After the plans had been "at upon" for some three months and a half, and somewhat crushed in the process, they were returned without one word of explanation, excepting the following note from the Local Board:—"Sir,—I am instructed by the Local Board to return your plans, &c., sent in for competition relating to the main drainage of Winchester. I have, therefore, forwarded them to you per rail this day, and if you feel obliged by your informing me of their safe arrival." The cool impudence of the note, returning the plans upon which so much labour, money, and experience had been expended, without at least one word of explanation or thanks, is only to be equalled by the sarcastic politeness of the Board's assumed anxiety for their "safe arrival."

I have obtained a local paper, by which I find that only ten other plans were sent in, and that the Board referred them all to their own surveyor to report upon, but acted in direct opposition to his report, and, without any

TRADES' UNIONS AND COUNTER-UNIONS.

The evidence taken before the Trades' Union Committee suggests a few queries that perhaps some of their champions will answer, says a correspondent of the Times.

"What is a fair day's work? Is it an ascertained average quantity agreed upon by masters and men, or is it an arbitrary standard fixed entirely by the men?"

The Unions fix their members for doing more than a fair day's work. I will not inquire whether they fine them for doing less, but I should like to know what action they take in the event of their being discharged by an employer for not doing a fair day's work. Do they allow the right of the employer to discharge what he considers an idle workman? They strive to limit as much as possible the quantity of labour employed and of work done. I suppose it will be allowed that the idliest man most completely carries out this policy. Are we to understand, therefore, that the idliest is the most worthy member of the society? They seek to enforce uniformity of work and of wages: do they, therefore, ignore all difference that may exist in a man's requirements? Is a man with a sick wife, a bed-ridden father, or a dozen children denied the right of doing more work and earning more money than the bachelor without a care? In framing their laws entirely for the advantage of the men, and to the disadvantage of the employers, do they contemplate the possibility of some of their number eventually becoming employers of labour themselves, or of their being entering their Union, abandon all hope of ever raising above their operative condition?"

A movement has been set on foot at Manchester for the formation of a Central Defence Association of Master Engineers, Millwrights, Machine-makers, and Ironfounders, with the object of adding those workmen who are opposed to the Trades' Union system; and a statement of general principles of action has been drawn up, from which we may make a few quotations, on the authority of the *Morning Journal*.

"First, to the Artisan: for so long as he follows manual labour in the Trades' Union, he is not free, individually, to embrace any opportunity of increased remuneration; though heter educated, more skillful, or more industrious than his fellow, he cannot rise above others of his class. The uniform rate of wages and pro-

competent advice as to cost, accuracy of principle and detail, or general excellence, summarily rejected several of the designs because they propose to avoid the cost of pumping, and irrigate by gravitation several hundred acres of meadow land adjoining the river Icho; while the Board retained four designs, to be submitted to an engineer, who is proposed to pump the sewage a considerable height on to some most expensive arable land, from which, also, a considerable portion of the sewage-water must find its way back into the river. Now no instruction or intimation was *publicly* given as to the particular portion of land which the Local Board desired to have irrigated; it is therefore manifestly unjust that those who sought to save the expense of pumping should, from the want of local knowledge, be excluded from any participation in the premiums, by an arbitrary rule which precludes any consideration of the general excellence of the designs. Any office-boy minus the most elementary knowledge of the first principles of drainage, who has by information or chance hit upon the Local Board ideas, may, for a plan, however roughly scrawled, obtain a premium. Out of the four designs selected for the award of three premiums it is believed that one is by a brother of a town-councillor; and a second by a local auctioneer; but as they are under mottoes, the Board is, of course, not aware of this fact, although one is rather curious as to the result.

Of the site proposed in the selected designs for irrigation the local surveyor reports it is "a very close subsoil not of a nature to absorb much moisture." This, he states, will be a fatal objection to three out of four of the plans selected. I also have had the opportunity of inspecting the whole of the plans, and I found that those which show a knowledge of the subject, care in detail, and exhibit a considerable amount of labour, are just those which have been rejected, while some of the accepted designs are of the most miserable description. One, for example, provides 6-inch pipes for street sewers, and a principal road in which holding is progressing, shows a main sewer one-quarter of a mile long of 9-inch pipes only, to a flat gradient. The well-studied and honest designs average about 25,000, without pumping-station and system of high-level irrigation, range so low as from 15,000 to 16,700. The nature of the locality is such that the outfall sewers of all the designs run in the same direction; the addition of a pumping-station near St. Cross to divert the sewage, east, west, or south, is simply a question of modification applicable to any design; and I positively assert that among the rejected designs are some which, with a little alteration, would meet the requirements of Winchester, as well as the views of the Board, better than any of the selected designs; therefore the whole should, as contended for by the more intelligent members of the Board, have been referred to some qualified engineer. No competition scheme is ever carried out without modification. Even the local surveyor informs the Board that the schemes admit of modification, and that none can be adopted in their entirety; therefore the rejection of seven designs out of eleven, without advice and without consideration, for a mere arbitrary and illogical reason, is simply an insult to the profession invited to compete. For once, I fear, Winchester has been found "without benefit of clergy."

ONE OF THE REJECTED.

RAIN THROUGH PORTLAND CEMENT.

In answer to "Club," p. 283, I beg to state that the chief cause of the rain and water showing through the cement is, in general, the inferior character of the work done by inexperienced workmen, and who use inferior cement and overpower it with sand, and, what is worse, sand full of loam, instead of clean, sharp sand. One of the best remedies the inquirer can have is to let the cement get thoroughly dry and well clean off the colour; then give it three coats of boiled oil (applied hot), or as much of it as the cement will suck up. No more is to be left on the surface. The oil penetrates into the cement, forms a good foundation for the paint, and prevents it peeling off. The cement will require three coats of best white-lead paint, stained to taste.

JOSEPH HAYES, SEN.

THE NEW LAW COURTS AND THE PUBLIC.

The reception which the designs for the new Law Courts have met with at the hands of a large class, who, as a rule, take but little interest in the subject, is worthy of serious attention, as indicating the popular estimate of modern secular architecture.

It may be safely asserted that the condition of no art can be satisfactory which does not possess a powerful hold upon the public mind: this architect has undoubtedly possessed whenever the art really flourished; but the deserted state of its exhibitions, and the ridicule or indifference so often manifested, when the subject is broached in general society, are strong evidences to the contrary, at the present time. Indeed, architects are accustomed, in their self-complacency, to console themselves for many slights of this kind, with the reflection that "the public know nothing about architecture."

It remains to be shown where the fault lies.

When the present revival commenced, it was argued wisely, that in order to found a modern school of architecture, it would be necessary at first to look back, and study the principles of obsolete styles; this, however, was only the means to an end, but we are apparently as far from that end as ever: the result hitherto has been the production of numerous specimens,

more or less successful, of extinct periods of art, entirely devoid of vitality.

The great mistake into which the Revivalists have fallen is this—instead of confining themselves to the study of the principles of preceding styles, and principles only, they have selected one style in particular, according to their predilections, and endeavored to resuscitate it *en masse*; and from the rival claims of two of these has arisen the so-called "Battle of the Styles."

This conflict, by serving to ventilate the whole question, has been productive of great good; but a decisive victory cannot be claimed by the partisans of either, from the simple fact, that no one style is of itself capable of fulfilling the manifold requirements of the present age.

For, however slow the profession may have been to discover the truth, many on the outside have, at all events, done so. A real, vital school of architecture, such as we all desire, can spring only out of the requirements of the age; and, as our requirements are totally different from those of any former age, such a school can have little in common with any preceding period of art, except in general forms; and if this be true, it follows, that in attempting to "evolve" a style of our own by resuscitating some previous style or combination of styles, we are simply encumbering ourselves with a mass of useless material, which, however beautiful and appropriate in its own day, speaks to the present generation in a dead language.

The most important modern building which England has produced, the New Palace at Westminster, is an illustration of this. All that lavish expenditure and the resources of a highly-gifted mind could do has been done here to resuscitate an obsolete style; but, though possessed of many admirable qualities, it is in its purely ornamental character little better than a monument of perverted ingenuity, and satisfies only the enthusiastic admirer of Tudor work.

Let the architect of the new Law Courts proceed on the same principle, and he may produce another "gorgonean revival" highly satisfactory to himself and his own immediate admirers, but not to the public generally, and certainly not to posterity.

In a "utilitarian" point of view only, a building capable of satisfying the commissioners, possessed of every convenience, and fully adapted to modern requirements, can be provided without the assistance of architects at all, by engineers and others, but such a work would justly hold us up to the scorn of contemporaries and of posterity; the architect is, therefore, called in. Is it too much to hope that such an opportunity will not be thrown away, and that the time has at length arrived for the production of a building worthy to represent the present generation?

The system of decoration which the architect may adopt should have some stronger argument in its favour than that it was the *correct thing* five centuries or more ago. If cloister-like courts, cathedral-like central halls, and long rows of knights, &c. in armour, are necessary, or if they produce a feeling of gratification at all commensurate with the cost, by all means let us have them; but the lawyers will certainly object to the first, and there is as much common sense in a row of knights in armour ornamenting a nineteenth-century Palace of Justice, as in a row of Egyptian sphinxes ornamenting a Gothic cathedral.

It is for the selected architect to consider whether he possesses the power to grapple with his task in the same spirit as the great masters of the art would do if we could call them from their graves to execute this work. We may be certain that they would not be slow to make use of the vast increase in our knowledge of almost everything bearing upon architecture, of the hundred subsidiary arts and appliances which were entirely unknown when they flourished; and that their productions of to-day would have little in common with their former works.

It is by working in this spirit only that he can hope to succeed, and help to recover for architecture her long-lost ascendancy over men's minds. He will probably have much to unlearn, many prejudices to disabuse his mind of; much also to contend with from the hostile criticism of many who require precedent for everything, and who judge of a feature not on its own intrinsic merits, but by the number of times it has been executed before; but such puerile criticism would be short-lived, the tide of public opinion would soon set in his favour, and he might safely leave the final judgment to posterity.

If art has no higher object than to pander to the caprices of mankind, or to afford one genera-

tion an opportunity for exercising their ingenuity in counterfeiting the works of another, it is of little import what style we select for our public buildings; but if the chief end and aim of art is the elevation of the human race, then it is important that the new Palace of Justice shall be "clothed with living, not ancient, graces"—graces in harmony with the feelings of the age, and capable of being read and understood of all men.

FRED. STONE.

PERIODICAL CHIMES.

DR. BURNEY, in his "Tour through Germany and the Netherlands," has made certain statements, which I do not hesitate to say grossly misrepresent the effect produced by the *carillons*, or chimes worked by a cylinder; while his remarks as to the capability of *le carillon d'clavier*, and the exhausted condition of a *carillonneur* after his performance, are truly absurd. Unfortunately, however, numerous writers in succession, down to the present day, have copied the doctor's erroneous statements in some form or other. The result is, that many people are prejudiced against the species of music in question.

I venture, then, to assert confidently, that the best *carillons*, or periodical chimes, now existing on the Continent, give out a stream of pleasing melody, enriched now and then with touches of delightful harmony, of which those who have heard nothing better than the uncouth music of certain old barrel chimes in England can have no adequate conception.

These Continental instruments, on the largest scale, as I have before intimated, are composed of a very extensive series of costly bells, and machinery of enormous magnitude; so that they are not likely to be sanctioned in Great Britain, except for lofty structures of great national importance.

I would again suggest, however, that it is very desirable to introduce *improved chime mechanisms*, equal to that of the *carillons* alluded to, which British workmen are competent to execute, in many of our large church towers, to play appropriate melodies at certain intervals upon the ordinary peals of eight, ten, or twelve bells; which would then speak to the ear by night as well as by day, giving, as it were, a musical "Tongue to Time."

If in any case the number of bells can be augmented to fifteen, or more, so much the better. I would observe, too, that the noble companions of some of our large Town-halls are well adapted for the reception of excellent chimes.

And now, by way of showing what may be done, permit me to add, that arrangements have lately been made for placing a considerable number of additional bells, and a set of chimes on an extensive scale, in the famous tower of Boston church. The expense of this undertaking will be upwards of 1,000*l.*, the greater part of which amount has already been raised by subscriptions. One lady gives a hundred guineas.

THOMAS WALESBY.

FROM BRISBANE, AUSTRALIA.

The only public building of importance still in progress is the new House of Parliament for Queensland; and in this the work is confined to roofing and glazing. When this is finished, the work is to be suspended until the Government are better prepared with funds to complete it. From twenty to thirty men are now busily engaged completing the roofing and preparing the window frames. The main building is nearly covered in, and all that remains to be done is to cover the central dome, and put up the ornamental iron work on the ridges and round the domes. The material used for covering is zinc. By the *Monckchester* have been received from the workshops of Messrs. Chance, of Birmingham, and imported by Messrs. W. & B. Brookes, a stained-glass window, intended to be placed in the great hall, near the entrance to the principal staircase. The central portion of the window consists of a full-length portrait of her Majesty on the throne; underneath is a sort of pedestal representing foliage in geometrical designs, and the upper section contains the royal arms. There are also some smaller windows of the same kind, one of which consists of a portrait of the Prince of Wales, and the other of the Princess, with borders of foliage. Two other windows, intended

for the entrance to the principal staircase, are filled with an illuminated scroll; one contains the words, "Except the Lord build the house, they labour but in vain who build it," and the other by a similar scroll, containing the words, "Except the Lord keep the city, the watchman waketh but in vain." These texts were selected by Mrs. O'Connell, the wife of the President of the Council. By the same vessel were also received a number of sunlights, of a new design, from Messrs. Strode, London, for lighting up the Assembly and Council Chambers; also a number of large globe lamps, for the same portion of the building; the latter are constructed so as to act as ventilators.

The other public buildings calling for mention are, the new Lying-in-Hospital, Adelaide-street, now completed and occupied, built from designs by the colonial architect, and capable of accommodating twenty patients; the Dalby Post-office, and Telegraph-office, which are progressing towards completion; the new Court-house and lock-up at Roma, which is nearly finished, and the prison depot, at St. Helena Island, Moreton Bay, which is still in progress, the labour being supplied by the prisoners. When this building is completed, it will be capable of accommodating 100 convicts, and the necessary military guard, &c. A design has been prepared by the colonial architect for a new drinking-fountain, which is to be erected in the Brisbane Botanical Gardens, at the intersection of the roads on the south-east side of the bamboo grove. The fountain will be over 12 ft. in height, and built of freestone, with polished Gladstone marble panels.

The Brisbane corporation works have all been suspended, with the exception of the bridge, and the contract for the construction of Edward-street and Turbot-street, across the reserve to Wickham-terrace. This latter work has been long necessary as a direct means of communication between North Brisbane and Wickham-terrace and Spring-hill. Vehicles now pass along from Queen-street over the Edward-street portion.

With reference to the bridge work, the Government have consented to allow 1,000*l.* per month to the Brisbane corporation out of the endowment for this year. The material has nearly all arrived.

COMPETITIONS.

Ellesmere Memorial.—I travelled one hundred miles to see the designs for the above memorial, and without in any way knowing "Architect," who wrote the letter in your paper last week, allow me to corroborate his statement with regard to the expense of at least two of the designs. With regard to the third, it certainly was not equal to several other designs banging upon the walls. A competent architect is to decide which is the best design of three. Is this fair to the remaining competitors? Why not have allowed the competent architect to have given his opinion upon all the designs, and not upon three only, probably chosen by an incompetent committee?

The cost of the designs for the memorial was restricted to 800*l.* The committee are bound to remember this in their decision.

FAIR PLAY.

CHURCH-BUILDING NEWS.

Pyll.—The church of St. Thomas à Beckett, at Pyll, near Shepton Mallett, is about to be pulled down, except the tower, and rebuilt at the expense of Lord Portman.

Oakley.—The Duke of Buccleuch, one of the principal land-owners of the neighbourhood of Kettering, has undertaken to defray the cost of restoring Oakley Church, which has been for several years in a dilapidated condition.

Saxlingham.—The parish church of Saxlingham, Norfolk, is about to undergo restoration, and also to have a new porch, vestry, and north aisle. The works are under the direction of Mr. J. S. Benet, of Norwich, architect.

Haggerstone.—St. Andrew's Church has been consecrated. It is situated in a district in the north-west of London, formerly being a part of St. Leonard's, Shoreditch. The style of the church is Decorated, and it is constructed to contain 936 persons. The interior consists of a nave and side aisles of four wide bays with a clearstory and high-pitched roof; a chancel of

extensive dimensions with aisles, that on the south side forming an organ-loft, and a portion of that on the north a vestry. The chancel is at present in an unfinished state; but the work indicates that a reredos of unusual size will fill the space below the eastern window, which is not placed lower than the string-course of the clearstory, and is filled with tracery of the Middle Pointed period. Over the western door is a rose-window. Beyond the altar is a plain super-altar. On the south side are sedilia and a piscina, surmounted by carved pinnacle work. The windows in the side-aisles are deeply recessed, and those of the clearstory are double lights with Middle Pointed tracery. The organ is by Messrs. Willis & Co., and when complete will have cost 600*l.* The seats are all free. The building, which cost about 10,000*l.*, was erected from designs furnished by Mr. William Woodyer, of Grafham, by Mr. Robert Fitcher, of Salisbury, under the superintendence of Mr. P. Bentlif. The stonework of the reredos and the carving in the church were executed by Mr. Nicholl, of Lambeth.

Battle.—The parish church of St. Mary, Battle, is about to be restored by Mr. Butterfield, and contributions for the purpose are invited by the Dean of Battle. A series of paintings in distemper exists on the walls of the clearstory of the nave, and has been partially restored by Mr. E. Ward, R.A. It was built almost contemporaneously with the Minister, for the use of the parishioners of the Lega or Precinct, and is now a wilderness of pews internally, whilst the external fabric urgently requires renovation. It is calculated that 4,600*l.* will be required for the restoration, and a considerable sum is yet wanting, even after liberal contributions and promises.

Viney Hill (Forest of Dean).—The church of Viney Hill, a small, scattered village in the most picturesque part of the Forest of Dean, has been consecrated. It has been erected in accordance with the will of Mrs. Bathurst's late husband. The cost of the church has been about 2,200*l.* The architect was Mr. Ewan Christian, of London; the builder, Mr. Griffiths, of Eldersfield, near Tewkesbury. The building is in the Early English style, consisting of nave, south aisle, apsidal chancel, with organ-chamber, and porch, surmounted by a bell-turret, surrounded by a large wall-enclosed graveyard. The church is capable of accommodating 250 people. The material used is the red stone of the neighbouring quarries, with grey Forest stone bands. The walls are built of coursed rubble, faced on the outside with rock-faced ashlar in random courses. There are close-jointed relieving arches over the windows and doorways; and the apexes of the bell gable and turret are finished with ornamental stone crosses. The roof is covered with slates of two colours, worked in courses, and the ridge consists of red-crested tiles. There are many windows, including a large west window, with iron stanchion bars set anglewise and foliated at the points, and filled with glass of a greenish hue, bordered with clear white glass, the tracery lights glazed in ornamental patterns. The doors are of English oak, and the other woodwork materials are Russian deal and Baltic fir. Inside the church, the open timbers of the roof are varnished, and the ironwork connected with them is of a plain chocolate colour. The pewing is open, and also varnished in a light tint. There are six columns in the arcade, four in the nave, and two in the chancel; they have crowned capitals, the carving executed by Mr. Purday, of Gloucester. The chancel arch is of simple mould and plain, with carved corbels. Seats for the choir are placed in the chancel, on the northern side of which is a vestry, separated by a low, open screen. The nave is paved with 6-in. black and red Lugwardine tiles, laid on a bed of concrete; the chancel with 4-in. tiles in two colours; and the altar space with enamelled encaustic tiles. The chancel is approached by steps of Painswick stone, with ornamental tile risers.

Cloughton.—St. Mark's Church, Grange Mount, Cloughton, is a permanent iron church, designed and erected by Messrs. F. Morton & Co., of Liverpool. Outside, the walls are composed of corrugated iron plates, whilst the roof is covered with Morton & Co.'s iron tiles. Inside, the walls are lined with boards to the height of the window sills, and above this they are lined with plaster. The roof is of open timber work braced together. The boarding which forms the internal lining is stained and varnished, whilst the principal cross braces and tracery are further encircled with ornaments. The roof over the

chancel is coloured azure blue and powdered with gold stars. Encaustic tiles are laid down in the chancel and the porch. The east and west windows are glazed with stained glass. The side windows and clearstory windows are also all of them partially so. The whole of the glass was supplied to the contractors by Messrs. Forrest & Co., of Liverpool. Mr. Wm. Bennett, jun., of Liverpool, a maker of warming apparatus, supplied the contractors with one for the church on his improved principle. The entire cost of the whole work is about 4*l.* per sitting.

Liverpool.—The chief stone of the new church of St. John the Baptist has been laid in the district of Tuebrook, in the parish of West Derby. The donor of the church is Mrs. J. C. Reade, of the Elms, West Derby. The situation selected is at the corner of Green-lane, West Derby-road, on a plot of land about an acre in extent, which was purchased from the corporation. The architectural features of the edifice will be Decorated Gothic, and it will be built of the local redstone, mixed with Tbatoo-heath whistestone; while for the interior dressings Stourton stone will be used. The church will consist of a nave, two side aisles, and chancel aisles, and a tower and spire of 100 ft. high. Though there are to be no galleries, it is calculated that the church will afford sitting room for between 700 and 800 persons. The estimated cost, we understand, is 9,000*l.* The architect is Mr. G. F. Bodley, of London; and the contractor Mr. Philip Horaman, of Wolverhampton. The work has been in progress for two months.

Calver, Derbyshire.—The foundation-stone of a church which is about to be erected in the little village of Calver, near Baslow, has been laid. The church will stand on a piece of ground really in the hamlet of Curbar, but it will be at the entrance to the village of Calver, from which it is divided only by the River Derwent. The necessary ground has been given by the Duke of Rutland; and near the edifice there will be the school building and the master's house. To the east of the church, and on a gentle elevation, it is intended to erect the clergyman's house, the land both for the house and the school being also given by the Duke of Rutland. The entire cost, it is estimated, will be about 3,000*l.*, which it is intended to raise by subscriptions. The edifice, which will be in the Pointed Gothic style of architecture, with nave, chancel, and one side aisle, will be capable of accommodating 350 persons, and all the seats will be free and unappropriated. The architect is Mr. Anthony Salvin, jun., of London; and the builder Mr. Ashwell, also of London.

Bolton.—The corner stone of the new parish church of Bolton has been laid. The new structure, the cost of which (about 30,000*l.*) will be defrayed by Mr. Peter Ormrod, will occupy the site of the old church, which had stood there upwards of 400 years.

DISSENTING CHURCH-BUILDING NEWS.

Keighley.—The foundation-stone of a new chapel, for the United Methodists, has been laid here, in Cavendish-street, Skipton-road. The building is in the Decorated Gothic style, simply treated, and the general plan of the chapel consists of a parallelogram, 86 ft. long and 47 ft. wide, within the walls, exclusive of an apsidal projection, 20 ft. deep, at the rear, for the orchestra. The interior is divided into nave and aisles, by a series of ornamental iron columns, from which springs an arcade of seven arches on each side, which supports open hammer-beam trusses across the nave, and these and corresponding trusses over the aisles have curved ribs or braces on the under side. A gallery runs round the sides of the chapel, three seats deep below the aisles on the sides, and nine seats deep on the front end. All the seats are open and of uniform character, with reclined backs. A raised platform occupies the place of the usual pulpit, with buttresses and panelling, with tracery below the floor of same, an ornamental iron balustrade above the steps, and a similar balustrade is carried round the communion-table. The exterior shows the triple arrangement of nave and aisles, with coupled doorways in the centre of the end, leading into a corridor, 8 ft. wide, laid with Milton's tiles, and extending between the gallery staircases on each side, which are of stone. The staircase on the left of the entrance-corridors is carried up in a square tower, surmounted by a spire. The height of the tower and spire together is 125 ft. Over the coupled doorway is

a five-light window, filled with tracery in the head. The sashes are divided into seven bays each by deeply-projecting buttresses, each bay with two heights of two-light windows, with traceried heads, the upper lights running into the roof sash dormers, with gables over the same, intersecting the aisle roofs, and terminated by iron finials. A combined stone and iron finial terminates the apex of the front gable. In the basement, under the chapel, the floor of which is 6 ft. above the street-level, and the same size as the chapel, is a school-room, lighted on the sides by a two-light window in each bay. The principal entrance to this school-room is at the rear of the chapel. On the level with the school-room there are class-rooms, store-room, and other conveniences. At the rear of the chapel, and on the ground-level, are two large class-rooms and vestry, &c. The whole of the woodwork will be stained and varnished, and it is proposed to warm the different divisions of the building by the warm-air system of Messrs. Haden & Son, Trowbridge. The excavator's bricklayer's, and stonemason's works have been let to Mr. John Smith; the plumber and glazier's work to Messrs. Wilson & Ackroyd; and the painter's work to Mr. G. Lonsdale, all of Keighley; and the carpenter and joiner's work to Mr. Thomas Smith, of Harden, near Keighley. Mr. William Sugden, of Leek, Staffordshire, is the architect.—The Wesleyan Chapel at Paper-mill Bridge is to be re-erected. The chapel was opened in 1864, and closed in 1865, in consequence of the foundations in front having given way when cutting for the tunnel for the Worth Valley Railway. The dispute between the trustees and the directors of the railway respecting the damages done to the chapel, boundary-wall, &c., was submitted to arbitration, the result being that about 1,980l. were awarded as damages. The chapel was afterwards taken down, and is now to be re-erected. The new chapel will stand a short distance further back from the road than its predecessor. All the old materials which are available will be used in the erection; the plastering and other ornamental work being of course new, and from new designs. The front will be in a simple Italian design, with projecting portico, arch-headed windows, and pediment. In the chapel will be a gallery and an organ recess. There will be accommodation for 700. The cost of the restoration will be about 2,000l. Messrs. Lockwood & Mawson, of Bradford, are the architects; and Messrs. Gibson & Mand, of Keighley, the contractors.

Darlington.—The foundation-stone of a new Wesleyan chapel has been laid at Bank Top. The site of the new building is a field in Yarnlane. The building is in a semi-Gothic style, with red pressed bricks, and stone arches to the circular-headed windows. In the interior it will be 60 ft. 6 in. long, 41 ft. wide, and will afford accommodation for about 430 persons. The pews will be of stained and varnished wood, and it is computed that the entire cost of the building when completed will be nearly 1,000l. Mr. R. B. Dixon is the architect.

STAINED GLASS.

Dodbrooke Church.—Messrs. E. & S. Beer have just erected a window in Dodbrooke Church. The window, a four-light one, has been placed at the east end of the edifice, and is intended as a memorial of Miss Prestwood Pearse and her sister. The subject represented is the Adoration of the Magi. In the central compartments appear the Virgin, with the Infant Jesus on her lap, an angel above pointing to the star which has guided the wise men to the birthplace, and two of the Eastern Kings in the act of adoration. The third King, an Ethiopian, is seen in the division on the left, and Joseph is described in the division on the right. Canopies surmount the figures. The base is decorated with Eucharistic emblems.

St. James's, Nottingham.—An ornamental window has lately been erected in this church in remembrance of Mr. W. Daft, by his widow and executors. The subject is the parable of the Ten Virgins. The window consists of five compartments, the central one containing the figure of the bridegroom. Those on the right contain five figures of the wise virgins, and the corresponding two on the left side contain five figures of the foolish. The upper portion of the window contains the ancient monograms of our Lord. The window was designed and executed by

Messrs. Heaton, Butler, & Bayne. The design of the stonework was supplied by Mr. S. D. Walker, of Nottingham, architect.

Christ Church, Whitley.—A stained-glass window, illustrating incidents in our Saviour's life, has just been placed in this church by Mr. W. S. Darter, of Sutherland's, in memory of his late wife.

St. Mary's, Reepham.—The east (chancel) window of this church has recently been replaced by a painted glass window, the subject being the Crucifixion, at the expense of the Rev. Sir Edward Repps Jodrell, bart., of Sall Park. The work, which costs upwards of 300l., has been executed by the Messrs. O'Connor, of London.

Rotherham Church.—A new stained-glass window has been erected in the south transept of this church by Miss Nightingale, of South-terrace, Rotherham, in memory of her late brother and sister, Mr. John and Miss Sarah Nightingale. The subject of the painting is taken from the life of our Lord, the main picture in the centre, which takes up the whole breadth of the window, and is divided into three compartments by two upright columns of masonry, representing Christ conversing with Martha and Mary. Above this is a canopy of foliage work, and the upper part of the window consists of tracery, the majority of the compartments containing angelic figures, bearing texts from the Scriptures. The lower portion of the window is divided into three small partitions, corresponding in breadth to the three divisions of the principal picture. The centre compartment contains a representation of Christ at the tomb of Lazarus, and in the side panels are figures bearing texts from Scripture. The window is from the establishment of Mr. W. Wailes, of Newcastle-upon-Tyne.

SCHOOL-BUILDING NEWS.

Witley (Surrey).—King Edward's Schools, Witley, have been opened. The architect was Mr. Sydney Smith, and the builders were Messrs. Mansell & Price. The structure has been raised at a cost of something like 26,000l. The architecture is a combination of the Elizabethan and Italian styles. The building is of red brick, with Bath stone dressings. The chief entrance to the block is through a gateway and porch, surmounted with a tower, containing bell and clock. In a niche of the tower in front there is sculptured statue of Edward VI., the founder of the school, executed by Mr. Rudock, to whom was entrusted the whole of the sculpture. Below this, and on either side, there are two other statues, the one on the left being a representation of our Saviour rescuing a lamb from the brambles; and on the right, Britannia rewarding young sailors. Entering through the porch into a yard, we find in the rear the dining-hall, kitchen, and the appliances for cooking, the latter having been erected by the Messrs. Hayden, of Trowbridge, under the direction of Mr. Blake. The wings to right and left contain class-rooms, masters' apartments, and dormitories capable of containing 150 boys. The front of the building is devoted to the superintendent's residence, servants' apartments, offices, &c. Water was found about 60 ft. deep, and it was never brought down more than a foot during the whole process of the building. The architect was represented on the spot by Mr. W. Lever, and the builders by Mr. C. H. Walpole. The governors of Bethlehem Hospital, on inaugurating the schools, laid the foundation-stone of a convalescent hospital. It is proposed, when this hospital is completed, to bring down convalescent patients from Bedlam to enjoy, for a while, the salubrious air of this part of Surrey, before returning them to their friends. The building will be in the Tudor style, and erected at a cost of about 16,000l. It will be able to accommodate from 40 to 50 patients. Mr. Smirke, R.A., is the architect, and Messrs. Mansell & Price the builders.

Burslem.—The chief stone of the new National Schools has been laid at Sneed. The Earl of Macclesfield has given the site, containing 1 rod and 5 perches, for the new building in Nile-street, and subscriptions have been given towards defraying the cost of the erection. The new building will consist of boys' school, 60 ft. by 20 ft., with class-room, 20 ft. by 12 ft. The girls' school will be 50 ft. by 20 ft., with class-room or infants' school, 20 ft. by 15 ft. The rooms will be connected by large sliding doors, so as to be made available for lectures and meetings. There will also be a lavatory and

the usual outbuildings for each school. Accommodation will be provided for about 400 children. The cost of the building fixtures, &c., will be about 1,400l., nearly 1,000l. of which will be subscribed, leaving a deficiency of 400l. The building will be of red and blue bricks, and covered with ornamental tiling, surmounted by a bell-turret. The architect is Mr. Dain, and the builders are Messrs. Bennett & Brindley.

Tettenhall.—For some time a large building has been in course of erection at Tettenhall, under the auspices of the Midland Counties Proprietary School Company, Limited, for the purposes of the school which was established by them in 1863. The object in view has been to offer chiefly, we believe, to the sons of Nonconformists in the Midland counties a liberal education, both classical and commercial, on moderate terms. The buildings contain all the necessary accommodation for 120 boys. The plan is in the form of the letter T. The centre of the principal or south front is occupied on the ground-floor with the library, master's sitting-room, and principal staircase; and on the first and second floors with master's bed and sitting rooms. In the east wing, on the ground-floor, is the dining-hall, and over, on the first and second floors, are boys' dormitories. In the west wing, on the ground-floor, are class-rooms, opening out of a wide corridor continued the full length of the wing; and over, a similar arrangement of boys' dormitories to that of the east wing. At right angles to the east wing, and extending back to the master's house, are the studies arranged for the use of the elder scholars, and over these are their dormitories. By a passage-way of communication through this building the head-master has access from his residence over the whole of the premises. The house, originally existing at the time of the purchase, having been repaired, is appropriated for the head-master's use. At the end of the west wing, and at right angles thereto, is the large school-room and communication to the playgrounds, together with lavatories, court, closets, &c. On the first-floor, over the school-room, is the chapel, planned to seat 250. The central group of buildings, which extend back to the high road, are planned around an enclosed court, and on the ground-floor provide waiting-rooms, masters' rooms, kitchen, pantries, and other domestic offices. On the first and second floors are additional dormitories for the boys, entered from the principal central corridor, together with lavatories, bath-rooms, &c. An infirmary is arranged, shut off from the rest of the building. Near to the east wing is a covered play-ground, five-wall, and a gymnasium. The style of the buildings is Gothic of the fourteenth century, and they are erected in brick, with stone dressings. The contractors were Messrs. Barnsley & Sons, of Birmingham; and the architect Mr. Bidlake, of Wolverhampton. The cost of the new buildings has been from 15,000l. to 16,000l. The hall and grounds were purchased for 4,000l., making about 20,000l., which is exclusive of furniture.

Books Received.

Experiments on the Strength of Cement, chiefly in reference to the Portland Cement used in the Southern Main Drainage Works. By JOHN GRANT, C.E. Printed by W. Clowes & Son, London.

THIS Excerpt from the Minutes of Proceedings of the Institution of Civil Engineers, which includes an abstract of the discussion upon the paper, edited by Mr. James Forrest, is a very valuable pamphlet, and if it be buyable, should be obtained by such of our readers as have to do with buildings. Mr. Grant had remarkable opportunities for experiment; and, being well qualified for the inquiry, made the most of his opportunities. Many of the speakers added very useful information.

The Architect's Guide; or, Office and Pocket Companion for Engineers, Architects, Surveyors, &c. By MESSRS. HASKELL, RENNIE, F. ROGERS, and P. THOMPSON. London: Atchley & Co.

WE have taken up this little volume more than once, with the intention of giving some account of it, and have put it down again rather than say what the examination of it prompted. The idea is a good one: in fact, if we mistake not, it is founded on a suggestion made by us some time ago; but it has been insufficiently carried

out, and with so little taste, that it has the aspect of being merely an advertisement of books issued by its publishers. The title-page, to give an example, is made to contain three complete advertisements, and one work on specifications is quoted from, and fully described in five places. Nevertheless, we can go so far as to say that students will find in the book a considerable amount of information in a handy shape.

Light: its Influence on Life and Death. By FORBES WINSLLOW, M.D., D.C.L., &c. London: Longmans & Co. 1867.

ALTHOUGH Dr. Winslow merely follows quite in all that regards the sanitary influence of light, he has written a useful *resumé* on the influence of light on life, animal and vegetable, together with what has been thought and said on what may be viewed as his own more special sphere, of lunar influences. As other medical authorities and as sanitary pioneers, certainly not excluding the *Builder*, have long urged, the beneficial influence of light on the sick in hospitals is dwelt on, by contrast with the old ideas and practices of medical men, who used to exclude light from the sick chamber. Dr. Winslow, in his brief preface, says, "the object of this work is to demonstrate the inestimable value of light as a hygienic agent, and to analytically examine its physiological influence in the development of vital phenomena as manifested in the animal and vegetable kingdoms;" and although it is rather late in the day for any one to speak of demonstrating the value of light as a hygienic agent, the author deprecates all idea of appropriating such a demonstration to himself exclusively, by freely acknowledging that he lays no claim to originality, or even to original experimental research on this score. This volume must be regarded as little more than an intelligent professional compilation on the subject.

A Dictionary of Science, Literature, and Art. Reconstructed and extended by the late W. T. BRANDE, D.C.L., &c. and the Rev. G. W. COX, M.A. London: Longmans & Co.

This standard work is now complete, in twelve parts, or three volumes. The present is the fourth edition. The editors have been aided by contributors of eminent scientific and literary acquirements, among whom we observe the names of Owen, Ansted, Lindley, Frankland, Wornum, Burnell, and many others. The publication of the last volume has been delayed, in part by difficulties inseparable from the vast range of the dictionary, but chiefly by the death of Professor Brande. The work comprises the definitions and derivations of the scientific terms in general use, together with the history and descriptions of the scientific principles of nearly every branch of human knowledge; and throughout the editors and contributors appear to have created their respective subjects with fulness and accuracy, as well as with strict impartiality, thus forming an excellent and valuable book of reference.

Miscellaneous.

EASTBOURNE DRAINAGE.—The completion of the main-drainage of this town was to be celebrated by a public dinner on (this) Friday, 3rd May; the Rev. Thomas Pitman, the chairman of the Local Board, chairman on the occasion.

HAYMARKET THEATRE.—Mr. Telbin and Mr. O'Connor have painted some very good scenery for the new comic drama "A Wild Goose." The piece itself is below the Haymarket standard, but it enables Mr. Sothorn to exhibit some excellent acting.

A UNION OF RAILWAY EMPLOYÉS.—A very crowded meeting of railway employés was held on Saturday night in London, to consider the best means to bring the whole of the 76,000 persons employed on railways into one huge "railway co-operative society" throughout the country. The chair was occupied by Mr. McKenzie, of the Great Western, who said he was glad to know that the delegates had come possessed of full powers. Several of the delegates addressed the meeting, and all agreed that the union would be the means of establishing a more friendly feeling amongst them, and would be highly conducive to their good. Rules were drawn up for the regulation of the society.

THE EXHIBITION OF NATIONAL PORTRAITS.—The second special Exhibition of National Portraits at South Kensington is now open to the public. The portraits, following chronologically the first exhibited, commence with the reign of William and Mary, and terminate with the last century.

THE POSTAL TELEGRAPH SYSTEM.—The *Engineer* understands that the contemplated postal telegraph will include every post town in the United Kingdom, and every town of 2,000 persons, and there is to be a deposit-office at every post-office which is not a telegraphic-office proper. In London there will be ten central telegraphic-offices corresponding with the postal districts, and payments for messages will be made in stamps, or the message will be written on stamped paper.

THE CHARITABLE THESSIANS.—On Saturday, the 27th ult., an amateur dramatic society, adopting the above title, gave its first representation at the Gallery of Illustration, in aid of the St. Saviour's Schools Building Fund. The audience was numerous and elegant, and gave promise of substantial benefit. The pieces selected were, "No. 1 Round the Corner," amusingly rendered by Messrs. Masson & Walker; "The Porter's Knot," in which Mr. Thirst shone most prominently, Mrs. Leigh Murray playing her original character, *Mrs. Burr*; and the burlesque of "Fra Diavolo," in which the extravagance of Mr. W. J. Roberts was conspicuous. The conventional burlesque-singing and dancing were well executed, and the play such as to make us think the apology made for inexperience needless. Previous to the "Porter's Knot," a prologue was spoken by the author, Mr. E. Roberts, F.S.A., which, alluding to the topics of the day as applicable to their *début*, caused much laughter, and was warmly received.

INTERNATIONAL SCIENTIFIC BANQUET IN PARIS. The French physicists and chemists gave, on the 22nd April, a banquet in Paris to the savans of all nations, collected by the International Exhibition as jurors or as commissioners of the various nations who take part in this great display. The dinner was given at Donix's restaurant, in the Palais Royal, and was of the most sumptuous description. Dumas, the celebrated chemist, and a Senator of France, occupied the chair; he had on his right the English chemist, Dr. Lyon Playfair, and on his left the venerable physicist De la Rive, of Geneva. Opposite to him sat Barou Liebig, supported by Ballard, the discoverer of bromine; Dové, the Berlin physicist; and Jacobi, the electrician, of St. Petersburg. There were 107 persons present. Among the English were Wheatstone, Tyndall, Sir Robert Kane, Frankland, Hoffman, De la Rue, and many others. Dumas proposed, as a toast, fraternity among the savans of all nations; and this toast was acknowledged by Dr. Lyon Playfair, who had been nominated for the purpose by the committee. This international banquet has raised such a warm feeling of friendship among the savans present in Paris, that arrangements have been made for evening receptions three times a week in the same hall for the next few weeks.

SERIOUS ACCIDENT IN A CHAPEL.—At a lecture in the United Methodist Free Church, Ridding-lane, Wednesbury, a temporary gallery gave way with about 300 persons on it, and fell on people below, breaking the backs of two persons and seriously injuring others. The gallery was constructed in the ordinary way, so far as cross-beams and uprights were concerned; but the ends of the latter, instead of being placed upon stout planks laid upon the floor, were allowed to rest upon the floor itself, which is composed of boards of not more than an inch in thickness. As a natural result, when the gallery became crowded, and the pressure upon the structure great, the end of one, if not more, of the centre uprights was driven through the floor. The cross-beam which it supported, yielding to the pressure, gradually turned over on its side, and while an attempt was being made to put in extra supports—but without removing the audience from the gallery—the cross-beam turned completely over on its side, snapped asunder, and dropped all those standing upon the centre of the gallery down upon a mass of people below. The two ends of the gallery immediately followed, and a frightful scene of confusion and excitement ensued. The lecture was a crowded one, the lecturer being a Mr. Murphy, of anti-Catholic note, and the subject "The Confessional."

THE MAYER COLLECTION OF ART-TREASURES AT LIVERPOOL.—The magnificent collection of art-treasures recently presented to Liverpool by Mr. Joseph Mayer, F.S.A., has been on view during the Easter holidays at the Free Library and Museum, and has been inspected by thousands of persons. The part of the Museum assigned to the collection consists of two galleries at the western end, and considerable ground-floor space. The famous Fauset collection of Anglo-Saxon antiquities is deposited in the first gallery, and it is supplemented by that of Mr. Ralfe, and that obtained by Mr. Meyer himself from Hoyalake.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.—At the last meeting—Mr. James Edmeston in the chair—an interesting lecture was delivered by Mr. W. Cave Thomas on "Fresco Painting." After a comparative estimate of oil and fresco painting, the lecturer urged the superior advantage of the latter for mural purposes, and therefore, as the appropriate decorative accessory to architecture. He described the process in considerable detail, and pointed out the conditions of wall-surface and atmosphere which were essential to the permanent effect of the performance. The lecture was illustrated by several examples from the old Italian masters.

A CO-OPERATIVE BUILDING COMPANY.—At a meeting of operative masons, bricklayers, and joiners held in Newcastle, Mr. Edward Waugh in the chair, it has been resolved to form a society to be called the "Newcastle and Gateshead Co-operative Building Company (Limited);" the capital of the company to be 10,000*l.*, subscribed by 1*l.* shares, to be paid up in monthly calls of 5*s.*, each shareholder to have a share in the profits, and to be liable to any loss to the extent of his shares. The object of the company will be to build houses, accept contracts, &c. The profits arising from the business the first year are to be retained to meet any losses which may occur hereafter.

NEW BUILDINGS FOR THE WEST LONDON UNION. The foundation stone of the new vacant wards and local offices of the West London Union has been laid. The old workhouse having been pulled down in order to make room for the street improvement in connexion with the new meat markets, the new workhouse was erected at Holloway, and now this new building is required for the reception of the houseless poor and the transaction of the business of the union. The site on which the proposed buildings are to be erected occupies the area of a double house in Thavies-inn, three houses in Robin Hood-court, and four in PloUGH-court. The old building in Thavies-inn is not to be removed, and the level of the existing floors is to be unaltered. The Thavies-inn House is for the use of the guardians and the officers. The architect engaged in designing and superintending the new building, is Mr. H. L. Isaac. The contractor is Mr. John Phillips, whose estimate for the whole is a little under 5,000*l.*

PARIS EXHIBITION.—The following minute has been recently passed by the Lords of the Committee:—"1. In accordance with the practice of the Science and Art Department of the International Exhibitions at Paris in 1855, and in London in 1862, my Lords consider it desirable to offer encouragement to the masters teaching in schools of science and art to visit the present International Exhibition at Paris, with the view of studying those objects which may be likely to benefit the instruction given in such schools. 2. Their lordships, therefore, announce to the certificated masters now engaged in giving instruction in schools of science and art connected with the Department, that they will pay to each such master or mistress visiting the Paris Exhibition the sum of 5*l.* in aid of their expenses, and to each an additional sum of 2*l.* for any report or any useful suggestions which any such teacher may make (in respect to his or her duties or teaching), derived from the study of the Exhibition, such report having first been published in any journal, local or otherwise, and afterwards approved by their lordships. 3. And further, to each of the three best of such reports referring to instruction in science, and to each of the three best reports referring to art, my Lords will give respectively the following prizes, in addition to the sum above named, namely,—for science, for the best report, 20*l.*; for the second best report, 15*l.*; and for the third best report, 10*l.*; and the same sums respectively to the three best reports for art."

CAS.—At the annual meeting of the Rotherham Gas Company a dividend after the rate of 10 per cent. on A stock, and 8 per cent. on B stock and D shares, for the past half-year, and half a year's arrears of dividend at the rate of 2 per cent. unpaid in former years on A stock, free from income-tax, were declared.

A HINT TO GAS COMPANIES.—IF THEY WILL TAKE IT.—In his elaborate volume on the gas manufacture, the Reverend Mr. Bowditch relates how a gas engineer, who had to work with a plant beneath the demand occasionally made upon him, would, when the emergency came, pour naphtha into his mains, "and in a quarter of an hour complaints were at an end." This, continues Mr. Bowditch, "was no affair of naphthalizing a few feet of gas in an experiment; but in a work as large as some of the London works, and at a time of extreme pressure, the illuminating power of the gas was raised so much as to relieve a town's complaint of deficient light, and the whole was accomplished in a few minutes; in fact, before the messengers arrived at home from the gas-works."

IRELAND.—A contract has been entered into by Mr. Albert Kimberley, of Banbury, for the building of a mansion at Humewood, in the county of Wicklow, Ireland, for Mr. W. W. F. Dick, M.P. for that county. The designs have been prepared by Mr. William White, architect, London. The character of the building is to be somewhat after the manner of the Scotch baronial buildings, but with certain Irish peculiarities of battlement, &c., and suited to modern requirements. It is also to be capable of defence. A tower more than 100 ft. high surmounts the entrance-hall, which is a lofty vaulted apartment. The whole cost is not to exceed 15,000*l.*

IMPROVEMENTS IN FIXING GRATES.—Mr. Wm. Young, of Queen-street, Cheapside, has taken out a patent for "improvements in and applicable to grates, and in the mode of fixing the same." The chief objects in view are increased facility in the setting and fixing of grates, and in the application of air to the same. For these purposes a template of the size adapted for each grate, and constructed as stated, is securely fixed into the solid brickwork, and the grate is afterwards fixed by screws on to the template. The template is constructed in the form of an iron frame, with cross bars or otherwise, so as to leave spaces through which the new brickwork can be filled into the hollow at the back of the grate—corresponding with the form of the backplate of the grate—after the template has been fixed. Both grate and template can be readily withdrawn from the brickwork without injuring or destroying it. An air chamber can also be arranged behind the grate, according to the construction of the template and grate, and so as to act upon the combustible gases evolved from the fuel by the heat of the fire.

NEW ROOF AT LONDON BRIDGE TERMINUS.—The accommodation for the London and Brighton line proving insufficient, a new roof has been erected, and the whole area of the station enlarged. The arched ribs are supported on two parallel rows of columns enclosing the central section of the station, and from either side of this space horizontal lattice girders extend from the columns to the side walls supporting the side roofs: the latter roofs having been previously designed and the walls built, the arched roof had to be designed in accordance with them. From the extremity of the roof towards the hooking-office it curves to suit the sweep of the line of rails for some distance, and for the remaining portion it is continued in a straight line, forming a tangent to the curve. The columns are 22 ft. 9 in. high, and 1 ft. 6 in. in diameter. The rain-water is conducted from the roof through the columns to the drain pipes. The roof is boarded and covered with zinc. A simple mode has been adopted by Mr. Wallis, who designed and supervised the work, for making the joints of the zinc sheet water-tight and free from liability to derangement. The sheets of zinc are laid and the edges turned up, forming a flange. A roll of wood is formed flat on one side and grooved to receive the zinc flanges. This roll of wood is then covered with zinc, the metal being made to extend around the curve surface, and one edge of the zinc is turned into each groove. This roll is then laid over the flanges, and secured to the hoarding with screws, thus preventing access of water to the joint, and it is not affected by expansion, nor is it liable to be deranged. The contractors were Messrs. Gazelee Brothers, City-road Ironworks.

PLANS FOR THE SEFTON PARK.—The Improvement Committee, Liverpool, after calling to its assistance a gentleman of experience, have unanimously awarded the first premium of 300 guineas to Messrs. Hornblower & Andre's plan; and the second, of 150 guineas, to Mr. Milner, of Sydenham.

ANOTHER FIRE AT THE THAMES EMBANKMENT. Last week, a fire, which at the outset excited the greatest alarm, broke out on the Thames Embankment, at the bottom of Norfolk-street and Arndel-street, Strand. That part of the Embankment on which it occurred is under the contract of Mr. Kitson, and is covered with sheds, containing horses, the workmen's tools, and a variety of mechanical appliances, which are of great value. It was in one of these sheds that the fire was first seen. From what cause it arose is not known. There is something remarkable in these successive fires on the Thames Embankment, the causes of which ought to be closely inquired into.

HARVESTING OF CORN IN WET WEATHER.—We are glad to hear the council of the Society of Arts have resolved to offer the Gold Medal of the Society, and a prize of fifty guineas, for the best Essay on the Harvesting of Corn in Wet Seasons. The first part of such essay—after noticing the various systems at present adopted in damp climates for counteracting the effects of moisture upon cut corn in the field, and for avoiding such exposure in wet seasons by peculiar harvesting processes—should furnish a practical and analytic exposition of the best available means:—1. Whereby cut corn may be protected from rain in the field. 2. Whereby standing corn may, in wet seasons, be cut and carried, for drying by artificial process. 3. Whereby corn so harvested may be dried by means of ventilation, hot air, or other methods; with suggestions for the storage both in the ear and after thrashing. 4. Whereby corn, sprouted, or otherwise injured, by wet, may be best treated for grinding or feeding purposes.

STONE BORING MACHINE SET WITH DIAMONDS.—In following the process of M. Leschot, M. Pichet has constructed a boring machine composed of a steel ring set with black diamonds. In order to use this apparatus it is only necessary to make the ring rotate, and press against the rock to be perforated. The diamond grinds the stone, and, consequently, by means of its circular motion, a cylindrical ring of rock is reduced to powder. A current of water carries away the fragments of the boring as quickly as they are produced, so that the work can be proceeded with rapidly. The borer does not hollow out a hole in the stone, but a cylindrical ring; the adhering core of rock remaining in the tube can then be easily detached by the blow of a mallet. M. Pichet's apparatus is now being employed at the tunnel of Port Vendres: it is moved by hydraulic power, and by its use, it is said, that 1-2 metre of rock is pierced per hour. The diamond wears but little, and when no longer usable, it is powdered, for polishing precious stones.

TENDERS

For building New Metropolitan Police Station, Leabridge-road, Mr. T. C. Sorby, architect. Quantities supplied by Mr. J. Scott:—	
J. & E. Bird	£3,850 0 0
Foord & Son	3,798 0 0
Haward	3,730 0 0
Macey	3,669 0 0
Lathey, Brothers	3,650 0 0
F. & F. J. Wood	3,433 0 0
Hill & Keddell	3,398 0 0
Higgs	3,378 0 0
Patman & Fotheringham	3,345 0 0
For building pair of semi-detached residences at South Norwood, for Mr. W. F. Stanley. Mr. T. C. Sorby, architect. Quantities supplied by Mr. J. Scott:—	
Wheeler	£2,397 0 0
Lathey, Brothers	2,463 0 0
Cubitt, Brothers	1,990 0 0
Smith	1,888 0 0
Sawyer	1,979 0 0
George	1,960 0 0
For alterations and additions to the Victoria Tavern, St. John's Wood, for Mr. E. Weatherley. Messrs. Finch Hill & Poirrie, architects. Quantities supplied by Mr. Gate:—	
Newman & Mann	£1,495 0 0
Langmead & Way	1,493 0 0
Lawrence & Bangs	1,480 0 0
Easton & Chapman	1,393 0 0
For alterations and additions to 64, Marine-parade, Brighton, for Mr. H. Hill. Mr. J. Johnson, architect:—	
Cheesman & Co.	£1,228 0 0
Winder	1,079 0 0
Farr	970 11 2

For sewers and other works in connexion therewith of the parish of Finchley. Mr. William Farmer, civil engineer.

Bell & Robertson	£2,098 11 2
Walton	1,849 0 0
Cheffins	1,780 0 0
Keble	1,744 0 0
Young & Fussell	1,636 0 0
Sharman	1,620 0 0
Pizzetti	1,603 0 0
Crockett	1,491 0 0
Mann	1,485 0 0
Parson	1,482 0 0
Nesbitt	1,344 0 0
Wood	1,393 0 0
Coulson	1,347 0 0
Coker	1,347 0 0
Thacker	1,341 0 0
Davenhill & Co.	1,331 0 0
Baker & Co.	1,302 0 0
Dickson & Oliver	1,249 0 0
Falconer & Cowley	1,173 0 0
M. Plowman	1,155 0 0
Harvey	1,142 0 0
Moxom & Matton	1,130 0 0
C. Plowman	1,113 0 0
Heal & Weston	1,102 0 0
Bloomfield	1,050 0 0
Burgis	1,045 0 0
Davison & Prime	982 0 0

The last nine are reserved for further consideration and inquiry.

