Messrs. Dent & Co. protest, too, against the decision; and so with others. The Rochdale Pioneers claim the prize of 4,000*l.* offered for the organization best calculated to promote the welfare of the working-classes, and think themselves shamefully used because the Commissioners, overcome by the difficulties which surround the adjudication, determine on making no award. Some of the French exhibitors are also calling out for explanations. On the other hand, several of our advertisers, Mr. Thomas Peake for example (*Tiles*), Clark & Co. (*Revolving shutters*), are proud to find that medals have been awarded to them, and would have it made known.

The very early intimation that we gave as to the award of medals to English architects has been seen to be correct.

ACCIDENTS.

An extensive conflagration has happened in Bermondsey, reducing to ruins property valued at several thousand pounds sterling. The disaster occurred on a piece of ground in Riley-street, on which were erected the manufacturing premises belonging to Mr. Benjamin Wells, builder and joiner. Before the fire was extinguished the five floors of the factory were burned out, the roof destroyed, the timber in the yard severely damaged by fire, &c.

At Sandbach, during a thunderstorm with rain, the water rushed down Hawk-street in such large quantities that the main sewer gave way, and undermined a house. A hole first appeared in the middle of the street, and rapidly increased, till the foundation wall of the house gave way and brought the whole side of the house with it. The inmates escaped, but articles of furniture were carried away. The sewer was built two years ago, and about a month ago a coal-cart, with a full load, got fast in a hole. The same cart ran a very close risk of getting in again while passing over it just a few minutes before the giving way, but this time unloaded. Mr. Stringer (who was contractor for the work in the first instance) procured a number of men who, by placing tim-

bers, prevented the damage extending to the next door house, the tenants of which had turned out. On the same afternoon as this happened, a wall fell at the Sandbach Baths, which occurrence, however, had nothing to do with the sewerage, but was due to the stoppage of a drain and the heavy rain.

One of the carpenters engaged on the cupola of Zion's Church, on Ohio-street, Indianapolis, fell from the spire while engaged in raising the framework of the steeple. He stepped by a ladder about 115 ft. from the ground, missed his foothold, and in falling struck upon the roof about two-thirds of the way from the comb to the eaves, breaking through the slate tiles and sheathing, and bouncing upon the roof of the two-story frame house just west, and thence to the ground. Strange to say, he was not killed outright, but was still alive, although no hopes were entertained of his recovery.

INTERNATIONAL COLLEGE, SPRING GROVE, LONDON.

We mentioned briefly the other day that the first stone of this building, previously described and illustrated in our pages, had been laid. Let us add that the decorations to ceilings and walls in the interior are being executed by Mr. Lovegrove, of Spring Grove; that the grounds are being laid out by Mr. D. Chester, of North-street, Lisson-grove, who presented the *Wellingtonia Gigantea* which the Prince of Wales planted; the spade (silver and oak) used on the occasion being supplied by the Messrs. Mappin, Brothers. The furniture and fittings are being supplied by Mr. F. Moeder, of Tottenham-court-road.

THE BRICK CHURCH, ST. SAVIOUR'S, ABERDEEN PARK, HIGHBURY.

The parochial district, St. Saviour's, Aberdeen Park, in Highbury Grove, London, has been formed co-extensive with the estate of the Rev. Prebendary Morrice, vicar of Longbridge Deverill, who has at his own expense erected the church here delineated to meet the needs of the rising population. The plan of the church is cruciform, consisting of a long chancel, with chancel aisles, a lofty central lantern, and transepts, nave, and aisles, and two porches. It follows somewhat the style of the Early Decorated. The nave has a lofty clearstory. The exterior view is taken from the direction of the main approach. The church stands in a large open plot of ground bounded by the road in front of an incomplete circus of semi-detached houses. It is entirely of brick within and without, and is covered with Staffordshire strawberry coloured tiles; the stonework, which is from the Ancaster quarries, being limited to the tracery of the windows and some of the mullions, the capitals of columns, the corbels, and crosses. Even the copings of parapets and gables are of tile, from Bridgewater. With the exception of the local stocks below the plinths, the whole of the bricks are from Aylesbury—red and buff, with a few grey headers. It presents generally a reproduction of the Early Medieval work, the bricks being long and thin with wide joints, and a mode of bond has been adopted like that prevailing at Bruges in the old buildings. The peculiarity of it consists in the wide side joints, and in the mode of alternation. The courses are alternate headers and stretchers, but the stretchers are placed, not over each other in their successive courses, but over each other in their alternate courses; whilst the headers come over each other in their bonding throughout. This in itself forms a sort of diaper pattern. The side joints are about 1½ in. wide between the headers, and barely as much between the stretchers.

And this arrangement affects also the design of the diaper patterns, which are confined almost exclusively to the gables and to bands at top of spring of windows, and under the parapets. These diapered patterns and bandings, though somewhat varied, are carried out after the same manner inside as out; and being confined to such salient parts as those enumerated, there is an absence of that striped effect often painfully conspicuous in modern work. But in addition to this, the buff bricks being burnt of clay from the same locality as the red, have a sufficient warmth of tone about them to escape the harsh and startling contrast of colour which

* To be continued.

INTERIOR OF ST. SAVIOUR'S CHURCH, HIGBURY.

apparently is considered in these days a great desideratum. In all cases where bricks are brought from different localities, and present a strong contrast in colour, it is needful to take the greater care to introduce much more sparingly and cautiously the contrasting colour, whether light or dark, into that to which it is intended to serve as a "dressing." Colours may be blended in almost equal masses; but if they are strongly contrasted there must be a strong preponderance of only one colour relieved, not crudely and recklessly, but delicately and carefully by the others.

The general effect of the brickwork externally is that of massiveness and repose; but internally the largeness of joint both in width and height, following as it does naturally, if not necessarily, that of the exterior, presents an amount of roughness not altogether pleasing. The eye craves for more finish and delicacy of texture for interior work, though this may be purchased at too extravagant a cost. But in the present case the roughness will be nearly, if not entirely, neutralized, when the original idea is carried out of having the whole of the walls diapered in colour, with the brickwork for a ground, in precisely the same manner (though of different

design) as the walls at the east end of the chancel, on either side of the altar.

The bricks measure $10\frac{1}{2}$ in. by $4\frac{1}{2}$ in. by 2 in., and it may be interesting to know that they cost at Aylesbury exactly the same in proportion to their cubical contents as the common Aylesbury brick, viz., 30s. per thousand, and the moulded bricks, 50s. It will be seen from this that the difference in cost for arches, &c., between brick and the most available stone, would be as about 1 to 6 or 7. The question of the employment of brickwork for churches is important. It is true that internal plaster surface, such as that commonly used in Medieval times, is the easiest and cheapest mode of finish. Plaster is, likewise, even more susceptible of decorative painting; but for arches and other structural features plaster is inadmissible excepting in the case of square soffits built of rough rubble stonework in certain localities; and it is certain that, until decoration can be provided, the baldness and coldness of plaster is less pleasing than the warmth of colouring obtainable by brickwork. Experience, moreover, shows that it is in vain to seek at present for any extensive revival of colour in churches.

The pillars supporting the arches are built of

Staffordshire pressed brick. The smaller shafts generally, both attached and detached, are of Aylesbury brick, with structural bondings. The open parapets of the church are built of tiles made for the purpose. The ceilings of the sanctuary and lantern internally are groined in wood, with ribs and match-boarding for future painting. The bells are hung in recesses outside the western gable. A baptistery, containing a carved and canopied font is formed in the western bay of the south aisle. The pulpit is of polished red and grey Aberdeen granite, with caps carved in white alabaster. The church is built to accommodate about 400 persons. The chief portion is open benched, but chairs are provided in the space at the west end in the chancel aisles. The seats are placed upon a floor of wood blocks, the passages and chancel being paved with Minton's tiles. The chancel is chorally arranged, and a lectern and Litany-desk are provided in the nave. The reredos is canopied in stone with three panels beneath, representing the two SS. John, and the Agnus Dei on a cross, with the Evangelist's symbols round, painted in the process developed by Mr. Gambier Parry. These are from cartoons by Mr. William White, F.S.A., of Wimpole-street, the architect of the church.

ST. SAVIOUR'S CHURCH, ABERDEEN PARK, HIGHBURY.—MR. W. WHITE, ARCHITECT.

NATIONAL ASSOCIATION FOR THE PROMOTION OF SOCIAL SCIENCE.

The annual meeting will be held this year in Belfast, from the 18th to the 25th of September, under the presidency of Lord Dufferin and Clarendon, Lord Brougham remaining president of the council.

In the health department, president, Sir James Y. Simpson, bart., M.D., the following special questions are named for discussion:—

- 1.—What measures are necessary to secure efficiency and uniformity in the working of the Sanitary Laws throughout the Kingdom?
- 2.—In what respects do the registration systems of England, Ireland, and Scotland need improvement? and is it desirable that they should be assimilated?
- 3.—In what form, and to what extent is it desirable that the public should provide means for the recreation of the working classes?

The following are also suggested as suitable subjects for voluntary papers:—1. Improvement of the dwellings of the labouring class. 2. The supply of trained nurses. 3. Town and domestic water supply. 4. Infantile mortality.

In the department of economy and trade, president, Sir Robert Kane, F.R.S., the special questions for discussion are:—

Section A.

- 1.—What legislative or other measures can be adopted to improve the relations between landlord and tenant in Ireland?
- 2.—What are the economic results of the continuous emigration from Ireland?
- 3.—Should the Local Government Acts be extended to Ireland?

Section B.

- 1.—Can any measures be taken to develop and extend the manufactures of Ireland?
- 2.—What action, if any, ought the Government to take with regard to railways?
- 3.—How may the extension of the Irish fisheries be best promoted?

There seems reason to expect that the meeting will be a good one.

A STUDENT CLASS AT THE INSTITUTION OF CIVIL ENGINEERS.

WITH a view of increasing the usefulness of the Institution, particularly to the junior members of the profession, it has been decided to create a student class, to take very much the place of that which was formerly the Graduate class, but with certain modifications, so as to avoid the difficulties that previously arose, and to provide those advantages which experience has pointed out to be desirable. It is contemplated to grant, under the control of the council, the use of the theatre of the institution to the students, for supplemental meetings, for the reading and discussion of papers among themselves, and possibly, also, for the delivery to them of lectures upon special subjects, the object of such supplemental meetings being for the advancement in scientific and technical knowledge of the junior members.

Believing it to be of the highest importance that the profession should not be divided, but should remain one united body, having a position and an influence which one united body only can have, the council are inviting the members to unite with them in the endeavour so to extend and enlarge the basis of the Institution as that it shall continue to embrace within it all branches of engineering and all classes of engineers.

PRIZES OF THE PLASTERERS' COMPANY.

THE Plasterers' Company, as our readers are aware, devote 25l. annually through the "Science and Art Department," towards the encouragement of the art of their special craft. These designs and models are now exhibited amongst the national works sent in competition by the various metropolitan and provincial schools, in one of the galleries at the Department of Art at South Kensington, and in reviewing these designs lately, we named the principal prize-gainers in the plasterers' competition; we, nevertheless, now give the complete list:—

1. For an original ornamental corner or angle, suitable for a panel on a ceiling or wall, with a portion of border attached, in any style, to be designed and modelled in plaster, by the competitor. First prize, 5l., R. J. Morris, South Kensington. Second prize, 4l., R. Lunn, South Kensington.
2. For the best model in plaster, from a photograph of one of the designs submitted in competition for the month, in 1865. First prize, 4l., R. J. Morris, South Kensington. Second prize, 2l., E. F. Marsh, South Kensington.
3. For an original design, for an ornamental diaper, either square or lozenge-shaped, suitable for a panel of a ceiling or wall. First prize, 5l., W. E. Mackerness, South

Kensington. Second prize, 2l., F. Longmore, Stoke School.

These prizes were open to all students in the Provincial or Metropolitan Schools of Art, including artisan classes in those schools.

To F. Longmore, Stoke School, honourable mention. A medal also was awarded to another competitor by the authorities of the Department of Art for his corner ornament.

A member of the company writes,—

"It would appear at first sight that credit is due to the head school, South Kensington, for gaining five out of the six prizes; but this is not so, for Mr. Morris, Mr. Lunn, and Mr. Marsh received the greater part of their art-education at the Burslem, Stoke, and Sheffield schools, before they came up to the head school to study and improve themselves."

Other subjects for competition are now under consideration to be offered for 1867-8.

TRANSMISSION OF SOUNDS.

THE ALBERT HALL.

In a recent letter by Mr. Bonicaunt, pointing out what he calls the "alarming features" of this enterprise, immediately after selecting his own box, for which he had voluntarily agreed to pay 1,000l., the writer makes the following statement:—

"It will be eleven times the size of Drury Lane Theatre, or eight times that of Westminster Hall. A church of ordinary dimensions might stand on its floor; its steeple would not reach the ceiling, which is to be 138 ft. in the clear in height. The human voice cannot fill such a space. But, it may be argued, the new hall, if vast, is designed for performances of vast proportion; the orchestra will accommodate 1,000 concertants. I reply that 2,000 voices singing or speaking together travel no farther than one voice. They may fill a certain area more completely with that intricacy of waves which, when very troubles, we call a din; but each voice exerts its own influence on the air, according to its power, and dies away within certain limits. A second voice acts independently and produces its own separate effect, not fortifying the first, but distinct from it."

Without now inquiring whether the hall is, or is not, too large, and is, or is not, likely to be a success, it seems to us that this particular statement by Mr. Bonicaunt, which has been accepted as truth, is not correct. Waves of sound have been likened to waves of water; and in the case of water, as was pointed out in our last when noticing Professor Tyndall's lectures on Acoustics, when the crests of one system of waves coincide with the crests of another system, higher waves will be the result of the two systems. Professor Tyndall lays it down as a rule that, if two sounds be of the same intensity, their coincidence produces a sound of four times the intensity of either.

As an illustration of these statements it may have been noticed that the sound of the cannonading during the recent Naval Review at Portsmouth was distinctly heard 150 miles off. Could any one of the guns employed on that occasion have made itself heard there alone?

ANNUAL REPORT ON EDUCATION.

THE Report of the Committee of Council on Education in respect of the year ending August 31, 1866, shows that the number of schools inspected in the year ending the 31st of August, 1865, was 11,230; in the next year, 11,818; in the following, 12,950; in the last, 13,586. The number of children present at inspection in the four years respectively was 1,092,741, 1,133,291, 1,246,055, and 1,287,604; the average number attending the schools, 1,008,925, 1,011,134, 1,057,745, and 1,082,055. The reduction in the number of pupil teachers continues, the last four years' returns showing 13,849, 11,712, 11,383, and 10,955. A considerable part of the apprenticeships never get beyond the third year. The supply of school-mistresses is maintained, but the masters are falling short. Mistresses are cheaper to employ than masters; and the committee of council regard the increased employment of mistresses as closely connected with the extension of grants to the smaller and poorer parishes of the kingdom. Of 11,635 parishes with less than 1,000 inhabitants, and containing together a population of more than 4,000,000 at the last census, only 2,099, or 2 in 11, had any share in the annual Parliamentary grant "for the promotion of education among the labouring classes." The average income of a certificated schoolmaster is shown to be 87l. a year, the majority living rent free besides. The report acknowledges that the general results of the examinations continue to show too backward a state of instruction. Only 664,005 day scholars were qualified by the 200 attendances within the year,

and were judged by the managers to be qualified by attainments for examinations at all, where 803,177 were qualified by age. Only 97,364 passed without failure above Standard III., where 264,231, being over ten years of age, ought to have done so; the difference marking nearly two-thirds passing out of school to work with less of elementary knowledge than Standard IV., denotes,—writing from dictation a sentence from a more advanced book used in the school, reading a short paragraph from the book, and working a sum in compound rules (money). Arithmetic continues to be the subject in which least success is obtained. A number of schools selected from all districts as fairly representative examples show these results:—In 643 boys' schools, with an average attendance of 71,196, 57,036 (80 per cent.) were examined in arithmetic, and 45,584, or not quite 80 per cent., passed; and in 613 girls' schools, with an average attendance of 56,220, 33,589 (70 per cent.) were examined in arithmetic, and 29,931, or 73 per cent., passed.

FRENCH WORKMEN.

IN a report rendered to the Foreign-office this year, M. Julian Fane, secretary of embassy at Paris, speaks of wages of skilled artisans in various towns in France as ranging from 5s. to 10s. a day; for inferior workmen, from 2s. to 3s. 6d.; for workwomen in clothing establishments, from 2s. to 4s. or 5s.; for children, from 1s. to 2s. The general rate of money wages in France may be said to have increased about 40 per cent. in the last fifteen years, but the rise in money wages has been accompanied by a very considerable rise in the price of the ordinary articles of consumption and in rent of lodgings. So that the improvement in the position of the labourer, meaning his power to supply himself with the necessaries and comforts of life, has been far from commensurate with the rise in the money value of his labour. Still, the relative proportions in which money wages and the price of commodities have risen leave a margin in favour of the former, and to this extent there has been a rise in real wages, enabling the labourer to feed, lodge, and clothe himself somewhat better than he could fifteen years ago.

There is scarcely a trade in France whosomembers have not combined in the last three years for the purpose of increasing the rate of wages and diminishing the duration of labour; and their efforts to this end have usually met with success. The employers, for the most part, assert that the law has proved to them an unmitigated evil, subjecting them to the tyrannous coercion of the employed. Various forms of the co-operative system are in course of trial in France with a view to prevent or lessen this collision of interests. The association of masons, for instance, is one that has met with remarkable success; some of the workmen are shareholders, and others are engaged as ordinary labourers and have no share in the profits, while some members of the association are simply holders of capital. In other establishments the workmen are allowed to share in the profits of the business by means of rewards or prizes allotted to them, or to the more worthy among them, by the proprietors at the end of the year, or by facilities for procuring food, clothing, lodging, and education for their children on advantageous terms.

FROM WALES.

A RESIDENCE is in course of erection for Mr. Chas. W. Wynn, M.P., at Meifod, Montgomeryshire. The site selected is one of the most beautiful in the vale. The contract for the house alone, not including the heating apparatus, stabling, lodge, &c., has been taken by Mr. John Potter, of Welshpool, for 4,000l. The stabling is being done by daywork.

A residence, designed for Mr. Thos. Gill, at Pont Adellad, is now in course of erection. The contract has been taken by Mr. George Clark, of Chester, for 1,700l.; but this sum does not include chimney-pieces, bells, haulage, stabling, &c.

The church at Pwytherin, Denbighshire, is undergoing restoration. The contract has been taken by Mr. Owen, of Tremerchion, for 600l.

It may also be mentioned that the church at Pennmachno, in Carnarvonshire, has been rebuilt. The old foundations were followed, and the roof,

a type of the church roofs in Wales, has been reproduced. The material of the walls was that furnished by the country, blue stone and a peculiar kind of limestone, which served as quoins. The windows and doors were of freestone.

A vicarage also was erected in the same place, the contractor being Mr. Owen Jones, of Penmachno. The contract was taken for 1,200l.

A mansion for Mr. Joseph Gill, of Trewern, Gohoven, near Oswestry, is just completed, the materials for walls being white brick and Enabon stone. The contracts were taken by Messrs. Barnsley & Sons, of Birmingham, and amounted to over 9,000l.

The following tenders were sent in for building residence at Llanychan, near Ruthin, North Wales, for Mr. John Taber:—

George Clark, Chester	£5,602	0	0
W. & J. Webb, Birmingham	5,628	0	0
Barnsley & Sons, Birmingham	5,388	0	0
Abel Roberts, Llandudno	4,213	0	0
Samuel Owen, Ruthin	2,745	0	0

The contract was let to Messrs. Barnsley & Sons. The lodge, gates, stabling, &c., are not included in the above contract.

A residence near Denbigh, for Mr. Thomas Gold Edwards, has recently been completed. The walls are of pressed red brick, fret-work of blue brick, dressings of doors and windows of free stone, and quoins of free stone. The contracts were executed by Mr. Bellis, of Chester, and amounted to about 2,800l.

Llysmereion, the residence of Mr. P. H. Chambers, the High Sheriff of Denbighshire, is undergoing alterations. The contractors for the first portion of the contract were Messrs. Barnsley & Sons, of Birmingham, and amounted to 2,000l.

The works at present being carried out are done by day-work. Messrs. Barnsley & Sons supply some of the materials.

Tenders for building summer residence at Colwyn, on the Chester and Holyhead line:—

Robert Williams, Rhyl	£1,340	0	0
A. Roberts, Llandudno (accepted) ...	1,025	0	0
Robert Davies, Rhyl	825	0	0

A shooting-box, &c., has lately been completed at Havod Eilly, about eight miles from Denbigh. The contractor is Mr. George Clark, of Chester. The cost of the works will be about 1,500l.

Some time ago it was determined to increase the accommodation at the North Wales Lunatic Asylum; for this purpose two wings were added, one for male and the other for female patients. These wings, with some alterations in the original structure, increased the accommodation 200; and cost, with new kitchens, store-rooms, residence for medical officer, &c., a little over 8,500l. The old house accommodated 200 patients, and was erected at a cost of 17,000l, or 18,000l. It is Elizabethan; the material being limestone, with Bath stone dressings. The new wings are in character with the old, but have freestone from the Cefn quarries—a better weather-stone than Bath. The contractors for the wings were Messrs. George Clark & Son, of Wootton Waven. The head of the firm has since died; Mr. George Clark, of Chester, carrying on the Welsh portion of the business. In this as in all the other works above mentioned, the architects were Messrs. Lloyd Williams & Underwood.

ROADMAKERS' LIABILITIES.

Hynes v. Webster, 15 *Weekly Reporter*, Q. B., 619. Various questions have from time to time arisen as to the precise nature of the liability incurred by a contractor taking up, or altering, or repairing, &c., public roads. As a general rule, where the work is properly authorized, he can only be held liable for any injuries to goods or property that may result from the state of a road under repair, if he has been guilty of some negligence. If he has taken all usual and proper precautions to avoid the occurrence of accidents, he cannot be held liable to compensate for the damage that the state of the road may occasion.

In *Hynes v. Webster* it was contended that the duty of a contractor who constructs a sewer under a highway is not terminated on the finishing of the sewer and the reinstating of the road, but that he must watch to observe the result of the work, and be liable for the works which may be detrimental to the road, and repair such subsidence, &c., from time to time. The defendant in this action was a contractor under the Metropolitan Board of Works, and he properly constructed a sewer under a highway, and then filled in the ground and reinstated the road, and in so doing used the usual means, and, in short, was not guilty of any negligence. The road subsequently subsided in consequence of the construction of the sewer, but it appeared in evidence at the trial that some such

subsidence always takes place after works of that nature. The plaintiff brought this action against the contractor to recover compensation for the effects of a fall which was caused by the stumbling of the plaintiff's horse in a hole in the road in question. The only point in issue was whether the contractor was under a legal duty to keep the road from subsiding after he had done all that was possible to restate it after the sewer was completed. The Court, after taking time to consider, decided that the defendant was not liable. This seems almost necessarily to follow from the finding of the jury that there had in fact not been any negligence on the part of the defendant. The case is not very important in its purely legal aspect, but as so much work in the streets of London is done every year by contractors in the position of the defendant, it is worth while to notice the case, as showing very well when such contractors may feel that they have fulfilled the duties cast upon them by the law.—*Solicitors' Journal*.

THAMES STEAM-BOATS AND THEIR DANGERS.

You will perhaps save a life or two if you can spare space for a few lines to call the attention of the proprietors of the river steam-boats to the clumsy and dangerous mode adopted in the embarkation and landing of passengers. As a general rule the only part of the boat in contact with the pier is the corner of one of the paddle-boxes. The landing-rails are seldom used, and passengers pass over an opening generally more or less dangerous. The young folks appear to like the fun of the thing; but to some of that numerous class who, like myself, are too old and fat to indulge in gymnastic exercises, the consequences may be serious.

Surely some contrivance could be suggested to secure, at little trouble, a safe passage. If an iron-railed footway were firmly attached to the boat, and could be lowered at a moment's notice in the same way in which the chimneys are made to descend, there would be no excuse for negligence. At all events, as things are at present managed, an accident must happen sooner or later, and with that impression I venture to submit the subject to your notice.

J. O. HALLIWELL.

ASSISTANT ENGINEERS' AND DRAUGHTSMEN'S BENEVOLENT ASSOCIATION.

Sir,—As there is every possibility of the above society being set on foot, I should like to ask Mr. B. M. Bancroft, as the promoter, what he thinks the amount of subscription per member would be? I would also suggest the desirability of opening branches throughout the country. I think, if Mr. Bancroft would explain the advantages that would accrue to members joining such an institution it would incite others to take it up, and so help the society forward more speedily. T. T.

ANOTHER correspondent says, How is it intended to deal with country subscribers?

STONE v. BRICK.

THERE are few facts connected with architectural progress more satisfactory to contemplate than the substitution of stone for brick as a building material, not only in public but in private buildings, and in those parts of the country where stone is not indigenous as well as in London. This fact is rendered still more remarkable by another, namely, that a very few years ago many architects, especially the younger members of the profession, were strongly and zealously advocating, by words as well as by designs, some executed and some only on paper, the use of "local materials;" brick in the clay districts, stone in the stone districts, timber in the woodlands; and which principle, if carried out to its extreme, would compel us to build ships of oyster-shells and fish-bones. It may be as well to put forth a word or two of encouragement to those proprietors and architects who are using and advocating the use of stone in these south-eastern cities and counties of England.

In doing this we have to consider (1) the question of appearance, (2) of solidity, (3) of economy, and (4) of the moral effects on producer and consumer.

1. The first question, if a question at all, might be dismissed almost with a single word, or even an unspelling interjection; and in answer to those who like to see bright red bricks, we can point out the much more sightly effect of

red granite and sandstones now in use, which in a smoky atmosphere do not attract the dirt as do porous bricks in a very few years after erection. With regard to the appearance of cement as compared with stone, when new every one can distinguish it by its muddy texture, and when about two years old by its sooty blackness.

2. The solidity of stone may be tested before its removal from the quarry; that of brick not practically till it has been not only made to form part of a structure, but has had the weight of floors, girders, and other superstructures imposed upon it, to say nothing of the superior work the strength of resisting the severe dynamical tests to which they are exposed is found to be in proportion to the largeness of the materials of which they are built and the simplicity of their construction; for while the Egyptian barracks and other fort works, consisting of 6-ft. granite walls, supporting, by medium of 18 in. by 6 in. oak joists, 12-in. floors of the former material, are shell and shot-proof, our brick-material towers are not at the present day worth a single pinch of snuff.

A careful examination of buildings of different ages, built in the two materials whose relative merits we are discussing, and this only, will show us the advantage that stone has of resisting age, or other destructive influences. Bricks, tiles, glass, and earthenware are as much subject to decay, and more so, than stone, marble, and granite. The plate, or cup, or glass that breaks when we let it fall on the floor, breaks where it was beginning, and hitherto imperceptibly, to decompose.

3. Taking a broad view of economy, there is more stone under the super-soil than there is clay. And clay is taken from those lands whose surface is already quite near enough to the level of the sea or the river. And we sink our basements to an unwholesome depth to acquire the earth to build our houses with, instead of helping to level rocky impediments to agriculture on the other side of the island. Again, we shall, many of us, live to see brick houses that we can remember being newly built, sink to half their original value from the decay of their materials, and the unequal sinking of their foundations. This latter condition can be prevented with the stone construction; not so with brick. Where are the brick houses, or at least nine-tenths of them, erected immediately after the fire of London? The answer to this question will show us that brick is barely fit to hastily rebuild an old city after a general conflagration, when there is not time enough to consider the systematic arrangement of its streets.

4. The disappointing hoggishness of many of our supposed interesting towns drives many an expectant visitor to them to spend his excursion-day in frivolous and vicious amusements. It is an indisputable fact, and the cause is equally indisputable, that the ugliest towns contain the greatest proportion of the haunts of vice. One who has visited a dozen important towns in different parts of England will be able to confirm this assertion.

When we enter an externally clean-looking building, we can always perceive much more clearly whether its internal condition in that respect agrees with its external. But we enter our dingy brick house, upon the exterior of which our eyes have been fixed since we turned the corner of the street or square in which it is situated, and do not perceive half the possible dirtiness of its interior. And we all know the connexion between cleanliness and morality, and have herein already discussed the relative superiority in that respect of stone as a building material. And thus much for the moral effects of the use of this or that material as regards the consumer. It remains only to consider their effects as regards the producer.

A stone-quarry is a very interesting sight, and worth going to see, whether or not at the time that the different operations of removing the stone are in progress; and there is nothing offensive or unhealthy either to the spectator or the workmen employed.

A brick-kiln is both unwholesome and nauseous and dirty. Stone-quarrying is instructing and elevating. Hugh Miller's "Old Red Sandstone" was written by a quarryman. When is our brickmaker's work on geology going to make its appearance? The relative cleanliness, enlightenment, and morality of the two classes of workmen—the natural result of their respective employments—is too well known to need investigating; we shall find a very correct portrait in

"Bleak House" in the brickmaker of St. Alban's. The highest summit of the working bricklayer's ambition is to be a master tiller—little more than a mere capitalist: here is now nothing in his craft to raise him beyond this. The working mason, on the contrary, will, independently of his connexion with other trades, find ample opportunities in his own of developing the genius of the sculptor. S.

AN AMERICAN VIEW OF THE WATER SUPPLY OF LONDON.*

COMING to London and modern times, we see this great city, with nearly three millions and a half of inhabitants, embarrassed not only in the quantity, but in the quality of her water supply. With five times the population of Philadelphia, she has in the river Thames, "the great river" of England, a supply, flowing over Teddington Weir, of just about half the volume discharged over Fairmount dam from the smallest of our two great rivers—the Schuylkill. She would literally threaten to drink up that "great river," were she not, in connexion with fifty-six other towns upon its banks, fast rendering it utterly unfit to be drunk. The degree of mineral impurity in 1854 was represented in figures as 15.52 degrees. It ranged in 1863-65, from 22 to 16 degrees, there being an improvement latterly, arising, we suppose, from a change in the sources of supply of some of the companies. The organic impurity, although increasingly perceptible to the senses, is not represented in the analysis. The mineral impurity of the Schuylkill at Fairmount is put at 6 degrees; and our chief engineer is every year reminding the authorities in his reports of the rapid increase of the sources of impurity to this river from the sewage of towns, and the filth of numerous factories of every kind, constantly multiplying on its banks.

As "the great river" of England is becoming hopelessly foul, and as artesian wells are totally inadequate to the wants of the city; as it is idle to look to surface drainage, or to streams in any of the densely-populated regions around the city; as even the Severn river, in its lower course, is almost as bad as the Thames, the question forces itself upon the authorities and property owners of the great metropolis, how this vital necessity is to be met? Is the growth of London to be arrested and its population finally scattered? and shall those melancholy anticipations of the essayist, with his famous New Zealander musing on the broken arches of London Bridge, already begin to cast the shadows of a cold reality upon the hearts of her surging and swelling millions? We seem to have found the limit of England's coal supply. About the time she has burned up all the coal she can come at, will her city populations have swallowed or hopelessly corrupted all the drinkable water within their reach?

English engineers are answering the question very hopefully for London and other great cities on the island. Far away among the remote and desolate hills of Northern Wales, where the damp winds from the Atlantic impinge upon the rocky walls, and first deliver their heaven-distilled treasures for the use of the inhabitants of earth, 171 miles from the half-famishing, half-poisoned millions of London, wise and skilful men have fixed the probable future location of the pure supplies which are to send health, comfort, and cleanliness through the streets of the metropolis. Here, the limpid streams, which form part of the head waters of the Severn, are depended on to furnish 200,000,000 gallons per day, or 50 gallons to each of the present inhabitants, with the chance of increasing the supply as it may be needed. The total cost of these great works, with the long range of aqueducts, is put at 8,600,000*l.*—not an enormous sum when the vast nature and utility of the enterprise is considered. A gala day, indeed, would it prove for London when such a gift was put in her keeping,—an omen of better days and of true advance to the corrupt, festering masses of her poorer population. Two millions of dollars' worth of soap alone would be saved each year by substituting the soft water of the hills for the hard water of the Thames River in washing the clothes of the Londoner.

A truly grand and comprehensive scheme is at the same time broached by these English

engineers, which proposes to supply Liverpool, Leeds, and a score of Northern towns, from one and the same undertaking. Copying, doubtless, the very successful experiment by which the pure Waters of Loch Katrine are brought into Glasgow, these engineers propose to apply the pure and abundant waters of two lakes in Cumberland and Westmoreland to a similar source. The mountainous ranges of these counties face seaward, and the regions showed in the years 1845-53, the extraordinary average rain-fall of 140 in. per annum; four times the average in this vicinity. Over the area drained by these lakes, there should, therefore, be an average daily drainage, allowing for evaporation, of 550 millions of gallons. From this immense store, in positions elevated from 400 ft. to 700 ft. above tide, it would be a simple problem to furnish those low-lying towns with a daily supply of 181 million gallons in the aggregate. The cost of the combined works would be 12,000,000*l.* sterling, the annual revenue being estimated to exceed interest and expenses of every kind.

CHURCH-BUILDING NEWS.

Wells.—A reredos has been presented to St. Cuthbert's church by the Freemasons. The new reredos is executed entirely of Caen stone in the style of the fifteenth century, which was adopted to harmonize with that of the church. The subject chosen for illustration was Our Lord's Supper. The design was accepted by the committee, and a model of the work was exhibited at the Royal Academy last year, and on the opening of the Paris Exhibition, Mr. Forsyth sent it with other of his works there. The permanent work, as a whole, is now in its proper position in the church of St. Cuthbert. The work is divided into three compartments, but the subject is unbroken. In a niche on the south side is a sculptured figure of St. Cuthbert, the patron saint of the church, and in a corresponding niche on the other side is a statue of St. Andrew, the patron saint of the cathedral. The sculptures are inserted in three recesses, arches, or canopies, surmounted by carved crocketed finials and tabernacle work, the spring of each canopy being adorned with carved angels bearing emblems of the Crucifixion. The sculptor, Mr. Forsyth, was assisted in the architectural design by Mr. W. Smith, of London. The whole of the chancel has been laid with Minton's encaustic tiles, graduating from comparative plainness in the west to more elaborate in the east. The steps are of dark limestone. Another addition to the chancel is the polished oak communion-rail, supported by four standards of hammered iron enriched with brass. There are also two side screens of hammered iron, by Mr. Cornell, of Cheltenham. Mr. Forsyth, who is a member of the craft, has executed the sculptures at cost price, viz., 250*l.* (the price to other parties would have been 350*l.* or 400*l.*), the whole of which has been provided by Freemasons. The expense of the extra work, the new altar-rail, side screens, &c., was between 150*l.* and 200*l.*, and this has been done by general subscription.

Wolverhampton.—The committee for erecting St. Jude's Church, Wolverhampton, have selected the design submitted by Mr. G. Bidlake, of Wolverhampton. The site of the church is on the Tettenhall-road; the proposed accommodation, 812; the outlay about 4,000*l.*

Wath (Yorkshire).—The chief stone of the cemetery at Wath has been laid. The architect is Mr. J. D. Webster.

Sharrow (Sheffield).—The corner-stone of the church now in course of erection at Sharrow has been laid by the Archbishop of York. The church is one of the seven proposed to be erected in the town by the Sheffield Church Extension Society, and it is being built upon a piece of land near the main road to Cherry Tree-hill. Messrs. Blackmoor & Mitchell-Withers, of Sheffield, are the architects. The cost will be about 4,000*l.* exclusive of boundary walls and heating apparatus.

Llanbrynmair.—Efforts have been made to build a church in the lower part of the parish. The ground for the site has been given by Sir W. W. Wynne, bart., with the addition of 100*l.* grant to the building fund. The total cost will be about 1,000*l.* The design and plans for the building have been drawn by Mr. J. W. Pondley, Black Hall, Kerry. The contract for the building has been taken by Mr. Harrison, builder, Montgomery.

Tilbrook (Beds).—The church here has been

re-opened. The wood screen has been displayed by the removal of the pews, and restored by the care of the Bedfordshire Archaeological Society, as a brass plate on the back records. This work has been confined to the effective preservation of the loosened structure, with the addition of such few pieces only as were requisite to make it whole. No re-painting has been allowed, and the new work is clearly distinguished from the old. All the south wall has been renewed, with the upper part of the east nave wall and the northern clearstory. The old work has been imitated by the alternate use of red and yellow stone, and the gable cross reproduced after the fragments of the old design. The nave and chancel roofs are entirely new; the principal timbers, of oak, moidled, with traceried spandrels and angels alternately. The stone corbels represent angels in the nave and natural foliage in the chancel, together with shields carrying the arms of Lord and Lady St. John, the bishop, and the rector. The east window, of grisaille glass, with arms of the Passion in the tracery, is the gift of the Duchess of Manchester. A memorial window in the south chancel is by Mr. Walker, and contains representations of the Crucifixion, the Holy Women at the Sepulchre, Mary at the Feet of Jesus, and Christ blessing the little Children. A pulpit of Caen stone is the gift of Mr. A. A. Young, of Oringsbury; it is enriched with foliage and serpentine shafts in the panels. The reading-desk, of oak, was given by Miss A. Young, of Riscely, and the window in the tower by the Rev. R. Barnes, the rector's brother-in-law. The tracery of the new reticulated windows in the south wall was presented by the Rev. B. G. Bridges, of Blackney, Lincolnshire. The whole of the church is re-seated in oak. The altar-rails are of oak and wrought iron, and encaustic tiles enrich the floor. The architect was Mr. W. White, of London. Mr. J. Wilson, of Kettering, was the contractor; and Mr. James Hudson the foreman of the works. The total cost of the restoration is about 1,400*l.*

Leighton Buzzard.—The new church of St. Andrew at Leighton Buzzard has been consecrated. It is situated at the extreme north end of the town, a locality in which both a church and a school have been long wanting. The church is of the style of the latter end of the thirteenth century, with a French element introduced. It consists of nave, north and south aisles, chancel, vestry, organ chamber, and north-west porch. The extreme length of the building is 110 ft., the width being 74 ft. The nave and side aisles are 66 ft. long and 50 ft. wide. The tower is placed at the north-west corner of the building, and, with the spire, is 110 ft. high. The materials used in the construction of the building are the local sandstone with Bath stone dressings. All the columns are of blue Pennant. The floor of the gangway is laid with Staffordshire squares, and the sacrosanct and chancel with encaustic tiles, manufactured by Messrs. Dering & Hargreaves. The whole of the wood-work, including the pulpit, is of red deal stained and varnished. The pulpit was designed by the architect, and was to have been of stone, with five panels containing seated figures of our Lord and of the Evangelists. The centre panel would have contained the Saviour, and in the other four panels would have been figures of the Evangelists. In the act of writing the gospels. The pulpit was actually executed, but some members of the building committee objected to it and it was laid on one side, the present wood one being substituted for it. A similar remark may be made with reference to the reredos, which has also been dispensed with. The timber in the roof is all displayed, and the roof of the chancel is boarded, with moidled ribs and bosses at the intersections. The architect is Mr. J. E. Neate, of Bristol; and the work has been executed by Messrs. Garridge & Holderstock, of Leighton. Mr. Joseph P. Stevens has been clerk of the works. The carving was executed by Mr. Margetson, of Bristol. The contract was for 2,840*l.*, but the total cost will be about 3,000*l.*

Pentonville (London).—The district church of St. Silas, Pentonville, has been consecrated. Recently, through the assistance of the Bishop of London's Fund, an arrangement was made with the Rev. Dr. Courtenay, of St. James's, Pentonville, to secure for this mission district the building lately erected and known as Christ Church, Pentonville. Before, however, it could be consecrated, there remained to be raised the sum of 3,250*l.*, toward which amount the Bishop of London's Fund contributed 1,400*l.*, and since then other friends have given about 1,100*l.*, still leaving about 750*l.* to be raised. The building

* From a paper "On the Water Supply of Our Great Cities," by the Rev. John W. Mears. (Published by order of the Water Committee of the Councils of Philadelphia.)

had been previously opened by license. In addition to this there is a site secured for schools, for the erection of which about 9000. have been raised, and it is reckoned that, for about 7000. more, suitable school premises may be built. It is proposed, as soon as possible, to raise the sum of 7500. still required for the church, and 7000. for the erection of the schools, which are urgently needed.

Weston-under-Penyard.—The parish church has been re-opened, after undergoing a restoration. An erection on the south side, hitherto used as a vestry, has been removed. An ancient south doorway has been opened out, and a new organ-chamber and vestry have been added on the south side of the chancel. The window-frames of former days have been removed, and the window-openings filled in with tracery of the fourteenth century, and some new windows have been inserted. A new chancel-arch and screen-wall have been built of local red stone, and a new sedilia, in the architecture of the fourteenth century, of Forest of Dean stone, has been inserted. All the internal and external masonry has been stripped of the plaster and whitewash, and restored. The chancel has had a new roof. The windows are glazed with tinted glass. Stained glass has been inserted by Messrs. Heaton & Co., of London, in the triple-lighted window in the east end, and a stained-glass window, by Messrs. Clayton & Bell, has also been put in at the west end. The chancel and nave are paved with encaustic tiles. The reredos has been supplied by Mr. Earp, of London. There are open seats of varnished deal in the body of the church, those in the chancel being of carved oak. The architect employed was Mr. G. E. Street, of London; and the work has been executed by Messrs. Collins & Collins, builders, Tewkesbury.

Bredhurst.—The church of this parish, which has long been in a dilapidated state, has lately been restored and enlarged at a cost of between 1,600. and 1,700., under the superintendence of Mr. E. Christian, at the sole expense of Mr. T. H. Day, of Frindsbury, father of the present incumbent. The old nave has been pulled down and a new one built, and a new arch now takes the place of the small one which formerly divided the nave and chancel. The chapel on the south side of the chancel, which for years has been separated from it by a lat-and-plaster partition, has been again thrown open, and the east windows filled with stained glass by Messrs. Cox & Son, to the memory of the little daughter of the present incumbent, given by her godmother. The chancel windows have also been filled with stained glass, by Messrs. Clayton & Bell. The floor of the chancel is paved with tiles. The whole work has been executed by Mr. W. Vaughan, of Maidstone.

DISSENTING CHURCH-BUILDING NEWS.

Eastwood.—The Committee for erecting a new Congregational Chapel at Eastwood, Nottinghamshire, have selected the design of Messrs. Bidlake & Tait, architects, of Leicester.

Brighton.—The foundation stone of a Congregational new chapel has been laid in Cliftonville. The edifice is situated at the north-west corner of Ventnor Villas, at the top of George-street. It is being built by Mr. C. E. Kemp, of Brighton, from designs furnished by Mr. Horatio N. Goulty, also of Brighton, architect. The style is Early English, faced with Kentish rag, with Bath stone dressings. There are to be six lancet-shaped windows on the north and south sides of the building; and in the principal frontage, in Ventnor Villas, there will be one large central window, triple-pointed, but divided into four lights; and beneath this window, between the entrances (which are to be north and south of it), will be a piece of fret-work in Bath stone. It is built to accommodate 400 persons on the ground floor. There are to be no galleries at present.

Kidderminster.—The chief stone of a Baptist school and schools has been laid here. The new building will be in the Gothic style, and is from a design by Mr. Bidlake, of Wolverhampton. The entrance from the street will be by a flight of steps right and left, opening into a corridor which runs along the front of the chapel, and is lighted by seven small windows. On what may be called the ground floor there is a school-room, 30 ft. by 40 ft., and 11 ft. high, and also four class-rooms of various dimensions. The chapel is above these, and extends further to the rear than the area they occupy. It will be 68 ft. in

length and 40 ft. in breadth. The height from the floor to the wall plate is 22 ft., and the roof rises steeply above, and will be left open in the interior to two-thirds of its height. The platform in the chapel is to be 14 ft. by 8 ft., and the baptistery 12 ft. by 3½ ft. There will be a gallery at one end of the interior 40 ft. by 20 ft., and an organ-loft 24 ft. by 12 ft. Three vestries will be provided. The fabric is to be of red brick and white Aylesey stone, intermixed with blue-brick bands and arches. A window will be at the end of the chapel nearest the street. The edifice will hold from 750 to 800 persons. The total cost, including site, is estimated at 2,0000. The builders are Messrs. Scholes & Warrington. Mr. J. Wilkinson is clerk of the works.

Liverpool.—A new Wesleyan Methodist chapel, at Fairfield, has been consecrated. The edifice, which has cost about 8,0000., has been built at the joint expense of Messrs. Daniel and Joseph Leather. The chapel, which stands in Laurel-road, is built in the Decorated style, with windows filled with flowing tracery, each window being of different design, and some of the larger ones having shafts with moulded bases, carved caps, &c. The plan of the building is cruciform, comprising a nave and transepts, with chancel and chancel aisle. The west gable is filled in with a deep sunk arch, moulded and carved; the inner part of the arch being occupied by a large traceried five-light window. The west porch faces Laurel-road, and the chapel is also entered by a porch on the south side. Separate entrances are provided for the transepts, north and south. The transept gables have traceried windows above the gallery level, and a row of three smaller ones below. The walls throughout are built of Yorkshire parpinto, with dressings of Stonor stone. The roof is slated with dark slates, interspersed with light green bands, and ventilators are fixed in the ridge. In the interior the nave is 76 ft. long by 43 ft. wide, with 42 ft. to the highest part of the ceiling, which is wagon-headed; the top part of the roof being shut off, which, it is said, gives an equal temperature and good acoustic results. The transepts are 17 ft. deep and 26 ft. wide, with a gallery in each, supported by brackets. The chancel is 20 ft. wide and 27 ft. deep, and opens into the nave with a stone arch and jambs, moulded and carved. The organ chamber is on the north of the chancel, and the entire east end is occupied by a large five-light window, with tracery and stained glass, continued to the floor by a reredos of Caen stone, with moulded arches, carved spandrels, caps, &c., and polished marble shafts. The floor of the chancel is laid with encaustic tiles. The pulpit, which stands on the one side, is of Dantzic oak, relieved by brown oak pillars, and supported upon a Caen-stone base with shafts of polished marble; and on the other side is the reading-desk, also of Dantzic oak. The chancel is filled on each side with stalls for the choir. The whole of the timber work is pitch-pine. The roof is stained, and is in one span, so as to avoid columns of any kind. The east and west windows are "memorials," stained by Mr. Wailes, of Newcastle. The other windows have opaque cathedral-tinted glass, with white margins. In addition to the chapel there are several vestries, lavatories, &c., and a large school or lecture room entered from the south side, and capable of being used independently of the main building. The design was by Mr. C. O. Ellison, architect, under whose supervision the buildings have been completed. Messrs. Burroughs & Sons were the contractors for the work; and the masonry was done by Mr. Black; the painting, plumbing, and glazing by Mr. Holt; and the slating, plastering, &c., by Mr. Callaghan. The carving was by Mr. G. Shaw, and the base of the pulpit and the reredos by Mr. Stirling.

Redland.—A Baptist Chapel is being erected from the design of Mr. S. Hancorn, of Bristol and Newport, architect. The design was chosen out of several others submitted in limited competition. The builders are Messrs. Marquis & Munro. Mr. Hotham is the clerk of works. The design is in the Decorated style of Gothic, and includes the chapel, with transepts; vestibule, with two lobbies in connexion therewith; open porch; chancel, with baptistery underneath and organ recess on one side the same; minister's and deacons' vestries with private entrance, and ladies' vestry with private entrance, and underneath the heating apparatus. An end gallery is also proposed over the vestibule and lobbies, with stone staircases leading thereto. A tower is included in the design, but it is not intended at present to carry it higher than necessary for the

stairway. The principal front faces White Ladies-road, from which the chapel floor will be raised about 3 ft. 6 in., and attained by a flight of broad, easy steps extending the entire length of the porch (26 ft.). A five-light traceried window is intended to be placed in the principal gable, and three-light traceried windows in each transept. The chapel will be further lighted with two-light traceried windows, with gables over same, at the side. The roof of the chapel will be in single span. The seats are proposed to be of pitch pine, and low with sloping backs. The walls of the chapel will be stuccoed, and have a string of encaustic tiles above the pews. The elevations of the edifice will be faced with Pennant stone in random-ranged courses, tucked point. The roof will be covered with Bangor slate, alternating in plain and ornamental courses. Cathedral glass, in patterns with two tints, is proposed for the windows. The floors of the vestibule and lobbies are intended to be paved with encaustic tiles. The chapel will be both heated and ventilated by Messrs. Haden, of Trowbridge. The contract has been taken at 5,6520., and it is thought the tower can be completed for about 8000. additional. The chapel will accommodate 580 persons.

Derby.—A new Congregational Chapel is about to be commenced here. Messrs. Bidlake & Tait, of Leicester, are the architects. New Presbyterian churches are also about to be erected from the designs of the same architects.

Greengate.—The foundation-stone of a new Wesleyan chapel has been laid at Greengate, a populous neighborhood near Apperley Bridge. The style adopted is Early Gothic. The edifice will be entirely of stone, and the roof and fittings of deal, stained and varnished. The size within the walls is 53 ft. 10 in. by 36 ft., and the height from the floor to the wall-plate at the eaves, is 17 ft. 3 in. The roof is open nearly to the ridge, and the timbers and bindings are dressed. The seats are low benches, with small doors, and will accommodate on the ground-floor, including the free seats, 360 persons. A small gallery crosses the end of the chapel, over the entrance-lobby, which will accommodate about sixty persons, making a total of 420, all seated. The building is to be heated with hot water, and ventilated. A small vestry is attached to the further end of the building, in the same style as the chapel. The contractors are,—for the masons', joiners', and plasterers' work, Mr. Robert Sugden, of Keighley; for the slaters' work, Mr. Smitbies; for the plumbers' and painters' work, Mr. J. Garth, of Idle. The architects are Messrs. Milnes & France, of Bradford. The estimated cost is 1,7000.

Falmouth.—A large building, erected by the Wesleyans at Pike's-hill, has been opened for public worship. The new building is of Gothic architecture. The architect is Mr. Lauder, of Bristol; the builder, Mr. Blatchford, of Tavistock. It contains sittings for about 800 persons, and the total cost is 2,5000., of which about half has been raised. The chapel is ceiled internally to the vaulted form of the sweep timbers of the roof, the ceiling springing from a wood cornice to the height of 38 ft. from the floor. At the intersection of the roof is fixed a sun-burner, having fifty jets, the gift of Captain Edmund Hancock, of Falmouth, which illuminates the whole of the chapel, excepting directly under the galleries. Daylight is afforded by three large five-light windows and one large wheel window, all traceried. A neighbouring owner of property has blocked up one of the windows on the outside by some brickwork.

STAINED GLASS.

Farsley.—This church, which has been closed for some weeks, has been re-opened. Five windows have recently been placed in the chancel, in memory of the late Rev. Samuel Marsden, a native of Farsley, known for his missionary labours in Australia and New Zealand, and for the services he rendered in establishing the Australian wool trade with this country. The windows are of stained glass, and are the work of Mr. Wailes, of Newcastle. The subject of the principal window is the "Good Shepherd." The expense of the memorial has been raised by public subscription. The nave has also received the addition of three stained windows at private cost. One of them is to the memory of children of the Rev. Parsons J. Manning, the incumbent.

St. Luke's, Maidenhead.—A stained-glass window has lately been placed in the south side

of the chancel of this church. The window was designed and painted by Messrs. Lavers & Barrard, of Bloomsbury. There are two groups in the window, the subjects of which are taken from the Gospel of St. Luke: one from chap. iii. 47. The woman who had touched the order of our Lord's garment is represented kneeling posture, and confessing to Him that she had done. The other, from chap. vii. 42, our Lord giving sight to the blind man. This is the first stained window placed in this church.

Mickledaver Church.—The memorial window in this church to the late Lord Northbrook is now completed. The stonework, executed in Bath stone in the Decorated style, and consisting of three lights with tracery, is by Messrs. Newman & Son, of Winchester. The stained glass representing the "Crucifixion" and "Good Samaritan," with the emblems of the Apostles, is by Messrs. Clayton & Bell, of London. Mr. John Tolson, of Winchester, was the architect.

years, than its manners and arts), "Cornish Antiquities," "Agricultural Gange" (with their proper condemnation), and "The New Courts of Law." The article in which the latter subject is dealt with is a piece of indiscriminate abuse of all the designs submitted. The writer proposes that the Strand front should consist of a range of houses and shops crowned with gables designed "by a dozen or a score of our best Gothic architects;" that the site should be enlarged so as to take in the whole ground from Chancery-lane to Newcastle-street, and from the Strand to Carey-street; and that for the courts themselves, Gothic architects of proved ability should be invited, without previous restriction of number (twenty-four or even thirty), to confer and settle the general plan of the buildings;— "while each architect would assume the initiative in designing his own separate portion, every part might be subject to such critical judgment of the entire number as would ensure the harmonious combination of the whole work." "The initiative of one architect for each court will give that individuality and variety which we have shown to be so essential; while a thorough harmony of effect will be secured through the general co-operation of the architects!" When we add that, according to the writer, there is to be no "design," but that the buildings are to "grow," we shall have made obvious the thoroughly practical nature of the article.

GLUE FOR METALS.—A good glue for metals may be made by mixing with sixteen parts of melted glue one part gum ammoniac, and then adding one part of saltpetre acid.

ALUMINIUM BRONZE.—This alloy, in which aluminium takes the place of the tin contained in common bronze, is becoming daily more and more important in the metal trades.

THE CHISEL.—Sir: Can any of your correspondents inform me when the chisel was first introduced into this country? My impression is, that it was in the eleventh century.—FREMASON.

NEW NATIONAL GALLERY ACT.—The New National Gallery Act is issued. Under the former one the Commissioners of Public Works were to acquire land for the enlargement and improvement of the National Gallery by agreement. No agreement had been made with the owners, and it was necessary to provide for the compulsory purchase of the land. Compensation is to be given for the purchase of the parochial schools of St. Martin-in-the-Fields. A copy of the lands required is to be deposited at the office of the Commissioners of Public Works, and to be open to the inspection of the public.

SCHOOL-BUILDING NEWS.

Tupsley.—The foundation-stone of the parochial schools for the parish of Tupsley has been laid. The first undertaking, after making provision for the newly-appointed incumbent, is the building of a parish church at a cost, we believe, of from 2,000 to 3,000, and the parishioners decided upon erecting a master's house and schools for the education of the children of the poor parishioners. The building, which is being erected by Mr. John Davies, Elder, Leominster, under the superintendence of Mr. F. R. Kempson, architect, will consist of the master's residence and schools. The latter will consist of two large rooms, one for boys and the other for girls, with cloak-rooms, porch, &c. The building will be composed of native stone, with Bath stone dressings, the interior being of oak. The contract sum for erecting the building is about 800l.

Hanley.—The new school for boys, with master's house, in connexion with Wellington Arch, has been opened. The school-room is a right wing to the original school-room, 46 ft. by 18 ft., and has been built by Mr. Hammersley, from the designs of Messrs. G. & C. G. G. architects. The total cost was 457l.

Miscellanea.

HEALTH OF NEWCASTLE-UPON-TYNE.—Typhoid fever has again made its appearance in the eastern part of Newcastle.

MORTUARIES AND POST-MORTEM ROOMS.—The Marylebone vestry have decided that, in addition to a mortuary-house, a post-mortem examination house shall be built. It is to be hoped the example will be followed.

TUNNELLING ON THE GO-AHEAD SYSTEM.—The Californians, who are working through their Summit Tunnel in the Sierra, have accomplished 1,600 ft. of the 1,660 ft. since last September. They not only began at both ends, but sank a shaft in the middle, and worked both ends from that.

BUSINESS AND AMUSEMENT COMBINED.—Pike's new opera house, now being built in Cincinnati, will be five stories high, with a frontage of 170 ft. The lower story is divided into six large stores. There are one hundred rooms on the second-floor, and a concert-hall 70 ft. wide and 128 ft. long. The remainder of the building is divided into rooms for mercantile purposes. The cost of the building will be more than a million dollars, and it is estimated that the total annual rent will amount to 150,000 dollars.

THE FEMALE SCHOOL OF ART.—The first gold medal given by her Majesty, to be competed for annually by the students of the Female School of Art, 43, Queen-square, has been awarded to Miss Alice Manly, for three groups of flowers, painted in *tempora* from nature. The adjudicators were,—Mr. Westmacott, R.A., Mr. Cope, R.A., and Miss Montrie. Miss Manly has also obtained this year a national silver medal, given by the Science and Art Department. We have before now commended her work.

SALE OF LAND BY AUCTION.—The new Act for amending the law of auctions of estates is to take effect on the 1st proximo. Where sales are invalid in law they are also to be invalid in equity, there being at the present time a conflict between law and equity in respect of the validity of sales by auction of land where a puffer had bid, although no right of bidding on behalf of the owner was reserved. With regard to the rules respecting sales without reserve it is enacted, "And whereas, as sales by auction are now conducted, many of such sales are illegal and could not be enforced against an unwilling purchaser, and it is expedient for the safety of both seller and purchaser that such sales should be so conducted as to be binding on both parties, be it therefore enacted, by the authority aforesaid, as follows:—That the particulars or conditions of sale by auction of any land shall state whether such land will be sold without reserve, or subject to a reserved price, or whether a right to bid is reserved; if it is stated such land will be sold without reserve, or to that effect, then it shall not be lawful for the seller to employ to bid at such sale, or for the auctioneer to take knowingly any bidding from any such person."

SANITARY INQUIRY AT EPPING.—One of the Government inspectors, Mr. A. Taylor, has been sent down to Epping to make sanitary inquiries in consequence of a complaint made to the Home Secretary to the effect that the sewer authority for the town had failed to properly drain the town, or supply its inhabitants with a sufficient quantity of water. The inspector has heard evidence on the subject, which goes to show that the whole drainage of the town is on the cess-pool system, and that it is surrounded with field-ditches, which evaporate noisome stenches most injurious to the health of the place. An abundant water supply, it is said, can be had in the neighbourhood.

HEALTH OF LIVERPOOL.—The official report by Dr. Trench, the borough medical officer of health, on the health of Liverpool during the March and June quarters of the present year, has been printed. During these quarters there were registered 7,285 deaths in the borough, making its death-rate equal to 29.5 per 1,000 per annum of the inhabitants. This shows a decrease of 2,825 deaths as compared with the corresponding period of 1866, and of 1,141 deaths as compared with the corrected averages of the last ten years. Of the total deaths, 3,858 were males, and 3,427 females, and 3,230, or 44.4 per cent., were children below five years of age. Zymotic diseases occasioned 1,368 deaths, being a decrease of 630 on the corrected averages of the last ten years, and 1,713 on the number registered under this class during the corresponding period of 1866. This gratifying diminution in the range of contagious diseases was chiefly observed in those affections such as typhus, diarrhoea, and small-pox, which are supposed to be either directly or mediately amenable to the influences of sanitary regulations.

WAVERTREE URNS.—The discovery of cinerary urns at Wavertree, similar to those found in the celebrated Derbyshire grave-hills and elsewhere, is referred to in a letter written by Mr. H. H. Vale, of Liverpool, architect. These urns are sun-baked, and not made by the potter's wheel. They are discoloured by smoke, as if burning matter had been put into them. Other finds of a like order in barrows and grave-hills, of pre-Roman and pre-Saxon origin, lead to the idea, remarks Mr. Vale, that "elevated sites were usually selected by the prehistoric races who inhabited this island for their interments, and the existence of Druid stones at Calderstones, upon which Sir J. Y. Simpson reports the indications of emblematical circles, and the finding of these urns at Wavertree and Roly, proves that this district of Lancashire was inhabited ages before the arrival of the Roman legionaries upon our shores. It is a peculiar feature of these ancient barrows that the British interments are frequently found underneath those of the Saxons, leading one to suppose that the places of burial were consecrated, and had been from time immemorial, and not merely haphazard interments on elevated situations, but cemeteries used by succeeding races. These grounds may have been consecrated thousands of years ago by the priests of a religion which has reached us only in those mysterious incised emblems which are at present exciting the attention of our best archaeologists."

Books Received.

Fouling and Corrosion of Iron Ships; their Causes and Means of Prevention. By C. F. T. LUNG, C.E., London Drawing Association, Delphi. 1867.

Fouling and corrosion of iron ships have in great trouble in the Navy, and a satisfactory remedy, it seems, is still a desideratum. The chief object of this volume is to advocate a plan brought forward by Mr. T. B. Daft, C.E., on all respects the soundest, simplest, and most practical. The author endeavours to prove that it is in all respects capable of fulfilling the requirements sought to be obtained; but this is a subject we can now enter on.

Aps and the Eastern Mails. By SIR CUSACK RONEY. London: Wilson, Royal Exchange.

A question of the best route to the East is ably discussed. Sir Cusack Roney thinks, as regards the European portion of it, the interest of England ought undoubtedly to lean towards the Simplon, and not towards St. Gothard. Nevertheless, as he remarks, Mont Cenis route, with the summit railway, according to Captain Tyler's calculations, will gain over the Marseilles route of 29½ hours, and of 42½ hours after the completion of the line from St. Michel to Susa. The objections and alterations suggested by Sir Cusack are of important improvements in the great of communication which connects the Eastern country with the whole of her Eastern possessions, and with the great commercial centres that lie farther eastward even than Constantinople. His pamphlet should have attention.

VARIORUM.

The Quarterly contains more than usual to give attention from our special point of view, "Paris" (less as to its buildings, on which millions sterling have been spent in fifteen

THE CHATHAM SURVEYOR.—At a recent meeting of the Local Board of Health, a gratuity of 20*l.* was unanimously voted to Mr. Greenstreet, their surveyor, for his services as architect of the new offices, while also attending zealously to his other duties.

IRISH ANTIQUITIES.—Within the last few days, on the farm of a man named Thomas M'Garry, residing at Anghamere, near Grara, there was discovered a curious relic in the shape of a wooden house, which is constructed of black bog oak. It was found under water in an exhausted bog, at a considerable depth beneath the surface. It measures 23 ft. by 10 ft., and consists of eight very strong beams, ranging in length from 10 ft. to 13 ft., which are supported by cross beams of great strength, and firmly jointed. The side beams are mortised, as if intended for uprights.

THE GATESHEAD TOWN-HALL DESIGNS.—The town council have resolved—"That this matter be referred back to the Town-hall Committee, and that the architects be requested to furnish detailed drawings and specifications, to enable the council to judge of their plans; and that they then be submitted to the contractors, to enable them to state the total cost of the building;"—also, "That the council appoint a thoroughly competent person to make an inquiry into the plans and specifications, after the contractors and architects have gone over the plans."

THE LONDON GAS COMPANIES.—The progress of the metropolis gas question has arrived at a sudden conclusion. Various objections were made by the companies; and the chairman said that, this being the case, the committee would not proceed any farther with the Bill, but would report their opinion to the House. He regretted that this long and, doubtless, very expensive inquiry had led to no further result at present; but he hoped, by the next session of Parliament, the companies would be able to introduce a Bill which would be considered satisfactory,—a singular termination, surely!

ADOPTION OF THE MAIDSTONE MAIN DRAINAGE SCHEME.—The town council as the local Board have resolved by a majority of ten to four, "That the plan of sewerage, recommended by the surveyor in his report of 21st January, 1867, as modified by Mr. Lawson in his report of the 13th May, 1867, be carried into execution, and that application be made to the Local Government Act Office for power to borrow, on mortgage of the rates, the sum necessary for the purpose, and also for statutory powers to purchase the requisite land, and that the drainage of the West Borough and Kingsley Estate be at once proceeded with."

ROYAL PRINCESS'S THEATRE.—Mr. Herman Vezin, one of the few actors left us capable of refined expression and the portrayal of delicate differences of feeling, has opened this house for a brief season with a new play by Mr. W. G. Wills, titled "The Man of Airlie." The play is well conceived, well written, and well acted; but that it has in it the qualities needed to ensure a popular success we cannot say so positively. It is, however, just one of those experiments that deserve the support of every earnest lover of the drama. Mr. Vezin plays a difficult part with great ability, and is well supported by Miss Nelly Moore, Mr. H. Forrester, Mr. E. Price, and Mr. Maclean, especially the latter.

CUMBERLAND AND WESTMORELAND ARCHAEOLOGICAL SOCIETY.—The members of this society have held a meeting in the Crown Hotel, Penrith, to hear three papers read, and to visit Brougham Castle, Yanwath Hall, and Maybrough. The Chairman, Mr. Brown, of Tallentire Hall, briefly opened the proceedings. The Rev. J. Simpson read a paper sent by the Rev. J. Maughan, of Bewcastle, with the title—"Was Lancaster a Roman Station?" The Rev. J. Simpson then read a paper on "Brougham Castle," and the weather having cleared up, a large party departed in conveyances to visit and explore the objects of archaeological interest in the neighbourhood indicated. On reaching Yanwath Hall, Dr. M. Taylor read a paper whilst standing on the scene of his subject. The society passed a vote of thanks to Lord Lonsdale, for his permission to visit and inspect the ancient apartments of Yanwath Hall. The company then proceeded to Brougham Hall, through the chapel, and then on to Brougham Castle. The visit to Maybrough was postponed until a future day. On the return from the excursion the members and friends partook of tea together at the Crown Hotel.

BOROUGH SURVEYORS AND PRIVATE PRACTICE. After much discussion it has been decided by the Council of Derby that the town surveyor may carry on his private practice.

BUILDING PROGRESS AT SUTTON.—The foundation-stone of some houses has been laid on the Rose-hill Park estate, which is planned out for the erection of houses. Mr. J. D. Hayton is the architect. Under the stone were laid various English, Belgian, and French coins.

ROYAL GALLERY OF ILLUSTRATION.—We willingly comply with a request to mention that Mr. German Reed will bring his season to a close on the 5th of August, when there will be a benefit for himself, Mrs. Reed, and Mr. John Parry. To a "Dream in Venice," got up as it is with care, and enriched with capital scenery, and "Merry Making," will be added other attractions on that night.

JASPER.—Jasper is now procured, to almost any required extent, at St. Gervais, in Savoy, where the quarry has a surface of at least 24,000 square yards, and a depth of about twenty-two yards. It is a variety of quartz, which is characterised by being opaque, and is of various colours. It is an excellent material for ornamentation, whether as stands for small objects, or as panels and columns, to be used by the architect.

THE BRICK-KILN NUISANCE: BRICKS MADE WITH SEWAGE.—In the Chancery Court, before Vice-Chancellor Stuart, the case of *Luscombe v. Steer*, was a motion to restrain the defendant from making bricks in a field of his, lying between the plaintiff's property and the Crystal Palace line of the London, Brighton, and South Coast Railway. The defendant, in making bricks, it was said, used water from a sewer into which four houses poured their refuse. The plaintiff contended also that the defendant was not entitled to make bricks on the land. The defendant denied that he was guilty of committing any nuisance. His field on the plaintiff's side of the railway was nearly half a mile from the house of the plaintiff, who, when he became tenant of his property, was fully apprised of defendant's rights. The Vice-Chancellor granted an injunction to restrain the defendant from making bricks to the damage or annoyance of the plaintiff.

THE CLERKENWELL MORTUARY.—At a recent meeting of the vestry, the clerk said he had received a letter from the Coroner of Central Middlesex, containing the presentment of a jury who sat at the Queen's Head, Princes-street, to inquire into the cause of the death of a person whose body lay, in a putrescent state, in an overcrowded house in Pettolville, in consequence of the public mortuary being closed, to the serious inconvenience of the medical officer whose duty it was to make the post-mortem examination, and to the danger of the health of the inmates of the house. The jury expressed themselves in the strongest terms against the closing of the mortuary. It was agreed that a copy of the resolution of the jury be forwarded to Mr. Beadle, the agent of the Marquis of Northampton, who had closed the mortuary, to the Marquis himself, and to the special committee recently appointed by the guardians to take steps for the re-opening of the mortuary chapel.

FRUIT WITHOUT STONES.—A new horticultural process has been described by the Rev. F. Firminger, at the last meeting of the Agricultural Society in India, whereby, it is said, the stones of fruit may be reduced or made to disappear, and the pulp be increased in size and flavour. During the cold season (says the *New York Tribune*, in giving an account of the process) select a branch that is to be used afterwards for inarching. Split it up carefully somewhat less than a span long. From both halves of the branch thus split scoop out clearly all the pith; then bring the split halves together again, and keep them bandaged till they have become thoroughly united. At the usual time, inarch the branch thus treated upon suitable stock, taking for the place of union the portion of the branch just below where the split was made. Upon the branch of the tree thus produced a similar operation is performed, and so on for successive seasons; the result being that the stone of the fruit becomes less and less after each successive operation. This process, it is added, has been applied likewise to the grape vine at Malaga; and plants thereby have been produced which bear the finest fruit, without the slightest vestige of a stone within them.

A GIFT.—Mr. Titus Salt, the proprietor of a well-known alpaca manufactory at Saltaire, has just made a magnificent offer to the borough of Hull. He proposes to give 5,000*l.* to the Sailors' Orphan Institution connected with the Port of Hull Society, on condition that the institution be enlarged, to give accommodation for 100 orphans, and the school 200.

HOUSE DECORATION: PRIZES.—It is due Mr. George Dobie, of Edinburgh, to draw attention to an advertisement which has appeared our columns in which he offers prizes for design in drawing-room wall-decorations. This is likely to encourage and develop talent, and it is as the best way to promote self-interest as well as public taste in house decoration.

OLD FILES.—Old and worn-out files may be perfectly renovated by first cleaning them in grease with a hard brush and a concentrated solution of soda; placing them in a dish containing water; adding to the latter an eighth part concentrated nitric acid, and mixing well; agitating; then leaving them at rest for five or twenty minutes; next withdrawing them, washing them with water, and brushing them, placing them in the dilute acid, to which is added a second eighth of nitric acid, and letting them lie for 50 minutes, then again brushing them, replacing them in the bath, to which a sixteenth part concentrated sulphuric acid has been added, finally washing in pure water and milk of lime to remove all traces of the acid, and drying. *Scientific Review.*

CHIMNEY TOPS OR COWLS.—The improved chimney top or cowl, patented by Mr. C. Whitehead (Nov. 13, 1866), is made by preference in two parts, one fitting over the other. The inner portion or part is made by preference of octagonal shape, but it may be round, square, or of any other shape. For the sake, however, of clearness, the patentee describes it as being octagonal, the top being covered with a cap, made by preference somewhat conical. The outer part, which fits over and rests on the inner, is made of a shape to correspond with the inner, and is open at top, terminating in a sort of crown or canopy. Ribs are brought from the top of the cap down the eight corners to the way down, or thereabouts, the top or cowl, each square formed between the ribs there, by preference three apertures, preferably square for the smoke to escape, which can cut ascend or descend, according as the wind is affected the draught. There are cross pieces from rib to rib, which act as shields to prevent the action of the wind when blowing down affecting the draught.

EXHIBITION OF WORKS OF ARTS AT LEE, 1868.—It is stated that there will be three galleries devoted to the old masters, each measuring about 120 ft. in length. For the English School there will be two galleries, each of 110 ft. long, besides the gallery set apart for water-colour drawings, which is also 110 ft. long. But perhaps one of the most important features will be the large gallery for pictures of foreign painters of the various schools, including those of America, lately distinguished in landscape art. In addition the principal galleries above referred to, will be one of the same size filled with engravings and drawings by old masters; an extensive portrait gallery of Yorkshire worthies, round the corridor of the central hall, with rooms of miniatures, and a complete museum of ancient ornamental art. The spacious staircases of the hall, in themselves highly ornamental, will be made available for pictures as well as for picturesque decoration of every kind in the shape of tapestry, pictures of arms and of the chase, while the principal examples of Scripture will be arranged round the central hall and in the picture galleries.

The Builder.

VOL. XXV.—No. 1278.

A Large Hotel for New York.

IG beyond compare, or, at any rate, very large, a hotel of considerable pretensions is about to be added to those already existing in New York, and we have received from the parties interested a view and particulars of the proposed building. Our readers will probably be glad to know what is doing in this way on the other side of the Atlantic, and we give them the advantage of the materials in our hands.* The site which has been bought by Mr. Cranston, now of the New York Hotel, is

opposite the main entrance to the Central Park, comprising the whole of the block between Fifty-ninth and Sixtieth streets, and extending on Fifth Avenue in front to Madison Avenue to the rear: it is a square of 201 ft. front by 100 ft. in depth. The intention was, when we were written to, to form a joint-stock company erect the building upon this plot forthwith.

The situation chosen is unrivalled, particularly in view of the rapid growth and expansion of the city in this quarter. The establishment is to be strictly a family hotel of the first class, similar to that of the Clarendon, of Fenton's, or Warr's, in London; and to this end the arrangements will be somewhat different in character from those of any hotel now existing in New York. The designs have been made by Messrs. Bryant & Gilman, architects of the new City Hall of Boston, and lately residents of that city. Mr. Gilman, having now removed to New York, will remain for the purpose of carrying out the works of the new hotel to their completion.

The proposed building is to be of five stories in height, in the walls, in addition to the basement story, and includes also a seventh story of members in the high Mansard roof, which covers the whole. It is built in blocks around two courts in the centre, which are separated by a cross wing of the building. The height of the blocks above the level of the area pavements is not 80 ft.

The plan comprises, as its principal feature, a large central court covered with a glass roof from which alone access is obtained to the whole building. This court is entered by two carriage-ways, each 26 ft. wide, one on Fifty-ninth-street, and one on Sixtieth-street, and includes an area of 88 ft. by 118 ft. Two white marble terraces, with steps of the same material, 10 ft. in width, give access from this court to the opposite wings of the main building, and open,

on the one side, to the *salle de reception*, 30 ft. by 46 ft., and on the other to the hotel office and the block on the Fifth-avenue front of the building. There are two main dining-rooms, one for the *table d'hôte*, 46 ft. by 110 ft., and one intended as a restaurant, 48 ft. by 100 ft., where meals will be served at all hours. There are eight staircases in all, each running from bottom to top of the house, four of which are for the public and four are service-stairs, of iron, enclosed in brick walls, for the use of the servants only, but available, in case of fire, from all the corridors of the building. Two of the public staircases are 10 ft. in width, and two, near the centre of the building, and opening directly from the *salle de reception* above mentioned, are each 8 ft. wide, and are to be of highly ornamental pierced and carved black walnut wood panelling, and intended for ladies mainly. Two lifts will run from the ground floor to the sixth story, opening from the corridor opposite the foot of the central staircases in every story. A balcony opens from the upper saloon, which is directly over the one before described, and of the same dimension (30 ft. by 46 ft.), the balcony entered from three carved doors, filled with plate-glass panels, and overlooking the large dining-room below from this higher level. The principal corridors of communication are 12 ft. wide, and the lesser ones 9 ft. wide, and are all open to the external light and air; by transverse passages across the whole width of each block at intervals of about 75 ft.

The bar-room, billiard-rooms, and barber's shop are all in the half-basement story, and occupy each an area of about 50 ft. by 50 ft. The kitchens, larders, pantries, service-rooms, laundries, and all the other domestic offices occupy the basement and first-floor of the whole rear wing on Madison-avenue, and the basement story of the dining-room wing in the centre of the second or house court before mentioned. All these apartments have been well studied out and arranged.

In regard to the accommodation for guests, it may be briefly stated that there are 174 private parlours on the several stories, the largest of which measures 18 ft. by 27 ft., and the smallest 16 ft. by 20 ft., each with one, two, or three chambers attached *en suite* respectively, each one with its own private bath-room and "closet" included; the bath-rooms measuring in general 7 ft. by 10 ft., and each suite having in addition its own antechamber, 7 ft. by 12 ft., giving access to each room of the suite, but separating them all by an entry and double doors from the noise of the public corridors outside. This feature insures privacy and quiet.

Besides the parlours above noted, there are upwards of 600 chambers, single and in suites, many of them being of the largest size, exclusive of more than 100 other rooms, for the officers and domestics of the house, for the servants of private families, and for other necessary uses.

The exterior architecture of the hotel will present many features of novelty in New York. The large hotels there, from the Astor House to the Fifth Avenue Hotel, have all been designed on nearly the same principle, viz., a large square block or mass of buildings, with a straight line of wall and cornice, both horizontally and vertically, and with no more relief or variety of outline than is to be found in a packing-case. This appearance it has been the aim of the architects in the present instance to avoid. The design of the exterior consists of pavilions at each angle of the great quadrangle, and massed in couples, with a higher line of roof connecting them in the centre of each longer façade. Thus it results that the composition separates itself into eight pavilions, connected by eight wings or curtains of different heights, and a considerable variety of outline is accordingly produced by the different heights of the parts. The angles stand somewhat forward from the line of the wings or

curtains, and terminate in lofty, square pavilion roofs, with a *couronnement* of gilt iron railing. The effect of these angles is repeated in the additional boldness and weight of the centre masses in each longer façade.

The centre of the Fifth Avenue front has a projecting portico of two orders, which forms a terrace walk overlooking the Park, in front of the public parlours on the first and second stories. Above this the *insignia* of the city of New York, surmounted by a mural crown are introduced in an ornamental shield in the centre of the pediment over the central compartment of the third story. The carriage-ways on Fifty-ninth and Sixtieth streets are entered between detached columns of the Doric order, carrying on their shafts vermiform bands (an ugly feature by the way, notwithstanding Philibert De Lorme), each column being surmounted by a sculptured figure. A profusion of balconies constructed of wrought-iron scroll-work are also introduced on the various floors, not less for the pleasure and convenience of the occupants of the apartments than for effect.

The authors acknowledge some obligation in the distribution of the masses, and the outline of the roofs to the premiated designs by Mr. Garling, for our Foreign Office.

It is intended that the great interior court, 88 ft. by 118 ft., through which, as we have observed, entrance will be had to the entire building, shall be made the most ornamental portion of the design. The general style of this part of the composition is studied from the well-known façades of the Château of Heidelberg. This court is to be protected by a light iron and glass roof, and it has been determined to construct the architectural work required in Ransome's concrete stone.

The new hotel, if carried out as proposed, will certainly prove an important addition to the architectural and social features of New York.

THE NIGHT-WATCHMAN.

THE very destructive fires which now and then break out in large manufactories and stores have set us thinking of late about that important officer the night-watchman. The latest great fire at Messrs. Myers & Son's, Lambeth, whereat property to the extent of 40,000l. or more was irredeemably burnt and spoiled, has raised the question in our mind of watching,—what it is, what it is not, and, above all, what it ought to be.

The first alarm was given by the inhabitants in the dwelling-houses adjoining, who were terrified by the unusual glare of light on the back windows. Where were the police? Is the question first to be asked. The locality is in the L division, and all the way down the road to the Waterloo dry arch is "studded" with manufactories of various inflammable materials. The great Indian army stores' office is almost next door, and it is believed, well supplied with a competent staff of watchmen or police, tell-tale clocks, and every appliance to keep such people to their duty. Where were they that they couldn't see such a body of fire sooner than people who were fast asleep in their beds when the fire broke out? Again, will anybody undertake to explain why a builder's fire on a Saturday night should be one of the ordinances of the Fates? When one is reported we have the same stereotyped story,— "The works were vacated early on Saturday afternoon, and at that time all was perfectly safe." Sometimes there is a watchman,—more frequently not,—and, when the watchman makes the discovery, it is,— "The first intimation of the fire was from the carpenter's shop on the first story, which the watchman found to be in flames, although, when he passed through half an hour previously, all appeared to be perfectly safe."

In this fire the conflagration had enveloped an entire factory from floor to roof, comprising the whole of the wood-working department. There were nearly twenty fire-engines on the spot, and a strong force of fire and salvage-corp's men. Most of the engines were steamers,

* See p. 571.

and threw large quantities of water, but, for all that, the fire burned until the Sunday afternoon. Adjoining the burning premises is a large block of buildings called "Bell's India-rubber Works." In a very short time the upper part of this building was all in flames; and, as if to give an idea of the terrible appearance of a town on fire, all the dwelling-houses abutting on the scene of the disaster in the Belvidere-road, Guildford-street, and the York-road, were set on fire also. The consternation in the neighbourhood was something awful: the noise of steam fire-engines, the shouting of men, the shrieking of women and children, and the crackling and falling of burning floors, roofs, and beams, were things fearful to witness in their terrible reality. In the midst of all this calamity came the inevitable contingent of the destroying hundred-thousand—the London plunder mob. It has been stated on reliable police statistics, that there is in London the enormous number of 100,000 persons who live by plunder, who do not know where their day's food is to come from when they get up in the morning. At every fire the police have a great deal to do to prevent these gentry breaking into adjoining houses and ransacking them, on the pretence of rendering assistance. The present instance formed no exception to the rule; the police had hard-fighting with them, and, even then, were not always successful.

The buildings destroyed consisted of saw-mills, moulding and planing shops, machine and timber-drying rooms, engine and boiler houses, woodsheds, joiners', smiths', and wheelwrights' shops, in all 340 ft. long by 116 ft. broad. The india-rubber factory had two floors burnt, and the roof burnt off the entire building; it was not insured. The backs of thirteen dwelling-houses were, more or less, burnt. In addition to all this the premises of Acre Wharf, in the occupation of Messrs. Crosse & Co., timber merchants, were damaged by fire and water. Look at all this destruction, and then say whether the night-watchman does not involuntarily rise up before the "mind's eye." Here is a case of such alarming dimensions that, watchman or no watchman, it calls for an investigation of the most searching character.

The place was stated to be "safe on the Saturday night," and what the public right demands is, that an endeavour ought to be made to ascertain how, under such averments of safety, a building 340 ft. long and 116 ft. broad came to be all in flames from basement to roof-tree by half-past three o'clock on Sunday morning? Was it by spontaneous combustion? Was it carelessness? Was it negligence? What was it? In all fires so terrible as this one—even in smaller ones—especially where the workable material is of a combustible character, a very strict inquiry should be originated. Are there any watchmen in each case? If so, what kind of men are they? Are there any tell-tale clocks to watch the watchmen—"quis custodiet ipsos custodes?" Who is to take care of the caretakers? What are the watchmen of this competitive age like? Are they old, worn-out men, or middle-aged active men? Are they given to ramble about in the day time and trust to the chance of a "pitch" during the night? Do they lodge in a place where sleep is not a difficulty during the day-time? Are they of the old "Charley" breed, and so, utterly worthless?

A night-watchman should be well paid; so well that the money would always command a superior class of men. He should be in the confidence of the counting-house, hold the rank of foreman, and be called "Mister." If practicable, he should be provided with a cottage either on or near the premises; and if he should happen to have a wife and family all the better, for then he will have continually before him so many hostages to fortune and good behaviour. Twice a week, at least, some member of the firm, or the manager, should converse freely with the watchman, and let him see that his care and intelligence are considered from a point of view beyond the pay-table. He should have a neat, plain uniform, something that he would feel proud to wear as the "regimentals" of the firm. He should be able to read and write well, and should, every morning, present a short "state" of everything that has transpired in and around his territory during the night. If he speaks to a policeman at the gate, let it go down, with the time and the man's number; name the last man away and the first back in the morning; and let the "state," or, which would be better, an "Occurrence Book," show to the counting-house all that had happened on the premises from watch to

watch. In short, the night-watchman should be revolutionised: instead of the common labourer, we would have a man of sufficient intelligence, good enough to be asked to sit down and offer any suggestions coming within the scope of his duty.

And the alteration would pay, and pay well. Look at the enormous value of the interests in some firms committed to his charge, and consider what his negligence or inattention may cost. We would not have a night-watchman on the place unless he was good enough to be a sergeant in the army. Such a qualification, combined with the habits of a first-class policeman, would make the article required. We have abolished the "Charleys" from the streets, but most of the night-watchmen I have seen have been merely a prolongation and transfer of the Charley system into where, of all other places, such a system is the most unreliable and dangerous; namely, large manufacturing premises. Some day the night-watchman will become a very important officer on an establishment, and his well-kept "occurrence-book" will be looked upon as storing information to the firm not obtainable in any other way. To be sure, the article must be paid for; but, with a good night-watchman, a 40,000l. fire would be a much more improbable contingency than with an indifferent watchman. We earnestly commend these views to the serious consideration of employers, and fully believe that, after one year's experience of the change, they would wonder how they had tolerated the old system so long.

Let us take any of our large manufacturing premises. We close business for the day, and commit thousands, and tens of thousands of pounds' worth of property to the care of the night-watchman—a man who, in a general way, is simply a common, unintelligent labourer. In many cases you may have good, well-meaning, honest, industrious men; and then it may be asked, "What more do you want?" You do want more. You want a higher order of intelligence with all this honesty and industry; and, when you look upon the vast "sleeping" interests confided to his care, you are as much called upon to have him as to have a good manager or foreman. We have heard most singular doctrines about the quality of night-watchmen. It has been said that when a man is fit for nothing else he'll do for a night-watchman. And the fallacy is far too often acted upon.

Again, in large premises, the "tell-tale" clock will be found a valuable adjunct in compelling the watchman to go to the place where it is and look it in the face, leaving the record of his visit behind him. Most of our readers have seen them, but those who have not can gratify their curiosity any day by a visit to the House of Commons; there they will be shown the tell-tale, or "peg-clock," by merely asking any policeman whom they may happen to see on duty. We will say what they are like for the information of those who do not happen to know.

The "Tell-tale" clock is the invention of Mr. Whitehurst, of Derby, and was adopted by Parliament many years ago. It will be more explanatory if the reader will occasionally look at an ordinary clock while reading the following lines:—Imagine the dial of a clock without hands, but with all the hours and minutes marked on it. This dial is screwed on the axle of the wheel that carries the hour-hand in other clocks. Fixed to the inside of the case, close to the figure of XII., and exactly opposite to the XII. "dot," is a small wedge-like pin, whilst standing up out of the rim of the dial are small brass pegs, about a quarter of an inch high, and placed at such a distance apart that four of them extend from one figure on the dial to another, so as to make a quarter of an hour in time between every one of them. Over the XII. again, and opposite the time-pointing wedge-shaped pin just mentioned, is a little fairy-looking hammer, covering the peg of each quarter, but not touching it. This hammer is connected by a wire, with a hell-pull on the outside of the clock-case. Everything is locked in, and the key kept by some superior officer. We will now set the clock going, if you please. Observe, and you will see the dial moving away to the left, which will shortly bring a quarter-past XII. in front of the time-pin, and you will notice that the quarter peg has been brought under the little hammer. Pull the hell now; down it goes, and for the next eighteen or twenty hours it will bear witness that you knocked it down at the proper time. As it is somewhat monotonous work

watching the dial of a clock, let us look round a little.

Well, the fifteen minutes having nearly expired, let us go back and hammer down the hammer past twelve. By Jove! we're just in time. Pull! Ah! the hammer has missed the peg: we are a minute too late, and that peg will record the fact on the other side of the hook against us without the possibility of preventing it except by smashing the concern. Sometimes the pegs are made to project from the rim instead of standing out of it. When they come round in the afternoon of the next day there is an incline, plate, or roller, over which the inside ends of the pins pass, and are thus pushed out again ready for work as before.

It will now be understood that, where there are two of these clocks, the night-watchmen must be with each of them every quarter, hour, or so on, of an hour, as may be deemed requisite. Thus, if one be placed at the gate and another at the further end of a range of shops, stores, or warehouses, the night-watchman may pay personal attention to them all the night through, or the pen-standing peg will surely be in its silence, where were you when you ought to have sent me to rest in the night?

We have probably said all that is necessary about the night-watchmen. That we have made a general advance in this direction few will be inclined to deny. It is a curious feature in our national character how long we will run upon an inferior article without for one moment thinking of its inferiority. We have often pondered over this question of the night-watchman when dreadful conflagrations have started the town. We are satisfied that the quality is not what we ought to have, and that some change should at once be made.

THE PUBLIC HEALTH IN THE SECOND QUARTER OF 1867.

SOME remarks upon the health of our last towns during the thirteen weeks ending the 22d of June last, appeared in our column a week or two since. The Registrar-General's Quarterly Return relating to these three months is now before us, and it is eminently satisfactory to find that the improvement in the health of our last towns was shared by the nation at large. I greatly increased birth-rate, and a remarkable decrease of deaths, be taken as a sign of prosperity, the present return is indeed gratifying. The natural increase in the population of England and Wales during the three months, excess of births over deaths, was 87,126, 23,359 more than in the same period of last year and at the rate of nearly 1,000 a day. The birth-rate of the quarter, 37·4 per 1,000 was the highest on record.

The marriages given in the return just published are those registered in the first three months of this year, and not for the same period as the births and deaths. In the first quarter of this year the persons married were only 13 per 1,000, instead of 14·00, the average rate the same quarter of the previous ten years. This depression of the marriage-rate was, doubtless, as suggested, caused by the most deplorable condition of the country. The commercial condition was greatest in Northumberland and Durham, where the shipping and coal trades were at a low ebb; and in Cornwall where the complete stagnation of business in the mining districts is causing an emigration which is spoken of by the local registrars as "exodus." The marriages in the first three months of this year in Cornwall were only 493, against 709 and 577 in the same quarters of 1865 and 1866. The births also fell from 3,453, and 3,313 in the second quarters of 1865 and 1866, to 3,013 last quarter. There is, therefore, no doubt that the population of this county is decreasing in a remarkable manner, at a time when the general increase in the population of the country is proceeding at a rate never before known.

The most important feature of the present quarterly return is, however, the decline of the rate of mortality, and the satisfactory conclusion which may be derived therefrom as to the improved condition of the public health. We are somewhat at a loss when we attempt to account for the healthiness of last quarter. We are used to attributing a rise or fall in the standard of health to the weather, that it would be scarcely unreasonable to expect that our knowledge as to the manner in which the tempera-

and various conditions of the temperate affect the public health should be making progress; but, beyond a certainty that extreme cold in winter or extreme heat in summer alike swell the returns of deaths, we really know little or nothing more than our grandfathers. The spring quarter of 1866 was one of the most unhealthy on record; while that just ended was healthier than any corresponding period since 1857. The mean temperature of the two quarters was almost identical, and in sudden alternations from wintry cold to summer heat the second quarter of this year was certainly most remarkable. Then, again, the price of wheat, which in the spring quarter of 1866 was only 46s. 6d., averaged 63s. 11d. last quarter, accompanied by a corresponding increase in the price of nearly all other articles of food. The decrease in the death-rate can, therefore, be scarcely attributed to the weather, or to the abundance of cheap provisions. How much, then, of this improvement in the nation's health dare we safely attribute to the great strides which in the past twelve months have been made in the sanitary condition of the country? In the spring of last year, when the unsatisfactory condition of the health, more particularly of our towns, was from time to time pointed out, not only in these columns, but by the press generally, warnings were freely given of the consequence of a cholera epidemic coming upon us, unprepared as we evidently were. That warning carried weight from the previous fatality from cholera on the Continent, and many towns immediately went to work in earnest, and, doubtless, thus saved themselves in many instances from the epidemic when it really came in autumn. Many towns and villages and parishes which delayed doing anything until cholera was really among us and was carrying off its hundreds a week in London, Liverpool, and the Welsh towns, then set to work in earnest, not only in organizing preventive measures, but in carrying out important sanitary improvements, the effect of which on the public health will prove cumulative. There is no longer any reason to doubt that the nation's intelligence and interest have at last been fairly roused to the vital importance of the subject; and when England sets about anything in earnest, it is generally thoroughly done in the end. More sanitary activity has been displayed during the past twelve months than in the previous twelve years. Again we ask, therefore, how much of the improvement in the health of the country dare we place to the credit of this sanitary activity?

During the three months ending 30th June the 112,523 deaths registered in England and Wales showed a decrease of 16,169 upon the number returned in the same quarter of last year in a smaller population. The annual rate of mortality to 1,000 persons living was 21.1, or 1.1 per 1,000 less than the average rate in the ten previous corresponding quarters, and 3.3 per 1,000 less than that in the same quarter of last year. In all the large town districts of England and Wales, containing in 1861 an enumerated population of eleven millions, the death-rate was 22.0 per 1,000, or 1.6 below the average, and 4.4 lower than last year. In the remainder of the population of the country, comprising the small towns and rural districts, the rate of mortality was 19.9, or only .6 below the average of ten previous quarters, and showing an improvement of only 1.8 per 1,000 upon the rate in the same districts last year. It is only natural that the greatest difference between an unhealthy and healthy season should be shown where the heaviest rates have long proved the greatest necessity for improvement; but it is also to be remembered that inasmuch as it was in large towns that most dread of cholera was experienced, so it has been in large towns that most has been done during the past year in the way of sanitary improvement.

The most marked decrease in the death-rate during last quarter took place in the ten largest towns of England, including London, and furnishing weekly returns, and estimated to contain at the present time a population of about five millions and a quarter. The annual death-rate in this population in the three months was only 22.0 per 1,000, against 27.5 in the same period of last year. The details relating to the improved health of these ten towns have been previously examined; suffice it here to remark that the decrease in the death-rate was greatest, 11.7 per 1,000, in Liverpool, 8.6 and 8.5 in Leeds and Sheffield, while in Manchester and Sheffield it was only 2.6 and 1.3 respectively. Both these towns are, however, now actively considering

measures for the improvement of their sanitary condition, and the appointment of efficient medical officers of health should be among the first fruits of their consideration. London, Bristol, Liverpool, and Leeds have already reaped an ample return from the services of their sanitary officers, although the effect of their labours is only now beginning fully to appear in the death returns.

Croydon, which, not a short time ago, was notorious for its unsanitary condition, now rejoices in a mortality of only 17 per 1,000, the standard of healthy districts. The registrar remarks that preventible diseases have there been reduced almost to a minimum. Southampton has also recently been unprecedently healthy, and to the present date shows no signs of its annual epidemic of diarrhoea. We hear, indeed, of marked improvement in towns, villages, and parishes in almost every corner of England and Wales, which renders the few exceptions noticed by the local registrars the more conspicuous.

Generally speaking, Wales, Yorkshire, and the Northern Counties are still the unhealthiest, and participated last quarter to the least extent in the improved health of the country. Winterton, near Glandford Brigg, Lincolnshire, and North-allerton, in the North Riding of Yorkshire, are, however, among the few places noticed as suffering from conditions the reverse of sanitary.

We, who have taken no inactive part in the crusade which has been fought during recent years against the ignorance and apathy which have been displayed upon all matters relating to sanitary reform, and against the almost wilful opposition which in towns, parishes, and vestries, has been made to the expenditure of money to save the lives and ameliorate the condition of our labouring population, in the crowded courts in town, as well as in the over-filled cottages in the country, cannot but rejoice at what appears to be at last the fruit of the general awakening of the public to the importance of such matters. But the victory is not won yet; we must still fight on, in the hope of seeing still more gratifying results from the completion of what is now only begun.

SKETCHES IN ANNANDALE.

DURING a brief residence on the northern shore of the Solway Frith, not long ago, we contrived to pick up a variety of curious information with regard to what the French authors would style its comparative civilization. We made some notes on the ancient history, as well as the present condition of its inhabitants. We had time to examine the ruins of some of the old feudal castles, and to contrast them with the modern mansions of the district; and we did our best to compare the condition of the working classes at the present day with those of former generations. Finally, we discovered certain curious coincidences of manners and customs on the opposite shores, which are worth recording; for, he it always remembered, the Solway constitutes the western boundary between the North of England and the South of Scotland. These notes we shall try to present in the order to the consideration of our readers, without, however, making any pretension to systematic treatment of what would in that case be a very wide subject.

Lady Mary Wortley Montague has pointed out, with that clear perception and delicacy of taste for which she was so distinguished, that the most interesting point in the landscape of a country is that in which the lowlands approximate to the highlands, and where the plains begin to lose themselves and merge into the slopes of the neighbouring mountains. A similar degree of interest, we think, belongs to those debatable regions of land and water which separate two countries; and if we regard the Solway from this point of view, we shall find it well deserving of study; for it is equally rich in the monuments of antiquity and of modern progress, in traditional lore, in ballad poetry, in the annals of war, and in the arts of peace. There are few subjects more fascinating and seductive than the antiquities of the Solway. The study may be regarded almost in the light of an Iliad in a nutshell. The history of England and of Scotland might be deduced from examples derived from its neighbourhood; and, in point of fact, it is to this district we must go for some of our chief historical landmarks.

The western extremity of the Roman wall, for example, abuts on the southern shore in the vicinity of Downess on the Cumberland coast.

The parish of Rn্থwell on the Dumfries-shire coast contains the finest extant specimen of a Runic cross,—with its primitive Christian poetry only recently deciphered,—that time and the inroads of warfare have left to us. Although we believe there are no round towers or borghs, still there are abundant legendary evidences of the ancient Picts and the aboriginal Celts; and from the vernacular language of the district we may easily trace the influences in their respective periods of the Danish and the Saxon invader. With regard to Norman antiquities, feudal castles, and the like, there is no district in the country so rich in ruins and so redolent of border traditions; and as to the relics of memorable battle-fields, these are equally valuable and abundant. A monumental pillar at Burgh Marsh, or Burgh-upon-the-Sands, still identifies the spot where Edward I. at the head of the English chivalry, was taken ill and died. On the opposite coast lies the little town of Annan, the patronimic burgh of King Robert the Bruce. Between these two points, at the apex of the triangle, lies the celebrated Solway Moss, which recalls the destruction of a Scottish army. And there are two memorable points in the Solway Frith—Dundrennan Abbey in Kirkcudbrightshire and Mary-Port in Cumberland—which signalise the departure from Scotland and the arrival in England of the beautiful and ill-fated Mary Queen of Scots!

To go back for a moment to the remote history of the Solway, we must begin with the Roman wall. On this head we cannot do better than repeat a portion of Dr. Bruce's valuable address, delivered at the Cumberland and Westmoreland Archeological Association's first meeting at Carlisle.* As showing the value of the Norman antiquities, he remarks that the statements of Gildas (the first British historian, as he is called) can only receive full credence when they have been sifted and rectified by the Roman inscriptions, and by the hoards of coins which turn up from time to time. Tacitus tells us, for example, that Agricola commenced the battle of the Grampians by ordering forward some Tungrian and Batavian cohorts. How interesting it is to find buried in some of the wildest parts of the north of England slabs and altars carved by Roman hands which mention both Batavian and Tungrian cohorts! At the request of the late Duke of Northumberland, Mr. Lauchlan has not only surveyed the Roman wall, but the Watling-street from the Scottish border to the Tees, the Devil's Cansway, and various branch roads communicating with these. He has also surveyed the ancient British and the Saxon and Danish encampments in large districts of that country; and he is now laying down the combined results of all his interesting researches in a map of Ancient Northumberland. Perhaps it is not too late to undertake a similar work for Cumberland. For it seems that the Romans took a firmer grasp of Cumberland than of any other part of the north of England. Besides the stations on the wall, including Burdoswald and Bowness, and all between, a chain of forts, the chief of which was Mary-Port, has extended all along the coast. These have evidently been intended to prevent the enemy, whether from Scotland or Ireland, from landing within the wall. A road had connected these coast defences, from which even modern military men might still take a lesson. Such a map would supply a desideratum, we have no doubt; and besides every ancient barrow, every Danish camp, every Border tower and Peel house ought to be carefully marked and authenticated.

With regard to the Roman antiquities north of the Solway, we shall just mention, on the authority of General Roy,† that the second principal Roman way, or that which served as the western communication into North Britain, crossed the Roman wall at Stanwix, near Carlisle, and leading by a place called Blackford, seems to have passed the east at or near Long-town Church. In the neighbourhood of this place a road had branched off to the right, leading towards Netherby; but the principal one, or at least that which is most conspicuous at present, points towards Gretna. From this place, for many miles together, the vestiges are distinctly to be seen leading through the *proctretium* of the station at Birrens, near Middleby. After leaving Malls Castle, Lockerbie, and Agricola's Camp, on Torwood Moor, it passed

* For a full report, see the *Carlisle Journal*, Nov. 9, 1866.
† Vide "Military Antiquities of Scotland," vol. i.

the River Dryffe, below Dryfesdale Church, not far from the junction of this river with the Annan, near which a branch had departed from to the left, taking the route of Nithsdale. On this line the most important remains are to be found at the Roman Encampment of Birrenswark Hill. This singular height is of an irregular oval shape, rising from the plain in solitary pre-eminence to an elevation of 500 ft. or 600 ft. It has been conjectured from this circumstance, and from comparison with similar works elsewhere, that the *Selgove*, a tribe of the ancient Britons, had a fort here in the days of their independence, when Roman legions were unknown; and certainly, adds General Roy, no better site could have been chosen within the whole circuit of their possessions on which to found the family stronghold of a Selgovian chief.*

Of the Roman remains excavated at the Birrens Camp, the chief, perhaps, is a votive altar, which was dug up in 1810, and now stands majestically in the entrance-hall of Burrfoot House, in a niche in the wall made on purpose for it. It measures 50 in. in height by 22 in. in breadth, and 9 in. in thickness, the back being as usual, roughly cut for standing against the wall. It is profusely decorated with leaves, birds, fishes, and other natural objects; and the mouldings are extremely fine. There is also in the possession of the same gentleman a lesser altar, and a fine bust, the remains of what must have been a beautiful statue, probably of Minerva. Vast quantities of coins have been found near Langholm, chiefly of the reigns of Nero and Vespasian. Numerous remains of urns, lacrymatories, and such-like specimens of Roman pottery, have also been discovered here; and, we may add, on the authority of a respectable builder in Ecclefechan, that, in addition to those remains, examples of the works have been also traced at this station of Roman engineers. When the line of the Caledonian Railway was in process of construction, there was found in the course of some cuttings, at a place called the Land, near the Roman Camp, several slabs of hewn pavement, abundant traces of scoriae and forge ashes; and also, we were told, specimens of iron filings! This would afford most fertile grounds of speculation, but we must not dwell any longer upon the Romans. We have only room for another curious fact. There is a spring well in this camp of Birrenswark, which the simple peasantry of the neighbourhood have from time immemorial been accustomed to call *Greckie's Well*, of course without knowing the reason why. But this Greckie, we suspect, is undoubtedly a corruption of Agricola; and if so, it is not the only instance in which the rude dialect of the Border has been enriched with the sonorous idioms of the Latin race.

Our next paragraph relates to the celebrated Runic cross of Ruthwell, a glance at which will carry us from the vestiges of Roman superstition and idolatry to the rude memorials of our Anglo-Saxon Christianity. Ruthwell is a parish of Annandale, lying close to the shore of the Solway, about half way between Dumfries and Annan, and comprehending within its boundaries a large portion of the celebrated Locher Moss, which we formerly described.

In a region where there are absolutely no historical traces of the nature and disposition of the primitive inhabitants it is always interesting to study the remains of such singular monuments. And even the very names of the places themselves are often the surest index and the only expression of a remote and almost obliterated civilization.

The etymology of Ruthwell has not, so far as we are aware, been satisfactorily explained; but Dr. Wilson suggests that the name of the parish has, in fact, been formed from the name of its Runic monument. He mentions, in corroboration of this idea, a place similarly, if not precisely so named in the ancient province of Moray, viz., *Rumelwethell*. But we need not pursue this topic. The Runes, it is hardly necessary to explain, are the characters of our most ancient extant graven records, and are distinguished into two varieties; the northern Runes, belonging to the ancient Celtic race, and the Anglo-Saxon Runes, of which Ruthwell Cross is a valuable specimen.

* At this period the districts, afterwards named Eskdale, Annandale, and Nithsdale, and now comprehended by Dumfriesshire, were occupied by this tribe of *Selgove*, from which name that of the adjacent *Solway Firth* is, by some authorities, considered a derivation, or rather a corruption.—*Comp. Henry's Hist. of England*, vol. i., p. 281.

The most ancient description of Ruthwell Cross which we remember to have read is that of Pennant, and it is still the best. The church of Ruthwell, he says, writing in 1772, contains the ruins of a most curious monument, an obelisk, once of great height, now lying in three pieces; for it was broken, strange to say, by an order of the General Assembly, in 1644, under pretence of its being an object of superstition among the vulgar! When entire it was probably about 20 ft. high, exclusive of pedestal and capital; but making allowances in the measurement of the present pieces of fragments chipped off when it was destroyed. It originally consisted of two pieces: the lowest, now in two, had been 15 ft. long. The upper had been placed on the other by means of a socket. The form was square and taper, but the sides of unequal breadth: the two opposite on one side at the bottom were 18½ in., at the top only 15 in.; the narrower side, 16 in. at the bottom and 11 in. at the top. He then goes on to transcribe the inscription,—the Runic characters, Saxon letters, the Latin legend as rendered by Mr. Gordon,† and finally the rude sculptures, which he says were probably the work of different artists and different nations, the first being Christian Saxons and the other of converted Danes.

The remains of this monument as they then appeared, were lying within the church; very soon after that date, however, they were carried out into the churchyard, where they lay exposed to every species of accident and ill-treatment, till the Rev. Mr. Duncan was presented to the parish. Soon after his settlement, he had the fragments conveyed into the manse garden, and re-erected in something like their original form. In this new situation it stood, displaying in mysterious characters legends that provoked and tantalized the curiosity of this worthy clergyman; but nothing was legible to him more than the fragmentary Latin inscriptions on the back and front of the cross, which had already been made out by Pennant, and had been freely quoted and discussed. He proceeded, however, to make careful drawings of the monument, giving a precise delineation of its ornaments, and a correct representation of its Runic and other inscriptions.† These drawings were engraved and accompanied by a history of the monument so far as could be gathered from parochial tradition, were forwarded to various parts of northern Europe, and to that quarter particularly, because the Runes were then believed to be inscriptions entirely peculiar to the Scandinavian races. The translation of the Ruthwell Runes was now an object of desire and ambition to the first antiquaries of Europe. It was first undertaken by Mr. Shorleiff G. Kepp, an approved scholar, and a native of Iceland, whose rendering, although unsatisfactory, remained for some time undisputed. Professor Finn Magnussen was the next to essay an interpretation, and although differing considerably in his version from that of Kepp, he still agreed that the inscription, though of one uniform Runic character, consisted of a mixture of both Anglo-Saxon and old Scandinavian words. Another Danish professor, Mr. Thorkeilia (who had travelled in England and Scotland in 1790), added to this the discovery of one of two etchings by the Scottish antiquary, Adam Cardonnel, accompanied with a description by Roger Gale, that had been read before the Society of Antiquaries in London. Still the secret remained undisclosed. At length, about the year 1838, Mr. J. M. Kemble, a most eminent English Anglo-Saxon scholar, undertook to render the Ruthwell Runes, and he gave a reading and interpretation entirely different from his predecessors. In his able paper on the subject, he pointed out that although the characters were no doubt Runic, and as such the proper characters to be employed by the old Scandinavians; yet as otherwise employed by the Anglo-Saxon race, the Runes represented only radicals of their native tongue; or, at most, Anglo-Saxon with a mixture of old Northern words. He was the more positive in the accuracy of his readings and correctness of the version he had executed, from having satisfactorily demonstrated that the inscription in its grammatical construction was of a rhythmic character peculiar to the poetic compositions of the Early Saxons. Even now, however, when the

language could be nearly read, the *theme* was only revealed in fragments—of rare beauty, however, and of high poetic grandeur.

At this stage of the investigation, a remarkable instance of good fortune occurred to reward the unweary research, and the uncommon zeal of the Runic antiquary, which confirmed in a most wonderful manner the conclusions of Mr. Kemble, and raised him to a high position among contemporary archaeologists. Some years before a manuscript volume, consisting chiefly of Anglo-Saxon homilies, had been discovered at Vercelli, a town in Piedmont, which also contained, intermingled with the prose compositions, some religious poems of Anglo-Saxon origin. Of these poems, one was found on closer examination, entitled "A Dream of the Holy Rood," extending to 310 lines, which contained the whole of the fragmentary lines previously translated by Mr. Kemble, as well as a context almost complete; but at all events sufficient to supply the numerous lacunae which occur on the broken inscription of the Ruthwell cross! It is difficult to say, says Dr. Wilson, whose excellent description we follow, whether this discovery, so singular in its circumstances, is more extraordinary for the confirmation it affords to previously published conclusions, or more interesting for the ample satisfaction it gives us respecting a local antiquity which, during many generations, had been the object of mystery, wonder, and superstition; or, finally, more surprising from the beauty and exquisite grace of its revelations of the faith of an earlier age and race.*

The "Dream of the Holy Rood" commences by representing a Christian startled from his sleep by a vision of the cross, which seems to come looming in glory through the sky, attended by angels, and displaying by various manifestations its intelligent sympathy with the insatiable passion that had been accomplished on it. Onwards this cross approaches, till at length, having arrived at the sleeper, it reveals in language its feelings at being made the instrument of the sufferings of the Son of God. It is from this part of the poem that the verses have been selected for inscription on the Ruthwell Cross, of which we can only presume to quote a dozen lines:—

"A cross was I reared—
I raised the powerful Kings,
The Lord of the heavens.
I dared not fall down,
They pierced me with dark nails:
On me are the wounds visible!
They reviled us both together,
I was all stained with blood.
All creation wept,
Christ was on the Cross;
Yet hither hastening
He came from afar
Unto the Noble One,
All that beheld me,
With sorrow I was overwhelmed,
They stood at the corpse's head,
They beheld the Lord of Heaven!"

The lines in italics represent some of the fragments which are still legible on the Ruthwell Cross. It only remains to state, that the date of the erection of this monument must have been somewhere between the periods of the sixth and eighth centuries, which corresponds with a period when the Anglo-Saxons of Northumberland attained to a state of civilization far advanced as any other portion of Teutonic Europe. The present incumbent of the parish, the Rev. Mr. Gordon, is most obliging in showing the cross and explaining it to all poor antiquaries and wandering artists; and we can only hope that our notice of this somewhat obscure but valuable antiquity may lead to some official conservation of its remains; for at the time of our visit its condition was not creditable to the antiquarian or archaeological societies of Scotland.

We shall now pass for a moment to the memorials of the Norman era. We need scarcely tell the most ordinary student of English history that although none of the early Norman monarchs succeeded in effecting a conquest of this Northern territory, it so happened that their followers obtained, one way or another,—we need not tell how,—possession of the greater portion of the most fertile land. Thus Robert Bruce was the descendant of a Norman baron; John Baliol, his rival, was another; John Comyn, whom Bruce slew, was also a Norman; the Gordons, the Hamiltons, the Lennoxes, the St. Clairs, the Randolphs, the Lindsayes, Kerrs, Montgomeries,

* In the *Itinerarium Septentrionale*.

† Dr. Duncan's drawings are engraved in the fourth volume of the *Archæologia Scotica*. This gentleman, we may mention, so distinguished and zealous as an antiquary, was also the originator of Savings Banks. See an excellent memoir in *Chambers's Edinburgh Journal*, vol. xvi.

* Vide the "Archæology and Prehistoric Annals of Scotland," by Daniel Wilson, LL.D., 2nd edition, p. 634, where the poem is quoted at length. See also Mr. Cuthbertson's excellent pamphlet entitled "Walks in Annandale," to which we acknowledge our obligations.

and many others, seem all to have been of Norman extraction. Let us glance, for a moment, at the sort of castles those Norman warriors built in order to secure their property, keep their vassals in order, and the neighbouring country in subjection. Perhaps the most celebrated ruin on the Solway,—at least as a specimen of departed feudal grandeur as a castellated fortress, or what the old historians quaintly denominated “a place of strength,”—is Caerlarvock Castle. Its history commences so far back in the remote periods of Scottish antiquity that it almost belongs to the region of fable. It has, however, been pretty clearly established that it was founded before the Saxon Kingdom of Bernicia, or, indeed, before the disciples of St. Columba had established Christianity in the Borders. But by whomsoever it was built, the fortress, as far back as the days of Malcolm Canmore, was the seat of the Maxwells, a family which still exists, and whose property it still is. William the Conqueror beleaguered it. Edward I. besieged it, and reduced it. It was recovered by Bruce; it was again taken and retaken; and, in fact, was so enfeebled by repeated sieges and dismantlings, that a new fortress had to be built, which was finally completed in 1425; and it is the ruins of *this* castle of which we must say a few words.

Leaving Dumfries on a fine sunny morning, having previously secured a box seat on the outside of the omnibus which plies between the Crown Hotel, in the High-street, and the Pier or Quay of Glenapple, on the shore of the Solway, we proceed in high spirits, and with much curiosity, to have a leisurely survey of this noble and interesting ruin. It has no connexion with the subject, but it is worth mentioning that we pass on our way down the old house of Kirkpatrick, the seat of the ancestors of the present Empress of the French.

It is an ancient square-built and rather modest-looking mansion, near the left-hand of the river Nith, and standing in the centre of a bare grassy field. What a contrast, one could not help reflecting, was this the Tulleries! Glenapple, as well as a seaport, is also a favourite resort for sea-bathing of the Dumfries burghers and their families, as one might see walking along the picturesque beach, which we must do for three miles before reaching the object of our search; and many a weary mile have we trodden in search of objects less interesting than Caerlarvock Castle. Near the shores of the Solway, about nine miles below Dumfries, and situated at the southern extremity of the parish to which it gives its name, this venerable ruin stands in solitude and peace in the centre of a wood of splendid oaks and birches. As to its external aspect, we must remark that it presents much the same appearance that it did in the days of Pennant and Grose, both of whom have given a description of it, and it is curious that their description corresponds closely with that which is given of the original edifice in the Norman-French poem, which is still preserved in the British Museum. It is triangular, or shield-like on the plan, and surrounded by a wet ditch. At two of the corners there had been two round towers, one on the western angle, of which there are traces, is called Murdock's tower, from the circumstance that the Regent Albany was confined in it. The other, or eastern, turret is entirely demolished. The entrance into the castle-yard lies through a gateway in the northern angle, which is machicolated, and flanked by two circular towers. Over the arch of the gate is still seen the crest of the Maxwells, with the date of the last repairs, and the motto “I hid ye fair.” The residence of the family was on the east side, which is elegantly built, has three stories, and measures 123 ft. in length. The doors and window-cases are handsomely adorned with sculpture. On the pediments of the lower story are the coats of arms and initials of the Maxwells, with different figures and devices. On the windows of the second story are representations of legendary tales; and over the third are sculptured designs taken from the fables of Ovid's *Metamorphoses*, a not uncommon characteristic of the feudal architecture of the period. The opposite side of the courtyard is plain. In the front is a handsome staircase leading to the great hall, which is 90 ft. by 26 ft.

The surrounding scenery is, of course, highly picturesque. To the north lie the finely-wooded uplands of Annandale; eastward lies the majestic form of the Criffell mountain; to the south the Solway extends, with its rippling waves sparkling in the sunbeams; and beyond the Solway lie the beautiful outlines of the Cumberland mountains, which contain

in their bosom the regions of the lakes. The fishing-boats, with their white sails, passing and repassing in the frith, and the fisher-villages, “peeping from among the trees,” add to the value of a landscape and sea-piece that for beauty and variety can hardly be surpassed. Who shall tell us about these Norman architects, who seemed to choose their sites for beauty as well as strength, and who combined the poetical decoration of a “Lady's Bower” with the grim constructive necessities of a Border tower and garrison? Caerlarvock Castle is still sometimes the scenes of feudal festivity. When Lord Herries, the present proprietor, came of age in 1858, there was a great and joyous meeting of the tenantry and their friends in the old castle hall; and Mr. Maxwell, of Breoch—who presided over the gathering—told, among other things, that the ancient and honorable family to which the noble lord belonged had been ever distinguished for kindness to their vassals and benevolence to their dependents! Long may the walls of Caerlarvock resound with the cheers which kindly acts must always evoke!*

To conclude this subject we will briefly allude to Drumlanrig Castle which will serve as an illustration of dual magnificence of the last century as contra-distinguished from the ancient feudal grandeur and the warlike necessities of a fortress. This extraordinary pile, it is said, occupied ten years in constructing and bears the date of 1689. It stands on a knoll or rising ground on the right bank of the Nith, about seventeen miles north-west of Dumfries, and within the parish of Durrisdeer; and for several miles forms a conspicuous feature in the rich and varied landscape of the valley of the Nith. The castle superstructure consists of a hollow square about 145 ft. on external walls, surmounted with turrets capped and spired at its angles. It presents such an array of windows that there is a local proverb to the effect that they are as numerous as the days of the year. The staircases enter from the inner court, and ascend at the angles in semi-circular towers. The architraves of the windows and doors are profusely embellished with the well-known arms of the Douglases—the bloody heart pendant on a field of stars. The principal gateway fronts to the north, and consists of a heavy Gothic archway; and the eastern walls also possess a noble though heavy elevation combining the aspects of strength and beauty as well as may be expressed in the united lineaments and proportions of a fortress and a mansion. There is no portcullis that we could see, but there is a very thick and quaintly panelled door of oak, as well as a ponderous iron gate at the principal or northern entrance. There are no means left of ascertaining the cost of this singular castle. It was built by William, the first Duke of Queensberry, who, it is said, only slept one night within its walls. But he had expended such enormous sums of his princely revenue in completing it that he packed up the hills of cost in a parcel, on the outside of which he wrote—“May the devil pick out the eyes of any of my descendants who dare to inquire into this!” The traditional and poetical taste of the district has rendered his famous sentence in the following couplet:—

“May the Devil pick out his een
That daurs to look herein!”†

Drumlanrig was the principal residence of the family of Queensberry; but on the death of Charles, the third duke—the famous duke—without male issue, it passed along with the Queensberry titles to William, Earl of March, and upon the death of the latter in 1810 it reverted by entail to the Duke of Buccleuch. During this period of its history it was little occupied, greatly neglected, and by the Highland rebels in 1745 it was much defaced. (A portrait of William III., by Godfrey Kneller, still bears the marks of their violence.) But the present noble proprietor, at his majority in 1827, adopted it as his favourite residence; and in a few years brought the castle itself and the beautiful grounds which surround it into the fine condition in which we now see it. The present Marquis of Queensberry, we may add, usually resides in a modern mansion on his paternal estate of Kellhead, near Annan. Of this respectable, but by no means architecturally remarkable,

* A good deal of valuable information respecting the settlement of the Normans in Scotland will be found in John Hill Burton's “History of Scotland,” vol. ii.
† Sir Walter Scott often quoted the example of the Duke of Queensberry with regard to his own expenditure on Abbotsford. See Lockhart's Life.

mansion—of which Smirke was the architect—we had intended to give some description; but we have already exceeded our space, and we must reserve some of our readers' patience for our notes on a humbler class of domiciles.

THE CASTLE OF ARQUES.*

LIKE many other castles in Normandy, Arques crowns and occupies the head of a steep and bold cape or promontory,—in this case a spur from the great chalk table-land of the “Pays de Caux.” On the west it is flanked by a short but deep combo or dry valley, and on the east by the deeper and far wider valley of the Bethune and Yvernee,—streams derived from different sources, but which here meander across a broad and level bottom, above half a mile wide, until, a little below the castle, uniting, they receive the tributary Aulne, and, thus combined, under the name of “la Rivière d'Arques,” fall into the sea at the port of Dieppe.

The castle thus stands above the left bank of the principal valley. It is about 4 miles from Dioppe; and immediately below, and to its north-east is the village whence it takes its name, remarkable for a church of unusual size, and a most elegant example of the style of the latter part of the sixteenth century. Beyond, upon the right bank, are the remains of the ancient Forest of Arques, a part of the spacious domain of the ancient lords of the fee, and upon the skirts of which, within shot of the castle, was fought, in 1589, the celebrated battle of which mention has already been made.

The castle, in its present form, is composed of a rectangular keep, standing in the south-west corner of an inner ward, in plan something less than a half-circle, having its chord to the west, and contained within an *encinte* wall, strengthened by towers and buttresses along its sides, and at its southern end, and capping its angles.

Applied to the north end of this is an outer ward, of later date, four-sided, and having drum towers at its four angles.

The main entrance, approached by a steep and winding road from the town, is in the north end, or at the point of the cape, between the two towers. Entering, is a second gatehouse, opening from the outer into the inner ward, also between two towers. A third gate-house, at the other end of the fortress, leads direct from the exterior into the south end of the inner ward, and thus opens a communication with the root of the cape. There is also a lateral postern, defended, within its vaulted passages, in the west wall of the outer ward.

Outside the wall, encircling it closely, is the Ditch, the most striking feature in the whole fortress. This is in general plan not unlike the long section of a pear, the northern end being the smaller, and the western side flattened so as to be nearly straight. The counterscarp of this ditch includes an area of about 5 acres. The ditch itself, measured from the level of the foot of the wall crowning its scarp, is about 60 ft. deep, with slopes of 1 ft. horizontal to 2 ft. vertical, and about 70 ft. broad. It is only just not too steep to be covered with short turf. The crest of the counterscarp is a ridge about 6 ft. broad, and about 20 ft. below the level of the foot of the wall. From it descends another slope, equally steep, but much deeper; on the west side descending about 150 ft. to the bottom of the valley, and on the east to a rather less depth, as here this “glacis” is succeeded by a sort of broad terrace of pasture land, which falls gently towards the river, the level of which may be 250 ft. below the platform of the castle.

At the north end the ditch is traversed by a very modern causeway of earth, which supercedes the earlier drawbridge. At the south end, where the ground is highest, and the ditch about 50 ft. deep and 80 ft. broad, there remain two engaged piers upon the scarp and counterscarp, and between them two detached piers, of which the outer has fallen against the inner. All are rectangular; and the inner of the detached two is considerably the largest, and probably carried a tower for the protection and working of a double drawbridge. These piers are of flint rubble, cased with ashlar, of which a small part only remains.

At the other end is the earthwork of a *little donjon*, or ravelin, of triangular plan, the passage from which was a little to the east side of the

* See p. 548, ante.

apex. This work was evidently constructed when artillery was in use, and is attributed to Henry IV., during the campaign of 1589. It no doubt represents an earlier barbican, also of earth and timber. There are now no traces of masonry beyond the bridge. This work opens upon the ridge of the promontory, which widens and rises somewhat higher to the south. Its surface is secured with banks and ditches, the remains of field-work of various dates, both of attack and defence.

The design of this castle ditch is peculiar. The more obvious plan would have been to place the walls upon the edge of the hill, and scarp its sides down to the valley with such steepness as aided the ground. Instead of this the upper 40 ft. of the hill, being chalk rock, was scarped vertically, and then faced or revetted by a wall, upon which was placed the *enceinte* wall of the inner ward. At the foot of the revetment was then excavated the ditch just described, the material being thrown onwards so as to form an artificial scarp, which thus became a sort of advanced banquette or earthwork, beyond the ditch, representing the crest of the glacis, and capable of being held by a line of soldiers, but which, when taken, was too exposed and too narrow to allow of its being held, or of cover being constructed upon it. This banquette was at a rather lower level than the foot of the opposite wall.

Such an arrangement is found in other castles in Normandy, and notably, as pointed out by M. Deville, at Molleaux, De Longueville, Bec de Montagne, and in the later work of Château Gaudiard, where, however, it is less marked.

The keep is rectangular, about 80 ft. north and south, by 70 ft. east and west, and at present about 60 ft. high. It stands in the south-west corner of the inner ward, close to the *enceinte* wall, of which its south-west angle forms a part. Its walls at the ground level are about 13 ft. thick. It presents three buttresses on the north face, and two on the south,—the third being a sort of cap thickening and enveloping the south-east angle. These are of the unusual breadth and projection of 9 ft., and they rise to the present, which cannot be above 10 ft. below the original, summit. At the north-east angle the adjacent buttresses are set square, leaving the angle free. The south face is plain, or nearly, excepting the cap at its south-east angle, which extends southwards, and is connected with the adjacent *enceinte* wall. The west face is plain, outside of which was the entrance.

This is composed of a flight of steps, beginning upon the north face, passing by a doorway through its most westerly buttress, and which then, turning, is continued along the west face, until, at its south end, it lands in the usual square appendage or barbican common in these keeps. This staircase was guarded by an exterior wall, and had a gateway at its foot, and one at its summit. It was covered over, as appears from marks upon the wall; and above it was, no doubt, the usual platform for defence. In the basement of the barbican, which forms also part of the *enceinte* wall, was a vaulted chamber opening into the basement of the keep; the usual prison. The landing story was also vaulted, in barrel, having at one end a loop towards the field, and at the other a door in the wall of the keep.

Entering this door, the staircase is continued southward in the wall of the keep, up a roughly-vaulted, round-headed, mural gallery, until at the angle it reaches the level of the first-floor. The gallery now turns the angle, and is continued, on the level, half-way along the south wall, when it is stopped abruptly. A door on the right leads upon the *enceinte* rampart, and one on the left probably leads into the keep.

The interior of the keep is composed of a basement and an upper, or perhaps two, floors, divided by a north and south wall into two chambers on a floor. This division-wall is said to be original, and ought to be so in a keep of this size, but it looks of the sixteenth century, and may represent an older one. The west basement is much choked up with rubbish. The east is tolerably clear, and shows an exterior aperture in its east wall, near the south end, which communicates with the adjacent south gateway. This may be original, but it is now a mere hole. In the north wall is a short mural gallery, entering a well-stair in the north-east angle, which ascends to the first floor and chapel only. The lower stage was not vaulted. The first floor has four windows on the north side, two in each room, and one on the east side. The second floor had also similar windows on its

north, and a vaulted chamber on its east side,—no doubt a chapel. The chapel is formed by throwing a vault from buttress to buttress for its floor, and at a higher level for its roof, and above this were the leads. There are traces of similar chambers on the north front. The upper story has been vaulted in six bays, three on each side, duly groined and ribbed, as is shown by the springers. The material and the workmanship, no less than the section of the ribs, show this to be a late addition, probably of the sixteenth century.

The supposed two upper floors were very possibly intended for one floor of state, with two tiers of windows and a chapel above. The chapel seems to have had a barrel round-headed vault, probably groined. The accounts show this eastern side to have been the royal chamber in the fourteenth century. The fire-places seem to be confined to the upper floors. As now seen they are of the date of the vaulting.

In the south-west angle of the keep, very near the wall, is the well, of which the pipe was continued at least to the first floor. It is about 6 ft. diameter, lined with ashlar, and in 1768 was choked up at 25 ft. deep, or about the level of the river; a depth now reduced to 30 ft. or 40 ft.

Outside, between the buttresses, are traces of walls, as though the space between them had been turned to account below as well as above; but these walls are thin, and do not seem original.

M. Deville cites the public records for the existence in 1318 of four turrets on the keep, roofed with lead.

M. Le Dno, in his Dictionary, art. "Donjon," gives a great variety of very curious detail connected with this keep, detail unknown to M. Deville, and for which there should be some authority other than the traces actually existing, which are very unsatisfactory.