For new vestry offices, Church-row, Bethnal-green:—	
Lark	£1,743 0 0
Henshaw	1,448 0 0
Hick	1,437 0 0
Wood	1,250 0 0
Page	1,189 0 0
Forrest (accepted)	1,107 0 0

For the purchase of the newly-erected casual warehouse, &c., St. Pancras Workhouse, to be pulled down and cleared away at the expense of the purchaser:—

Evyn (accepted)	£71 10 0
Snyrk	165 0 0
Maxn	165 0 0
Blount	160 0 0
Colman	137 0 0
Binns	130 0 0
Croaker	128 0 0
Sheller	121 0 0
Irons	118 0 0
Tatum	108 10 0
Reddin	74 0 0

For new warehouses in Houndsditch. Mr. T. C. Clarke, architect:—

Lawrence & Sons	£5,987 0 0
Colls & Son	5,769 0 0
Scrivener & White	5,577 0 0
Henshaw	5,470 0 0
Browne & Robinson	5,439 0 0
King & Sons	5,420 0 0
Brass	5,398 0 0

For maltings at North Woolwich. Messrs. Hunt, Stephenson, & Jones, architects:—

Cubitt & Co.	£31,434 0 0
Newman & Mann	30,439 0 0
Holland & Hannay	29,846 0 0
Piper & Wheeler	27,250 0 0
Jackson & Shaw	27,160 0 0
Myers & Sons	26,868 0 0
Henshaw	26,546 0 0

For a five-story warehouse (30 ft. by 61 ft.), with additions, and four shops, at St. John's-road, Hoxton. Mr. Herbert Ford, architect. Quantities supplied by Mr. J. W. Dennison:—

Bawlin	£7,398 0 0
Piper & Wheeler	7,059 0 0
Richard	6,799 0 0
Turner & Sons	6,713 0 0
Brass	6,678 0 0
Ashby & Sons	6,531 0 0
Browne & Robinson	6,439 0 0
Ashby & Horner	6,321 0 0
Henshaw	6,098 0 0
Webb & Sons	5,984 0 0
Mann (accepted)	5,887 0 0

For additions to Myddleton House, Waltham-cross, for Mr. H. C. B. Bowles. Mr. F. G. Widdows, architect:—

Webb & Sons	£1,847 0 0
Carter & Sons	1,770 0 0
Patman	1,769 0 0
Hill & Keddell	1,735 0 0
Rivett	1,720 0 0

For building a residence in Baker-street, Enfield, for Mr. G. Kiches. Mr. F. G. Widdows, architect:—

Webb & Sons	£2,477 0 0
Carter & Sons	2,330 0 0
Rivett	2,273 0 0
Hill & Keddell	2,205 0 0
Patman	2,178 0 0

Mr. Higgs writes.—My tender for works at Alton House, Roehampton Park, was 3,968*l.*—not 3,968*l.*

TO CORRESPONDENTS.

The late Sir Robert Smirke, Sir R. Smirke built many churches besides the one mentioned by "P. C." in our last. In due course an account of the life and works of Smirke will appear.

London Bridge.—Several correspondents read notes as to the widening, but nothing new.

We are compelled to decline pointing out books and giving addresses.

All statements of facts, lists of tenders, &c., must be accompanied by the names and addresses of the sender, and necessary for publication.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

The Builder.

VOL. XXVI.—No. 1266.

The Buildings for Great Exhibitions.

It is certainly full time that Architecture in the proper sense asserted the prerogative of its place among the arts,—and, it may be added, justified the concession of such prerogative, by assuming the direction of the structures destined for those great exhibitions of which the world is assuredly not now preparing to occupy itself with the last. This world of ours is more populous than it ever was, and becomes more so day by day; and notably in the classes that are susceptible of attraction to such displays, and capable of availing themselves of the means of concentration that continually develop in spread and despatch. Our epoch has some of the characters—some of the better characters—of the pacified days of imperial and populous Rome, which produced not alone the amphitheatre of Vespasian and Titus, but the so-called baths that covered several areas equal to that of the ancient republican city, with single regular structures, replete with all refreshment, and easily available to all, for body and mind and imagination. In fact, it is excusable to be sometimes a little uneasy at the closeness of the parallelism; and we may well bethink ourselves whether the rapid—the almost instantaneous—decadence that followed the concentration of monuments by Hadrian, and his epitomized representation of all centres of artistic celebrity at Tivoli, is not to be repeated as a catastrophe sequent to our Crystal Palace courts, or to the nest of cosmographic ellipses in the Champ de Mars.

The apprehension may not be chimerical, unless such displays prove to disclose the germ of a new development—truly healthy because truly artistic—as well as to display what former developments have done, that have already done their best. Of this germ there is no cynicism in declaring we find at present but little appearance. The advances that are registered in the successive shows, are found in detail, not in the whole, in the contained not in the containing, in discoveries and recoveries of processes, in new technical facilities, in surprising concentrations of capital and mechanical force, but little indeed in that general effect of impressiveness and beauty that raises men above themselves, and reveals to them susceptibilities of enthusiasm in their own nature that is all the more noble because it can neither be mistrusted by them nor obviously accounted for.

Museums and collections attract visitors for special or for general purposes. A mechanician

on the look out for a tool or an adjustment will seek for it and find it with undiverted pertinacity through a wilderness of art barren for him, but the very gardens of Hesperian fruit for the amateur, who flies instinctively to his object, and would do so were it deposited in a chaotic assemblage of whatever could be repugnant to him. But the eager and the earnest are not those who most require the stimulus of a world's show; it is difficult to enhance the instinct of the Stock Exchange, the counting-house, or even the studio. From these haunts come the actors who are pretty sure to have interest enough in their work: the audience comes from elsewhere; and the main end of the whole spectacle is to interest and enliven, and, if it may be, instruct and elevate these.

The immense majority of visitors to artistic and mixed industrial exhibitions will always be holiday-makers; and in great national and international displays, which affect to be more than markets on a great scale, it is for the avowed especial behoof of this great majority that the whole arrangement is set on foot and set in operation. Mere holiday-makers may seem to be people worth little consideration, and as such they may not be; but it is in the spirit of the time to recognise the fact that from the existing accessibility of culture, there are few of them who may not be made something much better. The Greek philosopher said life was like the Olympic games, where some came to get honour by joining in the contests, and many more to make money out of the requirements of the unusual assemblage; but the happiest of all were those who had no other interest than as lookers on. This happier majority have their rights in either case; and it is for the advantage of all that they should see to advantage: it is to their own great advantage if they are induced to see with attention, and they will do neither unless there is a possibility of their seeing with delight.

"Great is the value in dramatic poetry," says Horace, "of sequence and connexion"—that is, of happy sequence of appropriate combination; and the law holds good in the pursuit of all artistic effects, and the penalties are the same for disregarding it.

Exhibitions and museums alike forfeit half their value, if their contents are crowded, or are jumbled whether crowded or not. Part of the responsibility, in any case, must rest with the arrangers; and who has not been shocked by the intrusion of a colossal monument of decadence among the insulted relics of most perfect art,—who has not had occasion to remark how a collection of works that by its elements has been above an average exhibition, has on a time fallen far below in effect, through the errors, or vices, or caprices of collection. Of such mistakes let the authors take the opprobrium; and amendment is always within reach. But far more serious, as irreparable, are the mishaps due to the neglect of appropriate architectural conditions,—of those larger artistic framings-in and surroundings that exercise a predominant influence and give a tone to the feelings of the by no means unsceptical, if, it may be, not specially cultivated crowd.

The most valuable result, indeed, that the majority we are now interested in can usually bring away from a world's show, may be this very tone of feeling, for which, in most important degree, the architect will be answerable. The crowd pours in and pours along; *spectatum veniunt spectentur et ipsa*, and, of course, little less *et ipsi*. They see their friends, and are seen. They see the human face divine, at least, and, not without interest, the disguises of the human form; they crowd round the pretty and the striking; they are detained, it must in all candour be confessed, above all by whatever moves and whatever makes a noise. Doubtless, from time to time, they catch sight and take fair note

of some objects of beauty or contrivance that they peculiarly affect or understand: but when all is done, after all their gazing and idling, and occasional even involuntary study, when they come away they have seen more of the building itself than of anything else; and the character of this, as it has been enlivening or oppressive, exercises a deciding influence on the strength of the desire to go again or to go frequently again, and in what frame of mind, whether with respect for all, or with contempt of it.

The Exhibition building in Hyde Park of 1851 may be regarded as the first in effect, as well as in time, of these novel structures; but, greatly as the world delighted in it during that festive year, it could bear to see it doomed to destruction while revival was still uncertain; yet assuredly, had it possessed architectural beauty to the extent of which such structures are quite susceptible, a cry would have gone up like the greeting of a proposal to pull down St. Paul's to accommodate a railway station. Its charm was largely due to the predominance of the transept and to the vista of the long central avenue; but the conditions of the mechanical ease and rapidity with which it was constructed put art in the best sense out of the question. Grace and dignity in the highest refuse to be wooed in terms essentially prosaic; and endless and unvaried accumulation of identical elements is not the process by which nature develops its organisms or art its effects. The petals of the flower may be, as the botanists tell us, developments of leaves; but they are not mere repetitions of them enlarged or diminished, and still less agglutinations of a number of them otherwise unaltered. Thus the tame subservience to cheap expediency was far too salient; commensurability, after all, failed to supply the lacking play of proportion; and colour could not permanently satisfy the eye that recoiled from screws and nuts and wire ties, and longed for some merciful, at least, if not beautiful, qualification of the intrusiveness of hard construction.

After all that has been done since, the iron order is yet to come; and still it need not be, should not be, far off; but the matter is now ripe to be treated by the architectural sense,—recognizing, indeed, but holding well in subjection, the strictly constructional. Both in Continental and in English railway stations, in various other structures, and in the last great novelty at Paris, adjustments constantly meet the eye that are as compatible with artistic, with proper architectural treatment, as they are consistent with truth of construction. But construction must be made to know its place; and that place is servile with opportunity for enfranchisement in virtue of willing, unwearyed, and above all versatile exertion. The desire of the mechanical is ever to achieve its ends by mere repetition or at best reversal, to meet every emergency, by stamping from the same die, running a series of casts from a single mould. But the free hand of art knows the limitations as well as the use of its dudgeon Repetition; and modulates on occasion without remorse, and expects all that work not merely for love but for reward, to follow.

The art of displaying public collections, then, in a way to interest and delight the more numerous public, and to promote the most refined of all education, is distributed between the custodians and the architect. What the first may do is seen in the beautifully-arranged Temple Collection in the British Museum, as compared with the huddled vases or stuffed animals in adjacent rooms; and what the latter, was seen in the original Townley Gallery in the older building as compared with the veritable caves of Trophonis that succeed each other from entrance corridor to Elgin saloons in the new. The real solution of the great difficulties of enormous covered space, every variety of light,

for pictures, for sculpture, for manufactured products more or less artistic,—and characteristic beautiful effect, variety and vistas,—on the architect is this charge laid; but whatever the competence of his genius he has still to pray that in the regions from which commissions descend he may not find himself at last,—

"Compell'd in business and in art to drudge,
Without a second and without a judge."

HISTORICAL PAINTINGS IN THE PARIS INTERNATIONAL EXHIBITION, BY FRENCH AND ENGLISH ARTISTS.

In comparing the works of French and English painters, as seen in the Paris Exhibition, we are compelled by a sense of justice to consider the different circumstances under which the artists of each country exhibit; for to judge of the artistic power possessed by our English artists from an examination of their productions here displayed, would be to commit a grievous injustice, and form an opinion of no value. And this, we fear, is being done generally by the French critics, who do not conceal their absolute disappointment at the English exhibition of works of fine art. It is not difficult to find ample explanation of the fact, that in the capital of France, or even on the Continent of Europe, in any important international exhibition in a metropolis, French art should be better represented than English art. To prevent a full representation of the latter there are, firstly, the possession by private persons who do not choose to part with them, of the *chef-d'œuvre* of English artists; and secondly, the difficulties and dangers in transit through the necessity of a sea voyage, however short, and its accompaniments of packings in railway carriages and steamers, which foreign works of art of whatever country do not incur (at any rate, so far as the sea-voyage is concerned) to such an extent as English works inevitably risk. Then it is, perhaps, part of the explanation that there has been undoubtedly amongst our artists either an absence of *esprit du corps* to be efficiently represented as a school in the Exhibition, or that sufficient facilities have not been given them or inducements offered, to make them take the inevitable trouble of being well represented, for the only probable or possible reward which might be their portion. Against this we have to set the facilities given for a full and complete representation of the French school. For the most part French artists live in Paris, and those who do not always reside there have their studios in the capital, where they produce during the autumn and winter months the great and numerous works exhibited every year. Thus, in the matter of carriage for their works, the only transit has been from the *ateliers* in Paris to the Champ de Mars, and the risk of injury has been reduced to a minimum by the excellent arrangements made in Paris for the transmission of the French works of art. Then Frenchmen generally, and French artists especially, are keenly alive to the glory to be won for their country and themselves by an efficient national representation in an international competition; and even if this were not a sufficient inducement, it would be found that the honour of being an artist selected to represent French art in the limited space given to France in the world's concourse, would be an irresistible inducement to the French artistic mind.

Making allowances for these adverse circumstances in the one case, and favourable opportunities in the other, we were not prepared for the very moderate, if not even the insignificant position, of our own school of historical painting as compared with the French. Judging not only from the English paintings in the Exhibition, but with a knowledge also of the important works by our greatest living artists which are not exhibited, and regarding the works which are displayed only as being moderate types of what English artists are capable of, we yet discover in the works of our English school an absolute inferiority in some of the most important characteristics of a true historical school, when examined side by side with the French works. This inferiority is not compensated for by the technical excellencies of skilful manipulation and sweetness of local colour, in both of which it appears to us that our best painters excel the best painters of the French school, because the features in which our inferiority exists are es-

sential elements, whilst the points of superiority are but accessories. We will endeavour briefly to explain the grounds of this opinion.

Historical painting is an effort to represent to the eye, and thence to the mind, incidents which have actually occurred in the history of a nation, or in the lives of individuals, which is much the same thing, if the persons represented be of sufficient public importance to be engaged in deeds of general interest. The occasion or subject selected in history, or the actual episode in the individual life, will determine the poetic or prosaic character of the artist's mind, or suggest to us his sympathies and convictions; whilst the manner in which the fact represented is placed before us will indicate the true value of the work historically and artistically. It is evident, therefore, that the most important characteristic of a true historical painting is the absolute truth of the historical incident represented; and next to it the nobility or beauty in the manner of representation. But as artists, who live in the nineteenth century, cannot be responsible for the actual truth, in detail, of historical incidents which have happened centuries or thousands of years ago, we may roughly divide historical painting into the true and the imaginative, the first being the embodiment of incidents happening in the period in which the artists live, possibly have taken part in, or been present at their occurrence, and have had the means of ascertaining the veracity of the incidents and their accessories in detail, from their own experience and the testimony of eye witnesses, drawing from the actual objects for material truth; the second being subjects from remote or comparatively remote history, where the truth of the historical element is a matter of speculation only, and the principal value of the effort is its approximation to the truth according to our utmost knowledge, or the artistic excellence of the manner in which it is presented to us.

Works of the first description most nearly comply in principle with the definition of historical painting; and the truth of this statement can be easily attested by reference to the comparative estimation of the works of any two English artists who have variously interpreted the two kinds of true history and imaginative history. Take, for instance, the works of Hogarth as a painter of true history, and it is not too much to say that we place them upon an infinitely higher level as historical paintings than the works of West, whose subjects were more noble in incident and of a higher class in technical accessories; because our reliance upon Hogarth is reasonable, and we feel that he actually embodied for us the history of certain features of his own period; whilst our only feeling towards West is one of criticism purely, regarding the historical elements in his imaginative paintings as of no more value than the imperfect fruits of our own speculations.

Next to the absolute historical truth of the incident represented in an historical painting, comes in importance the material truth of the imitative faculty exhibited in execution and composition; and by far the greatest element of success in this feature is power in drawing; for, without this power, the motive of the work may be marred, and no accessorial excellence of colour or manipulation will atone for its absence.

It is in these prime characteristics of true and great historical work that we recognise the towering superiority of French art. In the selection of subject we give French artists the same sort of credit that we give to Hogarth, and in more recent times to Fribt, and O'Neill, and Wilkie in his best days,—not making them responsible for the sorrowful feature, humanly speaking, that a vast majority of their works are of warlike subjects, battles, military triumphs, and discomfites of the enemy. We must excuse something in the art of an essentially warlike people with a military history like that of the French, possessing, to artists, the inspiring example of Versailles and its miles of painted history, principally of military triumphs. But having made this sacrifice to our island prejudices, we cannot refrain from observing that the same power which is manifested in their military pictures, the subjects of which we have no sympathy with, is evident also in the rest of their exhibited works; and that this power is probably the result of the method of study necessitated by the importance to them of comprehensive knowledge of the human figure. Much of this knowledge comes from the method of instruction adopted in the French private *ateliers*

and public *écoles de dessin*,* but more from the almost national habit of drawing upon a life-size or heroic scale. Faults which may be hidden, because they are not obtrusive, in pictures upon a small scale, become hideous distortions when magnified to the size of life or enlarged beyond it. On the other hand, experience which has been derived from working upon the natural scale, in which from ease of comparison faults may be readily detected, will not be likely to be misapplied in works which are on a smaller scale than nature. The extent to which this practice of drawing in the large is carried by French artists, may be estimated by the illustration that an actual majority of the historical paintings of the French school in the Exposition are either life-size, or larger than that; and that if we take eight of the largest pictures in the French department of the Exhibition, they will give us about the same superficial area of canvas as the 163 exhibited works in oil comprising the English department of the display.

Another element of superiority in French practice is the study of the nude figure, and its consequent facility of execution. We prefer to say nothing about the demand that seems to exist for life-size paintings of the nude female figure, but only to remark that there are twelve works of this character in the Exhibition, many of which are most remarkable for beauty, both of drawing and colour. It is a common axiom amongst painters that he who can paint flesh can paint anything; and if this be so, French painters must be general in their accomplishments, for no other living artists can paint flesh so well. It is a positive pleasure to see flesh painted as it is in the "Secrets of Love," No. 382 in the French gallery, by Jourdan, and to see also this loveliness of colouring allied to so masterly a power of drawing; and the same may be said of 381, "Leda," by the same artist. "Le Reveil," by Landelle, No. 397, though characterised by drawing as correct, does not appear to us to be equally charming in colour. But for the three attributes of fine composition, good drawing, and a natural key of colouring, we see no works in the English exhibition to be compared to these, as exercises in painting, and would also draw the attention of students to the following works in the French department. No. 91, by Jules Breton, a seashore scene, and 83, by the same artist, "Blessing the Cornfields," as possessing very high qualification; and No. 84, "The Calling of the Cleaners," by Breton, completes a trio of excellent historical paintings of the very highest class. We refer to these works more especially as illustrating remarks already made concerning true historical art, and from a sense of comfort that there are French artists to be found, whose talents can be used to illustrate the peaceful scenes amongst which they live, as well as others who only seem at home on the battle-field. Of the same character as to subject are O'Neill's "Eastward Ho!" and Lewis's "Courtyard of the House of the Coptic Patriarch, Cairo," in the English gallery, both familiar to us from previous exhibition in England. Concerning the latter it would be impossible to say too much in praise, for a more marvellous specimen of art-workmanship, perhaps, does not exist. It has the merit also of being the valuable and truth-bearing testimony of one to whom God has given the seeing eye, and on whom education has bestowed the cunning hand of a true craftsman in art.

Of the huge battle-pieces which are the distinguishing mark of the French school of painting, perhaps the most successful as a picture is "An Episode in the Battle of Solferino" (No. 6), by Armand Dumaresque. In the foreground of this picture is an ambush of French marksmen engaging the retreating artillery of the Austrians, and the drawing of the reclining figures in front is both powerful and picturesque. More agreeable, however, in subject of the pictures which are on a larger scale than life, is No. 503, by J. A. Pils, of a *filé* given to the Emperor and Empress of the French at Algiers, during the autumn of 1850. This work has many excellent points, and exhibits great experience in the handling of masses, both as to colour and form. The figure of the empress, which is not finished, bids well to become a very beautiful creation. No. 507, also by M. Pils, of "The Battle of the Alma," is as good and no better than such enormous battle-pieces are generally. The virtue of and the apology for such works is that they are true history legiti-

* About which we shall have somewhat to say at a future time.

mately written by their authors, who have the best opportunities of being accurate in their embodiments; and if the French *must* have scenes of bloodshed always before them, to whet their youthful military appetites, it is better that these hero-creating works should approximate in some degree to the actual truth, than that their painters should wander back to the fictions of Mediæval history, and produce romances in colour.

Though indisposed to accord to works of the imagination the same degree of importance in subject as to those of true history, we yet regard the noble expression of a purely human conception, based on the generalising efforts of the mind solely, as among the very highest powers of the human intellect. A parable or an allegory, without exactly relating the true circumstances of any one particular instance, may contain in its conception a greater amount of truth as to the principle illustrated, than any one of any given number of instances. For this reason parables have from all time been a favourite method or vehicle for the conveyance of great truths or the illustration of vital doctrines. The parables of Christ have, in a like manner, been also among the most frequently chosen subjects of the best artists. Fortunately, for the sake of a comparison, a French artist, Edward Dubufe, has, in No. 225, "The Return of the Prodigal Son," illustrated one of these parables, and an English artist, J. E. Millais, has, in No. 104, "Satan sowing Tares," illustrated another. In the French work we have a painting equal in size to the largest of the enormous battle-pieces before referred to, divided into three compartments, the centre one being in colour, and occupying about three-fourths of the whole picture-space, and the remaining quarter, one-eighth on each side of the central illustration, made this into a margin of two pictures, are monochrome studies of parts of the story. The picture tells us the story of the Prodigal's Return, the moment selected being the rejoicing, when the penitent son is being robed with the best garment, amidst the acclamations of an assembled multitude. The joyousness of the spectators, the apparent consciousness of the undesired honour in the expression of the prodigal, and the feeling of triumph in the faces of that portion of the family who approve of the rejoicings, are among the most remarkable efforts of art at any period in any country. The drawing of the human figure in this work is, perhaps, its greatest glory, but the composition and colouring are brilliant also. A pupil of Paul Delacroix, Dubufe, seems to possess the breadth and solemnity of his master's style, whilst he greatly exceeds him in vivacity and *ton* sensible. This picture appears to us to occupy the same position in French art as Milton's "Paradise Lost" does in English literature. It is an epic of the first order; and, without venturing to weigh its claims against the magnificent works of the German and Belgian schools, we cannot refrain from believing that, so far as France and England are concerned, it must occupy the first place in the competition of the two countries.

Turning from this French illustration of one parable, we look at the English illustration of another, the devil sowing tares, by Millais. In it we have almost as remarkable a work of its kind as that of Dubufe, but of a totally different order. The picture is probably familiar to most of our readers, from the criticism it evoked in a former Royal Academy Exhibition. But to those who do not remember it, and for the sake of instituting a comparison, we will describe it. The devil is represented as a stealthy and watchful old man, engaged in the night time in sowing tares upon the cultivated field of a sleeping husbandman. In scale of the picture is about one-third the size of life, the only figure in it being that of Satan himself. The dark atmosphere of night is given with absolute truth of imitation, and the stealthy—we had almost said sneaking—attitude of the sower is very suggestive of the evil nature of his occupation. But the style of painting adopted contrasts but poorly with that of Dubufe. Of other ideal works of the French school, No. 466, "Marguerite trying on the Jewels," by Hugh Merle, is worthy of notice. It is a life-size study of a very lovely German girl, taking, evidently unconsciously, the first step downwards; and 313, "Christ healing the Lepers," by Gläuze, is a nobly painted picture.

Amongst the really valuable contributions to the illustrations of contemporary history are,

No. 85, "The Erection of a Calvary," ascribed in the catalogue to Cabanel, but really, we believe, the work of Breton. The principal figure in the Calvary, that of the crucified Saviour, has been brought from the church in which it has been consecrated, and is being borne on the shoulders of a number of monks, this group forming the principal part of a procession which has just emerged from the church porch on its way to the elevated central cross, seen in the churchyard beyond, which is prepared to receive the divine image. It is a fine, broadly painted work. Promising also are two pictures, by Charles Marchal, of (414) a group of figures singing Luther's hymn; and (445) a Statue Fair, as we should call it, both having unmistakable evidences of truth to nature, and powerful artistic treatment. One of the best of the incidents of war among the historical works is the "Ambulance, or Convoy of the Wounded," by Yvon, No. 620, painted from an episode in the Italian campaign of the French army. This, unlike the two gigantic works by the same artist, Nos. 618 and 619, is on a moderate scale, much less than life, but of keener human interest to us than the yards of sprawling figures, dead and dying, which are in the two Malakoff pictures. It was, we believe, Haydon who said that wherever English people go, they take with them horse-racing and portrait-painting. If this is so, the influence of the English residents in France must be infinitesimal, for there are not in the two magnificent galleries devoted to French art, as many portraits as may be seen in any one small room in the Royal Academy Exhibition every year. No. 124, portrait of the Emperor by Cabanel, and No. 255, same subject, by H. Flandrin, are perhaps the best in the French galleries, though No. 66, by Bonnat, is worthy of commendation, as is also No. 585, though this is more a collection of portraits, in the subject, which is "The Prince President giving Liberty to Abd-el-Kader."

The picture by Bonnat, No. 64, "St. Vincent de Paul taking the Place of a Convict," is excellent in composition and feeling, and, though not bearing upon the subject of these remarks, we cannot take leave of the French collection without noticing with words of special praise the studies of still life, Nos. 210 and 213, by Blais Desgoffe. To return to the English works. We have already suggested that in the English department there are no representatives of the two branches of subjects which occupy so important a place in the French display, viz., the life-size and heroic studies of the nude, and the battle and other pictures on the same scale. These seem to occupy the same position in France as the wholesome love of apparently inevitable portraits do in England. Both are peculiarities of race, and each more or less held in contempt by the other. We believe there are more life-size painted portraits in the English department than in the rest of the European collections together, and this is certainly suggestive of a greater love for ourselves than for the higher branches of art. The president of our Royal Academy exhibits four portrait pictures, excellent as works of portraiture, but sufficiently indicative of the sort of art we prefer nationally.

Of the elaborate and scholastic style of painting, which is the best feature of our English School, the works of E. M. Ward are, perhaps, the finest examples. His "Night of Rizzio's Murder" and "Antechamber at Whitehall: the Last Hours of Charles II.," are quite national in their character. In many features of art, Mr. Ward has held a prominent place for many years among our best painters, and these two works cannot but increase his distinction. The variety of expression, the truth to nature, and the absence of extravagance in both of these paintings, are worthy of all praise.

Of the historical pictures by English artists, one of the best, and certainly by far the most popular among the French visitors, is Elmore's "Tulleries, June 20, 1792." Marie Antoinette reviled by the mob. There is generally a crowd of French round this picture, and the commendations are loud and frequent. Frith's "Claude Duval," is also a favourite, both as subject and from a sense of fun amongst the visitors. A party of French people examining this work in our presence seemed greatly delighted that a French highwayman should have so kept up his national character as to demand a *piquette* with his captive beauty. The two contributions of Erskine Nicol, "Paying the Rent" and "Both Puzzled," are admirable pictures, abounding in

quaint humour and wholesome fun. There is in these works the ring of the true metal, and they possess in a high degree the qualities we defined as necessary to the best art.

Millais is but poorly represented in the paintings we have already noticed, and by "The Romans quitting Britain," and "Eve of St. Agnes." The French may well wonder why we think so highly of him, regarding these as specimens of his powers. "The Death of Chatterton," by Wallis, and the "Home from Work" of Arthur Hughes, will enable our neighbours to estimate the value of the Young English style of painting. Both of these works, beautiful in sentiment as they undoubtedly are, and genuinely good workmanship, are in a manner which appears extravagant and peculiar, after the broad, bold colouring and masterly drawing of the French school. Leighton's "Fiancées of Syracuse," and G. F. Watts's "Orlando," are both pictures which exhibit peculiarities entirely their own, and distinguish them from all other English works. After an examination of the galleries of almost any other country than our own, the majority of the English subject-pictures look like highly-finished miniatures, both on account of the smallness of the scale on which they are executed, and the degree of elaborate workmanship introduced into them. The paintings of Leighton and Watts do nothing towards creating this impression; on the contrary, they relieve us from the imputation that we cannot paint in a large style.

The technical difference in manipulation or handling of the French and English schools is most marked, and though in effect it is in favour of English art, as a matter of honesty we cannot but prefer the French. With the exception, perhaps, of the picture before referred to by Watts, and parts of that by Leighton, the English works are generally painted with transparent shadows, the local colours being thinly glazed into them. This undoubtedly gives brilliancy of effect and capacity of the highest possible finish. But of its honesty we are not quite so satisfied. A large proportion of the colouring matter used by our artists actually disappears by the evaporation of the medium with which the colours are so lavishly mixed, and, as a consequence, no English picture having a few years of age can be guarded against a perfect network of cracks and disfigurements. Eventually, as is the case already with some of the best pictures of Turner, the separated fragments of the picture will fall away and scale off, even if they do not change in colour.

French artists sacrifice the beauty and transparency of their shadows, by painting them thickly with opaque colours, using but little medium. From the habit also of painting on a large scale, the finish or blending of the colours used by them is but slight. There is in almost all the pictures exhibited a scene-painting effect, caused by contempt which the artists appear to have for smoothness and finish, of the sort we are accustomed to in our own works. The effect obtained is, however, permanent, the solid shadows being as little likely to change as the light opaque portions in which white is used. Whatever change does occur by age will be in the direction of improvement, the colours mellowing by age, and blending more perfectly as they lose their original brilliancy.

Whilst upon this subject of historical painting we would urge upon the visitor to Paris the advisability of visiting the Annual Exhibition of Painting and Sculpture in the Palais de l'Industrie, even if it were only to see Gustave Doré's picture of the German gambling-table, occupying the place of honour in the principal *salon*; but more on account of the treat such a vast collection will give him, when the works themselves are possessed generally of so large an amount of merit. Some idea of the art-producing faculty of the French people may also be obtained, by comparing the number of important pictures in this exhibition with those in any one year at the Royal Academy and of original groups in marble there, with the sculpture produced in a year at Trafalgar-square. It may be, and apparently is the case, that in some branches of art, to which we shall in a future number refer, English will bear a favourable comparison with French art. Historical painting, we feel, is not one of them; and considering also the marvellous power, grace, and refinement of many of the German and Belgian works in addition, there can be little doubt of the salutary and valuable lesson which may be learnt by our artists and art-students from a careful course of study in the Paris Exhibition.

THE PORTRAITS AT KENSINGTON.

THE Science and Art Department of the Committee of Council on Education have offered, in the second special exhibition of national portraits at South Kensington, a noble contribution to the materials of English history. The value of portraiture, as an element of historic truth, is very great. History is the record of the actions of human beings, and the better we are acquainted with the actors, to a certain extent, the better shall we understand the actions themselves. We say, to a certain extent, because close familiarity has often the effect of inducing us to merge the character of an act in that of the actor. It is only so-and-so's way: he means no harm; or—the matter looks amiss, but there must be a justification. And this, no doubt, is one of the causes why a certain lapse of time is held to be essential before history, properly so called, can commence. We must be free from the disturbance caused by the living human sympathies and antipathies of the actors themselves before we begin to estimate their actions. But apart from the question of that immediate proximity which may disturb the judgment, we lose much by ignorance of what manner of men and women they were of whom we speak. For how much does stature, mien, commanding or winning expression, melody or harshness of voice, enter into the directing causes of action. Let two men, equal, as far as may be, in station, in integrity, and in claims on public respect, attempt to persuade an assembly, the one with the mellow flow of a native orator and the other with a hesitating and confused stammer,—which will succeed? Thus we hold that among the most precious records of the past are those portraits of the great actors in human events on which reliance can be placed from extrinsic or intrinsic testimony. Look at the wonderful head of Cains Julius Cæsar in the British Museum; does it not tell us more of the man than do his "Commentaries" themselves? Look at other heads of the same memorable series. Can we mistake the portraits? Is there any need, any possibility, to ask which is Augustus and which is Tiberius? Who does not read with a more vivid sense of the stern and unflinching struggle the account of the repeated interviews of the leader of the Hebrew exodus with the Pharaoh of his day, after gazing on the commanding and self-reliant features of the great monarchs of that mighty eighteenth dynasty, among whom the adopted son of Thermotis was invited to take a place—Amemphis—Thothmes—Horus himself, the very Pharaoh of the Exodus. Who, to come to later times, has not formed a more definite idea of Oliver Cromwell from the Sidney Sussex crayon portrait than he can do from the pages of Carlyle?

At a time when authentic materials of English history are daily being rescued from oblivion by the labours directed by the Master of the Rolls, it is of the utmost interest to be enabled to gaze on the lineaments of the chief actors, and even to find them familiar to our study by the help of the photographer. The hundred and twelve years of history which are illustrated by the present exhibition, come more fully and distinctly before our eyes than could be the case with the longer period of time covered by the collection of last year. Yet even in the short space of little more than a century, what a change has come over the costumes, the circumstances, the countenances of English men and women. The first portrait, one by Kneller, of the Earl of Athole, is in "rich inland armour." The latest portraits are in costumes such as our fathers wore when young men. Most appropriately placed among the earliest pictures in the gallery, is the entrance of King William III. into London, by Vander Meulen. What a scene is presented to our eyes. The heavy lumbering coach, needing its six grey horses, not for show but for service; the snite in scarlet uniforms, surrounding the coach on foot as well as on horseback; the park-like scenery and fine timber of the spot, now densely covered with streets and houses, somewhere in the vicinity of the Bricklayers' Arms station; the few horses clustering round the steeple of St. Saviour's; the bridge covered with houses; the city, not undefined in its size, north of the Thames; the new pinnacles of the Cathedral of St. Paul, and the dome, apparently a later addition to the picture,—such was the scene presented by the Old Kent-road a hundred and eighty years ago.

King William, in Van der Meulen's picture, is considerably turning his face over his shoulder,

so as to show us at once his features and his star. Again we have him when young, from Hampton Court, in a three-quarter length; also from Hampton Court, on horse-back, small life-size; and as a boy, painted by Cornelius Jansen, the features under the stiff treatment of the artist foreshadowing the man. As much cannot he said of Earl Spencer's Rembrandt, in which it is so impossible to trace the likeness, that one can hardly don't the picture to be mis-named. John Graham of Claverhouse, Viscount of Dundee, and Admiral Edward Russell, Earl of Orford, are of the two most beautiful portraits of this reign. Of Sir Isaac Newton there are four representations very dissimilar, even to the colour of the eyes. The same difference exists between Vanloo's portrait of Marlborough, a well-painted, *bad* face, and a more ordinary grey-eyed representation of the great general by Kneller. Duchess Sarah appears four times under different aspects of gaiety and gloom. Prince Eugene, by Sir Godfrey Kneller, is a far more presentable person than he appears to be among the family portraits at Turin. Steele and Addison arrest the attention as we pass on; Kneller himself, in rich gold chain and medal; Swift, far better looking as a dean than as a student; Pope, very unfortunately limned,—each calls for more than a glance before we pass to the times of the Hanoverian dynasty.

Any unloyal and undutiful remarks on the physiognomy of the earlier Georges, or even on the honest, resolute features of the farmer king, must be silenced by comparison with the portraits of the elder and legitimate line of the house of Stuart. Of the son of James II., known by the somewhat ludicrous name of the Old Pretender, there are seven portraits—one of himself and his sister, the Princess Louisa, as children, by Largilliere, remarkable not less for vivacity of expression and brilliancy of eyes, than for having had their heads removed from the canvas and restored to their original position. The peculiar full under-lip of the boy subsides into something approaching imbecility in the man, in No. 200, from Hampton Court, and No. 198, evidently a copy of the former. Prince Charles Edward Stuart, the Young Chevalier, is represented five times; but the first trustworthy features of Flora MacDonald, by Allan Ramsay, seem to demand a more kindly here. There is a second Flora, by Hudson, in no way comparable to the first. But in the features of Prince Henry Benedict Stuart, Cardinal of York, the weakness of the expiring line seems to reach its utmost depression, and one cannot regard them without a feeling of satisfaction that our sceptre has eluded that hesitating grasp.

There is a very fine lesson in physiognomy to be drawn from the four portraits Nos. 196, 222, 223, and 225. The first, John Law, of Lanrioston, is a face that would not have looked strange among ourselves a year or two back. In the lines of the mouth are to be detected no faint indications of that most dangerous of deceivers, the man who believes in himself, and who sympathises with his followers. Aislabie and Craggs, on the other hand, are just the men fitted to serve as subordinates to such a leader, while the straight-forward features of "Downright Shuppen" present a contrast more marked to those of the other three than any that we can recall from the pages of Lavater.

Hogarth's portrait of Bishop Hooper arrests the attention by the life-like twinkle of the eyes. Lady Mary Wortley Montague, very theatrically painted by Della Rusca, is charmingly portrayed by Jonathan Richardson. Frederick Prince of Wales is represented as seated holding a volume of Pope's "Homer," while two Cupids are fluttering in the air beside him. The two portraits of the Duke of Cumberland show at once the meaning of his sobriquet of "butcher"—not as caused by any military truculence, but as characterising that unusually florid and well-nurtured aspect which either the constant smell of fresh meat or the frequent chances of a hearty meal usually impart to these useful members of the community. Bishop Butler's loving features and piercing glance of Bishop Berkeley. The portrait of Philip Dormer Stanhope, fourth earl of Chesterfield, by Gainsborough, in advanced age, leads one to regret that the fine portrait of the same peer in younger age, with the black eyebrows so strongly contrasting the powdered hair, has not been sent from Great George-street for comparison. Hogarth's fine portrait of James Thomson, the poet, is enhanced in value by the vicinity of one of the few bad pictures in this part of the Exhibi-

tion, Aikman's portrait of the same author. Mrs. Hogarth, by her husband, is an admirable picture.

The fair sex command more attention than the men as we advance towards the times of George III. A grand Lady Macheth seems Penelope Pitt, Countess Ligonier, the heroine of a duel and of a divorce; the two sisters, Elizabeth and Maria Gunning, so famous for their beauty, "the Goddesses the Gunnings," are represented, one as a landress and the other as using an iron; and the portraits tell us that their charms must have been rather those of expression or of manner than of regular outline. The two sirens to whom we are indebted for the Royal Marriage Act, Anne Luttrell, Mrs. Horton, and Duchess of Cumberland, and Maria Walpole, Countess of Cambridge, and Duchess of Gloucester, are each painted both by Reynolds and by Gainsborough, and between them, in her fresh young maternity, with the Princess Royal asleep on her knee, the often-caricatured Queen Charlotte, by Francis Cotes, is even a more pleasing picture than either of those four treasures of portraiture. But the face which most calls the attention,—you cannot tell why, but so it is,—is Nancy Parsons, Mrs. Horton, afterwards Lady Maynard, another of the magic productions of Gainsborough. Mrs. Sheridan is another gem by the same master, and Henry Frederick Duke of Cumberland, also from his brush, marches fiercely along with his cane in the air, overtopped and overshadowed by his duchess, whose eyelashes do not however attain the three-quarters of a yard estimated by Horacio Walpole.

Fewer portraits arrest the attention in the upper gallery. But one lesson of great importance is very plainly taught by No. 584, the portrait of Richard Burke, by Reynolds, which, in the freshness of its colouring, presents a marked contrast to the sadly faded condition of almost every work of this master. The reason is evident. The picture is glazed. So is 695, Lavinia, Countess Spencer; but this proper protection for all oil paintings appears to have been only recently,—or comparatively so,—adopted in this instance, and the whites are sadly injured. In another fine portrait by Sir Joshua, Lord Rokeby, archbishop of Armagh, the shadows have actually turned blue, and the effect is very curious. As we leave the features limned with the graceful but mending colour of Reynolds, and the nobler work of Gainsborough, artists and sitters seem to dwindle. There is a closer approach to the art of the sign-painter, and a series of faces that seem hardly to demand a more exalted style of art. One group of extreme interest, however, is composed of four portraits, lent by the Duke of Wellington, of his father, the Great Duke, the Marquess Wellesley, the Earl of Mornington, and Lord Cowley (No. 823). The noble mother of these noble sons should have been placed near enough to allow of the likeness which Arthur bears to her to be more distinctly traced.

Lady Milnes, a lovely portrait, by Romney (No. 810), as far as can be seen in an unfavourable position, is rapidly decaying. The Madame de Maintenon of Windsor, Mrs. Fitzherbert, lovely in features and in complexion, but with shoulders that look too small for the noble head and neck, is the gem of this part of the gallery; and, last of all, two Oxford portraits, William Eden, first Baron Auckland, and the Right Hon. Wm. Windham, by Sir Thomas Lawrence, reward the attention which has scrutinized without flagging the 866 portraits of this remarkable collection.

TESTIMONIAL TO MR. S. C. HALL.—This testimonial has been subscribed for by manufacturers and others in Birmingham. It consists of a desert service in the Pompeian style of ornament, the whole being carefully chased, parcel gilt, with the figures in oxidised silver, the dishes being of crystal, flashed with ruby, elaborately engraved and cut. Three Flamingo-like cupids, with scarf held in air, are introduced in the centre piece, which stands on a circular platoon, on which is engraved the following inscription:—"Presented by a number of the principal manufacturers and other inhabitants of Birmingham, to Samuel Carter Hall, Esq., F.S.A., projector and editor of the *Art Journal*, in testimony of his incessant labours for the advancement of art in connexion with manufactures, extending over a period of thirty years. May, 1867." The work has been executed by Messrs. Elkington.

ARCHITECTURAL EXHIBITION, CONDUIT STREET.

In the Conduit-street Galleries, under the auspices of the Architectural Exhibition Society, 391 designs, drawings, and photographs (including a carved panel by Miss Bloxam, two or three models, and some very good bits of Salvati's mosaic work), have been gathered together, and, as intimated in our last, are now open to the public. Four lectures are to be given during the continuance of the Exhibition, to which, as well as to the gallery at all times, a half-crown season ticket will admit. Such of our readers as did not see the competition designs for the National Gallery when they were exhibited in the Westminster Palace may be glad to know that they will find here illustrations of the designs of Messrs. Cockerell, Street, Owen Jones, M. D. Wyatt, James Murray, E. M. Barry, Cuthbert Brodrick, Banks & Barry, G. S. Clarke, and F. C. Penrose. Of the designs sent in for the new Law Courts there are photographs of those by Messrs. Seddon, Waterhouse, Garing, R. Brandon, Lockwood, Scott, and Burgess. Of the Manchester Royal Exchange competitions there are the designs submitted by Messrs. A. Baker, T. H. Watson (a clever set of drawings), Dunning & P. Gordon Smith, T. Meyer, and W. M. Peck.

The sketches and drawings sent from abroad by various architects are an interesting feature of the collection. We would especially mention those by Professor Hayter Lewis, T. H. Watson, R. P. Spiers, E. P. Anson, E. S. Cole, A. B. Donaldson (whose industry and ability are equally noticeable), H. W. Brewer, C. Fowler, Moore, Tarver, and the Rev. J. L. Pettit. Mr. Tite, M.P., makes a valuable contribution in the shape of four original architectural drawings, by Bramante, Canaletti (the Piazza S. Marco, 186 and 187), and Prout.

J. Moys Smith, in (1) "Corridor Niche," and some other contributions, shows facility with the pencil. This is not the merit of (14) "Priory of St. Dominic," Gilbert R. Bionni, where a good sensible building is damaged by the way in which it is set forth. 26, "Design submitted in competition for the new Town-hall, Grantham," R. W. Edis, to which the second premium was accorded, is noticeable for the union of an early round-arched style with vernacular Italian. 44, "Accepted Design for College Boarding Houses, Cheltenham," suggests a well-known wooden building in Coventry. Competitive designs for town halls in Wolverhampton (38) and Retford (47), E. Godwin and Crisp, show adherence to the same type cleverly followed by one of the firm at Congleton. Mr. Horace Jones sends his design for the "Metropolitan Meat Market, Smithfield" (152) (of which we have given an engraving), as well as views of some of his earlier works, "Cardiff Town-hall" (156), and the "Magnetic Telegraph Station, Threadneedle-street" (140). A. & G. Thomson exhibit several large frames of old office drawings, some of them not without merit in design. We cannot say this, however, of their "Design for Natural History Museum, Kensington" (154), a Greek temple, wholly unfit for the purpose.

A number of large residences, either built or in progress, are illustrated, including "Aldermaston Park" (51) and "Addington Manor" (52), by P. C. Hardwick; "Elvetham Hall" (70), a handsome brick building, balconies gilt and illuminated, by S. S. Tenlon; "Residence at Penzance" (99), Elizabethan in style, by D. Brandon, and "Stancliffe, near Matlock, in Derbyshire," designed for Mr. Joseph Whitworth, by T. Roger Smith. The style of the latter building, which is set forth in a number of clever drawings, may be described as refined Jacobean. Amongst the good drawings, by the way, may be mentioned that by which Mr. Fred. Marrable shows the chancel of his church in Wickham-road, Deptford, "St. Peter's" (117), on which we have before now commented. The "Design for proposed Church at Sharrow, near Sheffield," by W. Purdie, has a very ugly tower, which should be reconsidered before it is put into stone. The "Chapel designed for Buteham" (18), by Rowland Plumbe, will need more than its share of down-pipes for the rain-water. Wise provision is shown in the treatment of the lower part of the "Church of St. Mary Magdalene" (42), designed for Paddington, by G. E. Street.

The "Isometrical View of the Home for Little Boys, at Horton Kirby, Kent," by T. C. Clarke (153), shows a little village, the intention being that the boys should be distributed in small

hatches throughout the houses, each batch being under the care of a man and his wife. This would, of course, be the nearest possible approach to home-life, and we shall be glad to learn that funds are forthcoming to permit of the realization of the scheme. Elevations and plans of the various houses are shown in small around the general view. Messrs. Pictor's buildings have not justice done to them by the views sent; and we can scarcely believe that the house built, under Mr. G. Aitchison, for Mr. F. Leighton, A.R.A., who knows what beauty is, can be so ugly as the drawing here exhibited would lead people to suppose.

A RUN THROUGH GLASGOW.

"A GREAT book," said an ancient Greek philosopher, "is a great evil." In like manner, a well-known modern author tells us that the same thing may be said of a great city. There can be no doubt that the aphorism contains much truth in it; but like many wise saws, ancient and modern, it contains only a portion of the truth. Nor is the analogy too precise. A great city necessarily contains a greater amount of evil than a small town. But it also contains a greater proportion of good, a larger extent of opportunity, and a wider field for the exercise of progress. Above all things, it possesses greater resources for the cultivation of those sciences, moral as well as physical, upon which the welfare of society must always depend.

Since these scientific principles constitute, after all, the subjects with which our readers are chiefly concerned, we are sure they will be glad to hear something about what is going on at this moment in Glasgow. For if we except the metropolis itself, we scarcely know of any city in the country which has done more towards the furtherance of sound principles in sanitary science and social reform. At the same time it must be confessed that the good work is by no means finished; much remains still to be done. It must always be remembered that Glasgow is a place of singular contraries and extremes. It is unquestionably a place of great wealth and of great poverty. It has a history nearly as old as that of London; and in many respects its appearance curiously resembles that of London. But it possesses, we cannot help supposing, a greater affinity, or relationship, with Manchester or Birmingham. It has a university older than, and nearly as famous as, that of Edinburgh; yet how few are its great contributions, at least in the present day, to literature or philosophy! It possesses a cathedral, which, if not the finest, is certainly one of the most perfectly preserved specimens of Pointed architecture. We must add that this old cathedral is almost the only work of high art in ecclesiastical architecture of which the city can boast. On the other hand, it must be stated that the manufactures of Glasgow vie with those of Manchester; its commerce is second only to that of Liverpool; the population is at this moment the third largest of any city in Great Britain or Ireland; and, finally, its progress within the last century and a half is one of the most remarkable phenomena in modern history! Undoubtedly much of this material prosperity is due to the extraordinary fertility of the natural resources with which Glasgow is surrounded—its immense coal basin and mineral fields, its rich soil, temperate climate, and its noble river. But making allowance for all this, there can be no question that much also depends on the character and energies of the people.

In order to get an accurate conception of the different phases of progress in Glasgow, or, indeed, of any large city, one should always adopt the plan laid down by Eugene Sue, in the "Mysteres of Paris"; that is to say, begin at the very lowest quarters, and rise by successive stages to the very highest. But to do this properly is no such easy matter. For, in the first place, Glasgow is a city which covers, we should think, such an area, one way or another, as fifteen or twenty square miles. Unless, therefore, one chooses to surrender up his liberty of action to a cabman—a practice we never pursue ourselves, and by no means recommend to others,—it would be quite impossible to get over the ground. As some counterbalance to this impediment, it should be remembered that, although Glasgow is a very ancient city, there are but few remnants of antiquity left for patient investigation or attentive study, and these lie close together; indeed, there are no ancient shrines,

if we except the cathedral, to which the stranger can owe a lengthened pilgrimage, or an extraordinary devotion.

Overlooking, therefore, such objects for the present, and confining our rambles to the principal thoroughfares, with a careful study of the map, some quick observations, and a few pointed inquiries, we may soon get to the conclusion that the city of Glasgow may be roughly classified into three or four well-marked typical groups, something in the following order:—

1. *A Town of the Earlier Part of the Seventeenth Century* (based on the original plan).—This division will comprehend all the poorer localities of the city, such as the High-street, the Gallowgate, the Salt-market, and the Bridgegate.

2. *A Town of Various Periods in the Eighteenth Century* (the first great modern extension to the west).—Of this division the best type is comprehended in that parallelogram which is bounded on the east by Candleriggs; on the south by Trongate and Argyle-street; on the north by George-square; and on the south by Millar-street or Virginia-street: it may be described now as the quarter of warehouses.

3. *A Town of the Earlier Half of the Nineteenth Century* (the second modern extension, chiefly westward).—This division comprehends (A) the Royal Exchange and surrounding streets devoted to business,—as Queen-street, celebrated for its banks, and Buchanan-street for its shops; (B) the range of parallel streets, St. Vincent-street, West Regent-street, and Bath-street, which run westward from Buchanan-street, and terminate at Blythswood-square.

4. *A Town of the Later Half of the Nineteenth Century* (still in progress, chiefly westward and northward). This division comprehends all the terraces which overlook the Kelvin-side Park, the principal streets of Sauchiehall Grounds, Garnet Hill, Sandy-road, and, lastly, the terraces of Hillside, on the north of the Botanic Gardens, &c.

Of course this division must needs be more or less empirical; and, moreover, we must explain there are many subordinate degrees. There are first, second, and third class property; there are differences of locality, good streets and inferior streets; numerous back streets and by-gone streets, and not a few disreputable ones. There are the regions of manufactures and of commerce.

Port Dundass, for example, is a colony of chemical works and manufactories, which has chiefly sprung up since the beginning of the present century.

Once more, there are lower, middle, and higher styles of street architecture. It will be impossible for us to discuss minutely these various subdivisions, although we will not overlook them; and, as we have stated, we shall put out of consideration the remains of the ancient ecclesiastical city. With these exceptions, our classification, rough as it is, will include the whole interest of the city. We have not included the southern districts, as being unnecessary to our study.

But we may add, for the sake of future inquirers, that it is quite possible to get a general glance at the principal portions of Glasgow, on both sides of the river, if the visitor will select some centre of observation,—say the cathedral: then proceed by Duke-street, through the High-street, to the Cross, where the Gallowgate and Salt-market both debouch; from the Cross to the Royal Exchange, by Trongate and Argyle-street; thence, by way of Buchanan-street, to Sauchiehall-street and Blythswood-square. Here at the west end lie the very handsome crescents and the beautiful Kelvin-grove Park; then proceeding by Charing-cross and North-street to the Broomielaw and the harbour, he may cross Glasgow Bridge, and pass through Hutchison-town to the South-side Park; look, in passing, at the Gorbals, and return by Stockwell Bridge to Argyle-street and George-square, and so to bed, as Mr. Pepps would say.

Of course we cannot pretend to overtake this extent of ground in our own cursory survey; nevertheless, beginning at the old cathedral as a starting-point, we may pass at once, by Duke-street and Wellgrove-street, into the regions of the Gallowgate.

The Gallowgate of Glasgow—to give it its ancient, and still by no means inappropriate signification—is a street about a mile and a half in length, which recalls a certain faint resemblance to the High-street of Edinburgh. The houses are not so lofty, nor the closes, we fancy, so dingy; for we must acknowledge that much has been done within the last five-and-twenty years to improve the thoroughfare and the ten-

ments which abut upon it. Indeed, at the northern extremity it is quite modernized. Still, there are plenty specimens left of the ancient architecture, which consists chiefly of four-story tenements, with picturesque crow-stepped gables to the front, pointed triangular roofs, narrow windows, deeply chamfered on the lintels and jambs, with here and there the remains of an old gurgyle, which has been superseded perhaps, under the new Police Acts, by zinc roans and rain-water conductors. The doorways which are left entire are heavily moulded, and often contain quaint inscriptions or Scriptural legends. Our impression of the Gallowgate and its gamins was by no means so bad as we had anticipated; and, in fact, the only conspicuous fault we could find was a general one respecting the infantry barracks, which are situated within its precincts, and which, we are sorry to say, are anything but creditable to the city of Glasgow. However, the subject has already attracted the attention of the authorities, who will doubtless see to their improvement,—if not to their total removal to a better locality. Towards the lower end of the long street, as it begins to approach the Cross, we see unmistakable symptoms that the value of property must be rising. There are several new tenements which we examined, with spacious shops, and wide, well-paved archways leading to their common stairs. These new houses also possessed a water-closet on every floor, and the rental, we found, was moderate. They were chiefly inhabited by the better sort of working classes. From the foot of the Gallowgate we cross over Trongate and enter the Salt-market,—the Glasgow Cheapside of former days, and the locality of the immortal Balfie Nicol Jarvie,—which, we must admit, is also greatly improved since we saw it some years ago. What with the closing up of the open spaces of the ancient shoppes, the erection of iron girders and plate-glass windows in most of the shop-fronts, and the gandy style of painting, a great change is observable in the antique buildings as well as in the aspect of the old thoroughfare. Still it is easy to recognise some ancient tenement, with its Dutch gables and triangular dormers, that recall the old style of borough architecture which the modern shops seek after in vain.

If the interiors of these old tenements were as healthy as their exteriors are picturesque, we should have no cause to regret them on the score of public health; and if the inhabitants of the houses above were as frugal and industrious as the tenants of the shops underneath, we should have as little to lament on the score of public morals. But that is a wide question, and it must not be raised in a merely incidental form.

We must now take a glance at the notorious regions of the Briggate. Opposite Candleriggs, and on the south or river side of Trongate, we enter King-street, once the most fashionable, then the most respectable, business locality of the city. It is now one of the poorest and disreputable; for in that square of buildings embraced within King-street, Briggate, Stockwell, and Trongate, are situated some of those wretched and close places which have given such an unenviable notoriety to the lower districts of Glasgow; those dens of criminals and hotbeds of disease which, as we shall see, have evoked such strenuous efforts on the part of the Corporation to root out and destroy. And we must say that they had waited long enough. For it is scarcely possible to conceive a more disgusting quarter in any large town. Miller's place is worse than Clure-market. Prince's street is worse than the Cowgate of Edinburgh. In the Briggate (Bridge-gate) itself we could discern symptoms of improvement. The infamous goosebubs, for example, are almost obliterated. Still the condition was similar; only it was enlivened with a few more sheebens or low cating-houses. As to the condition of the alleys and closes branching off here, they are simply unspeakable, and we need not dwell on them; for, bad as the Briggate and its confluent wynds may be, we are of opinion that the High-street and its "vennels" are worse!—and that is saying a great deal.

The High-street of Glasgow and the population of its wynds and "vennels" have been described as *sanus sanum*; but it must still, we suspect, constitute a training ground "of what to mistrust,—that is to say, if the improvement bills do not actually improve it off the face of the earth! The architecture is of the same type as the rest of the ancient city; but in the old vennel we observed a most dilapidated tenement,

still covered with thatch, with curious apertures pierced at intervals to admit the light. But, after all, who can study antique buildings in the face of such inhabitants? We walked through the High-street on a quiet Sunday afternoon. Even then, on that day so peculiarly sacred in Glasgow, the low type of the population we saw clustering around the filthy orifices which lead to their filthy dwellings, was so well marked and easily distinguishable, that it made one shudder to think of the orgies of the preceding night. Low prostitutes, with their criminal confederates of the opposite sex, were thickly scattered about,—many of them still of premature age. If, as the modern sanitary maxim tells us, we are to judge of the people by the houses they inhabit, then we should say that they possess fit habitations. Of course, we seldom ventured to look beyond the entry of the close; and we could not but remark how ungracious was to give us information even as to the name of his miserable vennel! Such as we did look at,—Fingall's-close, Duncun's-close, Dewar's-close, and one, No. 55, which we were told had no name, like Willie Collins's heroine,—were all alike disgusting in their dirt and their wretchedness. It was clear the lofty tenements were provided with sanitary appliances; for a large iron dust-bin, or "law-box," placed at the foot of the stairs, served the sole receptacle of all the ordinary refuse, the animal and vegetable garbage, and the solid and liquid excrements.

It is a pleasing duty to report that effectual steps have been taken by the Corporation, under the recent Glasgow City Improvement Act, for the amelioration of these districts; and this Act we shall by-and-by have to describe more fully as the first great sanitary improvement which has been recently made in Glasgow.

Before passing to another division of our subject, it may be desirable to devote a paragraph to the removal of the university. But in case the *status* does not appear sufficiently plain, we must state that the present University of Glasgow stands in the very centre of those vile rookeries we have just been describing, in the High-street! What a place for a seminary of youth! Immediately opposite the college gate, at the corner of High-street and College-street, stands the house in which Thomas Campbell, the poet, lived during the period of his student life in Glasgow. One ought to see the place, in order to appreciate thoroughly the "Pleasures of Hope!" What a curious locality this was, to be sure, in which to entertain her Majesty during her first visit to Glasgow! The college buildings themselves are certainly the least worthy of all the temples of learning in the kingdom; for, although the front elevation to the High-street has a quaint half-conventional aspect, with its low arched gateway, stone balcony, decorated narrow windows, and antique dormers,—the courts, halls, and lecture-rooms are little short of absolute meanness, when we consider the noble purposes to which they are applied. The principal quadrangle bears the date, we observed, of 1652, and the style of architecture is of course Tudor,—upon a very inconsiderable plan, however, of small dimensions and grotesque details. We must confess that we were rather disappointed at the poverty of those ancient buildings of which we had previously heard so much. Unquestionably they possess a very high historical interest; but they are, we think, far inferior to the most humble and unpretentious buildings of the German universities of the same age. The venerable principal, Dr. Caird, we observed, from a brass plate, has his residence in this unhealthy atmosphere. Perhaps it may be a purely official residence, like that of the Prime Minister in Downing-street; and it is possible that he neither sleeps nor eats his meals there. But if he does, we can only say that his theological constituents are by no means so careful as his ought to be of a valuable life. The parish school yard by is adorned with a bulging circular dome, springing from a square base, which is about the noblest thing of the sort we ever recollect of seeing in Scotland. On the whole, we must congratulate the Glasgow professors and students, as well as the Glasgow public, on the prospect of a speedy removal of their ancient university to Gilmore-hill, for it has certainly fallen into evil society in its old age! The buildings were sold in 1864, under the authority of an Act of Parliament, to the Union Railway Company. This is the second, and without doubt one of the very best, measures we shall

have to report on what has recently been done in the shape of improvement in Glasgow.

In order to get a glance at our second division, we should make our starting-point at the Cross. Here we get for the first time a clear view along the Trongate, which, with its continuation, Argyle-street, constitutes the main artery of the city,—the Fleet-street and the Strand, as it were, of Glasgow. Here we may note the perceptible improvement on the ancient Cross,—one of those campanile towers surmounted by four terminal flying buttresses, springing from their base in the form of an imperial crown, which are common to Scottish Medieval Architecture. We confess that we were not so well pleased with the condition in which we found the statue of King William, its pedestal being at this moment converted into a post for a pair of cast-iron urns! These are certainly excellent improvements in their place; but they are rather destructive of the amenities as well as the artistic effect of an equestrian statue. If the necessity of the thing must overpower all other considerations, why should poor King William not be shifted to the Valhalla at George-square? There are precedents for such a course. Flaxman's statue of Pitt was removed from the Tontine Buildings, where we stand, to the Corporation Galleries. Marochetti's equestrian statue of her Majesty was removed to its present site from St. Vincent-street. Let us, then, put in our humble plea for the removal of the statue of "Protestant Willie"—a king whose memory ought to be dear to the hearts of all good Scotsmen—to a nobler site and more congenial company.* The Tontine Buildings we have mentioned were the centre of business and politics before the erection of the new Royal Exchange in Queen-street, and may fitly represent the greatest architectural effort of the eighteenth-century period we have at present under consideration; and if the arcade of these buildings, level with the pavement, were covered in and properly converted by modern improvements, it might still answer very well for a modern hotel in the Italian style, for the design from the first floor upwards is very good; but as it stands it has a yawning, hungry look, as if it were neither a hotel nor a raieto. Next to this is a very tasteful range of buildings in the Flemish vein of Scottish architecture, erected not long ago as a branch of the City of Glasgow Bank and other offices. But in order to get a specimen the finest in Glasgow of the application of Scottish Baronial to the architecture of a warehouse, we must pass through the Candleriggs to Ingram-street, to the magnificent buildings of Campbell & Co. Of course we cannot find fault with the taste nor the cost of it. There is no higher feature in burghal philosophy, ancient and modern, than the tendency of wealthy merchants to adorn their places of business. Yet it is a curious thing, after all, to see a Glasgow warehouse of the nineteenth century planned and executed to its minutest detail—turrets, towers, bartizans, rope mouldings, and flat-arched doorways,—upon the model of a Border fortress of the Middle Ages. Is not this a sort of paradox? Upon what principle can we reconcile the two purposes of the two buildings? We will not stay to answer the question, for we are glad to admit that Messrs. Campbell's warehouses are a fine piece of composition, a splendid structure, and, on the whole, does infinite honour to the city. But how much better it would have looked in a Highland glen than it does in Ingram-street! Contrasted with these buildings, where the Medieval elements are idealized and, as far as possible, modernized; where, in point of fact, modern taste has set to work upon a style of antique basis; we may note that shop and warehouse at the corner of Maxwell-street and Argyle-street, called the "Granite Buildings," in which we think there has been a modern perversion of an ancient material. These buildings must have been enormously expensive, inasmuch as the whole elevation, from basement to blocking course, is constructed with dressed Aberdeen or Argyleshire granite. We have seen in our day the best

* It is the fashion among the guide-book writers, who follow each other, of course, like sheep, to disparage this fine old statue, and to repeat that it is "of no great merit as a work of art."—(Fide "Black's Guide to Glasgow," p. 23; Millar's "Illustrated Guide," p. 27.) We can only say that, in our opinion, with the exception of Marochetti's Duke of Wellington in front of the Exchange, it is the best equestrian statue we have seen in Glasgow. The horse is not much worth, and the pedestal, we admit, is abominable; but the historical portrait of the man is invaluable. This statue, we may add, was presented to his native city by Mr. James Macrae, then governor of Madras.

productions of granite buildings both in Aberdeen and Cornwall; but we never saw the elaborate material used after such a fashion as this,—a gaudy, unmeaning attempt at elaborate French shop architecture, carved, ornamented, and, in short, overdone.

Of course, our readers will easily understand that those specimens of modern warehouses are rebuilt on former sites; in fact, the buildings which they superseded were the old mansion of the merchant princes, or tobacco lords, who first, by their wealth and its judicious expenditure, gave rise to the most important extension of Glasgow. The Buck's Head Inn, in Argyle-street, was the last specimen left of their well-ordered, self-contained mansions; but the cotton lords and modern merchants now fix their residences further west, and nothing is left of eighteenth-century Glasgow but an endless range of shops and a labyrinth of warehouses.

We now come to the central regions of "the money power" in Glasgow—that is, the neighbourhood of the Royal Exchange. Notwithstanding its artistic faults, its incongruities of design—such, for example, as the duplicate aspect of the building on the side elevations, arising from the fact that the eastern half is designed with attached pilasters, and the western by a projecting colonnade of fluted Corinthian pillars, and, finally, notwithstanding its acknowledged obligations to the Royal Exchange of London—the Glasgow Royal Exchange is a fine building. The great room is particularly handsome, the lofty arched and panelled ceiling, with the double row of supporting columns, adding greatly to its rich effect, which, however, is still business like, and not over-gilded nor too gaudily decorated. The Exchange is situated in the centre of a very stately square of buildings, of plain but massive design, rather too closely built, perhaps, to the central edifice, still forming as a whole, a remarkably rich and imposing cluster of buildings. All around, of course, we see banks, insurance-offices, rich warehouses, and splendid shops. Some of these public buildings—the National Bank, for instance—seem as if they had been transplanted by some Aladdin-like feat of enchantment from Lombard-street or Old Broad-street; and, indeed, the hand of the London architect is easily distinguishable. The National Bank is a very good specimen of modern Italian, highly decorated, consisting of two stories, the lower enriched with a range of Ionic columns, the upper with a similar range in the Corinthian style, surmounted by a rich entablature and cornice, and capped by a flat and bevelled platform roof. Rising from the cornice is a group of sculpture consisting of the royal arms in the centre, and an allegorical statue on either side. Alongside of this, in point of artistic merit, we are inclined to place the Commercial Bank in Gordon-street,—unfortunately too narrow a street for the full display of its qualities. This building is of a very old Italian type, and is said to be modelled after the Farnese Palace. The semicircular arched windows and doorway of the basement are deeply rusticated on the quoins and vousoirs, and a very graceful effect is produced by the introduction of sculpture in the segmental pediments of the upper stories. The doorway contains a recessed porch. The roof is cut into a centre block and two lower wings, and the elevation as a whole is noble as well as chaste. Nearly opposite this bank, at the corner of Gordon-street, and West Nile-street, we come upon a very fine range of shop and warehouses belonging to Sir Andrew Orr, the late Lord Provost of Glasgow. In Buchanan-street there are also many similar specimens of tasteful shop architecture,—in particular that of Messrs. Stewart & Macdonald and Richmond & Co., which are spacious without being disproportioned, and ornate without being florid. Some rather pretentious Italian façades we observed, in which the designs had failed to catch the true angles or segments in the pediments; but that is neither here nor there. The whole of these buildings were supplied with plate-glass windows, many, as we could see, with revolving shutters, and not a few with ornamented brass sash-bars. Indeed, the stranger need only be a single hour in Glasgow to discover that he is placed amidst a community who well understand the arts of commerce and its architectural correlations. There are not better banks, warehouses, and shops to be seen anywhere. They have not succeeded so well as yet in building churches, we are sorry to say.

As to the Domestic architecture embraced under our fourth division, we shall just notice three typical varieties:—the four-story tenements, with common stairs, which line both sides of Sauchiehall-street; the self-contained houses of Blythswood-square; and the modern self-contained houses in the crescents and terraces.

The first class of tenements are something similar to those which we recently described in the Domestic architecture of the New Town of Edinburgh, but with more ornament on their elevation, such as moulded lintels and jambs, and projecting cornices over windows.* The general plan of a tenement is, in a front street like Sauchiehall-street, ground-floor shops, with collars beneath, and doorway to the passage or close of common stair; first floor two houses, second floor two houses, and third floor two houses. In a back street such as Renfrew-street, the shops on the ground-floor are transformed into two main doors, with the inevitable "close" between them, and kitchen, &c., on basement, in place of cellars. The dimensions are, usually, we guess, of a tenement in the block, 60 ft. fronts by 40 ft. depth, by 50 ft. height, or thereby. This will allow of very good-sized apartments; ceilings of 12 ft., 11½ ft., 11 ft., 10½ ft. respectively. The rents vary more according to the neighbourhood than to the property; but, in general, a "balf flat," that is to say, a house of four or five apartments, is 25s. to 35s., more or less, per annum. All the houses we have comprehended in this division possess a water-closet, and the greater proportion a bath (shower and plunge). The "closet" of each house is usually planned to occupy the quarter of space which forms the landing of the staircase, and, accordingly, the only light or ventilation is by a little window into the staircase.

This vile practice, indeed, is universal in Glasgow. The heat and worst localities suffer alike in this respect. If the staircase itself were thoroughly ventilated, there might be less to regret; but such is not the case. There are other evils incidental to common stairs, such as the hell apparatus of the walls, and the dingy look of the windows; but we cannot stay to consider them. The worst fault we have heard alleged of these common stairs is that the policeman on duty goes to sleep in them during the night.

A similar resemblance pervades the self-contained houses in Blythswood-square to their congeners in Edinburgh, a sunk area in front, a hack green behind, a dining-room, drawing-room, and bedroom floor, with attics. Compared with the best Edinburgh square of the same period, however,—Charlotte-square we mean,—this Blythswood-square must be assigned a subordinate place. The rooms are not so lofty, the whole buildings are not so large, and the architectural character is meaner. Nevertheless, these houses are very highly rented, and are inhabited chiefly by professional men, clergymen, doctors, and lawyers. Madeline Smith's tragedy rather destroyed its character for some time. But it recovered its tone immediately when Professor Gardiner went to reside there.

The crescents which overlook the beautiful Kelvin-grove Park afford by far the finest and most recent examples of high-class Domestic architecture in Glasgow. As far as the somewhat composite style may be described of these palatial mansions, we may pronounce them a mixture of Italian and modern French. The elevation consists of handsome bay-windows on all the floors, with square or rectangular domical roofs, covered with zinc, high engrailed ridges, with spirelets, triangular or segmental dormers, and gables with tasteful finials. The interior fittings, as we understand, of most of the houses, are of the most luxurious and costly description. The halls and staircases are decorated with scagliola or imitation marble columns and pilasters, stained-glass windows, and elaborate ceilings. The drawing-rooms are decorated and gilded in the highest style of art. The baths are of marble, washand-basins of tinted porcelain, with hot and cold water laid on, and fittings of German silver. The furniture is costly and very extravagant, and the pictures in some houses are of a high class. But we cannot dwell on these things, however interesting. We can only sum up by stating that the houses in these splendid crescents are chiefly inhabited by the merchants and manufacturers whose places of business we have just reviewed, and we must own that whatever sins of omission these wealthy bourgeois may have laid to their charge, encouragement of architecture and the fine arts is certainly not among them. We

should add here that the magnificent range of terraces in the vicinity of the Botanic Gardens, Grosvenor-terrace, Kew-terrace, and Windsor-terrace, are quite equal to the crescents in point of architectural value and design.

Hitherto we have rapidly and imperfectly sketched the progress of a large city in so far as this has been determined by the wealth and individual effort of the citizens themselves in a private capacity. In another article we shall describe what has been done by them as a corporation.

PROGRESS AT PARIS EXHIBITION.

A CORRESPONDENT writes from Paris,—The weather here is all that could be desired. It is rather hot, but with a cool wind blowing that is very refreshing. The Exhibition is growing more and more in public estimation, and the radiating plan and the zones, as they are understood, have many advantages. There is one very remarkable feature which must be observed. When you have paid to enter the Park there are no regulations. You can go "in, and out, and round about," as you please. Excepting some of the unfinished buildings in the outer grounds, nothing is *défendu*. In fact, for the first time lately, the French can be free for a franc. This freedom to go which way you will is inexpressibly agreeable, and must produce a permanently useful impression on the French themselves. Nothing to an Englishman is so vexatious and intolerable as the way in which everything is "regulated" in France. Another feature is also deserving of observation. The absence of chairs in the courts is a positive advantage—there are plenty in the open courts and passages—and selfish people are thus prevented seating themselves in the way of those desiring to see and move on. Of the carpenters' work, which has been so much noticed, the most that can be said of it is that it will lead to variety of form and application of wood-work; but, as to artistic work, there is very little approach to English carpentry. The jalousies of the Turkish and Oriental houses exhibit beautiful and various forms, producing the most agreeable effect, and almost creating a feeling of wonder how such elaborate work can be available for the purpose. On a careful examination, however, they are found to be produced in the simplest manner. The turner has the principal hand in it. In the ceramic department there is a remarkable repetition and variation of Chinese patterns in all countries. Why is this? They are very beautiful nevertheless. In the Prussian and many other courts the price is put on each article, and this has led to a considerable number being sold: already the little ticket "*vendu*" is vexatiously frequent. In the Prussian, and, indeed, in all the Northern European courts, the prices are very reasonable, and many of the articles exceedingly beautiful. In one of the Prussian courts there are shown works in "*Carrara céramique*," something between terra-cotta and biscuit-china,—sharp, and beautiful in colour, in very large objects, cornices, brackets, and vases. One of the latter, about 4 ft. high, has been sold 200 times. The price for house decoration is from 10 francs to 50 francs per metro.

On all hands it is admitted that the English glass is far superior to that of all other countries. Our Minton and Wedgwood wares also rebut all competitors. Two large claret bottles, or jugs, by Dobson, engraved in a most wonderful and beautiful manner, have been bought by South Kensington for 150l. each. They are well worth the money. C. H.

A NEW FUEL.—Some experiments are in progress with regard to a new kind of peat-fuel, known as Lee's patent, which is alleged to possess great advantages over coal, both as regards power and economy, for generating steam. According to an account in the *Shipping Gazette*, of a trial of this fuel,—“The results arrived at were considered to prove that peat, when properly dried and submitted to a certain process, and then saturated in oil, has greater heating power than the best Welsh coal. The advantages possessed by this peat fuel are the rapidity with which a fire can be lighted, and economy in working and space. Put a few blocks in the furnace, apply a match, and in an instant the whole is in a mass of flame. Very little stoking is required.”

* See *Builder*, vol. xxiv, p. 518.

THE CHORLTON UNION HOSPITAL;
NEAR MANCHESTER.

SLOWLY, but by evident steps, the right system of the planning of hospitals is being established; and the pavilion-principle is being recognised and adopted in new buildings. Moreover, the system itself, of the separate blocks, is being supplemented and perfected by better attention to air-space and ventilation in the wards, and to the requirement of distance between the blocks, than was given in the original models such as the hospitals at Brussels and Bordeaux. The governors of St. Thomas's Hospital and their architect have gone far to mitigate what we must still regard as disadvantages of an urban site, by their adoption of a very wide-spaced distribution of the pavilions, and thus are improving greatly upon the planning of the Herbert Hospital at Woolwich. Doubtless, when the new building at Stangate is finished, it will rival the Government building in the completeness of its utilization of the different sanitary contrivances in which this period of the progress of the arts of construction is prolific, and which are never more important than when applied in buildings designed for the treatment of disease. Even in the existing hospitals of London—the wards of which for the most part are planned on what are now deemed erroneous principles—improvements of considerable importance have taken place, due to the present appreciation, by the faculty, not simply of the importance of ventilation, but of the difficulty of correcting, by mechanical contrivances, omission of provisions for the self-acting ingress and egress of air. The workhouse-hospitals, however, of the metropolis,—in which probably three or four times as many sick persons are provided for, as in the hospitals of the other class,—are little amended from the lamentable condition that was exposed by the “Lancet Commission” in 1865: indeed, all value being attached to nursing, they must continue in the main defective, or non-curative, and that way productive of pauperism, so long as the buildings are unimproved, or, rather, so long as they are not rebuilt.

It is satisfactory to find that every Union in England, under the Poor Law, does not deal with its poor on the harsh or mistaken system of the metropolis. The most recent example of improved hospital-construction, indeed, and one characterised by features deserving special notice, has been produced by one of the unions, the Chorlton Union, in the recently-erected hospital attached to the workhouse at Withington, near Manchester.

During the last dozen years we have watched, and, in some respects, largely influenced, that progress to which allusion has been made in our opening sentences,—not only illustrating the French examples, but describing from actual inspection each structure at home, at the time of its erection, from the Blackburn Infirmary to the last Woolwich building. In the same course of proceeding, and through similar means, we now supply particulars of the Chorlton Hospital. On another page will be found illustrations of the heating- and ventilating-arrangements of the wards.* Mr. Thomas Worthington is the architect of the building.

It may be well to mention that the Chorlton Union appears to be one of the largest and most populous in the kingdom. It includes a portion of the town of Manchester, and has a population of upwards of 180,000 persons, or more than there are in any of the parishes of the metropolis, excepting St. Pancras, which has a population of 193,788 on an area of 2,716 acres, or less than one-fourth of the area of the Chorlton Union. The Chorlton Guardians about ten years ago erected the workhouse at Withington, in the open country, south of the town. It contained accommodation for from 1,200 to 1,500 inmates, the latter being the number for which the building was originally certified by the Poor Law Board. The hospital then consisted of detached blocks placed at the extreme ends, and arranged each on the old plan, or with central corridor and wards on each side. Enormous growth of the population of the district led to great overcrowding of the hospital; all kinds of infectious disorders got mingled in the wards; and the sick had not infrequently to be placed in the body of the house. After long discussion, and much prejudice to be surmounted, the determination was arrived at to erect a new hospital on ground at the back of the line of the workhouse, and to adopt the

pavilion-principle in the design and building. The new hospital was commenced in 1864; and several of the wards were occupied in 1866.

The building consists of five pavilions, or ward-blocks, each of three stories, and 100 ft. apart, running nearly north and south, and connected at their southern ends by a long arcaded corridor of communication. Projecting from this corridor on the southern side, and not far from the centre of the length, is the kitchen, serving for both hospital and workhouse. It is connected at its southern end with the workhouse. The corridor is profusely lighted by large windows on both of its sides; and opposite the end of each of the four airing-courts between the blocks, there is a door with steps of descent into the court. Each ward proper, or portion, devoted to patients, of each story of the pavilion, is 124 ft. long and 24 ft. wide, and provides beds for 32 patients. The heights, in the clear, are 14 ft. 6 in. for the ground-story, 14 ft. for the first-floor, and 15 ft. for the ward at the top, which is partly within the slope of the roof. The air-space per patient may be taken as varying from very little over 1,300 cubic feet to about 1,380 cubic feet.

The quantity recommended by the “Lancet Commission” is from 1,000 to 1,200 cubic feet, but for fever cases much more. In a statement of principles of planning of hospitals in the *Lancet*, of May 19th, 1866, we find the quantity specified as at least 1,200 cubic feet, or 2,000 feet in the case of fever-wards. In the same statement, respecting area (of flooring) was set down as 80 ft. of wall-space; windows were to occupy one-sixth of exclusion of light when necessary; and the generation of air or of the sun's rays; whilst there was to be protection from the north and east. The wards of the Chorlton Hospital depart somewhat from these stipulations. The ends of the ward-blocks, farthest from the corridor of communication, and where there is an open-air balcony on each floor, are to the north. They have a considerable tract of country in front of them. The arrangement of the blocks was the best that the ground attached to the workhouse permitted. Further, as to stipulations concerning air-space, the document (signed by seven medical men) that was issued by the Association formed in 1866, for improving the infirmaries of workhouses, advised not less than 1,000 cubic feet, and for particular classes of cases 1,200 to 1,500 ft. per patient. The Barrack Commission specified 1,200 ft. for military hospitals; whilst Miss Nightingale and Mr. Robertson would have never less than 1,500 ft., and for surgical cases or infectious disorders from 1,500 to 2,000 ft. The Chorlton Guardians, after much discussion, determined upon 1,350 ft. or thereabouts, more than double the minimum space required by the Poor Law Board, and the larger Metropolitan workhouse-hospitals.

The particulars of the proceedings of the guardians are supplied in a paper giving an account of the hospital, that was read by the architect in January last, at a meeting of the Manchester Statistical Society,—the society at which Mr. Robertson had read his three papers on subjects bearing upon hospital-construction.* There are eight windows on each side, facing one another, in the length of each ward; and, generally, there are two beds against each pier between the windows. Each window-opening is 10 ft. in height and 4 ft. 8 in. in width; it stands 2 ft. 9 in. above the floor, and is carried up to the ceiling, or deducting only the space occupied by the lintel; and the height of the frame is divided into three parts, whereof the two lower are fitted with sliding sashes of the ordinary kind, and with Venetian blinds. The upper

portion of the window, above a transom, has a swivel-hung sash. A portion, amounting to about one-third of the height of this latter, takes the form of a hopper, sloping inwards, which is glazed at the front end, and has fine wire-gauze to the space (the length of the opening, and 2 in. in width,) at the top; so that, even in winter-time, or when all the sashes are closed, there is a small space, always open, through which there is an in-current; whilst, slightly upward direction is given by the sloping form of the hopper, in order that the air may be thrown towards the centre of the ward, and be so distributed as to avoid down-currents. The hopper is of cast-iron. The swivel-hung portion is opened, when required, by cords, by which it can be fixed at any angle. Thus, any or all of the divisions may be opened more or less. The glass of the swivel-hung sash is coloured green in most cases. The provisions just described, for ventilation, are not the only ones. A considerable number of small air-grids, or channels, for the admission of air, are built into the walls at short intervals close to the ceiling. These grids have a sloping lip on the inside, projecting about 5 in. from the wall, with an inclination of about 45°, to prevent the air falling at once in a cold volume to the lower part of the ward. A corresponding grid is placed in the opposite wall in each case; and the air appears to take a direction generally across the ward. By the several contrivances, and the air being admitted in very small quantities, and at very numerous places, there is a constant but imperceptible stream continually passing across close to the ceiling, towards the opposite window-opening, or diffusing itself without draughts, and displacing the gaseous portion of the contained air which naturally rises to the top. The form of the small air-channels is such that they would hardly be observed if not pointed out, and are therefore not likely to be willfully obstructed: indeed as they are close to the ceiling, they are out of reach. In the floor of each ward, at a distance of 6 ft. from the outer walls, are a number of “hit-and-miss” gratings, with galvanized-iron horizontal tubes or flues, to conduct the fresh air to the foot of the beds, should it be required in foul cases, or when it may not be desirable to open the windows. These last-mentioned contrivances, on the occasion of our visit, did not appear to have been ever used. For egress of air there are at various points below the ceiling, as for example on the chimney-breasts, openings which are connected with air-shafts, or flues, which are carried up, in most cases along with the smoke-flues, so as to discharge above the roof-level. Each smoke-flue forms a fireplace, and has in fact beside it a ventilating-flue from the same ward. In the case of the top-wards, which are partly in the roof, and where consequently the windows do not reach to the highest part of the ceiling, egress-flues are connected with revolving ventilators, of large diameter, on the ridge of the roof. For flushing the ward in a short time with fresh air, there is, besides the arrangement of the windows in the opposite walls, one for the purpose of obtaining a current from end to end of the ward, and clearing the upper part without opening the doors. Thus, at the entrance-end of the ward, over the door from the staircase, is an opening 6 ft. in height and 4 ft. in width, glazed with five louvres, which can be worked without noise by a key that is in the care of the attendant.

At the other or balcony end of the ward, there is a large swivel-window similar to windows already described. In practice, the louvres are rarely closed. Each ward is lighted at night by gas-burners, in three rings, over which a funnel-shaped cow is suspended, which terminates in an iron flue communicating with a shaft in the wall, by means of which the products of the gas are carried off, while at the same time an upward current is caused and a further impulse given to the ventilation during the night, when the windows are usually closed. The warming is effected by open fire-places, but differently from the arrangement in the Herbert Hospital, where the grates are in the middle of the floor of each ward, and where the smoke is conducted by descending flues, and then through the flooring, to the ascending flue in the walls. In the Chorlton Hospital, the fire-places are in the walls, or two fire-places on one side, and one on the other, or dividing the length into five equal spaces, and affording each patient a view of the fire. The openings are 5 ft. in width, and the better to assist ventilation of the ward are made so much as 5 ft. 6 in. in height to the

* See p. 330.

* The first of these latter, in 1858, was, “On the Defects with Reference to the Plan of Construction and Ventilation of most of our Hospitals for the Reception of the Sick and Wounded.” The second, in March, 1858, was entitled, “A few Additional Suggestions, with a View to the Improvement of Hospitals for the Sick and Wounded.” The third, November, 1859, was, “On the Need of Additional as well as Improved Hospital Accommodation for Surgical Patients in Manufacturing and Mining Districts, but especially in Manchester.” At the late Mr. Adeshead, entitled, “A Plea for the Establishment of a Convalescent Hospital for Manchester, and the surrounding District.” Mr. Robertson read another paper in 1862, on “The Laws of Nature's Ventilation.”

Further data are to be found in Miss Nightingale's book, in documents duly notified by us, as in the Report of the General Report of the Commissioners appointed for Improving the Sanitary Condition of Barracks and Hospitals, and in original initiatory articles in our columns.

upper part of the opening. The opening is partly closed by an iron hood; but in this is a large circular "hit-and-miss" grating. The object of the arrangement is, in short, that the opening may be closed when the fire is first lighted, and until the flue has got warmed, and the draught is well in action; and that then the grating may be opened, and a stratum of air, up to about 5 ft. 6 in. in height, be drawn from the room up into the chimney. "Practically," writes the architect, "the flues draw so effectually that it is very rarely necessary to close those gratings." Nevertheless we found the greater number of these in the wards were entered, closed, whether because the chimneys were apt to smoke, or only from forgetfulness, was not clear. When opened, in the lower wards, improvement in the air of the room, near the fire-place, was at once perceptible, albeit there had been nothing in the ventilation of the ward calling for notice, unless as favorably compared with wards of hospitals on the old plan. One of the top-wards however was full of smoke. The reason given was that the chimneys required sweeping. The sides and backs of the fire-places are formed of fire-brick, the sides being inclined at an angle of about 45°, so that the heat may be reflected at a corresponding angle across the ward. The fire, placed low down, is contained in a basket of plain wrought-iron bars; metal about the fire is avoided as much as possible. The angles at the back of the fire-brick are filled in solid with brickwork, though otherwise shown on our plan. There is a wide hearth, and a low stone fender. The temperature of the wards averaged 56°, on our visit at the end of February. In the three principal chimney-stacks in each of the five pavilions there is a special fire built, discharging above the roof, to which the drains are connected, for ventilating purposes. This flue is entirely independent of any other, but is placed between two smoke flues, which cause upward current. By this means the drainage is ventilated at fifteen points. On the top of these flues charcoal-boxes will be placed, to destroy any gases that may rise from the drains.

The drainage is entirely outside the buildings: in no case is a drain brought within the walls, excepting to receive the descending soil-pipes or waste-water pipes.

The wards are ceiled to the underside of the joists of the flooring above. The joists, which run in the direction of the length of the ward, are borne by cross-girders, the ends of which are carried on corbels that are built into the side-walls. The trimer-arches below the hearth, in the upper stories, are in each case carried partly by a short iron girder. The mode of finishing the walls internally, whether by Parisian cement or otherwise, is not decided on. Each wall is built with a cavity, to prevent any possible influx of damp. The floor-boarding is of deal filled-in in the joints with marine glue.

The ground-floor ward, in each pavilion, is reached from the longitudinal connecting-corridor of the pavilions, by passing across a hall which measures on plan 22 ft. by 19 ft. In this hall, to the left of the entrance, are the stairs of ascent to the wards of the two upper floors. They are of very easy ascent, and without winders. Right of the entrance are two rooms, one the nurse's room, and the other the ward-scellery or kitchen; and there is also a hoist, to the upper floors, for coals and food. The nurse's room has an inspection-window looking into the ward from the end. Considering that great, and doubtless well-deserved, praise, is given to the "unwearied efforts" and "gratuitous services" of two Sisters of Charity from the Protestant Religious Society at all Saints', Margaret-street, London, we were surprised to find the essential of the nurse's room, the window looking into the ward, closed. The scellery, or kitchen, is provided with a small cooking-range and oven and other requisite fittings. Under the stairs is a closet.

At the extreme northern end of each pavilion are small attached blocks, projecting laterally, containing in the case of the right-hand block, and looking northwards, the bath-room, and lavatory, and in the other case three closets and a sink. Between these blocks, or wings, is an open-air balcony, on each floor, for the patients who may be convalescent, and where an extensive view over green fields is obtained. The access to the balcony is through a large sash-door or window. The landings of the balconies of the upper stories are carried by iron columns. We should have mentioned that the terrace at the other end of the wards, forming the covering of the long corridor of communication, affords

space for a promenade on the first-floor level, exceeding 500 ft. in length.

It seems desirable that reconsideration of the arrangement of the lateral wing-projections should not be omitted in any future hospital. The balconies between these blocks, at the end of the pavilion, are provided perhaps better than such features could be in any other disposition; but the outlook from side-windows of the wards is interfered with, if not in some measure are light and air. However, all planning must be a compromise between advantages and disadvantages. In the bath-room, the bath is placed detached from the walls, so that a patient may be supported on both sides. The material of the bath is the Stonbridge fire-clay, lined with a coating of porcelain. The supply of water is constant; and hot water, though heated in the ward-kitchen, or scullery, at a distance of 140 ft., can be obtained at all times. Adjoining is the lavatory, where the basins are of earthenware in polished slate tables or slabs. Hot and cold water are obtainable at all times from taps, both for washing purposes and for filling the portable baths. A 2-inch fire-plug and hose are fixed in this wing on each floor.

Here also are the dust-shoot and the foul-linen shoot: the former is of cast-iron, with hopper and door on each floor, discharging into an ash-pit outside the building, and the latter of wood, discharging into a ventilated chamber in the basement. The two shafts adjoin, and are carried up about 8 ft. above the roof, with a revolving ventilator 2 ft. 6 in. diameter on the top, to prevent any foul or stagnant air accumulating in the shafts.

The water-closets, contained in the left wing, are simple in construction and inexpensive. The entire basin and seat are of earthenware, without wooden seats or fittings. The cleansing is effected by means of a chain attached to the door, which raises the valve and flushes the basin each time it is used. A sink or trough for emptying the bed-pans adjoins, and has a similar earthenware basin with a lead receiver on the top, flushed by means of a hand-pull. The divisions between the closets, as also between the bathroom and lavatory of the other wing-block, are of sawn slate: they are carried up to the height of about 7 ft., with a framework of cast-iron. In each wing is a small fire-place in an angle.

The Manchester Corporation convey the water to the workhouse by a special 7-inch main, which entirely surrounds the hospital-buildings. Fire-plugs are placed between every pavilion, both at the northern and the southern ends, besides in other convenient positions, and the pressure from the mains is sufficient to reach to the roof in case of fire. Ten tanks, one on the top of each of the wings just described, each containing 2,500 gallons of water, are supplied by rising mains 3 in. in diameter: so that when filled, 25,000 gallons of water are stored for the use of the hospital.

The hot-water apparatus has been contrived with care, and is arranged on a plan suggested by Mr. Ward, the contractor for this part of the work. The boiler and hot-water reservoir are in the small ward-kitchen on the ground floor, and the hot-water piping is carried as before mentioned to the wing containing the baths and lavatories. The whole of these pipes are wrapped in thick coarse felt, to prevent frost having effect on the water; and the entire system of piping may be emptied in the basement in case of repairs or extreme frost.

The works last in hand have included a complete refitting of the kitchen, by Messrs. Shillito & Shorland, of Manchester, with the cooking-apparatus required for the large number of residents or sojourners in the workhouse and hospital. These fittings display some clever contrivance and good workmanship, as in the case of a large steamer, with meat-stand; which last is enclosed, when the steaming is in progress, by a cover, working with balance-weights, and made to fit at the bottom-edges into grooves which the condensed steam fills, so as to make the whole air-tight.

The ground-floor of each pavilion is raised about 6 ft. above the ground outside. With a little additional cost, and some modification of the sleeper-walls, or other supports to the floors, and different arrangement of gas-mains, this space might, perhaps, have been utilized for storage in connexion with the workhouse.

The great merit of the plan, irrespective of the warming and ventilating arrangements which we have illustrated, is comprised in the ample space between the pavilions. The blocks, 100 ft. apart, are only 25 ft. less in distance than

those of St. Thomas's Hospital are to be. In the Herbert Hospital the dimension is 64 ft.—much too little. Each pavilion in the Chorlton Hospital provides 96 beds, that is, the thirty-two in each floor, or 480 beds in the entire hospital. The cost, including the gas and water-supply, and the various fittings of the wards—though whether those of the kitchen we are not aware—has somewhat exceeded 23,000l.; and the architect puts down the probable cost of such a hospital, with kitchens, stores, and the administrative department, and the land, at 30,000l., or at the rate of about 60l. per bed.

Results already, on the health of inmates, seem to have been of the most satisfactory kind. A decided difference was seen on the removal of the patients from the old wards in the workhouse, to those of the new hospital,—part of which, it is thought may be to be credited to contemporaneous change in the system of nursing, but of which a great part was certainly due to the increased air-space and the better ventilation. Such at least seems to be the opinion of the governor, Mr. Brokenshire, whom the guardians must be fortunate in having as their officer, and the poor inmates of the house in having in the position which he holds. Our thanks are also due to a very energetic guardian, Mr. Wood, for pains in showing us everything that we went to see. The Chorlton Union Board has set a brilliant example to the metropolis and the country generally. There is, however, something that the Guardians have yet to do. Every portion of the workhouse that we saw was orderly and clean beyond expectation; but the wards in which the insane were, regarded in their structural features, were not abreast with their knowledge of the day, and with the received principles whether for wards of lunatic asylums or those of general hospitals.

FACTORIES AMENDMENT ACT AND THE ENGINEERING TRADES.

On Thursday, the 2nd instant, a deputation, representing the engineering, millwrighting, and metal founding trades of Lancashire and Yorkshire, waited upon Mr. Walpole, at the Home Office, respecting the proposed Factories Amendment Act. The deputation consisted of Messrs. J. Robinson, C. Stewart, M. Curtis, R. Peacock, W. G. Madeley, W. Platt, E. T. Bellhouse, G. Peel, jun., and H. Wren, from Manchester; Messrs. Harrison and Dickenson, of Blackburn; Messrs. Masgrave and Wood, of Bolton; Mr. Beard, of Ashton; and Messrs. Clapham and Sellers, of Keighley; being members of engineering firms employing themselves 10,000 workpeople, and representing firms which in the aggregate employ upwards of 20,000 workpeople. Several members of Parliament introduced the deputation. Mr. J. Robinson (Sharp, Stewart, & Co.) stated the object of the deputation, and read the following memorial, which will sufficiently explain the objects sought:—

1. That there shall be no extension of the Factory Acts to the works of engineers, millwrights, boiler makers, machine-makers, and metal foundries.

(Memorandum.—That legislation, if necessary, is only applicable to the smaller works; those employing less than 100 hands at present exempt from the Bill.)

2. That should legislation be deemed necessary for these trades, it should not proceed until the result of the inquiry of the Royal Commissioners on Trades Unions is known, nor until a commission has been appointed to examine the engineering, machine-making, boiler-making, and metal-founding works of the country, nor until a select committee of the House of Commons has been appointed to gather evidence.

3. That, if legislation be decided upon for these trades, it should be by separate and distinctive enactment, and by well-defined clauses, so that the clashing of interests and terms used, which exist in the present Bill, may be avoided.

4. That, if legislation be found necessary, it shall not be applicable to any works in which neither boys under fourteen years of age, nor females, are employed.

5. That, in the case of the above-mentioned trades, it is undesirable to restrict them to any special days for holidays, inasmuch as an important part of their business is the repair of their own and the machinery of other factories; and as they have already, by custom, a greater number of holidays than is contemplated under the Factory Acts.

6. Should Her Majesty's Government feel it is requisite to press legislation, it is requested that they afford an opportunity for the suggestion of various clauses and modifications of the Bill.

Mr. Harrison, Mr. Curtis, Mr. Peacock, and Mr. Wren made statements bearing upon the subject, and showing reasons why the proposed Act would be inapplicable to the engineering trades. Mr. Walpole stated that he had had a deputation from the iron masters on the same subject, and that he proposed to ask the House for a select committee of inquiry.

ANCIENT IRON AND BRONZE WORK.

ANY one who has studied well the old German towns must be struck with the great beauty of the iron-work which is everywhere to be found about the houses, whether it is a railing, a hinge, a door-handle, or even the head of a nail. The German builders of the Middle Ages appear to have been anxious that it should become a work of art, and even long after every vestige of Gothic architecture had disappeared from their designs we still see this care and study continue to be given to the metal-work. The earliest examples of iron and bronze work existing in Germany are the great doors of the cathedral at Angsburg, evidently very early Romanesque, probably not later than the tenth century. They are divided into square panels, which are ornamented with very rude "has-reliefs," representing subjects from the Holy Scriptures. A pair of doors of very similar design exist at Hildesheim, and in the same church is a remarkable truncated column of bronzewith figures arranged round it upon a spiral curve similar to Trajan's column at Rome. The railings round the choir at Aix-la-Chapelle and the doors at Mayence cannot be much later than the eleventh century. The bronze candlesticks at Erfurth and Pragns are fine examples of twelfth-century work. The font at Würzburg and the pascal candlestick at Bamberg are early thirteenth century. Of the fourteenth and fifteenth centuries the examples are very numerous indeed. A few of the finest are the choir screen at Erfurth, the side screens at Cologne, the fonts of St. Stephen's, Prague, St. Sebald's, Nuremberg, &c. The sixteenth century, however, was the great age of German metal-work. Peter Vischer and his pupils and assistants have left wonderful examples of their skill all over Germany. Their masterpiece is the Shrine of St. Sebald, at Nuremberg. Monuments, executed by Peter Vischer himself, still exist at Nuremberg, Erfurth, Würzburg, Bamberg, Aschaffenberg, and many other places. These monuments generally consist of an effigy cast in deep relief, with a canopy over the head, and an inscription running round the border, which is sometimes ornamented. They are placed upon the walls, and not on the floor of the church. The Cathedral of Bamberg contains over 300 of these monuments: some of them are extremely beautiful, and are executed with the greatest delicacy. The railings round tombs, chapels, altars, &c., of this date are exceedingly good. We give in our illustrations two finials from the railing of a tomb in the cloisters of Würzburg Cathedral. Würzburg is rich in examples of the sixteenth-century ironwork; the grilles over the window of the townhall, and the finials and crosses to many of the churches and houses, are well worth careful study: we show several examples in our illustration. Bronze fonts of the tenth century are frequently to be seen; a very fine one, by Peter Vischer, exists at Ochsenfurth.

The seventeenth-century ironwork is very similar to that of the sixteenth. We give an example from the gates of the "Seminary at Würzburg;" it gets less pure and elegant, however, as the century advances, and before the year 1700 nearly all that is good has disappeared from the designs.

MONUMENT TO THE LATE ENGLISH CHAPLAIN AT ROME.

A MONUMENT has just been erected, by subscription, in the Protestant cemetery at Rome, to the Rev. Francis Blake Woodward, M.A., for fifteen years chaplain of the English church in that city, deceased, aged 65, on the 4th February, 1866. The sculptor who received commission for this work, Mr. Shakspear Wood, has designed it in the form of a sarcophagus with pointed roof, on the apex of which rests a cross, horizontally laid, with *ferrous* at the extremities; this roof of dark-grey hardito, the sarcophagus itself of white Sicilian marble, resting on a basement of hardito, and the whole rising from a platform of white marble. At the extremities of each longer, and at both the narrow sides, is introduced a decoration of inlaid-work in rich-colored marbles, imitation of the Italian Medieval mosaic so beautifully carried out in Roman examples. The design of this is in panels, hands, and circles; at the head the monogram of the Holy Name, within a diamond-shaped border; at the two sides and at the foot

a Greek cross within a circle, all in the same many-colored intarsio. The epitaph is given at both sides; but in one instance Latin, in the other English, terminating with the words: "Blessed are the pure in heart, for they shall see God." Respect for the merits and services of the deceased had induced many to subscribe for this monument, both among the British community in Rome and in England. Skillfully executed as it is, it stands in a conspicuous situation on the higher ground of that beautiful cemetery, beneath the ancient fortifying walls near the Porta San Paolo.

THE GAS WORKS OF MANCHESTER.

WE recently gave some particulars of the gas-works of the Manchester corporation. The Manchester City News has lately published additional particulars, from which we glean. In the year 1844, a year after the gas-works were transferred to the corporation, the consumption was 248,000,000 cubic feet; last year it was 1,160,000,000; this year it is estimated that it will be at least 1,300,000,000. The prospective increase is expected to be in at least an equal ratio; in twenty-three years the consumption is five-fold, and in 1877 it is expected that the consumption will be tenfold what it was in 1844, or about 2,500,000,000 cubic feet. The works as at present in operation are equal, on the emergency of a succession of short dark days in winter, to making and sending out 6,500,000 cubic feet per day, and it is expected that when improvements in progress have been completed they will be equal to the manufacture of 10,250,000 cubic feet per day.

The illuminating power of the Manchester gas is equal, according to the tests which are being made daily during the current month, to 21.6 sperm candles, consuming at the rate of 120 grains per hour, the consumption of the gas being reduced to a constant standard of 5 cubic feet per hour. Photometric observations are made daily by Mr. Leigh, in the centre of the town, and at one of the gas stations. It is tested daily for sulphuretted hydrogen, and is reported daily for the ordinary tests, and fortnightly for the continuous test, from its being led through a test solution. We believe that the gas is found to contain very little tarry matter or naphthaline, and that the ammonia has been reduced to the smallest possible proportion. It may here be mentioned, that Mr. Leigh, in conjunction with Mr. Macfarlane, gas engineer, entertain the confident expectation that certain experiments which have been perfectly successful in the laboratory may and will be applied shortly, they hope with success, to all the gas passing from the works, and solve satisfactorily the important problem of separating the sulphuret of carbon from the gas,—that element, as our readers are aware, being the destructive agent that tarnishes gilding and other decorations of rooms. It may here be mentioned, that under the Act 23 & 24 Vic., c. 125, which regulates the supply and quality of the gas provided by the thirteen companies to the metropolis, the illuminating power is fixed as low as twelve candles. Sulphate of iron has recently been made with satisfactory results in the works.

Since 1823 a succession of reductions have taken place until now, when the price, according to the last official report, is 3s. 2d. per 1,000 ft. Here again, for the purpose of comparison, it may be mentioned, hearing in mind that the Manchester gas is all made from canal coal, that it is of 21.6 sperm candles' illuminating power, occasionally considerably higher, and sold at 3s. 2d. per 1,000 ft.; that in the select committee of the House of Commons on the London Gas Bills, who sat last session, Sir John Trollope, the chairman, proposed that the London companies should be required to increase the minimum power to fourteen sperm candles, six to the pound; that the maximum price should be reduced to 4s. per 1,000 ft. for common gas, and 6s. for canal gas of twenty candles. He also proposed to report that since the passing of the Act before quoted the price of gas to London consumers had been increased, while the quality had become worse. As regards prices of gas, it may not be out of place to refer here to the charges of some of the London companies. The Chartered Gas Company charges 4s. 6d. and 6s. per 1,000 ft.; the City of London, 4s. common and 5s. 6d. canal; the Commercial, 4s.; the Crystal Palace District, 3s. 8d. to 4s. 8d.; the Equitable, 6s. and 5s. 6d.

canal, and 4s. 6d. and 4s. common; the Central, 4s. 6d.; the Imperial, 4s. 6d., maximum to 30th June, and 4s. from 30th June; the Independent, 3s. 4d. to 4s.; the London, 4s. 6d. to 5s. common, and 6s. canal; the Phoenix, 4s. town and 4s. 3d. country; the South Metropolitan, 3s. 4d. and 3s. 8d.; the Surrey, 4s. 6d.; the United General, 4s. 9d.; the Victoria Docks, 3s. 6d. to 5s.; the Wandsworth and Putney, 5s.; and the Woolwich (two companies), 4s. 6d.

The capital of the gasworks of Manchester amounts to 547,854l., made up of 347,472l., borrowed money owing, and 200,382l. excess of assets. Last year the gross profits amounted to 52,553l., which were thus appropriated:—Payment of interest, 13,252l. Liquidation of mortgage debt, 19,784l. Improvement purposes, 19,516l. In the same year 13,817l. were charged to revenue in respect of depreciation of works and mains. In the course of the last seven years 125,408l. have been paid out of the profits in liquidation of mortgage debt, and 129,220l. have been expended in public improvements. In the same seven years, revenue has been charged 80,776l. for depreciation of works and mains.

The committee has always acted upon the fair and reasonable principle of so adjusting the price of gas that the maximum profits should not exceed the ordinary 10 per cent. allowed to chartered gas companies. The gas consumers of Manchester may well be more than content that they have better and cheaper gas than ninety-nine of the hundred gas-consuming communities, and that the profits have been applied in public improvements.

THE TRADES' MOVEMENT.

Barnsley.—The masons, between 300 and 400, have struck work for an advance of wages to the extent of 2s. per week, and other concessions. At a meeting recently held the masters resolved to offer an advance of 1s. per week, but all other demands, as set forth in the notice, were refused. Building operations in the town, with the exception of a few apprentices and labourers and a few others, are entirely suspended.

Sheffield.—The builders and operative stone-masons have had a meeting at the request of the operatives, with a view to establish their new code of proposed rules. The employers refused to sign any new code of rules until the termination of the commission of inquiry on the working of trades' unions. The meeting terminated without coming to any arrangement as to their future guidance. A general meeting of the Sheffield and Rotherham Builders' Association has also been held, when all the principal builders of Rotherham were present, and became members of the association. A deputation was chosen to attend the annual meeting of the General Builders' Association, at Bristol. It was resolved that the present rate of wages and working hours of the stone-masons and brick-layers be adhered to.

Edinburgh.—A meeting of the house-painters has been held, Mr. Tarbet in the chair. A resolution was unanimously adopted to the effect that intimation should be given to the masters that, on and after the 6th of May, the wages be 6d. per hour for fifty-one hours per week—overtime to be calculated as agreed on at the meeting on the 25th of February, namely, time and a quarter. The meeting was unanimously of opinion that the intimations which had been made by several of the masters justified the men in taking immediate action to have this resolution carried into effect.

Rotherham.—An extraordinary strike has occurred at Rotherham. The manager of a colliery made a mistake in the amount he deducted from the wages of five boys who had broken their lamps. He offered to rectify the mistake, but the lads required that the whole fine should be refunded; and on this demand being rejected, all the boys employed at the pit—some 30 or 40 in number—struck. The result of this proceeding was that 400 men were thrown out of work, and the colliery closed.

Strikes Superseded.—It is a noticeable fact, that from a meeting of the coal-masters of Yorkshire was recently held at Leeds, and a counter meeting of coal-miners was held the same day at Normanton, the only colliers in the neighbourhood which did not cease work for the day were those of Henry Briggs, Sons, & Co. The understanding established between shareholders and workers induced both employers and employed to stay at home and attend to their joint interests, instead of going off to cabal

against each other.—The Industrial Partnerships Record for March.

The Engine-drivers.—The central committee of the engine-drivers deem it undesirable, in the present state of the contest on the North-Eastern Railway, to "ask men on other lines to withdraw from their employment." In fact, the contest alluded to is at an end.

The Paris Strikes and the Berlin Workmen.—In reply to a letter addressed to them by the working men of Berlin, those of Paris have written as follows:—

"Workmen of Berlin.—We have received with joy your pacific greeting. Like you, we desire only peace and liberty. As citizens, indeed, we love our mother country; but when the spirit of the past is endeavouring to revive prejudices, when the worshippers of force wish to confirm national hate, we working men shall never forget that only in peace and liberty can labour, which unites us in real and true bonds, be developed. It is not a question of deciding by arms the nationality of a slip of territory, but of uniting our efforts to bring about a reign of equity. Have we not enough sources of misery and suffering to go to, without adding to our own hands, leaving the fields untilled and the machines? Conquerors or conquered, we shall still be the victims. Labour is a right, and it is the law of modern society; war is a relic of civilization. Workmen of Germany and France, we have only too much need of all our strength to organize ourselves for the purposes of peace, to produce and exchange with one another, to establish between each other more intimate and friendly relations. For more we know the more we shall esteem one another. Brethren of Berlin and Germany it is in the name of universal solidarity and of the International Association, that we exchange with you our salutation, which will cement anew the indissoluble alliance of working men.—Signed on behalf of the Paris Commission,

TOLAIN, FERROUX, VARLIN.

Chicago.—A formidable strike has taken place among the working men of Chicago, in favour of eight hours' labour.

THE TRADES UNION COMMISSION.