The keep is built of large chalk flints grouted copiously in mortar, and cased outside with ashlar, now mostly stripped off and removed. Within, the flints are occasionally laid herring-bone fashion. The ashlar was a calcareous tufa, known in the country, and formed by the trickling of calcareous springs over moss and similar vegetation. It was used in the earlier castles, but not afterwards. The later ashlar of the vaulting ribs and inserted door cases seems to be a fine hard limestone, approaching Caen stone in appearance, and perhaps actually that material. Where the ashlar is wanting the putlog holes are seen, placed with exceeding regularity. The joints of the original ashlar are large, those of the later fine. The new and old ashlar can readily be distinguished; but one flint wall is very much like another.

The Inner Ward, in length about 160 yards, and in its greatest breadth about 70 yards, is a natural chalk platform, revetted all round by a wall about 8 ft. thick, which on the east side is reduced to a parapet, but on the west rises about 20 ft. higher, probably its original height. In 1708 this court contained the apartments of the governor and the staff of the garrison, a well, and a chapel. These were probably of the sixteenth century or later, and have now entirely disappeared.

The *enceinte* wall, which girdles this inner ward, deserves attention, as most of it is of early date. Setting aside the four northern towers with their curtains which are of later date, we have about 380 yards of curtain broken by five mural towers and three rectangular buttresses. Nearly the whole of the wall is faced with flint, with three bands of ashlar. Much of the flint is laid in herring-bone workmanship, the repairs, where of brick, being of much later date. The ashlar hands are of tufa. Of the towers two, half round, are on the east front. Of these one, though probably original, has been cased with brick. The other has had an ashlar base, and the upper part, of flint, shows herring-bone work. Each is about 15 ft. diameter, with walls 5 ft. thick.

Between these towers are three rectangular buttresses; two of 15 ft. breadth and 12 ft. projection, and one about 7 ft. square. The two former contain no herring-bone work, and are probably early additions, perhaps by Henry I.; the latter is original.

On the west face are now no towers, but in 1708 there were two; half-round, and of small size, traces of which remain. They were, no doubt, original.

The remaining three towers capped the three salient angles of the south end; the central containing the gateway, and the others flanking it. All are one-quarter engaged.

The flanking towers are alike; about 22 ft. diameter, and 55 ft. high from the exterior base, with walls 7 ft. thick. The bases are either solid or pierced by steps leading down to the galleries. There is a regular basement story, and above it a floor on the level of the inner ward. They are not vaulted, and show no exterior herring-bone work, though one has a little inside. A modern summer-house has been built upon that to the south-east.

The central or gate-tower is 24 ft. diameter. It is pierced at the level of the scarp by a portal which opens upon the drawbridge, the piers of which have been described; and there is a stage above this.

The portal ascends towards the keep; its details are much broken down, and little can be made of them.

Of the *enceinte* of the inner ward there remains to be noted the *northern gate-house*. This, the original, and probably the only entrance to the Norman fortress, though much ruined, does not appear to have been materially altered. It consists in a rectangular building, 40 ft. deep by 20 ft. broad, set in the centre of the curtain, with which its outer face is nearly flush. It is crossed by an outer, middle, and inner wall, each pierced by an arch of 12 ft. opening, through which lies the passage. There remain the rectangular grooves of a portcullis, and a few years ago was evidence of a second, and in the wall is herring-bone work. The arches are plain, without moulding or chamfer. The inner one is round-headed, and springs from a flat abacus chamfered below. The joints of the ashlar work are about 1 in. wide. The curtains on either side of this gateway, though much repaired, seem to be original, and there are traces of the old round gate-towers. The pit of the drawbridge remains in front of the gate, upon the original line of fosse.

The OUTER WARD no doubt occupies the site of an earlier outwork. It is built against the narrow and north end of the inner ward, is four-sided, about 250 ft. north and south, by a mean of 110 ft. east and west. Its west side is straight, being the continued line of that face of the old fortress. The east face has a slight re-entering angle, caused apparently by the shape of the ground. At the two southern angles are two large drum towers, which connect the old and newer work, and, probably, replace two smaller and older towers. These stand in the line of the old ditch, and flank the Norman gateway. That to the south-west, rather the larger of the two, and slightly oval in plan, has a mean diameter of 60 ft.; it is of two stages, both vaulted, or rather domed. That to the south-east, of 50 ft. diameter, is nearly circular, but has a remarkable spur, or keel-shaped projection, in plan, towards the field. It is of three stages, the two lower being domed. These towers are in fact casemates, having embrasures for small culverins towards the field. Each has a well-stair in its southern side, and is entered from the gorge.

The two other towers cap the northern angles of the ward, and flank the main gateway. They are of irregular form, semicircular to the field and angular within. In diameter they are about 40 feet, and about the same height. They are of two stages, which have been domed. The walls of these four towers are from 14 ft. to 16 ft. thick. They are of flint faced with brick.

Between the gate-tower is the gateway, composed of a larger and smaller portal, the latter very narrow. The present work is modern, but no doubt, in this double entry, represents the earlier openings. The ditch, two detached piers standing in it, and with these the traces of the drawbridge, are concealed by the modern causeway.

In the west curtain, near the south-west tower, a flight of steps beneath banging arches of brick descends from the ward level in the direction of the foot of the wall. This is much encumbered with ruin, but seems to have been a postern, opening upon the ditch.

All the works of this outer ward are of flint, rubble-faced with brick, which material forms the lines of the embrasures. The quoins are sometimes of ashlar, as are the extensive string-courses and bands, and the dressings of the openings. Traces of herring-bone work in its west curtain, outside, will be accounted for afterwards.

As the original castle was confined to the inner ward, its ditch everywhere encircled it. When the outer ward was added, the interrupted portion of the ditch was partially filled up, but the new work was included in a new ditch,

PLAN OF THE CASTLE OF ARQUES, NORMANDY.

which was an accurate prolongation of the old one, of equal depth and breadth, and continued in the same direction. Accurate observation will, however, detect two slight shoulders in the counterscarp, showing where began the curve of the old ditch.

Very remarkable in this castle are the subterranean GALLERIES, driven in the chalk rock beneath the lines of the original wall, and behind the scarp of the ditch. These are now in part blocked up, but there still remain two or three hundred yards of them of which the direction is known. They are entered by a passage in the inner ward, in its north-west quarter, and by a descent of fifty-four steps near the keep, and possibly from other points now lost. The galleries are about 7 ft. high and 6 ft. wide, rudely cut, and somewhat singularly laid out. They lie within, without, and beneath the wall, and give off frequent spurs or short passages intended to occupy any space in which a mine was likely to be opened. At this time they have been broken into at three or four points in the scarp of the ditch, about halfway down. They were intended as a system of permanent counter mines to meet any attempt at mining on the part of the besiegers. In one place a large central pier is surrounded by a gallery, whence the branches go off; an arrangement intended probably to check the progress of those who might break in. So far as is known these galleries, of which a survey was made in 1708, are confined to the southern half, or four-fifths of the old castle. There are none under the outer ward.

Outside, and to the north-east of the outer gate, are some semicircular platforms, which seems to have played a part in the defence of the castle; but whether before or after the use of artillery is uncertain.

THE BEL.—A curtain wall, which originally was about 5 ft. thick, and from 15 ft. to 20 ft. high, commences abruptly upon the crest of the counterscarp in two places; one on the east opposite to the mural tower, which marks about the centre of that front of the castle, and thence descends towards the river, and the other north, close outside of the drawbridge of the main entrance. This latter wall is continued down the hill, and makes a bold sweep towards the town, and finally reaching the river bank, joins the river wall. The enclosure thus formed contains about twice the area included by the ditch of the castle, and has long been known as Le Bel or La Baile, a form evidently of the Norman-Latin *Balium*, called by us the "Bailey." This enclosure is traversed by the road from Dieppe to Martigny, which passes through the two gates

bearing those names. A third, or water-gate, to the east, opened upon the river. Upon the north front appear to have been two small half-round mural towers, of which one remains. The river has somewhat encroached upon the lower part of the Bel, and has undermined part of the wall.

The Dieppe gate, which is also that from the town of Arques, was in 1433 called "La première Port du Bel de Château d'Arques," and as such was the subject of a tenure by castle guard already mentioned, the tenant being bound to defend it for forty days in time of war. From this gate the approach ascends to the castle, having the curtain-wall as a protection on its right. Where this wall approaches the castle, at either end, it is covered by a broad ditch, continued down the slope.

A flint-wall may be of any age, but the remains of the gates, which a few years ago showed round-headed arches, prove this enclosure to be of early date, probably one of the earliest additions to the castle, and made by Henry I. No doubt, before the construction of the outer ward, the wall of the Bel was produced, so as to unite with those of the castle. M. Deville has discovered a part of this wall worked into the great curtain of the outer ward, which lies in its line, and may still be seen.

Looking to the history of this castle, and to the evidence afforded by its remains, there can be little doubt that the keep is the oldest part of the whole, and the work of the Conqueror's uncle, Guillaume d'Arques, between the years 1035—1043, and it is supposed one of the earliest, if not the earliest of the rectangular Norman keeps known. The chronicle of Normandy, cited by M. Deville, says of William, "Si fist faire une tour moult forte, andessus du chasteil d'Arques," as though there had been an earlier castle, which is possible.

To William or his immediate successor must be attributed the *enceinte* of the inner ward, the excavation of the ditch, and the formation of the galleries. All these no doubt formed part of the original plan, and it is only the occasional appearance of round turrets upon the wall that leads to the opinion that any time intervened between the actual construction of the keep and of its surroundings.

The southern entrance, with its gate and two flanking towers, and one or two of the other mural towers or buttresses, seem to be additions, but of the Norman period, probably the work of the Conqueror's son, King Henry I., who, about 1123, seems also to have enclosed the Bel. Robert de Thorigny, called also "Du Mont," from his abbey of Mont St. Michael, a Norman

chronicler of the twelfth century, says that King Henry I. "fortified admirably the Castle of Arques with walls and a tower." This has been held to show that the whole structure was the work of Henry, who reigned from 1105 to 1135, and the extreme boldness of the buttresses and superincumbent constructions of the keep no doubt favour this view; but, as M. Deville remarks in the same passage, similar reference is made to Gisors, Falaise, and other castles, known to be of earlier date.

M. Deville is disposed to attribute the southern gate to Charles V., as he finds a record of 1367, charging cost of transport of 6 "naunces" of stone, each of 16 to 18 "tonneaux," from the river to the castle, for the masonry of the new bridge and the new gate of the castle. This material was taken by the king's direction from the dismantled "manoir" of Veules or Weulles, at St. Valery-en-Caux. The accounts of 1378-80 mention the tower on the bridge behind the keep, its drawbridge, axles, ties, "vergues" or levers, 18 ft. long, and its beams of 9 ft. Probably the three towers are Norman; but this was probably the southern drawbridge and gate, and the opening of the communication between this and the basement of the keep. These works are attributed to Charles V. about 1378-80. He probably only pierced the existing central tower, not otherwise altering or rebuilding it.

The next considerable work was the outer ward, which may be attributed to the fifteenth century, subsequent to the use of brick and the introduction of siege artillery. It is singular that no record of this very considerable work should be preserved, for it included not only the outer ward, a castle in itself, with its enormous towers and massive curtains, but the extension of the ditch, in itself an immense work, the repair of the older walls and towers, and finally the fitting up and vaulting of the keep. All this is supposed to have been the work of Francis I., and it is said that the date of 1553 was inscribed upon some of the additions to the keep.

Henry IV., during his occupation of the castle in 1589, may have constructed quarters in the inner ward and repaired what was amiss in the old building; but more probably his traces are to be found in the field works which crown the adjacent hills and along the high ground towards Dieppe.

It has been thought that the ditch of the castle is a remain of an older fortification, such a work as the early Normans or still earlier Celts might have constructed. No doubt this was often, perhaps usually, the case, with the sites of the great Norman castles, both in Normandy

and in England, and the position of Argues is a tempting one. There is, however, no positive evidence of an earlier encampment, and if one there was, it is probable that it was entirely removed when the present very peculiar ditch was excavated.

It will be observed that the keep is so placed as to command both the inner ward and the most exposed side of the castle, that along the level ridge of the promontory. It was perfectly capable of holding out when all else was taken, and finally, if threatened with fire or starvation, had a possible escape by the galleries.

This castle is the triumph of Norman skill. Often attacked, it was never taken by storm. Without being a royal residence it was visited in peace or in war by our Norman kings, from the Conqueror to John, and by most of the kings of France, from Henry I. to Henry IV.; and after a lapse of 800 years, its oldest parts are still those best worth attention, and are at least as well preserved as the additions of far later date. 1867. C.

A PUZZLE IN THE NAMES OF SOME BRITISH ARCHITECTS.

WHEN Southey was on a visit to the pleasant city of Norwich, two difficulties, he tells us, mightily puzzled and perplexed him,—the number of turnings in the streets, and the in-and-in muddle in the genealogy of the important family of the Genuys of "that ilk."

A difficulty such as Southey encountered puzzles and perplexes us. Curious and inquiring as we are, and have long been, about English architects, we have at times found ourselves in a Campbell and Breadalbane maze about the families of some of our best-known architects and builders:—the Dances and the Hollands, the Gandys and the Gandy-Deerings, the Hardwicks, the Gwills, the Smirkes, the Wyatts, and a Wyattville.

We first hear of an architect or builder of the name of Dance—"George Dance"—in or about the year 1737, when Caroline, queen of George II., died, and Coliu Campbell and Kent were fashionable architects through Lord Burlington's recommendation and ruling influence. Dance's great work was the "Mansion House" of the Lord Mayors of London. He died on the 11th of January, 1768. In the Soane Museum there is a large folio of miscellaneous drawings (originals) by Dance. What more is known about him?

The second George Dance (the son, I presume, of the Mansion House architect) was the architect of the Old Bailey Prison in London—a building the exterior front of which tells most unmistakably its use. This George Dance was born in 1740; married 24th March, 1772, Miss Gurnell, of Ealing, and, dying 14th January, 1825, was buried in St. Paul's Cathedral by the side of Sir Christopher Wren and John Kennie. His two folio volumes of profile portraits, engraved by William Daniell, R.A., are well known and deservedly admired. James Love, the actor, who died in 1774, was the son of this George Dance.*

Sir Nathaniel Dance (alias Holland), third son of Mansion House Dance, was born in 1730, and died 15th October, 1811, aged 81. He married a Mrs. Drummer, a Hampshire heiress, and changed his name to Holland. His widow (Lady Holland) died 12th June, 1825. Sir Nathaniel resigned his Royal Academy designation of R.A. on his marriage in 1790. There is a portrait of him by Cipriani at the Academy, and a half-length engraving of him by Charles Turner, after R. Westall, R.A.

We come now to Joseph Gandy, elder brother of John Peter Gandy. He took the name of Deering; had property in Buckinghamshire; and was M.P. for Aylesbury, in that county. In 1826 he was elected an A.R.A., and in 1838, a Royal Academician. Exeter Hall, in the Strand, will preserve his name. Let me add that he was living in April, 1814, at No. 58, Greek-street, Soho; and that he died in 1844.

From the Gandys to the Hardwicks is an easy and natural step; and here we have another involved architectural family. In April, 1802, Mr. Thomas Hardwick was living at No. 55, Berners-street, Oxford-street, next door to the Mrs. Tottenham (No. 54) on whom Theodore Hook played the memorable Berners-street coal-order hoax. He was there in the same house, and for many years, when Robert Smirke, the painter,

was living at No. 13, and Henry Bone, the enamel-ist, at No. 15.

As to the Gwills,—were there not more Gwills than two architects of name,—George, who died in 1856, and Joseph, who died in 1863? I may be allowed to observe that there is a good account of the latter in the *Builder* of 3rd October, 1863.

For nearly a century the family of the Wyatts has been well known to London contractors and London masons. James Wyatt, who died in 1813, having half destroyed the character of Salisbury Cathedral, is buried in Westminster Abbey, with a tablet to his memory, close to the grave of Camden, in the south transept or Poets' Corner. His best work, the Pantheon in Oxford-street, London, is still standing to preserve his name. The portico in Oxford-street is well proportioned, harmonious in all its parts, and useful.

Some account of the Pantheon (hitherto unpublished) from a competent hand will not be out of place.

"The late James Wyatt was employed, immediately on his return to England from his educational tour in Italy, on the erection (1770) of the original Pantheon in the Oxford-road,—then one of the suburban avenues into London. He produced a magnificent structure of most elaborate Roman architecture, which was for many years a fashionable place of resort, somewhat similar to Ranelagh (see allusion to it in the *Critic*). This building was destroyed by fire, except the portion connected with the entrance portico in the Oxford-road, and the side entrance in Poland-street. It was then rebuilt as a theatre, and was again destined to be a favourite with the fashionable world, for the performance of operas chiefly. It fell, however, into oblivion (or rather, into Chancery), and remained for many years deserted and dilapidated; its capacious stage during its latter years being occupied by Graham, the astronomer, for the construction and occasional inflation of his balloon. It was so tenanted (the audience part being thickly enveloped in soot and cobwebs, and reported to be in a dangerous state of dilapidation) when in 1834 a few gentlemen visited it with a view to the erection of the present bazaar at their joint expense.

With the exception of the rooms next the entrance, the whole of the walls were then taken down to within a few feet of the ground, and other premises purchased, so as to gain an access through into Great Marlborough-street. The present structure was designed by and executed under the superintendence of Mr. Sydney Smirke, at an expense of between 30,000l. and 40,000l.

The entrance-front, in Oxford-street, as originally designed by Wyatt, was but little altered, an attic being added, and the portico increased in size, and otherwise remodelled. The front rooms, which formed the refreshment-rooms in the original building, were converted into galleries, for the exhibition and sale of pictures, &c.; and the whole area of the theatre was occupied by the great room of the bazaar, being about 116 ft. long, 88 ft. wide, and 50 ft. high in the centre. An aviary and conservatory connects this great room with the southern entrance in Great Marlborough-street; and the wing, which extends from the great room eastwards to Poland-street, is devoted to the private accommodation of the numerous renters of the bazaar. There are rooms for the deposit of goods, as they are brought in from the wholesale dealers; inspectors' rooms, refectory, kitchens, &c.; and the whole extent of the basement, nearly three-quarters of an area in extent, is occupied as wine-cellars."[†]

A Jeffrey Wyatt changed his name from Wyatt to Wyattville. He was nephew of the Pantheon Wyatt, born 3rd of August, 1766, and died 18th of February, 1840. Windsor Castle, as restored or rebuilt under George IV., still preserves his name, and Chautrey's inimitable bust of him, his shrewd look and features. The bust well deserves the site it occupies in Windsor Castle.

There are still more Wyatt architects. Old Drury-lane Theatre,—the Drury and the Rejected Addresses,—

"By Wyatt's trowel patted plump and sleek,"—

was the work of B. Wyatt; and Apsley House, at Hyde Park Corner, as we now see it, was designed by Messrs. S. & B. Wyatt. Of Wyatts living this is not the time to speak.

PETER CUNNINGHAM.

* In the "Companion to the British Almanack for 1836," are many other details, drawn up by Professor Hosking, of King's College.

* Genest's History of the English Stage, v. 411.

SURREY ARCHÆOLOGICAL SOCIETY.

THE annual excursion of the members of this society has taken place. The locale of meeting, previous to the proceedings of the day commencing, was at the Box Hill Station of the South-Eastern Railway, and the Dorking Station of the London, Brighton, and South Coast Railway. One vehicle was occupied by Belgian volunteers: it was an open one, and the strangers had to endure a drizzling rain, which they did with equanimity, disdaining umbrellas. The route was to Great Bookham Church, which was down for the first visit, and Burford Bridge, Mickleham, Leatherhead, and Fetcham were passed. After a long ride, Great Bookham was at last sighted, with its little church on the rising ground, nestling among the trees.

Mr. Alfred Heales gave a description of the church and its associations.

The company then resumed the route onward through Little Bookham and Eflingham, towards West Horsley Place.

Mr. R. A. C. Godwin-Anstey, of Chilworth Manor, gave an interesting account of the manorial associations from the time it was possessed by the Berners family down to the present period.

At the conclusion of the account the company dispersed, and minutely examined all the various works of antiquity with which the house abounds.

Mr. Anstey, on the lawn, gave a short account of the front of the mansion.

The company then repaired to West Horsley Church, which abuts on the mansion.

Mr. W. H. Hart, in the absence of Mr. R. Bray, gave some account of the registers, and mentioned the startling fact, that in overhauling an old cupboard, a few minutes before, and alighting upon some ancient records of great interest, the sexton coolly informed him that there would have been more had he not from time to time used them as occasion required to light the fires in the church! This announcement rather startled the auditory, and many warm expressions of animadversion were hurled against the register-burning "man in office." Saved from this conflagration were many interesting parochial records, which Mr. Hart handed round to those present, dating from 1694. All these were in a perfect state of preservation, and contained the names of some who were in attendance. Mr. Hart suggested that they should be handed over to the society, who would have them bound, and place them among their archives.

The rector, the Rev. H. S. Cerjat explained some of the brasses and monuments. The company afterwards drove towards Uplands, Merrow Downs, the residence of Mr. W. Willmer Pocock, the president of the society, who had invited the members and visitors to a collation. The return journey was made over Newland's-corner, famed for its extensive views.

A NEW CEMENT.

WE learn from *Galignani* that M. Sorel has communicated to the Academy of Sciences a new cement, being a basic hydrated oxy-chloride of magnesium. It may be obtained by slacking magnesia with a solution of chloride of magnesium in a more or less concentrated state. The denser the solution, the harder it becomes on drying. The magnesium cement is described as the whitest and hardest of all those known to this day, and it can be moulded like plaster, in which case the cast acquires the hardness of marble. It will take any colour, and has been used by the inventor for mosaics, imitations of ivory, billiard-balls, &c. The new cement possesses the agglutinative property in the highest degree, so that solid masses may be made with it at a very low cost by mixing it up on a large scale with substances of little value. One part of magnesia may be incorporated with upwards of twenty parts of sand, limestone, and other inert substances, so as to form hard blocks. By means of these artificial blocks, building may easily be carried on in places where materials for the purpose are scarce. All that is required is simply to convey a quantity of magnesia and chloride of magnesium to the spot, if there be none to be had there, and then to mix them up with sand, pebbles, or any other matter of the kind close at hand; blocks can then be made of any shape, and imitating heavy stone. This magnesian cement may be obtained

THE ARCHBISHOP OF YORK ON
ARCHÆOLOGY.

at a very low cost, especially if the magnesia be extracted from the mother-ley of salt-works, either by M. Balard's process, whereby magnesia and hydrochloric acid are obtained at the same time, or else by decomposing the ley, which always contains a large proportion of chloride of magnesium, by means of quicklime, which by double decomposition yields magnesia and chloride of lime containing a certain quantity of chloride of magnesium, and which, with the addition of various other cheap substances, may be used for whitewashing.

At the opening meeting of the Archæological Institute in Hull, the Archbishop of York made an address as President. His Grace said,—We may be proud of the two churches in Hull, Holy Trinity and St. Mary, the former having and the latter having received a wise and liberal restoration. Hedon, a town which even in the time of Edward I. languished in poverty, fearing the nearness of the two rivals, Ravensrood and Hull increasing from day to day—Hedon, which in the time of Edward III. confessed that its commerce depended upon a sewer called the Sturch, along which boats used to pass to the borough, and that the said sewer was dried up, has managed to preserve for us a church worthy of a more flourishing and numerous population; and we cannot wonder that it bears some marks of decay. Unlike Hedon, which contains examples of various styles, the beautiful church at Patrington is of one period, the Decorated, and has the symmetry of one design. Its graceful spire, for which one is thankful in a country where a height of 190 ft. is almost mountainous, its noble oak roof, its beautiful proportions, entitle it to be called, after the fashion of county historians, "The glory of Holderness." A writer describing it in 1840 (Wm. Poulson) speaks of its ruinous condition. But it is already partly restored, and its present incumbent has shown such zeal in so arduous an undertaking that the completion of it cannot be a matter of doubt. Of the Abbey of Meaux, the remains are very small, but the archæologists have to thank Mr. Edward Levine for publishing a volume of MSS. relating to this important house, and amongst them a chronicle of its government and doings. Further from us, but within easy reach and embraced in the scope of the present meeting, the Minister of Beverley, and St. Mary's Church in the same place, now worthily restored, the Priory Church at Bridlington, the Abbey Church of Selby, the church at Driffield, possessing, we are told, an effigy of Paulinus, the first Archbishop of York, Howden with its chancel and chapter-house in ruins and fast disappearing, Thornton Abbey and the remains of the abbot's house, which are to be explained by one who has studied domestic architecture with the greatest success; all these, and many other monuments of the piety and skill of ages long gone will pass before us, and will be lectured upon by those whose knowledge may be trusted. Let us hope that with such a programme the veteran supporters of this society may carry away with them pleasant recollections, even new information from this meeting; let us hope that the novices whom they meet here,—a body over whom I should have many claims to preside,—may retain the instruction that they are certain to receive, and may catch the infection of that fervent zeal for the past which animates this and the sister association. In reading the transactions of the sister society, to which I happen to belong, I am struck with the moderation of the present race of archæologists in fixing the limits of their science, and in the method which they pursue within those limits. Archæology is a science of the remotest past; but this general description would include ethnology, the history of languages, and the study of ancient written records on palæography. Archæology, according to one authority, should be content to separate herself from all these tempting subjects, and to confine herself to the study of the works of human skill, which indicate the growth and social condition of man. A boundary-line so artificial as this is likely to be transgressed from time to time. The charter, the chronicle, and the will are often appealed to, although the object of the sciences is not the written documents, but they are used not so much for the written thought as for some tangible monument on which they may throw

light, not so much for the development of mind they contain as for their account of things produced by manual skill. The charter illustrates for us some church, castle, or abbey; the will, with its inventory of household possessions, admits us to the interior of a dwelling which we can by no other means reproduce as it was upon the day when the possessor left it never to return. The main business of archæology is with the work of men's hands. For my own part, I would venture to submit that, in taking for its materials all the materials of history, archæology would do better still. I am glad to see a department of history connected with this institute. Now this boundary is a very narrow and artificial one, but within it the archæologist has learned to prescribe to himself rigid rules of method. You know that every science consists of two parts, the collection of facts, and the grouping of the facts when collected under some idea, or law, or principle, call it what we will. A French writer tells us that in the course of their history sciences pass through three stages—the theological, the metaphysical, and the positive. I prefer to say that sciences are found in three conditions. The first, where facts are scanty and theory too active; the next, where facts have been industriously collected, but theory has not been applied for their due interpretation; and the last or perfect condition, where facts have been abundantly supplied, and theory has been used with sobriety, and yet with bold sagacity, for their explanation. Now, the greatest peril to science has always been on the side of the tendency to theorise overmuch. The hypothesis, too swift of foot for the laggard experience, has left her far behind. Bacon, in the sixteenth century, usually has the credit of awakening the world of science from a speculative dream to a sober experience; but the remarks of Leonardo da Vinci and others show that this was felt by other minds. Bacon was the spokesman for his generation of an intuition which perhaps no one else could have expressed so well or with so large a result. Now, the temptation which besets all physical sciences perhaps assails archæology with the greatest force and success. Over the restored building, or the exhumed relic, the feelings of wonder, reverence, respect, and curiosity are aroused: who can wonder that the theory, or rather guess, is prompt, or that its ambitions? Dr. Stukeley wrote, in 1740, that the church at Driffield was very old, and contained an effigy of Paulinus, the first Archbishop of York. I probably do him no wrong in saying, that the only evidence connecting the *basso relievo* which still exists in the church with my great predecessor, was that Paulinus was the first and most illustrious archbishop, and that there was no particular reason against fixing his name to the ecclesiastic with a crozier whom he found at Driffield. Stukeley was a wild and speculative inquirer, and in such hands archæology had not advanced very much beyond the monks of Meaux, who record that in the reign of Henry II. "the bones of King Arthur, and Glastonbury," and were distinguished by most unmistakable marks, for Arthur's thigh-bone exceeded by three fingers the length of the tallest man's thigh-bone that had ever been found when measured down to the knee. Moreover, the space between his eyebrows was of the breadth of the palm of a man's hand. One understands the mistake which makes artless monk and credulous doctor hasty to make over to saint and hero the first great and worthy thing that imagination can manage to connect with their names. But guesses of this kind are not archæology, and it makes little difference in our estimate of them whether they happen to be right or wrong; they tend to bring the whole subject into ridicule and disrepute.

Many people think, to this day, of a museum of antiquities as a collection of stones and potsherds ticketed into dignity by falsehoods, and divide collectors into two classes—those who deceive themselves, and those who would deceive other people. Modern archæologists do not, upon the whole, deserve this harsh estimate. In the transactions of both our English societies there is a remarkable caution and sobriety. To avoid a groundless theory seems to have become, as it were, part of the moral code of the archæologist. The time for theories, it seems to be admitted, begins when the collection of facts has been large and general, and as exhaustive as the subject seems to admit. Archæology has passed through the same stages as the other sciences. Once chemistry like astronomy was here of

facts, but full of dreams. But she was born late; and her earlier trips and stumbles took place amongst her grown-up sisters, who make merry with her failure; yet the ridicule has stimulated her efforts, and no science walks more firmly or more truly along the line of induction. But ever and again the ardent curiosity and impatience of symmetry will lead us into hasty generalisations. The theory of three periods—the stone age, the bronze age, and the iron age—has been carried too far; and in assigning a place to any weapon, or other implement, people often forget that long after bronze and iron were discovered, stone might continue to be used among the poorer and less civilised, whilst in our own country it is very probable that the iron instrument preceded the composite metal bronze which was in use on the Continent.

At present one cannot help thinking that many of those who explain to us lacustrine dwellings of early times, and the hurried flint implements, and the inhabited caves, have far outstripped the facts at their disposal. An enormous antiquity has been claimed for earthen vessels found about the lake dwellings, on the ground that the lake dwellings must be enormously old; but an archæologist sets them aside by aid of vessels known to be of the fifth and sixth centuries after Christ, of the sort known as Anglo-Saxon, and finds the form the same. Surely this marked similarity of form is worth more than any mere speculation as to what the age of the lake dwellings ought to have been. And this brings me to consider a little more closely the work of the archæologist, and to recognise its dignity and worth. Archæology might be called the microscope of history; and we know that without the microscope neither geology nor physiology could have reached its present exactness. Ehrenberg computed that every cubic inch of a stratum of Tripoli powder at Bilin, in Bohemia, contains 41,000 millions of the microscopic organisms, and this hit of stone or pinch of powder, a thousand times more populous than this island of men and women, would have kept its wealth of life a secret only for the microscope. One may say that without this instrument the science of physiology could not exist. The services which archæology render to history are of the same kind, and in the end they will probably not be less. Next to the soil of England, perhaps Englishmen are most interested in that country from whence the word of life has come to them—the land which the Lord made holy by His footsteps—the land which for eighteen centuries seems to have been mourning in ashes the crime of having put Him to death. We could not stand in Nazareth, embosomed in its low and rounded hills—we could not shelter from the heat under one of the aged olives of the Mount of Olives without our hearts burning within us with a sense of greater nearness to the heavenly. We of the English Church, known in those Eastern lands as "Christians of the Book" have studied with peculiar care the scenes that throw light upon the Bible. Strange to say, the archæology of Palestine is still in its infancy. The jealousy of Mahometans, and not less the jealousy of Christian sects towards each other, have hindered us from using the proper means; and the traveller has stood gazing and theorising upon some mound of earth under which perhaps lay buried the monuments that would have solved the riddle and set the guesses at rest. We have hardly broken ground in Palestine, though we know that the evidence we seek must be buried under the soil. But here, too, a beginning has been made. Our Government has lately published an elaborate work, full of exact measurements and plans, and photographic reproductions. A society has been formed for the exploration of Palestine, and a fortnight since I pleaded the cause of this society in a long interview with Enad Pasha, the powerful minister of the Sultan, who promised that every aid should be given to our explorers that was consistent with public order. "The Turkish Government," he said, "is tolerant to all; but the danger lies in the fanaticism of Christians against each other. We, too," he added, "believe in Christ, the Son of God, born of the Virgin—ascended into heaven; and only the crucifixion we do not believe." That is still to Jews a stumbling-block, to Gentiles foolishness. But with larger powers our little society will pursue its work so far as its means allow, and a word of sympathy and a word of prayer from members of this body will be valuable to us.

A CHAT ABOUT
THE RIVER FLEET.

In times that have not long gone by when there were but few facilities for travelling in comparison with those of the present, a voyage to Gravesend, or a journey to St. Alban's, Windsor, or other famous places in the parts surrounding London which are now within an hour's journey, was looked upon as an adventure of as much consequence as we at this time attribute to an expedition to the Dutch coast, Paris, or the bordering parts of Northumberland, Durham, or other comparatively far-off places. A journey to Edmonton, Waltham, or for travellers of greater endurance and enterprise, to Epping Forest, was an undertaking of consequence. But in those days, many went-up Londoners were content to be able to wander with their children to the Southampton Arms, the Bedford Arms tea-gardens, or to other pleasure-grounds at Camden-town; the Load of Hay, on the road to Hampstead, or to Chalk-farm. There was also accommodation nearer to the City hounds, at the Adam and Eve, in the Tottenham-court-road, and the tea-gardens of the same name adjoining old St. Pancras Church. Then there was the Elephant and Castle, and, not so far south, the Fortune of War. Nor in this list of tea-gardens and taverns should we omit the far-famed Bagnigge Wells, the Merlin's Cave, the Angel at Islington, the White Conduit, and other places of refreshment which were scattered here and there. Even now antiquaries who have diligently examined the books of local history connected with London and its environs will meet with much disappointment when they go in search of the realities. Wonderfully has the antiquarian map of the metropolis been changed. Although in the parts which lie from fifteen to twenty miles around London, there are scenes of exquisite beauty, which show a high state of cultivation; there are also immense tracts of heathy, wild, picturesque, and uncultivated land, which seem to have been disposed as they are for the express purpose of providing

for the recreation and other wants of the immense population which has accumulated upon the banks on each side of the Thames at London. In all directions, wide tracts of land are being occupied by buildings of various kinds. Others—and the spaces seem, when looked at, to be enormous,—are devoted to the purpose of hurrying the dead; and in various directions—in some instances by a slow process, and in others with a degree of rapidity which is astonishing—the barren districts are showing the several phases of progressive management in land culture. But we must not wander further in this direction at present, and may only remark that, both in the metropolis and while sojourning in provincial towns, we have found health, amusement, and instruction in observing with interest and care the rivers, streams, and other water-courses which flow through the various neighbourhoods. Get some distance away: take, for instance, the Tyne, and by some means of convenient water-transit sail from the rugged rocks on which the priory and castle stand; see the church and spots connected with the Venerable Bede at Jarrow, the vast groups of ships, the stait and other means of loading the vessels with coals, the great docks, manufactories, and other varied scenes of industry; the smoking and steaming of innumerable chimneys, the commanding appearance of the canny town of Newcastle, with its Norman keep, the symmetrical lantern of its ancient church, its famous bridges and other buildings, both old and new. Then, with knapsack on back and staff in hand, away to the immense manufactories of the Hawthorns, the Stephenson, and Sir William Armstrong; look to the Roman wall; refer to our histories for accounts of Scottish armies of invasion; away to Wyham, where George Stephenson was born, and where the locomotive was first brought into a rough working order; and so on to the little churchyard of Orvingham, where Robert and Thomas Bewick lie buried, and to the ruins of Prudhoe Castle; to Bywell, with its two little churches—one the Black Church, the other the White Church; the castle; the Roman and other remains of antiquity; and then through wild and solemn scenery, many points of which are rendered more than usually interesting by the legendary lore which is connected with them. And as mile after mile is passed, and the pencillings in the portfolio and notebook become more numerous, the chief stream of the Tyne dwindles away, until in the dry summer weather its course and rise amongst the heather-covered hills are scarcely distinguishable. Such a trip is not without its peculiar delights; and one in connexion with journeys of this kind is, that the traveller is taken out of the beaten track; he meets and mixes on terms of friendly familiarity with travellers by the way, and the dwellers who lead simple lives away from the turmoil of towns.

The English rivers have all—each in its way—varied interest; and we know of few modes in which a summer's holiday could be better spent than to select one of our rivers, and wander from the outlet in the ocean to the humble origin in the fissures of rocks, in minute gurgling streams, or in springs in moss-covered basins, in

the repose of nature, which is only broken by the pleasant sound of the water, the dry rustling of the withered grasses, and the notes of insects and solitary birds.

The spirit of travel is one of the characteristics of Englishmen. It is said that this feeling is more developed in Scotsmen, but respecting this trait we will not enter into dispute, and will just remark that the wanderers from the British Islands have found their way, notwithstanding dangers of all kinds, into most parts of the world. Notwithstanding the attention which has been bestowed on other matters, the exploration of rivers to their sources has always been a favourite kind of adventure. It is, therefore, not wonderful that if at home we have no opportunity of examining such a watercourse as the Nile, we should be tempted to take advantage of what in this particular kind of adventure offers itself; and, even without moving from our own land, the journey throughout the course of the Thames or of the Severn, if well performed, would yield adventures with which the traveller might with reason feel satisfied. Many would be unable to spare time for this purpose, although such a wandering, either alone or in company would, in fine weather, prove very delightful; and therefore many, especially in those hygone years to which we have referred, have been content, if dwelling in London, with the examination of some of the tributaries of Father Thames. Take, for instance, the river Lee, or the artificial stream made with so much skill, patience, and cost by Sir Hugh Myddelton, and called the "New River." Either of these streams will guide a cheerful company of Londoners in a pleasant way towards the Hertfordshire hills; or the "Male" and some other streams which flow into the Thames will take the pedestrian to many a delightful spot, where the landscape painter, the architectural draughtsman, and the antiquary might find subjects for study, nor would the naturalist and the geologist find the soil unprofitable.

But as regards the metropolis, the Londoner who in past times would have been content in the holiday-journey to Bagnigge-wells, the Spa-fields, Merlin's Cave, and some of the other places for the refreshment and repose of travellers, is forced to go further in search of green fields; and the little boys, humble followers of old Isaac Walton, who with parcels of provisions, earthenware vessels, willow rods, and other articles intended for the fell destruction of roach and dace, and such small fry, are obliged to walk miles away, even from Clerkenwell and the southern parts of Islington and St. Pancras, before they have the chance, with success, of casting a single line; and the bourne and streams which passed through parts of the City, and were so familiar to the dwellers of Old London, are hidden from the sight. And glad we should be of the circumstance. Notwithstanding the evident advantages of this shutting-up process, however, there are one or two drawbacks, which may be worth referring to. One of these is, that besides the watercourse, they brought along the margins a dash of the country into the town, and seemed to point out the way, especially in days when the watercourses had not become so polluted as to render them unwhole-

The River Fleet.

PROPOSED HOTEL, OPPOSITE THE ENTRANCE TO THE CENTRAL PARK, NEW YORK.—MESSRS. BRYANT & GILMAN, ARCHITECTS.

[See page 561, ante.]

some to the body, to pleasant walks which did not lie far away from the homes of the artisans and their children.

To refer, however, to the quarter of a century, or thirty years ago, mentioned at the commencement of the present paper: even then the chief of London streams had become hidden from the sight, cast into a state of oblivion to all except some of the authorities at the City Office of Sewers and a few very old inhabitants, or a small party of learned and painstaking antiquaries, who, by the patient examination of plans and maps, could, and even can now, by the names of the streets, or by the peculiarities of the gradients of the surface, trace the course which those once lucid waters ran, and in which, in Queen Elizabeth's days, and for long afterwards, close by the Mansion House, and in other parts within the City walls, the small boys of those generations may have caught minnows, or captured frogs, and chased the butterflies.

At the time we have stated (about thirty years since) although the Old Bourne and the other City streams had been for long closed, the River Fleet and the New River came, with the exception of a short length, openly and directly to their destination.

At this time there was but little difficulty in effecting an exploration of the course of the Fleet, from its source to the huge gully-hole from which, at high-water, it tumbled a polluted and unwholesome stream into the Thames; and, when the river was low, it fell with a splashing, heavy noise, adding during many yards of space to the unwholesome deposit which, to a depth of several feet, had collected on the shore. From the river, along Bridge-street and Farringdon-street, the Fleet stream was hidden from the river, and a substantial sewer passed in nearly a direct line to the back of the houses which formed the east side of Field-lane, but those who felt desirous to examine it might be fitted with water-tight jack-boots and suitable garments, and, in the guidance of some of the men whose business keeps them for many hours in the day attending to those great underground channels,—on the careful keeping of which the health of the metropolis much depends,—they might enter the covered part of the Fleet and progress northward. It was some time before the eye became accustomed to the darkness, notwithstanding the use of lantern-light, and to the deep roaring noise of the water. Far away in the distant perspective was a small light, which did not appear larger than a shilling, but seemed of an intensely-blue colour, and this showed the termination of the sewer at the point to which it had then been carried. In course of time the lantern-light began to glimmer on the brickwork,—on the thick water, unpleasantly tinted with a sickly greyish green, on the picturesque figures of the assembled company, on points of communication with other drains, and parts where, in summer months, when the water was not raised by heavy rain and thunder storms, there were accumulations of a dark-coloured, sandy-looking substance. At the time referred to, mud-larks and others often explored the Fleet in the search for articles of various value, which had been thrown away by careless housewives, or to pursue their trade of rat-catching, or in some instances to damage traps and carry away metal work of really small value, but which would be costly and troublesome to replace. Boys and youths often exposed themselves to danger, not only from the flow of the Thames, but also from those sudden land freshets which accumulated, and rolled down the Fleet stream with irresistible force, aided by the numerous streams which flow from various directions. The noise of the water, the peculiar sound of the conversation in this long archway, and in parts the heavy rumbling of the carriages on the pavement overhead, when once heard, kept their places in the memory amongst the strange noises of the great capital. The air was heavy here, and we were not sorry to pass from this portion of the bowels of London to the regions above, and to notice that behind Field-lane the actual surface of the Fleet river was about 10 ft. below the surrounding level, and that on each side, more or less, the houses were planted on a kind of quay, partly of brick and partly of stone work.

From a suitable point, if we could by any possibility have closed our sanitary eyes, the scene which was here presented would have been pleasant in respect of its striking and picturesque appearance. Here and there passing across the uncovered stream there were tumble-down wooden bridges, supported in part by rugged and dilapidated houses. From some

windows women were throwing liquid refuse, and from others drawing water out of the stream, which was often applied to domestic uses. From many parts clothes were hung out to dry; and here and there were open spaces, one of them being part of the premises of the celebrated "Horse-slaughterer to his Majesty." Others were devoted to preparation of cat's-gut, sausage and polony skins, which in immense festoons hung in various parts of the ditch. There were other unwholesome places, such as butchers' slaughter-houses and the premises of tripe-dressers, placed in the midst of tenements which were let to families, forming a dense population.

But for those who had not been acclimatised to the atmosphere, it was, in the days referred to, advisable to make a *détour* for the purpose of obtaining a breathing of better air, but good air could not be readily had in this vicinity. It would be difficult, however, for any one who had formerly known this locality to recognise it now. Over a large space the houses have been swept away, and those who once resided in them are dispersed, but accounts of the dwellings which once stood here have been given in these pages, as we saw them, both in the broad daylight, and in the darkness of night, when evil was rampant. Then the deep shadows of London were less known than they are now; but words, even when aided by the pencil, would fail to give a full idea of the terrible conditions which prevailed throughout the metropolis, and in this district especially.

Unable to find satisfactory air in the locality, part of which is now taken for the underground railway and its terminus, and where the partially completed vaults mark out the lines of new streets in such an imperfect and strange way, that the boys have been the first to christen it by the name now generally known as "the ruins," we wandered back over the surface of the part through which we had passed from the Thames in the covered sewer, and by means of old accounts, and prints, formed something like a notion of the scene here in the time of the grim walls and other portions of the Fleet Prison, with its outer walls and keeps eastward of the London-wall, Newgate, and so forth: the high-pitched centre of the inconvenient Fleet Bridge at Holborn, and before the Great Fire of 1666, Old St. Paul's, and portions of Ludgate and the City wall running towards the Thames. At the time of our exploration, however, no such marks of particular antiquity met the eye. Large houses without mark or picturesque quality, stretched along New Bridge-street, past obelisks at Fleet-street; the large bare wall, and the forbidding but singular-looking portal which afforded an entrance to the dreary, unwholesome, and unhealthy-looking debtors' prison: but even this has passed away, a circumstance which few will regret.

Again sauntering northward we reach the open part of the Fleet, and marvel, while looking along the line of the Fleet-valley and comparing its past value with the sums which it would at present fetch if placed in the market. For instance, the site of St. Pancras Workhouse would, only a few years since, have brought the usual price paid for pasture-land; but when thought of for an extension of the Midland Railway Company's line, the solicitor of the company offered to the vestry 80,000*l.*—to be paid without interest in four yearly instalments of 20,000*l.*—for the freehold land, the Vestry Hall, and other buildings. The land consists of 7½ acres, so that the price offered was over 10,000*l.* per acre; but after a consultation with Mr. Lockyer, the architect, the Board of Directors resolved that, in consequence of the central and advantageous position of the work-house, and the opening which the still unoccupied land offered for any necessary extension, the proposal of the Midland Railway Company for the purchase of the property be declined; and there can be no doubt that they were right on this point, for the value of the land will largely increase, and with great rapidity. It is a wise policy for those who wish to endow charities to let them depend for income upon the revenue of well-chosen land in the suburbs of the metropolis. Many remarkable instances of this might be given; but the following may be taken as a characteristic illustration. One William Harper, was born in the town of Bedford, from which town he came to London; and having carried on business as a tailor, became a member of the Merchant Tailors' Guild, and eventually served as Sheriff of Middlesex, and Lord Mayor of London. In the reign of Edward VI. let-

ters patent were granted him, conveying to the town of Bedford 13 acres 1 rood of meadow-land, in the parish of St. Andrew, Holborn, in the county of Middlesex, of the annual value of 140*l.*, for charitable uses, for the benefit of the inhabitants of Bedford and also of the school-house in the said town, which had been built by this worthy. The land was subsequently built upon, and now comprises part of Bedford-row, Bedford-street, Gray's Inn-passage, Featherstone-buildings, Haud-court, Three Crape-yard, Princess-street, Red Lion-street, Lamb's Conduit-street, Theobald's-road, and other places. The houses were leasehold, and the leases having all fallen in, the estate, which was only worth 140*l.* a year, now produces 13,000*l.* a year, and is known as the Bedford Charity. Other instances more immediately in the way of our journey might be mentioned; but we are in sight of the glittering and richly-coloured banners of Field-lane, and being invited by fair dealers, we enter this singular London region.

"Buy a good Indian handkerchief, gentlemen." "Here is the genuine article; half a dozen for a sovereign;" and other invitations to purchase meet the ear; and it is not easy to move along in consequence of the pulling and pushing and the bewildering caused by the flutter of silk handkerchiefs and articles of male and female costume, the persuasive voices of the daughters of Israel, most of whom were more fat than fair, and the mingling of male voices which more resembled the croaking of ravens than the speaking of human beings. Here as we pass along may be noted all the peculiarities, on a small scale, of Petticoat-lane; here were second-hand tools for workmen, boots and shoes, hats, caps, and whole suits of clothing, the chief of which were renovated and altered with such skill, and shone with such resplendent brightness, that the original owner would have failed to recognize the once familiar articles, which for long he had been accustomed to wear. Very skillful were the artists who effected those works of restoration; but vain was the trust which might be put in them by purchasers, for the chemical processes and rubbings, the hot glazings, and stiffenings, do not render the worn-out materials substantial; and as regards the gloss, the tail-end of an April shower or a few hours of a London fog at once deceived the most sanguine, and caused the discreet to distrust for evermore the charm-working of the dealers, who evinced the charm-working of the dealers, who still in loud words offered to stake their existence that old articles revived in this way were "better as new." In Field-lane, now no more, there were no indications of the rural condition from which its name was derived, except that the narrowness of the flag-stone covered footpath was of about the same width as that of many country footpaths; but now the noise and crowding were bewildering, and here and there amongst the shops there could be noticed narrow dark passages, which led to upstairs tenements, crowded with people, and back premises abutting on the side of the Fleet, in which lurked dangerous-looking groups of idle people, who eyed with dark glances any strange visitors. At the time mentioned, dog and cock fighting, rat-killing, badger-baiting, the fighting of boys and of men, and other barbarous practices were common in back slums such as this without interference; for then, although the time since is so short, it appeared to be a police rule to leave the benighted dwellers of these localities to their own resources. There were also in the lane lodging-houses for travellers, which were daily and nightly places of resort for thieves, their traitors and associates; and here might be met with old men, from whose physiognomy George Cruikshank has doubtless studied that remarkable figure of Fagan with which the story of "Oliver Twist" is illustrated. Very skillful were the thieves who dwell there, and it was by no means unusual that visitors who might have ventured into Field-lane from motives of curiosity, and effected a purchase, were robbed of the goods, and perhaps of other articles, before leaving it.

The dilapidated appearance of many of the premises which shunted upon the Fleet was extraordinary. Some of the houses were built of wood, mixed with brick and plaster, and both exteriors and interiors were crumbling to pieces. In some of the least noisily of those yards and other premises which at one time had been gardens, all the vegetation which remained was a few dead and withered trees; but there were gathered on those spots human weeds, where the flowers and fruit should have been, in the form of boys and youths, who in groups were as in-

tently bent on gambling as if the game were a matter on which life and death depended. Such were the nests of the young gull-birds of Field-lane, which, for the most part, were watched over by some neighbouring Fagan, who gained profit from their destruction.

In much the same way the River Fleet passed amongst the houses of Clerkenwell to the west of the workhouse towards King's-cross, where, as also along the Old St. Pancras-road, the stream was hidden from view; but old inhabitants remember when it was open throughout the distance. At the bottom of the King's-road, opposite the workhouse, by the garden behind the Elephant and Castle Tavern, and by the bottom of the grove,—this point forms the subject of one of the engravings,—a curious sailing-vessel was found imbedded below the stream. Some said it was of ancient British or Danish date, when the stream was navigable up to this point.

PICTURES BOUGHT BY THE ART-UNION OF LONDON.

The following additional works have been selected by prizeholders in the Art-Union of London:—

From the Royal Academy.—Carrickfergus Castle, near Belfast, G. Danby, 100*l.*; Phillis, A. Johnston, 60*l.*; The Young Student, S. B. Halle, 50*l.*; Cattle Ploughing, Wiclou, A. Barch, 50*l.*; Month Stream, North Wales, R. Harwood, 50*l.*; A Stormy Summer's Day, E. S. Rowley, 40*l.*; A Domestic Scene, A. W. Cooper, 40*l.*; Shadows and Sunshine, M. G. Brennan, 35*l.*; The Temple of Kom Ombo, F. Dillon, 35*l.*; Giustiniani, Roma, Miss B. Solomon, 35*l.*; Autumn Time, F. W. Hulme, 35*l.*; Winter's Evening, G. A. Williams, 35*l.*; The Race, J. A. Fitzgerald, 30*l.*; Cockmoor Vale of Monteith, R. F. Mac, 25*l.*; On the Lea Marshes, P. J. Soper, 25*l.*; The Spring Forest.—Ereng, E. L. Meadows, 25*l.*; On the Banks of a River, E. Gill, 25*l.*; From the Bavarian Highlands, A. Ludovic, 25*l.*; The Empty Cradle, J. C. Monro, 20*l.*; Boulders on the Deign, W. Williams, 20*l.*

From the Society of British Artists.—King Henry the Eighth, Act 3rd, Scene 1st, W. Bromley, 200*l.*; Away from Smoky London, J. Tennant, 150*l.*; Beatrice in the Ashour, E. J. Cobbett, 100*l.*; A Tedious Sermon, R. Roberts, 100*l.*; Scene near Barmouth, J. C. Ward, 75*l.*; Scarborough, J. P. Pettit, 75*l.*; Looking for the Smack, W. Bromley, 75*l.*; Waiting for the Lock-keeper, J. Tennant, 65*l.*; View of Rome, J. B. Payne, 65*l.*; The Message, H. Garland, 60*l.*; Before the Duel—Love or Honour, R. Dowling, 60*l.*; A Spanish Lady, C. S. Liddendale, 55*l.*; The Brock Side, E. Holmes, 40*l.*; Pont-y-pont, North Wales, J. B. Smith, 45*l.*; Leisure Moments, A. Campbell, 40*l.*; Retour au Port, J. J. Wilson, 40*l.*; Anxious Moments, W. Bromley, 40*l.*; The Fish Cart, J. Huxell, 40*l.*; Clearing the Old Lobster Boat, C. N. Henry, 40*l.*; Marquette Mocked by the Gossips, A. B. Donaldson, 40*l.*; Fruit and Bird's Nest, W. H. Ward, 35*l.*; Morning—Marazion Bay, E. Hayes, 30*l.*; Evening on the Clunians, C. J. Lewis, 30*l.*; North Shilole, J. Danby, 30*l.*; In the Duddon Valley, J. Peel, 30*l.*; Cottages at Capel Curig, J. Henzell, 30*l.*; On the Clancy, near Castleton, A. Tanton, 30*l.*; The Beggar's Story, Miss E. Brownlow, 30*l.*; The First Meeting of Valeria and E. C. Miles, 25*l.*; The Libero, or Lew Rock, W. A. Knevel, 25*l.*; Kenilworth, R. Rayner, 20*l.*; Woodside, Norfolk, J. B. Ludbrook, 20*l.*; Dover Beach, E. Hayes, 20*l.*; St. Margaret's Bay, J. J. Wilson, 20*l.*; Faces in a Fire, H. King, 20*l.*; Winding, E. G. Girardot, 20*l.*; "Will you have them?" J. R. Powell, 20*l.*

From the British Institution.—Amald, G. E. Hering, 35*l.*

From the General Exhibition of Water-colour Drawings. The Trial Trip, R. Tucker, 63*l.*; Many Hands make Light Work, J. Haylar, 50*l.*; Herring Fishing, R. Tucker, 40*l.*

From the Water-colour Society.—Remains of Kenilworth Castle, H. Gastineau, 150*l.*; The Ferry, Geo. Dodgson, 80*l.*; The Wharfe, looking up towards the Valley of Desolation, P. J. Naffel, 75*l.*; Lochness, Aberdeen-shire, G. Rosenbergh, 50*l.*; Chillingham, Kent, David Cox, jun., 42*l.*; Judge Croke, Miss M. Gillies, 30*l.*; Off Holy Island, Northumberland, J. Colow, 26*l.* 5*s.*

From the Institute of Painters in Water-colours.—Cockle Gatherers, J. H. Mole, 105*l.*; Salo, Lago di Garda, C. Vacher, 60*l.*; Latest News from the War, C. Green, 50*l.*; Mussel Gatherers, J. H. Mole, 35*l.*; Holywood in the Olden Time, J. Chase, 40*l.*; On the Brue-side, C. H. Pidgeon, 35*l.*; Mica Culpis, C. H. Wengall, 31*l.* 10*s.*; Sunrise on Conist Lake, A. Penley, 26*l.* 5*s.*; Fruit, Mrs. Duffield, 26*l.* 5*s.*; Waiting for the Ferry, J. G. Philip, 23*l.*; Gossamer, on the Rhine, C. Richardson, 21*l.*

THE METROPOLITAN WATER-SUPPLY.

The Commons' Committee on the East London Water Bills are convinced that the quantity and quality of the water-supply from the Thames are so far satisfactory that there is no ground for disturbing the arrangements made under the Act of 1852. The New River Company and the East London Company, drawing their supplies from the river Lea (the former having also the springs at Amwell, affording about 4,000,000 gallons daily), supplied nearly 38,000,000 gallons a day in 1856, and 41,670,000 gallons in 1866. The population supplied by them is now estimated at 1,458,570. The average daily flow in the Lea is about 90,000,000 gallons; in ex-

treme dry weather nearly 60,000,000 gallons. The companies are bound to leave sufficient water for the purposes of navigation. Any great addition to the present supply would make reservoirs for storing water requisite, but there does not seem to be any difficulty in constructing such works. The committee are satisfied that there will be an abundant provision of water for the eastern part of London for many years to come. They are also satisfied that, as far as science affords the means of judging, the water supplied by the New River and East London Companies is not only wholesome, but compares favourably with that supplied to other places. But they concur in the recommendation made by the Rivers Pollution Committee that after the lapse of a certain period no sewage (unless passed over land so as to become purified) and no injurious refuse should be allowed to be cast into the Lea or its tributaries. The committee state that with remedial measures already provided for, the Lea will be as free from risk of contamination as the Thames, and will afford a supply of wholesome water of unquestionable character to the East London Company at the lower source of supply, as it now does to the New River Company from its intake near Hertford. The other company, the North Kent, draws its water from deep wells, and no question has ever arisen as to the quality of the supply.

The result of the inquiry is, in the opinion of the committee, that London is found to have an ample supply of good water at its doors, and all that is needed is to stop the systematic contamination of it, and to pass a constant snappy into every house, both of which objects are attainable and ought now to be attained.

THE SANITARY CONDITION OF ISLINGTON.

The report of Dr. Ballard, the Medical Officer of Health for the parish of Islington, has been printed. A considerable portion of it consists of an interesting analysis of the cholera epidemic of last year, illustrated by a map, showing at a glance the localities where it prevailed. There were, between the 23rd of July and the 27th of November, 110 cases of cholera, with a fatality of 60 per cent., and 231 cases of the milder form of choleric seizure, with a fatality of nearly 4 per cent., and the disease swept over the parish, as it were, *in two waves*,—the first the highest and most overwhelming, the second lower. There were three principal foci towards which the epidemic influence appeared to gravitate. The principal of these was situated at the southern extremity of the parish; the second constituted by Lower Holloway, the Queen's-road, and Palmer-place sanitary districts; and the third was the immediate neighbourhood of the Back-road, Kingsland.

There is this in common in these three foci—they are all localities occupied by the lower class of the population, and situated at comparatively low levels. All to the south of the Essex-road is under 100 ft. of elevation. The second focus is situated at 100 ft. elevation, or a trifle above it; and the third focus at and below 80 ft. elevation.

Out of 108 cases, of which Dr. Ballard had precise information as to locality of attack, 73 resided in parts of the parish situated at or below 100 ft. of elevation; while of the remainder 23 resided at an elevation of above 100 ft. and below 120 ft., and 11 between 120 ft. and 130 ft. of elevation. Above 130 ft. no case at all occurred. Out of the 73 attacked at an elevation under 100 ft., 43, or 58 per cent. died; and 22, or 62 per cent., died. Judging by the fatality, he is disposed to consider that other cases were more potent than this in determining the precise seats of outbreak in the parish, as well as the intensity of operation of the causes of the disease.

As to the character of the houses in which the attacks occurred, four cases out of the number originated in the London Fever Hospital. These must be excluded; as also two, the locality of whose origin was not precisely known.

Of the remaining 104 attacks, 23 only occurred in houses with fairly large and airy rooms, and of these 14 or 60 per cent. were fatal. Eighty-one occurred in houses with small, close, confined rooms, and of these 49 or 60 per cent. were fatal. The only conclusion the medical officer can draw from this is, that the epidemic

influence was most felt in the houses of the latter class; but when the attack occurred, the result was not apparently influenced by any circumstance of this nature.

Again, of the 104 attacks, 56, or more than half, occurred in houses more or less remarkable for neglect of general cleanliness. Of these, 36 cases were fatal, or 65 per cent. On the other hand, 48 occurred in houses not thus remarkable; some of them very clean, even where the rooms were small; and of these 27, or 56 per cent., were fatal. The uncleanness of the habitations, then, had a distinct influence, both in favouring the occurrence of cholera and imparting to the disease a severe and fatal character.

SANITARY PROCESS IN EDINBURGH.

To us who have taken an active part in urging the necessity for sanitary improvement in the northern capital, it is satisfactory to note that the magistrates and Town Council are about to put the enactments of their Provisional Order into operation; and we condense from the *Scotsman* newspaper a few of the more important of the changes which it will introduce into the sanitary system of the city.

More extended powers of forming drains are conferred by the Order, and the authorities will now be enabled to execute much-needed works which previously they were utterly powerless to undertake. Thus, for example, the district draining into the Lochrin Burn, the defective sewerage of which has long been complained of, is immediately to be dealt with under the Order. Provision is also made for the trapping and ventilation of sewers. No one can form junctions with drains in future save with the consent of the Council, and after paying such sum of money as they may fix. Under this system, every one will have to pay for drainage, and no one will be able to take advantage of the expenditure of others without contributing his quota. Power is also given to the Council to borrow money for the construction of sewers, and to spread the payment of the sums borrowed over several years.

Every house must be drained to the satisfaction of the Council; and if the owners do not see to this, the authorities may do so, charging the owner with the cost. No house can be built in future in such a way as that the walls of the cellar, or lowest floors shall prevent proper drainage; and with a view to secure this, plans showing the levels of all houses to be built of new, or rebuilt, must be submitted to the Town Council for approval. From the decision of the Council, if the plans are disapproved of there is a summary appeal to the sheriff.

All branch-drains and cesspools are placed under the surveillance of the authorities, and must be repaired, cleaned, and kept in proper order at the cost of the owners of the premises to which they belong, or for the use of which they are constructed.

The owner of every house, or part of a house, occupied by a separate family, is bound, within one month after notice from the authorities, to provide such house, or part of a house, with water, sinks, soil-pipes, and water-closets. In all existing houses, where water-closets ventilate into common stairs so as to be offensive or injurious to health, every practicable means must be taken for having such water-closets ventilated by shaft or other means communicating directly and only with the open air, or in such other manner as the Town Council may direct. In all new houses to be erected for the use of two or more families, the water-closets must be constructed so as to ventilate by shaft or otherwise into the open air.

Concomitantly with the working out of these enactments must be the enforcement of the provisions which authorise the sheriff, on the application of the council and their officers, to deal with the overcrowding of dwellings. Wherever any inhabited house, building, or part thereof, has been rendered unwholesome or unfit for human habitation, by its being overcrowded, the sheriff may "limit the number of separate dwellings into which such common tenement or part thereof may be divided, or let to, and for the use of separate families, and the number of persons who may be accommodated in such common tenements, or such parts thereof which may be let to, or for the use of, separate families."

As affecting the ventilation and cleaning of

buildings, the Order provides that, before any school, place of public amusement, or other place for holding large numbers of people for any purpose whatever is begun to be built, there shall be submitted to the council a plan and description of the proposed construction of such building, with respect to the means of supplying fresh air to, or proper access to and exits from, such building. The owners of all common stairs and passages are bound to have the same properly ventilated and cleansed to the satisfaction of the borough engineer and inspector of cleaning; and these officers, as well as the medical officer, may enter all dwelling-houses or other premises where there is reason to believe that they are not in a cleanly condition.

The Order prohibits the establishment, without the consent of the council, of any noxious or offensive business or manufacture within the city, or within 200 yards thereof. It enacts that no premises within the city shall be used as an infirmary or hospital without a license from the magistrates, granted only after certification by a medical officer. It authorises the medical officer to cause persons labouring under infectious diseases to be removed to the infirmary, and it further authorises him to cause to be removed to a faneratory, to be provided by the magistrates and council for the purpose, such corpses as, if kept, would be offensive or prejudicial to the health of persons in the same or any adjoining tenement.

As regards the improvement of the City, the Order also confers important powers upon the Council. After one month's public notice, they may allow houses to be set forward so as to improve the line of street; and they may also, on making compensation to the owners, cause houses projecting beyond the line of street, when taken down in order to be altered or rebuilt, to be set back towards the line of the street or of the adjoining houses. They may also, after a resolution to that effect at a meeting called for the purpose, acquire houses or premises for the purpose of widening, enlarging, or otherwise improving any streets, courts, or closes, reselling such portions of the premises so acquired as may not be needed; they may drain, repair, pave, or otherwise improve streets, courts, and places where there may be doubts as to the liability of owners to execute such works. The Council may acquire lands or premises for the purpose of reserving them as vacant spaces, or of opening up thoroughfares, or of improving the buildings, or of otherwise disposing of them, so as to improve the sanitary condition of such localities.

THE BRITISH MUSEUM.

The House, in committee of supply, has just passed the annual vote for the British Museum, amounting this year to 99,621*l.*, being 3,123*l.* less than the estimate of last year.

Mr. Walpole, in moving the vote, said that the number of those who studied in the different departments was increasing, and that the accommodation required to be increased. Of the estimates a large part was devoted to the purchase of the Blacas Collection of Antiquities.

Mr. Layard said he considered that our collection in the British Museum, as illustrative of the progress of civilisation and art, was unequalled in the world; and he believed the reason why it was not adequately exhibited at the Museum was the want of room. He should like to have some information on the subject of the great catalogue so long in progress, and when it was likely to be finished. He hoped the Government would next year seriously consider as to providing adequate room for our various collections. He had it in intention to bring forward a bill for the better arrangement and organisation of our national collections, which he proposed to introduce next session, in the hope that it might be referred to a select committee.

Mr. Ayrton regretted that further arrangements had not been made for making the Museum accessible to the public. It was perfectly easy to light the Museum with gas, without any danger from fire or injury to the collection by the gaslight.

Colonel Sykes thought the result obtained was by no means commensurate with the immense expenditure of money on the British Museum. He found that in 1851 the number of visitors was 779,000; in 1863, 564,000; in 1865, 677,000; and in 1866, only 516,000, showing a progressive decrease in that period. In the same way the number of those who visited the Museum for

purposes of study and research declined from 136,000 in 1861 to only 99,000 in 1866.

The Chancellor of the Exchequer said the collections were packed almost in warehouses, and there was no inducement to collectors to leave their valuable possessions to the country. He believed there were many persons at this moment who would leave their collections to the country if a better state of things prevailed; and next year it would be the duty of the Government to submit a plan to Parliament, which they hoped, if adopted, would bring about results which had long been desired.

Colonel Sykes said the labouring classes ought to have the same facilities for visiting the British Museum in the evening which they possessed for going to the South Kensington Museum. There could be no difficulty whatever in fixing a number of sunlights in the building, from which no danger need be apprehended.

Mr. Layard said if he were a trustee of the British Museum, nothing would induce him to consent to the lighting of such a vast building with gas. It was a very doubtful question if works of art, such as pictures, did not seriously suffer from the effects of gas.

COTTAGE DESIGNS.

The Suffolk Agricultural Society offered two premiums, one of 25*l.* and the other of 15*l.*, for the two best plans, with detailed specification, of the cheapest double cottage, adapted for Suffolk labourers; the designs in competition to be exhibited at the Show of the Royal Agricultural Society of England at Bury St. Edmund's.

The committee to whom the matter was referred reported that there had been sixty-three plans sent in for competition, the cost of carrying out which, according to the designers' estimates, varied from 106*l.* to 338*l.* each. Upon this point the committee remark that, having been assisted by practical builders, they have ascertained that in many cases the estimated cost is far below what the actual outlay would be in erecting the same. The committee state that:—

"After close investigation, they have unanimously arrived at the conclusion that the plan bearing the motto 'Suitability,' and costing 170*l.* 3*s.* 8*d.*, should have the first prize of 25*l.*; and that the second prize of 15*l.* should be awarded to the plan bearing the motto of 'Level,' and costing 139*l.*

The former the committee consider would be improved by continuing the roof so as to form gable ends, also by placing fireplaces where the dressers are in each of the sculleries, instead of that in the bakery. In both plans more shading outside is desirable.

In second prize a pair more rafters at each end are required. Sliding casements would be preferable. A fire-place is wanted in the scullery, also windows in the pantries for ventilation."

Messrs. Couder & Larkett, of London, were accordingly awarded the first premium; and Mr. Shaw, of Birkhead, the second.

On the first-prize plan, the main entrances are at each end of the block, the doors to the lobbies being further protected by simple hood porches. In the lobbies are the doors of the living-rooms and staircases, the scullery opening from the living-room; and out of the scullery open the pantry and a cellar or fuel closet. The dimensions of the ground-floor rooms are,—of the front room, 11 ft. 7 in. by 12 ft.; of the back room, 6 ft. 2 in. by 8 ft. 9 in.; pantry, 3 ft. by 5 ft. 6 in.; closet, 3 ft. by 2 ft. 10 in. Between the two sculleries and opening to the yard is the common bakehouse of the two cottages, which is furnished with a large oven, kneading-trough, and copper. The cottages and bakehouse are thus brought within four walls. The water-closets stand at the end of the common yard, their doors opening away from the house. A water-butt containing 130 gallons is provided to each cottage, but no provision is made for a well, owing to the impossibility of making any estimate for a work the expense of which entirely depends on the situation. There are windows to the staircases, and from the landing at the top of each independent access is obtained to the three bed-rooms, whose dimensions are respectively 14 ft. 3 in. by 9 ft. 1 in.; 7 ft. 3 in. by 11 ft. 8 in.; and 8 ft. 10 in. by 6 ft. 8 in. Two of the bed-rooms in each cottage are furnished with fireplaces, and the third is ventilated by means of a piece of perforated zinc in a framed opening in the middle of the ceiling, the air passing into a false roof terminated at each end by louver boards. The windows of the upper floor being below the roof-plate, the roof, with the exception of these breaks for ventilation, is uninterrupted, and the additional ex-

pendence of gullies is avoided. The committee, however, recommend that even this interruption in the line of roof should be omitted. In the larger bed-room is a corner cupboard, and in one of the smaller a closet. The internal work is designed to be neatly done, the doors being panelled and the casements chamfered. The total estimated cost is 170*l.* 3*s.* 8*d.*,—approved, it is said, by a Suffolk builder. The woodwork is painted internally with three, externally with four coats. In the partitioners of cost, the red bricks are put at 25*s.* per 1,000, the floor bricks at 42*s.*, the pantries at 7*s.* per 100. The bricklayers' work is set down at 3*s.* 6*d.* a yard (9 in.), the flooring at 2*s.* 3*d.*

In the second prize design, the front elevation shows the four windows of the living-rooms (two to each), with bed-room windows above them. The cottages form a square block, and the entrance-doors are at the side. Each opens into a lobby, from which there is access to the staircase, the living-room, 15 ft. 6 in. by 12 ft., and the scullery, 9 ft. by 8 ft. 6 in. The latter is provided with oven, boiler, and sink, and has also a pantry, 5 ft. 6 in. by 3 ft., each cottage being entirely independent of the other. The scullery has a door opening into a back yard, at the further end of which is a privy, with its door at the side. Adjacent to the latter is an ash-pit common to both cottages. The staircase gives independent access to each of the bed-rooms, respectively 12 ft. by 9 ft., 9 ft. by 6 ft. 6 in., and 9 ft. by 9 ft. 6 in. Two of these have fire-places, and there is also a closet, 5 ft. 6 in. by 3 ft., conveniently situated on the landing. Estimated cost, 190*l.*

GAS AND GAS-PIPES.

If there were no other reason why it is desirable that some radical change should be effected in the management of gas-supply, the fact that the streets are torn up and the traffic stopped at the will of the gas companies would be sufficient. If the pipes were laid in the subways, no such disturbance of the roads would be necessary, and the cost incurred by frequent paving and repaving would be dispensed with.

But there are other reasons why it is inevitable that a complete reform must be accomplished. Under the present system, the companies enjoy a monopoly, and the only control which the Government obtains in virtue of this concession is in its very nature an evil. The dividends of the shareholders can never rise above 10 per cent. The Act of 1860 fixed that limit, and as a matter of fact the limit has been attained; so that there is no longer any sufficient motive to induce the companies to improve their process of manufacture with a view to economy or to supply gas of a better quality, for in neither case could they gain anything by change. The monopoly protects them, and the limit to their profits acts as a complete check to improvement. This is the present state of matters as regards the gas-supply in the metropolis, and it is very justly awakening the attention of Parliament. The problem is to devise a plan by which the companies shall be encouraged to improve their process of manufacture so as to cheapen gas and to supply it of a better quality. And so perplexing is the task of solving this problem that the Select Committee appointed to investigate the question, and if possible to propose a remedy, has abandoned the task as hopeless. But a solution of the difficulty must be found; and until this is done we must seek it patiently.

A scheme which has been proposed by Mr. R. H. Patterson is apparently attracting some attention. Mr. Patterson believes that any attempt to fix the price which the companies should charge for gas would be a mistake. He thinks that ordinary trade principles are sufficient to determine this point, and that it is beyond the power or province of Parliament to touch it. He proposes that, in order to secure gas of the best quality, we should adopt a system akin to that of the Excise. He would have certain officers empowered to apply appropriate tests for illuminating power at the mains near the manufactory, and for purity near the extremities of the supply pipes, whenever and wherever they please. In short, that the gas companies should be treated as the distillers are. He recommends a system of heavy fines for the supply of gas of inferior quality, and these he would enforce, giving the inspectors a large share in the fines, in addition to a fair salary. With this check Mr. Patterson would

abolish the Act of 1860, which limits the dividend to 10 per cent. He would fix 8 per cent. as a starting-point, and above this permit the companies to gain what profits they pleased, provided only that for every 1 per cent. so gained, one-half per cent. should be appropriated to a deduction in the price charged for gas. The half per cent. dividend would thus induce the companies to earn 1 per cent. by improvements in their process of manufacture, and the consumers of gas would profit equally with the companies by the lessened price consequent upon these improvements.

But Mr. Patterson's scheme comprises a still greater change. He thinks it desirable that the municipality should buy up the companies, and take the business into their own hands. The question arises, is the scheme practicable? To this Mr. Patterson replies as follows:—

"The transfer of the property of the gas companies to the municipality (so to call it, or the aggregate municipal bodies) can be effected without any direct purchase, and without any loan or other financial process, on the part of the municipality. All that is required is to convert the shares of those companies into city bonds of equal amount, bearing 10 per cent. of yearly interest. The funds necessary for the payment of interest on these bonds are already in existence: they are applied by the proceeds of the rate at present levied upon the community by the companies. The only change which would be made would be that the present amount of the gas-rate would be collected by the municipality, and paid to the shareholders of the companies as interest on the bonds, instead of being collected by the companies themselves, and paid by them as dividend to their shareholders.

This is all that is necessary in order, by one stroke, to transfer the property and interests of the gas companies to the municipality. No loan or new rate would be needed, and all, and no less could possibly happen to the municipality from the arrangement, seeing that the funds required for the annual payment on these new City bonds are already in existence."

There is something ingenious about the proposition thus stated. A circular letter which Mr. R. H. Patterson has recently published explains the matter more fully, but enough has been said to show that it deserves attention. The subject is a most important one, and legislation upon it cannot be long postponed. It is too late to do anything decisive to this session, but the matter must not be allowed to drop.

WELSH NEWS.

Llangollen.—The court-house here has recently been completed. The contractor was Mr. John Griffiths, and the architects were Messrs. Lloyd Williams & Underwood. The cost was about 1,200l.—The assembly-rooms and markets, designed by the same architects, are also completed, the contract having been taken by Messrs. Morris Roberts. The total cost of the works has been about 2,200l.

Ruthin.—The contract for alterations and additions at Ruthin Gaol has been let to Mr. John Griffiths, whose tender was 8,000l. Messrs. Lloyd Williams & Underwood are the architects, Mr. Lloyd Williams being county surveyor.

Bangor.—The first portion of the contract at the George Hotel, Bangor, amounting to about 4,000l., and including alterations to old house, new portico, new laundries, kitchens, stabling, billiard-rooms, servants' range, gas-house, &c., has been completed by Messrs. Thomas & Sons, of Bangor. Architects, Messrs. Lloyd Williams & Underwood.

THE YORK GUILDHALL WINDOWS.

Two more windows have been erected in the Guildhall. They are the gifts of the Lord Mayor (Mr. James Meek), and of Mr. R. Farrar (ex-sheriff). The Lord Mayor's window illustrates the first of a series of historical subjects intended to be commemorated. In the centre of the window is represented the election of Constantine the Great, as emperor, at York, July, A.D. 306. Constantine, habited in a mourning-dress, is represented as receiving the principal military and civil authorities (among the former of whom would be the commanders of the 6th or Victorious Legion, so long stationed at York), who bring him the sceptre, the golden orb, the laurel crown, and the imperial mantle. The portrait of Constantine has been studied from his coins in the British Museum. In the lower compartments are introduced on each side the Roman eagle, and in the middle the monogram of our Saviour, which Constantine, after his conversion, adopted as a device for the imperial standard. This window has been manufactured by Messrs. Hardman & Son, of Birmingham. The next

window, given by Mr. Farrar, represents the granting, by King Edgar, of permission to the men of the north to make their own laws. In the centre is King Edgar, who, standing before the throne and holding the sceptre, announces to the ecclesiastical and military chiefs of the north his grant to them of the privilege of making or choosing the laws for themselves. On the right of the king is his chancellor, holding his charter recording the concession. Next the chancellor are Oslytel, Archbishop of York, and his attendants. On the opposite side is Osloc, Earl of Northumbria. With him are other northern chiefs, one of whom bears aloft the royal sword of state. Behind these chiefs is the Dragon, the ensign of Wessex, Edgar's principal kingdom. In the lower compartments of the window are introduced the Dragon, the Raven, and the White Horse, the ensigns of Wessex, Northumbria, and Kent. This window has been manufactured by Messrs. James Powell & Sons, of London. Both windows were designed by Mr. James E. Doyle, the author of "The Chronicles of England." Other windows, continuing the series, and depicting some of the most interesting events in the city's history, are in progress of manufacture, the necessary funds having been promised by other citizens.

FROM SCOTLAND.

Edinburgh.—The thirty-third annual meeting of the Royal Association for the Promotion of the Fine Arts in Scotland has been held in Queen-street Hall. There was a large attendance. The distribution of the prizes also took place in Queen-street Hall. The attendance was not large. The Solicitor-General presided. The chairman stated that the total number of subscriptions for the year was 5,235, compared with 5,171 last year, which he considered very satisfactory.

Glasgow.—The window placed in the west end of the nave of the cathedral, and known as the "Baird Memorial Window," has been wantonly destroyed by a person named John Marshall. It is broken in three different places, by stones. The culprit was asked why he had committed the offence, and coolly replied he had an ill-will towards the church, and, were he liberated tomorrow, he would do the same thing. Afterwards, however, he said he was starving of hunger, and did the act in order that he might be relieved from his destitute condition. The cost of the window was about 2,000l.

Hamilton.—At the time of the demise of the late Duke of Hamilton, in 1863, a general wish was expressed by the tenantry on the estate, as well as by many personal friends, that a monument should be erected to his memory. A committee was appointed, subscription sheets issued and in a very short time a sum was subscribed sufficient to enable the committee to enter at once into preliminary arrangements. The committee invited specimen designs for a monumental structure; and, after considerable labour, and frequent consultation with Her Highness Princess Marie, the Duchess of Hamilton, at length decided on adopting that furnished by Messrs. C. H. Wilson & D. Thomson, architects, Glasgow. The site fixed on, and which was also approved of by the duchess, is at the entrance to Cadzow Forest. The monument is to be erected on a rock of red sandstone, on the bank of the river Avon. It is designed in the classic style of architecture, the plan being circular, with square projections for pedestals under columns. The basement will consist of masonry 8 ft. high, with channels wrought on the joints, having a moulded base-course about 2 ft. high and a cornice at top. At the front there will be a flight of steps leading to the interior of the monument. The floor will be paved with stone, and it is intended to fix seats between the columns all round the apartment. These seats, which are to be of stone, will be 1 ft. 6 in. high. There are to be nine columns, placed at equal distances; each will be about 15 ft. high and 19 in. diameter at the foot, diminishing to 16 in. at the top. The shafts of these columns are to be of Aberdeen granite, while the bases and capitals will be formed of freestone. In the interior of the monument a pedestal of grey granite, 6 ft. in height, and surmounted by a bust of the late duke, will be erected. The whole structure will be about 22 ft. in diameter outside, and from ground to top of roof about 32 ft. high. The works are estimated to cost about 1,500l.

Paisley.—Some months ago a meeting was held to consider what should be done with the sum raised by subscription in Paisley about forty years ago, for the erection of a monument to Wilson, Hardie, and Baird, who were executed in 1820 for the part they took in connexion with the Radical movement of that period. A good amount was collected in a short time, and the design of a monument by Mr. William Robin sculptor, Paisley, was approved, and the work was proceeded with. The monument has just been erected in the cemetery here, and inaugurated in presence of a large number of spectators. It consists of a square basement and shaft, formed of a durable white freestone.

DOVAGER COUNTESS OF ELLESMERE MEMORIAL.

To those who have inquired on this subject, we are enabled to say that the three designs selected by the committee were those of Mr. Charles Henry Driver, of Westminster, London; Mr. T. Graham Jackson, of Devereux-court, London; and Mr. John Gibbs, of Oxford. The committee afterwards submitted these three to the arbitration of Mr. C. E. Street, who, after visiting the locality, and examining the drawings, has decided in favour of Mr. Graham Jackson's design.

BUILDERS' BENEVOLENT INSTITUTION.

ON Wednesday afternoon, the twentieth annual meeting of the subscribers and friends of the above charity was held at Willis's Rooms, King-street, St. James's, for the purpose of receiving the report for the past year; for the election of president, treasurer, directors, and auditors for the year ensuing; and for other matters connected with the welfare of the institution. Mr. Benjamin Hammen, president of the institution, occupied the chair.

The secretary then proceeded to read the following report:—

"The directors, in presenting to the friends and supporters of the Builders' Benevolent Institution their report for the past year, take leave to state that notwithstanding the unparalleled monetary depression of the last twelve months which has so seriously affected all classes of society, the funds of the Institution have not diminished; the annual subscription having increased, which, taken into consideration the above-named cause, is highly creditable both to the feelings and generosity of all connected with the building trades.

Since the last general meeting several friends have been removed by death, and the directors have to announce the receipt of the following bequests in aid of the funds of the Institution:—Firstly, the late Robert Foster, esq., 1,000l.; less duty; secondly, the late Charles Beachcroft, esq., 500l.; thirdly, the late H. Larner, esq., 21l.; fourthly, the late Charles Hack, esq., 200l.; less duty; and they take pleasure in expressing their deep regret, and the great solicitude by their bounty those of their brethren who had been less fortunate in life than themselves.

Two elections of pensioners have been held, the first in November last, when three were elected, viz., two males and one female; the second in May, 1867, when a similar number was chosen, making a total of four males and two females during the past year; and two deaths have taken place during the same period, one man and one woman, making the number now in receipt of the benefits of the charity 45—23 males and 22 females. Pensioners elected: Males—James Webb, elected November, 1866; J. F. Goff, ditto; George Hunt, May, 1867; Charles Gravel, ditto. Females—Mrs. A. Colborn, Brighton, November, 1866; Mrs. Ann Walker, May, 1867. Pensioners deceased: John Noble, elected November, 1862, died August, 1866; Mrs. A. Thomas, May, 1856, died April, 1867. 1,368l. 18s. 6d. has been added to the Relief Fund, and 100l. 4s. 8d. to the Building Fund, making an addition of 1,468l. 2s. 8d. Stock Three per Cent. Consols purchased during the past year. There is now standing in the names of the trustees, for the Relief Fund, 9,866l. 10s. 1d.; for the Building Fund, 2,832l. 11s.; being a total of 12,698l. 11s. 1d. The directors again notice with regret that there is still a large number of building carpenters, bricklayers, plumbers, &c., who have not yet responded to the numerous appeals made to them to become supporters of a charity which relieves many of the trades in immediate connexion with the building interest; but they do hope that, either through themselves or through the persuasion of subscribers, they may be induced to give their support to the Builders' Benevolent Institution.

In accordance with rule 15, section 3, a special general meeting was held on the 3rd December, at Willis's Rooms, St. James's, to take into consideration what should be done with the surplus of the Building Fund, when the following resolutions were passed:—"That it be recommended that there be a sub-committee formed from the general committee for the purpose of selecting such sites of ground as may be eligible for the erection of almshouses hereafter, within a radius of several miles from Charing-cross, the land not to be less than three acres in extent; and the report of such sites shall be laid before the general committee at their monthly meeting for March, 1867, when they shall be empowered to negotiate the purchase of the site upon which they may determine." Several meetings of the said sub-committee have been held, and plots within the past six months, and plots (and land viewed); but no definite result has been determined on.

The subscribers and donors are respectfully requested to notice that permanent offices have been taken in an eligible and central position at No. 4, Vernon-place, Bloomsbury-square, W.C.

The Chairman moved that the report be received, adopted, and printed, which, being seconded, was unanimously carried.

Mr. Plucknett, of the firm of Cubitt & Co., proposed that Mr. W. R. Rogers, his partner, be elected president for the ensuing year.

Mr. G. Bird seconded, and Mr. Rogers was unanimously elected.

Mr. Plucknett was re-elected treasurer to the Institution, and the directors and auditors for the past year were reinstated for the year ensuing.

The usual vote of thanks to the chairman and retiring president concluded the proceedings.

A COMPETITION ABROAD.

The Society for "la Propagation de l'Architecture," at Amsterdam, offer a premium of 500 florins for the best design for an Hôtel de Ville for the capital of the kingdom. The rewarded design will be published. The competition is open to all nations, and should any of our student readers desire to enter on it, they may consult the programme at our office.

THE PAYMENT OF GOVERNMENT ARCHITECTS.

A DEPUTATION from the Institute of British Architects, consisting of Mr. W. Tite, M.P. (president), Mr. Lanyon, M.P., Professor Donaldson, and Mr. D. Brandon (vice-president), had an interview a few days ago with Lord John Manners, M.P., at the Office of Her Majesty's Works, Whitehall-place. The deputation attended in reference to the commission to be paid to the architects of that department for works in connexion with the Houses of Parliament, and other public offices, concerning which we have already spoken. Lord John Manners said he would inquire into the matter; and as to the practice of the Governmental Boards, alleged to pay the 5 per cent. free from the measuring; further, that in requiring the measuring to be included in the charge of 5 per cent., he did not originate the question, but merely followed the practice of his office.

PAYMENT BY LOCAL BOARDS.

At a recent meeting of the United Water Boards of Duesbury, Batley, and Heckmondwike, a discussion ensued as to the plans and superintendence of two local supply reservoirs to be constructed at Staincliffe. Some of the committee seemed to think they could draw the plans themselves. A letter was read from a civil engineer offering to make all the necessary drawings, general and detail, and the specifications; to set out and fix all levels, superintend the works, attend all meetings of the Board when requested, &c., for one per cent. on the outlay. A correspondent on the subject says:—This will give the profession a clear insight into the treatment they are likely to receive, and the rivals they are likely to encounter, when they become competitors for the premiums offered by local Boards. If it is right to learn from the enemy, one receives a miserable lesson in pursuing the right!

THE THAMES EMBANKMENT AT WHITEHALL, AND THE RAILWAY.

Sir,—As an engineer of upwards of fifty years' experience, I beg to call your attention to this important subject. According to a published account of the north embankment, it is intended that the underground railway (fortunately not yet commenced) is to be constructed in the inner side of the embankment, next the intended river-front terrace houses, and the main sewer and the subway above it are to be placed next to the river walling, a portion of which is already built; whereas, for all practical and beneficial purposes, it must be obvious to every one that the reverse position should have been adopted, which would afford the following beneficial result. The drains and sewers from all

the Strand streets and longshore houses, &c., would thus discharge direct into the main sewer, as also the connexion with subway for supply of gas, water, &c., without crossing over or syphoning under the railway, which must upon the present arrangement be done to connect the present shore drainage with the main outlet sewer, and pipes to subway. Also the very tremulous agitation which the close proximity of the underground railway must produce on the whole length of this deep and treacherous-made "ground" and where neither light, air, nor ventilation can possibly be obtained, and the only exit for steam and foul air must be by shafts at intervals, to the injury of the surrounding inhabitants, for the whole length of the embankment. But if the position of the railway be reversed, so as to run immediately within the river wall, it may be thoroughly lighted and ventilated the whole length, by external apertures, 15 ft. or 20 ft. long and 3 ft. high, 18 in. above high-water mark, and filled in with ornamental iron perforated work, in lieu of the present blank parapet wall; and with white glazed brick slanting apertures to angle of roof of tunnel, and a low water outlet for any percolation time might effect. This railway would thus be as light as day, and free from small and unwholesome gases, as at Gower-street metropolitan line.

Notwithstanding this error has so far advanced, there is yet time to rectify the evil before the railway is commenced, or connected with its Westminster approach. And even in this there seems some blind generalship to have allowed so many "thousands of thousands" of loads of ground and debris to have been filled in on either of these sites of construction; and it is to be hoped that, through the medium of your powerful agency and support, this evil may yet be averted, and the public service and benefit intended be speedily effected, before it is too late.

H. H. R., C.E.

BUILDER AND ARCHITECT.

Sir,—Having noticed a communication headed "Architect and Builder" in your last number, I am induced to send you a few lines which may be headed "Builder and Architect."

I am superintending the erection, from my own designs, of several semi-detached villas. A lady living opposite approves of them, and wishes to erect a similar pair of houses. She sends for the builder, who undertakes to build her a similar pair for the same amount as mine. They copy the agreement, word for word, which I drew up for my client; in fact, everything is copied, without my consent or that of my client, and without even asking permission. Upon remonstrating with the lady in question, she informs me that the builder said he had a right to make use of the plans, &c., as he pleased; also that a friend, who is an estate agent, is going to superintend the works without any charge.

I should feel obliged if any of your readers could inform me whether they know of a similar case, and whether I have any remedy; because, if not, architects had better be builders also, and carry out their own designs, as it will not be safe to entrust them to builders, who may make use of them *ad lib.* I will send the names of the parties, if necessary, to show that the above is a real case.

ARCHITECT.

NEW ST. THOMAS'S HOSPITAL.

The following is a list of the tenders received for the New St. Thomas's Hospital, at Stangate. The foundations are already in. Mr. Henry Curry, it will be remembered, is the architect:—

Ashby & Horner	Stone and Red Bricks.	All Stone.
Hill & Keddel	432,100	430,400
Piper & Wheeler	381,050	400,300
Brass	377,060	395,108
Lee	367,021	383,826
Gannon	354,000	390,000
Thorne	362,664	395,566
Webster	353,745	382,645
Higgs	353,654	375,908
Mansfield	349,260	367,276
Holland & Hannen	347,168	364,173
Mears	344,252	364,468
Lucas	340,946	363,649
Perry	339,160	357,455
	332,748	356,780

Messrs. Perry's tender has since been accepted. We may add that Messrs. Baker, Messrs. W. Cubitt & Co., Mr. Downs, and Messrs. Trollope, were invited, but did not submit any tender.

PROPOSED NEW SYNAGOGUE, LONDON.

Sir,—Permit me in justice to myself and other unsuccessful competitors to correct a statement in your notice relative to this competition. Mr. Philip Hardwick was not consulted, nor did his opinion guide the committee in determining the merits of the designs submitted. I competed solely under the belief that the inferential obligation as conveyed in the instructions to architects would have been fulfilled by the committee, and that Mr. Hardwick's well-known ability and impartial judgment would, at least, have guided, if not determined, the ultimate selection.

H. H. COLLINS.

* * * The statement that Mr. Hardwick would so act came to us from the committee.

THE CHISEL.

Sir,—In reply to your correspondent, "A Freemason," who asks when the chisel was first introduced into this country, I beg to assure him that it is possessed of a much higher antiquity than the eleventh century, as he supposes. There are evident marks of the chisel on the tablets of Stonehenge. There are chisels to be found among the relics of the Bronze period. How old that may be I cannot tell; but I think your correspondent would probably arrive at a sound conclusion were he to suppose, in the utter absence of authentic proof, that the chisel was introduced into this country much about the same time as the hammer; and there can be no doubt whatever that it must be assigned to a period vastly anterior to that of the screwdriver.

AN ANTIQUARY.

CONCRETE CONSTRUCTION.

Sir,—I have refrained from making any remarks upon your correspondent's letter in the *Builder* of July 6th until I made myself acquainted with the facts of his assertions.

First permit me to state the small house he speaks of is built by Messrs. Harwood, cement manufacturers, of Northfleet. His blocks are made one day and laid the next, necessitating a larger proportion of cement than one in eight, as in my concrete, and thereby sacrificing both strength and economy. I am at a loss to understand how he can call it concrete building, as it is built with cement blocks as bricks, and with a large proportion of bricks in chimney-jambes &c.

He thinks hollow walls far "beyond" solid ones. I differ in opinion, and at the same time think he must be totally ignorant of my system of building, or he must know, in the way my houses are cast, in one solid block, I have only to insert cores, say 2 in. long, 2 in. thick, and 9 in., 10 in., 11 in., or 12 in. dia., in the centre of my mould, and 4 in. or 6 in. apart, in the same way that I turn the recesses for my joints, &c., and I get the hollow wall he thinks so much of. A 6-in. wall may be made hollow by 14-in. cores or prints. I think, sir, this will apply equally to Mr. Edwin Chadwick's remarks on hollow wall construction. I am sure that gentleman has not been well informed of my system of building, or he would have spoken of it in his able remarks on improved construction.

Your correspondent thinks he can build cheaper and quicker. Permit me to say he is a bricklayer, and his lumps were laid by skilled labour.

I commenced two houses on Monday, the 22nd of last month, and on Saturday, the 27th, my houses were 9 ft. 6 in. in height, the work done being equal to laying 14,580 bricks. The whole of this was done in forty-three hours by two labourers and one strong boy. They fill the apparatus every day in seven hours (excepting on Saturday, when, owing to so many gentlemen visiting the building, they took one hour longer). I have no hesitation in saying my two houses will be up and covered in by August 10.

My men being labourers do not superintend work by the rod, and take it by the yard super. of 8-in. work. 14,580 bricks will lay 142½ yards super., which, at 6d. per brick, equals 34.12s. 10½d., the amount earned by two men and one boy in four days and three hours, which I paid on Saturday last. When the houses are ready for the roof, the labour for walls will equal cost me 7s. 6s. 6d., the amount of work being equal to laying 29,160 bricks, including moulded reveals to windows and doors.

If you and your intelligent readers will compare this with the cost of casting separately, and laying separately, cement lumps, I feel sure you will at once be satisfied as to the economy of the system.

J. TALL.

SMOKE FROM BAKERS' FURNACES.

At the Marylebone police court, on Wednesday last (July 31st), Mr. Dolamore, master baker, of South-street, Manchester-square, was summoned at the instance of the Government Inspector for unlawfully using upon his premises a certain furnace not constructed so as to consume or burn its own smoke.

Mr. Saunders, the inspector, said he had given orders for certain alterations in the furnace, which had not been carried out, and called two police-constables who gave evidence that on different occasions they had observed smoke issuing from defendant's chimney.

Defendant produced a receipt from a leading tradesman, to show that every alteration required by the Government inspector had been duly made by him, and that Mr. Dolamore had paid him for the work. Defendant's foreman was also called, who particularized the alterations which had been ordered by the inspector, and he swore positively that every requirement had been carried out. He said it was impossible at the first start off that all the smoke could be consumed, and he would undertake to prove that if any practical man went to the bakery he would say that nothing further could be done than had been already done.

Mr. DeLamore, who was fined thirty shillings and costs, said it was very hazardous to make because practical and scientific men were unable to construct an apparatus that burnt all the smoke. He had paid the best price to a first-class tradesman to enable him to comply with the Act of Parliament, and had failed. Would his worship or the Government's inspector advise him what to do?

Both the magistrates and the inspector declined to give any advice, and defendant paid the money with a remark that there were scores of makers in the immediate district who were precisely in the same predicament as himself with regard to furnaces that "could not" be made to consume the whole of their smoke.

INDUSTRY ENCOURAGED.

A CORRESPONDENT sends us for publication the following resolution of the Laborers' Trade Society in the Staffordshire Potteries:—

"You are strictly cautioned not to outstep good rules by doing double the work you are required, and causing others to do the same, in order to gain a smile from your master. Such foolhardy and dissipated actions leave a great portion of good members out of employment the year round. Certain individuals have been guilty, who will be expelled if they do not refrain."

THE SANITARY STATE OF EPPING.

THE adjourned official inquiry into the sanitary state of Epping, before the Government inspector, Mr. Arnold Taylor, was resumed at the police-station in that town on the 18th ult., in the presence of a large number of the inhabitants. Mr. Docwra, of London, C.E., said he was quite satisfied that a good supply of water could be obtained for Epping at a reasonable cost. The estimate for sinking a well with a small engine of about six-horse power, and a small reservoir over it, would come in round numbers to about 1,600l. or 1,700l., and their pipes through the town might be put down at 800l., which would make up the total cost. 2,500l. would be sufficient every way, and he would guarantee that it could be carried out for less than that. That would give a supply at constant pressure of twenty gallons a day for 4,000 people, which was double the present population of Epping. After some other evidence for and against the necessity for something being done, the inspector said:—"After what I have seen to-day I am quite satisfied, apart from the application made to the Home Office, there is more than sufficient to justify this inquiry, and it is most disgraceful that some of the places should be allowed to remain in their present state. As to your sewers you are doing the right thing in the wrong place, for you are taking no steps to compel the owners of property to drain their premises by bringing them within the prescribed limits." The proceedings then closed.

THE ARCHITECT FOR THE HOLBORN VALLEY IMPROVEMENT.

At the Court of Common Council, on Monday last, Deputy Fry, the chairman of the Improvement Committee, brought up a report from that committee, recommending that they should be empowered to engage the professional services of Mr. Heywood, the engineer to the Commissioners of Sewers, in any further manner they may consider advisable for the successful completion of the above works. The object sought to be obtained by the committee in this report appeared to be that Mr. Heywood should be employed to superintend not only the work for which his services were originally retained, namely, the viaduct,—but that he should also be engaged in preparing plans for the erection of shops and other buildings that would have to be erected, a duty which would, in the ordinary course, fall within the province of the City architect.

The report was strenuously opposed by Alderman J. C. Lawrence, Mr. Lowman Taylor, and several other honourable members, on the ground not only that it would entail a very large additional expense on the corporation by employing Mr. Heywood in the way suggested, but that it would also cast a slur upon the City architect, by passing him over and retaining the professional services of another gentleman to perform a duty which he was perfectly competent to perform. Mr. R. N. Phillips, and several other members, in supporting the report, repudiated the slightest intention of casting a slur upon either the talent or the fitness of the architect to perform the work, but said that his time was fully occupied by the great and important works that were already in progress, and particularly

the meat market in Smithfield, and that it would be most advisable that the Holborn Valley works should be entirely carried out under the supervision of one professional gentleman, who had been engaged upon them from the commencement, and that a great saving of time was likely to be thus effected. Mr. Medwin, one of the members of the committee, also stated that from the inquiries they had instituted, they had reason to believe that the two gentlemen would not act harmoniously together, and, therefore, the committee had no alternative but to make the recommendation they had done in their report.

After a lengthened discussion, the reception of the report was negatived by a majority of 14,—the numbers being, in favour of the report, 37; against it, 51.

CHURCH-BUILDING NEWS.

Leek.—The chancel of the Old Parish Church, Leek, after undergoing thorough restoration, has been publicly re-opened by the Bishop of Lichfield. For about two years the work of restoring the east end has been in progress, though delayed in its final completion. The whole interior of the chancel has been renewed. One chief feature in the restoration is the number of memorial gifts. The memorial window at the east end of the chancel has been placed there at the cost of Mr. Thomas Carr, of Leek. The window is of five lights, each divided into two compartments. The centre one in the upper series contains a representation of our Lord's Crucifixion, and in the compartments right and left are the Betrayal, the Scourging, the Transfiguration, and the Resurrection. In the compartments of the lower series are represented the Ascension, the Last Supper, the Raising of Jairus's Daughter, Christ turning Water into Wine, and the Feeding of the Multitude. In the north and south walls of the chancel are other memorial windows. One on the north side is of two lights, containing a representation of the Descent of the Holy Ghost. There is also another memorial window of stained glass on the north side of the chancel, of two lights, representing two passages in the life of Naomi. This window has been given by Mrs. George Davenport, of Leek. A memorial window at the south end of the chancel is the gift of Miss Wood. Corresponding in design and dimensions with those in the opposite wall, it is of two lights, divided into four compartments, in which are represented scenes from the life of our Saviour, viz., the "Touch me not," Christ's Charge to Peter, the Entombment, and the three Angels at the Sepulchre. The only structural addition to the church is the chancel aisle on the south side, and this also contains two memorial windows, one at the east end of the aisle, but partially overshadowed by the organ. It is of three lights, and contains figures of the Psalmist King, St. Cecilia, and St. Aithan, formerly bishop of the diocese of Lichfield. The window is the gift of the late Mr. Thomas Crompton, of Leek. On the south side of the chancel aisle is likewise a three-light lancet-shaped stained-glass window, the gift of Mrs. Hannah Sleigh. In the right and left compartments of the window are two representations of St. John the Evangelist; and in the centre the figure of the patron saint of the church, Edward the Confessor. In the west end of the church, at the south side of the tower, is a memorial window of two lights, representing Moses, and Aaron the High Priest. This window is the gift of Mr. George Young. The pulpit is the gift of Mrs. Heathcote, widow of the late Vicar of Leek. It is of old English oak, baying round its body twelve niches, in which are full-length figures of the twelve apostles, each bearing an emblem of his sacred calling. Surmounting the figures is a canopy of richly-carved oak. The pulpit has been executed by Mr. Earp, carver, London, from the designs of Mr. Street, the architect of the church restoration, at a cost of 250l. The font is of marble and alabaster, and stands at the south-west end of the nave. The work included in the general contract embraces the erection of a reredos of alabaster and marble of various kinds; also a screen separating the chancel from the nave, of Derbyshire grey marble, moulded, and enriched with alabaster, and filled in with mosaic work of variegated pattern. The floor of the chancel is laid with Godwin's encaustic tiles, and the chancel is furnished with open stalls for the choristers. At the west end the old arch has been re-opened,

and the floor tiled, making a robing-room for the choir, and an additional entrance to the edifice through the tower. The restoration and addition have cost about 3,500l., the contract work having been executed by Mr. John Nadin, of Leek, from designs of Mr. Street, the architect.

Broadstairs (Kent).—Holy Trinity Church having been considerably enlarged towards the east, and the altar consequently moved, has been reconsecrated. The works which have just been completed, have dealt with the interior, and the points which have been aimed at are increased accommodation, superior heating and ventilation, and better provision for carrying out the services of the church. The architect employed was Mr. William E. Smith, of London. The vestry and boys' school which occupied the east end of the church under an eastern gallery have been removed, together with that gallery, and the east end of the church is now occupied by choir-stalls to the north and south, by the sanctuary with an oak altar-rail on ornamental iron standards, and coloured tile paving in patterns, and by the altar on a foot-piece of stone and tiles, the east window being brought full into view. An organ-chamber has been built on the north side, and the organ removed into it. The taking into the church of the space occupied by the boys' school rendered necessary very considerable alterations and enlargement of the schools, so as to provide accommodation for the boys, and the whole of the schools and vestry have been renovated; these are also heated by means of hot water. The total outlay is about 1,200l., nearly 400l. of which remains to be subscribed. We understand that the east end is to have illuminated stables of the Decalogue, Lord's Prayer, and Creed, and that the east window is to be temporarily stencilled in colour, awaiting a stained-glass window.

Books Received.

The Last Thirty Years in a Mining District. By

IGNOTUS. London: Longmans, Green, & Co. The writer of this sketch considers the last thirty years to be the most important period in colliery experiences, not only as regards mining in relation to the development of minerals for trade and profit, and as to the statistics of science, but equally so as regards the habits, education, and general development of the working man.

Of the colliers, as a class, he says:—

"Amazingly the supply is becoming exhausted, some say deteriorated. This, I believe, is not at all the case, and that the rising generation of collier is, physically and constitutionally, as strong as his predecessors. We can account for it more readily and certainly in connexion with the following considerations:—Accidents by explosion and otherwise, not only directly diminishing the stock, but deterring others from following the like calling; monotony of labour, and education, both tending to inculcate preferences for labour above ground, not being permitted to smoke, or take intoxicating drinks into the workings, but more especially the non-renewal caused by emigration some years ago, and which even now draws largely upon us at distracted periods; for we must recollect that, not only did the gold-diggings cause a greater draught upon this class than any other, but they were in a certain ratio absolutely necessary for the opening of those large fields of wealth, and to be procured at almost any price. Even at the present time, in the mines on the Continent and the New World, no undertaking is contemplated without the assistance of the British miner. I believe to these causes may be attributed our being so short-handed at present, and which hodes so unsatisfactory a prospect for the future in skilled and, in fact, colour generally. Colliers are a race peculiar to themselves; idiosyncrasy, they differ most materially from any other set of men who gain their bread by the work of their hands. I would seriously draw the attention of masters to the extreme desirability of encouraging them to the utmost, and extending them as a class. I would respectfully, likewise, urge the Government to render them every protection, not only where life and limb are concerned, but extend their support to any legitimate cause; for unless we derive aid from machinery, we shall find ourselves at no distant day wishing we had thought on these things. For they, assuredly,

"When once destroyed can never be supplied."

The author also treats of trades unions, and on the most important question of coal exhaustion.

VARIORUM.

A new edition has been published (Tegg) of "The Juryman's Guide," by Sir George Stephen, revised to meet the law as it now stands. Every man liable to serve as a juror will be rendered much better able to discharge the duties of the office properly by reading it.—Various letters that appeared in the *Gateshead Observer*, on the subject of the Gateshead Town-hall Designs, have been reprinted in the shape of a pamphlet.

Miscellaneous.

THE STRAND MUSIC HALL.—The sale of this freehold property, consisting of the Strand Music Hall (now closed), together with the adjoining houses and shops in the Strand and Catherine-street, has been attempted by auction at the Mart in Tokenhouse-yard, City, by Messrs. Ghinock, Galsworthy, & Chincock. The site is described as extending over an area of 14,000 ft. The auctioneer started the bidding at 40,000l. No advance being offered on that sum, it was withdrawn from sale. A portion of the site was next offered, but, as no bid was made over 30,000l, no sale was effected.

COLNEY HATCH LUNATIC ASYLUM.—At the Vice-Chancellor's Court, before Sir R. Malins, the case of the "Attorney-General v. Colney Hatch Lunatic Asylum," has come on for hearing. This case has for its object the abatement of an alleged serious nuisance by reason of the present mode of carrying off the sewage. The asylum contains 2,300 inmates. Mr. Bazilgette, the engineer, had made a scheme, and there had been a commission and report, which, as the defendants urged, would no doubt terminate in some Government Parliamentary measure. After a good deal of discussion, the Vice-Chancellor directed the case to stand over until November, meanwhile it might be seen whether some scheme could not be devised. It was stated that a pipe could carry off the sewage at a cost of 500l.

REVIVAL OF THE PROPOSAL TO BURN THE DEAD. A discussion on this subject took place some years ago in the *Builder*. The Paris correspondent of the *Star* calls attention to a paper published in the last number of the *Journal des Connaissances Médicales*, and bearing entirely upon the expediency of burning the dead, instead of burying them. Dr. Caffé, the author of this article, he says, very ably demonstrates that the cremation of the dead might be effected at a small expense by means of a *sarcophage*, or purifier of the body, erected on some elevated point of the town, and of which he gives a description. The body once being incinerated, the ashes might then be gathered into an urn, and sent to the family. Dr. Caffé believes that the vast cemetery which the city of Paris proposes establishing at Pontoise, and which will measure 2,125 acres, will exercise a most pernicious and baneful influence on the sanitary condition of the capital.

PRESERVATION OF NATIONAL ANTIQUITIES.—In the House of Commons, on Wednesday, Sir H. Verney asked the Secretary of State for the Home Department, whether he would endeavour to devise means for the preservation of ancient monuments, many of them belonging to pre-historic periods, and some to the Roman occupation of Great Britain, which existed in different parts of the country, and many of which had been injured and partially destroyed, owing to the ignorance of their value and want of care of their owners. Mr. Hardy thought there would be great difficulty in the way of the Home Department becoming an archaeological department, as it had not the means of doing so. "The objects of antiquity to which the question referred were private property; it was extremely desirable they should be preserved, and perhaps the growing intelligence of the country would supply the best means for this purpose." Ought we to trust wholly to this?

HARBOURS OF REFUGE.—The annual reports of the engineers show that at Portland the quantity of rough stone deposited in the breakwater mound, and the foundations of the heads, has reached 5,627,654 tons. With a slight exception the works have stood successfully the storms of the winter, and large numbers of vessels have taken shelter within the harbour. At Dover the expenditure upon the breakwater, or west arm of the harbour, has reached 611,277l., the estimate being 725,000l. At Alderney the expenditure at the end of March, the period to which all these reports are made up, had reached 1,140,513l., the estimate being 1,300,000l. At Holyhead, at that date, a length of 7,037 feet of the superstructure of the north breakwater had been built to its full height, and a length of 7,124 ft. was built above high-water; the inner or harbour wall was built to its full height, and a length of 5,930 ft. In the year ending the 31st of March, 3,647 vessels sought the shelter of this harbour. The expenditure had reached 1,371,165l.

ACCIDENT BY LIGHTNING.—The vane and upper part of the spire of Rillington Church, near Malton, have been thrown down by lightning. Whether there has been a proper lightning-conductor we do not know, but should rather think not.

LANDLORD AND TENANT.—A notice of his intention to quit given by a tenant on a Sunday is good and binding on him. This point was decided by Sir J. Eardley Wilmot, Judge of the Brentford County Court, in the case of *Sangster v. Noy*, where the plaintiff had, on a Sunday, given a written notice of his intention to quit the defendant's premises. The learned judge remarked on the fact that the notice was the act of the plaintiff, who, having chosen to give it on a Sunday, now sought to treat it as a nullity, and to take advantage of his own wrong.

THE CANNING STATUE IN PALACE-YARD.—On a motion by Lord Stratheden, in the House of Lords, for the restoration of the Canning statue to its old position in Palace-yard, Lord Stratford de Redcliffe, as a relative, concurred in the motion, and other lords spoke on the subject. Lord Malmesbury said there was not the slightest reason to suppose that any disrespect was intended by the removal of the statue, and he was sure that that step had not been sanctioned by the late Government without due consideration. The present Government had only followed in their footsteps. He owned, however, that there was something invidious in the removal of any statue. Under all the circumstances, he would recommend that the motion should be withdrawn, and he would then undertake that the subject should receive the consideration of her Majesty's Government, who would bear in mind the high interest which their lordships had expressed in the matter. The motion was accordingly withdrawn.

THE BIRKBECK BUILDING SOCIETY.—The sixteenth annual report of this society states that their undivided accumulated profits, after providing for all contingencies, amount to 25,490l. 16s. 1d., which equals a bonus of nearly 66 per cent. upon the total amount due to the shareholders. "During the last three years," says the report, "the profits realised are nearly three times the amount of the total profits of the first thirteen years. Under these favourable circumstances the Directors are enabled to declare upon all investing shares which have been in existence for ten complete years a further bonus at the rate of 85l. per cent. upon the three years' subscriptions which have become due and payable since the last triennial division of profits, thus showing a remarkable increase in comparison with the former allotments, the first division having been at the rate of 4l. per cent., the second 9l. per cent., the third 30l. per cent., the fourth 53l. per cent., and the fifth 85l. per cent., which gives an average of upwards of 36l. per cent. on the amount paid on completed shares of ten years' standing, in addition to the 5l. per cent. compound interest guaranteed by the rules."

VITAL STATISTICS OF SCOTLAND.—The Registrar-General has now completed ten years' detailed reports of births, marriages, and deaths in Scotland; and we have now, therefore, the means of ascertaining the vital statistics of the country more accurately than at any time since Scotland has been a nation. The annual birth-rate in the ten years, 1855—64 has averaged 3.47 per cent.; the marriage-rate, 0.689 per cent.; the death-rate, 2.135 per cent. The death-rate in England in the same period was 2.216 per cent. The lower mortality in Scotland is due, partly, at all events, to its smaller proportion of large towns. The annual death-rate in Glasgow in the ten years averaged 3.01 per cent. 91 per cent. of all the children born were illegitimate. In the same period the registers show only 6.4 per cent. illegitimate in England, but a considerable number of births escape registration in England, and it is assumed that the proportion of illegitimate children at birth is nearly the same in both countries. Owing to the Scottish law of legitimization by subsequent marriage of the parents, however, fewer persons in the population are illegitimate in Scotland than in England. In the five years 1855-59, 88.2 per cent. of the men who married and 76.5 per cent. of the women were able to sign their names in the parish register; in the five years 1860-64, 89.3 per cent. of the men and 78.1 per cent. of the women. These numbers are much above those of England.

THE METROPOLITAN BUILDINGS AND MANAGEMENT BILL.—On the motion of Mr. Tite, leave was given in the House of Commons to introduce a Bill to regulate the construction and use of buildings, and the formation of streets and of sewers and drains, in the metropolis, and for other purposes connected therewith. The Bill was afterwards read a first time.

FIFTY PHOTOGRAPHS AT ONCE.—Mr. Halsey, a Liverpool photographer, according to the *Albion*, after years of "hope deferred," has at last invented a machine by which he can simultaneously take fifty photographs of a person or object. As yet Mr. Halsey has only applied his discovery to the production of miniature cartes, about the size of postage-stamps, and which—gummed at the back—are very useful for placing on cards, letters, &c. The likenesses taken by the process, adds the *Albion*, are admirable in every respect.

DISCOVERY OF AN ANCIENT AMERICAN TOMB.—In Monroe county, Indiana, lately, as some workmen were digging a cellar, they struck a block of stone which disappeared with a dull thump. Investigation disclosed a chamber with a 6-ft. ceiling, and 18 ft. by 25 ft. within the walls, which are of solid newly-seamed stone-work. Ranged in rows, on rudely-constructed platforms, were twelve skeletons, each with tomahawk and arrow-heads at their sides, ear-rings and bracelets of solid silver lying where they dropped, and piles of what appeared to have been furs, in the centre of the platform, each pile crumbling to dust as soon as exposed to the light. A number of tools, made of copper, and hardened equal to the best cast-steel, were also unearthed.

FALL OF PART OF A TUNNEL AT ABERDEEN.—It was the intention of the Government inspector to go over the Demburn Junction Railway preparatory to its being opened for traffic in August; but on Sunday night, says last week's *Scotsman*, between seven and eight o'clock, about 26 ft. of the Maberly-street tunnel, Aberdeen, fell in, and the opening of the line is consequently delayed for some time. On Saturday the line was inspected by Mr. Inrosidie, and every part of the tunnel was considered by him quite satisfactory. During the night a heavy fall of rain occurred, and this, coupled with the fact of some springs of water from the west side mixing with the clay falling on the arch, caused it to give way and fall. About 400 cubic yards of rubbish lie in the tunnel.

A BEAN FEAST.—Sir: I beg to inform you that the annual bean feast of the *employés* of Messrs. Thorn & Co. took place on Saturday last, at the Gun Inn, Findon, Sussex, where there were covers laid for 200, presided over by Mr. P. Thorn, and the manager, Mr. J. Nadin, supported by several influential tradesmen and gentlemen of the surrounding district. The procession was headed by the brass band, numbering twenty-two, composed of Messrs. Thorn's *employés*. All kinds of old English sports were indulged in until dark, when a walk of about half a mile brought us to where the carriages were in waiting, and we regained our head-quarters at 10.30, without a dissentient voice or accident. Knowing your willingness to aid in recording evidences of friendly feeling between employers and employed, and being a twenty-one years' subscriber to your valuable paper, will be some excuse for my intrusion on your space.—R. V. C.

ANIMAL POISONS SUPPOSED TO BE ALLIED TO CHOLERA POISON.—In some experiments on the poison of the cobra di espella, which George B. Halford, M.D., Professor of Anatomy in the University of Melbourne, has been lately engaged in, he has discovered that when a person is mortally bitten by the cobra, molecules of living "germinal" matter are thrown into the blood and speedily grow into cells. These cells multiply so rapidly that in a few hours millions upon millions are produced at the expense of the oxygen absorbed into the blood during respiration; and hence the gradual decrease and ultimate extinction of combustion and chemical change in every other part of the body, followed by coldness, sleepiness, insensibility, slow breathing, and death. The professor adds to his account of the action of this powerful poison that he has many reasons for believing that the *matrices morbi* of cholera is a nearly allied animal poison, and that if this, on further examination, should prove to be the case, we may hope to know something definite of the poisons of hydrophobia, small-pox, scarlet fever, and, indeed, of all zymotic diseases.

THE SURVEYORSHIP OF ST. LUKE'S PARISH.—It has been resolved in appointing a new surveyor in the place of Mr. Christie, resigned, that the salary shall be 250*l.* a year, the surveyor giving his whole time to the parish and residing in it. Advertisements for candidates were ordered to be issued.

THE RATE OF MORTALITY.—The annual rate of mortality last week was 23 per 1,000 in London, 23 in Edinburgh, 23 in Dublin, 22 in Bristol, 21 in Birmingham, 27 in Liverpool, 34 in Manchester, 27 in Salford, 21 in Sheffield, 24 in Leeds, 20 in Hull, 26 in Newcastle-upon-Tyne, and 23 in Glasgow. The rate in Vienna was 23 per 1,000 during the week ending the 20th ult., when the mean temperature was 86° Fahrenheit higher than in the same week in London, where the rate was 21.

THE THAMES EMBANKMENT BILLS.—In consequence of the postponement of the second reading of the Wine and Coal Duties Bill till Monday next, and the lateness of the session, it is understood that the Thames Embankment (North Approaches) Bill, which was a Bill to authorise the making of several new streets between Whitehall and Waterloo Bridge, and altering others, and also the Thames Embankment (Chelsea) Bill, will not be proceeded with this session,—the funds for carrying out the above works being derivable from securities which would be available to the Commissioners of Works by the passing of the Wine and Coal Duties Bill.

THE NEW STRUCTURES AT STANHOPE-STREET GATE.—In the Commons a few days ago Lord Ebury asked upon whose responsibility the structures now in process of erection at Stanhope-street gate were being built, and whether the further progress of the works could be stayed until an expression of some competent opinion could be obtained in regard to them. The Duke of Buckingham replied that the structures in question were being erected under the direction of Mr. Penneborne, architect. The works were so far advanced that they could not be stayed. In consequence of the widening of Park-lane it had been deemed desirable to add another story to the lodges in question. Whether a hoarding could not be placed round them the duke could not say.

KENT ARCHEOLOGICAL SOCIETY.—The tenth annual meeting of this flourishing society has been held at Dartford. The chair was taken by Earl Amherst, the president. The Rev. T. P. Coates read the annual report, which spoke in suitable terms of the unexpected death of the late Marquis Camden. The finances of the society were represented as being in a flourishing state. The archaeologists then proceeded to examine the many objects of interest to be found in Dartford. The principal of these is the church, attributed by Dunkin, the historian of Kent, to the Saxon period, but in which there is abundance of work undoubtedly contemporary with Gundulph, who was not only one of the princes of the church but an architect of great taste and skill. Amongst the objects of interest in Dartford are some panel paintings in the Old Bull Inn. Some remarkable caves were visited in the plateau between the rivers Cray and Darenth, which Mr. Dunkin describes as the city of Casivelanun, or Caswallon, to which Cesar marched in his second invasion of Kent, and where the Romans were defeated. The archaeologists then proceeded in open carriages to the neighbouring village of Stone, where the Rev. F. W. Murray, the rector, acting as guide, pointed out all the interesting peculiarities of the church, lately restored by Mr. Street, architect. The party then returned to Dartford, where a banquet was prepared beneath a spacious marquee erected upon a lawn at the back of the Bull Hotel. The chair was taken by Sir W. Stirling. In the evening a number of papers were read in the Bull Assembly Rooms in relation to several places of local interest. Several excursions were arranged for the next day.

Atkinson Morley Convalescent Hospital, Wimbledon.—The contractors for this building are Messrs. J. Simpson & Son, Baker-street, Portman-square.

TO CORRESPONDENTS.

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

Advertisements cannot be received for the current week's issue later than THREE o'clock, p.m., on THURSDAY. The Publisher cannot be responsible for ORIGINAL TESTIMONIALS left at the Office in reply to Advertisements, and strongly recommends that COPIES ONLY should be sent.

The Builder.

VOL XXV.—No. 1279.

Town Drainage.

THE sodden ground of an undrained town breeds fever and malaria. Seldom is the wisdom of the authorities sufficient to enable them to foresee this. An epidemic comes upon them, and they cast about for a remedy, and use a great deal of chloride of lime—the best disinfectant of rotten organizations; call out the doctors to cure the infected persons; and get ready the machinery of burial.

The engineer is then called in, and he cuts up the ground in all directions to relieve it of the overcharged liquid refuse.

In the old days,—that is to say, before the time of the glorious

old Board of Health,—this work, when done at all, was done on a scale of magnitude, and vast sums of money were spent in providing receptacles which took down the filth from the surface to a few feet below it; and, for the most part, kept it there to still breed malaria, and send it up through the open street-gullies and open sinks in and about the houses. Was this an improvement? It is useless to inquire whether it was or not. There are now few if any towns absolutely undrained, and scarcely any so badly drained as most of them were before the time of about 1848. We find the more usual state of things now to be, that towns are drained more or less well under the advice and superintendence of their surveyors, who are for the most part competent engineers equal to the design and construction of any work that may arise. The town surveyors of England have not yet reached the climax of their glory, but they are working towards it. The day of their glory will be the day when one can live in a town with as much pleasure as in the open country, and with no more liability to disease.

The health of the people is the object of the town surveyor. It is not always that he has the advantage of having associated with him a medical officer of health, but whether he has or not his proper object remains the same, viz., the health of the people.

Some of our surveyors of towns and cities do not take a high view of their position, and are satisfied to follow in the wake of committees, and do anything or nothing as they may be instructed. This is unfortunate for any town subject to it, but the remedy for these evils will come when these gentlemen, who fail to appreciate their true position, are succeeded by better men.

The atmosphere is one great disseminator of health or of disease; and it is to the want of attention to the ventilation of the drains that the

want of success in many attempts to improve the health of towns is to be attributed. To leave the street gullies open is to poison the people in the streets. To leave the house-sinks untrapped is to bring poison into the houses. To ventilate the sewers by shafts over them in the streets is a clumsy and imperfect device; and to ventilate by means of the rain-water pipes is not much better, unless great care be exercised in selecting proper places. That the sewers and drains ought to be ventilated no one should deny. The decomposition of the animal and vegetable matter they receive cannot be prevented, and the gas into which these substances are converted will rise, and find outlets into the atmosphere. The higher temperature of a close sewer facilitates the formation of gases, and increases their quantity. To provide, then, a proper means of ventilation of the sewers and drains is a necessity. How is this to be best done? Various means have been proposed from time to time. At one time huge chimneys are to be built, but they are found to be impracticable for any good, for they would only draw up the air from the immediately surrounding area of very limited extent, and would by no means answer the purpose they would be intended for. To come at once to the point, the proper way of ventilating the sewers and drains seems to be to carry up a flue or pipe at the head of every house-drain, that being the highest point of the drainage. In building new houses, a flue of half a brick square should be carried up with and adjoining to, but quite independent of, the fire-flue, and be continued to the top of the chimney. In draining houses already built, a 4-inch pipe, which may be the common sort of rain-water piping, answers the purpose, and it should be carried up at the back of the fire-flue and to the top of the chimney. There are houses of such construction as to make this difficult, if not even impossible; but they are few and may be neglected.

Nearly every house in the town being thus provided with a ventilating flue or pipe for its own drains, and by thus providing for ventilation in detail, the whole system of sewers becomes ventilated, which is precisely what is wanted to make the work complete. The air that is breathed by men and animals is drawn from a space limited to about 6 ft. vertical height from the ground in the daytime, and to a height at all other times less than the height of the chimney. It is this clearing of the lower 6-feet space of noxious effluvia from sewers that renders a town healthy. The gas that is most injurious to health is lighter than common air, and will continue to ascend when conducted to the top of the chimney, and will not descend again to the ground. In considering the effect of this system of ventilation it will be seen that the means taken to conduct away the foul air of the sewers renders the production of the foul air itself almost impossible; for, to feed these numerous ventilating pipes, there must enter the sewers a supply of atmospheric air, which reduces the temperature within the sewers and drains, and so checks the formation of gases. And instead now of the gullies being trapped to prevent the escape of sewer gases into the streets, they must be left open to supply fresh air to the sewers, which ascends the tall ventilating pipes by the law of motion of fluids. This is the consummation devoutly to be wished. The expense of building in the wall such a flue as has been described is very small; and the cutting off of a corner of a cupboard, or other space adjoining the fireplace where the wall is thinly built, as is usual in cottage houses, is of no great moment or injury to the convenience of the tenant, while the benefit to the health of the people is immense. And where houses are already built before they are drained, the carrying up of such a pipe as has been described need not cost more

than 20s. per house. Not so much on the average, because the practice is frequently to drain half a dozen houses by one drain of, say, 6 in. diameter, and in these cases it is sufficient to carry up one flue; or one pipe, at the head of the drain.

In one town that has been drained on these principles, the cost has not exceeded 10s. per house, and the results are the reduction of the mortality from zymotic diseases to the extent of 50 per cent. of the population during the last five years, since the drainage works were completed, compared with a period of ten years immediately preceding that time. Another town is now being drained on the same principles, and a like benefit is anticipated. The reduction of the death-rate is not the only advantage of good drainage. The reduction of the number of days of sickness of the people is of vast calculable advantage. It is easy, by going thoroughly into the statistics, and taking the numbers sick that accompany one death, and the duration of their sickness in the one case and in the other, to show an absolute saving to the community, when the people can go about their work without being made ill by it, and can return home at night and stay there until morning without being made worse by the inhalation of a poisonous atmosphere. The owners of house property are directly interested in these things in a pecuniary way; for if the man and his family are made sick, the one cannot work, and the others become a burden. Soon he finds he cannot pay his rent, and goes to another house, of lower rent, that he may perhaps be able to pay; but he does not rest there, and the pursuit of the inquiry what becomes of him and his family is too painful to be contemplated, and, indeed, is sufficiently obvious. It is more to the purpose to show a positive benefit to the prosperity of a well-drained town, and this is proved by past experience, and is in the course of proof at the present time. The results of one town were given in the *Builder* not many months since. But it is not necessary to wait for a multiplicity of proof in such a case as this, where all that is advocated is as agreeable to common sense as it is to physical law.

The cost of these ventilating flues and pipes falls properly on the owners of the houses, each owner ventilating his own drains, and so by degrees the whole town becomes healthy. This necessity of ventilation is the thing most commonly overlooked, and therefore it is here mentioned in the first place; but there is another thing very necessary to be attended to in laying drains, and which is but too often neglected, and it is that the joints of the pipes, or of the brick-work, as the case may be, should be made *water-tight*. This is necessary both for preventing the escape of liquids from the drains, and for preventing the admission of land-water into them; for in the former case, the escape of the liquids prevents the solids being carried forward towards the outfall, besides contaminating the surrounding soil; and in the latter case the drains become surcharged with mere water.