The Secretary of the Operative Bricklayers' Society at Sheffield, Mr. George Housley, stated that the society which he represents is both a trades' union and a friendly society; that he joined it because of the latter feature; that the society never interfered with him before joining it, but that he was making the most of his skill; that no such rule as the one with regard to "chasing" obtains amongst the members of this society; that he is sending a member to Coventry for working too long; that every member is at liberty to do the best he can for himself, and to obtain the highest wages which he can induce his master to give him; that the society has no minimum of wages under which members are not allowed to work, and that strikes, although supported by the branch funds of the society, are not encouraged, and are very uncommon. On the other hand, certain details were elicited, the character of which was not satisfactory. For example, after mentioning certain items of expenditure, which amounted for the greater part of the sum said to be paid out during the year, there was a deficiency of about £2,000. Pressed for an account of the manner in which this sum was disposed of, Mr. Housley accounted for 1,688*l.* by saying that it was expended at a "delegate meeting," explaining that the said meeting took place on the 10th of April, and that the delegates were sent 1*l.* 6*d.* a day, with 6*d.* for refreshments, and that the cost of their lodgings and railway fares was deducted from the society. Next came the statement that 306*l.* had been expended on the support of tramps seeking work, although no means were taken to ascertain where the tramps were to be sent, and to ascertain where the most of the difficulties thrown in that way of labourers and bricklayers. According to Mr. Housley's statement, if an employer put a few intelligent labourers, selected from his men for some years, to lay bricks, the emergency might be, and would be, supported in the strike of the society.

On the Commission resuming their sittings after the Easter holidays, reporters were again refused admission, and discussions before the witnesses were called in for a private to the use made of the published evidence by not known. Mr. Piper, master builder, of London, of the London Master Builders' Association, was the first witness. His evidence was given very fully and impartially; and there was no doubt but that trades' unions had succeeded in their object to obtain both an advance of wages and a reduction in the hours of labour. The state of trade in London is, however, such that the men were not allowed to get it much sooner by their trades' unions than advance the wages of their men, except upon the result of combined effort. The whole of the tenor of the evidence was in favour of trades' unions, though dis-

Mr. G. Smith, of the firm of Smith & Taylor, the contractors for the new Foreign Office, was next evidence given by Mr. Coulson, secretary to the brickwork at the Foreign Office was a work under competent foremen, and it was the duty of the clerk of the works, appointed by the Government, and that the work was properly done and good material, but mistaken in that the work done was performed in a proper manner.

Mr. Trollope, Jun., of the firm of Trollope & Sons, builders, Fimble, in whose establishment the strike and lock-out in connection with the nine-hours movement in 1859 commenced, was the third and last witness. He entered into a long and detailed statement of the movement, throwing all the blame upon the men. He was very severe upon trades' unions, considering them injurious to both employer and workman. At the conclusion of the examination of this witness, the commission adjourned. Mr. Moul, the secretary, and several members of the General Master Builders' Association, were present. Mr. Conolly attended on behalf of the Trades' Conference Committee to watch the proceedings.

INSTITUTE OF PAINTERS IN WATER-COLOURS.

By admitting to their exhibition pictures by M. Gallait, M. Madon, Madlle. H. Browne, and Madlle. Rosa Bonheur, the Water-Colour Institute have strengthened the collection, but it seems to us a mistake nevertheless. If they have room to say should, as we think, strengthen their ranks rather by electing some of the many excellent water-colour artists still unattached to either society, than by filling it with the works of foreign artists already sold, as it is publicly stated, to dealers.

The collection consists of 319 pictures. Mr. L. Haghe has several works, necessarily with high merits, but less interesting than on previous occasions. Four large drawings by Mr. H. Tidey, typifying, each by a single female figure, the Seasons, would seem to be intended for decorative purposes. Mr. Edward Corbould sends a rich piece of colour in (211), "Contest for the large Diamond," but it was more than "half-miracle" if Lancelot's own thrust drove the whole pile of men and horses against the barrier in the manner therein represented. Mr. Edmund Warren exhibits a landscape of considerable size and importance (226), "The Battle of the Waters." It is admirably painted, and cannot fail to advance the reputation of the artist. "Parting Rays" (25), by J. Mogford; "On the Downs at Eastbourne" (40), by H. G. Iline; "The Snowdon Range from Llyn" (77), by J. C. Reed; "Autumn" (246), by G. Shalders; "Lynor" (253), by Charles Vacher; "West Portals of Abbeville Cathedral" (193), by L. J. Wood, are charming and admirable landscapes.

THE ROYAL ACADEMY.

The present exhibition is one of considerable interest, including capital pictures by F. Goodall ("Rebekah"), F. Leighton ("Spanish Dancing Girl"), Poole ("Lea"), Millais ("Sleeping"), E. Landseer ("Her Majesty at Osborne"), E. M. Ward ("Juliet in Friar Lawrence's Cell"), ("King Charles the Poor Man's Friend"), Frith ("Lady Jane Grey"), Herbert ("St. Edmund, King of East Anglia"), the late J. Phillip ("Antonia"), Emore ("On the House-tops"), E. W. Cooke ("Canal of the Giudecca, Venice"), E. Nicol ("Country Looking-office"), J. Lobbey ("The Dole"), Hook ("Herrings from Banff"), W. F. Yeames ("The Dawn of the Reformation"), J. Pettie ("Treason"), Calderon ("Home after Victory"), M. Stone ("Nell Gwynne"), Mrs. Ward ("Joan of Arc"), V. Prinsep ("A Venetian Gaining-house, sixteenth century"), Thorburn ("The Marys at the Sepulchre"), G. D. Leslie ("Willow, Willow"), Holman Hunt ("Il dolce far niente"), and others. Amongst the artists showing most advance are two bearing architectural names, E. J. Poynter ("Israel in Egypt," a remarkable work), and A. B. Donaldson ("The Garden of Faith"). Under the head of "Architecture" there are fifty-two works, twelve of which are sketches abroad. To the designs we shall return.

LINNEAN SOCIETY.—PRESIDENT'S SOIRÉE.

At the meeting held at Burlington House on the 1st instant, the so-called "mimicry in nature" received some remarkable illustrations. Mr. Wallace exhibited a case of large butterflies, the creatures in which when seen alive and flying, with the wings displayed, are very attractive objects, colored with black and orange; when pursued by birds they suddenly, and by instinct, poise themselves upon a branch and display the under side of the closed wings, which so exactly represents a dead leaf as to

defy detection. One corner of the wing is elongated to form a leaf-stalk, from which springs the mid-rib of the leaf; from this mid-rib spring various lesser ribs, in colour and in every other respect so exactly resembling a leaf as to become perfectly marvellous. Closely adjoining were displayed certain bold and rapacious birds side by side with other species belonging to distinct families, exactly mimicking each other in form and colour; but in nature, whilst the first are bold and given to plunder, the latter are in the same degree timid and inoffensive;—the mimicry is evident only a means of evading attack from creatures of superior power. Mr. Rogers exhibited some excellent wood-carvings, and showed a specimen of insect mischief in the lime-wood carvings of Grinling Gibbons, in which the whole interior of the work was eaten away, leaving a mere shell, which was perforated by the insects in every direction. Mr. Hardwick sent two very large sheets of coloured drawings of mushrooms and toadstools he is about to publish, being the first attempt to thoroughly popularise the subject of "fungophagy" in this country. No little attention was given to a drawing (to a sixteenth scale) of the Picoadilly elevation of the new works proposed at Burlington House, exhibited by Messrs. Banks & Barry.

LIVERPOOL ARCHITECTURAL SOCIETY.

On the 1st inst., the concluding meeting of the session was held, when Mr. J. A. Kilpin, the retiring president, was re-elected for the ensuing year; and Messrs. Horner and May were elected vice-presidents. Messrs. W. H. Picton, Grayson, Ridsdale, C. Hornmann, and Vane were elected as the council; and Mr. D. Black was re-appointed librarian, Mr. Bradley treasurer, and Mr. Statham secretary for the next twelve months.

The president then delivered an address, the interest of which is chiefly local. At the close he said,—"The adage that 'a prophet has no honour in his own country,' is not in all cases of universal application, as our society numbers amongst its members our popular friend, Lewis Hornblower, to whom the town council, acting under the advice of the best judges, with the universal approbation of the public, have awarded the first premium for the designs for Sefton Park. This award has excited as little envy and as sincere congratulation as human nature—I mean professional human nature—is perhaps capable of. It is not to be regretted, I think, that he has availed himself of the services, as his coadjutor, of M. André, the French landscape gardener, who has greatly distinguished himself in that capacity in Paris. The plans are so laid out as to promote largely the advantage, health, and pleasure of the public, and ultimately, from the sale of the lots appropriated for building, to prove a source of profit to the corporation. Permit me to close by repeating a wish that these may be—

Soon adorned with villas, in infinite variety, And all design'd by members of the Architectural Society."

PROPOSED WORKHOUSE FOR ST. MARTIN'S-IN-THE-FIELDS.

The Committee appointed to consider the requirements for the new workhouse to be erected at Wimbledon, after ascertaining the workhouse recently erected at Shoreditch, the site of which is a plot of ground measuring about 360 ft. by 150 ft., have arrived at the conclusion,—

"That usually in constructing workhouses, the mode pursued is defective in principle and wanting in convenient arrangement, inasmuch as the persons who, by infirmity, muscular assistance, medical aid, and so forth, are located at the summit or highest part of the building, which is portion the establishment from whence every requisite can be obtained."

The committee say that they have had submitted to them a rough sketch of a building, in which the requirements are provided for, upon a scheme not previously designed for the consideration of any Board, and which to the committee appears desirable; and that the plan may be fully discussed, they have directed a sketch to be prepared to scale, which will, it is expected, be ready by the next meeting of the Board, when the committee advise the consideration of the mode of proceeding with reference to the appointment of architect.

COMPETITIONS.

Albert Institute, Windsor.—The designs for the proposed Albert Institute at Windsor, sent in by the competing architects, have been on view in the Council-chamber at the Town-hall. Eight architects were invited to compete, and five submitted designs, which were placed on view. The building sub-committee, by a majority of five to four, decided to recommend the design of Messrs. Bacon & Bell for adoption. A general meeting of the committee will consider the subject, and the question of final adoption will in all probability be submitted to a meeting of the members of the Literary and Scientific Institute, an institution which will be merged in the Albert Institute. The committee estimate that they will have about 3,000l. at their disposal, and out of this sum they propose to erect in Sheet-street an ornamental building which will afford accommodation to the members of the institution and be available for lectures, concerts, and other public purposes. The five competitors are Messrs. Bacon & Bell, of London; Mr. W. Sim, of London and Windsor; Mr. Alfred Bedborough, of Southampton; Messrs. Robinson & Bradbury, of Westminster; and "X. X. X.," the signature to a plan contributed by Mr. Underhay, jun., of Windsor. The plans are not all drawn to the same scale. The selected design is Greek in style, with a seated statue of the Prince in a niche over the entrance.

THE PRESIDENCY OF THE INSTITUTE OF ARCHITECTS.

At the annual general meeting on Monday last, Mr. W. Tite, M.P., was elected by acclamation President for the ensuing year, and, on taking the chair, addressed the meeting, and expressed his determination at all times to support the dignity of the profession and further the interests of its professors. Mr. Tite spoke forcibly and feelingly.

Mr. Bessford Hope, M.P., the retiring President, to whom a hearty vote of thanks was accorded for his services during the past two years, also made an interesting address, in the course of which he alluded to the extent to which he was influenced in his pursuits by desire to carry on the architectural traditions of his family.

THE ASHTON AND DUKINFIELD CEMETERIES.

THESE conjoined cemeteries contain nearly 40 acres within the boundaries purchased by the Ashton-under-Lyne Corporation and the Dukinfield Board of Health for the purpose. To this eye, the whole appears as one cemetery; and so far as the buildings are concerned there is no division, each structure serving jointly for both. Each cemetery is subdivided into three parts, respectively appropriated to the Church of England, to Nonconformists, and to Roman Catholics, in the proportion of three-eighths to each of the first two sections, and two-eighths to the last named. No manifest demarcation appears between the allotments of the Nonconformists and the Roman Catholics—a pathway only intervening; and metre stones at certain corners mark the pathway dividing the consecrated ground from the remainder. At present a considerable portion of the Ashton land is to be unappropriated for interments; the proportion of the several sections meanwhile remaining as before stated. Each section has its own chapel, and each chapel stands upon the ground it represents, but the buildings are common to both cemeteries. Those of the Church of England and Nonconformists are united in one block of building, though under separate roofs. The shape of the plan is like the letter T; the stem representing the Church of England Chapel (which lies east and west), and the Nonconformists' standing at right angles with it. In the angle of junction next the carriage road is a tower, 16 ft. square, 55 ft. high to the cornice, terminating in an octagonal lantern, 20 ft. high, and a spire 50 ft., additional, to the top of the vane, total height 125 ft. This feature, standing on the brow of a slope, 130 ft. above the river Tame, is a prominent landmark for many miles around. The two chapels are each 34 ft. long, 22 ft. wide, and 36 ft. high, to the ridge, but the internal arrangements differ. Seated accommo-

dation is provided for 130 adults in each chapel. Adjoining each, but separated from it by an arcade filled in with plate-glass, is a mortuary chamber, intended for the reception of corpses during the time of service. For the Roman Catholics a detached chapel has been erected, cruciform in arrangement, and without a mortuary chamber. This building has two porches immediately opposite each other, and a straight path to each porch extends a long distance on each side. Over the porch facing the carriage road is a sculptured figure of our Lord, "Salvator Mundi." All three chapels have vestries and other conveniences, and Haden's heating apparatus is fitted up in a cellar under each building. The style chosen by the architects is the Geometric. The heads of the windows are filled with stone tracery, in varied patterns, and glazed with coloured glass. All the seating is of red deal, resembling pitch pine, and stained and varnished.

Externally, a contrast between the body of the wall facings and the stone dressings has been obtained by the use of wall stones from a neighbouring stone quarry, of a warm reddish grey colour. Sufficient of this material could not be secured in time for the domestic buildings, and these are consequently faced with stone from Danford Bridge. Adjoining the western entrance-gates is a house for the registrar and offices for business; unmounted by a clock tower, 65 ft. high. The clock is illuminated, and has been supplied by Dent, of London. Opposite the registrar's house is a lodge and a waiting-shed in connexion with it, having retiring-rooms and all conveniences. At the eastern entrance-gates another lodge is erected. These buildings will be occupied by the chief sexton and grave-diggers. The carriage-road has been planned in curvilinear form, with a gradual rise from Hall Green to the combined chapels. The grounds have an open palisading in the boundaries, instead of a close wall. The design of the ironwork is in keeping with the buildings, and is arranged in lengths with stone piers between to suit the inclination of the surface. At present no planting has been done. Indeed, the earthworks are not yet complete. All the works have been executed from the designs, and under the superintendence of the architects, Messrs. Paull & Ayliffe, of Manchester; but this firm having been dissolved in June last, they have been completed under the care of Mr. Paull, alone. The clerk of the works is Mr. Gregory Gill. The contractor for the masons' work is Mr. O. Horsman, of Wolverhampton; and all the other works, to the buildings, have been contracted for by Mr. Burton, of Ashton. Messrs. Grierson, of Ashton, have supplied the palisading; and Mr. Dovey, of Manchester, has executed the wrought-iron entrance-gates. The carving is by Mr. Earp, of London.

PATENTS CONNECTED WITH BUILDING.

APPARATUS FOR HEATING PIPES BY HOT WATER.—*G. W. Canning & J. K. Edmonds.* Dated February 10, 1866.—This invention relates to improvements in the construction of boilers for heating pipes by hot water, applicable to hot-houses, buildings, and other purposes where water is circulated through such boilers by means of a system of tubes or pipes. The patentees construct a boiler of the shape known as the saddle-boiler, by preference; but they also propose to use a common boiler, or any hot-water boiler suitable in shape and capable of adaptation for a flow or circulation of hot water. Such boiler or boilers is or are to be enclosed or surrounded by a series of water tubes or pipes of a circular, elliptical, or any other shape, such pipes or tubes being connected with the boiler in order that the water may circulate through them. Pipes are also brought into connexion with the series of tubes and boiler for the purpose of conveying the flow and return of hot water, and of transmitting such hot water to the rooms of buildings or other places. The fire and heated products from the furnace pass around the boiler and tubes and rapidly heat them. Over the boiler and tubes a horizontal smoke flue is formed in the masonry, and communicates with the furnace by means of three or more vertical flues, so that the heat may be drawn to all parts of the tubes and boiler. Below the fire-bars chambers are formed for the entrance of cold air to the ash-pit, and thence between the bars.

OPENING, CLOSING, AND SECURING WINDOWS, DOORS, AND SHUTTERS.—*J. Carter.* Dated June 14,

1866.—This invention consists in the following arrangements:—A screw or screws is or are arranged on either side of the sash, shutter, or door, as the case may be, and the shaft or shafts of the screw or screws is or are provided at one end with a bevel pinion gearing into corresponding wheels or pinions upon a horizontal shaft. Nuts are secured to the side or sides of the window, door, or shutter, into or through which the screws pass. When it is desired to lift or close the sash, door, or shutter, an attendant imparts motion to the horizontal shaft by means of a cranked handle or otherwise; or, in the case of very large windows, shutters, or doors, motive power may be employed for effecting the lifting or lowering. If desired, the window, shutter, or door may be so arranged that one of the nuts should be made capable of being detached from the side, so that the window, shutter, or door, can be turned round on the opposite screw as a hinge or centre. By means of this invention the part to which it is applied can be rendered fixed and permanent in a position so that the necessity for any kind of lock, as now employed, is avoided.

FROM SCOTLAND.

Edinburgh.—Mr. Ross, of Rockville, has given 2,000l. towards the erection of a fountain in East Princes-street Gardens. The town council have granted the site, and have agreed to supply the fountain with water. The fountain, which will be chiefly constructed of bronzed cast-iron, will stand on the upper terrace of the garden, midway between the Scott monument and the Wilson statue, and will be a conspicuous object. The design is that of M. Duranne, of Paris, and was shown during the Exhibition of 1862. The diameter of the great basin is 60 ft., and the height to the head of the highest figure is about the same. The entire cost is calculated to be not less than 3,500l., of which sum 1,500l. must be raised by public subscription. Several donations have already been received, and subscriptions are to be sent out shortly. We should be better pleased to have this money spent in the production of a fine fountain by English artists.

St. Andrew's.—The chief stone of a new College-hall has been laid with masonic honours, by the Grand Master Mason of Scotland, Mr. John Whyte Melville.

Perth.—Part of a train on the Scottish Central section of the Caledonian railway has fallen over a bridge 60 ft. high over the Carron stream, at Larbert junction. The train was loaded fortunately with cattle only, many of which were killed. Strange to say, the guard, conductor, and a shepherd, who were thrown over, escaped with but slight injuries.

PRIVATE AND PUBLIC BUILDINGS OF CONSTANTINOPLE.

SIR,—Such of your readers as have not made a tour through Turkey can have little idea of the remarkable buildings in that country.

The city of the Bosphorus, is remarkable for its beauty. A declining promontory, secured by narrow seas at the east of Europe, stretches out to meet the continent of Asia, and the strait is so narrow that in a quarter of an hour a boat can row from one side to the other. This channel is the Bosphorus, and runs about twenty miles from the Black Sea, and before the river is lost in the Sea of Marmora, it makes a deep elbow to the right, flowing between the triangle of Constantinople and the suburbs of Galata and Pera, forming the port called the Golden Horn.

Stamboul is built on seven hills, which appear to rise above one another. The ridge of the first is occupied by the seraglio; behind which, a little on the reverse of the hill, the dome of Santa Sophia can be seen. The second is crowned by the mosque of Osmanich, the dome of which is strikingly bold and lofty. The third has the Grand Mosque of Soliman; whilst an ancient aqueduct unites the summits of the third and fourth hills. All these are intermingled with houses painted of different colours: the gilded domes and the slender minarets crowned by the shining crescent, show the magnificence of Constantinople. The minarets form one of the most striking and striking features in the architecture of Constantinople, and nothing can surpass the effect produced on the nights of illumination,

when long strings of lamps are hung in festoons from one to the other of these slender lofty towers. Its situation upon these hills is not only the cause of its beauty, but of its salubrity, as it catches the breezes from the Bosphorus and the plains of Thrace. It occupies the whole of a triangle, outlined by old walls flanked by towers. The interior of the city, however, but ill corresponds with the beautiful coup d'œil which it presents at a distance. It consists of an assemblage of dark and narrow streets without names, badly paved, and choked up with dust or mud. Galata lies on the west side, and resembles the worst part of Wapping. The streets are very steep, dirty, and unpaved. This is the chief business quarter for European merchants. Pera is situated immediately above Galata, and stretches more than two miles along the summit of a lofty hill. It has long been the residence of the Corps Diplomatiques from the different nations of Europe, and each has a palace here, but not much has been done to render it a habitable place. On one of the seven hills stands the palace and gardens of the Seraglio. The palace is enclosed with lofty walls, the whole space of which is covered with suites of apartments, mosques, baths, gardens, &c. So many glittering domes produce at a distance a very beautiful effect, which, upon a closer inspection, is entirely lost, for they are huddled together without symmetry or order. The principal entrance is on the west, through the Babahojmanjan Porte, which is built of marble, and has a very heavy appearance. Within is the first court, containing the Mint and the Vizier's divan: opposite is the Baba Salem, or Gate of Health, leading to the second court, where the audience chamber is, containing the throne, which resembles a large four-poster bed. The gate terminating the second court is called Baba-Saadi, or Gate of Happiness, through which no stranger is allowed to pass. The walls of the palace are wainscoted with jasper, veneered ivory, and mother of pearl.

In Constantinople there are fourteen imperial mosques, sixty ordinary mosques, varying in size and beauty, and over two hundred inferior mosques and meschids: the latter are distinguished as places of worship by having little minarets contiguous to them. The Mosque of Santa Sophia, situated near the principal gate of the Seraglio, is the first both for its architectural magnificence: it was built by Constantine. Among the numerous pillars which adorn this mosque are six of green jasper, which once supported the roof of the Temple of Diana at Ephesus, and eight of porphyry, that had been imported by Aurelian in the Temple of the Sun at Rome, but were removed thither by Constantine. The immense size of the building, the stupendous concave of the dome, the magnificence of the columns, and the variety of marbles; the singular manner in which it is illuminated with globes of crystal, and lamps of coloured glass, and ornamented with ostrich eggs, &c., produces a striking effect. The most handsome mosques after Santa Sophia are that of Mahomet II, which crowns one of the seven hills, and stands upon the site of the celebrated Church of the Apostles; that of Achmet I, constructed 610, at an enormous expense, and which has six minarets of great height and beauty; that of Bajazet, in which are twenty columns of remarkable size and value, viz., ten of verd-antique, four of jasper, and six of Egyptian granite; that of Solyman II, which is esteemed of superior symmetry and elegance. The Mosque of Lalali, or the Tulip, is small, but elegant, and was built by Sultan Mahmood in 1753. It is wainscoted with veneered marble, and has two large embroidered tablets, on which are represented the cities of Mecca and Medina. Every mosque has in general a large area in front, surrounded by a lofty colonnade of marble, with gates of wrought brass, and in the centre a fountain of polished marble. Adjoining to each is the sepulchral chapel of its founder, where his remains are deposited. Some of these tombs are exceedingly pretty, and in looking through the grated windows of these, the coffins, mounted by shawls and turbans, and slightly elevated from the floor, with little lamps continually burning, and immense wax torches lighted on particular occasions, strike the eye with peculiar effect. The tomb of Sultan Mahmood is a beautiful building, entirely composed of white marble, and only recently erected. It is the most handsome tomb in Stamboul. After the mosques, the public fountains are among the chief ornaments of this remarkable city. Some of these, with their marble fronts, elaborate arabesque ornaments, and Chinese-like

roofs, are most beautiful objects, and their number is extraordinary; they meet you which ever way you direct your walk; they stand by every mosque—for before a Turk prostrates himself in prayer he must perform his ablutions. The quantity of water required to supply these fountains is immense, and is brought from artificial lakes near the forest of Belgrade, about twelve miles from the city. It is conveyed by means of subterranean aqueducts and siphons, or hydraulic pyramids, which latter are placed at regular distances, and ingeniously contrived to overcome the inequalities of surface presented by the country. The bazars are very peculiar and are very extensive, and essentially Oriental in appearance. They consist of lofty cloisters, or corridors, built of stone, and lighted by domes, which are admirably adapted for the climate. Every trade has its particular quarter. In one street nothing is seen but arms of different kinds: another is filled with jewels, &c.; and so on through all the streets of the city. There is a peculiar square called a Han, or Khan, surrounded by buildings, with galleries all round, a tree or two, and a fountain or coffee-house in the middle; and there are nearly two hundred of these places for the accommodation of merchants.

W. G. P.

RAILWAY MATTERS.

The Metropolitan Underground Railway.—The increase of traffic on this line is exhibited in a return of passengers conveyed on Easter Monday during the past three years, viz., 1865, 66, 232; 1866, 87,662; 1867, 101,493: number of trains (exclusive of goods, coal trains, and engines) running over the line on Easter Monday, 1867, 462; and during one hour, from 8 a.m. to 9 a.m., on the same day, thirty-five trains passed between the King's-cross and Farringdon-street Stations, or one train every second minute. The system of signalling by telegraph, and constant supervision, seconded by the co-operation of the company to convey this enormous number of passengers in one day without the slightest confusion or mishap of any kind.

Traffic Receipts.—The traffic receipts of the United Kingdom amounted, for the week ending April 20th, on 12,776 miles, to 713,110l., and for the corresponding week of last year, on 12,516 miles, to 695,525l., showing an increase of 260 miles, and of 17,585l.

Progress of Mont Cenis Tunnel.—This tunnel continues to progress much more rapidly now that the quartz rock has been passed through and a softer material encountered. The whole distance as yet penetrated is, on the south, 4,119 metres, and on the north, 2,523 metres; total, 6,642 metres; which, as the entire length is 12,220 metres, leaves yet to be executed 5,673 metres.

THE LATE SIR ROBERT SMIRKE.

SIR,—I have read with much interest the sketch of my late brother, Sir Robert's life in your number of the 27th ult., and for the favourable tone of his remarks I cannot but feel grateful to the writer; but the sketch, though brief, is not without various errors, which will be very apparent to those who knew the subject of the sketch. The only error, however, that I think it necessary specially to note, is the statement that he ever had "a longing to be an actor." That he had a great personal regard and esteem for John Kemble (a feeling which I have reason to know was mutual) is perfectly true; but that he ever entertained the slightest idea of the stage as a profession, or, indeed, of any other professional pursuit whatever, except that to which from his earliest years he was ardently attached, is wholly without any shadow of foundation.

SYDNEY SMIRKE.

WINCHESTER SEWAGE COMPETITION.

SIR,—I read with much pleasure the indignant letter on this subject in your last journal from "One of the Rejected." Nothing could be more irregular or improper than the course which the Local Board have adopted. So strongly did I feel this to be the case that I wrote to the town clerk a letter, which I enclose. The courtesy of an acknowledgment or reply has not been accorded me; but a few days afterwards my designs were returned, with a circular-note in the same form as that addressed to your correspondent. Like him, I have had experience in town drainage, having been engineer for about a dozen provincial works; and I feel not a little vexed that the time

and money I had bestowed upon these plans should have been ignored, simply because, in common with two-thirds of my brother engineers, I selected the nearest available lands upon which to distribute the sewage, in ignorance of the preconceived and predetermined views of the Board. It is the first time I have competed for drainage works, and it will most certainly be the last. But I think the more protest. The injustice done to me is so gross and so palpable that I think we should even yet endeavour to obtain for our designs the consideration which has hitherto been denied them; and I therefore invite the six gentlemen who, together with myself, have been dismissed from the competition, to communicate with me, in order that we may take counsel on the subject.

Park-street, Westminster. G. W. STEVENSON.

CHARCOAL FILTERS.

SIR,—Last July I procured about seven pounds of animal charcoal, and made myself a filter on the usual principle, which yields about 1½ gallon per minute. This has apparently acted very well until about two months ago, since which time, if no water is drawn for a few hours, the first gallon or so emits a slightly turbid colour. Can any of your correspondents oblige me by stating if the animal charcoal loses its good effects so soon, or should some other filtering material be inserted for the water to pass through after it has been acted upon by the animal charcoal? The water filtered is that supplied by the Southwark and Vauxhall Company, which appears so clear as scarcely to require filtration. The hot weather is approaching I think this is likely to be a matter of some interest to many of your readers, who, like myself, can manufacture an article of the kind for their own use, and to whom the price asked by the professional filter-makers is an object.

E. J.

THE WIDENING OF PARK LANE.

AFTER the demonstration last summer in which the railings separating Park-lane from Hyde Park were levelled, the vestry of St. George's, Hanover-square, passed a resolution urging the Government that a great boon would be conferred upon the public if a portion of the Park running parallel with Park-lane were given up for the purpose of being converted into a roadway, in order to add to the width of the present thoroughfare. On Thursday last, a letter was received at the vestry from the First Commissioner of Works, stating—"That upon the representation to her Majesty that the width of that portion of Park-lane within the parish of St. George, Hanover-square, is not sufficient to provide for the safe passage of the increasing traffic through it, and that the demerit of Hyde Park would be a great public improvement, her Majesty has been graciously pleased, in order to facilitate this improvement, to authorize the permission is accompanied with the proviso that "it shall not operate to divest or prejudice the Crown's right of soil in or over the portion of Hyde Park which may be appropriated for the purpose of the improvement." The cost of paving the portion of the park presented at the prospect of the speedy widening of a portion at least of Park-lane, by the order of the Crown, was agreed that negotiations be carried on with the necessary plans, &c., showing how it was intended to carry out the proposed improvement.

KINGSHOLM ST. CATHERINE, GLOUCESTER.

THE drainage of this district has just been completed by the Local Government Board, and the whole of the sewage is now diverted from the Twiver. The works comprise a new main outfall sewer and sewage-depositing tank, with overflow for storm waters into the Severn, brick and pipe branch sewers in all the streets, and appliances for flushing and ventilation. The works have been carried out by Messrs. King & Godwin, of Gloucester, under Messrs. Gotto & Beesley, Engineers, of London.

CHURCH-BUILDING NEWS.

Fulham.—A private chapel has been erected for the Bishop of London at Fulham Palace. Mr. Butterfield was the architect. An organ has been specially constructed for it by Mr. J. Robson, of St. Martin's Lane, under the supervision of the Rev. Mr. Stittwell, of Stepney, assistant-chaplain to the bishop.

Chelwynd (near Newport, Shropshire).—The new church here (of which a short account, as proposed to be built, was given in the *Builder* of October 21st, 1865) was consecrated on the 25th of April by the Bishop of Lichfield. In addition to the particulars therein mentioned, it may be stated that the spire is about 120 ft. high. The nave is separated from the south aisle by an arcade of four arches. The columns are of polished Devonshire marble, and the

capitals are of stone, carved. Over the arches on the nave side are illuminated texts by Mr. Charles Hudson, of London. The chancel arch is supported by marble shafts on corbels, and similarly enriched by an illuminated text. There is a lych-gate at the entrance to the churchyard on the north side, of framed timber work, covered with oak shingles. The total cost has been about 3,000*l.*, the expense of which has been defrayed by Mr. J. C. Burton Borough, of Chetwynd Park, and friends. The architect was Mr. Ferrey, and the contractor Mr. Richard Yates, of Shiffnal.

Burton.—St. John's Church has been re-opened for public worship, after having been reseated and decorated. The alterations were carried out by Mr. Hall, of Nottingham, builder.

Callow.—A church, dedicated to St. Peter, has been consecrated at Callow by the Bishop of Lichfield. The style of architecture is Early English. The architect was Mr. S. Rollinson, jun., and the builder, Mr. Wright, of Chesterfield. A want of funds prevents the erection of a spire at present.

Maldstone.—St. Philip's Church is to be enlarged by 200 additional free seats, and other alterations and improvements carried out, comprising north and south transepts, with a tower and spire facing the town. Mr. E. W. Stephens, architect, Maldstone, has prepared plans. It is estimated that the total cost will be about 2,000*l.*, of which the sum of 1,127*l.* is either promised or paid.

Worpleston.—The church here has been restored, under Mr. Woodyer, architect, by Messrs. J. Goddard & Son, of Farnham, builders. The contract price was 1,800*l.*, and the probable cost, including extras, 2,200*l.*

Bolton.—The chief stone of a new church has been laid here, by Mr. Peter Ormrod, who is to defray the cost, which, it is said, will be not less than 30,000*l.* The architect is Mr. E. G. Paley, of Lancaster; and the contractors are Messrs. Cooper & Tullis, of Preston. The style will be Decorated Gothic.

Binfield (Oxon).—St. Mark's Church has been consecrated. The style is Early English, and the material brick. Mr. A. W. Blomfield, of London, was the architect; and Mr. Joseph Lawrence, of Binfield, the builder. The plan is cruciform, and the entire cost was 1,650*l.*

Brockdish.—The parish church here has been restored, under Mr. Murrable, of London, architect, by Messrs. Wells & Son, of Dickleburgh, and George Kemp, of Brockdish. The curving was executed by Mr. B. Barrett, of Norwich.

Upper Heyford.—The parish church has been rebuilt and opened for divine service, by Mr. Talbot Bry, of London, was the architect; and Mr. Cowley, of Oxford, the builder. The style is Perpendicular, and there is a tower, with belfry.

Allstree (Derbyshire).—The church here has been restored, at a cost of upwards of 4,000*l.*, and reopened. The general architectural character of the church is of the fourteenth century. The building works have been done by Mr. Joseph Thompson, of Derby. Mr. James O'Shea, of Derby, has executed the stone and wood carvings. The heating apparatus has been carried out under the immediate direction of Mr. Holmes, of Makeney, by Mr. Crump, of Derby, who have also fitted up the church with gas cornices, suspended from the roof. Mr. Haslam, of Derby, took the ironwork in hand. The architect's clerk of the works was Mr. George Moat, jun., of Sandwich. The restoration was carried out under Messrs. Stevens & Robinson, of Derby and London, architects.

Faversham.—The new tower of Ospringe church is approaching completion. Flint, faced with Caen stone, has been employed, and the entire expense borne by Major Hall, of Syndale House. Mr. Whiting, of Ospringe, is the builder.

—Preston church has been reopened. A north aisle has been added; the south porch rebuilt on the old foundations; and the tower has been raised about 12 ft., and a spire of about 30 ft. added. The total cost of the restoration is about 2,000*l.* The architect was Mr. Joseph Clarke; and the builders, Mr. Lewis Shrubsole, for the flint and wood work, and Mr. Henry Kirby for the stonework. Mr. Nott acted as clerk of the works.

Stapleton.—The church of St. John the Baptist, Stapleton, has been restored and reopened. The north wall being, in its centre, 7 in. out of the perpendicular, has been strengthened by a flying buttress; and the east wall having been found crooked from the top to the bottom, has been moved 7 ft. eastward, and rebuilt with the old stones. The old internal

quoins in the south wall are left *in situ*, to mark the original wall line. The church has been restored under the direction of Messrs. W. Slater & R. Herbert Carpenter, of London. The works have been carried out by Mr. W. Jones, of Stapleton; and the chancel seats and eagle are by Mr. Pepper, of Brighton; the ironwork and brasswork by Mr. T. Potter, of London; the warming apparatus by Mr. Rimmington.

DISSENTING CHURCH-BUILDING NEWS.

Wednesbury.—The memorial stones of the new Wesleyan Chapel, now in course of erection at Spring Head, Wednesbury, have been laid. The architects are Messrs. Loxton, Brothers, Wednesbury, and the builders Messrs. Trow & Sons, Wednesbury. The estimated cost of the new building is 2,830*l.* The building will be Italian in style, brick being the principal material used, with stone dressings. Internally, it will be 81 ft. long by 56 ft. wide, and will be fitted with galleries and other conveniences. The timber work will all be stained and varnished.

Rotherham.—A new Congregational Church has been opened at Rotherham. The site is near the old windmill on the Doncaster-road. With the exception of a few minor details, and the erection of a proposed tower, the church is now completed. It is built of stone obtained from the Thrybergh quarry. Externally the style of architecture is Early Decorated, which has been so modified in the interior as to suit the requirements of the Congregational form of worship. The plan of the church is cruciform, having a nave 90 ft. by 38 ft. and a north and south transept, each 20 ft. by 18 ft. Abutting on the west end of the nave are the vestries, surmounted by a tower and spire rising to a height of 170 ft. At the opposite or east end of the nave, which abuts on the new road branching off at right angles to the Doncaster road, the gable rises to the height of 50 ft., and is surmounted by an iron cross. In the upper part of the gable is a trefoil light, beneath which is a large window with five lights, 20 ft. high. On either side the window are the two principal entrances of the church, consisting of deeply-recessed arches with columns, the doors being of oak, with foliated hinge irons. There is a large window at the end of each transept, and three smaller ones at each side of the nave. At the east end of the nave there is also a gallery, and it is proposed to erect one in each transept, when the church will afford accommodation for 1,000 persons: at present it will seat 900. The pews are of stained wood, as is also the ceiling, which is arched and is constructed with the object of rendering the building as perfect as possible in an acoustical point of view. The pulpit is in a prominent position, standing immediately in front of the organ-loft and singing-gallery, which are over the vestries at the west end of the nave. It is anticipated that the total cost of the building will amount to 4,500*l.*, though the first proposed outlay was only 3,500*l.* Mr. Shaw, of Rotherham, is the architect.

Bacup.—The corner stone of a new Wesleyan Chapel, to be built at Heald, near Bacup, has been laid. The site of the building has been given to the trustees by Messrs. C. H. Sieber & Co., of Irwell Springs Mill. The chapel will be built from plans by Messrs. Russell & Whitaker, architects, Rochdale; is estimated to accommodate 500 persons; and the cost will be about 2,000*l.*

Edgworth.—A new Congregational Church has been opened at Edgworth. The site of the building is close to the proposed Bolton new waterworks. The edifice is in the Geometrical style, and will accommodate on the ground-floor 340 persons, and in a gallery at the west end, about 100. The cost has been 1,500*l.* exclusive of land and fencing. The architect is Mr. J. Maxwell, of Bury.

Sheffield.—The chief stone of a Primitive Methodist Chapel has been laid between Sunderland-road and Harleton-street. The architects are Messrs. C. J. Innocent & Brown, of Sheffield. The style is Italian Gothic, and the work has been contracted for at 3,157*l.*, including boundary walls.

Shepley.—The chief stone of a new chapel for Bible Christians has been laid at the entrance to the village. The architect is Mr. Smith, of Portsmouth; and the contractors are, for the masonry, Mr. Carpenter, and for the timber work, Mr. Harwood, of Chichester. The cost will be between 500*l.* and 600*l.*

Longsight (Manchester).—The chief stones of a new Wesleyan Chapel have been laid on the Stockport-road. Mr. G. Woodhouse, of Bolton, is the architect, and the style is Early Decorated. The cost will be between 5,000*l.* and 6,000*l.* Mr. Joseph Robinson, of Hyde, is the contractor.

Christchurch.—On Good Friday a new Congregational Chapel was dedicated at Christchurch, Hants. It is built in the Italian style, freely treated. The walls are of white and yellow brick, with ganged arches to doors and windows, and relieved with Bath stone dressings. At the south-west angle are a tower and spire, 100 ft. high. The interior of the chapel is 75 ft. long by 40 ft. wide, and accommodates, with the galleries, 700 persons. The interior of the roof is open, of framed timber, ceiled at the collar-beam, subdivided into panels by moulded ribs, slightly stained and varnished, and the ceiling and walls being tinted. The panels are pierced for the purposes of ventilation. The building is heated by a hot-air apparatus, supplied by Mr. Haden, of Trowbridge. The architect is Mr. W. J. Stent, of Warminster, Wilts; and the contractor, Mr. Walden, of Christchurch.

Books Received.

Extracts from Reports in favour of the Extension of Municipal Institutions to the Metropolis. Published by the Metropolitan Municipal Association, 1, Adam-street, Adelphi, 1866.

With the view of exciting the requisite attention, in order that reformation of the municipal institutions of the metropolis may be effected, the Metropolitan Municipal Association, of which Lord Ebury is president, and Mr. Beal, of Piccadilly, honorary secretary, have here published a thick pamphlet of 216 pages, containing various more or less lengthened extracts from the second report on municipal corporations (1837); from report of commissioners appointed to inquire into the existing state of the Corporation of the City of London (1854); and from reports on metropolis local taxation and government (1861, 1866) in favour of the extension of municipal institutions in the metropolis; including suggestions by the chairman (Mr. Ayrton) of the committee on metropolis local taxation not adopted by the committee, and various other evidence. A speech by Mr. Beal in explanation of the proposal to extend municipal institutions to the metropolis has also been separately printed.

Stannak's Tables for Engineers, Iron Manufacturers, Shipbuilders, &c. London: Virtue & Co., Ivy-lane, 1867.

THE accuracy of these tables being taken for granted, they must be very useful to those for whose purposes they are intended. They give weights of angle and T iron in lbs. per lineal foot, in about 9,000 sections, ranging from $\frac{1}{8}$ to about $\frac{3}{4}$ of an inch thick inclusive, advancing every sixteenth of an inch; and are systematically arranged. The compiler states that they were prepared originally for his own use, and, as he felt that such tables were much wanted, he has published them, carefully recalculating and proving them again before sending them to press.

A Treatise on the Law of Window Lights. By FRANCIS LAW LATHAM, Barrister-at-Law. London: Butterworth, 7, Fleet-street, 1867.

THE ancient-light question, owing to the demand for enlarged buildings within the area of our large towns, becomes more important every day, and Mr. Latham has done well in producing a new treatise on the subject, and setting forth some of the more recent decisions of the courts. The law cannot long remain as it is, but it will be changed, it is necessary we should know what it can and cannot do, with which end we refer our readers to Mr. Latham's book. It is well arranged and clearly written. The author has a chapter treating "of the evidence and measurement in cases of alleged injury to the right to window lights," but does not show acquaintance with the recent discussions on this part of the subject, and the means proposed for measuring the extent of deprivation. Mr. Bacon, by the way, made a happy quotation not long ago in a light and airy case, when commenting on the evidence of a witness who had attempted to prove the exact number of degrees of light which would be obstructed. He compared him

to the philosopher mentioned in "Hindibras," who, he said,—

"By means of geometric scale,
Could tell the size of quarts of ale."

Mr. Latham may attach no greater importance to the proposed system, but it should have been mentioned. We recommend the book nevertheless.

VARIORUM.

"Hardwicke's Science Gossip" goes on well, and will in hundreds of cases give to country life a fresh pleasure. The current number has an able illustrated paper by Dr. Tilbury Fox on the Chignon Fungus, which he has grown under various circumstances. As to its influence in the production of disease, Dr. Fox arrives at the conclusion that in England "the total danger on the whole is slight."—"Ellerslie House: a Book for Boys. By Emma Leslie. Partridge." The object illustrated in this tale is the necessity of a firm resistance to wrong-doing and adherence to principles, spite of laughter and abuse. It is calculated to interest boys, and to benefit them.—"What's What in Paris, 1867" (Bailey & Co. Cornhill), is a rattling gossip about the French metropolis, its ways and weaknesses; and it contains many bits not to be found in Murray's or Galloni's, to assist explorers in seeing something of Paris "life."—The wood engravings which illustrate the second part of the Paris Universal Exhibition in the Art-union (Virtue) are admirable specimens of the art, and thickly srew every one of twenty-four pages devoted to the catalogue.

Miscellaneous.

THE PLATE-GLASS TRADE.—A deputation from English plate-glass manufacturers, including Mr. W. Swinburne (chairman of the British plate-glass Manufacturers' Association), and Mr. G. Williams (secretary to the association), had an interview with the Duke of Richmond, the office of the Board of Trade, relative to a French duties on plate-glass.

LONDON BRIDGE.—With reference to a recent communication, Mr. O'Keeffe, C.E., reminds us that in the *Builder* for 1856, Feb. 3rd, he suggested the formation of a superway for foot-passengers across London Bridge, based on two rows of columns, 15 ft. high and 30 ft. apart, so distributed as to divide the slow from the quick traffic below, while also supporting transverse and longitudinal girders, on which superway would be laid, and which would be ended by some thirty steps.

THE CANNING AND OTHER STATUES, PALACE.—In reply to questions put in the Commons, Lord John Manners said that, in consequence of the great increase of traffic in the neighbourhood, his predecessor in office had adopted a plan for giving increased facilities of approach to the House of Commons, which had been adopted by the House. It consisted of an improved carriage way and an improved footway, and when the latter was completed the statue of Canning would stand at the end of it, and that of Sir R. Peel at the other. Lord Palmerston would also be placed in the immediate neighbourhood.

WATER-BORING INSECT IN AUSTRALIA.—The insect referred to in the *Builder* of April 20, is, without doubt, the *Toxicus monographus*, so named in India for perforating the casks containing malt liquors, and quite new to Australia. It has been known for a very long time, and its representations of its effects on the casks have been made in this country for the last twenty years or more, and committees have been appointed to investigate the nature of these little creatures, and the cause of the attack. It is calculated that one cask alone was perforated in every direction in more than 150,000 casks, causing fearful leakage and waste. At one time it was asserted that the insect was sent to this country, but happily at present we do not find the creature here: the statement must be without foundation. Sometimes they are what in common, at other times they swarm in great numbers, and are plentiful now, causing great waste. At one time they were almost exterminated to Burmah, but now Secunderabad appears to be their head quarters. The best way to prevent their numbers is to introduce boiling water to their notice.

AMERICAN STATUE OF SHAKESPEARE.—The United States sculptor, Dr. Ward, has received a commission for a statue of Shakspeare for the central park of New York.

STONE-CUTTING MACHINE AT SWANSEA.—The Local Board of Health has just erected a stone-cutting, or rather stone-crushing, machine, worked by hydraulic power, and capable of breaking 40 tons of stones per day. The cost of the stones to the Board is thus reduced from 1s. 3d. to about 3d. per ton.

THREATENED STRIKE ON METROPOLITAN OMNIBUSES.—A publication called the *Whip*, says,— "We have reason to believe that unless a petition, on the eve of presentation from the *employés* of the London General Omnibus Company, be complied with, a general strike among the conductors and drivers will take place before the end of the month."

NEW RESERVOIR OF HALIFAX WATERWORKS.—The first sod of a large new reservoir in connexion with the Halifax Waterworks has been cut at Mikenden. The reservoir will hold about 100,000,000 gallons, and will be a supplementary and storage reservoir at Ogden. The cost of the new one will be about 20,000l. This is the last reservoir of the scheme which the corporation has Parliamentary power to make, and upon which the town has expended or will expend several hundred thousand pounds.

ELECTRO-MAGNETISM IN IRON SMELTING.—The use of an electro-magnetic current in the smelting of iron has been tried at one of the leading ironworks in Sheffield, it is said, with complete success. A fixed electro-magnet is placed opposite an opening in the side of the furnace: the magnet is excited by means of a Smee's battery, and the current of magnetism is directed into the molten metal. The effect is described as being surprising. The metal appears to bubble and boil; the metal is expedited, which economizes fuel; and the quality of the iron is so much improved that for toughness and hardness it can hardly be equalled.

NEW FIRE ESCAPE.—A public trial of Messrs. Jones & Hedge's patent portable fire-escape has taken place at Scotland-yard, Whitehall. It is small and portable, weighing but a few pounds. The most useful size contains 40 ft. of wire rope, and is 10 in. in diameter and 1½ in. thick; and its arrangements are such as to enable those going down by it to descend at whatever speed they please, or, if required, to stop at any window they may pass in descending, and take out any other person that may need rescue, and then reach the ground in safety. In descending, the apparatus is fastened to the body by a leather strap, and the wire made fast to something above. The apparatus can also be made fast above, and a basket or bag slung to the rope, so that when its load is safely landed, the person above can wind it up and let himself down. It can be fastened to any article of furniture, to the bars of a grate, or to a permanent crook or pin fixed in the wall or window-frame. In appearance the whole apparatus is little more than a flat wire rope, to which any sort of conveyance can be attached.

TWINING'S LECTURES TO THE WORKING CLASSES. In a letter, Mr. Twining, of Twickenham, of whose valuable museum we have heretofore spoken, writes, of the course of lectures which he has prepared for reading by others to working class auditories,—

"I am happy to be able to say that, from the commencement of the course in Lambeth up to the present time, it has been almost constantly under delivery, weekly or fortnightly, and often at two places in the same week; and though audiences numerically equal to those at the Baths were not to be found elsewhere, yet everywhere, in some orderly, earnest, and appreciative attention has prevailed. Unless an institution can afford to undertake some portion of the expense without inconvenience, I gladly take charge of everything, except placards and advertisements, only desiring the prospect of a working-class audience of not less than 500 persons, in a suitable meeting-place. I provide for distribution any required number of programmes, containing a full syllabus. The type is kept up by my Twickenham printer, who has merely to alter a little the title-page, and change the dates for those appointed for each successive place. Eight thousand have been printed up to the present time. I forward a few copies, by which you will see at once the educational character of these preparatory lectures, comprising, firstly, an introductory explanation of the scope and importance of domestic and sanitary economy, or the science of the elementary sciences, on the preparatory knowledge of the elementary sciences, on the application of which it is founded,—the most interesting and useful of the physical properties of bodies. Secondly, a continuation of the foregoing, including the mechanical notions of aerostatics, hydrostatics, and acoustics. Thirdly, light and heat. Fourthly, elementary outlines of chemistry."

DRAINAGE OF BATTERSEA.—It is asserted that the main drainage works at Battersea are not equal to their purpose.

THE PUGIN STUDENTSHIP.—Mr. Henry Walker, of Leeds, has been elected Pugin Travelling Student for the year 1867.

SOCIETY OF ENGINEERS.—The president, vice-president, members of council, and other members of the Society of Engineers have made arrangements to proceed to Paris on the 1st of June, to visit the Exhibition. A meeting of the Society and a dinner will take place in Paris during the first week in June.

CARVED PICTURE-FRAMES.—We have before us photographs of a number of picture-frames prepared by Mr. C. Rowley, of Manchester, and sent by him to the Paris Exhibition, some of which are very superior in point of design to those generally used. Mr. Rowley called in to his assistance Mr. W. H. Rogers, Mr. J. Whitehead, and Mr. W. J. Mickleby, the head-master of the Manchester school of art, who have supplied him with some elegant and appropriate designs.

VALUE OF LAND AT HAMPTSTEAD.—The residence, known as Branch-hill Lodge, at Hampstead, Middlesex, and 13a. Br. 37p. of pasture and garden ground adjoining, were sold at the Auction Mart, near the Bank of England, on Monday last, in one lot. After a spirited competition the lot was knocked down to a City wine-merchant, for his own occupation, at 20,050l. The late owner and occupier purchased the estate fifteen years ago for 10,000l.

PICTURE DEALING.—Particulars have been given in the newspapers of the prices realized at a sale last week of English pictures; the property, as asserted, of a well-known picture-dealer. The history of some of these sales would be curious, and not very satisfactory, were we disposed to think. It is asserted that pictures are sold backwards and forwards, and that all sorts of dodges are resorted to to get up or keep up the prices of particular artists' works. If all that is stated be true, there has been a complete conspiracy for some time past against the picture-buying part of the British public, and large fortunes have been made by some of the conspirators.

METROPOLITAN BOARD OF WORKS.—A return just made to Parliament shows that in the ten years 1856-65 precepts were issued for levying rates amounting to 1,050,572l. for the general expenditure of the Metropolitan Board of Works, and 2,182,650l. for the main drainage rate. The total expenditure on the main drainage works had, at the close of the year 1866, reached 3,798,208l., and a further outlay of 701,791l. was required to finish the works. The main drainage is now complete with the exception of the northern low-level sewer and works. The total amount received by the Board up to Lady-day, 1866, whether from rates or loans or otherwise, was 8,912,333l., and the total amount of debt then owing by the Board was 5,271,186l.

THE SANITARY ACT IN ST. GILES'S DISTRICT, HOLBORN.—The Board of Works for the St. Giles's District have been seeking, as bound, to carry out the regulations of the "Sanitary Act of 1866" as to houses let in lodgings. For a time these will be felt to be stringent, and will require to be put in force with discretion. We are not surprised therefore to hear that considerable opposition has been manifested in some quarters, and that the Board find it necessary to issue an explanatory statement. The regulations are of the utmost importance, and must not be disregarded, however cautiously it may be necessary to proceed in enforcing them at first. Very much depends on the persons who are charged with putting them into force.

ROYAL HORTICULTURAL SOCIETY.—On Tuesday last, the first May *fête* took place at the Horticultural Gardens, South Kensington. The day was fine, the gardens were charming; they seem to improve upon each fresh visit: the crowd was large and gay. Where, by the way, are the uniformed bands? Though that in attendance on Tuesday played well, we do not prefer Mufli on the occasion of these enjoyable promenades. We hear that the gardens are to be made use of on the 20th of this month, when the Queen will lay the first stone of the central Hall of Arts and Sciences. It is hoped that her Majesty will walk round the gardens amongst her people, that they may again see her taking an active part in the work her lamented consort loved so well.

VIRGINIA WATER.—The well-known Chinese fishing temple at Virginia Water having become decayed, it will be replaced by another building, designed like a Swiss chalet, which will give increased accommodation when required by the Royal Family. It is to be completed by the autumn.

FALL OF A CHAPEL CEILING AT BARNSELY.—A large portion of the ceiling of the Primitive Methodist Chapel, in Westgate, Barnsley, recently fell, completely covering the pews in the gallery, and scattering lime and wood over the entire interior of the building. The estimated damage is about 100l.

THE FINE ARTS IN BIRMINGHAM.—The Birmingham Society of Arts has, during the past month, for the second time, opened a spring exhibition, and again with complete success. It contains nearly 600 examples of water-colour drawings displayed on the walls of the Society's gallery in New-street. Among the number of works exhibited, are a few oil-colour sketches and pencil drawings. Of the entire collection, many are by well-known artists.

PUBLIC BUILDINGS.—The annual charges for the maintenance and repair of public buildings and expenses connected therewith, as the supply of water and rents of houses required for temporary accommodation of public departments, amount to 128,805l. The chief items are 4,311l. for Chelsea Hospital, 5,434l. for the Royal Military Asylum at Chelsea, 3,187l. for the erection of a new Jewel-house in the Tower of London, and 2,868l. for supplying the palaces, Houses of Parliament, and public offices with water. A large proportion of the total estimate is required for rents of houses occupied by various departments, 1,284l. being paid for the offices of the Registry of Seamen and Shipping at Adelaide-place, London Bridge; 1,305l. for the National Debt Office, in Jewry-street; 1,960l. for houses occupied by the War-Office in Pall-mall; and 1,450l. for the temporary Foreign-Office in Whitehall Gardens. This vote also includes a sum of 2,053l. for maintaining, watering, and lighting Westminster Bridge, this item having hitherto formed a separate estimate.

A "PACIFICATOR."—M. Gensleve Struve raises a corner of the veil which covers the new engine of war called the "hall-pump." He has published in the *Beobachter* of Stuttgart a letter full of the most terrible promises of destruction. He says: "All that is seen is an iron plate, which receives the balls, and a tube which discharges them with the rapidity of lightning. The visible apparatus is a which worked by hand or steam, according to the weight of the projectiles." M. Struve has seen it in operation in both manners; it fired balls of two, twelve, and eight pounds, not at fifty a minute, as had been said, but at three hundred. The stream of bullets can only be compared to the jet of water from a fire-engine. There is no recoil, no noise, no smoke. The barrel never heats, if even red-hot shot be fired. The machine never fogs, and it works for ever. The range depends upon the strength of the motive power. "I have seen it," says M. Struve, "throw balls across the Hudson where it was a mile wide, when eight men turned the handle. The inventor has assured me that it would carry two miles."

THE METROPOLITAN GAS BILL.—On the order for resuming the debate upon the second reading of this Bill, Sir S. Northcote said he had been induced to arrange with the companies so as not to interfere with the distribution of profits within the limits of the Act of 1860. He had also agreed to omit the purchasing clauses. The companies had agreed, on these conditions, not to oppose the second reading. He complained that he had received letters from clergymen and widows, and all sorts of people, telling him that he was going to ruin them; and that if members still obstructed the progress of the Bill, the Government would abandon it altogether. Their intention was to act as arbiters between the London gas companies and the London gas consumers. On the part of the gas consumers, Mr. Ayrton repudiated any acquiescence in the proposed arrangement. He objected to the abandonment of all the rights of the inhabitants, who would not be bound by any such arrangement. Various other members spoke on the subject, and the Bill was then read a second time, and it was passed *pro forma* through committee before being submitted to a select committee. The amendments were inserted, and the Bill ordered to be reprinted.

LYNN.—Mr. Scott has been consulted as to the restoration of St. Margaret's Church. He proposes alterations at a cost of 1,000l., besides re-arrangement of seats, &c., at about 1,500l. more. Less urgent restorations are also spoken of.

THE NEW BUILDING ACT.—At the meeting of the Metropolitan Board of Works, on Friday, the Building Act Committee submitted the Bill to amend the Building Act, and recommended that the solicitor of the Board be instructed to take the necessary steps to introduce the same into the House of Lords. Mr. Shaw (St. Marylebone) pointed out several defects in the Bill, and moved that it be referred back to the Committee for reconsideration, which was agreed to.

PROPOSED LAW COURTS.—In reply to a motion by Mr. Lanyon, in the Commons, Mr. W. Hunt said the Government had no desire but to obtain the best designs for the contemplated work. He should, however, remind the House that the selection of the judges had been made before the Government came into office, and the eminence of the judges had not been questioned. The Government had every reason to suppose that the selection which had been approved by the late Government, and which for many months had not been questioned, was acquiesced in. Some weeks since the competing architects requested that the two professional architects appointed to assist the judges should be added to the number of judges, and if the judges considered that they would be strengthened by such addition, and that the commissioners also acquiesced, her Majesty's Government had no objection whatever to that course being adopted. Mr. Cowper said that, as one of the committee of judges, he could not entertain any possible objection to the proposal made by his hon. friend.

RESTORATION OF ST. NICHOLAS'S STEEPLE, NEWCASTLE-UPON-TYNE.—The contract with Mr. Walter Scott for the restoration of the tower and steeple has been signed by the Committee of Management on behalf of the subscribers to the fund for that purpose, a clause being inserted in the contract protecting them against any personal liability. The appointment, by Mr. Gilbert Scott, of Mr. Henry Pulman as clerk of the works, has also been confirmed. The contract is divided into three sections:—

First,—Comprising unroofing of the north-east and north-west pillars, the introduction of various ties and binding courses in the walls of the tower.....	£1,811 11 9
Second,—Comprising the lantern, arched buttresses, and pinnacles, and new diagonal ties.....	1,932 16 0
Third,—Comprising the repairs and restoration of the tower generally.....	2,533 13 7
Amounting altogether to.....	£6,278 0 4

The carrying out of the second and third divisions will depend upon the amount of the subscriptions realised, those promised being barely sufficient to cover the cost of the first section. The work of restoration has already commenced. The committee received nine tenders in all, embracing builders from Bradford, Durham, and Alnwick. Mr. Walter Scott's tender for the first section was the lowest.

INFECTION AND CONTAGION.—We had occasion not long since to complain that even medical men did not always make a clear distinction between the words infection and contagion, some diseases which are infectious being occasionally called contagions, and contagious diseases being sometimes said to be infectious. The distinction is a very material one. This looseness of expression has induced Sir J. C. Jervoise, in the Commons, to move an address to her Majesty, to cause such inquiry to be instituted as may lead to the better distinction between contagious diseases and such as are termed infectious, so as to obviate as far as possible the loss, alarm, and injurious consequence of certain diseases when unsupported by demonstration. The question, be remarked, affected persons in every position of life, both at home and in the colonies. He had recently come across an article on leprosy [a contagious disease] in one of the public papers, in which it was stated that the infectious nature of the disease was believed in in many parts of India, and that such precautions were taken as inflicted the greatest cruelties upon the sufferers. The object he had in view was further inquiry. Lord Montagu, in reply, expressed his confidence in the machinery which at present existed for ascertaining the character of disorders.

TENDERS

For alterations to 239, Upper-street, Islington, for Mr. Harris.....
Johnson (accepted)..... £236 0 0

For building a studio for Mr. W. Oliver. Mr. F. Potter, architect:—

Design A.....	Design B.....
Tracey & Co..... £240 0 0	£250 0 0
Stephens & Watson.....	253 0 0
Styell.....	219 0 0
Aylett.....	126 0 0
	125 0 0

For the erection of a house at Pinner, near London, for Mr. R. Brown, Mr. Reiche, architect:—

Chappell.....	£2,807 0 0
Till.....	2,705 0 0
Poxon & Smith.....	2,195 0 0
Kemp.....	1,290 0 0
Jamies.....	1,743 0 0

For the erection of a villa residence on the Riddlesdown Park Estate, Kenley, Surrey. Mr. Thos. Dandy, architect. Quantities supplied by Mr. Shrnobole:—

Residence, Conservatory, Fences.....	
Harrison & Edwards..... £1,108	£53 10 0

For building the Holy Trinity schools and residence at Kilburn, Messrs. Francis, architects. Quantities Mr. Joseph Robson:—

Schools.....	Residence.....
Myers & Sons..... £2,120 0 0	£629 0 0
King & Sons.....	2,008 0 0
Howard.....	2,087 0 0
Colls & Son.....	2,430 0 0
Hill & Sons.....	2,034 0 0
Dove.....	1,925 0 0

For the erection of quarters for five sergeants, and other works, at the Wiltshire County Militia Stores Devises. Mr. Weaver, architect:—

Long & Jones.....	£1,013 0 0
Cane & Co.....	917 0 0
Long.....	917 0 0
Mullings (accepted).....	840 0 0

For building schools, culvert, and fence-wall adjacent to the Presbyterian Church, Tottenham. Messrs. W. Habershon & Pite, architects:—

Staines.....	£575 0 0
Osborn.....	568 0 0
Wilcox.....	540 0 0
Johnson.....	525 0 0
Kemp.....	515 0 0
Poxon & Smith.....	455 0 0

For sundry alterations, additions, &c., to a house at Fortis-green, Finchley. Mr. Wimperis, architect:—

Fish.....	£900 0 0
Carter & Sons.....	607 0 0
Southcott & Wigdery.....	485 0 0
Watson (accepted).....	475 0 0

For sundry alterations, additions, &c., to Leo Ho Finchley-common. Mr. Wimperis, architect:—

Watson.....	£714 0 0
Carter & Sons.....	680 0 0
Wheeler (accepted).....	430 0 0

For new front inclosure-wall and rehangng old gate at Fortis-green, Finchley. Messrs. Carter & Sons, architects:—

Watson.....	£350 0 0
	335 0 0

For additions and alterations to a house at Fortis-green, Finchley, for Mr. J. A. Noble. Mr. Wimperis, architect:—

Fish.....	£1,750 0 0
Moultrie.....	1,720 0 0
Carter & Sons.....	1,670 0 0
Watson.....	1,570 0 0
Wheeler.....	1,522 0 0

For building small picture-gallery, sundry alterations, general repairs, &c., to No. 6, Glasshouse-street, Finsbury. Mr. Wimperis, architect:—

Kilby.....	£398 0 0
Bywaters & Co.....	357 0 0
Scrivener & White.....	329 0 0

TO CORRESPONDENTS.

Reply at the Royal Academy. A prohibitory drawing must be sent in. The gold medal competition is open only to students of the Academy...

All statements of facts, lists of tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication.

Advertisements cannot be received for the current week's issue later than THREE O'CLOCK, P.M., on THURSDAY.

The Publisher cannot be responsible for ORIGINAL TESTIMONIALS left at the Office in reply to advertisements, and strongly recommends that COPIES ONLY should be sent.

TO SUBSCRIBERS.

NOW READY, THE TWENTY-FOURTH VOLUME OF "THE BUILDER" (bound), for the year 1866, Price One Guinea.

CLOTH CASES for binding the Numbers, price one Shilling and Ninepence.

CLOTH READING CASES, price Half-a-crown.

COLOURED TITLE-PAGE, Gratis.

SUBSCRIBERS' VOLUMES will be bound on any copy sent to the Office, at a cost of Three Shillings and Sixpence each.

[ADVERTISEMENTS.]

PARIS EXHIBITION.—To Architects visiting the Continent.—Clark's Patent Shutters can be seen in two different places in the Building...

CHURCH, TURRET, and STABLE CLOCKS. W. BENSON, having erected steam-powered improved machinery for clock-making...

ADVERTISEMENTS.

WINDMILL, close to Aton Heath.—To Builders, Contractors, and others.—Builder's Plant, Horse, Cart, Material, &c.

CHARMING FRESH BUILDING SITES for Gentleman and Dealer, in the midst of one of the most fertile valleys, the demand for which is great...

SHELDON ESTATE, WORTHING. MR. EDWIN WHITE will sell, on MONDAY, 9th MAY, 1867, at THREE O'CLOCK precisely, in front of the park, with view of the sea...

CHESSWOOD ESTATE, WORTHING. MR. EDWIN WHITE will offer for position, at THREE O'CLOCK precisely, on MONDAY, MAY 27, BUILDING LAND, near to the railway station...

MR. EDWIN WHITE will OFFER for position, at THREE O'CLOCK precisely, on MONDAY, MAY 27, at THREE O'CLOCK precisely, several FLOTS of FRESHWATER BAGGERS...

About 850 lots of Chimney-pieces and Decorative Items. MR. EDWIN WHITE will sell by 12, Holborn-bar, and 1, Cannon-street, Holborn...

MR. EDWIN WHITE will sell by 12, Holborn-bar, and 1, Cannon-street, Holborn, on TUESDAY, 13th MAY, 1867, at TWO O'CLOCK precisely...

MR. H. HUMPHREYS will sell by AUCTION, at the AUCTION MART, Tokenhouse-yard, City, London, on THURSDAY, MAY 16th, 1867, at TWO O'CLOCK precisely...

METROPOLITAN RAILWAY.—Horse, Cart, Harness, &c. by direction of the eminent Contractor, John Kirk, Esq.—10 BE BE...

MR. J. S. GOWER, at his RESIDENCY, 2, Park Lane, on FRIDAY, MAY 24th, about Three o'clock, will sell by public auction...

FOR SALE BY PUBLIC AUCTION, in the SALEROOM, of YACHTS, CANOES, MARINE, &c. on WEDNESDAY, the 22nd of MAY, 1867, at HALF PAST ONE O'CLOCK precisely...

25,000 Spruce Deals, 100 ft. long, and 100 ft. wide, 10,000 Quarter Pine Deals and Planks, 10,000 Fir Deals, 10,000 Fir Planks, 10,000 Fir Battens, 10,000 Fir Boards and Boars, 10,000 Fir and Yellow Pine Timber, 10,000 Fir and Yellow Pine Timber, 10,000 Fir and Yellow Pine Timber, 10,000 Fir and Yellow Pine Timber...

Also, about FIVE O'CLOCK, on THE WOOD, 23 Legs Santa Anna Malagasy, 20 Legs Santa Anna Malagasy, 20 Legs Santa Anna Malagasy...

MESSRS. HAMMOND & SON ARE instructed to sell by AUCTION, at their PUBLIC SALE ROOMS, 26, Abchurch-lane, on THURSDAY, MAY 16, at TWO O'CLOCK precisely...

MESSRS. VENTOM, CLARKE, & BULL are instructed to sell by AUCTION, at the AUCTION MART, Tokenhouse-yard, City, London, on TUESDAY, MAY 28, at TWO O'CLOCK precisely...

MESSRS. BURBY.—Valuable Freshhold Building Land. MR. EDWIN WHITE will sell by AUCTION, at the AUCTION MART, Tokenhouse-yard, City, London, on THURSDAY, MAY 16, at TWO O'CLOCK precisely...

BURBY.—In the parishes of Walton-on-Thames and West Molesey, presenting most desirable building features...

MESSRS. COOKES & SONS are instructed to sell by AUCTION, at the MART, Tokenhouse-yard, on the 12th day of JUNE next...

Valuable Freshhold Building Estate, land-tax redeemed and title-free, consisting of upwards of 100 acres of beautifully-timbered land...

MESSRS. WALTERS & LOVEJOY are instructed to sell by AUCTION, on MONDAY, JUNE 24, at 10 O'CLOCK precisely, at TWELVE, at the late AUCTION MART, Tokenhouse-yard...

FAVE-SHAM, KENT.—FRESHWATER BUILDING LAND to be sold by AUCTION, on WEDNESDAY, the 15th MAY, 1867, at the SHIP HOTEL, Faversham...

MR. J. HIGHAM, on WEDNESDAY, the 15th MAY, 1867, at the SHIP HOTEL, Faversham, in thirty-four lots, will sell by public auction...

LEYTONSTONE.—Fillbrook Estate, adjoining Leytonstone Railway Station. MR. G. KEATES will sell by AUCTION, on MONDAY, MAY 13, at TWO O'CLOCK precisely...

UPON and PLAINSTOW, BRSEX.—Valuable Freshhold Building Land, comprising about 45 acres, adjoining the rural villages of Upon and Plainstow...

MESSRS. DRIVER & CO. have received instructions from the Trustees of the will of the late Sir John Henry Pyle, Bart., to sell by AUCTION, at the MART, Tokenhouse-yard, City, London, on FRIDAY, JULY 13th, at TWO O'CLOCK precisely...

Valuable Freshhold Grand-terrace and Freshhold Dwelling-houses in the parish of St. George-in-the-Field, with the Reversion to execute...

MESSRS. DANIEL SMITH, SON, & CO. are instructed to sell by AUCTION, at the AUCTION MART, Tokenhouse-yard, City, London, on THURSDAY, MAY 16, at TWO O'CLOCK precisely...

MESSRS. VENTOM, CLARKE, & BULL are instructed to sell by AUCTION, at the AUCTION MART, Tokenhouse-yard, City, London, on TUESDAY, MAY 28, at TWO O'CLOCK precisely...

MESSRS. BURBY.—Valuable Freshhold Building Land. MR. EDWIN WHITE will sell by AUCTION, at the AUCTION MART, Tokenhouse-yard, City, London, on THURSDAY, MAY 16, at TWO O'CLOCK precisely...

The Builder.

VOL. XXVI.—No. 1267.

A Walk and a Talk about Silchester.

RECENTLY interesting to those who see with mind and heart is a visit to Silchester, with which hurried city of the Romans few persons, comparatively, seem to be acquainted. A few gossiping notes addressed to those who do not know of it, and have thought but little if at all of Roman Britain, may have a use. Silchester is in North Hants, on the line of railway that connects Reading and Basingstoke. It is about seven miles from the first of these towns and six from the second. From Mardock Station, on the line in question, it may be reached by a walk of two miles, but there is no vehicle to be had there except by previous arrangement. We are amongst the Strathfields here, Strathfield Saye (of which all the world has heard), Strathfield Turgiss (the Rev. C. H. Griffith, rector), and Strathfield Mardock. The "straight field," say some; but those seem nearer right who find the origin of the name in the proximity of these places to the great Roman Street, connecting Silchester with London, and which, as it was a fine sound work, has long been called the Devil's Highway. Most things that were above the comprehension of the early folk appear to have been ascribed to that same agent. "Stop," says an inquirer, "you mentioned Basingstoke just now, and as you are speaking of derivations, what is it that we so often hear of that word 'Stoke'?"—Stoke in Cheshire, Stoke in Kent, Stoke Alhois, Stoke Damerell, Stoke Newington, Stoke Poges, Stoke-upon-Trent, and scores of other instances?" The word is derived from the Saxon *stoc* or *stoces*, the stock or trunk of a tree, and it comes to be applied to these places, says one, because towns at first were built of wood, within a *stockade*, from the neighbouring forests. We may get back, however, a little farther, and find its primary sense is something set or fixed, from the Saxon *stican*, to stick; so that in Stoke we find intimation of an early settlement or fixing, and may read Basingstoke as the settlement of the Basingas.

Basingstoke, however, must not lead us away from Silchester, though it makes a nice continuation for a day's trip. Silchester gets its present name from the Saxons,—perhaps as *sol-caestres*, the castle or settlement in the wood; but of course other derivations have been proposed. As to part of the title, at any rate, there is no doubt. Nearly all places of Roman origin amongst us were distinguished under the Saxons by the term *caestre* or *chester*, from *castrum*. They are usually oblong areas crossed by two principal streets at right angles. When the Roman soldiers were finally withdrawn Britain possessed at least fifty walled towns united by

excellent roads, upon which at certain distances were places for resting, called *mansiones*, and *mutationes* where relays of horses were kept. Besides the towns there were military walled stations. The towns included fine public buildings; statues decorated the highways, and close by were amphitheatres of large size for dramatic representations, capable in many instances of accommodating thousands of spectators. Add to these towns and stations the extensive villas, nobly adorned, which, as the spade has shown us, were scattered over the country far and wide, and some idea may be formed of the appearance of Roman Britain.

A British town, Caer Segont, is thought to have occupied the site of Silchester before the Romans came and built their city supposed to be the "Calleva" mentioned in the itineraries. Some, whose opinion is entitled to great consideration, deny that Silchester can be identified with either of the Callevas recorded: we are contented, however, after consideration, to go with those who do not see this difficulty. It is asserted that the usurper Constantine, at the beginning of the fifth century, was crowned here. In that same century descended upon it those Saxons who became kings of England. They took it, but if we may judge from the result of diggings up to this time, could scarcely have occupied it for any time. A tradition connects with it "the blameless King," and,—

"The Table Round
Which good King Arthur founded, years ago,
With signs and wonders, there
At Camelot, ere the coming of the Queen."
Tennyson.

But there is nothing to show in support of the story.

True or false the tales, absent or present the written account, there now lies the Roman city; and, though it lies, no man can question its truth. No fear of false scribes in the history told in brick and stone. A drain-tile, a moulding, the plan of an apartment marked by a few flints left in the soil, speak with a veracity that none can doubt. The plan of the city is an irregular figure of seven sides, surrounded by a wall of flints, with bonding courses of stone at intervals, in parts still from 18 ft. to 20 ft. in height, with a fosse all round. This shape is very peculiar, for the Roman towns were usually square. We have not examined the walls all round; our notes are the result of but a hasty visit, and we are adopting received dimensions, not confirming them. The city was crossed by two main roads, as usual, its Via Pretoria and Principalis, with four gates in the walls; and, if the indications observable on the crops at certain times of the year are correctly stated, the streets were all at right angles, notwithstanding the irregular form of the boundary. The wall is more than a mile and a half round, and encloses about 100 acres. Some years ago the ground was opened in two or three places; but recently, under the direction of the Rev. J. G. Joyce, vicar of Strathfieldsaye, and at the cost of the Duke of Wellington, the examination has been more systematically conducted, and with very interesting results. In one large excavation at the corner of two streets the plan is somewhat confused; and Mr. Joyce, in a valuable paper read last week at the Society of Antiquaries, pointed out that here are to be seen the walls of three successive buildings of different dates, or rather of enlargements and alterations of three different periods. The walls are of a rough character; those of the latest period are of flints, put together only with mud. Of cut stone work there is scarcely any visible. There are some few tiles, forming the openings and angles. Two small stone columns were found, one of good Roman character, the other much ruder, probably the work of a later date. We will not attempt to describe or appropriate the buildings; it could not be done without plans. We simply indicate a few of the more salient points. There is a hypocaust about 20 ft.

square, the conducting chambers of which radiate to a centre pillar, while circular fines are formed through the solid intervening portions, so as to bring all into communication. This, and other very interesting remnants, are protected by wooden buildings, but we understand that water rises in the hypocaust at particular seasons, so that its gradual destruction must be feared. A mosaic pavement, of somewhat rude character, was found in an apartment near. Various other pavements are to be seen in adjoining parts, mostly plain, of white and red tesserae. One includes hexagon and octagon tiles, somewhat peculiarly disposed. In many cases, as we know, the finer mosaic pavements used in Britain were brought from Italy. In Silchester such as were put down were probably made in the neighbourhood. The tools used by workers in mosaic have been found on the spot. Roofing-tiles of various kinds, many of them marked as usual by the feet of animals and birds impressed before burning, and hollow flue-tiles are seen in various places. Some of the latter are ornamented on the outside with lines formed apparently with a comb-like instrument, exactly similar to such flue-tiles found at Cirencester and elsewhere. Pieces of Samian and other pottery are preserved in a small building appropriated to the purpose; and here, too, will be seen specimens of greenish glass and pieces of plaster from the inside walls of rooms decorated with colour. A piece of glass tubing is amongst the most curious relics. The remnants here would afford sufficient text for a long essay.

Nearly in the centre of the area the lines of a large square inclosure, containing the foundations of walls, had been always observable at certain periods of the year, and had been regarded as the Forum. In July of last year the soil was removed, and the relief made certain. The inclosing walls, 3 ft. in thickness, form a parallelogram about 310 ft. one way and 275 ft. the other. Around this is an ambulatory, from 12 ft. to 15 ft. in width, and then come the foundations of various buildings and apartments, the most important of which, 60 ft. in width, is considered, and with reason, to have been a hall of justice or basilica. It has an apse for the magistrates, and the position of the hema, or tribunal, is marked out. Various apartments near it are alternately square and absidal. The walls here contain some bricks, and the work is sounder and better than in other parts. In a room adjoining the basilica the interesting discovery was made of the body of a bird in bronze, with means for its attachment, and which would seem actually to be a Roman legionary eagle.

Diggings are now going on in this inclosure, and Mr. Joyce will find his hands strengthened rather than otherwise, if we urge the men employed to examine carefully all the earth they remove. Coins are being constantly turned up, and, according to a list we saw on the ground, range from the time of Augustus Caesar (29 B.C. to A.D. 14) to that of Honorius, who died in the year 423 of the Christian era. As is the case at Cirencester, Richborough, and elsewhere, the coins of Carausius are numerous. Some of our readers may not remember that Carausius was commander of a Roman fleet, who, having incurred sentence of death by an act displeasing to the Emperors Diocletian and Maximian, sailed over to Britain, assumed the purple, and ultimately forced the emperors to acknowledge him as their colleague. He came hither about the year 257, and was killed by his minister, Allectus, A.D. 293. Stukely asserts that he was a native of St. David's. His coins were mostly minted in Britain, and, with those of Allectus, serve to illustrate its history during the ten years it was separated from the Roman empire, a period concerning which, we believe, few monumental inscriptions are extant.

The number of Roman coins that have been

found in this country is enormous and remarkable, and serves to make evident the fact, that the metallic currency was very abundant in ancient days. The difficulty of transmitting money in troubled times was very great, and it was largely concealed in the earth. Apart from this the owners must have been much less careful of their coins than we are: the sites of some Roman towns and stations were positively strewn with them. It is computed, for example, that within twenty years two collectors alone obtained from Richborough, in Kent, 2,000 specimens, though for hundreds of years previously Roman money had been found there in extraordinary profusion. The value of coins and medals to the historian, the antiquary, and the artist, can scarcely be overstated. They often serve to confirm the history of events in the most precise manner. It is scarcely fanciful to imagine old Chronon, when a bridge was commenced, or a town destroyed, shaking from his pocket on to the site an indelible date for the benefit of posterity, which handed down at the same time a portrait of the reigning sovereign.

It puzzles one to imagine at Silchester what has become of the mass of material the old city must have furnished. Where, it may be asked, too, was the burial-place? An interesting find awaits the intelligent explorer. There must be, somewhere near, a British burial-place, as well as that of the Romans.*

Within the line of walls at Silchester stands the parish church, which has some Norman columns, an Early English chancel, a recessed tomb, and an oak carved chancel screen. The structure is in a terribly bad condition, damp and ruinous, and calls loudly for repair. A new church, too, seems wanted at the west end of the parish.

Just outside the walls stands a noble amphitheatre, one of the largest found in this country. The size of the arena enclosed by the mounds, once presenting ranges of seats (*gradins*), is called 150 ft. by 120 ft., and looks to be quite as much. The entrances remain obvious. The area of the amphitheatre at Cirencester is 148 ft. by 134 ft.; that at Dorchester is 219 ft. by 138 ft. There is not any masonry visible at Silchester; but this by no means proves that the amphitheatre was not walled, and we should be glad to have it carefully examined. The amphitheatre at Richborough presented no evidence of masonry; but on digging, an external wall was found enclosing an ellipse, of which the longer diameter measured 200 ft., and the shorter 166 ft. The wall was about 3 ft. 6 in. in width, and built with flint faced with chalk.† According to Murray's "Hants," one of the best of his good Hand-books, the area at Silchester is said to have been covered with fine sand to a depth of 2 ft. or 3 ft. We know that this was the practice, and in the same way that the Ring at Astley's was often called "the saw-dust," from its covering (and the racing system is known as the turf), so this sand (*arena*, Latin) gave a name to the floor of the amphitheatre, and afterwards to all places for display.

The area is clear, but the mounds are covered with large trees, which, though they increase the beauty of the picture, will gradually, it may be feared, destroy the character of the construction. Here, however, we must break off. We have probably said enough to show that Silchester has matter to interest many,—the antiquary, the lover of art, the student of history. It is impossible to walk round its picturesque walls, to ponder over the foundations in the Forum, or look down into the arena of the amphitheatre, without a flight of thoughts; and we do not envy those who receive them in a cold or careless spirit. Truly England is very populous to those who can read the past.

* Of what the former of these might furnish we have a suggestion in the discovery of the best week in a barrow opened near Driffield, in Yorkshire. It contained the skeleton of a young Briton. The right hand grasped a fine bronze dagger, of very early type. The blade was thin, and curved-oblong in shape, the broad end having three bronze rivets, and retaining distinctly the semi-lunar outline of the end of the wooden handle. Upon the dagger was deposited a large flint knife, and beneath it a bronze awl or bodkin, a very curious implement. Before the chest and just below the chin were five very large polished jet buttons, quite 1½ in. in diameter. Behind the skeleton was a remarkably fine bronze axe, of the earliest type, evidently modelled on the plan of the old stone hatchet. The handle and sheath of the dagger had been of wood.

† See "The Antiquities of Richborough, &c." by Charles Roach Smith and F. W. Fairholt—a volume containing much interesting information on the subject. See also "Illustrations of the Remains of Roman Art in Cirencester, the Site of Ancient Corinium." By Professor Buckman and C. H. Newmarch.

THE PRINCIPLE OF SYMMETRY AND ITS DEVELOPMENT.

If it has appeared that the principles of proportion are the common endowment of both Gothic and Classic architecture, of necessity also and still more obviously must this be the case with the principles of composition.—in fact, if it were not desirable rather to concentrate than extend our field of view, we might argue that they override all the arts, and even declare themselves and are manifest in all the happiest instances of the beauty of independent nature. For composition in the largest sense is the studied disposition of diversified elements to the effect that they combine in harmonious union,—form a congruous whole. But a whole, whether natural or artificial, becomes so only in virtue of being congruous relatively to a definite and self-consistent purpose, and by the subjection to this of whatever influences approach it. All nature is crowded with examples in which the common ends of animated existence are effected through endless and seemingly spontaneous modifications of conditions of existence; but at a certain point Nature withholds her aid. Parent-like, she has set her most favoured son examples of composition in abundance; has furnished him with faculties and materials for self-help,—for art, and then has left him to face alone the nobler task which she spares the less gifted, of pursuing, though it may be through pain and labour, the completion of his proper problem.

The problem at large divides: it is with its architectural phase—itsself comprising innumerable secondary problems—that we are here concerned. The particular problems of the art, again, after every allowance for intrinsic complexity, have to be reduced in the first instance to distinctness and individuality of aim under the postulation of adequate resources: a main architectural purpose holds itself ever prepared to have regard to subsidiary, and to work under, special limitations of modes and means; but not even Nature herself deals in composition of incompatibles.

All unity in art holds ultimately, then, from unity and congruousness of the purpose; grade of dignity issues from its natural dignity, and special characteristics are inspirations,—evolutions from its ruling character.

Difficult indeed are the problems that for ever present themselves of effecting purpose under the given conditions; of reconciling subordinate with superior distribution, and separate with co-operative function; but these are fortunately as often the opportunities for the artist's triumph as the occasion of failure or despair.

Then the artistic expression of unity crowns its solid effectuation, like the "bright consummate flower," and many such a completed ideal invites the critic to leave aside abstractions and expatiate on examples. Declining, however, the more attractive analysis, let us endeavour to penetrate to the primary development of composition; evolve, if we can, its more universal characteristic; observing, if we may, an occasional illustrative application.

Excluding special purpose, therefore, for the present, we may consider architecture as concerned in common with some other arts, in the harmonious composition of,—

1. Forms,—by which word is implied solids, magnitudes of the three dimensions, such as a column or a buttress, a pinnacle or a dome.

2. Figures,—involving two dimensions only, although limiting or attached to forms; such as profiles, whether of mouldings or larger members, or the bounding outlines of the structure as a whole, or of portions of its plan, the triangle of the pediment, the rectangle of the chamber.

3. Lines,—either lines of whatever degree of complexity only not constituting figure by enclosing space; or lines of single dimension,—straight lines.

These may be considered as general terms, comprising the elements of composition as geometrical; taken thus generally, they imply nothing but the most unrestrained capacity for variation; they are, in fact, the undrilled elements of composition. In what manner and by what aids may they be reduced to some order, and marshalled and brigaded? The purpose in hand of course dictate at once the selection of certain general combinations; the magnitudes and shapes of rooms are settled within limits, though not up to a limit, and so also the general types of supports, of arrangements to span intervals, of sloping roofs and openings for light, or issue, and so forth; all open to the

utmost variety in simplicity and complexity, regularly and irregularly.

The first reducing principle is Repetition,—a marked expression of that predominance of one influence, that unity implies; identical repetition, as of windows of like size, &c., or repetition in varied scale, as of large columns of peristyle and smaller of pornaos,—piers of nave, and of aisle, &c.; thirdly, repetition of the same type but in varied proportions; an oblong chamber being succeeded by a square, a Gothic window broad and low being repeated, but made narrower and high,—the vault of nave modified in that of aisle, and so forth. The repetition of one type is the emphatic exclusion of others as irrelevant, and the tenacity with which it asserts itself even under enforced change of scale and proportion reinforces the emphasis.

But here, again, whether change of scale or of absolute proportions be resorted to, regularity varied tends to random variety, and variety to diffuse itself to infinity; the necessities of cases will not give strictly determining hints for adopting one dimension rather than another; and option must either resign to chance, or, what argues as little self-respect, merely follow with steadiness a norm adopted irrationally; the better course remains to seek out a rational norm. In either of the cases supposed the question is one of difference of Proportion, and can only be rationally decided by a proof of the propriety of one difference rather than another; at least of a presumption for certain absolute exclusions. Where convenience does not dictate absolutely, more general effect has claim, and ever under allegiance to the law of pertinence and connexion in composition, is influenced chiefly by regard to smoothness of gradation and liveliness of antithesis, vivacity of contrast. It is clear, therefore, that it behoves us to set the series of proportions in order, and to master, if we may, the principle on which sequences, in gradation but not overcrowded, in contrast but not harshly so, may be taken from the general crowd, and relied on in a given case as an effective scale.

When this shall have been done it will appear that the regulative value that applies to repetition of a form, figure, or line, will apply also to repetition of a given proportion; the same degree of difference may be repeated and insisted on over and over again, no less than actualities or identical forms; and again, as the variation of repeated form by a change of proportion has its advantage, so also the retention of a proportion, but with varied application, will also help the expression of unity. Thus it is that in Gothic structures the proportions of the plan are occasionally applied to the elevation of a bay; the height of Cologne Cathedral measures its length, and so in the Parthenon the proportion of the stylobate re-appears in the front elevation of the order, as well as in many another versiform presentation.

Simple repetition—apart from these more reconduce, but, in fact, more artistic refinements—has had its value allowed in architecture in all ages, in all countries. It is a main instrument in that expression of solidity and repose which is so essential in an art of which the primary responsibility is equilibrium, that scarcely ever loses a reminiscence of dignity, and has so constantly aspired to and attained the majestic. The unrivalled magnitudes relatively to man with which the art deals, seem to impose this law upon themselves that they may not oppress and baffle and confuse the senses. By emphatic regularity again, architecture asserts itself as against the fluctuating and irregular forms of the nature with which it comes into comparison, and places itself resolutely in contrast, not to say in rivalry. The festalation of a northern cathedral, or of a southern palace, admits the principle equally; it reigns as decidedly in the peristyle and the carved mouldings of a Greek temple as in the nave bays and string-courses of Westminster Abbey.

The essential, the indispensable complement of repetition is Symmetry; repetition vindicates its own propriety in commencement, but suggests none for its conclusion. The ancient who defined as the requisites of a tragic composition that it should have a beginning, a middle, and an end, may well be recognized as champion of that indispensable unity that is the living soul of all compositions.

Symmetry is the contrary opposition of equals and similars; thus, a Gothic doorway is symmetrical, because, if a vertical line or plane be passed through the apex of the arch, each half will have corresponding points equidistant from

identical points on the vertical; the two sides are exactly alike, with the difference that they face different ways. Thus the successive crockets on a pinnacle are similar, but not symmetrical; as compared with each other they form a case of repetition,—only as compared with opposite crockets, each with each, do they become symmetrical. Symmetry, therefore, gives us a centre, and in this a decided limit, a term that is unavoidable, not that, like a suspended repetition, may be optional.

No form that does not admit of exact bisection as defined, is properly symmetrical; thus the line of beauty of Hogarth—the spiral of double curvature—is as little a symmetrical figure as a single Ionic volute. Nay, it is only a fictitious symmetry that can be admitted in such a figure as the so-called Catherine-wheel, with spokes curved. In itself it is inconclusive, and requires to be opposed by another with spokes of contrasting curves. It is impossible not to recognise a certain restlessness of effect in those Gothic rose windows, which, regular as they are, are still as wholes unsymmetrical; it is the same effect that results from running a Greek wave border conspicuously round a circular cornice, and that is little helped by a single opposition in the direction of the waves at a motiveless and otherwise unaccentuated point. The manner in which the difficulty was corrected by interruptions and filled squares in the Greek fret will be familiar to all.

The Greek honeysuckle pattern is an example of the beauty evolved by the symmetrical disposition of unsymmetrical forms; a vertical line divides it into corresponding halves, each of which exhibits repetition of regular but unsymmetrical petals, varied successively by gradually proportioned curvature and contour. The intermediate ornament divides in like manner with petals of contrasting form.

Repetitions and contrasts, and repetitions of contrasts, are thus the elements of symmetry in the first instance, though afterwards symmetrical combinations may themselves be combined into larger symmetries. In the profile of the Attic base the scotia is similar, but contrasted,—the seeming contradiction is none,—to the torus; and the contrast is repeated with new modification between the upper torus and apophyge. By the circularity of the base the entire profile on one side reappears in true symmetry on the other. Here again in the charm observable in varied dimension of upper and lower torus we are referred to proportion, and to proportion on a principle to minister suggestions for ordering the variable dimensions,—variable inexhaustibly, for the ultimate arbitration of taste and genius, doubtless, but without need of resorting to random or caprice. In the Romanesque churches about the Rhine, at Cologne, at Bonn, may be seen charming applications of this type of the Attic base,—a duplication itself, duplicated in varied proportions on pier and pier base; and Gothic architecture traced through its developments brings us to the same motive over and over again.

The temptation of the subject must be resisted; but let it be enough to remark, or to remind, how the Attic base was reversed to form the Early English capital; was extended into base moulding, string course; was turned round archivolts; and by duplication, triplication, and altered proportions of contrasting rolls and sinkings, grew into those most artistic combinations—the fully moulded arch-openings of nave arch and doorways, and sedilia. But this is leading away.

Systems which, like many rose-windows, are susceptible of equally symmetrical division by several or numerous lines, have still not the last quality of decisive conclusiveness, and are too apt to suggest revolution on a fixed point, rather than permanence upon a fixed line.

Symmetries, again, which are little more than a juxtaposed pair of symmetries, have lack of emphasis. Nature gives us an example in the compound leaves with graduated fronds on each side of the stipe, but none at the end. In a Gothic doorway, a double-pointed door opening is only saved by the more important including arch; on the other hand, the omission of this may be as useful when the proper aim is to secure subordination; but only when the point is attained of a general bisection which is without a fellow or an alternative and of which the halves are not resolvable into parts all symmetrical independently, does symmetry effect the full service which it can render to expressive unity.

The importance of the central bisected member

in relative magnitude, is by parity of consequence very conducive to the expression of concluding and comprehensive unity; and this is the expressive value of the Greek pediment, which an ancient said could not be spared even in the dwellings of the gods in Olympus, though there was no rain to be thrown off; and of the type of roof shield surmounting the large arch of a Gothic porch.

Infinite schemes may be devised for distributing predominance variously between centre and wings, and subdivisions of wings, and again we are referred to our studies of rational proportion.

In looking at the façades of Cologne Cathedral, as it will appear when completed, it is difficult to believe that the pinched-up west window, gable, and door will ever be able to assert the required central predominance over the pair of spires and their towers,—it has of late become far easier to be sanguine of German political unity. For the furtherance of unity, moreover, it is requisite that the lateral divisions should not be each in itself absolutely or even proximately symmetrical, and to this danger, again, the towers of Cologne are far too indifferent. Even here, however, in the combination and subordination of symmetries, is a field in which Genius has ever delighted to exercise itself; and prolific invention has followed up novelty with novelty, while theory follows after, like grammar dogging the heels of orator or critic, or straining his sight to follow the mazy transitions of a Greek lyric poet. Theory, nevertheless, will not desist, and, indeed, it should not; and it is not the accomplished artist who will condemn the grammar of his art,—the garut of his harmonies, however inspiration may enable him to lead where they can only, sometimes can hardly, follow.

Collect or imagine whatever variety of *schemata* of composition the theorist may, the true artist will always surprise and shoot beyond him, and yet may be usefully warn the advancing, nay, may even do good service in stimulating to a rejoinder, otherwise unbought on, from one who is already on before. Be it enough, then, to remark how composition leans to repetition on the one hand and symmetry on the other, attempts them in every variety and proportion with each other, and with the chastened enlivenment of unsymmetrical regularity; and so conquers an expression of self-contained and self-sufficing unity, without forfeiting an intimation of internal variety, and a constitution, if aloof, not alien from the wilder diversities of the outer world.

The contrast which makes the character of an individual form glide, therefore, most easily into repetition, whether simple or of proportional gradations, and repetition into symmetry; and perfected symmetry brings us at once to the gates of that contrast which seems to be the opposite, but in fact is but the culminating point of gradation. This is the scale with which each artist in his proper art has to make himself familiar, and over exercises himself in passing up and down it with ease and certainty, whether he would avail himself of its subtle modulations, or dare boldly a wide transition.

The neglect and disturbance of subordinate symmetry, so long as it remains secure and thoroughly established in the main, often induces a certain grace of contrast in antithesis, and emancipating design from interference with trifles, leaves the grand governing principle of order unobliterated and unimpaired. The licence, however, under which these graces most liberally accrue are the more special appanage of sculptor and painter. In statuary the Apollo Belvedere is as distinctly symmetrical to our senses, albeit his limbs are in varied action, as the Egyptian statue, with its feet close together and arms hanging straight down on either side. Here symmetry, in a freer sense,—correlative if not parallel distribution, still remains in respect of kind and form and quantity of parts, and dominates their modifications in relative position. It also remains in the important respect of apparent balance of weight, and even of equality of plane visible surface. Symmetry, then, and antithesis constitute jointly the natural expression, as in nature they are the prevailing consequences, of the law that action and reaction are at once equal and contrary. They are equally and conjointly at once a declaration of difference and of equivalence. One side of the body may as truly be said to be antithetical to the other, as symmetry with it; and balance is not disturbed, but in truth established by contrast, when contrast is regulated by the norm of equi-

valence. Symmetry thus interpreted has a larger sense than correspondence of dimension. It is applicable, and its correlative antithesis no less, to correspondence of force of whatever kind,—of value, of power. A painter works under observation of this higher symmetry when he effects a balance of lights and shades, of warm and cold colours, of interest and expression, as much as when he is careful to set mass against mass, and to relieve a prevailing inclination of lines by giving emphasis to others of counter inclination.

As regards the dignified composition of numerous figures, which has more analogy to architecture, we might pursue the analysis by tracing the gradual development of the formal and strict into the equally effective but freest symmetry, in Italian painting; thus in the subject of the Last Supper we have repeatedly the central Saviour with six apostles formally on either side. In the painting of Leonardo,—the Cenacolo by pre-eminence,—this arrangement remains, but the two sets are in most varied action individually, while still dividing into equivalent sub-groups that are recognizably antithetical.

But we have as striking examples in architectural sculpture; in the pediments of the Æginetan temple a central figure is supported by a double series, figure for figure to right and left,—ever equivalents, and in many cases, as in the angles, almost absolutely antithetical. In the grand composition in the western front of the Parthenon we see the contending pair of deities in the centre supported on either side by attendants and spectators, who again answer to each other figure for figure, group for group, with as absolute an expression of balance as at Ægina,—but with how much more developed a faculty for reconciling variations with general equivalence!

To architecture, however, by its nature, is conceded much less liberty of substituting the effective for the formal antithesis; this art is bound by the terms of its original charter to give leading value to the expression of permanence, of solidity. Hence the freest variations that can be associated with it must declare themselves rather as adjuncts than as elements; if the capitals of Gothic piers are all varied in fanciful sculpture the variations will be scarcely acceptable unless subordinated to some prominent uniform features and outlines. When such condition is observed the relief of sculpture is inestimable, and this precisely because architecture proper lies exactly here under a disability; the varied outlines of living forms and flexible draperies are all but absolutely required to mitigate the severity of even the most ornate but still pure architecture, to our feelings; but even so the law of symmetrical antithesis applies,—an antithesis which is not a random jumble of the disconnected, but a pertinent rejoinder,—no irrelevant protest, but a qualification that is perfectly to the point. The very sculpture that reflects upon the rigid architecture the flowing lines of living or agitated nature still admits the genius of the art it is for the time dependent on, and whether under Gothic canopy or Classic pediment, whether in niche or in metope, attempts its freedom with more of the formality of symmetrism than when it is fairly on its own independent domain and at liberty, and bound indeed to attain the liminary law to its very highest tension.

The greatest triumph of the antithetical equivalence of groups in modern art is in Raffaele's school of Athens,—in ancient, the Contest of Neptune and Minerva in the pediment of the Parthenon. Comparison of these will be found to illustrate admirably how of two artists, each at the summit of his art, one admitted exactly that degree of formality into his scheme of composition that enabled him to harmonize sculpture with architecture; and how the other, by availing himself of an exactly symmetrical architectural background, reduced to accentuated steadiness a combination of groups in which freedom of differentiation is played with daringly to the uttermost verge of proper composition.

THE NATIONAL PORTRAIT EXHIBITION.—The charming collection at South Kensington has failed up to the present time, strange to say, in attracting public attention. The total number of visitors last week was 1,732, and on more than one occasion we have found the galleries with fewer visitors in them than there are attendants. This is very much to be regretted.

ARCHITECTURAL-ARTS COURT, PARIS EXHIBITION.*

AMONG the many stone-carvers in England who profess to be foremost, or at any rate forward, in the modern revival of Medieval art-work, we find but one name, that of Mr. Forsyth; and on the Classic side none! What can have become of their love of art, their desire to make a name, or their readiness to court popularity, or at least publicity, which prompted them on former occasions to put forth their strength, and show what they could do? We must suppose them all fully occupied, or impressed with the fear of damage accruing to their fragile productions; for we cannot think they are so apathetic as to art, so careless as to business, or so afraid of the odds against them, as to decline the race on such grounds alone.

However, to Mr. Forsyth belongs the praise, as well as the courage, for running alone. To his executed works he adds models and photographs of those proposed or already completed. His works are so well understood by our readers, that we simply mention that his exhibits include a font and cover for church at Dudley; two fountains, represented by models (one designed by Mr. Nesfield), for the Earl of Dudley; reredos for St. Outbert's Church, at Wells; and a beautiful head of the Virgin in marble, inclosed in a vesica. The latter is altogether of a moral ideal character than usual, and deserves to be pointed out.

We ought, perhaps, to add to the list Mr. Seymour, of Taunton, who has four stone capitals, copied chiefly from Wells Cathedral, including the celebrated tooth-ache head, all pretty faithful reproductions, but showing of course little of the power of design which such careful studies ought to, and perhaps have produced in this artist. Mr. Baylis, amongst the wood-carvers, has made himself a name of late years, but is represented only by a small clock-case, of architectural character, suitable for an Elizabethan mansion; and Mr. Kendall, of Warwick, shows by his birds and fruits that he can carve, though not making any claim to the speciality of architectural work.

In the catalogue we notice a list of prize works, in stone and wood carving, modelling in clay, marble mosaic and enameled, both transparent and opaque; but although we understand these were committed to the charge of the South Kensington authorities for transmission to Paris many months ago, we do not notice them placed in the court. This is particularly unfortunate for the subscribers to the Architectural Museum, who generously contributed for the prizes; who earnestly and disinterestedly endeavour to foster and encourage those arts which are "cognate to architecture," and who from the first gave up their individuality, and merged their claim for space in the general demand by the Paris Architectural Committee. Doubtless, however, the absence can be explained.

So much has been said as to Messrs. Maw & Co.'s, and Messrs. Minton, Hollins, & Co.'s tiles, that we may spare ourselves the task of analysing their special exhibits on this occasion, merely remarking *en passant*, that the former are at especial pains to explain and illustrate the actual manufacture, by specimens of the clays and other ingredients composing the tiles, while the latter firm show their peculiarly fine majolica tiles, and subdued though richly-colored stamped tiles for wall-decoration. We must not omit to mention, rather for the sake of the manufacture than because of the special success of the example, a picture (by Messrs. Maw & Co.) in mosaic, representing "Spring," an infant plucking a flower, intended to form but one small compartment in a pavement, though itself composed of more than 10,000 pieces; in fact, this number is required for one square foot of such work. The cost, however, makes it unfit for pavement, and more suitable for wall-decoration at some little height from the eye, and in a position where any similar painted work would be liable to destruction and decay.

Nothing, however, for ecclesiastical purposes can come nearer in design and colour to ancient tile work than that by Godwin of Lugwardine, in Herefordshire, but the manufacture is limited, if we may judge by the small quantity exhibited; and, we may add, they seem very poorly laid for exhibition specimens. The Poole Pottery Company do not seem to show any novelties, and some of their works are not so well and carefully executed as usual. This is to be regretted. We cannot refrain from adding our

surprise that the present great demand for tiling should not have called forward other manufacturers, or, at least, that some specially fresh designs should not have testified to the desire of well-established names to show the inexhaustible vitality of their art, as well as the goodness of their manufacture. At present all seem to be resting on their oars; perhaps engaged in gathering in the profits of their well-earned reputation. At the same time, we would observe, it is not so that their reputation was made—not so that they can keep up with the ever-increasing demand for artistic work. One notable example occurs to us of a firm, trading on their reputation and inundating the country with mediocre copies of former first-rate designs, till one begins to nansate even the old specimens, or, at least, become indifferent to them. So may it be, if, indeed, it is not so already, with many patterns at one time taken to be far in advance, but now greatly behind, the age—though still shown in an International Exhibition.

Of the decorative works, or, rather, works of decorations, as exhibited in this court, we are not able to speak with great favour except in a few instances; indeed, we think it would have been well for Messrs. Cox & Co., for instance, not to have exhibited at all, if they had nothing to send but "an oak *prie-dieu*," or "an oak chair." Really, such specimens of woodwork should be confined to the shop where they were made rather than be taken out for the purpose of exhibition anywhere, more particularly in Paris.

However much better may be the design of the wooden lectern, it is without any finish or surfacing, while a stone and marble font has a very close resemblance to the photograph of a similar work executed by Forsyth, and which is hung within a yard of it, as if to challenge comparison. The brass work, too, is not what we might expect, and we find a fac-simile of a monumental brass—a mere painted board,—as if it were too much to send a real engraved brass. We hardly think, either, Messrs. Harland & Fisher can be satisfied with their cabinets,—one painted—one inlaid,—when they look at similar French work in the Exhibition; but we note they exhibit also a panel in marble mosaic. One small piece of ecclesiastical embroidery is shown by Frank Smith & Co.; but a large altar-cloth (designed, we believe, by Mr. Street) is exhibited by Messrs. Jones & Willis, who also supply patterns of carpets and hangings for the decorations of the doorways of the court, but no objects of plate, or furniture, or altar-fittings, for which they are celebrated, except the above. We are disappointed to find also lost one article exhibited illustrative of the work carried on by Messrs. Heaton, Butler, & Bayne as decorators and decorative furniture makers; but this is designed specially by Mr. Charles L. Eastlake, and in accordance with certain principles. The success, however, of every effort so begun, is not always so great as to warrant unqualified praise; and, in this cabinet or book-case, our satisfaction arises chiefly from the negative qualities of the work, and not from its execution being equal to any very high aim.

It is a puzzle to us, however, how this exhibit came to be described as architectural-decoration, and placed in Class XV., Group III., while a similar cabinet by another artist is in the adjoining class; perhaps it was on account of the exhibition, also by the same firm, of one of the panels of the reredos in the Lady Chapel of Chester Cathedral.

Messrs. Jesso Rust & Co.'s mosaic work and materials we have previously referred to, and we may close our notice with a repetition of our remark as to the architectural court, that as a whole we feel disappointed with the result of so much labour and trouble,—perhaps we may add, expense,—and while fully appreciating the disinterested efforts of the committee, we are glad to know that most of the works carried out every day under architectural superintendence (without exhibition) are superior to what are seen in this court. Foreigners, judging us without further knowledge than can be obtained here, will have a far lower opinion of art-workmanship in England than is deserved. At the same time, we believe great good will result from the grouping together of artistic objects connected with each other by ties of architectural affinity; and at any rate our architects have shown themselves capable of united action, and ready to enter the lists against all comers in the arts of design, not only on their own special ground, but in respect of everything connected with the arts cognate to architecture.

BETTER TIMES FOR RAILWAY SHAREHOLDERS.

THERE are few of us to whom it has not occurred to watch with impatience the clearing of the heavens after a violent and long-continued storm. In mountain districts, and from positions which command a wide horizon, the coming gleam of sunshine may be traced in its approach while the sky is yet black overhead, and the rain beats heavily around us. One by one, peak, and glade, and tree, shake themselves free of the gloom in which we are involved, and seem to laugh in the sunshine. And when at last the ragged edge of the storm clouds has reached the zenith, when the sky is all clear to windward and all black and murky to the lea, who has not been fain to attribute especial malignity to the last floating islands of Indian ink—to think the last drops of the shower the heaviest that have fallen, or even to wonder at the continued fall of water from invisible clouds? A few seconds more, and the storm has passed, leaving traces of its anger only in the foaming force, or in the fresh verdure of the landscape.

It is not often safe to say what a week or what a day may bring forth in the wider horizon of the social heavens. Yet men who have long shaken their heads when fine weather was predicted, now announce a steady, if not a rapid, rise of the political and financial barometer, and are even heard to associate a change to fair weather with the arrival of the anniversary of the fatal Eleventh of May. We have had black cloud to the very last, and the threatening gloom of the shadow cast by the fortress that was once the stronghold of the subtle Count de St. Pol, seemed to the last moment ominous of recourse to the bayonet. For the first time for many years the firm, modest, and successful activity of an English Minister for Foreign Affairs has met with the general gratitude of Europe. The cannon is not, as was feared, to be directed against the crystal roofs of the world's fair. Politicians at home have found the causes of party-warfare to vanish as rapidly as have disappeared those of international strife, and the word "public confidence" is pronounced without a grimace.