In dealing with the sewage, the less superfluous liquid there is to be dealt with the better. Therefore, make the joints of all drains and sewers *water-tight*. Clay is the best of all materials for this purpose. It is quite as invulnerable to the passage of water as cement; and it is more easily removed when junctions are required to be made with the drains or sewers.

The fall that should be given to drains has often been overrated. The absolute quantity of water or sewage that has to pass through them is small, comparatively, with the dimensions and falls often given to them. It is seldom that a house-drain, even when it drains a number of houses, requires to be more than 6 in. diameter, or to have more fall than 1 in 120.

The joints and the direction of the drain, and its form of junction with the sewer, these are

more important to be considered, because more liable to be overlooked as secondary, whereas they are of the first importance. The direction of the drain should be the nearest way to the sewer, turning all angles with bend pipes of about 3 ft. radius, and laying the intermediate lengths straight; instead of following the bad practice of trying to make long curves with straight pipes, and leaving every joint open on the outside of the curve, whereby obstruction is offered and accumulation is promoted. Besides, the shorter the distance the greater the fall *pro rata*.

Another important thing is that the kitchen sinks should not communicate directly with the drains; but the pipe from them should be carried through the wall, and empty into a trap outside the house, from which the water should pass into the drains. In other words, a drain should never terminate inside a house.

With this trap outside, as with street gullies and other openings at the ground level, where an efficient system of ventilation is provided, it becomes unnecessary to trap it; and, indeed, it is better that it and they should not be trapped, but that the refuse from the kitchen sinks should all pass into the drains,—the solids with the liquids,—and be all carried away to the outfall instead of clogging up the traps, and being, as all traps are, a constant trouble to the tenants to clean them out. But it is only with a thorough system of ventilation that this becomes practicable.

In carrying out the system of ventilation that has been described, it has not been without difficulty that the prejudices of the architects and builders have been overcome in favour of the system of providing a flue or pipe to the head of every house-drain. The objections have been sometimes ingenious, and it may be well to state some of them. The first was, that the sewer air would be taken up to the bedroom windows, and blown into them. The answer to this is, that, to begin with, ventilation is necessary, and has always been admitted to be so; and then that the attempts first made to accomplish it were either to leave every opening into the drains untrapped, and so diffuse the sewer air all over the town, or to trap the house-drains and leave the street-gullies open, or to trap these too, and carry up a ventilating-shaft in the middle of the street, with or without charcoal-boxes; or, further, to ventilate the sewers and drains by the down pipes from the roofs. This latter system, indiscriminately carried out, does convey the sewer air to a too close proximity to the bedroom windows, and even where great care is taken to omit such down pipes as lead up close to the windows, yet the system must be allowed to be imperfect; for, besides the risk of contamination of the air drawn into open bedroom windows, these pipes do not in general enter the head of the drain, and so do not lead away the air from the higher parts of it, where it accumulates. The improvement, therefore, seems to suggest itself that a flue or pipe shall be taken up near the fireplace for the purpose of increasing its temperature, and, therefore, power of ventilation, and be continued to the highest practicable part of the building. The house-drain is easily connected with this flue or pipe by an earthenware pipe underground.

Another objection has been attempted to the effect that as all houses are not of the same height the higher ones will do more than their share of duty by reason of their greater power of ventilation. Well, this would be no great harm if it did occur, but in reality the quantity of air passing up any flue or pipe is capable of being regulated by its size. In practice, however, these small objections may be disregarded. It is satisfactory to know that the system is being recognised and carried out.

A COUNTRY HOSPITAL FOR MANCHESTER.—Of 16,000 children born annually in Manchester and Salford, 8,000 die prematurely. The stress upon the children's hospitals of the town is excessive. A successful effort has been made towards building a country hospital in connexion with the General Hospital and Dispensary, for sick children of Manchester. A receiving-house will be retained in the city, of which the estimated cost is 3,000l.; and a hospital will be erected in the country, containing three detached wards of twenty-six beds each, on the Pavilion system, with a central house for domestic and administrative purposes. This will cost 12,000l. Nearly 10,000l. have already been subscribed.

BRITISH ARCHAEOLOGICAL ASSOCIATION AT LUDLOW.

In the course of the address with which the Congress on the 29th ult. was inaugurated, Sir Charles Ross Broughton, bart., as president, referred to the local historians of the district, citing the names of men living and dead, who had contributed to illustrate and elucidate that history—the late Mr. Botfield, who so long represented Ludlow in Parliament, Mr. Wright, Mr. Dukes, Mr. Pigeon, Archdeacon Owen, Mr. Blakeney, Mr. R. Anderson, Mr. Nightingale, and a host of other Shropshire worthies. He might remind them, he continued, that it was in that neighbourhood, at Berrington, near Shrewsbury, that an individual was born in the reign of Charles I.,—that old, old, very old man, Thomas Parr. He proposed to say nothing to them that evening of all the ancient remains in that locality—the British earthwork, the Druidical remains, the Roman camp and town, the Norman abbey, the Plantagenet castles—with which that part of the country was so thickly studded; but he trusted his archaeological friends would bear with him if for a moment he reminded them of how much interest lay at their very feet. If they would learn all that was known of the early history of Ludlow and the solitary time the inhabitants must have led, they could consult no better authority than Wright's "History." Others had chronicled the subsequent feuds in which their castle was engaged, and how different great men were alternately lords of the castle and inmates of its dungeons. It was here probably that the great victories of Mortimer's Cross, Wigton, Barnet, and Towkesbury were planned, and here probably the forces were rallied after the great defeats of Ludford, Wakefield, St. Alban's, and others. But it was not only as a stronghold of war that Ludlow Castle appealed to their sympathies, but after these tribulations had passed it became the chosen residence of royalty. Could those old walls speak, how many a story of the courtly revelries of the princes of York might they not unfold; how much of misery saddest scene of all was presented, when the funeral cortège departed from those gates with the remains of Prince Arthur for their last long home under Worcester Cathedral, after a short period of happiness in wedded life with the lovely Katherine of Aragon. Then again, it was here that the lofty intellect of Milton first drew attention in his "Comus;" and here Butler's satirical pen was wielded. Passing over the Government of Sir Henry Sidney they came to the time when, stripped of its roof, the old border rallying-place of centuries, the castle became the ruin it now was. If they would gather something from these antiquarian reminiscences, they might ask themselves how careful the thought ought to make them when they reflected that the men, were that quietly viewed the destruction of Ludlow Castle, and how anxious they should be that posterity should not pass on them the same verdict as we did on those before us. Those days which saw the ruin of this fortress were not the days of what was called a barbarous age, but were the days when Swift and Congreve lashed the most prominent of our national vices. They were the days when the *Spectator* and the *Tatler* charmed our forefathers with the wit of Steele and Addison,—the days when Bolingbroke, Pope, Arbuthnot, and others gave to the world a literature which is still among our most cherished possessions. If, then, there was much to cause them to mix regret with pleasure in viewing Ludlow Castle, he was glad to say no such mingled feelings need be entertained with respect to Ludlow Church. Sir Charles briefly sketched a history of the church, which he said had gone through three periods,—a period of splendour, a partial eclipse, and a perfect revival. He then referred to other ancient remains in the town,—the old town walls, and one of the original gateways still standing, the sites of two priories, and half-timbered gabled houses, and acknowledged the invitations received from the wick, Lady Mary Clive, and Mr. Knight, of Downton, to visit Oakley Park, Burford, Downton Castle, &c. He should also himself have pleasure in receiving the corporation at Downton Hall, though he had not much of antiquarian interest to show them, for they knew that old stones must not be moved if they wished them to retain their moss, and his family had its foundation on a Warwickshire soil.

In the evening of Tuesday, after visiting various places and an entertainment at the president's,

Mr. E. Roberts, F.S.A., gave an account of the day's excursion to Bitterley Church, Middleton Chapel, Titterstone Clew Hill, and Downton Hall; after which

Mr. R. Kyrke Penson, F.S.A., read a paper on "Ludlow Church," taking as a fact that in 1199 the then existing Norman church was taken down and enlarged, and that the early English church, exclusive of the side chapels, coincided in extent with the present building.

The Chairman then called upon Mr. Thomas Wright for his remarks and extracts, upon early churchwardens' accounts.

Mr. Wright said they were no doubt aware that the corporation of Ludlow possessed a collection of records which contained a very considerable number of documents of the greatest interest, not only to the town of Ludlow but to the country generally, because they threw much light on the history of past ages. It was his original intention to give them a full report upon those records; but, unfortunately, some delay had been caused by their removal to a place where he could more conveniently examine them, and some of the papers had got disarranged, and he was sorry to say that this had obliged him to postpone what he intended to do. On some future occasion, however, he hoped to be able to complete his report, and to lay it before them in full. In the meantime he had chosen from among the records one remarkable document, containing the churchwardens' accounts for a period earlier than any other document with which he was acquainted at present. It began in 1540, and extended to 1607, and it contained entries of a very interesting kind, almost, he might say, of an exceptional kind. He was not well acquainted with the details of the history of Ludlow Church at its early period; but he was rather inclined to think that it originally belonged to the Guild of Palmers, or, at any rate, that they were in some way connected with it. After the dissolution of the guild—indeed, before it was altogether dissolved—the corporation had great power over it, and the churchwardens' accounts appeared to have got into the hands of the corporation, where the documents now under notice had been preserved. Partly for these reasons, perhaps, there were items of expenditure in these accounts which were not usually found in accounts of this description; but that they might more fully understand their nature, he would read some extracts from them. Mr. Wright then read several extracts: among the most interesting were these:—

Richard Langford and Wm. Bacon (or Bacon) churchwardens. 31 Henry 8th 1540.

Item, paid to Philip Fryer and Mathew Buchlermaster for draynage of the vryn and malynge of the stappels *vjd.*

Item, paid his sonne [Thomas Farves] for whippage dogges out of the church *vijd.*

Robert Aldier and Richard Lane, 1544, churchwardens.

"The work upon the church is full and curious: continual mending and making of door keys to church or to different parts of it."

Holl' ap Rees and John Glee, 1545.

Item, to the Belmon for malyngs cline of the church, *vijd.*

Item, paid for redynge the church of stonyes, *vjd.*

Item, paid for mendinge of our Lady bedchamber, *vjd.*

Item, paid for a loke to the clocke dore, *vjd.*

Item, to Sir Nichd. Cupper in a reward a pair of gloves, price *vjd.*

Item, for mennyng of the window in Saint Margretes chancelle, and for pargetynge the leades to Thomas Season, *ixs. vijd.*

William Roke and Thomas Coxe, 1549, churchwardens.

"The receipts become this year a very important article of the accounts, for they arose from the sale of the objects of Romish superstition, and we learn not only the appearance which the interior of our church must have presented before the Reformation, but the manner in which these superstitious objects were distributed for sale."

Antony Atkinson and Edward Cuper, 1550.

Item, to Thomas Season for gowinge up into the stiple *vjd.* wyndy ngyhtes to save the glasse ther in the wyndows, *2d.*

Item, to the said Thomas for ix. fote of new glasse to the west wyndow in the stiple, *vjs.*

Mr. Wright went on to say that the early history of pews was exceedingly obscure, and the accounts usually given were confused and inaccurate. Then the article in the *Penny Cyclopaedia*, which was supposed to have been carefully compiled, informed them that "there were no pews in churches until about the period of the Reformation, prior to which the seats were movable, such as chairs and benches as we see at this time in the Roman Catholic churches on the Continent. Before that time no cases are to be found of claims to pews." The extracts he had read from the churchwardens' accounts of

Ludlow were sufficient to show the inaccuracy of this statement. But he had another proof of the antiquity of the use of the pew. In the English "Mort d'Arthur" of Sir Thomas Malory, printed by Caxton, one of the monks of the hermits, Galahad, arrived at the monastery, and, says the text,—"On the morn he had his masse, and in the monastery he fonde a preeste rely at the altar. And on the ryght syde he sawe a pewe cloyd with yron." This, no doubt, was a closed pew. He was inclined to think the word "pew" was not of foreign origin, but that it had been some English word of popular formation.

A short discussion followed, in the course of which the Rev. Sir F. A. G. Onseley expressed a hope that further search would be made in these records for entries relating to organs, organ building, and organ players.

On Wednesday the meeting-place was the Castle, where the members mustered well. Mr. T. Wright, stationed on a bench surrounding a tree, gave a brief outline of the history of the castle, tracing the memorable events connected with it from the time of its being built, in the reign of William the Conqueror. The castle was then explored, and the party afterwards proceeded to Ludlow Church, over which they were conducted by Mr. Gordon Hills and Mr. Roberts, in the absence of Mr. Penson. An adjournment then took place to the Feathers to luncheon, to which the Association had been invited by the Mayor and Corporation of Ludlow. The tables were laid for 200 guests, and every seat was occupied. The ex-mayor presided. After toasts, preparations were made for proceeding to Ludford, when the "house" was kindly thrown open by Major Ogle, who described the many objects of interest there. A movement was then made to Ludford Church, which was inspected, and then onward to Whitton Court, over which the Association was shown by the Rev. C. Whiteford. The last place visited this day was Ashford Court, where some interesting old books were shown by Mr. Hall, who also provided refreshments.

At the evening meeting, papers were read by Mr. Levin, M.A., on the "Barony of Burford," and by the Rev. J. De La Touche, F.S.A., on "Stokestry Castle," a small castle now disused on the banks of the river Onney, about four miles from Ludlow. He traced its history from about 1200. In 1291 a licence was granted to Laurence de Ludlow to crenellate his house, to guard it against the Welsh marauders. The castle has not been very famous in history. In 1790 it was the resting-place for a night of the Bishop of Hereford. The bishop appeared to have purchased food for himself. Ten generations of the De Ludlows held possession of the castle down to 1497, when a female descendant married one Vernon, and the property remained in the Vernon family down to 1616: eventually it came to the Cravens.

On Thursday the excursion was by road through Ludford, Woolferton, Ashford, &c., to Little Hereford; thence to Bushford, and so on to Tenbury. The first halting-place was at Little Hereford, where there is a quaint old church close to the river-Teme. Mr. Roberts was the guide to the party, and described the archaeological features of the church. The party, after spending a short time at Little Hereford Church, resumed their carriages, and proceeded to Burford, where they were conducted over the mansion and church.

The party next wended their way to Tenbury, where, at the Swan Hotel, Lord Northwick (who was detained in London by Parliamentary duties) had ordered to be prepared for the travellers a most hospitable reception. The church was visited, as was an Oriental collection at Sir F. Gore Onseley's. At Burford Church, previously examined,—

Mr. Roberts said that, with the exception of the monuments in the church, there was not much of particular interest. Mr. Levin had stated that the church existed at a very early period prior to Domesday, and had two priests; but that after Domesday it was not mentioned until 1253, and then it was held in three portions. There were three churches or chapels. The monuments were restored in 1848, and repaired, according to the accounts given by Dineley. However much they might regret that they did not see the monuments with the portions of their original colours, it must be acknowledged that there had been a very considerable amount of zeal exhibited by the incumbent in the restoration, but he (Mr. Roberts), as an archaeologist, would rather that they had been untouched. The chancel, he had been informed, was supposed to be Anglo-Saxon, but

as far as he could see, there was nothing of the kind. They could not tell without excavations what the foundations might be, but there certainly was a church there before the Conquest. It was supposed besides, that the church was shortened at the east end and the west wall cut through, and a new arch inserted in the nave at the latter date, probably just before the Reformation. The registers commenced in 1569, and were carried on to 1676.

The Rev. J. W. Joyce then proceeded to describe the monuments. He said that those which would afford them the greatest interest were those of Lady Elizabeth of Lancaster, who was laid under the north window, and a small monument under which the heart of one of the Cornwalls was buried. Elizabeth of Lancaster, daughter of John of Gannet, was first married to the Duke of Exeter, who was beheaded at Cirencester, for rebellion against Henry IV. She afterwards married Green Cornwall (so called because he was born at sea), afterwards Lord Faulhope, who distinguished himself very much at Agincourt, and afterwards at a tournament, where he won great praise. Mr. Joyce, replying to the expressions of regret which had fallen from Mr. Roberts, that the monuments should have been touched, said that if nothing had been done to them the archaeologists would have found them covered with whitewash, and the effigies covered with very thick coarse red paint. Through the advantage of the Dineley MSS. they had been enabled to restore them to their original painting. Then there was the Baron Burford, Edmund Cornwall, a man of great stature, 7 ft. 3 in., whose walking-stick would be shown them presently. They next came to a little monument, or rather stone, with a hole in it, in which the heart of one of the Cornwalls was buried, who died at Cologne, and willed that his heart should be sent to his native soil. Above this tomb was the inscription,—

"O Lord, my contrite heart is meek,
Do not refuse, I thee beseech."

And also the following verse:—

"O God, my soul I do bequeath, to rest in heaven his,
And there my corpse to be interred where I shall hap
to die;
My heart unto my native soil for burial I betake,
My faith unto my friends I yield,—this is the will I
make."

At the evening meeting in Ludlow, Mr. Gordon Hills read a communication, which he had just received from Mr. Jackson, of Leintwardine, respecting a discovery that had been made in some fields at Broadwood Hall, Creighton, near Leintwardine. There had been some draining and well-sinking going on there; and the workmen, in sinking one of these wells, had come upon a mass of spear-heads, some being very perfect, and others oxidized and welded together by the effects of wet. Some of these masses weighed as much as 1 cwt. A jar was also found, but, unfortunately, was broken; some of the fragments, however, were saved. These remains were found at a depth of 7 ft. from the surface. There were 3 ft. or 4 ft. of soil, and the rest was clay, except some gravel on which the spear-heads were lying. The writer said it appeared to him that the place was originally a morass, and the animals had been entrapped in it; for a great number of bones of animals were found, and among them quantities of teeth, apparently of large animals, probably some of them horses' teeth.

The Rev. W. Perton gave a description of an ancient and originally Saxon church at Stottesdon, near Cleobury-Mortimer, which was illustrated by drawings. The font was a fine specimen of a Norman font, with bold carvings upon it. Some coats of arms in the windows were referred to in one of the Harleian MSS. In 1840 the church was restored, when the beautiful rood-screen was pulled down, and most of it used for firewood, and a "three-story pagoda" was built for the parson and clerk; but a few fragments of the original rood-screen had been rescued, from which he hoped to be able to restore the whole.

Mr. Dillon Croker read a paper on Milton's "Masque of Comus," which was performed in Ludlow Castle in 1634. After reviewing the origin of this form of entertainment, of which "Comus" may be considered the most important, he glanced at the literary history of the work of Milton, tracing in certain passages of it a likeness to the writings of Chaucer, Spenser (in his "Faerie Queen"), Shakespeare (notably in the "Tempest"), and other authors; and in the plot a striking resemblance to a scarce old play by George Peele, called "The Old Wives' Tale"

(1645). The incidents were so similar that he thought there was much reason to believe that the old drama may have furnished Milton with the idea and plan of "Comus." Again, from Fletcher's "Faithful Shepherdess," and from Browne's "Inner Temple Masque," it was thought Milton might have taken some hints. But to whatever extent Milton might have been indebted, either to the ancient writers or to those of his own time, it could not be questioned that he had interwoven many new allusions and refined sentiments. The story, for which OIdys was the earliest known authority, was that Lord Brackley, then aged twelve (who performed the part of the older brother, and who was the eldest surviving son of the Earl of Bridgewater), accompanied by the Hon. Thomas Egerton (who enacted the second brother), with their sister, the Lady Alice (who could not have been at that time more than thirteen, and who acted the lady), were on their way to Ludlow from the house of some relatives in Herefordshire, when they rested on their journey and were benighted in Hayward Forest, and the incident (the Lady Alice having been even lost for a short time) furnished, it was thought, the subject of "Comus," as the Michaelmas festivity which was acted in the great hall of the castle, the occasion being the installation of the earl as president over the March of Wales, to which office he was nominated. The early edition, a small quarto of 35 pp., was simply entitled "A Masque presented at Ludlow Castle, 1634, on Michaelmas Night, before the Right Honourable John Earl of Bridgewater, Viscount Brackley, Lord President of Wales, and one of his Majesty's most Honourable Privy Counsell, &c., London. Printed for Humphrey Robinson, at the signe of the Three Pigeons, in Paul's Church-yard, 1637." The "Masque" did not bear Milton's name until 1645. Between 1637 and 1797 as many as twenty-seven editions have been enumerated, and it is presumed that others existed. Entertainments of this kind having been discouraged, "Comus" was the delight of comparatively few until 1738, when it was produced at Drury-lane Theatre, divided into three acts, and adapted to the stage by Dr. Dalton, prebendary of Worcester, Lawes's music being rejected, and new accompaniments composed for the occasion by Dr. Arne. It was subsequently (1773) reduced into two acts by George Colman, and performed at Covent-garden; since which period it has been repeatedly presented on the stage, and was revived as recently as two years ago, at Drury-lane. In 1760 it was acted and published for the benefit of Milton's granddaughter, who kept a chandler's shop, an occasional program being written by Dr. Johnson, and spoken by Garrick. It was surmised that Milton produced "Comus" under his father's roof, at Horton, near Colnbrook, in Buckinghamshire (Milton was then twenty-six years of age). The poet went to reside at Horton after leaving Cambridge, his father having retired there on a competent fortune, and holding his house under the Earl of Bridgewater. There was no evidence to prove that Milton was ever present at Ludlow Castle during the representation of his work, though it was thought that the general theme of Milton's poem was chosen to rebuke the excesses of the inhabitants of that town.

Mr. Cocking read some remarks on the remains of the Austin Friars at Ludlow, which were accidentally discovered when digging on the site of the present cattle-market, in 1861. At that time Mr. Cocking was mayor of Ludlow, and fortunately being an archaeologist, the accidental opening of some of the foundations attracted his attention; a subscription was got up, and the whole of the foundations were uncovered, and having been accurately measured and drawn, were again covered over, and the cattle-market is now carried on over part of their site. At that time the existence of any such buildings was forgotten, though there was a street close to it called Friars-lane. The different offices were all clearly traced,—the friary, and of the tower, nave, aisle, chancel, and apartments of friars and servants, refectory, &c.

On Friday evening the Rev. G. F. Townsend discoursed on "Medieval Instruments of Torture." Mr. Townsend's remarks had especial reference to certain instruments of popular punishment that had been preserved at Leominster and Ludlow. He proceeded to describe the "mortar," the "cucking-stool," and the "brank." The mortar was a wooden utensil, made something in the fashion of an ordinary pail or bucket, which was used as occasion required. It was carried by the offender, or by a

beadle accompanying him, or a constable ringing a bell, the different processes being meant to effect the same end,—the provoking towards the culprit the laughter, ridicule, or contempt of the bystanders. The causes of a resort to this punishment were the offences of the tongue. As late as 1637, Boys, in his History of Sandwich, related that a woman was compelled by the magistrates to convey the mortar through the town hanging on the handle of a broom. After referring to the learned authorities on this subject, he described the cucking-stool. The original use of this instrument was in later years accompanied by immersion in water, and in process of time the name was changed to "ducking-stool." This mode of punishment held its place among the most acknowledged punishments of this country. He had fallen in with a gentleman (Dr. Walker) who remembered seeing it used at Leominster, about 1809, on a woman named Jenny Pipes. He next came to the branks. This instrument was closely allied in its motive and purpose to the two other engines that had been described. It was, however, a much more cruel and severe punishment, and was, he feared, more common. Mr. Jewett counted up thirteen examples in Cheshire. Lancaster had only five, and that was the number found in many other counties. It was thus constructed:—The foundation was an iron collar, which fastened round the neck with a sort of hinge. Where this collar would touch the centre of the nape of the neck, another iron bar rose with a slope forward, extending to about the centre of the forehead, where it was fastened by a hinge to another bar, which passed across the nose, and was fitted with a gag, which, when the descending bar was fastened into the collar in front, pressed upon the tongue and caused exquisite torture. Another cruel instrument in the Ludlow Museum appeared to have been intended to dislocate the arm and to cramp and crush the fingers at the same time. He concluded by some remarks on the question how far our public law admitted the use of torture, and came to the conclusion that, although the letter of the law forbade it, the practice of the law permitted it. In the instructions to Sir Philip Sydney, among the records of Ludlow, was an authority to the Lord President and Council, to "put any person accused or suspected of any treason, murder, or felony to torture when they shall think convenient." There was, therefore, a direct commission to torture, and these instruments might or might not have been used for this purpose.

Mr. G. R. Wright, F.S.A., next read a paper "On Sir Philip Sydney in his relation with Ludlow Castle," which, in reference to one portion of it, wherein he referred to the character of the Earl of Leicester, led to a lively discussion. The Chairman (Mr. Hills) observed that the memory of the Earl of Leicester had no doubt suffered from the way in which it had been handled by Sir Walter Scott; in his "Kenilworth" but he thought that Mr. Pettigrew, at the Newbury congress, had relieved his memory from the murder of Amy Robsart.

Mr. L. vien protested against the apotheosis of scamps. He thought Mr. Pettigrew had vindicated the character of Leicester as to his treatment of Amy Robsart. They knew he could also write fine letters; but they all knew what was said about "fine words" and the "battering" of parsnips, and he thought public records showed that he had been a designing, cold-hearted, and cold-blooded man, and, though he might have had one or two flukes, that could never vindicate him from the charge of being a thorough scamp.

Mr. Blaskell made some remarks on certain figures, carved upside down on the lintel of Stottesdon Church: various theories were advanced as to the origin of such reversed figures, which appeared in more places than one.

Mr. Goldsmid, F.S.A., observed that shields were reversed in the case of the last of a family, and also as a mark of disgrace.

On Saturday, Stanton Lacy and Diddlebury Churches were visited; and at Stokesay Castle the Rev. J. D. La Touche pointed out its interesting features, which he had already described in a paper read on Wednesday night. Bromfield Church and Abbey were subsequently examined, and Lady Mary Clive entertained the party at Oakley Park.

In the evening, on the return of the Association to Ludlow, short papers were read by the Rev. Prebendary H. M. Scarth, "On Roman Itineraries connected with Wales;" and by Mr. T. Blaskell, "On the Half-timbered Houses of Ludlow."

THE BEECH.*

THE beech (*Fagus sylvatica*), if it be not the most magnificent of all British trees, certainly rivals the oak itself in size and majestic beauty; a grove of stately well-grown beeches on chalky loam is at once graceful and grand; the effect on the spectator is thoroughly awe-inspiring; the massive, smooth, upright fasciated trunks, and the far-spreading groin-like branches call to mind some huge cathedral nave; the trunks are pier-like, massive, bossed, and channelled; the branches like arches interlacing, curving, and entangling; and the roots moulded, curled, grotesque, and snaky, help to complete a scene of the most impressive character. The body of the tree is frequently stained of a vivid grass-green, produced by the growth of a parasitic lichen, the beauty of which is enhanced on a summer's day by the bands of pure gold projected on the limbs where the straggling sunbeams find a temporary passage through the dense umbrage above.

In the silent groves and avenues of beeches no sound is heard except the gentle moving of the foliage overhead, or the sharp crackling of last year's leaves underfoot; the fleet squirrel is frequently seen climbing the trees or flying from branch to branch, but it seldom disturbs the silence.

The value of the wood for building purposes is by no means equal to the beauty of the tree; for whether in a living state and full of sap, felled for use, or dried and made up into furniture, beech-wood is invariably riddled by a parasitic worm: this is one of the principal reasons why the wood is seldom or never used for floors and roofs. The wood, whilst apparently sound externally, is frequently rotten within, for on sawing up sound-looking but diseased or damaged beech furniture, the interior is commonly found to be one mass of decay, produced by the tunnelling of these worms; the same may be said of the tree in a living state, for sometimes the first storms of autumn will snap off at the root beeches that were apparently hearty, but really in a state of decay; owing to this and other causes, such as the rapid growth of the mycelium of fungi, large branches of this tree (as indeed of the elm) will frequently suddenly snap off without warning, and doubtless gave rise to the singular superstitions of bygone times. The beech, however, cannot bear the loss of branches like the elm, as it is very sensible to any damage; but the elm, as is well known, will bear any amount of lopping, and when the head and every branch has been cut off will sprout out as cheerfully as ever.

The wood of the beech, when green and sound, is singularly hard, and if used for purposes which require its immersion in water, it is perhaps second to no other British tree; but an enormous quantity of beech is used for making bedsteads, chairs, packing-cases, and furniture in general; it is used for the bottoms of vessels; carriage-makers use it a little, and sometimes gun-stocks and cannon-carriages are made of it. But amongst timber trees it occupies a very low place. Some years ago a French process was brought forward, for the purpose of indurating beech-wood, and making it equal to oak; but as nothing has been heard of it for a long time, it probably did not answer the expectations that were raised on its behalf. If the wood, however, be simply treated with corrosive sublimate, much will be done to preserve it both from insects and decay. It is a favourite fuel in some parts of Europe, and is now used to a great extent in this country, and admired for the glowing heat and agreeable odour which it emits. A well-grown beech is hardsome and attractive in every way, it presents so many peculiarities, and is often so grotesque in its form and habits. Sometimes five, six, or seven trunks will become confluent at the base; at other times two or three trees will embrace, entwine, and entangle their main bodies and branches in the most fantastic manner. We have seen many instances of both these vagaries in Epping Forest, where there are a number of magnificent beeches still left. In one place there is a beech and an oak growing so closely together as to look like one tree: the gnarled roots of the two are twisted together like Celtic knot-work: about 6 ft. from the ground the beech trunk suddenly opens and embraces the rugged oak, the foliage above being mingled in the most singular manner. No

one who has once seen a beech can have failed to remark the singular hemispherical bosses on the trunk; sometimes they are no larger than a very small nut; at other times they reach the size of a large orange. This singular growth is produced by the puncture of an insect. Occasionally beeches are afflicted with growths which resemble immense semi-globular tumours, attaining a gigantic size (sometimes 5 ft. or 6 ft. in diameter). These curious growths have caused one of the Burnham beeches to assume the form of a gigantic female torso, the curves of the breasts and body being unsurprisingly life-like and perfect. The roots, too, of beeches are frequently exposed, or appear to lift themselves out of the ground; they writhe, intertwine, and curve like pythons. The bark is very characteristic, generally smooth, of a cold grey colour, like plate-armour; and as it is easily incised, it usually bears the mark of the genus *homo*. But there is another inscription common on beech-trees, far more delicate and beautiful than ever Orlando carved to his Rosalind. It looks like a magic incantation from the realms of Fairyland, but is known to science as *Opegrapha scripta*,—"written lichen." It consists of a delicate white membrane (like fairy-paper), spreading over the beech trunks, and covered with small black characters, closely resembling the arrow-head inscriptions of the Assyrian sculptures.

The leaves of the beech are noticeable in many ways. The two sides are not shaped exactly alike, owing to the way in which they are folded in the bud. They are strongly marked with parallel ribs, running from the mid rib at an angle of forty-five degrees. The leaf entirely depends on this feature for its ornamental character. In the spring the beech-tree puts forth its flowers. The sexes are separated, the female flowers being on the upper part of the tree, and erect, and the male situated on the lower portions of the tree, and pendulous; the tree, therefore, would seldom fruit, unless aided by some external agency, such as that of insects carrying the fertilising element from one flower to the other, &c. When autumn has once set in, these leaves speedily change from a bright green to a brilliant yellow colour, which they retain for some weeks,—indeed, till the first frosts of winter have fairly set in, when the leaves fall in showers of gold. It is at this time that beechen groves present the most interest and perhaps the most beauty. No animals will browse on the foliage of the beech, and it is very rare to find any plant growing amongst the leaves and debris. This is partly owing, perhaps, to the persistence of the fallen leaves, as it is long before they decay, remaining crisp as they do from one year's end to the other. Many country folks stuff their beds with dry beech-leaves in place of feathers, and they are highly approved by many.

Every one knows the fruit of the beech in the four-valved beech-nuts, or beech-mast, as it is called, and the oily kernel of doubtful quality. With the exception of a few cryptogam plants, nothing will vegetate on this beech-mast. Beech avenues are generally quite devoid of all undergrowth. Several very pretty agarics grow upon and are peculiar to beech-nuts; and an account has recently been published of how a gentleman found a number of beech-nuts in a stream, apparently endowed with life and moving to and fro. The mystery was explained by finding that a colony of caddis-worms had secured the old shells for habitations, and were going higher and thither in search of prey, with their houses on their backs. The young beech-plants that spring from the fallen fruit, after putting up three or four leaves, perish in the struggle for existence.

One can never visit the Architectural Exhibition, or the architectural room of the Royal Academy, without observing certain trees with deep purple brown foliage, introduced as follies to other trees in the foreground of the coloured perspective drawings: this tree does or should represent the curious black or purple beech; it has not been long known, and is much more common in shrubberies now than it was some years since, often in company with intermediate varieties of every shade between green and deep purple, sometimes the leaves are almost yellow or sienna, and at others full bronze. This object must not be confounded with young yews and cypresses common in church and cemetery chapel foregrounds. The artist, or designer, in search of animal life will find no lack of it where beech trees grow; although, with the exception of a few moths, comparatively few insects are to be found, rats, mice, squirrels, and other creatures

* For accounts of the oak, yew, elm, &c., see previous numbers of the *Builder*.

are common; bogs eagerly devour the fruit, whilst the branches are frequently alive with thrushes and blackbirds.

A large number of vegetable parasites attack the beech tree, and should any of them once become established they prove sure forerunners of destruction: a beech tree that was broken short off in a storm last year at Hampstead, had several specimens of the Sulphur Polyporus growing on its side; and a few days ago we gathered a large specimen of the *Liver fungus* (which afforded us a hearty meal) from a beech in Epping Forest; but, perhaps, the most beautiful plant growing on doomed beeches is *Agaricus micidius*: this ivory-white mushroom-like agaric seldom attacks beeches north of London, but falls upon those in the southern counties, where we have seen it in hundreds growing from top to bottom of the trees; we never saw it elsewhere with the exception of a small batch on a beech stump in Lord Mansfield's wood at Hampstead: in its young state it is one of the most exquisite of fungi; but when matured, as its specific name indicates, it becomes mutterably loathsome—one horrid viscous mass. A most remarkable object sometimes takes its place on old beech trunks closely resembling in colour and outline an immense caniflower (*Hydnum caroloides*); it is extremely rare, but has recently appeared at Barnet on an ash. The myclium, too, of *Peziza eryngioides*, sometimes permanently stains the wood to a great depth of a beautiful verdigris green colour.

W. G. S.

SOMETHING NEW CONCERNING SHAKSPEARE.

THE following really important royal sign-manual warrant of King Charles II., issued in the first year of his actual reign, is, strange to say, new to our dramatic history. I found it in an old Office-book, belonging to the office of the Lord Chamberlain. Oddly enough, it has been unnoticed by Malone, who examined carefully at times the books that were unrestrictedly open to him. Stranger still, Mr. John Payne Collier, who very rarely allows an entry of moment connected with our early dramatic literature to escape his detection, has passed it by; and yet, as George Colman's unpaid representative as licenser, he was allowed unrestricted access to the papers of the Lord Chamberlain:—

MS. Warrant Book of the Lord Chamberlain to King Charles II., vol. iv., p. 343.

CHARLES R.

WHEREAS Sir William Davenant, knight, hath humbly presented to us a proposition of reforming some of the most ancient plays that were played at Blackfriars, and making them fit for the company of actors appointed under his direction and command; viz., the plays called,—“The Tempest,” “Measure for Measure,” “Much ado about Nothing,” “Romeo and Juliet,” “Twelfth Night,” “The Life of King Henry the Eighth,” “The Sophy,” “King Lear,” “The Tragedy of Macbeth,” “The Tragedy of Hamlet Prince of Denmark,” and “The Duchess of Malfi.” Therefore we have granted unto the said Sir William Davenant liberty to represent the plays above named by the actors under his command, notwithstanding any warrant to the contrary formerly granted, And it is the sense of us that those plays written by the said Sir William Davenant shall appoint, And we further grant liberty unto the said Sir William Davenant to represent by the actors under his command all the plays written by himself formerly for the Blackfriars; and it is likewise our will and pleasure, and we do command, that no person or persons, upon what pretence soever, shall act or cause to be acted any of those above named eleven plays upon pain of our high displeasure, but only such persons as Sir William Davenant shall appoint. And we further grant liberty unto the said Sir William Davenant to represent by the actors under his command all the plays written by himself formerly for the Blackfriars; and it is likewise our will and pleasure, and we do command, that no person or persons, upon what pretence soever, but those under Sir William Davenant's appointment, shall act or cause to be acted any of those plays written by Sir William Davenant formerly, or what hereafter shall be written by him; and further, we command that no man or woman entertained by Sir William Davenant in the company under him for representations in places shall be received in the company that is under Mr. Thomas Killigrew's command, nor those nor any of those men and women representing plays in the company under Mr. Killigrew shall be admitted in the company under Sir William Davenant without the consent of Mr. Thomas Killigrew and Sir William Davenant jointly.

And we likewise grant liberty to the said Sir William Davenant, during the space of two months after the date hereof, to cause to be represented publicly by the actors under his appointment the six following plays, viz., “The Maid's Love,” “The Maid in the Mill,” “The Spanish Curate,” “The Loyal Subject,” “Rule a Wife and Have a Wife,” and “Pericles, Prince of Tyre.”

Given at our Court at Whitehall, December 12th, 1660.

By His Majesty's command, EDWARD NICHOLAS.

Here are eleven plays assigned to Sir William Davenant, the patentee of “The Duke's Theatre,” one by Webster, “The Duchess of Malfi;” one by Sir John Denham, “The Sophy;” and nine by Shakspeare. We have here, then, fresh and startling evidence of the pre-eminent popularity of Shakspeare over other dramatists

in the reign of King Charles II. When the progress and history of Shakspeare's reputation is first written,—its immediate and its steady progress,—the warrant I now first print will, I feel, be referred to as proof positive and conclusive. P. C.

THE BUILDING OF THE TEMPLE.

I.
One said, “What ist' you make?—
A vain, an idle thing;
Whence far and wide
Conceited pride
Would o'er the small folk vantage take.
What hath it else than shame
For sequel, save it bring
A conscience lame,
And slow to wake
A heart opposed to righteous blame?”
A second, “Vain and rude,
God wot!—the very stones would shape
Themselves in forms less rude.”
A third, “What, if this fool, sagape,
All lesser fools about him ring?
They point but at the truth; we find
Within the kingdom of the blind
The one-eyed man is king.”
Slipped in a fourth, “And plain to me
He spees at heart you ancient spire,
Forgetful of his own degree,
The churl! I rede ye such desire
Is scornful of appointed piece,
Pride, discontent, and deady sin;
Presumption true persisted in,
Will work it fall.
Let be: mine eyes in sorrow trace
God's hand upon the wall.”

II.
Meanwhile the worker soar'd apace
From cave and trench in power and grace,
On vaulted pinnons through the air;
And strong of arm, as pure in art,—
Of sun and shadow unaware,—
Enwrought each inharmonious part
In slow design to promiscue,
He heard but as the windy rain
About the stormy gates of morn;
And heeded less. “Who strive in vain
Alone aere meet to sit for crade.”
He mused within, nor lift his face:
“They fret their little hearts with scorn;
But I must run my appointed race:
God grant that I attain!”

III.
“Begat of folly, borne of pride,
Vain emulation stultified,—
So spake they in the morn.
How find we in the eve-tide
The prophecies outborne?”

IV.
Magnificently o'er the sea
The cloven sun, low-lapp'd in fire,
Lay lying in the purple calm;
White, on the mountain sloped before
In green ways to the golden shore,
Uplift her pure face gloriously,
A Living Temple, perfect, fair,
From vaulted base to crowning spire;
An overlasting face of prayer;
A carved chaat, a shrined psalm;
And vent' each part of beauty thro'
“Lans of glorie, Demino.”

ELGOOD PENCHARD.

ON OLD HOUSES.

At the meeting of the Essex Archaeological Society in Dunmow last week, the Rev. C. Lesingham Smith read this paper:—

Though I am by no means competent to speak learnedly or authoritatively on the subject which stands connected with my name, I am glad to call the attention, not of archaeologists themselves, who need no hint from me, but of such persons as are merely interested more or less in archaeological pursuits, to those “old houses” which are so rapidly disappearing from every city and county of England. It is not wise to lament that decayed and inconvenient abodes are continually being changed for others more healthy and commodious; but we may reasonably regret that any structures of the olden time should be swept away before some zealous and skillful hand has photographed or traced with pen or pencil those peculiarities in them which tell us of ancient manners and throw light on the home-life of our ancestors. Few buildings of any kind now exist which date back a thousand years, and the age of our oldest dwelling-houses is confined to a much narrower span.

This is what might have been expected even before we had closely examined. At the dawn of civilization the first fixed abodes of man on the open surface of the earth must necessarily have been constructed of slight and portable materials, and were therefore doomed to speedy decay. It was not till the mechanical arts of shaping and moving large massive materials had

been discovered, that edifices could be reared capable of resisting the attacks of time and of the elements for any considerable period, especially in a climate like ours. Long after vast and solid structures of stone had been erected, dwelling-houses still continued to be almost universally built of wood, partly because of the facility of manipulating it and partly because of its far greater abundance in earlier times. Of course so perishable a substance seldom lasted for many centuries, and the consequence is that we have few houses in existence which are more than 200 or 300 years old; but even in those which are of this lower degree of antiquity there is something which usually at once arrests the attention of the most careless observer. The main lines and contours which diversify the exterior surface vary considerably from what we see in ordinary modern houses, which are comparatively bald and flat; and this surface, however concealed and defaced by the abomination of plaster or whitewash, generally exhibits decided traces of that picturesque complication of wood-work which constitutes the frame of the building, and is graphically described by Tennyson as

“A front of timber-croost antiquity,
So propt, worm-eaten, ruinously old,
He thought it must have gone.”

One of the most striking features of an old house is the usual projection of one story over another for the double purpose of enlarging the upper apartments and of securing more shelter from sun and rain outside. The deep shadows produced by this mode of construction add marvellously to the picturesque. From it also advantage was often taken to introduce that effective ornament which consists simply of the beam-ends of the intermediate floor visibly projecting outside below the ampler upper story, and supporting its wall. Ornaments of this kind, which arise out of the very construction of a building, are always particularly grateful to the eye, because they are at once perceived to have a meaning; such are the triglyphs in Greek architecture, which were originally nothing else but the slightly projecting ends of the beams of the flat wooden roof. There is a good example of this kind of constructive decoration in an old house at Takeley, on the north of the high road. It is not only the human artist that admires such a fabric as I am describing; the “temple-haunting marlet” also highly “approves” it, finding there many “a jutting frieze and coigne of vantage” for “its pendent bid and procreant cradle.” The continually projecting story was much used in Mediaeval cities, whose increased room above and shelter below were so desirable; but the streets in these cities being usually very narrow, it often happened that the upper rooms on opposite sides of the street approached very near to each other; and to counterbalance the disadvantages mentioned, there was the terrible drawback of impeded ventilation, making these crowded dwelling nurseries for the plague and other pestilential diseases. London gained more in the sanitary point of view than it lost in the picturesque when the great fire devoured so vast a number of its ancient dwelling-houses.

From the general aspect of old houses I would to notice a few of their details, and we will commence with the highest point—the visible chimney. The first human dwellings doubtless had no vent at all for the smoke, which was allowed, as it is now in many a moorland cottage, to find its way out as well as it could, through door, or window, or crevice. Then came rude contrivances, such as are employed at this day in the Highlands of Scotland, where it is very common to see an old berring-barrel tilted a little out of the perpendicular and stuck into a hole in the rough thatch of the roof: this is intended to be an exit for the peat-smoke; but fulfils its purpose no better than those sarcastically described by Swift as

“Chimneys with scorn rejecting smoke.”

They were gradually, however, made more effective for their end, and assumed a more ornamental form above the roof, till at last they contributed in no slight degree to the architectural beauty of the whole building. Before the fire at Easton Lodge, there were some exquisite specimens in wrought brick: one stack still surmounts the roof, but the most beautiful and elaborate one, though little, if at all, injured by removal at the time of the fire, was sacrificed by the architect of the new building, and I know not what has become of it. Before we quit the

chimneys, we will pass down to the hearths communicating with them. In all old houses the hearth was of ample dimensions, yielding room, not only for a large fire, but also for a seat on each side, called the *ingle* (a word supposed to be derived from *igniculus*), or the chimney corner,—the coziest place in the house, and noted proverbially for being the resort of idlers; thus Leslie, an old writer, says of one who had told an idle tale, "perhaps he had it from an old woman in a chimney corner, or out of a romance." In a family house the hearth was the place of reunion for all the members; and was, as it were, the hallowed centre of the home. This circumstance must have rendered the "chimney-money" or "hearth-money" levied by statute in Charles II.'s time peculiarly odious; and the abolition of that tax was one of the many blessings conferred in the reign of William and Mary. The great size of the opening of the hearth, even in ordinary dwellings, tells of the abundance of forest wood in those days. Only a few specimens remain unaltered here and there at old farm-houses. Several in my own parish have, within my remembrance, been blocked up with a modern fire-place and grate, in order to spare the consumption of coal and economise the heat. A good example will be seen at Stone Hall. The roofs of old houses were generally more exposed to view than modern roofs, and had a steeper pitch, and the gables were often brought to the front. This arrangement is especially prevalent in the old Belgian cities, from which so many of our late visitors have come,—such as Bruges, Ghent, &c.; and it gives a peculiar character of quaintness to the aspect of their streets. Certainly the sloping lines of the gable, with its far-projecting, deeply-shaded eaves, are infinitely more picturesque than the plain flat horizontal parapets, in which our modern street houses so generally terminate above. The space within the roof was always utilized, and it is not uncommon abroad to find lofty roofs with three, four, or even five and six tiers of windows opening from them, and as many stories within, available for garrets or places of store. The more important windows of old city dwelling-houses, and, indeed, of all old houses, were oftener bayed than modern ones. The architect of those days had no fear of the window-tax to cripple his designs, and so made the openings for light as large and as numerous as he pleased. We may well rejoice that this most injudicious impost, which has rendered the exteriors of so many modern houses dull and repulsive, has been for ever removed. The bay-window in the second story of an ancient street-house was a clear view of all the traffic and passengers below. Specimens may still be seen in Coventry, Chester, Conway, and other ancient cities. The same construction was also used in country houses for the sake of the prospect; and there is a very fine example not far from hence, at Horham Hall, where are still preserved the tall and noble bay-windows within which Queen Elizabeth often sat to contemplate the view.

A large size of window was rendered the more necessary from the circumstance that the interiors of rooms were usually panelled with wood, which soon assumed a dark hue, and thus required a great deal of light to be thrown into the room. The effect of this paneling was often excessively rich; there was a beautiful specimen of it in the old drawing-room of Easton Lodge destroyed by the fire. Many fragments of paneling remained to a late time in houses not far from this place, but nearly all have now disappeared, having been destroyed or removed and sold. Sir Brydges Henniker has laudably preserved some from old Newton Hall, and my friend the Rev. Mr. Toke, of Barnston, has collected from various quarters many good specimens, with which he has adorned his rectory. I will add yet one more characteristic of old houses, of which very few examples survive in England. I mean the *inscription* of texts of scripture, or moral sentences, on the horizontal timbers or other convenient surface outside. This custom probably had its origin in the injunction to the Israelites, recorded in Deut. vi. 9, to write the commandments of the Lord "on the posts of their houses and on their gates." In Switzerland and Germany examples are continually to be met with, and the passer-by can hardly for them lead him back to respect and reverence, and not only not ashamed of their religion but loved to proclaim it from their house-tops and sides.

THE AMERICAN INSTITUTE OF ARCHITECTS.

WE obtain from New York some particulars of the American Institute of Architects, which may rightly find a place in our pages.

On the 23rd of February, 1857, a few architects, then practising in this city, met at the office of Mr. Richard Upjohn, for the purpose of forming an association for mutual improvement, and uniting their influence with a view to advancing the general interests of the profession. The following architects were present, and may be considered the founders of the present Institute:—Richard Upjohn, Edward Gardner, Henry W. Cleveland, Jacob Wrey Mould, Leopold Eidlitz, Henry Dudley, Fred. A. Petersen, Charles Babcock, Joseph C. Wells, Richard M. Hunt, John Welch, John N. Priest, and Richard M. Upjohn. Richard Upjohn was president of the meeting, and has ever since been president of the Institute. Joseph C. Wells was the secretary. Previous to the adoption of a constitution the following architects were invited to join in the movement; and, having accepted, became also original founders: Calvert Vaux, John W. Ritch, Frederick C. Withers, A. J. Davis, Frederick Diaper, Joseph Sands, Thomas N. Walter, of Washington; George Snell, Arthur Gilman, and Edward Cabot, of Boston; James Renwick, jun., R. G. Hatfield, S. A. Warner, and Detlef Lienau.

On the 2nd of April, 1857, a constitution was adopted, and the Institute was fully organized by the election of the following, who constituted the first board of trustees: Richard Upjohn, Thomas U. Walter, A. J. Davis, F. A. Petersen, J. W. Ritch, Frederick Diaper, Richard M. Hunt, Joseph C. Wells, and Henry Dudley.

On looking over the list of original members, we find the names of many who are still among the prominent members of the profession. First Richard Upjohn, architect of Trinity Church, Trinity Chapel, Trinity Building, the Madison-Greenwood Cemetery, and the entrance to every city in this country. The name of Thomas U. Walter will readily be recognised. It was he that designed the extensions and dome of the Capitol at Washington, and was turned off by the jealous army officers when his work was nearly completed. Mr. Mould first introduced in this country exterior colour decoration applied to buildings, in All Souls' (Dr. Bellows's) Church. He has since done better work in Trinity Parochial School, adjoining Trinity Chapel, on Twenty-fifth-street, and in the new Presbyterian church on Forty-second-street. In addition to these and many other churches and secular buildings, Mr. Mould designed most of the beautiful details of the architectural work in the Central Park. Mr. Vaux is well known in connexion with the laying out of the Central Park, of which he was consulting architect. Mr. Eidlitz has designed some of the most remarkable buildings of this city and vicinity, among which are the American Exchange and Continental banks, the Produce Exchange, the Brooklyn Academy of Music, the Tabernacle (Dr. Thompson's), and St. George's (Dr. Tyng's) Church. One of his most beautiful works is the Hamilton Avenue Ferry-house, on the Brooklyn side. Messrs. Dudley, Hunt, R. M. Upjohn, Rich. Withers, Diaper, Sands, Gilman, Cabot, Renwick, Hatfield, Warner, and Lienau are also engaged in practice. Messrs. Gardner, Petersen, Babcock, Welch, Davis, and Snell have retired from the profession. Two of the original members are dead: John W. Priest and Joseph C. Wells. Both were shining ornaments to the profession.

Objects.

The object of the organization thus completed cannot be better stated than by quoting from article 2 of the constitution, which said:—"The object of the Institute is to promote the artistic, scientific, and practical efficiency of its members, to facilitate their intercourse and good fellowship, to elevate the standing of the profession, and to combine the efforts of those engaged in the practice of architecture for the general advancement of the art."

How this was to be done is best explained by the following article:—

"The means of accomplishing this end shall be regular meetings of the members for the discussion of matters of professional importance, the reading of essays and original papers, lectures on topics of general interest, a library, a

collection of designs and models, and other means calculated to promote the objects of the Institute."

The constitution provided for three classes of members:—

1st. Professional members,—corresponding with the Fellows in the Royal Institute of British Architects,—who are architects that have been engaged as principals in the practice of architecture for not less than three successive years.

2nd. Associates, whose qualification is that they shall have studied for three successive years in the office of a professional architect.

3rd. Honorary members. Meetings were held in the offices of the members until the 17th of November, 1857, when the Institute held its first meeting in its own rooms, in the University building. About this time the Institute was incorporated under the laws of the State of New York.

From its organization until March 19, 1861, it has held meetings regularly twice a month, except during the summer months. The first four years were devoted principally to self-improvement. At each meeting a paper on some subject connected with the profession of architecture was read by some member, and its subject matter discussed. The members compared notes with reference to matters happening in their business experience, and were thus enabled to come to a mutual understanding about many matters of professional practice that were before unsettled. Thus the first object stated in the constitution was fulfilled.

Meanwhile the state legislature, in the session of 1859, recognised the assistance that could be obtained from the Institute in establishing a thorough system of superintending new buildings. The law passed at that session provided that no inspectors of buildings should be appointed until they had been examined with reference to their capacities by a committee of the Institute of Architects, and pronounced by them to be fit for appointment. Thus the Unsafe Building Act became and has continued to this day to be most effective in its operation from the fact that none but properly qualified inspectors can be appointed under its provisions.

The committee of the Institute has several times been called in by the commissioner to assist in the survey of unsafe buildings, and it was through the instrumentality of this committee that the directors of the Academy of Music were compelled to take down the dangerous walls of the old building that they had tried to retain.

In the spring of 1861 the great excitement about the war, which then absorbed all minds, had its natural effect upon the Institute, as well as on many similar bodies. The meetings became less frequent, and at length stopped altogether; but the organization was still kept up. But what the war dispersed it also gathered together. The Metropolitan Fair became the absorbing topic in the spring of 1864, and the architects felt it to be their duty to contribute to the great undertaking. A special meeting of the Institute was held, and it was one of the largest and most enthusiastic meetings ever held by this association. The result was that the Institute contributed several portfolios of photographs, engravings, and original drawings to the fair. From that time meetings continued to be held, and the old spirit of the organization was revived. In March a room in Trinity-building was hired, and the meetings were from that time held twice a month, at three o'clock in the afternoon. A new constitution was soon adopted, and the meetings resumed their former attractiveness. Papers were read, and discussions of professional topics resumed.

In March, 1866, the rooms in Trinity-building were given up, and the Institute, in view of the desirability of holding evening meetings, moved to the Cooper Institute, where its meetings are now held.

Architects and Contracts.

The Institute has sought, first, self-improvement, with a view to the fact that thereby the work of its members can be improved. It has sought to elevate the standard to which an architect should attain, and to eliminate from the profession many immoral and dishonest practices which had tended to bring all architects into reproach. It is a well-known fact, and need not be disguised, that many architects are in the habit of receiving commissions and presents from builders who are performing contracts subject to their acceptance, and from

dealers whose materials may be recommended by

the architect. With the almost sure prospect of making their fees in this way, and the utter impossibility of detection in such collusion, men calling themselves architects are often ready to offer their services to any one who will employ them for a mere song,—in fact, for less money than it would cost to make the drawings. Of the utter dishonesty of such practices, and the danger that may result to capitalists from the employment of such persons, it is unnecessary to speak, for they are self-evident.

The Institute has always frowned upon such evil practices, and endeavored to keep its ranks free from all architects about whose honesty the least suspicion has been aroused. To this end it has established a uniform rate of commission to be charged by all its members, and thereby prevented all competition except that which rests on professional skill and reputation. It has endeavored to establish by uniform practice the mutual relations of clients, architects, and builders. Fortunately, it has never attempted to set up a standard of criticism in matters of taste and style, and it is to be hoped that it never will. All attempts of the kind have ruined the bodies in which they have been originated. But the Institute can reform abuses, establish precedents, and educate architects. Such is its mission. Independent and fearless criticism, and the common sense of an intelligent community, will in time settle the question of taste and style.

The Institute of Architects contemplates in its organization, as will be seen, many things that it has not yet attempted. It has the nucleus of a good library of works of arts, and it is to be hoped that it will rapidly increase this department. It has in contemplation the establishment of a school and a course of popular lectures, both of which we will gladly welcome.

Meanwhile, it needs the material assistance not only of the architects, but of all who are interested in its objects and aims. It should have a good building of its own, such as the Academy of Design has, and one which of itself would be a model of good architecture. It needs the encouragement of the business community, which is so much benefited by it, in establishing a library and school, and we trust that the means will not long be wanting.

FROM SCOTLAND.

St. Andrew's.—The foundation-stone of a new cathedral church has been laid in this city, with full Masonic ceremonial, by Mr. J. Whyte Molville, of Bannockhill and Strathkinness, Grand Master Mason of Scotland, in presence of deputations from numerous provincial lodges, and of a large assemblage of the inhabitants and neighboring gentry.

Thurso.—The chief stone of a new Free Church School has been laid. The buildings consist of two school-rooms and a teacher's dwelling-house. The largest room is 52 ft. by 20 ft., and the second 26 ft. by 20 ft. The buildings will cost about 900l. when completed. The plans were drawn out by Mr. Duncan, in accordance with the instructions of the Central Education Board.

FROM AMERICA.

Germans of a New City in the Far West.—A new city has been laid out on the plains at Cheyennes, near the Black Hills, America. Coal, iron, minerals, and water-power are found in proximity. The Union Pacific will concentrate its great locomotive machine car shop at this point. It is confidently expected that the city will have five thousand inhabitants in less than twelve months. At present it is a bare prairie, but within four months it will be the terminus of the railroad.

Abundance of American Timber.—It is stated that over 100,000,000 ft. of logs are boomed on the Mississippi, above the Falls of St. Anthony, to be sawed into lumber. A nearly equal amount has come down the tributaries of the St. Croix, and the supply from the Upper Mississippi is now abundant enough to run all the mills upon the Mississippi as far down as St. Louis. Eastern Wisconsin and Michigan are likewise yielding increased supplies. It is believed the plentiful supply must cause a decline in the price of lumber, and that building enterprises will be stimulated thereby.

Bridging the Mississippi.—The plans for a new

bridge across the Mississippi river at St. Louis have been accepted, and it is to be commenced without delay. The new bridge will be an immense structure. It will accommodate two double tracks of rails for street cars, besides sidewalks for foot passengers, and will consist of three arches, the central arch having a span of 515 ft., and the two side arches 497 ft. The central piers will be nearly 200 ft. in height from the bed of the river. The estimated cost of this great bridge is 5,000,000 dol.

The Temple of the Mowmentes.—The great tabernacle of the "Saints" at Salt Lake City is now finished. It is 250 ft. wide, and furnishes comfortable sitting-room for 10,000 persons. At present this city contains 18,821 dwelling-houses and hotels. Of these houses 1,720 are valued at less than 1,000 dol., nine at more than 375,000 dol. Two hotels are appraised at 115,000 dol. each; five, each at 120,000 dol., 125,000 dol., 145,000 dol., 150,000 dol., and 176,000 dol.; two at 225,000 dol.; one at 281,000 dol., and one at 325,000 dol.

THE CENTRAL HALL OF ARTS AND SCIENCES.

MR. LABOUCHERE in the House of Commons recently asked the Vice-president of the Committee of Council on Education whether he was aware that the charter of incorporation granted to the Central Hall of Arts and Sciences was promulgated without consultation with the subscribers; that much dissatisfaction was felt with respect to certain of its provisions; such as the appointment of an executive committee, and the power given to the provisional committee to withhold all accounts until one year after the completion of the hall; that under the powers given to the executive committee a contract had been entered into of a nature deemed by many subscribers to be improvident, and such as might fail to justify the hopes held out in the statement on the faith of which subscriptions were solicited; namely, that subscribers would obtain for their subscriptions a valuable pecuniary investment; and whether Her Majesty's Government were prepared, on application from subscribers, to revise the charter, and, if necessary, to issue an amended one, affording to subscribers the same powers and the same representation as was usual in joint-stock undertakings.

Mr. Bruce said that, perhaps, as he was a member of the Provisional and Executive Committee, his explanation would be accepted. The character of the charter was fully stated in the prospectus: each subscriber received notice of the charter, and agreed in writing to accept it. No one objected to it, and no complaint had been received by the Provisional or Executive Committee with respect to it. As to the contract, it had been entered into under powers originally conferred upon the Provisional Committee. It was a highly advantageous one; no complaint had been received against it; and the accounts were open to inspection. The management, including the preparation of legal documents, had been conducted without any charge to the undertaking. He was not aware that the Government had any power to revise the charter without the consent of the subscribers; but if the majority of them thought there should be a revision, he had no doubt the Board of Trade would advise Her Majesty to revise it.

PROVINCIAL NEWS.

Frankingham (Suffolk).—A "People's Hall" Company has been formed here to provide a hall for the general use of the town. For this purpose the company have purchased premises at the entrance to the town from the railway, which they are about to alter and enlarge for a public hall, with reading and committee rooms, library, &c. A new staircase tower, rising to a considerable height above the building, will be erected in connexion with the intended additions. The building throughout will be warmed by Messrs. Haden & Son's apparatus. Mr. Sagden, of Leek, is the architect to the company.

Droitwich.—The additions and alterations to the Town-hall and the new building for the police-station have just been completed. The new station is situated at the junction of St. Andrew-street and Friar-street, which latter street has been considerably widened. The

building is composed of red dressed brick, with Bath stone facings. The buildings have been erected by Mr. Beard, builder, under the direction of Mr. Rowe, architect, Worcester.

Eastbourne.—The foundation of a new Convalescent Hospital at Eastbourne has been laid by Lady Fanny Howard. Two years ago, through the exertions of Miss Brownlow Byron and the Sisters of All Saints' Home, Cavendish-square, a house was opened at Eastbourne as a hospital for convalescents; but the number of applications for admission was so great that the accommodation was found inadequate. Accordingly, a site of five acres at Meads, close to the sea, has been purchased from the Duke of Devonshire; and, a sum of 10,000l. having been subscribed, the plan for a new building capable of containing 100 patients was obtained. One wing is to be devoted to the reception of thirty incurables. It is stated that a sum of 12,000l. is still required in order to complete the hospital, the foundation of which has been laid.

PROTECTION AGAINST FIRE.

THERE has now been issued the report of the select committee of the House of Commons appointed to inquire into the existing legislative provisions for the protection of life and property against fires in the United Kingdom, and as to the best means to be adopted for ascertaining the causes and preventing the frequency of fires.

The committee, after stating the course which they have pursued in making these investigations, and describing the general character of the evidence they have received, proceed to offer a series of recommendations.

They advise a general building act for all towns and places in the United Kingdom governed by municipal corporations, &c., similar to the Metropolitan Building Act and to the Building Acts of Liverpool, the suggestions of professional witnesses as to the thickness of walls and other details being taken advantage of in passing such an act. In all buildings composed of shops below and dwelling-houses above, the committee recommend that the floor immediately above the shop should be made fire-proof, and that there should be a ready means of escape from the roof; also that the floors of all large lodging-houses for the poor be made fire-proof, and that there should be ample means of escape. The architects, builders, and district surveyors who were examined before the committee, deposed that when a fire takes place in a warehouse, iron is of little use in stopping its progress. Generally speaking, they prefer wood well plastered for fire-proof purposes to iron, and some of them give a preference to wooden stairs instead of stone, as the latter crumble with the heat. It seems that hills for the supply of water by companies or local authorities containing clauses providing that the water need not be constantly laid on, have been allowed to pass without investigation, and the committee recommend that it should be made a standing order of the House that such bills shall be referred to the referees to inquire whether sufficient reason exist for such provisions. Where it is proved in an investigation that the fire was caused by culpable carelessness, the person or persons implicated should be deemed guilty of a punishable offence.

Other recommendations of the committee relate to the igniting point of mineral oils used for illuminating purposes, which ought not, they think, to be sold with an igniting point under 110° Fahrenheit. All such oils imported ought to be tested in this respect and marked before being stored, and more stringent regulations should be made regarding the storing in warehouses and keeping in shops, of turpentine, camphine, and similar spirits. In very few other towns save London and Liverpool is this subject attended to. There remain fires that are wilfully caused. On referring to the evidence, the committee find that those are to be traced to several sources. 1st, to individuals and organized gangs of men who make a trade of it to defraud the insurance companies; 2nd, to parties who have been unfortunate in business, and who cannot meet the claims made upon them; 3rd, to persons in warehouses to conceal theft of goods made by them on the warehouses. 4th, to malice. The witnesses concur in the belief that an inquiry made into all fires would reduce the gross number of them. The police, or fire brigade, should initiate the inquiry, and report to au

THE NORWICH GATES : PARIS EXHIBITION.

authorized officer, who, the committee think, should be the coroner, anything that appears in the least suspicious; the officer should examine witnesses, or, if he thinks proper, impanel a jury; and any person shown to be implicated should be prosecuted at the Central Criminal Court. The coroner should be paid partly by fees and partly by salary out of the rates. The committee specially recommend that no claim should be settled by any insurance company without a certificate from the police or fire brigade, or officer appointed to conduct the investigation into the origin of the fire; but this certificate should not debar the insurance officers from opposing the claim if they think proper.

SOME WROUGHT METAL WORK IN THE PARIS EXHIBITION.

THE new part of the *Art Journal* Catalogue of the Paris Universal Exhibition maintains the high character gained by the previous parts.* It is amply illustrated, and with the view of showing the excellent manner in which this is done, we are enabled to reproduce the representations given of the Wrought-iron Gates by Messrs. Barnard, Bishop, & Barnard, of Norwich, described in one of our early articles on the contents of the Exhibition. The *repoussé* work on

the solid parts of the gates, at the bottom, for example, is scarcely made so obvious as it might have been.

From a previous part we give illustrations of the Albert National Memorial, now in progress; viz., the Spire over the canopy, executed by Mr. Skidmore, and the terminating Cross, drawn to a large scale, in order to show the details more distinctly.* The Spire is formed throughout of metal, with enrichments produced by inlays of crystals, jaspers, rich stones, and brilliant enamels. The total height of the cross from the ground will be 150 ft.

* Virtue, Ivy-lane.

* See p. 690.

RAILWAYS.

AN experiment on the American system of railway travelling will, it is said, probably be made shortly in England. The bridge and viaduct at Runcorn Gap will save ten miles in the London and North-Western Company's line between London and Liverpool. On the completion of this work, the company are to put on express trains in which the convenience of passengers is to be consulted by the construction of carriages on the American principle. There will be a passage from end to end of the train, as we have long urged, together with retiring and refreshment rooms.

The new line to Tambridge has been inspected by the directors of the South-Eastern. The line is about twenty-three miles in length, and shortens the distance between London and Folkestone, Dover, Tunbridge-wells, St. Leonard's, Hastings, and other important localities reached by the South-Eastern, by about thirteen miles. The line has been constructed under the direction of Mr. Peter Ashcroft, the company's engineer, at considerably less than the contract price. The works are of a very heavy character, —the heaviest in the south of England in embankments, cuttings, and tunnels. There are four tunnels in the 23½ miles. Some of the cuttings are 90 ft. deep, and one of the embankments, of great length, is 80 ft. high. The brickwork in the tunnels was inspected by the help of the lime-light.

On the Great Eastern Railway the following legal notification has been affixed to the stations, carriages, &c. :—

"Take notice that all the fixtures, goods, chattels, and fittings in, about, and upon these premises are the property of the undersigned, Alexander Tracy, of Cambridge, in the county of Cambridge, contractor, William Booth, of Eastwood, in the county of Nottingham, esq., and John McMahon, of No. 1, St. John's-grove, Brixton, in the county of Surrey, esq., and are used by the Great Eastern Railway Company as their lessees; and that any person or persons intermeddling or interfering with the same will do so at his or their peril.—Janson, Cobb, & Pearson, 41, Finsbury-circus, London, E.C., solicitors for the said Alexander Tracy, William Booth, and John McMahon."

The traffic receipts of railways in the United Kingdom amounted, for the week ending July 30th, on 12,823 miles, to 797,589*l.*, and for the corresponding week of last year, on 12,560 miles, to 774,585*l.*, showing an increase of 263 miles, and of 23,004*l.*

A TUNNEL THROUGH AN EXTINCT VOLCANO.

LYTTELTON, NEW ZEALAND.

THE fertile "plains" of the Canterbury settlement, in the southern of the two great islands of New Zealand, are divided from the port of Lyttelton by almost impracticable hills, over which even a bridle-road was at first a difficulty. In course of time certain comparative improvements in this primitive mode of conveyance were effected; and in May, 1861, the local Government accepted a tender from Messrs. George Holmes & Co., of Melbourne, to complete a line of railway from Lyttelton to Christchurch, a distance of six miles, with the exception of the stations, in five years, ending June 1st, 1866, for 240,500*l.*, the cost of a tunnel, 2,838 yards long, and called the Moorhouse Tunnel, being fixed at 195,000*l.* The first sod was cut in the Heathcote Valley on the 17th of July, 1861, and this may he said to have been the date of the commencement of the tunnel works, as up to this time nothing had been accomplished beyond sinking the trial shafts, and driving ninety-six yards of heading, viz., thirty at the south, and sixty-six at the north end of the tunnel.

The plan adopted by the contractors was to mine the whole work from a wide bottom-heading. To expedite the work, three additional shafts were sunk, one close to each front, and one in the clay cutting at the north end of the tunnel, whilst at the same time a gullet was driven up the cutting to meet the heading. Although the ground proved very wet in places, rendering it necessary to close-pole a length of seven chains through clay and sand, this plan was perfectly successful, and the timbering remained in good order until the commencement of the brick lining, at the end of the following year.

On the 29th of September, 1862, Mrs. Moorhouse laid the first stone at the north end of the tunnel, that of the south being laid by Mr. John Hall, in April, 1864.

The works were at first carried on under great

disadvantages, on account of the Otago gold fever and other causes; but the tunnel may now be said to have been completed, as on the 24th of May last communication was established between the two drives, by the miners on the port side breaking into a drill-hole sunk some days previously in the face of the Heathcote drive. After a few minutes spent in enlarging the opening, an iron rod was passed through from drive to drive, the distance between the two faces being 14 ft. The alignment and the levels were thus proved to have been perfectly correct.

The present tunnel affords, it is believed, the first instance where a complete section of an extinct volcano has been opened out. The elaborate drawings prepared by Dr. Haast for exhibition in Paris, will draw the attention of geologists to the fact, and doubtless afford the greatest satisfaction to the scientific world. The rock in the tunnel may be described as a series of lava-streams and beds of tufa, intersected by vertical dykes of phonolite. The lava-streams generally consist of scoria, overlying a coarse pink trachyte, which passes gradually through shades of grey, purple, and blue, into a black, finely-grained dolomite, intensely hard and tough; the lightest and softest rock being at the top and the densest and blackest at the bottom. Regarded from an engineering point of view, the work is considered eminently successful. Wherever difficulties have been met, they have been quickly and successfully overcome. A siphon 600 yards long was employed for the drainage of the upper half of the tunnel. The system of ventilation has proved perfectly adapted to the requirements of the case, and has been not only effective but simple and comparatively inexpensive. The engineers of the Mont Cenis tunnel have found it necessary to adopt similar means of ventilation in that famous work. In the first instance, air was driven in by fans worked by horse-power, but this soon proved quite insufficient; and when the works had extended some distance, much time was lost owing to the difficulty of getting rid of the smoke. To obviate this on the Lyttelton side, the upper portion of the tunnel was partitioned off by a floor or brattice, about 9 ft. above rail-level, forming a smoke-flue connected with one of the shafts, at the bottom of which was placed a furnace, which, by rarefying the air, caused a steady current up the shaft, and drew the smoke away from the face of the workings. A similar plan was adopted at the north end, the chimney of a forge being led into the shaft, and answering the purpose of a furnace, but the brattice was only continued for a short distance beyond the upcast shaft.

On the Lyttelton side this system answered perfectly well, and the ventilation has continued good ever since; but on the Heathcote side, where the work for the last quarter of a mile has been driven by a top-heading (the temporary floor being left above the permanent rail-level for drainage purposes), the ventilation at the close of the work became sluggish, and recourse was had to driving air on to the face by means of four fans driven by an 8-horse steam-engine. This proved perfectly successful.

The system employed to secure the correctness of the alignment of the two ends of the tunnel was very simple. A permanent mark was fixed in the centre line of the tunnel, on a tower built on the dividing range, nearly midway between the two ends. A transit instrument being placed on the meridian of the tunnel, as well as of the tower on the hill, it could be seen at once whether the flame of a candle placed in the centre line of the work inside the tunnel was in a vertical plane with the mark on the tower. But it was also desirable, in case of error, to have the means not only of correcting, but of calculating the amount of such error, and this could be readily done. The permanent mark on the central tower consisted of a hollow 6 in. wide, with a black stripe 1 in. wide down the centre. The eye-piece of the transit instrument being furnished with five vertical wires placed at equal distances apart, the value of the space between any two wires at a distance equal to that of the mark on the tower could be ascertained by reference to the width of the bratten, which thus gave a scale by which the error in the position of a light placed in the tunnel under the power could be rated with great exactness. It has been by this means that the alignment has been tested from time to time, and the proof of the correctness of the system has been established by the present result.

In spite of the peculiar character of the work, the health of the men has been generally very good. Accidents have been of rare occurrence, and of comparative unimportance.

The total length of the tunnel, as nearly as could be ascertained at the moment, is, in round numbers, 2,870 yards, or about 30 yards more than the contract measurement; and the cost, according to the contract, is 195,000*l.*

According to the design, drawn as in London, the tunnel would have entered Lyttelton at a slight curve. This part of the plan was altered, so as to give a straight run throughout.

Mr. Edward Dobson is the engineer; and the work has been superintended throughout by Mr. Edward Walker and Mr. Harry Smith as foremen.

THE CATHEDRAL OF RATISBON.

In the year 1273 several buildings in Ratisbon, and amongst them the Cathedral, were destroyed by fire.

Bishop Leo, of the patrician family of the "Thundorfer," resolved to build a new cathedral, which was to be constructed of hewn stone; and his intentions were seconded by the rich burghers of the town, especially by the "Zaude" family, one of the most prominent in Ratisbon. In 1275 the foundation-stone was laid. The work went rapidly on, so much so that in 1276 the choir was consecrated. Ludwig, who was the architect, directed the work after his plans. After the death of Bishop Leo (in 1277), the building advanced considerably under his successor, Heinrich von Roteneck, especially so towards the western side; and the choir was completed. The rapid continuation of the works was facilitated by the great abundance of provisions of every kind at that time, so that the wages of the workmen were very low. Bishop Heinrich von Roteneck died in 1296. His successor was Conrad von Lupburg, to whom Nicolas von Stachowitz followed in 1313. During his episcopate, which lasted twenty-seven years, much was done; but great difficulties and impediments were in the way for continuing the western side, and for beginning the building of the two towers.

It was necessary to remove several houses and chapels adjoining, in order to begin the towers now existing. Such changes, in those times, required difficult and much prolonged negotiations; but these were so far effected in 1325 that the foundation of the southern tower was laid. In 1380, at last, it was decided that the demolition of the Minster on the square was to be effected, and one year afterwards the difficulties were removed, which so many years had been in the way of completing the building of the cathedral; soon after which the second tower was built. The principal altar was erected of stone in 1404; it existed until the beginning of the seventeenth century. The present altar was erected in the year 1755.

The building of the cathedral itself went on without interruption, though slowly, by means of many voluntary contributions, made principally by citizens of Ratisbon, who did everything they could to promote the work. But the doctrine of the Reformation taught by Wycliff and John Huss caused great excitement and disorder, and the Hussites laid waste the country, so that the funds for building the cathedral could only with difficulty be collected. When the Reformation was effected a total interruption took place, estranging a great part of the population from the Roman Catholic clergy. In consequence of the contributions coming in very sparingly, the tower reached in 1436 only the height of the roof of the church. The naves were vaulted in 1464, and the gable between the two towers was built in 1480. In 1496 the third story of the northern tower was so far raised as it was still seen in 1858. After the year 1496 but little was done towards completing the building.

The following persons were active as "building and working masters" (*Baubau und Werkmeister*) of the steeples:—Liebhart der Hymner, Heinrich Dürmstetter Wenszle, Andreas Egl, the three Rortzer, Conrad, Mathias, and Wolfgang, father and sons. The last named, as ringleader of a rebellion against the magistrate of the town, was beheaded in 1514. After him followed Erhard Heydenreich, who died in 1524. Albrecht von Törring (1613-1649) caused the cathedral to be restored after the taste then prevalent. A rich iron trellis was made at the entrance into the choir, before the high altar two large candel-

WROUGHT METAL WORK IN THE PARIS EXHIBITION.

Spire of the National Memorial of the Prince Consort, Hyde Park.

The Cross on a larger Scale.

[See p. 588, ante.]

labra were placed, and the towers were provided with roofs. It was under the same Alhert von Türring that the Thirty Years' War broke out. Duke Bernhard of Weimar captured the town, and the Protestants took possession of the cathedral, and kept it during nine months.

Under Bishop Clemens (a Duke of Bavaria) more attention was, at the end of the seventeenth century, bestowed on the building of the cathedral. Above the crossing of the nave Master Anton Riva, of Landslut, erected a cupola according to the Italian taste, and from that time the works proceeded in the same sense and manner. The interior was overloaded with tasteless pomp, and the noble building was thereby disfigured.

King Ludovic I., of Bavaria, in the years 1834 to 1838, caused all that was contrary to good taste to be removed; the cathedral was ornamented with many painted windows; the altars

were renewed or restored in more appropriate style. The cupola, erected by Anton Riva, was taken down and replaced by a cross vault. These works were performed, under the direction of Councillor Gärtner, of Munich, by Inspector Nadler, of Ratishon, who accomplished the noble but difficult task with praiseworthy and conscientious care. The restoration was completed in 1839.

In the year 1858 a society for finishing completely all parts of the cathedral was founded under the patronage of King Maximilian II. and of the bishop of the diocese: and Mr. Denzinger, architect, was appointed *dombau-meister*.

The object of the society is to procure the necessary means for completing the building, especially the raising and finishing of the two principal spires. These steeples, which, before the beginning of the work, had a height of 152 ft., are to be raised to a height of 365 ft.

Our view shows the cathedral as it is proposed to be completed.

A beginning was made in 1859, and with the raising of the steeples in 1860. Up to the year 1863 the pecuniary means at the disposition of the building-master were insignificant, and little could, therefore, be done. It was then that King Ludovic I. of Bavaria took upon him to promote the undertaking by a yearly gift of 20,000 florins (about 1,666l. sterling). Since that time the works have proceeded with more speed; but they would be carried on faster if additional means could be collected.

Since 1860, about 310,000 florins, or 26,000l. sterling, have been spent upon the building. The works, it is asserted, will be completed in the year 1870. The porch to the principal entrance, as shown in our view, is triangular on plan. Of this remarkable work we shall give a more complete illustration.

RATISBON CATHEDRAL. AS PROPOSED TO BE COMPLETED — MR. DENZINGER, ARCHITECT.

THE LAW COURTS COMPETITION.

We have reason to believe, though we do not speak quite positively, that the Judges of Designs have reported in favour of the plan we have from the first pointed out as seeming to meet the greatest number of the stated requirements,—that of Mr. E. M. Barry. Further, that in respect of the external design, they give the preference to that of Mr. Street.

FROM MELBOURNE.

The Intercolonial Exhibition Commissioners reported at the close of the Exhibition that the number of exhibitors from the respective colonies was as follows:—

Victoria	1,459
New South Wales	273
South Australia	103
Queensland	36
Western Australia	193
Tasmania	738
New Zealand	88
New Caledonia	36
Netherland India	3
Mauritius	2
Total	2,956

The medallions and certificates distributed were as follow:—

	Medallions.	Certificates.
Victoria	398	61
New South Wales	80	34
South Australia	34	30
Queensland	8	6
Western Australia	18	21
Tasmania	72	89
New Zealand	22	22
New Caledonia	10	17
Netherland India	5	6
Mauritius	1	2
Total	648	640

The finance committee have just issued their balance-sheet, showing their receipts and expenditure. The Exhibition was open for 106 days. During that time 150,896 persons paid admission at the doors, and the gross attendance, including season-ticket holders, free passes, &c., amounted to 268,634 persons. The receipts are 14,433l. 2s. 1d. The expenditure amounted to 14,477l. 18s. 3d. Of this total there are at present 6,572l. 15s. 6d., which represent available assets in the shape of permanent works, which are to be handed over to the Government. The population of Victoria on the 31st of March, 1867, consisted of 364,746 males and 413,0 females, or 643,876 persons. The register-general remarks:—"During the past quarter there has been a total loss to the population of twelve persons, arising from the fact that the excess of departures over arrivals (1,473), exceeded the excess of births over deaths (1,461) that number."

The new Post Office, which has been so long in course of erection, was to be opened for the first time on the 1st of July.

The cattle market special committee, and the race committee, recommend that premiums of £1 and £50 be paid for the best designs for pens for cattle and sheep, &c., to be erected at Mouttagalla. Application is to be invited from candidates for the office of city surveyor.

A new Presbyterian church at West Melbourne has been opened for divine worship. The church has been completely finished within. The floor slopes from the west end down to the east a few yards of the pulpit, at an angle of 30 degrees, a flight of steps being placed on each aisle. Stairs lead up to the entrances, which there are two, one at each extremity of the west end, and the passages within converge to the pulpit in the form of the letter V. The church is stuccoed within, and set off with carvings. The usual form of construction has been employed in the roof, which is supported by columns, and varnished in a wainscot style. The windows are stained in devices, including scrolls with texts of Scripture. At night the church is lighted by three large lamps in the roof. The cost of the portion completed is £10,000, of which 5,000l. have already been subscribed.

Men engaged in repairing the Amherst embankment have discovered that the damage has been caused by the boring of water into the bank. The perforation has been stopped.

It is proposed to supply Pleasant Creek with water by means of an independent scheme, the scheme consists in the construction of a reservoir in the Black Range, of a capacity

of 90,000,000 gallons, and two smaller ones, one at Stawell, and one at the Reefs,—the reservoir already constructed by the Government at the Reefs to be made available as a storage reservoir, and the whole of these reservoirs to be connected by pipes. In the mean time it is proposed to construct the reservoir at Stawell of a capacity of 40,000,000 gallons, and that proposed at the Reefs of 5,000,000 gallons. The total capacity of the proposed reservoirs will thus be 135,000,000 gallons, independently of the reservoir already constructed by the Government. Landsborough is proposed to be supplied from a reservoir constructed on the Landsborough Creek, from which the water would be conveyed by means of an open channel. The supply is estimated at 600,000 gallons per diem, and the cost would be about 6,000l.

BIRMINGHAM AND MIDLAND BANK.

The corner-stone of the new building was laid on Monday last. It will be erected at the corner of Stephenson-place and New-street, Birmingham, and will be "Classical" in design. The front towards New-street will be in three, and that towards Stephenson-place in eight compartments, divided on the ground-floor by rusticated pilasters, having Ionic pilaster caps on a plain substantial basement. The first floor will have three-quarter attached columns of the Corinthian order, with coupled pilasters at the angles. The upper cornice will be crowned by an open balustrade, the angles being carried higher, and treated as coupled pilasters, with separate caps and cornices. The public entrance will be in the centre of the New-street front, under a portico having four Ionic detached columns, the shafts and bases of which will be of polished granite, each in one piece. The banking-room will be 32 ft. long, 49 ft. wide, and 30 ft. high, lighted by nine circular-headed windows, each 18 ft. high, and by a lantern-light in the centre of ceiling, 37 ft. by 18 ft. 6 in. The private entrance will be in Stephenson-place, and the board-room and ante-rooms on the first floor. The rest of the upper portion of the building will be occupied by the private rooms for managers and apartments for the resident clerks, porters, &c. The strong-room is removed from the external walls, and will have double doors. The books, bullion, &c., are to be lowered and raised by means of a hydraulic lift. The main fronts will be in Portland stone, and the interior walls and decorations of the bank and principal rooms in Martin's cement. The fittings will be of polished mahogany, and the bank and other principal rooms are intended to be warmed and ventilated by Dr. Van Hecke's system, introduced into this country by Mr. W. W. Phipson, C.E. The whole will be executed under the direction of Mr. Edward Holmes, architect. The builders are Messrs. John Cresswell & Son.

A SLIP AT ROMSEY ABBEY CHURCH.

SIR,—The Abbey Church of Romsey is well known as one of the finest specimens of Norman architecture in the kingdom, and much has been done of late years in restoring it, and for the most part very well done. To the Ecclesiastical Commissioners, as chief recipients of the rectorial tithes, belongs the duty of keeping the church in repair; and this, after long waiting for, is now being done. The lower tier of arches is opened, displaying the massive grandeur of the columns, which before was hidden, and producing a magnificence of effect hardly to be equalled. The clearstory and triforium arches are being restored, and a fine roof is in course of construction to replace the old dilapidated one, which formerly extended to the extremity of the building; but, having been destroyed by fire, was replaced by one nearly flat; and the present one, which is raised to the original pitch, instead of being continued to the end of the building, stops short some feet, and is furnished with a plain gable, of the barn style, and the battlemented parapet remains. It is not yet too late to remedy this, which, if completed, will always be regarded as a great mistake. The north transept was restored two years since, and original one, rises from the outer wall, and instead of being plain, has five fine arches, the centre one open to the interior, and now filled with stained glass. The restoration of the south transept is contemplated, and that, when carried

out, will correspond with the north; and then the chancel, which, if there were any difference, should have been more elaborate, will be plainer externally and internally, and with the incongruous parapet remaining. It is true the architecture of the east front differs from the others, as there are two fine Early English windows inserted; but this only makes the unsightliness of the present arrangement more conspicuous.

OBSERVER.

THE CHISEL.

"ANOTHER FREEMASON" writes,—I did not see the letter of your correspondent "Freemason" until the commenting of "Antiquary" in your last issue drew my attention to the query concerning the invention of the chisel. Perhaps it may be of interest to point out that the derivation of the name is probably from the old British word *chisel*, a stone; as, for instance, in the remarkable ridge of pebbles on the south coast of Devon, called from this circumstance, "The Chisel-bank." And, again, also (as local historians agree) in the word *Chelsea*, derived from *Chisel-ee*, on account of the nature of its gravelly or stony soil. These derivations would carry us back to the era of flint implements as the period of the invention of the chisel. Many of the specimens shown in museums were evidently intended for the same purposes as the modern steel tool, which has had appropriated to it, in industrial technology, the word originally employed to designate a shaped sharp stone, used for the purpose of hollowing out canoes, or other wooden conveniences of savage life.

THE INTERNATIONAL ARCHITECTURAL CONFERENCE.

LAST week brought to a close the Conférence Internationale projectée by the Société Impériale et Centrale des Architectes à Paris, of which M. Baltard is president. It was numerous attended by French architects, and Russia, Germany, Italy, Prussia, Portugal, &c., were well represented; but I am sorry to say only one Englishman attended, although it was made known to the Institute some time since. Had they taken a little trouble to have made it known to its members, Englishmen would have more fully responded. The nourishing this feeling of fraternity between the two nations is a great boon, at least to the younger members of our profession, for one learns more in an hour in the bureau of a friend than during a week *en ville*. It is there we can see and comprehend their system of planning, in which they excel all others. After the conference was ended the society gave a banquet at the Grand Hôtel du Louvre, inviting *tous les étrangers*. About 130 or more attended, and the evening passed off very pleasantly.

W. HOVENDEN HENDRY.

ST. STEPHEN'S, VIENNA, AND THE SULTAN.

SIR,—No doubt, when Abdul Aziz first beheld Vienna's greatest ornament, he was well aware of a family anecdote, highly creditable to the architectural taste, and perhaps some religious liberality, of an ancestor. But as the fact seems, strangely, little known, it may be well worth bringing into notice at this juncture. May that well-omened visit, as those to other countries, not least our own, be the harbinger of much peace and mutual benefit!

During the fearful Ottoman siege, under the Sultan of the time when the city was relieved, when sinking with its insufficient garrison of 11,000 men under Stahremberg, by the good ally John Sobieski of Poland (its then own master, Augustus, being of little worth), the Sultan appears to have been deeply struck with the noble spire of St. Stephen's Cathedral; so much so as to have revolted from its wanton destruction. He therefore sent a message to the authorities, that if his insignia and cypher were placed on the building, he would direct great care to be taken against injuring it. This was promptly agreed to; and, to the credit of all, the insignia have never been disturbed, and are passed now by the visitor, at a high star, during his ascent, which can be made nearly to the top, as at Antwerp.

This tower and spire of Vienna (of which there is a south-west view in Dibdin's "Tour") are perhaps the most beautiful in the world. Of towers alone, Ulm (300 ft. high) may come second; and the nearest approaches in England may be St. Peter's, Norwich; and Wrexham. The lower story of Vienna, outside the south wall of the church, is very large. From thence the gradual decrease or tapering is of wondrous beauty, to the summit, which is about 50 ft. higher than our St. Paul's.

In the words of a recent traveller, it is literally "frosted over" (only not excessively conspicuous), with carved ornaments. It has a clock, a kind of gallery for observations, and contains many large bells, the "great" one weighing about twenty-four thousand pounds. P.

COMPLETION.—BOARD OF WORKS, POPLAR DISTRICT, NEW OFFICES.

At the meeting of the Board, on the 30th ult., the report of the New Offices Committee, recommending the following designs, was received and adopted:—

Motto.	Name.	Premium.
Circinus.....	Mr. Fletcher, late Assistant Surveyor to the Board.	350
Octagon.....	Mr. Arthur Harston, East-India-road, Limehouse.	20
Cives.....	Mr. A. Wilson, Bow.	20

Forty-three designs were submitted.

SIR,—A short time since ten designs out of forty-five were selected by a committee of the Poplar Board of Works, and referred to Mr. Sancton Wood to report upon, but not in their order of merit, as the Board reserved to themselves the right of awarding the premiums, which they have now done to three competitors, who are intimately acquainted with the Committee.

The sum proposed to be expended, according to the instructions to competitors, was 5,000l. Mr. S. Wood estimates the first premiated design, "Circinus," to cost 5,436l.; the second, "Octagon," 6,080l. (?); the third, "Cives," 6,995l. (!)

There are, I understand, several designs sent in showing far greater artistic merit at a less cost than those selected for premiums.

The designs are to be exhibited for one week in the Town-hall, Poplar, and one week in the Vestry-hall, Bow, the admission to be by tickets. The following extract from the local paper (*East London Observer*) is sufficient to open the eyes of the ratepayers to a neat job:—

"We may state that it was reported that 'Circinus' is no other than Mr. Fletcher, the late Assistant-Surveyor to the Poplar Board of Works; 'Octagon,' Mr. Arthur Harston, of East-India-road; and 'Cives,' a son of Mr. A. Wilson, of Bow. Of course, the conduct of the members of the Board is unimpeachable; and there cannot be the slightest doubt but that they exercised their architect's knowledge to the fullest extent in the selection of the plans. But the fact that one of the three favourites has been connected with the Board, that another is about to form an alliance with a member's daughter, and that the third is a gentleman of considerable local influence, is so very remarkable that we hasten to endeavour to remove any idea that there has been the faintest tinge of favoritism or collusion between the parties, more especially as the committee, to protect the public (and themselves from suspicion), employed an surveyor to guide them in their decision, and have awarded him the magnificent sum of 25l. to give an unbiased opinion on the relative merits of the plans submitted to him."

DELTA.

BARRED STREETS.

Some attention has recently been directed to the number of streets in London having bars across them, which of course precludes any other than local traffic; and during a discussion in the Metropolitan Board of Works, a member stated that he lived in a street having a bar, and should it be done away with, he would expect to be compensated. It further appears that these streets are paved, watched, and lighted at the public expense, just as other streets are, where no such privilege exists, which leads one to wonder upon what principle of equity such an arrangement is permitted to continue. Surely there is something wrong in allowing individuals to lay out streets, and for their own privacy and convenience debarring the public from their use; and as in the case of Hamilton-place, a few persons, socially and politically powerful, com-

elling the public to an outlay of probably more than 100,000l., to keep their little *cul de sac* quiet and secluded.

All these seems to show pretty clearly that every interest having sufficient political influence in this country is well protected, save the public interest, which has but small chance of success in the scramble of powerful cliques and coteries, armed with prescriptive rights, privileges, and franchises, which are in most cases, when closely scrutinized, founded upon usurpation or political corruption, if not something worse.

If, however, the claim be recognised, let us see how far it will take us. There has lately been a good deal said about opening out blind alleys, if for no other purpose than their ventilation, and few will deny the benefit of such a change; but will not the owners and occupiers of such places, in even the most unsavoury parts of the town, be entitled to compensation for having their courts and alleys disturbed by being made public thoroughfares? No doubt, if other things were equal; but "there's the rub."

To return to the subject of barred streets and streets ending in a *cul de sac*, I will venture on what may be deemed a rash assertion; that is, that to continue these streets and to abolish those bars would be to stop at once the cry for wider streets and more of them. Let me mention Long-acre, Old-street, Paternoster-row, Lincoln's-inn-fields, Judd-street, and scores of others too many to name. J. W.

BURLINGTON HOUSE SCREEN.

SIR,—Perceiving that workmen have commenced the removal of the wall in front of Burlington House, permit me to suggest that the well-known colonnade on the inner side should be re-erected in one of our public gardens. It would be useful as a screen to many objectionable features, and as a shelter to visitors from rain. Possessing some architectural beauty, and associated with memories of Swift, Pope, Handel, Edmund Burke, and many other eminent men of the eighteenth century, I believe the question of its preservation well worthy of consideration.

Should this note have no other effect, it may serve as a hint that one of our best public buildings is about to undergo great alterations in consequence of a vote which silently passed the House of Commons, viz. 15,000l., for adapting Burlington House to the use of certain learned societies. B. H. P.

APPARATUS FOR BUILDING CONCRETE HOUSES.

SIR,—In your journal there is an advertisement headed "Fall's patent Apparatus for constructing Walls, Houses, and other Buildings," accompanied by a wood-cut of the said apparatus, which Mr. Tall in his advertisement claims the credit of having invented.

The apparatus in question was not invented by Mr. Tall, but is well known to engineers and architects as being fully figured and described in most of the standard elementary works on building.

For example, in "Rondelet, de l'Art de Bâtir," vol. i., article 2, "des Pierres Artificielles," pp. 229—230, the apparatus is fully described and illustrated by sixteen figures, occupying the whole of plates 4 and 5 in the first volume of the folio atlases of plates accompanying the work.

In another well-known work, "Peter Nicholson's Architectural Dictionary," the same apparatus is described in p. 526 of the second volume, and fully illustrated on the plate facing that page by fifteen figures. Nicholson says that it has been in "use for some time in different parts of this kingdom, as in Bedfordshire, Lancashire, &c."

The apparatus is also fully described and illustrated by woodcuts in pp. 725, 726, and 727 of "Cresy's Encyclopedia of Civil Engineering."

The apparatus thus elaborately figured and described in these three very well known standard works is in all respects identical with that claimed and figured by Mr. Tall in his advertisement as his own invention. "The chimney core" figured in his advertisement has also been in common use in forming flues in rubble walls for the last ten years at least.

There are two other statements in his advertisement that invite comment. He states that the coat is only half that of brickwork, and the strength ten times as great. This is an enormous exaggeration. For equal thicknesses the strength of the concrete wall is not ten-fold, but only three-fold that of brick: as correctly stated in Mr. Chacwick's report on the concrete buildings at the French Exhibition.

Duke-street, S.W. HENRY CONYBEARE.

FALL OF BRICKWORK.

LAST week the fronts of two shops in course of erection with others in the Gloucester-road, Old Brompton, fell just before the workmen left. One man was injured and taken to the hospital. The materials appeared to be good. The cause of the downfall seems to have been the giving way of that portion of the party-wall on which the bressummers of the two shops rested, there being no ties to keep the bressummers from being thrust outwards by the weight of the brickwork above, neither were the story-posts inserted. Too much care cannot be taken in carrying up a party-wall the end of which has, as is constantly the case, to support the weight of the fronts of two houses. It should be constructed of hard bricks set in good cement under the end of bressummer, with hoop iron bond about every six courses, and strong iron ties should be built into the walls, say 5 or 6 ft. long, passing over the top of the bressummer and securely fixed; ties should also be inserted to steady its position. The stone temple under each end of bressummer should be, at any rate, the full width of the bressummer. The surprise is that there are not more accidents than even do occur from neglect in this particular. If builders would but think, they would see the risk they run, and that it might be avoided by a very small extra outlay. We have made more, perhaps, of this matter than might at first appear needful; but if this careless system of constructing the walling to carry so much weight be not altered, and requisite ties used to keep the bressummers in their proper position, some far more serious accidents must occur sooner or later than has hitherto taken place.

THE GUILDHALL, LONDON.

At the meeting of the Common Council on the 2nd inst., on the motion of Mr. Stapleton, chairman of the City Lands Committee, who stated that during the last fifteen years the Corporation had expended about 50,000l., in all, in adapting the Guildhall to great State ceremonies, it was resolved by a majority of 11 in a court of 97 members:—

"That the repeated and heavy expenditure which takes place at Guildhall on every occasion of public reception affords evidence of the inefficiency of the accommodation of the space available for the library and museum, which the Corporation for such purposes, while the space available for the library and museum has also been declared altogether insufficient; that, therefore, it is desirable some comprehensive and well-considered plan for providing permanently for such objects should be at once prepared and laid before His Court, and that it be referred to such committee as His Court shall direct to obtain a plan and estimate accordingly."

On the motion of Dr. Sanders, it was resolved in effect to retain the building in Guildhall-yard recently erected for the reception of the Sultan for the use of the Corporation until after the 9th of November next, Lord Mayor's-day.

It puzzles us to divine a reason why the style of the Guildhall was not followed in the erection of the temporary building referred to. The actual effect is very incongruous. By the way, we should much like to learn how many representatives of art, literature, or science were invited on the occasion of the recent visit of H.R.H. the Prince of Wales and the Sniltau?

COMPENSATION CASES.

Lieut.-Col. James and Metropolitan Railway.—T property acquired for the extension of the Moorgate Street Station, comprises some twenty-seven shops and warehouses, &c., known as Nos. 61, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, and 85, Fore-street, and No. 11, Little Moorfield, and it was agreed to refer the question of compensation arbitration, the arbitrators being Mr. B. A. Withall, on behalf of the Company, and Mr. Geo. Fuller, of Fore-street, on behalf of the claimant, who appointed as the umpire Mr. Charles Lee; and the case was commenced the Westminster Palace Hotel, on Wednesday, the 29th ult., the claimant being represented by Mr. Haslewood Q.C., and Mr. Little, instructed by Mr. Geo. Stennish, solicitor, of Tonbridge, Kent; and the Company by Mr. Lloyd and Mr. Holloway.

Mr. Hawkins, in opening the case, maintained that the correct way of arriving at the value of property of this description, was by considering it as building land, and adapted to much more valuable purposes than the present use. A question had arisen as to the validity of certain leases granted by Col. James's father, and he would therefore produce evidence as to the value in either alternative.

Mr. George Fuller, arbitrator, valued the property, 86,000l., or, subject to the said leases, at 77,500l. Mr. Haslewood, architect, said his opinion was that the whole of the land should be cleared, and it might then let on building leases in Little Moorfield, at 2s. per foot, in the eastern part of the estate, in Fore-street 3s. per foot, and the western part at 2s. 6d. per foot, with 100ft.

capitalized, would give a sum, including the customary addition for forced sale, of 87,857l. or allowing the disputed leases, 77,527l.

Mr. Horne, of the firm of Eversfield, Horne, & Co. valued the property at 87,453l.; or, allowing the leases, 77,237l.

Mr. Farmer, of Messrs. Debenham, Tewson, & Farmer, valued that the ground at the eastward end, if cleared, could be 2s. 8d. a foot; and that at the westward end some of the houses were of a very good description, and were worth at the corner, The Grapes, 20s. 6d. per annum, the public-house and trade attached to it, and being worth 400l. per annum. This would give a total of 87,897l.; or with the leases allowed, 79,939l.

Mr. Trist, of the firm of Norton, Trist, Watney, & Co., was of opinion that if the leases were held to be valid, the eastern portion of the estate should be divided into blocks, each of which should be cleared at, and not until, the expiration of the longest lease in each block, and the land would then be worth on an average 2s. 6d. per foot, and the side of the estate might be taken at their present rental value. This would bring the valuation to 55,858l.; or, if the leases were invalid, to 71,432l., but these figures did not include the reversionary interest in the public-houses.

Mr. Vigne dealt with the property in a similar manner to Mr. Trist, and valued it, in the event of the leases being good, at 65,684l., or if in hand, at 71,867l.

Mr. Ashpitel, architect, also divided the property into sections, but differently to the two previous witnesses, and valued it with valid leases at 68,453l., or invalid at 62,175l.

Stevens v. The Royal Commissioners of the new Law Courts. This was a covenant claim at Courts of Justice Compensation Court, August 1st. Before High Bailiff of Westminster, and a jury, exceeding 20,000l., on the part of Mr. Kelly, the publisher of "Kelly's Directory," in violation of the terms of a business premises and lease by removal. The case was appointed for half-past ten o'clock, and seemed to have created much interest.

Mr. Kelly, Mr. Kelly, C.C., and Mr. Horace Lloyd were for the claimant; and the solicitor for the defendants was Mr. M'Alabon appeared for the Royal Commissioners. A special jury was summoned, and only "one" attorney looked his seat in the box for more than an hour. The parties separated to settle the matter for the property required for the new Palace of Justice. At 12,000l., if he felt himself compelled to give a verdict for the claimant, and the solicitor for the defendants. The jurymen said, "Oh, yes, for twice the amount." The High Bailiff thought they should be sworn to give a verdict. The suggestion was acted upon, and a verdict by consent was recorded for 12,000l., and the jurymen received their

Stevens v. The Royal Commissioners. This was a claim of 6,728l. for premises required for the new Law Courts, at 2, Bell-yard, and for loss consequent on removal, as printers' warehouses for printing, &c., known as a "Cottage." On this occasion nine special jurors attended, and the parties consulted for some time to settle the matter. Mr. Kelly, for the claimant, said his learned friend Mr. Lloyd had been so pathetic that he had been more liberal than perhaps he ought to have been. The jurymen gave a verdict for 10,000l.

Mr. Lloyd said there were other conditions as to occupation to Lady Day, and the plan to be taken at 200l. A verdict was returned by the jury for 10,000l.

CHURCH-BUILDING NEWS.

Paddington.—The foundation-stone of the church of St. Mary Magdalene, was laid on the 22nd ult. The edifice will be situated in Goodchester-street, Harrow-road. Mr. Street is the architect, and Mr. Cowland the builder. The church will be in the Gothic style, and built of Bath red brick and stone. The estimated cost will be about 20,000l., a portion of which comes out of the Bishop of London's fund, the balance being supplied by private donations. The edifice will accommodate about 1,000 persons.

Kensal Green.—A gentleman, who has preserved his incognito, has contributed 5,000l. to the Bishop of London's Fund, for the purpose of promoting the erection of a new church at Kensal-green, the district around which is rapidly increasing in population.

Broadwinser.—A new church has been opened at Drimpton, a hamlet in this parish. The cost has been defrayed by subscription. The whole of the stone was given by Captain Murray, of Catherstone, Charnwood, who is a baronet, and this was drawn gratuitously by Mr. Pottinger, Mr. Slatler, and other farmers. The building is at the upper end of the hamlet. It has four single-light lancet-headed windows on each side, which crosses between them, a three-light window at the east end, and a small window of three lights under a pointed arch at the west end, the only doorway. A bell-turret surmounts the west end. The church has an open wood and the pulpit and reading-desk stand at the corner of the chancel railings. The open benches supply seats for 90. The design was finished by Mr. Allen, architect, Cromwell, the building is by Mr. Chick, of Beaminster, Mr. Holt, of Broadwinser.

Embsay.—The foundation-stone of the new church which is to be built in this parish has been laid. The contract has been undertaken

by Mr. A. Squibbs, of Bridgwater, builder, for 2,000l. The architect is Mr. C. Knowles. The church is to be built in the Perpendicular style, and will accommodate 200 persons.

All Cannings (Wills).—The chancel of the ancient church of All Cannings has been restored by the Rev. T. A. Methuen, rector of the parish. A new pulpit of carved oak has also been erected by the friends of the rector as a memorial of his ministry for half a century. A brass plate beneath a stained-glass window, given by Mr. Sotheron Estcourt, bears this inscription:—"This window is dedicated to the honour and glory of Almighty God by Thomas Sotheron Estcourt, in memory of a friendship of more than 50 years between the houses of Methuen and Estcourt. We took sweet counsel together, and walked in the House of God as friends;" Psalms lv. 14."

Great Billing.—The church of St. Andrew at Great Billing, has been restored in the interior, and a new organ, built by Messrs. Bevington, of London, inaugurated. There is a mortuary chapel (generally called the Thomond Chapel) on the north side of the chancel, which contained, in addition to several mural monuments of the family, a huge family pew, with its fire-place, screen, and curtains, in the style of the last century, looking more like an inferior drawing-room than a place for prayer. This has been removed, and an arch formed at the east end of the north aisle, and the organ now occupies the place of the pew. This mortuary chapel was formerly entered by an archway of bad classic character and proportions. This has been removed, and an arcade of two arches, with carved foliated capitals of Early Decorated character, substituted in its place. The architects (Messrs. E. F. Law & Sons) originally intended to form an arcade of three arches, but on pulling down parts of the west wall, for the purpose of inserting the arches, discovered two old square-headed Decorated windows, one at the east and one at the west end of the wall. These have been preserved and restored, and two arches only placed between them. All the old pews have been removed, and new open seats, with open-framed backs, and hook and kneeling boards placed in their stead. The whole are executed in pitch pine. The church is heated upon Messrs. Haden & Son's principle; that is, arrangements are made for extracting the cold air from the church, as well as for forcing the hot air into it. A new oak pulpit, on stone base, of Decorated character, is placed on the north side of the middle aisle, and on the south side is an oak lectern of similar character. Much discussion took place as to the restoration or removal of an old oak screen of Perpendicular character which stood at the entrance to the chancel. At the request of the Architectural Society, as well as by the particular desire of the rector, and with the full consent of the architects, the screen has been retained and restored. The sanctuary is paved with encaustic tiles from the works of Messrs. Maw & Co., and on the face of the risers to the steps are laid the same description of tiles. The works have been carried out, under contract, by Mr. Banks, the woodwork being executed for him by Mr. Kightley, and the stonework by Mr. Belton. It is proposed to remove the flat ceiling of the nave, chancel, and chapel, and substitute open-timbered roofs. The seating, pulpit, and heating apparatus, have cost 726l., which, except 50l. contributed by the parishioners towards the heating apparatus, has been paid by Mr. Valentine Cary-Elwes. The chancel seats, sanctuary pavement, and chancel door, have cost 166l., which amount has been met by the rector and his friends. The works have been executed from designs, and under the superintendence, of Messrs. E. F. Law & Sons, of Northampton. The organ (which is the gift of Mrs. Cary-Elwes) was built by Messrs. Bevington & Sons, of London, at a cost of about 140l.

Worcester.—A new scheme, says the local Herald, is to be granted by the Court of Chancery for the government and expansion of St. Oswald's Hospital, which has been for many years "impounded" in that Court; under which scheme considerable alterations and enlargements to the charity,—its almshouses and chapel,—will take place. It is now proposed to take advantage of this new era in the history of the hospital by erecting such a church on the site of its present chapel as shall be fully adequate, not only for the requirements of the inmates of the institution, but for the accommodation of the Tything district generally. This plan is proposed as being in every way more

desirable than the erection of two churches so near together as would be the new one of St. Oswald's and the proposed new one opposite thereto. At all events, the chapel will have to be enlarged or rebuilt under the new scheme, and, with the addition of the funds already raised for the Tything church, ample means will be afforded for the erection of one good structure sufficiently capacious for the district. The bishop of the district is in favour of the scheme, and so are the Tything Church Committee. A public meeting has been held to consider the question generally, and to investigate Mr. Scott's plans for the new church.

Willenhall.—The new parish church, which has just been erected on the site of the old brick edifice, has been consecrated. The edifice is Decorated, and stands partly upon the foundations of the former building, measures 105 ft. in length internally, and consists of nave, with north and south aisles, chancel, double transept on the north side, vestry on the south side of the chancel, and a tower, through which is the principal entrance, at the west end of the north aisle. The height of the tower is about 100 ft., and of the nave, to the apex of the roof, about 45 ft. from the ground-line. The walls are faced externally with red sandstone, from Codsall, and the roofs are covered with grey and red tiles, the ridges being surmounted by an ornamental cresting. Internally the columns, arches, and window-dressings are of stone, from Codsall, of deal, stained, but not varnished. The sittings are all of oak, the greater part being new, and the remainder made from the oak pews taken from the old church. The chancel-floor is laid with encaustic tiles, from Mr. Thorne's works, at Broseley, and the aisles are paved with black and red Staffordshire quarries. The nave is divided from north and south aisles, of considerable width, by symmetrical stone pillars, over-arched by a pointed roof. The pulpit is of stone. The east window, which has five lights, is filled with stained glass, the gift of Mr. R. D. Gough. The lower part of the window is divided into ten compartments, each illustrating some special incident in connexion with the passion, death, and resurrection of our Lord Jesus Christ. The window has been put in by Messrs. Clayton & Bell, of London, and the cost is said to be 250l. On the north side of the chancel is a memorial window to a deceased son of the incumbent. The subject illustrated is Christ blessing little children. The windows on the south side of the chancel are also of stained glass, and contain representations of the armorial bearings of the Duke of Sutherland and the Earl of Lichfield. There is also a window in the north transept to the memory of Dr. Richard Wilkes, Willenhall. The window exhibits the family crests and motto. The latter windows are the work of Mr. Holland, of Warwick. The church is intended to seat about 850 persons, and one-half of these are set aside as free. The warming apparatus has been fixed by Messrs. Blakemore, of Walsley, and the gas mains by Mr. Ready, of Wolverhampton. The total cost of the structure, including fittings and the necessary preliminary expenses, is expected to be about 6,700l., and the subscriptions paid amount to 5,600l., and the subscriptions paid by Mr. Ready, in various ways, 2,300l.

Carlisle.—St. James's Church, Denton Holme, has been consecrated. The new church is situated upon an elevated plateau of ground a few hundred yards to the south of Murrell Hill House. The architects were Messrs. Andrew & Pepper, of Bradford. The material used is red sandstone, relieved by white stone from the Howrigh quarries. The design is geometric. The total length of the edifice from east to west is 112 ft., and its extreme width 58 ft. The nave, which is 50 ft. in height from the floor to the top of the ridge, is flanked by two aisles, each of which is lighted by four two-light windows, enriched with quatrefoil tracery. The chancel at the east end of the building is of circular form, lighted by three trefoil windows; but the chief feature of the building is at the west end, where a square tower rises 54 ft. high, relieved by two windows on each side and surmounted by an octagonal spire, supplemented by pinnacles at each of the four corners of the tower, the other four sides of the octagon having projecting windows also filled with tracery. The spire is relieved by bands of white stone, and finished with an ornamental iron crest of foliated design, the gift of Mr. Head, of Rickerby House. A large five-

light window, the upper part of which is filled with tracery, in geometric design, is placed in the western end of the building; and at each end of the edifice a stone cross gives finish to the roof. Mr. Spooner acted as clerk of works, and the contractors were as follow: Messrs. Thomas Dodd, Carlisle, mason; W. Davidson, Carlisle, joiner; Irving & Lowthian, Carlisle, plumbers; David Canning, Carlisle, glazier & painter; Irving, of Stanwix, slater; Hampson, of Wigton, plasterers; Maw & Ingle, Leeds, and Pickering, Carlisle, stone-carvers; W. Slater, Bradford, metal work for doors. The edifice has been built at a cost of about 4,350l.

Kidbrooke (near Blackheath).—In consequence of the increasing population in the neighbourhood of Blackheath, especially in the part known as the Hamlet of Kidbrooke, it was determined to form a district out of the parish of Charlton, Kent, and to build a church for it. Lord St. Germans, having liberally given an acre and a half of land for a site for church and rectory, the church has been erected, and was consecrated on the 3rd of July by the Bishop of Rochester. It is in the Early Decorated style, and is built of Kentish ragstone with Bath stone dressings, and has a tower and spire at the north-east angle of the nave, 150 ft. high. The nave is 86 ft. long and 28 ft. wide; the side aisles 14 ft. wide; the chancel 26 ft. long and 28 ft. wide. The vestry is on the south side of the chancel, and the organ-chamber on the north side. The pulpit, reading-desk, font, and reredos were the result of collections among friends of the rector, and were designed by Messrs. Newman & Billing, the architects of the church. The works were executed by Messrs. Dove, at a cost of about 7,200l., exclusive of the gifts, carving, organ, &c. The organ was built by Mr. Robson. The carving of pulpit, reredos, and of the church generally was executed by Mr. Seale, of Walworth.

Sedlescombe, near Battle.—The ancient parish church having become dilapidated, and the rector being desirous of obtaining increased accommodation, a committee was formed, and necessary funds having been raised, the edifice has been restored, a new chancel erected, using the old windows, sedilia, &c.; the galleries and pews have been removed, new seating after the old model being put in, by which means upwards of 100 additional sittings have been provided. These works have been performed by Mr. Catt, builder, of Sedlescombe, under the superintendence of Messrs. Newman & Billing, architects.

DISSENTING CHURCH-BUILDING NEWS.

Wolverhampton.—The new chapel erected by the members of the Methodist New Connexion of this town, on an extension of the site formerly occupied by their old one in Horsley-fields, has been formally opened for divine service. The building is not quite finished. It is in the Anglo-Italian style. The front elevation has a slightly recessed centre with two wings, the principal feature being a portico of peculiar form, some 20 ft. long, with circular ends supported by four detached columns of Corinthian character with foliated capitals. Above the portico is a triple window, and on each side is a single window. The windows in the wing have ornamented beads, and are further decorated with small columns, foliated caps, and other embellishments. The upper part of the gable is formed into a pediment. All the windows are margined at the sides and down the centre with amber and ruby-stained glass. The pews have low sloping backs and scroll ends, and will seat about 800. All the woodwork is stained and varnished with a light colour. The walls inside are an imitation of stonework. The length of the chapel is 65 ft.; width, 42 ft.; height, 36 ft. There are three large vestries, also a large school, some 65 ft. long by 42 ft. wide, under the chapel, with classroom, and some other offices. The expenses attending the erection of the building, exclusive of the cost of site, are about 2,500l. The building will be heated by an apparatus furnished by Mr. Blake, of Leamington. The architect is Mr. C. Manton, of Wolverhampton, who has personally superintended the erection of the structure.

Eccles.—Zion Temple, at Eccles, in which the members of the Methodist New Connexion worship, being now too small for the requirements of the body, a site for a new chapel and schools has been obtained in Wellington-road, and the foundation-stone has been laid. The chapel is to be in the Italian style of architecture, built of brick with stone dressings. A

portion will be partitioned off for schools until the schools can be erected. Altogether the chapel will accommodate 450 persons, and the schools hereafter to be built, 300 children. Mr. Webster, of Manchester, is the architect.

Market Weighton.—The foundation-stone of a new Wesleyan chapel has been laid here. The present edifice will occupy a site near to the present chapel, having a frontage to the principal street. The building is designed in the Italian style, by Mr. W. Botterill, of Hull, architect, and externally will be executed in stock bricks of two colours, with dressings of stone from the Harehill quarries. The principal elevation will exhibit three compartments, in which are placed the doorway and window openings, divided by pilasters with moulded bases and carved capitals. The central arch connecting the pilasters will rise into the gable, which will be finished with a modillion cornice and an ornamental apex. The side elevations will also be divided by pilasters and arches, with two tiers of windows, the one below, and the other above the galleries. Internally the dimensions are: length, 54 ft.; width, 34 ft.; and height from the floor to the ceiling, 30 ft. The accommodation provided is for nearly 400 persons, and the cost will be about 1,500l. The contractors for the building are as follow:—Bricklayers, stonemasons, and plasterers' work, Mr. R. Pape, Beverley; carpenters and joiners' work, Mr. Jas. Jackson, Hull; plumbers and glaziers' work, Mr. H. H. Law, Market Weighton; slaters' work, Messrs. T. Smith & Co., Hull; and painters' work, Mr. J. Richardson, Market Weighton.

STAINED GLASS.

West Retford Church.—A window has been placed in this church in memory of the late Rev. Charles Dales Butterfield, rector of the parish. The window is inserted at the east end of the church, and is of three lights of an Early English character, and with the crisps and spandrels floriated. The interior of the upper quatrefoils are principally filled with the representation of angels, having instruments of music, whilst the two centre ones contain each the figures of cherubim. The centre, and of course, the principal compartment, contains an allegorical representation of St. Michael the Archangel (to whom the church itself is dedicated), holding scales in his left hand, and apparently "treading the clouds and walking upon the wings of the wind," below which are seraphim amongst stars. The upper dexter are the three angels announcing to Abraham the birth of a son; the lower portion, that of Samuel being led to the Temple; thus blending the Old Testament dispensation with the New. Messrs. Hardman & Co., of Birmingham, were the artists, and the cost was 200 guineas.

St. Mary's, Eye-hill.—This church has just received an addition to its internal decorations in the shape of a stained-glass window. Mr. Baguley, long connected with the establishment of Mr. Wailes, is the artist. The window, which is in the Decorated period of architecture, consists of two openings, and is in the south transept: the design of the ornamented portion is the rose and lily, terminating in a floriated cross. On a red ground, the shapes in which the groups are placed are formed by entwining the stems. The subjects are explained by texts beneath—"Mary hath chosen that good part," &c.; and, "Jesus saith unto her, 'Thy brother shall rise again.'" "The Lamb which was slain" is the subject of the tracery. The window is created by a lady, in remembrance of two relatives. The portrait of one is inserted in the lower part of the window.

St. Olave's, York.—A stained-glass memorial window, executed by J. W. Knowles, York, has been erected in this church. The window chosen is on the south side of the church, and is of three lights, with tracery of Late Perpendicular work. In the centre compartment, under a canopy, is represented the figure of Christ as the Good Shepherd, the side-lights and tracery being filled in with geometrical ornament.

St. Peter's Church, St. Alban's.—Three stained-glass windows, by J. B. Capronnier, of Brussels, have just been inserted in the south side of the nave of this church, at a cost of about 400l. The windows are each divided into three principal lights. The subject of the first of these windows next the chancel is Our Lord's parable of the Good Samaritan. The second window contains a representation of Our Lord as the

Good Shepherd. The subject of the third window is the parable of the Prodigal Son. The stonework of the windows has been restored by Mr. Haselgrove. The other stained-glass windows in the church are also by M. Capronnier. In the east window, the figure of an elder, "harping with his harp," has been substituted for a symbolic pelican, which has been removed to another window of the church. On the north side of the chancel five divisions of windows have been glazed with relics of stained-glass windows of the fourteenth century.

SCHOOL-BUILDING NEWS.

Ruthin.—The Grammar School, Ruthin, has been undergoing extensive alterations and additions, which are upon the eve of completion. The contractor was Mr. George Clark, of Chester architects, Messrs. Lloyd Williams & Underwood.—The National Schools, Llanynghan near Ruthin, were recently opened. They accommodate nearly eighty children, and were designed by the same architects. The contractor was Mr. Robert Williams, of Rhyl. The cost was under 700l. The material for walls is pressed brick and free stone, all millions, quoins, plinths, jamba, &c., being of the latter material. *Gwynnysynghid, near Mold.*—A national school has been erected here, at a cost of about 300l. The walls are of stone, and the dressing of free stone. Mr. John Roberts, of Mold, was the builder.

Bodelern.—The national schools at Bodelern Anglesey, have been designed by Messrs. Lloyd Williams & Underwood. The works are on day work, Mr. Nicholson superintending them. The cost was 600l. The walls are of limestone and the mullions and dressings of free stone.

Wincle (Cheshire).—The new school-building at this place, the gift, with the site, of Mr. T. P. Daintry, of North Rode, have recently been opened. They comprise school and master residence, with the requisite offices, and walled yards, and play-grounds. The buildings are erected of stone, and the school is faced internally with pressed bricks, blue and red, bands and patterns, the porches being faced with stone, as the exterior. The roof is open timbered, with a ventilating spirelet on top covered with plain and ornamental tiles, and the whole of the woodwork is stained and varnished. The site offered some difficulties, which have been satisfactorily overcome. The inequality of the ground have been formed into terraces round the building, and planted with shrub. The school is warmed by Messrs. Haden & Son apparatus, and arrangement is made by which the entrance and staircase of the master's house can be warmed when desired. Mr. Sugden, Leek, was the architect.

Kingsley (Staffordshire).—The new endow school-buildings at this place were opened on the 23rd ult. They are built of brick, with cast dressings and blue brick hands, and comprise boys', girls', and infants' schools, with class-rooms and separate play-grounds, with the requisite offices, and residences for the master and mistress. The entrance-lobbies to the schools afford accommodation for hats and cloaks, and are also provided with washhand-basins in recesses in the walls. The roofs are open-timbered, constructed with collars and curved braces, covered with plain and ornamental tiles. At the intersection of the roof is a hall spirelet, which acts as a ventilator and is one of the front gables is mounted by a bell-turret. The residences contain sitting-room, kitchen, scullery, parlour, and three bed-rooms, with closets, &c., a separate yard and out-offices. Open fireplaces are provided both to the schools and class-rooms, but provision has also been made for the induction hereafter of the warming apparatus. Messrs. Haden & Son, of Trowbridge. Externally an expression of a domestic character has been given to the residences, which serves to distinguish them readily from the schools, but with any disturbance of the unity of the combined group of buildings. The works have been carried out by Messrs. Henry Goldstraw, Wetley Rocks, and Geo. Tipper, of Kingsley. Mr. Sugden, of Leek, was the architect.

Bristol.—New Wesleyan Methodist Day-Sunday Schools are now being erected at Bay Mills, Bristol. A memorial stone has been set by Mr. Holden, M.P. The architect is Samuel Hancock, of Bristol, and Newport in Gloucestershire; and the builder is Mr. Summerville, of Bristol.

Miscellaneous.

ERRATUM.—Collage Designs, Dury St. Edmunds. The names of the successful competitors are Corder & Laslett, not "Corder & Larkett," as printed.

METAL SCREEN: ST. MICHAEL'S CHURCH, CLIFTON HAMPTON.—A brass screen, manufactured by Messrs. Hart & Son, has been erected in this church under the superintendence of their foreman, Mr. Buckingham. It consists of five arches. Two on each side are surmounted with a crest of polished brass foliage. The centre one consists of a crocketed pediment, terminating in an ornamental Latin cross, under which, on an ornamental bracket of rich foliage, stands a full-length figure of St. Michael (the patron saint of the church) in bronze. The shafts of the arches are of brass and iron, terminating in ornamental capitals of brass.

THE GLASGOW WATER.—Chemists at the London Institution have examined the water from Loch Katrine, as supplied to Glasgow, with an unexpected result. They say:—"We find that 1,000,000 parts of this water contain putrescible organic matter corresponding to 0.13 parts of ammonia. The numbers for the New River water, which supplies some parts of London, are 0.09, and for the Southwark and Vauxhall Company's water, taken from the Thames high up the river, 0.20. The Caterham water, and also a spring in the greensand near Dorking, contain no putrescible organic matter. These facts point to the propriety of seeking for a supply of drinking-water from springs, and not from rivers and lakes."

KIDDERMINSTER SCHOOL OF ART.—The students of this school have been very successful in the national competition which has recently taken place. A gold medal has been awarded to one student, Edward Poole, and there are but two gold medals for design awarded amongst the 110 schools of art in the kingdom. The intrinsic worth of the medal is 18*l.*, but its mere monetary value is, of course, secondary to the honour which it carries with it. In the same competition a bronze medal was obtained by George Lees, and honourable mention and Queen's prizes by various others. Since Mr. Kennedy's appointment to this school, nine national medals have been obtained by nine different students, who are now, through skill as designers, filling situations of importance in London, Halifax, Glasgow, and other places. This ought to show the manufacturers and others interested that the money expended in supporting the school is well invested.

REMARKABLE ARCHEOLOGICAL DISCOVERY ON THE POTOMAC RIVER IN AMERICA.—A narrative bearing date 1117, and called the Skalhott Sagr, was found in the ruins of the college at Skalhott, in Iceland, in 1863; and the truth of this narrative, so far as it relates to Icelandic voyagers having reached America, or Great Ireland, is said to have been recently confirmed by the discovery of a Runic inscription, with bones, bronze trinkets, and even Roman coins (!) on the Potomac river in the United States. This inscription is thus described by M. T. C. Rafinesse, who is said to be an eminent antiquary:—

"On the 28th of June, 1867, in company with M. Louis Pasteur, the distinguished geologist, Professor Brand, of Washington, and Dr. Boyce, of London, I had the happiness and satisfaction to discover the most indisputable proofs of the early Icelandic voyage in a Runic inscription, marking the grave of an Icelandic woman, named Runa, and afterwards by examining the partial remains of a human body in the very spot indicated by the Runic inscription, to which I have given the distinctive name of the White-shirt Runic Inscription, is on the north-east side of the large rock commonly called the 'arrow-head,' in the Potomac river. The White-shirt inscription, transcribed into Roman letters (with the signs and accents) reads as follows:—[Sign X] HER HVIHLIR SVASY [Sign T] AGRHARDR [Sign X] AUSTREIR THINGR [Sign X] GLEDA [Sign X] HAFTHIN [Sign X] GAI [Sign X] GLEDA [Sign X] HAFTHIN [Sign X] HENAR [Sign X] HVIHLIR [Sign X] HVIHLIR. Which, translated into English as nearly literally as possible, and omitting the signs, reads thus:—'Here lies the body of Runa, the fair-haired, a person from the island of Iceland, the widow of Kjeldr, and sister of Thorgr, the son of the same father . . . twenty-five years of age. May God make glad her soul. 1061.' This remarkable inscription is written in the ancient style of Runes, known as the Navok, a variety found only in the Orkney Islands of the Isle of Barholm. Let me here only note that on the same rock with this Runic inscription, and just above its base, there is the name, 'W. Langley, 1255,' of distinctly though rarely engraved. . . . In connection with the accounts in the Skalhott Sagr, it is an instance of the most solid, tangible realities, and longer is the Huitramannaland a visionary Atlantis, longer is the discovery of America by the Irish, in the presence of the panorama of history, pointed to as if the spectre of a dream."

SOMERSETSHIRE ARCHEOLOGICAL SOCIETY.—The annual meeting of this Society will be held at Bristol, on Tuesday, the 27th inst., and two following days, under the presidency of Sir Edward Strachey, bart.

METROPOLITAN GOVERNMENT.—It is said that Government will next year take in hand the reform of the Corporation of London, and that the members of the Corporation are willing to make sacrifices for the purpose of bringing the whole of the metropolis under one rule; the whole metropolis being divided into several municipalities with the Lord Mayor at the head of all.

THE MANSION HOUSE, LONDON.—At a meeting of the common council last week, the chairman of the General Purposes Committee stated that the repairs to the foundations of the Mansion House were entirely completed, and that a much smaller sum than was originally voted for the purpose had been expended. He would add that but for these repairs, in all probability long before this the Mansion House would have fallen down.—(Cries of "Oh, oh.") He could assure the court, notwithstanding the cries of "Oh," that what he had stated was the fact.

OPENING OF THE PUBLIC ART GALLERY AT BIRMINGHAM.—The Picture Gallery in the Free Library building, Ratcliff-place, erected by the corporation, has at length been thrown open. In addition to several pictures, the gifts of some liberal donors, and those which have been placed in the gallery by the Institute and the Society of Arts, many local collectors have placed the contents of their galleries at the service of the Free Libraries Committee, to whom the credit of the Exhibition belongs. The gallery opens with some fifty oil-paintings of varying degrees of merit and style, and a large collection of chromo-lithographs published by the Arndel Society, the whole collection being presided over by the god Buddha, presented to the town a few years ago by Mr. Samuel Thornton.

THE YELLOW FEVER AT THE MAURITIUS.—It would appear that the dreadful fever which has been decimating the population of this unfortunate island for the last nine or ten months is still continuing its deadly work. Letters to the British Medical Journal speak of a diminution in the daily rate of mortality, from which 250 in the town of Port Louis alone has fallen down to 50; but this diminution is considerable in appearance only; for we must bear in mind that of the 80,000 residents whom Port Louis numbered in the beginning of 1866, perhaps from 18,000 to 20,000 have perished by this time, while all those who could afford it have fled from that pest-house and both of fever to the higher and healthier parts of the island. We understand that the Council of the Epidemiological Society has memorialized the Government on the propriety of instituting an inquiry into the causes and mode of propagation of this fever; and that this will be done.

IMPERIAL HOTEL, SOUTHAMPTON.—This structure has been opened for public accommodation. It is situated in close proximity to the docks and terminus. The rooms possess varied and extensive views over the Solent, Isle of Wight, Southampton Water, and the New Forest. The building is for the most part intended to be fire-proof. The staircases are of stone, of easy ascent; the kitchens being upon the fourth floor, thereby avoiding the usual fumes of the culinary department. The building is supplied with bells worked by electricity. There are also hydraulic lifts, which travel the entire height of the building. The pressure of water is obtained from a large reservoir in the tower, which is filled by means of steam pumps from the basement, and supplies the lavatories, baths, &c. The building contains nearly 100 principal bedrooms, in addition to nearly an equal number required for other purposes; and there are, besides, various saloons, sitting-rooms, ladies' coffee-rooms, private dining-rooms, &c. The *salle-à-manger* is connected by corridors with other parts of the building, and is nearly 80 ft. long, 35 ft. wide, and of proportionate height, opening into an oval room. The building has two frontages, which are freely treated in the Italian style of architecture. The elevations are in Farnham red bricks, with Bath stone dressings. It is stated that the directors have expended nearly 100,000*l.* in the undertaking. The architects who designed and superintended the various works were Mr. John Norton, of London, and Messrs. Guillaume, Parmenter, & Guillaume, of Southampton.

BOATS OF PAPIER-MÂCHÉ.—Mr. George A. Waters, of Troy, New York, has been showing that paper makes the best material for shell boats, by constructing one 30 ft. long, which weighs only 40 lb., and is in every respect, it is said, superior to boats made of wood. It is quite thin, lighter than a wooden boat, is rendered impervious to water by a coating of oil and other compounds, and it is asserted that it is more durable, and that it will stand shocks which would destroy a wooden shell.

"CAST-IRON RAIN-WATER GOODS."—Messrs. Macfarlane & Co. have issued a trade-book under this title, the chief purpose of which is to set forth, in various forms, Mr. John Taylor's "telescopic tubes," first illustrated in our own pages. Their usefulness, in view of the annoyance constantly caused by the overflowing of rain-water pipes, we have already pointed out. The book contains, in addition, representations of numerous rain-water pipe-heads, ears, gutters, and brackets, also designed by the same architect, many of them novel and appropriate.

SOCIETY OF ENGINEERS.—On Friday in last week upwards of sixty of the members of this society visited the Millwall Docks, now nearly completed. Preparations having been made for their reception by the engineers in charge of the works, the society had every facility afforded them of inspecting the wrought-iron lock-gates, bridges, hydraulic machinery, and other objects of interest. In the evening the members dined together at the Ship Tavern, Greenwich, Mr. W. H. Le Fenve, president, in the chair, with Mr. Alfred Williams and Mr. James Hendry as vice-chairmen.

SUPPLY OF WATER FOR LONDON.—A communication from Mr. R. H. Smith, F.R.S., printed in the *Laboratory*, hears on the great scheme for supplying London from Bala Lake. A sample of water was taken from the lake on Monday, July 15, and examined on the following Wednesday. The result arrived at is that, although this water is healthfully soft, it is not remarkable for its freedom from organic impurity. In aluminoid or putrescible nitrogenous matter Mr. Smith declares that this water is on a par with that of the Thames at Hampton, and hence concludes that it will not do for London.

JUST ONE MORE CHIMNEY-POT.—A correspondent, "W. J. D.," suggests the widening out of the top of the chimney-pot, and supporting a cone in the centre, leaving sufficient space between the bottom edge of the cone and the side of the pot for the smoke to pass:—

"To be more exact," he says, "taking a pot 9 in. in diameter, let the top be gradually widened upward, so that it is 12 in. wide at 12 in. above the smallest part; from this smallest part rises the cone, sloping inward at the same angle that the sides do outward, or so that it would form a cone, showing 18 in. above the widened top and hollow for 8 in. from its base, with openings round the side of such hollow part to allow the passage of the smoke. The part of this cone above the top edge of the pot might be shortened down to the conical form not less than 6 in. high."

It might be tried in zinc, or constructed in three parts, in terra-cotta, or glazed earthenware, or the cone in glass, after the manner of a bottle, with an ornamental stopper if desirable. The design might be made in keeping with Gothic details, or be otherwise ornamental.

RESTORATION OF KENDAL PARISH CHURCH.—A recent examination of the roofs over the two northern aisles, made by Mr. Crowther, of Manchester, architect, has shown that in certain portions of these roofs immediate repair of a substantial character is absolutely necessary to insure their safety. The restoration committee have had contracts entered into to carry out the proposed work. The accepted tenders were those of Messrs. John Fisher and Samuel Compton, carpenters; Mr. Robert Winder, plumber; Mr. Robert Shaw, mason; Mr. William Jackson, stainer and varnisher; Mr. Joseph Steel, plasterer. The first three named were the contractors for the two northern roofs, which were restored in 1838-64. The total amount required, including the *veredas* (which is nearly completed), the architect's charge, and other expenses, will be altogether about 2,000*l.*, towards which 1,162*l.* have already been promised; thus leaving between 800*l.* and 900*l.* yet to be collected. The timbers and masonry will be prepared during the autumn and winter; and in the ensuing spring the work will be commenced. There is no intention to appropriate any portion of the 2,000*l.* required to any contemplated lighting of the interior of the church with gas for Sunday evening service.

LARROW - ON THE HILL LOCAL BOARD OF HEALTH.—Mr. Jacob, of Croydon, pupil to Mr. Aldwin Latbam, C.E., was appointed surveyor to this Board on Tuesday, July 30th. The other two selected candidates were Mr. Young, surveyor to the Washington Highway Board, and Mr. Fraser, of the R.L.E., New Brompton.

DESIGNS FOR MANCHESTER TOWN-HALL.—The preliminary designs in this competition have been sent in. Several correspondents urge, and the request is a fair one, that a list of the various sets of designs with their respective notices, should at once be printed, so that the competitors may feel assured that their drawings have arrived at head quarters.

THE IMPROVED INDUSTRIAL DWELLINGS COMPANY.—The ordinary half-yearly meeting of this company has been held. From the report it appears that all the 1000 shares have been allotted, and 31,225. have been subscribed in 251 shares, making the total capital subscribed 81,225. Six blocks of buildings, for 168 families, are being erected on the Britannia-street Estate; and nine acres of old houses and cottages at Bethnal-green are being purchased for laying out on an improved plan, for new blocks of buildings. The report was adopted. A dividend of 5 per cent. on paid-up capital for the last half-year was declared.

FINE ARTS COLLECTIONS.—Mr. Cowper moved in the Commons last week,—

“For the appointment of a royal commission to consider and report what portions of the national collection of fine arts ought to be exhibited in the new National Gallery in Trafalgar-square, what provision ought to be made for the exhibition of the portraits belonging to the National Portrait Gallery; and what division ought to be adopted between the classes of objects to be hereafter exhibited in the following institutions,—The National Gallery, British Museum, the South Kensington Museum, the Museum of Patents and Mechanical Inventions, the India Museum, the Edinburgh Museum of Science and Art, and the Museum of Irish Industry.”

After some remarks by the mover and Mr. Beesford Hope, Lord John Manners said the Government was prepared to deal with such questions as should arise for consideration, there having already been several commissions in reference to this subject. The motion was then withdrawn.

SUNDAY STREET-WATERING.—When the Metropolitan Board of Works was established, it was generally anticipated that the state of our streets would be in every respect improved. There is no more patent or serious annoyance than the neglect of the authorities in most parts of London to water the streets on Sunday. All the great leading thoroughfares and streets on a hot Sunday are totally without this wholesome and refreshing sprinkling. If, as we are led to believe, cleanliness be next to godliness, surely sprinkling the streets to keep the people clean of a Sunday cannot be a sin. Contrast the streets of Paris on the day named with those of London. The state of our principal thoroughfares on the Sunday afternoon is really most offensive. If it was found needful for the efficiency of the Fire Brigade that the Board of Works should have full control over it, suggests the *Lancet*, why should they not really control street-watering, and at once remove this cause of complaint?

A WORKMAN'S FUNERAL.—A funeral of a somewhat unusual character took place at the Brompton Cemetery on Saturday last. A bricklayer, named Richard Duffield, who had been employed by Messrs. Corbett & McClymont, builders, on the Redcliffe Estate, West Brompton, accompanied the whole body of the workmen engaged by that firm to their annual dinner, at Colney-hatch, on Saturday week last. On returning the vans pulled up at the Swiss Cottage, and Duffield descended from his place on the roof. On ascending again his foot slipped, and he fell heavily head foremost to the ground. Medical aid was promptly obtained, but the man died immediately after being taken to the hospital. An inquest was held on Thursday last, at which evidence was given to show that at the time he fell the deceased was quite sober, and a verdict of accidental death was returned. His fellow workmen, in order to express their regret at his sudden death, and sympathy with his family, arranged a public funeral, the expense of which they (the workpeople) bore entirely. The funeral procession was headed by a band, and the workmen were joined by the members of the Foresters' Lodge of which deceased was a member. The deceased has left a widow and five children, and his fellow-workmen have, with great liberality, subscribed to a fund intended for their support.

THE SICK POOR IN WORKHOUSES.—The three committees of the Metropolitan Asylums Board of Managers appointed to look after the Lunacy Asylums, the Small-pox Hospital, and the Fever Hospital, are commencing business. The Lunacy Committee have appointed Mr. Wyatt, of Hanwell, as chairman. The committee have at once to provide for 3,000 imbecile and chronic lunatics. The committees are, according to the orders of the Poor-law Board, invested with the full powers of the general body. Any two members are empowered, in case of exigency, to meet and use the full powers of the Board, and their acts will be valid as acts of the Board.

TENDERS

For parochial infant schools, St. Mary's, Islington. Mr. Edmonstone, architect:—
Watts £1,132 0 0
Thorpe 1,990 0 0
Taylor 984 0 0
Dove 955 0 0
Carter & Sons 892 0 0

For erecting house and shop in the Anerley-road, Upper Norwood, for Mr. W. H. Wright. Mr. Samuel H. Hope, architect. Quantities supplied:—
Messrs. Wood £1,397 0 0
Jennings 1,263 0 0
Kings & Hewell 1,238 0 0
Thorpe 1,190 0 0
Cressell 1,150 0 0

Leominster Water Supply and Drainage.—Contract No. 1.—For sinking a well and boring, erecting pumping establishment and covered service reservoir, providing and laying water mains, and for the construction of brick and pipe sewers. Quantities supplied. Messrs. Gotto & Beesley, engineers:—
Coker £14,162 8 0
Dowell 11,673 7 8
Mackenzie & Abell 11,838 1 6
Bagbird 10,981 0 0
R. R. & W. Mills 9,610 0 0
King & Godwin 8,155 0 0
Wells & Son 6,770 0 0

Contract No. 2.—For two horizontal steam engines, with boilers and pumps:—
J. & H. Gwynne £1,997 0 0
Handyside & Co. 1,830 0 0
Bridges & Bridges 1,450 0 0
Watt & Co. 1,350 0 0
Easton, Amon, & Co. 1,300 0 0
Astbury & Son 1,300 0 0
Burton, Sons, & Waller 1,250 0 0
Claridge, North, & Co. 1,228 0 0
Lillehall Company 1,095 0 0
Worcester Engine Work Co. 1,060 0 0
Fielding & Platt 1,060 0 0
Mackenzie & Abell 1,050 0 0
Birrell, Rotherow, & Co. 952 0 0
Barrington, Topham, & Co. 800 0 0
Gimson & Co. 860 0 0

For building St. Paul's Church, Brentford. Messrs. Francis, architects. Quantities supplied by Mr. Joseph Robson:—
Colls & Sons £7,780 0 0
Adamson 7,345 0 0
Myers & Son 7,277 0 0
Gibson 7,090 0 0
Dove 6,985 0 0
Nye (accepted) 6,740 0 0

For building dye-house and other buildings at Ponder's end, for Mr. Seadock. Mr. Aubrey, architect:—
Marland £2,498 0 0
Nightingale 1,383 0 0
Hall 464 0 0
Field & Son 450 0 0
Batman 449 0 0
Payson 413 0 0
Shurman (accepted) 417 0 0

For altering No. 18, Palace New-road, Lambeth, into public-house, for Messrs. R. & W. Fritchard. Mr. B. Brookes, architect. Contract No. 1:—
Langmaid & Way (accepted) £525 0 0

For alterations and additions to Nos. 4 and 5, Bowater-crescent, Woolwich, for Messrs. J. & J. Smith. Messrs. W. Gosling & Son, architects, by whom quantities were supplied:—
Morris & Brown £249 0 0
Wise 383 0 0
Brett & Bradbury 337 0 0
Ledbitter 332 0 0
Wicks 330 0 0
Vickers 315 0 0
Penn 254 0 0

For the erection of a detached family residence, boundary walls, &c., at Plumstead, for Mr. J. Flegg. Messrs. W. Gosling & Son, architects. Quantities not supplied:—
Brett & Bradbury £267 0 0
Smart & Pings 180 0 0
Wise 898 0 0
Vickers 875 0 0
Ledbitter 794 0 0
Wicks 760 0 0
Penn 695 0 0

For the erection of a public-house at Upton, Essex, for Mr. E. V. Ward. Mr. J. T. Newman, architect. Quantities supplied:—
Lugg £1,850 0 0
Mathews 1,770 0 0
Allen 1,661 0 0
Holgate 1,668 0 0
Bunn 1,582 0 0
Wicks 1,505 0 0
Henshaw 1,471 0 0
Aldous (accepted) 1,460 0 0

For alterations to Nos. 2 and 3, Honey-lane Market City. Mr. Lewis H. Isaacs, architect. Quantities supplied:—
Axford £260 0 0
Walker 89 15 0
Bamford 750 0 0
Prince (accepted) 735 0 0

For erecting five warehouses in Commercial-street E.C., for Mr. M. Moses, Mr. N. S. Joseph, architects. Quantities by Mr. Thomas Pearson:—
Piper & Wheeler £49,142 0 0
Newman & Mann 8,147 0 0
Brass 7,987 0 0
Browne & Robinson 7,880 0 0
Higgs 7,636 0 0
Coader 7,432 0 0
Ashby & Horner 7,380 0 0
King & Son 7,269 0 0
Hill & Keddell 7,345 0 0

For completing twenty houses, Alexandra-road, Kilburn. Mr. Thomas J. Hill, architect:—
Wood & Co. £11,450 0 0
Cushing 10,220 0 0
Colls & Son 10,020 0 0
White 9,120 0 0
Eydman 8,672 0 0
Anley 8,740 0 0
Henshaw 8,674 0 0
Webb & Sons 8,652 0 0
Smith 8,601 0 0
Taylor (too late) 8,501 0 0
Salter 8,420 0 0
A. & J. Smith 8,098 0 0
Corbeldick 7,710 0 0
Perry 7,696 0 0
Sabey 7,216 0 0

For the erection of a house and shop, Newington causeway, for Mr. Hughes. Mr. Henry Jarvis, architect:—
Turner & Son £2,639 0 0
Piper & Wheeler 2,618 0 0
Myers & Son 2,525 0 0
Browne & Robinson 2,420 0 0
Lawrence & Baugh 2,349 0 0
Thompson 2,236 0 0
Henshaw 2,205 0 0
Higgs 2,173 0 0

For additions to Nos. 3 and 4 Wharfs, Regent's Canal for the Honourable Commissioners of City Sewers. Mr. W. Haywood, engineer. Quantities by Mr. Warburton Stent:—
Mowlem & Co. £2,460 0 0
Gannon & Son 2,331 0 0
Newman & Mann 2,297 0 0
Hill & Keddell 2,229 0 0
Crook & Son 1,657 0 0

For villa residence, at Ellsborough, Bucks. Mr. P. Freedy, architect. Quantities supplied:—
House £473 0 0
Credit materials 473 0 0
Turner & Sons 1,821 0 0
Haddon 1,629 7 8
Jones & Sons 1,490 0 0
Tapley 1,468 0 0
Selby 1,430 0 0
Cooper 1,248 0 0

For alterations and additions to the Gravesend Milton Union. Mr. John Gould, surveyor. Quantities supplied by Messrs. Curtis & Son:—
1st Estimate. 2nd Estimate.
Nightingale £8,173 0 0 £3,867 0 0
Henshaw 5,969 0 0 5,969 0 0
Goulman 5,397 15 8 5,347 15 8
Sollett 5,270 0 0 4,004 0 0
Naylor 5,145 0 0 3,850 0 0
Blake 4,993 0 0 4,790 0 0
Crook & Son 4,767 0 0 3,627 0 0
Lillystone, withdrawn 4,225 0 0 3,532 0 0
* Accepted.

For rebuilding Messrs. Howard's premises at Cleveland street, Fitzroy-square. Mr. J. Schofield, architect:—
Roberts £2,250 0 0
Gannon 2,087 0 0
Simpson 1,715 0 0
Conder 1,713 0 0
Nightingale 1,640 0 0
Lawrence & Baugh 1,337 0 0
Longmire & Budge 1,666 0 0

For Hinton House, near Cosham, Hants, for Mr. H. Tooker. Mr. Ewan Christian, architect:—
Longmire & Budge £9,976 0 0
Stevens 5,463 0 0
Fletcher 5,430 0 0
Jackson & Shaw 5,500 0 0
Barnes 5,660 0 0

For repairs to St. John's Chapel, St. John's Wood, the Marylebone Vestry:—
Spence £95 0 0
Sutton 88 0 0
Routen 86 10 0
Brown 80 0 0
Smith (accepted) 64 10 0

The Builder.

VOL. XXV.—No. 1280.

Lucca, the Industrious.

LUCCA would delight the heart of our uncle Toby: it is as neat and compact a specimen of a town fortified on the principles of Vanban as he could desire. Perhaps he would have proposed a more satisfactory glacis; possibly, for the sake of humanity, he would have wished that it should, at least, once have been satisfactorily invested; have

made gallant opposition to the commencement of the second parallel at least; have cost the besiegers its exactly estimated price, to a day, a cannon-shot, and a man; been battered in breach, and after a vain night attack on the trenches have been taken by assault, and occupied in the name of his Majesty,—if his Majesty could be conveniently committed to a war at Lucca. Still the example is very complete as it stands: bastion and curtain, and ditch and counterscarp, ravelin and half-moon, covered-way, and all the rest of it taken together, are as neat and as obsolete as the diagram of the lecturer on fortification in any military college in New World or Old. There are even now no ragged suburbs without the walls, nor buildings that impede free circulation of troops along their circuit within. Corporal Trim might stand behind his bonour's chair placed above a re-entering angle, and fight over again the combat at the gate of St. Nicolas; and whether they looked to fortifications or citywards, forget occasionally that they were not still before the model and mutable town that encroached on the kitchen-garden at home, with its bridges and its batteries; its representative houses hooking on and off with such endless facility of re-arrangement; its toy-steeples and majestic cathedral.

Still Lucca is a larger place than it would be supposed from the impressions of a walk round the walls, or rather the ramparts; the fresh green of the well-watered plats around it, and the beauty of the mountains that close in the prospect, so beguile the time. Some word of intermediate dignity between hills and mountains is required to designate the spurs and ranges by which the Apennines here descend to the plain; certain barer overpeering peaks of the proper Apennines, to say nothing of memories of Alps not far remote, forbid us to call these nearer eminences mountains, as a certain majesty in outline, even more than magnitude, entitles them to promotion above the commonalty, with no inferiors more important than mounds and slopes and hillocks. More time is thus spent in making the circuit and pausing for admiration and the refreshment of cool airs

under shady trees than we are well aware of; and we find, when we descend, that the space enclosed admits of not insignificant open squares, and a network of streets, among which the objects of interest are distributed quite widely enough for the shortest cuts in hot days to be welcome. As may well be supposed, in the centuries when Lucca was a republic, it had walls of very different character; these have vanished, and there would be little interest now in tracing their lines or relation to a still earlier cincture in the Roman period. Enough that the Church of Santa Maria Farnesportum—without the walls—is now considerably within the present.

The city is most frequently entered from the railroad on one side, and from the opposite by the road that, following the embanked margin of the Serchio, brings back sojourners of the Bagni di Lucca. Those who have delayed their study of the city till after their enjoyment of the baths, and then for consistency in inversion take up the monuments as they present themselves, will so drop not unhappily; they will come first upon the Amphitheatre, the most important relic of Roman ages, and on the Church of San Frediano, the earliest in many respects of the Christian monuments. The lofty and elaborate facade of San Michele will then come into view; the interior will not delay even an archaeological long, on the way to the cathedral, the great centre of the curious, the ornate, and the beautiful in Lucca.

The condition of the Roman Amphitheatre is very similar to that of one of the primæval *spongiades* that is detectable in a flint; the general form preserved, the internal markings quite recognizable on fracture; and here and there what seems externally a trace of yet unobliterated organic substance; some of the recovery of original details: their demonstration is due to comparatively modern clearances. Small houses and gardens cleared away have left the internal oval of the arena clear for a market; an elliptical line of street defines the external outline, the houses being raised on the foundations of the seats, and seeming to observe the divisions of the enveloping arcades; while the inner Piazza del Mercato is entered by passages that pierce the barrier, and admit us where abatments at least and a vauissor or two give indication that we tread the line of ancient *vomitoria*. Of proper architectural features not a trace remains; to find these we must follow them to the Church of San Frediano (Frigidianns), where within and without in small pillars and large, we may observe shafts and capitals manifestly transferred from Roman buildings. In every church of Lucca, indeed, that does not belong to the Renaissance, except the cathedral, we trace this utilization of Roman columns, and parts of columns, a proof, at least, that the ancient city abounded in public monuments. As in similar cases at Rome, their variety is remarkable, and a single church is found to contain ancient capitals in so many varieties as to imply either that a considerable number of structures were laid under contribution for one; or that in single structures of the later classic time a greater variability was affected than ever had toleration or vogue in the earlier. We may note as remarkable in San Frediano, that the small row of pillars, manifestly ancient, on the front, support not an arcade, but an architrave. Of the derivative character of these arcades we may find occasion to speak at the cathedral. In the interior the columns of classic proportions, and no doubt date also, however rude in many cases, support the nave arches of which the archivolts are quite plain and flush with the plain wall above, a very frequent model; the bases are Attic on plinths, and with no pedestal. Within, an immense font, with sculpture elaborate, but such as might be expected from a Robertus Magister in the twelfth century, illustrates a recommence-

ment of the art, and an altar, by Jacopo della Quercia, exhibits as decidedly the symptoms of decadence, date, though he does, only 1422. There are some frescoes, and a Francia for those who are worthy thereof; but sympathy will go rather with those who linger before a work, unnoted by the guides, of Luca della Robbia. The great charm of this is not in the Annunciation that fills an upper semicircle, still less in the enormous rolls of garrulous green and yellow leafage and fruitage that descend on either side, and are sustained for still another length by angels. It is on a frieze-like band below the upper subject in seven cherub heads symmetrically disposed, that we recognize the great artist of the bas-reliefs in the Uffizi. These heads are beaming with the tender and instinctive intelligence that not unfrequently dignifies feminine expression, but that art has most successfully rendered by its invention of forms infantine, and yet apparently mature. The cherubs of the Sistine Madonna are probably the highest example, but this row of life-size heads, the types of cheerful and rejoicing innocence, may be admiringly dwelt on even with Raffaele in our memories.

San Frediano, we are told, was the son of an Irish King who made a pilgrimage to Rome, returned and founded a monastery, came back to Italy—as it is still difficult not to do for those who make pilgrimages thither for whatever purpose. Not all can hope to have as good a reason for remaining. He was made Bishop of Lucca, and built a church. He was just the man,—for an inscription of the eleventh century testifies that he was equal, with the assistance—somewhat officious it would seem—of his canons,—to lift a slab of marble some 17 ft. by 7 ft. place it on a car, and not disdaining help from two wild cows, deposit it where we now see it against the wall of the choir, and where it has never answered any purpose at all. The inscription is in Latin, of course, and, along with the stone, will probably last with its marvellous averment for centuries more. Latin is conservative of inscriptions. To this day we see at Metz an inscription conspicuous over a church which records still the gratitude and joy of France for the providential recovery from measles of Louis XV.—he the Well-beloved,—whose memory still is sweet, it would seem, in brass and marble, and blossoms still unswept away by the flood of liberty, fraternity, equality, and imperialism that his corruptions and those of his race gave entrance to over the land. Even in this country may be seen from time to time Latin commemorative inscriptions erected by the ecclesiastical in their churches within the last few years that would scarcely live long in the full candour of the vernacular. The Latin inscription round the edge of our own Monument, ascribing the fire of London to the Roman Catholics, has certainly had its vicissitudes; cut under Charles, it was obliterated by James; was recut under William III., and in our own time we remember (was it under the fourth William, or could it be still earlier?) it disappeared again by civic mandate, and its place is now seen as a channel so deep that the inscription will scarcely be able to house itself there hereafter. So a line of Pope is falsified, and—

London's column pointing to the skies,

no longer

Like a tall bully lifts his head and lies,—

but perhaps, as bully-like, provokes first, and then finally and abjectly retracts. May the citizens and their authorities right worshipful be as successful—if the work, indeed, is still to do—in falsifying the rest of Pope's satiric apologue, and the Sir Balaams of to-day come out, and even come to court, unscathed—safer in simplicity than in "tower of brass,"

"Though all the demon make his full descent
In one continued shower of cent. per cent."

The citizens of Lucca, — Lucca "the industrious,"—lightened their purses, and, in so doing, their temptations, not to say sometimes their consciences, by no sparing outlay upon public monuments. It was ever, indeed, the way of the wealthy of Medieval Italy to eschew lavishness whatever their means, in those indulgences that perish in the using. They knew well how to put limits to that cacœthes of the money-spinner insatiability of revenue-yielding investments for revenue as it accrues—a mistake of revenue for capital sometimes as miserable as the spendthrift's treatment of capital as revenue. But they loved to disburse for the realization of enjoyments permanent, not only for themselves, but for generations after them,—for the commonwealth around. In this sense did the prosperous burghers bring back into the very circle of luxury those good old simple days described by Horace when private resources were spare, and those of the community unlimited. The Cathedral and Campaule of Florence, or the monuments of Pisa, are the most conspicuous instances; but even Lucca evinces no contemptible rivalry in the noble emulation.

Her most characteristic, as well as most splendid monuments, are certainly the Duomo and the Church of San Michele, so far as regards its façade. This latter work is assigned to the date 1183, and the architect Gindetto, and historically has of course to be considered as afflicting on the monuments of Pisa. But, like Diomed in the Iliad, it evidently would fain

"Boast to be far better than its sire,"

and in this case also, not without a certain justification. The façade of the Cathedral of Pisa has a certain tenacity in the uniform multiplicity, so to speak, of its arcades and pillars; of which also the relative smallness reduces dignity. Gindetto clearly perceived the value of gradation, contrast, and more important magnitude in his ultimate members. His work seems to have begun pretty high up, and in consequence—as in the spire of Fribourg, in Breisgau, and elsewhere—the new elaboration is somewhat out of harmony with the plainer basis. His work is entirely of white marble inlaid with black, except where some shafts of coloured stone are introduced. The font, as at Pisa, is clothed with arcades in tiers, the pillars diminishing in height in the same way to accommodate the slope of the side roof. The shafts are variously carved with spirals and inlaid, and the spandrels and plain surface above them have inlaid black figures of animals and hunters, with patterns interspersed. There seems to be no peculiar appropriateness in these vague subjects, which at best only faintly reflect the victory of Michael over the great serpent that crowns the whole. Above the point where the side roofs meet the line of the nave, the façade rises loftily, with still new tiers; but here it is a pure frontispiece, for the building behind is far lower, and the piercing of the screen with window-like openings is but a counter-sense. This screen-like surmounting of a western façade became quite a characteristic of Italian Gothic, and when it was cleared of the remnants of pretence became as justly available to confer dignity to dignified aspect, as a finial for completing a pinnacle.

The façade that was added to the Duomo by the same architect, was a later, a more elaborate, and, in some respects, a finer work. A strange work it assuredly is. Here the addition comprised a portico as well as a façade, and in consequence the general effect is more homogeneous; but to attain this the sacrifices, to say nothing of difficulties, were not slight. An ancient and very large campanile tower stood at the south-west angle of the church, detached so far as to admit good passage between them, but advanced to the north beyond the alignment of the south wall, though not so far as to screen from the front the entrance to the aisle. It, therefore, stood bolt in the way of the extension of the church by a portico westward, as it occupied precisely the site required for the southern angle,—occupied and occupies, for the architect determined, or was obliged to leave it, and yet did not give up his portico. Normally completed, it would consist of a nobly proportioned semi-circular arch before the central door, with two others smaller, one before either aisle door, and naturally matching each other. The campanile just leaves room for an arch on the south, that by attaching the abutment would range well in opening with the small aisle door. It was of course quite open to the architect, thus under constraint, to make his northern arch of

the same limited span, and get rid of the excess of margin at the northern angle by ornament and "treatment." He did nothing of the kind, wisely or not, he boldly made his north arch as wide as he could, and the southern, in corresponding position, as narrow as he must. Concealment of the state of the case is out of the question, and is not attempted. The southern arch is struck with a very irregular line, and seems stilted, not to say pinched; but still the designer wisely did not even forcibly make it as lofty as the northern, but seems to have considered that one great anomaly was best left to be kept in countenance by several others secondary. The real harmonizing influence is obtained by the regular spacing of the tier of carved and inlaid pillars above, and by the management that this regularity shall bring a pillar accurately against the side of the interfering Campanile. It is for the draughtsman and the photographer to reproduce the elegant caprice,—the capricious elegance of the enrichment of the front; it has the advantage of being usually arrived at from the happiest point of view, and the unaccountable charm of the composition takes full possession of the spectator before he has time to consider whether it is either to be accounted for or justified. The shaftlets of the several tiers have the greatest variety; there are plain white or coloured marbles,—white inlaid with black in rings of zigzags, in figures, twisted shafts with the most boldly-grooved and delicately-moulded spirals, compound shafts of four—knotted in the middle, and yet even so avoiding offensive suggestion of unrigidity; others are carved with a complication of animal and human figures in a manner to suggest the barbaric carvings of the new world,—of canoes or clubs,—but still are kept in subjection by rarity and by the rule of a pervading symmetry. Symmetry, however, has here a way of its own. In the three tiers of small arches we observe at once a care in matching the shafts, varied as they are, so that the contrasts of alternation shall be balanced by side answering to side; yet at the top this scheme seems wantonly departed from; a red shaft is central, but the alternate shafts are on one side red; on the other white marble. Why was not the white marble flanked by the two red shafts? It is much to be suspected that the overbalance here of the two heavier shafts on the north side was decided on as demanded by the overbalance of the wide northern arch below.

History gives the date of 1204 to this façade without hesitation. The cathedral itself is in an entirely different, and in many important respects very beautiful style, and worthy of most detailed examination,—the which it must dispense with here.

The portico of Lucca, therefore, was as secondary an addition to a pre-established plan as that of the Norman cathedral of Peterborough. The English architect was at least as bold a designer, and his imaginations were subjected to as stringent a condition. His solution of the difficulty, however, was of another nature entirely. The beauty he had in his mind to realize was evidently a triad of three lofty and deeply-recessed and shafted arches; but such is the spacing of the nave and aisles that, had he put the widest arch in the centre, it will be found that his piers would have blocked up or covered the entrances to the aisles. Had he reduced the width of the side arches in order to subordinate them to the present central arch, they would either have been of intolerably tall and narrow proportions, or he must have forfeited the principle of his composition by reducing their height and leaving the centre super-eminent. Thus beset he recovered his general proportion by giving extra width to the side porches against all precedent, and, although it involved an extension laterally beyond the breadth of the cathedral, he disregarded the inevitable false centering of the side entrances which hug the central piers, and trusted to the distinction of position and contrast to give sufficient weight to the arch of smaller span. The chief difficulty of the problem furnished him thus with his characteristic motive. There are differences of opinion as to both his commencement and his completions; but the world, on the whole, are agreed to applaud him, and take pleasure in his work.

The original cathedral, of which we must probably go below ground to find traces, was founded by the Bishop of Lucca, we read (in fact, in Murray), who, as Pope, presented William of Normandy with his consecrated

banner, and the favourite oath of William the Red was by that relic, before the shrine of which the city but a few years since hung up the lamp of solid gold, we see, out of alarm at cholera. Doubtless, the intercourse between Italy and the western islands in those early days had other results besides the exportation of Irish prince-bishops balanced in exchange by holy hummers and profane oaths, and there is good reason to believe that the passion and principles of enrichment so pronounced at Pisa had a stimulating effect on invention and rivalry, that told in the choir of Canterbury still more effectively than in the façades at Lucca.

THE COAL-FIELDS OF THE FUTURE.

THE present annual production of the coal-mines of Great Britain is considerably more, not only than that of any other country, but than that of all other countries together, the English yield being estimated at 100,000,000 tons; and the total yield of the whole number of coal-mines now worked being little more than 170,000,000 tons. Next in production to Great Britain we find Prussia and the North American Provinces, the annual production in each instance being estimated at 17,000,000 tons. France and Belgium, after Russia and North America, rank side by side, each supplying some 12,000,000 tons. Germany, Russia, Spain, Italy, Asia, South America, and Australia together, only produce some 14,000,000 tons. The value of the total product is about the double of that of all the mines of gold and of silver in the world; that is to say, the annual earnings of coal-miners, rated at a money value, amount to twice the annual products of the industry of all the miners, diggers, and washers engaged in the collection of the precious metals. And it will not be forgotten that while gold and silver, apart from their use as articles of luxury, form, by their service as coin, the basis of the mercantile transactions of the world, the more bulky and more perishable mineral forms the very spring of manufacturing energy, renders habitable large districts of the earth that, without the use of mineral fuel, would be closed to civilized life, and enables the steam-engine to render services to mankind that exceed the widest dreams of the most sanguine enthusiasts of the past century.

While the production of the United Kingdom is thus in advance of the total united production of all the other countries, there is one respect in which the activity of another country exceeds our own. If we compare the amount of production of the chief European coal-fields with the extent of their area, Belgium is in the van of the world. Our 100,000,000 tons are the yield, in round numbers, of 1,000 square leagues of coal measures,—at the rate, therefore, of 100,000 tons per square league. But the 12,000,000 tons produced by Belgium come from an area of only one-tenth part of the size of the British coal-fields, being at the rate of 120,000 tons per square league, or 20 per cent. more than our own rate of produce. Prussia, in this respect, ranks 15 per cent. below Great Britain, and France 25 per cent. below Prussia, the produce being at the rate of 85,000 tons per square league in the latter country, and 60,000 tons per square league in France.

While the actual produce of Great Britain and while the relative produce of Belgium thus evince the most active expenditure of their large but limited stores of the chief source of material prosperity, the tables are altogether turned when we inquire into the amount of stored up wealth which, in the different known coal-fields of the world, awaits the necessities of the future. In Europe, indeed, England maintains an unquestionable pre-eminence, her coal-producing area being ten times that of Belgium, and one-fourth more than that of the whole of Continental Europe. All other countries of the world together, with one exception, present a total area of 3,200 square leagues, less than the double of the 1,800 square leagues of the European measures. But this united surface of 5,000 square leagues is but a fourth part of the area of the enormous coal-fields of North America, including both those of the United States and those of the British provinces. Figures such as these are more eloquent than argument, and point with unerring certitude as to the locality of the great coal-fields of the future. The proportion of coal measures to surface unproductive of coal is not very different in North America, in Great

Britain, and in Belgium, the former being respectively a twentieth, a nineteenth, and an eighteenth of the total area; so that in proportionate coal-hearing surface, as well as in the activity with which that surface is utilised, Belgium ranks foremost in the world.

The actual service drawn by each country from the produce of its coal-mines may be estimated in different manners. We may consider either the gross amount of absolute value or the amount which is proportionate to the country. In either of these points of view the United Kingdom is first among the collieries of the world. The value of coal annually raised cannot be estimated at less than 50,000,000, sterling. The amount raised per head of population is, in round numbers, three tons and a third per annum; the quantity actually consumed is not less than three tons per head. The City of London annually imports more than 3,000,000 tons of coal by sea, and very nearly as large a quantity by land. It exports less than 1,000,000 tons, so that the consumption of the metropolis for fuel, gas, and the manufactures and engine-power carried on within its limits, is at the rate of 1.7 tons per inhabitant. The consumption of Belgium is two tons per head; that of Prussia 15 cwt.; that of France less than 10 cwt. France consumes a third more coal than she produces. Prussia exports about one-eighth of her produce, Belgium one-sixth, Great Britain an eleventh only.

The service rendered to Great Britain by the consumption of an annual quantity of ninety millions of tons of coals is of a magnitude hard to realise. To value the results of this consumption, as we have done approximately the price of coal, at 10s. per ton, will fail to give any approximation to the amount of national wealth that is created by the process of combustion. If we set aside the consumption requisite for the comfort and health of the people,—for warming, for cooking, and for lighting,—if we then separate the large quantity consumed in the reduction of metals,—the remainder will be chiefly employed in the production of steam. For iron works alone, our annual consumption of coal must amount to from 20,000,000 to 25,000,000 tons. Some 2,000,000 tons more will be required for the reduction and working of the other metals. If we suppose the consumption for domestic purposes throughout the United Kingdom to be at the same rate per head as the total requirements of Prussia, we shall find that half our total consumption remains to be accounted for; and that we have to divide the useful effects of the application of this large quantity between manufactures and commerce, or, in other words, that we annually consume more than 40,000,000 tons of coal for the service of steam-engines,—marine, locomotive, and stationary. What amount of human labour do those forty million tons of coal represent!

The combustion of coal, chemically considered, is a phenomenon closely allied to the slow combustion which is a function of animal life. In the furnace and in the lungs the same process is carried on with greater and with less rapidity. Carbon, in each instance, unites with oxygen to form carbonic acid, which is liberated in the process. In the first instance, the heat thus obtained is made available as a motive power through the use of the convenient medium of water; in the second, we can only say that its production is very intimately connected with the phenomena of animal motion. We cannot, as yet, eat coal, but the same portion of oxygen may be united either to the carbon of the mine, or to that of the blood; it may be used to support either consumption or respiration. The quantity, therefore, of oxygen required for the combustion of 40,000,000 tons of coal would have been sufficient for the respiration of a certain number of human beings. We get thus a rough approximation of the service rendered to England by the invention of Watt. The approximation is rough, but it is instructive. It must not be forgotten that coal is not pure carbon. The proportion of combustible and non-combustible matter varies in every district and in every vein. But then, on the other hand, a large quantity of coal goes to waste as slack or as nunion coal, and is consumed in working the collieries; so that one may, for the sake of estimate, be set against the other. Again, it is true that the coal actually burnt is by no means consumed in the most economical manner, or in anything approaching such economy. But neither, on the other hand, are human beings invariably, nor even in a decided majority of cases, industrious. We lose at least as much by

human idleness as we do by wasteful consumption of fuel. Taking, then, the annual consumption of oxygen by a full-grown man as an element of calculation, we may reckon it to be about equal to that requisite for the consumption of 10 cwt. of coal; so that the equivalent for the 40 million tons of coal consumed in manufacture and in locomotion would be the annual labour of 80 millions of men. We have said that the estimate is rough, but it is not therefore one-sided. We cannot doubt that our coal-fields, besides all that they minister to our comfort, health, and police, renders the service of an army of helots of from twice to three times the number of our entire population, 350,000 workmen, employed in our collieries, place this amount of service at our command. Mechanical invention and capital—that is to say, the savings of labour—do the rest. Need we seek any further for the source of the material prosperity of Great Britain in the nineteenth century?

Valuable information on this important subject may be derived from a French work published at the close of 1866, *La Vie Souterraine*, par L. Simonin. We should express a wish to see an English translation, but for the consideration of the loss in spirit and life that would almost inevitably accompany the change of dress, and the hope that to most of those who wish to study the subject, the language of continental Europe cannot be a sealed tongue. The plates of minerals are almost as instructive as actual specimens, and have greatly the advantage in respect to portability. We have freely referred to a work hitherto little known, or unknown, in England, for data which it tabulates, which we thus feel bound to acknowledge. Our Colliery Commission will do well to place M. Simonin's work before them as a guide when they come to draw up their report.

It is as lying at the root of the national prosperity of Great Britain that we regard the industry of the collier. We have recently seen an able effort made to trace that prosperity to the introduction of railways. We took occasion to point out the fallacy of this view. We showed that, while increased facilities of transport were necessary, in order to allow the development of increased manufacturing activity, they were not in themselves a source of production. The manufacturer might be checked by want of roads, but the improvement of roads was not the increase of production. Increase of national wealth means increase of production; means of intercourse, like *media* of commerce, require corresponding increase; but it is the increase of productive power, not that of transporting power, that is the main element of wealth. We traced that increase to the introduction of the steam-engine, and of the motive power of heat. We now see whence the food of these engines has been derived; how the heat of the sun, stored up for uncalculated periods in the strata of the coal measures, has been liberated to enrich our country by supplementing human labour by the service of machinery. Before, we indicated the source, now, we roughly point out the nature and extent of that source. We see the speed at which we are racing our most active competitors in rifling the treasures of the soil, and we see that, so long as our stores last, for the labour of every collier the mineral which he wins is capable of doing the work of more than 200 men. So long as the coal-fields of Europe hold out, those of England are not likely to be exhausted. But whatever be the duration promised to the civilisation of Europe, so far as it is dependent on coal, the future of the Western hemisphere exceeds it by 400 per cent. We seem almost to reckon the future, as we do the past, by geological rather than by astronomical time.

In England, in Belgium, and in this France, the production of coal now doubles in fifteen years. In Prussia and in the United States it doubles in ten years. But the most remarkable feature in this part of the case is one which is very decidedly in opposition to the theory that the extraction of coal is likely hereafter but little to increase, a theory which has been supported by an analysis of our present chief demands for combustion. The petroleum trade has sprung into existence, and poured into the market large supplies of a fuel which for many purposes replaces coal, and that without producing any apparent check in the growth of the coal trade. The United States, which in 1865 exported 283 million gallons of petroleum, exported in 1866, 66½ million gallons. Yet London imported, by land and by sea, 111,000 more tons of coal, and exported 23,000 more in the

latter than in the former year. It seems, therefore, that any hopes as to the prolonged duration of our own coal-mines that are based on the expectation of a falling off in the annual increase of demand for coal, are inconsistent with experience.

It is dreary to look upon a blank wall, at whatever distance from the eye it may have the prospect. That the material advantage possessed by Great Britain over other countries is chiefly due to her mineral wealth, can hardly be disputed. That at a date more or less remote, if our present rate of consumption continues, our coal-fields will be exhausted to a depth below which it will be unremunerative to work them, is a mere logical deduction from the fact that their contents are finite and not infinite. How soon it would become cheaper to import coal from America than to sink for it beneath our present working levels, is not the present question. Whatever be our expectation of life, as far as national life depends on coal, that of the United States is four times as great. It does not, however, follow that it will overrun the dome of St. Paul's when Englishmen shall have ceased to mine. Persons ignorant of mechanical science have called on mechanical men to name a substitute for coal, and have made suggestions for its replacement on a par with that of the royal lady who thought that a starving populace had better eat cake. Nature, herself, however, may yield a better reply. We owe the hardihood of our national character in great measure to our insular position. Our commerce springs from our early aptitude to encounter the buffets of the waves. In the enormous tidal power that is developed on our coasts, a power which no engineering Xerxes has yet attempted to yoke, we have a direct effect of the solar influence far exceeding in magnitude the amount of force which has been confined by the slow process of carboniferous vegetation. The mechanical power evolved by the rise of a 20 ft. tide over the surface of Milford Haven, or of Falmouth Bay, or of Cork Harbour, is capable of accurate calculation. The direction of that force to the production of heat by compression of air, or by other means, is a subject to which our attention has not yet been turned, nor is it likely to be practically grappled with while coal maintains its present price. But the economising of this vast source of power, and its direct application to the service of man, is not more foreign to many of our present mechanical procedures, than the lighting of streets and houses by the vapour of coal, conveyed in subterranean tubes, was to the lamp-lighters of 1815. To warm our houses, or to drive our mills by the water-power now wasted on our coast, may seem a dream at the present day. Those of us who remember how long the time-honoured oil-lamps of Grosvenor-square disdained to be banished by gas, may well believe that the dream may be denounced as preposterous. For all that, the day will come, if the world lasts, when the present source of power will fail in England; and we cannot doubt that, as that day approaches, science will be able to make some use of the enormous tidal power that is now wasted on our coasts.

POPLAR OFFICES COMPETITION.

THE fact as stated last week that the authors of the three designs to which premiums have been awarded are all more or less closely connected with the Board might well at first sight seem to justify the objections that have been raised against this decision. An examination of the drawings, however, considerably lessens the strength of the objection. The fact is, that the majority of the so-called designs sent in are so horridly bad as to deserve no attention whatever. The number of properly-educated architects that have contributed could be counted on one hand of fingers. This ought to show Boards the condition to which competitions are being brought by the present system. The plan to which the first premium has been awarded, "Circinus" (25), has the entrance at the angle, and appears to provide all the accommodation required. The elevation, however, is terribly ugly, and we advise the Board to pause before they perpetuate it in brick and stone. An alternative elevation submitted by the author, hybrid Gothic in style, is somewhat less repulsive. The design, "Cives" (2), to which the third premium has been awarded, Italian in style, would make a much handsomer building, and the plan, too, is artist-like: but then comes the question of

expense. The designers were limited to 5,000*l.*, and this could not be carried out, we suppose, for that sum. The external appearance of the premiated plan marked "Octagon" (4) (this has a staircase tower at the angle), is also superior to that of "Circinus."

Amongst the other designs may be mentioned the set of drawings marked "Incognita" (9), as clever. These are Domestic Gothic in style, and the meeting hall has an open-timbered roof. In the elevation of the design marked "Civis Romanns" (10), the doorway is awkwardly placed; so too is the staircase, but the design has merit. "Utilitas" (27) seems to know what he is about; (30) anonymous, is a sensible design in Domestic Gothic style; and "Business Requirements well attended to" (31) is far superior to the majority of the designs. The last hung is marked "Quod," and that is where many of the competitors should be sent for their ignorance and impudence.

THE LATE SIR ROBERT SMIRKE, R.A., ARCHITECT.*

I HAVE to tender my thanks to you for permitting, and even encouraging me, to read before you a short memoir of my brother, Sir Robert Smirke. For this favour I can plead no claim whatever, nor any other qualification for the task, save only the long, intimate, and confidential intercourse which subsisted between us. The task might better, and certainly more naturally, have devolved on another member of our family; but I have reason to believe it to be one from which he would, under the circumstances, desire to be relieved.

In the beginning of the year 1796 my brother Robert, being of the age of fifteen, was, by the advice and recommendation of Mr. George Dance, received as a pupil in the office of Mr. Soane, then engaged on works at the Bank of England. In July of that year he became also a student of the Royal Academy. For reasons which I do not know, but can only conjecture, he was removed from Mr. Soane's office after the lapse of less than twelve months, with his father's concurrence and approbation. That his son took a lively interest in his architectural pursuits during that time, is evident from his contemporary letters now in my hands and addressed to his father; but any one having the slightest acquaintance with Mr. Soane's works, especially at the Bank and in the present Courts of Justice at Westminster, will have little difficulty in concluding that, although my brother probably received some benefit from his experience of practical work in that office, he certainly retained afterwards no trace of the characteristic architectural peculiarities, whether for good or otherwise, of his first teacher.

In December, 1796, he obtained a medal of the Royal Academy for architectural drawing. In 1797 he received a like medal of the Society of Arts; and in 1799 the gold medal of the Royal Academy for Design.

In 1801, my brother, having attained the age of twenty, went abroad with his elder brother, Richard, and attempted to visit Paris by way of Holland, hoping to pass for Americans, and to pay a sort of surreptitious visit to that city, where some of the great works of Italian art, the product of the cisalpine raids of Napoleon in Italy, were in course of accumulation. The excursion, however, was a failure, and my brother escaped (not without some difficulty) a permanent detention in France.

In 1802 the peace of Amiens opened the Continent again to English visitors, and my brother found himself on his way to Paris, with every prospect of an extension of his tour to the south of France and Italy. During the whole of this excursion, and, indeed, the whole of my brother's absence, a constant and very detailed correspondence between him and his father attests his devotion to the great objects of his visit, namely, professional improvement and experience.

In the course of the year 1803, writing from Pisa, he announced his earnest desire to extend his tour forthwith to Greece. My brother had already made himself pretty well acquainted with the publications of Stuart, Chandler, Le Roy, and others, who had before visited and described many of the remains of Greek art, and he was, therefore, well prepared to turn to account this

* By Mr. Edward Smirke, M.A. Read at a meeting of the Royal Institute of British Architects.

extension of his tour. Lord Elgin had, about this time, arrived at Rome on his way to Constantinople, with a corps of Italian and Russian (or Crimean) co-adjutors, and had already earned celebrity for the successful prosecution of those Athenian and other researches which eventually secured to this country those inestimable treasures of art with which we are all now familiar.

These researches were known to my brother, but it was not known to me until I lately examined his journal and papers, that overtures had been before made to his elder brother and himself (I believe before he left England), on the part of Lord Elgin, with a view to enlist them in his service.

It is well known that his lordship had much difficulty in securing competent aid to carry out his original intention, which at first contemplated only the obtaining of careful architectural drawings, casts, and copies of the most important remains of Greek sculpture and architecture. The terms of this negotiation are not specified by my brother, but only noticed as a matter that had gone off. The gentleman who was at last engaged to superintend the works carrying on at Athens on behalf of Lord Elgin, was Lusieri, a very accomplished Italian artist, whom my brother found still engaged in his lordship's service, when he visited Greece.

It was an additional incentive to my brother's earnest wish to visit Greece, that he had the good fortune to meet with such amateurs of classic antiquity as Lord Aberdeen and Mr. W. R. Hamilton, who had both been engaged in like researches, though, of course, with immeasurably more effective means at their disposal for indulging in their tastes than my brother could ever hope to possess.

His utmost ambition was to visit the Peloponnesus, Attica, and the adjacent islands, then known to be teeming with the crumbling relics of ancient art belonging to the most illustrious period of Greek culture. He and his young friend, William Walker, only prepared to themselves a rough journey over a charming country, on foot or horseback, unincumbered by passports, or firman, and with no other difficulties before them than those which which health, youth, high spirits, and a good will, could overcome. When they landed in the Morea, they found themselves, to their great dismay, at the head of an escort of horse and foot, guides, and guards, to be paid, fed, and fed'd at their own costs, to the manifest detriment of their very slender financial arrangements.

Their stock of portable topographic information consisted of an edition of Pausanias, with the Greek and Latin text, and the memory of what they had learned before they started, or had picked up on their way. Occasional letters to a local consul afforded them their chief hope of assistance in difficulty, and letters of credit, that never got nearer to them than Naples, were their resource for supplies in a country overrun with insolent Turks, and Albanians, who performed the double functions of soldiers and robbers, especially the last.

With such aids and companions these young men scrambled over the Morea from Patras to Tripolitza, Sparta, along the valleys of the Eurotas and Alpheus, Messeno, Arcadia, Argolis, Corinth, and Epidaurus to Athens, enchanted with the scenery, and well pleased to copy a fractured capital, or a mutilated inscription, with a janissary, armed with a loaded musket, on each side to protect them, and an armoury of small arms, swords, &c., round their own belts. Whether this district of southern Greece be now traversable without material risk or inconvenience since the expulsion of the Turks, I will not undertake to say; but I am informed that it cannot, even now, be regarded as a very safe or satisfactory excursion, at least to parties so little provided for as the travellers of whom I am speaking.

At Athens the work of removal was still in progress, and my brother does not conceal his regret as he watched the rough removal of the bas-reliefs by crow-bars from the walls of the cell of the Parthenon, and could not help feeling it to be the signal for the annihilation of these interesting local monuments, though he is pleased with the prospect that they were destined for his own country, and that the exertions, which had been made by the French to secure them, would fail. Though he did not at first purpose to stay long there, he confesses that he never felt such interest at the sight of any of the most celebrated Roman works. "I wish," he says, "I could come day after day, and walk about these wonderful specimens of architecture." He

is everywhere forcibly impressed with the simplicity and dignity of the great works which 2,000 years of decay and destruction had left behind, and the memory of those grand architectural features was ever after present in his mind, constantly counteracting the more popular inclination to superficial decoration, in which, I think, he was always disposed to indulge but sparingly in the exterior of his buildings.

On my brother's homeward voyage to Messina he became apprised of the renewal of the Continental war and threats of imminent invasion, and began in his letters to express a mournful apprehension that, on his return to England, he should have to resign himself to the disappointment of his visions of professional advancement, and to "put on a red coat and shoulder a gun" for the rest of his days.

His anticipations were only so far verified that he and his two brothers and father were, on his return, enrolled in that defensive voluntary force which has, in our time, received so large a development; but, happily, his professional prospects, as we shall see, were in no degree impaired. It is worth notice, that he became the author of a small illustrated manual called "A Review of a Battalion of Infantry," on the drill of infantry, which continued in use in the regular forces as late as 1840, and, I have heard, even to a still later date. His name was alone attached to it, but there is a family tradition that his father had some unavowed hand in it.

On his return from Greece he made a detailed examination and careful drawings of some of the architectural remains in the Island of Sicily, and he determined to visit the principal cities between Rome and Venice, so far as the hostile occupation of French troops would permit.

When at Rome, he found that his remittances had miscarried, and he resolved to return on foot with a young Italian to Naples, and to visit the buried cities of Campania; and, meantime, to trust (as he expressed himself in his letters) "to Providence and the highway" for the deficient funds, and "to live on bread and water" sooner than give up his visit to Pompeii. One of those resources, viz., the *highway*, was one to which he had, as a patient, become tolerably familiar in the mountain passes of the Morea.

In his way through the principal Italian cities the copious criticisms on them in his letters mention with satisfaction the works of Palladio; but he rarely speaks with much approval of what is usually termed the Italian, Medieval Italian, or Gothic, so far, at least, as regards the architectural features of them. He remarks that "there is too much of a mixed style in these works, to be agreeable to me," and he refers to the prevalent practice of introducing, both outside and within, horizontal stripes of dark-coloured stone every 2 or 3 ft. in height, which are carried through the columns, pilasters, and everything, and which, as he remarks, "essentially injure the effect of the building." He even goes so far as to express his doubts whether the long stay of a student, in the presence of those examples, may not be as likely "to hurt as to improve him: for the eye may grow familiar with such practice, especially when associated with very superior work, till it ceases to be sensitive of its defects."

My brother's tour was prolonged by a stay of several months in those parts of the Tyrol and Germany which were not under French occupation. In this part of his excursion the visit to Berlin seems to have best pleased him. He returned to his own country and home early in 1805.

Among the first fruits of his return was the announcement of an illustrated work with "specimens of continental architecture." The first part consisted of coloured engravings of Italian buildings and interiors, which we may suppose to have been specimens of those which had been most consonant with his tastes at that time and in that country. The series, however, was soon discontinued. In fact, a year had not expired since his return before he received the first and one of the most important of his professional commissions—viz., the erection of Lowther Castle in Westmoreland; a commission which he owed to the united recommendation of Sir George Beaumont, hart, and Mr. George Dance. From that year, down to the time of his final retirement from all further professional engagements, it may be said with truth that there never was any interruption in his continuous employment.

If I were to remind his surviving friends (of whom, I fear, there are now not many) of his

various professional works, even confining the number to works of a public character and to considerable private mansions both in England and Scotland; it might seem a somewhat ostentatious catalogue, and might wear an aspect of self-glorification, in which, if I knew him rightly, he would not have permitted himself, or wished his friends, to indulge.

An enumeration of this kind, extending over nearly fifty years (for he may be said to have declined every new engagement after 1845), would not be very easy to make; accounts would have to be examined, and even buildings inspected, in order to distinguish mere reparations, or unimportant additions, from a building or mansion that was practically a new work. Perhaps, however, we may be able hereafter, to a certain extent, to accomplish this object.

His earliest employment on public works was in connexion with the Board of Trade, at the nomination of Lord Bathurst, in July, 1807, and on the new Mint in 1809. Eventually, he became one of the attached architects of the Board of Works upon the subdivision of the office on the decease of Mr. James Wyatt. Among the latest prominent works extant, in that character, were the General Post-office, the British Museum, and King's College, London.

Lowther, Eastnor, and Kinfauns (N. Britain) castles, are surviving and important examples of this domestic architecture on a princely scale. As to courts of justice, council houses, and the like, I am really unable at present to enumerate them, if I were disposed to do so. Nor would it be pertinent to this memoir to particularize those various buildings, on which my brother had to perform the less ostensible, but rather important and responsible, office, of upholding or reinstating the work of some less fortunate of his contemporaries, whose constructive character had suffered by the knavery or negligence of contractors. Among these I will merely remind you on occasions such as these (of which I could mention several others), that his friend, Mr. Croker, formerly Secretary of the Admiralty, was pleased to designate him as the "Dr. Bailey of architects," whose painful office it was to be attendant on the last hours of a sinking patient.

I believe that I am justified by the published writings, as well as private letters, of General Sir Charles Pasley and others, in attributing to Sir Robert, not indeed the first use or invention of concrete foundations in lieu or in aid of piles, but the habitual and systematic use of concrete in suitable situations to a far greater extent than had been theretofore applied in civil architecture. I have made this statement, not on his authority, or any claim of his own, for I find none. In fact, it was a sort of controversy on which his habitual disregard of assumption, or self-assertion, would have made him an impassive, unconcerned, bystander, rather than a party litigant.

About 1845, at the close of his general practice, Sir Robert was placed by Sir Robert Peel on the Commission for London Improvements, on which he attended for two or three years, but with a strong sense of his increasing inability to serve the public by any active exertions.

Let me venture to offer to the members of this Institute, which may fairly be taken to represent the highest development of recent architectural art, some observations on one or two of Sir Robert's earliest works, already referred to; and to offer them in no spirit of criticism, or envidious comparison, or of depreciation—sentiments which, in your presence, I feel no title, or inclination, to indulge in.

Lowther Castle was the first great work which he undertook. Eastnor Castle was not much later in the series, and in both the Medieval style of castellated architecture, utilized and modified for the purpose of convenient occupation by a nobleman of the nineteenth century, was deliberately adopted. Sir Robert, therefore, cannot be quoted as an authority by those who assume Medieval forms unsuitable to domestic architecture. These occupy two of the finest sites in England.

I need not remind you that when the first stone of Lowther was laid, the public taste had been but scantily educated by the careful study and delineation of the details and forms of the style usually called Gothic. The folio volumes of John Carter were known, and Mr. Britton had only just commenced his series of excellent drawings illustrative of English ecclesiastical architecture.

Since that time, a host of young architectural draughtsmen, and other aspirants to ecclesiology, have arisen, who have laboured, and with great success, to familiarize—I had almost said to saturate—the public mind, clerical as well as lay, with detailed examples of our most notable fabrics of Medieval design; but whatever had been done, especially in England, in that way, before the close of the last century, had been of such a character, that our present race of amateurs would have been well satisfied if it had been left *undone*.

Under the guidance of my brother's early and valued friend, Mr. Samuel Lysons, whose varied researches embraced the whole range of ancient and Medieval art in England from the vestiges of Roman rule, included in his "Reliquiæ Britannico-Romanæ," to the sacred and civil architecture of the Middle Ages, comprised in the "Magna Britannia," and other monographs of local antiquities, it was impossible that my brother should be uninformed on these matters, or unacquainted with the earliest and best examples, although he was not, and could not well have been, provided with those superabundant materials which are now at the disposal of even an architectural tyro, who has never stirred out of his study. Among the engraved illustrations of those well-known works of Lysons, you will find many proofs of my brother's early connexion with them, testified by very careful and correct drawings, from which the larger prints were engraved. Yet, with all such drawbacks and snob difficulties, I venture to doubt whether, after the lapse of sixty years, the design and forms of those majestic masses of towers and terraces at Lowther and Eastnor, which overhang Ulswater, or crown the lesser heights of Malvern, have since been excelled in their dominant features.

I have already admitted that, so far as regards the Teuto-Roman Gothic in North Italy, my brother's experience (not, perhaps, a very mature one at the age of twenty-one) had not left an agreeable impression on his memory. He looked on it as a heterogeneous phase of art, though not unaccompanied in some remarkable instances by very striking effects, and very admirable decorative details:—how could it be otherwise, at a time when the arts of sculpture, colour, and architecture were found so often concentrated in a single highly-gifted genius!

Whether this opinion of Sir R. Smirke in 1803-4 has been since reversed or over-ruled, at least by those of his successors who appreciate the purity and beauty of Anglo-Gothic models, or admire the marvels of French and Flemish Medieval genius, I know not; for, though I occasionally meet with recent works, which, I presume, mean to represent "Italian Gothic" of the fourteenth or fifteenth century, I am imperfectly acquainted with the extent or success of the late attempts to naturalise it in this country.

Again, let me offer a few remarks on the late theatre at Covent Garden, erected by my brother on the site of the one burnt down in 1808.

On the application of John Philip Kemble and Mr. Harris, then proprietors, he was engaged to build a new one. From the papers before me I infer that he was left at liberty to adopt such design as he thought fit. The funds were considerable, and my brother turned to the fond recollection of his first architectural love, and determined to make the new building an occasion for realizing his early ideal of Athenian architecture and art, which we have seen exercising so strong an influence over him on his visit to Greece. The façade of the Propylæa, rather than those of the Dorian temples, appears to have been the more immediate idea in his mind's eye. The vast and severe simplicity of the Doric shaft, capital, and entablature, were, for the first time on a large scale, to be exemplified in this metropolis, in which draped statues, types of the dramatic art, were to occupy niches, while sculpture in the low relief, which he had so much admired in the Phidian cella and sculptures in the Acropolis, was to enrich the masonry of the surface. To these the classical genius of Flaxman and the careful execution of Rossi were made contributory.

In the interior an upper saloon, appropriated in the original design to the circle of private boxes, with its ranges of Sienna marble pilasters and statues, recalled the internal taste and decorations of an Italian villa or palazzo; but this disappeared many years ago and lapsed into a disreputable appropriation.

The natural life of a theatre is generally a short, though it may be a cheerful, one. Its

"littile life" (as Prospero would have said), "is rounded with a *fiat*." But that to which I refer survived its perils for fifty years, though, in the course of those years, much of the interior, and many of its important external features, had undergone strange mutations for the worse before its final extinction in 1856; and nearly all the precautions against fire designed by the architect, so far as regarded the fabric, and counselled by the great chemist of the day, Sir Humphrey Davy, with reference to the more inflammable materials of scenery and drapery—had been removed and forgotten. The details of the original design now exist only on paper.

The correspondence on the occasion of this building between Mr. Kemble and my brother is extant, and is full of entertaining matter, to which that great and very accomplished actor was the chief contributor. The work was at the time prodigiously eulogized and admired by the Hopes and Aberdeens of that day.

With the close of Sir Robert's professional life, this Memoir ought also to end. Any notice of his private life has no proper place here; and if I were to yield to my personal inclination to portray him in his domestic character of a very dutiful and affectionate son, and a brother to whom we were all attached, and from whom we never failed to receive constant proofs of kindness, my testimony would be of little worth. But a reference to some of those qualities, which certainly conduced to his success, will neither be inappropriate nor fairly liable to the suspicion of fraternal partiality.

It was said by the biographer of an accomplished Roman, that a "man's moral habits are the mould of his character"—"*sui civique mores fingunt fortunam*,"* a saying which I believe to be the origin of the motto adopted by a great architect, William of Wykeham, and expressed in his archaic phraseology—"manners *analyth* man." My brother was eminently the architect of his own fortune. We have seen that no difficulty, personal privation, or personal risk, ever discouraged him in the zealous and laborious pursuit of his adopted vocation. From the school, to which he was indebted for a very solid classical education, he turned into a wider world with an aptitude for assiduous labour which left no time idle on his hands. In 1796 he wrote to his father—"I am writing *alone* in the office [Mr. Soane's] at 8 p.m., and I send this to you to let you know how I am getting on here" [and then follows a long folio letter of three sides]. From the dawn of actual practice down to the final suspension of all his labours (1845), and his permanent retirement from it to his pleasant villa at Stanmore, he was daily up and at work long before any one else was stirring in the house.

Another habit, which also conduced to his satisfactory transaction of business, was the methodical and orderly manner in which all his arrangements were made.

His remarkable equality of temper and uniform moderation of language in oral intercourse were known to all with whom he had relations of business. I imagine that it must have been a very difficult thing to provoke him, or to find the materials for a quarrel with him. I can undertake to say that I do not recollect a single client with whom he had important transactions of a professional kind who did not in the result become his fast personal friend. I do not recollect, nor have I found in his most exact and methodical private accounts, the occurrence in a single instance of any difference or dispute between him and his employers in relation to his professional practice, or the settlement of his accounts, or any complaint on the old subject of estimates exceeded. In this respect I speak from the constant intercourse of some fifty years and upwards of my own life, and from the assurances of those who had habitual transactions with him both of a private and public nature. When the Office of Works was remodelled and his services dispensed with as an attached architect, Lord Melbourne personally told him that knighthood was conferred on him to testify that no ground of complaint or dissatisfaction existed personally against himself.

It is well known that he never prepared designs for public works in competition with any of his professional brethren. It is true that, on two occasions, he was invited at the instance of the Government to prepare designs. The Houses of Parliament may be cited as an instance of this, where the design and execution were eventually intrusted to another gentleman, a

* *Cora. Nepos, c. xi.*

most distinguished architect, in consequence of the subsequent adoption of the principle of competition by order of the House of Commons. On such occasions my brother withdrew wholly from the arena,—not in dudgeon, but for reasons which will readily suggest themselves to those who may have themselves been placed in the like position.

With respect to architectural works, founded on special votes of the Commons, it seems probable that this sort of qualified commission will at this day be generally resorted to. In such cases it is not likely that gentlemen who occupy the position in which Sir Robert Smirke then stood will usually consider the terms of such a conditional engagement acceptable; for their time would be too valuable to tempt them to the possible loss of it. With others, and especially younger practitioners, the state of things is different, and the invitation may naturally and reasonably induce them to embark in an adventure that may perhaps terminate in a lucrative and creditable engagement. This principle of competition can, as we all know, plead very orthodox precedents in the best days of Italian art. We know that Cosmo designed to invite the emulation of all the sculptors of the Academy to provide models of statues in competition for the Sacristy of Lorenzo; but we also know that he looked to one of the greatest of them all, then eighty years of age, to guide and direct him in his judgment, and thus the real difficulty was, in that case, surmounted,—namely, the selection of such judicial referees as may at once secure the public from a lamentable failure of judgment, and obtain for the competitors a fair, unbiased consideration of their claims. Whether the former of these objects has always been practically secured, at least in architectural works, is, I fear, still open to question. It must be obvious that, in architectural rivalry, even the most attractive designs and admirable drawings do not necessarily imply competent constructive ability to direct and superintend the execution of the work.

On the retirement of Sir Robert Smirke, he was gratified with the presentation of a marble bust, admirably executed by Campbell, as a testimonial by his various surviving pupils. Of this excellent portrait bust, I have laid on the table for your acceptance a very good photographic copy.

In 1853, this Institute honoured him with their gold medal, a testimony of respect which he greatly prized, as, indeed, he could hardly fail to do, when we look over the roll of names of those who have received this compliment.

When he permanently quitted London as a residence, he resigned the trusteeship of the Royal Academy of Arts, after holding it for thirty years and upwards. He was elected an academican in A.D. 1811, and had at all times been warmly devoted to its prosperity and interests. Feeling, too, that he was no longer able to render any material assistance to that body by participating in its duties, he tendered to the president and council his resignation of the style and title of Academican, and her Majesty notified to them her sanction of their acceptance of such resignation, with an expression of "her full appreciation of the motives which actuated Sir Robert in tendering it."

I should mention that his willingness to take this step had been before expressed to Sir Charles Eastlake, through your late president, Professor Cockerell; but, in consequence of other arrangements then pending, with a view to some permanent modification of the constitution of the Academy, my brother's intentions were not carried into effect.

The voluntary task which I have undertaken in memory of Sir Robert Smirke, and as an imperfect notice of his life and labours, must here close. I am sensible of the embarrassment which is inevitable when a biographical sketch, and especially that of a professional life, by a near relative, is attempted by one who, like myself, can lay claim to no critical or practical knowledge of that profession, or to any qualification beyond a sincere love of art, and the memory of many long years of sympathy and friendship with some of its most esteemed professors in various departments of it. If, in the course of this notice, I may appear to have formed too partial an opinion of his merits, I must pray you will have me excused. But most of all I should regret if I shall have had the misfortune to convey to any an impression that Sir Robert was used to assume an air of critical superiority with regard to the works of his brother architects. Far from it. As for his

own, he was really as little accustomed to talk of them, as he was to talk about himself, either for self-display or otherwise. Upon such an occasion and such a topic no one would have more willingly acquiesced in the judgment of the Spartan patriot, and in the words of our own poet, he would have said,—

—“Be the Spartan’s epithet on me,
Sparta has many a worthier son than he.”

HOWDEN AND SELBY.

THE ARCHÆOLOGICAL INSTITUTE.

In the course of the recent congress Howden and Selby were visited.

The Collegiate Church at Howden is of great size, and has a total length of 255 ft. The church belongs to the thirteenth century, but a good portion has been added since that date. All the chancel is in ruins, as well as an octagonal chapter-house standing beside it. Originally Howden Church was a rectory parochial, but in 1267 it was made collegiate. When Henry VIII. dissolved the college, the structure suffered in consequence, and in 1630 the chancel had to be deserted, being considered unsafe for the celebration of divine worship. Sixty-six years later the roof of the chancel fell. The building is in the form of a cross, with lofty square tower at the intersection of the transepts. In the west front, which is very elegant, there are four divisions, formed by buttresses ending in crocketed pinnacles. There is a fine window of four lights, divided by a transom, displaying much beautiful tracery. Mr. J. S. Petit and the Rev. W. Hutchinson, vicar of Howden, officiated as honorary guides. Beginning with the exterior of the western front, Mr. Petit said that part was of the fourteenth century, or at least the end of the thirteenth. The transom was of a later origin. No doubt the beautiful general effect was much heightened by restoration not having been made. He should be very sorry to see the figures in the niches replaced by others. Although the tower was almost wholly without ornamentation, still it would be agreed that it had a character of great richness, owing to the carrying up of the lines and the buttresses, and giving subdivisions in a vertical direction. Then, again, though one of the tallest towers in proportion, it still had an air of massiveness—a characteristic that was not always gained by a much shorter tower. That he considered to be due to the flatness of the tower, and its being without pinnacles. It was said by Stukeley that the tower was built by Bishop Skurlow as a refuge from the floods. It was not very likely that the floods should ever come up to that height, flat though the district was; but it was very possible that the tower was erected as a land-mark, for which it would serve most distinctively, owing to its great height and individuality, there being no tower like it in the district. Indeed, there were very few towers resembling it.—Mr. Parker said that, if the vanes on the corners of the tower were original, no pinnacles would be intended. It was stated, however, that the vanes were not original, because some one remembered their being placed there.—Mr. Petit continued that the tower had a shaft of early date. He pointed out the south transept porch, which, he said, was given historically as of the time of Edward II. This would confirm the date of the porch, which would be of the fourteenth century. The south transept was of Early English date. Early decorated characterised the windows of the transepts; in fact, there was the earliest type of the real tracery. The easternmost window of the nave aisle was an earlier type of geometric tracery than the others. The others, though geometrical, had not the same severe form. On coming to the chapter-house, Mr. Petit said there could be no doubt that it must have been executed at an early period of Bishop Skurlow's life. He died at the beginning of the fifteenth century, 1405, but the chapter-house, he thought, must have been executed long before that time. It was a very beautiful specimen of the perpendicular, retaining a great deal of the feeling of the decorated. There were a few circles and quatrefoils, that showed the reigning spirit of the time, and the chapter-house must have been built in an early period of the bishop's life. The choir was of an earlier character, that was rather early in the fourteenth century, and was pure decorated. When it was constructed, the style must have reached its completion. The windows, though they had a geometric feeling

about them, still gave outlines which were flowing. There was no doubt that the flowing of the curvilinear tracery was established at the time, but very likely in this case, for the sake of uniformity, a geometric character was nevertheless introduced. The work reminded him of a little of the chancel in Nantwich, Cheshire.—At this stage it was remarked by a member that the sum of 107 had been left in 1387, toward the building of the chapter-house.—The chancel Mr. Petit afterwards proceeded to say, was thoroughly unique in arrangement. There were some very beautiful fronts of chancels remaining, but he did not know of any more beautiful than this. The great east window seemed to retain lines of geometric. There were, no doubt, part geometric, but there were also some flowing parts. Mr. E. Sharpe had drawn and described a restoration of the east front. The buttresses were, what he believed Rickman to have pronounced them, the most beautiful examples of the decorated style we had. The pinnacle over the top of the central window was unique, he thought. The parapets were hexagonal, but all set the same way. Notwithstanding its ruinous state, the front was altogether most beautiful.

From 1300 to 1320 was assigned as the date of the chancel by Mr. Petit.—Mr. Sharpe remarked that he was rather inclined to put it down from 1315 to 1320.—According to Mr. Parker, 1327 was pronounced not to be too late.—Mr. Petit, as regards the tower, said he should be sorry to have any addition made to it, but there was one addition he should like made, and that was a lightning conductor, as during thunderstorms it might possibly be injured. Upon proceeding inside the church, Mr. Petit alluding to the transept part of the structure said the first building after the early English would be the tower arches and the windows. That might be after the time the church was made collegiate, which was in 1267.—Mr. Parker said Bishop Skurlow came there in 1380. The chapter-house must be a little later, perhaps from 1380 to 1390.—All having examined the building, Mr. Freeman made some remarks of the history of the church.

Wressel was arrived at shortly after noon, and the Castle there was forthwith inspected, Mr. Parker acting as guide. This castle was built in the time of Richard II. by Thomas Percy, Earl of Worcester. Originally the building formed a great square, but in the time of Charles I. three sides were pulled down by the Parliamentary army to prevent the stronghold being occupied by the Royalists. The south front now remains, flanked by two square towers round which ivy was twined. Small as is this part, it came very near destruction by the fire which occurred when the building was used as a farm homestead.—Mr. Parker quoted Leland's description of the castle, and added a few remarks of his own from his work on "Domestic Architecture."—Mr. Clarke, of Muddiford, stated that the Earl of Northumberland of his day, to whom Anne Boleyn was betrothed, died broken-hearted here, and left the place to Henry the Eighth, who in September, 1541, passed two days in the Castle. He was then in company with Catherine Howard.

At Selby, which the excursionists reached at three o'clock, a visit was at once paid to the renowned Abbey. Devoid of its tower, Selby Abbey still appears majestic and stately, and whilst possessing the beautiful decoration of the fourteenth century, has also some fine Norman work, and almost every period down to the curvilinear. The abbey is believed to have been founded by William the Conqueror in 1069, who bestowed many privileges upon the institution. When Henry VIII. dissolved the monasteries, Selby Abbey, then in a state of great splendour, was made a parochial church. Mr. Sharpe acted as guide. He remarked that since reading his paper at Hull, he had been put in possession of documentary evidence of a valuable character in an account of Selby and neighbourhood and the Abbey Church, by Mr. Morrell. In Selby Church the Institute had for the first time in the Hull district met with a very interesting example of the Norman period of architecture. No such prominent example of Norman work had yet been seen. Four of the principal portions of English architecture were represented characteristically in the building; first, the Norman work of the transepts and the crossing. Only a certain portion of the nave was of the same period. Then, in point of date, there was a very interesting example of the transitional period, with the ornamentation so peculiar to that class of building, in the western portion of

the nave with its porch and doorway. There was then a very interesting example of the lancet period, or Early English, in the upper part of the nave, on the south side; and, lastly, there was just the commencement of the beautiful choir in geometrical style, and its completion in the curvilinear period, when flowing tracery was prevalent. The building had been conducted on a very grand style, and, as had been remarked, was frequently the case in Yorkshire, the magnificent choir that was constructed in the fourteenth century was of equal length with the nave. The edifice was therefore cross in form. In the nave there was a tri-partite division, which was also shown vertically, there being a lower storey, a middle of blind storey, and the clearstory above. The north transept still remained of the Norman period, and the curious string-course then used was observable. From some excavations which had been made it would be observed that the south transept had been in the same style. The first four compartments of the south aisle westward from the tower were Norman, and four piers were left alternately circular and compound, an arrangement that was common in Norman buildings. Whether the Norman builders completed the church according to the plan now seen, or whether the work was arrested in its progress at the fourth pillar on the south side of the nave owing to want of funds, or whether the design was completed and afterwards accidentally destroyed, could not now be determined, but something like seventy years must have elapsed between the completion of the first part of the work and the commencement of the work of the second order he had named. Although some early Norman architects did not vault the entire portion of a church, they always vaulted the side aisles, and in the south aisle could be seen what they would have done. In the first bay there was a very good specimen of quadrupart vaulting. He attributed all the early Norman work to the year 1090. Mr. Morrell, in his book, gave the life of the man who built that part. It was commenced by an abbot of the name in 1067, and he occupied the greater part of his abbacy in building the church. Mr. Sharpe then considered the second portion of the architecture, to which he ascribed the date 1170. The Norman work did not reach to the roof, to the full extent of the four compartments in the south aisle. In the blind and clearstories only two compartments were constructed; and these, if the Normans left off their work at that point, would act as buttresses to the tower. In the continuation of the works, the round Norman arch was preserved, instead of the pointed arch of the transitional period, evidently for the sake of uniformity. Between 1145 and 1190, he presumed, the whole of the north aisle was built. On the capitals of the middle story pillars clustered together in the style of the lancet period, Mr. Sharpe pointed out the peculiar transitional volutes.

The party then proceeded to the west front, where in the doorway Mr. Sharpe stated that there was represented one of the most beautiful examples of the ornamentation of the transitional period. Mr. Parker said the volute ornamentation spoken of came from Syria, and was, he believed, one of the styles introduced by the crusaders. In reference to the north doorway, Mr. Sharpe said there was the same ornamentation as was on the west front. There was the transitional volute exhibited again; and, excepting the doorway itself, the pointed arch overrode the whole of the work. It was curious that the rounded arch was always treated with more decoration than the pointed arch. The party having re-entered the nave, had the characteristics of the Lancet Period pointed out to them on the middle story of the south aisle. Mr. Sharpe compared the east end of Howden, Wisborough, and Ripon churches with that of the building, which he said probably dated about 1320. His style is remarkable for buttresses and gables, ornamented by crocketed pinnacles. In the course of the proceedings recorded above, Mr. Sharpe announced that an interesting discovery had been made that day. In digging excavations to find the foundations of the south Norman transept, a tombstone was come upon inscribed with the name of Alexander. This tombstone was found at a depth of about 15 ft., and was bordered with dog-tooth masonry, indicating the date 1220. Under the coffin, a wooden coffin was discovered with skeleton complete as skeleton could be after remaining in process of decay for 700 years. The skull is perfect, and no doubt an adept at pre-natal diagnosis could have told whether the worthy eccle-

siastic was great in the intellectual and moral faculties, or, like many of his cloth, had much of the animal in his temperament. One woman, with true womanly characteristic perception, said he evidently had an excellent set of teeth, the white enamel still being greatly visible. Mr. Sharpe stated that in the history of the church there was an abbot, named Alexander, who was appointed to the abbey in 1214, and resigned in 1221, he being twelfth abbot. His name did not usually occur in the catalogue.

As to the date of Early English architecture, Mr. Parker said that it was proved that Lancet Gothic was certainly of English origin. Saint Hugh built the choir of Lincoln—the earliest Gothic—in 1190 to 1200. Clive Church was consecrated by him A.D. 1192, as shown by an inscription still remaining, and that church is in the same style. These examples were twenty years in advance of anything of the kind on the Continent.

THE LATE MR. THOMAS CUNDY, ARCHITECT.

THE death of this gentleman, one of a family long known in Pimlico, took place very suddenly at his residence in Chester-square. Mr. Cundy was born in London in 1790, and was brought up in the office of his father, who, the founder of his own fortune, was extensively engaged as an architect and builder. He succeeded to his father's large connexion at the age of 36, and thenceforth practised as an architect only. The principal works he was engaged upon at that time, were Havel Park, for the Earl of Plymouth; Tottenham Park, for the Earl of Ailesbury; Moor Park; Grosvenor House and Gallery, for Earl Grosvenor; with many others both in town and country. In later years he was engaged in the erection of several of the West-end churches,—the Holy Trinity, Paddington, St. Barnabas, St. Paul's, St. Michael's, and others in Pimlico. But he was more especially known as surveyor to the extensive estates of the Marquis of Westminster, an appointment he held for upwards of forty years, during which period the extraordinary speculations entered upon by the late Mr. Thomas Cubitt were commenced and completed. Mr. Cundy was an honourable and courteous gentleman, and maintained the dignity of his profession.

THE LAW COURTS COMPETITION.

ALTHOUGH we have no official confirmation of the belief expressed in our last, we have no reason to doubt its correctness. Rumour, always busy when facts are kept back, says further that the Judges' Report occupies only five lines of note paper; and that the Treasury are dissatisfied with the decision on the ground that the Judges were not competent to name two architects. If this statement be accurate, and we believe it is, and should the Treasury insist upon the Judges' naming one architect, it is not unlikely that the report would then take something of the form of the Report on the National Gallery Competition.

Mr. Scott has sent in a protest to the Treasury. He is reported to have stated that his plan cannot, even at the worst, be considered as less than second to Mr. Barry's, while his architecture is superior, and therefore in fairness he ought to have had the award; for he, too, considers that the Judges had no right to name two.

THE SUSSEX ARCHEOLOGICAL SOCIETY.

THE annual excursion, or general meeting, of this society took place this year at Midhurst, on the extreme western portion of the county, perhaps one of the most inaccessible, certainly the most difficult to reach, by persons coming from the eastern part of Sussex. Brighton was made the rallying point, the London and Brighton Railway Company having consented to run a special train from Brighton to Midhurst. A large number of persons, between 200 and 300, were set down at the Midhurst Station after a two hours' ride through the most diversified tract of country and picturesque scenery. With so short a distance to travel before the first point of interest was

reached, the majority of the company preferred to walk; and the vehicles were, therefore, chiefly freighted with ladies.

A few minutes' walk sufficed to gain the parish church; and thither all proceeded, the character and principal points of interest connected with the building being explained by the Rev. W. Haydon, M.A., the incumbent.

Leaving the church, the members and their friends proceeded to the Grammar School, as the most convenient place for holding the "business-meeting" part of the day's proceedings.

Mr. William Townley Mitford, M.P. for Midhurst, was elected to the chair.

Mr. William Durrant Cooper had promised to read a paper on "The Lords of Midhurst and its Inhabitants," when a visit was made to the Cowdray Ruins; but, as the weather looked treacherous, he proposed to read a digest of it before the meeting broke up. It was, he said, prepared for publication in the next volume of the Society's works; but he thought some idea of it might be formed from an abridgement, which he accordingly gave.

Sir Sibbald Scott, who had consented to act as cicerone, led the way to the Cowdray Ruins, which were thrown open by Lord Egmont, the present proprietor; and his lordship, to show more distinctly the delicate tracery of the stonework of the windows, had given orders for the ivy to be cut away which envelops the ruins. Sir Sibbald pointed out various features of interest as he led the company from one portion of the roofless building to another. The grounds and town were visited, and the priory, the village of Eastbourne, &c. About three o'clock they returned to the grounds at Cowdray, where a cold collation was provided in the Society's marquee, to which upwards of 200 sat down. Mr. Mitford, M.P., took the chair.

CONDITION OF NEWPORT PAGNELL.

THE guardians of the peace here are in want of guardians of their health. In other words, the Newport Pagnell police-station presents such abominable conditions in a sanitary point of view that every officer condemned to it has suffered from disease; while the lock-up is altogether unfit for the retention of prisoners. Bad drainage and the immediate proximity of a had sewer are set forth by the medical officer of the town as the chief causes. The drainage of the town generally is very defective and calls loudly for attention, if the inhabitants desire to retain their health and would avoid the outbreak of an epidemic. We have particulars before us of the condition of some of the outages that show an altogether abominable and discreditable state of things. The lady-visitors should state what they know, and Mr. Surgeon Hailey and the local Gazette must not relax in their endeavours. The good people of Newport Pagnell should know that had health and premature death are very expensive and damaging things.

PULPIT IN THE CHURCH OF ST. MARY MAGDALENE, TAUNTON.

THE idea of a new pulpit which should be worthy of this church, originated with Mr. Taylor, the senior churchwarden, and received the cordial support of the vicar, and the other churchwardens. The design was furnished by Mr. Ferrey, F.S.A., under whom the restoration of the church, in 1845, was conducted, and who, with Mr. Scott, was more recently architect for the rebuilding of the noble tower of the church. The carrying out of the design was entrusted to Mr. Davis, the builder of the new tower. So far all was well. But afterwards a few persons commenced a vigorous opposition to the scheme, protesting that it was contrary to the wishes of the parishioners. This objection was set aside by a majority of about four to one in the vestry. But a new difficulty arose. A solicitor in the town, who had been acting for the churchwardens, threw them over, and shortly after declared himself the opponent of their scheme, and induced two or three others to oppose it, on the ground that there were figures in the niches of the pulpit, which might occasion the danger of idolatry! A judge was found who held these objections to be valid, and refused a faculty for the pulpit. A compromise was entered into, and the figures were withdrawn, upon which the

CARVED PULPIT, ST. MARY'S, TAUNTON.—MR. B. FERREY, ARCHITECT.

faculty was allowed. The place of the figures is at present occupied by diapered panels. The pulpit is built of Ham-hill stone, and is of octagonal form, having five sides complete. Each side forms a niche, with a trefoil arch, crocketed and diapered, supported by four spar columns, with moulded bases and carved capitals of white lias. The central niche was filled with a figure of Our Lord, represented as the good Shepherd; the other niches filled with figures of the Four Evangelists: the angles are of polished green marble shafts, supporting a carved cornice, carried upon a Ham-hill moulded corbel, raised upon a carved capital, with polished

dark marble columns, and mould base of white lias, the whole being raised upon two polished black lias plinth stones.

SIR.—I have lately returned from viewing the new pulpit designed by me, and recently fixed in this noble church, St. Mary's, Taunton. I can scarcely repress my feelings of indignation at finding the pulpit robbed of the beautifully carved statues of Our Lord and the four Evangelists, which filled the niches, and are represented in the accompanying illustration. The senseless opposition which has been raised against these figures has so far succeeded, that permission to erect the pulpit has been granted solely on the condition that they should be omitted. There is something so inconsistent in this, that one cannot understand it. This church has not been the

scene either of extreme ritualism or clerical vestments. The zealous vicar fills his church through the earnestness of his ministrations, and no suspicion on the ground of excessive display in the mode of conducting divine service can be alleged against him. At this very moment a reredos is in course of erection at St. Cuthbert's Church, Wells, containing figures in high relief, representing the Last Supper, some of them showing much action. This group is put up without let or hindrance; and in the church at Buckland St. Mary, a few miles distant (lately built under me), there are heaps of statues; but it is not necessary to look further than to the exterior of the new tower to this church, the niches of which are furnished with figures; indeed, no work of any high art can be executed without them. I must, therefore, in the cause of art, protest against this stretch of delegated authority, by which the pulpit has been stripped of its chief features.

BENJAMIN FERREY, F.S.A.

ANGULAR POICH, RATIONON CATHEDRAL.

THE PORCH, RATISBON CATHEDRAL.

To the view of Ratisbon Cathedral given in our last, we now add an enlarged view of the triangular porch from a drawing purposely made for us on the spot. A history of the building accompanied the previous view.*

THE EARLY CAVES IN THE CHALK.

At the recent annual meeting of the Kent Archaeological Society, which was held in Dartford, Mr. F. Spurrell read the following paper upon the Early Caves in the neighbourhood:—

I have to call your attention to these excavations, so numerous in our county, known by the names of "walls," "chalk-holes," or "chalk-wells," "gonnals," "swallow," and "dene" or "Dane-holes." On the surface of the ground the pits present several aspects between the perfect and obliterated. When perfect, there is but a small opening about 3 ft. wide, the edges of which are flush with the surrounding level, presenting in a wood or grassy field no mark for the eye to catch at more than about a dozen paces off; sometimes the ground around the opening of the mouth breaks away and leaves a great crater, but more frequently they are quite filled up, only leaving a more or less gentle depression of varying diameters, from three to thirty yards. It is in these latter cases that the common accident happens of a horse whilst ploughing, or cow feeding, being engaged, all the soil but a remnant at the surface having settled, and leaving insufficient support for their extra weight. They are generally found on the slopes of hills, but also on high land and in valleys near the origin of winter springs. Hereabouts the shaft is always of such a depth as to penetrate the chalk a few feet only before it is lost in its expansion for the cave, and consequently it varies in length with the distance of that rock from the surface of the ground, which may be any distance to about 70 ft., I believe. Its diameter varies from a little less than 3 ft. to more than 8 ft., though I suppose that to have been originally only 3 ft. It is usually uniform all the way down, circular and perpendicular, and terminates generally in the middle of the cave. There are some shafts which penetrate the chalk about 100 ft., and seem to have no enlargement below. The cavern widens more or less horizontally from the shaft, a few feet below the upper edge of the chalk, forming a very large space. There were three methods adopted in forming the cave; the simplest was merely to continue the shaft with a rapid enlargement of diameter, making it of a sort of vertically elongated beehive shape, having the angle formed by lines drawn from opposite sides of the bottom and meeting at the top a right angle or less. The second form is that in which the shaft, having been enlarged by one or two diameters, has three, sometimes four chambers or recesses, of about equal width, and made at about equal distances from each other round it. The third form consists of a boring at opposite sides of the bottom of the shaft for about 6 ft., and then each excavation is continued on each side in two directions at right angles to the first horizontal cutting—it was proceeded with by cutting away the chalk and leaving pillars. The floors of such as can be seen are shallow, basin-shaped, and smooth. The roofs are, in many cases, fallen in, the diggers having been too impatient to proceed horizontally to have secured a sufficient thickness of chalk above, to allow for a certain quantity falling down without endangering the whole. They are very large and lofty, one being in two greatest measurements at right angles to each other, 49 ft. by 38 ft. The probable depth of its floor from the surface is over 70 ft.; this has pillars to support it. I have been able to make out very little of their contents—the amount of earth thrown down and broken from the roof being in general too great to remove conveniently, in several that I have dug in; nothing was found but shells and bones of large and small forest animals, and also of tame ones; but the very fact of the ones I attempted being so clear of rubbish at the present day as to make it a tolerably easy task to get at the bottom, was enough to lead one to expect nothing, they having been, without doubt, worked for chalk of late times. Some are filled to the surface with sand, with which is intimately mixed black organic matter, and bones and bits of Roman

and Romano-British pottery. Such an instance is described in our society's transactions, by Mr. Robert B. Lyster. The sand and chalk were loosened by picks, the numerous and varying marks of which resemble those at present made. The access to the pits is provided for by holes or steps cut in opposite sides of the shaft, some of these holes being from 6 in. to 20 in. deep. I suppose that sticks were placed across like a ladder, perhaps only at intervals—as rests: it is probable that in the latter part of the descent a tree or notched pole was required in some pits. I have not been able to find two caves communicating by a passage below ground, but have seen one or two cases in which I conjectured such to have been the case, and from the extreme proximity of some caves, should suppose it would have been the ultimate intention to unite them. A connexion is traced between them by means of fosses and banks above ground, which are plainly to be discerned in the woods from the comparatively undisturbed state of the ground. These I take to have been paths or leading marks through the forest. Others inclose small spaces of land, whilst the batches of pits themselves are generally surrounded with them. Such is also the case at Compton, in Berkshire, and at Fisherton, in Wilts. I may say that the whole of the country between the Thames and the hills bounding the Weald on the north, and extending through Kent, Surrey, and even into Berkshire, is thickly studded with them, being found, I believe, in White Horse Vale at Compton, in the latter county—also in Hampshire and Wilts, where, at Fisherton, near Salisbury, a remarkable settlement has been found by Mr. Adlam. This, though different, I think it necessary to notice. The pits, which are single or in clusters, and communicating below, are dug in a drift gravel resting on chalk, are entered by a circular descending shaft, are carried from 7 ft. to 10 ft. into the soil, and have their floors of chalk, which are from 5 ft. to 7 ft. across. At the surface they are from 2 ft. 6 in. to 3 ft. 6 in. across, and were covered by moveable covers of wickerwork covered with burnt clay. Worked in them, flints, and pieces of pottery were found in them. Within this area are some very particularly well-known instances—such as the Hegdale pit, described by Hasted, near Faversham; the Chibberluther's Hole, in Swanscombe Park, which somebody described in 1803 as having been stopped up thirty years, yet as being a wonderful cavern, divided into detached cells, and so large as to require candles to traverse it. Of its present appearance, he says that its entrance, which was sloping downwards, has now a foss of ten or more feet deep, and even its principal is a well-like hole, which the guide judiciously considered was a fall of the earth over the crown of the cavity, and called Caer l'Arhre's chimney. There is also the Chiselhurst Swallow, and the one in Camden Park. They were probably rather numerous in Norfolk, depressions and falling in of earth similar to those we have here occurring at North Elmham, Dereham, &c., and I have seen signs of them all along the road between Norwich and Aylsham, also southward of Norwich near Boyland Hall, and on Monsehold Heath, and at Stratton Strawless. There is an admirable example at Royston, in Hertfordshire; this, however, has been much mutilated. They are numerous in South Essex on the chalk hills near the Thames about Grays, the Chadwells, and East Tilbury, &c. There are some pits the description of which answered somewhat to that of the present ones at Ashton Cold, Gloucestershire, possibly at Perth, in Scotland, and Newbottle, near Edinburgh, according to Pennant, who says that they agree with Tacitus's description of the ancient German manner of forming their caves. It is to be noticed that they are not found south of the Weald, that is in the Sussex downs, &c., that I can learn. The most remarkable clusters here are several in Joyden's wood, in a wood called Stankey, near it, and in Little Tharrock in Essex. It will be seen by this that the number must have been very large from the traces left, and from Lambard's, Hasted's, and Camden's remarks, &c., which do not now hold good, as the existence of undestroyed examples is comparatively rare. I will now consider the probable uses of these pits. Their form is admirably adapted to that of dwellings; they are dry and warm enough in winter to be very comfortable; not needing a fire, it is probable their continued occupation in summer was not required. They are always found in clusters, never isolated; I am convinced that if one should be thought so,

on further examination one or more will be discovered near. From thirty to forty may be found in as many as three or four acres sometimes. The great similarity of form in the caves at Fisherton may be considered in favour of their having been inhabited. In France on the banks of the Somme, from its mouth to Peronne, are caves descended into by a well-like opening in the chalk, which though obviously superior in design and appearance to ours, as to be recognised at once as habitations from their plan only, yet by their general description they bear a relation to them. No human relics were found in the Peronne caves. I think that evidence may be obtained from foreign usages in favour of their having been used as dwellings. Tacitus says of the Germans, "They dig subterranean caves and cover them with much litter; these they use as winter retreats and granaries; for they preserve a moderate temperature, and upon an invasion, when the country is plundered, these recesses remain unviolated either because the enemy is ignorant of them or because he will not trouble himself with the search." Which use Lambard has adopted in our case, calling the Germans the "verie Syres of these Saxons" "our ancestors" who he supposes made them. Xenophon, speaking of the cold country of the Armenians, says that "their houses were underground. They were like the mouth of a well, but spacious. Below these were passages dug into them for cattle, but people descended into theirs by ladders." Ainsworth commenting on this says,—"This description of a village on the Armenian uplands applies itself to many I visited at the present day," and he says the object of the one small hole is to keep out the cold. Also before him, Bertrand de la Brognière mentions them. Dr. E. Brown also mentions that at Clesch, in Toopolchan, when the Turks and Tartars invaded the country, the people retired and hid themselves for long periods in such cavities whence they could only be withdrawn by stratagem. As to their having been granaries, we have the assurance of Dioscorus that the "Britons stored their corn in the ear in subterranean repositories," which seems to the point. According to King, in his "Mnimenta," Le Bruyn met with many pits and wells near Rania, in Syria, which he was told had served to keep corn and grain in; and, by throwing down stones, he discovered they were very deep. In Mingrelia, and in a hundred places in Tartary, the inhabitants place their corn, &c., as do all the peasants of the East, in deep "fosses" which are called "amher," that is to say magazines, which they cover so evenly that the earth does not seem to have been disturbed, according to Chardin; and M. Langles says that the Arabs of Barbary keep theirs so too; which Shaw confirms by saying that he has seen 200 or 300 together sometimes, the smallest of which would contain 400 bushels. Hirtius mentions this in his "Bellum Africanum." Dr. M. Russell says that the granaries near Aleppo are subterranean grottoes, the entry to which is by a small hole like a well. Of their having been used to obtain chalk we have the direct evidence of Pliny, who says "another kind of manure is the white chalk that is used for cleaning silver." It is taken from a considerable depth in the ground, the pits being sunk in most instances as much as 100 ft.; these pits are narrow at the mouth, but the shafts enlarge very considerably in the interior, as is the case in mines. It is in Britain that this is employed." These pits are often found where the chalk is on the surface, or within a few yards of where it becomes so, and where of course there was no necessity for this laborious method of procuring it, making it unlikely that they were merely dug for that purpose. It seems that there was a regular trade in chalk between England and the continent as proved by inscriptions, yet that chalk obtained by these difficult inland means for exportation as has been asserted, should be preferred to that obtained from our cliffs, for the picking, it is impossible to believe. Some suppose them to have been burial places, but they have as yet produced no signs of such a use in this country, though one exactly answering in the main points to ours, having the cave with descending shaft and steps in its sides, &c., but carefully finished and furnished with a supplementary stairs and gallery with a well, &c., was found in Rome, with niches in the sides and cinerary urns standing in them. Some have supposed them to be sand-pipes or galls, the empty ones being those emptied of gravel for use, Mr. Prestwich even describing some as such

* See p. 569, ante.

on the Stour, and accounting for the engulfing of small intermittent streams by them (which is a very common circumstance) as simply sand-pipes in more violent action than those that are "blind." It is plain that though called Dane-holes now they were in existence anterior to the Danish invasion. It is plain they were not Saxon as Lambarde, Camden, Hasted, and others say, being in existence when the Romans were here, as we learn from Pliny. Though the Romans and Saxons may have dug some, such is probable, copying ours from their suitability to certain uses, yet that either originated them is unnecessary to consider after Pliny's notice of this British peculiarity. The Romans made use of them either as conveniently ready-made places for getting rid of the remnants, worn-out implements, and ashes, of the sacrifice. 2. As pucieris or common receptacles for the poorer dead whether burned or not. 3. Or as common rubbish pits, cesspools, &c. The shafts closely resembling the rubbish pits which are often seen outside the boundary of some Roman towns. Some of the old pits have been worked at a late date for chalk, and I am told that some have been dug lately and may be now in use. The earliest history of them after Diodorus and Pliny's is that contained in a charter concerning which I will quote from Mr. Lister's paper in our transactions. The swallow near Camden Park appears to have been a honnary mark in A.D. 862, mentioned in a Saxon charter of Athelbert, King of Wessex, to Drychtwald, his minister, granting ten carucates of land in Bromleag.

"Denne fram Swelgende, Cregfetna haga to Liochthire."

"Then from the swallow, the Craysettlers dwelling to the gibbet mark." Perhaps it is the same as that afterwards mentioned in the "Carta Etheldredi Regis qua concedat terras in Bromleghe" in these words—"To spelsende panne fram spelsende cregsetnahaga to siochthire." In Morant's Essex, while speaking of the cave field in East Chadwell, there is a remark to this effect—"Tradition will have it that here were King Canobelo's gold mines." Upon the strength of this notion countenanced by a passage in Dr. Plot's Natural History of Oxfordshire, one of the bubbles or pernicions projects set up in the year 1720, was for extracting gold or silver out of the soil here, with this title—"For improving a Royalty in Essex." Part of the passage in Dr. Plot's book reads—"This probable, at least, that here (in Oxfordshire) may have been formerly such a mine, stopped up, as I first thought, by the Aboriginal Britons, upon the arrival and conquest of the Romans or Saxons, who not being able to recover their country within the memory of man, it might be lost like the gold mine of Canobelo in Hungary, when Bethlem Gabor overran that country, or the gold mine of Canobelo in Essex, discovered again temp. Henry the fourth, as appears by the king's letters of mandamus bearing date May 2 an 2 (1401 A.D.) (Rot. XXXIV.), directed to Walter Fitz-Walter concerning it, and since then lost again." The date of Dr. Plot's book is 1676. Camden mentions them, and Hasted in 1778.

At the conclusion of the paper, Mr. Bloxam moved a vote of thanks to Mr. Spurrell for attempting to throw light upon the subject, which was seconded and carried unanimously.

ART-UNION OF LONDON EXHIBITION.

The pictures and other works of art selected by the prizeholders of the current year, 142 in number, are now being exhibited in the gallery of the Institute of Painters in Water-Colours, Pall-mall. As we have already given a list of all the pictures from those of 20L in value upwards, it will be unnecessary for us to recapitulate to any great extent; amongst the most important will be found "Dean Swift and the Peasant," by T. P. Hall (150L); "Scene from King Henry VIII.," by W. Bromley (200L); "Beatrice in the Arbor," by E. J. Cobbett (100L); "Carrickfergus Castle," by J. Danby (100L); "The Life-boat," by E. Hayes (150L); "Away from Smoky London," by J. Tennant (150L); "The Wharfe" (water-colours), by P. J. Naftel (73L 10s.); "Judge Croke," by Margaret Gillies (80L); and "Kenbaan Castle," by H. Gastineau (150L). The print for the ensuing year, by Sharpe, after MacIver, "The Play-scene, Hamlet," is a fine work. Each impression will be worth much more than the amount of the subscription.

Amongst the miscellaneous works exhibited is a redwood model, by Mr. Woodington, of "The Nelson Memorial, Trafalgar-square." It is proposed to produce this in bronze, and distribute examples of it as prizes. It will be an admirable work.

We may mention, a little in advance, that the council are about to offer a premium of some amount for a series of drawings illustrative of events in the history of the country during the present century, and will even increase that amount should any series submitted be marked by peculiar excellence.

THE LAW OF THE BUILDING OF CHURCHES.*

WERE it not for the labours of text-writers, who have reduced into something like order numerous important beads of our jurisprudence lying scattered in chaotic confusion, amidst many hundreds of bulky volumes of statutes and law reports, it would be well-nigh impossible, even for lawyers to ascertain or judges to administer the laws of England.

Many subjects, however, still remain, if not untouched, certainly not thoroughly investigated by legal authors. Amongst these may be reckoned the important subject taken in hand by Mr. Trower.

The necessity for such a work will be readily acknowledged by all who have had anything to do with the building of churches, parsonages, and schools, as well as by those who in administering the law, are compelled to elicit some meaning from the statute law relating thereto, and who rarely mention the Church Building Acts, except in terms of well-merited condemnation. "I need not comment," says one judge, "upon their obscurity; that is a matter of public notoriety; and of them—the Act of Lord Blandford—(19 & 20 Vict. c. 104)—is entitled to pre-eminence for obscurity and difficulty of construction" (per Doctor Lushington, in *Gough v. Jones*, 11 W. R., 108). And again, "It has been no easy task to discover the meaning of the Local Act" (then under construction); "but that Act is light itself compared with the obscurity of the Church Building Statutes" (per Dr. Lushington, *Varty v. Nunn*, 2 Curt., 893). And Vice-Chancellor Kindersley has characterized them as "ill-drawn and obscure, and extremely difficult to assign a meaning to, presenting a labyrinth of ambiguity, rendering it difficult in the last degree to discover the intention, no less than twenty-five Acts having been passed on this single branch of the law alone in the last forty-five years" (*Tuckness v. Alexander*, 2 N. R., 480).

To reduce these statistics and the decisions arising out of their construction as far as practicable into clear and logical order was the task Mr. Trower took upon himself—a task by no means inviting, but one which the author, evidently looking upon it as a labour of love, anxious to throw light upon an obscure but most important subject, governing, as he well observes, "in sacred things millions of our fellow-countrymen," has performed in a manner which does justice to the subject and credit to his own reputation as a scholar and lawyer.

In order to give our readers a fair notion of the work, it may be well to notice briefly the contents of the ten chapters into which it is divided. The first chapter gives very clear and able definitions of the various important words occurring in the work. The second chapter is on sites for churches and chapels in parishes, and for church and chapel yard approaches, accesses, and curtilages thereto; and on sites for cemeteries and burial grounds, and burial lodges and chapels. Chapter third is on sites for rebuilding, enlarging, and improving (and, therefore, altering) churches and chapels; and on enlarging, repairing, altering, and making additional church and chapel yards, cemeteries, and burial grounds. Chapter fourth is on the building of churches and chapels without or before a district assigned to them (i.e., before division). Chapter fifth, on the taking down, rebuilding, restoring, repairing (otherwise than by rates), enlarging, altering, and improving of churches and chapels. Chapter sixth is the divisions of parishes and places. Chapter seventh discusses the subjects of

* The Law of the Building of Churches, Parsonages, and Schools, and of Divisions of Parishes and Places. By Charles Francis Trower, M.A., Barrister-at-Law; late Fellow of Exeter College, Oxford. London: Butterworths, Fleet-street. 1867.

augmentation, annexation, conversion, and substitution. Chapter eighth treats of the disunion and union of benefices and places. Chapter ninth on clergy residences, houses, and glebe; and chapter tenth on sites for schools (for the poor) and for schoolmasters' residences, and on the building thereof.

There are also some useful appendices to the work, containing remarks on Banns of Marriage, Queen Anne's Bounty, the Charity Board, the Curates' Augmentation Fund, the Additional Curates and Pastoral Church Aid Societies, the Redemption of Tithe Rent-charge, Land given in commutation of Tithe Rent-charge, Mr. Hadfield's Bill, the Ecclesiastical Commissioners, and Church-building Contracts.

This brief analysis of the work will, we think, show that Mr. Trower's book will not only be useful to lawyers and clergymen, but also to many of our readers who are in various ways either interested or employed in the building of churches. Attempts have been recently made to consolidate this branch of law, by embodying it in one comprehensive statute. These attempts have hitherto failed; but at no distant period we hope to see such a measure successfully carried out. One thing, however, is certain, that Mr. Trower's treatise will greatly facilitate future legislation on the subject.

MANCHESTER TOWN HALL COMPETITION.

At a recent meeting of the City Council, the Mayor said 136 sets of designs had been sent in, many of which were very beautiful. He thought there would be no difficulty in making a selection of about a dozen. The estimates of the architects ranged from 150,000L to 400,000L. "It was decided that the public should not be admitted to see the designs, as some of the architects made it a consideration that their plans should not be seen by the public until the final selection had been made."

We cannot congratulate the architects whose letters have led to this unwise determination. It is to be hoped that the Council will obtain proper professional assistance in making their first selection. To select about a dozen would be a matter of no difficulty, as the mayor said; but to select the best dozen is another matter. Further, let there be no hurry.

LOWESTOFT, IN SUFFOLK.

The fine old perpendicular church of Lowestoft, in Suffolk, is now under a thorough restoration. Mr. Christian, of London, is the Surveyor-General of its wants, and of what it needs to look again what it once was like. It is a long-backed church, of good East Coast of England proportions, with a tower and, sad to say, an intrusive modern churchwarden steeple of the All-Souls', Langbam-place, London, character and characteristics. To all Shakspearian idolators and students of Elizabethan literature this is a church of great interest; for Nash, the artist and, in some degree, the antagonist of Shakspeare, was the son of the minister of Lowestoft. See a communication on this subject in the papers of the Shakspearian Society from information supplied by Mr. Albert Way. Antiquaries will be sorry to hear that the whole south side of the church has been so much undermined (unnecessarily so) that, "nodding to its fall," it has to be shored up for future but uncertain safety.

THE NEWSPAPER PRESS FUND.

The report read at the annual meeting of this Institution, on the 10th inst., showed that the recent dinner presided over by the Right Hon. W. E. Gladstone, M.P., had benefited the fund to the extent of more than 800L. The number of members then on the roll-book of the Society was 200, of whom 139 were annual, and the remaining 61 life members; the whole being composed of 142 metropolitan and 58 country members. Seven new life members had been elected since the last annual meeting. Two members of the Institution had died, and in each case the widow had received a liberal grant from the Fund. Other grants had also been made to applicants.

The assets of the Association now amount to 700l., well invested. The chairman of the meeting, in moving the adoption of the report, expressed the surprise and regret with which he heard the number of members enrolled. Considering that all who were connected with newspapers throughout the United Kingdom could entitle themselves to participate in the advantages of the Fund, by a merely nominal annual payment, the number could be nearer 2,000 than 200. The Association appeared to be managed with care and economy, and he thought the members of the provincial press, if on selfish grounds alone, would hasten to become members on being fully informed of its scope and character. We shall be glad if this memorandum serve to advance the desired end.

ARCHITECTURAL AND ARCHÆOLOGICAL SOCIETY OF NORTHUMBERLAND AND DURHAM.

The third general meeting of the members of this Society has been held at the village of Bothal, arriving at Morpeth shortly after mid-day, the members of the Society proceeded along the river side walk, inspecting on the way the ruins—scarcely scant now—of the Lady Chapel. On reaching Bothal, the company at once proceeded to inspect the church. Mr. R. J. Johnson (Messrs. Pictet & Johnson, architects, Newcastle), described the edifice, but prior to entering it, a paper was read respecting Bothal Castle, by Mr. Westgaff. Leaving the church, the company proceeded to the castle, which is occupied by Mr. Temple, the agent of the Duke of Portland, the owner of the Bothal estate. Here, after having walked three or four miles, a welcome invitation was given to the company by Mrs. Temple (Mr. Temple being absent), to enter the castle and partake of refreshments. Having viewed the remains of the castle, the company returned to Morpeth by way of the fields, arriving at the Queen's Head Hotel, they sat down to dinner, the Rev. W. Greenwell, president of the Society, in the chair. The chairman addressed the meeting chiefly on the subject of a restoration of St. Andrew's Church, Newcastle. He severely condemned the "restoration" which had been carried out by the churchwardens and incumbent, and pointed out what this Society had done to prevent the destruction of the original features of the church. The east end had been entirely destroyed, and the whole is a very ugly thing.

FATAL ACCIDENT IN NOTTINGHAM.

RESPONSIBILITY OF CONTRACTORS. A fatal accident, resulting in the loss of two lives and seriously endangering another, has occurred in Chaucer-street, Nottingham. Three labourers, the employ of Mr. Thumbs, contractor, were engaged in excavating for a new culvert, which was being constructed by the Board of Health, up a centre of Chaucer-street. The culvert runs 10 ft. or 13 ft. deep, but opposite the Midland Institution for the Blind (where the accident happened) the depth was not nearly so great, being at the point where the excavation had ceased. There was no shoring to the excavation, and the three men were throwing out soil, when a slide in the cutting gave way, and they were literally buried alive. Two of them were completely covered by the earth which fell on them, and died, but Brooks's head was above the ground. As a coroner's jury, after hearing evidence, returned the following verdict in one of the two cases:— "That the said Henry Westgaff died from having been accidentally crushed by the fall of earth in a culvert in Chaucer-street, in this town of Nottingham, where he was engaged as a workman; and it appears to this jury that his death was brought about by the neglect of the contractor, and necessary precautions by the contractor, William Thumbs, and the clerk of the works, Thomas Gascoyne, in protecting the lives of the workmen employed in the dangerous calling of cutting the said culvert. The jury desire to express their strong opinion, that in all such cases works in Nottingham of a nature like those in Chaucer-street, the town authorities should insist that the safety of the cuttings be properly shored up, and be placed under more efficient superintendance."

A similar verdict was returned in the other case. The coroner, previous to reading over the verdict, called Mr. Thumbs into the room. The coroner then said,—It has been with consider-

able difficulty that the jury have decided not to return a verdict of manslaughter against you. Had they done so it would have been my duty to have committed you, and the charge would have been laid against you and Mr. Gascoyne. That the accident arose from a want of precaution on your parts, no one who has heard the evidence can doubt. I very much regret that you should have made a statement to the effect that timber was taken to that street and from thence to another. Nobody saw it but yourself, and you only saw it in imagination, although you swore to it as a fact. That your statement was untrue was borne out by the facts; your statements were contradicted by every witness who was examined; and after it had been flatly contradicted you said it was mere hearsay. I think you will remember, with feelings of pain, that the deaths of those two men have been brought about very much by your neglect.

Ten jurymen, it is said, were strongly in favour of returning a verdict of "Manslaughter," but were compelled to give way to the others.

ST. MARYLEBONE BATHS AND WASH-HOUSES.

The Vestry of St. Marylebone have just been gratified with the information that the mortgage incurred by them in building and fitting up the above establishments, in the vicinity of Lisson Grove, has been entirely paid off. For the future, the baths and wash-houses of the parish will not only be self-supporting, but will return to the parish exchequer a clear sum exceeding 1,000l. annually. Since the opening of the baths in 1849, the number of bathers has been 2,487,109; and the number of those availing themselves of the wash-house has been 388,431. The almost insurmountable difficulty of getting a site at the eastern end of the parish is the sole reason why the Vestry have not hitherto erected similar establishments in that district of the parish also.

THE MARYLEBONE MORTUARY.

The decision of the vestry of St. Marylebone to erect a mortuary in the Paddington-street burial-ground has caused great opposition amongst the inhabitants of the immediate vicinity, and the vestry held a special meeting on Tuesday last, the 13th inst., to consider the propriety of rescinding the resolution. After discussion, Mr. Tyler said there had been no less than three requisitions from corners' juries at different times asking the vestry to erect a mortuary, and, though there was a semblance of opposition by the inhabitants of the district, he would undertake to get more signatures from the neighbourhood of the burial-ground in favour of the erection of the mortuary than could be got against it.

Professor Marks quoted from personal knowledge several instances of the ill-effects produced on the health and the morals of the poor by the absence of such useful places as mortuaries.

The chairman put the motion for the rescinding of the resolution of the vestry that the mortuary be erected, with the following result: For rescinding, 16; on the contrary, 25. The result is that the mortuary will be erected. We may add that it is to be placed in the centre of the burying-ground, will be surrounded by trees so as to be nearly invisible to the public, and will be at a considerable distance from the adjoining houses.

THE WINCHESTER DRAINAGE COMPETITION.

There were sent in eleven plans by competitors for the three premiums. From the eleven plans the committee selected four, because they all proposed to distribute the sewage in the Chilcomb Valley, which some consider to be objectionable for the purposes of profitable utilization. The committee returned the other seven to the respective engineers, knowing nothing, or next to nothing, of their merits. Not being able to decide upon the four selected, they called in the assistance of Mr. Bothams, the surveyor to the town council of Salisbury. Mr. Bothams has decided the plan No. 7, motto "Experience," to be the best of the four, and consequently enti-

led to the premium of 150l. It also appears that he has decided that the three others are so defective, from inaccuracy of levels and other important omissions, that they are, in their present state, practically useless. But the committee must now decide how the second and third premiums are to be disposed of. A special meeting is to be held, to settle this somewhat perplexing point.

WINCHESTER DRAINAGE COMPETITION.

Sir,—The unfairness, not to say dishonesty of the Winchester Local Board, in the matter of their recent main drainage competition, demands the fullest publicity, and the rejected competitors hope to enlist your powerful aid in exposing the gross injustice to which they have been subjected by the Board.

The "printed particulars" issued by the Local Board say, "The plans and specifications to set forth the best place and method of disposing of the sewage." From this it would appear as if the Local Board had not determined upon the place in which to dispose of the sewage, and accordingly we carefully surveyed the entire district, and selected a locality which was best adapted, in our opinion, for the disposal and profitable utilization of the sewage. We did not, however, select the Chilcomb Valley, and for this, and this only, our designs were rejected. It matters not with the members of the Winchester town council what were the merits in other respects of the seven rejected designs. With these self-constituted judges it now appears to have been a *vis qua non* that the sewage should waste its fragrance in the marshy air of Chilcomb Valley, and any engineer, no matter what his judgment or experience might be, who recommended any other locality, thereby deprived himself of the consideration and courtesy which he had a right to expect at the hands of the council. Upon these grounds we protest against the decision which has been given. The advertisement was a delusion and a snare, and the authors of it obtained designs and awarded premiums under false pretences. COMPETITORS.

PROPOSED NEW SYNAGOGUE, LONDON.

Sir,—In the *Builder* of the 3rd inst., a letter appeared signed by Mr. H. E. Collins, one of the unsuccessful competitors in the late competition for the above building, in which it was stated that—"Mr. Philip Hardwick was not consulted, nor did his opinion guide the committee in determining the merits of the designs submitted."

Both these statements are quite inaccurate. The absence of Mr. Hardwick from London has prevented our noticing this letter previously. Immediately on his return to town, however, we saw Mr. Hardwick on the subject, and we have his authority to state that he was consulted, and reported to and advised the committee upon the merits of the designs submitted. We have further the permission of various members of the Building Committee, whom we have seen, to state that the report submitted by Mr. Hardwick was duly considered by them, and was mainly instrumental in their arriving at their ultimate selection.

THE SUCCESSFUL COMPETITORS.

BUILDER AND ARCHITECT.

Sir,—The complaint of your correspondent "Architect" is one of long standing and too frequent occurrence, the only remedy for which, I believe, is for us architects to adopt the system of keeping down the extras in our own accounts and those of builders.

Exceeding the amount clients are desirous of spending, and following the example of lawyers in making our charges, often are the cause of those clients to build placing themselves at the tender mercies of their builders who adopt the plan of ignoring the architect's existence, except in scribbling his ideas.

As an example of this, allow me to state that in my immediate neighbourhood a fresh-blown speculating builder is engaged in erecting a private residence for a client, and so far is this light-house builder superior to draughtsmen (except upon his client frequently) that he designs (?) the building as it is carried up, trusting to Providence how the next story may turn out.

What such building will end in, is some satisfaction to us slighted professionals when we contemplate the soundness of the foundations, and of the persons who think themselves so cute in being so cheaply done for.

W. E. B.

ROUND NUMBERS FOR THE HOUSE OF COMMONS.

Sir,—I take as a text a passage in the *Builder* of July 27th (p. 512), "The establishing of schools and museums . . . would cost a good deal less than half as much as one of those pondering iron-clads which appear to be superadded on an average about every six months."

When a comparison of expenses of this kind is to be submitted to Parliament, I wish to assume an analogy between that august assembly and the partners in a firm of contractors who are on the eve of putting a tender for a large job. Suppose that the priced bill of quantities lies on the table before the leading partners, while the sleeping ones occupy the back benches of the concave, supported by the managing clerk and other subordinate, in readiness to furnish all required information. I take it for granted that a very natural proceeding on the part of an anxious partner will be, to look at the round numbers only, the several heads under which long castings of figures are ranged; for instance, if the trade "wood-carver" casts up to 988l. 18s. 2½d., cost price, he will look at it as "1,000l.," perhaps, too, he will fortify his judgment by taking a scrap of paper and scribbling down the round sum.

Now, my proposition is, that the House of Commons be furnished with a black board and white chalk, by

means of which, while one responsible minister of the Crown is in the usual style stating the estimates for the year, calculated to the uttermost farthing, another responsible minister of the Crown shall write down conspicuously the round numbers only, emphasizing the millions and the hundreds of thousands of pounds, and putting cyphers for the odd amounts; or, if this plan be unsuitable to the construction of the house, a series of light wood and paper frames, like boys' paper kites, might be brought in, in a portfolio, and held up to view at the proper moment. Familiarized to such exhibitions of general views of the public expenditure, the members and the public might be led to a rational comparison of the cost of shot, shell, and gunpowder consumed in experiments and salutes, with the expense of museums and educational establishments, and might even go so far as to discover whether selling Epping Forest would produce money enough to buy a new park of ten acres in extent.

G. M.

WOOD WORKING MACHINERY IN THE PARIS EXHIBITION.

Srs.—An official report of English Wood-working Machinery has been published, in which commendation has been accorded to several exhibitors of the above description of machinery, and to which no doubt they are entitled.

Without imputing any motive, I think justice has not been done by the total omission of my name from this report, as it is to me that the only silver medal (the highest prize in this section) has been awarded. The expense and pains on my part of contributing to the English display of machinery (mine being all in motion) has, of course, been very great, and it certainly is not unnatural for me to expect to be at least mentioned in connexion with the others; and, moreover, it appears to me a very poor compliment to the jurors "to make conspicuous by its absence" the name of the recipient of the highest award.

S. WORSSAM.

FLAT ROOFS.

Sir,—While I agree in much that Mr. Chadwick has advanced with regard to the propriety of utilising the roof space in dwellings for the labouring classes, I wish to point out two important purposes which flat roofs could not be made to serve as he seems to indicate. First, in drying clothes. In the country this would be unnecessary; in the town it would not only be drying, but smoking them. Secondly, he says (*Builder*, July 20), "On them the father of the family may sit in fine weather, and have better air and an extended prospect, and enjoy himself in the Oriental fashion." I am afraid, in London at all events, the old fellow would, after a few hazardous experiments, be glad to descend once more to terra firma and enjoy himself in the old and well-known occidental fashion. I am not at all sure about his having better air; but at any rate, in fine weather, I, for one, should prefer the garden to the house-top; and in cold or wet weather, even Mr. Chadwick, I suspect, would prefer sitting by the dining-room fire to the top of the kitchen chimney.

PHILIP DORMER.

GAS.

THE Worcester Gas Company have declared a dividend of 10 per cent.; the Taunton company of 8 per cent., and the Wisbech one of 10 per cent., for the past year. The chairman of the New-castle-under-Line Gas Company at their general meeting said:—"When the directors reduced the price of gas to 4s. per 1,000 ft. (making within the last four or five years a reduction of fully 20 per cent.), they expressed a hope that they should be able, ere long, to make a further reduction, even if it was not very large, and the directors would now with much pleasure propose at the present meeting that after the next quarter the price should be 3s. 9d.; and by energy and watchfulness on the part of the directors he hoped this would be done without infringing on the dividend to which the shareholders were fairly entitled." A resolution to this effect was unanimously carried, and a dividend at the rate of 10 per cent. per annum on the old shares and $\frac{7}{8}$ on the new was declared.

At the Bedfordshire summer assizes, in the case of *Smith v. The Bedford Gaslight Company*, a verdict of 50l. has been obtained by consent for damages to cottage property by percolation of offensive matter from the old and disused gas works near the property.

Mr. Cardwell, in the House of Commons, has brought up the report of the select committee upon the subject of the supply of gas in the metropolis, and expressed a hope that early next session some satisfactory measures, founded upon the report, will be introduced.

A paper has been printed which was read by Mr. E. Goddard, engineer to the Ipswich Gas Works, at the meeting of the British

Association of Gas Managers, held at Nottingham, in June last. The subject is, "On the application of liquid hydrocarbons as a substitute for cannel in the manufacture of gas of high illuminating power." The discussion which ensued is also printed. Cannel coal is becoming more expensive every day; but certain companies are compelled to use it in order to increase the illuminating power of their gas to parliamentary standard. A substitute for cannel is desired; and attention is being directed to the waste products from the oil works in combination with coal, as a substitute. Mr. McKenzie has been making a trial of an oil produced from "schist," or "schist clay;" and, it would seem, successfully, seeing that works are being erected at Merton, near Seaham Harbour, which "will be able shortly to supply the material equal to the best Boghead cannel at about half the price of cannel." It was to Mr. McKenzie's patent that Mr. Goddard's paper was mainly confined.

THE LATE GREAT RAINFALL IN THE SEWERS.

At the usual weekly meeting of the Metropolitan Board of Works the engineer (Mr. Bazalgette) read a report, in reference to the recent heavy fall of rain, of which we give an abstract:—"A fall of rain such as has not been recorded in London for the last twenty years, and stated in the Registrar-General's return of July 27th, to have been unprecedented at the Greenwich Observatory, fell between midnight on the 25th July and nine o'clock on the following morning. During these nine hours 34 inches of rain fell; not like a thunder-storm confined to a portion of the metropolis only, but a uniform down-fall extending over the whole of the metropolitan area and the surrounding country. Thus one-eighth of the average rainfall of a whole year fell in nine hours, or nearly one-thousandth part of a year, one quarter of the year's rain having fallen during the month of July. In preparing the scheme for the main drainage of the metropolis, it was anticipated that the low level district of London would be very considerably relieved of the flooding which had previously produced such disastrous destruction of property during heavy rains, and those expectations have been fully realised. It was not, however, contemplated by the intercepting sewers to carry off all the flood waters produced by extraordinary rainfalls. The reports of the eminent engineers who have considered this subject, and my own commencing in 1854, are numerous and very explicit. They propose, in addition to the sewage, to carry off by the intercepting sewers one-quarter of an inch of rain in twenty-four hours. They give an average of the number of days per annum upon which such rainfalls have occurred, and explain the manner in which it is proposed to deal with exceptional rain-storms; and how impossible it would be, by works of reasonable magnitude and cost, to carry off and pump through the intercepting system such exceptional storms as fell on the night of the 25th July, and which within nine hours deluged London with 26,000,000 tons of water. Such a rainfall may not within the present generation again occur. . . . The intercepting sewers have more than answered the original expectations with respect to them. Their soundness and efficiency can scarcely again be more severely tested than on the 25th of July last. The pumps were that day lifting a volume of water equal to nearly half an inch of rain over the whole of the low-level area, nearly double the quantity they were intended to lift, and without even such partial failure or accident as might, in a work of such magnitude and under so severe a test, have been fairly expected."