Some of the last drops in our own metropolis have fallen from a quarter from which has emanated no small portion of the gloom of the past year. Panic is one thing, the cause of panic is another, and so long as the latter is a *vera causa* it is but poor wisdom to rejoice in the removal of alarm. But in the instance to which we are referring the right persons are at last appearing on the scene. In industrial, as well as in political, questions, men are beginning to refuse to be sacrificed any longer for the emolument, for the ambition, or for the point of honour, of their leaders. The shareholders of the Brighton Railway seem at last to have arrived at the common sense conclusion that their property, such as it is, is their own, and that it will become rapidly converted from a positive to a negative value if they allow other people to manage it for them. To phrase to catch a Targem is as familiar as it is expressive. But our language wants a phrase to denote that course of action which "defenda" a fine property by doubling its capital expenditure with the result of increasing its income by some 20 per cent. That is about the result of the "defensive" measures carried out by the Brighton Board. What a war policy has cost to its competitors we shall probably know by and by; but the Brighton figures alone give us the impression that at least some six millions of the last eight expended by the direction have been little better than wasted. If we add South-Eastern expenditure, and South-Western expenditure, and, awful tale! London, Chatham, and Dover expenditure, how goodly a pile of shareholders' gold has been swept off by the rake of the cropper. And this is not all. It is not even the worst. It is bad enough for the shareholders to have acted so long the part of powder-monkeys, but we must own it has been their own fault. Had they stopped the supplies of ammunition the war would have gone out of itself. But the public have been sufferers by the Brighton and South-Eastern war to a greater extent than the shareholders. And it is very much to be feared that the public will be permanently injured by the results of the strife. We have repeatedly called attention to that sturdily disorganised system of rails and platforms that delays the traveller south-east of London Bridge. So purposely has each branch, each junction, each crossing, been mapped out for offensive pur-

*See p. 286, &c., ante.

poses, that it is only by the most careful and most energetic application of the skill of the engineer that any very great amount of public advantage can be derived from the amalgamation of the working arrangements of these long-contending companies. London Bridge Station has long been a burden and a disgrace to the commerce of London that has attracted the wonder and the scorn of those who were familiar with travelling, but not familiar with travelling over Brighton and South Eastern points of junction. A wise and free reconstruction can alone permit of anything like the quiet punctuality that now characterises the Victoria Station being attained at London Bridge. The saving to the contending companies, by the mere abandonment of duplicate trains and similar measures of offence, has been estimated by competent authority at 150,000*l.* per annum, a comfortable crumb for original shareholders. We hardly think we should be up to the mark in estimating the time lost to the City of London by the bad arrangements of the lines concentrating at London Bridge at 50,000*l.* per diem—an amount not lost out of pocket—but of business not done—time consumed in losing temper at junctions and stations, instead of being devoted to the pen and the ledger—to the correspondence of the merchant and the appointments of the purchaser or the seller. We do trust that in the wholesome reaction now setting in, the public may not be lost sight of. For the interest of the shareholders to be made the first object, rather than the success of the policy of the Board, will be in itself a reform of the most gratifying character, and as in all such cases the real interest of the public is that also of the railway company,—the true convenience of the customer is the best wisdom of the carrier,—we may hope before May 1868 to get from Forest-hill to Charing Cross, at least, in as short a time as from London to Slough.

In peaceful leagues, of some nature, lies the first hope of an improved future for railways. It is too late to *unspend* the money wasted in duplicate lines. But the mere economizing of the wages and stores consumed in running duplicate trains, would make no inconsiderable figure in the half-year's balance-sheets. To the public it can make no manner of difference whether the train that stops at Croydon, or at New Cross, belongs to the Brighton or to the Dover Company. But it may make a great difference to the passenger provided with a ticket for the carriages of the one, if he is refused a seat in the train that suits his hour, because it happens to belong to the other. It is indispensable that in the ticket system, as well as in the timing of the trains, there should be a single and comprehensive service; and, above all things, it is needful that the best measures should be taken for separating the long and the short traffic, so that each may travel at its own speed to its own platform, without fear of interference with the other; and that the quiet spin of the City merchant from his villa at Sydenham should not be arrested for some odd ten minutes to allow of the passage of the French mail or the tidal train.

That the railways of each great district of the country must, sooner or later, amalgamate, we have for a long time expressed our belief. That a larger and a more intimate union will follow we think more than likely. But the first thing to be done is to stop the gap through which that which otherwise would be divided is running to waste; to prevent quarrels—to prevent rival works—to prevent rival hills; and this first step can only be taken, will only be taken, by the shareholders themselves. With the utmost forbearance for those gentlemen who have fulfilled the functions of directors in stormy times, we counsel all shareholders to avoid entrusting them with their proxies. Let them attend their own meetings, and vote on their own judgment. So alone can they hope to rescue their property from destruction. We recently took occasion to show that if an arrangement were made, which readily could be made, for paying a 4 per cent. interest on a consolidated debenture stock, and for relieving the lines from the burdens of renewal and of financing, there would remain, even without increase of traffic, or reduction of working charges, 6 per cent. on the gross preference capital, and 3 per cent. on the gross original capital of railway enterprise in this country. Attention to railway property, then, is not throwing good money after bad, or wasting valuable time in a hopeless quest. The property is sound at this moment, in spite of cruel waste and mismanagement, and

the mere reduction of working expenses that will arise from the fact of neighbouring lines working in unison instead of in opposition, would be immediately evinced by a rise of dividend. With hostilities at an end, the natural development of railway traffic by light branches would follow, as a matter of course. That this subject should have received earlier and more serious attention abroad than at home, is exclusively owing to the rivalry and the quarrels of competing Boards. What would the six millions wasted by the Brighton Company have done for the Southern and Eastern traffic, if laid out in the prudent construction of light branches? Not a village in the district but might have been put in organic connexion with the metropolis. Six millions would have paid for the construction of a thousand miles of branch lines, and left a very handsome profit for somebody into the bargain.

This is not matter of estimate. If in this, the cradle of the railway system, we have been content to deal with the light traffic of 1845, other people have been more provident. Norway is an instance. There the railway system, with one exception, is on the light principle, and on a 3-ft. 6-in. gauge. The line from Grundset to Hammar, a distance of 24 English miles through an easy undulating country, has cost, including rolling stock and stations, 3,000*l.* per mile. That from Thronthjem to Støren, through 30 miles of difficult country, with a viaduct 620 ft. long and 110 ft. high, eleven other large bridges, two terminal and six intermediate stations, workshops and engine sheds, locomotives, and rolling-stock, has cost 6,000*l.* per mile. From a northern latitude we may turn to a tropical climate. The railway from the Arcorum junction of the Madras Railway to the town of Conjevaram, 19 miles long, cost 3,900*l.* per mile, including telegraphs, stations, and rolling-stock. The same principle is now being applied to the Government railways of the colony of Queensland, about 50 miles of which are open for traffic. The works on certain sections of these lines are unusually heavy, with rock-cuttings and tunnels, one of which is 27 chains long, and with twenty iron bridges of spans from 60 ft. to 100 ft. in width.

It is expected that these lines will be constructed under the most difficult circumstances for between 11,000*l.* and 12,000*l.* per mile, and under ordinary circumstances for 6,000*l.* per mile, although the rates of labour ruling in the colony are from 6*s.* to 7*s.* per day for an unskilled labourer, and from 10*s.* to 12*s.* per day for a skilled workman. We refer our readers for further particulars to Mr. C. Douglas Fox's paper on Light Railways, which was read to the Institution of Civil Engineers on the 27th of November last.

If the long,—the unprecedentedly long,—period of gloom which has, we would fain hope, come to a conclusion, has had the result of leading the owners of railway property to look their position in the face,—to prohibit litigation and rivalry, to economise working expenses, and to provide completely and inexpensively for the future traffic of the entire country, we may have gained from a long period of suffering and of struggle something worthy of the cost.

DUNKIRK.

SOME time in the seventh century (so goes the legend) two small hamlets were established upon the summit of two neighboring hills or *dunes* on the north-west coast of Gaul, looking out upon the north sea. One of these hamlets put itself under the protection of Saint Eloi, the apostle of the country—the great Saint Eloi, the guide, philosopher, and friend of King Dagobert, whose good deeds are commemorated in the popular ballad,—

“Le bon Roi Dagobert fassit peu sa berche an hiver;
Le grand Saint Eloi lui dit, “O mon Roi
Il faut du savon pour votre menton.”
“C'est vrai, lui dit le Roi; “as-tu deux sous ?”—pré-
tes moi.”

The other took as patron Saint Gilles, or Saint Giles. In the course of time, a third village sprang up more to the east, which some two or three hundred years since changed its primitive name of Pierperks to the more musical name of Roosendael (the valley of roses), which it still retains, and is now a suburb of Dunkirk. About the middle of the tenth century, St. Gilles was enclosed with walls, and was called Dunkerque (l'Église des Dunes, or sandhills). Saint Eloi

became a suburb of the new town but was not incorporated with it until the reign of Louis XVI., some two hundred years ago.

Dunkirk was first fortified by Count Baldwin III. of Flanders, about A.D. 960. In the twelfth century Philip of Alsace equipped a fleet from hence for the Holy Land. After the death of Philip, Dunkirk passed by inheritance into the hands of the Counts of Hainault, who sold it to its former owners in 1280. The town was occupied by Philip the Fair from 1299 to 1305, and sacked in 1325, and again in 1357, in an insurrection by the Flemings against their count. It was again besieged by the French in 1488, but unsuccessfully. In 1558 the French Marshal de Termes was more successful, and having given the town up to pillage, his soldiers committed great cruelties upon the inhabitants. The battle of Gravelines, in which the Flemings, under Egmont, were victorious, afforded an opportunity for a terrible retaliation on the French prisoners. The town for the next century was occupied alternately by the Spaniards and French, neither retaining it for any length of time. In 1658 was fought the decisive battle of Dunes, in which the Spaniards, under Condé, were totally defeated by the allied armies of France and England, under Turenne. In pursuance of the agreement with Cromwell, who had furnished 10,000 men to Louis XIV., on condition of receiving the first place captured by the allies, Dunkirk was taken possession of by the English, by whom it was fortified. Charles II., with his usual indifference, sold it to the French, in 1662, for 5,000,000 livres (500,000*l.*). The town was then fortified on a grand scale, under the direction of Vanhan; the harbour was deepened, and Dunkirk rapidly became a place of importance. When the war between England and France broke out, the privateers from Dunkirk, under the command of the celebrated Jean Bart and the Chevalier Forbin, inflicted very serious injury upon British and Dutch commerce. In ten years, from 1688 to 1697, the property captured or destroyed by them amounted to nearly two millions and a quarter sterling. By the Treaty of Utrecht it was stipulated by the allies that the fortifications of Dunkirk should be destroyed, and the harbour filled up. This stipulation was partly carried out; but the French endeavoured to evade the conditions of the treaty by forming a harbour at Mardick, and enlarging the canal which connects Mardick with Dunkirk. The English Government protested against the evasion, and the restriction was renewed by the Treaty of Paris, in 1763. It was found impracticable to insist upon the entire destruction of the defences of Dunkirk, and that portion of the treaty was repealed in 1783. The works were subsequently largely increased, and at the present time very considerable improvements in the harbour and defences of the town are contemplated.

The position of Dunkirk and its neighbourhood, many portions of which are below the level of the sea, have given rise to very extensive systems of drainage. In the time of the Romans this part of the coast was almost entirely covered by an arm of the sea which reached as far into the interior as St. Omer. In the seventh century dykes were constructed around the islands in this gulf, and the sea was gradually driven backwards. The country is now protected by tall mounds of earthwork and by a very elaborate system of sluices against the encroachments of the sea. The land thus recovered and rendered available for agriculture is about 100,000 acres.

The communication between France and Belgium is at present very imperfect, but when the railway from Dunkirk to Furnes is completed it will afford ready access to all the principal Belgian towns.

The cathedral at the angle of the Rue de l'Église and the Place Jesu Bart, founded in 1440 and rebuilt about the middle of the sixteenth century, is rather a fine building, mutilated as it is by a portion of the nave at the west end having been demolished in the year 1783 for the purpose of making a new street. The brick belfry was then disengaged from the church, from which it is now separated by the width of the street, and a Corinthian façade was tacked on to the Gothic body of the building. The base mouldings to the nave columns and the mouldings to the arches, which die into the piers, are worth noticing. The chapels at the east end are very picturesquely planned, and the modern stained glass windows, although rather unequal in merit, are about the general level of such things in this country. A tablet near the door

of the society professes to indicate the last resting-place of Jean Bart, who died at Dunkirk, his native place, in 1702; but his body was buried under the high-altar with great pomp, and the stone has probably been removed from another part of the church. Bart's second wife and his heroic son, François Cornil Bart, are also buried here. The other churches of Dunkirk are not in any way remarkable except for their ugliness and the number of *ex-votos* exhibited at some of the altars.

The theatre, in what was formerly the Place Jean Bart, is a pretensions-looking building, erected some twenty years ago. The plan is a parallelogram, with a rounded end, and an open porch next the Place. The semicircular end, formed by the arrangement of the boxes, is carried up to the roof, and has a very agreeable effect.

The interior is being entirely reconstructed, and will have new boxes, new ceiling, new floors, and will be entirely re-decorated. The opening of the proscenium is about 35 ft., and the depth of the auditorium, from front to back, about 50 ft.

The Palais de Justice, on the Place Napoléon, is a handsome edifice of two orders, with a large central hall, inaugurated, as a tablet in the interior informs us, in April, 1864: M. Develle, of Dunkirk, architect. The grand hall and staircase are constructed throughout of stone, the lower story has low segmental arches resting on square piers, and the upper floor, a handsome Ionic order, with very well designed detached columns and small Corinthian pilasters over, with enriched panels between. The decorations of the courts and the details generally are very carefully studied, and satisfactory in effect.

A new church is in course of construction, in the Rue de Paris, Basse Ville, on the Quai Saint Martin, and will very shortly be completed, the roof being covered in, and the walls ready for plastering. The style is Romanesque, and the materials are red brick with stone dressings, and the plain faces on the inside being plastered. The church consists of a nave, 28 ft. wide, divided into five bays, side aisles 12 ft. wide, with a chapel in each bay, and semicircular apse, covered with a semidome at the east end. The bays of the aisles are covered with plaster domes, coloured and jointed to imitate stone, which has a very unpleasant effect. The nave has semicircular arches springing from round shafts, with enriched capitals, triforium with triple lights and lofty clerestory. The roof is not yet commenced, but will be vaulted in plaster, the vaulting shafts coming down on to the caps of the nave columns. Those portions of the plastering which have been finished are tinted in warm ochre, with the joints picked out in white. In the exterior the western end has two square towers, finished with slated spires, a plain entrance doorway, with wheel window over, filled in with plate tracery. The works are being carried out by M. Develle, the town architect, who appears to have most of the practice in Dunkirk.

In the Rue de l'Église, near the cathedral, some houses which are in course of rebuilding have been set back in order to widen the street. The Museum, founded in 1838, and occupying the upper part of the Bourse, contains the usual medley of curiosities to be found in most provincial museums. Indian figures, snuff-boxes made out of remarkable trees, second-hand Napoleon relics, casts of the hands of English heroes, hatteries, and beetles,—these form some of the attractions to be enumerated. The principal element is of course very strong, and considerable capital is made of Dunkirk celebrities who, for the most part, are very little known out of their native town. Some of the portraits, however, are interesting; among others that of the Admiral Coelaert, a native of the town, where he was born in 1584, according to the catalogue, dated "1630, *atatis suæ* 50," which would make the year of his birth 1580. He is a fine burly fellow, with his hand on his sword, and, with his second wife, Jeanne Piereus, whose portrait is also here, form a very remarkable pair. Another portrait of a man in a Spanish dress, dated 1646 (No. 50), and portraits of Alexander Leys, syndic of the Corporation of Butchers in 16—, by Jean de Reyn, a Dunkerquois, the painter of Admiral Coelaert, mentioned above, deserve particular notice, the last two being very remarkable for their spirit and accurate costume. A charming Rubens, 2 ft. 4 in. by 1 ft. 10 in., the Marriage of the Virgin, the Virgin a portrait of his second wife, Helena Forman, a head attributed to Spagnoletto, a very fine portrait of Luther, extremely expressive (62),

by Holbein, and a study of a man in a Spanish dress, by Giorgione, with some modern pictures from the annual Paris Exhibitions, the gift of the Emperor, are about the only objects worthy of remark among a wilderness of platitudes and provincial mediocrity. There are some outrageous patriotic performances on a colossal scale by Dunkirk artists, which only prove that the worthy Dunkerquois are better hands at wielding the sword than the brush.

A series of paintings by Jean Baptiste Descamps, a native of Dunkirk (born 1706, died 1791), are interesting, as showing the appearance of the town in the seventeenth and eighteenth centuries.

A view of the bombardment of the town in 1694 by the combined fleets of England and Holland, under Admiral Barkley, shows the two batteries at the end of the pier, and two forts in the sea to the southward.

A plan of the town, divided into six cantons, and dated "An 9 de la République," exhibits some curious changes of name. The Place Jean Bart was called *Place de la Liberté*; Rue du Parc de la Marine, *Rue des Droits de l'Homme*; Rue de l'Église, *Rue de la Vérité*; and such names as *Rue du Brutus*, *Rue de la Raison*, attest the classic and philosophical taste of the time. The quays have been widened, and some minor alterations made in the streets, but generally the configuration of the town remains before.

Another plan shows the fortifications before their demolition in 1712. The shore is called *Estran*, a name which survives in the *Porte de l'Estran*. There are two forts shown in the sea, *Fort Blanc* and *Risban*, and a large fort, *Fort Louis*, with four bastions, on the canal from Dunquerque to Bergues.

It has been for a long time contemplated to improve the harbour of Dunkirk, which, although at present commodious and handsome, considering the importance of the town, is insufficient for the increasing commerce of the port. It is proposed to construct a new basin, called the *Bassin de l'Ouest*, 1,804 feet long and 410 feet in width, between the present citadel and the *Bassin des Chasses*. This work was decided upon as long as five years ago, the imperial decree authorising its execution being dated July 14th, 1861; but the French are not quite as prompt as we are at this kind of enterprise, their forte lying rather in works of demolition and reconstruction. It is also proposed to construct another basin, similar in size to that already mentioned, to the south-west of the *Bassin de l'Ouest*, communicating with it by locks and flood-gates. The present *arrière port à l'Est*, which connects the harbour with the Bergues Canal, will be deepened and enlarged, the unsightly buildings and yards to the west of the *Paro de la Marine* removed, and a handsome esplanade formed next the harbour. The fortifications on the east and west sides of the town will be thrown back, and the Canal de la Cuneite diverted so as to get a greater depth of water at the entrance of the harbour.

There are no private houses in Dunkirk of a date anterior to the seventeenth century, but there are a few remaining (distinguishable by their fantastic gables), which belong to the period of the Spanish conquest at the commencement of that century.

The house where Jean Bart was born is not known; but the house where he died, in the year 1702, is in the Rue Royer, and is now a ladies' school, conducted by the *Milles Gallois*.

About five miles to the south of Dunkirk is Bergues, a singularly quiet little town, said to contain 6,000 inhabitants. There are, however, but few to be seen in the streets, and the shutters of most of the houses being generally closed, and the grass growing in the roadways, gives the place a very desolate appearance. It was formerly a town of some importance, having been fortified as early as the tenth century, and was the scene of constant struggles between the French and the English from the fourteenth century down to the year 1793, when it was unsuccessfully besieged by the English. Its fortifications, by Vauban, are still intact, as well as four forts, which protect the approaches to the town. Its importance, however, has gradually decreased during the present century, and its business and privileges have been transferred to its more vigorous neighbour, Dunkirk.

Weaving is still carried on, and the whirr of the shuttle is heard from the interiors as you pass along in the streets.

The Hôtel de Ville is being rebuilt on a site adjoining the ancient building, and now forms

one side of the Grande Place, opposite the Belfry, some small houses which formerly surrounded the building on two sides having been removed, and it is now completely disengaged from the neighbouring dwellings. A portion of the old Hôtel de Ville has been demolished to make room for the new building; but five hours of a very picturesque Flamboyant and a small part of a Renaissance addition still remain, and it is to be hoped will be preserved as what the French call "an historical monument," the Government taking charge of all buildings which serve to illustrate the history of the country. The new building is an exact reproduction of the Renaissance part of the old building, the details being preserved with scrupulous care. There is some resemblance to our Elizabethan in the use of strap-work and flat decoration, but the proportions are good, and there is a breadth of effect which is wanting in our buildings of this period. The new structure has two lofty stories and an attic, and is built of a blueish stone from Valenciennes, finely tooled, which is very pleasant to look at. The works proceed very slowly, and although the building is already roofed in, it will take three years to complete.

Some of the houses are noticeable for their decoration; many have the date, in large figures in wrought iron, attached to the walls, between the windows, the figures sometimes serving as plates for the rods carried through the piers. A house in the Rue de Chata, dated 1750, has some cleverly-moulded panels in plaster, and a bas-relief of the temptation of Saint Antony. The laughing devil with two black eyes is approaching the saint, attended by the drollest little devil in the guise of a Cupid, showing his cloven foot from under his trappings.

The belfry at Bergues is one of the finest in the department, and has a charming carillon, which plays every day from half-past eleven till midday. The other celebrities of the town are the ruins of the abbey of St. Winoc, and the *Mont-de-Piété*, a bizarre-looking brick building of the seventeenth century. J. H.

THE REMUNERATION OF ARCHITECTS.

In return to an order of the House of Commons, copies of the correspondence between the Office of works and Mr. E. M. Barry, the architect employed at the New Palace at Westminster, from the date of his appointment to the present time, respecting his professional remuneration, and of communications with the Royal Institute of British Architects on the subject, have been printed.

The main point at issue is the endeavour to devolve on the architect the duty of measuring and making out the accounts without charge, beyond his *five per cent.* commission. The following extract from one of the letters will show the position taken by Mr. Barry:—

"I am unable to concur in this opinion, and I do not think it can be supported by the practice of any architect of eminence at the present time. I enclose a printed list of rules drawn up by the Royal Institute of British Architects for the regulation of architects' remuneration, which rules are considered binding by my profession. Clause 15 defines the duties of an architect, as included in the charge of 5 per cent., and expressly excludes therefrom the obligation to measure and make out extras and omissions.

An architect's duty may be described as that of designing and superintending the erection of the work. Taking out the quantities at the commencement or measuring the work on completion, are duties entrusted to a surveyor. There is no difference in principle between these two operations. Measurement is in reality taking the quantities of a work when finished from the work itself, while taking out the quantities at the commencement differs only in that the quantities are in that case taken from drawings in the absence of the work.

I am not aware that it has ever been contended that an architect should pay the surveyors for taking out the quantities at the commencement of the work, and I must respectfully submit that no reason can exist for calling upon him to do so for measuring or taking the quantities on the completion of the work. The system of taking out quantities has been repeatedly recognized by the Board, and architects employed on Government works have received their full commission of 5 per cent. for their services, exclusive of taking out the quantities."

In this view he is supported by the Institute. If the profession think the question important enough to be taken up they should do what they can to at once strengthen the hands of the Institute, who still have the matter under consideration. The papers bring out clearly what the "practice" of the profession is; and if it be true that the "practice of the Department" is in opposition to it, the latter ought to be altered, as no reason can exist why the Government should pay less remuneration to its profes-

sional advisers than the public generally. Lord J. Manners has the opportunity of having the facts from the eminent surveyor attached to the Office of Works, than whom none knows better the practice of his profession, and that as a question of fact architects are never called upon to pay surveyors. Indeed, were it so, the profit of the architect might soon disappear altogether, as at the usual rates now obtaining the surveyors make far more profit than the generality of architects.

EXCAVATIONS AT OSTIA.

THE excavations at Ostia, commenced by the Papal Government in 1853, have been continued, and usually for six months of every year, since that date, with some vigour, necessarily interrupted, indeed, by the dangers of *malaria* during the sultry season, and for a longer period suspended owing to political circumstances, in 1860. It is by the labour of about forty *galeotti* (convicts), who inhabit the picturesque old castle in the modern village, that these works are now prosecuted, and all contingent expenses are defrayed from the private purse of the Pontiff. We have already described the street of tombs leading to the principal gateway, the quarter of the city first laid open, the Mithraeum (or Mithras Temple), and that larger fane whose cells of fine brickwork, above a vaulted crypt, is surrounded by a peribolos (or sacred court) with marble colonnades, but whose dedication is uncertain; also the *Therma* of Antonina Pius, notices of which we find in history, discovered adjacent to that temple of Mithras. Many other edifices brought to light within the last year and a half, besides rich store of epigraphs, sarcophagi, and some admirable specimens of mosaic pavement, have well rewarded the labours on this desolate but promising site. The approach to the principal gateway, of which remains only the broad threshold stone, might remind one of Pompeii; for here also, as in the lava-buried city, we reach the habitations of the living through those of the dead; and close to that gate, on the outside, we find, as at Pompeii, a quarter for the *custodia militaris*, containing eight small chambers, in one of which we see, on the marble pavement, a relic of military amusements, consisting of a gaming-table,—such, at least, the apparent purpose of the series of circles, diminishing towards both extremities, incised on the surface. From the description of brickwork it is believed the Ostian sepulchres may date from the third and fourth centuries of our era; and among the more interesting is a mansoleum, with a spacious vaulted chamber, entirely inlaid with sarcophagi of terra-cotta placed in two parallel rows, each of the four sides opening in an arched recess above other tombs, like the *arcosolia* in Christian catacombs.

The baths near the Mithraeum comprise a suite of chambers, all roofless, besides a large hypocaust court, the *Palæstra*, surrounded by a portico of *Carystian* (green-veined) marble; first being entered the *spoliatorium* (for undressing), whose floor is paved with mosaic, black and white, in a pleasing pattern like carpet-work; next, the *gymna*, with niches round its walls, no doubt for sculptures, a female statue, found in one of which, has been taken to the Vatican; next, the chambers for the tepid and hot baths, in that for which latter purpose the terra-cotta tubes of the *clorifera* still remain, and we may look down into the hypocaust below. Among the mosaics in these interiors are some figures of spirited design, especially a Cupid riding on a dolphin; but the best, a coloured composition, has been removed to the hall in the Vatican, now known as that of the "Immaculate Conception," from the frescoes, illustrative of that doctrine and its definition, on its walls and ceiling. On the pavement of the *Palæstra* is a very curious (among Roman works, we believe, unique) representation, in black and white mosaic, of a labyrinth inclosed by quadrangular walls, and entered by four gates, the central compartment occupied by a large altar on which fire is burning. Most interesting, and relevant to the story of a singular religious system, is the Mithraeum, now entirely laid open, divided into three compartments, not by columns, but by differences of level. This consists of an oblong parallelogram, 16 by 5½ metres, with walls of lateral brickwork still preserved almost up to the impost of the vault, but no traces of windows,—illuminated, we may suppose, by lamps and candelabra, of which many were found here.

At one of the narrower sides is the chief entrance, and at the opposite, the altar, still in its place, a block of *Carystian* marble, standing on the summit of four steps, with its dedicatory epigraph in good letters,—“C. Cælius Hermæros Antistes hinc loci fecit sua pec;” above which appears to have stood the group of the Mithraic sacrifice, namely, a youth in Phrygian costume and tiara sacrificing a bull, with various mystic symbols around, but of which sculpture remained only the principal head and the hand with the sacrificial knife, wrought in good style. Around the altar were found several masses of tufa rock cut into conic forms (a known Mithraic symbol, allusive to the sacred fire), and some columns of fine marble, probably for supporting lamps or symbols. The area of this cella is lower in the midst, more elevated, and reached by two steps along the sides; and those higher aisles (so to call them) served for the initiated; the central nave for the other worshippers; this part being paved with plain mosaics, along the edge of which is inscribed, alike on both longer sides, in mosaic letters, *Soli Invicti, Mith. D.D.* [dono dedit], *L. Agrippæ Calentio*. The walls are painted red; and the remnant of sculpture found above the altar had also colour, the face carnation, and the Phrygian cap purple-tinted. Leaning against the steps of the aisles were found two statues with two reliefs of Mithraic priests in Phrygian dress, one lifting, the other reversing a torch,—the allusion thus conveyed by Oriental symbolism, and contemporaneous with Mithraic doctrines, to the sun in spring and the sun in autumn, as approaching and distancing our earth; these sculptures being also of some merit and retaining many remnants of gilding. Besides these were found other symbolic marbles—a lion's head (the animal of the sun), and the sign also of a high degree of initiation), and a Phrygian cap, evidently meant to stand on a haement, not for any head, pierced in seven places for so many rays to be inserted.

The most curious detail of all in this sacred building is one the explanation of which, published by the Ober Visconti, is both learned and satisfactory,—indeed, convincing. At an angle near the principal doorway is a small *ædicula*, like an oven, about 5 palms high, with its recess and cover painted red on the same surface of intonaco as seen on the walls, and with a kind of predella at the haement. Other Mithraic monuments, found near two ancient cities of Dacia, supply the key to this mystery, both showing in relief a similar *ædicula*, with an animal like a he-goat couchant inside, a devotee kneeling on one side, and seven altars, or *pyra*, ranged in front. In this recess we may recognise the imaginary “Station of Capricorn;” knowing as we do that the Mithraic theories assumed the existence of two solstitial points in the tropics of Cancer and Capricorn, regarded as the two gates of Heaven,—the former for the descent of souls to earth, the latter for their ascent to regain the celestial mansion, after a purifying passage through the seven planets. According to the Zindavesta, Mithras resides in Heaven, between the sun and moon, where he perpetually presides over the transmigration of souls; and as the kneeling figure in the relief represents the initiate or *mystagogue*, the seven altars represent the planets, and the *ædicula* with the goat inside the heavenly portal under the sign of Capricorn. It is remarkable that a lateral entrance to this temple, as also a recess at the right of the altar, were found choked up with rubble, evidently to prevent ingress,—a measure ordered, no doubt, on the suppression of this Oriental worship, first abolished by law at Rome, A.D. 376.—See “The Epistle of St. Jerome (p. vii.) to Laeta.” The names of consuls in the inscriptions below the figures of the priests indicate a date answering to A.D. 164, the time of Marcus Aurelius, under whom and the other Antonine emperors the Mithraic worship was at the zenith of ascendancy in the West. External to its temple here we enter several small chambers, probably for residence of the *Antistes*; one containing what seems to be a fireplace, or oven; another terminating in a curved recess above a staircase, lined with blue vitreous mosaic, and in the upper part adorned with a valuable art-work (now in the Lateran Museum), the figure in fine coloured mosaics, of Sylvanus, standing amidst trees with a flaming altar on one side; his dress a tunic; on his head a crown of pine or cypress, like a halo; in one hand a cypress branch, in the other a sickle; a dog seated at his feet.

Visconti shows grounds for the conclusion

that Mithraic worship was introduced at Rome so early as the year of the city 687; and first by the mariners of the fleet, who in that year had defeated Cilician pirates, and had probably learned those Persian doctrines from the pirates themselves (v. Plutarch's “Life of Pompey”). We might infer that Ostia was the first centre in Western Europe where such a superstition took root, seeing that no fewer than five Mithraic monuments (all now in the Vatican) had been yielded by this soil before the late discovery; and that two other Mithraic sanctuaries besides the above-described have been found here, one in the form of a cavern, as it appears were all those destined for the initiation in this worship,—first re-opened by the English artist, Fagan, who discovered much at Ostia, in 1797. A very significant Mithraic relief of the usual sacrifice by the *intercessory* to the higher deity,—Mithras to the supreme Ormuzd,—was dug up in Rome, under the court of a private house, in 1802.

Of other discoveries latest made at Ostia, most important is the more spacious structure for *therma*, which, from their brickwork, may be referred to the time of Hadrian, and are, in some respects, the most complete yet known among Roman remains of this class. The halls of this building are descended into at some depth below the surrounding level, but are seen by daylight, and quite roofless; their most noticeable contents being the mosaic pavements, and the still perfect arrangements for the heating from below. In designs of much spirit (black and white, like the other examples) we here see an elaborate illustration of the athletic games, and the prizes won therein: winged genii holding palms for the victors; the trumpeter ready to sound his signal; the vase for the powder used to rub the body before the contest; and the *mensa agonistica*, or table laid with the crowns and palms bestowed on victors. In other chambers, Tritons blowing their horns, while each holds an oar in one hand; Nereids riding on marine monsters that combine the horse, the ox, and the tiger with the dragon form; and in the centre amidst these, Oceanus, a large, wild-looking being with floating hair and curly beard. In the hall for the sweating-bath (*sudatorium*), paved with plain mosaic, the whole method in use for such compartments may be apprehended better than in almost any other antique example; round its walls are seen the vertical tubes (terra cotta) for conveying hot air, and in the midst, near one end of the oblong, the circular furnace gaping open below the pavement, communicating with a narrow passage for the ministers, and several parallel conduits running thence under the mosaic floor. Here the work of disencumbering is not yet quite completed, and nothing has yet been touched or removed within these interesting ruins. Not far from the same spot we look down into another area, just excavated, where stand several massive columns, brick or concrete; and near the narrower end wall of a quadrangle, an ample inlet in *opus reticulatum* masonry, quite firm and perfect,—this being, perhaps, the outer court of some important mansion, or the residence of some collegiate body. Another area, whose uses are evident from its contents, is filled with immense *dolia*, laid up to their necks in soil, probably intended for deposit not only of oil and wine, but also of solids, grain, &c., as inferable from the marble weights here found, some to the amount of 100 lb.

Besides the mansolea forming that necropolis external to the city, have been opened, through recent works, several columbaria and other species of tomb-chambers, some presenting evidence of the co-existent modes of disposing of the dead by cremation and interment in sarcophagi. The largest of the columbaria has its vaulted interior entirely covered with decorative painting, but has been deprived of its most remarkable adornment, a picture of the descent of Orpheus to rescue Eurydice from Hades, now in the Lateran Museum. The pavement of that interior has a central opening, through which we look into a subterranean, probably for the interment of slaves, who were not allowed the honours of the funeral pyre or cinerary urn; and on one side, near the entrance, is an epitaph in the best characters of the best period to a child whose age is given, with affectionate minuteness, as one year, one month, eleven days, and one hour. Among other noticeable paintings in tombs recently found, are the Rape of Proserpine, Saturn devouring his children, and receiving from Rhea a swaddled stone, the maternal de-

vice to save the infant Jove; Mercury with caduceus and bag, as the god of commerce, standing near a ship, which several slaves are in the act of lading with grain; all these engraved in outline, being now purchasable in a brochure by the Chev. Visconti, "*Pittura murale Ostiense.*" The ruins of the theatre, a scattered series of structures like low archways, quite without architectural character, have not yet been touched, but certainly claim attention; for this edifice is known to be of the time of Hadrian, and is mentioned in hagiography as that before which was beheaded the martyr Cyriacus, A.D. 300.

It is uncertain what was the dedication of that principal temple, the lofty brick walls of whose cella rise most conspicuous among the ruins on this wide extent of solitary sea-coast; some conjecture a *Cæsareum*, or fane of all the deified emperors; others, Castor and Pollux, or Neptune, as the deities here honoured. Its ruins were first partly cleared by works in the time of Pius VII., and have become much more interesting since was made accessible the crypt in two large vaulted halls, and disencumbered, as we now see, the surrounding area once paved with marble and enclosed within a portico, enormous fragments of whose fluted columns lie strewn on the soil. That cella had, as is evident, no vaulting, but a wooden ceiled roof; and the walls are shown, by the numerous cavities on both sides, to have been incrustated with marble alike on the outer and inner surfaces. In its actual condition, though presenting no architectural elevation to be called beautiful, a certain forlorn majesty is possessed by this temple; and the mournful solitude that reigns around adds to that effect. Within its spacious cella was assembled, on a fine day in March, a large party of English who had inspected all the Ostian antiquities and listened to the reading *in situ* of a descriptive paper translated from Signor Visconti's original Italian; the excursion having been arranged by the British Archaeological Society, and in every respect to the satisfaction of all concerned. One of the most picturesque, and of course the most interesting, of scenes, in which were grouped about sixty individuals, during that day's adventures, was the mastering of the cold collation spread on the grassy ground, within that ruined cella. Thence the party drove to Castel Fusano, the forlorn hut most romantic old villa of the Chigi family, amidst the solemn shades of a primeval pine forest that extends its dark holt, far from all other human habitations, along the sea-coast; and under whose shade we walk, for some half-mile at least, on the antique pavement of the Via Severiana, till reaching the sandy beach on which that forest continually encroaches.

On the return to Rome that evening, the effect of a cloudy but rich-toned sunset-sky, above the far-extending level of the Ostian coast, the wild village, and scattered ruins, was a sight not easily to be forgotten. Nor could any illumination have been more suitable to the landscape and its associations than the last pale gleams of that sunset on the winding Tiber, and on the few ruinous tombs that stand amidst uncultivated uplands and hollows beside the Via Ostiense.

NEW SOUTHWARK-STREET AND ITS ARCHITECTURE.

The principles of action of the Metropolitan Board of Works have proved themselves, on the whole, broad, simple, and animated by the true "spirit of progress," in the fullest meaning of that term. Minor details in the carrying out of the vast improvements undertaken may be more or less, open to criticism; but taking a fair general view of the working of this important institution, as regards both the theory and the actual reduction to practice of the various projects initiated, both system and working out have proved themselves so excellent and, in the main, so successful that our vast London is already deriving a number of advantages in the form of sanitary, artistic, and also commercial improvement of the greatest interest and importance. Among the chief of these may be cited the purification of the Thames by means of a new system of drainage, carried out upon a gigantic scale, as illustrating the general character of sanitary ameliorations. The practical carrying out of a system of embankment, by means of which spacious quays will be created on each side of the river, to be eventually occupied by stately buildings, which will

form the crowning glory of new London, if properly done with a right sense of the importance of the opportunity, ought to afford a splendid example of the artistic and monumental advantages to be derived from the course of action pursued; while the creation of new Southwark-street, connecting the eastern and western centres of our vast metropolis by a direct line of communication on the south side of the river, serves to illustrate the advantages of a commercial character which have distinguished the operations of the Metropolitan Board of Works.

Some method of relieving the crowded state of the traffic along the Strand, Fleet-street, Ludgate-hill, and Cheapside, had long been a desideratum; but no plan ever appeared so direct, simple, and inexpensive as the creation of a continuous and spacious new street on the south side of the river, and that idea has, at last, been successfully carried out, with results which have fully borne out its asserted superiority over all other suggestions. Before the improvement, the land on this side of the river was, comparatively speaking, cheap—a circumstance which enabled the Board, at a moderate outlay, to buy up the sites required for their purpose. The street having been formed, the frontages on either side were offered to the public, as freeholds, with a direct parliamentary title, or as leaseholds at a ground-rent, at such reasonable prices that the whole has been taken up much more rapidly than might have been expected, considering the great extent of building ground of a particular character thus thrown into the market at once.

Very few empty spaces now remain along the whole line, which has already become a great subsidiary thoroughfare from Westminster to London Bridge. The buildings which have thus rapidly arisen along the course of this new commercial avenue are, as a whole, of so distinctive a class that they appear to call for special notice as presenting in their aggregate an architectural aspect of somewhat unusual character. We have in other parts of London witnessed the recent erection of vast buildings destined to strictly commercial purposes, which from their dimensions and architectural merit must be accepted as important monuments of the architecture of the period. These vast stacks of buildings erected as manufactories, or warehouses, in various parts are frequently of very imposing aspect, but nowhere do they form so remarkable a general feature of a district as in Southwark-street, though in several cases individually superior. One of the chief causes of the distinct general character of the new buildings of this spacious street, both individually and collectively, is that in most instances the buildings are detached from each other, like the great club-houses of Pall-mall, and so produce a very different effect from that of a series of façades like those of ordinary streets, which are closely contiguous, and, in fact, joined to each other.

The great warehouse-edifices of Southwark-street are nearly all sufficiently detached to give each the full advantage of its own distinctive features; and these features are, in most instances, sufficiently remarkable to warrant an individual assertion of their character. They have, however, a general homogeneity of generic character, arising, in the first place, from the generally adopted principle of fitness in determining the style of an architectural design; secondly, from the grand dimensions of most of the buildings and the seemingly prevailing feeling of both architect and capitalist that a structure for carrying on extensive commercial transactions in a country which has risen to greatness and riches by the success of its merchants and manufacturers, should present a more important character, even from a purely architectural point of view; and thirdly, from the fact of the buildings in question deriving a marked character from being constructed almost entirely of brickwork. The mansions of the Elizabethan serve to demonstrate that very grand and even palatial effects can be produced by brickwork, especially with stone dressings; and even in established architecture there are the magnificent and nearly perfect remains of Hurstmonceux Castle, and other equally fine examples, to show what grandeur of effect may be produced by an artistic management of the national red brick. But the use of brickwork, from an architectonic point of view, had so utterly declined, and was still further declining, during the first quarter of the present century, that its treatment seemed unlikely to be resuscitated as an important branch of architectural study. In recent years, how-

ever, by great advances in the various ramifications of the architect's domain of action, the study of brick architecture has been revived with much success. Even churches have been constructed entirely of brick, in which not only have fine effects been produced externally, but even the interior surfaces of the walls, the columnar supports, the groining of the ceilings, and other features of internal decoration, have been made to display not only the great natural capacities of the material, but also new modes of structure; and the warehouses of Southwark-street furnish us with the most recent series of examples of the restoration in question.

Travelling eastward along the new street, the first building that forcibly arrests the attention of the architectural critic is the wholesale stationery warehouse of Messrs. Causton & Sons. The style adopted is bold and simple, and looks like a free adaptation of the spirit and general proportions of the best Renaissance period. The main structure is of brick, with soberly-introduced stone dressings, which are sparingly enriched with some, well-sculptured ornaments. The general mass of the building is upon a scale that invests it with a character that at once arrests the attention even of a casual passer-by.

The next great stack of buildings, though having a generic affinity of character with the one just described, is yet distinguished from it by features of its own. Extending to the corner of an intersecting street, the angle of the building is formed of a well-designed tower, which rises slightly above the general height of the structure. The general cornice of the main front is made very ornamental by a judicious management of the brickwork, now in common practice, by means of which a pattern is produced similar to the "dog-tooth" ornament of sculptured stone mouldings, coloured bricks being sparingly introduced above the continuous arcade formed by the upper windows. The windows of the principal story are square-topped, and somewhat after the fashion of those frequently found in the domestic Gothic of the old German towns, the tier below being arched. The arch of these lower windows is formed of alternate white and dark bricks, each mass of colour occupying the space of about three bricks in breadth. This alternation of white with a tone of full violet black produces a bright and, at the same time, bold, effect, which enlivens the whole façade, and is the more acceptable as it is at once felt to be a legitimate feature of ornamentation naturally suggested by the material in use.

Balt & Co., the army contractors, are the occupiers of the next noticeable mass of buildings of this class. The cornice of the whole structure is a bold and effective piece of brickwork, with a fascia enlivened by a well-managed pattern of red, blue-grey, and green bricks, the effect of which is very quiet, and appropriate to the general decorative treatment of the edifice. The upper windows, after a fashion now becoming very general in buildings of this kind, form a continuous and connected arcade, the arched top of each window being formed of red, white, and black bricks. These window-arches are supported alternately by single columns and pairs of columns, of polished granite; below this arcade the façade is divided into compartments by means of broad piers of slight projection, forming intermediate round-topped panels or recesses, in which are three tiers of windows, connected ornamentally by a conspicuous band of coloured brickwork of green and red. This band of ornament is interrupted at intervals by circular devices in relief, formed of the rose, shamrock, and thistle, which are coloured black, and painted with gilding: they appear to be cast iron, relieved, and gilt, or terracotta, so treated. The sills and lintels of the windows are stone, and so is the principal entrance-doorway, the treatment of which is founded upon that epoch of Gothic art known as Early English. Other buildings of similar character, though of inferior importance in dimensions, next occur; and, at the corner of Guildford-street, excavations are actively proceeding in preparation for another great mass of buildings of an analogous class.

Wigan and Crosier's hop warehouses next arrest the attention of the architectural explorer. They are perhaps on the whole the finest stack of buildings in that part of the new street, but being more in the ordinary style in which the advanced study of modern brickwork has most generally developed itself, the structure does not call for special description. We next meet with a continuous row of buildings combining

the character of retail shop and warehouse. Each of these façades is distinct in design, and two or three of them are remarkably good. A rather new feature adopted in one of them, in order to admit more light into the rooms in the roof, may be thus described. Instead of a row of dormer windows at distances (there might be room for four), there is a continuous glass gallery, which, rising from behind the parapet, and being surmounted by a rich bordering, or crest, of ironwork, relieved by gilding, produces an attractive effect. Opposite to this row of buildings is another detached warehouse, and then come Messrs. Andrew Dunn & Son's iron-works. In this building, which is a combination of brick and cement, the chief decorative feature is formed by deep intaglio patterns in the cement dressings of the doors and windows. On the opposite side of the street, the next new building is that occupied by Messrs. Tenlon & Dogget, hop merchants. Nearly the whole frontage of each floor is glazed, producing a light and pleasing effect, and the whole of the design, though upon a comparatively small scale, is neat and elegant. Adjoining are the important premises of the Hop Planters' Association, which are somewhat like most of the others of their class in this street, as combinations of brick and stone; the stone dressings in this instance, however, being rather more profuse and massive than in the neighbouring buildings. The general style adopted appears to be founded upon a study of the Norman and Byzantine epochs, but the gateway does not accord in architectural feeling with the rest of the building, being of a much lighter character, and rather Italian in aspect. Adjoining this structure is Calvert's buildings, a pretty elevation, in a set Elizabethan style; brick with stone dressings. The advancing spectator next meets with four warehouses, which are all fair average samples of the general advanced styles of brick buildings, with stone or cement dressings. The last structure on that side of the street is a handsome building, occupied by the Southwark branch of the Alliance Bank, which stands in a commanding position, forming the angle from which Southwark-street and High-street diverge, a point remarkable for the extremely decorative group of lamps which protects the centre of the wide crossing, illustrated in these pages some time ago.

Opposite to the Alliance Bank rises the Hop and Malt Exchange, by far the most important building in the new street. This structure occupies a frontage of 120 ft., and is fast approaching completion. The lower columns of the façade, the shafts of which are richly ornamented, are of cast-iron, and intended for further enrichment by means of bronze and gilding. The general front has an imposing aspect from its great height, consisting as it does of ten stories. The basement is occupied by two stories of cellars, which for extent and lightness of appearance, are of very remarkable character. Their roofs are supported on detached iron columns connected by girders, and are very successful pieces of construction. Above the two stories of cellars, and a little above the level of the street, is a covered area of 80 ft. by 50 ft., which is destined for the Exchange. The design of the floor of this noble chamber is very handsome, including oncaustic tiles, and the roof over the whole area, at the height of 100 ft., will be of a very effective character, and composed of glass and iron. It is now in rapid progress, and will probably produce a very fine beautiful effect, admitting a flood of light, which it is not the intention of Mr. Moore, the architect, to lose the advantage of, in a decorative point of view; it being part of his plan to have the upper portions of the walls decorated with frescoes, representing hop planting, hop picking, the barley harvest, and other subjects of an appropriate character. Attached to this spacious covered area, nearly as large as the internal court of the Royal Exchange, is a large subscription reading-room, and also, on another side, a refreshment-room of more than usual dimensions. The interior of the Exchange itself presents an attractive appearance from the nature of the structure, arising out of its purposes. It is surrounded by four tiers of decorative galleries, each leading to a series of snuffing rooms for hops and malt, and the approach to each of these rooms being formed by an arched entrance, has necessitated the creation of a series of arcades, one above another, to the height of four stories, which imparts a very unusual and impressive aspect to this remarkable interior, which, when completed, with its surmounting frescoes, decorating the closed arches

of the upper story, will be unlike anything of its class in London, and will recall to the mind of those who have visited Rome one of the courts of the Vatican, but with original features of its own sufficient to stamp it with a perfectly distinctive character. The entrance from the street to the Exchange is spacious and handsome, and for its final completion is only waiting for its decorative columns, which are to be of Irish marble. The pilasters, forming the chief decoration of the walls, are to be of that bright green marble of Galway: no other quarries in Europe furnish marble of a similar tone: and the detached columns are Limerick marble, of a rich ruddy tone, beautifully veined with both lighter and darker streakings of the same colour. The four first stories of the façade, above the basement, consist of offices destined for the use of hop growers, hop merchants, hop factors, and others connected with dealings in that great national staple, the central market of which has been long established in the part of the Borough of which the Hop Exchange will now form the appropriate centre. Other building features connected with improvements in this part of Southwark are well worthy of notice, but must await another opportunity.

A NOTE FROM THE CHAMP DE MARS.

I MUST preface a few remarks I desire to make on the Fine Arts Department of the Paris Exhibition with a protest against the exceedingly ugly marble bracket displayed in the front of the London Society of Arts' case of premiated objects, No. 86, Class 65. The subject is a Cupid and Dolphin's Head, and the bracket obtained the first prize, 15*l.*, in 1865. Nothing can be imagined more flat and shapeless than the left arm, or more frightful than the round mass which represents the right foot, and which suggests a club-foot with the toes only indicated but not developed; and the meaningless face is simply abominable. I do not presume to give an opinion as to the wisdom of the council or committee of the Society of Arts in awarding a 15*l.* prize for such a piece of ugliness; but I feel sure any lover of art will agree with me that to stick it up in front of the case, where it is impossible it can be passed over, is a mistake, and will join me in requesting it may be hidden away out of sight as quickly as possible.

The question as to whether the English or French mode of screening their picture-gallery from too much sunshine be best, is now most definitively settled, and in favour of the English method. The full height of our gallery has been preserved, the sun-blind stretching across from side to side from the summit of the walls. This blind is formed of thin white muslin nearly as wide as the gallery, and is laced down each side by red cord to a piece attached to the wall; the advantage of this being, I presume, that it was fixed up very quickly,—I saw it in operation,—and can be tightened if it should stretch and get slack; added to which the red zigzag trellis is ornamental. Below this white muslin ceiling comes a broad band of deep crimson or bright chocolate colour on the walls, upon which, in legible gold letters, are inscribed the names of our artists, with the date of their birth and death; then comes the plain green wall, which is certainly not a pretty colour, but which harmonises with all sorts of pictures far better than does the ugly brickdust red of the walls in the French gallery.

But our greatest triumph is in having gone to the expense and trouble of laying the floor with cocoa-nut matting, which, besides being neat and clean, is so restful to one's poor weary feet after the gritty, dusty, muddy floor of the French gallery. I say "French gallery" because I have only seen that besides the English, and do not yet know what other nations have done; but I do know, to my cost, that three or four hours spent in the French gallery sent me home fearfully footsore, and horribly out of temper with the men who are everlastingly coming round with their water-cans and dabbing the contents about, disturbing and annoying every one. In fact, the gallery is always in a state of gritty dust or mud. As to the pendent sunblind, it is extremely ugly, takes off from the height sadly, makes the gallery very hot; and the flat portions being all formed of paper, it is cracked and torn in all directions, and looks ragged and neglected. But the pictures themselves are very beautiful; too much cannot be said in admiration of them. Unfortunately, as is always the case in a collec-

tion of French pictures, one is obliged to turn away the eye from a vast amount of nudity, and blood, and slaughter, and distressing subjects of all sorts, which, to our English taste, so greatly detract from the pleasures of visiting a French picture-gallery; but this admitted and regretted, there remains so much careful study, delicate manipulation, bold handling and rich colouring, that all gazers, of whatever age or class, must reap great delight from a minute study of these fine productions. To mention alone Gérôme, who has thirteen works exhibited, most of them well known in England, to wit, "Dual an sortir d'un Bal masqué," "Les Gladiateurs," "Le Prisonnier," Arab fettered, lying across a Nile boat; Fichel, who has three gems; Meissonier, fourteen works, most of them also well known in England, and of which it is useless to say anything, they are all so charming; Edmond Frère, who has eight of his delicious little bits, of which "La Bibliothèque" seems to me to carry off the palm from its simplicity, truth, and tenderness. Two sisters, soberly attired in brown stuff dresses and green aprons, sit side by side on low stools in a dear old well-stored book-room; and the roundness of the beads, the manner in which the light falls on the figures, and, indeed, the whole composition of the picture, are perfection. Vetter, who has six pieces, of which "Le Départ pour la Promenade," a *beau galant* dressed in violet velvet and lace ruffles, is a marvellous bit of colouring; Tonlmonche, Bellangé, well remembered by his "Doux Amis" Sebastopol, 1855," exhibited in our '62 International Exhibition, and here also; Rosa Bonheur; Claude, "Un Jour de Fermeture de Chasse;" Armand Leleux; and many very fine portraits, life-size, well substantiate the general admiration I have accorded to the oil paintings in the French Gallery.

There is a fine picture by Pierre Jollivet, called a "Dessin," which must not be passed over; especially as, from being placed high up, above the row of very excellent miniatures, it is the more likely to escape observation. The subject is an inspired-looking youngish man, in loose robes, standing on a platform of bare rock, surrounded by a vast expanse of sea and sky. The title of the picture is "Le Sentiment de l'Infini." The figure has the hands pressed on each side of the chest, as if to control the swelling of the heart, and the elbows are extended from the body, indicative of force and emotion. There is no other vestige of creation apparent, save the man, the rock, sea, and sky, and the effect is very sublime.

Another grand work, that does not seem to attract much attention, is a statue in plaster, by Camille de Veroy. It is a slightly-draped male figure, half-sitting, half-reclining on the ground, the subject Lafontaine's fable of the gourd and the acorn. Lost any of your readers may not remember, I may tell them how the fable runs:—A philosopher lay one day beneath the shade of a vast oak; at his feet trailed a gourd-vine, loaded with its heavy fruit. "Had I been the Creator," said the philosopher, "I would have placed the large gourd on the strong tree, which is able to sustain it, and the light acorn on the delicate vine." At that moment an acorn detached itself from the branch above his head, and fell on his face. Then he understood that, had a gourd been in the acorn's place, it would have been a serious matter for him; and, repented and penitent, he raised his eyes to heaven, and exclaimed,—"*Dieu fait bien ce qu'il fait!*" 'Tis in the moment the sculptor has chosen for representing, and the result is a grand statue.

R. F. H.

N.B.—Many will be glad to hear that the Superior Council of the International Jury has decided that the number of recompenses, originally fixed, independently of the grand prizes, at 100 gold medals, 1,000 silver, and 3,000 bronze, are to be increased respectively to 500, 3,000, and 4,000. The 5,000 honourable mentions will remain without change.

MANCHESTER NEW TOWNHALL COMPETITION.—A correspondent complains that there is to be no exhibition of the preliminary designs. Architects may thank some of their own body for this regrettable determination. The letters that have been written on this competition by architects would almost justify the Manchester corporation, or any other corporation, in taking exactly what steps they thought best, without the slightest reference to the opinions of the profession.