MR. THOS. CARLYLE ON LONDON BUILDINGS.

In a paper recently published, Mr. Carlyle writes thus:—

"Cheap and nasty" in operation. One small example only! London bricks are redned to dry clay again in sixty years, or sooner. Bricks, burnt them rightly, build them faithfully, with mortar faithfully tempered, they will stand, I believe, barring earthquakes and canons, for 6,000 years if you like! Etruscan pottery (baked clay, but rightly baked) is some 3,000 years of age, and still fresh as an infant. Nothing I know of is more lasting than a well-made brick—we have them here, at the head of this garden (wall once of a manor park), which are in their third or fourth century (Henry VIII.'s time) was told, and still perfect in every particular. Truly the state of

London houses and London house-building, at this who shall express how detestable it is, how fit moral too, which is far more. I have often sadly thought of this. The fresh human soul should be born in a place, born in the midst of a concrete mass, taught at every moment not to abhor a lie, but to th lie all proper, the fixed custom and general law of the land, and to love its young affections round that sort of England needs to be rebuilt once every seventy years. Build it once rightly, the expense will be say fifty per cent. more; but it will stand till the day of judgment. In seventy years we shall have the expense of building England over again! Say nine-tenths of the expense say three-fourths of it (allowing for the change necessary in the change of things); and in right arithmetic, such is the saving possible to you; lying your nose there; soliciting you to pick it up;—by mere act of behaving like sons of Adam, not like descendant phantasms and sons of Bel and the Dracena; Here is a thrift of money, if you want money;—money-saving would (you can compute in what length of time) pay your National Debt for you, by the ocean for you; wipe away your smoky nuisances, muddly ditto, your miscellaneous ditto, and make the of England clean again;—and all this I reckon as zero in comparison with the accompanying improve to your poor souls,—now dead in trespases and drowned in beer-huts, wine-huts, in glutinious, in quackeries, but recallen them to blessed life again, an sight of heaven and earth instead of payday, and Me Co.'s future. Oh, my bewildered brothers, what a infernal Circle has come over you, and changed you men once really rather noble of their kind, into beasts into hogs and asses, and beasts of the field or the I declare I had rather die."

CHURCH-BUILDING NEWS.

Bridgwater.—The foundation stone of a church, which is to be built at Cumbwiche, has been laid. The late Rev. Dr. Jeffery, vicar of Otterhampton, left 1,500l. towards this object, and an additional sum of 500l. has been subscribed. The contract has been undertaken by Mr. A. Squibbs, of Bridgwater, builder, 2,000l. The architect is Mr. C. Knowles. The church is to be built in the Perpendicular style and will accommodate 200 persons.

Dursley.—The church of St. James, which has fallen into a very dilapidated condition, the roof especially being considered to be in a very dangerous state, is now in course of restoration. The estimate for the work is 4,000l., and the contractor is Mr. Robert Fletcher, of Salisbury. Mr. Thomas Graham Jackson, of London, is the architect; and the work is under the immediate superintendence of Mr. Robert Mockford.

Widnesbury.—A vestry meeting, held at W Green, has sanctioned the borrowing by the Burial Board of a further sum of 2,000l. for the purpose of completing the cemetery at W Green. The total cost of the works at that cemetery, in excess of the 8,000l. already expended, will be 1,744l.

Winchester.—A monument to the officers and men of the Royal Bengal Fusiliers who fell, died subsequently from wounds received, Umbayla Pass, in 1863, has been placed in the cathedral. The monument, which is a wall or pyramid in its form, is the background black, and the front of white marble. At the apex, in a scroll, is the word "Passay," denoting that the corps was present at that great action of Clive's, in 1757, the effect of which was to establish British superiority in India. Beneath this is a lozenge-shaped device charged with the name of the regiment, and having its number (101st) in the centre. Under this is the word "Pegu," another of the many brilliant achievements of the corps.

Books Received.

A FILE of books addressed to the general reader, rather than to those of any special class, have come to hand and call for notice. Prominent amongst them are three volumes, titled "The Adventures of an Arcot Rupee," by Major Chas. F. Kirby, late of the Madras Army (Saunders & Ooley). This book treats amusingly and graphically of the social condition of India at the commencement of the present century, and points to what the author considers the causes that led to the Madras mutiny in 1806, and their likeness to those which brought about the great mutiny of Bengal. A very lively picture is given of Anglo-Indian manners at that time, and the whole is connected by a continuous story which is interesting and lifelike. "Ciree," by Babington White, having passed through a popular magazine, now takes the shape of two neat volumes, published by Ward, Lock, & Co. The story is "inscribed to the memory of a Painter," and tells of an unbalanced mind wrecked by the

cheries of beauty without heart. The incident is less uncommon than some would suppose. In Paris, the story has the merit of interesting the reader. The author sees in the life of his unfortunate hero a protest against the worship of the sensuous in art—surely," he exclaims, "in the religion of Art there is a higher and purer form of worship than at which begins and ends at the feet of earthly only."—Mr. Winwood Reade's paper in *Alphania*, "The Gorilla as I found him," is an ample of plain speaking seldom equalled. He says M. du Chailu is a liar, while he gives him high credit for the difficulties overcome in penetrating to Ashango Land. If M. du Chailu ever shot a gorilla, in former days he would certainly have shot a Reade had he so spoken. Reade properly gibbets Sir Roderick Marrison for his impertinent intrusion into discussion on which he knows nothing.—*Westley's Magazine*, edited by Mr. Edmund Yates, gives well, Dr. William Russell, Mr. Shirley Cooks, and other well-known writers ably operating with him. The aim of its energetic and clever editor must be to give it character of its own.—*The Broadway*, our new venture (Routledge), is addressed equally to New York and London, but its first number contains nothing, beyond a brief review of W. Cullen Bryant, from or specially pertaining to the other side of the Atlantic. It is, however, a very amusing part. I am a remarkably good sixpennyworth.—Martin Chuzzlewit," the second volume issued in the "Charles Dickens Edition," has special charms upon us, setting forth, as it does, the man architect Pecksniff, and the miserable way which the poor were, even are, attended to in sickness. In all his writings Mr. Dickens has never omitted an opportunity to show forcibly his crying want of sanitary improvement in the dwellings of the labouring classes. In addition to Martin Chuzzlewit is a capital story,—a book that will live.

Miscellaneous.

EFFECTS OF A STRIKE.—Upwards of 600 men, mostly engine-drivers and firemen on the North-Eastern Railway—the victims of the memorable strike on the 10th of April last—were virtually starving.

THE PARIS EXHIBITION.—The Imperial Commission of the Universal Exhibition has just issued a notice that the date of the 31st October, fixed for the closing, will be punctually observed. The materials of the palace and park will be promptly offered for sale.

ALMSHOUSES AT SANDOWN, ISLE OF WIGHT.—It is said that the late Major Smyth has left £20,000 to be expended in the erection of a block of almshouses for the widows of naval and military officers on the plot of land at the top of Sandown-street. £2,000 have also been left to provide bells and a belfry.

THE ARTISANS' AND LABOURERS' DWELLINGS.—We regret very much to observe that the hill has been discharged. Mr. McCallagh, in moving the discharge of the order relating to the hill, complained of the implacable hostility shown to the principles and provisions which will by a small section of the House, but which he himself is bringing forward a similar bill at the next session, when, it is to be hoped, the Government will give him real support.

TESTIMONIAL TO MR. ROBERT THOMPSON, OF THE ROYAL HORTICULTURAL SOCIETY'S GARDENS.—In retirement of Mr. E. Thompson from active service in the service of the Royal Horticultural Society has been thought by his friends to offer on a fitting occasion on which to present him with a substantial testimonial, expressive of their cordial sympathy with him in his declining years, and indicating also their high appreciation of the many services which he has rendered to horticulture and meteorology during a long and useful life. The council of the society have taken the initiative by inviting several gentlemen connected with horticulture to attend a preliminary meeting, at which a committee was deputed to carry out the proposed object. The services rendered by Mr. Thompson, both horticultural and meteorological sciences, are well known to those who are actively engaged in these pursuits. For upwards of forty years he has held a prominent position in the working of the Royal Horticultural Society.

REPAIR OF TOULOUSE CATHEDRAL.—This cathedral is to be repaired by means of a lottery; tickets, 25d. each, giving an investor the chance of winning 4,000l.

HASLINGDEN WORKHOUSE.—A correspondent writes that the guardians have appointed an architect for this building, without going to competition. We really cannot blame them.

A SECRET TELEGRAPH.—M. E. ARNOUX, a superior officer of the French naval artillery, has endeavoured to ensure the secrecy of telegraphic despatches by a contrivance which he has described in a pamphlet entitled "La Lettre Electrique: Nouveau Service Telegraphique." We cannot enter into the minute details of his system, which is intended to apply, with some modifications, to all the various telegraphs now in use. It is not too simple.

GREAT FIRE IN NEWCASTLE.—There has been great destruction by fire in the pile of buildings known as the Central Exchange. The fire was only extinguished after a free course of about five hours. The erection is a triangular block of lofty stone buildings facing into Market-street, Grainger-street, and Grey-street; it was a great feature in the scheme of town improvement carried out by the late Mr. Richard Grainger, and the domes at the angles facing Grey-street and Market-street, Grainger-street and Grey-street, and Market-street and Grainger-street were prominent objects from whatever point the town was viewed. The fire commenced in the upper story of the hotel. Property to the value of 60,000l. has suffered.

A PUBLIC HALL FOR TURNERIDGE WELLS.—Some years ago a public company was formed, having for its object the building of a large central hall, with which should be connected public offices, reading-rooms, baths, and other conveniences. For some reason the undertaking fell through, and the company collapsed, but recently a somewhat similar plan has been suggested by a gentleman known by his efforts to improve the condition of the working classes. His idea appears to be to build a large hall where all the business of the various friendly societies in the town, including a very large number of working men, might be transacted. It is said that he has, in conjunction with other gentlemen, expressed his willingness to advance 2,000l. towards such a building, free of interest, provided that members of friendly societies and others interested would raise a like sum in shares on the limited liability principle.

A NEW SAFETY LAMP.—Mr. Samuel Higgs, jun., of Penzance, has invented a safety-lamp, the principle of which is to enclose the ordinary Davy Lamp in a case, or tube, made partly of glass and partly of brass; by these means, it is said, there is no diminution of the light; no possible chance of an explosion, however strong the current of air; nor can the lamp be tampered with, as the inner lamp is locked with one description of fastener and the casing with another. The pricker, or trimmer, is done away with; a flat, prepared wick being substituted for the ordinary coarse wick; and the lower part of the casing being of glass, a better light is obtained. The lamp has been subjected to severe tests. Highly explosive coal-gas—gas which elongates the flame and causes the Davy lamp to become red-hot—has no perceptible influence on Mr. Higgs's double Davy, nor can any amount of blowing force the lamp-flame through the two surroundings of gauze.

NEW MUSIC-HALL FOR SHEFFIELD.—The plans for the proposed new music-hall, which is to be erected fronting Barker Pool and Burgess-street, have now been prepared by Messrs. Flockton & Abbott. The principal entrance is in Barker Pool, and it is proposed to extend a portion of an ornamental character over the pavement, so as to enable persons to enter dry-shod from their carriages. The gallery entrance is at the upper angle in Barker Pool. There are also two subsidiary entrances to the hall in Burgess-street. The building will be about 70 ft. high up to the square. The basement story contains dwelling for the hall-keeper, large kitchens, with cooking accommodation; a bar for refreshments, and cellars. On the ground floor is an entrance-hall, 27 ft. by 24 ft., opening from the portico, and communicating also with retiring-rooms for ladies and gentlemen. On the floor of the large hall there are rooms for a variety of purposes. The large hall is 125 ft. long by 60 ft. wide, and 55 ft. high.

JOINER'S WORK FROM ABROAD.—At the recent meeting of the Company for Providing Improved Dwellings for Artizans in the Metropolis, Mr. Henry Edwards, M.P., the deputy-chairman, said that the doors, windows, and other carpenter's work used in the buildings now in course of erection were made and brought from Stockholm at a cost of 25 per cent. less than they could be produced for in this country.

MONUMENTAL.—When the *Alabama* was sinking, after her action with the *Kearsage*, its surgeon, Mr. David Herbert Llewellyn, refused to enter the crowded boat, and thus perilled the safety of the wounded; and remaining on board the vessel, went down with her. All honour to his memory! To commemorate his heroic act a tablet has just been placed in the lecture theatre of the Charing-cross Hospital, in which he was once a student. Though simple and unpretending, the memorial is suitable. Mr. W. T. Hale was the designer and sculptor.—A statue of Napoleon I. is to be inaugurated on the 18th instant, at Montreux. It will stand on the spot where the emperor uttered the words, "The bullet which is to kill me is not yet cast."

AMENDMENT OF TRIAL BY JURY.—Progress is being made with this much needed amendment. The first report has been made to the Law Amendment Society by the special committee on the preservation and amendment of trial by jury. The scope of the report is limited to that part of the inquiry which relates to the devising a better and more equitable system of registration and summoning; and was prepared with a view to its being put in evidence to the select committee of the House of Commons (nominated a few weeks since), by Mr. Sergeant Pulling, chairman of this committee, who was the first witness examined. Next session it is the intention of the committee to resume its sittings for the consideration and discussion of other branches of the subject. The committee have necessarily been at considerable expense, and they solicit a little assistance in support of the fund.

THE ATMOSPHERE OF THE UNDERGROUND RAILWAY.—Sarah Dohner, aged 56, died at the Bishop's-road Station of the Metropolitan Railway on Tuesday before last. Deceased had complained of a great difficulty of breathing while on the underground, and while waiting for the second train she said she was in great pain. A medical gentleman advised her removal to the hospital, but it was then believed she was dead. Mr. Anderson, one of the surgeons at St. Mary's Hospital, who made the *post-mortem* examination, said the deceased was labouring under disease of the bronchial gland, and undoubtedly the suffocating air of the Underground Railway had accelerated death. The coroner, at the inquest, said he had experienced the depressing effects of that railway, and he therefore avoided it as much as possible. The tunnels and stations should be ventilated, but he supposed that would not be done until some shocking loss of life from suffocation had occurred. The jury returned a verdict of "Death from natural causes, accelerated by the suffocating atmosphere of the Underground Railway." It is to be hoped this verdict will lead to the adoption of some such means of ventilation as have already been suggested in the *Builder*.

THE VELOCIPÈDE.—Self-moving carriages on a small scale, especially if some motive-power, such as that of condensed air, steam itself, or even watch-movement on a great scale, could be applied to them, might become very serviceable to those who cannot afford to "keep a gig," and to workmen, clerks, and others, living at a distance from their places of business. The *Builder* has often recurred to this idea; and in Paris the extension of the velocipède seems now to be taken up in earnest, and not, like with us, as a mere toy. Not only is there now in Paris a velocipède driving-school, but also a velocipède club. The Prince de Sagan, M. Aguado, M. Blount, and twenty other gentlemen riders, have taken it under their patronage; and the Duke de Bassano has just ordered a velocipède in aluminium. In America, too, the *Builder's* idea is taking root. A new style of carriage appeared in Boston recently. It was a light open buggy, carrying two men, and had no visible means of locomotion save a slight apparatus under the box. The vehicle came along a street on the track just behind a horse car; but when the car stopped the buggy was turned aside and passed by the car, and was guided as easily as if a horse had been attached.

THE TRADES MOVEMENT IN IRELAND.—The Amalgamated Building Trades of Dublin have passed a resolution indignantly denouncing the Sheffield outrages, and "repudiating all connection with the trades unions of England."

WINDOW GARDENING IN LONDON.—The inspector of nuisances to the Holborn District Board of Works has given formal notice in his district to those having flower-pots in their windows to remove them immediately, otherwise proceedings will be taken to compel their removal.

THE YORKSHIRE MEMORIAL TO THE LATE EARL OF CARLISLE.—The foundation-stone of the county memorial to the late Earl of Carlisle was laid on Tuesday last, on the summit of Bulmer Hill, at the southern end of the long avenue at Castle Howard.

MAGNETISM IN THE IRON MANUFACTURE.—A new mode of manufacturing iron, patented by Mr. W. Robinson, in February, 1865, was recently introduced at Brown & Company's works, Sheffield.

CHARING-CROSS HOTEL COMPANY (LIMITED).—The seventh half-yearly meeting of this company has been held at the hotel; the Hon. J. Byng in the chair. It appeared from the report read by Mr. G. S. Haines, secretary, that the directors' anticipations of increased business had been fully realized.

THE NORTH POLE AS A WINNING POST.—Who will first reach the North Pole? Britons, Americans, Swedes, or Frenchmen. Hitherto the rivalry has been between Britons and Americans.

For building new lock weir, and other additions, to Royal, Portsmouth, Portsea, and Gosport Hospitals. Messrs. Rake & Rawell, architects. Quantities supplied:—

THE LABOURERS' DWELLINGS QUESTION AT LIVERPOOL.—Some conversation on the subject has taken place in the local Health Committee. Mr. Robertson Gladstone asked as to the present position of the question, and stated that 500 labourers' dwellings were to be erected, on the most modern and approved principles, near Edgelande, on the London and North-Western Railway route.

TENDERS

For the erection of two houses, at Adlestone, for Mr. Thorn. Mr. B. Tabberer, architect:—

For pulling down and rebuilding No. 6, Pilgrim-street, Ludgate-hill, for Alderman Sir B. S. Phillips. Mr. H. H. Collins, architect. Quantities supplied by Mr. George Mortimer:—

For Holy Trinity Schools, Dover. Mr. Clarke, architect. Quantities supplied by Pais & Clarke:—

For building Christ Church, Park gate, Yorkshire. Mr. William White, architect. Quantities by Mr. Samuel Field:—

For the erection of a range of stables and coachhouses, covered stable-yard, and dwelling-house, for Mr. Lewis in Newington Green-lane. Mr. H. W. Bndd, architect:—

For the abutments of a small girder bridge, Leicester. Mr. Stephens, borough surveyor:—

For restoration, Priory Church, Dunstable. Mr. G. Somers Clarke, architect:—

For additions to Bath House, Honnelow, for Mr. G. H. Barber. Mr. Gordon Stanham, architect:—

For erecting workshops, Euston-road, for Mr. G. J. Bowyer. Messrs. Wadmore & Baker, architects:—

Absalom £2,919 0 0
Simms & Marten 2,911 14 9
Lawrence 2,859 19 6
Light, Brothers 2,720 0 0
Backhurst (accepted) 2,715 0 0
For incidental works, &c.
Lawrence (accepted) £685 0 0

For finishing six houses, in Cornwall-road, Kensington, for Mr. Thos. Joyce. Mr. W. King, architect:—

For finishing two houses, in Cornwall-road, for Mr. Sharnan. Mr. W. King, architect:—

For building additions to two houses in the Clarendon-road, Kensington, for Mr. Bowron. Mr. W. King, architect:—

For finishing four houses, in Aston-road, Kensington, for Mr. George Ansell. Mr. W. King, architect:—

For farmstead, six cottages, and lodge, at Wadhurst, for Mr. J. Gee. Mr. J. Wimble, architect. Quantities supplied by Messrs. Birdsays & Stoner:—

For town-hall and market-house, Cinderford, East Dean, for the East Dean Town-hall and Market Company (Limited). Mr. Edwin J. Reynolds, architect:—

For alterations, at 78, Upper-street, Islington, and workshops in rear, for Mr. J. H. Maschu. Mr. K. Farries, architect:—

For taking down and rebuilding three cottages, with shops, at Greenwich, for Mr. J. Buskin. Messrs. Bird & Walters, architects:—

For making up Avenue-road, Acton, Middlesex, and for other works, for the Acton Local Board. Mr. Edward Monson, C.E. surveyor to the Local Board:—

For erecting workshops, Euston-road, for Mr. G. J. Bowyer. Messrs. Wadmore & Baker, architects:—

The Builder.

VOL. XXV.—No. 1281.

Still
in London.

IN those comprehensive and instructive glances which the accomplished naturalist casts from time to time over the surface of the planet Earth, he regards with interest those migratory movements by which furred or feathered wanderers follow the declination of the sun. The clouds

of quails which fly by night over the Mediterranean, and, alighting on the Italian shores, set forth (so many of them, at least, as escape the ponched nets erected for their reception) on a rapid pedestrian journey into France, may he awaited almost to a day. The great swift, that whirls through our villages, shrieking with delight, or with eagerness, in pursuit of his insect prey, has travelled to our shores from Senegal, at the rate of seventy miles per hour, a speed now no longer attained by the express trains of the Great Western Railway. The number of degrees of latitude covered by this rapid traveller exceeds the ordinary range of any except human wanderers; but wherever the map of the Old World may be studied at appropriate periods, we shall find marks of the constant self-adjustment of animal abode to the change of seasons.

Artificial, conventional, civilised life is subject to the same element of disturbance, and follows, to some extent, the same laws. A philosopher of that modern school which, after unceremoniously throwing overboard the greater part of that which is most surely received among us, has been compelled to invent the facts on which the previously invented theories are to be supported, would probably astonish us with the synchronisms to be remarked in our own island in the months of August and September. Three days before the festival of the Assumption of the Virgin, he would say, a remarkable migration of a large gallinaceous bird called the Tetrao takes place into the United Kingdom, and specimens are to be met with not only on Cumberland and Scotch moors, but simultaneously, and in great numbers, in the streets of London—no doubt exhausted by fatigue—so that the inhabitants of that metropolis, who remain there for that express purpose, invariably celebrate the Feast of the Assumption by partaking of the flesh of that bird. Seventeen days later a similar phenomenon may be expected to occur with the same regularity, it being remarkable that the second influx of birds consists of those of another species, smaller in size and lighter in colour, but appearing in the same sudden manner over the whole country. It also has been observed that the species of club, or rhetorical exhibition, which has come to replace the ancient Saxon wittengemote, usually comes to a close between these two gallinaceous immigrations, and that this

event is invariably preceded by the capture in the river Thames, in the vicinity of Greenwich, of large shoals of a very small fish, peculiar to the river and to the season, on which the Cabinet Councillors are, by virtue of their oaths taken on appointment, bound annually to feast in the hospital erected in that town.

If we exchange the style of language and of thought borrowed thus from our German neighbours for our own plainer vernacular, we shall have occasion to congratulate such of our readers as are more or less restricted to a metropolitan residence, on one result of the Parliamentary session of 1867. Before rushing northward or westward for the solemnities of the 1st of September, or at least for that mouthful of country air which the torrid heat of 86 degrees of Fahrenheit in the shade has rendered so absolutely necessary to comfort and to health, the Legislature has passed one measure highly calculated to save the time of the residents in, and visitors to, London, from its most amazing mode of consumption. While men of all parties and of all antecedents have been gaily consenting to take a more unprecedented leap in the dark than English history has yet witnessed, but of which we are not at all afraid, we find with no less surprise than gratitude that a practical measure of real and necessary reform has actually escaped the murder of the innocents, and struggled into legal existence. The Legislature which could calmly and with perfect indifference survey the ruin which its own ill-considered and contradicting action had brought on that great interest to which the internal communications of the country have been committed with so little precaution, has been moved to forbid obstructions to the Cabs in which honourable members may have occasion to visit their stockbrokers. There was of course a great outcry. It was held to be a tyrannical invasion of the rights secured by Magna Charta, to prevent any resident in a great thoroughfare from having in his coach or his beer at any moment which either he, or his coal-merchant, or his brewer, might find most perfectly convenient, the incidental block of the entire east and west traffic of the city for five or ten minutes being one of those trifles with which such independent resident had no concern. Why should the coal-heaver be forced to get up an hour or two earlier in order that the banker's brougham might save a quarter of an hour in the middle of the day? Could any specimen of class legislation be more odiously unfair? Where is the hereditary freedom of the Englishman if he is liable to be ordered by a man in a felt helmet to go through one of two parallel streets rather than through another, for the simple reason of expediting the general movement of a city traffic? These champions of inconvenient freedom have, however, at length, been worsted, and it will now be distinctly the fault of the police authorities if London continue to be the city in which, while the traffic is the most enormous in the world, it is at the same time the most confused and unregulated. That a moderate amount of activity and intelligence on the part of the directors of the police would have done much to render the Bill for the Regulation of Metropolitan Traffic unnecessary, we think few who have watched the neighbourhood of St. James's-street on Court-days can doubt. But now, at all events, all doubt as to the full legality of preventing persons from inconveniencing one another by sheer pig-headedness is at an end, and we trust that regulations at once simple and efficient will be intelligently made and unhesitatingly enforced.

The importance of the relief which the introduction of system in the place of irresponsible confusion is calculated to give to the street traffic, has received, within the last few days, an illustration from an unexpected source. If the emoluments of the coroner depend on the number of fatal accidents as to which he may be called

upon to bold an investigation, the independent and defiant liberty with which every carman and cabman in London has hitherto driven across his neighbour's path, must have been a great source of gain to that inglorious functionary. But a new field has opened to his exertions. When the engineer suggested that the traffic of London might be carried on in two stories, and that a new system of thorough communication might be wrested from the dominion of the rats, the water-pipes, and the sewers, it might have been expected that the palpable necessity of providing a respirable atmosphere for the intended passengers would not have been left out of sight. How completely and inexcusably this has been done we have not now for the first time to complain. Very few persons who have come underground, say from Edgware-road to King's Cross, about three or four o'clock in the day, will think any language that we can venture to print sufficiently strong to reprobate the intolerable and stifling atmosphere into which those passengers have to descend who seek to shun the fierce sun of the streets, and the intermitting torture of the public conveyances. But now that we have the authority of the coroner for attributing death directly to the atmosphere of the Underground Railway, we trust that the directors of that enterprise will feel convinced that it will pay to attend to the ventilation of their pestiferous tunnels. The traffic on the railway is enormous, and conducted as it is by fully adequate locomotive power, and unimpeded by the delays caused by junctions, or by the charging and discharging of luggage, it is calculated to relieve the streets almost entirely of a large amount of through traffic, were it not for this one grand obstacle, want of ventilation. There can, we should think, be little doubt that a due attention to this essential requisite of comfort would very largely increase the traffic of the Metropolitan Railway. If people could convey their own oxygen, like water spiders in an aquarium, very few would hesitate between the cost of a cab or the discomfort of an omnibus on the one hand, and the punctuality, speed, and easy motion of a railway carriage on the other. As it is, the long lines of omnibuses are not only far better served, but appear to be more numerously supported than was the case before the piercing of the tunnel under the New-road. How much of this active support of the more cumbrous, interrupted, and crowded mode of transit is due to the stifling atmosphere of the tunnel, we suppose the Metropolitan directors have never calculated. But a little reflection only is necessary in order to arrive at the conclusion that nature in this, as in other cases, tacitly asserts her rights. The man who now hesitates whether to take a ticket by railway or to reach the City by some above ground conveyance, may not be at all aware how much his choice is influenced by dim remembrances of former escapes from suffocation. But, on the other hand, supply the shorter and easier route with respirable air, washed and dried if you like, like that furnished to the Houses of Parliament, but at all events not overloaded with the products of respiration and of combustion, and he will not hesitate at all. One would no more think of going from Paddington to the City by omnibus than of posting from London to Birmingham, were it not for the fact that it is difficult to respire on the route when conveyed underground. Now that it appears that what all travellers have felt to be a painful difficulty may in a given case become a positive impossibility, we trust that those responsible for the metropolitan traffic will not be in vain appealed to in that most sensitive part of the official organisation—the pocket.

One other reflection may occur to the fugitive from London, pursued as he is by the dreary aspect of brick-making suburbs down to West Drayton and even to Slough, or met by the heavy veil peculiar to the island metropolis when

wafted by easterly winds almost to the Royal Keep of Windsor. The Thames has actually ceased to be an open sewer; the quality of the drinking water supplied to the metropolis has engaged much and beneficial attention. Our ways are about to be set in order; and in the rapid rebuilding of many districts of the hundred and twenty square miles of town, many noticeable artistic features are daily springing up. The river-wall of the Thames is rising. But we all remember, with a scarce suppressed shudder, that during the part of the year when the game are all shot, the croquet grounds made unpleasant by the damp, the compulsory inactivity of John Doe and Richard Roe is at an end, and duty or necessity, in one form or another, is re-peopleing the dense abodes of the metropolis, it is not the normal state of things for London to be visible. The November fog season awaits our return: the combination of the vapour of the Thames valley with the unconsumed and floating dust arising from our wasteful and unmechanical mode of burning our daily supply of fourteen thousand tons of coal, which makes all London at times somewhat of a subterranean city. Even here there is hope. Mighty is the power of the pocket. To burn coal economically, instead of to volatilise 30 per cent. of that which we purchase in the form of smoke, and to send half of the heat produced up the chimneys, has been as yet too hard a task for us to accomplish. Gradual and enlightened reform in a matter of this kind, perhaps of any kind, is not altogether germane to the English character. But when a new feature is introduced, when a new power comes into play, great and salutary improvements often accompany it, as if of their own accord. Such seems to be the promise of the consumption of petroleum. If all that we hear of the economy and convenience of this material as a fuel be true, there can be little doubt that it will rapidly supersede coal for manufacturing if not for domestic purposes. In such case, a smokeless London is not an impossibility. Let our photographers not omit to perpetuate some of the effects of picturesque gloom which, during August, 1867, have shrouded the leeward districts of London as if under perpetual thunderclouds. The residents in a smokeless London would find it hard to understand how their predecessors should have supported life in the metropolis as it existed during the dog days of the present year; and no photograph can enable those happy future citizens, if such be about to succeed us, to tell how far the chief necessary of human life, the air we breathe, has been poisoned by the improvident development of commercial activity, and by a gradually accumulated neglect of the prime laws of comfort and of health.

OUR WATER SUPPLY.

PUBLIC attention is at this moment turned to the present state and future supply of water to London and the provincial towns of the country; and it is sincerely to be hoped that the inquiry now being conducted will lead to some sound and practical system, founded upon a full and clear elucidation of the subject, exhausting all the skill and science that can be brought to bear upon it, and which have been zealously devoted to it now for a considerable period in the conduct of works, and acting up to the absolute wants and spirit of the age. In aid of that object we tender the following remarks:—

Water is a necessary element of life; in all civilized countries and in all ages it has been the especial object and care of the supreme and ruling authority to secure an abundance of this indispensable and vital element in human, animal, and vegetable economy.

In the palmy days of ancient Kingdoms, even the imperial heads of states did not consider it beneath their position or dignity to confer upon their subjects these inestimable blessings; and the funds for carrying out the necessary works of supply were not exacted directly from the people, but flowed freely from imperial resources and princely revenues. With us it has been the prevailing practice to allow all our great works to emanate from the spirit, enterprise, and resources of the people, guided in a slight measure by Government and our Parliament; and thus has sprung up and been satisfactorily established such an extent of roads, canals, railways, waterworks, &c., as no other country can boast of, even in ancient or modern times. Still it must not be supposed, because we

have succeeded in carrying out these very extensive and magnificent works,—that all that has been done in designing, laying out, and carrying into effect,—every object has been attained, every want satisfied, every requirement fulfilled, and all that we have now to do is to reap the harvest of the spirit, enterprise, skill, and science of the age have so widely and extensively sown.

But if the antecedents of our water-works speculations come to be closely analysed, it will be found that as many bad speculations and errors have been made in originating and projecting them as now unhappily exist in our railway system, which our great capitalists have found out to their serious cost. A relative of the writer turned his attention at an early period to railways, as an originator and projector of the railway system; in 1821 he obtained an Act of Parliament for a line of railway for general purposes, and from that period he, in conjunction with William James and others, urged upon the public by every means in their power the importance of availing themselves of the great advantages of the railway system. In the year 1830 he published a map of Great Britain, and upon it he laid down a system of railways, such as he thought possible and practicable, from his topographical knowledge of the country, and the requirements of trade and commerce.

This map was urged on the attention of the Government of that day, and also upon the leading men of the aristocracy, the Parliament, and the commercial world; and he suggested that these lines should be surveyed, sanctioned, and adopted by the Government, and carried out by private enterprise, and no other lines be permitted to be made until these the main arteries were completed; as they are now absolutely done, closely resembling the lines he laid down. By the adoption of the plan suggested, all controversy and competition would thus have been avoided, and such costly suits as opposition railway bills would not have been heard of, and our railway system, instead of costing us the unprecedented sum of 500 millions of money, would have cost us only 300 millions, and thus we should have saved 200 millions, the loss of which has ruined and broken the heart of many a hapless shareholder, and added considerably to the cost of railway transit.

The Government evidently afterwards saw the error of their ways, as in the year 1838, when railways were first talked of in Ireland, they directed the country to be thoroughly surveyed, and lines were laid down and adopted by them, and were thus carried out with better success. They saw that if the same system had been carried out in poverty-stricken Ireland as had been adopted in England it would have been attended with ruin and disaster, as Ireland had no surplus wealth to throw away in speculation and unprofitable works. And even now, under this better and more economical system, the Irish lines of railway are not commercially successful, and what would they have been if the foresight and forethought of Government had not adopted a different line of policy to that of Great Britain?

In France the same system of Government initiation and sanction scores, in a measure, the convenience of the public and the commercial excess of the undertakings, and nothing is left to chance, competition, or speculation. On the other hand, in the United States the utmost facility is afforded to projectors, reckless speculation is the order of the day, and the result is badly-constructed lines and little or no dividends; the heavy wear and tear of the lines and rolling stock, numberless accidents, and other causes absorb nearly all, if not quite all, the profits in many cases.

This line of argument applies forcibly to the system adopted in carrying out the water-works of many of our towns: they are treated too much, in many instances, as commercial speculations, and but little care or attention is bestowed on the mode of supply, the quality of the water, or the wants and necessities of the inhabitants.

If the necessity is now felt for the state to possess our system of railways, telegraphs, &c., to amend what is wrong and remedy abuses, though how to accomplish the object is at present beyond the scope of our present legislators, how much more necessary is it that every municipality should possess its own system of water-supply, and that no body of capitalists should have power to tax us heavily for this vital and necessary part of our existence. Water should be supplied at the lowest, cheapest rate, just

sufficient to cover the expenses of establishing the works, their maintenance, and working expenses, and not that enormous dividends and bonuses should be exacted from an otherwise heavily taxed and burthened people.

To elucidate the position that water-works are not always well executed or attended with success, we could instance Rotherham, Sheffield, and many other places if requisite. In the former place the works were laid out under the power of the Public Health Act (1848); a fine scheme was projected to obtain a supply of water from springs and existing wells, and about 30,000*l.* were expended in constructing elevated service-reservoirs for high-pressure supply, large pumping-engines, an extensive system of mains, &c.; and after all these fine works had been completed, it was discovered there was yet one thing needful to render these large preparations profitable and useful, *viz.*, a supply of water. For years that district has had less than 100,000 gallons of water to supply about 15,000 inhabitants. The magnificent works were looked for first, and that which was to render them useful to the inhabitants was only a secondary consideration. But the spirit of the inhabitants would not be balked by this bungling engineering, and in 1864 they determined to go to Parliament again, for further powers to obtain an adequate supply from other sources, from gathering grounds in the neighbourhood; and this time the Parliamentary estimate exceeded 26,000*l.* These works are partially carried out, and upwards of 20,000*l.* have been expended of that amount, so that in that suffering and heavily-taxed district their waterworks have already cost about 56,000*l.* (and are still far from complete, requiring impounding reservoirs and other works that will amount to about 20,000*l.* more), for supplying so small a population; and from the limited character of the gathering-ground, and the probable supplies should the population rapidly increase, as it is expected to do, being a manufacturing district, other sources of supply will have to be looked for, at a further heavy outlay.

In this instance the failure was in the municipality; but this arose from their want of discernment and discrimination, in selecting competent and experienced engineering talent to advise and direct them, and which ought not to have been left to their discretion.

Sheffield, also, has been unfortunate and unlucky with reference to her water-supply works. That town is supplied by a company, from water collected from the high moors and land situated about seven miles distant to the west of the town, and collected in reservoirs at Redmires, Crookes, and other places. For many years past grievous complaints have been made of the extreme shortness of water; and their works have been extended from time to time to increase the supply, and to meet the public demands; and even this year a Bill has been passed to increase the supply, and to meet the demand of the inhabitants, and the feeling of opposition created by the disastrous failure of the Bradfield reservoir, and its attendant consequences, which occurred in the year 1864, generally supposed to be from imperfect design and improper workmanship; but, from whatever cause it arose, it is patent to the world that the reservoir works failed, and that, if every proper consideration had been given to its design and construction, the substrata on which it rested, and every subject matter connected with it, the reservoir ought to have been successfully carried out, and not so much as failure dreamed of in their philosophy. At Bradford, Halifax, Dublin, Long-dendale, and many other places, reports of failures and defective works have been made public, and these, doubtless it will be said, arose from unforeseen causes and matters beyond the control of the designers and constructors; but if such are the facts, the causes of the failures may be very interesting subjects to engineers to investigate; but the public judge in every case of these works solely by the constructive, commercial, and other success of the undertakings.

We have alluded to the preceding cases as examples of the manner in which the water-supply works of some of our towns have been conducted, and for the purpose of showing that, like the defects of our railway system they have arisen from causes that should have been within the control and supervision of imperial authority and regulations. It is quite as important that the future water-supply works of our population should be matter of consideration and investiga-

tion as much as our mode of travelling from place to place. Even in these railway days everybody does not travel: it is just possible to find people who have never travelled a mile by railway; but it is not possible to find a living soul who could dispense with the use of water, and therefore it is a more general necessity.

It would seem that just as much as it was necessary for Government to select lines, and lay down our system of railways, they should devise and originate schemes for the water supply of the inhabitants, and it might be accomplished in this manner.

Let correct surveys be made of the water-sheds of all our rivers and their tributaries, or outline copies of the Ordnance Survey be obtained from their months up to the points where they take their rise. Let accurate meteorological observations be made on each water-shed, and the rainfall carefully noted, making use of those data which already exist, and where they are trustworthy, but extending them so that they may embrace the whole drainage area of the respective rivers.

On each water-shed let a correct census be taken of the towns, villages, and other populations residing thereon, pointing out their present modes of water-supply, their position, and deficiency, if any. Let the quantities of water necessary to supply them be computed, estimating 20 gallons per head, if not a manufacturing population, and 30 gallons per head if a manufacturing population. Let impounding reservoirs be provided in the best and most suitable localities on every water-shed, to collect the water that falls during the rainy season, taking care to select it at the best moment when it is least affected with filthy matter, or discoloured with floods, and so regulating the supply of the water in the reservoirs, by occasionally letting it off and taking in a new supply, as to keep it fresh and pure at all times; and these impounding reservoirs should be held as a reserve to keep up a continuous supply of water to each district even through the driest seasons known to man.

This system of collecting and storing up water is not new; it is well known to travellers who have visited tropical countries, as there in the rainy season it is the custom to collect and store up the water in reservoirs and tanks sufficient to supply the inhabitants through the period of drought. And these sometimes extend over a great length of time in Central America. We have known it to be six months without a drop of rain, when vegetation becomes sickly, dried, and withered up with the powerful rays of the tropical sun, and it is quite a novelty at those times to see a green leaf or blade of grass.

But to render the water of our rivers and their tributaries proper and useful for the supply of our population, further means must be taken to prevent the inhabitants from pouring their sewage into and polluting them, rendering the water filthy and unwholesome, wasting a valuable fertilizer, and spreading disease and misery along their verdant banks. It is already an offence against the laws for the authorities of towns to do so, and in some instances parties aggrieved have obtained injunctions to prevent it; but, nevertheless, the evil continues to be acted upon and extended, and some more stringent steps should be taken to prevent this crying evil, as a perfect remedy in all cases is open to the inhabitants if they only would avail themselves of it.

These preliminary steps suggested on the part of Government are necessary in consequence of the alleged necessity, or expressed intention, on the part of certain parties to look out for other sources of supply for London, Liverpool, and other places. London, at present, obtains its supply of water from several sources: the Chelsea, Grand Junction, Southwark, and Vauxhall, Lambeth, and West Middlesex, procure their supply from the River Thames and the New River; the East London chiefly from the River Lea; the Kent Company from the River Ravensbourne; the Hampstead Company from artesian wells at Hampstead and Kenwood, and the New River; the Plumstead, Woolwich, and Charlton derive their supply from a well and boring sunk into the chalk above the town of Woolwich. The whole of the water so obtained is filtered (with the slight exception of a small quantity supplied by the New River Company), pumped into elevated reservoirs, and passed by gravitation to the tanks of the consumers. These supplies of water are comparatively modern, as they were carried out under the Metropolis Water Act (1852), and yield, it is said, a supply of 81 mil-

lions of gallons daily, which has been obtained at a total cost for works of about 7,161,823*l*.

There are several sources of supply talked of for London,—the Lakes in Cumberland, the source of the River Severn, and other projects, which, doubtless would yield an abundance of good water; but these crude projects require close and rigid investigation, and the fullest and most complete inquiry, by all and every party interested. The estimated cost of the former project is about 8,600,000*l*, and the latter 12,000,000*l*, to bring the supply to London; and this cost is, we believe, exclusive of the purchase of the existing works and plant, and exclusive of compensation, and other expenses, that will materially add to the total of the gross estimates.

Liverpool, also, complains of a shortness in the supply of water, although it is not much more than nine years since they constructed large and extensive works at Rivington, about twenty-five miles distant; the rainfall of the district was carefully taken, and, impounding reservoirs made calculated to supply 13 million gallons daily, but this has been found to fall short, producing for many years not much more than 9 million gallons; and this, with the addition of about 6 million gallons from the wells in the red sandstone formation beneath the town, makes a total of about 15 million gallons, while the present wants of the inhabitants exceed 18 million gallons, irrespective of a supply for their future necessities. In consequence, preliminary surveys have been made, with the view of changing their source of supply, and Bala Lake, Ullswater, Haweswater, and other places have been mentioned as the future probable sources.

The tendency of modern engineering science is to look out for large and easily acquired sources of supply for such places as London, Liverpool, and similar places. Glasgow is already supplied from Loch Katrine and other lakes; it is brought a distance of thirty-four miles, is 360 ft. above tide-level at Glasgow, and is conveyed through an 8 ft. aqueduct to the service reservoir at Mugdock Castle, 311 ft. above the level of the sea; thence it is carried through two lines of pipes to the city.

Manchester is also supplied from a distant point, some twenty-six miles off. The water is collected in the Longendale series of reservoirs, Woodhead being the largest and principal, and which may be seen from the line of the Sheffield and Manchester Railway. The water is collected from an extensive gathering-ground, abounding with mosses, and consequently is not the most desirable ground to collect from, nor is the water of the best and purest quality; but reservoir space is found for upwards of 611 million gallons, for the supply of the inhabitants, which is conveyed through aqueducts and pipes, by gravitation, to supply the city.

Bristol has long been supplied from a distance. The water is collected from the Mendip hills, some sixteen miles distant from the city, and is conveyed by means of aqueducts and pipes, by gravitation, for the supply of the inhabitants.

Bradford has been recently supplied from gathering-grounds and springs, some thirty-three miles distant to the north-west of the town, from a district which is particularly interesting and picturesque, and where the Wharfe, Ribbles, and other rivers take their rise, its principal reservoirs being Grimwith, Barden Park, Chelker, Silsden, and Heaton, and their total contents of water is about 1,525 million gallons.

We have mentioned these four places to show that it is not without precedent that London and Liverpool should seek a more distant and purer source of supply than they at present possess; but what should be specially guarded against is, that these important, powerful, and wealthy places should not be allowed to secure and monopolise the important sources of supply in the country, and leave numerous and less important places, situated not far distant, "out in the cold," or with a supply inadequate for their present purposes or future necessities.

The district adjoining where it is proposed to take these large volumes of water from to supply distant places, is becoming every year more thickly populated, and it is not unfair to calculate, as population increases, that, at no very remote period, many of those places must necessarily seek these very sources to obtain a supply of water. Besides, it has not yet been shown that the water-shed of the Thames, if properly reserved and economised, is not equal to the requirements of London; and it is probable that recent legislation, if effectually carried out, will relieve the river of its many foul impurities. It

is calculated that the lowest summer discharge of the Thames is from 300 million gallons to 360 million gallons of water per day,—more than four times the present supply of London; and, of course, the discharge in winter and in rainy seasons is very much greater.

For the sake of illustration, let us observe that the drainage area of the river Thames is generally admitted to be about 3,086 superficial square miles; and if we calculate the rainfall on that area at 24 in. per annum, and allow 66 per cent. for evaporation and absorption (which is an extreme average), we have the enormous quantity of 157,137,429 cubic feet, equal to 982,000,000 gallons of water to be dealt with, and to be rendered available, if necessary, for the supply of the respective towns situated on its drainage area,—more than equal to the supply of the inhabitants of Great Britain and Ireland calculated at thirty gallons a head of the population.

Many of the towns of England, France, Prussia, and the United States are supplied from rivers, and it is generally found that the water is usually softer than that derived from wells, springs, and small streams, and contains a less amount of mineral salts than either of these; at the same time it is commonly more impregnated with organic matter, and this may be accounted for from its flowing over a great variety of geological formations and many different varieties of soil; but this is capable of easy removal by subsidence and filtration.

The system of land drainage now so universally adopted has had the effect of lessening the summer discharges of rivers, and increasing the volume in times of floods, so that flood discharges are much more rapid than formerly, and springs are, therefore, not so copiously fed.

Much controversy has taken place on the supply of water to London from deep wells sunk in the chalk formation; and although there are many wells in and about the neighbourhood of London, Cheshunt, Watford, Southamton, Brighton, and other places yielding a copious supply, it is not certain that it can be obtained in sufficient quantity to supply continuously a large population.

It is a singular fact that although the capacity of the new red sandstone for absorbing and holding water has been much insisted on of late years, in the valley of the Eden, on the western side of Lancashire and Derbyshire, on the eastern side of Durham, Yorkshire, and Nottingham, the midland district south of the great Derbyshire coal field, and in the West of England, how few towns situated in those districts and on that formation have availed themselves of the opportunity of obtaining a supply of water from deep wells; the long and severe contests in Liverpool, Manchester, and Birmingham on that subject have satisfied them that deep and expensive wells are no longer objects to be eagerly sought after and secured, as two of those places have already obtained large supplies of water from extensive gathering grounds situated at a distance from them, and the latter town would probably have done so but for the fact of the numerous private wells that exist in the gravelly and porous strata on which the town stands.

Most of the towns situated in the districts above mentioned are supplied from rivers and from gathering grounds, and but few from wells; the latter include Sunderland, Northalton (shallow), Nottingham (partially), Liverpool (partially), Wolverhampton, Bridgworth, Coventry, Warwick, and Wells; and out of these there are only two towns, viz., Nottingham and Coventry, that can be said to be satisfactorily supplied by public wells.

Doncaster is now supplied with water from the filthy river Don, notwithstanding the extreme foulness of the river, occasioned by the drainage of Sheffield, Rotherham, and other places being improperly thrown into it; and the authorities of that place have endeavoured for some time past to obtain other sources of supply, and some time ago they commenced to sink an Artesian well, and they carried it to a depth of 900 ft., and incurred an expense of 1,500*l*, but they failed to obtain a supply of water and they abandoned the attempt.

The conclusion arrived at in Liverpool some years ago by Robert Stephenson, and subsequently by the present engineer, is that it is not desirable to sink additional wells to obtain a further supply of water, but to look out for other sources from lakes, rivers, or gathering grounds at a distance, rather than incur the risk, expense, and uncertainty of obtaining a fall

and adequate supply from wells. Since this article was commenced, Liverpool has decided to abandon the new sources of supply at present; and they have determined to construct an additional reservoir at Rivington; to collect the additional supply required. If the cost of London wells is to amount to as much as those of Truman's or Reid & Co.'s brewery (the former cost 4,056l., or 21l. per foot, the latter 7,454l., or 29l. per foot, and the latter yields 227,200 gallons per day), and to produce 81 millions of gallons of water, as now supplied by the companies, it would require about 300 of these wells, and thus at the average cost of those above mentioned, it would amount to 1,726,500l., irrespective of the extensive machinery required at each pumping station, and the complicated character of the work.

But it is by no means certain—indeed, it is extremely problematical—that if this large expense is incurred in sinking wells, anything like that average quantity of water will be obtained, as it has been discovered at Liverpool and other places that the yield over a given area has not been *pro rata* to the number of wells sunk, as one well has been found to drain the area of another, and to lessen considerably the supply of that well; so no correct or definite calculation can be made from the yield of one well as to what others will produce. Indeed, out of seven wells sunk for the supply of Liverpool, five out of the seven yield a decreased quantity, and that decrease was very considerable between the years 1854 and 1865, as appears by the following table:—

	1854, Max. yield in 24 hours. Gallons.	1865, Max. yield in 24 hours. Gallons.
Bottle.....	1,121,000	648,679
Bath.....	393,884	
Soho.....	69,828	512,204
Hotham-street.....	304,000	300,600
Water-street.....	576,957	416,218
Windsor.....	1,028,000	666,316
Green Lane.....	2,605,812	2,776,842

And the yield from the above wells in 1854 was considerably less than in 1850, and it is, therefore, fair to suppose that that decrease will continue. It is thought that, in the instance of the Windsor and Green Lane wells, the yield is considerably increased by infiltration of water from the river Mersey. It will be inferred from the preceding remarks that we are inclined to the belief that the proper source of supply of water for London is her own fine noble river Thames, by impounding up her surplus waters in suitable and convenient localities, and in sufficient quantities, that would afford an ample supply through all seasons, even the driest known.

Of course care must be taken to perfectly purify and filter the water, and this it is possible to do, by putting in force the powers of the new Bill, so that all sewage and filthy drainage water may be religiously excluded, and by the construction of large impounding reservoirs, that would also serve for the purpose of subsidence and purification.

And while on the subject of reservoirs, it would be desirable that some better and more substantial system should be adopted than in the construction of some modern works. If a system of impounding reservoirs is to be carried out generally in the country so as to preserve a regular and continuous supply of water in all seasons, it becomes a matter of serious consideration so to design and construct them that they shall become permanent and substantial works, as is so well exemplified in the works of our old canal engineers. In their days there is no record of such disastrous failures as those that have occurred at Bradfield or Holmfirth, nor the lesser defects of those at Longendale, Roundwood (Dublin), Halifax, Bradford, and some other places.

The great fault in the construction of the former works arose from the tops of the embankments being too narrow (Bradfield is only 12 ft. wide; Holmfirth, 16 ft.); and therefore the banks are too light to resist the weight of water, the inner and outer slopes of insufficient angle, the earth of which they are composed being of an improper character, loosely, badly, and hurriedly put together, not carried up in thin lifts or layers, and one lift being thoroughly punned and consolidated before another is laid on.

In the case of Bradfield the embankment was carried up by means of tramways and earth-wagons in lifts of many feet in thickness, and before the bank had become consolidated the water was turned in, and resulted in that terrible catastrophe. The core or puddle wall was not of good substantial tenacious clay but the centre of the bank, or carried up sufficiently

high above top-water level. The inner face of the bank should have been faced with a strong apron of puddle, and protected from the wash and abrasion of the water by a durable stone pitching. The face of the outer slope to be soiled down and sown with grass seeds, or the turf that is stripped off the base of the embankment may be used for the purpose of securing a green sward, as a protection to the face of the slope. Many of the reservoirs that are now used for the supply of our canals are now approaching closely upon half a century old, and yet they stand enduring and lasting monuments of man's handiwork; and we see no reason why modern works should not be similarly constructed, if only the same painstaking and labour were bestowed upon them as was the prevailing practice of our forefathers.

Economy now appears to be the order of the day; but it is false economy to construct works carelessly and insufficiently, merely to save a little in the space of time or a few pounds in the first cost, as works like these are generally found the least expensive in the end that are well and substantially executed, regardless of time or expense. According to modern practice there seems to be no given rule for the construction of reservoir embankments. At Longendale the compensation reservoir bank is 27 ft. wide at top, the inside slope 3 to 1, outer side 2 to 1, and 30 ft. deep (the Crowden reservoir, by the same engineer, is only 15 ft. wide at top with similar slopes), while the Bradfield reservoir was only 12 ft. wide at top, with inner slopes 2½ to 1, outer ones 1½ to 1 (as I found them), and 95 ft. deep. The Round Wood reservoir, near Dublin, has a 30 ft. width of top bank with a depth of 60 ft., while the Holmfirth reservoir was only 16 ft. wide at top, inner slopes 3 to 1, outer 2 to 1, and with a depth of 96 ft. At Oldham the Pyhton reservoir has a width of top bank of 30 ft., with a depth of 60 ft. of water, while a reservoir which failed at Over Darwen had a width of top bank of only 8 ft.

Most of the reservoirs were designed and carried into effect by eminent engineers, and yet the practice so widely differs as to be quite incomprehensible; either the larger dimensions are too strong, or the smaller ones ridiculously weak: it is evident "there is something rotten in the state of Denmark," and this must be patent to the most casual observer.

We do not find these defects and errors of design amongst the works of our Telfords, Walkers, Rennies, and other worthies. Telford's usual practice was to proportion the top width of his embankments to be equal to two-fifths of the depth, with inner slopes 3 to 1, outer slopes 2 to 1, and many of these works have withstood the invaluable test of time, and are more than half a century old. Moleworth, in his Tables on Reservoir Dams, gives the top width of *high* dams at from 7 ft. to 20 ft., without particularly specifying a definite width for height of embankment, although it is important and absolutely necessary there should be a sufficient body and strength of embankment to resist the weight of water pressing against it, as the pressure of water is as the square of the depth, therefore the resistance should be in a similar ratio.

The inner slopes he recommends should be 3 to 1, and the outer ones 2 to 1, the generally admitted proportions for slopes.

It may not be considered out of place here to allude to the modern fittings of water supply; and although we would advocate the system of high-pressure supply for the waterworks of towns, it leads to a very considerable loss and leakage of water, without great care. Of course the pressure being always on the pipes, they are all put to a very severe strain in every part, and leakages frequently occur, that have been going on probably for some time until it attains sufficient volume and force as to carry everything before it, as was evidenced in Liverpool a short time ago, and in some other places. There is also a considerable leakage at the taps, which not even the use of the "screw-down tap" effectually prevents.

There is something more required to preserve the water, and to prevent it being wasted, than the mere screw-down tap. Probably each house should be supplied with a "stop-tap" also, so that there may be a double check on the escape and waste of water. The stop-tap might be fixed within the premises, and in a position easily accessible to the inmates. Stop-taps are generally fixed on the service-pipes outside the premises and in the street, so that the water may

be shut off at any time, and to facilitate repairs; but that is of no service at any other time, and does not aid in all to prevent waste or the escape of water.

These remarks have been extended to a greater length than was intended, but it is a subject of national importance, and needs full and ample discussion.

LOSS OF THE CATHEDRAL AT FRANKFORT.

ALL those who take an interest in the memorials of former times or delight in the glorious monuments which the Middle Ages have left us, will have heard with grief the news of the destruction of the cathedral at Frankfort-on-the-Main. The fire which destroyed this noble church must be looked upon by Germany as a national calamity, as this cathedral was the electoral church of the German empire. It may not be uninteresting to our readers to give a short historical sketch and a description of the late cathedral. The first notice we have of a church on this site dates back as early as the year 874. In the year 882 this building is referred to as "the Chapel of St. Saviour." This chapel was rebuilt in the year 1239, but of this second structure there are probably no remains, as the church was again rebuilt on a much larger scale in the fourteenth century, and the building then erected formed the late cathedral. The foundations of the church were laid in the year 1315, under Louis the Bavarian. The choir was completed and used for mass in 1338. The nave and aisles were completed in 1352, and the vaultings in 1410. The great glory of the cathedral, the noble western tower, was begun in the year 1415, and carried on until the year 1512. The architect of this noble work was Madern Gertner. The church when completed was dedicated to St. Bartholomew.

The plan of Frankfort Cathedral is a very singular one. It consists of a choir of great length, a very short nave (only three compartments long), aisles, and immense transepts, each of five bays. Each transept is considerably longer than the nave. The nave and choir are also much lower than the transepts, so that it is difficult at first to realize the fact that the church was not built north and south, and that the two large transepts are not a great nave and choir. There is a tower nearly 40 ft. square at the west end, and over 300 ft. in height. Leading from the transepts are chapels. The whole church is vaulted. The choir contained a fine set of stalls, with frescoes by Stephen, of Cologne, adorning the wall-spaces below the windows. These paintings were executed in 1427. In the south transept was a statue of the Madonna, with a splendid lofty stone canopy. In two of the chapels leading out of the transepts were fine old stone altars, with canopied retables. In the north transept was the remarkably fine monument of John Holzhasen, 1371. A new pulpit of good design and an organ had been recently erected. The beautiful tower was of a very similar design to that of Freiberg, except that it was crowned with a dome instead of a spire. The lower part of the tower is square, with noble buttresses; the upper portion is octagon. The corner spaces or *broches* were carried up with noble groups of pinnacles to the full height of the octagon. The whole had been recently restored. It is quite impossible to say yet what injury this noble edifice has sustained; but it is much feared that little or none of it will be in a sufficiently sound condition to remain standing, particularly the tower, which has suffered very much from the quantity of wood used in the construction of the heavy floors. The bells fell through the vaulting under the tower, and smashed the organ, setting fire to the interior of the church. Until the building can be carefully examined by an experienced architect the real damage cannot be estimated. We understand the cathedral is heavily insured, and we feel that the Frankforters will use every exertion in their power to restore, or, if necessary, rebuild this, the greatest ornament and most interesting building of their celebrated city.

TO LOOSEN A RUSTY SCREW.—If you have a screw rusted into wood, or a nut or bolt that will not readily turn, pour on a little kerosene and let it remain. In a little while it will penetrate the interstices, so that the screw may be easily started.

SKETCHES IN ANNANDALE.*

The District of country which lies to the north-west of Carlisle in the contumacious counties of Cumberland and Dumfries is possessed of a certain curious, weird, historical interest which is peculiar to itself. After crossing the splendid viaduct which bridges the river Esk, we get into the very centre of that celebrated debateable land which is sacred to the memory of the Moss-trooper, where we are beset on all hands with traditional lore of Border deeds, tales of adventure, and records of battle-fields. The times are somewhat changed—some will say degenerated—since Kinmount Willie and Will o' Deloraine used to ride on the opposing shores! The Lords Wardens of the neighbouring marches sleep with their fathers; and the Howards and Percies have long abandoned their hereditary feuds with the Maxwells and the Douglases. The general features of the country are indeed unchanged. We have still the distant Cheviots and the Northumberland fells. The stately forehead of Skiddaw still reposes in wreaths of vapoury clouds: and the distant peak of Criffel may still be seen keeping solemn watch and ward over the estuary where Solway tides roll in their rapid and impetuous career. It is only when we come to observe the improved agriculture of the district, the farm-houses dotted here and there, the nicely situated gentlemen's seats, the pleasant villages, and the peaceable aspect of the people that we can form an estimate of the social improvement which the beneficence of Government and the fruits of peaceful industry have wrought since the union of the two countries. Even yet the old feudal fortresses, as we have seen, are still conspicuous objects in the landscape; and many a romantic and secluded dell is yet rich with the ruins of the ancient abbeys, whose monks derived a splendid revenue from the illegal spoils of their ferocious neighbours. The vesper-bell is now silent; the feudal castles are tenantless; the Moss-trooper's descendants are sheep-farmers; and the mosses themselves are in process of being reclaimed. Yet we must not suppose that such vital and organic changes in the Border society were suddenly brought about, or that this progress was the work of a generation or even of a century.

The vivid and most accurate description which M. Thiery † has drawn of the manners and customs of the population, or what is more properly translated the *peoples*, of this Border debateable land at the time of the Norman invasion still characterised it long after the blessings of peace had spread over the country; and indeed very strong traces of their lawlessness and insubordination may easily be found at the present day. For those who under the film of a somewhat enforced and artificial civilization choose to penetrate the crust of outward appearances may still observe that the force of habit as to the disregard of property law has by no means died out. Even yet it sometimes holds—

“The simple rule, the good old plan,
That he should take who has the power,
And he should keep who can.”

The Border population surrounding the Solway is, in fact, still largely composed of people half gipsy, part smuggler, part poacher, who are not at all enchanted with the rules of peaceable and orderly society; not given to marriage, for example, nor sobriety; and above all, most woefully deficient in the exercises of religion. Whoever chooses to read the account which the poor parish-minister of Gretna once gave of his wayward and backsliding flock ‡ will not, in all probability, seek for other of a parish clergyman. Indeed, the officers of a parish clergyman are very much at a discount in that quarter of the country; and notwithstanding it sometimes happens—where the Church of Scotland, or any or all of its formidable troop of dissenters, fail to evangelise a poor and lawless district—that the Roman Catholic priest has met with signal success, even he has totally failed in the debateable land; and in fact there is neither chapel nor priest to be found in the neighbourhood. The poor Scots-Irish of Maxwellton and Dumfries have their spiritual wants amply supplied, but the missionaries of the Roman Catholic church have not yet reached westward further than Annan. We mention this as a curious circumstance which may partly

account for a social phenomenon which for many years has puzzled our legislators and played a conspicuous part in the marriage-customs of England. There can be no doubt, we think, that it was from this lax and irreligious condition of the people that those habitually irregular marriages sprang which ultimately concentrated at Gretna Green and has made that obscure village immortal,—customs which the law of Scotland still tolerates, and which have only, thanks to Lord Brongbam, been recently declared illegal by the English Legislature.

From these causes, also, seem to have sprung the circumstances which made Bewcastle, Rockcliffe, and that neighbourhood the head-quarters of the gipsies. This is a fascinating subject; but we must not dwell here on the curious details of gipsy life. The whole subject has recently been investigated with much skill and learning by Mr. Simson,* who seems to have established to his own satisfaction that many noble families in Scotland have gipsy blood in their veins! It is a wonder, by the way, in these days of ethnological analysis, that no such candid inquirer has taken Burns for a gipsy. His swart complexion,—

“The vellum of the pedigree they claim,”—

his raven locks, his brilliant black eyes, together with his stooping though muscular shoulders, gave all the requisite physical signs, as we are expected to believe. And then the erratic and undisciplined character of his genius! Shade of the illustrious Blumenbach, how many theories of race could be half as well established? How many Aryan mysteries could be so simplified and solved? We only hope that any future writer who pursues the subject will not forget to remember, as the fashion is, that we had thrown out such a hint. There might, perhaps, be certain geographical difficulties in connecting him with the gipsy tribes of the Solway; but what of that? are they not merely branches of one great trunk—lineal descendants of one great family? *Quod erat demonstrandum*. We need say no more. The well-known Act of Geo. III., which brought the poor gipsies under the penalties of the law by designating them rogues and vagabonds, made sad work, under the vigorous administration of the squirearchy and the justices of the peace, with their villages and cantonments; but even yet the pedestrian who is fond of prowling into unexplored nooks of the Border country, will meet perchance with an aged sybil who can trace the pedigree and the locality of her tribe for 200 years.

To the gipsies succeeded, in the natural order of things, a community of smugglers, who have only of late years become extinct. It is very remarkable how little information we possess respecting the Solway smugglers; indeed, what we do know seems to be altogether derived from the pages of fiction: their adventures are chiefly enshrined in the themes of forgotten ballads. There can be no question, however, but up to a very recent period—probably to the very date of the equalization of the spirit duties between England and Scotland—that this desperate profession did, in fact, engross the attention of a very large section of the population. Their plan of operation was simple enough and well understood. The Isle of Man was the great depot for the kegs of brandy, kilderkins of hollands, runlets of old Jamaica, bales of Virginia tobacco, parcels of Valenciennes lace, and other wet and dry commodities, which the British Legislature in its wisdom, thought fit to lay under the embargo of heavy duties. The whole secret, therefore, of the Solway smuggling was to transport these goods from the island by means of a swift sailing-lugger,—that is to say, a small vessel carrying three masts, with a running bowsprit and lug sails,—to any of the numerous ports, or rather landing-places on either side of the shore. A party of people were always ready to receive the vessel on a preconcerted signal, which invariably returned by the same tide. Sometimes, in cases of extreme danger, the cargo was hid in pits dug in the sandy beach; but, generally the spreading shadows of the night favoured the debarkation, and the bales and casks were speedily landed, slung on the backs of horses and “run” over the adjacent country. Such a traffic—illegal, immoral, and in the highest degree dangerous—was, nevertheless, lucrative; and many loyal and unsuspected traders had, it was quietly understood, a share in its profits. Traces of its wide-spread influence may still be

found, if cautiously sought for; and among these we may venture to point out—of course with all manner of charity—the large amount of *cellarage* and storage that one may see in such places as Bowness and Skinburness, as well as Port Annan and Rutwell. Indeed, the cellars in the little towns of the Solway are quite a curiosity in their way: there is not an obscure village baker's, butcher's, or even shoemaker's shop that is not supplied with a capacious cellar as large as that of a London gin-shop in Oxford-street, or an ironmonger's store in Upper Thames-street. Such cellars for the most part have large and substantially built openings, 6 ft. by 4 ft., at the very least, and are usually supplied with stout double-folding timber hatchways hinged on the sides, and opening outwards. There are iron stanchions and gratings across the daylight openings, stout gangways and gantries, iron rings batted into kerbstones; in short, all the facilities for getting in and out a puncheon or a hoghead with the utmost secrecy and despatch. We had the curiosity to inquire of an old inhabitant of Annan, the meaning of this extensive range of cellars, which seemed, we said, to be as much part and parcel of the plan of the houses in that royal burgh as a kitchen area in an ordinary house in London or Edinburgh. We were told very quietly in reply that Annan had once possessed a *considerable wine trade!* Upon another occasion, while walking on the sands near Burnock, we got into conversation with an old sailor, one of those curious lounging amphibious animals, half fisherman, half smuggler, and whole poacher, who seem to be indigenous to the Solway. He was, we found, as well acquainted with the Cumberland as with the Dumfriesshire coast; and could point out to our great astonishment every cove or headland in the bay, where a lugger might be run in with safety, and a cargo bumped ashore. “I have been on the top of that mountain, sir,” he said, pointing to Skiddaw, on the opposite coast, over which a curious atmospheric effect was at that moment visible. “Indeed,” we replied; “in search of the picturesque?” “No,” “Shooting partridges?” “No.” “Studying the rocks?” “No.” “What, then?” “Well, sir,” he replied, with a most knowing squint, “I was showing a red light!” It is possible the old salt might be tampering with our credulity; for unless on a very clear frosty night it would require an immense stretch of imagination to suppose a solitary signal of that nature useful at so great a distance. But, on the other hand, the story is, at any rate, a good one, and so we have written it down. We will only add respecting the smugglers, that the ancient spirit is still kept up, it is reported—but we must own, as far as we are concerned, without a jot or tittle of evidence—by the practice of illicit distillation. On this subject, and with the recent New York revelations before us, we can only observe that the present high duties on Scotch whisky—notwithstanding all the vigilance of the inland revenue officers—is sufficient to tempt certain classes of the people into secret crime. This is an abstract question, which has very nice limits, and is of course beyond our province to discuss; but it does seem odd, we must confess, that this commodity alone, of all our national products, should be taxed at the rate of 500 per cent. If, as it is sometimes supposed, the high duties promoted temperance, then we might safely affirm that the legislative wisdom of Mr. Cladstone had reconciled one of the greatest paradoxes in taxation, to wit: by the levying of high duties he had also improved the public morality. But, unfortunately, it turns out that the Scotch people consume as much of the dear whisky as they did when it was cheap. There is plenty of evidence with regard to the poachers, but we need only refer our readers on this point to the district returns of crime. The Solway poachers,—of whom there are two sorts,—land rats and water-rats,—seem to suffer great temptation under the laws which preserve the grouse till August, and from the Acts which constitute an annual close time for the salmon, that is, from August till February. The close time, indeed, seems to exercise a most pernicious influence on the character of the Solway fishermen, who are every year pulled up and fined or imprisoned for divers intricate and very often ill-defined breaches of the Salmon Fisheries Acts. The fishermen complain bitterly,—and, as it seems to us, not without reason,—of the great injustice done them by these recent Acts of Parliament; and, in nothing more than this, that they are uniformly tried before the local justices, who are chiefly

* See p. 563, ante.

* History of the Gipsies. London: S. Low, 1865.

upper proprietors in the neighbouring rivers, and, consequently, their mortal enemies.

The Solway fishermen, we ought to explain, are divisible into three classes at least. In the first place, there are the regular lessees of the salmon fisheries,—men of considerable capital,—who fish the Solway by means of the stake-nets, that give so much offence to riparian owners. These are the sort of persons to whom Billingsgate is chiefly indebted for its regular supply of the finest fish. In the second place, there is a class of small farmers, who are known in the district as "Pencilers," from the circumstance, we presume, of their farms consisting generally of small penicils of land abutting on the shore. These men have usually the right of Solway fishing *enadverso* of their lands, as a condition of their lease; and between the two farms,—the sea and the land,—it is said that they manage to pay a tolerable rent. One curious fact concerning these "Pencilers" is worth stating. It is said they can only afford to keep one horse; consequently, when about to plough, each has to borrow another horse of his neighbour.

There is a set of foreign invaders, we should mention, who have within the last few years sprung into existence in the "trawlers," who come from Morecambe Bay in Lancashire, and who are supposed to confine their operations to the capture of shrimps and cockles. Such interlopers do not come within our category; but we may mention that these travelling gentlemen, under the colourable pretext of dredging for those molluscs we have just named, have of late years contrived to do a good deal of illegal fishing for salmon.

The third and last real division of the Solway fishermen is that numerous class who fish for everything that comes to the net,—for the most part according to law, but not unfrequently according to conscience,—a quality of the Solway mind which, we need scarcely add, possesses great flexibility and powers of digestion. There is an old saw current on the Solway to this effect,—that the conscience of a fisherman is like the stomach of a fish; and we may add another which belongs to the Channel Islands, which is, however, better expressed in the Guernsey patois,—they are like the fish they catch; they walk backwards! To this law, if it be one, the fisher folk of the Solway form no exception; for, like most fishermen, they strive to keep as much behind the age as the agricultural and manufacturing population do to keep abreast of it! The ingenious author of the "Origin of Species" ought, we think, to give a glance at the unprogressive character of these people before committing himself to a theory of transmutation. No doubt much may be said for their want of education, and so forth; but we ought to consider, at the same time, that no possible form of scholastic training could teach them hither than their own instincts and experience to catch fish! The bad effect of an irregular calling also tells on them,—the interruption by storms and floods, Acts of Parliament, and, what is worse than all, the scarcity of fish. Besides, it should always be remembered that they suffer more than other handicraftsmen by exposure to the weather and all its attendant evils; and, finally, they run a risk more or less constant of eventually finding a watery grave.

It is curious to trace the influence which centuries of English companionship has exercised here; for unquestionably there is a strong tincture of the same civilization on opposite banks. The very names of places, a sure symptom of kindred races, are often identical. There is a hill, for example, called Saddleback in the neighbourhood of Derwentwater: there is a hamlet of the same name in Moffatdale. There is a Wigton in Cumberland and one in Galloway. There are two villages called Bride Kirk in the opposite counties, and there are likewise a couple of Daltons. Thorthorwald, in Annandale, is pure Saxon; Murray Thwaite is an importation from the Lakes; and Lanrig, Mealrig, Longtown, West Newton, and such like names in Cumberland, have numerous correlatives in the south of Scotland. It is also very remarkable that both English and Scottish districts have their share of Irish immigrants with all their Milesian influences; and it is curious in both cases that these colonies are chiefly confined to the western coasts.

Similar analogies might be drawn from the dialects of the common people. The term "statesman" for landed proprietor is often used on both sides of the Solway. "Ca thee came" is a proverb indigenous to both districts; and we may easily detect by a little attention,—amidst

the profusion of rough and guttural expletives which adorn that horrid drawing, snivelling patois which is distinguished by Prince Jerome Bonaparte into Low Country Scotch,—that peculiar broad, open pronunciation of the "a" "o" and "u" which is peculiar to the vernacular language of Cumberland; which is, we are told by philologists, to be clearly assigned to a Danish origin, and which constitutes, indeed, nearly all the vocal traces that we have left in these islands of a Scandinavian supremacy.

These analogies of course indicate plainly an early and continuous intermixture of the different races. The population which has lined the shores of the Solway seem to have migrated indiscriminately from time immemorial, from the south to the north, and from the north to the south. It is a singular fact, but it is nevertheless true, and all good observers come to the same conclusion, that there are more Cumberland people in Dumfriesshire and Galloway than there are Dumfriesshire and Galloway people in Cumberland. Does not this fact rather tell against the universality of Dr. Johnson's maxim,—that a Scotsman's best prospect was the high road to England? But in whatever light we may view it, there can be no doubt of the intermixture and the consequent identity of the popular manners and customs. The food is the same,—not so much oatmeal and milk, as bread, bacon, and beer. The dress is the same, only that is not so much to be wondered at in the era of Moses & Son. But the fashion of wearing clogs, for instance, in place of shoes or boots, which is universal among the peasantry of the north of England, is also common to the south of Scotland, and these are worn by all ages and both sexes. This, we partly suspect, is a necessity of the rough pavements of the district; for such towns as are situated at the mouths of the rivers are usually paved with the small round, hard, and water-worn boulders derived from the bed of the neighbouring stream. To walk over a pavement so constructed is not unlike the ancient penance inflicted by the Church of Rome, on certain holy pilgrims, of walking to the shrine of Loretto with pebbles in their shoes!

Again, a market day in Cumberland and one in Dumfriesshire are so entirely similar in their manifestations, that it would puzzle the keenest observer to detect the difference. There is the same curious exhibition of caravans, steamhorses, rare shows, wax works, giants, equestrians, clowns, and wild animals are also characterized by the same stupid, antiquated, and pernicious fashion of the ploughmen and farm-girls exhibiting themselves like lower animals, and showing their points to the farmers like the slaves in the market of Constantinople! Other circumstances there are which flow from these hiring fairs in which the two countries have, unfortunately, a common experience; but on this sickening subject we will not dwell.

A much more gratifying *point de ressemblance* may be found in the gymnastic games which are common to both sides of the border; and it is curious that Dumfriesshire, in the matter of fox hunting and horse racing, is almost entitled to the character of an English Midland county. For example, the Annan race meeting which, after a lapse of ten years, was revived in 1855, and which has risen since that time from comparative insignificance into something like respectability, came off the other day on the usual course on the sands of the Solway. There was a very large attendance of sporting gentlemen, and the course was crowded by less interested spectators. The Marquis and Marchioness of Queensberry graced the meeting with their presence, and took great interest in the proceedings of the day, the marquis riding the winner in the Hurdle Race, and his own horse in a match with Mr. Lindsay.

Undoubtedly, however, the greatest elements of similarity are perceptible in the striking resemblance of the architecture. We do not speak so much of the churches and other public buildings,—although even here, to give an illustration, the town-house of Keswick and that of Annan possess a distinct and well-marked consanguinity; horrible gaol-looking buildings both of them!—as we do of the villas, farmsteadings, and cottages. It was, we confess, new to our eyes; but with much pleasure did we trace in the south of Scotland a few of those features which are inseparably associated with our old English village architecture. Here is a villa perched on the side of a sloping hill, with neat triangular roof, dormers, oriel windows, bargeboards, finials, and tasteful dressings, such as

we see any day in the neighbourhood of Carlisle or Durham. There we may see a modern farm-town, as they are called; in other words, a decently-constructed steading, with proper and convenient offices, showing some traces of design and fitness of purpose. Of course, the strong similarity of the building materials add to the effect. In street architecture, the principal houses of a town such as Annan or Lockerbie are built of the beautiful red sandstone of the district,—a continuation, the geologists say of the Permian system of Cumberland,—which admits of every variety of treatment; but there is also abundance of brick,—sometimes particularly,—plenty of compe, plastered fronts, and painted imitations of freestone; together with Welsh slates,—dark blue and dark green,—often tastefully intercourses on the roofs; and finally, a profusion of different patterns of terra-cotta ornaments, ornamental red tiles, and stone-ware chimneys.

One sometimes wonders where all the curious old-fashioned designs in those ornamental articles are disposed of. The mystery is solved at once by the study of the sky-lines of a Border town. One very curious point of resemblance we observed in the chimney-pots, which are often composed of four mired slates connected with copper wire; pots which prevail all over the Cumberland lake district, where slates are abundant, and are here imported into Annandale where no such materials exist! Speaking of chimneys, we may notice the very picturesque feature which is incidentally obtained by constructing the stalks of a chimney separately and diagonally on the plan—an arrangement we observed in this quarter for the first time in Scotland.

One or two important lessons may be gained by studying the respective qualities of the opposite counties with regard to the question of site. We need not enter on the nature of the climate; but in the selection of a site for villas, for example, two or three considerations occur. If we examine the slopes of the Solway basin on the Cumberland coast, we shall find that it wears a darker hue as it ascends from the shore to the heights of the Skiddaw. Slanting downwards from the sun it has a much darker shade than the opposite slopes of Scotland, which face the sun, and are consequently in possession of the southern exposure. The difference, therefore, of the climate of the north of England and the south of Scotland is in favour of the latter. But, on the other hand, the northern coast is more exposed to the ravages of the south-west wind, which during certain seasons blows uncommonly fierce and strong, from which the southern coast is protected by the Cumberland mountains. It ought to be remembered, therefore, in planning a house north of the Solway, that the ordinary law of southern exposure ought to be modified; and that it might turn out a happy accident if the proprietor got a hill or a forest between his prospect and the "Atlantic south-wester."

With respect to the general plan of houses, the English form is everywhere visible. There are no *flats* on the Solway. Even in the neighbourhood of Dumfries, although there are numerous specimens of the antiquated and barbarous pent-roofs, there are few of the Edinburgh and Glasgow tenements and common stairs. As to construction, we may state that the mason-work is generally very good. Some houses, near Annan, we examined, that were being built by Mr. Hugh Ker, were quite of a superior execution. The joiner-work is not so deserving of praise; but this is not to be wondered at in a country district. A curious fashion seems to have prevailed in the slater-work, of commencing at the eaves with slates probably 2½ ft. by 2 ft., gradually diminished in the upper courses, and finishing at the ridge with slates 9 in. by 6 in. The plumber-work is not very far advanced. But the compe is carried to a pitch of imitation that almost deserves the name of high art; and we are of opinion that the craft of plasterer exists here in a very high state of perfection, or, at least, of development. For example, we shall see in any small country town, houses of precisely similar plan and elevation, much diversified in their external coating: one is plastered and painted imitation free-stone—a darker and lighter shade of raw sienna alternating all too regularly on the wall-courses; another is done to represent a slate-coloured whin-stone,—very small blocks, very well cubed, and exquisitely pointed; and a third gives a glaring neutral tint of real sand-stone irregular rubble, with contrasts of colour in cornice,

THE YORKSHIRE MEMORIAL OF THE LATE LORD CARLISLE.

We may add to our previous memorandum that the site selected for this monument is Balmor Hill, not far from Spittle Beck. It is so placed that when the proposed alterations are completely effected, it will stand in the centre of a magnificent avenue of trees, extending from the top of Slingsby Hill down to Barton Hill Railway Station, and having in a line with it the arch of the Crow's Nest Inn, Castle Howard, and the Marlborough Obelisk. The column will spring from a square platform, about 13 ft. high, having pyramidal supports, and approached on the Castle Howard side by a flight of steps. The height of the platform and column will be about 120 ft., and the hill on which it stands may be taken as from 350 ft. to 400 ft. above the level of the sea. An ornamented capital will crown the column, and the column itself, in addition to a pendant scroll of flowers on either side, will be fluted to a depth of 6 ft. or 7 ft. on the upper part of the shaft. Surmounting the column will be an iron tripod supporting a mass of flame. The monument will be constructed of Bolton Cragg moor stone. Mr. John Chick (agent to Sir E. A. E. Lechmere, Bart.), of Whitwell, has undertaken to superintend the works. The contractors are Messrs. G. Bailey & Son, of York.

MURRAY'S SCOTLAND.*

WHEN Mr. John Murray chooses to present the world with a Handbook, it should be received in the light that we accept a Russian bond from Rothschild. The subject may be open to doubt in a variety of ways; but the doubt can in no way apply to the hanker. Mr. Murray is the colossus of guide-book publishers; and it is hardly necessary to observe that in such a business experience is worth its weight in gold. There can be no doubt, for example, that the method which has been so successfully employed in conducting thousands of bewildered travellers over the Alps or up the Rhine would be at least as servicable in the Scottish Highlands or the Hebrides; and accordingly Mr. Murray's title to be heard—to purse, as our Scotch legal friends would say—on the subject of Scotland is beyond all question. How he may have conducted his case is a different affair, and, in fact, we must confess that we looked for this handbook of Scotland with some anxiety, and we will explain why.

Scotland, although it has now been for more than a century and a half an integral portion of the British empire, is, nevertheless, in many respects, less known and understood by the mass of Englishmen than any country on the Continent taken at random. Its whole system of jurisprudence differs from ours; and to that curious extent that at this moment England in the eye of Scottish law is a foreign country! Let us ask any average man on this side of the Tweed what he knows about the Scotch marriage laws, for example, or the tenure of land, or that complicated legal process which is called a multiple-poinning, or an action of declarator and putting to silence, or a warrant in *meditationes fugas*? You might as easily get authentic information about the political state of Patagonia or the climate of Kamtschatka! Again, the Scottish theology is so very peculiar—partaking, to a much greater extent than most people would suppose, of the ancient Jewish economy, or, rather, of the dogmas and doctrines of the Pharisees. With all this pretension to superior sanctity, the statistical returns of the Registrar-General show an amount of absolute immorality which is not surpassed by any country of Europe. Alas!—

Not all the blood of beasts
On Jewish altars slain—

can wipe out this sad blot on the national escutcheon. We will say nothing about the consumption of whisky, nor of certain other little profanities, of which the Jedburgh people found themselves guilty the other day. We have said enough to show what, however, requires no demonstration, that our northern countrymen are a peculiar people. If we pass from a consideration of the society in Scotland to that of the physical character of the country, the change is like some beautiful transformation

scene; the feeling is nearly as grateful and refreshing as that which we experience on emerging from a long, dark, suffocating railway tunnel to a fertile champagne country, rich with verdure, and sparkling with silver streams. Take it all in all, there is no country under the sun so varied, and upon a certain scale so magnificent in its natural beauty as Scotland. The highland hills of course cannot be compared to the snow-clad Alps. Loch Lomond must veil its beauty when compared with the Lake of Geneva. Even the Hebrides must sink into insignificance beside the islets of the Grecian Archipelago. But for all that, Scotland is a country eminently calculated to arouse the flame of patriotism, and inspire the soul of poetry and song. Hence it is that the very soil, so to speak, is impregnated with poetry, and the very woods are vocal with music. In fact, we must confess, speaking for ourselves, that after a good deal of patient observation and study of the multifarious subjects, moral, intellectual, and physical, which may be comprehended under the head of Scotland, we are very far indeed from getting to the root of the matter.

For these reasons, among others, we looked, as we have said, with some anxiety to the appearance of Murray's "Scotland." But we are glad to find that the compiler has risen to the occasion; and on the whole, this handbook will amply sustain the high reputation of its publisher's red-covered series. Of course, it would be unreasonable to expect that among the numerous subjects of which it treats no mistakes had occurred. Unless a man possessed the encyclopaedic genius of Hermes Trismegistus he could hardly combine the elements of history, poetry, philosophy, archæology, topography, and geology without falling into some blunders. Accordingly there are both sins of omission and of commission in this respect. The Solway Firth, for instance, is not mentioned at all, although the traveller passes close to its northern shore. Holyrood Palace was not built on the grounds of Drumseuch, from which it is distant nearly two miles. There is no mention of "artistic granite" in Aberdeen, one of the staple manufactures of that flourishing seaport. Kinrara belonged to the Duchess of Gordon. Some errors are obviously typographical, as, for example, where we are told to pronounce monzie as monce. John Milne & Son, in Edinburgh, are brass-founders, and not type founders, &c. &c. These and such like errors we must view with leniency in the first edition of a book which possesses many solid qualities to recommend it, and we will not dwell upon them. It is a more pleasing task to indicate its merits.

In the first place, there is nothing of the turgid, verbose, and rapid descriptions of scenery—untruthful for the most part—which distinguishes the most of Highland guide-books. This fault originated, we believe, with Dr. Macculloch and his disciples, whose accounts, notwithstanding a copious interfusion of scientific jargon, are habitually exaggerated. Even Mr. Geikie, the most recent exponent of this school, rather allows his language to govern his ideas when he talks, for example, of the "long, lonely moor of Rannoch." Of course a moor is not a meadow; but there are many lonelier moors in Scotland than Rannoch, as we know to our bitter experience; and what is worse, plenty that are far more barren of birds. The editor, in making use of such materials, very judiciously prunes away much of their surplus eloquence; and in place of that we get some account, in a rational way, of the industrial resources of the country. We select for quotation the following interesting paragraph upon "Coal and Iron":—

"These products are, perhaps, the most important and characteristic of Scotch industry, employing indirectly at least seven-tenths of the population of the Lowlands. For legislative purposes the collieries of Scotland are placed in two divisions, West and East. The former includes W. Lanark, Ayr, W. Strirling, Dumbarton, Renfrew, Argyle, and Dumfries, and embraces 233 collieries, which produced in 1865, 6,250,000 tons. In the eastern district are E. Lanark, Fife, Clackmannan, Haddington, Kinross, Edinburgh, Leithgow, E. Strirling, Peebles, and Perth, including 274 collieries yielding 6,400,000 tons. Of canal coal 222,000 tons were raised in 1865; and the annual consumption of the Boghead coal, which is so extensively used for distillation into paraffine, &c., is equal to nearly 100,000 tons per annum. It may be of interest, as the oil trade from coal distillation has become so very important, to mention that the Boghead coal produces 128 gallons of oil per ton, while the other coals vary from 72 to 90. As regards the iron trade, there were in 1865, 141 furnaces in blast (producing 1,165,000 tons of pig iron), which consumed upwards of 13 million tons of iron ore, all raised in the district. Next to Staffordshire, the Scotch iron market is the most important of any. The principal iron shipping ports are Glasgow and Ardrossan, on the Clyde, and Bo'ness and Grangemouth on the Forth" (p. 30).

* Handbook for Travellers in Scotland, with Travelling Maps and Plans, 8vo., pp. 388. 1867.

intels, quoins, and string-courses, which, on the principle that good wine needs no bush, seems much less carefully constructed than its artificial neighbours. To conclude this subject, we may suppose the painters not to be so plentiful, or that paint on the northern shore was very scarce. Some doors and windows we observed in Annau appeared as if they had not been painted these twenty years.

The cottages on the Solway are, upon the whole, favourable enough specimens, very superior indeed to what we have seen in other parts of Scotland. The worst are those rude, ill-built, and diminutive hovels, with barely any light, and scarcely any room to stand upright in, which we may see clustered around any fishing station. The best are those on improved estates, such as that of Lord Mansfield. The late General Drom gave a prodigious impulse to the improvement of cottages, in the carrying out and building of the village of Brydekirk, so far back as the beginning of the century; and although these little houses are now antiquated and too small still, they are capable of being clean and well aired. Even before his day there seems to have been a spirit of improvement abroad. We observed on the road to Ecclefechan, a group of cottages bearing the date of 1769, substantially built of sandstone, and slated, with sashed windows, ceilings 8 ft. in height, and decent-sized rooms of the ordinary "int-and-ben" plan. This was, we confess, a surprise to us. It was not so good to see one of them that had been built in 1866—a century afterwards—of the very same plan, mould, type, variety, and form! The very dimensions of the small windows had been slavishly copied. Surely there was an utter absence of the spirit of progress here. One gratifying fact we may record; the cottages generally seem to cultivate a taste for flowers, which may be due, perhaps, to the circumstance that Annandale is celebrated for its gardens and for its horticultural trade. But there are other manifestations which lead us to believe that the love of art is innate in the poorest classes of people. The pavement we have mentioned is generally composed of smooth water-worn boulders,—or chuckie stones, as they are termed in Scotland,—and we need not say that a river which takes its rise in a granitic rock, and drains a district of red sandstone, superimposed upon clay slate, and lined over its banks with glacial debris and conglomerates,—that such a river will produce very great diversity of boulders, in form, composition, and colour. In fact, a proper selection can at any time supply all the positive colours, most of the intermediate combinations, and many of the most brilliant shades. With these materials, then, the inhabitants of Annandale construct their pavements; in fact, they make a rude sort of tessellated pavement, mostly of regular geometrical designs, such as a rhomboid enclosed in a parallelogram. But this is not all. There is a fashion among the peasantry, and also the servant-girls, with regard to door-steps which would greatly delight Mr. Henry Cole, or any art-master of Kensington who dreams about popular intuitions in our schools of art. The steps are usually constructed of red sandstone; but, at all events, in cleaning the steps a piece of very deep red sandstone—keel, in fact—is commonly employed. This constitutes the groundwork of the picture, over which a series of graceful curves, after the manner of engineering, are produced with a piece of white pipe-clay! The effect is then heightened by touching off with white the corners of the steps, which, from long rubbing, become regularly chamfered, and seem as if they had been so constructed as to afford a ground for the felt of colour.

Hitherto we have pointed out, as far as we mean, the similarity which exists, under certain circumstances, between the two populations on the opposite shores of the Solway; and we should now, like good artists, proceed to describe the difference—to reverse the picture, so to speak; put in some shadows, and throw some light on the background, but our space is exhausted.

THE PARIS EXHIBITION BUILDING.—The Nord says the Exhibition building will not be pulled down as soon as the Exhibition is over, but will be used for an international bazaar, in which the productions of all parts of the world will be offered for sale. A canal is to be made between the Seine and the Champ de Mars, so as to place the building in direct communication with the river.

In the second place, the arrangement of routes, the wayside divergences, and the variety of schemes introduced for tours of one, two, or three months, in order to suit the different periods of time at the disposal of tourists, are, we find, all that can be expected or accomplished. The clear and precise series of charts from Stanford's geographical establishment, in themselves a most valuable feature, are so introduced as to give the utmost value to the letterpress. The architectural notices are much superior to those in other Scottish guide-books. We quote the description given of Sir Walter Scott's Monument, in Edinburgh:—

The Scott Monument is the most beautiful work of art in Edinburgh, but it is not well placed. It was completed in 1844, from the designs of George Kemp, an architect, who was previously unknown to fame, and did not live to see his plans completed. He was an intense admirer of Melrose Abbey, and has endeavoured in this monument to combine all the characteristics and proportions of that building. Four grand Early English arches support the whole superstructure, which serves as a canopy to the statue. To these main arches four others are attached at the corners, affording to the former a strong lateral support, and sustained themselves by strong exterior entressed piers, surmounted by pinnacles. From these spring four flying buttresses, which serve to support the arches of the second story. Three galleries of the same style rise above this, so that the monument may be said to consist of a pile of arches in the Early English style, gradually decreasing in size till the whole terminates in a single pinnacle. An interior staircase (admission 2d.) conducts to the top, which is 200 ft. from the ground. Above the principal arches, and in various parts of the structure, are fifty-six niches, which are to be filled with statues representing the most prominent characters in Sir Walter's novels; of these, nine have been completed and put up. Beneath the main arches is placed a statue of Sir Walter Scott and dog, by Steel, a first-rate work of art, but the situation is an unfortunate one, the loftiness of the arches making the figure seem insignificant.

Upon the whole, then, what we have to say of Murray's "Scotland" is to recommend it warmly to our readers, particularly to those who are going north of the Tweed. If they do not find it a "guide, philosopher, and friend," they will probably discover that it possesses as much of that ternary compound as can be conveniently stuffed into a knapsack or packed in a portmanteau.

FROM MELBOURNE.

A HANDSOME stained-glass window was lately on view at the works of Messrs. Ferguson, Urie, & Lyon, Curzon-street, North Melbourne. It is designed for the chancel of St. Peter's Church, Woolloomooloo, near Sydney, and it is the gift of Mr. James Gordon. The window is composed of three lancet lights, and is 16 ft. by 7 ft. in size. It has nine separate subjects, the centre being a large figure of our Saviour. The other subjects bear on the principal events in the life of St. Peter. No. 1 is the calling of St. Peter; No. 2, Peter witnessing the Transfiguration; No. 3, Peter awakening Jesus from sleep during the Tempest; No. 4, the Last Supper. In No. 5, Christ's agony in the Garden of Gethsemane, Peter is shown sleeping, leaning on his sword; No. 6 represents Christ supporting Peter on the water; No. 7, the Crucifixion; No. 8, Christ's charge to Peter,—"Feed my sheep." The style is Early English.

The same artists designed a chancel window for St. John's Church, Launceston. The central figure is the figure of our Saviour in the Transfiguration, and in the two side lights are the accessories. Beneath is Jesus at the Last Supper with the bread and wine. In the three top lights are the Dove and the Alpha and Omega.

The new post-office is nearly completed. In February, 1866, and June last, the *Australian News* gave views of it, an exterior and interior one. The central hall is 80 ft. long by 30 ft. wide, and 47 ft. high. It is lighted during the day by the windows in the roof and sides of the building, and at night by four large sun-lights. The Elizabeth-street frontage is at present 194 ft. long, the intention being to extend it to 316 ft. An arcade runs along the front of the building, affording access to the receiving and delivery windows, registration, sale of stamps, inquiry windows, and private letter-boxes. The opposite side is appropriated to the letter-carriers and receiving-rooms for inward mails, which enter the building by the mail-yard, on the eastern side from Bonrke-street. On the first floor access is obtained by corridors to the offices of the corresponding branch on the right or east side, and to the accountants' branch on the west side. A view is obtained from the corridor of the operations on the ground floor, but it is intended to carry a screen round of sufficient height to intercept the view. The necessary supervision will be obtained at the north end, which it is

also intended to screen off, but to leave peculiar openings, by which means a watch may be kept up without the cognisance of the Post-office employés. The furniture fittings, which are of New South Wales cedar, cost something like 6,000*l.* The rooms are lofty and well ventilated. Around the arcades which extend along the sides, or fronts of the building, tessellated pavement is being laid down of an expensive description. The contractor for the building is Mr. Samuel Amess; and, when ready for occupation, it will have cost close upon 140,000*l.*

The works at Stony Creek, for the supply of water to Geelong, are progressing satisfactorily. There are at present nearly three hundred men in the employ of Mr. J. Chappell. The embankment has been built up to the height of 61 ft., and the stonework of the front of the tunnel is nearly completed, two-thirds of the fencing round the reservoir has been erected, and labourers are sinking shafts at the site of the proposed reservoir at Lovely Banks to ascertain the kind of strata.

The Victorian Chemical Works, Footscray, for the manufacture of kerosene from Sydney shale, consist of a main building for the manufacturing processes, and another building some distance apart from the main one, for containing the oils, and for packing operations. The main building, in which the retorts, stills, and refinery are, is constructed of iron, and measures 100 ft. long, 20 ft. high, and 60 ft. broad. The other building, detached from the main one is also of iron, and measures 66 ft. long by 33 ft. in width. The works are situated at Footscray, on the bank of the Saltwater river.

From the Registrar-General's report on the vital statistics of Melbourne and suburbs during the month of April, we learn that the deaths during that period amounted to 393, being a daily average of 13.10, against a daily average of 14.16 in March. The deaths, however, exceeded those of any previous month of April since 1860, with the exception of 1865, when the number was 399. The deaths of children under five years of age numbered 221, of which 115, or about 52 per cent., were of males, and 106, or nearly 48 per cent., were of females.

The first part of the population statistics of Victoria, for the year 1866, has been presented to the colonial Parliament in the form of a blue-book. The number of immigrants who arrived during the year was 32,173, divided into 21,142 male adults, 7,639 adult females, and 3,397 children. From the United Kingdom the arrivals were 4,071 adult males, 3,133 females, and 1,310 children; total, 8,514. From foreign ports the arrivals were 1,439 adult males, 133 females, and 97 children. Of the arrivals from the United Kingdom, 3,610 were warrant holders, and 684 were Government immigrants. The number of warrant-holders was nearly equal of both sexes, but of the Government immigrants there were 513 adult females to 42 males and 29 children. From the neighboring colonies there arrived 15,632 adult males, 4,375 females, and 1,900 children. From New Zealand, there arrived 5,043 adult males to only 624 adult females. The number of emigrants who took their departure from the colony was 27,629, leaving a balance in favour of the colony of 4,549. The number of Chinese who arrived was 974 against 1,043 departures. The total number of the population on the 1st January, 1866, is given at 626,639, of whom 357,515 were males, and 269,124 females. At the end of the year the number was 643,912, or 365,317 males and 278,595 females; the increase being 17,273, or 7,802 males and 9,471 females. About three-sevenths of the entire population are given as on the gold-fields, the number being 257,264. The aboriginal population is estimated at 1,908 men, women, and children. There are sixty-two municipal bodies in the colony, including the City of Melbourne and the town of Geelong, containing an estimated amount of rateable property valued at 20,241,073*l.*, having an annual value of 2,314,594*l.* The revenue they receive amounts to 341,429*l.*, the expenditure being 315,475*l.* The estimated population of the municipalities amounted to 315,939, and the dwellings they contained numbered 68,968, their area 241,930 acres.

In 1865, the imports into the Australian colonies reached 35,000,000*l.*, and the exports 30,000,000*l.* Within the last sixteen years New South Wales and Victoria have yielded 150,000,000*l.* worth of gold, and New South Wales has produced 5,000,000 tons of coal. South Australia has also, within the last ten years, exported 5,000,000*l.* worth of copper. The tonnage of vessels which arrived at Australasian

ports in 1865 was 2,000,000, and a similar amount of tonnage left those ports during the same period. Forty years ago the number of horses, cattle, and sheep in Australia was under 400,000; the number is now nearly 35,000,000.

A copy of the Official Record of the Intercolonial Exhibition held at Melbourne 1866-67, has been sent to us by the Commissioners. It is a goodly volume of many pages, and besides a business-like Introduction by the secretary and general manager, Mr. J. G. Knight, and the Catalogue of Exhibits, Guide Reports and Awards, it contains eight valuable Exhibition Essays on the Progress of Victoria; its mining and general statistics; its physical geography, geology, and mineralogy; its gems and precious stones; its agricultural resources; its zoology and paleontology; and its climate; and on Australian vegetation. There is also an appendix containing much further information as to New South Wales, Queensland, South Australia, Tasmania, New Zealand, and Western Australia.

THE NEW THEATRE ROYAL, LEEDS.

THE new Theatre Royal, Leeds, is in the Italian style of architecture. The entrance to the boxes, the floor of which is tessellated pavement, is by a broad stone staircase, with gilt balustrades, and it is lighted from the dome by a chandelier, and a number of figures in niches in the wall, holding globes. The boxes are entered from corridors, and will be furnished with chairs, instead of inconvenient benches, and besides the front circle of boxes at the sides, there are twelve private and other boxes, approached by separate entrances, that will hold about eight persons each, and the entire boxes will accommodate 220 persons. The pit, reached by an entrance at the side, will hold about 1,100 persons. The gallery is approached by a stone staircase at the back of the theatre, down Waterloo-street, through a covered passage forming part of the building. It will seat 1,150 persons. The entire accommodation of the theatre is 2,516 seats.

The stage was laid down by Mr. Richard Huby, and was built away from the theatre in pieces. The width of the proscenium is 25 ft., and the height 28 ft., and the depth from the front to the back of the stage is 55 ft.

The architects are Messrs. Moore & Son, of Sunderland. Messrs. Nicholson & Son, of Leeds, are the builders.

The entire cost of the building is roughly estimated at from 15,000*l.* to 20,000*l.*

FROM SCOTLAND.

Johnstone (Renfrewshire).—Subscriptions for a new public hall having been got, a committee was some time ago appointed to get designs for the buildings. Several architects were asked to submit plans, and the designs of Mr. Lamb, of Paisley, were selected as the most suitable of those sent in. A site was obtained at the corner of Ludovic-square and Church-street. The building will thus have a double frontage of 50 ft. to the square, and of 90 ft. to the street. The principal entrance is from Ludovic-square, on the south, by a hall and staircase to the public-hall floor. The ground-story has a games or amusement room, about 62 ft. by 23 1/2 ft., with a 17 ft. ceiling. It is lighted from the side walls. The reading-room or newspaper-room is 43 1/2 ft. long and 16 ft. wide. The library is 16 ft. square; and the directors' room is 16 ft. by 11 1/2 ft. There is an entrance from Church-street, from which all the rooms on the ground floor can readily be reached by a corridor. There is also by this entrance a special staircase to the public hall, and for concerts or similar entertainments it may be used for the first-class seats. The two staircases and wide entrance-doors give ready means of exit. On the ground-floor are lavatories, bath-room, and other accommodation. On the upper floor is the public hall, 62 ft. long, 46 ft. wide, and 26 ft. high. The hall is entered from both ends of the building, and has a large platform at the north end, with a suite of retiring-rooms for ladies and gentlemen. Attention has been paid to ventilation. The architect has selected modern Italian as the style. The door-piece, with an ornamental balcony over it, is the central feature, and enriched Venetian windows balance the door-piece and light up the upper story. The build-

has been contracted for, the contractors being for the masonry department, Messrs. D. Jaffray & Son, Johnstone; for the carpenter and joiner work, Mr. Robert Whyte, Glasgow; for the plaster work, Mr. John Robertson, Johnstone; for the lumbar work, Mr. John Stewart, Johnstone; for the plaster work, Mr. James Hutchinson, Paisley, *Kirkwall (Orkney)*.—The new iron pier at the harbour, extending 500 ft. in total length from the head of the East Quay, is now nearly completed. Messrs. Laidlaw & Son, of Glasgow, were the contractors. They were to complete it by the 18th of October, 1866, for a lump sum of £10,490l. The progress of the work was slow at first, owing to delays caused by the rocky bottom near the head of the quay deflecting the screw piles, and also by an unfortunate accident which befell the crane, and which terminated fatally in the case of one of the workmen hanging to the town. The narrow part of the pier, extending 332 ft. from the top of the East Quay, is provided with a tramway, which has a crossing in the central part, and a rail-off promenade for foot-passengers, floored with hard wood. Between the broad iron rails of the tramway there is a pavement of asphalt, 4 ft. 4 in. in breadth. The tramway rests on twenty-eight cast-iron piles, connected by arches. The pier, which has an upper and under platform, is 38 ft. in breadth from rail to rail, and 168 ft. in length, making the total extent of the structure 500 ft. here, and at the head, sixty-four iron piles and twenty-three fender piles of strong teak wood. A specially of the pier is that the timber bracing is separate from the iron framework, so that any injury done to the fender piles by the concussion of vessels driving alongside leaves the iron part of the structure unharmed.

covered space, 93 ft. by 33 ft., to the market. On each side of the entrance is a shop, and above these, and extending the whole width of the market, an armory for the volunteers has been provided, with an entrance at each end, and a place at the back for cleaning arms. The new part of the market is ventilated by louvres. Mr. Griffiths, the county surveyor, was the architect, and the contract was taken by Mr. Christopher Espley.

MANCHESTER TOWN HALL COMPETITION.

READERS will learn with satisfaction that the Corporation of Manchester have carried out the suggestion made in our pages, and have printed a list of the designs received under notices or devices. It will be found in our advertising columns, so that all competitors will know if their designs have been received. We are in a position to state also that the committee have called in professional aid to assist them in making their first selection of not fewer than six nor more than twelve, thus offering further evidence that a strong desire exists to do full justice to the competing architects.

We would suggest to the two or three competitors who have addressed letters to us on the subject that they should at least wait until the Committee have done something before saying that they have done wrong. So far as we have the means of judging, the Committee appear, and we have said this before, to have the strongest desire to do justice and to bring about a satisfactory conclusion.

SEFTON PARK, LIVERPOOL.

SOME few years ago the enormously increasing size of the borough of Liverpool (which had nearly trebled itself in twenty years), induced some of the leading members of the council to consider the best way of preserving open spaces for breathing room, while the land was yet to be obtained at a reasonable rate at the outskirts of the town. They already possessed the Newsham House Estate, situated on the extreme eastern boundaries, and by the munificence of the late Mr. Richard Vaughan Yates, the Princes Park was in existence at the south-eastern boundary. Yet the connecting link between the extreme northern boundary of the borough and the southern was not completed. Mr. James Newlands, the excellent borough engineer, suggested that, if sufficient space was not to be obtained to continue the *cordon* of parks, an inner and outer boulevard, of wide dimensions, should be substituted, well planted with trees, to connect the two divisions of the town to the north-east, east, and south-east, while the noble river Mersey completed the circuit of this densely populated town. But at this time a most popular gentleman, Mr. Robert Hutchinson, late mayor, presided over the Improvement Committee, and he was determined that the whole of the *cordon* of parks should be accomplished. In accordance with this determination the council purchased a large tract of land, some 160 acres in extent, from the Earl of Derby, at the extreme north of the town. This is now being laid out as the Stanley Park, under the direction of Mr. Edward Kemp, of the Birkenhead Park. The corporation then purchased the site of Shiel Park, named after an old and esteemed member of the council, which is now completed and open to the public. This completed the circuit up to the Newsham House Park. The Waverley Park and old Botanical Gardens continue the line to within a short distance of Parliament-fields, still unbuilt upon. The Princes Park here joins, and at the Ullet-road boundary of this park the Sefton Park commences, and stretches over hill and hollow to Mossley-hill and Aighurth.

The area of the park is 400 acres, distributed thus:—

	s.	d.	p.
Building sites surrounding Park	113	0	0
Botanical Garden	19	0	0
Area of Lake and running water	14	0	0
Area of Roads and Drives	64	0	0
	210	0	0

The 190 acres left will be planted and laid out with carriage-drives and walks.

At the latter part of last year the corporation of Liverpool offered liberal premiums for the best designs for laying out the land as a park. Besides the sites for budding lots and hotanical

garden, the council required a review ground capable of reviewing the local Volunteers, a large cricket-ground, and, lastly, a grand hollow of 75 ft. wide (having a gallop or Rotten Row running beside it), forming a connecting link with the Croxteth and Princes Park roads, which give the chief access to Liverpool from the esteemed quarter of Mossley-hill, Garston, and Aighurth.

Twenty-nine competitors sent in designs, and after calling in and consulting Mr. Nesfield, the distinguished metropolitan gardener, the Council awarded, as we have before now stated, the first premium to the authors of this design—Mr. Edward André, of Paris, and Mr. Lewis Hornblower, of Liverpool; the former gentleman having charge of the public parks and gardens of Paris, and the latter being a local architect, who had the advantage of experience in these matters under the direction of the late Sir J. Paxton.

We give a bird's eye view, which will explain the whole arrangement proposed. The hollowed is in the foreground, running from Croxteth-road on the left to the Garston-road on the right, a distance of one mile and a quarter.

The Park proper is enclosed by a carriage-drive 50 ft. wide, with side footpaths.

The Botanical Gardens are enclosed with iron railings, and are centrally situated, with a south-westerly aspect. Nineteen acres are devoted to this department. It seems well arranged, and includes many modern improvements.

The contour of the land shows a valley running longitudinally down the centre of the park, while about half-way down this valley another joins, coming from the Mossley Hill side. Both valleys have a great fall 45 ft. towards the lowest part of the land. This fact, and the small streams which issue from the heads of each valley, suggested to the designers a series of cascades leading from the heads of the valleys to the lakes at the lowest or Aighurth-road entrance to the park.

These cascades are eleven in number, varying in the depth of fall from 12 ft. to 6 ft., and are formed with ornamental rockwork and other accessories. Five bridges will span the streams at various selected spots, each bridge varying in design and size. Footpaths of 10 ft. wide follow the windings of the rivulets, and intersect the ornamental plantings surrounding the lakes, &c.

Secondary carriage-drives of 30 ft. wide follow the course of the lake, and intersect with the main drives round the park. At many commanding spots kiosks and other ornamental buildings will be erected. A large band pavilion, first and second class restaurants, a cricket pavilion, with markers' stalls, covered sheds for equestrians, boat-houses, deer-house, &c. &c., will be provided.

Lodges will be placed at all the entrances, and it is the wish of the council that these should be habitable as well as ornamental. Houses for the curator of the gardens, grand conservatory with monumental cascades, fountains, &c., will be introduced. Some few of the elevations of these buildings we have engraved.

The park and garden are estimated to cost 140,000l., and it is expected that the sale of the building lots, 290 in number, varying in size from 1,250 to 6,000 square yards, will nearly repay the council for their outlay in the purchase of the land and laying out the park; at any rate, the difference will be amply repaid by the large open park area of 190 acres secured to the public for ever.

The staking out of the roads and drives is now being proceeded with rapidly; but it is intended, when the fences are down and before the earthworks are commenced, that an opportunity shall be given to the county of Lancaster and its northern neighbours to show what their Volunteer army can do in a review on a grand scale; and it is expected that, on the 3rd or 4th of October, some 25,000 Volunteers of the northern district will be reviewed by H.R.H. the Duke of Cambridge.

It is expected, and indeed arranged, that the whole of the works will be completed in two years from the date of the contracts. We may state that, since the resignation of Mr. Hutchinson from the council, the corporation have selected Mr. Joseph Hinchak as the chairman of the Improvement Committee, under whose auspices every encouragement is given to the designers to carry out their work in its entirety and without interference.

The views we give represent, in order, beginning at the top, The Main Lodges and Gates; The Head Gardener's House; The Shepherd's House; and the Cricket Pavilion.

PROVINCIAL NEWS.

Macclesfield.—The foundation-stone of a new infirmary has been laid here by Earl Grosvenor, &c. The intended new institution takes its origin in an endowment of the sum of 30,000l., bequeathed by the late Mr. Joseph Tunnickiff, a eligible site has been chosen—a vacant plot of ground bounded by two new streets, Cumberland-street and Westminster-road, and adjoining a public park. The building will be erected on a pavilion plan, and be made to accommodate fifty patients. The architect is Mr. Stevens, of Manchester and Macclesfield; and the contract has been let to Messrs. Nield & Sons, of Manchester, for 12,650l., exclusive of the furnishing, lighting, &c., which it is estimated will cost 2,000l. more. The existing Macclesfield Dispensary will be incorporated with the new institution.

Stafford.—The new Manchester and Liverpool District Bank is now almost completed. The new building is of red brick, with Hollington stone dressings, and the shafts which support the capitals in the windows and doorways are of Mansfield stone. The style is Gothic, treated with considerable freedom, and a good deal of carving and other ornamentation. The front is divided into three gables, terminating with pediments. The whole width is 44 ft. All the door and window openings inside and outside have shafts of red Mansfield stone, supporting carved capitals. The bank itself is 40 ft. 6 in. long by 11 ft. wide. It is entirely lighted from the top by a large lantern with side lights all round it, and which is also partially roofed with glass, an intervening ceiling of ornamental glass in panels serving to soften the effect of the vertical light. The architect is Mr. Robert Griffiths, county surveyor; and the work has been carried out by Mr. H. Lovatt, contractor, of Wolverhampton.

Hoylake.—The Stanley Hotel, at Hoylake, has been formally opened. The building was commenced about four years ago by Mr. Cookson, and owing to a want of funds it remained for a considerable time in *statu quo*. Recently it was taken in hand by the Amalgamated Brewery Company, of Birkenhead. The building stands upon about an acre and a half of ground, and it is a frontage of something like 300 ft. The hotel is intended chiefly as a place of resort for excursionists, and, with this view, it has been built to meet the requirements of all parties. It commands a view of the race-course, as well as the whole surrounding neighbourhood. Mr. J. Bratton, of Birkenhead, was the architect; and Mr. Evans, of Hoylake, the builder.

Stafford.—The covered market has been engaged. The space between the Guildhall and the covered market has been cleared of the old police barracks, and entirely enclosed, adding a

BOROUGH-OF-LIVERPOOL

DESIGN FOR LAYING OUT
SETTON PARK

— BIRDS EYE VIEW —
BY MM. EDWARD ANDRE
AND LEWIS HORNELOWER

Designed by E. & L. Hornelower

BUILDINGS DESIGNED FOR SEFTON PARK, LIVERPOOL

DISCOVERIES IN KILDALE CHURCH, YORKSHIRE.

In the course of the works here, just within the line of the north wall of the church, a series of interments, laid east and west, and with the head of one near the feet of the next, were found to the number of seven or eight; and with them a number of weapons of iron and articles of bronze. Among the former were three swords, an axe, three or four daggers (presumably: from the state of corrosion it is hard to say decisively that one at least is not a spear or javelin-head), a knife in a bone handle, portions apparently of spurs, &c. Among the last is a pair of tweezers, a curious object consisting of two legs, each 2 in. long, set square in the ends of a cross-bar (about half the length of the legs), and terminating each of them in movable rings, not unlike a means of suspension for some object or objects unknown; the remains of two hemispherical bowls of thin metal, about 2½ in. in diameter at the mouth, and perforated with four small holes near the rim, which probably or certainly formed parts of a balance. A plug of lead also was met with, which, from the green metallic matter about it, seemed to have come from a bronze or bronze-lined socket; and a shield-shaped and decorated plate of bronze, which may have been the chape of a sword or dagger-sheath. A small wooden frame was also found, with a movable panel, inclosing a small plate of lead, about the thickness of half-a-crown, and ½ in. by 1 in. in dimensions.

A writer in the *Yorkshire Gazette* considers,—the axe-head, and one at least of the swords, are so characteristic that they belong to the period of the Danish occupation of Cleveland. The dispossessed owners of Kildale, named in *Domesday*, were Orme and Ligulf; and there can be no reasonable doubt that they were heirs—at least successors—to others whose nationality was as distinctly declared by their names, as in the case not only of these two, but in that of twenty-one more out of the twenty-seven owners in Cleveland specified in the *Domesday Book*. It is scarcely a mere surmise that some of the earliest of these settlers—perhaps not quite the earliest—might be buried within the limits of a Christian edifice and yet not without the accustomed weapons of their heathen fore-elders. The swords lay with the blades obliquely across the bones of the leg, the hilt at one right hip. The axe lay on the instep of its one-time owner, so that its belve must have reached up to or towards his right hand.

THE TRADES MOVEMENT.

A SUBSCRIPTION has been set on foot for the purpose of raising a testimonial to Mr. W. C. Leng, the editor of the *Sheffield Daily Telegraph*, for the important and many part he took in reference to the recent outrage commission, and a sum of about 200l. has already been subscribed. After the New Hereford-street outrage a December last, Mr. Leng advocated the appointment of a commission with extraordinary powers, for the purpose of making a thorough investigation. He also broadly stated that there could be no doubt of the complicity of some of the trades unions in that and similar outrages which had disgraced the town, and meetings of trade societies were held at which the accusation was denied with great warmth, Broadhead being, perhaps, the most emphatic and energetic in "hurling back the foul imputation." While Mr. Leng was writing on the subject, one of Broadhead's accomplices (Hallam)—who subsequently gave most important evidence before the commissioners—called upon him and made a confession, which was communicated to the public, and proved to be of the greatest value, notwithstanding threats of vengeance, and continued efforts to damage the circulation of his paper. Mr. Leng persisted in his demands for a commission. In this he was cordially assisted by merchants and manufacturers of the town. In speaking of the efforts of the local press, I should not be forgotten that in a less prominent but in a firm and courageous manner, this exposure of dangerous rascality was materially promoted by the editor of the *Sheffield Independent*. We may here note that the Saw-Grinders' Union have virtually and formally confessed themselves to be accomplices of the suspicious Broadhead, at least after the fact, if not also before it. It is to be hoped Parliament will know what use to make of this confession.

Liverpool.—The Operative Carpenters and Joiners have met to consider the new trade rules proposed by the masters. Several amendments to the proposed rules were submitted and carried. The eighth rule proposed by the masters was as follows:—

"Each employer shall conduct his business in any way he may think advantageous in the matter of letting piece-work, employment of society or non-society men, taking apprentices, using machinery and implements, and in all details of management not infringing the individual liberty of the workmen."

The adoption of this rule was strongly opposed, and the rule was rejected.

Glasgow.—The masons are on strike at the University Buildings. The original cause of the dispute was the employment by Mr. Thomson, the contractor, of certain non-union men, and his refusal to dismiss these when requested by the unionists to do so. The immediate result of the misunderstanding was that nearly all the builders and hewers then engaged on the works, numbering 180, threw down their tools, leaving on the ground only labourers, quarrymen, smiths, and joiners. Mr. Thomson, however, adhered to his determination to employ non-unionists if he saw fit. In the absence of masons employment was given to the labourers and quarrymen in obtaining stone, and thus at least one important branch of the work was vigorously pushed on. Meanwhile, masons continued to come in on Mr. Thomson's terms, and by this time, it is said, the full complement would have been made up but for the unionists. The result is that only some seventy-eight masons have yet come in, the number required being about 250. Some of those who have accepted employment were unionists.

THE METROPOLITAN MUNICIPAL GOVERNMENT BILLS.

BESIDES the scheme proposed by Mr. Ayrton's committee, two Bills were brought into Parliament by Mr. Mill, M.P., under the auspices of the Metropolitan Municipal Association, 1, Adam-street, Adelphi. In introducing the second of his two Bills, Mr. Mill said the Bill embodied the remainder of the plan which he had introduced in another Bill at an earlier period of the session. It could not be expected that the Bill could be carried into effect that session, and his object was simply to have it printed, so that it might be laid before the public with a view to its being considered next session. It provided for a central government, and proceeded very much in accordance with the recommendations of a commission which had considered the question. It enlarged the City corporation into a municipality for the whole of London, leaving so much of the present corporation in the City as was necessary for purely local purposes. There would be a mayor and two aldermen for each district, they being those candidates for the common councilorship who had the greatest number of votes. The corporation property would pass into the possession of this larger municipality. The City, it was right to say, had not yet authorised this session. It was proposed that the City should have twice the number of representatives in the common council that its population would justify; it would thus have six aldermen. It was proposed that the county of the City of London should become the county of all London, and should have one commission of peace, of which all the aldermen should be members. As a temporary measure it was proposed that the Board of Works and all the present aldermen should be added to the council, Sir John Thwaites being appointed chairman of the standing committees at his present salary, provided that he was willing to accept the office.

The Metropolitan Municipal Association have issued, in a printed form, "Notes in explanation" of these two Bills. The first of the two, they state, is so framed as to be capable of passing into law alone, although the two form in reality one whole, and could be passed, *pari passu*, with an enactment in the second that the two should be construed as one. The objects of the two are thus summarized in the "explanations":—

- 1st.—To extend throughout the metropolis that local municipal life which is characteristic of our towns, but which, in the metropolis, has hitherto been confined to the City of London.
- 2nd.—To retain the Corporation of London as one of a group of district municipalities, all henceforth to be represented in a common council.
- 3rd.—To establish a central municipal authority over the whole metropolis, absorbing into it the Corporation of the City of London and the Metropolitan Board of Works.

The term "London" in this summary means the whole of the metropolis, and "City of London" the City proper only.

In contrasting Mr. Ayrton's scheme with this one, it is submitted that the bumber scheme embodied in the Metropolitan Municipalities' Bill and the Metropolitan Municipal Government Bill offers over Mr. Ayrton's the following advantages amongst others:—

- 1st.—It is self-acting, and can be put to work without any Government interference.
- 2nd.—It is based upon principles and embodied in forms which are approved by experience and familiar to the people.
- 3rd.—It makes use, as far as possible, of all existing municipal agencies, and develops instead of destroying them.
- 4th.—Whilst far more moderate in its immediate aims, it affords a basis broad enough to include hereafter every reform which experience may show to be desirable.

Mr. Ayrton's scheme, it is maintained, is "characterised by centralization and official interference," while Mr. Mill's, though introducing a vast change in the municipal administration of the metropolis, avoids these characteristics, and is essentially conservative.

THE COST OF METROPOLITAN PAVING.

A REPORT from the Highways, Sewers, and Public Works Committee of St. Pancras has just been printed for the consideration of the vestry, showing the outlay for paving purposes, as well as the additional sum thrown upon the parish by the abolition of tolls, by which that vast monopoly, the London General Omnibus Company, has derived enormous advantages, without affording the public any adequate benefit. The report sets out by stating that for 1866 the rates levied for paving purposes were insufficient by 4,600l. to meet paving requirements, whilst at the same time extraordinary expenses had to be incurred out of the general rate, making a total under this head of 2,975l. The cost of works in relaying footways and paving intersecting portions of adjacent roads in connexion with paving certain of the late turnpike roads, had been 6,976l. The total cost of paving these roadways amounted to 49,661l., for defraying the cost of which 50,000l. had been borrowed by the vestry. In consequence of works executed there was a large quantity of surplus material in the depot, which being available for other streets requiring repair, might be regarded as an asset to the value of 1,500l. Amongst the estimates for 1866 was an item for repairing the carriageway and footways of Tottenham-court-road at a cost of 8,288l., but the old paving could be dressed for other thoroughfares of lesser traffic. After referring to the payment of great works on roads, such as Gray's-in-road and others, out of the general rate to the extent of 13,000l., which they considered a great mistake, the committee report that the cost of maintaining the roads thrown upon the parish by the abolition of tolls was 11,000l. per annum; but the vestry having borrowed the 50,000l. referred to, and paved with granite these portions of the old turnpike roads that were subjected to the heaviest traffic, had reduced the cost of maintenance, including the payment of the instalment of loan and interest to 8,400l. per annum, which was equal to a rate of 2½d. in the pound. The appendix to the report thus shows that the amount required for paving works in the parish of St. Pancras in 1864, the year in which tolls were taken off and turnpike roads thrown on the parish, had been: March, 18,097l.; September, 17,710l. In 1865,—March, 18,517l.; September, 21,607l. In 1866,—March, 18,794l.; September, 21,710l. In 1867,—March, 21,842l.;—total, 138,277l., the amount for all purposes required under the general rate for the same period being 170,166l.

HOW TO COOL HOUSES?

CAN any of your correspondents oblige me with information on the following subject? I must premise that I have been for many years a resident in India, and am about to return there. A cool house is an object I seek with earnestness, as essential not only to the comfort but to the health and happiness of myself and my family. Some fourteen or fifteen years ago, Professor Piazzi Smyth suggested that this object might be accomplished by the expansion of compressed air cooled down while in a state of compression to the temperature of the surrounding atmosphere. It is well known that air will give

out its beat under compression, and will, in consequence, be colder on its re-expansion than it was before. Professor Smyth's idea was that it would be practicable to compress the air in strong vessels outside the house, and then allow it to expand, after being cooled down, in the interior, to which it would be passed through pipes. In 1854 I met with a paragraph in the *Calcutta Literary Gazette* which stated that a paper had been read on behalf of Mr. Macquorn Rankine, at the meeting of the British Association for the Advancement of Science, which described how this mode of cooling houses might be applied; and which stated that a one-horse power steam engine with a bell receiver would compress 66,000 cubic feet of air per hour to so great an extent as to reduce its temperature 30°, say from 90° to 60°. A much less quantity would be sufficient to cool an ordinary house as greatly as would be necessary or pleasant, and the plan, therefore, seems to be as practicable and convenient as could be desired. Yet, strange to say, though the comfort and happiness of great numbers in India, where families are constantly broken up by the ill-health produced by heat, would be secured by its operation, I have been unable to learn by any inquiries that I have had in my power to make either in India or England, that it has ever been tried, or that any notice has been taken of it. The only mention I have seen made of it was in a short paragraph in the *Friend of India*, in which it was spoken of as too expensive for use; but this could not be if Mr. Rankine's statement was correct. What I now seek is information about this mode of cooling houses, whether it has ever been tried, and with what result, and I should be extremely obliged to any one who could afford it. Steam-power I could not command; but I suppose that of a one-horse power engine could be obtained by the use of oxen. I cannot say that I understand, from the imperfect description given in the paper I have referred to, the mode of operation propounded by Mr. Rankine. The plan which appears to me the most feasible would be to compress the air by means of a condensing pump, in a long air-tight cast-iron tube, running through a small canal of water, and opening into the house, the end in the house being closed with a valve so loaded as to produce the requisite degree of condensation.

INDICUS.

HOUSE DRAINAGE AND VENTILATION.

SIR,—Our experience before and since our combined works of water supply and drainage came into operation (at Leek) is so exactly in accordance with the views expressed in your recent leader (p. 581), that I cannot help forwarding you some practical detailed results as to our case. A large portion of my time during the last ten years has been devoted to the important question upon which you write so forcibly. The system of ventilation you advocate has been practically tested here during the last six years. Atmospheric air is admitted into the main sewer at the lower levels, and sulphuretted hydrogen and other light poisons are carried off by 3 in., 4 in., and 6 in. pipes from the drain heads at the high levels. Nature is thus allowed to do the whole work of ventilation herself. I have frequently demonstrated chemically the truth of what you say as to the propriety of ventilating every drain. Where a drain, quickly ascending off the main sewer, is not ventilated, fill one vessel with the atmosphere of the drain at the drain-head, and another from the street sewer, where the drains enter, and in nearly every case the latter will support life, while the former will not.

Experience justifies me in stating that I know of nothing so mischievous as allowing slop-stone pipes to be directly connected with the drain; when this was allowed here, I found 40 to 50 per cent. where the hell-trap was either defective or removed, and a constant stream of gaseous poison entering the house. Taking the slop-stone pipe through the wall into a trap outside, in the manner you suggest, would, in my opinion, if universally carried out, save thousands of lives.

I do not approve of street gullies being untrapped, except here and there one at very low level, where, if a few dry shavings are kindled, the draught is forced inward.

Our town drainage was executed by Mr. C. Slagg, C.E., now borough surveyor at Kingston, at a total cost of about 10,000. We have lately gone through the mains, and I do not think a

hundredweight of sub-soil could be found in the entire length.

The chief advantage has been derived by the poorer classes. The following is an example in proof:—During the six years previous to the drainage works the mean number of members belonging to the Leek Burial Society was 5,178, and the total number of deaths 984, and the average age at death 18'66 years. During the six years since the new drainage works came into operation it stands thus:—Mean number of members 5,988, number of deaths 608, average age at death 27'06 years; showing the decrease in the number of deaths, corrected for the increase of members, to be 475, which is equal to a decrease in the annual rate of mortality of 13'24 to 1,000 of the living. The increase in the value of life is 8'4 years. I estimate the total number of weeks' sickness prevented amongst these persons during the last six years to be upwards of 40,000. It is found that one-third of the total amount of sickness experienced occurs between the ages of fifteen and fifty-five years. Supporting each male between these ages to earn 10s. per week, and each female 5s. per week, and the medical and other expenses attending each person sick to be 10s., and the cost of each funeral 5l., the total saving to this portion of the community, under these heads, during the six years, amounts to 2,000. more than the entire cost of the whole of the drainage works. And supposing the same state of things that has existed during the last six years to continue during the after-life of the present members of this society, the total saving that will have resulted to them under these heads, when the last shall have died off, will be 61,978l.

ROBERT FARROW.

THE LAW COURTS COMPETITION.

SIR,—I beg to offer a few words in correction of a statement in your impression of this week.

What I said in reference to the reported double award of the judges did not amount to a protest, but only to a suggestion of the question, whether or not such an award would be consistent with fairness to the competitors, and the impression under which they had entered the competition. The opinion said to have been offered by me as to my own claims and to my position in the competition would have been most unbecoming as proceeding from me, and I need hardly add, was not expressed.

I will only add, that I have no kind of doubt that Mr. Barry and Mr. Street would produce an excellent building, my only doubt being as to the justice, according to the customary rules of competitions, of thus, as it were, clubbing together the merits of different competitors. Should this, however, be thought right by those best authorized to judge, no protest shall proceed from me; but I shall rejoice if a noble result is the consequence.

GEO. GILBERT SCOTT.

P.S.—I am sorry to observe that my cause has been taken up by an over-zealous friend, in one of the papers, in a tone which I should never have for a moment sanctioned had I been consulted.

BATHING.

It appears to me that all our watering-places should provide enclosed bathing-places, so as to be available "at all times of tide;" either in form of "floating baths," or fixed ones formed of an enclosure of piles, and a timber grating rising and falling with the tide. Nothing can be more economy or unwholesome than our machines, with their hoods behind draws down, excluding sun and air. If the "Continental mode" is objected to by the fastidious here, separate the sexes; but why confine them to the limit of a small machine? There is no bathing in the proper sense of the term here.

Owing to the tides bathing is rendered very difficult at the proper hours. Is a remedy so difficult? What is wanted are proper baths and bathing-places. NARAYAN.

FUTURE COMPETITIONS.

SIR,—Will you allow me a line to repeat the suggestion I made some time ago as to the future of architectural competitions? It is that in all cases the architects competing should be required to furnish *bond fide* drawings of the future building and its details.

Suppose in every instance, as a just free trade trial, a *plan, section, and elevation* only be sent in the actual drawing of the architect himself as evidence of his power as an artist, not all clerks' work and the result of hired assistance. So much for the general competition open to the world. The next process should be to reduce this number to three or six or twelve, according to extent of the work, and to demand of those competing *illustrative*

drawings so as to show the design fully, and these drawings to be paid for as in the instance of the Manchester Town Hall competition. Thus would two ends be gained,—first, the whole art could and would have its chance, without the excessive labour of complete drawings, but yet enough; and next, the real competing architects would feel that they were earning their wages fairly by the being paid for, to a certain extent, profitable and assured work; and finally, and not the least, a blow would be struck at the system of putting forth a series of drawings, and evidences of fine art capacity, wholly the handwork of others, whenever appear it, except, perhaps, to hear it told to the world afterwards as the reason of the short coming and final failure that they, and not their employer, who gets everything, are the real and primal cause of that failure. The whole future of art in reality depends on the following of this course and principle of action,—that of the *bond fide* work of the exhibiting artist becoming *à sine qua non*. I think this idea has already begun to live, and that the result of the Law Courts competition partly proves it; and surely, sir, it is the interest of every artist and architect and artist workman, to help to make the public aware of its absolute necessity. Until this be done an architect's competition is an impossibility—the resultant work is "starved," for the real workers are starved! C. B. A.

BOARDS AND SURVEYORS.

SIR,—The enclosed application for the office of "District Surveyor" has been sent to the Watlington District Highway Board, Oxon, in reply to an advertisement in your pages, the character of which should not be passed unnoted. S. T.

(Copy.)

SIR,—I wish to apply for the post of district surveyor for Watlington, having been brought up in that line, and I can produce first-class testimonials from all the most eminent London surveyors. I have passed the examination at the Royal Institute of British Architects, which is necessary under Act of Parliament, before one can perform the duties of a district surveyor.

Having hitherto found the scope for my intellectual powers rather confined in London, I look forward with "Great Expectations" to an open tract of 150 miles of country, with a salary of equal amount.

My incidental relatives ought to advance the security of 200l., which might be deposited at interest with the Society for the Prevention of Cruelty to Animals for the benefit of the horse.

Gathering from the obscure wording of the advertisement that the Board find the horse, but that I should have to find the board, I wish to ask whether his appetite is good, and how is his poor feet? Do the Board pay the terrapins? Does the horse go quiet in harness, or do they expect to find an ass to ride him?

The advertisement does not give me a chance of judging of the handwriting of the Board, but having been educated at Oxford I will undertake to write as clear English.

Should I be entitled to parochial relief from each of the thirty-nine parishes? My wife takes in washing. Would the Board undertake to push the business in industrial quarters? Should I be allowed time for tending the masie? and how much of my "whole time" could be devoted to sleep? CLAUDE VIATOR.

To the Clerk of the Watlington Highway Board, Oxon.

WINCHESTER DRAINAGE COMPETITION.

SIR,—The blundering one idea of the Winchester Local Board (the utilization in Chilcomb Valley) having been a complete failure as to the second and third premiums, the only honourable course open to them seems to me, to at once recall the rejected designs, and submit them all to Mr. Botnam, or any other competent engineer, as they ought to have done in the first instance.

In the Farnham Drainage Competition the Local Board fortunately had the advice of an eminent civil engineer residing in the neighbourhood, and upon his suggestion they at once sent the whole of the competing designs to Mr. Leather, for him to decide their merits. These amateur engineers at Winchester, however, were above (or below) advice, including that of their own surveyor and now behold his result.

The arrangements suggested above, though not including the first premium (which I imagine is now unavoidably awarded to "No. 7") will show that the Winchester Local Board are willing to acknowledge their error, and refute the unpleasant (though not unreasonable-looking) statement of your correspondent "Competitors," that "they have obtained designs under false pretences."

USE OF THE REJECTED.

APPARATUS FOR BUILDING CONCRETE HOUSES.

WE have received a communication from Mr. Tall in reply to Mr. Conybeare's letter (p. 594 ante), stating that he only claims "improvements in apparatus," and that his apparatus is superior to that referred to. Those who are interested can compare for themselves. As to the strength of concrete, the writer adds:—

"In order to prove to the public and to 'H. C.' how erroneous his statements are, I will make a beam of concrete, and let him make a beam of ordinary brickwork, and if my concrete beam is not only ten but twenty times stronger than his brickwork beam, I will forfeit 50l., he to forfeit a like amount if it is so. And further, as he says my apparatus is 'in all respects identical' with the one he professes to know so much about, I challenge him to make one of them, and build a wall, say 40 ft. high, and I will use my apparatus and also build a wall, and if I do not build twice as fast, with the same number of men, that is 2 ft. to his 1 ft., I will forfeit 50l., he also to be subject to a like forfeit if I do so."

WANTED: INFORMATION.

OBSERVING in your interesting number of the 3rd inst., a statement about a new cement, the main elements of which are magnesia and chloride of magnesium, I presume many of your readers have by this time experimented thereon. Would you be so good as to ask some of them to contribute the result of their experience, together with the information where the above materials can be readily procured, and the cost of each article, and ohlige,

A SAND-RAIL.

VARIOUS inquiries continue to reach us as to what was described in our pages some time ago as "Italian plaster," and said to be obtainable in Ipswich. We shall be glad to receive precise information on the subject. The recent rains have penetrated brick walls and stone walls in all parts of the country. Some means of rendering walls waterproof are anxiously asked for by a dozen correspondents. At present we can but refer them to previous numbers of the *Builder*, wherein various remedies have been at different times discussed.

DEERING AND WYATT.

SIR,—Your correspondent P. C. says (p. 568), "We come now to Joseph Gandy, elder brother of John Peter Gandy. He took the name of Deering," &c. &c. Joseph Michael Gandy should be styled A.M.A.: he was the most celebrated architectural draughtsman of his day, but he did not take the name of Deering as stated, that name being taken by his youngest brother, John Peter Gandy.

Drury Lane Theatre was the work of Mr. Benjamin Wyatt, son of James Wyatt. Apsley House, "as we now see it," was designed by Mr. Benjamin Wyatt and his brother Philip, and not by S. and B. Wyatt.

COTTAGE PLANS.

A CORRESPONDENT of the *Suffolk Chronicle* states, in reference to the cottage plans exhibited at the late Royal Show, that the Suffolk Agricultural Society have offered 10*l.* towards the publication of the two prize plans, upon condition that each of the members should have copies, and have appointed a committee to carry the matter through, and if the amount of subscriptions is sufficient, to publish other plans with them. The expense of reducing and publishing 500 copies each, containing a dozen plans (giving elevation, section, ground, and chamber arrangements of each cottage) would be about 60*l.* For 10*l.* or 15*l.* more an additional 500 could be struck off. A subscriber of 1*l.* will probably have ten copies; one of 10*s.*, four copies. Subscribers' copies to be from the first impressions, and copies not subscribed for to be sold by pay expenses.

We have received a letter, signed "Alfred Creer," stating that the design for which the Suffolk Agricultural Society awarded the second premium to Mr. Shaw (see p. 575 ante) was in reality by the writer; and that our "error" as regards the authorship "has occurred through a friendly arrangement having been made between Mr. Shaw and himself for a simple exchange of names in the matter of this competition." It is somewhat cool, certainly, for a man who has written a lie to tell those who believed him that they have committed an error. We advise Mr. Alfred Creer to avoid all such "dodges" in future, and to stick to his own name before he is made ashamed of it.

LABOUR AND PRICES IN SYDNEY.

SIR,—I am not surprised that you should have been led to write as you have done upon receipt of the "memorial" from the Sydney operatives, although I cannot but regret that towards the conclusion of your article you were irresponsibly led to consent to some misgiving as to the accuracy of the averments in the "memorial." If I can satisfy you that the statements in the "memorial" are false, your whole argument falls to the ground. Although I do not append my usual signature, I am not unknown to you, at least, by report, and you will admit I am in a position to speak on this subject, and that what I write may be relied on. I am bound, however, to preface what I have to write by acknowledging I am a resident in Melbourne and not Sydney; but so far as comparison of wages with cost of living is concerned, my visit to the latter place and frequent correspondence enable me to

state that the Sydney operatives have the advantage of their brethren here. There is also to admit; that about the time it was despatched the prices of meat were ruling higher than they are here now.

Having thus somewhat cleared the way, let me now institute a comparison of wages and cost of living in Melbourne and Sydney, as they are presently in competition, particularly in the building trades. All the operatives in Melbourne work only eight hours, for which, as is stated, they receive from 8*s.* to 10*s.* per diem, some working piece-work even more. Labourers engaged on buildings receive 6*s.* to 8*s.* The proportion of employment is much higher than stated. I do not say that men are never out of employment, but I constantly hear contractors complain of the difficulty of getting men; and of this I am certain, that because good workmen are scarce many men are employed here who would not be tolerated in England. A good workman in any trade here can always ensure employment.

Then as to living, let me give you some of the prices quoted to me in the market this morning. Large cahagnes 1*d.* each, cauliflowers 1*d.* each, last week 3*d.* each. Turnips and carrots 1*d.* per bunch. Mutton from 2*d.* to 3*d.* per lb.; by the side 2*d.* Milk is selling at 3*d.* to 6*d.* per quart, according to locality. Bacon and cheese at 1*s.* and upwards per lb. Tea from 1*s.* 3*d.* upwards; sugar from 3*d.* All groceries can be had of the best quality and at very reasonable rates. Boots and shoes can be had good and at fair prices. Rents vary, of course, as to locality from 5*s.* and 6*s.* upwards for seven cottages. I think I have already jotted down sufficient to show you that our operatives are not so badly off as some would have you believe. I could name some in several trades who are letting house or houses to others. There are among the poor oppressed workmen who warn their fellows in England not to come to Australia. Was there ever a more hollow pretence? I am sorry to say that with scarcely an exception, the trade unions are not, in my opinion, the most successful or most reliable men in their several callings; that there are good workmen connected with the unions; admit; but they generally join in self-defence, the roughs, like scum, rising to the top.

You were misled when you wrote,—"There are no well-lighted . . . shops" &c.; "no lofty smithies, with engines for turning lathes for filters," &c. &c. Not only have we steam, but water engines employed. Indeed, machinery to a very large extent is used in various trades and but few builders are without proper accommodation for their workmen. While I should be afraid to venture for their workmen, I have seen well-appointed foundries supplied with every appliance, engine-driven lathes are in almost every such establishment, while already some two or three steam-hammers have also found their way to the colony. If you recollect that we are only a small community, some 700,000 in the whole colony, these facts will stand out much more prominently, and prove that our men are made of sterner stuff, full of indomitable energy. To the man who is not afraid to work and know his business, I say there is plenty of room; let him come.

MELBOURNE.

P.S.—Since the above was written the following clipping appeared in the *Melbourne Argus*—

"The whole of the moulders employed in the Victoria and Phoenix Foundries, Ballarat," says the *Post* of Monday, "have struck work, in consequence of a proposal by their employers to reduce the rate of wages from 15*s.* to 13*s.* per day.

THE THAMES EMBANKMENT.

The engineer to the Metropolitan Board of Works has reported on the progress of the embankment. We give a condensed abstract of the report. "Contract No. 1, between Westminster and Waterloo Bridges—The dams are completed, and portions removed from the works where sufficiently advanced; 3,262 ft. of the low level sewer, 3,244 ft. of the subway, 2,925 ft. of the smaller sewer for intercepting the drains from the foreshore, and 284 ft. of the flushing culvert are also complete. About 320 ft. of the Westminster Steamboat Pier and the face wall next the bridge, the main wall, return wall, screen and retaining walls, &c., are all in a very forward state; 586 ft. of the adjoining river wall are complete, and a further length of 134 ft. has been brought to a height of 3½ ft. above Trinity high-water mark; 100 ft. of the York-gate sub-structure are brought to a level of about 1 ft. above that mark; 200 ft. of the river wall adjoining are complete, and a further length of 463 ft. is constructed to a height of 3½ ft. above Trinity datum; 45 ft. of the Charing-cross Pier are brought to the same level, and excavating, concreting, and brickwork are proceeding within the dam for the completion of the remainder of this pier; 302 ft. of the river wall adjacent are brought to heights varying from 1 ft. to 3½ ft. above Trinity datum. The works to the Adelphi landing-stairs are brought to 1 ft. above, and 395 ft. of the river wall adjoining those works are brought to levels varying from 1 ft. below to 3½ ft. above that mark. In connexion with the Waterloo Steamboat Pier works up to the junction with the No. 2 contract, the works generally are brought to levels varying from 1 ft. below to about 1 ft. above Trinity datum. Filling in behind the walls and in the works has been carried out to the extent of about 500,000 cubic yards. The Victoria and Regent-street sewer outlets are complete. Approximately the cost of the whole of these works amounts to about 394,200*l.* Contract No. 2, between Waterloo Bridge and Temple Gardens.—The low-level sewer, subway, and smaller intercept-

ing sewer now complete, the river wall is constructed to its full height, and the parapet is being formed thereon. The new Temple Pier is also approaching completion. The approximate value of the whole of the works completed amounts to about 215,490*l.* Contract No. 3—The drawings are completed. They comprise a viaduct from the eastern end of Inner Temple Gardens to Blackfriars Bridge, and will complete the line of embankment between Westminster and Blackfriars Bridges; but this section of the work awaits certain negotiations pending between the board, the Metropolitan District Railway Company, and the City Gas Works. The roadway along the whole length of the embankment cannot be completed until after the construction of the Metropolitan District Railway. Southern Embankment—A length of about 2,570 ft. of the dam, and 2,870 ft. of the staging is complete, and in the construction of which about 237,000 cubic feet of timber, 13,000 cubic yards of clay puddle, and 185 tons of iron have been used. Within the dam about 240 ft. in length of the river wall have been brought to a level of 1 ft. below, and 2,060 ft. of the wall to levels varying from 1 ft. to 7½ ft. above Trinity high-water mark. For the construction of this wall about 87,000 cubic yards of earth have been excavated, 30,000 yards filled in, 22,000 yards of concrete deposited, 580 yards of brickwork laid, and 123,000 cubic feet of stone bedded. The total approximate value of the work done is 107,000*l.*"

SHOREDITCH NEW VESTRY HALL.

At a meeting of the Shoreditch vestry, held on Tuesday evening, a long discussion took place with reference to the Vestry-hall in course of being erected in Old Street-road. The principal point raised was in respect to the painting of the interior, which, in terms of the specification, was required to be "painted in four oils to all stucco work." The contractor having put a solution of vitriol on the wall next the lime, the clerk of the works, Mr. Merriam, condemned it as being contrary to specification, and stopped the work. On the matter coming before the building committee they ordered the paint to be removed and the vitriol size taken off, at the expense of the contractor. The discussion in vestry arose upon the report of the committee. On one side it was contended that the vitriol was used to fill the active properties of the lime, and prevent the paint becoming embedded, so that more paint being made to appear on the surface of the wall when finished than had been used, the desired purpose of the projector of the building had not been effected. On the other hand, the practice was said to be in accordance with the practice of the trade in such cases, and the difference of opinion thus expressed was the real bone of contention. The clerk of the works was called, and he persisted that he had acted properly, and for the interest of his employers, by insisting that the contract should be duly executed according to the terms of the specification. The architect, Mr. C. A. Long, was not present during this discussion, although he had attended the meeting of the committee when it was resolved that the paint should be taken off and the vitriol size removed, which was done with his concurrence. The result of the discussion was, that the vestry adopted the report of the committee, and confirmed the decision at which it had arrived.

CHURCH-BUILDING NEWS.

Northill.—The first stone of All Saints Church, Caldecote, has been laid. The late rector's widow gives 1,000*l.* towards its erection. Mr. Harvey has presented a site, adjoining the school-house, for the church and a burial-ground around it, valued with his subscription at 250*l.* Other contributions bring up the list to about 1,660*l.*, the estimated cost being nearly 2,000*l.* Plans for a church to hold 400, and to be constructed for the most part of brick, after a Romanesque design, have been obtained from Mr. A. Blomfield, of London, and the execution of the works has been entrusted to Mr. Warren, of Stevenage.

East Brixton.—The foundation-stone of St. Jude's Church, Dulwich-lane, East Brixton, was laid by Mr. Joshua Blackburn, of Brockwell Hall, on Saturday last, the 3rd instant. The archdeacon of Surrey delivered the address, the service being read by the Rev. N. A. Garland, assisted by the local clergy. The church will accommodate nearly 1,100 persons, on the ground-floor. One-third of the sittings are free. The building is designed in the Early Decorated style. It is faced with Kentish rag and Bath stone dressings, and is arranged with nave and aisles divided by arcades, sustained on circular stone piers with carved capitals. There are shallow transepts and a deep chancel, the tower and spire being situated in the angle between the end of the north aisle and the side of the chancel. Mr. E. C. Robins is the architect, and Mr. John Kirk is the contractor, whose tender

for the erection and completion of the church is under 6,000l.

Pemhury.—The parish church of Pemhury has been re-opened, after extensive repairs. The restorations have been carried out under the direction of Mr. B. Wheeler, of Brenchley, and embrace the removal of the galleries and high square pews. These have given place to open benches. The walls have been repaired and renovated throughout the building. The east wall has been partially rebuilt, and a new eastern window inserted. A vestry has been erected on the north side of the chancel. The nave roof has been stripped of the plaster which covered the old timbers, and opened to view. A new roof of the same pitch as the nave has been constructed over the chancel, and has taken the place of the former flat plaster ceiling. The internal part is formed in panels and ribs, with moulded principals. All the windows, doors, ways, &c., have been restored as far as possible in accordance with the ancient work, the old architecture being retained where decay had not rendered this impracticable. The chancel is seated stall-wise, and is raised two steps above the level of the nave. The communion is approached by three steps of polished marble. The floor of the chancel is laid with encaustic tiles, the altar floor and foot pace being composed of different coloured marbles. This portion of the work is the gift of Mr. William Amhurst Tyssen Amhurst, of Diddington Hall, Norfolk, some members of whose family lie interred beneath the sanctuary floor. The reredos is a composition of marble and alabaster. Beneath a carved canopy are inlaid marbles of divers colours, on which are incised the sacred monogram. In the spandrels are carved subjects of the pelican and Agnus Dei. The works have been executed by Mr. Punnett, of Tonbridge, at a cost of about 1,300l., exclusive of gifts in kind.

Beighton (Sheffield).—At a meeting of the inhabitants of Beighton, held in the vestry of the parish church, to consider the propriety of restoring the church, it was resolved that plans for this object, which had been prepared by Mr. S. Rollinson, of Chesterfield, architect, should be adopted. Earl Manvers, the patron of the living, has headed the subscription list with a donation of 500l. All the seats in the church, when restored, are to be open and unappropriated.

Manchester.—The last portion of the Philips Park Cemetery, that is devoted to the Church of England, is now so near completion that it has been consecrated by the Bishop of Manchester. The cemetery, of which we have before spoken, has been constructed by the Corporation of Manchester, and occupies the site on which St. Ann's Rectory formerly stood, to the north of Philips Park, from which it is separated by the River Medlock. Altogether, the corporation purchased about forty-six acres of land, stretching for more than half a mile along the banks of the Medlock. They then advertised for designs for laying out the grounds, and for chapels to be erected; and out of the forty designs submitted, those of Messrs. Panll & Ayliffe, architects, of Manchester, for the chapels and other buildings, and of Mr. William Gay, landscape gardener, Bradford, Yorkshire, for the engineering works and for the laying out of the grounds and approaches, were selected. The main feature of Mr. Gay's plan, which has been carried out, was the fixing of the principal entrance at the north-west corner, being the nearest approach to the city, and the arterial road running from it through the centre of the ground to the eastern end. The approaches and boundary roads have reduced the area within the walls to 4½ acres. Of this the western end, 19½ acres in extent, has been appropriated to the Church of England, next 14 acres to the Dissenters, and at the eastern end 7½ acres to the Roman Catholics. Each portion of the cemetery is made complete within itself, having its chapel and lodges, and those appropriated to the Dissenters and Roman Catholics have separate entrances, independent of the main entrance. Though all the chapels are in one style,—the transitional period of Gothic architecture,—each is distinct in design. The whole of the buildings are treated rather severely, no elaborate ornamentation being permitted. Mr. W. Storr, of Stalybridge, was the contractor. The road making, drainage, and earthworks have been carried out by Mr. Israel Thornton, under a schedule of prices; and the laying out and planting by the corporation, who employed a number of cotton operatives who had been thrown out

of work during the cotton famine at day labour. The total cost of the cemetery, including land buildings, engineering works, &c., is estimated at about 60,000l. Since the dissolution of partnership between Messrs. Panll & Ayliffe, the works have been completed under the superintendence of Mr. Panll.

Ipswich.—At a vestry of the parish of St. Margaret, Ipswich, it has been resolved "that Mr. Barnes, the architect, be requested to survey the church at California to ascertain what amount would be required to put it into repair and what amount would be requisite to enlarge it so as to hold 400 persons and in order to make it suitable for consecration by the bishop."

Leicester.—The spire of St. Martin's Church is now completed. The total height of tower and spire, from the floor-line to the top of the vane, is 218 ft. 6 in., the tower being 107 ft., and the spire 111 ft. 6 in. The style is Early English, to correspond with the tower, lately restored. The architect was Mr. Raphael Brandon, of London, and the work has been carried out by Messrs. W. Neale & Sons, of this town. The weathercock was put on by the vicar.

DISSENTING CHURCH-BUILDING NEWS.

Liverpool.—The foundation-stone has been recently laid of a Wesleyan Chapel at Old Swan, near Liverpool. The building will be in the Gothic style, of red sandstone, and contain 478 sittings. It will have a large school-room and a minister's vestry at the back, and three class-rooms on the basement. The estimate is 2,117l. 10s. This includes the cost of heating, boundary-wall, and fittings. The architects are the Messrs. Green & Parslow, of Liverpool, and the contractor is Mr. John Westmorland, also of Liverpool.

Scarborough.—The exterior of the new Baptist Chapel, which was recently opened, is designed in the Geometric Decorated style of Gothic architecture, and its site is the centre of Albemarle Crescent. The south-east corner of the principal front is occupied by a tower and spire, rising to a height of 110 ft. The windows of the upper stage of the tower are moulded, filled in with tracery, and surmounted by crocketed canopies rising high up the four faces of the spire. The centre portion of the façade consists of a vestibule entered by triple arches springing from circular shafts with moulded hauses and bands and sculptured capitals. From this vestibule the entrances to the ground and gallery floors of the chapel are reached. Above the arched vestibule is a large six-light window, filled in with tracery. The façade is flanked by the gallery staircases. The materials used are Bradford Wall stones, with dressings and spire of Whitby ashlar. Internally the chapel consists of a nave and aisles, divided by iron columns, and supporting an open-timbered roof. The transepts correspond in height with the nave, and have each a large five-light tracery window; while behind the pulpit is an ornamental baptistery with an apse end, the three two-light openings of which are filled in with memorial windows. Vestries are situated in each side of the baptistery, and a large lecture-room is built on the ground behind. An organ-chapel, a minister's vestry, and a gallery across one end of the chapel complete the accommodation provided, which is for 750 people. The cost of the building, including the land, is estimated at 5,500l., and it has been erected by Mr. John Barry, contractor, of Scarborough, from the designs of Messrs. Lockwood & Mawson.

Buckley.—A new Wesleyan chapel is to be built for Buckley. The edifice is to be situated on land given for the purpose by Mr. Craven. Its dimensions will be 56 ft. by 36 ft. and it is calculated to seat 300 persons. The style will be a modified Gothic. The architect is Mr. Krolow. The total cost is estimated at about 600l.

Walsall.—The memorial-stones of a new Wesleyan chapel, intended to be built at the corner of Queen-street and Bridgman-street, have been laid by four ladies. The new structure is designed and will be built by Mr. J. Wilkes, of Darlington. It will partly supplement and partly supplant a school chapel, which was built on an adjacent plot of land nearly three years ago, and which, on the completion of the new structure, will be used for school purposes only. In style it will be a mixture of Gothic and Italian and, as regards capacity, it will seat 350 persons. At present there will only be one end gallery for the school-children put up; but the building

will be so arranged as to admit of the addition of side galleries hereafter. The total outlay is set down at 900l., rather more than one-half of which has now been raised.

Hanley.—The corner-stone of a Methodist New Connexion chapel has been laid here. The Building Committee engaged the services of Messrs. Scrivener & Son, of Hanley, architects, to design a suitable edifice, at a cost of something like 2,000l., more than one-half of which amount has already been raised. The chapel will be 72 ft. long, 37 ft. wide, and 36 ft. from floor to ceiling. The style is Gothic of the thirteenth century. It will be built with white bricks and stone dressings. The main front (which is south) is gabled, and has a series of six windows, with lancet heads, divided by columns with moulded caps and bases. Above this is a four-light traceried window. On the east side of the front is a porch entrance. The porch is carried up as a tower, and has stone pinnacles with carved finials rising from the angle buttresses. At the west corner is a square tower, with angle buttresses, rising to a height of 46 ft., and from the tower is a spire rising to the height of 76 ft., making a total height of 122 ft. This tower is the principal entrance to the chapel. A doorway with columns and deeply recessed mouldings is the main feature. The sides of the chapel are formed into bays by buttresses with stone weatherings. In each bay is a single-light window with traceried head. The interior is fitted up with open benches in red deal, and with a rostrum of novel design. Behind the rostrum are the vestries and organ-gallery and choir. There is a gallery at the south end; the gallery fronts are framed in quatrefoil panels, which are filled in with crimson cloth. The roof is open timbered, the spandrels being filled in with open tracery. The ceiling is pentagonal in section and covered with red deal boards; all the wood-work is stained and varnished. The heating is by hot air, and the system of ventilation is what is now termed the "natural," the fresh air being admitted through ducts covered with wire gauze, and the vitiated air carried off through the ceiling into the apex of the roof, and thence into the atmosphere. The chapel is being erected by Mr. C. Wootledge, of Hanley.

Whitby.—The commencement of the new Congregational Church, West Cliff, Whitby, has been celebrated by a devotional service on the site. The foundation stone will be laid on September 11th, by Mr. S. Morley, of London, who has contributed 300l. in aid of the building fund. It is expected that the church will be opened for worship in twelve months. The architect is Mr. Pritchett, of Darlington, and the builder Mr. B. Robinson, of Whitby. The total cost of the building, including land, will be about 4,000l., 1,400l. of which have yet to be raised.

SCHOOL-BUILDING NEWS.

Tamworth.—The foundation-stone of the new Grammar School at Tamworth has been laid by the Marquis Townshend, who, as Viscount Raynham, represented the borough in Parliament for some years. The site is on the outskirts of the town, on the Ashby road. The position is elevated. Considerable delay has taken place in the erection of the building, owing partly to Sir Robert Peel, the senior member for the borough, having taken objections to the site and other points in the proposals of the trustees, and besides urging his views upon the Charity Commissioners, having addressed meetings at Tamworth on this and other local topics. The right hon. baronet moved in the House of Commons for the correspondence on the subject with the Charity Commissioners to be printed, and the hinc hock containing this was, with the newspapers of the day and coins of the present reign, deposited in a cavity of the stone. Mr. Nicholas Joyce, of Stafford, was selected as architect; and the building is being erected according to his designs by Mr. Charles Clarkson, of Tamworth, builder, for 2,800l. The walls were up a considerable height when the ceremony took place. The front of the building is about 140 ft. in length. In the centre is the master's residence, with sitting-rooms, dormitories, and other accommodation for twenty-five boarders. At the north end are the servants' apartments and domestic offices, and at the south end the schoolroom, 42 ft. long and 20 ft. wide. On the ground-floor is a large room in which the public library will be placed. This is an old library belonging to

town. The building will be of Gothic character, the walls faced with pressed bricks, enriched with dressings of Bath stone, and the roofs covered with Staffordshire tiles, in ornamental patterns.

Carlisle.—The new schools in connexion with the recently erected church of St. Stephen's, in this city, have been formally opened. The building has been erected at the west end of the church. It is of brick, faced with white stone. The building consists of three rooms. The architect was Mr. Jas. Nelson, jun., of this city, who also designed the church; and Mr. Milburn, of this city, was the builder.

STAINED GLASS.

St. Thomas's, Rylol.—An east window has been presented to this church as a memorial of the help and sympathy given by the Bishop of St. Asaph in its erection. Messrs. Ward & Hughes are the artists.

Rastrick Church.—A memorial window has been placed in the parish church of Rastrick, or Brighoune, Yorkshire, in memory of the son of Mr. Thomas Bradbury, Longroyds, Brighoune. The window is composed of two lights, crowned by a transom, and contains in the lower division two subjects, namely, the "Nativity" and the presentation in the Temple, framed by pinnacles and mosaic borders. The upper parts of the window are filled with medallions, containing angels; and the base is formed with mosaic work, under which is placed the inscription. The window is from the works of Messrs. B. Edmundson & Son, of Manchester.

Books Received.

Irrigation in Spain. By J. P. ROBERTS, C.E. London: Spon. 1867.

The author has compiled this essay from information collected during a residence of several years in Spain. He is of opinion that irrigation works, when properly carried out with a regard to economy, must, besides being highly beneficial to landed proprietors and tenants, be exceedingly remunerative to those who embark their capital in them, if the districts to be irrigated be judiciously selected. The Araya district of Spain, in which he resided for years, has for centuries been irrigated, and the subject is thoroughly understood. He is professionally engaged for some time in examining projected irrigation works; and as he knows very little is known on this subject in England, he rightly says that his notes contain a matter of sufficient importance to merit publication, especially in connexion with the agricultural improvement of our possessions in Spain.

VARIORUM.

Stevens & Hole's Monthly Meteorological Magazine (London, Charing-Cross) for August contains the usual information on rainfall, especially in the district paper, on the excessive rainfall of 26th of last, which is illustrated by a map and useable tabular details, given by various observers in the vicinity of the Thames and Medway, showing the enormous amount of rainfall in some cases compared with others not far off. Thus at Strathfield Turgiss, Winchfield, Hants, Rev. C. H. Griffith found the amount of rainfall on that occasion to be 1.25 in.; and at Meland, West Hootley, Sussex, Mr. J. Longeon records 1.33 in.; Dr. Ballard at Comperrace, Islington, Middlesex, gives 2.22 in.; J. J. Glaisher at Greenwich Observatory, records 3.67 in.; and Mr. W. Bland Martlip, Sittingbourne, in Kent, 5.04 in. The value of these observations is great.—**Stevens & Hole's School Series: The Standard Arithmetical Copy-book.** By Henry Combes & John Hines.—**Longmans & Co.'s "Stevens & Hole's School Series: The Complete Writer."** By Henry Combes, E. T. Stevens, & C. Hole.—**Longmans & Co.** The first of these series of school books forms a carefully-prepared course of arithmetic, advancing step by step from the simplest elements to the higher branches of the science, arranged so as to ensure good figures, clear methods, and correct results. There are two of them. The principle upon which the course is constructed is that of showing,

by example, how the work should be written out, and then leading the pupil step by step to do similar work for himself. The idea is a decidedly good one, and will probably be found far more effectual than the older or more usual modes. "The Complete Writer" comprises a course of sixteen carefully graduated narrative copy-books, designed to lead to good and correct writing for upper and middle class schools. The postscript and other selections given as copies are a great improvement on the old jog-trot system.

Miscellaneous.

WROXETER.—The excavations at Wroxeter have been proceeding for more than three weeks by the liberality of Mr. Meyer. Three or four men have been employed in clearing out the ground on the north angle of the buildings generally termed the enameller's workshop, and between this, and what has been supposed to have been, a *bastula*. A good many feet of ancient wall have been laid open, and are being measured and laid down to a scale by Mr. H. Davies, and much curious subterranean building has been discovered. Various articles have been found, almost all of which are, by this time, to be seen in the Museum.

FURNACE CHIMNEY.—A chimney has been built at the works of the West Cumberland Hematite Iron Company, near Workington, from a design by Professor Rankine; the builders are Messrs. William Wilson & Son, of Glasgow. The following are the principal dimensions: height above ground level, 250 ft.; depth of foundation below ground level (including a bed of concrete 3 ft. deep), 17 ft.; basement, 30 ft. square at the bottom, diminishing to an octagon at the ground level, pierced by four apertures for flues, each 7 ft. 6 in. in diameter; outside diameters of cone, at bottom, 25 ft. 7 in.; at top, 15 ft. 3 in. The cone has a straight batter of 1 in 48; thickness of brickwork in cone, 2½ bricks at bottom, diminishing by steps inside to 1½ brick at top, and including fire-brick lining.

TOWNS' SEWAGE.—An important Bill, known by the title of "The Sewage Utilisation Act of 1867," for facilitating the distribution of town sewage for agricultural purposes, has just been printed, in the form in which it left the House of Commons. Briefly stated, its provisions empower Local Boards to provide any works for receiving, storing, disinfecting, or distributing sewage within their respective districts; and in districts where no Local Boards exist, a special authority may be created for the purpose. Such Boards or authorities may purchase any requisite lands, and for agricultural objects may lease land for a period not exceeding seven years, or may contract to share the produce, or farm it and dispose of the produce. Different districts may unite for these ends. Authorities under the Act may also agree to contribute to any outlay on the part of private capitalists or public companies for carrying sewage plans into execution, and, as regards companies, may become shareholders. All assessments under the Act are to be included in the poor-rates.

FALL OF A HOUSE IN LIVERPOOL.—A portion of a house situated in Prescot-road, Old Swan, nearly opposite the police-office, has fallen. At the rear is a chasm between 40 and 50 ft. deep, evidently an old quarry, and the back parts of the houses project over this, and are supported by massive stone pillars. It is supposed that the foundations of those pillars were not sufficiently firm to sustain the superincumbent weight, and that those supporting Mr. Has-kayne's house sunk, and so caused the catastrophe. A police-constable named Basham, who being informed that there was a female inside unable to get out and in danger, at once ascended to the upper floors as quickly as he could, snatched the young woman out of bed, and brought her down in his arms. He narrowly escaped, for just as he had reached the foot of the stairs the flooring gave way beneath him, and he and his burthen would certainly have fallen into the frightful pit beneath had not five or six of the more courageous of the crowd rendered their assistance, and dragged them both out. The adjoining houses of the row appear also to be in a very dangerous state, the pillars supporting them to the rear not seeming to be in a reliable condition, and cracks in the walls, sinking of floors, and other unpleasant signs, give strong indications of danger.

CARELESSNESS IN STACKING BRICKS.—Three boys have been buried by a stack of falling bricks at the Liverpool new Exchange buildings, but fortunately they were rescued without loss of life.

FIRE IN A CHURCH AT VENICE.—A great fire has occurred here in the Church of St. John and St. Paul, Venice. Titian's painting of Peter the Martyr and many other master-pieces of art were burned.

WHITE LEAD.—An invention has been provisionally specified by Mr. Bonville, of Paris, for obtaining white lead direct from the ore, by pouring the molten metal into cold water, to render it as porous and bulky as possible; it is then dissolved in sulphuric acid, and the sulphate is treated with pyroligneous or oxalic acid, combined or not with tinctal dissolved in water, and next dried over the fire on trays. The vessels employed are either made of stone or wood, lined with lead.

GLASS WALLS FOR FRUIT TREES.—A contrivance for more thoroughly ripening fruit, noticed or suggested in the *Builder* some years ago, has been introduced in this shape. Small bars of wood are driven into the earth about 3 ft. from an ordinary brick wall, and being grooved easily receive plates of glass. The fruit trees are trained against this glass wall on the inside, and so besides the light and heat obtained on the one side through the glass get the reflected heat from the wall opposite. With two glass walls about 4 ft. apart in the open trees can be trained on the insides of both, and in either case the tops can easily be covered in case of frost.

THE NEW BUNHILL-FIELDS PARK.—Agreeably to the new Act, which has just received the Royal assent, for the preservation of Bunhill-fields burial-ground, the Corporation of the City of London is now to perform its part in the implied contract, and convert the burial-ground, which contains the bones of so many eminent men, into a public garden or "park." Bunhill-fields possesses a large area of ground, capable of being converted into a place of recreation for resident citizens, of park-like dimensions, and we hear it will receive the name of "Bunhill-fields Park." It is to be hoped that the tombs of Bunyan, De Poe, and the other worthies there will be duly cared for.

PORTABLE HEN HOUSES.—M. Giot has invented a "fowl-omnibus." One of these perambulating hen-houses is to be seen at the Paris Exhibition. M. Giot puts nest-boxes and perches into a broken-down bus, fills it with fowls, and wheels it out into the fallows and plough lands. The *Houdans* and *Cybec-cours* feed themselves entirely, follow the plough or harrow, clear the land thoroughly of worm and fly, pick up all the stray grain after harvest, manure the soil, lay innumerable eggs, rear hardy broods, and make capital poultry for the table, all without cost or trouble, beyond the necessity of tending them now and then to a new spot.

PREPARATION OF WHITEWASH.—Whitewash is one of the most valuable articles in the world when properly applied. It not only prevents the decay of wood, but conduces greatly to the healthiness of all buildings, whether of wood or stone. Out-buildings and fences, when not painted, should be supplied once or twice every year with a good coat of whitewash, which should be prepared in the following way:—Take a clean water-tight barrel, or other suitable cask, and put into it half a bushel of lime. Slake it by pouring water over it, boiling hot, and in sufficient quantity to cover it 5 in. deep, and stir it briskly till thoroughly slaked. When the slaking has been thoroughly effected, dissolve it in water, and add two pounds of sulphate of zinc and one of common salt; these will cause the wash to harden and prevent its cracking, which gives an unseemly appearance to the work. If desirable, a beautiful cream colour may be communicated to the above wash, by adding three pounds of yellow ochre; or a good pearl or lead colour, by the addition of lamp, vine, or ivory black. For fawn colour, add four pounds ofumber—Turkish or American, the latter is the cheapest—one pound of Indian red, and one pound of common lamp black. For common stone colour, add four pounds of raw umber, and two pounds of lamp black. This wash may be applied with a common whitewash brush, and will be found much superior both in appearance and durability, to the common whitewash.—*Albany Country Gentleman.*

GOLD FOR THE MORMONS.—A communication from the Salt Lake, dated the 10th of July, speaks of great excitement, owing to rich discoveries of gold near the South Pass, some 250 miles from the city. The mines are said to exceed any others ever found on the American continent for value and extent.

THE PUBLIC PARK AT HALIFAX.—Sir F. Crossley, bart., who in 1857 presented to his fellow-townsmen a People's Park, which cost 30,000*l.*, has commemorated the tenth anniversary of the opening by presenting to the town of Halifax a sum of 6,300*l.*, the interest to provide salaries to park-keepers and other expenses.

OPENING OF THE NEW RAILWAY BETWEEN LONDON AND EDGWARE.—A want which has long been felt, viz., the establishment of direct communication by railway between the metropolis and the extreme northern districts, is supplied by the opening of the new London and Edgware line by the Great Northern Railway Company.

RESTORATION OF THE CRYSTAL PALACE.—We are told that a contract has been made with the Hamilton Windsor Ironworks Company of Liverpool, for the erection of 145 ft. of the north end of the Crystal Palace, destroyed by fire, bringing the restored part up to the spot at which the north transept formerly stood. The work is to be completed by November.

VALUE OF PROPERTY IN LIVERPOOL.—In the Sheriff's Court, St. George's Hall, before Mr. J. J. Aston, assessor, and a jury, an arbitration case between the Corporation and certain owners of property in Church-street has been heard. Mr. Lloyd stated the nature of the claim. He said the premises were required by the Corporation for the purposes of improvements in Church-street. It was obvious that they did not want the whole of it, but they desired to recoup the ratepayers the outlay they were about to make by purchasing the whole block, and then reselling a portion of it. A number of witnesses were examined on both sides. The area of the premises was 37½ yards, with a frontage to Church-street of 49 ft. 21 in. Mr. Wordley estimated the value of the land at 50 guineas per yard, or 22,125*l.* for land and buildings. Mr. T. J. Kilpin 22,321*l.*; Mr. Hornblower, 22,011*l.*; and Mr. Cunningham, 21,825*l.* For the Corporation, Mr. Culshaw, on being examined, stated it as his opinion that the value of the ground was 16,005*l.*, which was an average of 42*l.* 4s. a yard; by one calculation out of three he made it 12,038*l.* Mr. W. Scott valued the land at 15,832*l.*; Mr. P. Ellis, 14,367*l.*; and Mr. James Holme, 15,120*l.* The jury found for the claimants, 18,500*l.* compensation.

EXCAVATIONS IN SANDAY, ORKNEY.—Mr. Farrar has discovered an ancient building apparently of the "brough" order, at the Brough of Gurness, in the island of Sanday. The mound is 63 ft. in diameter and 12 ft. in height. The building has been 32 ft. in diameter, and there is a space of 12 ft. between an inner and an outer wall, thus leaving a sort of area or court encircling the whole building. Outside this outer wall is another, regularly built, leaving a space of 3½ ft., which is filled with loose stones. Mr. Farrar thinks the object was to strengthen the original wall. On the south-east side of the mound there is a passage 12 ft. long by 3 ft. high and 21 in. wide, covered with large stones set on edge. This passage communicates with a large oblong chamber in the centre of the mound. This chamber is 11 ft. 10 in. long, 4 ft. 5 in. wide, and 12 ft. 6 in. deep. Within the wall on the north-west side are two kists of a semicircular shape, 19 in. wide at the entrance, and 6 ft. high inside, and 5 ft. respectively. They contained no bones. On the right of the entrance passage there is a kist 20 in. wide and 6 ft. high, and on the left another probably of the same dimensions but not yet cleared out. Both of these kists contained skulls and a few other human bones. There were also other human remains found in course of the excavations. Mr. Farrar says, "it would be difficult to determine positively whether the mound was, in its original state, a burial-place. It may have been a brough, and the space between the inner and outer walls—which I suppose to have been an open area—may have been a mass of rude walling constructed with the view of supporting the building in which the graves are found. Further excavations can alone settle this point."

LAYING ON FRESH AIR.—A Mr. Thomas has a scheme by which he proposes to revivify London by means of fresh-country air, conveyed in pipes, cooled by passing through tunnels and ice houses! Nature would do this for us, if we would but let her.

TIN-LINED LEAD WATER-PIPES.—Experiments have been made at New York with these pipes, and the pipes, as well as the experiments, are thus described in the *Journal of the Franklin Institute*:—"A solid cylinder of tin, weighing, say, 15 pounds, is bored of a certain diameter. It is then placed in a larger cylinder, having poured around it melted lead. A powerful hydraulic press forces it through a gauge, just as in wire drawing, a steel rod forming, as it were, the core. The line of contact of the lead and tin is clearly defined, and the pipe is a very perfect one. The following are the results of some of the experiments.—An ordinary leaden pipe, 1 in. interior diameter, and weighing 4 pounds 11 ounces per foot, burst at pressure of 1,000 pounds on gauge. A tin-coated pipe, of like capacity, but weighing only 2 pounds 6 ounces per foot, required 1,150 pounds to burst it. A ¾-in. lead pipe, weighing 3 and 8-10ths of a pound per foot, required a pressure of 1,200 pounds before bursting. A tin-coated pipe of the same calibre brought the dynamometer up to 1,275 before bursting. This last weighed only 1 and 12-100ths pounds per foot. About the same ratio was kept up with other sizes experimented upon, showing a great saving in weight, with a commensurate gain in strength."

For stabling and alterations to the White Lion, Corn-street, St. Luke's, for Mr. Gardner. Mr. James Schofield, architect:—

PIGGOTT, BROTHERS, No. 59, Bishopsgate Without, London, E.

The Builder.

VOL. XXV.—No. 1282.

The Inquiry, in connexion with the Paris Exhibition, into the Condition of the People of different Countries.

LONG with the setting-forth materials from every source, machines and tools of various applications, and products of each kind, including works of fine art, it was an object with the promoters of the Universal Exhibition of 1867 to place in relief institutions that might be found tending to ameliorate the physical and moral welfare of the people in different countries. With that view was constituted the "Tenth Group" of the Exhibition, having relation with all the other

Groups so far as signaling things that might be more especially of the useful sort, and summing-up the economic aspect of the entire agglomeration of works and specimens displayed. The best means of educating men, and of feeding, clothing, housing, and supplying them with work, were to be exemplified, following out the idea attempted to be set forth in 1855. It is the same idea as that upon which Mr. Twining has founded his Economic Museum at Twickenham; and probably it owes much, as did the feature of the Exhibition of 1855, to Mr. Twining's initiation.

The Group was divided into seven Classes, numbered 89 to 95, inclusive, in the general collection. The first of these (89) comprised appliances and methods of the education of children; Class 90, hooks and other appliances for the education of adults, in the family, the worksop, the *commune*, or the corporation; Class 91, furniture, clothing, and food, of every kind, distinguished by the useful qualities as well as cheapness; Class 92, specimens of the popular costumes of different countries; class 93, specimens of habitations characterised by cheapness, conjoined with the conditions of health and comfortableness; Class 94, products of every kind of handicraft by superior workmen; and the last class of the seven, tools and processes of work specially appertaining to craftsmen of the kind referred to in the description of Class 94. The Group was intended to occupy a sector of the plan of the building, like each one of the nations, instead of a circular gallery, like each of the nine other Groups.

Originally, the *bureaux* of the seven Classes were formed into a central committee. It included the names of M. Conti (as president), who is the secretary and *Chef du Cabinet* of the Emperor, and is president of Class 93; of L. Charles Robert, General Secretary of the

Ministry of Public Instruction, and president of Class 90; of the Baron Séguier, president of Class 95; and twenty-four others, presidents, vice-presidents, or secretaries of Classes. The secretary to the union of *bureaux*, or to the Group, is M. Guyot de Montpayroux, the secretary of Class 89.

It was soon felt that the objects to be attained rendered necessary an inquiry not hounded by the Exhibition itself. Therefore, in January, 1866, an appeal was addressed to the committees of the Départements of France; and in the following April, this was followed by a circular with questions to be answered. The result has been the collection of more than a hundred papers of particulars concerning the working-classes of France, and their relations with their employers. From foreign countries, by the help of their commissions, eighty different documents were collected. The possession of the materials suggested the preparation of an Analytical Catalogue. Five members of the united *bureaux* were named as a commission for examination of the documents, and the compilation of the volume. The names were those of MM. Conti, Léon Donnat, Fr. Ducuing, Guyot de Montpayroux, and Charles Robert; and there were also five secretaries of the commission, viz., MM. Chamberet, Compaignon de Marchéville, Léon Morillot, Sazerac de Forge, and Sudre. Proposals were soon addressed to them by foreign publishers; and editions of the catalogue are likely to appear in London and Frankfort. Since the French edition went to press, a great number of new reports have been sent to the Commission: some of these it is proposed to take notice of in a future edition.

A copy of the first French edition of this catalogue is now before us.* The object of the publication is defined to be, in pointing out examples, the giving the desire to imitate them; secondly, the inducing the working classes to seek amelioration of their lot in wise measures, and not cloudy theories; and, lastly, and especially, the inspiring competent men with the ardent desire of sounding those problems of which the solution is of so much importance to modern society. Following the appeal that we have referred to, or on the 7th of June, 1866, was promulgated the decree that has been so much commented on in the English press, establishing "a new order of awards," or "in favour of persons, establishments, or localities that, by an organization or some special institutions, have developed entire harmony between those co-operating in the same labours, and have assured to the workmen, material, moral, and intellectual well-being." A jury to award these distinctions was constituted on the 30th of November.

The manner in which the aims of those who established the Group, and promoted the inquiry, were met in this country, was such that not nine pages of the catalogue are devoted to the United Kingdom. These give just nine designations of trading-concerns, or institutions of the co-operative kind, with particulars summarized under the prescribed heads of inquiry. But even those few pages are marked by errors, which it becomes the Commission to explain the origin of, as well as to correct: for, their tendency must be to discredit the volume with English readers,—a volume that, we really believe, contains matter of extraordinary value, and points the way to more. Let us give instances of the blundering to which we have referred; and which, we may say, seems to us unparalleled in any public document. Under the head "Rochdale District: *Conté de Lancastre*," we get some particulars

* "Exposition Universelle de 1867. L'Enquête du Dixième Groupe: Catalogue Analytique des Documents, Mémoires et Rapports exposés hors Classe dans le dixième Groupe, et relatifs aux Institutions Publiques et Privées créées par l'Etat, les Départements, les Communes, et les Particuliers pour Améliorer la Condition Physique et Morale de la Population. Paris: E. Dentu, Libraire-Éditeur de la Commission Impériale, Palais-Royal, 17 et 19, Galerie d'Orléans. 1867." 8vo., pp. 283.

of a co-operative store, ("*Société co-opérative de consommation*,") founded, as we read, in "1850," by members of the Rochdale Pioneers. We learn that "*subventions*" are given, by the *Société*, to certain institutions, including, besides a certain "*Hospice de la Charité*," an "*Imprimerie royale de Manchester*." Now it is possible there is in Rochdale an almshouse with a name to be freely translated by "*la Charité*," but what is the Royal Printing-house of Manchester? We know the latter town pretty well, and never heard of any printing-establishment of the importance indicated by "*Imprimerie Royale*." Can it be that the English words were "*Royal Infirmary of Manchester*?" But this would not be the worst of the blunders in the volume. On the page opposite the one last referred to, are particulars of the Rochdale Equitable Pioneers ("*Association des Pionniers de Rochdale*." For "*Pioneers*," in the English title, we get "*Pionniers*," but we never knew French printer, or his "*reader*," who could spell an English name correctly, even with type-copy before him, so will not expect M. Ch. Lahure to be better than others, the printer of the *Moniteur* included. So let us look at what is stated as to the foundation of the Rochdale Society. After the words "*Conté de Lancastre*," this is what immediately follows,—"*Fondé en 1844 par 28 à 30 ouvriers tisserands*;" but, then, next, in a separate line, we have "*Fondé en 1863 par M. Alderman et Sheriff Waterlow*." Whether the now-knighted gentleman's family-name would be, to the French reader, something compounded with "*Sheriff*," we need not trouble about; but we pity the inquirer who is left, as to the date of foundation and authorship of the institution, to his speculations from two different statements, or one of them erroneous. After what refers to the Rochdale Society, we get a heading "*Société des Cités Ouvrières*," which institution, according to the next line, was "*Fondée en 1863, par M. Waterlow, à Halifax*." Perhaps this should have had some relation with the particulars given under a different heading, that of "*James Akroyd et Fils*."

The other designations of establishments or institutions, representing all the efforts for the amelioration of the physical and moral condition of the people of the United Kingdom, are "*Thomas Adams et Cie*," of Nottingham; "*John Hare et Cie*," of Bristol; "*Bliss (William) et Fils*," of Chipping Norton; "*Sailors' Homes, de Cork*;" and "*Sailors' Homes de Dublin*," whilst in some of the statements appended to these, evidence of bad "reading" for the press is apparent to an English eye.

We happen to know, in the case of one important institution, the "Working Men's Club and Institute Union," that no communication relating to the inquiry ever reached the secretary, and that consequently the particulars which would have been sent were not sent; and this may be taken to represent the facts generally, connected with the representation of the social movement in this country. For such omissions there may have been some excuse. But is it too much to ask of French compilers and printers greater care than they exhibit in dealing with English names? For the *Builder* we can say, we never print a foreign name without careful examination of every letter of it; but French editors and printers habitually give English names any way but the right, and often print the same name spelt in different ways in the same column. Where these particular defects do not occur, there are others, to the eye of the English printer, as in the want of the precise distinction that is usual in English printers' work, between quoted words and others, and in the use of the comma to mark decimals, instead of the point generally adopted in England. We proceed, however, to the examination of what forms the bulk of the "Catalogue," or what relates to France; for, the whole of the foreign

inquiry occupies only seventy-five pages, as appendix.

To complete the particulars, as far as possible, for France, certain institutions under the control of the Government were included, though no comparison of their results and those of other institutions was offered. The inquiry thus embraced institutions of every kind, in France, established with the aim of ameliorating the condition of the class devoted to manual labour, and a certain number of foreign institutions. These were classed, at least in France, into,—1. Institutions connected with popular education, providence, and charity, due to the intervention of the public authority, and of associations not industrial; and, 2. Institutions created by the initiative of heads of establishments and the workmen. The particulars under the two heads are introduced by a "Notice Préliminaire," in two sections.

With the institutions in the first section are included those attached to the observance of religion. The religious, or sectarian, question has been so much a difficulty in the way of education in England, that it may be well to quote the opening sentence. This runs:—

"The Government provides in the widest measure for the wants of the recognised forms of worship. Catholics, Protestants, Israelites, find in the resources of the budget, means of receiving, according to their consciences, the religious aid necessary to them. The service of the different forms of worship represents an annual expense of 48 millions incurred by the State."

That is to say, an amount equal to 1,920,000*l.* This, of course, is a mere contribution to the large funds accruing from private sources. In the small *communes*, often short of means, the Government has created more than 2,000 parishes in fifteen years.

Next to the support of public worship are placed education, and the parish-roads. The desire to augment, at the same time, the value of the products, and that of the man who cultivates the soil, had been expressed throughout the reports of the inquiry, of somewhat antecedent date, into the agricultural condition of France. The improvement of the roads has within the last fortnight been the subject of important measures initiated by the Emperor.

What relates to education, or instruction, in the "Notice," includes the assertion that it guarantees the exercise of rights and political liberties. In the present position of this country it may be not amiss to quote the words, often referred to, of the Emperor, and quoted in the pages before us, that "In the country of universal suffrage, every citizen ought to know how to read and write." It is due to the Emperor to state that he has repeatedly expressed similar views as to the importance and urgency of education; albeit something is left to be done in France ere education will be rendered obligatory and made entirely free of cost; which is the position that has been contended for by some of the chief publicists. What is, relatively, in an advanced state in France, as compared with primary education in that country, or with the ordinary middle-class education in this country, is the secondary and collegiate education, as well as the technical education; of which last so much has been said of late, and not a word too much. This superior education is obtainable by people of almost every social position, or at very moderate cost; and the result is the existence of middle-class educational attainments possessed by people of a lower class socially than the English middle-class, that is to say by many handicraftsmen, and a corresponding dissemination of the higher university-education over a larger proportion than with us of the class below the aristocracy.

The great business of education is not limited to the work of the ministerial department that is specially charged with public instruction and public worship. The Ministry of War provides regimental schools, and even makes instruction therein obligatory. The Ministry of Marine gives primary and professional instruction, in schools of eight different kinds, to those destined for the navy, to the junior officers, and others, as well as to engine-men and stokers. The Ministry of Agriculture, Commerce, and Public Works apportions wholly, or in part, three schools of agriculture, forty-eight school-farms, three schools of "Arts et Métiers," and other technical schools,—besides that there are some about being formed,—in addition to what may be the result of the labours of the mixed commission appointed, in connexion with the Ministry of Public Instruction, specially with a view to agriculture. Then, as connected with industrial matters, the compiler of the "Notice" thinks

fit to mention the *Conservatoire des Arts et Métiers* and the *École Centrale des Arts et Manufactures*; but he really might have gone further, and included many institutions, such as the schools for miners, and a school for horology, besides the *École des Ponts et Chaussées*, and the *École Polytechnique*.

The work of general popular education is divided, as will have been understood, into two branches, or what are here called "Enseignement primaire" and "Enseignement secondaire spécial." A law bearing upon the former has been passed this year; and one relating to the latter is dated 21st June, 1865. The secondary instruction of the special character, in the words of the statement before us, will form the *sub-officers* of industry, and will powerfully serve also the interests of agriculture. In this instruction, living languages are to be substituted for Latin and Greek (for, the same error has been made in France as here; where the classics, and not always well taught, have been almost exclusively considered); and the applications of the sciences are to be set forth. As regards primary instruction, there was a law, of 1833, which is called one of the best vestiges of the Government that made it. But it forgot girls' schools; and financial conditions were left, involving restrictions in its application.

Considerable progress has been made under the Empire. In 1862, the rate of remuneration of teachers was increased. Lately, evening classes for the instruction of adults have been highly successful. Near upon 10,000 primary schools have been opened since 1847; whilst the result of the new law will be the opening of 11,000 more such schools; of which number 8,000 will be for girls. Of educational libraries, intended for the same persons as those forming the classes of adults, there are now about 8,000. These seem to date from 1862. They lend, every year, 500,000 volumes. Perhaps it is in the number of the libraries, rather than in that of the volumes lent, that the greatest contrast with England should be taken note of. Agricultural and horticultural instruction in the country districts, and instruction in drawing in the towns, and everywhere the extension of singing and musical classes; the complete dissemination of knowledge of the laws of health; and the development of gymnastic exercises: such are the points to which the attention of the Government is now particularly directed. To instruct the peasant, and to make him content with the village, is stated to be the double object that the Government pursues. To the school to which payment is ordinarily required, free admission is given to those who are on the lists of the *bureau de bienfaisance*; whilst, moreover, should the family be able to support the cost of education only by painful privations, the *commune*, if needy, is to draw from the national exchequer. Including 3,572 infants' schools with those of the boys and girls, there are now 73,271 schools, giving instruction to 4,850,000 scholars, of whom nearly two millions have been admitted gratuitously. The attendance is 3,500,000 scholars more than in 1829, and 1,300,000 more than in 1847. The ordinary service of public instruction in France, including subventions for construction of schools, cost in 1865, 58 millions of francs (2,320,000*l.*); of which, however, we may suppose that the larger portion either was returned directly, or in some other manner did not come into the accounts; since the total charge to the State is put down at only 6,800,000 francs. The new law will, however, increase this latter sum by seven or eight millions.

Besides the State, many private societies and religious associations are engaged in the work of education, including what is "technical." The pages immediately before us mention only some few of them. Thus there are the "Institut des frères des écoles chrétiennes" and like institutions, and others, similar, in which women are the gratuitous ministrants: there is a society for primary instruction amongst the Protestants; and there are other societies devoted to education of adults, as well as children, in different localities. To teach reading is insufficient: it is necessary to cast-abroad books. This is perceived in France, and is the object pursued in Paris by the "Société Franklin," the "Société pour l'amélioration et l'encouragement des publications populaires," and the "Société des livres utiles" recently founded; to which last the Emperor has advanced a sum equal to 1,600*l.*, and which commences by drawing from English literature,—characterized in the "Notice" as rich in popular moral and instructive works at low

price. Similar institutions to these of Paris exist in several of the Départements. Technical education, or apprenticeship given in school, is fostered, so far as it emanates spontaneously from associations, private individuals, or *communes*, by the Ecole Lamartinière of Lyons, by different institutions at Mulhouse, by the establishment of Saint-Nicolas of the *Frères des Écoles chrétiennes*, and by the Asile Fénelon, and also, for women, by the institution of the Notre-Dame-des-Arts, and the schools in the Rue de Turanne and the Rue Rochechouart at Paris. There is a school for apprentices at Nancy; one is about being opened at Tours; and the Jews have a School of "Arts et Métiers" at Strasbourg.

Having recapitulated works of the State, and of private associations, in connexion with objects religious and educational, and of which the statutes or regulations are placed in the Tenth Group, the "Notice" here adds something as to the efforts in the two directions named, made by the heads of industrial concerns,—these last however being more especially the subject of the second section. At Creusot, Blanz, Wesseling, Munster, Mulhouse, and many other places, profits of industry are employed largely, and in a spirit of tolerance, in the construction of churches and other places of worship, and at great expense. And, from north to south, from east to west, according to our authority, it is by the school that the master, or "patron," endeavours to attach to his manufactory phalanxes of intelligent and well-behaved workmen. Evening-classes are founded, as at Guebwiller, Mulhouse, and the *ateliers* of the Orleans company, or work-rooms (*ouvroirs*) as by the company of Saint-Gobain at Ghauny. Generally, the expense is defrayed by the heads of the establishments; but sometimes, as at the coal-mines of Decazeville, the mutual-aid fund of the workmen provides for the support of the schools; thus putting, as is well observed, "the malady of ignorance with the number of miseries that it feels bound to relieve." At one place, La Grand Combe, the workmen's fund has lent to the company 100,000 francs (4,000*l.*) for the construction of schools. In some schools payment is made: in others, the instruction is gratuitous. Some manufacturers leave the workman free to send his children to school; but many others, especially in the eastern part of France, have considered themselves as fulfilling a duty, and at the same time making a clever calculation, in declaring the attendance at school obligatory for those who would ultimately replace their fathers. To the primary education, and that connected with the manufacture, a great number of the heads of establishments have joined singing and music. Or as the volume before us says:—

"... they have comprehended that man has need of the enjoyments of art, and that the sentiment of the beautiful is for the workman who has within him the noblest relaxation: they have also founded, nearly everywhere, libraries to combat the influence of the public-house (*cabaret*), and to group in the evening-time the whole of a family around a good book. It is to be desired that in forming co-operative societies, workmen attach to them of their own accord useful institutions of this kind. Examples already numerous prove that they themselves feel the need of these institutions: it is often on their demand, and at their expense, that the friendly-society, the school, the library, and the music-class have been established."

As regards the provident and charitable institutions, the principal contributor to the Tenth Group is the Emperor. He exhibits specimens of habitations, in the Class 93; but the catalogue sets forth other matters due to his initiative, and that of the Empress. According to the "Notice," the Imperial Government has been pursuing for fifteen years the work of reconciliation of classes and protection of the feeble. The principle maintained is that when the action of individual citizens is not sufficiently energetic, it is for the Government to intervene, in setting example, and, if need be, by direct assistance.

Therefore the Imperial Government has not limited itself to the development and encouragement of institutions existing, such as savings-banks, relief-offices, hospitals and alms-houses, orphanages, nursing-establishments, and the establishments for the insane, the blind, and the deaf and dumb. It has propagated, with particular care, the mutual-aid societies, which by the law or decree of 1852 were to be established in all the *communes*: thus there are now 6,000 of these societies, counting near a million members, and possessing forty millions of francs. By a decree of 1855 were created the refuges of Vincennes and Vésinet, for convalescents (workmen and workwomen) of Paris. In 1864, there

was the law on coalitions, said to have "consecrated the principle of the liberty of labour." A year ago was set on foot a system of annuities for workmen invalided, or permanently incapacitated. At the same time the subjects of public health, and decent, comfortable, and economic lodging, were being pursued. In 1849, had been erected the first *Cité Ouvrière* of Paris. In 1850, a law was enacted relating to insalubrious dwellings. Two years later ten millions of *francs* (400,000*l.*) were placed to the account of amelioration of workmen's dwellings in the great manufacturing-towns. Subventions were accorded to companies having the same object, in particular 300,000 *francs* to the "*Société des Cités Ouvrières*" of Mulhouse. A model-house containing eighty-five furnished lodgings for unmarried workmen was built in 1866, near the *Asile de Vincennes*, on ground given by the Emperor; and his Majesty has quite recently erected a large structure, near the *Champ de Mars*, for workmen's families. Baths and public wash-houses, a loan-society for assisting the purchase of tools, a society for the saving of life at sea, great agricultural works like those of the Landes and in Sologne, and redemption of honra of work for children, are amongst the other measures of various kinds undertaken or commenced.

Example has been fertile of imitation on all sides. The beads of manufacturing establishments have recourse especially to friendly societies, deposit-banks, gratuitous advances, and annuities, to ensure themselves devoted fellow-labourers. Whilst public institutions have been founded, the Emperor has not ceased to stimulate the emulation of these heads of establishments, and to encourage the initiative of citizens. His words, in 1863, to the exhibitors returned from London, testify to his feeling that the Government should be relieved from being "the sole promoter of the vital forces of a nation."

The movement resulting from the initiative has already exercised an important influence upon the condition of the working-classes in France. This is shown in the following chapter, relating to institutions created by masters and workmen, and in the particulars which occupy the chief portion of the catalogue.

SOUTHAMPTON versus SALISBURY.

No more satisfactory evidence of a growing interest in sanitary matters, and of a fuller appreciation of the importance of the public health, need be wished for than the controversies which are now, from time to time, appearing in the columns of our leading newspapers, as to the rival claims of various towns to be enjoying the lowest death-rates. Although it is to be regretted that into such controversies are too often introduced certain amount of personality, and a needless waste to throw discredit upon rival claimants, accompanied at times by inaccuracies and somewhat random assertions, it must be remembered that this over-zeal is in a good cause. Besides drawing public attention to the effect of sanitary activity in certain towns, it is to be hoped that others will, from time to time, enter the lists, and strive long and earnestly to obtain that enviable, and we are thankful to find, now much coveted position of "the healthiest town."

Not the least important of the controversies to which we have above alluded, is that between Mr. A. B. Middleton, of the Close, Salisbury, and Dr. MacCormack, the medical officer of health for Southampton. It has resulted in a correspondence which has found its way into local papers; into the *Lancet*; and last, but not least, into the columns of the *Times* itself. As is well known our interest in the health of towns is cosmopolitan, but it so happens that we have devoted considerable attention to the sanitary state of Southampton. In the *Builder* for May 26, 1866, too, a column or two were devoted to the condition of that town, incident upon the recent appointment of Dr. MacCormack, and upon its unsatisfactory sanitary condition, as evidenced by an outbreak of cholera in the autumn of 1865, and by a severe epidemic of scarlatina which prevailed throughout the winter of 1865-6. We take the present opportunity, therefore, of reviewing the result of Dr. MacCormack's labours as shown in the rate of mortality which has prevailed since his appointment to the present time, and intend also to say a word or two about Salisbury. If we cannot satisfy the rival claimants for the palm of health, we may at least succeed in convincing our readers that

the moot point is rather a nice one, and that both towns fully deserve to be at the present time held up as models of sanitary progress, and to receive the congratulations of all other town populations.

The borough of Southampton, which in 1851 contained an enumerated population of 35,305, had increased to 46,960 by the census of 1861: assuming that the same rate of increase has prevailed since 1861, the population at the middle of this year is estimated at 56,170. During the ten years 1851-60 the average annual death-rate in the borough was 24.4 per 1,000. During the first three years of the present decennial the town was remarkably healthy, the rate being in 1861, 19.7; in 1862, 20.0; and in 1863, 19.8; but in 1864 and 1865 it rose successively to 23.6 and 24.9. In the autumn of 1865 there was a slight visitation of cholera, and about that time Mr. Francis Cooper, who had been for many years medical officer of health for the town, died; and it is believed that his death was hastened by anxiety and hard work in connexion with the epidemic. Dr. MacCormack, his successor, was not appointed till March, 1866. In the first quarter of that year, when the epidemic of scarlatina had scarcely subsided, the mortality was at the annual rate of 27.9 per 1,000; in the June quarter it fell to 21.2. In the third quarter, however, there was another visitation of cholera far more severe than in 1865, and the death-rate became 27.7 per 1,000; during the last three months of the year the town was again healthy, and the rate fell to 18.3. The average annual rate for the year 1866, in spite of the cholera, did not, therefore, exceed 23.8 per 1,000. Since the beginning of the present year the improvement in the health of Southampton has advanced with rapid strides. In the March quarter the death-rate was only 17.2, and in the three months ending 30th June had fallen so low as 15.0. In the nine months ending 30th June the rate, therefore, averaged only 16.8, and if the returns for the remaining weeks of the current quarter continue as satisfactory as they have been since the beginning of July, Southampton will have enjoyed a year of unexampled health. Before passing on to consider Salisbury's case, a word or two upon the causes of death in Southampton last year. All the previous rates have been calculated for the borough proper, but as the Portsmouth tything, containing in 1861 a population of 3,546 persons, although within the borough is not situated within the registration district of Southampton, the figures relating to the causes of death will refer to the district only. Of the 1,178 deaths there registered in 1866, 335, or 28.4 per cent, were referred to diseases of the zymotic order—small-pox. Cholera, which in 1865 had only caused 21 deaths, was fatal in 106 cases in 1866; 18 were also the result of dysentery, and 41 of diarrhoea; the latter number showed a considerable decrease upon the two previous years, when the figures were 64 and 79. The fatal cases of scarlatina fell from 172 in 1865 to 46 last year; those of typhus from 52 to 27; measles and whooping-cough in 1866 caused respectively 39 and 35 deaths; and not a single death from small-pox occurred. Though the efforts of the medical officer were futile to prevent the mortality from cholera, we feel satisfied as a result of Dr. MacCormack's labours with the reduced death-rate of the past nine months, alluded to above, and with the fact that the mortality from typhus in 1866 was only just above half what it was in 1865. If the present satisfactory condition of health continue in Southampton, its inhabitants may fairly expect to have seen the last of cholera as an epidemic, and can at any rate assure themselves that a low death-rate and an immunity from ordinary zymotic diseases afford the only reliable guarantee against such visitations. It may be as well to allude to the birth-rate in Southampton, as corroborative of the assumed increase of population since the census of 1861. The births registered in the district have, with very slight fluctuations, risen from 1,572 in 1861 to 1,690 in 1866, averaging 1,613 in those six years against 1,470 in the ten years 1851-60. The birth-rate to 1,000 persons living during the year 1866 was 34.4, or 2.5 below the average rate in the thirteen other large towns of the United Kingdom furnishing weekly returns.

The municipal borough of Salisbury, according to the census of 1861, contained a population of 12,278 persons. As is the case in Southampton, however, the registration district of Salisbury does not include the entire borough, but only the parishes of St. Edmund and St. Thomas, and the municipal portion of St. Martin's; these con-

tained at the census 9,039 persons. The remainder of the borough, namely, the liberty of the Close, 602 persons, part of Fisherton Anger parish, 2,334, and part of Milford parish, 303 persons, form part of the registration district of Alderbury, and the births and deaths there recorded are included in the returns from that district. As Salisbury is not one of the towns furnishing weekly returns to the Registrar-General, the figures for the whole borough are not available, as in Southampton; and in the following remarks we must entirely confine our facts and calculations to the district of Salisbury. Between 1841 and 1861, the population of the district declined from 9,430 to 8,930, but had increased again by the census of 1861 to 9,031; it was still, however, between 400 and 500 below the population of 1841. Bearing this in mind, it has been assumed, in calculating the following rates, that the population of Salisbury has been stationary since 1861, and this estimate is strengthened by the fact that the births registered in the six years 1861-6 have only averaged 28.3, against 28.7 in the ten years 1851-60. Moreover, the birth-rate per 1,000 in 1866 was only 29.5, a low rate even for rural districts, and a sufficient argument against the probability of any under-estimate of population. During the ten years 1841-50, the average annual death-rate in Salisbury was 28 per 1,000, and this fell to 24 per 1,000 during the next decennial 1851-60. In the five years 1861-5, the rate was respectively 18.0, 26.6, 17.6, 22.5, and 23.1, and last year it fell again to 19.6; therefore, in the six years ending 1866, it has averaged only 21.2 per 1,000, a still further considerable reduction upon the improved rate prevailing in the previous ten years. In the year 1866, of 177 deaths in Salisbury only 16, or 9 per cent, were referred to all diseases of the zymotic class, and but 60 or 34 per cent, occurred among children under five years of age. In Southampton 28 per cent of the deaths were from zymotic causes, and 38 per cent of infants under five years. The first two quarters of this year were unusually healthy throughout the country, and Salisbury enjoyed its full share of benefit therefrom, as the annual death-rate per 1,000 in the first quarter was only 21.1, and in the three months ending 30th June fell to 14.6, making the average rate in the nine months ending that date 18.5. All these rates, let it be remembered, are calculated on the enumerated population of Salisbury district in 1861, which is assumed to have remained stationary.

Publicity having been given to the present satisfactory condition of the health of both Southampton and Salisbury, we should be inclined to rest satisfied; but the question has been raised, and warmly disputed, too, as to which is the healthiest, and as we have thoroughly investigated the subject, we may be entitled to express an opinion thereon. There is such an infinity of matters to be taken into consideration in comparing the death-rates of towns opposed to each other in character so widely as the two in question, that it will be better, in the first place, to compare the actual death-rates, to 1,000 persons living, in a series of years, without any qualification whatever. In the decennial 1851-60 the mortality averaged 24 in the districts both of Southampton and Salisbury. In the six years 1861-6, the rate has been 22.4 in Southampton (including two cholera epidemics), and 21.2 in Salisbury. In the first two quarters of this year the rate in the borough of Southampton (we prefer to use the municipal boundaries of towns when practicable), the rate has been 17.2 and 15.0, against 21.1 and 14.6 in Salisbury. Taking the nine months ending the 30th of June last, the advantage appears still stronger on the side of Southampton with 16.8, against 16.5 in Salisbury. Although, therefore, Salisbury has rather the best of it in the actual rate for last quarter, which, we believe, first gave rise to the controversy, by taking the whole nine months Southampton would appear to have been the healthiest. Without for one moment wishing to detract from the merit due to Salisbury, which has reduced its mortality from 28 per 1,000 in the ten years 1841-50, to 19.6 last year, and 17.9 in the first half of this year, we cannot but come to the conclusion that the present low death-rate in Southampton is still more remarkable. Seaport towns invariably labour under many disadvantages, sanitarily speaking; they contain a considerable population of the seafaring and fishing type, to whom cleanliness of person and home is unusual, and difficult to enforce, and among whom a greater amount of poverty and distress at times prevails than in

any other class. Such towns, moreover, are more directly liable to infection from cholera or other epidemics from in-coming vessels; and a not inconsiderable number of persons arriving off long voyages only live to land, whose deaths appear against the towns in which they die. There are also one or two considerations which bear specially upon Southampton and Salisbury. The density of the two districts does not so materially differ, being twenty-nine persons to an acre in the district of Southampton, and twenty to an acre in Salisbury; but the advantages of a town with a stationary or slightly-decreasing population, like Salisbury, are very great compared with a town in which a rapid rate of increase prevails, as in Southampton, where those vital questions of providing proper house accommodation and preventing over-crowding come prominently before the health officers. The apparently inevitable mortality which prevails among infants during the first few months of their existence renders it, moreover, necessary to make some allowance for the difference between the birth-rates, 34.4 per 1,000 in Southampton, and 29.5 in Salisbury.

In conclusion, we would venture to offer a few suggestions which may prove useful to those anxious to test the rate of mortality prevailing in their towns or parishes. Having ascertained the number of deaths for any given period, the only difficulty likely to arise is in finding the correct population to apply to these deaths. In large towns, where the rate of increase of population is subject to considerable fluctuation from a rise or fall in the prosperity of any staple trade, or any special commercial convulsion, the necessity for a quinquennial instead of a decennial census is often felt, in order satisfactorily to estimate the population towards the end of the interval of ten years; but in ordinary town or country districts it has been found sufficiently correct, where a given rate of increase has prevailed between one census and another, to assume that the same rate will continue during the next ten years. To raise the population of any place to the middle of the present year, it would therefore now be necessary to add to the enumerated population in 1861 six and a quarter times the annual rate of increase between 1851 and 1861: so much for the population. Rates for comparison should be given in as uniform a manner as possible; experience has proved that annual rates are most instructive, and that it is most convenient to calculate them to 1,000 persons living. It would be, moreover, useful, and often prevent misunderstandings, if in all public statements as to rates of mortality, the population (estimated or otherwise), upon which they have been based were given. It is more than probable that a very large portion of the difference between the rates for Southampton and Salisbury, as calculated by their rival advocates, might be explained by the use of differently estimated populations. Not very long ago the mayor of a considerable town in the East of England made a most startling announcement in the *Times* as to the mortality in his town. On investigation it was discovered that he had taken the deaths for one quarter, and, applying them to the population, had published the rate in the quarter as an annual rate. Except that the method of handling such figures is now becoming so much better understood, we should have warned those making such attempts for the first time that, if the deaths obtained are for any portion of a year, either the deaths must be raised up to a year, or the years of life exposed to risk must be reduced to agree with the period over which the deaths extend.

Leamington has already entered its claim, which is apparently well founded, to rank with Southampton and Salisbury; and we hope other towns will lose no time in at any rate ascertaining their death-rate, and we shall always feel great satisfaction in acknowledging the attainment in any towns of the success achieved by Southampton and Salisbury in the prosecution of their sanitary improvement.

SINKING OF CLAY CROSS TUNNEL.—The arch of this well-known tunnel has sunk, and is now being repaired and strengthened, and the traffic is now carried on by one track. It is feared that unless great skill be brought to bear in repairing the arch the whole of the traffic through the tunnel will have to be stopped. The giving way of the arch is attributed to the extensive getting of coal and ironstone in the immediate neighbourhood of the tunnel.

DEVELOPMENT v. CRITICISM.

It is amongst the anomalies of art in its historical manifestation that the theory of its scope and practice should so frequently be most satisfactorily understood and expounded in periods when the production of works of art in the highest sense is little better than extinct. Criticism would almost appear never to flourish so luxuriantly as when it succeeds to the ground that an age rather of instinct than intelligence once occupied with a luxuriance of beauty that reached its acme only to forfeit the faculty of reproduction. The exchange seems hardly acceptable; the law of progress that our hopes cling to appears to be reversed. The botanical sequence that we are told of, in which pines have regularly supplanted ferns, and beech succeeded to pines, until the richer oak forests again pushed out the beech, or took up the districts that their exhausted forces seemed to leave desolate, but really had enriched by their decaying trunks: this is a development that warms and interests, but creative power—the poetry of art—seems ill forfeited, for even the highest critical acuteness. If the song of the nightingale is to be even jeopardised, not to say lost for ever, we would rather dispense with the best demonstration of the anatomy of its larynx. And it is not alone that just criticism is so often dissociated in period with creative power as almost to seem to exclude it naturally, but it appears as provokingly, not to say perplexingly, compatible with any amount of miscreation. The production of bad works of art is often most rife at a period when the best are for the first time, or after long neglect, attaining, if not their highest appreciation, certainly their most intelligent. The age of the great Greek tragedians had gone by when Aristotle expounded the theory of their art, as absolutely as free self-government was obsolete in the Grecian societies and cities when he laid the foundation of the philosophy of politics and made a collection of their constitutions. Whatever may be the date of the work of Vitruvius, the architect that he at least did his hearty best to expound had already had his highest triumphs, and was doomed to fall before whatever innovating system might prove most vigorous.

Shall we say, then, that critical acumen and theory exert a noxious influence upon creative genius, and positively check it and choke it? Is the artist wise who declines to combine intellectual study with imaginative enthusiasm? Are we prepared to give up as fallacious all the intimations in the greatest achievements of poetry and poetic art, of studied and revised adaptations, of conscious arrangement and purpose? The statements of these questions involve their answers, and go far to solve whatever there may be of enigmatical in the case. A critic is scarcely a critic, and cannot be a fine one who is not somewhat,—nay, no little,—of an artist; and an artist conversely has of necessity no moderate proportion of the spirit of the critic; and yet are the two,—such distinction is there due to the predominance of one or other spirit,—as wide asunder as the poles, as contrasted in their functions as are the polar operations. Nothing but a development that amounts to transformation will make these species convertible. There is one certain mode of critical acumen wherein lies the force of the critic; and logic is its ally, and definition in command of most unambiguous expression should be its handmaiden. On the other hand, for the most purely intellectual processes of the artist there is no need whatever that they should be endowed with words,—nay, none that they should reduce themselves to propositions awaiting recognition. Numerous and manifold will be the successions of his ideas that, could they be arrested, would truly admit of statement in form, and figure, and syllogism; but they are not to be followed, and are not to be retained. The conclusions they lead to are constantly caught sight of afar off, and cancelled at once, or confirmed by a sense of harmony that it is for Imagination, a fellow labourer, to minister. Imagination seizes what pertains to it of right, wherever it is found, and dispenses by loftier privilege with tracing how it came within her reach.

The critical acumen, therefore, which helps us to understand and even enhances our enjoyment of works of art is quite a different power, or a power in very different form,—allotropic, the chemists would say,—from that which assists most effectively in their production. To return to our illustration: the very best demonstration of an organism may teach us some conditions of

its health or disorders, of its action and co-operation, but will in no way enable us to make a comparable imitation of it. Criticism proper only begins to exist after the completion of the masterpieces it treats of, as the herbage must at least have been ready for the animals that can only exist by browsing it, as the air and its qualities are pre-supposed by the plumage and apparatus of flight. But if the masterpiece is antecedent to criticism, the latter in tendering assistance cannot at any rate claim to be indispensable. Study,—tenacity in thinking will do much,—many things, but a work of art may be of highest quality and yet will owe its best perfections to something besides having been, as it is called, thoroughly thought out, to something antecedent and superior to any such operation whatsoever may be its persistency and its nature.

It is no doubt true that there are great differences between even high artists in the faculty of distinctly recognizing and stating, though it be but to themselves, the principles on which they proceed; some work under a cloud of the seeming unconsciousness that gave Plato occasion to speak of poets,—in some peevishness,—as inspired idiots; and Shakespeare himself to bracket them with "Innatics and lovers," men, like the elements,—

"That know not what nor why, yet do effect Rare issues by their operance."

But effective reasoning no less than the aptitude—the reasoning power—is as absolutely there as it is in the deaf and dumb, to whom only the extravagant nominalist school of John S. Mill, if school in this matter he has, would deny it for an instant. These are the curiosities of the human mind. We have a common-place parallel in the calculating boys of whom one has been able to render an account of his processes, while others, neither more nor less prompt in their astonishing solutions, are only cognizant of an interval of concentrated pondering and its result. It is thus actually given sometimes to the critic proper to trace more justly than can the artist himself, the course of his associations, and the value that in reality decided his adoption of one epithet rather than another, of a subsidiary incident, of a principle of grouping, whether of figures in a picture, or windows in a façade.

Can we wonder, then, that some great artists have given strange reasons for what they have done well, and more wisely than they are distinctly aware of, and in the face of their own utterance; and while it is speaking trumpet-tongued to the intelligent, will weaken its force if anything could, by diverging into the far-fetched or trivially irrelevant explanation?

It is probably architecture that among all the arts demands the most nearly balanced alliance of the Reason and the Imagination, bound, as these endowments are, to co-operate, however diversely proportional, in all. There is no escape in the *ars regina*, as a late professor of architecture loved to call it, from the responsibility of diligently collecting and collating evidence most detailed, and then co-ordinating the conditions and options and opportunities of the problem in hand, to be treated after all with freedom and mastery demanding the broadest intellectual grasp. And yet, when the result shall be brought out, if it does not appeal to the sympathies with a liveliness that justifies everything, yet that tasks all the resources of scientific aesthetics to follow, and will baffle them to entirely explain, the work for all its vigour of ratiocination is inapt and feeble, and despite whatever other wealth it may be lavish of, it is nought.

A form in which many artists,—and all more or less,—embody the results of their definite reflections, their critical theory, is in maxims. There are few who have not a predilection for some favourite maxims,—and wherefore not? Some are positive and positively valuable as eternal principles, and the negative are as often as not convenient warnings laid down upon the chart, of hidden rocks that have been grazed in times gone by, or vorices that have sucked down too adventurous sailors before their sight.

In the best form, however, and most harmless cases, they are but brief expositions of characteristics of predilection, the turning-points of an individual style. The artist has yet to be born, and there is no need to be anxious for him, whose work can rise absolutely above his individuality, who shall be able truly to boast that he never repeats in one work a characteristic treatment that can betray the authorship, that bespeaks his own idiosyncrasy and not exclu-

sively that of the occasion that he is dealing with. But maxims have their abuse; and just as style may degenerate into mannerism, a set of so-called principles may receive such ill-considered development into a code as to degrade them into dead rules,—receipts for the evolution of the Becoming and the Beautiful. There is scarcely any maxim in art that can be so framed, retaining any show of usefulness, that it will bear to be stated absolutely. Absolutely, yes, if taken in tacit connexion with all that its enunciator is ever bearing in mind, but otherwise it will only degenerate into that pernicious mis-growth of criticism crossed with pedantry—a law of art.

Architecture is, perhaps, scarcely infested so unluckily with this spurious and intrusive legislation as the sister art of painting, and, still more pestilently, sculpture. The dogmatism begins with the critics; and if it only infected the constitutions of weaker artists the mischief would be slight. But it spreads to the public,—it is epidemic with patrons, and when the world has once begun to condemn beauty,—the gates of Ghiberti, the campanile of Giotto,—the choristors of Della Robbia,—the Medicean monuments of Michelangelo, as confounding the laws of the distinct arts—it is on the brink of admitting ugliness on the ground of conscientious adherence to rules at once uncompromising and all-sufficient. Admiration by book is not so disastrous as design by hook, but is too likely to tempt to it, and may become strong enough to enforce it even in important cases.

Beauty, like truth, is justified in all her children; and art, at its highest states, exhibits the problems that criticism has to solve, and declines as politely as it may—declines if it is on a level with the dignity of its calling—to accept as necessities the presumptive laws which owe their currency and sanction to herself, and are subject to her magical reversal at any moment. All great advances in the arts have been made by innovation, of which development is but a milder name; and every such change has been signalized by a wreck of criticisms and a ruin of laws that critics had deduced and inculcated,—fulminated, rather, as eternal. Here, then, we touch on the cause why an age of very excellent appreciative criticism is often an age of hot bastard style and poor invention. The eyes of the world are still fixed on perfections already achieved; its ears are full of their glorification, and the exposition of their peculiarities, even more than of their principles. Who can be surprised that imitators are eager to take the open road, and that even bolder spirits are tempted or forced to qualify their originality with concessions to a taste that, if it never can be obsolete, is, as regards its natural growth, exhausted, not to say effete. Criticism fully competent to expound the past pretence,—with pertinence, to be deprecated,—guarded against,—to legislate for the present and all time. It is too apt to set a fashion under pretence of defining taste, and cling to it with a favoritism that allows no change but an enhancement of extravagance, and, rather than admit a fault in it, will—

“Exalt each trifle, every vice adore.”

If art is to escape the catastrophe that ever awaits the elevation of even the truly admirable into a blind worship, it will be due to the resoluteness of artistic genius, that fully accomplished, indeed, with the resources of the past, shall above all be alive to the best promptings of the most daring present, and so be present of the future.

THE CARVINGS OF GRINLING GIBBONS.

In the year 1721 died Grinling Gibbons, a wonderful handicraftsman in wood, who was born of Dutch parents in Spur-alley, in the Strand. Comparatively little is known of his personal history, and the same may be said of his work, notwithstanding that it embellishes a very large number of the most celebrated public edifices and private mansions of England. In many instances, the beautiful and fragile carvings of Gibbons have suffered from the attack of larvae, or have been tampered with by the inartistic hands of Philistines, who, by plastering and painting what they could neither understand nor appreciate, have done much to ruin it for ever. Another circumstance, which may to some extent account for the ignorance that exists regarding the work of Gibbons, except among the few, is that though London possesses several

charming specimens of the master, some of the most marvellous things he ever did are scattered widely apart throughout the country—in the private mansions of the wealthy, and so are comparatively lost treasures. It is only when skillful and experienced experts in wood-carving are to be found to search out these treasures that we learn anything satisfactory (sometimes, alas! how unsatisfactory also) concerning them, and are made aware how much the arts of sculpture and carving really owe to such men as Grinling Gibbons. It is only after the investigations of Mr. W. G. Rogers and others that we learn, for instance, that the peculiar description of light interlacing scroll-work of which Gibbons was so perfect a master, and of which the most exquisite examples are to be met with in nearly all of his important works, has never been successfully attempted since his time. It originated with him and died with him. Mr. Rogers's paper under the title of “Remarks upon Grinling Gibbons,” and read at a recent meeting of the Royal Institute of British Architects, is highly important and interesting. To this gentleman we are indebted for the restoration of the valuable carvings by Gibbons at Belton House, the seat of Earl Brownlow. In 1855 these carvings were described as being in such a condition as to render it absolutely necessary that something should be done to prevent their complete destruction. They were placed in the hands of Mr. Rogers, and their restoration seems to have been an experiment. Happily it turned out completely successful, for, on recent examination, not a single live worm was found in the carvings, and, where formerly hundreds, if not thousands, had congregated. It may be as well to give the method adopted on this occasion, as we find it stated in the Report of the Commission appointed by the Committee of Council for Education to inquire into the causes of decay in wood carvings, with a view to preserving the valuable decorative examples in the South Kensington Museum. It appears, then, that the first step taken was to have the various pieces photographed, as a means of recording the position of each detail of the ornamentation, &c.

“The whole of the works were in a serious state of decay, portions being completely honey-combed by the worm. In order to destroy or prevent any future development of the insect within the wood, Mr. Rogers caused the whole to be saturated with a strong solution of corrosive sublimate (chloride of mercury) in water. The colour of the wood, however, suffered so seriously by the action of the mercury that it was found necessary to adopt some means of restoring the original tint. This was effected by ammonia in the first instance, and subsequently by a slight treatment with muriatic acid. After this the interior of the wood was injected with vegetable gum and gelatine, in order to fill up the worm-holes and strengthen the fabric of the carvings. A varnish of resin, dissolved in spirits of wine, was afterwards spread on the surface, and then the dismembered pieces were put together in conformity with the photographs taken as records, prior to the work of restoration having been commenced.”

Mr. Rogers is now investigating the Gibbons work so profusely used in the Wrennian churches of the metropolis, and also in the great halls of the various guilds, and the private houses of wealthy citizens of the seventeenth century. He hopes to extend his inquiries to Windsor Castle, Hampton Court, and St. James's Palace, and other places where there is too much reason to fear the carved treasures are rapidly falling into worm-dust. In the meantime we have a report of a number of examples of carving by Gibbons at different places already examined. Of the peculiar foliated scroll-work previously mentioned, the retables in the church of St. Nicholas, Abchurch-lane, is one of the richest in the City, and deserves to be better known.

“Large masses of festoons and pendants of fruits and flowers cover the whole width of the wall up to the cornice; this has been painted over in the same way as the carved work at St. James's, Piccadilly (another marvellous specimen). The horizontal bands on the organ in St. Paul's Cathedral are the perfection of his character of foliated scroll-work. I remember,” continues Mr. Rogers in a note, “seeing in the Church of St. Michael, Crooked-lane (since taken down to enlarge the approaches to London Bridge), two curious pieces of carved drapery by Gibbons, representing curtains hanging on a rod by rings placed on the back of the high pews as a screen; there were other and more objects of interest in the church. I have often regretted that such choice little bits have not been preserved in the City Library at Guildhall, as they are sure to be lost when they fall into private hands.”

At Cassiobury, the seat of the Countess of Essex, Mr. Rogers found room after room covered with the finest of Gibbons's work—dead game, wild flowers, scrolls, live birds in the softest plumage, masses of fruit entwined with delicate tendrils—all as pure as when the carver left them. This was more than thirty years ago. On making a second visit to Cassiobury two years since, he found “that all this charming

work had been covered over, and loaded with a thick brown paint and heavy varnish; all the delicate feathering of the birds and veining of the leafage were effaced, smothered up, and had vanished; and what repairs had been made were wrought in plaster or a composition.” Gibbons's name is frequently associated with works which he never could have seen, and which would have disgraced it: Mr. Rogers alludes to some of the great companies' halls in the City mis-described in this way. At Chatsworth, Mr. Rogers says, “his name may not appear in the records, but this was his school, and there he educated his workmen who partook of his inspiration.” We know of no evidence that Gibbons did much at Chatsworth. Mr. Newdegate, M.P., has in his possession, at Arbury, the original accounts of Gibbons for the carvings done at Harefield Church. Among other places mentioned is Kirtlington Park, eight miles from Oxford. This mansion is particularly rich in carvings:—

“The Great Hall is striking and lofty, and has in it an alcove and niches, with classical figures. Over the marble chimney is a panel, 5 ft. or 6 ft. square, in the best style of the master, and worth a long pilgrimage to see. It is nearly in its virgin state, and quite capable of being recovered and brought back from its present dark state to the rich golden tone of the carvings in the cedar chapel at Chatsworth. On the grand staircase, in rather a dark corner, high up, is a second Gibbons panel, the subject of which is a basket of flowers and fruit, with side pendants, covering a space of about 5 ft. by 4 ft. The two panels are the largest and finest I have yet seen.”

At Oxford and Cambridge may also be seen much of the work by Gibbons. The exquisite ceiling and fittings of the chapel of Trinity College, at the former University, are particularly worthy of mention. Unfortunately, however, a great portion of the carving there, “wrought in costly, richly, sweet-scented cedar, is now covered over with a dirty undrying oil.” The discussion which followed the reading of the paper, brought out one or two points of importance in connexion with this interesting subject. In answer to a question as to the best means of restoring old carvings which have been painted over, to something like their original condition, Mr. Rogers observed that the process was a difficult one.

“It was not possible to scour and wash the paint off in the ordinary way. In order to remove the paint it must be eaten off, and for that purpose he made a trough large enough to hold the carving, and to admit of its being covered over with sandstun, which would be saturated with an alkaline solution of a strength varying according to the circumstances of the carving to be treated. By allowing it to remain in that state for a few days, the whole of the paint would be eaten off. That was the only method of treatment he was aware of, without the risk of breaking. With reference to the restoration of carvings which had not been painted, but had become blackened, in such cases scouring must be resorted to; but it required to be done by the careful hand of an experienced man. They knew that scouring either with strong or weak alkali or ammonia would raise the grain of the wood; nor could they sand-paper it over, to get the raised grain of the wood off; but a number of little tools were required, the ends of which were dipped into a little glue, to which powdered glass would suffice itself, and thus make a sand-paper at the end of the stick. In that way the burrs which were formed upon the wood by moisture could be removed from the delicate parts of the carving; but this likewise required to be done by an experienced hand. That was the method he had adopted at Chatsworth and elsewhere.”

It was further elicited that carvings in lime-wood appeared to be the most susceptible to the ravages of insects, and of all woods cedar was the least susceptible. We are glad to hear that though some portions have been broken by violence, the Lord Mayor's stall, and the stalls of the bishops in St. Paul's, are in a remarkable state of preservation. It appears, indeed, that all the carving in the venerable cathedral has escaped the ravages of the worm, and is in excellent condition. Mr. Rogers considers that painting is fatal to the preservation of carvings.

THE NEIGHBOURHOOD OF THE ROYAL HORTICULTURAL GARDENS.

The fine open space reserved for these gardens is now completed in all its external boundaries by ranges of the most costly mansions in the metropolis, nearly half a mile long and a quarter of a mile in width. The end next the park, facing the Albert Memorial, is laid out for the hall of arts and sciences, already planned; and the south portion is reserved for the erection of national museums. The whole extent of this great quadrangle of fashion is larger than either St. James's or the Green Park; and from its position close to Hyde Park and Kensington Gardens, promises to become the most attractive locality for aristocratic residence.

On the east side, Mr. Freake began mansions in Princes-terrace and along the entire length

of Exhibition-road, which for the most part are hacked by open squares, and from the Horticultural Gardens; on the west, Albert-road is also complete; both presenting grand thoroughfares, terminating in the Park on the north, and which it is proposed to extend,—on one side to connect with the fine quarter of Onslow-square, and on the Albert-road side to be extended so as to reach the river at Chelsea, through continuous squares, flanked by mansions of importance.

Queen's Gate-gardens, Harrington and Stanhope squares (already laid out and partly built), and other large squares projected on Mr. Freaque's new south-western creations, will connect Albert-road with Chelsea; and the southern side of the quadrilateral along Cromwell-road being finished with palatial residences, no quarter of London can compete with South Kensington in size of houses, width of noble thoroughfares, and convenience, with healthfulness of position. The internal arrangements and structural aptitudes of the new houses show great improvement upon the old system of internal construction. In most cases there are ten or twelve bed-rooms, with baths, lavatories, conservatories, and all modern accessories; lofty rooms, richly ornamented; together with stables and coach-houses. Mr. Aldin began the terraces along the Albert-road, and Mr. Marler is now finishing its southern continuation, which in the rear of the houses has the advantage of several open squares, and the vicinage of the new Metropolitan Railway Terminus within a quarter of a mile, the distance to the river at Chelsea being scarcely a mile, and to Hyde Park-corner about the same.

So far as the plan and arrangement of this new quarter are concerned, there is nothing to be said, as the whole is laid out and in progress; but now is the moment to provide for the fittings, not to say decent, reform of the grand southern route by Knightsbridge; the harracks, that unsightly and incommodious lair, constricting the road, defiling the Park, and destroying an incomparable site for noble mansions, is the blot and the blemish which infect and depreciate this essential and communicating link between Piccadilly and Royal Kensington. The whole length of this grand boulevard ought to be Parkside, from Apsley House to Kensington Palace gates.

Whilst renovations on a colossal scale are in progress, such as will enormously improve London,—the Holborn improvements, the river embankment, besides other extensive matters in the hands of the Board of Works,—it is pitiable that the principal boulevard of this city, conducting from Regent Circus to the ancient Palace, should at the present day be left unopened, and in its pristine state of deformity and constriction.

EARLY MAPS OF LONDON.

The following attempt at a catalogue or list of Maps of London known to be preserved, and of a date anterior to the year 1800, has been compiled by me from maps (some unique) preserved in the libraries or portfolios of the British Museum, the Library of the Society of Antiquaries, the Library (at Guildhall) of the Lord Mayor and Corporation of the City of London, and the rich collection of London illustrations made with skill, assiduity, and at any cost by the late Mr. Crace, the late well-known and skilled decorator of more than one large room demanding taste.

Radolph Agas (about 1590) * "Civitas Londinensium" a map or bird's-eye view, 6 ft. 1 in. by 2 ft. 4 in.

There is a copy of this map in the Guildhall library, a recent purchase at the cost of 35*l.*; a second in the library at Lambeth; and a third in the Pepysian Library at Cambridge. All these, I believe, differ. Agas's map was re-engraved by Verelst in 1737.

The Guildhall copy has the arms of King James in the corner (as after insertion), and the arms of Queen Elizabeth upon the state-barge on the river.

John Norden's maps of London and Westminster in his "Middeset," 1593, very curious; the re-engraved copies not so good.

Norden's maps, executed for John Speed, are of little authority or consequence.

C. Vischer's long prospect of London (1616), of great merit and rarity (Vischer was never probably in England. Walpole Anec. by Dalrymple, v. 152), published at Antwerp or Amsterdam. There is a copy in the Pepysian Library at Cambridge. A lithographic facsimile has recently been made.

Wenceslaus Hollar. View of London from Greenwich Park (in 2 plates), 1637.

Prospect of London from Westminster to beyond St. Katharine's at the Tower, 7 ft. 6 in. by 1½ ft. "Sold at

* See an account of Agas (now to biography) in the *Gentleman's Magazine*, while under the editorial care of John Bruce, F.S.A. It was furnished by the writer of this attempt.

Amsterdam by Corn. Danckers 1647." Latin verses at the end by Edward Benlowes. [Sold at the Towney sale for 15*l.* 16*s.*] Lithographed the same size by Robert Martin, 1832.

The Prospect of London and Westminster, taken from Lambeth, by W. Hollar, 5 ft. by 1 ft. (no date).

London and its Vicinity, "being a ready guide for all strangers to find any place therein." This is a plan on two large sheets, and sold in the Towney sale for 13*l.* 6*s.* Date 1675.

A New Map of the Cities of London, Westminster, and the Borough of Southwark, with their Suburbs, showing ye streets, lanes, alleys, courts, &c. with other remarks, as they are now truly and carefully delineated. Sold by Robert Green at ye Rose and Crown in Budgess-row, and by Robert Morden at ye Atlas in Cornhill, 1680.—*W. Hollar, fecit, 1680.*

On one imperial sheet of paper, price 12*d.* [*Lond. Gaz.*, No. 1036]. The upper part of this map contains a "Prospect of London as it was flourishing before the Destruction by Fire" [size 23 in. by 17].

"A General Map of the whole City of London, with Westminster and all the suburbs, by which may be computed the proportion of that which is burnt with the other parts standing."—*W. Hollar, fecit, 1686.*

A map or ground-plan of the City of London and the Suburbs thereof, that is to say, all which is within the jurisdiction of the Lord Mayor, or proper call of London, by which is exactly demonstrated the present condition thereof since the last sad accident of fire. The blank space signifying the burnt part, and where the houses are expressed those places yet standing. Sold by John Overton, at the Whitehorse in Little Brittain, next doore to Little St. Bartholomew-gate, 1686.

The Newest and Exactest Map of the most famous Cities London and Westminster, with their Suburbs; and the manner of the streets; with the names of the chiefest of them, written at length, and numbers set in the Table, with numbers of the streets, &c. &c. so that it is a ready help or guide to direct countrymen and strangers to find the nearest way from one place to another. By T. Porter. Printed and Sold by Robt. Walton, at the Globe and Compass, on the north side of St. Paul's.

T. Porter. No date, but before the Restoration, and curious, as marking the site of Pileadilly Hall. A copy in the library of the Society of Antiquaries. The late Mr. Crace, of Wigmore-street, had a copy in his noble collection of London maps and plans. No other copies known.

William Faithorne (1633). Thus described by Walpole (Anec. by Dalrymple, v. 143):—"A plan of London and Westminster, in six sheets and two halves. Published and surveyed by Newton, 1633. Very rare."

Ogilby & Morgan (May, 1682).—*Lond. Gazette* of that period. Engraved on twenty plates. Ogilby's daughter married a Mr. Morgan, whose son by Ogilby's daughter succeeded the post-geographer in his situation as his Majesty's cosmographer (Aubrey's "Lives").

Those who have been employed in making a general map of London, set forth in the year 1682, told me that in that year they had found above 6,000 houses to be in London.—*Sir W. Petty*, p. 23.

London, Westminster, and Southwark, by Ro. Morden, Phil. Lees, Chr. Browne, "I. Harris, Deim. et Sculp.", 1700, in the corner. This is a capital map. A copy in the British Museum, among King George III's maps.

A Book of the Prospects of the Remarkable Places in and about the City of London, by Rob. Morden, at the Atlas, in Cornhill, and Phil. Lees, at the Atlas and Hercules, in Chesapeake.

The maps in Strype's edition of "Stow's London" (two vols. 6*l.*, 1720) are of great value.

View of London, from the top of Buckingham House, by Rip, 6 ft. 8 in. by 3 ft. A copy in the Guildhall library.

Several Prospects of the most noted Public Buildings in and about the City of London (twenty-four in number, oblong-shape). London: Printed and sold by John Bowles and Bowles, map seller, over against Stocks Market, 1724.

A new and exact plan of the Cities of London and Westminster, the Borough of Southwark, and the several new Buildings, Churches, &c., in the present year, 1735. Laid down in such a manner that any site or place may readily be found by inspection; the like not extant. Printed and sold by Thomas Jefferys, geographer to his Royal Highness the Prince of Wales, in Red Lyon-street, near St. John's Gate, a very large map, with references, well done. A copy in the Guildhall library.

1738. Published by Geo. Foster, 30th August, 1738. A copy in the British Museum, among the king's maps.

1744. John Rocque's. In several sheets, and good.

1763. By John Pine and John Tinney. Minute and accurate. King's maps (the engraver, John Pine died in 1768).

1762-9. R. Horwood's, "showing every house."

The maps of Bowles, in St. Paul's-churchyard, London (published about 1770), are of little or no authority. Clarendon House, Piccadilly, and Cavendish-square are marked as standing at the same time.

London maps of the nineteenth century are common enough—so common, indeed, that instructive though they be, an account of them would unnecessarily crowd your columns.

PETER CUNNINGHAM.

ENGLISH EXHIBITORS AT THE PARIS EXHIBITION.

THE fact that in many cases English exhibitors in the Champ de Mars have not been well treated is made every day more certain. Thus, in the case of Mr. Denton, jun., who had sent illustrations of farm buildings showing the accepted details of our foremost agriculturists, and illustrations of rural labourers' cottages, twelve sets, it appears clear, from a correspondence recently printed, that his Exhibit was not even looked at by a jury. It seems to have been transferred from one class to another, and so to have received no notice whatever. We did not see when in Paris what Mr. Denton submitted, and are unable to say that

it deserved any reward; but we do most certainly assert that it ought to have had full consideration as an illustration of what has been done in England in recent years, in the way of the housing of Farm Stock as well as of Farm Labourers. To the award of a gold medal to the Emperor of the French, for what his majesty has done in the latter direction (though the plan of the houses he has put up in Paris is not a good one by any means, and the buildings were erected by an English contractor), we have not the slightest objection to make. The good desire thus expressed on the part of a ruler deserved the fullest recognition. England, however, should have justice.

BELLS AND WOOD-WORK.

EXETER ARCHITECTURAL SOCIETY.

At the annual meeting of the Exeter Diocesan Architectural Society reference was made, in the report read, to a paper by the Rev. Mr. Ellacombe on the Bells of Devon:—

"Our church towers wherein these church bells are hung are widely scattered; they are in very many cases not easy of access. When the tower is reached, the bell-chamber must be visited; the bells have to be unstrung, the inscriptions and mottoes have to be copied, and this, and much more than this, has been done by our good and energetic committee-man. The society respects the benefit of his labours, and has withal a good example in him of what earnest work in a church case really is. There are points of special interest in that paper, and your committee cannot but feel that directing attention to the evidence which is therein given. Of the absence of that care, which our church towers and bells demand from us, your committee feel that in too many cases the towers and the bell-chambers have been passed by, or have not been cared for as they ought. And a united experience can in many cases convince us that the ascent of a church-tower is a work of no little difficulty, and, in some cases, of even some danger. Another point ought also to be referred to. Mr. Ellacombe has given us in his paper a great deal of information about our cathedral bells,—the finest peal, it is generally admitted, in the kingdom; but much more information is wanted before their history is complete, and your committee must express their opinion that much more information on that history might be obtained through a careful search of the cathedral archives."

The Chairman (Mr. Ellacombe) said he was sorry that there were no archdeacons present, for he should have liked to inform them of the disgraceful state in which some of the church towers in the diocese were. On that account he did not enter much into detail, but made a few conventional remarks. He divided the state in which they were kept into three classes, good, bad, and dirty.

Mr. Ford inquired whether Mr. Ellacombe meant by bad that there was danger to the structures, because if that were so he would certainly recommend that a communication be sent to the various rural deans. They would be failing in their duty if they did not found upon the report some practical course of action.

The Chairman said he found some of the towers shamefully treated by the bellhangers, who chopped away at the stones of the fabric, so as to get in extra holes easily.

Mr. Ashworth read a paper on "The Ancient Woodwork of Devon." He commenced with an allusion to the mistaken notions of church builders of the beginning of this and the preceding century in designing Gothic woodwork, whether in roofs, screens, or seats, and comments on their fondness for plaster imitations of old oak in ceilings, and proneness to plaster over what could not be imitated. Of early woodwork in screens we have the gates of the choir aisles in the cathedral, and the curious bishop's throne; the latter's pyramidal form is composed of a series of ogee canopies finishing with a light crocketed open spire, and is eloquent of the best period of Decorated work, though set down in historical records as dating 1470. After referring to trussed rafter roofs the early introduction of curved braces, i.e., timber arches, was noticed in the roofs of Hacombe Chapel, Tavstock Church, and in secular buildings, as in the Exeter Guildhall, and a roof at Bowhill, in St. Thomas parish. Of hammer-beam roofs of the Perpendicular period, there are in Devon very few examples: the rich one over the hall at Wear Gifford; another over a hall in the cathedral yard, now Mr. Down's office; a beautiful example in the hall at Bradfield, near Cullompton. Amongst a number of drawings with which the paper was illustrated, the ordinary cradle roof of many Perpendicular churches was exhibited, culminating as it were in the *ne plus ultra* of florid decoration at Cullompton Church, and the no less splendid example of a different construction over the chapter-house of our cathedral, dating about 1430. Somewhat akin to this latter was shown the tie-beam roof

of Wear Cliford Church, and a simpler tie-beam roof over the south aisle of St. Peter's Church, Tiverton. Of church seats no very old examples are preserved except the stall seats in the choir of the cathedral, which are genuine Early English, although surrounded by debased work of the worst character. Poppy-head terminations to bench ends are rarely found. There are a few at Atherington and at Ilington, and peculiar finials at Buckland Monachorum. Many churches, however, preserve their old square-topped carved bench ends, near Exeter. They are preserved at Christow, Rewe, Plymtree, Talaton, and Ashton churches, and also at High Bickington, Westleigh, Lappford, Marwood, and many other churches in North Devon. Devonshire, in comparison with many other counties, is rich in oak screens, mostly of the fifteenth century. A series of traceried compartments between moulded and standard, which ramify into a groined canopy supporting a rood-loft, rich with ribs, bosses, and vignette enrichments, frequently extend the whole width of the church. In many instances the groining has been torn off. Amongst the rood-screens comparatively perfect may be instanced those at Cullompton, Bradninch, Plymtree, Dartmouth, Honiton, Bideford, Kenton, Stokeinteighhead, Kentisbeare, Burlescombe, Talaton, Payhembury, Lappford, Chulmleigh, Chawleigh, and several others. These retain much of their old colouring. In domestic work it was lamented that Dartmouth, with the curiously carved windows of its old houses, was gradually becoming modern, and that the wainscoted interiors have long since been stripped of their beauties.

CHÂTEAU-GAILLARD.

CHÂTEAU-GAILLARD, the "Saucy Castle" of Cœur-de-Lion, the work of one year of his brief reign, and the enduring monument of his skill as a military engineer, is in its position and details one of the most remarkable, and in its history one of the most interesting, of the castles of Normandy. Although a ruin, enough remains to enable the antiquary to recover all its leading particulars. These particulars, both in plan and elevation, are so peculiar that experience derived from other buildings throws but an uncertain light upon their age; but of this guide, usually so important, they are independent, from the somewhat uncommon fact that the fortress is wholly of one date, and that date is on record. Moreover, within a few years of its construction, whilst its defences were new and perfect, with a numerous garrison and a castellan, one of the best soldiers of the Anglo-Norman baronage, it was besieged by the whole disposable force of the most powerful monarch of his day; and the particulars of the siege have been recorded by a contemporary historian with a minuteness which leaves little for the imagination to supply, and which, by the help of the place and works, but little changed, enables us to obtain a very clear comprehension of the manner in which great fortresses were attacked and defended at the commencement of the thirteenth century.

Château-Gaillard crowns the almost precipitous head of a bold and narrow promontory of chalk, which, isolated on either hand by a deep valley, stands out from the broad table-land of Le Vexin, at a height of 300 ft. above the deep and rapid Seine, which washes and has for ages threatened to undermine its base.

The course of the Seine through Normandy, from below the conflux of the Epte to the sea, is one rapid succession of bold and graceful curves, the concavities of which, bluff and precipitous, are attacked by the advancing stream, in strong contrast to the opposite banks, which, deposited and encircled by it, are low and fertile, and studded with ancient villages, churches, and manor-houses, rising through a mantle of rich smiling verdure.

At the bottom of one of the highest and grandest of these reaches, in the centre of a vast amphitheatre, stands the saucy boast of Cœur-de-Lion. Right and left are the bold bluffs of the chalk range, masked with turf, green as that of Sussex or Kent, varied by the occasional protrusion of a cliff of chalk, and relieved by a band of vegetation covering the foot of the steep, and intervening between the high ground and the river. In front, beyond the imnumerable islands of the Seine, is the tongue of rich low land known as the peninsula of Bernieres, a village, which, with Toeni and Venables—names familiar in Anglo-Norman history, is seen in the

foreground. The valley on the right, or east, and immediately below the castle, is that of the Cambon, upon which are the towns of Great and Little Andelys; the former the birthplace—or within a mile of the birthplace—of Nicholas Ponsin and Brunel; the latter half-a-mile lower down, upon the junction of the stream with the Seine, and under the immediate command of the castle, and contemporary with its foundation.

Château-Gaillard is composed of two principal parts, the castle proper and the outwork: the one covering the whole head of the promontory, the other occupying the only level ground, being the root of the ridge, from which the fortress could be attacked on equal terms.

The castle proper is composed of a keep; an inner ward, of the *enceinte* of which the keep forms a part, and which has its own ditch; and an outer ward, within which the inner ward is placed, the two uniting, or nearly so, at the north end. This division of the fortress is therefore concentric. The outwork, in advance of the ditch of the outer ward, has a ditch of its own, and presents its salient or strongest part towards the south.

The keep is a tower of which one half, in plan, is round, and the other projects into the ward as a right angle, or spur,—a form of tower well known in French castles. It is 48 ft. in diameter, or 55 ft. taken at the spur. The walls are 11 ft. thick, at the spur 18 ft., and the circular interior is 26 ft. At this time it is composed of a basement and a first floor; nor does there appear to have been a second below the ramparts. In the basement is one window towards the west, or exterior, and a rough aperture towards the east, or the inner ward. There are marks as though this had been a door of 4 ft. 6 in. opening; but if so, it was doubtless not original. This keep is not likely to have had an entrance on the ground floor.

The first floor has two windows towards the west, and a door to the north. The windows being on the cliff side, and inaccessible, are moderately large. They are of two lights, flat-headed, beneath an equilateral arch. Their internal recesses are slightly pointed. The doorway, also flat-headed, occupies the space of a window-light. In the other space is a loop, commanding the approach. Both are beneath a round-headed arch, the tympanum being closed.

There are neither mural chambers nor a staircase within the keep. The floors were of wood. There is no fire-place, nor visible garderobe, and no well. The spur is solid.

The exterior is very peculiar. The lower two-thirds batters considerably all round, so as to add strength to the base, and cause a missile dropped from above to be projected onwards upon an assailant. About half-way up this slope there commences from corbels a series of buttresses, which expand laterally as they rise, but have vertical faces. They are, in fact, machicolations, but commencing low down; and, like ordinary machicolations, are connected by a series of arches, carrying the parapet, behind which was a passage for projectiles, as, for example, at Avignon. These exaggerated machicolations give a considerable increase of space to the top of the keep, but they are confined to its inner two-thirds, the outer side being sufficiently secure without them. As the upper part of the keep has been removed, the arches are gone, and only the buttresses remain. One of these defences overhangs the entrance.

From a curious representation of the castle in stone in the church of Great Andelys, there is evidence that the keep was surmounted by a second and smaller tower within the rampart walk, and this again by another within that, rising like the tubes of a telescope.

A narrow flight of steps, commencing at the ward level, and carried up the outside of the keep, ascended, with two turns, to the entrance. Part of this narrow and dangerous staircase remains. There are also traces of a lean-to building on the east side of the keep, probably an addition.

The material of the keep is flint rubble, grouted in a copious bath of mortar, and faced inside and out with ashlar. The stones are about 1 ft. 6 in. long by 6 in. high, and are a hard and durable variety of chalk, with occasional flints. The material is probably local. The workmanship, though plain and without ornament, is good. The joints are moderately open, enough to admit an ordinary lead-pencil.

The inner ward is something of the shape of the human ear, the keep standing in the west or hollow-side, and the lobe being to the north or north-east. This ward measures about 200 ft.

north and south by 100 ft. east and west. Its *enceinte* wall is one of the curiosities of the castle. It is in girth about 500 ft. O' this the keep, a round tower, and an intermediate building, occupy about one-third on the north-west quarter, and the remaining two-thirds includes some plain wall, a gateway, and seventeen segmental buttresses of 9 ft. in the chord, placed upon the curtain 3 ft. apart. The wall, about 8 ft. thick, is plain within. By means of this arrangement great strength was given to the wall, and a series of flanking defences provided on the only face on which the ground admitted of any attack being directed. This part of the wall was probably about 30 ft. high, and stood upon a vertical scarp of about 20 ft. more. The battlements are gone, so that it does not appear how the wall was crested. A wall similarly buttressed, and of rather earlier date, existed at the Castle of Cherbourg, and there is something a little like it at Caerphilly.

The keep has already been described. It stands in the line of this *enceinte*, on the west side, which it protects. Annexed to the keep, on the north side, and also a part of the *enceinte*, is a rectangular building, probably the lodging of the castellan. It is about 30 ft. wide, and 40 ft. long, having a basement excavated in the chalk rock. It is of two floors, with fireplaces and segmental arches, and has an appendage on the north, perhaps for offices. It has windows in the curtain looking over the cliff towards the river. Stairs from hence descend to the postern, and the keep stair lies between this building and the keep.

At the northern point outside of, but engaged in, the wall, is the foundation of a round tower, now included in a square bastion, belonging rather to the outer ward than to this.

The postern is common to this and the outer ward, or rather at this point the two run into one, and the postern pierces the common wall. It is a narrow door having a flat top supported by two brackets, and above a round-head arch with closed tympanum. It opens in a re-entering angle of the wall, covered by the bastion, and upon the scarp, so that it must have been reached by a shifting bridge or ladder, the arrangements for working which seem indicated by some recesses for bars just within the portal. There is no portcullis; the defence was a barred door. The sill of this postern is about 30 ft. below the base of the keep. It is reached by steps cut in the chalk rock, and but little worn.

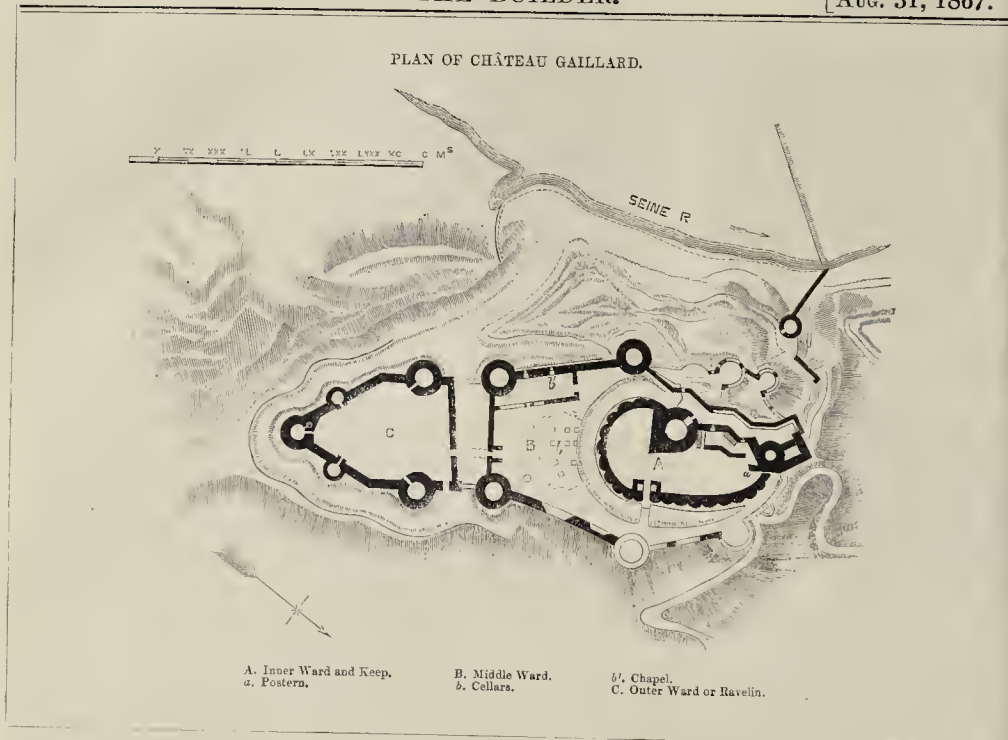

The great gateway of this ward opens in the curtain to the east, and had a gate-house almost entirely within the wall. This gate is considerably below the level of the ward. A steep descent leads to it, and the portal vault has three hanging ribs or arches, with a portcullis inside them, with a square groove. The inner half of the portal is gone; probably there was a second vault and portcullis, and an open space between. The face of the porter's lodge is gone, but the lodge is seen to have had a plain segmental vault. Outside the gate is a curious square groove as for a portcullis, but it is stopped, and does not descend below the springing level of the gate arch.

This gate opens upon the ditch. The base of the scarp-pier of the bridge remains. The counterscarp has tumbled in. There was probably a central pier in the ditch. The new bridge was not original. The approach to this gate left by Cœur-de-Lion was a causeway, formed by leaving the rock intact. It was over this causeway that the inner ward was taken.

Just within this gate was a well 270 ft. deep, now blocked up.

Outside the *enceinte* is the ditch, about 20 ft. deep and 30 ft. wide at the gate, and along the south front, with vertical sides, but running out to nothing on the steep ground as its ends pass northwards.

This ditch is, in fact, in the *outer ward*, which envelops the inner ward. This ward is oblong, about 325 ft. north and south, and 200 ft. east and west. Its northern half is of an irregular oval form, following the rock, and terminating in two large rectangular conjoined bastions upon the precipitous north end. The southern half is nearly rectangular; having a straight south face 125 ft. long, flanked by two drum towers. From these pass off the lateral curtains, forming the east and west front, and now ending in two other drum towers, of which that to the east, nearly opposite the inner-ward gateway, is gone. The curtain from this tower northwards is also gone. On the opposite or west side it is a mere parapet, cresting the precipice and following its

outlines. From the manner in which the inner ward is placed in this ward it occupies nearly all its northern end, but leaves to the south a platform, outside the ditch, of about 140 ft. by 100 ft. Here is a rectangular foundation, about 40 ft. broad by 60 ft. long, and divided lengthways by a wall. Its length is north and south, but here is said to have been the chapel, probably built across one end. It was the work of King John, placed upon a substructure of cellars, and in close contiguity to the castle garderobe in the west wall. "Juxta forticas, quod quidem religioni contrarium videbatur," say the chronicler. The end walls and the east side are faced with ashlar, but there is nothing like a chapel. Here, however, it appears to have been, and its roof was visible above the wall. These foundations are interesting, since it was here, through a window in the contiguous wall, that the ward was entered and surprised during the great siege.

No regular gateway remains in this ward. There is an opening in the south curtain which led to the great outwork, but which could scarcely have been the regular entrance. Neither could this have been on the west or north fronts. Probably, therefore, it was to the north-east, where the wall is now wanting. It is said not to have been opposite the inner gateway. At best the approach must have been little suited to wheel carriages. There was a well in the east quarter of this ward.

Mention has to be made of some curious chambers cut in the chalk of the escarpment of the ditch, from which at this time they are entered. There are three or four of these, about 80 ft. in length and 7 ft. high. They are carved with a sort of rough regularity, with pilasters left against the wall, and bands representing segmental arches. One large octagonal pier has a cap and base, and the latter has the water-bearing hollow of the Early English style, and is evidently original. It is probable, from what is said of these places in the account of the surprise of this ward, that they had a door towards the ditch, but they seem to have been also entered by a round hole, 4 ft. across, in the roof, as was the case with the dungeons at Concy.

The outer ward has its proper ditch, cut with vertical sides across the ridge in front of the south wall, between it and the rear of the outwork. This ditch is about 30 ft. wide and

20 ft. deep, but runs out to nothing when it reaches the steep ground.

The outwork, ravelin, or outer ward, is an antemural work, intended to cover the only side upon which the castle was open to an attack from level, or rather rising, ground, and to occupy what would otherwise have been a very dangerous platform.

It is in figure an isosceles triangle, having a base of 125 ft., and sides of 175 ft. Each of the three angles is capped by a round tower of 35 ft. diameter, having walls 11 ft. thick, and which seem to have been at least 40 ft. high. Besides these, in the side walls, 60 ft. in rear of the front tower, are two subordinate towers, also round, of 25 ft. diameter; and again, a few feet from these, the curtain is slightly bent, so as to present an obtuse salient to the field. The work, therefore, though in general plan a triangle, has really five angles and as many towers. The front tower has a well-stair at its junction with its western curtain. The curtain is much broken down, but must have been at least 30 ft. high, and, near the front, about 12 ft. thick, and elsewhere 8 ft.

The rear or gorge wall is not exactly a curtain to the flanking towers. It is placed a little outside of them, on the edge of the ditch; and between it and the east tower was the gateway, the special and independent entrance of the outwork. The north side is gone, but the other side shows the springing of the portal arches and a square portonilis groove. In this gorge wall, not far from the gate, is a large arch, corresponding to that already mentioned in the outwork wall. This was, no doubt, a way of communication between the castle and the earth-worth. This ditch was crossed by a wall at the east end, which connected the two works and protected the bridge. The west end is filled with ruin. There are now no traces of building in the outwork.