ROCKHURST, WEST HOATHLEY, SUSSEX.—Messrs. G. & H. Godwin, Architects.

THE TRADES MOVEMENT.

Worcester.—A meeting of the master builders has been held to "consider, in the present state of affairs, the necessity of endeavouring to adopt some general system of rules and rates of wages." After the matter had been fully discussed, it was decided by the meeting to form themselves into a branch of the General Builders' Association.

The plasterers, carpenters, and joiners here have recently agitated to leave work at one o'clock on Saturdays, receiving the same wages as before. Messrs. Wood granted the concession, and the other builders followed suit.

Bradford.—The hours of labour of the journey-men plasterers and their labourers have just been reduced five hours and a half per week, and their wages at the same time increased 2s. per week. The wages of the plasterers in the town now range from 28s. to 31s. per week, and the wages of the labourers are 22s. per week.

Oldham.—The stone masons are on strike, in

consequence of the employers having refused to comply with a set of rules submitted to them by the men. The bricklayers' labourers are also on strike for an increase of wages; and the joiners have given notice that they will cease working on the 1st of June at all places where non-society men, or persons who have not served a regular apprenticeship to the business, are employed. The calm here have also struck, in consequence of their employers refusing to grant them a cessation from work for half a day on every alternate Sunday.

Glasgow.—It is estimated that there are 150,000 working men at present out of employment in this city.

America.—There are now twenty trades on strike in the States of New York, New Jersey, and Pennsylvania, and although some employers are able to stand firm, many have yielded to the demand for higher rates. In Chicago there is to be an established organ of the working classes, founded upon principles of which one is, "There are no rights but the rights of labour." Mr. Horace

Greeley, who accepts almost everything else the extreme popular party puts forth, takes exception to this maxim. He is an employer, and, like the rest of his class, is powerless against the governing body, which is made up of the labouring portions of the community.

ROCKHURST, WEST HOATHLEY.

In a recent number we gave a view and plans of the house lately built here,* and some particulars of this charming and remarkable estate. We now add illustrations of some of the carving and ironwork. The terminals present the same appearance seen from the side as in front. The ferns recognizable in the capitals are—Hart's-tongue Fern, *Scolopendrium vulgare*; Poly-pody, *Polypodium vulgare*; and Buckler Fern, *Lastrea Filix-mas*.

THE PAXTON MEMORIAL.—DESIGNED BY MESSRS. GODDARD & SON, ARCHITECTS.

PAXTON MEMORIAL.

THE erection of a memorial to Sir Joseph Paxton, at Coventry, having been determined on, a committee of gentlemen was formed, with Mr. John Galsoun as chairman, for the purpose of carrying out that determination. A number of architects were invited to send in designs, and Messrs. Goddard & Son, of Leicester, were the successful competitors. We give an illustration of their design in our present number. The memorial will be executed in Portland stone, with polished granite shafts, and it is decided to erect it in the cemetery. Sir Joseph Paxton, as will be remembered, was M.P. for the city of Coventry.

MODEL OF PROPOSED NEW DOCK APPROACHES, LIVERPOOL.

MR. C. N. THWAITE, of London, has prepared a model of the scheme of Mr. Lyster, the dock engineer, for extensive re-arrangement of the dock approaches; and it is now deposited at the Albert Dock Warehouse Offices. It embraces every point of even the minutest detail, from the Albert Dock Warehouses on the south to the Waterloo Dock Warehouses on the north, and from mid-river to beyond the Town-hall. Mr. Lyster's plan includes the filling up of the George's Basin, the entire reconstruction of George's Dock, Man Island, and the Bridgewater Basin; the pulling down of the Gore-piazas, the construction of a new high-level road along the line of Strand-street to join the high-level approach to the Landing-stage, which will be approached from the heart of the town by a broad road running close to the south side of the Old Church, near the site of the present high-level footway. The high-level approach terminates in an extensive promenade overlooking the landing-stages. Various other alterations and improvements are included in the scheme. The one great objection to it is its vastness, the cost of which would be too great even for Liverpool; but the engineer has shown that there are many expensive features which may be omitted at present, and completed at a more convenient time.

CONCRETE BUILDINGS.—COMPARATIVE STRENGTH OF CONCRETE AND BRICKWORK.

SIR,—In a recent discussion at the Society of Arts on the subject of building in concrete, Mr. W. E. Newton, C.E., gave a detailed statement of what he had done in England, and is now doing, in concrete constructions. I should not have troubled you with any observations of mine on this subject (although my name was mentioned) had not some incorrect statements been made. I think Mr. Newton, in his speech at the Society of Arts, and in his subsequent letter, completely settled the question of economy of construction, and I can from a pretty fair experience fully corroborate him.

As some proof of the applicability of Portland concrete walls and constructions as described, I beg to forward you the plan of four 8-roomed villa-residences I am now building at Gravesend—a photograph of a pair of them in their present state and course of construction. You will see that the fireplaces are half their width out of the centre of the room. By this arrangement I am enabled to set all the flues in a 15-inch wall. As modern stoves are only 9 in. deep I get a back 6 in. thick. This arrangement will also give 50 cubic feet more space in each room, a great desideratum in building houses for the working classes. The cost price of these houses will not exceed 140*l.*, finished with the best materials and workmanship. The inspection and critical examination of these houses by architects and builders are invited.

As regards the strength of Portland concrete in comparison with brickwork, I can at once settle that question.

In the photographic view of the houses I am now building at Gravesend you will see that I am standing on a bracket or lever fixed in and extending 6 ft. 6 in. from the weakest part of the wall—namely, a pier 2 ft. wide between the windows. This pier is 9 in. thick and eleven days old. If the lever were placed inside the building there would be some support from the window-frames, as they would form a rebate, but being on the outside the reverse is

the case. There is also a block of concrete 3 ft. long, 12 in. deep, and 4½ in. high. It is suspended from the hressummer in the opening for the bay windows. This block is made with seven parts of crushed stone to one of cement. A large box, 3 ft. long, 2 ft. 3 in. deep, and 18 in. wide, loaded with flints, stone, and brickbats, closely packed, is suspended from the block. I calculate this weight at about half a ton, but I have no doubt the concrete block would sustain double the load.

Professor Kerr asked, "Did any one mean to say he could build a wall 30 ft. long and 25 ft. high, 6 in. thick?" Mr. Newton said, "Yes," and I say, "Yes," and I am willing to satisfy those who doubt to give the following challenge:—First to attach one of my brackets, 6 ft. 6 in. long, to a pier built in concrete 9 in. thick, and my opponents to do the same, with a pier of ordinary bricks and mortar, 14 in. thick, 2 ft. wide, and eleven days old. The bricklayer is to carry up the pier without knowing that it is to be subjected to any test. The builder of that pier which sustains the heaviest load and strain to receive 50*l.*, which shall be forfeited by the other side. Secondly, subject to the same conditions; let a block of bricks and mortar be made the same size as the block of concrete, and the same age, that will carry 1-20th the weight of concrete block of the same dimensions, and I will forfeit 50*l.*

Thirdly, I will build a wall in concrete, using my bracket-scaffolding, in competition with a brick wall of the above dimensions, and 9 in. thick. Both walls to be built with my bracket-scaffolding, and each wall to be built 18 in. every day, wet or fine weather.

If the brickwork stands the test mentioned I will forfeit 50*l.* and the cost of the wall; and if it will not stand the test mentioned as above, the same shall be forfeited to me. All my concrete shall be made at half the cost of my intended opponent's brickwork.

The great desire you have always shown in your valuable paper to solve the question of building houses for the working classes, and also for the public in general, in an economical manner, have induced me to address you at this length, and if the challenge I have given me not taken up, I think I may then assume that my propositions are sound, and that I may say the question of building improved dwellings for the people is answered.

JOSEPH TALL.

THE GOVERNMENT POSTAL TELEGRAPH SCHEME.

THE Post-office authorities are said to be busily engaged in maturing their postal telegraph scheme. It will be incorporated in a Bill which is to be submitted to Parliament as soon as the Reform Bills have left the Commons. A compulsory purchase by the Government of the plant and interest of all the existing telegraph companies was originally contemplated, but the Treasury and the Board of Trade have taken some objections to this course, and the Bill will now be of a permissive character, giving the companies the option of sale on terms to be agreed upon with the Government. When the Government has acquired the telegraph-lines, they will become a department of the Post-office. New wires will be laid down, and existing wires re-arranged and redistributed on postal principles, combining despatch with a low uniform rate of charge, and pre-payment by stamps. It is proposed to begin with a shilling rate for any distance, which will frank a message of twenty words, without including the names and addresses of either the sender or receiver. The message will be delivered free by special mes-

sengers within the radius of a mile, so that a considerable demand will be created for the services of lads and young men. Railway companies, it is assumed, will be glad to sell the use of their surplus wires to the Government, and to permit additional wires to be laid down along their lines. In London each of the ten postal districts is to have its own central telegraphic office, and each receiving-house in those districts will be a subordinate office. Pillar-boxes will be used for the deposit of messages. More frequent collections will be established; and as soon as the message deposited in the pillar-box reaches the head office of the district the telegram will be transmitted to its destination.

PROVINCIAL NEWS.

Birmingham.—The new building for the Union Club, at the top of Newhall-street, has been begun. Mr. Yeoville Thomason is the architect. The new building is Italian in style, and possesses a frontage of 100 ft. to Colmore-row, and half that extent in Newhall-street, the height of the elevation being 55 ft. The windows on the ground-floor are worked with recessed pilasters and sculptured key-stones. Those on the upper floor are arched, and ornamented with pilasters, cornices, and pediments, and are provided with balconies. The frontage will be set back about 5 ft. from the present line of the street, the basement area being protected by a railed balustrade. The whole of the elevation will be of Pillingh stone, and the interior corridors will be laid with encaustic tiles. The builders are Messrs. Barnsley & Sons, the contract being for nearly 13,000*l.*

Castle Eden.—A new Court-house, according to the *Gateshead Observer*, has been opened at Castle Eden. The building is about 200 yards from the railway station, on an eligible site adjoining the road. The frontage is about 90 ft., and faces the south. The building is from a design by Mr. W. Crozier, C.E., the county architect; and the contractors are Messrs. Strouhair & Cramen, of Hartlepool. The cost of the building will be about 1,200*l.*, which sum is defrayed by Mr. Bardou, who is also owner of the land on which it is erected, and he will lease the building to the county for an annual rent.

THE ARCHITECTURAL ASSOCIATION.

CONTRACTS.

THE ordinary meeting of members was held on Friday evening (the 10th inst.), at the House, in Conduit-street, Mr. R. W. Edis in the chair. On the motion of the chairman, a vote of thanks was passed to the clergy of St. Helen's Church, Bishopsgate, and to the architect, for their kindness in allowing the members to inspect the church, and also to Mr. Birch for the interesting paper which he read upon it. The chairman announced that the members of the association would be enabled, by the kindness of Mr. Gilbert Scott, to pay their next visit of inspection to the new Foreign Office in Downing-street.

The meeting proceeded to consider certain alterations in the rules of the society.

Mr. Rickman read the report of the delegates from the Association who had attended the last meeting of the Architectural Alliance, and a motion was subsequently made, that the form of contract suggested by the Alliance should be approved by the meeting. The reader said, that in ordinary contracts the architect was the sole arbitrator, and that he could object, without appeal, to the materials used, or to the manner in which the work was executed. Some builders, however, objected to so much power being given to the architect, and desired that in every form of contract a clause should be put in, providing that an umpire should be appointed in case of disputes. Under the present system the reference to an umpire might occasion delay in carrying out the works; and so great had the inconvenience been felt in some parts of the country, that at Birmingham, for instance, builders as a general rule would not sign any contract which did not provide for the appointment of an arbitrator. The new form of contract would, however, allow the works to proceed, and whenever the builder affirmed his work to be done, the power of the arbitrator would come into operation. The practice of inserting an arbitration clause was not usual in

London; but it would be for the meeting to say whether the proposed form of contract might not be a compromise, as, if adopted, no inconvenience would ensue to the client, as the works would not be stopped pending any delay consequent upon a dispute between the builder and the architect.

After some discussion, the Chairman moved an amendment to the effect that it was not desirable to introduce an arbitration clause into the building contract, as it was most important that the entire power should be left in the hands of the architect. His own experience led him to believe that such clauses did not work advantageously, and that they were calculated to encourage litigation, and to undermine the confidence which the client naturally placed in the architect. Moreover, it should be borne in mind that of all descriptions of litigation arbitrations were the most tedious and expensive.

This view was supported by Mr. Jarvis (who seconded the amendment), and by other speakers, and on a division was carried against the original motion.

Messrs. Edis, Richman, T. R. Smith, and J. D. Mathews (Hon. Secretary) were appointed delegates from the Association to the meeting of the Alliance to be held in July next.

The next business brought under the notice of the meeting was the circular of the "General Builders' Association," and eventually, on the motion of the Chairman, a resolution was passed thanking the Association for their suggestions, but stating that, inasmuch as the same had been discussed at the Alliance, the meeting was of opinion that it would not be desirable for the Association to take action in the matter.

Mr. Wilson called attention to the measure which had been taken to erect a memorial to the late Mr. Wigley, formerly a president of the Association, who recently died in Rome. He stated that a very handsome stained glass window to his memory had been placed in the Roman Catholic Cemetery, dedicated to St. Mary, at Kensal-green.

WORKS ALREADY SELECTED BY PRIZE-HOLDERS IN THE ART-UNION OF LONDON.

From the Royal Academy.—Dean Swift and the Peasant, * T. P. Hall, 150l.; The Mouth of the Harbour, J. G. Naish, 30l.; Highland Scots, A. Corbould, 20l.

From the British Institution.—Sappho (marble), J. T. Westmacott, 60l.

From the Society of British Artists.—The Life Boat, E. H. Hayes, 150l.; Heath Scene—Winter, C. Jones, 50l.; The Lesson, J. Tennant, 42l.; Off the French Coast, J. E. Meadows, 35l.; The Lunch, J. Henzell, 35l.; The Future Home, Miss Macleod, 30l.; Scene in Glentannoch, T. Whittle, 25l.; Mountain Stream, A. Barland, 25l.; Caught Napping, A. A. Hunt, 25l.; Feeding Ducks, E. Holmes, 24l. 5s.; The Stream from Lynn Idwal, J. J. Curnock, 21l.; The Plagues of his Life, E. R. Taylor, 15l. 15s.; Scene in North Wales, C. Pearson, 15l. 15s.

From the Water-Colour Society.—Shipping off Brixham, J. Callow, 21l.

From the Institute of Water Colours.—Stormy Weather, E. Hayes, 70l.; Coast near Beachy Head, † H. G. Hine, 107l. 10s.; Mnrano, Venice, S. H. D'Égville, 35l.; Quindici Anni, A. Bouvier, 40l.; Italian Landscape, E. M. Richardson, 31l. 10s.; The Iats Mr. Davis, Royal Huntsman, G. H. Laporte, 25l.; Oystermouth Bay, E. Hayes, 15l.

From the Royal Scottish Academy.—Autumn Morning on the Lochy, ‡ W. B. Brown, 150l.

NEW RAILWAY STATION AT WAKEFIELD.

On the 1st of May the Great Northern Railway Company opened the large passenger station at Westgate, Wakefield. It is erected within 100 yards of the old Westgate Station, which is now being taken down for the purpose of completing the southern end of the passenger-platforms.

The new station is approached from Westgate by a carriage-drive 40 ft. wide, paved and flagged, having a gentle rise towards the station. The station is in the Italian style, having a frontage to the approach of 250 ft., and is divided into three parts; the centre of which stands out from the wings, and has a frontage of 55 ft. It is carried up much higher than the rest of the building, and the roof is crowned by

a gilded iron cresting with banners. In the front of this centre block, which is entirely allotted to the booking-offices, an ornamental roof is constructed of cast and wrought iron, 85 ft. by 30 ft., the spandrels being filled with wrought iron and copper scrolls and flowers, gilded, &c.; the whole being covered in with glass, under which a platform and carriage-road have been formed.

At the south-east angle of the building a clock-tower has been erected, the height of which from the approach road to the centre of the dials is 53 ft., and to the top of the vane 77 ft., the total height from Westgate being 97 ft. There are four dials, each 8 ft. in diameter, one of which can be distinctly seen from the market-place. It is intended to have an illuminated clock. Above the masonry of these dials four cast-iron ribs rise and carry a lantern which is terminated by a gilded weather-vane. The space between the ribs is partly filled up with ornamental pierced cast-iron plates, under which a ball is hung; upon this the clock will strike the hours.

The booking-office, which has a wood coffered ceiling, will be used by the Great Northern, the Midland, and the Manchester, Sheffield, and Lincolnshire Railway Companies jointly. The remainder of the station comprises first and second class ladies' and gentlemen's waiting-rooms, refreshment-rooms, with cellars, kitchens, and hoist; station-master's office, parcels and left luggage, porter's and lamp rooms, telegraph offices, &c. At the south end a stone staircase has been constructed from Westgate to the level of platforms. A wrought-iron bridge, 84 ft. span, is carried across the four lines of railway, and the two platforms, for passengers to cross from one platform to the other, the access to which is by means of a wide stone staircase on each side of the railway, that on the west side being enclosed in a handsome tower, in which a fine staircase is also carried down to the station yard, which is level with Westgate.

The platform on each side of the railway is 500 ft. long, by 20 ft. wide, the greatest part of which is covered by a wrought and cast iron roof, covered entirely with glass, 24 ft. wide, the spandrels of which, and the finials to each bay, being of wrought iron, with copper foliage, coloured, and relieved with gold. The walls of the staircase, &c., have been built with white glazed bricks, with coloured brick friezes under the ceilings, which are of wood, coffered. All the woodwork is stained and varnished.

The total cost is 60,000l. Mr. Archibald Neill, of Bradford, is the contractor; and Mr. J. B. Fraser, of Leeds, the architect.

SUGGESTIONS TO PREVENT FIRES.

This is the season of the year when people begin to leave off having fires, and the time when most fires and loss of life occur, through the carelessness of servants in putting out lights and fires; therefore a few suggestions in regard to their prevention might prevent many of these sad occurrences. We propose to give a few of them.—Keep matches in metal boxes, and out of the reach of children; wax matches are particularly dangerous, and should be kept out of the way of rats and mice; be careful in making fires with shavings and other light kindling; do not deposit coal or wood ashes in a wood vessel, and be sure burning cinders are extinguished before they are deposited; never put firewood upon the stove to dry; never put ashes or a light under a staircase; fill fluid or spirit lamps only by daylight, and never near a fire or light; do not leave a candle burning on a bureau or a chest; always be cautious in extinguishing matches and other lighters before throwing them away; never throw a cigar-stump upon the floor, or spitbox containing sawdust or trash, without being certain that it contains no fire; after blowing out a candle, never put it away on a shelf, or anywhere else, until sure that the snuff has gone entirely out; a lighted candle ought not to be stuck up against a frame wall, or placed upon any portion of the wood-work in a stable, manufactory, shop, or any other places; never enter a barn or stable at night, with an uncovered light; ostlers should never smoke about stables; never take an open light to examine a gas-meter; do not put gas or other lights near curtains; never take a light into a closet; do not read in bed, either by candle or lamp light; place glass shades over gaslights in show-windows, and do

not crowd goods too close to them; no smoking should ever be permitted in warehouses, especially where goods are packed or cotton stored; the principal register of a furnace should always be fastened open; stove-pipes should be at least 4 in. from woodwork, and well guarded by tin or zinc; rags ought never to be stuffed into stove-pipe holes; openings in chimney-flues for stove-pipes which are not used, ought always to be securely protected by metallic coverings; never close up a place of business in the evening without looking well to the extinguishment of lights, and the proper security of the fires; when retiring to bed at night, always see that there is no danger from your fires, and be sure that your lights are safe. The above suggestions, if carefully followed, may be the means of preventing numerous fires, and thereby saving thousands of pounds' worth of property, as well as preserving many valuable lives.

WORKING CLASS DWELLINGS IN LIVERPOOL.

THE borough engineer has submitted to the local Health Committee the following tabular statement, showing the number of houses at various rents which had been built in Liverpool for a number of years past:—

Year.	Under £12 per annum rent.	From £12 to £25.	From £25 to £35.	From £35 and upwards.	Total.
1838	351	452	31	50	1,052
1839	390	471	86	50	927
1840	623	760	131	62	1,576
1841	628	873	188	72	1,761
1842	724	914	305	84	2,027
1843	440	794	114	42	1,390
1844	1,040	950	333	127	2,450
1845	1,212	2,007	532	177	3,728
1846	710	2,323	293	188	3,499
1847	59	925	167	89	1,229
1848	74	506	48	28	656
1849	80	258	53	35	446
1850	41	207	41	41	329
1851	101	578	88	70	837
1852	223	727	76	110	1,136
1853	52	754	79	58	923
1854	16	655	102	58	829
1855	63	1,144	99	49	1,355
1856	17	1,455	125	146	1,703
1857	124	1,655	181	169	1,929
1858	114	1,289	182	122	1,717
1859	85	1,315	277	81	1,758
1860	161	1,429	163	96	1,549
1861	45	1,040	103	33	1,221
1862	22	1,145	298	141	1,516
1863	110	1,714	117	74	2,015
1864	123	1,962	217	98	2,400
1865	—	1,185	170	141	1,496
1866	—	967	131	80	1,098

The engineer called attention to the fact that no houses under 12l. a year had been built in Liverpool in 1865 or 1866. Dr. Dawson said this was an alarming state of things. They were taking down houses in every direction, and sending the people adrift, so that they must crowd somewhere. The chairman remarked that it did not follow that there were not houses for those people, for two or more families might live in a house at a rent of over 12l. a year. Dr. Dawson said 2,000 or 3,000 people had been driven out of Dale-street, and no provision made for them.

ST. DAVID'S CHURCH, NEATH.

This church, which was lately consecrated, is designed in the style of the thirteenth century, with French treatment of ornament and detail. It is built of local blue sandstone, with Bath stone dressings, and bands of red sandstone introduced, the roofs being covered with ornamental tiles in bands. The building is lined internally with red bricks in diaper patterns, with hands of blue bricks, the arches being of Bath stone, and red sandstone, in alternate sections. The plan of the building is cruciform, and it consists of nave, north and south aisles, north and south transepts, with north transept aisle (to be used as a vestry); chancel, terminated by a circular apse; tower, the lower stage of which forms the organ-chamber; south porch and north porch, or western porch.

The seats are of deal, stained and varnished and accommodation is afforded for upwards of 1,200 persons, all the seats being free. The roofs throughout are open, and of stained deal.

The nave is 101 ft. long, 31 ft. 8 in. wide, and 61 ft. high to the ridge, separated from the aisles and transepts by arcades of six arches, the easternmost arches (opening into transepts) being of much loftier proportions and greater width than the others. The columns of these arches are alternately circular and quatrefoiled.

The clearstory windows consist of two trefoiled

* 115l. were added by Mr. Hughes, prizeholder of 36l., to obtain this work.
 † 57l. 10s. were added by Mr. Fergusson, prizeholder of 50l., to obtain this work.
 ‡ Mr. J. M'Laren, prizeholder of 45l., added 105l.

lights, with a large foliated circle in the head, enclosed internally under a pointed arch. The west window consists of four lights, with geometrical tracery in the head, comprised within a deeply-recessed, moulded, and pointed arch. The aisles are 13 ft. wide and 12 ft. high to plate.

The windows are alternately single and double trefoiled lights, each bay being marked externally by projecting buttresses, terminated by carved and panelled pinnacles; and a moulded and panelled parapet runs the whole length of the aisles.

The tower, which is placed at the south-west angle of the chancel, will consist, when completed, of four stages, surmounted by a low spire. It is square on the plan, and rises to a height of 88 ft. without break or buttress. At this point projects a bartlemated cornice, from which a gradual slope of stone-work leads up to a series of low arches, supported by columns, which carry the spire. The cost of the tower has been estimated at 2,000l.

Pinnacles of square outline, with recessed panels, and surmounted by figures of the four evangelists, stand at the angles. The total height of the structure is 152 ft.

The whole of the carved work in the building has been executed by Mr. Shaylor, of Gloucester. The church throughout is laid with tiles of various patterns, the chancel and aisle being of rich design. Three memorial windows of painted glass have been placed in the centre of the aisle, by Mr. Gwyn, M.P., the subjects of the paintings being the life of Christ. The gas-fittings consist of brass coronas suspended from the centre of the aisle and principals of the nave, with brackets painted and gilt for the aisle, and standards of wrought brass, with vermilion backing, on the chancel screen, and rows of lotus-form lights, along the top of the stained-glass windows of the vestry and organ-chamber. The entire work has been executed by Messrs. Hale, of Bristol. The heating apparatus has been erected by Messrs. Haden, of Trowbridge. The architect of the building is Mr. John Norton, of London, whose estimate of cost was 6,400l., and under whose superintendence the whole of the works have been carried out by Messrs. Jones & Son, of Gloucester. The clerk of the works is Mr. John Cooper.

FALL OF A HOUSE AT CROYDON.

AN inquest has been held on the bodies of Anne Sophia Hawkins, aged five years, and Mary Anne Finn, aged four years. On the 3rd instant the deceased girls were crumpled to death by the falling upon them of the side of the house, No. 15, Windmill-grove, Croydon. It appeared that alterations were being made in the house by a Mr. Henry Batchelor, with a view to converting the premises into a beer-shop.

Several witnesses were examined as to the removal of earth for the purpose of forming a cellar,—a too common practice.

Charles Hamilton, a laborer, deposed that he had been ordered to excavate for cellarage to the depth of 8 ft., and when he had dug 4 ft. 6 in. he refused to go any further until he got timber to strut the house up. The water had rushed in from a spring.

Some further evidence was given, and after two hours' deliberation the jury returned a verdict. "That the deceased children came to their deaths through the criminal neglect of Mr. Batchelor." A verdict of Manslaughter was then recorded.

WATER SUPPLY FOR THE CITY OF HYDRABAD.

A PROJECT has been brought forward by Mr. Charles Lee, C.E., the secretary and surveyor of the Hyderabad municipality, for supplying Hyderabad with water. Computing the population at 40,000, and allowing seventeen gallons of water per diem per head, the daily supply would amount to 680,000 gallons. The probable consumption of the railway company (in the event of the Indus Valley extension being an accomplished fact) would be 25,000 gallons daily. The quantity required by the municipality for flushing sewers, cleansing and watering streets, for road-side trees, fountains, &c., will be probably 30,500 gallons daily, leaving an additional 14,500 gallons daily for any exceptional or miscellaneous purposes: total, 750,000 gallons to be supplied every twenty-four hours, or 273,750,000 gallons per annum. Of the two sources open, viz., the Foallic and the Indus, the latter has been chosen, both for quantity and quality of water. The spot selected as a source is near the entrenched camp, about 3 miles from the fort, where the head works, settling reservoirs, filters, &c., could be established. The cost of the

works (from detailed estimates) would be as follows:—

1. Settling reservoirs, &c.....	Rs. 55,161
2. Engine-house for ditto.....	17,809
3. Egg-shaped tunnel.....	96,558
4. Covered reservoir.....	19,963
5. Engine-house at Hydrabad.....	20,099
6. Water-tower at Hydrabad.....	36,553
7. Two engineers' cottages.....	9,234
8. Tank for camp supply.....	5,000
9. Two sets firemen's huts.....	800
10. Machinery, mains, &c.....	2,25,368
Total.....	Rs. 4,89,294

The annual revenue is estimated at Rs. 96,480; and the annual expenditure, including 5 per cent. on capital, at Rs. 61,251; balance to profit per annum, Rs. 35,229. Mr. Lee proposes to carry out the whole of the works by a joint-stock company, and he anticipates no difficulty in realizing the capital required, if Government could be induced to assist and encourage the undertaking.

CHRIST CHURCH, ALBANY STREET.

STR,—The transformation which has been performed in the restoration of this church is a credit to the skill of the architect, Mr. Butterfield. The church has been entirely re-floored and repaired. The gallery on the north side has been shortened, to allow of the new organ being built there instead of in the end gallery, which is now used for seats for the school children; and the two children's galleries high up near the ceiling have been taken down from each side of the tower. New open wainscot oak seats in the nave, aisles, and choir, have taken the place of close pews. The font is of white marble, with a circle of Derbyshire or dove marble at the base. The floors in the nave and aisle are of encaustic tiles, plain, self-coloured, mixed with Portland stone. A copy of Raffaele's painting of the "Transfiguration" (the original of which is in the Vatican) has been raised to allow room for a reredos, composed of various marbles and of alabaster. The design of the chancel is rich and tasteful. Mr. Butterfield's great aim seems to have been to give force and religious character to a church which was, as far as the interior architectural design was concerned, very deficient in both; without in any way Gothicizing it. The materials which have been used in the chancel work are as follows:—Alabaster, Llan-guedoc red marble, white marble, Derbyshire fossil, Dove, Irish green marble, and gold mosaic. There is a super-alter. The communion-table is not quite long enough to hide the white Portland stone at the back. The effect is peculiar on entering the church. The steps to the altar are marble,—risers of red and dove marble to white treads. The pilasters, walls, and ceiling at this end of the church have been painted in patterns of decided colours, with the inscription from the *Te Deum* as being suitable to Christ Church, "Thou art the King of Glory, O Christ!" The walls of the nave and aisles, as well as the ceiling, have been tinted throughout in several tints, but less strongly than the chancel work. The lottery is modelled from that now in Southwell Minster, and which was raised from the lake at Newstead Abbey, Notts. A large organ is in course of being built by Mr. Henry Jones, of Brompton. It has in all thirty stops, thirteen pedals, 1,644 pipes, and will be finished and opened on Whit-Sunday.

B. FYPE.

MEPHITIC ATMOSPHERE OF THE UNDERGROUND RAILWAY.

IT appears to me that a much more simple and effective mode to ventilate the above railway than that set forth by "A. J. B." and Thos. Goodchild would be to build the whole length of the underground portion of the railway tunnel and in the centre thereof, extending from the ground to the soffit of the arch, a bare brick wall, and thereby cutting the tunnel in two, or rather making two tunnels instead of one. The motive power I would bring to bear, so as to effectually clear the tunnel, would be the trains themselves: each train as it rapidly passes in one direction would constantly keep the current of air in motion in one direction too, and deliver it in the stations, at which points simple arrangements could be made for its exit. Any person who has walked through railway tunnels must have observed the force by which waste steam and air are ejected from the tunnel in the direction the train has just passed, and which current of air is immediately checked and reversed upon the entry of a train in the opposite direction; and if he have descended a mine he will not have failed to observe that, if there be not an upcast and a downcast shaft, there will be a shaft divided near the centre, so that the air going downward shall not be interfered with by the upward air. The contact of the two would be fatal to the proper ventilation of the mine. Other examples may be referred to, to illustrate the principle I wish to set forth, but I think I have written sufficient to make my meaning clear. H. M.

THE DRAINAGE OF BATTERSEA.

"DRAINAGE OF BATTERSEA.—It is asserted that the main drainage works at Battersea are not equal to their purpose."

SIR,—I am afraid the above paragraph in the *Builder* will tend to make a wrong impression in the minds of my friends and of persons not acquainted with the facts, and who are not aware what the *main drainage* means.

Since the completion of the Battersea permanent sewers, and their connection with the Metropolitan main sewer (the southern low-level), three or four cellars in the lower part of Battersea have been flooded to the depth of 21 in., and the cause is as follows:—In severe storms the water in the Metropolitan main sewer has risen to a greater height than the floors of the cellars; it therefore found its way into them through the drain connexions, and, of course, filled the tributary local sewer. The cause of this, I believe, is from the simple fact of the storm overflows in the southern low-level being a greater height than the floors of the places flooded.

A deputation of this Board are about to wait upon the Metropolitan Board of Works, to ask for an explanation and a remedy, when I have no doubt Mr. Bazalgette will be able to give one.

I enclose you a short description of the Battersea drainage, which has just been completed from my designs, and which is most perfect in all its parts, and I trust you will give a full explanation in your next impression, as it may injure my professional reputation.

THOMAS BUCKHAM, C.E.

** The following is the description sent:—

"The approximate length of the sewers is 18 miles, and they vary in size from 3½ ft. dia. by 2½ ft. dia. brick sewers to 12 in. pipes. The most difficult portion of the sewers are in the town of Battersea, where a gradient of a fall of 1 in 1,000 only is obtained. The system of ventilation is of a design invented by the surveyor, and consists of a cast-iron ventilator fixed upon the top of a shaft immediately over the top of the sewers. The box of the ventilator is filled with charcoal, which perfectly destroys the noxious gases and gives every ventilation that is necessary to the sewers. Provision is also made for the surface drainage of the roads by the construction of a large quantity of gullies in appropriate positions, and there is also provision made for the insertion of a large quantity of eyes for the drainage connexion of houses and other property. The whole of the brick sewers are constructed in Portland cement and pressed Galt bricks, and are surrounded with concrete in Portland cement."

The above sewers were commenced in June 1865, and have just been completed, at a cost of 46,000l. Mr. Blackmore was the contractor. During the progress of the works upwards of 3,000 houses have been drained into the sewers.

INTERNATIONAL SCALE.

ABOUT a twelvemonth since you inserted a letter of mine, showing how a scale capable of expression in parts of English feet and inches, and also in any foreign decimal scale, could be constructed by repeatedly halving the full size and taking one-tenth of any of the products.

I have been asked to explain the process by constructing the following table:—

TABLE OF INTERNATIONAL SCALES.	
Expressed in parts of feet and inches.	Expressed decimally for Foreign scales.
Full size.....	= Grandeur naturelle.
Half full size, or 6 in. = 1 ft.	= La moitie (5)
Quarter full size, or 3 in. = 1 ft.	= Le quart (25)
1½ in. = 1 ft.	= Echelle 125
1 in. = 1 ft.	= Echelle 166.666
&c., &c.	

And one-tenth of any of these, viz. —

1½ in. = 1 ft.	= Echelle 10
1 in. = 1 ft.	= Echelle 166.666
¾ in. = 1 ft.	= Echelle 133.333
½ in. = 1 ft.	= Echelle 100
¼ in. = 1 ft.	= Echelle 66.666
&c., &c.	

I hope the above may be found clearly intelligible and not without practical utility.

EDWIN LAWRENCE.

WHO SHALL DESIGN?

SIR,—The *Builder* has ever been distinguished in maintaining the professional rights of architects. Therefore I lay before you a subject which deserves your attention. Within the last few years some of the stained glass and other ecclesiastical firms have been in the habit of giving sketches free to those who request them, for alters, reredoses, fonts, pulpits, &c., which, I submit, are purely architectural objects of design. If in this case of competition a non-professional firm supplies without charge sketches for a costly reredos, why should they not give plans gratis for a church? The practice which I complain of is encouraged sometimes by architects even, who will not take the trouble to do this most interesting work in their own office. A. R. E. A.

CHURCH-BUILDING NEWS.

Hayle.—St. Gwihan Church, near Hayle, has been rebuilt and reopened. The cost of the new edifice is 1,000*l*. The architect was Mr. E. Sedding, of Penzance.

Easthamstead.—A new parish church has been erected on the old site, and consecrated. It is dedicated to St. Mary Magdalene and St. Michael. Mr. John West Hngall, of London, was the architect, and the style is of the twelfth century.

Salisbury.—St. Edmund's Church has been restored and enlarged, and the new chancel consecrated. Mr. Scott supplied the plans. The contractor was Mr. E. Fitcher, of Fisherton, and the clerk of works, Mr. H. Cane. The works have been carried out under the superintendence of Mr. P. Bentlif, of Fisherton. The total cost of the restorations was about 6,000*l*.

Heyford.—The parish church of Upper Heyford has been rebuilt, except the tower, at a cost of nearly 2,000*l*, and re-opened for divine service. Mr. Talbot Bury, of London, was the architect, and Mr. Cowley, of Oxford, the builder.

Leamington.—The foundation stone of the new south transept of the parish church has been laid. The plans were prepared by the vicar, the Rev. J. Craig.

Thorington.—The church of this parish has been re-opened after being partially rebuilt, and the remainder restored. The architect employed was Mr. Ewan Christian, of London; and the contractor, Mr. Joseph Grimes, of Colchester. The total cost of the restoration and gifts to the church, has been 1,700*l*.

Shrewsbury.—The first stone of the new church at Mele Brace, which will replace an edifice erected at the very commencement of this century, was laid on the 30th ult. It will consist of a nave 68 ft. 6 in. long inside by 26 ft., having north and south aisles; a chancel, the width of the nave, and 35 ft. long, terminating in a three-sided apse; and north and south chancel aisles, one being provided for the organ. There will also be a south porch, and at the west end of the north aisle provision is being made for a massive tower, for which there are not at present sufficient funds. The accommodation will be for 500 persons. The style of the church is Early Decorated, and the cost is estimated at 3,360*l*, exclusive of the tower. Red-hill stone is being used for the walling, Shelooke for the dressings, and for the shafts to arcade and chancel-arch, Besford wood. The architect is Mr. E. Haywell, jun., of Shrewsbury; the contractors being Messrs. Bowdler & Darlington.

Kilburn.—The new church called Holy Trinity Church, Kilburn, has just been completed in the Brondebury-road, and was consecrated May 3rd. The church is situated in the parish of Willesden, out of which a new district has been assigned. The Ecclesiastical Commissioners, who own considerable property in the parish, have given the site. The church consists of nave, north aisle, chancel, north transept, vestry, tower and spire, and is in the Decorated or Middle Pointed style. The materials used have been brick for both internal and external facing, the dressings, windows, doors, strings, arches, and piers being of Bath stone. The spire is covered with slate relieved by green bands. The dimensions of the building are as follow:—Nave, 85 ft. 6 in. by 32 ft. to centre of piers; north aisle, 79 ft. 6 in. by 25 ft.; chancel, which is apsidal, 36 ft. by 25 ft. wide; north transept, 26 ft. by 16 ft. The tower, which is placed against the north wall of aisle, is 19 ft. square externally, and is 66 ft. high to base of spire,—the latter, which is plain with simple hroaches, being 68 ft. high to top of vane. The roofs are of Memel fir, and are of wrought and unwrought timber, with boarding at hack of rafters, the whole stained and partly varnished. The height of nave from floor to ridge is 57 ft. The necessity for a large accommodation obliged the introduction of galleries in the north aisle and at west end. The seats, pews, and stalls are of deal, stained and varnished; the pulpit also of deal on stone base. The chancel is paved with Minton's tiles. The lighting, which has been executed by Messrs. Hart & Son, consists of a series of corona suspended from the wall by brackets on each side of nave, assisted by wall brackets. The chancel standards, presented by the architects, are handsome and effective, and successfully light up the east end of the church. The whole of the carving, as also the font, has been executed by Mr. J. G. Amstey. The builders were Messrs. King & Sons. The cost will be about 7,500*l*. Messrs. Francis are the architects.

Bawdrip.—The parish church of Bawdrip has been re-opened after undergoing an almost thorough restoration, the work of which has extended over a period of nearly two years. The total cost has been about 1,500*l*. Three new stained glass windows have been put in the church at the expense of Mr. B. C. Greenhill, of Knowe Hall. The work of restoration has been done by Mr. Squibbs, of Bridgwater, builder. The architects employed were Messrs. Giles & Robinson, of London.

STAINED GLASS.

North-hill Church, Penzance.—A memorial window of stained-glass has just been placed in the south wall of the chancel of this church by the rector, the Rev. Charles Rodd. The window consists principally of three compartments, in which are represented the Nativity, the Burial, and the Resurrection of Christ. Beneath is a sedilia, designed by Mr. Edmund Sedding, of Penzance, and executed by Messrs. Bone & Son, of Liskeard, of polyphant stone, supported on four pillars of polished serpentine.

New Church, Sutton.—The Alocok memorial window has been completed. There are five chief lights to the window, as well as the canopy, with numerous foliated divisions. In the former figures representing the Ascension appear. In the centre is the form of the rising Redeemer. The city of Jerusalem, with its temple and public buildings, forms the background. In each of the other lights to the right and the left are figures of the apostles, three being apportioned to each light. They are all in the attitude of gazing upon their ascending Lord. Above is the emblematic device of the Lamb with the Cross, and above this the I.H.S., the smaller lights around being filled with foliage work and mirror devices. The figures of the apostles are thrown up by a dark background, in which the foliage of the olive and the palm and the deep hues of the sky are mingled. The base of the window is also filled with foliage work. The stone corbels at the arch of the window have been carved into bunches of wheat and grapes, emblematic of the bread and wine of the Sacrament. The window was from the works of Messrs. Heaton, Butler, & Bayne, of London. The corona of the gas-pendant which hangs from the centre of the chancel roof at present interferes with the view of the window from the aisle and body of the church. It is intended to obviate this by the substitution of two pendants for the one, placing them on the sides. But with this improvement the window will not be seen to advantage until the side windows of the north of the chancel are also filled with stained glass, or the glare of light diminished by the addition on this side of the much-needed vestry.

Hawkhurst Church.—A stained glass window has just been placed in the south aisle of this church, by Mr. E. G. Hartnell, of Eflord, to the memory of an only son. The window consists of three lights, and in each is represented an instance of faith, as displayed by a Roman centurion. This is the fourth stained glass window which has been placed in the church since 1863.

Tunbridge Church.—A memorial in stained glass to the late Rev. Sir C. Hardinge, bart., has been put up in the east window of this church, by Mr. Wailes, of Newcastle-upon-Tyne, at a cost of 250*l*. The subject is the resurrection of our Lord, with several accessory incidents.

SCHOOL-BUILDING NEWS.

Park, near Bury.—A new building, intended for the accommodation of the Sunday scholars attending Park Chapel, near Bury, has been opened. The structure is of stone, 59 ft. 6 in. long by 40 ft. high. It is two stories high, and in a Classic style of architecture. The cost has been 1,000*l*. Mr. J. Maxwell, of Bury, was the architect.

Crockham.—The foundation-stone has been laid for the new parochial schools, designed by Mr. G. Habershon, and the building of which is entrusted to Mr. Worsell.

Blackburn.—The foundation stone of St. Thomas's Schools has been laid by the mayor. The site is adjacent to the church, occupies the whole of the space between Skiddaw and Pendle streets, and contains an area of 3,200 square yards. It is the gift of the Venerable Arch-

deacon Rushton. The building will be from designs by Mr. James Bertwistle, of Blackburn, and after the type of ecclesiastical structures of the Early English period. In the centre portion will be an infant school, 60 ft. by 30 ft., with class-room, 30 ft. by 20 ft.; the sides being the boys' and girls' schools, 65 ft. by 20 ft., with class-rooms, 20 ft. by 16 ft. The building will be set back 40 ft., having infants' playground and gardens in the front, being enclosed with wall and iron palisading. There will be two separate porches with archways, forming entrances to the whole of the schools. The boys' and girls' schools will also have separate side entrances, with lavatories, large open playgrounds, out-buildings, &c. The roof will be upon timbered, having curved principals, surmounted by a large ventilator, and each gable will finish at the apex with an ornamental cross. The whole of the windows will be glazed with cathedral glass, of geometrical pattern. The infant school is the portion intended to be built. Messrs. Lewis & Gudgeon are the contractors for the masonry. The schools will be built of Haslingden Grane pierpoints, with freestone dressings, and quoins at the angles. The middle or the infant portion will be first proceeded with, and the estimated cost is about 1,000*l*., nearly all of which, we understand, is provided for. The plans have been prepared subject to the approval of the Privy Council on Education.

South Shields.—The foundation stone of the edifice which is in course of erection in Ocean-road, South Shields, by the executors of the late Dr. Winterbottom, Westoe, for a marine school, has been laid. This school was endowed by Dr. Winterbottom for educating seamen to fill the situations of mates or masters of vessels. Upwards of 30,000*l*. were sunk for this purpose. After allowing a large sum for the construction of the school, a liberal amount has been set aside for securing the best instructors.

Heage (Derbyshire).—The chief stone of the endowed schools at Heage has been laid. The edifice will be in the Elizabethan style. Mr. G. H. Sheffield, of Derby, is the architect.

Bedford.—The Buryan Memorial Schools were lately opened. The buildings are erected with red bricks and stone and white brick dressings. The front to Castle-end is 90 ft. in length. The whole of the rooms, corridors, and chapel have been heated by Perkins's high pressure hot-water apparatus. The works have been executed by Messrs. Dickens, Massey, Cunvin, Carling, Kilpin, & Jarvis, under the superintendence of and from designs by Mr. John Usher, architect.

Books Received.

An *Encyclopaedia of Architecture, Historical, Theoretical, and Practical.* By JOSEPH GWILT. A new edition, revised, with additions. By WYATT PAWORTH. London: Longmans, Green, & Co. 1867.

We remember to have said, when reviewing a previous edition of Gwilt's *Encyclopaedia*, that it was one of the few books in which we always found what we looked for, and a longer experience of it does not lead us to withdraw the observation. Gwilt brought into it the pith of several of his previous works and the fruits of all his long reading, and the result is a body of information of the most valuable and comprehensive character. The book is too well and widely known to require now any observations on its contents: our duty is confined to making known the fact of a fresh issue, and the extent of the additions it has received at the hands of its editor. The chapter on Pointed Architecture has been entirely re-written. Chapters in the Book on Theory have been considerably enlarged, and made to include the latest information on the subjects to which they refer. Although headed Theory, the information here given is practical, and of great value. Good use has been made of the enormous mass of information on the various branches of building to be found in the *Builder*, the source being always fully and ungrudgingly acknowledged. The strength of beams, girders, and pillars, both timber and iron, is ably treated of, with the latest light. In Book III. a valuable chapter on Mediaeval Architecture has been introduced, and includes an elaborate account of the systems of proportion propounded by various investigators. When we add that the editor has made useful minor additions throughout, and has carried on the very important List of Publications

relating to the subject, it will be seen that this is really a new edition and not a mere reprint. Mr. Wyatt Papworth has executed his task admirably, and has honourably connected his name henceforth with this very valuable book, which ought to have a place in most libraries, and must find one in that of every architect. The original edition contained more than 1,100 engravings on wood. The present edition, it is stated, has 600 in addition. The woodcut of Beverley Minster, however good of its class, has scarcely weight enough to serve as frontispiece to a book of such importance as this.

Miscellaneous.

HALL OF ARTS AND SCIENCES, KENSINGTON.—At the first stone of the proposed Hall will be laid by the Queen on Monday morning next, with some ceremony. Her Majesty is expected to arrive on the ground at half-past 11 o'clock.

ALBERT INSTITUTE, WINDSOR.—At a general meeting of the subscribers and members of this institution, on Monday evening, the recommendation by the Building Committee of the design by Messrs. Bacon & Bell for adoption was ratified by a large majority.

BRITISH ARCHAEOLOGICAL ASSOCIATION.—At the annual meeting on Wednesday, the 5th May, Mr. Planché in the chair, when Sir Charles H. House Houghton, Bart., was elected President, and the various other officers were elected; the Treasurer read the obituary for the past year, and the auditors produced the accounts, showing a balance of 263l. 13s. 4d., all liabilities being discharged.

WORSE THAN EVER.—The following Tenders have been received for repairs to twenty-four houses in St. James's-street, Edward-street, and William-street, Barnsbury-road, Islington, for Mr. J. Ramsay. Mr. T. Danby, architect and surveyor:—

French.....	£1,100 0 0
Richards.....	1,017 12 9
Pritchard.....	988 10 0
Foster.....	930 0 0
Wilcox.....	705 0 0
Smith.....	690 0 0
Perkins.....	590 0 0
Ransom.....	550 0 0
Beaumont.....	420 0 0
Trickett.....	400 0 0
Harrison & Edwards.....	358 0 0
Norris.....	325 0 0

SUBWAYS IN LONDON.—Mr. Tite has laid before the House of Commons a Bill giving power to the Metropolitan Board of Works to require that all new pipes to be laid under the surface of the Thames Embankment, and the streets constructed, or authorized to be constructed, by the Board, with subways, shall be laid in the subway. The Board may also require that pipes already laid down be removed into the subway, submitting to arbitration the question of payment of the cost of such removal. The Board may demand rent for the use of the subway, subject to arbitration if the amount be disputed. This Act is intended to be adopted also in future Acts for the construction of new streets.

PRINTING WITHOUT INK.—A specimen of printing without the inking of the types has been shown us, and from an account of the process given in "The Printer's Register" of 5th May, by Mr. Küster, of Messrs. Wyman & Sons's printing establishment, it appears that the system was invented by a M. Gustave Leboyer, and is exhibited in the Paris Exposition. Mr. Küster states that he saw the specimen referred to (which contains 145 letters in seven different kinds of types, and two colours—red and black) composed, and 100 copies printed, all in three minutes; the printing being done in 32 seconds! M. Leboyer has taken out a patent in England, as well as in other countries. His machines appear to be chiefly intended for cards and bills, letter-heads, &c. The time expended in the usual inking process must, of course, be saved in the working of hand machines. The colours show no defect of intensity: they are good colours and well printed. A chemical paper or other fabric overlies the card or paper to be printed on, and the types are rapidly stamped upon this endless chemical band, which impresses the colour on the card. The hand lasts for several days in constant work, and costs only about three halfpence. Whether the types be of steel we do not know. Might not several copies on thin paper be taken at once, on the many-fold principle?

INSTITUTION OF CIVIL ENGINEERS.—At the last ordinary meeting, held on the 14th inst., Mr. Fowler, the president, announced that the late Mrs. Locke had bequeathed to the institution, on behalf of her deceased husband, Mr. Joseph Locke, M.P., who occupied the chair of the Society during the years 1858 and 1859, the full-length portrait, by Grant, of that eminent engineer (the companion portrait to the picture of George Stephenson standing on Chat Moss), as well as a sum of 2,000l., free of legacy-duty.

A DRINKING FOUNTAIN IN THE COUNTRY.—A "Thirsty Traveller" writes,—Walking on a recent very hot day (something like 100° in the sun) from Pinner to Watford, I was pleased to find, by the kindness of Mr. Crewe, a drinking-fountain, attached to the offices of a house he has lately built near the highway, where I gratefully quenched my thirst. As water to drink is often more difficult to get in the country than in a town, I hope you will give fame to the name of Mr. Crewe, and so stimulate others to follow his kind example.

THE NEW SEFTON PARK, LIVERPOOL.—The Improvement Committee of the Liverpool Town Council accepted the contract of Messrs. E. André, of Paris, and Lewis Hornblower, of Liverpool, for completing the New Sefton Park. The terms arranged are 5 per cent. on the outlay. With generosity the committee gave Messrs. André & Hornblower a cheque for the 300 guineas premium, which, according to the conditions, might have been absorbed in the commission. The works are to be commenced at once, and the park is to be completed in two years.

UNIVERSITY OF LONDON.—In reply to questions in the Commons, Lord John Manners said that he had fulfilled the promise made before the Easter recess, namely, to place the designs in the library of that House for the inspection of hon. members. It was not for him to offer an opinion as to which of the designs should be adopted. Whatever decision might be come to as to the choice of those designs he would be prepared to adopt. Time was of great importance, and it was impossible for him to pledge himself to refer the designs to a select committee. He thought the course pursued in the case of the Foreign-office competition should be adopted.

SHERIFF COURT-HOUSES IN SCOTLAND.—The approval of her Majesty's Government has up to the present time been given for the improvement of existing or the erection of new court-houses in twenty-two cities and towns in Scotland, the total cost of which will amount to 136,458l. One-half of this sum has been paid or will be payable from public funds—Edinburgh requiring 42,060l.; Dundee, 13,587l.; Dumfries, 10,148l.; Perth, 13,273l.; Wigtown, 9,145l.; and Jedburgh, 7,065l., for the completion of their court-houses and offices. The estimate for this year under the above vote is 21,000l., a sum of 30,000l. having been expended last year.

METROPOLITAN CRIMINAL STATISTICS.—The Metropolitan Police returns for 1866 have been issued in a printed form. From these returns it appears that 65,806 persons were taken into custody; 28,524 were discharged by the magistrates; 33,179 were summarily convicted or held to bail; 4,103 were committed for trial; 3,188 were convicted and sentenced; 748 were acquitted; and 167 were not prosecuted, or bills were not found against them. Of those taken into custody, 44,679 were males, and 21,127 females; 4,845 males and 2,000 females could neither read nor write; 38,024 males and 19,082 females could read only or read and write imperfectly; 1,758 males and 45 females could read and write well; and 52 males had superior instruction.

PUBLIC WORKS IN BRUSSELS.—The ceremony of inaugurating the works for the deepening of the Senne took place at Brussels, in the presence of the King and Queen, the Count and Countess de Flandre, and the principal local authorities. The contract, taken by the Belgian Public Works Company, Limited, an English undertaking, was represented by Mr. A. Grant, M.P., chairman, and Mr. F. Doulton, M.P., director. M. Anspach, burgomaster of Brussels, received their Majesties on their arrival, and read an address, to which his Majesty graciously replied. The King afterwards had a long conversation with Messrs. Grant and Doulton, to whom he expressed his gratification at the advance already made in the works, and his hopes of their speedy and satisfactory completion.

WORKHOUSE FOR ST. MARTIN-IN-THE-FIELD. The guardians appointed six architects to prepare designs, viz.—Mr. H. M. Burton, Mr. F. Marrable, Mr. Kendall, Mr. H. R. Cotton, Mr. W. S. Cross, and Mr. W. Lee; each of the unsuccessful competitors to receive fifty guineas. These designs are now on view, but we must postpone particulars.

THE ROYAL LITERARY FUND.—The anniversary dinner on the 15th inst. was presided over by the Dean of St. Paul's, who made a scholarly and admirable address. Earl Stanhope, Dean Alford, Dean Stanley, Mr. A. Trollope, the President of the Royal Academy, Mr. Beresford Hope, Dr. W. Smith, the Queen's Advocate, Mr. Fairbairn, and others spoke. The donations amounted to about 700l.

THE BATH STONE COMPANY, LIMITED.—At the ordinary general half-yearly meeting of this company a dividend for the last half-year at the rate of 7½ per cent. per annum on the paid-up capital was declared; and it was stated that the business of the company was on the increase. A depot had been established at Paddington. The meeting authorized the issue of 150 of their hitherto unissued shares, with power to the directors to make calls up to 10l. at such times as they might see desirable.