The towers of the outwork are of great strength, and have been faced with ashlar. The front tower especially is strong, and does not appear ever to have been mined or breached. Also the rock beneath it is undisturbed. Possibly the breach spoken of at the siege was in the adjacent curtain on the east.

In the rear of this work is the ditch already described, and along its front and flanks is another ditch, proper to the outwork, and the most formidable of all the defences. It is about

30 ft. wide, and at the advanced point, where the ground rises, above 40 ft. deep. The scarp and counterscarp are vertical.

Besides these regular works are others of a less regular, but very formidable character, on the west side. This face of the rock towards the Seine, steep naturally, has been scarped and defended by art. Half way down the slope is a round tower, connected, it is said, with the work above, by a gallery cut in the chalk. From the tower a wall descended to the river, so that the approaches on this side and the road between the hill and the river were effectually commanded. This wall seems to have terminated on the river bank, in a pier of which traces remain, and which supported one end of a strong dam or weir of piles, which extended across the river, and was part of the original work of Oœur-de-Lion. Several other works were stepped into the rocky slope, and especially covered the west side.

The weir crossed above the island, called formerly D'Andelys, upon which was the octangular fort, erected also by Richard, and of which traces remain. The bridges from this island, either way, to the banks, were of timber, and have left no trace behind.

Finally are to be mentioned the fortifications of the lesser Andelys, now destroyed, and the lake, fed by the waters of the Gambon, and which washed the walls of Great Andelys, and completely enveloped the lower town. These additional defences are now destroyed, and the lake is drained and filled up, but indications remain sufficient to verify the detailed description of Guillaume le Breton, and to justify M. Deville in his description, and M. le Duc, in his restorations, advanced under the excellent articles "Château" and "Donjon" in his Dictionary.*

DESIGNS FOR THE PROPOSED LAW COURTS.

WE publish in our present number a bird's-eye view of Mr. Street's design, to which, in conjunction with the plan submitted by Mr. Barry, the Judges of Designs have pointed particular attention. A key plan of Mr. Street's proposed building, and some descriptive particulars, will be found in a previous number.†

* To be continued. † See p. 108 and p. 113, &c.

DESIGN FOR THE PROPOSED LAW COURTS.—BY MR. G. E. STREET, A.R.C.A.

NEW ACT ON EQUITABLE COUNCILS.

The Act to establish equitable councils of conciliation to adjust differences between masters and workmen has just been printed. After receiving the 5th George IV., c. 96, and the other Acts to amend the same, it declares that in order to better facilitate the settlement of disputes between masters and workmen it is expedient, without repeating the several Acts, that masters and workmen should be enabled, when licensed by her Majesty, to form equitable councils of conciliation or arbitration, and that the powers of the Acts for enforcing awards should be extended to such equitable councils of conciliation. The mode of procedure is for a number of masters and workmen in a locality to call a meeting, and agree to form a council of conciliation and arbitration, and to petition her Majesty or the Secretary of State to grant a licence, which may be done after notice in the newspapers. A council is not to consist of less than two or more than ten masters and workmen and a chairman, and the petitioners for a licence are to proceed to the appointment of a council from among themselves within thirty days after such grant of licence, and the council is to remain in office until the appointment of a new council in its stead. The council is to have power to determine questions submitted to it, and to enforce its awards, as mentioned in the first-recited Act, by an application to a magistrate, by distress, sale, or imprisonment. No council under the Act is to establish a rate of wages or price of labour or workmanship at which the workman shall in future be paid. A committee of conciliation is to be appointed by a council. "No council, solicitors, or attorneys to be allowed to attend on any hearing before the council or committee of conciliation unless consented to by both parties." Householders and part-occupiers may demand to be registered and to have a vote on the council, and may be elected thereto. A registry is to be kept, and the masters and workmen are to elect the council. The forms to be used in carrying out the Act, and to enforce the awards of the council on the questions "submitted to them by both parties," appear in the Act.

THE DUKE OF NORTHUMBERLAND.

This venerable nobleman, whose remains will this week be interred with much solemnity and ceremony in Westminster Abbey, has enjoyed his great possessions for so short a time, that it is not surprising that we have not a large number of architectural works to chronicle as marks of his day. Nevertheless we must record that building works have not been altogether at a standstill since the death of one of the greatest builders of his race, Duke Algernon. At the village of Lesbury, which lies on the road between his ancestral seat, Alnwick, and the sea, there are now building various sets of cottages, which great consideration has been given, not only to external sightliness and interior comfort, but to general sanitary requisites. Entering the village from the west, the first of a series presents itself. This is a very striking cottage, nearly completed, having a central gable and two one-storied wings. In the box of the gable is another story, affording to the two cottages just that much extra accommodation that in so many cases makes all the difference between decency and the reverse. In these houselets the window difficulty is very successfully managed, for without having recourse to the diamond-paned lattice, a very picturesque effect is gained. The secret of this appears to consist entirely in the proportions of the window openings, and the mullions that divide each into four compartments. These windows are amply large enough to make each room cheerily light, without having that bare factory-like appearance that large openings in small cottages generally produce. The sanitary arrangements are upon an equally satisfactory basis. In most Northumbrian cottages the labour of the person entrusted with the charge of feeding the pigs has alone been taken into consideration, and the styes are placed as close to the back door as can be erected, and more frequently than built against the back wall as lean-tos. But these instances the pigstyes, as well as the necessary conveniences for the inmates, have not placed some 30 ft. in the rear, leaving a small garden space between them and the cottage wall. Seeing how faithfully models are copied in the country for years, we may look upon this

as a progressive innovation. In the same village there are sets of single and double cottages now finishing that will, doubtless, give a tone to all future cottage building in the locality, whether on the dual estate or otherwise. Some farm-houses, too, have been rebuilt. But his grace's memory will be most associated with the hospitality with which he opened the superb edifice his predecessor embellished for the entertainment of thousands of his neighbours on the attainment of his grandson's majority. As Earl Lumley of Beverley his grace was a prominent figure in the "war time" at the commencement of the century. The remains of the late duke lay in state in the sumptuous apartments in Alnwick Castle on Monday and Tuesday. The gorgeous ceilings, the lustrous whiteness of the sculptured chimney-pieces, the glitter of the carved and gilded furniture, the superb paintings, of the chambers first slowly traversed with hushed tread, formed, as it were, a vestibule of dual splendour that fitly conducted the stream of visitors into the darkened room, hung with black cloth, in which the remains lay. The Percy vaults formed an imposing and suitable ground of honour.

INDUSTRIAL ART IN FRANCE AND ENGLAND: PARIS EXHIBITION.

Schools of Art, in the sense of schools for teaching art, are but scantily represented in the Paris Universal Exhibition. This is hardly to be wondered at, nor perhaps regretted. The exhibition of the best works of the best School of Art is interesting to and understood by few except those engaged in art teaching or art learning. To the public the display of drawings from the antique, studies from the life, models in clay or plaster, and compositions for colour, are mystifying, if not repulsive. Placed, as they must be in a "Great Exhibition" in close proximity to gorgeous paintings and sculpture, and even more gorgeous specimens of manufacture in precious materials, they become reduced to complete insignificance.

There are, however, some collections of works exhibited by Art Schools, the most remarkable of which is that from the "Künste Schule" of Nuremberg. It comprises a number of full-sized studies from the antique, studies from the life, and a range of studies of heads from living models—these last especially full of character and individuality, transparent in tone, masterly in execution. A fair collection of models and a few designs for manufactures complete the display.

The École Impériale de Dessin exhibits a selection of students' works, and a screen is creditably filled by a collection of drawings, paintings, and models from the Lambeth School of Art. The Municipal Schools of Design of Paris are illustrated by rather meagre displays on the walls, and by folios filled with the ordinary school studies.

The Science and Art Department attempts no exhibition of the works of the English Schools of Art, confining itself to the exemplification of the means of diffusing a knowledge of art provided through its agency.

Incidental to this object, a series of drawings and models illustrating the course of instruction adopted by the Department, from the earliest outline exercise to the section of "Applied Design," is exhibited; but from the way they are framed and hung they are difficult to examine.

The examples of the reproduction of works of art, executed at the cost or through the inspiration of the Department, are beyond praise. They range from such important works as the Pulpit of the Baptistery at Pisa, of which a complete cast is exhibited, and the Bronze Gates of the Duomo at Pisa, reproduced in electro-deposit, down to minute carvings imitated in fictile ivory, and include coloured photographs of choice examples of applied art from every source.

An estimate of the state of instruction in industrial art in the different states contributing to the Exhibition must be chiefly based upon the results of such teaching as is shown in manufactured goods. But this is surrounded with difficulties. In many articles the value or beauty of the material conceals poverty of art-work, while the vast area that industrial art embraces ranges from works in precious materials which are virtually works of high art in the strictest sense, to the plainest woven or printed fabric decorated with a few stripes of colour.

The relative position of England and other

countries in regard to the application of art to manufactures remains very much as in 1862. Indeed, some few of the actual specimens of art-manufacture exhibited in the Cromwell-road may this year be recognized in the Champ de Mars.

No small portion of the success of the English "exhibits" has been ascribed to the employment of French artists by some of the leading manufacturers in this country in the preparation of high-class specimens of manufacture. So far from this being blameable, the English manufacturers who employ French talent are largely promoting the progress and improvement of applied art, and it is no proof of the failure of the system of art-education adopted by our Government that the demand for industrial art of the highest order is in part supplied from abroad. Our insular position and the comparative neglect of art-education in any shape until a comparatively recent period, render it surprising that we hold as high a position in respect to industrial art as we do.

In France, schools of art have long existed, both in the capital and in the provinces. The foundation of some of them date back as far as the close of the seventeenth century. Most of these institutions have originated and thriven quite apart from Government aid, and their success is due, perhaps, in a great measure to this independence, the necessities of the more important local manufactures having developed and sustained them. The course of instruction in these schools has been based upon no uniform system, the aim of the authorities being to adapt the teaching as closely as possible to the requirements of the locality.

The greater distances from the capital and the difficulties of communication have doubtless had their influence in further isolating from each other the French provincial art-schools, and it is just possible the more prominent success of one or two of our more remote schools of art, as those of Sheffield and Cork, is due in part to their distance from the capital.

What in France was done independently and at different times, in England was attempted to be done at once. At first wholly supported by Government, and managed in accordance with rules approved by it, and taught by teachers more or less trained to the views of the central authorities, it is not surprising that for a long time the success of our schools of art was very imperfect, and that even now their influence on industrial art is sometimes called in question.

A large portion of the work of Schools of Art must always consist in the production of draughtsmen and copyists, for whose services there is comparatively a large demand; and it is hardly generally understood how few original designers are required to satisfy the wants of manufacturing industry. Only a few important firms require more than one chief artist, although he may require a strong staff of assistant draughtsmen or modellers under his control. Many manufacturers prefer to purchase designs from various artists. With some it is an object to establish an individuality of style, which can only be done by retaining exclusively the services of an artist of high standing, while others seek variety.

There is probably no want of industrial artists to supply the wants of the manufacturers of the country, the great problem to be solved being the raising of the standard of their artistic attainments. It is of no use educating a number of designers if it is impossible to find employment for them; and the aim of the State should be rather to increase the opportunities of study and improvement in the rare cases of genius which crop up from time to time in our Schools of Art, than to train a comparatively large number to a low level of mediocrity.

The training of certificated art-teachers at South Kensington having in a great measure ceased, in consequence of the falling off in the demand for them, greater attention is now paid to the training of industrial artists.

At present the more successful pupils of country Schools of Art are invited to compete for "national scholarships" (Queen's scholarships) would be a better term). These at most may be held for two years, and their maximum money value is 100l. per annum. There can be no doubt that a young man of talent can learn a great many things in the schools and museums at South Kensington; but the proposed training of these scholars does not go nearly far enough, and the scholarships are too easily obtainable. They should be open to all comers, and the period of study should be extended, say, to five

years. A certain small number of travelling scholarships should be established for competition among those who seek to become designers of the highest class. A year or two spent in study abroad, and notably in Paris as the great centre of industrial arts, arrangements being made with the French Government that the scholars should attend the State schools, would wonderfully enlarge the knowledge and ripen the talent of a promising young man.

It is not that the Museum at South Kensington is deficient in examples or reproductions of examples of applied art in many, if not in all, styles; but in Paris one lives and moves in a medium so impregnated with artistic elements of all kinds that a new state of existence is entered upon. The easy access to museums and palaces, to say nothing of the variety of details of architectural ornament of all periods and styles, some had, but mostly good, the endless streets of shops containing goods displaying art-workmanship in endless variety, all tend to keep alive the impulses of genius. It may be objected that this course of training, if successful, would produce a race of industrial artists as essentially French as Frenchmen themselves. It might, and if it did, we should still be gainers; but in the analogous cases of English artists and architects, who have studied abroad, it does not appear that they have lost to any disastrous extent the nationality of their art.

If, however, the State should undertake to educate industrial artists to the extent here proposed, it would be necessary to devise some means of securing their matured services to the country. We have no State manufactories to absorb them, and private manufacturers could not be compelled to employ them.

The experiment, however, is surely worth trying; and a beginning made on a limited scale, and persevered in in spite of possible first failures, is not beyond the means of our authorities.

DAVID W. RALMBACH.

NOTES FROM IRELAND.

MUCH activity is still apparent in the "Green Isle" on public and other works, despite the supposed depressing influence of reputed Fenianism. In every province there is a little doing, and from indications it needs no prophecy to say there will be much more. In the west of Ireland, where much desolation existed for the last few months, the Government has lately set some works in operation at Spiddal and Clifden in the Irish highlands. These will help in some manner to give employment to the poor in that very poor district.

Preparations are now making to take up and finish the navigation works of Lough Mask and the River Rye in the County Mayo. The town of Ballynole would be much benefited if this were done. It is nearly a quarter of a century since these navigation works were first projected. They were subsequently carried on, but came to a standstill a dozen years since. Of course, if the Government don't think it advisable to apportion an adequate grant to carry out these works in the west of Ireland, they will remain in nearly precisely the same state as they are. Between fifty and sixty thousand pounds were expended upon them previous to their discontinuance. In the southern counties, Harbour Board and Town Council are busily engaged in projecting improvements and devising plans for raising the all-potent legal tender. The Royal dockworks, at Haulholme, alluded to a couple of months since in the *Builder*, are progressing favourably. A good deal of dressed stone is ready for the boundary walls and causeway between Spike Island and Haulholme. The limestone quarry discovered at Haulholme has turned out a valuable affair, and leads to immense saving, considering that stones had on former occasions to be carted several miles. Free and convict labour, as we on a former occasion remarked, is extensively engaged on the dockworks. Of the hands employed, there are nearly 300 convicts and somewhat under one hundred free labourers. We believe we are correct in saying that among these hands are included some of the Fenian prisoners lately convicted. Messrs. Dowson & Co., London, are the contractors for supplying 1,500 tons of pine timber for the Haulholme dock works.

In Waterford the city magnates are busy agitating for a postal subsidy from Government for the Milford route. It is argued that the

route between Waterford and Milford Haven would be little inferior and less expensive than the Holyhead one. It is calculated that passengers leaving Waterford at six in the evening would reach London early in the morning. It may not be generally remembered that the Government some years ago established a daily service between these two ports, and spent a large sum of money in the construction of a dock at Dunmore for that object. Many years ago the same thing was done at Howth, north of Dublin; but the embarkation of the Fourth George at Old Dunleary rolled Howth of the honour. Dunleary was dubbed Kingstown in consequence, and became the packet station *à la* Holyhead. If the mails can be sent quicker by this route from Ireland to London, by ranning the trains in conjunction, Waterford and Milford may get a chance.

A water scheme is also afloat. The motion for carrying it was passed at a town council meeting. The cost is put down at the moderate sum of 8,000*l.*, but it is not at all unlikely it will swell a little more. There is one commendable feature about it which will recommend it to the citizens and the poor. No man is to be asked to contribute the smallest amount towards carrying it out: so we are told; but we are a little suspicious when municipal bodies assert that they will carry public works to completion "on their own resources." The people require water, and a plentiful supply; and if they do not pay for this, perhaps the supply they are in the habit of having will by some charge or other become gradually small and beautifully less. In a sanitary sense, however, we want to see a plentiful supply of water. Basins, reservoirs, tanks, wells, pumps, and fountains cannot be too many.

In Waterford, the spinning factory of Messrs. Denny gives employment to about 300 hands; and the firm are at present adding to their machinery. The establishment is a boon to the poor of Waterford. A flax factory was lately established at Cork, which has also proved very successful. Mr. Maguire, the Irish member, exerted and interested himself greatly in setting this in operation.

In Wexford, harbour improvement works are in operation; but the commissioners are anxious to obtain additional aid from the Admiralty to carry them out. From the reply of the Admiralty it seems the Harbour Commissioners will have to raise the wherewithal to continue operations. Having identified themselves with the Dogger Bank works they are, according to a provisional order of 1863, empowered to raise funds. They must do this, for the sums at present at the disposal of the Admiralty Commissioners will be soon run out. The har at Wexford is at present in a bad condition.

In New Ross, in the same county, the new bridge will be forthwith commenced. The Wexford Grand Jury Bill has passed the Lords, so all obstacles to further delay will be removed. The construction of main sewers in this town was considered a needless expenditure by one wise man in the council, but the chairman of the meeting, like a sensible man, thought otherwise; so the motion was put and carried.

In the north of Ireland, and particularly in commercial and manufacturing Belfast, there is seldom a lull. At Woodburn very large waterworks are in course of construction for supplying the town of Belfast with an increased supply of water. The south Woodburn reservoirs will embrace 85 English acres, and will have an average depth of 25 ft. when filled. About May next, or early in the summer, will complete the southern portion of these. Some engineering difficulties having been experienced, the reservoir on the upper side will be somewhat longer delayed.

In Belfast, as well as in Waterford, a mail service is warmly discussed. The Postmaster-General inclines to the route *à la* Dublin; but the Belfast folk are reluctant to give up the bright idea of a short sea passage.

In the town of Cavan, the people are crying out for the establishment of a pork market, and other improvements and removals. A public grievance exists in the town called "The Dummy's Wall." This is an obstruction caused by the existence of some walls. These walls are built across the river Erne; so when the water rises, the lands of the poor people are completely flooded. The Government has been called on to interfere, and a report is about being drawn up. The retention of the walls is certainly an injury to the surrounding lands; but on their removal, the owners of the mills will have to be

heavily compensated. A local paper in the town asserts that hundreds of acres are flooded by the obstruction.

The foundation of a new Roman Catholic church has been laid at Headfort, in Galway.

At the inspection of the scene of the great railway accident at Brayhead, Dublin, it was found that a portion of a new rail was fitted in at the curve, about half an inch narrower than the old plate: this of course caused an obstruction to the flange of the wheel, which resulted in lifting it off the rail. The incline was on the land side, or the engine, carriages, and all would have been at once precipitated into the sea. Accidents are somewhat rare on Irish lines. We hope there may be a rigid inquiry into this occurrence, as a great many persons are seriously injured and disabled.

At the *conversations* held in Dublin, to which all the members of the British Medical Association were invited, among the rare and curious MSS. examined by the company were a collection of MSS. of the twelfth century, a portion of the Four Gospels in the vernacular, the Book of Ballymore, the Book of Leamane, the Transcript of the Book of Ballymore, the Transcript of the Wars of 1641, the original MSS. of the Annals of the Four Masters, and the Book of Conquests. Numerous autographs were also viewed, among which were Archbishop Maher, William III., James II., Robert Boyle, Swift, Tyrconnell, Bishop Percy Berkeley, Brinsley Sheridan, and the manuscript Journal of Dumont de Bouquet, so often referred to by the late historian Macaulay, relating to the war of 1689-90. Many other scarce and curious tracts on astronomy and medicine, in Irish, were also examined, which evidenced, on the part of the native writers, considerable acquaintance with Greek, Hebrew, Latin, and Arabic, copious quotations in these languages having been made by them.

The notice of the Postmaster-General, announcing that he will be ready to receive tenders for her Majesty's mails from some ports in the United Kingdom for New York, has set the citizens of Limerick a-thinking. Limerick, in consequence, puts in her superior claims as the site of a transatlantic station. The former Galway enterprise proved such an unlucky affair we fear Limerick will not be successful in obtaining the coveted prize.

In conclusion we may add that the crops throughout the country promise well; and, as this question bears upon the social and sanitary aspect of a people, it will not be out of place to mention it here. Capital is wanted in Ireland; but money, without enterprise or experience on the part of projectors and speculators, will be of little use, as late events have clearly shown.

ENGLISH SAFES v. AMERICAN SAFES.

The contest in the Paris Exhibition, of which we have before spoken, has now taken place. The purpose was to test the impregnability of the fire-proof and burglar-proof safes of Mr. Chatwood, of London, and Mr. Herring, of New York. The contest arose out of the challenge of Mr. Herring. Each side staked a sum of 800*l.* The Germans who were employed to operate on Mr. Chatwood's safe brought a great number and variety of tools: the Lancashire men who operated on Mr. Herring's safe had comparatively few. It was proposed that each side should be allowed only the same weight of tools. A piece of wood with a seal upon it was put by Mr. Chatwood into his safe, and the task for the Germans was to get it out. The Germans first of all tried the lock, but failed to do anything with it. They tried to drill through the door, but against the intersected steel their powerful instrument was useless. They tried to wedge open the door, but there again they completely failed. They spent an hour upon the door, but could not make any impression upon it. Failing in the front attack, they next approached the safe on its flank. After three hours and fifty-five minutes of very hard work they laid hands upon the sealed block of wood and exhibited it in triumph, to the great delight of the Americans. Had Mr. Chatwood put the block of wood into one of the drawers which opens outwards against the door which had resisted all efforts, it would have cost more time to get it out. In that case the Chatwood safe would not have been the first penetrated. In the mean time the Lancashire men were working on Mr. Herring's safe. The

Herring safe is about double the size of the other, being built on the principle of safe within safe. The outer door was burst open in twenty-nine minutes. The burglar-proof safe, which is a strong box with an iron door fixed on the bottom of the larger safe, is from its position difficult to get at. The Lancashire men were deficient in tools, and as their work proceeded they had to get a sledge hammer to put themselves on something like an equality with their German rivals. What they wanted most of all, however, was wedges. They worked on helplessly with such tools as they had, much depending on the sledge hammer. The result is that it took twenty minutes more time to break into Mr. Herring's safe than it took to break into Mr. Chatwood's. The committee have not yet given their decision, but there are no two opinions, among the English at least, as to the superiority of the Chatwood safe, as the Herring safe was taken in front and entered by the door, whereas the Chatwood safe presented an impenetrable front, and was entered on the flank, which is usually inaccessible to burglars.

THEATRE ROYAL, NEWCASTLE.

This theatre has been re-opened, after entire renovation of the interior, under the direction of Mr. Phipps, architect. The Greek style has been adopted. The principal ceiling is of a light turquoise, enriched with ornamental borders. Bold honeysuckle and other ornaments are painted on the box facings, in colours turquoise, blue, red, and gold, being enriched further with stencilled borders, mouldings of gilt, crimson resters for the arms, and vandyked valances of rich amber damask. All parts below the level of the dress circle are coloured with a full Indian red. The lighting of the interior of the theatre has undergone an alteration. The chief improvement is the removal of the chandeliers from the boxes, and the substitution of a very handsome and brilliant chandelier, with sunlight combined, which is pendant from the centre of the ceiling. This is from the manufactory of Messrs. Jones & Co., Covent-garden. With the exception of the lighting, the whole of the new work has been done by Messrs. Green & King, of London.

The painting-room has a frame 42 ft. by 32 ft., which travels up and down at the painter's pleasure. There are also two painting bridges 26 ft. long, which move up and down, and carry the artist to the height of 30 ft., if required. The depth of the stage from the foot-lights to the back is 58 ft.; the width from wall to wall 62 ft., which does not include the large scene dock, which is 40 ft. by 30 ft. The height from stage to gridiron is 60 ft.; the depth from the stage to the magazine floor is 10 ft.; from the magazine floor to the cellar is 16 ft., which makes 26 ft. from the stage to the cellar. Over the scene dock is the carpenter's shop, and under it is the working property-shop. At the back of the scene dock is a large furniture-room for the storage of furniture. Mr. Day, of the Prince of Wales Theatre, Liverpool, erected the stage.

ROMAN CATHOLIC CATHEDRAL, SLIGO.

PREPARATIONS are being made for commencing the erection of a large and important structure in the town of Sligo, as the cathedral of the ancient Roman Catholic see of Elphin.

The site is a commanding one, and when erected the cathedral will be the prominent feature of the town. The building is by special desire to be of Lombard or Norman character, and will consist of nave, aisles, transepts, semicircular apse, with an aisle passing round it and apsidal chapel beyond, and two chapels of the same form in the transepts. A massive and lofty tower and spire will rise at the western end of the nave, and lateral porches and sacristy buildings, with hall for meetings, sacristan's residence, and connecting cloister, complete the arrangements.

The dimensions are as follow:—Total external length, 219 ft. 6 in., ditto internal, 211 ft.; total external width across transepts, 121 ft. 6 in., ditto internal, 115 ft. 6 in.; width of nave and aisles, 66 ft.; height of nave under vault, 61 ft.; height of tower and spire, 176 ft.

The materials are to be, externally, the local blue limestone, and internally, the yellow sandstone of the country, with a partial use of the

limestone in columns and shafts, and polished Irish marbles about the apse and choir. The contracts have been let to Mr. Killgallon, of Sligo, for the mass of the work, and Mr. Clarence, of Balsodare, for the cut stone work. The designs and working drawings have been provided by Mr. George Goldie, of London. The whole cost of the work will be about 20,000l.

MANCHESTER.

We are glad to hear that the Sanitary Sub-committee have unanimously resolved to report in favour of the appointment of an Officer of Health for this city. His duties will necessarily be multifarious and important. The astonishing part of the business is that Manchester is still without an officer of that kind. It is to be hoped that the Council will at once adopt the recommendation and carry it out. The Committee suggest for the office, at a salary of 500l. per annum, Mr. John Leigh, a surgeon locally known for the interest he has manifested in sanitary inquiries and his chemical knowledge. As to this part of the report, however, we say nothing beyond the remark that the best obtainable man for the position should be looked for. The Sanitary Sub-committee appears to include some energetic and far-seeing members.

As to the Town Hall competition, the selection sub-committee met on Tuesday last, and after further careful consideration, with professional assistance, agreed upon a list of the competitors who are to be invited to a second competition under the terms of the advertisement, each receiving the sum of 300l., except the author of the one design eventually selected for execution, who will receive the usual professional remuneration. This list has been reported to the General Purposes Committee, and will go up to the Council next week for their decision. 137 sets of designs were sent in by 123 competitors.

THE DRAINAGE OF CANTERBURY.

Sir,—The unfairness of the Canterbury Local Board in the matter of their recent competition for the supply of stoneware-pipes demands the fullest publicity.

The advertisement published in the *Builder* of the 13th and 20th of July informed stoneware-pipe makers that tenders would be received by the Local Board up to the 30th of July. Well, Sir, myself and others tendered according to the conditions of contract and specifications proposed by the engineer.

At a meeting of the Local Board it was decided that none of these tenders should be received, and that an advertisement for further tenders should be issued. This appeared in the *Builder* of the 10th inst., informing us that tenders would be received up to the 25th inst. On the 13th the Board held a special meeting, and decided that one of the tenders first sent in should be accepted. Now, Sir, is this a fair and honourable way of treating us?—to put us to the trouble and expense of preparing fresh tenders, and then to accept one of the first tenders in the face of their advertisement for further ones.

A PIPE MAKER.

HOW TO USE TOWN SEWAGE.

Sir,—To comply with the Act of the Thames Conservators, it will be necessary to dispose of the sewage of Kingston and the adjacent places in some other way than running it into the River Thames. In March last I began to consider how it should be disposed of; and, to obviate the objections to the exhalations from surface irrigation, it occurred to me that the sewage might be run underground, in pipes with open joints, or preferably in half-round pipes, or tiles with serrated edges, covered with a flat tile; and that through the serrations the liquid sewage would flow to the roots of the crops right and left, the distance apart of these lines of pipes being varied according to the retentiveness or otherwise of the ground.

At that time I was not prepared to make any report on the disposal of the Kingston sewage, not having completed my investigation of the district; but about that same time the people of Leytonstone, in Essex, wanted to know how to dispose of their sewage, and the following is an extract from my report, dated April 24, 1867, to the committee appointed to carry out the provisions of the Sewage Utilization Act, 1865, and the Sanitary Act, 1866:—

"As to the disposal of the sewage, the success of surface irrigation of land is very considerable where suitable land can be obtained. It is possible that a sufficient breadth of land might be obtained, but it does not lie in that convenient form which renders surface irrigation a success in some places. Looking at the nature of the ground at command, I recommend a more simple and effectual plan. I recommend that the sewage be led to

the land coloured red on the accompanying plan, and there buried at a depth of, say, 18 in. below the surface by pipes, which I will call reverse drain-pipes, laid all over the land.

The depth of 18 in. of earth over them will prevent any exhalation from the sewage, and the sewage will become naturally decomposed and rendered innocuous before it is carried off by water-courses and drained away to sea by the natural streams.

The liquid sewage will be applied to the roots of the crops—this is the gist of my plan—so that the roots of the crops take up the liquid sewage for their growth, and the insoluble matter remains in the ground.

This plan avoids all those expensive artificial means of dealing with the sewage; it utilizes it by the growing crops absorbing it; it avoids exposure of the sewage to the sun and the atmosphere; but allows the essence of the sewage to be drawn out of the ground by the sun acting on the vegetation, the growth of which will be greatly promoted and increased."

I was glad to see in the newspapers that the same or a similar plan has been proposed for Malvern, and I think it is a plan worth serious consideration for all places.

CHARLES SLAGO, Assoc. Inst. C. E.

MASTER BUILDERS AND THEIR WORKMEN.

At the Marylebone Police-court, on Tuesday, Mr. Coyle, master builder, of Great Marylebone-street, appeared to answer a summons under the following circumstances. It appears that he engaged complainant, a carpenter, to do a certain job for him, but in two hours, being dissatisfied with the work, he there and then discharged him. He also offered him a shilling for his two hours' work, but complainant declined, avowing he must have 1s. 3d., being at the rate of 8d. per hour. Defendant refused, and complainant stayed in the shop for eight hours, and now sought to obtain his wages for all that time, inasmuch as he was "not" discharged until he was paid. Mr. Mansfield said, it was ridiculous to suppose that a man who chose to stay a fortnight on the premises of his master after being told to go about his business could demand payment for all those hours. The complainant said, that when a master told his workman to pack up his tools and go away, he must pay him for the work already done at the recognized rate of wages. Unless the man were paid there was no discharge. Mr. Mansfield would not allow the pay for the waiting hours, but ordered defendant to settle the matter by paying the 1s. 3d. The defendant then produced a workman, who said that complainant's work was so badly done that it had to be re-made. Mr. Mansfield thereupon altered his decision and dismissed the summons, with the remark, that if a workman failed to do his work the master was not liable to pay him anything.

BATHING.

I QUITE agree with "Nator," that at all our watering-places "enclosed bathing-places" or *leufs* should be provided for the public. "There is no bathing, in the proper sense of the term," at any of our most frequented coast towns. I have just passed a fortnight at Brighton, and the bathing there is anything but satisfactory. The vast multitude who visit that beautiful town with the view of having a few dips into the sea find themselves restricted to the cold, comfortless bathing-machines after eight o'clock in the morning, let the tide be high or low. At low water a swimmer must wade a long way out before he can get his pleasant plunge, whereas if he could be allowed to bathe when the tide suited, at any hour of the day, he could enjoy his swim with the luxury he had taken the trouble to travel for; and, without interfering with the comfort of others, invigorate himself without the risk of that sudden chill which wading in shallow water creates. This applies also to the ladies. The bathing is worse than useless in low tides. Their machines are kept so much out of the water, that the ladies scarcely get a dip of the pure water, and are kept shivering and deep in the dirty air. There is a vast expanse of beach at Brighton, and suitably distant from the promenade to prevent any indecency: surely a portion might be set aside for the public generally—whether for those who care or those who cannot afford to patronise the icy, miserable machines. A BATHER.

THE PARIS INTERNATIONAL EXHIBITION.

Sir,—It is a rare thing to hear the Paris Exhibition spoken of with praise—a very rare thing to hear it referred to with enthusiasm. I believe the general feeling in England to be, that it may be well enough, if one is led by circumstances to Paris, to turn in for a few hours at the Champ de Mars, but that the Exhibition is not worth taking any trouble to see; that Paris is ruinously expensive just now, and that little is to be gained by going there."

These, at any rate, were my own notions a week ago; but having been to Paris, I have learned how grievously wrong I was, and I am anxious to be allowed to argue upon all those of your readers who have the means and the opportunity to go, that if they allow the very few weeks during which the Exhibition still remains open to pass without visiting it, they will miss a valuable opportunity of study, and a great treat. The Exhibition is full of objects which cannot fail to interest those who form the main body of your readers.

The antiquary will find the illustrations of the "history of labour" and the wonderful fragments in the Egyptian Temple a most complete, most instructive, and most comprehensive archaeological collection. From the dawn of prehistoric to our own day the arts of Western Europe (and partly of the East) are exhibited in precious collections of the pre-historic and almost all the historic periods.

* No reader of the *Builder* ought to have this impression.—Ed.

The lover of modern works of art will delight in the French galleries, rich in paintings by Gérôme, Meissonier, Rosa Bonheur, Xron, and many others. The Bavarian gallery, where Kaulbach and Piloti exhibit some of their grandest works; the Dutch gallery, where a whole host of skilled painters maintain the traditions of their school, while the works of Alcuin De Maas seem to win for it distinction in a new field; and, not least, the Belgian gallery, where the noble Pre-Raphaelite works of Leys hang side by side with the charming trifles of Stevens, and the graceful and finished studies of Willem. Nor is fine sculpture entirely absent, though it is scarce.

The student of modern art-work, and the artisan, will find the greatest imaginable perfection of workmanship, the most striking variety of design in the furniture and textile fabrics, the pottery and goldsmiths' work, and the jewelry, and the dresses of European nations. In the unprecedentedly complete and rich exhibition of Indian, Chinese, Japanese, Turkish, Persian, and Egyptian art, he will find examples of faultless design and coloring crowded together in profusion.

This list could be extended indefinitely, for what may be called the practical portions of the Exhibition, displaying machinery, materials, structures, and contrivances, such as those relating to arts and antiquities. All the things are easily approached, and well seen. The arrangement adopted is most satisfactory, and the only drawbacks is the fatigue caused by the want of a proper amount of fresh air in many parts of the building, by the discomfort of concrete floors, and by the closeness of seats. But the park and the central garden, and the excellent and abundant arrangements for refreshments, are a great counterbalance to this evil, and are all readily accessible from any point.

Lastly, I did not find prices much raised. I paid, in an excellent hotel, about half-a-crown a night more for my room than at ordinary times; but other charges remained just about the same that I have found them in Paris during the last year or two.

THE BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

THE first annual meeting of this meritorious Association was held, *pro forma*, on the 26th inst., Mr. William Henshaw presiding. It was adjourned to the 23rd of September, when it is to be hoped that all who are interested in its success will endeavour to attend. The Institute has now completed the first year of its existence. The purpose is to maintain and educate the orphan children of builders' clerks, and to relieve distressed clerks and their widows. Although founded just at the crisis of the recent monetary depression, its first year's operations have exceeded in success the anticipations of its friends. The balance-sheet shows donations and subscriptions amounting to the sum of 638*l.* 13*s.* 4*d.*, against which the necessary disbursements have been 161*l.* 1*s.* 11*d.* The meeting, though small, was enthusiastic.

CHURCH-BUILDING NEWS.

Wombwell.—The foundation-stone of a new cemetery has been laid at Wombwell for the township. The site chosen consists of six acres of land, which have been purchased for 1,200*l.* It is only proposed to lay down one-half of the land at present. The cemetery is situated at the Bursley end of the village, and is removed from the houses. The architect is Mr. Thomas Dobh, of Rotherham. The contractors for the various kinds of work are as follows:—Mason's work, Mr. W. Scharf; joiner's work, Mr. D. Hamerton; slater, Mr. John Jarvis. Some of the other work is not let. The total cost of the buildings, land, laying out the grounds, &c., is 1,755*l.*, or with the land, 2,900*l.*

Plastow.—The new church of Holy Trinity, Plastow, has been consecrated. The edifice is in the ornamental English style, has been built from designs by Mr. Charles Barry, of the firm of Banks & Barry, and the builder is Mr. Emor, of Hackney. The interior is plain, and the whole of the sittings, which consist of plain open benches with accommodation for 1,029, are free.

Wetherby.—The foundation-stone of a new church has been laid at Hunsingore. The old structure had become somewhat dilapidated, and to a certain extent unfit for use. Mr. Charles Kirk, of Sleaford, Lincolnshire, architect, was consulted on the matter, and the edifice is to be erected at the cost of the patron, Mr. Dent. The church will consist of a nave, aisle, and chancel, with apsidal termination, vestry, porch, and a tower and spire at the west end of the south aisle. The structure will be in the Geometrical Decorated style of architecture. The floor is to be paved with Minton tiles. It is in contemplation to put a peal of bells in the tower.

Twickenham.—The cemetery lately consecrated is eight acres in extent. The walls have been formed of different curves. The chapels are of a modified character of English Gothic. The buildings are constructed of Kentish rag with

Bath stone groins. The stone carving, both externally and internally, was executed by Mr. Dore, of Brentford. The stained glass in the east windows of the chapels, with the other glazing, was by the Savoy Glass Company. The whole of the works have been executed by Mr. Nye, of Ealing, at a cost of 3,000*l.*, from designs, and under the superintendence of the architect, Mr. Charles Jones, of the same place.

Ryde.—The Church Building Committee, we hear, says the *Hampshire Independent*, "have abandoned the idea of raising a church suitable to the standing of the town, and have dropped Mr. Gilbert Scott's plan, that was estimated to cost 15,000*l.*, and have advertised for a plan that, with fittings and enclosure, must not exceed 8,000*l.* The sale of the adowson of Newchurch has realised 3,750*l.*, and 3,000*l.* have been subscribed. With such a sum to start with, the church building committee only show their incapacity for the work, and their want of resource."

Aylesbury.—The first and second contracts for the restoration of St. Mary's Church, including the repairs of all the lower portions of the edifice, are now nearly completed. The churchwardens and the committee have received, or had promises sufficient, amounting to about 700*l.*, to warrant them in going on with the restoration of the tower and spire, and a contract is being entered into. The tower, like the other parts, will be faced with stone, the spire and clock tower will be leaded, and the battlements of the main and clock tower will assume a more architectural character, according to the plans of Mr. Scott. Some few hundreds of pounds will be required to complete the clearstories.

Hyde, Cheshire.—The foundation-stone of a new church, to be called St. Thomas's Church, has been laid by Lord de Tabley, the head of the Masonic fraternity in the Cheshire district, attended by a large number of the brethren of the province. The church will consist of nave, 71 ft. 3 in. long, and 42 ft. 9 in. wide, with chancel, organ chamber, and vestry; but this is only part of the scheme, which includes north and south transepts, and an extension of nave, one bay westward, with porches under the western gallery. The present western elevation will, therefore, be of a simpler character than the completed design. The roof will be of timber, stained and varnished. The pews will have low and broad seats, and sloped backs. There will be a bell gable of a simple character at the west end. The materials are the local rubble stone, with brick dressing at the angles of the building, and jambs of doors and windows, and in bands with ashlar, where required. The passages will be paved with Broseley tiles, in geometrical patterns. The church will accommodate at all 472 persons. The contract has been taken at 2,128*l.*, by Messrs. Robinson & Son, of Hyde. The architect is Mr. J. Medland Taylor, of Manchester.

Dorchester.—For the rebuilding of Holy Trinity Church so large a number of plans have been sent in that it was deemed advisable to remove them to the Town-hall, where the public were invited to inspect them. The estimated cost is about 6,000*l.*; but towards this amount scarcely 2,000*l.* have yet been promised, and this including a sum of 400*l.*, offered on condition that the work should have been commenced before the present time. A piece of ground is also offered conditionally upon the requisite funds being raised within two years.

Wombourne.—The church here has recently been restored and enlarged, and is now consecrated, by the Bishop of Rochester. The architect engaged in the work was Mr. G. E. Street, and his plans have been carried out by Messrs. G. & F. Higham, of this town, builders. The church now contains 560 sittings. The total cost of the restoration and improvements is estimated at 3,500*l.*, the greater part of which has already been raised by voluntary contributions. The reason for the ceremony of consecration was, that the present new chancel has been built partly on new ground.

Shaftesbury.—The new Church of St. James has been consecrated. The total cost has been 3,500*l.*, of which the Marquis of Westminster has given 2,000*l.*, and the site, and the Rev. H. Boucher 500*l.* The materials of the old church, so far as they were serviceable, have been used in the construction of the new one. The designs for the building were furnished by Mr. T. H. Wyatt, of London, the builder being Mr. Miles, of Shaftesbury. Though the general character of the church is Early English, that style has not been rigidly adhered to throughout the edifice. It has been built of greenstone, with

Bath stone dressings. There are two entrances, one under the tower at the west end, and the other by a porch on the north side. The front of the porch is a moulded arch, with carved capitals on a cluster of Purbeck marble shafts, with moulded bases. The tower at the west end is 65 ft. high, with four pinnacles, surmounted with iron crosses and copper vanes. There is a battlemented parapet, with carved gurgoyles. The entrance underneath the tower is by an arch, supported on Purbeck marble columns. In the interior of the aisles, the parapets of the old church have been retained. The church itself consists of a nave, north and south aisles, and chancel. The nave is separated from the aisles on either side by four arches, on clustered piers, with carved capitals. The roof throughout is open timbered. The fittings of the chancel are of oak, obtained from the old church, but all carved. The chancel is paved with Maw's encaustic tiles. The organ has been supplied from the manufactory of Messrs. Bevington & Sons, London, and is fixed at the east end of the north aisle. It is what the builders call the chancel organ, which they have made a speciality of their own, and which has obtained for them a silver medal at the Paris Exhibition. The nave is lighted by six clearstory quatrefoil windows; the south aisle with two two-light, and one three-light windows; the north aisle by three two-light, the north transept by a large three-light tracery window, and the south transept by two three-light tracery windows, decorated. At the west end of the north aisle there are two small memorial windows, one a two-light window with figures of Faith and Hope, the other also a two-light, with figures of St. Stephen and the Prophet Samuel. At the east side of the south transept there is a memorial window of stained glass. It is a three-light decorated window, bearing figures of St. Peter, St. James, and St. John the Evangelist. This was the chancel window of the old church. The chancel is lighted by a large five-light tracery window at the east end; in the north side there is a two-light window; and on the south side two two-lights, of coloured diaper glass, and three small windows, being the gift of the architect and builder. It is hoped that before long the eastern window will be filled with stained glass. In the tower at the west end there is a four-light tracery window. The three stained glass windows were all supplied by Messrs. Lavers & Barrand, of London. The seats throughout the church are open, and of stained deal. There will be accommodation for 440, the old church having only accommodation for 230. The building is heated with apparatus supplied by Messrs. Haden & Son, Trowbridge; and it will be lighted by eight decorated coronae, there being two polished brass brackets in the chancel, supplied by Messrs. Willis & Jones, of Frome. The old clock has been refixed in the tower. The churchyard has been extended.

PROVINCIAL NEWS.

Bacup.—The new Market-hall at this place has been opened with some ceremony. The internal dimensions of the Market-hall are 137 ft. by 71 ft. The erection is of stone. The central area is fitted with a uniform arrangement of stallages. There are three principal aisles or passages, and around the interior are twenty-three enclosed shops. In addition to this, there are under the basement of the building eight other shops which are used for the sale of fish, &c. The roof of the building is of iron and glass, in three bays, supported by twenty cast-iron columns, with ornamental girders. The height of the central roof from the floor of the Market-hall is 32 ft. The interior has been coloured, and there is ornamental stained glass in the roof. In connexion with the market, but having separate access, is a board-room, office for surveyor, and waiting-room, with lavatories, &c., &c. The total cost will be a little over 6,000*l.* The building has been erected by the Local Board from the designs and under the superintendence of Mr. Joseph Brierley, of Blackburn.

Doncaster.—The Grand Race Stand is being improved. Messrs. T. & C. Anelay, the contractors, are at work on it. The entrance to the Stand has been enlarged; the vestibule will be much wider; recesses are formed, and counters fixed in them for the sale of tickets. There are now two doorways, each of which is as wide as the old one, and if found desirable they

may be used separately for ingress and egress. The new building is in uniformity with the rear of the stand. A portico, approached by a flight of steps, will be erected and carried out with balustrades, &c., in detail, as the colonnade in front of the stand. The work is under the supervision of Mr. Anelay, the borough surveyor.

STAINED GLASS.

Llangollen Church.—The large eastern window of this church has been filled with stained glass by Messrs. Dono & Davies, of this town. The window has been erected at the cost of Lieut.-Colonel Tottenham, of Plas Berwyn, as a memorial to his mother. The window illustrates the Law and the Gospel. In the centre of the lower tier (representing the Law) is the figure of Moses, holding in his left hand the tables of the Law, and with his right pointing to them with a rod. In the four compartments on either side are the figures of the four major prophets, Isaiah, Jeremiah, Ezekiel, and Daniel. In the upper tier are the figures of our Saviour and the four Evangelists, our Saviour occupying the centre compartment, being raised above the side figures. In the tracery above them are their emblems; the angel, the lion, the bull, and the eagle, surrounded with ornament, in which are introduced the rose, leek, shamrock, and thistle. Above these, on the right side, is the figure of St. David, the patron saint of Wales, and near him are the arms of the see. On the left is the figure of St. Patrick, and above him the arms of the donor, who is of an Irish family. Over our Saviour are two angels holding scrolls. The two upper tops finish with a canopy formed by the lily.

Books Received.

"Railway Finance," by Joseph Mitchell, F.R.S.E. and C.E. Stanford, London. This pamphlet contains suggestions for the resuscitation and improvement of the railway companies who are at present in financial difficulties. It is in the form of a letter to Mr. Disraeli, as Chancellor of the Exchequer. The author says: "My idea is, that this is a most suitable opportunity for the interference of the Government in railway affairs,—for an experiment to ascertain the value of a semi-governmental management of railways, and for an interposition of a limited Government guarantee, which would restore public confidence, and enable the companies to right themselves."

The Government has to advance nothing, but simply to interpose its guarantee. When it has restored the company's finances, it may hand over the line and works to the shareholders, and recede from its charge."

This last remark, which is made in connexion with one special case illustrative of the author's idea, cannot fail to excite a rather sad smile on the countenances of many guarantors who read it. How often have they been told in confident language that they will have to advance nothing? Nevertheless, something should at once be done to put the great highways of the country on a right footing for the public convenience.

"Local Government in Battersea." The substance of an address, by J. C. Buckmaster, churchwarden, at a meeting of ratepayers (Chapman, Battersea). The object of the author of this address is to promote the discussion of parochial questions with a view to a more just and efficient system of local government. Few vestrymen, he remarks, know anything about parish business, or care to know: nay, in Battersea it is considered "scarcely respectable to attend vestry meetings"; and sixteen out of thirty-eight have never attended a single meeting. Mr. Buckmaster's observations well deserve attention.

Miscellanea.

THE LATE M. PACCARD, ARCHITECT.—The death is announced of M. Paccard, architect of the Palaces of Fontainebleau and Rambouillet, at Aix-les-Bains, in his 54th year.

HEARING IN THE HOUSE OF LORDS.—Professor Tyndall, Dr. Percy, and Mr. Barry, the committee appointed to report on the best means for improving the acoustic qualities of the House of Lords, have recommended that they shall be permitted to postpone full consideration of the subject until the beginning of next session.

COMPETITION, HARROGATE.—The premium offered by the West-end Park Company for a plan for laying out their estate, has been awarded to Mr. H. Hirst, architect, Bristol.

FREE SUNDAY AT THE CRYSTAL PALACE.—About 10,000 of the artisans of London, with their wives and families, assembled at the Crystal Palace, on the 25th August, it being the free Sunday granted by the directors every year to the officers of the trade societies and other organisations of workmen. The tickets are necessarily limited in number, and are distributed through the agency of the National Sunday League. Short addresses were delivered by several gentlemen from the platform on the great orchestra. In the evening a selection of sacred music was performed on the great organ.

SCHOOLS AT THE CREUSOT IRONWORKS.—Monsieur Schneider, the President of the Corps Législatif, and the head of the great ironworks at Creusot, has presented to the British Government a complete set of the illustrations of the system of primary instruction carried on in the schools attached to his works. In these schools upwards of 4,000 children are educated, and the system appears to be far more comprehensive and complete than that in any similar school in England. It is at these works that a large number of the locomotives for the Great Eastern Railway are manufactured and imported into England.

A TOWN UNDER SEQUESTRATION.—The governing body of the Royal Leamington Spa, Warwickshire, are placed in a position of great difficulty in consequence of Mr. Thomas Heath, of Warwick, one of the plaintiffs in the recent protracted litigation in Chancery against the Leamington Local Board, having taken steps to enforce the sequestration issued by the court for the infraction of an injunction restraining the Board from discharging the filtered town sewage into the river Leam, so as to pollute that stream. The penalty which the sequestration is to exact is 5,000*l.* The local Board are left without funds to meet the current expenses of the town.

NORFOLK AND NORWICH ARCHAEOLOGICAL SOCIETY.—The annual meeting of this society was held at Great Yarmouth. There was a numerous attendance. The proceedings commenced with a paper by Mr. C. J. Palmer on the Star Hotel, in which they were assembled. The members next inspected the Town Hall, after which they proceeded to the parish church of St. Nicholas, a paper on which was read by Mr. A. W. Morant. The party, after quitting St. Nicholas, proceeded on their excursion tour, visiting in their route the churches of Caister, Hemsby, Winterton, West Somerton, Martham, Rollesby, at most of which short papers were read. In the evening, after their return, the party dined at the Star Hotel, the Mayor presiding.

MANCHESTER INSTITUTION OF ENGINEERS.—The first annual meeting of this institution has been held in the Town-hall, King-street. There was a large attendance. Mr. Alderman Bennett presided. Mr. E. Dando, the secretary, read the committee's report, which stated, that since the institution was formed, in March, 1867, its progress had been in every respect most satisfactory. There were now sixty-four members, eight associates, and one graduate. The primary objects of the institution were an interchange of ideas, and the growth of mechanical and scientific knowledge, and the committee hoped to be favoured with many communications for the enlightenment of the members. The report was adopted, and the council for the current year appointed.

THE BELLS OF ST. ANDREW'S, PLYMOUTH.—The bells of St. Andrew's Church, Plymouth, have undergone inspection by Mr. Hooper, of Exeter, who has been requested to send in his estimate of the cost of putting the peal in complete order. The steeple and bells were pronounced to be in a very satisfactory condition, and the frames perfectly steady and free from vibration when the large bells were in full swing—a fact attributable no doubt to the enormous strength of the walls of the steeple, which allows of what would otherwise be considered a dangerous course, wedging the frames to the walls. Some of the large bells, however, require considerable strengthening of the stocks to which they are suspended, and also of the ironwork. Surprise has often been expressed by ringers that this peal, which was always intended to be ten (the places being left for two bells) should have remained so long incomplete.

EASNEY PARK, NEAR WARE, HERTS.—The foundation stone for this mansion for Mr. J. F. Buxton, has been laid. Mr. A. Waterhouse is the architect; Mr. W. Beass the builder; and Mr. G. Burton, clerk of works.

ODESSA HARBOUR.—We understand that the prize of 1,200*l.* has been awarded (over twenty other competitors) by the Emperor of Russia to Sir Charles A. Hartley, C.E., and engineer in chief to the European Commission of the Danube, for his plans for improvements of the harbour of Odessa.

A SPIRE SHATTERED BY LIGHTNING.—The spire of Eldersfield church, near Tewkesbury, has been struck by lightning. The lightning struck the spire about 16 ft. from the top, displacing large portions of masonry both above and below the part struck. Passing down, it struck out holes through the stone in several places, cracking the spire more or less all the way down; it then appears to have expended its remaining force on the covered top of the belfry staircase, a portion of which it shattered. The stones driven out were scattered about the churchyard. Fortunately the bells were uninjured. The spire had been partly rebuilt and thoroughly repaired in the autumn of 1862. A considerable portion of it will require rebuilding.

A DISPUTED CONTRACT.—At the Stockton County Court, the case of Wright v. Moore has been decided. The plaintiff was a contractor living at South Stockton, and the defendant resided near Stokesley. The action was brought to recover 14*l.* 8*s.* 6*d.* for drainage work. Complaints were made to the Stockton Local Board of Health of a nuisance existing on defendant's property, and he was requested to abate the nuisance. The defendant saw Mr. Spicer, the surveyor to the Board, and gave him authority to do what work was required to remove the nuisance. On one occasion Mr. Spicer introduced plaintiff to Moore as a suitable person to repair the drains complained of. The defendant gave him orders to do the work, and afterwards disputed the bill, saying that the Local Board were liable. A verdict was given for the plaintiff to the full amount.

MONUMENTAL.—A favourable site for the national monument to Lord Clyde has been fixed upon, and the monument itself is in a fair way to completion, more than half of it being already erected. The site is in Carlton-gardens, opposite the monument recently erected to Sir John Franklin, the Arctic navigator.—The German press contains a proposal by Karl Blind to erect a monument in honour of Robert Blinn, the member of the German Parliament who was executed at Vienna in 1848, according to a court-martial decree; as well as one in honour of Trutzschler, also a member of the German Parliament, who was shot at Mannheim in 1849, together with a large number of the champions of democracy, at the order of the then Prince, and now King of Prussia.—An equestrian statue of Napoleon I. has just been inaugurated at Montreux (Seine-et-Marne) with great ceremony. The figure stands upon the level space between the two bridges at the confluence of the Yonne and the Seine, in front of the plateau of Sarville.

THREATENED ENCLOSURE OF WANDSWORTH COMMON.—A great meeting of the inhabitants of the parishes of Wandsworth and Battersea has been held at Clapham Junction. Between 4,000 and 5,000 were present. The destruction of a fence surrounding a portion of the common enclosed by the Brighton Railway Company seems to have been threatened, but Earl Spencer got from Sir Richard Mayne a body of mounted police to check any damage, and the railway company had a suspicious number of "navvies" in knots among the crowd. The proceedings commenced with an address from Mr. J. C. Buckmaster, M.A., churchwarden of Battersea, and it was resolved unanimously:—"That this meeting regards with extreme sorrow and regret the enclosures which have taken place on Wandsworth Common, and urges the committee appointed for its preservation to take every step to restore the privileges which the public have enjoyed from time immemorial." Mr. Buckmaster said that two or three private gentlemen would destroy the fence, in order to try the rights of the case; and, in a closing speech, he produced roars of laughter by the repetition of the lines,—

"The crime is great in man or woman
Who steals a goose from off the Common;
But who shall plead the man's excuse,
Who steals the Common from the goose?"

"TO ARTISTS."—We would draw attention to the premium for designs offered by the Council of the Art-Union of London. The advertisement of this in our last said,—the drawings must illustrate some "political" or historical work. This should have been *poetical* or historical work.

CHOLERA.—The epidemic which lately visited us is spreading through the Continent, and, besides its more prominent field in Italy, at present, has appeared at Marseilles, Rotterdam, and elsewhere. Severe as it has been about Rome, the filthy state of which has been an object of remark in the newspapers, cholera is by no means so virulent now, at least in this country, as it once was. Our sanitary improvements have evidently stripped it of half its terrors.

VEGETABLE HAIR.—California papers state that there is now dug out of the mountains of the Sierra Nevada range a better material for beds than has been hitherto available in the markets of the world. It is the soap root, which grows in unlimited quantities in that region. It is a bulbous root, enveloped in a very tough and supple fibre, resembling somewhat the husk of coccoanut in colour and appearance, but nearly as tough as whalebone. The natural colour is brown, but it is often coloured black, and an expert, it is said, would find it hard to tell it from curled hair.

PROGRESS OF THE TRUE PACIFICATORS.—Another "terrible engine of war" has been invented by Herr Von Dreyse. It is a shell needle-ric; that is to say, a needle gun which throws diminutive shells, which burst in the human body and tear the flesh to pieces. If anything be likely to put an utter end to war, it must be a diabolical invention such as this. Could they not add poison to the shells to strike additional terror into those whom kings lead like unresisting sheep to the slaughter? Our only hope is that both sides in the next threatened war will be supplied with such pacificators.

THE LATE MR. MACINTOSH, MARBLER.—A correspondent mentions the death of Mr. James Macintosh, of the firm of Macintosh & Nicol, imitators of woods and marbles, and whose productions in the Royal palaces, the principal public buildings of London, the provinces, Scotland, and Ireland are well known. He left Scotland some twenty-six years ago as a journeyman painter, and worked his own way to a good position. His last works were for the Queen, under Mr. Homan's directions at H.R.H. the Prince Consort's Mausoleum, and the Duchess of Kent's Mausoleum, at Windsor; and at the Enton Hotel coffee-room, Easton-square, for Messrs. Holland & Hannen.

TWO CHURCHES UNDER ONE ROOF.—Instances of two churches in one churchyard have been mentioned in your columns, but the following example of two churches under one roof must be unique. Two distinct churches are under one roof at Pakefield, near Lowestoft—All Saints' and St. Margaret's—forming a double aisle of similar architecture and dimensions, divided by seven pointed arches on octagonal pillars. It was evidently erected for two distinct congregations, and each had its own altar with raised steps. There is a square tower at the west end, and the lower compartment of a richly-painted rood screen, and the silver chalice is dated 1337. This instance is mentioned in Mr. Nall's *Hand-book to Great Yarmouth and Lowestoft*, from which book a great deal of valuable matter may be derived.—*Notes and Queries.*

BLACKFRIARS BRIDGE.—While removing one of the Surrey piers, preparatory to the construction of the new Blackfriars Bridge, two foundation-stones of black slate were discovered by the workmen. One of them is evidently a stone that was laid with all pomp and ceremonial, while the other and smaller one found near it was as evidently stowed away on the same day, but prior to the ceremonial, by some master workman, who took this advantage of his opportunity to hand down his name to posterity. The clear cut inscription on the first says:—"On the 23d day of June, 1761, in the first year of the reign of King George III., in the first stone of this the first pier was laid by Sir Robert Ludbrooke, knight, and president of the Honourable Committee for carrying this bridge into execution. Robert Mylne, architect; Joseph Dixon, mason." The second stone says:—"On the 23d day of June, 1761, in the first year of the reign of King George III., the first stone of this pier was laid by Joseph Dixon, master mason to this bridge."

CRICKET AND JOINERS.—Messrs. Simms & Marten have established a cricket club for the joiners belonging to their works at Chelsea. The two elevens meet at Battersea every Saturday from three till five; and the principals, as well as the foremen, attend and take part as often as circumstances will permit. They also have a club at Hastings.

FALL OF A NEW BRIDGE.—The bridge in course of construction at Crieff has been destroyed. Mr. Pitkeathley, the inspector, went to examine a damaged arch, when the fabric suddenly gave way, and he and four others were precipitated into the water below. A mason had his legs and arms broken, and the inspector got his jawbone fractured, and was otherwise cut about the head.

BIRMINGHAM SOCIETY OF ARTISTS.—The "private view" of this year's exhibition took place on Saturday last. Amongst the pictures exhibited there are the productions of Sir Joseph Noel Paton, R.S.A.; Vicat Cole, R. Thornburn, J. E. Millais, R.A.; T. Faed, R.A.; R. V. Martineau, James Danby, W. H. Fisk, G. E. Hicks, F. Dillon, J. Sant, A.R.A.; E. Nicholl, A.R.A.; the late J. Philip, R.A.; the late C. R. Leslie, R.A.; Eyre Crowe, George Sant, James Archer, R.S.A.; &c. The local artists come out creditably.

OUR NARROW RAILWAY BRIDGES: PERIL OF HER MAJESTY.—Every now and then one hears of a railway-guard being killed in attempting, from want of a proper gangway, or access through the carriages, to crawl over their tops as a watchman or actual guard over the train; and in one week lately two such cases occurred. From a slight excess of size in a carriage, the Queen has been in peril of her life from a similar cause, on her way to Kelso. Some doubt was suggested whether the new state carriage was not too wide for some of the bridges on the Waverley route. The gauge of the royal train was taken and applied to the bridges, and the result was that it was found that the new carriage would not pass through! At Carlisle the whole train had to be re-arranged, and a smaller saloon carriage of the London and North-Western Company put in place of the state carriage.

THE NEW MILLWALL DOCKS.—These docks have now nearly approached completion. The total area of the land purchased by the Millwall Dock Company is 204 acres; 42 acres will be the area of the water in the docks, so that 152 acres will be available for wharfs and warehouses. The portions of the work already constructed have a water area of something more than 33 acres, and present about 2,600 yards of wharf frontage. The graving-dock, which is also included in the work completed, is 413 ft. long, and has an entrance 65 ft. in width. The Millwall Docks are situated to the south of the West India system, and will, when completed, be of a T form in plan, the supporting line of the letter stretching towards the West-India Docks, the cross arms running at right-angles with the perpendicular, and being of nearly equal length. The lock-gates are each 43 ft. wide by 31 ft. high.

NEW UNDERGROUND TELEGRAPHIC SYSTEM.—A number of gentlemen connected with telegraphy have been at the residence of Mr. D. Nicoll, Oaklands Hall, Kilburn, for the purpose of witnessing a series of experiments with a new species of underground electric telegraph. The principle consists of its being made in sections of any length, and at any angle, and laid down in shallow or deep trenches at option, just as a line of railway may be laid, but without chairs, bolts, rivets, &c. The system is described as being of exceedingly simple construction, consisting of a zinc or other metallic semi-tube, or species of gutter, in which any number of electric wires can be laid. In manufacturing the conductors the wires receive first a coating of insulating substance, then a coating of fibre, and each wire is then embedded in the semi-tube, and embedded in more of the insulating compound. This insulating material does not decompose. It consists mainly of *copied* Trinidad bitumen, and with 16-gauge copper wires in zinc troughs the system can be laid and completed, it is said, for 20 per cent. less than the present cost of overhead wires, either on poles or house-tops. It has been calculated that twenty miles of sections, containing fifty or more wires, may be laid in a day by thirty labourers. The cost of each wire will, it is said, ordinarily average not more than 5l. per mile.

ORGANS IN THE UNITED STATES.—A large new organ has just been completed in the Boston Music Hall, and has been opened before a numerous and enthusiastic assemblage of listeners. In other cities it is said that new organs of considerable size have lately been built, and the choral societies after our English fashion at here and there springing up.

THE COPPER TRADE.—The firmness evinced by holders, say Messrs. Vivian, Younger, & Bon (August 23), especially of Chili produce in Liverpool, has resulted in a further improvement in prices of that description, bringing the figure for spot bars, good brands, up to 70l., while 14s. 6d. have been refused for a cargo of regulum to arrive. The actual business done has been only moderate. At the present moment there are no sellers of bars to arrive at 71l. English copper has participated in the improvement and a fair business has been done in tough at 78l. and 79l.

SOUTH WALES INSTITUTE OF CIVIL ENGINEERS. The annual general meeting of the members of this flourishing institute has been held in the theatre of the Royal Institution, Swansea, under the presidency of Mr. George Martin, of Dowlais. Upon the table were specimens of fuel dipped in petroleum—bricks of compressed Aberdare steam coal, made at Aberaman, submerged in water 10 hours; of the Tredegar coal exposed to the sun wind, and rain for six weeks, made by Barker's machine, also sections of Davies's steam strikers. After some official business had been got through a previous discussion on a paper by Mr. G. C. Pearce on Mechanical Ventilation was continued, and papers on the Structure of Iron, by Mr. Vivian; on the Duration of the South Wales Coal-field, by Mr. Bedington; on the Port of Newport and its Coal-field, by Mr. A. Bassett; and on the Cornish Engine, by Mr. Loam, were read and discussed. Other papers were read, and several postponed. The members and friends of the Institution afterwards dined together at the Cameron Hotel.

TENDERS

For erecting a pier and landing-stage at Battersea, for Messrs. Peck & Jardein, Mr. C. P. P. P., architect.—
 Simms & Marten £850 0 0
 Hedge 546 10 0
 Ripley 490 0 0

For a house at Tuenbridge Wells, for Mr. John Guy, Mr. Fredk. Johnstone, architect:—
 Axford £6,170 0 0
 Willicombe & Oakley 6,350 0 0
 Punnett & Son 6,074 0 0
 Simms & Marten 5,876 0 0

For alterations and repairs to No. 3, Portland-place, Mr. W. A. Baker, architect. Quantities supplied by Messrs. Richardson & Waghorn:—
 Burdett £1,938 0 0
 Wheeler (accepted) 1,777 0 0

For the erection of four houses in Longfield-street, Merton-road, Wandsworth, for Mr. T. Oliver, Mr. De Carly, architect:—
 Hearn £699 10 0
 Strong, H. 697 0 0
 Rendall & Son 685 0 0
 Peck 613 10 0
 Strong, W. 560 0 0

For additions and alterations at Nos. 12 and 13, St. John's-street, Clerkenwell, for Mr. W. E. Bridges, Mr. W. P. Griffith, architect:—
 Devereux £785 0 0
 Martin 650 0 0
 Bishop 613 10 0
 Bamford 600 0 0

For building four shops on North London Railway Company's land, Dalston-lane, Mr. E. H. Horne, architect:—
 Bishop £2,679 0 0
 Axford 2,554 0 0
 Eston & Chapman 2,482 0 0
 Freedy & Son 2,375 0 0
 Crabb & Vaughan 2,268 0 0
 Turner (accepted) 2,447 0 0

For the erection of an hotel in the Cattle-market, Derby, exclusive of foundations, cellaring, and stabling, Mr. George Thompson, Borough Surveyor, architect:—
 Lockett & Forrest £1,490 0 0
 Thompson 1,744 0 0
 Gadsby 1,564 0 0
 Fryer (accepted) 1,539 0 0

For the construction of pipe-sewers and other works in connexion therewith in the parish of Putney, for the Wandsworth Board of Works. Mr. Jas. Niblett, surveyor:—
 Blackmore £1,650 0 0
 Brew & Co. 1,429 0 0
 Trisley 1,387 4 0
 Avis & Son 1,355 0 0
 Watwright 1,349 0 0
 Goodyear 1,209 0 0
 Robinson 1,246 0 0
 Strickson 1,175 0 0
 Wigmore 1,098 10 0
 Thackerah 950 0 0

The Builder.

VOL. XXV.—No. 1283.

"Wanted, a Manager."

CONSOLS, we are informed by the oldest, and, we may add, deservedly the most influential of those daily journalists who tell us of the state of the money market, "are again at the point from which during the last eight weeks they have several times suffered a relapse." "The relapse usual of late after every slight advance in the English funds has been witnessed to-day." "The English funds continue to decline." "Railway stocks showed a tendency to relapse." "British railways were again disposed to weakness." Such is the ordinary tenour of the "City intelligence" during the present harvest season.

"This season," says a well-known agricultural authority and experimentalist, "will be a very profitable one." "The Corn-market," says our earlier quoted informant, "was very dull this morning, at the decline of between 2s. and 3s." "Prices," we hear from Dorsetshire, "have a decided downward tendency." "Old wheat," at Gainsborough, sold at 2s. per quarter "less money." At Salisbury, with "an improved attendance of farmers, millers, and dealers," new wheat fetched from 2s. to 3s. per quarter less than last week. The same character of market prevails at the eight principal local centres of the corn trade, from Newcastle to Dorchester, from Lynn to Monmouthshire, that is to be remarked on the Corn-exchange in Mark-lane. It will be borne in mind that a decline in the price of wheat is evidence of an increase in the supply, or, in other words, of a progress in the harvest more abundant than the promise of the previous week gave reason to expect.

If we turn to another part of the same journal we read that—"The Board of Trade returns for the past month indicate the continuance of a steady export business, the declared value of our shipments having been 15,562,430l., or 4 per cent. in excess of those of the corresponding month of last year, and 10 per cent. above those of July, 1865.

The existence, in parallel columns of the same journal, of reports such as we have above cited, is a proof of that remarkable and unprecedented condition of our commercial and financial industry which, more than eighteen months ago, we warned our readers to expect. For it must be borne in mind that dulness in the money market and dulness in the market for produce may, under the same name, describe a very different state of things. The English funds remaining with little fluctuation at the high price of 94 or 95, indicates an abundance of disposable money, and the returns of the Bank of England, as well as those of the Bank of France show an accumulation of million almost altogether without precedent in the vaults of those two gigantic establishments. The certain indication of the improved character of the harvest which is given by a general decline in prices, assures us against the probability of a diminution in that stock of bullion for the purchase of foreign grain, as well as of that increase in comfort and activity of our industrial classes

which is affected by the price of the loaf. With these symptoms of that description of prosperity which is expressed by the significant phrase of plenty of ready money, we have to couple the absolute testimony of statistical returns as to the increasing activity of our commerce. A rise in the value of the exports of the month of 4 per cent. over that of the corresponding month in 1866, which in its turn was 6 per cent. above that of the similar period in 1865, would seem to be in itself no very imperfect criterion of the well-doing of the country during the present year.

And yet the tone in which the writers of the money articles speak is one of almost hopeless dependency. Nor can any one fail to be aware, to some extent, of the cause. Private suffering is known to be very considerable; and all those professional and industrial classes which the rapid development of our great public works during the last third of a century has swelled into so important a portion of the nation, are suffering, more or less acutely and persistently, from want of occupation.

The novelty, then, of the present position is this: production, properly so called, and trade, in as much as it is not speculative, but a true function of production, are not only unchecked, but steadily increasing in a ratio far above that of the increase of the population. But, on the other hand, speculation, as it once existed, has disappeared, and the want of confidence engendered by the heavy losses and reckless extravagance of the last period of inflation has put a stop to that higher species of production which looks beyond the returns of the single year, and increases the national wealth by the constant application of labour to the development of the resources of the future. There is, therefore, good as well as evil to be found in the causes of the present embarrassment. Unfortunately, the two are not to be dissociated, and it would be hoping in the face of all experience of human nature to suppose that we shall witness a wise application of our ready money to increase the actual productive power of the nation, without a revival at the same time of that spirit of gambling which has made so many victims to the decennial panics of the present century.

We may regard the same important question in another light, but with a similar result. If we leave out of consideration those whose realisable property exempts them from the call to labour, in any manner, for their support, and those who are but too happy to find employment for their daily toil, and even thus to secure little more than daily bread, we must be aware that the sources of the income of most of the active classes are of a two-fold nature. First, there is the legitimate direct income, to which the attention of the recipient is naturally, regularly, and beneficially directed. Such are the fees which the physician earns from his patients, and the barrister from his clients; such are the profits of the farmer, the manufacturer, the carrier, the wholesale or retail trader. But then most of these persons have more or less income, for which they do not actually work. They have laid by so much of the earnings of former years, as they have not consumed in the support of their families, and from the investment of their earnings they derive a supplementary income. Some of these persons are content with such an investment of their surplus funds as need cost them no thought after it is once carefully made. Funds, exchequer bills, such plain loans on mortgage, rest of all a few acres of land, are purchases on which the fortunate man, who is a *bona fide* investor, may safely go to sleep. To such a man the "City article" has no interest—the financial panic no terror. The last month's excess over the customary banker's balance, bought Consols at 94—that of next month may hay them 1 per cent. higher or lower—it makes no appreciable difference. To sell to-day be-

cause one can make a five-pound note on the displacement of five hundred pounds, would be to trifle with time and attention far more usefully and more lucratively employed. The thought of a man in this position, if he be a wise man, is, to know best what to buy with safety, and so to lay up his spare money, that its dividends will thereafter come in without giving him any trouble or anxiety. And if he likes to make a fancy purchase, to take shares in the railway over which he daily travels, or in any undertaking, of the ultimate solvency and stability of which he has good reason to be persuaded, such investment takes the same position as the rest; he makes it for better or for worse, in hope, no doubt, of the better, but safe from any possible chance of taking a glass of wine less in the week if it turn out to be the worse.

Now, investors of this sensible character are the natural enemies of the large body of well-dressed sharks who live on the cupidity and on the fears of their neighbours. For our friends, not being unduly tempted by the former passion, are not readily to be preyed upon by the latter. And it is the possession by persons such as these, in considerable proportion, of Consols, of Bank Stock, or of any other of the more approved species of marketable security, that prevents those fluctuations on which a large number of unprincipled men exist from assuming the formidable proportions to which the speculators proper are always endeavouring to drive them. Speculation, then, would be a less profitable pursuit than it sometimes appears to be if it were not for the large number of industrial men, who neglect their legitimate sources of income when dazzled by the prospects of speculative investment. Men of this kind have also their business, but their hearts are not wholly there. It is not the spare money that they invest in a safe and remunerative fund, but all the money they can spare, which is a very different thing. And this they lay out, not as an investment, properly so called, but in something that they will buy to-day in the hope of selling better to-morrow. Now, it is clear that these men, half given to trade or professional exertion, half given to speculation, are likely to go to the wall in either case. The anxiety caused by the perusal of the "City article" distracts attention from the counter, the ledger, and the letter-book on the one hand, while on the other, hurried visits to the broker, or stolen half-hours of furtive calculation or picking up information, leave them no less at the mercy of the keener speculators who make a business of speculation.

It is this class of people who have (with the exception above given of the civil engineer and the rank and file of his subordinates) been the greatest sufferers from the financial crisis. At the same time it cannot be denied that it is to the same individuals that the crisis has been mainly due. Anxious to become rich, not by the pursuits to which they had been bred, but by a shorter cut to wealth, they have formed the ready prey of the speculator proper,—we were going to say the gambler; but it is a character worse than the mere gambler, it is the professional black-leg, who keeps himself cool and apparently respectable, and who can afford to keep cool because he knows how the dice are clogged. It may be said, that without the existence of the men who go in for a rise no public enterprise would be launched. It may be replied, that in their absence many public enterprises would not have been launched, and that it is just these undertakings that have come to grief. It is, of course, impossible to discriminate with any absolute certitude between the real and the speculative investor. Extraordinary circumstances may for a time convert the former into the latter. Still less can it be possible to arrive at their proportionate numbers. But we can hardly err if we set down the 200,000,000l. which

other writers besides ourselves have estimated to have been wantonly and mischievously squandered in our railway system to the credit of these half investors. That is one little result of their leaving their natural callings in order to get rich in a hurry. We have seen instances of the result in the leaders: who can tell the amount of misery caused and suffered by the rank and file?

As the main corpus on which the commencement of ill-judged and unremunerative enterprises has been based is composed of the ever-shifting and varying class of semi-speculators, it is not unnatural that the method of management usually adopted is precisely that which reason as well as experience would induce us to expect to turn even a good affair into a misfortune. A Board of Directors is chosen, or, in the first instance at least, usually chooses itself. A board, the well-known action of which form of association is to bring into prominence the worst features of each individual member, and to cast his better qualities into the shade, is usually a compound, inconsistent, and irresponsible artificial personage that undertakes the management of a large business, with the principles and details of which he is necessarily unacquainted, and deals with a large capital of which it owns an almost infinitesimal share. The real interest of the proprietors, and the "policy" of the directors, are thus materially dissociated, and very frequently opposed. It will be remembered that the men most anxious for the dignity or for the remuneration of directors are for the most part those who desire things to fill up their time because it is not better employed. The anatomy of one board might throw light on the structure of scores. Here you have the respectable country gentleman, engaged for his name and for the weight that it may add to his less known colleagues,—anxious to keep name and weight, but seeing little further over the green cloth spread before him than it is convenient for the secretary to allow. Then comes the active shrewd director on, or some how or other closely connected with, the Stock Exchange.

His influence goes to decide measures that may be expected to affect the price of shares, to tide matters over a crisis, or even to bring on that shock which "must come" before affairs can mend. Then follow two or three gentlemen whose names are down on many lists, and who are continually consulting their watches and their pocket-books in order to be in time to earn the next guinea at some other board. You may sometimes add to these the obstinate and stupid director, who may in other respects be a most estimable man, but who is accustomed to make a great hole in the available working time of the board by insisting on an explanation of what is patent to every one else, though sometimes he is not without value. Among these, or besides these, as secretary, director, manager, or what not, may be found the real wire-puller, the man who, unseen and irresponsible, moves the whole; and who, if he were the known and responsible manager, avowedly and equitably paid for his services, and responsible, at least in character, for the conduct of the undertaking, would give it the best chance of success. With a machinery such as this how can we be surprised to be told one day of a company which, "having taken legal advice," has "suspended the proceedings" to which they led their shareholders to look for solvency; another, of one which, having paid a dividend of 5½ per cent. upon eight millions of capital in 1854, has since that time spent another eight millions without producing a shilling of additional profit in the shape of returns; in short, from day to day, of the scandalous results of the most imbecile or most wanton mismanagement.

A famous French financier is said to have gained the first capital of which he made such active use by the simple expedient of annexing to the list of deaths which were chronicled in a local newspaper with which he was connected the name of the medical attendant on the defunct. So intolerable, after a time, did the attention thus excited to the results of the practice of his prey become, that a large purse was made up to buy off the inconvenient chronicler. A Shareholders' Manual, giving in a legible print the names of directors of failing and faltering companies, pointing out the date of their services, and giving adequate indications of the state of capital account, of dividend distributed, and of dividend earned, from year to year, might be of service to the next crop of eager purchasers of "something really reliable."

A better and more business-like plan has been

adopted by another large company, which, while involved in the struggles and the expenditure of the time, has kept to some extent out of the slough which has engulfed its most active rival. The chairman having intimated that the affairs of the company were now in such a state that he could leave them without peril, and that he must attend to his own interests, the shareholders very wisely secured the services of a man who seems to know what he is about, and to carry out what he purposes, by voting him an annual salary of 2,500*l.* A step of this kind is true economy. We do not speak of the individual, but of the principle. To select an able man—to give him ample power, to attach to him full and public responsibility, and to assure him an income which will enable him to devote his whole undivided energy to his work—such is the only rational mode of attempting to administer the greater number of our large social enterprises. No essentially rotten scheme can thus be made good, but many a good one might thus have a chance of fair development—many a moderate capital might be thus saved from extinction. When proprietors of property which they do not know how to manage will burst the bonds of clique, and look out in earnest for the best man for a manager, the worst of social enterprise will have passed. The true cry for the mass of helpless shareholders,—the one point to be kept, in the first instance, before every half-yearly meeting,—is: "WANTED, A MANAGER."

ROME, WITH SOME OBJECTIONS.

AND what of architecture at Rome? It seems a shame to have spent not a few weeks in the city that was the metropolis of the old world, when the world had indeed but one metropolis, and to have nothing to say of structures, ancient or modern,—nothing that if not new may not at least be as interesting to the absent as reminiscences from absent and unchanged friends are wont to be.

But certainly Rome is not a city that, whether in its ancient or more modern monuments, warms the architect to the preest enthusiasm. Doubtless it contains much that the architectural student may gladly take note of; but, as he re-peruses his notes, he will be apt to find that warnings of what is to be avoided outnumber the hints and the suggestions of beauty to be achieved. The sculptor and the painter have much better reward for lingering. In the Sistine chapel of Michelangelo and the Stanze of Raffaele, all the thoughts and imagery, the philosophy, poetry, and pictorial art of the Middle Ages ripened, and were harvested and garnered. Raffaele set forth the growth and progress of intellectual accomplishment in the "School of Athens," as Michelangelo depicted the expressive epochs of the great development of Hebrew religion; and, as his antithesis of the pagan sibyls and the Hebrew prophets declares, the anticipation that the two most progressive sections of the human race were at last to react upon each other. The so-called "Dispute of the Sacrament" of Raffaele is in fact an exhibition of the great project of the scholastics to reconcile reason and religion, philosophy and faith, Plato and the gospels. They may not have been so successful, their processes not quite so unquestionable as they are represented as supposing, but of the importance and dignity of the problem we are assured by the disputations that go on around us to this day.

It is not easy, again, to overestimate the importance of the Roman collections of sculpture for the sculptor. The Elgin collection of the British Museum is no doubt to sculpture what the Sistine Chapel and the Stanze are to painting. London must remain the most interesting centre of this art until the Oriental, the Eastern, question shall be so solved that we shall be justified no less than we are bound to return the greatest works of the greatest sculptor to their appropriate and rightful seat. Still Rome is its collections must be the basis of study for those who seek for the highest enjoyment of its varied capabilities and styles, or would hope to reunite, if it may be, some of the broken up and dispersed connexions of its development in history.

What pleasures has Rome to offer to the architectural sense that can be placed in worthy comparison? It has on one side St. Peter's, its porico, and the Vatican; on the other, in as distinct a group, the Colosseum, the baths and palaces of

the Casars, and even some republican, not to regal, reminiscences about the sacred way, forum, and the approach to the capital. The hill of the capital and the Tarpeian rock interposed between these more secluded groves and the modern city, which covers in its crowded parts the anciently free space of Campus Martius, and covers the sites or elaps round the remains of its scattered monument from the column of Trajan to that of Antonine from the almost perfect Pantheon to the opera theatre that now occupies the concave of a ruined mausoleum of Augustus. Arranged chronologically, there are scanty regal and republican remains, abundant Casarian of various merit—some few refined, and more that are chiefly remarkable for mass,—temples, and baths and palaces; then follow, but probably rather intermixed than in sequence, some structures that seem original in the debasement of classic art as it died out, and others composed of adapted fragments of earlier buildings; afterwards come on a more vigorous period when plunder materials were still adapted, but with a certain freshness in style of arrangement and a certain independence. Again, and this is scarcely change, if old materials are admitted they are without influence on plan, which leans on mix Byzantine and Lombard inspiration; proper Gothic is then sparingly interposed before the access of the full Renaissance, which is rife and rampant everywhere, and when not in entire and first possession is constantly found casing the works of predecessors without, or lining the within. In such an abundant series there cannot but be much to study and interest; but still we come back to the point, that of works that have that degree of perfection that entitles them to rank as finished works of art, lamentable indeed is the dearth at Rome.

A city may be taken as an architectural work in itself, and let us dismiss that first. The accidental who comes to Rome after seeing a few of the northern Italian cities is apt to be surprised at finding it so modern. The visit city might seem to have sprung up entire within the 150 years nearest to A.D. 1500. To one who may have been accustomed to think that the Reformation ruined the power of Rome it will be strange indeed to note how much of that constitutes its splendour as well as its mass dates, at least, after the birth of Luther. He may profit by the surprise if he turn back again to some neglected pages of history, which will fully account for how this happened,—by the vigorous reaction, and, indeed, qualified reformation within Catholicism, and by the large share that fell to the lot of the powers that remained Catholic in the flood of wealth that set in from the new world.

The productiveness of general industry was also at this time increased immensely; but at Rome these advantages were for the church and the nobles; in a less degree—in scarcely any degree at all—for a municipality; hence what we see,—sumptuous, elaborate, and immense, if not very frequently imposing structures, Churches, and colleges, and palaces, are placed for the most part, it seems, at random among surroundings of squalor unutterable. Here and there we trace an attempt to consult the architectural effect of an open space or public approach, but it is usually unfortunate and incomplete; at the best it is not exempt from the general rule, that whatever is in itself ornate is embraced by the atmosphere and all the incidents of the vilest slums. Dignity escapes from the contact, to a certain extent, though it cannot from the penalties of transit. When we penetrate to the interior of a palace or college we find that flights of stairs lift the noble apartments above the worst contaminations, while sometimes inner courts, glorions with well tended fruits and foliage, comfort eyes that have acquired a habitude of unconsciousness in traversing the vile approaches. Refinement turns its back upon the public ways, and climbs contentedly above the lower world; and housed amidst the happiness of art and decoration and secluded outlook, can afford to forget the conditions of a city that envelops it. Visitors still more excusably rush from the few well-founded hotels to galleries—to the Vatican, the gardens on the Pincian, the unrivalled landscape of the Campagna, and rationally are averse to allow a sojourn too short for all the delights at hand, to be poisoned by either sensations or reflections that are shocking or simply disagreeable. But there are some who have, more or less, self-command, whichever it may be; and such a one traverses the city from Via della Purificazione

to Ghetto, from Capitol to extremity of Corso, and does not find twenty consecutive yards that may not remind him of Seneca's allusion to *locus videtur meluentis*. Pio Nono is in the seat of the pupil of Seneca and the odies, and the fear of them have departed. If anything would revive that strangely regretful superstition (met with elsewhere besides in Suetonius), that Nero after all was not really dead, but would return from beyond the Euphrates and rule again, it might be a fond hope that he would bring back his odies, the antique district surveyors, and the who-some awe they inspired, along with him. The Roman fever as incipient is no doubt constantly chargeable on the surrounding Campagna and its miasma; but let physicians say how frequently its fatal result is due to the influences within the walls.

In a general view of the city, the cupola of St. Peter's is of course a most conspicuous feature, but from the nearer views it does not dominate the whole with the effect of St. Paul's,—a consequence of its position without, instead of in the midst of, and at the highest point of the city. For what value it has in this respect it must be caught sight of eminent above the horizon, when Rome is approached from the direction of Tivoli, or the Flaminian way. In some other directions its effect is marred by the mimicry of five or six other cupolas of not insignificant size in themselves, and nearer to the spectator. To mistake any one of these for St. Peter's may seem absurd enough; yet the mistake is at least often so near happening that the question is suggested,—the great cupola being sometimes out of sight, and its magnitude in many cases receiving no emphasis from the mean adjuncts at its base. It is possible that a painter by persevering search may find a point of view from which the projecting architecture of Rome may fall into happy combination,—but the effect does not occur spontaneously, and it will go hard but that pictorial license must be shrewdly indulged. It is in this respect that the aspect of the city of Florence is so effective; not alone from Bellasguardo, but from numerous other points, and from some, more happily, the towers and steeples and municipal palaces and Duomo rise above the houses and group most beautifully; their forms have sufficient variety for contrast, yet within a range sufficiently restricted to conserve the characteristic; in collation they are neither huddled nor dispersed, and by relative magnitude subordination enhances unity. The city of London of Wren has claims to be put in comparison,—Paris scarcely. But we are in Italy now, and shall do well to accept them otherwise were tempting to expound now it is that in the case of the twin spires of Coventry, “each gives each a double charm,” while in a not remote cathedral town the spires of the cathedral lose dignity by a spire of a later church, that after all only achieves for itself an expression of impertinence.

Modern Rome inherited from ancient times a large number of Egyptian obelisks, large and small, sculptured and plain, and has not been wanting in care for them; all are re-erected, repaired, and the inserted pieces in some cases, as at that of Psammethicus in the Campus Martius, have been spared the disgrace of clumsy and fictitious hieroglyphics to replace the obliterated. At Rome, however, as little as elsewhere, has the problem been solved of inventing a pedestal that shall improve upon the Egyptian mode of setting up these monuments upon a sheer flat; a problem possibly that it was not necessary to entertain for an obelisk any more than for a Doric column. Roman examples in confirmation of others, authorize us to speak of another treatment without any qualification as an abuse; this is the erection of a lofty obelisk directly in front of an important façade that interferes with it from important points of view. Three streets converge to the Porta del Popolo, and in the midst of the Piazza del Popolo is erected an obelisk that bisects the field of the archway, however we approach it from within. The Porta del Popolo is worth little architecturally; a reason good for either hiding it or pulling it down, but not for setting it in half; not for presenting an obstacle in the very line of our prospect of egress. Still more vexatiously out of place and in the way is the obelisk in front of the church of Trinita di Monte. The church is seen high and conspicuous by the many who come by direct line from the bridge of St. Angelo, past the Borghese Palace and along the much-frequented Via Condotti to the important Piazza d'Espagna; it is thus constantly in sight; the symmetry of the

front is most emphatically expressed in the central division, even the space immediately in front of it is so confined that when it is favoured it would at best scarcely afford a favourable point of view; and if it did the southern exposure would make it but rarely tenable; the value of the façade upon a noble site from its one excellent point of view is thus disgraced and ruined. The damage is more conspicuous as its central composition is responded to below by a double ascent of ample stone steps which carry the symmetrical distribution from the very piazza to the crowning structure only to collapse in renegeation and bathos. The elaborate double flight that passes intermediately and then branches upward again to right and left, seems almost as much sacrificed by this countenance at the conclusion as the church itself; it can ill afford reduction in importance as an object, for its uses are very secondary. Well do its barlike lines merit from students who look at them and shudder in passage to and again between easel and Caffè Greco, the title of the “Gridiron.” From the exposure to mid-day sun already spoken of, the vaporous heat rising from the steps as from a kiln makes their lines wavy and indistinct till it would be difficult to count them; and even hurried passers to the Via Felice creep round by backsteps, undignified but thoughtfully contrived, on either side.

The obelisk in front of St. Peter's is, of course, our last example, but, perhaps, it is the least reprehensible of all; by the time it comes into sight the cupola has already sunk into eclipse behind the meanly-designed façade, and the attempt of this to realize an effective central feature is far too miserable a failure for us to feel very hurt that it did not command more respect. Irony apart, however, the division of the ascent is still unfortunate, and the obelisk, from its magnitude, the symmetry of the beautiful fountains on either side, and the responsive curves of the porticoes, narrowly escapes usurping all the honours of the approach.

If we may be borne with in another reference to Florence, attention may be drawn to the care and skill with which the pair of obelisks—pyramidal cones, we may rather call them—are so disposed in the piazza before the Church of Sta. Maria Novella as to declare a definite principle of collocation, and yet not to interfere with façades from any important points of view.

The obelisk at Luxor flanked the entrance to a temple. One of the pair removed to Paris is now erected in a central position, where it must cut in two either the Palace of the Tuileries or the Triumphal Arch, and seems thus to jostle the spectator out of the one standing-place from which he could contemplate either, undamaged and at will. In this case, however—we have it on the best authority—architectural considerations were overruled by other influences: very pertinacious opposition indeed was unable to move Louis Philippe from his resolution that the site of the execution of Louis XVI. should be occupied by a monument that might have the greatest possible chance of being a fixture for all time. On the same authority the atmosphere of Paris, less conservative than the valley of the Nile, has already sensibly affected the sharp edges of the stone and its sculptures. Our own eyes, however, have their notes, and it is both fair and graceful to advert to them. The Monument interferes, indeed, with nothing; but it seems a pity that the few feet were not allowed for in the new street that would have brought it full in view from the very Mansion-house. The lofty pedestal of Chantrey's Duke does no good to the Royal Exchange as approached from Cheapside; and, though it is hard to cavil at the honours of Nelson as we come up Parliament-street, and are aware of the associations of the Admiralty, it is hard, too, that the column should so seriously complicate the problem of dealing with a site that remains fine and noble in the eyes even of those who have seen more of the sites of Europe than had Sir Robert Peel.

From Trafalgar-square, by the associative link of fountains, we pass easily back again to Rome. Fountains abound in Rome, and almost the only ugly one is that which interferes with the *beauchure* of the Via Condotti almost as destructively as the obelisk that is in a line with it above. It might seem as if the wealth of waters that ennoble Tivoli,—the precepts Anio of Horace,—had made any ignoble management of water here impossible. Even this waterfall of Tivoli—these waterfalls, as we now see them, are, to a great extent, works of art and

results of management; but Nature has all her rights reserved, and the scene from the peristyle of the temple of the Sibyl or from olive-groves around is worthy of that temple, the only architectural work within reach of the Capitol that is really worthy of name along with the master-works of Greece. Within the city, the fountain of the Trevi is, of course, supreme; and in what a situation!—it abuts upon a palace, and has much that is less sweet than Seven Dials for its immediate surrounding;—and even this is forgotten as we go out of our way,—shorter it may be, but not otherwise redolent,—to pass by it. Let not him drink of it, it is said, who would not be possessed thereafter with longing to revisit Rome. The excellence of the water is not disconnected with its beauty. There is a difference in quality of briskness and sparkle between fount or streams and tarns as ever appreciative eye of Jew could detect between the metaphorical water of diamond and diamond. Water pumped and re-pumped never shall reach this glory. But to describe all the beauty of the fountains of the Trevi would require an article by itself, and the point of view of architecture would still be liable to be lost in a rhapsody upon the variety of effect obtainable by the crystalline liquid spread as it descends into a glassy sheet, dropping in more silent but more copious mass, straggling in wild meanders, and escaping in spray, from under tufts of dwarf vegetation and self-sown lily fern, tossed into jets that add intermittent linking to the steady murmur, and all at last uniting in the ample basin rippled with the opening wavelets, and dotted, must it be said, with floating lemou-skins, and refuse more ungainly,—welcome, nevertheless, as a cooling bath to “Eric, good dog,” in intermission of his evening exercise, too apt to degenerate into a cat-nap. By light of day or light of moon, in shadow or in shine, this fountain is beautiful, probably the most beautiful ever devised, and after this admission we must reconcile ourselves as we may to the imitation rocks it flows over, the mythological sculpture that does not quite effect the aim that was boldly tried for, and the mouldings of the architecture of the Palazzo Polo, that lend into the rough unshapen masses, leaving some uncertainty as to whether it is in gradual development from the rude, or not rather about to sink back into undistinguished tufa, from which the chisel only temporarily could deliver it.

Not purity of water alone, but dryness and tranquillity of air, are essential to the beauty of a fountain. The fountain that breaks into spray to reinforce a fog, give effect to a chill, or simply drench a pavement, has claims to a kind of attention to which the beautiful is indifferent. Beauty is not much interfered with in this way at Rome, and there has been little check therefore to the varied forms in which water is sported with. The water is ever copious, and so far as we have observed, unintermittent; and however it is managed for the sake of beauty, the chief reliance is always placed on the hearty that is to be elicited from the water as water,—not as thrown into representations of cages and basket-work. Then even the variety of sound that water produces as it falls variously seems to have given motives of treatment, and one fountain is passed from time to time, where the water seems delivered in an upper basin in successive basketful and comes over regulated but splashing.

Climate must ever limit the application of fountains in England as enhancements of architectural combinations; but climate being duly allowed for, they may often be important as well as beautiful. Fountains by the street side for thirsty wayfarers may seem more within the province of the sculptor; yet there is no escape from the observation that too many protest by visible signs against a failure not alone in proportion and architectonic detail, but in those adjustments with reference to physical incidents as well as taste that the architect alone has always under his consideration.

BRIDPORT SCHOOL OF ART.—The annual meeting of this school has been held. A large number of persons attended. The Mayor distributed the prizes. Mr. J. P. Montague was in the chair, and expressed himself strongly in favour of the teacher, Mr. Dewar Campbell, and the success of his efforts. Two hundred and forty-five works, executed by the students, had been sent to Kensington for the annual examination.

OLD ST. PANCRAS.

THINGS have wonderfully changed since the author of "Speculum Britannia" wrote, in 1593, that "Pancras Church standeth all alone, as utterly forsaken, old and wetherheaten, which for the antiquitie thereof, it is thought not to yield to Paule's in London. About this church have been maile buildings now decayed, leaving poore Pancras without companie or comfort; yet it is now and then visited with Kentish Towne and Highgate, which are members thereof; but they seldom come there, for that they have chappels of ease within themselves; but when there is a corpse to be interred, they are forced to leave the same in this forsaken church or churchyard, where (no doubt) it resteth as seems against the day of resurrection as if it laie in stately Paule's." Honest John Norden as little foresaw the wreck which the Great Fire made of "stately Paule's," as he did the havoc which the Midland Railway Company have committed in "poore Pancras." The former event is a matter of history, and we propose in the present article to say a few words on the latter, and to mention some points of interest connected with the locality. Public attention was drawn to the subject in this journal about eighteen months ago, and most of our readers are aware that the line of the Midland Railway passes directly across the churchyard.

The first thing which strikes a visitor on entering the churchyard is the number of grave-stones bearing crosses, the occurrence of such inscriptions as, "*Pie Jesu Domine, dona ei requiem*," and representations of the Crucifixion. One of these is rather elaborate, and is carved in low relief,—a very unhappy imitation of rude Medieval work. Their appearance shows plainly that they were erected at a period when Anglicanism was not sufficiently advanced to admit of such things in a Church of England burial-ground. They belong, in fact, to Roman Catholics, with whom St. Pancras was at one time a very favourite place of interment. It has been asserted that this preference was owing to the fact that Roman Catholics were burnt there in Queen Elizabeth's reign. It has also been explained by saying that mass is said daily in a church dedicated to the same saint in the south of France, for the repose of the souls of the faithful buried at St. Pancras in London.

Both of these statements appear, however, to be without foundation, and Mr. Markland, in a note to Croker's edition of Boswell's "Life of Johnson" (1860, p. 840) says,—"*I learn from unquestionable authority that it rests upon no foundation, and that mere prejudice exists among Roman Catholics in favour of this church, as is the case with respect to other places of burial in various parts of the kingdom.*" It is also said that this was the last church in England after the Reformation whose bell tolled for mass, and in which the rites of the Roman church were celebrated. Several of these interments may be accounted for by the fact that a large number of French refugees, who were driven from France at the Revolution, settled close by in Clarendon-square. They would naturally find a last resting-place in their parish churchyard. Amongst them were several bishops, but the inscriptions on many of their grave-stones are entirely obliterated (thanks to a London atmosphere and the exhalations from some gas-works in the neighbourhood), whilst the bodies of others have been removed. The most conspicuous of the monuments was that erected to the memory of Jean François de la Marche, Bishop of St. Pol de Leon. Forced to fly from France, he devoted himself whilst in this country to helping and consoling his suffering fellow-countrymen. He died in Queen-street, Bloomsbury, in 1806. His epitaph is said to have been written by the Marquis of Buckingham. A mean, neglected gravestone, situated a few feet from the eastern wall, tells us that Arthur Richard De Lox, Archbishop of Narbonne, is buried underneath. He died in 1806. One of the most touching epitaphs in the churchyard is that of a poor French nobleman, who, whilst grateful for the shelter which England afforded him, cannot forget "*Ma Normandie*." It runs as follows:—" *Ici, loin de sa patrie, repose L. F. E. Camus, Seigneur de Pontcarré, de noble et très ancienne famille de magistrature, premier Président du Parlement de Normandie, Conseiller du Roi en tous ses conseils. Décédé le 6 Janvier, 1810, âgé de 64 ans. Fidèle à son Dieu, à son Roi, à ses sermens, il fut persécuté, dépourvu d'une grande fortune. Proscrit, il vint avec une partie de sa famille sur cette terre*

hospitalière et généreuse. Longues années après sa veuve et ses enfans ont rendu cet hommage à sa mémoire vénérée." The Comte d'Hervilly and several other French marshals are buried here, as is also the Chevalier de Sainte Croix, Minister Plenipotentiary of Louis XVI. at the court of Sweden. At the fall of his royal master he fled to this country, where he became involved in much pecuniary distress, and died in 1803. We may also mention Tiberius Cavallo, a well-known Neapolitan writer on natural philosophy; the Chevalier d'Eon, the unfortunate nobleman whose sex was a matter of so much dispute during the last century; Jeremy Collier; Timothy Cunningham, author of the "Law Dictionary;" James Leoni, architect; General Pascal de Paoli, Corsican patriot; Stephen Paxton and William Webbe, both well-known musical composers of the last century; Samuel Francis Ravenet and William Woollett, engravers; John Walker, the lexicographer; William Godwin, author of "Caleb Williams" and "Political Justice," and his wife, Mary Woolstonecraft, who wrote the "Rights of Woman." Although the monument remained, the bodies of these individuals were removed many years ago to Bournemouth. Amongst the eminent Roman Catholics we must not omit Father O'Leary, of the Order of St. Francis, who died in 1802. He was much esteemed for his amiability, but he held heretical opinions with regard to the temporal power of the Pope. The monument was erected by Earl Moira, and repaired by public subscription so recently as 1851.

The appearance of the churchyard is materially altered since its invasion by the Midland Railway Company. It is as nearly as possible five acres in extent, and in its original condition Old St. Pancras Churchyard was a very dismal place indeed. There were no paths, and the grass was apparently never cut, but had been for some years allowed to grow and die down again. The outline of most of the graves was entirely obliterated, and scarcely any two grave-stones were parallel. The burial ground of St. Giles, which joins Old St. Pancras Churchyard, is of about the same size, but the desolation is relieved by the presence of a few trees. We may remark, that the building formerly used as the Cemetery Chapel, in the vaults of which a large number of bodies are interred, is now a school-house.

The churchyard consisted originally of about 1½ acre, and the population in the immediate neighbourhood was exceedingly small, the chapel-of-ease at Kentish Town being really of more importance than the mother-church. In the latter part of the last century the population increased very rapidly, and several new streets and squares were built in the neighbourhood of the New Road. The churchyard was soon overcrowded, and the vestry-books of the period contain continual complaints to this effect. In the year 1792 an Act was obtained to enlarge the ground, stop up a foot-road which ran across the churchyard, and build a house for the sexton. So anxious were the Parsonians to economise their space that the sexton's house was built on the old ground instead of on the new. This fact was brought to light when the house was demolished, a short time back, by the Midland Railway Company, bones and fragments of coffins having been discovered amongst the foundations. It was originally intended that the railway should pass over the churchyard by a viaduct which would just clear the tombstones, and the only powers conferred on the company (so far as St. Pancras churchyard is concerned) by their original Act of July 22, 1863, are those necessary to take the sexton's house, and a portion of the churchyard, for constructing the piers, the dimensions of which are strictly limited. The representatives of persons buried in those parts of the ground required for the piers were allowed to remove the remains of their friends, the cost being borne by the company. The original plan, though very objectionable, was not nearly so bad as the one which was afterwards carried out. By a subsequent Act, which received the Royal Assent on the 25th of July, 1864, the company were empowered to make a tunnel, to join the Metropolitan at King's Cross, in addition to the viaduct above mentioned, which carries the line leading to the proposed terminus in the New-road. No part of the tunnel was to be within 12 ft. of the surface, and the company were not to acquire an absolute interest in any part of the churchyard, but were empowered to purchase and take an easement under it, to such an extent as might be necessary for the construction of the railway.

Now it is obvious to any one possessing even slight knowledge of London graveyards, that a limit of 12 ft. from the surface is of very little use in preserving the remains intact.

The sickening nature of the excavations which were rendered necessary by the rebuilding and enlargement of the old church in 1840, was described in these columns by Mr. Gough, the architect engaged in the work. Mr. Chadwick quotes the evidence of the chairman of the Highborn and Finsbury Division of Sewers, showing that the exudations arising from the decomposition of the bodies were most offensive in the excavations of a sewer situated at a distance of 30 ft. from the churchyard. These statements refer to a period of twenty-five years ago; and seeing that the ground has now been closed for some time, the work of removing the bodies during the recent encroachment by the Midland Railway Company, has not been attended with much inconvenience. At all events, the task of tunnelling through a densely packed mass of old coffins was not pleasant to contemplate; so the company drove their Adair and opened a trench right across the churchyard. In the course of their operations they removed between 10,000 and 15,000 bodies, which were re-interred in an adjoining piece of ground which had been purchased and consecrated for the express purpose. The removal appears to have been effected with great care, and with as much reverence as the case would admit of. Attempts have even been made to place tombstones in their proper relative positions in the new ground, but the crowded state of the churchyard must have rendered this almost impossible. There is little doubt, but that the plan adopted by the company was the best, although at first sight it looks like a gross violation of the pledge. The proceedings of the railway company have been the cause of much pain to the inhabitants of the parish, most of whom were, however, too poor to do anything but complain. On the occasion of one of our visits, the subject was being discussed very warmly by two or three groups of people whose friends were hurried in the ground. The news reached even to Corsica, where much indignation was felt at the proposed removal of the bodies of Paoli and his countrymen. These graves have, however, not been interfered with.

Respect for the dead, and for their last resting-place, is happily not uncommon, and it is important that no violence should be done to such a sentiment. Those portions of the earth which have been set apart and used for sepulture should not be lightly disturbed. It is quite unnecessary to consider whether the ground has been "consecrated;" it is in our sense holy to the remains of those who were dear to us. The law, it is true, recognises no such claim as this, but, on the other hand, it has conferred certain important privileges on consecrated ground. Burial-grounds have never been consecrated, but has most properly been allowed to remain undisturbed. With "poore Pancras," however, the case is different. The choice of the company lay between a churchyard and some gas-works, and it was easy to predict which would be taken. The bodies, we have said, were removed to a new piece of ground consecrated a short time previously. Now, supposing the company funds, in a few years, that this new graveyard would be desirable site for a goods-shed, is there any reason to believe that it would not be built due course? Judging from the facility with which the company obtained permission to make a huge gas in the old ground, we should be decidedly so. The solemn dedication of ground to sacred purposes becomes, in fact, a mere form when it can be deconsecrated almost as a matter of course by simply applying to Parliament. Such a state of things is not desirable, and, if all the protection afforded, the ceremony of consecration might as well be performed in a dunghill.

The Midland Company made an attempt, we believe, to buy the entire ground, including the church; but this was happily frustrated,—for the present, at all events. It will, however, probably happen, sooner or later. The churchyard of Old St. Pancras is somewhat peculiarly situated. It is the Act 56 Geo. III., cap. 39, the rights and privileges of Old St. Pancras as a mother church were transferred to the new edifice in the New-road; but, whilst the old building ceased to be the parish church, the burying-ground remain-

* A Supplementary Report . . . on Intermment Towns: London, 1843.

the parish churchyard, and, as such, is vested in the Vicar of St. Pancras. Unremitting efforts have been made by the Rev. Mr. Arrowsmith, perpetual curate of Old St. Pancras, to preserve a ground attached to his church; but the curate decided that he had no *locus standi*.

Whilst defending burial-grounds we must not fall into a very common misapprehension, and which it may not be improper to mention by way of conclusion. It is generally held at a person once deposited in a churchyard as a sort of legal right to that ground for ever afterwards. The law of the subject was clearly laid down in a judgment given by Lord Stowell, in the case of *Gilbert v. The Churchwardens of St. Andrew's, Holborn*, on the use of iron coffins. "It has been argued," says his lordship, "that the ground once given to the body appropriated to it for ever. It is literally in certain unalienably. It is not only the *domus eterna*, but the *domus eterna* of that tenant, and is never to be disturbed, be his condition what it may. The introduction of another body into that lodgement at any time, however distant, is an unwarrantable intrusion. In these positions he true, it certainly follows at the question of comparative duration does not utter insignificance. In support of them, it seems to be assumed that the earth itself is imperishable; for, surely there can be no inextinguishable title, no perpetuity of possession, belonging to a substance which itself is perishable. But the error is that "man" and "for ever" are terms quite incompatible in any state of his existence, dead or living, in this world. The time must come when *ipse pariterque*, when the possessor remains must mingle with and compose a part of that soil in which they have been deposited. . . . The *domus eterna* is a mere flourish of rhetoric; the process of nature will steadily resolve them into an intimate mixture with their kindred dust; and their dust will slip to furnish a place of repose for other occupants in succession. The common cemetery is *res unus atatis*, the property of one generation now departed, but is likewise the common property of the living, and of generations yet unborn." The judgment goes on to say that any contrivance which prolongs the time of dissolution beyond the period at which the common understanding and usage have fixed it, is an act of injustice, unless compensated in some way or other. Such contrivances, moreover, are sure to bodies a much longer possession, and comparatively small portion of the dead will ponder out the living and their posterity. This, however, is not sufficient to justify such desecration as that recently committed by the Great Eastern Railway Company, and we have not a word to say in favour of the way in which it is to be "acquired" a church and churchyard, as a little compunction as they would buy a bit-house and tea-gardens.

A NEW SKETCH-BOOK.

THERE has been recently quietly and privately published a new sketch-book, or book of architectural sketches of Mediaeval antiquities, intended for private circulation. It is of some singularity regards the contributors, who are all supposed to have been bred in the same school, or modern *variance*, to have wrought in the same office under the same direction; as well as some merit both as to execution and taste in the choice of subjects. It is called the "Spring-wood Sketch-book," a title that serves the dual purpose of a designation and a statement of obscurity. The list of members, as the contributors are called, includes several well-known names, whose owners, however, are understood to have been, at some time or other, either interior or out-door, *collaborateurs* of Mr. G. G. Scott, an architect, who is the president of the staff. Mr. Barlison is the vice-president; and Mr. Arthur Thompson is the treasurer. The leading contributors we shall name in our brief notice of contents. The first volume, of more than twenty plates, is now completed, and the first sheets of the second volume are issued. We must assume that none of the sketches are mere pictures. Most of the subjects are measured and drawn to scale, and in every instance where it is feasible ample details are figured. Nor are they confined to one class of objects, nor even to the acknowledgment of one nation, for there are two or three examples of foreign art. The book is on a scale known as *largo folio*.

Among the earliest plates we notice a bold drawing of the Cathedral Church, Oxford. Standing in the verges garden, the limner, Mr. Tining, has chosen the point of intersection beneath the central tower as the leading idea in his sketch. Above the two lines of building, departing at right angles from one another, rises the grave pyramidically-capped tower, with the ancient high-pitched roof-marks of the great arms of the cruciform buildings still showing, and with small Norman openings in the stage beneath the heltry, telling of an older structure than that with which it is now finished. The venerable, crumbling character of the masonry of this early portion of the tower is indicated by a fine soft treatment, in contradistinction to the general hard, bold, effective strokes with which the rest of this picture is made. We are next specially impressed with a detail drawing of two finials from the stalls of the Church of St. Lawrence, Ludlow. Many who saw the suggestive sketch for tracery of a great window made by Mr. Millais some years ago, in which the leading lines were formed with the hold edges of angels' wings, will agree with King Solomon when they gaze on these finials. In the first of them the Mediaeval artist obtained his pinnacle by grouping together and drawing to a point the wings of the angels with which the top of the finial is composed; and thus, with the exception that he compressed the wings instead of extending them, anticipated the poetical design of our eminent modern painter by some four or five hundred years. Two sets of scaves, the first alternately tall and short, in the nave of the Church of SS. Peter and Paul, Warington, and the second in the nave of the Church of St. Bartholomew, Closon, or Church-down, Gloucestershire, are also given on this sheet, which bears the signature of Mr. Medland. As we turn over the leaves we are next startled at the forelorn east end of St. Andrew's Cathedral, Scotland, standing spectrally on the page, with its window openings only so many sorrowful eyes looking down upon the beautiful wilderness of ruin around. This frayed piece of Transitional workmanship has been sketched with feeling by Mr. E. Hughes. In contrast to this Mr. Hubert J. Austen gives the south-west angle tower of Helmsley Castle, Yorkshire, used as a residence by one of the Dukes of Buckingham, a sturdy piece of domestic architecture of tolerably settled times, four stories high, based upon a foundation in which an arrow-slit indicates that resistance and defence were requisite when it was built. This is an agreeable sketch, leafy, sunny, and careful. Close upon this we notice a plate divided into four compartments, each containing a very spirited drawing of an iron standard from the Strozzi Palazzo, Florence. Three of these standards (*Lumiera maravigliosa*) are in the form of winged dragons, the third having the head of a woman. All have wings attached to them. They are known as the work of Nicolo Grasso, called "Caparra," who flourished in Florence about the middle of the thirteenth century. Our cleverest metal workers will be grateful to Mr. C. J. Fergusson for the particulars of these choice specimens of the work of one of their able predecessors. Though tempted by reason of the embarrassment of riches to allow page after page to flutter over, we must tell how neatly and quietly Mr. S. Clarke has shown a portion of the former palace of the Archbishops of Canterbury, at Maidstone, and a ripped old half-timbered mansion at East Masculs, near Lindfield, Sussex. As an instance of the variety of the contents of the sketch-book, we mention two drawings of a chasuble, by Mr. J. T. Mickelwhite. One shows the chasuble; the other gives exact details of the crucifix, with figures of the Virgin and St. John embroidered on the back orphrey, full size, with the colours indicated in marginal notes. Another striking variety is the old bridge at Heybridge, illustrated by Mr. Kelly. Our old bridges are so much more picturesque than our new ones, that they deserve examination and consideration. Their low, pointed arches, their quaint abutments, often containing a seat for wayfarers, and always affording them a retreat from the perils of the narrow way, and the ancient gateway towers with which some of them are defended, are as characteristic in their way as any other department of Mediaeval buildings. A sketch-book of old English bridges would occupy a niche among artists as desirable as that accorded to the water-pot by men of letters. Mr. Kelly gives plan, section, elevation, besides sections of parapet, cutwater, and arches, as well as a placid perspective. Different, again, from this, and

awaking a very dissimilar train of ideas, are three sketches—the somewhat bald execution of the north view suggests the substitution of the word scratches—of the unmistakably Norman-French church of Varengeville-sur-Mer. This is evidently a very interesting edifice, whose details would have been worth giving, and it is a matter of regret that Mr. Austen dismissed it in such a peremptory fashion. As the loose leaves of this well-stored sketch-book continue to pass before us, we catch sight of a fragment of Welsh architecture that stays our hand. It is part of Chirk Castle, in North Wales. A round tower stands holdly forward, as though it were a promontory in masonry, and in the angle whence it commences its hold sweep is a curious doorway rendered in most eccentric perspective.

The barn of a Benedictine priory, at Harmondsworth, Middlesex, a cell of the alien abbot of St. Katherine, at Ronen, makes a good drawing of ancient timber work. There is not a particle of ornamentation, but the multiplicity of the timbers, and their regular arrangement give an appearance of considerable richness to the priors' barn. Many of our modern corn-exchanges would look miserably bare by the side of it. When we come across such specimens of honest workmanship as this, we can but allow that the "good old times" earned their reputation. It would be as well, perhaps, if the architectural draughtsmen combining together for the perfection of the sketch-book, had agreed not to encumber it with subjects that were already published in works of acknowledged repute. Mr. Delamotte's drawing of the draw-well in the inner bailey of Alnwick Castle is a case in point. The subject is interesting in itself, doubtless, and it is the only draw-well in the book, but it has been recently given in the "Fendal and Military Antiquities of Northumberland and the Scottish Border," by the late Rev. C. H. Hartshorne, as well as in the sumptuous volume printed for the private circulation of the late Algernon, 4th Duke of Northumberland. Moreover, this drawing may have been made more than ten years ago, for a modern doorway shown by the side of the well has long since been removed. The west end of Holyrood chapel, too, is somewhat familiar to all who would inspect the work for the sake of information, though it is charmingly drawn by Mr. Hughes. We might say the same of Mr. Baker's faithful and delicate delineations of portions of St. Alban's Abbey church.

Mr. G. G. Scott, jun., has given some details of stalls in a masterly manner. The Chichester stalls, with their admixture of foliage and geometrical figures, are particularly fine, and Mr. Scott has made them appear so. Mr. Henry Walker has been to Bolton, and when there wisely abstained from the well-known general views in favour of details, which are not so accessible to travellers whose journeys are performed in the library. He usefully gives sections of jamb and arch mouldings, of the bases and sills of lower and upper arcades, of the caps and strings of both arcades, and sketches of other details, such as the hinge on the north-west door to a scale of 2 in. to 1 ft. In like manner Mr. Ralph Nevill has been to Lichfield, and brought away careful portraits of parts of its great and glorious fan. Very clear and plain-speaking, too, is a drawing of the triforium in the north-east bay of the south transept of Westminster Abbey church, by Mr. W. Jolley. From these, carefully drawn with rule and ruling pen, with compass and how, it is amusing to turn to two sketches of foreign subjects apparently depicted without aid from either. The author does not affix his name to these two studies; nor has he occasion to do so: there is an individuality about them that is unmistakable. Close to the eye, a series of rough lines; removed from it, an aerial perspective: these can be no doubt as to the authorship of these rigid though transparent incognito sketches. Here we have Hameln, Germany, scorching in the sun before us, a cruciform building, surmounted by an octagonal tower, with a minaret-like terminal; and a wonderful Norman pile at Conges. The foreign air is not more apparent than the hazy, baking heat and the venerable age of the fabrics. As a contrast to these we turn to the repose and cold of some sculpture. Mr. J. O. Scott gives two draped figures from the north portal of Chartres, whose drapery, arranged in minute and many folds, shows the favour in which intricacy in this department was once held; just as the figures given by Mr. W. G. Niven, from the tomb of Aymer de Valence, in Westminster Abbey, show the ease with which it could be

dispensed. Many of the plates we have not mentioned are of equal interest. We have aimed at showing a sample of the contents of the new sketch-book, rather than selecting for praise the best execution or the choicest subjects. We mention the work to suggest that it should be thrown open to the public. If the drawings were designs, we could understand the reticence of the authors; but as they are all representations of early works of art, we think the good cause of preservation, which we presume every architect has at heart, would be best promoted by their widest dissemination.

WILLIAM EDMONSTOUNE AYTOUN.*

It is long since we have risen from the perusal of a book with such feelings of sadness as we have done after reading this graceful and unassuming memoir of Professor Aytoun. Mr. Theodore Martin, we suspect, must have written it under the pressure of very deep emotion. Indeed, we do not know how he found the courage to undertake the task. Orestes might have got through the *dogs* of his friend Pylades; Damon might have pronounced the funeral oration over the corpse of Pythias with the composure of ancient Greeks and Pagan philosophers. The case is somewhat different when a Christian author of the nineteenth century is required to write the biography of his dearest and most valued friend. This performance, we suspect, even in ordinary circumstances, is one which taxes to the very uttermost the principles of sacrifice upon which our common Christianity reposes. But when those friends are both poets,—and poets who have published books with their joint names on the title-pages, the cruelty of the situation almost amounts to an intellectual crucifixion. "To the sisters of my friend," writes the biographer, in his brief but touching dedication, "this memorial of his life is inscribed in affectionate remembrance." "*Amicum perdere*," he might have added, in the words of Publius Syrus, "to lose such a friend is the greatest of losses. It is irreparable."

We think it may be for this reason, perhaps, that Mr. Martin has not attempted anything more than a brief sketch of Aytoun's life. There is no attempt at historical analysis, no estimate of the society in which Aytoun's lot was cast, hardly any of his correspondence, and, finally, no attempt to assign his place in modern literature. As a consequence, his treatment of the subject almost conveys the impression that he has struck too low a tone in estimating the probable interest of his readers. We can also detect, as we fancy, the uneasy feelings of a distinguished author torn between the necessities of the publicist and the sacred duties of private friendship,—undesirous of obtruding his own opinions, and, above all things, averse from displaying his personal emotions. Now, here Mr. Martin has, in our opinion, committed an error—a most excusable error indeed—of judgment. Whatever may be the impression in London literary circles, Aytoun's countrymen are proud of him. There may perhaps be greater Scotsmen in the present generation, although we do not know them; but certainly there is now no greater Scottish poet. Whatever Aytoun's other qualities may have been, this he possessed in an eminent degree—the power of exciting the sympathies and kindling the enthusiasm of all classes of his countrymen. He was, we suspect, "the last of the clan," the solitary representative of a class of illustrious Scotsmen who have either been expatriated or become extinct.

William Edmonstoune Aytoun was descended from an old Fifeshire family, the same that is now represented by Mr. Roger Sinclair Aytoun, of Inchdairnie. He was not the first poet of his race. This ancient house had the honour of possessing among its sons the celebrated scholar and poet, Sir Robert Aytoun, who has long been laid in Westminster Abbey; and who was the friend in his day of Ben Jonson and Hohhes of Malmesbury. His father was Mr. Roger Aytoun, a writer to the signet, a genial, kindly, and honourable man; and a sound Whig of the good old Gibson-Craig and Jeffrey and Cockburn clique. His mother was a Perthshire

lady, a daughter of Keir of Kinmouth, a woman of great accomplishments, and endowed with high literary taste. She was, of course, a staunch Jacobite; and from her there can be no doubt Aytoun, her only son, imbibed his poetical passion and his strong historical bias towards the dynasty of the Stuaris. He was born at Abercrombie-place, Edinburgh, on the 21st June, 1813; the rest of his family consisted of two sisters, who both survive him. His boyhood was spent in Edinburgh and its neighbourhood, where his father possessed a small woodland estate. He was educated at the Edinburgh Academy, under the care of the late Archdeacon Williams, and at the University, under Pillans, Daubar, Wilson, Hamilton, Ritchie, Jamieson, and Hope, the professors respectively of Latin and Greek, moral philosophy, logic and metaphysics, natural history and chemistry. He was not a distinguished student, we are told; but he was by no means indolent or negligent of his studies; and, moreover, he was throughout his whole career an ardent devourer of books. It was at college that his biographer first saw Aytoun, though he did not really become acquainted with him for some years afterwards. The occasion of their meeting was rather remarkable, and its result was thoroughly characteristic of Aytoun; indeed, it was no less an incident than a meeting of students where the future professor of literature, in a single unprepared and *impromptu* speech, put to rout and general disorder the best laid schemes of Thomson Gordon, the future Sheriff of Edinburgh, and James Moncrieff, the future Lord-Advocate of Scotland.

About this time he became a clerk in his father's office. In this capacity he was much engaged, it appears, in the Lanarkshire election, which immediately preceded the passing of the Reform Bill. The experience of the electioneering policy of that time, doubtless, supplied him with material for the vivid and life-like descriptions of election scenes that occur in several of his works. In the year 1833 we find him in the office of a parliamentary agent in London; but he remained there only one session: indeed, he began to discover a hitter and insupportable aversion to the purely formal and technical part of his profession; and we may as well state here that Aytoun's love of green fields and Highland streams and mountains was far too strong to coincide with the necessities of his legal studies.

At length he went to Aschaffenburg for the purpose of studying German, where he remained for a year, in the course of which he made a translation in blank verse of Goethe's "*Fans*," which, however, was never published. Like every intelligent Scotsman who goes abroad, the Sunday usages of the people of France and Germany seem to have struck Aytoun very much, and he had the courage and good sense in writing to his mother to state frankly how the contrast affected him. Dating from Aschaffenburg, on the 1st of April, 1834, he says:—"The people here are certainly more religious and attend far better to public worship than the generality of people in North Britain—a circumstance which I must attribute to their very different way of passing the Sunday." He was certainly correct in this view. Our London gin-palaces are worse places than Continental tear-gardens; and there is no greater piece of legal or ecclesiastical fiction, we will not say imposture, under the sun than the forced observance of the Jewish Sabbath as it exists in Scotland. How an intelligent and high-spirited nation so quietly submit to the tyranny, is one of the numerous paradoxes which puzzle every observer of Scottish civilization.

During his residence in Germany, he made great progress in his studies, and gained the friendship and good opinion of his respected tutor, Professor Joseph E. Merkel, a distinguished scholar, and a man of great and varied attainments. Under his guidance he acquired a mastery of that language which set open to him the treasure-house of German poetry, philosophy, and literature; and from which he gathered materials that were of infinite value to him in his future career.

On his return to Edinburgh, in 1835, he passed as a Writer to the Signet; and he was a few years afterwards called to the bar. Before this time he had begun contributing to *Blackwood's Magazine*. His first papers consisted of translations from the German poet Uhland, in 1836; but he soon spread his wings in the larger sphere of politics and literature; and what was rarer in Scotland at that time, he wrote several able essays upon art. He continued hencefor-

ward to be a constant contributor to *Blackwood* down to the close of his valuable life.

It was about the year 1841 that Mr. Theod. Martin began to form that literary partnership with Aytoun, which only by death has dissolved, and which had for its immediate results, among other things, the production of the celebrated *Ben Gaultier Ballads*,—after James and Hor. Smith's "rejected addresses,"—the most popular and inimitable hurlequins of the day. "*Lays of the Cavaliers*" also began to appear about this time. "The Burial March of Dundee" the first of those stirring ballads, appeared April, 1843. This year he sustained his first great loss in the death of his father, and the Jacobite ballads were accordingly written under the pressure of deep personal emotion. He was now thrown entirely upon his own resources, but at length, in the year 1845, he was elected by acclamation to fill the chair of Rhetoric and Belles Lettres, in the University of Edinburgh, a position to which he had early aspired and had long looked forward to as the summit of his literary ambition. His genius and advocacy of conservative politics procured him the sheriffdom of Orkney in 1852; of which office he used to say pleasantly respecting his own administrative and judicial powers, that was "Czar of all the Orkneys." Two or three years afterwards he made his celebrated avowal to the ranks of the spasmodic poets by the publication of "*Firmilian, the Student Badajos*," and in 1855 he produced his last and greatest work, "*Bothwell*," a poem, which, although unsatisfactory in its original plan, nevertheless contains passages of great power and picturesque beauty. We have now arrived at that period where the poet's star has reached its zenith; and the rest is the story of its decline. In the year 1859 his wife—a daughter, his guide, philosopher, and friend, John Wilson—died, after a painful and lingering illness, a blow from this blow he never recovered. His health began to fail. Twice he tried the waters of Homburg, and each time with beneficial results; and in 1863 he felt comparatively restored to health, so much so as to venture upon a second marriage; and the following year he seemed almost to have taken a renewed lease of his life. But the fact is, his constitution had been overtaxed, and had at length given way. All intellectual work became painful and even distressing. He had hired a shooting-box for the season at a place called Blackhills near Elgin; and he died on the 4th of August, 1865, in the 52nd year of his age. His body was brought to Edinburgh and buried in the Dean cemetery, a plot of ground which he had long ago selected and in which reposed the ashes of Emily Wilson, his first wife.

It would, of course, be out of place in these columns to enter on a lengthened critical estimate of the genius of Professor Aytoun. But we think it possible in a few words to indicate the leading features of his character as a poet, teacher, and a public writer,—within the limits of which mental classification his claims to respect and admiration of posterity will, we believe, ultimately rest.