GIBSON'S MONUMENT, ROME.—A monument is soon to be erected to the late Mr. Gibson in the Protestant Cemetery in Rome, the sculpture to be a simple profile head, executed by the late Mr. Spence (Gibson's most successful pupil); the epitaph written, at the request of the principal executor to the deceased, Mr. Henry Williams, by Lord Bulwer Lytton, who has treated this theme with such feeling and appropriate expression as might be expected. The sum of 50l. was all the great sculptor left for his own monument, desiring it should not be exceeded.

ARTISTS' BENEVOLENT FUND.—The anniversary dinner was presided over by Lord de Tabley, whose predecessor, Theodore Hook, knowing his love of pictures, said should have been called Lord de Tableau. There was a fair muster, thanks to the efforts of Mr. C. J. Dimond, the honorary secretary, and the collection was a good one. It was remarkable for including a donation of one hundred guineas, sent by an original member of the Artists' Annuity Fund (1810), Mr. Frederick Rudolph Hay. The president of the Royal Academy, Dr. Sibson, Mr. Desanges, Mr. Dighton, and others spoke.

THE DWELLINGS OF THE POOR.—A joint meeting of the clerical and lay members of the Denaries of Thingoe, Thedwastre, and Blackbourn, convened by Lord Arthur Hervey, the archdeacon of Sudbury, has been held at the Guildhall, Bury, to consider the question approved by the bishop, "How may the dwellings of the poor in town and country districts be improved?" The members of other denaries within the archdeaconry were also invited to assist in the discussion, which resulted in the appointment of a committee, to draw up a statement for circulation amongst them, showing the duty devolving upon them, and also pointing out some practical plan of building the necessary cottages cheaply, and so as to pay a good per centage on money laid out. It is to be part of the business of the committee to ascertain what has been done in other counties where the same difficulties have arisen.

LOCAL GOVERNMENT OF THE METROPOLIS.—The second report of the select committee appointed to inquire into the local government and local taxation of the metropolis has been issued. Convinced of the necessity for establishing a strong and efficient local administration in London, for the purpose of assuring the health, comfort, and convenience of the inhabitants, the committee set forth, in a series of resolutions, the conclusions they have arrived at as to the means of attaining this object in a way consistent with the special circumstances of London, and the seat of her Majesty's Government. They propose the formation of a "Municipal Council of London" instead of the Metropolitan Board of Works, and with additional powers, its executive duties to be performed by means of committees, subject to revision by the council. Vestries would be superseded by "Common Councils" of the district. Gas and water supply would be placed under the control of the municipal council, and the Building Act would be amended, so as to prevent the erection of dwellings injurious to health.

SANITARY STATE OF THE THAMES.—As a proof of the improved condition of the Thames, it is stated that a fine, well-conditioned sturgeon, upwards of 60lb. weight, was caught on Saturday morning, at Westminster Bridge, and is now alive in a tank.

ALTON PARISH CHURCH, CHEADLE.—The restorations and improvements are nearly, if not quite completed. In the nave of the church, which has been furnished with a new warming apparatus, all the pews have been cleared away, giving increased effect to the old arcade of Norman pillars, which dates from the twelfth century. The pews have been replaced by open stalls of oak, varnished. These are all on the free and open principle. The whole has been done by subscription. The chancel has been restored at the expense of Mr. Charles Bill, of Farley Hall.

MEMORIAL TO THOMAS STOTHARD, R.A.—During the month of March, the committee issued an address to the admirers of the works and character of Thomas Stothard, as an appeal for subscriptions towards having a bust of him executed by Mr. H. Weekes, R.A., to be presented to the National Gallery, as a companion to similar memorials of deceased British artists. That appeal has been so warmly responded to, that the committee have felt themselves justified in at once giving the commission to Mr. Weekes, who will lose no time in completing the work. Mr. William Smith, the honorary treasurer and secretary, will receive subscriptions at No. 20, Upper Southwick-street, Cambridge-square, W.

LIABILITY OF MANUFACTURERS FOR THE COST OF MOULDS EXPERIMENTALLY USED.—In an action at the County Court, Rotherham, to recover 50*l.*, value of a pattern or model for an ornamental flower-stand, supplied by Mr. Charles H. Whitaker, an ornamental designer, modeller, and draughtsman, residing in Birmingham, to Messrs. Wright & Chambers, stove grate manufacturers, Burton Weir Works, it was shown in evidence and admitted that the model, which had been delivered rather late in the season, had been used in the foundry, in order the defendant said, to test the weight of the casting in iron. It was then returned, after being broken in the packing. The judge, after hearing the case, said if he were to give his verdict now, it would be for the plaintiff; but he would read over the correspondence, and see whether this contained anything which might induce him to change his mind.

JAPANESE ALLOYS.—A writer in an American scientific journal gives some interesting facts with especial reference to the alloys in use in Japan. The first alloy given may be regarded as a weak Japanese imitation of jewellers' gold. This "Shakdo" is an interesting alloy of copper and gold, the latter metal in proportions varying between 1 per cent. and 10 per cent. Objects made from this composition, after being polished, are holed in a solution of sulphate of copper, alum, and verdigris, by which they receive a beautiful bluish-black colour. "Gin shi bu ichi" ("quarter silver") is an alloy of copper and silver, in which the amount of silver varies between 30 per cent. and 50 per cent. Ornamental articles made from this composition take, when subjected to the action of the above solution, a rich grey colour, much liked by the Japanese. "Mokume" is a mixture of several alloys and metals of different colours associated in such manner as to produce an ornamental effect. Beautiful damask work is produced by soldering together, one over the other in alternate order, thirty or forty sheets of gold, *shakdo* silver, rose copper, and *gin shi bu ichi*, and then cutting deep into the thick plate thus formed with conical reamers, to produce concentric circles, and making troughs of triangular section to produce parallel, straight, or contorted lines. The plate is then hammered out until the holes disappear, manufactured into the desired shape, scoured with ashes, polished, and boiled in the solution already mentioned. The hollow brings out the colours of the *shakdo*, *gin shi bu ichi*, and rose copper. Of brasses (*Sin chu*) the finest quality of brass is formed of 10 parts of copper and 5 parts of zinc. A lower quality, of 10 parts copper and 27 parts zinc. *Kara kane* (bell metal) varies from first quality—copper 10, tin 4, iron 5, zinc 14th, to 4th quality—copper 10, tin 2, lead 2. The best small bells are made from the former quality, and large bells from the latter.

TORQUAY.—We hear that the ratepayers of Torquay have presented a testimonial to Mr. Shaw, their late surveyor and water-works manager. It is illuminated on parchment. The inhabitants have also presented a first-class level and staff, the inscription there being,—"Presented to E. W. Shaw, Esq., C.E., by the Inhabitants of Torquay, as a Token of their Regard and Esteem." A dressing-case, for Mrs. Shaw was added.

THE RESTORATION OF WORCESTER CATHEDRAL.—The public meeting of the inhabitants of the counties of Worcester and Warwick, convened by the Right Hon. Lord Lyttelton, lord-lieutenant of the county, was held at the Guildhall. There were about 250 persons present, including the bishop of the diocese, Lord Leigh, lord-lieutenant of Warwickshire, Mr. Scott and Mr. A. E. Perkins, the architects. The dean read the report. Appropriate resolutions promotive of the object in view, and of which we have already informed our readers, were unanimously agreed to.

TENDERS

For a pair of semi-detached villa residences, at Strat-bam. Mr. Chas. E. Barlow, architect.—
Newman & Mason..... £3,900 0 0
Mason..... 3,725 0 0
Godder & Webb..... 3,625 0 0
Rigby..... 3,414 0 0

Building Land for Country Villas, with Paddock and Gardens, near Watford, Herts.

MESSERS. HUMBERT & COX are invited by the proprietor to submit for SALE by AUCTION, on June 18th next, at the 8-BEECH ARMS, Watford, at TWO for THREE o'clock, and unless previously disposed of, by private contract, the following selected and choice lots of BUILDING LAND, each being admirably adapted as a site for the villa of a gentleman, desiring to own a small place out of town, with or without a paddock, viz.:

- Lot 1. All that Meadow, with a frontage of 370 feet on the Langley-road, Watford, and a depth of 440 feet, containing nearly three acres, and surrounded on two sides by a park-pale fence, and the handsome house and grounds of other proprietors.
Lot 2. All that Meadow, nearly opposite St. Andrew's paragon-house, with a frontage of 390 feet, on the Church road, and an average depth of 270 feet, containing nearly two acres, with beautiful views on all sides, and suited for one or more villas.
Lot 3. A similar lot, with similar frontage and views, and an average depth of 390 feet, and also containing nearly two acres.
Lot 4. All that piece of Land, near to the paragon-house, with a frontage to the Church road, of 180 feet, and a depth of 200 feet, and suited for one or more villas, with garden.
Lot 5. All that piece of Land adjoining the last lot, with similar frontage & a depth.
Lot 6. All that piece of Land, having a frontage to the Langley-road of 390 feet, with an average depth of 175 feet, and suited for one villa.
Lot 7. The adjoining lot 7, but having a very extensive frontage on the Langley-road of 370 feet, and containing 14 ac. 33p. This land is situated 1/2 mile from London, five minutes' walk from, but well out of sight of, the Watford Station, whence the numerous passenger trains to Brompton Station and the city. The land looks to the east on a high bank, which is a most beautiful view, and which is of a more rural character. A few charming residences have already been built for their owners' own occupation. The whole forms a beautiful suburb of Watford, and is surrounded by Cheshambury, and many parks and seats of the nobility and country gentlemen. The walls and fences in all directions and within a mile of the property, are most varied and pleasing, the country being undulating and magnificently timbered. Season tickets, churches, gravel pits, and water, running in the immediate neighborhood of an excellent town, are among the advantages. The land is all offered for sale as laid down to permanent pasture with the finest seeds, with a crop, which water will be taken by the vendor. The vendor has sold nearly the whole of his cottage-land near the station, at prices averaging nearly 1,000 per acre; and much of the villa land is fulfilling an average price of over 500 per acre, but the reserves have been re-purchased, and will be of the most moderate description. For particulars apply to Messrs. VAI-PY & LIDDAW, 17, Lincoln's Inn-fields; or to the Auctioneers at Watford, and Palace-chambers, St. James's-street.

Forty-two lots of valuable BUILDING LAND, adjoining a first-class Station of the London, Brighton, and South Coast Railway, near Eastbourne, to BE SOLD by AUCTION, by

MR. SAMUEL SOUTHERDEN, at the ANCHOR HOTEL, Eastbourne, on FRIDAY, JUNE 7, 1867, at FOUR o'clock, precisely. The position of this property is so important for its immediate demand, contiguous to the proposed extension of the line of the railway to Eastbourne, Brighton, Lewes, St. Leonards, and Hastings, and its contiguity to the favourite watering-place of Eastbourne, at which, during the season, the demand for houses and lodgings far exceeds the supply, rendered by a very desirable investment, with every prospect of success, and a rapid development. The situation commands extensive views of the woodland scenery of the Weald to the north, the beautiful scenery of the Wealden valley and woods, backed by the verdant slopes of the South Downs to the south, and to the east the groups of the sea, between the town of Eastbourne and Langney Point. An acre of 40 lots will shortly be obtainable by applying the property, at moderate prices. Excellent arrangements have been made for an abundant supply of excellent water for household purposes, besides which there are two streams running through the estate, and description of building and road materials are easy of access, either by rail or railway. Roads, 40 feet in width, have been cut on the estate, and with an efficient system of drainage, are in a forward state of completion. Developers are permitted on estates in a liberal manner, and during the season, but an estimate on the estate has been set apart for the erection of a district church and parsonage-house, leaving the summer months open for the erection of villas daily arrive at, and depart from, the Brighton Station, and postal accommodation is in all that can be desired. Excellent facilities are to be had for the water-borne trade, either with four mules or barriels, thus rendering the situation advantageous for a sporting gentleman, as well as being a most healthy and eligible site for an extensive property and advantages of a country residence, with all the conveniences of a suburban villa, and the same may be obtained in a suburban watering-place and to the seaside—Particulars and conditions of sale, with plans of the estate, may be obtained of FRANCIS H. LILLMAN, Esq., Solicitor, R. R. LESLIE, Esq., Architect, West-quay, and S. FERRIS, Esq., London; the Auctioneer, Eastbourne; also at the Place de la Foire, and of Messrs. GILLING, BULLMAN, YEATMAN, & HART, Solicitors, 25, Chancery-lane, London.

EPPING, ESSEX.—Valuable Freehold Building and Accommodation Land, House, Coach-houses, Shop, Trade Premises, and several Cottages, situated in and upon the outskirts of the town of Epping.

MESSRS. BEADEL are instructed by the Executors of the late J. W. Whitman, esq. to SELL by AUCTION, at the MART, London, on THURSDAY, JUNE 20, at 10 o'clock precisely, in Lots, very eligible FREEHOLD PROPERTIES, comprehending some capital lots of building land, situated opposite the East and West Railway Station, and suitable for the erection of first-class shops and private residences.

The Builder.

VOL. XXV.—No. 1268.

Design, in Form and Colour, in the Paris Exhibition.

NE of the common characteristics of all nations, irrespective of progress in what is usually considered civilization, is a desire to beautify objects of use. It is scarcely possible to conceive the existence for any considerable period of a nation, a people, or even a tribe, whose clothing, implements, or weapons were entirely devoid of ornamentation; and this faculty of design, in a large number of races, appears to exist out of all ratio with their social condition, education in art, or opportunities of attaining to excellence, by contact with more accomplished nations. We not infrequently discover a purity of taste and an elaborate style of skilled workmanship existing among races whose habits are barbarous, and whose education has not yet commenced. This is an indication that a love of decoration is human, and the exercise of it independent of transmitted skill. Indeed, the infancy of a race has sometimes been a period of its greatest success in design; and future epochs in its history only served to develop some principle of government or solve some social problem, whilst its natural powers have been lost, as its acquired knowledge of other subjects advanced towards perfection. These remarks apply only to those longings and strivings after the ornamental, which are common to the human race, and necessarily are therefore inapplicable to those highest developments of this common faculty, which are dependent upon a long-continued progress in art-culture and study. Among a rude people we seldom find any outline of the first principles of ornamentation, so that their efforts are confined to decorating their weapons or implements, such as the handle of a spear or the paddle of a canoe; and as seldom find anything which is not an outrage when art-love tempts them beyond this simple exercise of their natural taste. We question whether an accurately-proportioned imitation of a human figure has ever been discovered which was produced by a people who had not made great progress in the sister arts, or who did not possess a literature and a history. It is, then, that a rational deduction of design and ornament up to a certain point of human requirements, beyond that point are accomplishments and luxuries of a conventional civilization. Consideration of these principles will lead us to see the very great importance of the cultivation of the arts of design, both to the happiness and the prosperity of a nation;—to its greatness, because had art like had food or drink, habits, or corrupt and wicked government helps to destroy a nation's character, and its principal sources of enjoyment, and retards its development; to its prosperity, because the cultivation of skill in the arts of a people closes

against it the markets of all nations save those who are richer than itself, and has a tendency to limit its wealth to the natural products of the country in which it is located. Wealth is not accumulated labour, and the highest human skill which demands and receives the greatest value and reward is the product of continued labour, and is equivalent to wealth. In ordinary conditions of society then, national skill in the fine or industrial arts means national wealth, because skill is a coin of universal currency, limited only by local requirements.

In the products of many branches of industry, the value of the material used is but a fraction of their pecuniary worth; and in none, not even in the precious metals, is the value of the manufactured article unaffected by the character of the art employed in their production. In proportion, then, to the original valuelessness of the raw material, and the difficulty of reducing it back again to its first condition or worth, the importance of skilled labour becomes evident in its production. A terra-cotta sketch, the value of the raw material of which is too small to be represented by any English coin, may become, by the application of skilled labour, worth more than its own weight in gold; and a golden chalice, moulded at a period when there was less wealth of art than of metal, may be worth only what it will fetch for the melting-pot. Beautiful stone and choice wood may be so wrought as to have even their original value destroyed, by either ignorance of art, or a too scrupulous attention to the vagaries of a whimsical and fleeting fashion, whilst upon the rudest materials the cunning craftsman may so work as to resemble the fabled touch of the alchemist, converting the grossest material into the most precious possession.

This power of design in the most developed form comes not, however, by chance, but is rather the result, as we have before pointed out, of long continued and patient labour, of favourable conditions of society, and of enlightened public action in the encouragement of the arts. To the whole human race belongs the faculty of appreciating ornament, but to cultivated nations only appertains the wealth resulting from systematic application of the arts of design. In our own country the introduction of more highly skilled labour than has previously been employed in a manufacture has increased, immediately and beyond all calculation or precedent, the money value of the objects produced. Such was the case with the pottery of Wedgwood when the skill of Flaxman was employed. The demand for the elaborate and costly race cups, shields as testimonials, and other large works in the precious metals, has really been created through the employment by firms such as Hunt & Roskell, Hancock & Co., and Garrard & Co., of the highest artistic labour that was obtainable; and such labour only has been procurable since we have recognised nationally the source of wealth we had entirely ignored by leaving art education unprovided for until comparatively recent times.

It is somewhat curious when examining the application of design in various branches of industrial manufacture, to observe how perfect may be the taste displayed in the exhibited works of a nation in some special subject, whilst other branches of industrial art by the same people may be characterised by either an absence of taste or design upon utterly false principles. This is the case with some of the exhibited works of Russia, and is nowhere more evident than in a comparison of her common earthenware pottery with her silver plate. In the Russian Court one large stand or table is almost entirely devoted to the display of rough pottery in earthenware, such as jugs, basins, mugs, ewers of various sorts, all having the prices marked, varying from a few kopecks to many, or in English money from a few pence to a few shil-

lings. The forms of these utensils are, with hardly any exception, as graceful and beautiful as anything in the Exhibition, whilst the colours of the clay and those applied to it are refined and chaste. The glaze is hard and brilliant, and can hardly be removed even by violence. We compared this rough cheap pottery with similar productions of other countries, and could find nothing which approached it in the beauty of its form or the exquisiteness of its colour. Doulton & Co., of Lambeth, deserve great praise for an effort to improve this stone ware, and exhibit some jugs, marked with such names as Cambridge, Pompeii, Doric Salisbury, Hierulaneum, which are really excellent in form and of a more refined colour than the sickly yellows and reds we are accustomed to see. But these, which are the only examples of common earthenware comparable with the Russian, fall entirely beneath them in both colour and form. It seems hardly possible to believe that the glass and plate and furniture and a chimney-piece in marble, exhibited in the Russian Court, can be the works of the same nation whose common pottery stands so high. We sincerely hope that some of the almost general announcements of "Vendit" on this Russian pottery have been affixed to them on behalf of the South Kensington authorities; for it is now impossible to secure examples of the ware, so great has been the appreciation of its excellence. In the more expensive kinds of pottery, china, and porcelain, the Russians have a meagre display, though some elaborate and no doubt costly sets of tea services in cabinet cases have high qualities of manufacture. But in design, whether in plate or furniture, or glass or fabrics, the prevailing feeling in the Russian display is that where the productions of other nations have not been copied, the ornament is rude in drawing and coarse in execution, and the forms are without grace, whilst the colours are gaudy and vulgar.

The imperial manufacture of Sevres holds its own in the larger descriptions of porcelain, vases, ornaments, and elaborately-painted china, though in the majority of its once unrivalled productions it is closely competed with by the Berlin Royal Manufactory and our own private firms of Copeland & Wedgwood. The system of design, which appears to be inevitable in all the porcelain works referred to, is doubtless contrary to all true principles of decoration, and the beautiful materials used seem to be treated for the sole purpose of obtaining costly productions. For this reason both the forms and the ornamental treatments are apparently at a standstill, and all the variety obtained is that which is arrived at by putting two different flowers on two similar plates, or varying the landscapes or figures with which the surfaces of the objects are too generously covered. Though there are unquestionably many good examples of design in some of the more modest works exhibited in the Sevres display, we prefer some of the plain white porcelain on the side-tables of the Sevres and Gobelins court to the elaborate works in the centre. The forms and manufacture of this colourless Sevres porcelain are very exquisite, and deserve the attention of the student of form. The same remark holds good of the white porcelain in the French court, exhibited by Ghis & Co., of Limoges, and by Mons. Burguin, of Coulevre. Where the effort is not to produce mere costliness, there has been more scope for design in form, and the result is that there is really nothing so purely chaste and so serviceably lovely in the more expensive productions of the French manufactories referred to, as in these modest and cheap objects. We do not hesitate to say that in these, as in the stoneware of Wedgwood and Doulton the rude earthenware of Russia and coarse pottery of Denmark, there is more of the true spirit and actual fulfilment of good design, than

In the more expensive and elaborate productions of the great porcelain factories of whatever country. It is a comparatively easy matter to design a form sufficiently good to make the background of a picture, or to exhibit the prettiness of floral decoration exactly imitated from nature; and given the power of painting, it is no difficult task to distribute rustic scenes or pretty faces or pleasing natural objects, over a tescup or a dessert-plate, so that the result shall appear elaborate, and its effect luxuriant and costly. But let an artist sit down to design a tescup, which shall be colourless and have no decoration or ornament whatever, or an earthenware jug, with the limitation of two or three colours, and no ornament, and he will find that all his knowledge and all his taste are required. For this reason we give some credit to the works in which design has stood upon its own merits, and owed nothing to the help of adventitious arts it would be better without.

It may be taken for granted that whenever designers so far forget their occupation as to reproduce objects or scenes from nature, however badly or beautifully executed, to ornament objects of common use which are given to them to decorate, it is a plain indication of the fact that to them it is easier to imitate than it is to design. And when this stage in any industrial process has been arrived at, and people are contented with it, we may expect no further development of design, but rather what we now see in the most costly porcelain, manipulative skill applied monotonously, and variety only in degrees of croneous design.

It is pleasing to turn from porcelain and pottery to a branch of industrial art in which design is of greater consequence to the value of the manufactured article, and in which it is in a more satisfactory condition, viz. wall-decoration. The improvement in the character of the design for both common and expensive wall-papers is one of the most pleasing features of the Exhibition, and none the less so because our own manufacturers occupy a prominent place in this advancement. At the time of the first International Exhibition there was no branch of furniture in which so utterly bad taste prevailed as in paperhangings, and even costliness in their price only gave us radically false principles of design in a little better style of manufacture. Since 1851, a good deal of attention has been paid by the manufacturers in selecting designs in better taste, appropriate to the decoration of wall surface, treating it as a background for the better display of works of art or the furniture of the room. Mr. Owen Jones has done good service in this direction; the excellent papers designed by him in that tempered Moorish style he has made his own, having been the pioneers to a purer style in wall-decoration. The English exhibitors, Messrs. H. W. Woollams & Co., J. Woollams & Co., Messrs. Scott, Cutberson, & Co., of London; and Messrs. Potter, of Over Darwen; and Cooke, of Leeds; all show specimens of wall-papers in the best taste, and remarkable for the excellence of their design in both form and colour. Perhaps the most satisfactory in the refinement and beauty of colour are those of H. W. Woollams & Co.; the raised patterns of Scott, Cutberson, & Co. being also superb examples of manufacture. In all the examples displayed by the firms referred to we miss the atrocious natural imitations of fruit, flowers, and landscapes, once so popular among all classes, and in place of them, a sober, conventional treatment of foliage, exhibiting considerable skill in design and arrangement, the colours used being the warm and cool neutral tints which are well adapted for backgrounds in rooms of every description. The English makers are fairly entitled to stand at the head of exhibitors in this class, for though the French distinguish themselves as much as ever in the high qualities of their manufacture, there is less of sound taste observable in their productions than in the English. In Belgian paperhangings may be observed better colouring than form or composition, the designs being too frequently in that highly relieved style which was once common with us, but which has recently given place to a quieter and better system of flat treatment.

It will be observed generally that in those classes of manufactures which include such articles as paperhangings, carpets, tapestry, furniture, all intended to be subordinate features of house furniture and decoration, much better taste prevails than has been observable in former exhibitions. A certain amount of embodiment of the national characteristics may be expected in articles of so general use in all

European countries, as paperhangings and carpets, and this can be easily detected in them. Thus the French papers are generally of a lighter colour, of more fantastic design, and richer and more ambitious in composition than the English; and in the latter we see very sober colour generally, comparatively little gold introduced, but dark reds, maroons, buffs, and drabs, the designs being severe and very usually geometric in character, and never erring on the side of a redundancy of imagination. The carpets of the two countries cannot so well be compared, the French manufacturers adhering to their very national taste in them, whilst they certainly produce some remarkably handsome works. Our own carpets show a tendency still further toward the Eastern sombre colours and simple design, so characteristic now as ever of the Oriental carpets. A carpet is of the highest character ornamentally, remembering its position and functions, when it has the least possible character as to form. Its task is to be unobtrusive and harmonising, improving the effect of the furniture, but attracting no special attention to itself. Any design for a carpet sufficiently large that characteristic portions of it may be bidden by tables or chairs, or couches; or of such high merit as a composition that we feel sorry to tread it under foot or spoil its graceful lines, is in radically bad taste. A thing that is made to be seen on account of its beautiful design, ought not to be concealed by its use; and that which is made for a purpose by which a greater portion of it will be bidden, ought not to be so designed that we want to see more of it than is exposed to the eye. In other words, subordinate features such as carpets and paperhangings must either be negative in colour and unobtrusive in design, which is their true character, or they become impertinences.

It is very gratifying that in some of the most entirely decorative portions of house furniture such good taste should prevail; and pleasing, also, that this improvement is not confined to wall-papers and carpets. In the various articles comprised under the names of cabinet-making, upholstery, and furniture generally, there is observable in the French, English, and German works, a more refined style of design, and a much higher class of art-workmanship in detail, than has been hitherto seen in previous Exhibitions. In such objects as cabinets, bookcases, &c., the most original feature in the French and English work is the very general introduction of medallions in terra-cotta, porcelain, and bronze, and of coloured details of ornament, when the object is otherwise in one kind of wood, and not ornamented by inlays of wood of a different colour. There is also apparently a greater variety of woods, in their natural colour, and of stained wood used in the manufacture of the highest class of works, now than formerly; and the introduction in some of the larger and heavier articles of the pale-green and ash-grey woods and stains, give a lightness and grace which is quite novel.

In English furniture, the Messrs. Trollope exhibit works which are remarkable for an absence of this new system of inlays, hardly any being used in their cabinet-work; but in other respects, the design and carving, though the latter is rather heavy, are highly commendable. The Messrs. Hunter, of London, use in their wardrobe and toilet-table a profusion of Wedgwood medallions, white on coloured grounds, which have a refined and pleasing effect. The same use of medallion inlays, sage-green colour, also is to be seen in the very chaste sandal-wood bookcase exhibited by Messrs. Wright & Mansfield, of London; whilst Jackson & Graham include, in rather an extensive display, some of the choicest ebony furniture, inlaid with ivory, in the whole exhibition, as already mentioned by us. The oak onboard and side table of Messrs. Holland & Sons, in the substantial old English style, are also rare examples of the use of inlays, of various materials. In all these works of English exhibitors there is an absence of extravagance, and a sound and conscientious style of design and workmanship, both in the construction of the objects and in their decoration by carving and inlays, which is very praiseworthy. The workmanship in them is unsurpassed, and the designs in their general composition, use of enrichments, and architectonic spirit, together with their adaptation to purpose, are a great stride upon anything yet exhibited by this country. It seems to us a matter of regret that almost all the most elaborate objects, both in the English and foreign furniture, should be in so dark a wood as ebony. There is, of course, the

answer that fine work must be in hard wood in order that a good surface may be obtained to take the finish, and an absence of grain allows of the centring of delicate parts. But these qualities are obtainable in lighter hard woods, such as box-wood, and the carved enrichments show infinitely better in them than in ebony. Though the French exhibit a fine collection of furniture, and are as fond of ebony as a material, they manage to relieve it from the sombreness of effect caused by the darkness of the wood, by a variety of methods. Thus it is not uncommon to see an ebony cabinet, the edges and projections of which are protected by brass, the hollow mouldings enriched by electrolyte friezes, in copper or silver, a fretwork of ivory inlay developing the principal lines of the design, and, at intervals, coloured enamels introduced in the panels. In some cases only one or more of these materials are used; but hardly any of the most elaborate works are without either bronze enrichments or enamelled medallions. The walnut-wood cabinet of Fourdinot is among the most tasteful of the French works, and is an instance of the use of stones of various colour as inlays. The design and carving of this cabinet maintain the high reputation obtained by the artist so long ago as our own Exhibition of 1851. In this, as in the best works exhibited by France, there is less disposition to over-relieve the ornament, but rather to let parts of the construction serve the purpose of breaking up the masses in the composition, leaving the surken portions to be ornamented by carving. In the ebony bookcase of Genrot Frères there is, perhaps, some of the best work, as far as technical manipulation goes, that can be seen in the French department, but there is a profusion of carving, which destroys the otherwise good design. Better in every way is the thermometer case in pear tree, by the same firm, the carving of it being minute and wonderful, and the composition effective. Of the remainder of the French display, the following are worthy of examination:—No. 49, Ebony cabinet, inlaid with enamel, by Sormani; No. 50, Bookcase, in different coloured woods, and inlaid with the same, by Gerson & Weber; a bed, by Roll, of Paris, No. 30, valued at 1,000*l.*; the bedroom furniture of Clère & Drapier, in pale green wood, as well as their ebony cabinet; and, lastly, though by no means least, the "Meubles de luxe" of Diehl. In the works of the last exhibitor, there is an extensive use of bronze and silvered bronze, together with wood inlays, most tastefully introduced, and having a superb effect. We would especially direct the attention of art-workmen to the cabinet to contain coins exhibited by this maker. It is in oscar wood, the drawers being in walnut, and the mouldings, which are not elaborately carved, being enriched by bronzes or electrolytes. For this cabinet the maker asks the trifling sum of 2,200*l.*

In these articles of luxury, we do not see the great superiority in design or workmanship of the French so much as in 1851 or 1852. Our own makers have steadily progressed, and now compare well with the exhibitors of any country. There is certainly even yet to be seen the imperfect struggling after a high standard of drawing in our carved work, and this will be so until our workmen can draw as freely as French workmen.

The furniture exhibited by the Italians is characterised by very great profuseness of carving, which is on the whole well executed; but the designs are heavy and tasteless. The ornament is coarse and in high relief, made too important in many cases, as in the picture and mirror frames in the Italian Court, where from its prominence in relief and the largeness of its members, the frames appear simply as a collection of ornamental details, and the construction disappears under a crowd of carving. The same undue importance of ornament is observable in the Belgian furniture, though in a less degree. A nation producing the elaborate pulpits which the Belgians seem so proud to exhibit, can hardly be expected to fail in the manipulation of wood, and consequently we see a very masterly treatment of the material in all the Belgian works; but little can be said of the skill shewn in the designs which this manipulative power is exercised upon. It is refreshing to see even the simple and comparatively rude designs of the Danes, after the very elaborate compositions of the Belgians, though the furniture of the former is inclined as far to the opposite extreme of meagreness of ornament as the latter is to profusion. To the Belgians art seems a necessity recognised so long that the country is a museum of the churches picture-galleries, and every provin-

THE SOUTH KENSINGTON SECOND NATIONAL PORTRAIT EXHIBITION, 1688-1800.

"THE Science and Art Department of the Committee of Council on Education" has done good work in collecting for the use and service of Great Britain and "elsewhere," a "second special Exhibition of National Portraits, commencing with the reign of William and Mary, and ending with the year 1800," the *fortieth* of the long reign of the grandfather of Queen Victoria," though, strange to say, the exhibition has been made to contain, pleasantly enough, "counter-presentments" of men and women, known to our comparatively young sovereign. One example will be enough. Here we find Sir Thomas Lawrence's very fine portrait of the *Reform Bill* Earl Grey, who died as recently as 1845, when "Victoria R." had been long on the throne of these countries.

In all we have at South Kensington 866 portraits, from full-lengths to Kit-Kat, and all of interest to the many who carry information with them, and are prepared to carry information away with them. When (as at South Kensington), we have placed before us examples of the art of Sir Thomas Lawrence, whom so many still remember alive in then fashionable Russell-square, we feel that we are with the dead, and can occasionally recall to life (and with pleasure), those whom we have seen as they moved in the flesh, and as they spoke, or attracted attention, in public or in private life.

In this collection (of which we are now speaking for the second time), it is delightful to find 154 examples of the Great Master of English portraiture—Sir Joshua Reynolds; forty-eight examples of his Rival and Friend, Thomas Gainsborough; followed historically and ably by specimens of Hoppner, Owen, Raeburn, Phillips, &c., and fourteen examples of Sir Joshua's grandson in the presidency.—Sir Thomas Lawrence.

A committee, however active and well-informed, could not fall in having to encounter a difficulty where and when to draw a margin or line, when to begin or where to leave off. Thus we find—and are not displeased in finding—four portraits from the pencil of Sir Peter Lely, who died in 1680 (eight years before William and Mary sent father-in-law and father, "a packing"), and *forty-nine* from the easel of Sir Godfrey Kneller, who died in 1723, in the ninth year of the reign of our first Hanoverian King.

A defect of the catalogue is, that it lacks an index of painters and persons painted. How is Sir Peter Lely represented? The catalogue does not condense to tell us. Let us learn for ourselves. We have *four* examples:—

14. Roger North, the charming family biographer. Lent by Mr. J. T. Gibson Craig.

23. Sir Isaac Newton, when young. Lent by the Earl of Dartrey. A picture too little known.

49. Anne Digby, Countess of Sanderland. Lent by Earl Spencer.

75. Henry Sidney. The handsome Sidney of De Grammont's Memoirs. Lent by Earl Spencer.

We could have wished to have seen Lely's "Cowley," the poet, and Lely's "Wycherley," the dramatist, both from Drayton Manor. How is it that our *third* Baronet of Tamworth, Sir Robert Peel, is so selfish? He did not even send to Manchester. Are the pictures at Drayton and Whitehall *immortal*?

From Sir Peter Lely it is a natural descent in art (we write heraldically) to Sir Godfrey Kneller. What has President the Earl of Derby, and his "Committee of Advice," done for us towards an education in English Historical Portraiture? Much we admit, and are thankful for, but there are omissions and oversights, possibly to be corrected and supplied hereafter.

"Students" (more than that) of what Mr. Murray calls "Student's Humes," and "Student's Mrs. Markhams," will enjoy a thorough reading of Kneller's contributions to the gallery at South Kensington. Here they are, with the numbers prefixed, and a running commentary of what may be remembered. Sir Godfrey opens the exhibition.

Sir Godfrey Kneller's Portraits at South Kensington.

1. Godard De R. Kinkell, first Earl of Athlone.

6. Grewe, Bishop of Dnrham. He was Kneller's neighbour and fellow parishioner in Covent Garden; and was plagued (as the Parish Registers of Covent Garden testify) with newly born "Tom Joneses" deposited at his door.

9. Mrs. Anne Pitt, one of the maids of honour to Caroline, Queen of George II., and sister to the first Mr. Pitt. She was a wit. A little anecdote will illustrate this. Dr. Johnson's Lord Chesterfield, in the latter part of his life, called upon Mrs. Anne Pitt, the sister of the great Minister of that name, and complained very much of his bad health, and his incapacity of exerting his mind. "I fear," said he, "that I am growing an old woman." "I am glad of it, my lord," replied the lady; "I was afraid that you were growing an old man, which, you know, is a much worse thing."

We resume our Kneller numbers.

15. Lady Middleton. A Hampton Court "Beauty," from Hampton Court. We could have wished that the Committee had chosen Lady Ranelagh instead, for the sake of Fielding, Tom Jones, and—Sophia Western. See Fielding's "Tom Jones."

24. Tillotson. Archbishop of Canterbury (from Lambeth Palace). We may add to what the catalogue says, that Tillotson was the first English prelate who wore a wig.

27. Duchess of Ormond. (Lent by the Duke of Beaufort.) She was a Somerset, and the cataloguers might have added with advantage, the wife of the second and last Duke, and daughter-in-law to the gallant Osory, known to all who read Dryden.

30. John Locke. (Lent by Lord Sherborne.) Signed and dated at back "1697." We were glad to become acquainted with this little known picture, though the features of Locke are well-known.

32. Pridéaux, Dean of Norwich: died 1724. This is doubtful.

33. Sir Isaac Newton. (Lent by the Earl of Portsmouth.) Dated 1689. Compare the Thornhill, No. 35.

37. Gilbert Bernet, Bishop of Salisbury. Lent by the Earl of Hardwicke. Genuine.

40. John Locke. Lent by Christ Church, Oxford; the College from which he was expelled—properly and improperly.

42. Elizabeth Percy, Duchess of Somerset.

52. Charles Montagu, Earl of Halifax. A great man who, by preferring Addison to Pope, will live in immortal English verse.

56. John Sheffield, Duke of Buckingham (died 1721). Should be Buckinghamshire. The cataloguer tells us that the duke is "holding a plan." We may add, for the information of some at "Buckingham Palace," or "Our Palace at Picnic," that our poet-duke holds two grand-plans of "Buckingham House," one room inscribed "18 feet high," the other (a hall?) inscribed "15. 6."

57. John Dalrymple, 2nd Viscount and 1st Earl of Stair.

58. Secretary Sir Joseph Williamson.

60. William III. (small full-length).

61 and 67. Thomas Betterton, (61) the actor, by Pope, the first after Kneller; and 67, the original, No. 67, at Knowle, in Kent (the Countess Delawarr's; and No. 61, at Caen Wood, Middlesex (the Earl of Mansfield's)).

Pope,—more than "possessed" with a thirst for knowledge,—was by his mother's side nearly related to Samuel Cooper, the celebrated miniature painter. He himself studied a little under Kneller, and was a collector of pictures. Would the same genius that made him a great poet have made him a great painter?

Colley Cibber reminds and informs his "Apology" readers (present and to come), that there is a mezzo-tinto of Betterton after Kneller "extremely like him." (Cibber's "Apology," p. 98, 2nd ed. Svo. 1740.)

65. John Dryden, lent by Mr. C. B. Dryden.

* * * This we more than doubt; and we have paid great attention to the *received* portraits of the great poet.

69. The father of Pope's Lord Marchmont.

76. Secretary Sir William Trumbull, one of the principal secretaries of state to King William III. Pope's fine epitaph in verse on Trumbull recurs to us.

77. Sir Robert Southwell, Secretary of State to William III.

78. Sarah Jennings, Duchess of Marlborough, wife of the great duke. Lent by the Duke of Marlborough. The cataloguer calls her Sarah "of Sandridge, co. Hereford." For Hereford read Hertford. The great Duke was created Baron Sandridge. Oh, the time and money we have spent in Hertfordshire, and elsewhere, in seeking to find when and where Sarah Jennings, daughter of Sir John Jennings, of Holywell, in St. Alban's, was married to Colonel John Churchill (son of Sir Winston). Of the early

cial town an academy of art, in which from the Middle Ages the artist youths and art workmen have studied and drank in art culture just as we in England fall down and worship the goddess of money-making. But to the rude and simple Danes art is a luxury, and in their furniture and other branches of industrial art ornament seems to be regarded as a garnishing of the most necessities, recognised as the requirements of refined people, but employed very sparingly. If we only had the Danish display of art in this Exhibition as data, and were required to judge of the character of the nation exhibiting it, the decision must inevitably be that the Danes were a primitive and severe people, regarding art as an indulgence and an indication of weakness.

The visitor who is disposed to examine the attainments in art of a people of long-continued culture, should by no means miss the Prussian notice, especially that exhibited by König, of Berlin. Without being ambitious of the most sensational effects, the art shown in his works is perfect in refinement and grace. In the ornamental porcelain displayed there seems to us to be a delicacy of colour, neutral generally, though sometimes launching into more brilliant tints, which compares well with the Sevres and English works. The art of design in form appears to be studied thoroughly, and colour added as an accessory to develop form, rather than as an apology for its absence or its rudeness.

The cabinet work from Dresden is also well worthy of notice, especially the ebony jewellery by O. B. Friedrich, and the coin cabinet of J. A. Türpe.

In the precious metals design is becoming more and more an element which is required to receive, and does receive, attention. It seems to us that in race-cups, tazzas, and large works in the round, our own silversmiths stand pre-eminently; in shields, and all works requiring bas-relief of figures, scenes, and historical subjects, the Germans excel; whilst, in the design applied to objects of use, such as domestic plate, the French display more taste and aptness of design than any other nation.

Regarding the subject of design from a general point of view, both as to its application in industrial processes and its condition in all countries, we judge from the examination of its application upon all objects that progress in refinement is undoubtedly being made. The character of the art element, and the manner of its application in the various manufacturing processes, is getting to be better understood and refined; and we see less of the peculiarities or necessities of one process imitated as a matter of taste in another, of which these peculiarities are so characteristic. Thus, in paperhanging, designers have given up the freak of imitating square notched lines which are necessities in woven fabrics, and rely more on the capabilities of the different process in the manufacture of paper staining itself, developing a style of ornament and an arrangement of colours adapted to block-printing. Some improvement is also observable in the productions of the principal nations exhibiting in the matter of purity of style, and the application of original ideas of varied variations in the use of any historical style it may have been adopted. There is more of stem, of consistency, and of developed thought the manner in which a style has been used, the majority of the best works; though, if a trifling feature be unmistakably impressed upon the highest works, it is that they shall be subordinate as design can make them, beautiful, but costly beyond all precedent.

There is lamentable luxury evidenced in too many of the exhibited articles of all the great European nations, a sort of feverish desire to make things as expensive as possible, even though the beauty of the things themselves be sacrificed by this excess of ornament. The only exception to this art-plague is the ecclesiastical and decoration in the English department, which may be observed the union of good design and excellent workmanship, without the inclusion of ornamental features which is to be seen elsewhere. To this subject we shall recur, the Ecclesiastical and Domestic work being of too important a character to be dismissed at the end of a notice of the general condition of design. There is, however, in the Exhibition a sufficiently prominent indication of improvement generally, in design, to be very hopeful for the future; and we anticipate a more decided progress in design in the next few years between this and the last International Exhibition, than even in the interval between 1851 and 1862.

life of the great Duke of Marlborough little or nothing (sad to think) is known.

82. Sarah, Duchess of Marlborough and Lady Fitzhardinge. Lent by the Duke of Marlborough. Signed "G. Kneller, fe. 1691."

85. Queen Anne's son, the youthful Duke of Gloucester. Lent by Mr. J. Fairfax Chinnery.

87. John, Duke of Marlborough, and General John Armstrong. Lent by the Duke of Marlborough.

88. Prince Eugene, of Savoy. Lent by the Duke of Marlborough.

89. Sarah Jennings, Duchess of Marlborough.

90. The same, "supporting her long hair with right hand." Why did not the cataloguer tell the ladies, at least, the charming story of the Duchess cutting off her hair to vex her husband?

91. Ladies Henrietta and Anne Churchill. Here an extract from Colley Cibber's Apology would come in to good purpose.

96. John, fourth Baron and first Earl, Polet, K.G. Lent by Mr. Baldwin J. P. Bastard.

98. Lord Treasurer Oxford. Lent by the trustees of the British Museum. A more interesting portrait, holding the Succession Bill, is at Welbeck—the Duke of Portland's.

99. Sir William Wyndham—the Wyndham of Bolingbroke and Pope. Here the cataloguer rightly favours us with a quotation from Pope.

100. Pope's Lord Peterborough—looking from his left heretically. Lent by Mr. W. B. Stopford, and very fine. There is a finer portrait of this heroic and romantic nobleman at Burghley House, the Marquis of Exeter's.

101. Lord High Treasurer Godolphin, with his staff. Lent by Earl of St. Cermain's. We have seen finer heads of the Lord Treasurer than this example.

104. "Cranville the Polite," of Pope. Lent by E. V. Keene, LL.D.

108. James, first Earl Stanhope. A gift to the National Portrait Gallery from Earl Stanhope, President of the Society of Antiquaries, and a noble contributor to modern English history and biography.

111. Sir Richard Steele,—the famous Kit-Kat Jacob Tonson picture.

112. Sir John Vanbrugh, another of the same far-famed set.

114. Addison's Countess of Warwick. Lent by the Earl of Bradford.

115. Addison,—the famous Kit-Kat Jacob Tonson picture.

116. Congreve. The same remark.

117. Diamond Pitt, grandfather of the first Earl of Chatham.

118. The first Marquis of Wharton, a famous Kit-Kat Jacob Tonson picture.

119. Charles Dartmouth,—commemorated by Pope. A Kit-Kat Club picture.

120. Sir Godfrey Kneller himself. The cataloguer tells us that Sir Godfrey was "hurried at Whitton, near Hampton Court." The parish register at Twickenham records that he was "buried at Twickenham," November 7th, 1723. There is no church at Whitton.

122. Sir Spencer Compton, Earl of Wilmington, a Kit Kat Club picture. The visitor may like to be reminded that Thomson dedicated his poem of "Spring" (one of "The Seasons") to Speaker Compton.

123. Charles Lord Mollu, killed 1712, in the famous duel with "Duke Hamilton." The catalogue informs us that Lord Mollu was buried in Westminster Abbey. In what way this is to be reconciled with the *burial register* of Totteridge, in Hertfordshire, we are not able to say. The register of Totteridge records his burial there. (See Lysons's "Environ's" under "Totteridge," vol. iv., p. 46. 4to. 1796.)

And thus ends the catalogue of the *Knellers* in this most interesting and instructive exhibition. We shall probably have something to say on the "154" Sir Joshua's; for this South Kensington gathering is not for a season in memory and interest, but "for all time."

DISCOVERY OF A SILK PLANT.—The Department of State at Washington has received information from the United States consul at Lambayeque, Peru, that an important discovery had recently been made in Peru of the silk plant. Preparations were being made to cultivate it upon an extensive scale. The shrub is 3 ft. or 1 ft. in height. The silk is inclosed in a pod, of which each plant gives a great number, and is declared to be superior in fineness and quality to the production of the silkworm.

STONE CUTTING AND FACING MACHINERY.

An interesting paper on new machinery for cutting, tunnelling, quarrying, and facing slate, stone, and marbles, was recently read by Mr. W. Fothergill Cooke, at the Society of Arts.

This machinery, said Mr. Cooke, depends chiefly for its efficacy on the peculiar forms of the cutting tools or moveable teeth; firstly, in the application of them as attached to holders or sockets fixed in the edges of the blade, instead of the blade itself forming the cutting edge; and, secondly, as applied to the circumference of cylinders for surfacing. The tools, or cutting-teeth, are, in consequence of their being movable in the sockets, easily replaced as required without any reduction of the diameter of the blade, which so soon renders the circular saw, when applied to the cutting of stone or slate, useless. These moveable tools or teeth are capable of application to machinery for a variety of purposes; firstly, to the sawing of blocks and slabs of rock of considerable thickness, for building or other purposes; secondly, for facing the surface of squared-up stones in an ornamental manner; thirdly, for tunnelling, for undercutting stone, slate, or coal *in situ*, where the rock lies more or less on the incline, and also for the vertical cutting of the living rock almost as readily as a haycutter cuts hay out of a stack.

These moveable tools, held in movable sockets, are, as I have said, the distinctive features of this machinery, and they are exclusively the invention of Mr. George Hunter (now of Maentwrog, North Wales). "Hunter's saws," with the improvements which have rendered them so effective for many purposes, and as it is known to many now present that my own name is united with Mr. Hunter's in several recent patents, I will observe that my share has chiefly consisted in extending the application of the movable tools and tool-holders (the real essence of his invention) to fresh and wider fields of usefulness, whilst the art of adapting the machinery to each novel application, and in so doing producing an entirely new result, has fallen upon the inventive genius and mechanical skill of Mr. George Hunter.

The movable cutting tool, now most in use, is a hot made of the best rod steel: the head is forged into a cupped or trumpet form—turned, and then hardened. When in use it is simply slipped into its socket, which is also made of steel, and wedged tight by a piece of paper or a thin shaving of wood. When the edge is dulled or chipped the tool is turned in its socket so as to offer a fresh cutting margin: and, as it wears away chiefly on the advancing side, the tool will generally offer three, sometimes four, fresh surfaces before it is worn out. These tools, according to the circumference of the saw blade, are cutting from 4 in. to 8 in. long, and the cutting head itself from half an inch to one and a quarter inch wide. The length of the bolt allows of the tool being softened, again set up, turned, and hardened, until it is too short for further use.

The stems of the sockets are of the same thickness as the blades that receive them, and are slipped into grooved openings in the margin of the blades, to which they are fitted with accuracy by machinery. As the blades revolve slowly, the tools are naturally replaced, or merely turned round in their sockets when necessary, without stopping the machine, and should thus be kept always in good cutting order. The cupping, shaping, and tempering of these tools require modification in each case, to adapt them to the texture of different kinds of stone. Limestone and sandstone, for example, cut away in large chips, whilst slate has to be scraped away, and the tool must be made to suit each case.

The next tool to which I will direct your attention is formed by the double action of a punch. The first action cuts out a round disc from a plate of steel, like the punching of a boiler plate; the second action converts the disc into a tool precisely similar to the head of the bolt-like tool just described, only ready cupped and sharpened, with a hosa behind, to fit into a corresponding groove in the back of its holder, and with a hollow in front for a nipping bolt, or pinching screw, to grip it. These discs, so punched into the exact form required, only need tempering to be at once fit for use. The holder of the disc-tool grasps it between (as it were) its finger and thumb with perfect firmness, and as the cutting rim projects only very slightly beyond the holder, it offers very little leverage to the resistance of the stone, and never gets

loose or displaced. Either of these forms of tools may frequently be used for the same object, but each has its specific application as well.

Another form of tool, equally simple in its character with the last, but peculiar in its adaptation to a distinct purpose, is formed out of a symmetrical, acute-angled trapezium, cut from a bar of steel, two or three sixteenths of an inch thick, according to the roughness of the work it has to do. To convert these slips of steel into the required form of tool, they are bent sharply on their middle, so as to bring the acute angles opposite to each other, but slightly turned out at their cutting angles.

These tools are cut from the ribs of steel without any waste, and if not left sufficiently sharp by the shears, a number of the flat slips are screwed up together in the vice, and sharpened by the file; they are then bent and hardened, and are fit for use.

The socket for this form of tool is extremely simple; it is merely a hole into which the tool slips, and in which it is held by the spring of its own arms. The chief use of this tool will be the roughing down grindstones, and scarifying the rough surface of slate and stones, preparatory to the facing tool; and it is, perhaps, the best form of tool for under-cutting coal.

In addition to those already described, there are flat, concave, and other formed tools, all adapted to the holders, for giving ornamental and apparently hand-tooled surfaces to ashlar, quoins, sills, &c.

For cutting window-sills, door-posts, steps, coping-stones, and a host of other building materials, out of rough blocks of slate—which were formerly necessarily thrown away as useless, because there was no means of working them—we employ now in Hunter's saw three or four blades of 4 ft. diameter, all cutting at the same time upon the same axle. These blocks, frequently 12 to 16 in. thick, and weighing several tons, are simultaneously reduced to five thick slices, and immediately split up into the required thicknesses for planing, or tooling, as most suitable. An immense amount of paying work is thus turned out of rock formerly all thrown away, and still accumulating by thousands of tons yearly on some of the giant and wasteful rubbish-heaps of the Welsh slate-quarries.

Under a recent improvement, we use a succession of tables always advancing, on which the blocks are prepared before the saw is ready for them, which saves the time of running back the table, unloading, and preparing another block. The next application of the movable cutting tools differs but little in principle from the last, but is productive of very different results. The axle of the cutters is above the table, but capable of being raised or lowered, as the cutting tools are in the ordinary engineer's plane. Instead of two or more blades fixed on their sliding collars, carrying an array of cutting tools on their peripheries, as in the saw, the axle itself, or a removable cylinder slipped on, or bolted in halves to the axle, receives the tools.

The object of the machine now under consideration is to give a finished surface to building or other stone of a more or less ornamental character; and breadth, not depth, has to be cut. The tools are fixed in holders, placed spirally round the axle or cylinder, so that a divided and regular pressure may come upon the face of the stone at intervals of two or three inches, always nearly uniform, but ever passing spirally from right to left. In the specimens of ashlar shown, the tools formed one spiral, each fourth tool cutting at the same time, and six tools were entering into the cut as other six were leaving. A double spiral, in which the tools followed each other more closely in their cut, would have given more uniformity of strain, but could hardly have produced a more perfect piece of work. The fluting here produced may be varied without limit, or the margin work may be carried over the whole surface. By the introduction of a second cylinder, the beginning and end of each stone will receive a border across the stone corresponding to the long margin of whatever pattern it may be. For fluting, or simular work, the punched tools have a great advantage, whether of the disc or flat-faced form, as they are always of exactly the same diameter, and produce uniform work. The marginal tool may cut off a chamfer, if required.

Anything that parallel working tools on a revolving axle can execute, will be done readily by this machine, and on a larger cylinder tools of different shape may work along the same line so

as to vary a running figure, by alternate markings. In fact, the outline of work thus produced seems unlimited, and ornamental figures, that this machinery cannot complete, may yet be prepared by it in outline ready for the sculptor's hand. Take the instance of a Gothic church window. The perpendiculars would be easily cut out in any running pattern, on a straight moving table, by a series of tools corresponding in their forms to the required surface.

The roughing-tool can be made to imitate the marks of a pickaxe in rustic stone work with the usually chiselled work around it. Some of the patterns of flat tooling by these machines can be made to imitate chisel-work so closely as to be distinguishable alone by the finer finish given by the machine. The finer kinds of lime-stones, including especially those of the Isle of Anglesea, receive almost a polish from the cutters.

A class of stone rarely or never seen, I believe, in London buildings, but much used in the best buildings in North Wales and some parts of England, the tertiary limestone, is very durable and cheap, and takes an excellent face, almost approaching to a polish, under the new tool. Sandstones, Portland, Caen, and Bath stone, are all much softer and mostly less durable than limestone, but not more easily worked. The harder stones, including the granites and granite-like rocks, cannot be operated upon by this machinery at all.

These machines will be of moderate weight except when required for the facing of massive blocks, and a very small power works them, so that they could be sent about the country to prepare the stones for a building on the spot, where an equivalent complement of masons could only be obtained by collecting them from great distances.