As a political writer he is beyond our province. He has been accused by his adversaries of misstating or overstating his facts. We are not aware that the same thing has ever been said with regard to his enunciation of principle. From his earliest years he seems to have acquired a thorough knowledge of sound and true doctrines on the subject of political economy; and on this head we shall extract a passage from his biography, which will serve to support our thesis, and at the same time illustrate Mr. Martin's admirable style. The subject is Aytoun's celebrated account of the "*Glenmtchkin Railway*:"—

"About this time, what has since been known as the '*railway mania*,' had begun to set in. The great lines of communication, so far as completed and in operation, were yielding very high dividends, and it had become apparent that their extension throughout the country was indispensable to its prosperity. The success with which several legitimate enterprises had been launched was followed by the projection of schemes solely for the purposes of speculation on the Stock Exchange. Money changed hands more rapidly than in the saloons of Baden and Ems. . . . Of this general game the Glasgow neighbour Aytoun was a close observer. Most of his immediate circle of friends had gone deeply into it. He saw its pernicious influence upon the habits of many worthy fellows, who, as he used afterwards to say, were 'out in the 45'; and he was too well versed in common sense not to foresee very clearly the disastrous results to which the universal scramble after sudden wealth could not fail to lead. At first, and before he became aware of the extent to which the mischief had spread, of the rascally devices by which bubble schemes were forced upon the public, he dealt with the subject in purely jocular spirit, as in his sketch, '*My First Spec-*'

* "*Memoirs of William Edmonstoune Aytoun*, D.C.L., Author of '*Lays of the Scottish Cavaliers*,' &c., &c. By Theodore Martin. With an Appendix." 8vo. William Blackwood & Sons, Edinburgh and London. 1867.

the Biggleswades,* most of the actors in which were real personages under a very faint disguise. But as the fever of speculation grew worse and worse, and the project of those who traded upon it more rascally, Aytoun determined to let in some light upon the rottenness of the system, and help to arrest the folly which he saw carrying thousands to inevitable ruin. With this view he wrote—“How we got up the Glenmutchkin Railway, and how we got out of it! Never was truth more pitifully told, nor a good purpose better served, under the disguise of humour. People laughed at the tale, but it made them think. Knavish projectors saw their infamous system laid bare; and their miserable dupes stood aghast at the folly which had made them the easy prey of the M'Corinkales and the Dunshunners. The *Times* reprinted the paper at full length, delighted to have the warnings so emphatically backed which it had for a long time been preaching in vain. ‘Glenmutchkin’ became a byword for every outrageous project; and ridicule saw what had been proof against the assaults of the strongest argument. The demon, it is true, was only laid for a period; and when he rose again, he spread his snares under another guise. Unhappily there has arisen no second Aytoun to show us up, with the same force of sarcasm, the gigantic rascalities of railway ‘financing,’ and to fix for immortal infancy the lineaments of the men who have carried on under that name a system of falsehood and fraud which has desolated the homes and blighted the lives of thousands in these later days.”

It is upon such social topics above all others that we must regret the loss of Aytoun; at the same time we must say on our own account, and Mr. Martin will we are certain do us the justice to admit, that we have stood in the vanguard (if almost alone) in reprobating the deplorable infirmity of our modern railway “financing.” And all we can say is that the sooner the whole subject passes from the domain of the journalist to that of the criminal jurist the better.

As a lecturer Professor Aytoun had no compeer in the Edinburgh University,—at all events, after the death of Wilson. He possessed a manner which we can only describe as at once kindly and dignified; a voice which, although somewhat plaintive in its tone, as often became his subject, was singularly mellifluous and well modulated; and an accent correct and refined without being over-refined. His lectures were perfect models of literary disquisition; beautifully composed and carefully studied and thought out. He has been charged with not rising to the philosophy of his subject, and the charge is to some extent true. But *cui bono?* we do not see for whose benefit it would have been to teach the raw and undisciplined lads who came up from Ross-shire or the Isle of Skye every year to study heology and metaphysics anything more than rudimentary rhetoric and *belles lettres*. Goizot or Villeman, not to speak of that positive philosopher Monsieur Cousin, would have failed, in our opinion, had they lectured on the philosophy of history and literature in the Edinburgh University instead of the Sorbonne. On this subject, Colonel Hamley points out* with some astonishment the practice which, as he supposed, Aytoun tolerated of the students expressing their approbation of his teaching by the ordinary British method of stamping their feet. “I once accompanied him to his lecture-room, and sat beside him, while in front of us gathered an audience most respectfully attentive; but who, so soon as to my surprise, evinced their approval of certain brilliant passages of the discourse by a loud and general clattering of their feet.” Col. Hamley obviously did not suppose nor would our readers believe, that Aytoun’s students also exercised this “privilege” in expressing disapprobation of the discourse; and sometimes, indeed, without any adequate motive at all! “Lecturing,” adds the colonel, “was a pleasure to him, and he did it well. But another portion of his duties must have been less congenial: I need to see his tables loaded for weeks together with the books in which the members of his class wrote their essays, and which he was at great pains to correct.” We really do not know how to add another word to this inestimable proof of Aytoun’s earnestness and assiduity as a teacher. And, to tell the truth, when we got to understand this department of his academical duties we did not think it necessary to seek for any other cause of his premature and untimely death. To correct the literary essays of three or four hundred Scotch students every year. *Parbleu!* Even Julius Cesar Scaliger would have sunk under it.

Aytoun’s knowledge of art, we may state, was great; and his taste, like that of all true lovers of external nature, was healthy and truthful. Writing from Homburg to Mr. J. Blackwood, in 1862,† respecting Noel Paton’s designs for the illustration of “The Lays of the Cavaliers,”

he makes the following sensible remarks about ghosts and skeletons—

“... Ghosts are not skeletons; nor are they ever so portrayed. If, in the tragedy of ‘Macbeth,’ a skeleton were to walk on instead of the image of the murdered Banquo, the whole interest would disappear. A skeleton, in the view of Albert Durer, the old masters, and the old poets, typifies ‘Death,’—not the apparition of a man who has been slain. A skeleton was, indeed, technically called a ‘Death,’ as in the account of the hideous figure that appeared in the dance at Holyrood on the occasion of the nuptials of our last King Alexander. And such were the veiled figures that were supposed to fit through towns infected by the plague. The idea of skeleton ghosts was, I think, first started by Birger and Mat. Lewis, and is a poor conception, since it is hardly possible to distinguish one skeleton from another, and nobody ever saw his own. I hope Noel Paton will seriously consider this, for even in allegorical design there should be an observance of propriety; and I am quite sure that this drawing of his (masterly in execution, as is everything from his pencil) would be objected to as in doubtful taste. I do not like to presume so far as to offer a suggestion, but it seems to me that if the head were left, and, instead of the skeletons, two veiled female figures were introduced, with averted faces, and hands clasped and raised to heaven, the sentiment would be more effectively expressed.”

But we must hurry on. We have only room for a few more lines in which we must venture to speak of Aytoun as a poet; and here we are certain that he suffers for the moment at the hands of his critics, if not of his biographer, from a misapprehension.

In the first place, we must always remember that Aytoun was not merely a Scottish poet, but a Jacobite. His sentiment of attachment to the Stuart race which, as we have mentioned, he had inherited from his mother, amounted to a passion, if not to a positive frenzy; and there can be no doubt whatever but his intense love for the memory of the ill-fated Mary Queen of Scots did lead him to select a hero in that unmitigated scoundrel Bothwell, into whose arms she was obviously driven by the very terror for her life. With all this original error of conception, superadded to an excessively faulty construction, there are lines in Bothwell of such tenderness and beauty, so full of melancholy music and sad retrospection, that they leave a lingering cadence on the ear like the fabled song of the Dying Swan. Nevertheless, we are hintily told by one of his posthumous critics “that whether working in prose or in verse, Aytoun’s forte lay in farce.” The same thing might have been said—substituting the word burlesque for farce, which must have been meant, we suspect—of Goethe or of Shakspeare, or of Walter Scott. But who would estimate the sum of Shakspeare’s intellectual power from a study of the clowns at Ophelia’s grave; or of Scott from the picture of Caleb Balderston in the “Bride of Lammermoor?” Because Aytoun wrote clever burlesques like the “Massacre of the Macpherson,” does it follow that he was disqualified or incapable of writing in a strain of truthful and elevated poetry? We think not. The fact is, in our opinion, that Aytoun was so much of a true minstrel or troubadour that he had acquired the command of a variety of instruments. He could touch the chords of the harp; he could sound a *veuille* on the trumpet; he had even acquired the art of playing on the bagpipe. A poet whose forte lay in farce would scarcely attempt to strike anything of a higher tone in a Mason’s Lodge; yet here is the sort of lines he produced on one occasion,—a copy of which we read with admiration at the time, although they have not, as far as we know, been published. We have not space for more than a few stanzas—

“THE RAISING OF THE BEAUSEANT,”

As recited by PROFESSOR AYTOUN, at a Festival of the Knights Templars of the Metropolitan Priory of Scotland, 1862.

Fling out the Temple banner as of old!
Age hath not stain’d the whiteness of its fold,
Nor marr’d the ruddy cross, Salvation’s sign.
Once more we lift our sacred standard up—
Companions, fill the cup—
We pledge the Beauseant in this sparkling wine!

Oh! what a valiant host have fought and bled
Beneath that banner to the wind outspread,
Since first it moved against the infidel!
Who knows not how it waved on Salent’s towers,
When Acre, Ramla, Nazareth, were ours,
And at Tiberias fell?

Fell with the knights who bore it to the field,
When fustian treason broke the Christian shield,
And bade the Turkish crescent-sign advance!
Fell but to rise again with triple pride.

When, bounding o’er the tide,
The armies came of England and of France!

And who is he, the leader of that band,
Who first sets foot upon the Holy Land?
None, on, unrival’d champion that thou art!
Shout, brethren, shout! shout your banners ding—
‘Tis he, the Christian’s hope, the island king—
Richard, the Lion-heart!

DEATH OF PROFESSOR FARADAY.

The public have learnt with very general regret that Professor Faraday is dead.

Michael Faraday was born in 1791, in the parish of Newington, Surrey, and was entirely a self-made man. After being instructed in the mere rudiments of knowledge he was apprenticed to a bookseller and bookbinder, and continued to work at his trade till 1812. During this early period of his life, however, he showed the bent of his genius; for in the intervals of his employment, he not only read with avidity such works on science as fell in his way, but applied himself to the construction of electric and other machines. Having been present at some of the last lectures delivered by Sir H. Davy, Faraday wrote to him asking encouragement, and inclosing notes of the lectures. Sir H. Davy answered the request of the young aspirant promptly and kindly; and in 1813 he was admitted into the Royal Institution as chemical assistant to Professor Brand. Faraday soon became the favourite pupil and friend of his patron, whom he accompanied in the autumn of the same year on a visit to France, Italy, Switzerland, &c., returning to his place in the Royal Institution in 1815. In 1820, Faraday discovered the chlorides of carbon, and, in the year following, the mutual rotation of a magnetic pole and an electric current; in 1823, the condensation of gases; in 1831 and following years, the development of the induction of electric currents and the evolution of electricity from magnetism. The establishment of the principle of definite electrolytic action, the discovery of diamagnetism, and the influence of magnetism upon light, obtained for him in 1845 the Rumford medal and that of the Royal Society. In 1847 he announced the magnetic character of oxygen and the magnetic relations of flame and gases.

In 1835 Mr. Faraday received a pension of 300*l.* a year from Lord Melbourne’s Government. In the following year he was appointed scientific adviser on lights to the Trinity House, and was subsequently nominated to a similar post under the Board of Trade. He was chemical lecturer from 1829 to 1842 to the cadets of the Royal Military Academy at Woolwich. In 1825 he was elected a fellow of the Royal Society; and in 1832 the honorary degree of Doctor of Civil Laws was conferred on him by the University of Oxford. He was a knight of the Prussian order of merit, of the Italian order of St. Maurice and Lazarus, and one of the eight foreign associates of the Imperial Academy of Sciences of Paris. In 1855 he was nominated an officer of the Legion of Honour, and in 1863 he was made an associate of the Paris Academy of Medicine.

Although the late professor chiefly confined himself to experimental researches, there are theoretical views thrown out with regard to static induction, atmospheric electricity, the lines of force, both representative and physical, which are well worthy of consideration. His papers on the conservation of force, and on the division of gold and other metals, are amongst his latest productions. It is in connexion with electricity, and its relations with almost all physical, chemical, and physiological phenomena that his fame will principally depend. He was the best lecturer that was ever listened to.

FROM PARIS.

At Notre-Dame a portion of the constructions in plans, forming the moulding *attiques*, has disappeared, and on the spot, south of the cathedral, a new sacristy is being erected, the style of which will harmonize with the church. The door-hangings of the lateral porches of the Virgin and of St. Anne on the western facade of the cathedral are very curious examples of the iron-work of the twelfth and thirteenth centuries. According to an old tradition, this ironwork was the handiwork of no less a personage than the demon himself, who associated himself and made a pact with a workman of the name of Bisornet, charged with this work, which was above his means to complete. All the resources of the devil failed to finish the iron-work of the central door through which the Encharist is carried on days of solemnity. The task of completion remained for a modern artist, and a fine piece of ornamental iron-work is being put in place, executed by M. Boulanger, under the direction of M. Viollet-le-Duc. In the interior of the church the works of restoration undertaken

* In an able sketch which Mr. Martin has printed, p. 175, *et seq.*
† Quoted at p. 220.

more than twenty years ago, have been continued almost without intermission, and the last finishing touch is being given to the restoration of the screen, of stone, adorned with figures, enclosing exteriorly the choir of the church. This long series of sculptures, executed in a great portion by Maître Jean Ravy, who was mason of Notre-Dame during twenty-six years, was completed in 1351 by Jean de Bouteiller, as appears by an ancient inscription placed at the end of the screen due to the chisel of these sculptors.

The new Gothic porch of the church of St. Laurent, now quite terminated, has been stripped of its scaffolding, and now appears in all its architectural splendour. The new façade has two open-work gables 30 metres high, and the whole is surmounted by a wooden spire, covered with lead, the edges of which are gilt, so that it bears some resemblance to that of the Sainte-Chapelle. It is decorated with the figures of the twelve apostles, as large as life, which protect the dais pertaining to the florid Gothic style; six great counterforts, terminated by pinnacles, relieve the pressure of the arches of the vaulted roof. The summit of spire is 147 ft. 7 in. above the ground.

The new reading-room of the Imperial Library is now completely finished; it is occupied by sixteen rows of tables. At the extremity, in a large and magnificent hemicycle, ornamented with caryatides, is the bureau of the guardians, attendants, &c. At the end of this is a large semicircular-headed doorway, with two doors, leading to the library, properly so called, which is of iron open-work, and five stories high. An ingenious contrivance is provided for ascending and descending with the books. The whole is heated by hypocausts. Nothing now remains to be done but the placing and classifying of the books, and for this purpose three hundred sub-officers and soldiers are employed to aid the employees of the library.

A New Invention.—The "Parisian" stereoscope is constructed by M. Marinier, so as to show stereoscopic views and those of 16 centimètres magnified by a glass placed on a third aperture. This stereoscope can contain an indefinite number of slides, and the mechanism which effects the changes is of the simplest description. Each card, after having been introduced into one of the upper slits, according to its size, rests upon a small balance, which becomes moveable by pressing downwards a button placed on the right side of the instrument. The views fall flat at the bottom of the box, where they remain one over the other, until, in withdrawing them by a door situated underneath the three eye-holes, the slides are seen one after the other, and a great number can thus successively be brought under notice. There are two models of this stereoscope, one for the stereoscopic vision only, with two glasses; the other with a third glass over the two others. To view the stereoscopic slides, all that is necessary is to introduce them into the slit nearest the eye.

MANCHESTER TOWN HALL COMPETITION.

The committee reported to the Council, on Wednesday morning last, that, after frequent deliberations among themselves, they had called in Mr. George Godwin, architect, to assist them with his professional opinion of the several designs, and the result was that this gentleman's choice agreed in the main with that which the committee had themselves arrived at. They, therefore, recommended that the authors of the designs bearing the following mottoes and devices be invited to send in designs for the second competition, each receiving, as arranged, 300*l.*, with the exception of the author of the design selected for execution:—St. Michael; "Ring out the old, ring in the new;" A circle within a ring; "Time tryeth Truth;" "Polyanthus;" "Municipal;" Three Hebrew characters; and "An bon Droit."

The Council unanimously adopted the report of the Committee.

After the resolution had been passed, the Mayor opened the letters containing the names of the successful competitors, and announced them to the Council, as follows:—

Mr. Cuthbert Brodrick, Buckingham-street, Strand, London.

Mr. William Lee, Cornhill, London.

Mr. Edward Salomons, King-street, Manchester.

Mr. John O. Scott, Spring-gardens, London.

Messrs. Speakman & Charlesworth, Princess-street, Manchester.

Mr. Alfred Waterhouse, New Cavendish-street, Portland-place, London.

Mr. Thomas Wortbington, John Dalton-street, Manchester; and

Mr. T. H. Wyatt, Great Russell-street, Bloomsbury-square, London.

We have given the names alphabetically and not in the order of the mottoes.

WORKHOUSE FOR ST. MARTIN'S-IN-THE-FIELDS COMPETITION.

It will be remembered that six architects were invited by the Board of Guardians to submit designs for a workhouse about to be erected at Wimbledon, for 400 old men and women, each competitor receiving 50 guineas.* A general idea of the plan desired was given to them by the clerk to the guardians, consisting of an annular building, with dormitories, wards, and other apartments radiating from it all round. As was mentioned in our notice of the designs that were sent in, Mr. Frederick Marrable was the only one of the competitors who had really carried out this idea.

It seems that the guardians were not sufficiently satisfied with any one of the designs submitted to adopt it; and, moreover, had become aware that by confining the building to one end of the plot of land belonging to them, they would be able to let a valuable frontage for building on, and so materially lessen the cost to the parish. They accordingly, after allowing the competing architects to examine each other's designs, invited them to send in revised plans.

Regarding alone the great object of a competition, which is, to obtain the best possible building for the purpose in view, this proceeding, speaking in the abstract, is a good one. But when to this is added, as of course it should be, the question of perfect fairness to the competitors, it is, at least, open to discussion. In the present case, however, so far as we know, the course pursued has the concurrence of the competitors. Mr. Marrable adheres to the suggested plan, but has materially improved his version of it by clearing away attached buildings; and this he might do with advantage to a still greater extent, so as to get windows on both sides of his radiating wards. The expediency of giving a circular, or even polygonal form, to a building, in the construction of which economic principles should govern, may be doubtful; but this, as we understand it, was the outline prescribed, and a competitor should certainly not be damaged by adherence to conditions. Two of the competitors, Mr. H. M. Burton and Mr. H. R. Cotton, have coalesced, and, in addition to revised versions of their original plans, have sent in jointly an entirely fresh design, wherein the main building is a parallelogram, having an internal open area, 90 ft. by 60 ft., with three pavilions projecting at right angles from each of the longer sides. From the entrance in the central building, corridors communicate on the right to the side of the building devoted to women, and on the left to that for the men. At each of the four angles of the parallelogram is placed a staircase, with stone stairs; the staircases being carried up as towers, and holding water-cisterns. It is not unlikely that the decision will rest between these gentlemen and Mr. Marrable. We again, however, advise the Board to take professional assistance in making the selection, and to look carefully to the "Conditions" under which the designs were prepared.

NEW OFFICES, POPLAR DISTRICT. COMPETITION.

At the last meeting of the Board the letters accompanying the selected designs were opened, and it was found that "Circinus" was from Mr. W. A. Hills, architect and surveyor, Bow; "Octagon," Mr. A. Harston, East India-road, Poplar; "Gives," Mr. C. A. Wilson, Bow.

According to the report in the *Tower Hamlets Express*,—Mr. Blott said he was quite surprised to hear that "Circinus" did not belong to Mr. Fletcher, who had been spoken of as the successful candidate in that room. He believed the Board had done quite right in selecting the plan

they had done, and he was satisfied they would find Mr. Hills's building well adapted for their purpose.

Mr. Rugg: Whom did you vote for? Mr. Fletcher or Mr. Hills?

Mr. Blott: Mr. Fletcher!

A correspondent writes,—"Rumour was very little wrong; Mr. Hills, late assistant-surveyor, is now in partnership with Mr. Fletcher, the recently resigned surveyor. In your number for June 1 (p. 397) is a letter signed "B.," wherein the actual result is pointed to as probable. The writer asks the Poplar Board how the competition is to be decided, and says,—

"I hear that the present assistant surveyor, assisted by the past assistant surveyor, is likely to be a competitor; and now, probably enough, we shall find the future assistant surveyor has a finger in the pie. If the members have determined to uphold at all risks their association of past, present, and future assistant surveyors, why ask for other designs?"

Putting out of sight these questionable complications, we feel forced to reiterate our assertion made after examining the drawings (p. 602, ante) that the design by "Circinus" is abominably ugly, and to urge the Board to pause before they perpetrate it,—we might say *perpetrate* it,—in brick and stone. If the Board will not take advice, the ratemakers, before it is too late, should look to it.

WORKSHOP NEW CHURCH COMPETITION.

Forty-three designs were sent in for this church. That by Messrs. Clarke & Son, of Nottingham, was chosen, and they have received instructions to carry out the works.

SOUTH HAYLING: COMPETITION.

In reply to offer of three premiums (100*l.*, 50*l.*, and 25*l.*), for laying out 200 acres of land at South Hayling, thirty-three designs have been sent in. Mr. F. Fuller, by whom the premiums are offered, has adopted the expedient of making the competitors the judges; each competitor having three votes. They are to meet (this Saturday, at Hayling, for the purpose. We shall be anxious to hear the result. It is another "leap in the dark."

BRONZES.

CLASSIFIED lists of photographs taken for the Department of Science and Art, and which are purchasable, are being published in a cheap form, under different headings.* Each subject is prefaced with some introductory observations. Thus, under the head of Bronzes:—

The art of casting in bronze is of great antiquity; it is stated to have been practised by the Eastern nations long prior to its introduction into Europe. The Chinese historians say that Yu, who was associated on the throne with Chun, 2,500 years before the Christian era, caused nine brass vases to be cast, upon each of which he had engraved the map and description of the nine provinces of the empire. That the art was much practised by the ancient Greeks and Romans, and that they attained to the greatest perfection in it, is well proved by the celebrated monuments of their work which remain. The finest collection of ancient bronzes is at Naples; among the specimens there are some showing the very curious manner in which the ringlets of hair, worked separately, were fastened on; many of them are the size of life. Bronze casting in Greece seems to have reached its perfection about the time of Alexander the Great (330 B.C.). The accounts given of the works executed about that time almost exceed belief. After Lysippus, the favourite sculptor of Alexander, who executed, according to Pliny, above 600 works,—the art began to decline in that country. The taste of the ancients was still preserved in Italy in the fourth and fifth centuries, and many important works in bronze casting are recorded as having been achieved by them at that early period. In France, Germany, and England objects cast in bronze have also been discovered in the tombs of the fifth, sixth, and seventh centuries. During the three following centuries this art seems to have declined and been little practised in the

* Arundel Society, Bond-street.

Western countries, for we read of no great works being produced by it until the beginning of the eleventh century, when it was revived in Germany under St. Bernard, Bishop of Hildesheim, who had the gates of his church cast in bronze, and who erected in the year 1022 on the space in front of it a bronze column about 15 ft. high, ornamented with bas-reliefs ascending spirally from the base, depicting the life of Christ, in twenty-eight groups.

In France the revival of this art was of a still later period, the earliest evidence of it being the gates of the church of St. Denis, which were cast in bronze under the direction of the Abbot Suger in 1140, and were enriched with bas-reliefs illustrating Christ's Passion and Resurrection.

Italy furnishes no important evidences of the revival of bronze casting prior to the end of the twelfth century, when Bonano produced the bronze gates of the cathedral of Pisa, and soon after those of St. Martin of Lucca; the large gates of the cathedral of Monreale were also executed by him, and bear his name inscribed on them.

Many of the objects used in religious services in Germany, France, and Italy, were made in bronze during the twelfth century, such as candlesticks, candelabra, baptismal fonts, and some of the vessels for the altar. Important specimens of the work of this period are still to be seen in the different churches.

The Medieval and Renaissance periods also produced for the same purposes numerous specimens of bronze casting; but as these pieces were always more or less enriched with precious materials, they belong more especially to the goldsmith's art.

Italy possessed in the sixteenth century a great number of celebrated artists, who designed and executed with incredible rapidity statues, groups, monuments, and fountains in marble and in bronze. There were many also who reproduced in bronze, miniature bas-reliefs and statuettes, either from the antique or from the works of contemporary masters. Florence was most renowned for these works. The pupils of John of Bologna reproduced, in bronze, statuettes of the numerous works of their master. Many of these beautiful statuettes and fine bas-reliefs are found in the collections of the present day, and are much sought for by amateurs. These artists did not disdain to employ their talents on the improvement and decoration of objects of ordinary domestic use; in the museums and private collections of the present day there are many beautiful specimens of their work, such as candlesticks, fire-dogs, knockers and handles for doors, inkstands, &c., which are justly valued as objects of art.

The photographs named in the catalogue are almost from works of the fifteenth and sixteenth centuries, selected from the collection in the South Kensington Museum, and from specimens lent for exhibition by private collectors.

SINGLE-SPAN CHURCHES.

ONE of our former numbers contains a description of two very remarkable churches at Angers, and we promised our readers that we would continue the subject. We now fulfil our promise by giving an account of the cathedral in that ancient city, to which we append a few observations upon single-span churches, which, it is hoped, will not be without interest.

The Cathedral of Angers is dedicated to St. Martin, and is a building of the latter portion of the twelfth century, with additions of the thirteenth and fourteenth centuries. It has the peculiarity of being one of the very few cathedrals in Europe which are built in one single span, and is without aisles either to the nave, choir, or transepts. The nave consists of three bays, each of which on plan forms a square of 52 ft.; a fourth bay of the same dimensions forms the junction of nave and transept; each transept is of one square bay, as is also the choir, which is terminated by a large round apse. At the west end are two fine First Pointed towers, with two long belfry windows in each face. These support well-designed fourteenth century spires, which in outline remind one of St. Mary's Church at Oxford. The interior of this cathedral is singularly noble and majestic: the groups of columns supporting the vaulting give an air of grandeur that is rarely to be met with, and the low arches between them convey an idea of vast

strength and solidity, while the finely-proportioned windows above give an elegance and relieve it from heaviness or squatness. A kind church, supported upon boldly-carved corbels. The foliage of the capitals is exceedingly elegant, and most of the windows are filled with very early stained glass. The "Dog-tooth" is very uncommon in France, but we find it here used sparingly and with good effect. Another singularity is observable in the mouldings. The large heads do not run down on to the abaci of the capitals, but are stopped upon small bases about a foot above them. We shall now leave Angers and proceed to make a few remarks upon other churches of the same kind.

Le Mans is justly celebrated for its superb cathedral, certainly one of the finest in France; but it possesses another church, which is, perhaps, even more interesting to the antiquary. This church is known under the singular appellation of "Notre Dame de la Couture," which some have supposed to be a corruption of the words "De Cultura Dei." The dedication is very remarkable, and is not, to the best of our knowledge, to be met with elsewhere.

The church is a building of mixed dates. The earliest portion is the choir, the arches of which are circular and very much stilted; they are supported upon very massive round columns with square caps; the arches are entirely without mouldings. The nave is late twelfth-century work, and bears so strong a resemblance to that of the cathedral at Angers that one is led to believe them to be the work of the same architect; this nave, however, is very much smaller than that of Angers, as the squares of each compartment are only 35 ft. instead of 52 ft. The detail is also less refined; and the way in which the great blank arch cuts into the triforium cornice is clumsy; the windows, although far more elaborate than those at Angers, fail to give the building that effect of elegance which is so noticeable in the latter church. The chancel, or choir, is chiefly Early Romanesque; but the clearstory, which is exceedingly lofty and fine, is later in the style; the triforium gallery or balcony is similar to the nave; large fourteenth-century windows have been inserted into the clearstory; the ambulatory or aisle round the apse, or, as the French call it, the *chevet*, is evidently very Early Romanesque, and the three chapels which open into it are remarkable specimens of the architecture of that date.

The west front is a very striking composition,—two square towers project from the face of the west end of the nave, so that their eastern sides alone are engaged to the church; a narthex or open porch with one bold arch connects the lower portions of the towers, through which is seen a splendid though much mutilated western doorway. This narthex forms a kind of external gallery; the west window of the nave is seen above the narthex, and is a most beautiful example of fourteenth-century tracery. The towers are only carried up one story above the walls of the nave, and are capped with temporary pyramidal roofs; the middle story of each tower has a large open arch in each face, showing a vaulted space: the effect is very striking; there are doorways in each tower, but they do not lead into the church.

Other single-span churches are to be found at Angoulême and Alby. The cathedral of the latter place is probably the largest church under one roof in existence; it is over 300 ft. long, about 60 ft. clear span from wall to wall internally, and 100 ft. to the crown of the vaulting; which is, perhaps, the boldest ever constructed during the Middle Ages, both on account of its vast size and the solidity of its construction. It is built of solid brickwork, 2 ft. thick; the ribs are of stone, and are nearly four times the size of those used in the roofs of ordinary cathedrals. As, however, this church has been most admirably described and illustrated by Mr. King, we shall not enter into any detailed account of it.

The nave of the abbey church of St. Martin des Champs is a singular and early example of a one-span nave; it is said to be by the same architect as La Sainte Chapelle. The detail is good but simple; the span is about 40 ft.; the roof is wagon-formed, and of wood; the choir, which is earlier, has aisles.

In England, the widest single-span church is Trinity Church, at Ely, which originally formed the Lady Chapel of Ely Cathedral. The clear

span is 47 ft., the length 100 ft.; it is vaulted in stone, and is one of the most superb examples of Late Decorated work in the country. The Church of New Monkton, St. Mary's, near York, is a good example of a nave of one span. The style is fine Early English. In Belgium a few examples of single-span churches are to be found; they are not, however of an earlier date than the fourteenth century, and belong, or have belonged, to the Franciscans and Dominicans. The church of the Dominicans at Ghent is a fine example. The buttresses are inside the building, and the spaces between them form a row of chapels on each side of the nave. The roof is of wood. The style is late thirteenth or early fourteenth century. In Germany, single-span churches are more frequently to be met with; they are not, however, generally of an early date, and have, in nearly every instance, belonged, to mendicant orders. The Franciscan church at Dettelbach, near Würzburg, is a good example. This church is vaulted in stone. The span is about 45 ft. The Pilgrimage Church at Volkach, in Bavaria, is in one span, with a flat wooden roof. The effect is very ugly. The same arrangement occurs at the very remarkable church of Dettwang, near Rothenburg, where the nave is exactly square. At the east end of the nave is a roof screen, filling up the entire end of the nave with three arched bays, each vaulted, two of which form chapels, and contain ancient altars, and the centre opens into the chancel, which is vaulted. The church of St. Mary at Rothenburg, and St. Wolfgang, in the same town, are fine specimens of single-span churches; both are finely vaulted, and are fifteenth-century works. The church of St. Paul at Würms is a very early example of a single-span nave. The old roof, however, does not exist. The style is very early Romanesque. The Franciscan church at Eppard, the Carmelite church of Hunwelsfurt, the Dominican church at Zell, near Würzburg, are late examples of single-span churches.

Several churches of this description exist in Spain; but they have been so thoroughly studied and described by Mr. Street, that we cannot do better than refer our readers to his work. In Italy, single-span churches are far from uncommon. The churches of the Eremitani at Padua, St. Fermo Maggiore, and St. Francis at Assisi, are good examples. The latter church is vaulted; the two former have boarded roofs. These churches are works of the latter portion of the thirteenth century.

Several modern attempts to revive this form of church have been made, but few have proved successful: and we believe the reason for the almost universal failure in this form of church is the absence of vaulting. A one-span church seems to demand a vaulted roof, either in wood or stone; without this important feature it looks like a large hall. This is strongly apparent in Mr. Hansom's new R.C. church of St. Walburga at Preston, which looks exactly like a reproduction of Westminster Hall.

The illustrations are from sketches made on the spot by Mr. G. Goldie.

MARCH NEW CEMETERY, IN THE ISLE OF ELY, CAMBRIDGE.

THIS new cemetery is situated on the east side of the Elm-road, about three-quarters of a mile from the town, and occupies an area of about six acres. The two mortuary chapels, fourteenth century in style, are 32 ft. by 15 ft. within the walls of each chapel, and have a small vestry attached to each. The chapels are connected by a tower and spire 97 ft. high.

The walls of all the buildings are of hammer-dressed wall stone, laid in "random" courses, and tuck-pointed in black mortar. The wall stone is from the Warmsworth Quarries, in Yorkshire; the tracery and all the other stonework is of polished Ancaster stone.

Mr. G. W. Stephenson (late of the Town-hall, Liverpool), engineer to the local Board of Health, is architect to the Burial Board, and laid out and planted the grounds. Messrs. Breadhurst & Dearing, of March, were the contractors for chapels, lodge, &c., at the sum of 1,463l. 2s.

THE CROTON AQUEDUCT.

It will be well worth a visit to the beautiful villages of Carmansville and Manhattanville to take a peep at the works which are being carried on there under the Croton Board, so as to have the water from their aqueduct conducted to all the places of importance in the north part of the city, and to every district where the population guarantees the requisite expenditure. We get some few particulars from the *New York Herald*. The preparations for erecting the engine-house and boilers will soon be perfected; and the Croton Board is, through their engineer, pushing on the work well.

The engine-house will convey water to the great tower, and through that medium to all the highest points of the north end of the city. Messrs. Brown & Withrall, in erecting this tower, feel confident of giving every satisfaction. From the tower water can be forced to Washington Heights, Fort Washington, and all the other places in the district where it is necessary to send it. The water will be heaved between 300 ft. and 400 ft. from the engine-house to the tower. This will be a work of much importance to the public comfort. There will be two new gate-houses, the one at the east and the other at the west end of the reservoir. They will be erected by Messrs. Roach & Jenkins, the builders of the reservoir. The gate-houses will be plain and substantial.

The inside walls of the reservoir have been commenced, and are being constructed with solid stone and cement. Captain Edick superintends this as well as the general work. The machinist, the mason, the carpenter, the blaster of rocks, the hewer of wood, and the drawer of water, are all working like so many honest men to finish this beautiful improvement to the city of New York. The inside wall of the reservoir, called the slope wall, will be very strong, and those who have seen it state that it is the best of the kind ever built in the State or United States. When the reservoir is finished, the gate-houses built, and the tower in complete working order, then the Croton Board will have done their duty to the north end of the city.

WINDOW GARDENING.

Window gardens assume many forms, but we seldom see plants grown or displayed in windows in a thoroughly satisfactory manner. Usually the display consists of plants in pots, and this is better than nothing, if the plants are good; but the appearance of the pots is not pleasing. The *Gardener's Magazine* has some remarks on the subject of window gardening, from which we may glean a few suggestions.

Those who are familiar with the western parts of London must have noticed of late the increase of an elegant form of window garden, consisting of a glass case projecting beyond the plane of the window-sashes—a sort of vertical box-window constituting the lower sashes; and in these groups of plants are seen at all seasons of the year. There are some charming examples of these window gardens attached to the windows of mansions in Piccadilly, Cavendish-square, and other districts, where the residents are almost all wealthy persons.

The great difficulty with many persons who see and desire such things as these is to obtain them. If a tradesman be called in and instructed, there is always a risk that a mistake will be made in some part of the affair, and that a high price will be charged for work occasioning to all parties very much trouble, and which will be quite useless when done. Those who have dabbled in the manufacture of fern-cases, aquaria, and heating apparatus, employing persons not practised in such things, will quite appreciate the importance of being enabled to purchase window gardens of the kind just described from a maker who understands all the requirements of the case, and who studied the business from a horticultural as well as from an artistic point of view. Given a simple idea of this sort, and a skilful manufacturer will soon vary it to suit many tastes and circumstances. Generally speaking, the planer and outer sill together are made available to give considerable breadth to these cases; that is to say, breadth at right angles to the wall in which the window is set, without any greater projection beyond the line of the wall than is consistent with safety and convenience. The lower sash perhaps is removed, and a plant-case

takes its place. In many parts of great towns it is necessary to exclude the view of the street, no less for the privacy of the inmates than their protection from absolute offence and annoyance. The ordinary means of accomplishing this is to "frost" the glass with an alkaline salt, or to put on a thin coat of paint, or to employ embossed glass. But a plant-case accomplishes the same, and more agreeably and quite as effectually, and renders the house cheerful within and elegant without. Where the embellishment of the interior is the matter of highest importance, an aquarium can be fitted to the inner side below the level of the sill, and in this case exterior embellishment is possible by forming a bank of ferns on a miniature rockery above the water. A slab of slate is the best foundation, and it should be pierced for drainage where plants are grown. A depth of 4 in. to 6 in. will usually be found sufficient for the small plants that are best adapted for such cases. But in a window of ordinary dimensions a depth of 9 in. for soil could be obtained without difficulty, and an elegant moulding on both sides of the case suffices to hide pots and soil from view.

A few years ago was produced a useful form of open boxes for windows. These were made in every variety of style imaginable, some having rustic work in front, others with architectural fronts to harmonise with stone and stuccoed walls. The glass cases are of course to be preferred, where a portion of the window can be permanently given up to them, as in these a display of beautiful vegetation can be secured without difficulty the whole year round; for in the depth of winter the plants derive a considerable degree of warmth from the room, and it is even possible to heat the cases in the same manner that some plant-cases are heated, by means of a boiler periodically filled with boiling water. Light and air are precious gifts, and no plant-cases should ever interfere with the free admission of two such health-giving agencies to dwelling-rooms; but where the window plant-case can be adopted without interfering with light and ventilation, there can scarcely be a better way of increasing the elegant resources of town life.

THE BRITISH ASSOCIATION AT DUNDEE.

The opening meeting of the British Association for the Advancement of Science was held at Dundee on Wednesday evening last; but too close upon our time of going to press for us to say more than that the Duke of Buccleuch delivered the inaugural address. If first impressions are to be trusted, the local arrangements are inferior to those of previous meetings. When the train from London arrived at mid-day on Wednesday, with its passengers tired, travel-stained, and hungry, after some seventeen hours on the journey by day and night, the local secretaries were not to be found; moreover, the lodging-accommodation in the town is of very inferior character, and exorbitant in price.

DESTRUCTION OF TITIAN'S ST. PETER MARTYR.

By a fire which originated in the chapel of the Madonna del Rosario, of the Church of San Giovanni e Paolo, the irreparable loss of Titian's celebrated picture titled "St. Peter, Martyr," has occurred. This was one of Titian's three grandest works,—the "Assumption," the "St. Peter, Martyr," and the "Bacchus and Ariadne." The Académie of Venice has the first; our National Gallery possesses the last. These two were painted in 1516, and were the work of his youth. Twelve years later, in 1528, in the maturity of his powers, Titian painted the "St. Peter, Martyr." It has existed three hundred and thirty-nine years. There are copies, of course. One is in England, at the house of a private gentleman of Norfolk, according to the *Morning Post*, but considerably reduced in the proportions.

Together with the Titian and the Bellini, Jacopo Tintoretto's "Virgin of the Rosary," which stood over Marco Giustiani's monument, was displaced to insure its safety, and has been consumed. The other pictures burnt are of infinitely less importance.

It has always been a matter of wonder that the Venetians could consent to allow the principal glories of their city to remain scattered among the various churches at the mercy of the thousand

misdeeds daily and nightly threatening them from the carelessness of those old men and women to whom the places are entrusted. For many years the council of the municipality have been considering the advisability of the measure of removing all the great pictures of the Académie. It seems, moreover, that it had just been decided to carry it into action.

The Prefect of Venice, at all events, according to the local *Gazette*, has requested the President of the Academy of Fine Arts to properly advise upon suitable means for preserving from accident the objects of art which are in the churches, and particularly in those in which clergy who had belonged to the suppressed religious corporations perform the services.

MONUMENTAL.

ON Monday last there was great rejoicing in the beautiful village of Dunchurch, a few miles from Rugby, where a statue of the late Lord John Scott was inaugurated by his brother, the Duke of Buccleuch. The statue is the work of Mr. Durham, A.R.A., and was subscribed for by the tenantry of Lord John. The statue, we are not surprised to hear, has obtained the entire approval of his family.

In Eyam Churchyard a subscription monument has been erected to the memory of the late Mr. Wm. Wood, a native of the village, but more extensively known as the author of the "History of the Plague at Eyam," "Tales and Traditions of the Peak," and other literary productions. The design was selected from "Clarke's Sketches and Drawings of Sepulchral Monuments," with a few alterations. The base, 4 ft. square, is composed of two courses, rusticated and pointed. The upper edge of the first tier is chamfered so as to unite with the square above, which is of less dimensions. On this is a hollow and round moulding, supporting a square pillar, polished, to receive inscriptions. Its four sides are enriched with tracery in the Perpendicular Gothic style. The panels formed by the arches are incised and sunk. The corner spaces above the curves are filled in with trefoils and seraph's wings, pointed with the chisel. Over the pillar is a projecting cornice or dripstone, which will protect the inscriptions from the weather. Above are several receding parts, each member moulded in the Early English style. The whole is surmounted by a Grecian tazza vase, resting on an octagonal foot and stem, the swell carved and enriched with foliage in relief. The lip is decorated with laurel leaves, whose points overlap the edge and form a sort of Vandycque ornament round the rim. From base to summit the monument measures 14 ft. Mr. John Bright, of Tideswell executed the design.

A monument has been erected at Darlington as a memorial of the late Rev. William Hogarth, D.D., Roman Catholic Bishop of Hexham and Newcastle. The deceased bishop lived at Darlington for the greater part of his life, where he was much respected. The memorial is composed of four steps of polished Park Spring stone, which composes the basement, and the plinth being in colour dark red, the base dark gray, surmounted with a gilt cross. The structure stands about 31 ft. high. It is from the design of Mr. A. Pugin, of London, architect. The work has been executed by Messrs. Priestman, of Darlington.

A monument to those sailors who perished in H.M.'s ship *Bombay*, which took fire, as will be recollected, on the coast of South America, has been executed by Mr. Brodie, of Edinburgh's R.S.A., for a church near the place where the event occurred. Ninety seamen and two officers perished on the occasion. The sculpture represents the ship on fire, and the inscription records that, "By the steady discipline displayed by officers and men, the boats were hoisted out in the midst of the flames, and, by their means only, 524 out of 616 people then on board were saved."

The same artist has in his studio, according to the *Scotsman*, another piece of sculpture connected with a monument to be erected in the Cathedral of Glasgow in memory of the officers and men of the 71st Regiment who fell in the campaign of Eusofzal. The tale is told and the names are graven upon a marble slab.

The Morny Statue at Deauville.—The statue of the late Duke de Morny has been inaugurated at Deauville, in presence of an immense crowd both from the surrounding dis-

tricts and from Paris. General Vaubert de Genlis, aide-de-camp to the Emperor, represented his Majesty at the ceremony, and the Prefect of the Calvados, M. Le Provost de Lannay, was at their head. M. Boitelle, senator, gave the hand to the two youthful daughters of the Duke de Morny. Baron Haussmann, Prefect of the Seine, took his place upon the platform erected for the invited guests. Immediately upon the statue being uncovered, the Prefect of the Calvados delivered an address, in which he gave a sketch of the late duke's career.

THE STAGE.

Haymarket Theatre.—Mrs. Scott-Siddons has made a successful re-appearance as *Rosalind* in "As You Like It." The weakness with which the first scenes are gone through scarcely justifies the audience in expecting the graceful and effective acting shown later by Mrs. Siddons when in boy's clothes. In the present dearth of female talent on the stage the appearance of so promising a young actress is an event of interest to all concerned in the welfare of the drama. Let us hope that injudicious friends may not by over-praise check those earnest endeavours to improve, which must be made by Mrs. Scott-Siddons if she would take a place as a great actress. We look forward with interest to her promised appearance in "Romeo and Juliet." Mr. Howe was the *Jacques*; *Orlando* was played by Mr. Kendal, a young actor, who, if he improve his elocution and conquer certain tones in his voice, has a good future before him. There can be found no better *Touchstone* and *Audrey* than Mr. Compton and Mrs. Edward Fitzwilliam present; and Mr. Walter Gordon gave more force to the elder brother than is always obtained. Mr. Buckstone is wonderfully funny in the farce that follows the play—"To Paris and Back for 5L."

The Adelphi.—An exceptionally good performance of the same charming play took place here on Wednesday evening for the benefit of Mr. Anson, the treasurer and something more. Mr. and Mrs. Herman Vezin played admirably *Rosalind* and *Orlando*, Mr. Sterling *Jacques* (much more really the "melancholy Jacques" than Mr. Howe's version), Mr. Widdicombe *Touchstone*, Miss E. Farren *Audrey*, and Mr. Addison *Adam*; Mr. William Harrison singing the songs that make the part of *Amiens*. The piece was applauded from beginning to end by a full house. Let us take the opportunity of mentioning with great admiration the acting of Mrs. Vezin in "Masks and Faces" on a recent occasion at the Princess's Theatre.

The Princess's.—Mr. Vining has opened with "The Streets of London," himself playing *Dodger* with his accustomed vigour, and this is to be succeeded in a week by "Arrah na Pogue," Mr. and Mrs. Boucicaut sustaining their original parts. We hear, too, of a novelty in preparation.

THE TRADES MOVEMENT.

Sheffield.—Mr. Gomersall, builder and contractor, has been advertising for joiners, and another advertisement advises joiners to keep away from Sheffield. A dispute has arisen between Mr. Gomersall and his joiners, as to making overtime at the work connected with alterations of the town-hall. In consequence twenty-two joiners have left work. Mr. Gomersall has on hand work connected with the erection of new premises at the corner of Fargate and Church-street. The dressed stones for this erection were lying at his yard, and during the night some persons got into the yard and broke or otherwise defaced a large part of these stones. Mr. Gomersall believes that the damage has been caused by the joiners on strike, and offers 20L reward for the discovery of the offenders.—In consequence of the ruling of Mr. Baron Pigott, and the decision of the jury in the recent action against the File Masters' Association, the men who left Messrs. Turton & Son's employ, by reason of their refusing to discharge a non-unionist, have expressed their willingness to return to their work, and several of them have been reinstated in their former situations. The non-unionist still remains with the Messrs. Turton, but it is to be feared the poor fellow will not have a pleasant time of it with his fellow workmen.—A numerously attended special meeting of stone-masons has been held to consider the notorious "resolu-

tions" passed by the saw-grinders. It was unanimously resolved:—

"That this meeting has heard with the utmost horror and regret the frightful disclosures brought to light by the Commissioners; and hereby expresses its abhorrence of the instigators and perpetrators of the diabolical deeds committed in the name of the union, and believes that such actions will be detrimental to the interest of their own union, and also to the interest of other unions throughout the country; and hopes that all well-regulated unions will stand aloof from the Saw-grinders' Union, which has not only brought disgrace on their own order, but done serious damage to the trade of the town by their unwise action in retaining Broadhead and Crookes as members of the union; and by their attempted justification of the outrages they have done much to separate capital and labour."

On the motion of the Chairman, a vote of thanks was unanimously passed to the local *Independent*, for the attitude it had taken in the late controversies.

Leeds.—A strike, which at one time threatened to prove a serious impediment to the progress of the extensive works at the new railway-station in Neville-street, now in course of erection, by Messrs. George Thompson & Co., the contractors for the North-Eastern Railway Company, took place recently amongst the operative masons. Several of the foremen, who are non-unionists, were objectionable to the men on account of not being connected with their society, and the latter waited upon one of the members of the firm and demanded that they should either be compelled to join the union or be dismissed from the job, intimating, at the same time, that the whole of the masons would leave the works if this demand were not complied with. He was surprised at the suddenness of the demand, and desired the men to wait until the following morning, in order that he might take it into consideration; but to this the men would not consent, and required their immediate discharge. This he declined to comply with, and within ten or fifteen minutes afterwards the whole of the masons, of whom there were upwards of a hundred, stopped work, notwithstanding that they were receiving 3s. a week wages, where the ordinary wages of the town are only 30s. Subsequently the men offered to resume work if their demands were acceded to, but the Messrs. Thompson steadily refused to do this, and the men who struck still remain out. The directors of the company at once granted an additional twelvemonth for the completion of the contract, and expressed their willingness to extend the time still further if it should be necessary. A large number of the men on strike have been replaced by non-unionists, and the contractors are sanguine that they will ere long be able to secure their full complement of hands.

Harrogate.—The usual half-yearly meeting of the Yorkshire Association of Master Builders has been held here, under the presidency of Mr. Archibald Neill, the president for the past half-year. After the business of the meeting had been commenced, Mr. Fawcett, of Huddersfield, was elected president for the ensuing year; Mr. Beauland, of Bradford, treasurer; and Mr. Longley, of Leeds, secretary. The report of the past half-year, which contained satisfactory accounts of the operations of all the local societies, and which alluded to the sittings of the Royal Commission, was read and adopted, after which there was some conversation on the question of architects making bills of quantities; and the meeting, after fixing upon Wakefield as the place for holding their meeting for the next half-year, separated. A dinner was held at the Dragon Hotel, at which Mr. Fawcett presided.

Darlington.—As showing the opposition which is still manifested by some classes of workmen to the use of machinery in their trade, a story is told of what has happened to Mr. D. McDermid, an upholsterer, of Darlington. This gentleman, it seems, has invented a machine by which he proposes to save one-third of the usual amount of labour in paperhanging, and has taken out a patent for it. He tried to get it introduced in London, but although the masters were favourable to the design, the workmen were hostile, and either purposely spoil the paper or refused to use the apparatus. He had been recommended to the chief of one large paperhanging firm, but he found that in repeated calls the gentleman could not be communicated with, as he was always out. He learnt some time afterwards, although he had repeatedly left cards for the principal, that that gentleman had never been permitted to hear of his invention; and when ultimately he did so he stated he could not adopt it because of the hostility of his men. In another instance he was civilly invited by some operative paperhangers to attend in a

certain quarter and show them the machine. This he did, when all he got for his pains was a heavy blow from the fist of one of the party, and a strong blackguarding. On leaving, one of the fellows followed him, and pretending to be indignant at the usage to which he had been subjected, persuaded him to go to another part of London to see a paperhanger, with whom he was induced to leave one of his machines. This was another ruse, as he afterwards discovered, and the machine he left was totally destroyed. Eventually he left London, not feeling himself safe there. Even in Darlington the union feeling has been manifested against the machine, which, however, is in use by one or two firms.

Manchester.—A Trades-Union Commission is being opened at Manchester in order to inquire "into any acts of intimidation, outrage, or wrong," which are supposed to have originated or been promoted by trade organisations.

TRADE-UNION LAW.

The Leeds plasterers have a rule that,—

"Providing any labourer, bricklayer, mason, or the like, commence any job by lathing, or any other portion being a part of the business of a plasterer, no member of this society will be allowed to work on the said job; any member breaking this rule will be fined 1s. and one month will be allowed to pay the fine, and if neglected will be liable to expulsion from this society."

The same rule, it is said, exists in the whole of the branch rules belonging to this same association.

A witness before the late Commission stated some curious instances of trade-union restrictive regulations, which lead one to anticipate something like the Hindu caste stagnation at some future time amongst our own operatives if the present system continue to prevail. This witness says:—

While I was engaged in an arbitration case at Bolton last year, or at the commencement of this year, I was told by a master of the name of Mr. Day, who is quite willing to come here and tell you the same, that during that same week some bricklayers had passed by one of his works and had heard some hammering of brickwork going on inside, and had looked inside, and had found a carpenter, whom he had sent to fix some joists, who was cutting the holes left in the brickwork to put the joists into a little larger, and because he had allowed this carpenter to do that the bricklayers fined the master 2L, and the master told the fine! Here is a case from Ashton-under-Lyne exactly similar, only I have this in the writing of the gentleman who was concerned.—Mr. George Colbeck, joiner and builder of Ashton-under-Lyne, in December, 1865, sent a joiner, a bricklayer, and two labourers to make some alterations in an inhabited house; a door was to be removed half the width of itself, the bricklayer built up the part requiring it. The joiner, having to stand idly by while this was doing, proceeded to pull out until he said the fine. He remonstrated, but to no purpose. He had infringed their rules by permitting a joiner to pull out bricks, which must be done by a bricklayer, and must pay. The black mail was accordingly paid!

I have a case from a Mr. Murdy, a master plasterer in Nottingham. He says, "Two years ago a respectable man (who had formerly been in business as a bricklayer and plasterer, but who had been reduced in circumstances to obtain his livelihood as a journeyman) came to me for employment. Feeling sorry for the man, and knowing him in better days, I gave him employment. After he had been at work a few days, the trade unionists in my employ informed me that I must discharge this man, as they had passed a resolution that as he professed to be as much a bricklayer as a plasterer, he should not be allowed to work as a plasterer, and he might go some where else and work as a bricklayer." I remonstrated with them, but to no purpose. The poor man tried all he could to retain his employment with me. He offered to join their trade union, and become one of their body if they would allow him to work for his living; he pleaded to them that he had a wife and a large family dependent upon him for their support, and that he would do the work as well as any of our neighbourhood. He accordingly employed two bricklayers to do this work, and immediately he employed them the masons struck. He asked the masons whether any of them who were on the ground who could do the work at all, because they had all been brought up as hankers hands and not as setters, and were not accustomed accordingly to the use of the trowel."

The following extract is no less ridiculous and amusing than those already given, though it relates to a rather different point of the inquiry:—

"Notice.—Any brother in the union professing to carry any more than the common number, which is eight bricks, shall be fined 1s., to be paid within one month, or remain out of benefit until such fine be paid; any member knowing the same shall be fined the same sum, unless he give the earliest information to the committee of management." Chairman: "What does 'knowing the same' mean?" "It means to say knowing it of any other man. I should tell the committee that this 'eight bricks' is a ridiculously small number. At Liverpool the rule is twelve bricks. I believe that the usual rule all over the country is ten bricks. I remember the case of a master who met one of his Irish labourers carrying up eight bricks on to the first floor of a house, and he said to him, 'Hallo! what are you doing this for?' The man answered, 'Well, sir, you know it is the rule.' 'No,' said the master, 'it is only the first floor.' 'Ah! but sir,' replied the man, 'I am taking it up a three-story ladder.'"

THE LAW OF MASTER AND SERVANT.

In the new Act to amend the statute law as between master and servant there are twenty-six sections, carrying out the declaration of the preamble as to the expediency of altering "in some respects the existing enactments relative to the determination of questions arising between employers and employed under contracts of service." After a definition of the expressions used, in which the term "employed" is to include persons under age, there is a limitation and substitution for existing enactments contained in the first schedule annexed. Either side, employer or employed, can make complaint before a magistrate and a summons be obtained, and in the event of non-attendance a warrant to follow, and where there is an intention to abscond security can be required for the appearance. Compensation may be awarded for breach or non-performance, or a fine not exceeding 20*l.* may be imposed, and security may be required for the fulfilment of the contract. The money ordered may be recovered by distress, and in default of payment, with imprisonment not exceeding three months, without hard labour. There is a provision in this Act for "aggravated misconduct," contained in the following words:—"Where, on the hearing of an information or complaint under this Act, it appears to the justices, magistrate, or sheriff that any injury inflicted on the person or property of the party complaining, or the misconduct, misdemeanour, or ill-treatment complained of has been of an aggravated character, and that such injury, misconduct, misdemeanour, or ill-treatment has not arisen or been committed in the *bona fide* exercise of a legal right existing or *bona fide* and reasonably supposed to exist, and, further, that any pecuniary compensation or other remedy by this Act provided will not meet the circumstances of the case, then the justices, magistrate, or sheriff may by warrant commit the party complained against to the common goal or house of correction within their or his jurisdiction, there to be (in the discretion of the justices, magistrate, or sheriff) imprisoned with or without hard labour for any term not exceeding three months." The Act, which extends to the United Kingdom, is not to prevent proceedings by civil actions. It is to continue in force one year from the 20th of August and to the end of the then next session of Parliament.

RAILWAY MATTERS.

The traffic receipts of railways in the United Kingdom amounted for the week ending August 17th, on 12,823 miles, to 834,180*l.*, and for the corresponding week of last year, on 12,560 miles, to 788,430*l.*, showing an increase of 263 miles and of 45,750*l.*

A return moved for by Mr. Bazley has just been issued of the amount of capital, in shares and by loans respectively, proposed to be raised by the railway and other Bills brought before Parliament in the session of 1867, and the aggregate amount of such capitals and loans; together with the gross aggregate amount of similar returns for the years 1865 and 1866. The return shows that during the present year, the proposed capital was, by shares, 24,947,447*l.*; by loan, 17,691,328; total, 42,638,775*l.* The gross aggregate amount of a similar return for 1865, 126,441,708*l.*, and for 1866, 175,490,546*l.*

The Duke of Sutherland has used a private railway-carriage of his own invention during his recent journey to Scotland. This is probably

the first instance of a railway-carriage not the property of any railway company having been made use of. It is of the largest size that can be run with safety, and is luxuriously fitted up with three compartments and a roomy platform, covered, but open at the sides, which is suggestive of the comfort of a cigar in travelling.

The Emperor Napoleon's railway state carriages are connected by decorated bridges, and are furnished with chairs, ottomans, sofas, mirrors, pictures, clocks, and chandeliers. There is a study, a bedroom, with two beds, a drawing-room, a kitchen, a wine-cellar, and a conservatory. The Emperor can communicate by telegraph with his suite in the other carriages.

The *Mont Cenis Summit Railway*.—The line of railway which has been in the course of construction for the last eighteen months over this pass, and which follows in the main the great road of the First Napoleon, has been successfully traversed over its whole length of forty-eight miles by a locomotive engine. Mr. Fell's system consists of the application of a central double-headed rail placed on its side in the middle of the way, and elevated about 14 in. above the ordinary rails. There are four horizontal driving wheels on the engine, under the control of the engine-driver, which can be made by pressure to grasp the central rail so as to utilize the whole power of the engine, and so enable it to work up incredible gradients without slipping. The carriages also have four horizontal wheels underneath, which, with the central rail, form a complete safety-guard. In addition to the ordinary break there are breaks upon the central rail.

ADVERTISING ARCHITECTS.

We have received from two or three quarters the most remarkable handbill of prices ever issued by a gentleman calling himself "architect and surveyor." "I think this will astonish you," writes one correspondent: "What next?" It does astonish us; and in reply to the inquiry we say that nothing can go beyond it, in its way, but an offer of payment to be allowed to act as architect. How the gentleman proposes really to get paid for his time is best known to himself. He sets himself forth as an exhibitor, and his handbill is made to look as if he dated from the House of the Institute in Conduit-street; but this is not the case. One of his items will serve to show his *calibre*:—

"Plan of, and Report on any Delapidation [sic], the materials of which shall not exceed the value of 1,000*l.*...1*l.* 10s."

He will design a 2,000*l.* house for 3*l.* 10s., and then make all the working and detail drawings, "including all levels, sections, plans of drains, &c.," for a five-pound note in addition. He might fairly stipulate for a "drop o' beer" extra when the job is done to owner's satisfaction.

GAS.

The Liverpool United Gas-Light Company have declared their usual dividend of 10 per cent. per annum for the last half-year. The price of gas at present in Liverpool is 3s. in the borough and 3s. 4d. in the country districts. The Wolverhampton Town Council are in dispute with the local gas company on the subject of the supply of gas. The company having reduced the price of their gas to a minimum of 2s. 9d., desired the council to renew their contract for three years, paying the minimum price to ordinary consumers; but to this the council object, having always hitherto, as large consumers, had it at 3d. per thousand less, and they demand it at 2s. 6d. The council have also been negotiating for a transfer of the works to themselves; but the company ask for a bonus of 6,040*l.* on their total capital, making in all 105,000*l.*, and this is considered exorbitant. At a meeting of the council on Monday, Alderman Hawksford said works of sufficient magnitude to supply the town could be erected for 50,000*l.* A series of resolutions were adopted, authorising the continuance of negotiations, and requesting the company to light the lamps on their own terms till the 1st of October.

The Sunderland Gas Company's directors recommend a dividend of 9 per cent. per annum for the last year on the original capital stock, and 8½ per cent. (the maximum) on recently created stock of the company.

A meeting of the gas consumers of Brierley-

hill, Dudley, was announced by a placard to consider the following questions:—"Shall we burn gas at the extortionate price it now is?" "Why pay 4s. 7d. for gas when it is sold at 2s. 6d. in other towns?" The meeting was attended by about 180 persons. At a former meeting the secretary was requested to write to the directors of the Gas Company to inquire when they intended to reduce the price of gas, and what reduction they intended to make; and to ask, on behalf of the consumers, that the price should be reduced to 3s. 9d. per 1,000 ft., the same as at Stourbridge. The replies of the directors, which were read, were to the effect that they were not prepared at present to fix any date for a reduction in the price of gas nor the rate of such reduction. It was resolved that the Gas Company should be allowed till the 25th of September to consider whether they would reduce the price of gas, and that in the event of their not doing so the consumers present would cut off their entire supply.

The Gloucester Gas Company have declared dividends for the last half-year of 10*l.* per cent. per annum upon Class A shares, and 7*l.* 10s. upon Class B shares, leaving 55*l.* 12s. 7d. to be carried over to the next half-year.

NEWS FROM WALES.

The Welsh Presbyterians have lately enlarged one of their chapels in Carnarvon, at a cost of 2,300*l.* It has now a front of Penmaenmawr blue stone, all dressings being limestone. The portico in front is a structure of the Tuscan order. The building has a gallery on the three sides, and the whole will seat about 1,000 persons. The minister's platform is constructed of pitch pine, French polished, at a cost of 100*l.*, a gift of a lady belonging to the congregation. The edifice was opened in January last. Contractor, Mr. Evan Jones, Maen Coch. The other chapel, called Moriah, belonging to the same body, is now in course of re-construction, the whole of the interior being re-peved in Memel pine, varnished; platform, pitch pine, French polished; a very ornamental panelled ceiling, and a new portico of Wrexham stone added in front. Seats are provided for about 1,150; size, 75 ft. by 54; gallery on three sides. Cost 2,400*l.* Contractor, Mr. Hugh Rowlands, Carnarvon.

The same body are also erecting a new chapel at Brynrodyn, four miles from Carnarvon, with seat-room for 650 persons, the front being Penmaenmawr blue stone, and all dressings in front and sides are of Wrexham stone. There are to be, also, vestries and minister's house connected. Total cost about 2,000*l.* Contractor, Mr. J. R. Jones, Rhyll.

The Welsh Presbyterians are erecting a new chapel at Abergele. The style is Gothic, of the Early English type; the plan cruciform, with nave, transepts, and short apsidal chancel, vestries behind; wings for gallery staircases, and an entrance porch in front; the whole exterior being built of Penmaenmawr random rubble and Wrexham stone dressings throughout. It will seat about 650 persons. The total cost will be about 3,000*l.* Contractor, Mr. J. R. Jones.

Mr. J. R. Jones also erected a new chapel for the Welsh Baptists at Rhyll, at a cost of 1,600*l.*; seat-room for about 350 persons; schoolroom and vestry connected; the exterior part being of Yorkshire shoddy and Wrexham stone dressings. Opened last June.

The Welsh Presbyterians in Dwyran, Anglesea, are about rebuilding their chapel, at a cost of 1,500*l.*

Messrs. Lewis & Thomas, drapers, Bangor, are building new premises for themselves in High-street, one of the most commodious in the principality, the shop itself being about 80 ft. by 30 ft., and a large dwelling-house attached. The total cost will be about 2,500*l.* The contractor is Mr. Hugh Rowlands, Carnarvon.

Mr. Roberts, timber merchant, Liverpool, has lately erected a dwelling-house at Bryngwauallt, near Abergele, the style being Domestic Gothic with barge boards, all of pitch pine, varnished. The exterior walls are dressed limestone, the whole interior woodwork being pitch pine. The verandah and all halls and staircases are laid with Minton tiles; all windows glazed with polished plate; all chimney-pieces made to designs furnished by the architect, and grates to match. It is being done day-work, under the superintendence of the architect and Mr. J. Jones as foreman over all. The architect in

this and in the previous cases mentioned above is Mr. Richard Owens, Liverpool.

Farm buildings have recently been erected at Plas Llanddog, Llanrwst, for Mr. H. B. Roberts, from the designs of Messrs. Lloyd Williams & Underwood. The contractor was Mr. George Clark, of Chester; the cost was about 2,900l.

The foundation-stone of a new school was laid at Rhayader last month. It will be capable of accommodating 120 children, and when completed will add one more to the large list of new ornamental structures recently erected in this rising little town. The architect is Mr. E. H. Lingen Barker, and the contractor Mr. William Evans, of Rhayader.

The foundation stone of a new town-hall has been laid at Loughor. The question of the erection of a building of this description has been for a long time under discussion, and at length, principally through the exertions of Mr. Benjamin Jones, of Llanelli, and Mr. William Edmunds, of Swansea, the present inaugural movement has been made. The plans have been drawn by Mr. Henry Davies, of Llanelli, and the building is to be erected by Messrs. Gough & Griffiths, contractors. It is 37 ft. long by 27 ft. in breadth. It is to be two stories in height, and the lower floor will be a residence for the local police and a lock-up. Two large rooms are to be over the whole of this, one to serve as a reading and a public library, and the other as a court-house and magistrates' meeting-room. This is also to be used for the general transaction of the town business.

IMPROVEMENTS IN CALCUTTA.

WE understand that, after more than three years' discussion, it has been at last decided that the Government Telegraph Department is to have a separate building, instead of having its offices in the same building as the Post-office; and that Mr. Granville has been instructed to prepare plans for the office to be constructed in continuation of the southern wing of the new Post-office in Coila-Ghat-street; this will give greater accommodation to each department than could be given if they were both located in the same building. *The Calcutta Engineer's Journal* says,—Plans are also in course of preparation for new Government offices at the south-eastern corner of Dalhousie-square, on the site of the premises lately occupied by Messrs. Birkinyoung & Co., and we believe the works are to be undertaken as soon as the plans are complete. The works at the new High Court are progressing rapidly, after having been temporarily suspended: we believe the lower story is to be completed and fit for occupation before the walls are carried up for the second story. The carving of the capitals of the pillars, which are of Caen stone, is really very fine: these pillars (twenty-seven in number) were delivered in Calcutta within one year from the date of the order having been given. The waterworks contract is being rapidly proceeded with, and the drainage works of the southern portion of the town are in a very forward state.

PROVINCIAL NEWS.

Mirfield.—The Mayor of Dewsbury has laid the corner-stone of a town-hall in Mirfield, in the presence of about 3,000 people. There was a demonstration by various friendly societies, volunteers, and principal inhabitants. The building, which will be in the Italian style of architecture, will cost, with the site, about 4,000l., and comprise a large hall capable of affording sitting accommodation for 1,000 persons, and suites of offices. The roof of the great hall will be dressed and partially exposed, the principals being carried on projecting corbels. The principal features of the building externally will be the south front, with tower, and the east front. The architects are Messrs. John Kirk & Sons, of Huddersfield and Dewsbury.

Southampton.—The corner-stone of the new relief offices, dispensary, &c., has been laid. The contractor is Mr. J. Bull, and the architect is Mr. Skelton. The structure is to be raised on a piece of ground near the park, facing Hondwell. The building will present to the park a red brick elevation, with stone windowsills and lintels. A waiting-hall, with an open-timbered roof, and large windows in each gable, is entered from the St. George's-road by a porch.

From this hall are approached the relieving officers' rooms, through which the persons to be relieved will pass into a corridor, having on one side a suite of rooms for the medical officer, and on the other a dispensary and a dispenser's residence; and from this corridor a door leads to the footpath on the north side of the building. The plans were approved of by the Poor Law Board without alteration.

SUFFOCATED IN A CESSPOOL.

A SAD accident has happened at the north part of Brighton, proving fatal to one man, and nearly depriving two others of their lives. The man who lost his life was a well-digger, who had contracted to dig a cesspool in the back premises of the Horse and Groom Inn, Islingword-road. The cesspool was to be joined to another which was full, and which was to be drained into it. The men had finished digging, and deceased had driven a "heading" from one cesspool to another, when the landlord gave them a quart of ale. They had had none previously, and deceased was perfectly sober; but, on going down the new cesspool again to make the heading larger, he began to roll about. He was told to take hold of the rope which was hanging down the hole, but he was unable to do this, and fell into the hole head-foremost. A fellow labourer went down to help the deceased, and he became insensible, as did a baker who went down to save both, but who succeeded in fastening a rope to the leg of one of them, and so saved his life.

A medical student of Guy's Hospital stated at the inquest that he was summoned to the place of the accident, and arrived there just as they got the body of the deceased up. Life was quite extinct. He tried artificial respiration, but with no effect. The body, upon which there were no marks of violence, was very livid, and smelt very strongly of sulphuretted hydrogen, the imbalation of which had, he believed, caused death. He saw the other two men, who seemed to be suffering from the same cause.

The jury returned a verdict of "Accidental death."

PAPIER-MÂCHÉ IN ROMSEY ABBEY CHURCH.

SIR,—Our noble abbey is in the course of restoration, and much of it is well done; but we have an ingenious vicar, who has employed his leisure time in making bosses for the roof in papier-mâché, which are painted, and put up in the north transept. He says they look as good as carved work.

What would the old builders of the walls say if they could rise and see the papier-mâché decorations?

COMPETITION COMMITTEES.

SIR,—An advertisement was placed in your journal, offering a premium of 25l. for the best design for a proposed new church at Dorechester. In answer to this appeal I prepared a very carefully-studied set of drawings. A friend of mine, who is quite old in the study and practice of church architecture, also sent in an elaborately-prepared set of drawings. After waiting about a fortnight the drawings have been returned, and I am informed that none of the designs have been accepted. I should scarcely have thought it possible that there could be found a committee, having 6,000l. at their disposal, so mean as to withhold a paltry premium of 25l., after having caused a number of architects to throw away at least six weeks' labour, as well as other expenses, such as frames, artistic colouring, &c. Surely the committee, even if they had determined not to carry out any of the designs, must have seen that the least they could do, consistently with honour, would have been to award this paltry premium, as it would scarcely cover the expenses of the successful competitor.

A VIZIER.

SOUTHWARK PARK.

SIR,—As I have not met with the following particulars respecting New Southwark Park in the *Builder*, and as the subject is important to many thousands, perhaps you will think these lines of sufficient interest for insertion. At the meeting of the Metropolitan Board of Works on the first day of last March, the Works and General Purposes Committee submitted amended plans and estimates for lodges, and plans for entrance-gates, fencing, and roadways of the Park, and for the drainage of the roadways and houses, and recommended that the same be approved, and that the officers should be directed to prepare specifications and plans with a view to advertisements being issued for tenders for the several works; and with regard to the question of the land drainage of the Park, the committee recommended that the same be deferred. The plans were approved, and the Board resolved that tenders for the several works should be received that day six weeks.

On April 12 the tenders were opened. The work had been divided into three contracts, and this was the result:—

For the drainage of roads, &c., eleven tenders were sent in, the highest being 4,700l., and the lowest 2,417l.

For the formation of carriage-roads, footpaths, &c., twelve tenders were sent in, the highest being 6,253l. and the lowest 1,651l.

For the principal lodges, entrance-gates, palines, &c., eleven tenders were sent in, the highest being 5,149l., and the lowest 3,300l.

It was resolved that, subject to the usual inquiries, the lowest tender should in each case be accepted; and that the drainage and formation of the roads should be placed under the charge of the engineer; and the construction of the lodges, gateways, &c., under the charge of the architect.

On May 17th the Board resolved, a further report from the Committee of Works and General Purposes having been received, that a tender of 2,812l. for the carriage-roads, footpaths, &c., should be accepted, instead of the tender of 1,651l. previously accepted provisionally.

The matter was finally settled thus:—

Drainage of roads, &c.	£3,417
Formation of roads, &c.	2,812
	£6,229
(These to be under the control of the engineer).	
Principal lodges, entrance-gates, &c.	3,950
(These to be under the control of the architect).	49,179

In conclusion, I would observe that the whole business of the park seems to be still making anything but rapid progress, and I think that another deputation should wait upon the authorities at Spring Gardens (as soon as they return), to again urge despatch in the matter.

ABSQUE LABORE NILIL.

APPARATUS FOR BUILDING CONCRETE HOUSES.

MR. CONYBEARE replies to Mr. Tall, and forwards copies of the works of Rondel, Nicholson, and Cresy, to prove his statements. We are not disposed, however, to carry the correspondence further. Mr. Conybeare adds:—

"As I am not a builder, Mr. Tall's offer to build a wall twice as fast as I can, goes for nothing. His allegation that he can make a beam of concrete twenty times as strong as one of brickwork is simply irrelevant, as the question was the building of walls (in which the material would only be exposed to compression) and not of beams. I do not at all wish to be understood to disapprove of the use of hydraulic concrete in walling; on the contrary, I am of opinion that if the quality of such concrete can be ensured, it is very much better and cheaper material than ordinary brick and mortar; but to over-rate the strength of a material now coming largely into use in construction is a course not without its danger. I have (as you must be aware) no interest that could be in any way affected by the validity or otherwise of Mr. Tall's patent, and in pointing out the original of his patented apparatus, was only acting on the principle of '*anum outaque?*'"

THE "UNDERGROUND" IN BAD ODOUR.

IT has unfortunately happened that a third death has occurred within a few weeks amongst the Metropolitan railway passengers, and the coroner's jury have rightly resolved to adjourn till a chemical analysis of the atmosphere of the line shall be made, although the medical man who made the *post-mortem* examination declined to say decidedly that the death, which occurred from constriction of the aortic orifice, was even hastened by the atmosphere of the "Underground."

That there is a want of proper ventilation seems evident, and something really must be done to remove the stagnant air regularly from the tunnels; but on occasions when we have personally gone through them we cannot say they felt worse than tunnels always are, so far as regarded sensible odour at least, or even of conscious oppression in breathing. The Metropolitan carries 25,000,000 passengers annually; and it must be remembered that many persons in bad health who would not be likely to journey on country lines, will pass to and fro within the limits of the metropolis. There they are, as it were, at home; and every one knows that more people die at home than anywhere else. The directors express their anxiety to promote inquiry, and they point to the good health of their servants who are permanently engaged on the line, to show that it cannot be injurious to passengers.

SIR,—It appears that the deaths on the Metropolitan Railway have induced the company to employ Drs. Letheby, Whitmore, and Bachofner to report upon the sanitary condition of the atmosphere of the railway.

Now, the mere fact of the above-named gentlemen being employed by the railway company to report to the railway company on the unhealthiness, or otherwise, of the company's property, when the pockets of the company are directly concerned, seems to me sufficient to nullify their report. It is well known that the law is paid by their clients generally coincide in opinion with their

clients. Doctors may, or may not, act upon a different policy.

The Railway Department of the Board of Trade should take action in the matter, and appoint one or more competent chemists to analyse the railway atmosphere, and report on its condition. Nothing less will be satisfactory to the public.

During the last three years I have passed by, almost daily, the Gower-street and Portland-road stations, and on some occasions have been nearly suffocated, although possessing a vigorous constitution and healthy lungs, by inhaling the noxious gases issuing from these stations.

I trust, sir, you will use your influence in protecting the lives of her Majesty's subjects.

E. NUGENT, Civil Engineer.

NEW METROPOLITAN TRAFFIC ACT.

This Act has been issued in a printed form. There are twenty-nine sections in the Act. As to scavengers, it is enacted, that after the 1st of January next, between the hours of ten in the morning and seven in the evening, in such streets as may be named by the Commissioner of Police, no ashes, &c., are to be removed from a house, and no goods deposited or unloaded, under certain penalties, between the hours mentioned. Within the "general limits" of the Act, the driver of a metropolitan stage carriage shall not stop such carriage for the purpose of taking up or setting down passengers at any part of a street except as near as may be to the left or near side of the roadway. For acting in contravention the fine is not to exceed 40s. Advertisements on carriages, &c., are prohibited, except those approved by the commissioner; but the section is not to apply to the sale of newspapers. The Commissioner of Police may make "special limits," with the approval of the Secretary of State, and regulations may be made after notice as to the route of vehicles, &c., and for disobedience, penalties are to be enforced; and within special limits no driver of a metropolitan carriage is to take up or set down. Certain rules are to be enforced as to the delivery of coals and timber, and as to hackney carriages. There are to be regulations as to shoeblacks and messengers, and as to dogs. Three or more persons assembling for betting in a street are to be deemed an obstruction, and each is liable to a penalty of 5s. No fare for a hackney carriage is to be less than 1s. The Act is to take effect on the 1st of November next.

CHURCH-BUILDING NEWS.

Hay.—The church here has been re-opened. It was desirable to improve and enlarge the chancel, and open it to the nave. There have been added an apse of semicircular Norman form, an organ-chamber and vestry on either side of the chancel, besides which the nave has been divided from the latter by a triple-pointed arch of the Early English order, springing from two central circular columns with carved capitals, and square cushions, each arch being surmounted by a tooth-work moulding; the terminating corbels form human heads, whilst a similar design forms the key or finial at the point of each arch. The whole is composed of alternate layers of blue and white Bath stone. The organ-chamber and vestry are, like the church itself, plain structures. The apse is lighted by three small lancet windows filled with stained glass by Messrs. Clayton & Bell; they are the gift of Mr. F. R. Trumper, of Hay. The subjects are, centrally, the Crucifixion, and right and left, the Agony in the Garden and the Entombment of our Saviour. Besides the apse windows, Mr. Trumper has given a costly pulpit in commemoration of a departed wife and her mother. This is composed of rock alabaster, octagonal in form, and rests upon a central column of red Mansfield stone, the stairs being also composed of the latter material. Beside the central column supporting the pulpit there are others of serpentine marble forming an arcade; the front panels are each adorned with an oval quatrefoil recess, containing, in high relief, medallions of white marble representing our Saviour and the four Evangelists. The pulpit and the alterations generally were designed by Mr. T. Nicholson, of Hereford, architect; and the brasswork was from Messrs. Hart & Son, of London. The pulpit has been executed by Mr. R. L. Boulton, Cheltenham, and all the other portions of the work have been carried out by Mr. Merrick, of Hereford, at a cost of between 600l. and 700l. All the work has been executed externally with native

stone toolled, and hard stone dressings; and the internal dressings and ashlarings with Bath stone. The roofs are of open construction, boarded, varnished, felted, and covered with green Pembroke slates. That over the apse is carried upon curved braces springing from carved corbels. The plaster ceiling over the old chancel has been removed, and an open timber roof set up in its place. The apse and organ chamber open from the chancel through arches, composed of alternate voussoirs of grey and white stones. The chancel is studded with open benches, and the floor laid with encaustic tiles. The style of architecture adopted is Early English, treated somewhat after a continental type. The carving was executed by Mr. Walker, and is a combination of natural and conventional foliage.

Pitsoford.—The parish church has been reopened for divine service. The old church had long been in a state requiring restoration, and about fourteen months since the work was commenced, and it has been brought nearly to completion. The capitals and other stone work still require carving, but funds are still wanted. The new church consists of nave with north and south aisles, south porch, and tower at the west end. The nave, south aisle, and porch are wholly new. The tower and north aisle formed part of the old church, and the three windows in the north wall were inserted instead of three others that were debased. The new church is larger than the old one by the whole of the space comprised within the south aisle, porch, and chancel. It is Middle-Pointed or Decorated. The arcades, with clustered shafts, are intended to have carved capitals. The chancel arch is moulded. The deal roof is formed with moulded ribs, wall pieces, &c., and boarded, the whole being open to the ridge. The seats, of varnished deal, are moulded from the old example. The painted east window, representing the Crucifixion and incidental connected with it, was executed by Messrs. Heaton, Butler, & Bayne, under the superintendence of the Rev. Mr. Sutton, vicar of Tbeddingworth. The church has been erected from the designs and under the superintendence of Mr. W. Slater, and Mr. H. Carpenter, architects, London; the builders being Messrs. Halliday & Co., of Oakham. The works were superintended by Mr. W. Thompson and Mr. J. T. Halliday.

Hereford Cathedral.—Eight stained-glass windows are to be put up in the Lady's Chapel of this cathedral in memory of the late Canon Morgan.

Kirkheaton.—The church of Kirkheaton has been re-opened, after having undergone various restorations and improvements. The restorations consist of the entire re-building of the chancel, except a small portion of the south-east corner, opening a window in the west end, adding a new vestry, removing the old-fashioned pews, and replacing them with rush-seated chairs. Mr. Bodely, of London, was the architect, under whose superintendence the work was done. The chancel has been fitted up with oak seatings, candelabras, and hangings, revived, under Mr. Bodely's superintendence, from very old designs in the Paris Exhibition of the present year.

SCHOOL-BUILDING NEWS.

Gateshead.—The Building Committee of the Albert Memorial Schools met on Saturday at the new Town-hall, Queen's Head Hotel, Gateshead; the mayor (Mr. Miller) in the chair. Mr. A. Swan, architect, has submitted his amended plans for the schools, which have been agreed to; and the officers of builders to execute the works having been considered, the offer of Messrs. N. & R. Reed, 4, 222., being the lowest, was accepted. The site proposed by the architect was approved, and is to be purchased from Sir Walter James.

Ipswich.—A large convent has been commenced in the environs of Ipswich, planned with the view of affording accommodation as a place of education. The architects are Messrs. Goldie & Child, of London; and Mr. R. S. Smith, of Ipswich, is the contractor. Red Suffolk brick, with a spring use of white and black bricks and Bath stone dressings, are the materials. The style is a free treatment of Early Domestic Gothic, with large shafted windows opening in sashes, strings, buttresses, and other features, simply to mark the points of the floor-lines, &c. The rooms are all to be spacious, light, and airy,

and the whole design combines simplicity with architectural character.

Totley (Sheffield).—The corner stone of the new building in course of erection for this Orphanage, at Brook Hall, Totley, has been laid. The work has made considerable progress, the structure being in many places several feet above the ground. The building is entirely of blue stone from the Twenty-well-sick quarries, the walling being rock-faced courses, and the dressings tooled. The architectural arrangements are adapted to the purpose of the building, there being a school-room, a dining-room, nursery, kitchens, dormitories, store-rooms, teachers' sitting and bed rooms, &c. The ventilation of all the rooms has been cared for, and the drainage will be good. The building stands on the side of the hill behind Brook Hall, and can be seen from the Sheffield and Baslow road. Messrs. C. J. Innocent & Brown, of Sheffield, are the architects; and the contract, which is for 1,630l., has been taken by Messrs. T. & W. Nelson, of Wadley Bridge.

Manchester.—The foundation stone of the Manchester Warehousemen and Clerks' Schools, which are being erected near Cbeadle Hulme, and near Stockport, by the Manchester Warehousemen and Clerks' Association, has been laid by Earl Granville, with considerable éclat. The building is from the designs of Mr. E. Bate, of Manchester and London, and will be after the geometrical period of the Gothic style. The front elevation will have a total length of 188 ft., and show three gables, one central, and one at the end of each wing. The height will be three stories, and at the side of the central gable, over the principal staircase, will be a tower and spire 120 ft. high. The building will be of brick moulded on the spot, with dressings of Darley Dale stone, and hands of blue brick. The front, which faces the London and North-Western Railway, will be decorated with stone carving. The tower and spire will be covered with blue Welsh slates, in patterns, and the total cost of the structure will be about 13,000l. The site covers five acres of land.

PATENTS CONNECTED WITH BUILDING.

IMPROVED MEANS OF FORMING JOINTS BETWEEN SASHES, DOORS, DRAWERS, AND OTHER STRUCTURES, AND THE FRAMES IN WHICH THEY MOVE OR ARE FITTED.—*J. R. Cadman.* Dated 12th November, 1866.—This invention consists in forming joints as follows:—Around the inside of the frame in which a sash-door, drawer, or other structure moves or is fitted, the patentee cuts a dovetailed or other formed groove or recess, and in this groove he fits a tube or cushion of india-rubber, or other suitable yielding and elastic material; then upon or against the tube or cushion he fits a bead of ebony, metal, wood, or other suitable hard material, which projects from the frame like an ordinary bead, but can be forced inwardly owing to the elasticity of the tube or cushion behind it. The sash-door or other structure fitted in the frame is cut with a groove corresponding to the bead, and the elasticity given to the bead by the tube or cushion behind it forms an air-tight joint, and at the same time prevents the sash or other structure bearing upon or rubbing the wood of the frame, and compensates for any shrinkage in the material of the frame, or of the sash or other structure.

APPARATUS FOR GRINDING CLAY, &c.—*H. Goodfellow.* Dated 22nd December, 1866.—The object of this invention is to grind clay and strong marls so that a great deal of labour now necessary in the ordinary manner of preparing clay for the pugging-mill may be saved. The object is also so to place the apparatus for grinding the clay, that when in a proper condition the material may fall into the pug-mill beneath, and so by the practical combination of the two the finished material may be prepared at a very great reduction in cost. The apparatus is particularly intended to dispense with the very expensive system of wheeling ground marl into large heaps to be watered, sometimes turned over, afterwards tempered by the moulder, and then wheeled back to be pugged. Upon an upright shaft is hung a conical runner, having cast upon it certain ribs or projections, which are placed in an oblique direction. The said cone-shaped runner works within a strong metal casting of suitable shape and size, which is provided internally with certain other ribs or projections, to correspond with those with which the runner is furnished, except that these may be either placed obliquely

or in a perpendicular direction. The marl is supplied to the grinding apparatus from a platform fixed to the upper part of the cone-shaped casing, and it will be obvious that, as the runner revolves, the clay will be ground and worked downwards to the bottom of the cone. From here it falls into the pug-mill underneath, but which is no part of this invention except as far as regards its combination with the grinding mill and its position in respect of the said grinding apparatus. Part of the metal casing within which the cone-shaped runner revolves is made recessed and set back from the runner. It is also removable at pleasure, and by preference forms that part of the casing over which the marl is applied to the apparatus for grinding from the platform. The object of this is to allow stones and other hard foreign substances which may be in the marl to remain in the said recessed space while the clay is being ground, until the casing being removed the stones may be taken out. Motion may be given to the apparatus by any convenient means.

Books Received.

The second number of *Tinsley's Magazine* is a good one. The stories by Dr. W. Russell and Mr. Yates increase in interest. The introduction of a monthly chapter on French fashions, attractive as it may be, is to be regretted. The enormous and growing importance attached to female dressing is one of the worst signs of the times. One trembles to think of the generation that is to proceed from such a race of mothers. Nothing but dress is thought of or desired, and in many cases means of any kind are resorted to to obtain it.—*London Society* has a vigorous protest against the eccentricities of fashion in our day. The writer says justly,—

"These freaks of fancy make us ashamed of our countrywomen. They savour too much of the *demi-monde*, and are suggestive of all that is coarse and sensual."

—The current number of *The Quiver* contains some good and interesting writing. The illustrations of this work are scarcely equal to the literary part of it in merit. Some of them, indeed, are very bad. Better give a few good than many poor.—Mr. Jas. Hannay contributes an affectionate recollection of Alexander Smith, the poet, in *Cassell's Magazine*, which well maintains its place among the cheap periodicals.—*Fraser's Magazine* commences with an appreciative notice of General Grey's most touching account of "The Early Years of H.R.H. the Prince Consort." Never was curtain in palace so lifted up before. In what other palace would the sight displayed be so wholly admirable and charming?—"Pastimes with Neptune. By Joseph Longland, C.E. Worthing: Loveday, London: Hamilton, Adams, & Co." The author, who is surveyor to the Worthing Local Board of Health, here gives a design for improving sea-bathing at Worthing. He proposes to make the town peculiar or original by providing it with something that other towns have not got, although they may imitate it; and that something comprises two artificial sea-water, swimming lakes, one for ladies, and the other for gentlemen, with hot, shower, Turkish, and vapour baths; waiting, reading, and refreshment rooms, conservatory promenade, or "spacious crystal ways to the lakes," and public hall. The total expense he estimates at 22,000*l.*, and the total profits at 7,640*l.* per annum; working expenses, 2,000*l.*; net income 5,640*l.* per annum, or a profit of more than 25 per cent. The site proposed is the large space of open ground lying between the sea and the south end of East-street. The scheme would cover 2½ acres of ground.

Miscellaneous.

THE RESTORATION OF RIFON CATHEDRAL.—The committee appointed five years ago to carry out the restoration of this cathedral in accordance with the recommendations of Mr. G. G. Scott, has issued a report, showing the present position of this important undertaking. Mr. Scott estimated that 32,000*l.* would be required to complete the entire restoration necessary. Towards this sum 28,787*l.* have been promised, and the committee earnestly appeal to Churchmen of the diocese to aid them in completing the proposed alterations.

PROFITS OF IRON MASTERS.—The personality of the late Mr. Wm. Crawshaw, the great iron-master, has been sworn upon 2,000,000*l.*

TREES OF MISSOURI.—Professor Swallow, of the Missouri Geological Survey, gives the following actual measurements of large trees in southeast Missouri:—"The largest is a sycamore in Mississippi county, 65 ft. high, which 2 ft. above the ground measures 43 ft. in circumference. Another sycamore, in Howard county, is 38½ ft. in diameter. A cypress in Cape Girardeau county, at a distance of 1 ft. above the ground, measures 29 ft. in circumference. A cottonwood in Mississippi county measures 30 ft. round at a distance of 6 ft. above the ground.

BUSTING OF A CAISSON AT CHATHAM.—Shortly after two o'clock on Saturday morning in last week, during an unusually high tide, the caisson at the entrance of No. 4 Dock, in which the double-screw steamer *Beacon* is fitting, suddenly gave way, without any previous indications. The water rushed into the dock with the roar of thunder, carrying the *Beacon* to the hrow of the dock, and afterwards throwing her on her beam-ends, and causing considerable damage to her. The occurrence taking place in the night there were no workmen in the dockyard, and messengers had to be despatched in various directions for assistance. The *Beacon* was ultimately secured and shored up. Her starboard screw shaft and propeller were found to be broken off, and her port propeller also injured, while the vessel was filled with water.

THE LIGHTING OF HYDE PARK.—The Commissioners of Woods and Forests have effected an improvement in Hyde Park which will be heartily welcomed by the public. Along all the main roads, with the exception of the road from the Marble Arch to Notting Hill, powerful lamps, with solar reflectors, have been placed. It is suggested that lime lights might be erected at two or three stations sufficient to illuminate the larger portion of the entire area, and it is not too much to hope that the improvement may be extended to the several parks under the control of the Commissioners. The work has been executed by Messrs. Comyn, Ching, & Co., but it is understood that the lighting is delayed by the difficulty of arranging the gas supply with the companies. A new mode of lighting, it is said, is to be adopted by an electric apparatus fixed in the base of the pillar.

FREE EDUCATION IN SOUTHWARK.—It is doubtless unknown to the majority of our readers, says the *Guardian*, that close to London Bridge there exists an institution which is now seriously impeded in carrying out the object for which it was originally founded. As publicity would appear to be the only remedy in its existing circumstances, we beg to call the attention of our readers to the matter. The institution to which we allude is the Queen Elizabeth's Free Grammar School of St. Olave's and St. John's parishes, which offers a free education to children of all the inhabitants of those parishes, but from various causes it has been found impossible, we are told, to attract to the school children of a class able to avail themselves of the excellent classical education offered to them, and consequently, although numbers of boys flock to the commercial school, there are, comparatively speaking, no candidates for the numerous exhibitions at the universities and elsewhere which the governors of the school are anxious to give. A great deal of the house property in the two parishes belongs to the school; and, as it would appear indisputable that a house which carries with it a free education for the children of its occupants is worth more than a house which does not, it is hoped that this notice may attract new residents, and thus relieve the corporation from their present embarrassment of having but few boys upon whom to bestow the benefits of a first-class education. The buildings of the school are second to none in the kingdom, the masters are excellent, and boys to educate is the only requirement for the school to become to the inhabitants of Southwark what the City of London School is to those of the City. The school consists at present of an upper classical division, which is completely separated from the rest of the boys, a lower classical school, and an English school, which has now been placed under the Revised Code; and, as we have said above, it is only necessary for parents to reside in these parishes to obtain for their children an excellent education, and the right of competing for scholarships and exhibitions at the universities.

COLOURING OF MARBLES.—Variegated marble, it is announced, may be imitated in all the rich coloured veins for which some species of it are distinguished. For this purpose a solid block of marble to be treated is first warmed in an oven, after which the colours are applied. These consist of an alcoholic solution of alkanet root, to produce a rich lavender; a madder lake, to make a crimson; indigo, to produce a blue; verdigris, green; and gamboge, yellow. They are put on according to the fancy and taste of the artist, so as to form the desired patterns; after which the marble is again warmed, to make it absorb the colours.

A TELEGRAPH CLERK STRUCK BY LIGHTNING.—The *Scotsman* relates a singular accident which occurred to the telegraph clerk at the Buchan railway station during a late storm. The young man had discovered that the telegraph wires had somehow got out of order, and, while engaged at the battery, from which the operating handles had been removed, the electric force from the atmosphere ran along the wires, and, entering the body by both hands, it produced such a shock as to throw him prostrate on the ground. The agony was excruciating. Both arms were entirely paralysed, and remained so, the left for two or three hours, and the right for a much longer period.

THE LATE MR. BETTS.—Mr. Betts, contractor was buried in Southampton Cemetery. He was a native of Ashford, in Kent. He was of humble origin, and when he left his native place, fifty years ago, he said he would never return to it until he could enter it in his carriage. Many years afterwards, when he kept his carriage, he visited his native village. He at one time owned large property in Southampton. He purchased Bevois Mount, once the property of the Earl of Peterborough. Relics of Pope and Voltaire, who visited the earl, are still to be seen there. Mr. Betts was a Wesleyan, and a munificent supporter of that sect. He was the father of Mr. Edward Ladd Betts, the partner and son-in-law of Sir Morton Peto. Mr. Betts died at the age of 73.

METAL TRADE.—According to the *Iron Trade Circular* the trade in iron and metals is healthy active, copper is not easy to be got at with advancing prices, and tin has made a stride of 40s. forward. These are specially good signs, the latter more particularly. Pig iron is being largely exported from Scotland and the North; Staffordshire numbers also finding buyers, and continuing to be preferred where a superior and dependable quality of iron is indispensable,—indeed, specified in contracts. Merchant iron is no longer a drug; of manufactured iron generally, we no longer bear a desponding character. The export lists tell the tale of the trade in a manner that the hardest grumblers cannot contradict. If thousands of tons of rails go out, somebody must send them, and, what is of more importance, somebody must pay for them. An impulse has been given to the ship-building trade by the Government contracts for steam shipping, and hence, perhaps, we may account for an unexpected call for plates. Some signs of recovered courage are showing themselves. Here and there contractors are getting to work again.

THE DRAINAGE OF ST. LEONARD'S-ON-SEA.—Mr. J. A. Hatchard, of St. Leonard's, has addressed a letter to the *Times*, in which he says:—"Hitherto, like most sea-side places, St. Leonard's got rid of its sewage by discharging it into the sea [on which we have often commented], from 'long dirty tubes,' resembling 'vast unclean centipedes.' I am happy to inform you that the St. Leonard's commissioners have now removed all the nine channels of pollution that disfigured the sea-shore under their control. An intercepting sewer has been constructed, which commences at the St. Leonard's Archway, the boundary between Hastings and St. Leonard's proper, or West St. Leonard's, and passes under the beach at the foot of the parade-wall, intercepting and carrying away all the sewage and drainage until it reaches the western extremity of the town. It then passes along and under the Bechill-road and falls into a reservoir formed in the heath westward of Bopeep railway station. This reservoir is so constructed as to contain within it all the sewage until the period when the tide turns westward, and by the strong sea current of the ebb tide it is then carried miles away to sea in the direction of Beachey-head never to return. All this is accomplished by gravitation."

FRANKFORT CATHEDRAL.—A committee for the reconstruction of this cathedral has been formed in Frankfort.

FALL OF A NEW CORNICE.—The narrow thoroughfare known as Cow Cross-street, Smithfield, which has been for some time past the route taken by vehicles going east from Holborn to the City, was the scene of an alarming accident on Wednesday morning. At half-past ten o'clock, when the street was crowded with omnibuses, cabs, and pedestrians, the cornice of a new building, and in course of erection by Messrs. Kipperley & White, suddenly fell, forcing down part of the scaffolding and workmen, and precipitating a large quantity of debris into the road. The passengers on an omnibus which was passing at the time appear to have suffered very severely, and several others are stated to have been badly injured.

A NEW KNIGHT.—Mr. John Brown, of the Atlas Works, Sheffield, has received the honour of knighthood. Sir John Brown commenced business not a great number of years ago in a small way as an iron manufacturer, and by his perseverance has succeeded in making an immense fortune, which he largely devotes to the promotion of benevolent and religious objects. His works have gradually increased in extent until they rank as one of the largest iron factories in the country, and closely rival the stupendous establishment of Krupp's. John Brown's armour plates are known all over the world, and the largest plate ever rolled was rolled at the Atlas Works, in the presence of the Prince of Wales. The works are now the property of a limited company, but the founder of them is largely interested in their prosperity.

A PRUSSIAN RAILWAY CARRIAGE AT THE PARIS EXHIBITION.—In the Prussian department a first and second-class railway carriage, made at Berlin, is exhibited, which has many novelties and conveniences worthy of the attention of our railway authorities. The carriage accommodates six first-class and sixteen second-class passengers; the first-class compartment has a separate retiring-room, with lavatory, and the seats are made into comfortable beds. Each second-class compartment has a retiring-room. Instead of heated water vessels under the feet, vessels of heated sand are fixed under the seats. The lighting is brought near the passengers for reading. There is a passage for the guard through the carriage, and footboards at both ends of the carriage communicating with the next. The price is between 400*l.* and 500*l.* per carriage.

NEW DREDGING MACHINE.—During last week a new dredging vessel or mid-agitator of a peculiar kind has been at work on trial in front of Woolwich yard. The vessel employed is one of the old gun-boats, with engine power and screw. The agitating machinery consists of a barrel with large and numerous spikes made to work across the stern of the vessel. Rapid motion is given to this barrel from a shaft fixed across the deck, taking its motion direct from the screw shaft. By the rapid action of the barrel the mud is brought to the surface in a liquid state, and is carried away to a great distance (many miles) dependent on the strength of the stream and the depth of water. By winches on the deck the barrel is capable of being lowered or raised to suit the depth required, or the vessel with its machinery may be taken from one establishment to another by its own power. This invention was designed for moving mud or sand from all tidal rivers, bars, or basins. Objections have been raised that, in certain localities, the mud so raised may be inconveniently deposited. To this the author has explained that the great bulk, being once removed, either at once or at intervals, it would not again be allowed to accumulate by using this machinery frequently, and the small quantity so removed must be unobjectionable. The usual cost of removing and depositing mud is from 1*s.* to 1*s.* 6*d.* per ton. The probable cost by this new method should not exceed 3*d.* per ton. Just twenty-six years ago the first trial of the agitating machinery was made in front of Woolwich yard. The question that may now be asked is, whether the Board of Admiralty were justified in not allowing the machinery to be employed during twenty-six years, and thus entailing an expense of many thousands annually for dredging by the ordinary method, or whether they are justified now in incurring an expense for new machinery, the conditions not having been altered. The machinery was fitted to the vessel by Messrs. Blythe, Army and Navy Gazette.

CHATHAM DRAINAGE.—The Local Board of Health has resolved to carry out Messrs. Gotto & Beesley's plan for the high level intercepting sewer to drain the south side and east end of the town. The sewer will discharge into the present outlet at the level of high-water mark, and will be executed mostly in tunnel through the chalk.

"RIGHT TO A T."—It is as well to be so. The newspapers have been telling how Baron Triqueti's marble inlay Scriptural pictures, now in the Paris Exhibition (French department), are to be placed on the walls of the Albert Memorial Chapel, Windsor, under the line of the windows. They will form the dado, in fact. The costly decorations of this chapel are being contributed, as our readers know, by the princes and princesses of the Royal family. Of these panels the one contributed by his Royal Highness Prince Leopold has for its subject "David and Saul," that by Princess Louise, "A Scene from the Life of Moses." On the panel given by Prince Arthur, David is shown with his harp; while Princess Beatrice has presented a picture of Nathaniel. Above each panel is a medallion portrait of the contributing prince or princess, sculptured on white marble, and there are appropriate inscriptions attached to each panel. One of these inscriptions is intended to show that the subject refers to the "latter days" of Lot, but it is written the *later* days; and as this, to the English mind, does not convey precisely the same impression, we suggest to the sculptor that the error should be set right before the work is fixed. The panels display much elegance.

BURIED IN A TUNNEL.—John Martin, aged 73, was a labourer in the employ of a Mr. Morley, a builder; and on Saturday last, he and Robert Morley, his employer's son, were engaged in making a tunnel underneath a footpath and garden in front of a new residence recently built at Navarino-road, Dalston. Robert Morley said the old man was told to make an open cutting in order to reach some pipes in connexion with the drainage, but he preferred to make a tunnel. The tunnel was made through sandy soil, 6 ft. below the surface of the earth, and it was 2½ feet high. It was only intended to make it 5 ft. long; but the deceased, while tunnelling, made a mistake and missed the pipe, and carried the tunnel 8 ft. further on. The tunnel was not shored up in any way. The Coroner asked the witness why he was so foolish as to enter an unshored tunnel through sandy soil. The witness said that he trusted to Martin's experience. On Saturday, while they were both in the tunnel, 2½ ft. of the top of it suddenly gave way, and the deceased, who was at the end of it, was instantly buried alive. The witness was near the opening, and he had just time to pull his head out of the way, when the sand fell. The jury returned a verdict of "Accidental death through being buried alive in a tunnel."

RE-OPENING OF THE CATHOLIC APOSTOLIC CHURCH, STRET福德 NEW-ROAD, MANCHESTER.—This building, which has been rebuilt and enlarged, was opened on Sunday last. It occupies the whole of the site on a portion of which stood the former church, and has a frontage of 36 ft. to the Stretford-road, and a depth of 100 ft., the whole of which is appropriated to the church, a cottage in the rear having been adapted for vestries. The materials of the old church have been re-used as far as serviceable. The principal entrance is by a central doorway in the Stretford-road. There is a nave, with side aisles, lower choir, with provision for organ-chamber, and chancel, with upper choir, and sanctuary and chancel aisles. The arches to clearstory of nave are supported on columns of red Mansfield stone, with Bath stone caps and bases. The roof of nave and chancel are continuous, giving length and height to the building, the chancel roof being distinguished from that of the nave by trusses, supported on carved corbels, with columns of red Mansfield stone. There are also similar columns to the coupled windows of the clearstory. The west window is of four lights, and the large east window of five lights, the upper portions filled with tracery. The internal fittings are temporary, and the old stalls have been refixed in the chancel. There will be a screen to the arches on either side of the chancel. The building will accommodate 380 persons, and has been erected in the Early Gothic style of architecture, from the designs of Mr. O. Ayliffe, architect, by Messrs. Ellis & Hinchliffe, who were the general contractors.

ROYAL MANCHESTER INSTITUTION.—The Exhibition of Modern Paintings and Works of Art here, will be opened to the public next Monday.

ART IN RUSSIA.—The *Artiste* informs us that the greatest amateurs and most distinguished *dilettanti* of Russia, Sweden, Spain, and Portugal, are,—The Emperor of Russia, the principal amateur of the empire; after him comes the grand-duchess, Marie-Nicolas; the hereditary Grand Duke has also a princely collection. The Museum of Fine Arts of St. Petersburg confines also to collect many modern paintings. Among the most distinguished amateurs in private life are;—Prince Wiawaroff, Prince Narishkina, Count Auvaroff, Count J. de Stenbock, Messrs. Trtiakoff, Prianischnikoff, Soldatenkoff, Klondoff, Swindoff, Bykoff, and Barissowsky. The Grand Duke Nicolaiévitch has sent to the Paris Exhibition a very fine painting by Soukhodolsky; also some excellent ones by Sokoloff and Remers have been lent by the Grand Duchess Maria. In Spain the amateurs are extremely rare, the objects being collected in great galleries and palaces. Portugal is fortunate in having an artist for king; he produces and purchases. Dom Auguste is a princely *dilettante*. His portrait may be seen at the Exhibition, painted by Fonseca for his gallery.

THE LIVERPOOL AND BIRKENHEAD DOCKS.—The report of Mr. Lyster, the dock engineer, on the dock works of Liverpool and Birkenhead, during the year ending the 24th of June last, has been published. The North River Wall has been carried and completed to its northern extremity, a total length of 1,596 ft., and a raised terrace with a retaining wall had been formed at the back of the pampet. The dock line of railway had been extended to the timber storage yards at Bootle. The Lancashire and Yorkshire and London and North-Western Railway Companies had opened new communications with the north docks. At Waterloo Dock Works, the whole of the internal masonry and excavations are completed. The river entrances are drawing towards completion. The whole of the gates, bridges, and capstans of the several entrances, with the hydraulic machinery for working the same, are drawing towards completion. The east block of the corn warehouses is completed. The west block is very nearly completed. Nothing has been done towards the improvement of the river approaches. The total expenditure of the year on works on the Liverpool side was 294,178*l.* 8*s.* 11*d.* At Birkenhead the construction of the warehouses is now proceeding satisfactorily. Preparations have commenced for laying hydraulic pipes from the northern entrances to the warehouses and other constructions on the north side of the Float, with the view to establishing a common system for working the whole of the machinery in that locality. The total expenditure during the year on the Birkenhead works was 220,907*l.*

THE DRAINAGE OF CHILD'S HILL, HAMSTEAD. A meeting of some of the most influential inhabitants of Child's-hill was lately held at the Parsonage, Mr. Charles Baylis in the chair, to consider the best means to be adopted in order to procure an effectual drainage of the district, which, including Cricklowwood, now contains a population of 1,700 persons. It appeared that the illness had materially decreased, partly in consequence of the change of weather, and partly from the efforts of Mr. Frentan, the inspector of nuisances of the Hendon Union. The feeling of the meeting, however, according to the *Hampstead and Highgate Express's* report, appeared to be that no time should be lost in having proper drainage works carried out, however costly they might be; and it was understood that the authorities of the parish of Hendon were ready to do all in their power, but that the real, and at present apparently insurmountable, difficulty was, that there was no outfall, and the Metropolitan Board of Works would not allow their main drainage system to be entered from any outlying districts. On the motion of Dr. Lankester, who resides at Child's-hill, seconded by Mr. Henry Briedenbach, a committee of twenty gentlemen, consisting of the most prominent residents, was formed, to be designated "The Child's-hill Sanitary Committee." Mr. A. T. Cox, of the Hermitage, was elected hon. sec., and it was resolved that the committee should seek an interview with the Board of Guardians of Hendon, to urge upon them the necessity of taking immediate steps for the adoption of sanitary measures for the improvement of the health of the locality.

SOUTH KENSINGTON MUSEUM.—The visitors during the week ending 31st August, amounted to the large number 27,877, 18,951 being free, 1,407 at 6d. each, and to the National Portrait Exhibition by payment, 7,519.

FALL OF A LIGHTHOUSE.—Considerable alarm has been created in consequence of the falling over into the river Liffey of the metal lighthouse at the extreme end of the North Wall, Dublin. Fortunately no loss of life ensued. The accident is attributed to excavations which are being carried on at the quay wall. Arrangements have been made to fit up a temporary light.

A MEDAL FOR PUBLIC SERVICES.—A decree of the King of Italy orders that a medal shall be struck in bronze, silver, and gold, to be conferred on such persons as shall have rendered signal services during the prevalence of cholera or any other grave epidemic. It will have no one side the head of the king, and on the other a crown of oak, with a legend importing that it is a recompense for services in connexion with public health.

LONDON LABOURERS' DWELLING SOCIETY.—The twelfth half-yearly meeting of the members of this society, was held on the 29th ult., Mr. Richard Foster, in the chair. The directors presented their report for the six months ending June 30th, which was received and adopted, and the usual dividend at the rate of 5 per cent. per annum, free of income-tax, was declared. The capital of the society now amounts to 30,500l., the sinking fund (for the redemption of the leasehold property of the society) to 830l., and the reserve fund (for the equalization of dividends, or extraordinary expenses), to 3,962l., of which sum 1,000l. are deposited at interest in order to provide the means of purchasing temporarily at par any shares that a member may from unforeseen circumstances wish to realize.

GRANITE-CUTTING MACHINE.—A correspondent says of this machine,—It does not effect results, as I thought at one time, by a series of revolving chisels, but by cutting instruments not unlike the large cheese-knife of the cheesemonger. This is made of a surprisingly well-tempered steel. The machine being brought to the block of granite, the quarry-side, or a cliff, a series of these knives cut their way into the solid material with accuracy and despatch. You can divide a huge block in two, or pare off the least piece of surface, in either case the chisels leaving their work so smooth that the face of the stone is at once fit for the polishing-hed or lath. All kinds of the most odourate material have been successfully acted on; and one of the machines has been, or is to be, tested as a tunneller and driver of levels.

MADAME DE SÉVIGNÉ'S RESIDENCE.—The railway from Vitry to Fongères was opened a few days ago, and many of the visitors at the inauguration profited by the occasion of examining the ancient chateau of Les Rochers, well known as the residence of Madame de Sévigné. It is one of the most picturesque spots in Brittany; and though the modest retreat—scarcely can we call it a chateau—was surrounded by woods and desert plains, it was the favourite abode of the marchioness. The tower still remains, in which the celebrated "cabinet vert" was placed. It contained the "secrétaire," sitting before which she chatted so gaily with her son-in-law, "sa chère de Grignon." In the saloon there is an excellent full-length portrait of Madame de Sévigné, in court dress, attributed to Mignard.

TERRIBLE POWDER EXPLOSION AT THE CAMP DE CHALONS.—On Friday, the 30th ult., as the troops were preparing for striking the camp on the 1st, a terrific explosion took place, by which eight persons were literally blown to atoms. Among the victims was M. Rivière, captain of the target practice, a young officer of great promise. The circumstances of the case are as follows:—Each division has a dépôt of blank and ball cartridges. At 1.30 p.m. the soldiers brought the packets of cartouches, which remained over and above after the great manoeuvres, to the artillery dépôt; but the guard of artillery refused to receive them, as they were open here and there; so they were taken back to the divisional dépôt, and remade. During this manipulation the explosion occurred. No cause has yet been assigned for this explosion; but I must be recollected that the new cartridges are extremely explosive, and contain the fulminating matter of a percussion-cap. It is probable that one being trodden upon, exploded and set fire to the rest.

TENDERS

For a vicarage and stables at Addington, Surrey. Mr. Ewan Christian, architect:—
 Adamson & Son £2,340 0 0
 Wells 2,162 0 0
 Brass 1,989 0 0
 Jarratt 1,932 0 0
 Sharrington & Cole 1,915 0 0
 Rhodes & Roberts 1,882 0 0

For a new billiard-room, and bedrooms over, at Layson Villa, for Mr. F. G. Hobson. Messrs. Nash & Son, architects:—
 Gibson £597 0 0
 Oibbon 585 0 0
 Preston 498 0 0
 Sagers (accepted) 498 0 0

For new front, staircases, and gallery to Independent Chapel at Watertree. Messrs. W. & J. Hay, architects:—
 Denton £1,300 0 0
 Tyan 1,320 0 0
 Robinson 1,298 0 0
 Barker & Son 1,255 0 0
 Westmorland 1,098 0 0
 Nicholson & Ayres 1,084 0 0
 O'Kills & Morrison (accepted) 1,007 0 0

For an iron fence, 1,940 ft. long, at the river promenade, Kingston-on-Thames. Mr. Charles Slagg, borough surveyor:—
 Matthews £695 0 0*
 Bevington 692 0 0
 Deuce 676 0 0
 St. Panens Iron Company 654 0 0
 Turner & Allen 655 0 0
 Windsor 567 0 0
 Cochran, Grove, & Co. 562 0 0
 Edlington 536 0 0
 Harris 535 0 0
 Yates, Haywood, & Co. 533 0 0
 Gulliford 530 0 0
 Bell 524 0 0
 Haywood 524 0 0
 Finney 515 0 0
 Butt 515 0 0
 Dixon 489 0 0
 Simpson 485 0 0
 Smyth 485 0 0
 Shaw 455 0 0
 Newton, Chambers, & Co. 454 0 0
 Hill & Smith 447 0 0
 Morgan 445 0 0
 Russell 444 0 0
 Brooks & Shoobridge 440 0 0
 Norton 438 0 0
 Williams 435 0 0
 Hall 429 0 0
 Waddington 315 0 0
 Ingram 310 0 0

* There were three tenders very much higher than this, but for the credit of the parties tendering they are withheld from publication.

For the erection of two dwelling-houses in Elizabeth-street, Cheetham, Manchester. Mr. Herbert E. Tison, architect:—
 Fell & Sons £1,180 0 0
 Thompson 1,070 0 0
 Forgett 1,063 0 0
 Farrell 1,028 0 0
 Heron (accepted) 1,028 0 0

For chapel, Barking-lane, Ilford, Essex. Mr. A. Manning, architect:—
 Warner £1,296 0 0
 Hearle 1,025 0 0
 Withers 860 0 0
 Hill & Keddell (accepted) 874 0 0

For the building of St. Jude's Church, Woiverrhampton. Mr. George Bidlake, architect:—
 Thompson £4,800 0 0
 Lovatt 4,347 0 0
 Horman 4,349 0 0
 Nelson 4,260 0 0

For alterations and repairs at the Pavilion stabling, Brighton. Quantities supplied:—
 Anson & Nevenham £443 0 0
 Sims & Marten 694 0 0
 Hall 658 0 0
 Lockyer 652 0 0
 Saunders 623 0 0
 Furr 603 0 0
 Nightingale 442 0 0
 Chaseman 440 0 0

For new bar-fittings at the Dublin Castle, Walmer-road, Notting Hill, for Mr. J. Shailer. Mr. F. F. Holdsworth, architect:—
 Nutt & Co. £280 0 0
 Manley & Rogers 289 0 0
 Kelly, Brothers (accepted) 283 0 0

For alterations and additions to ale stores and offices, Frederick-street, Hampstead-road, for Mr. Taylor. Mr. Potter, architect. Quantities not supplied:—
 Hatchman £884 10 0
 Henderson 874 13 0
 Saby & Sons 859 0 0
 Perkins 758 0 0

For the erection of additional vestry at the Congregational Church, Clapham. Mr. John Tarring, architect:—
 Skyes £240 0 0
 Saunders (accepted) 265 0 0

For works in building reformatory, with master's and superintendent's residence, at New Wandsworth, for Mr. J. Leyland. Mr. H. M. Burton, architect:—
 Nightingale (accepted) £3,100 0 0

For constructing brick sewers and for other works on an estate adjoining Portobello-road, Notting Hill, for the Freehold Securities Company (Limited). Mr. Hoale, architect:—
 Tinsley £1,469 8 4
 Burgess 1,400 0 0
 Crockett 1,350 0 0
 Burton 1,290 0 0
 Whitlick 1,185 0 0
 J. & S. Williams 1,140 0 0
 Shrimpton 1,061 0 0
 Ryan & Co. 1,035 0 0
 Faulkner & Cowley 897 0 0
 Goodair 867 0 0
 Moxon & Mutton 858 0 0
 Carter 855 0 0
 J. Porter & Staggles 878 0 0
 George 830 0 0
 Wigmore 825 0 0
 Hayden 810 0 0
 Brewer & Staggles 775 0 0
 P. Porter 768 0 0

For constructing brick sewers and for other works on an estate near Westbourne Park Station, for the Land and House Investment Society (Limited). Mr. Josiah Hoale, architect:—
 Burton £1,180 0 0
 Burgess 1,064 10 0
 Shrimpton 1,022 12 10
 Brewer & Staggles 930 0 0
 Crockett 923 0 0
 Carter 918 0 0
 Wigmore 900 10 0
 George 890 0 0
 Hayden 880 0 0
 Ryan & Co. 880 0 0
 Whitlick 858 5 0
 Tinsley 821 18 3
 Moxon & Mutton 818 0 0
 J. & S. Williams 789 0 0
 P. Porter 748 0 0
 Goodair 736 0 0
 J. Porter 728 0 0

For seed and jute warehouse, East-India Import Docks, for the East and West India Dock Company. Mr. E. J. Leonard, engineer. Quantities supplied by Messrs. Parr & Strong:—
 Hill & Keddell (accepted).

For erecting a pair of houses at Gipsy Hill, for Mr. E. J. Gordon. Mr. Samuel H. Hope, architect:—
 Cressell (accepted) £520 0 0

For the erection of the Earl Spencer Tavern, Battersea, for Mr. H. U. Hewitt. Mr. K. J. Dangerfield, architect:—
 Whitlick £1,530 0 0

For extending six shops, Highgate Hill, for Mr. G. Flowers. Mr. L. W. Keed, architect:—

	If with Plate Glass and Mahogany Sashes.	If Deal Painted Sashes and Sweet Glass.
Headley £26 8 0	£789 10 0	—
King 785 0 0	—	—
Prebles, Brothers 695 0 0	587 0 0	587 0 0
Richards 613 0 0	629 0 0	600 0 0
Rome & Ball 600 0 0	590 0 0	590 0 0
Cubitt, Brothers 698 0 0	480 0 0	480 0 0
Brett & Bradbury 534 0 0	440 10 0	440 10 0
Sheffield 497 0 0	368 0 0	368 0 0
Gordon & Co. 422 0 0	368 0 0	368 0 0
Franklin & Lamie 432 5 0	420 0 0	420 0 0

For the erection of a dwelling-house, for Mr. W. C. Parkinson, at Tufnell Park, W. Mr. John Tarring, architect:—
 Saunders (accepted) £2,655 0 0

For iron fencing for new premises, 533, Oxford-street. Mr. John Dale, architect:—
 Daniels £147 5 6
 Sweet, Brothers 149 0 0
 Rotherham Iron Company* 136 0 0

* Accepted.
 For alterations, for Mr. John Mixer, at 85, Newgate-street. Mr. John Dale, architect:—
 Carter & Sons £1,845 0 0
 Macey 1,737 0 0
 Josephs 1,687 0 0
 Axford & Co. 1,635 0 0
 Lister 1,559 0 0
 Mather & Reid 1,553 0 0
 Walker 1,520 0 0
 Ashton 1,310 0 0
 Parsons 1,383 0 0
 Henshaw 1,374 0 0
 Baxter (accepted) 1,327 0 0

For Church of St. Columba, Haggerstone. Mr. J. Young, architect:—
 Perry £9,065 0 0
 Longmire & Burge 8,867 0 0
 Fisher 8,790 0 0
 Higgs 8,473 0 0
 Hill & Keddell 8,375 0 0
 Ashby & Sons 8,144 0 0
 Ennor 8,133 0 0
 Piper & Wheeler 7,890 0 0
 Henshaw 7,894 0 0

For alterations to the Prince of Orange Hotel, Gravesend. Bird & Walters, architects:—
 Kelly, Brothers £1,385 0 0
 Newman & Mann 1,257 0 0
 Williams & Sons 1,237 0 0
 Ebbs & Sons 1,195 0 0
 Blake 1,190 0 0
 Henshaw 1,117 0 0

The Builder.

VOL. XXV.—No. 1284.

The Antwerp Congress.

HERE the foreign members attending the International Archaeological Congress arrived in Antwerp on the 25th ult. they were cordially received in the Hôtel de Ville, took *le vin d'honneur*, and then proceeded to the inaugural meeting in the hall belonging to the Royal Society of Harmony, where several questions were discussed. Without attempting to give an account of the proceedings, which lasted a week, we may needfully jot down a few particulars. America, Belgium, the Brazils, Denmark, England, France, Germany, Spain, Switzerland, Sweden, and Turkey were represented. Amongst those who attended from England were Mr. Pollen, M.A. (of South Kensington Museum), Mr. Wykeham Martin, M.P., vice-president of the Society of Antiquaries, Mr. Lewis Pocock, F.S.A., and Mr. J. H. Parker, F.S.A. In the Archaeological Section, on the 26th, M. de Caumont presiding, Mr. Worsaae, inspector-general of Danish monuments, delivered an interesting discourse on the monuments of the age of Stone, the age of Bronze, and the age of Iron, in the North. As these grand phases of the history of humanity have occupied thousands of years (at any rate, the two first), they had established, he said, in Denmark, sub-divisions. In the two divisions of the Stone age the works of the second were superior to those of the first; but of the two divisions of the age of Bronze, the works belonging to the first were better made than those of the second. He was unable to give the date at which these different periods commenced, they never found stone implements in monuments of the Iron age. Mr. Worsaae described some of the recent discoveries in Denmark, especially in the peat bogs, and an animated discussion ensued.

(On the question whether what was known of the Dolmens of Ireland and Scotland (in Scotland, by the way, there are very few) interfered with the conclusions arrived at by the French Antiquaries as to those of Brittany and Normandy, the meeting appeared to be unanimously of opinion that they were all of the same epoch, and agreed in all points.

The age of tombs of lead, and the position of the study of Runic inscriptions, were amongst the other subjects discussed.

In the Historical Section, Mr. Wykeham Martin, president, the place of birth of Peter Paul Rubens was the first subject treated of. All that appears clear at present is, that he was not born in Antwerp, as is usually asserted.

Even the name of his mother is doubtful, some asserting that he was an illegitimate child taken charge of by the wife of his father!

An attempt to determine the influence exercised by Greece and Etruria on the development of the arts and sciences in primitive Rome, led to a long discussion; but the illustrations given were too few to have weight.

On the 27th the Archaeological Section returned to Runic inscriptions.—Mr. Zesterman, of Germany, speaking learnedly,—and to the consideration of the Stone period. Afterwards M. Colfs spoke at some length on the question—"Were the forms of Greek Temple-architecture borrowed from constructions in wood?" discussing the opinion of M. Viollet-le-Duc, who thinks they were not. The speaker urged that M. Le-Duc had not gone back far enough in his researches for the origin of the Greek Temple, and gave reasons for taking the affirmative side of the question. He ended with some remarks on the changes and mystifications that have been introduced into the writings of Vitruvius by editors and translators, and said that what Vitruvius wrote of the Greek Temple had been confounded with the Doric of the Romans. To study Vitruvius usefully, it was necessary to consult at the same time drawings and profiles of the ancient Doric temple, and to get rid of the greater part of the illustrations which had been added by others to his works. M. Colfs's address was printed.

In the Historical Section, on the same day, Mr. Wykeham Martin gave some particulars of what had been done in England for the preservation of our archives, which remain unbroken from the time of Edward I., many dating from William the Conqueror. The documents are joined together to form a band of considerable length, which is rolled on a cylinder. There is an inventory of them, giving a summary of each document, and an index points out the names cited in the documents, and the page of the inventory where the summary will be found. M. Advielle said the arrangement in France was better. Inventories were printed and issued by the Government: the collection already comprised 1,500 volumes. The departmental archives were in two classes,—the historical, and those posterior to the Revolution. The first were nearly all classified; the latter only imperfectly.

Particulars were given of the archives of other countries. In the course of the discussion it was stated that the designs of the departmental architects in France charged with the restoration of churches, also the designs made by the Corps des Ponts et Chaussées, were not properly preserved.

The Archaeological Section, on the 28th, occupied itself wholly with architectural subjects. The question how to determine the character of Carolingian Architecture and its influence on the art of building, and the influence of the Normans upon that art after the time of Charlemagne, was discussed at some length, the Baron de Quast, president, and others, describing various early buildings, and seeking to arrive at features peculiar to the earlier periods. Then came the question, "Is the Pointed style to be considered the natural and complete development of the Romanesque?" M. de Caumont and M. le Maître d'Antwerp pointed to buildings wherein the transition was seen.

Mr. Parker said the transition occurred not in one building, but all. What they wanted was to know precisely the date of each monument. It was in Anjou and in England that the real origin of the Pointed style was to be found. The change in the ornamentation took place before the change in the style. The Pointed style could not be dated earlier than the end of the twelfth century: before that it was Transitional. Each country had its peculiarity; every abbey had its school of workmen, and each was

striving to surpass the others. The first monument in the Pointed style was the Cathedral of Lincoln, built from the year 1192 to 1200. There was no other so ancient.

In the Historical Section the position of the art of glass-painting excited considerable interest. The heading in the programme was,— "Describe the processes employed in the Middle Ages for the manufacture of painted glass, and point out the ancient ateliers most renowned for its fabrication." Mr. O'Kelly contended that the ancient processes were unknown to us. As to schools, we had none. M. Pecher, of Tournay, said, if we failed in obtaining satisfactory results, it was because the manufacture of glass was bad. By the old glass, the rays of the sun were decomposed, and effects were produced that we could not equal. Formerly the glass-painters made the glass themselves; now they were obliged to trust to manufacturers, who supplied glass that was too translucent. Baron de Quast said, in Germany they had had ateliers very renowned, especially in Bavaria, from the tenth century. In the Cathedral of Augsburg there were remarkable painted windows, but of which the date was unknown. The constant re-appearance of the same details showed that there were but a few centres from which the artists transported themselves from place to place. M. Dognée observed that, in Belgium, France, and England there were manufactories of stained glass according to the ancient processes: these had never been lost, though in consequence of difference in materials there was a certain difference of colour. In Switzerland they used double glass to obtain the degree of opacity desired. M. Bordeaux said the Paris Exposition showed the condition of mediocrity into which glass-painting had fallen. As a rule, modern glass-paintings were below the level of contemporary arts. Some modern windows, not twenty years old, were already deteriorated. The fabrication of painted windows was to-day a mere matter of trade, and price was considered rather than goodness. The Abbé Sauvage replied, that was true; nevertheless there were good and conscientious artists to be found who produced solid and artistic works. The art was not lost any more than was the art of the worker in bronze. Other speakers urged that if the builders of churches would exercise more discretion in their choice of artists, and would pay more, they might obtain better windows. The race of men of talent was not yet lost.

In the course of the sitting on the 29th Mr. Pollen described to the meeting the Universal Catalogue of Works of Art proposed to be produced by the Department of Science and Art. The letters A and B are nearly complete, and the speaker sought the aid of the learned in all countries to supply omissions and rectify errors. The announcement of this work was received with great applause.

A discussion of the right of the Van Eycks to be considered the inventors of painting brought out some interesting particulars of Roger Van der Weyden and the Tournay school of painting. The great influence of the Flemish artists at that period was made evident.

Amongst several interesting subjects discussed on the 31st was this,—What are the principles that should be followed in the restoration of an ancient monument constructed at successive epochs, and in different styles? M. Colfs contended, in a memoir he had prepared, that the course to be pursued was to bring back the building to the primitive conception; or, if that could not be done, to give the preference to the dominant style, and restore the building in accordance with that! For example, he said, if I have to restore a building constructed two-thirds in the Romanesque style, and one-third in the Pointed style, I apply myself to suppress the one-third of Pointed (we are using the speaker's own words), so as to present after

restoration, a pure style! M. Bordeaux energetically combated this destructive view: in thus pretending to produce unity works of the highest interest would be destroyed. Baron de Quast took the same view, and mentioned some very bad cases of injudicious restoration in Belgium; and ultimately, on the motion of M. Genard, the meeting came to a Resolution, that in the restoration of ancient monuments each part of the building should be repaired and conserved in the special style in which it was built, and with the character which was proper to it. Colonel Meyers called upon the members present to pledge themselves to assist in bringing about the reconstruction of the ancient Bourse of Antwerp, important from both an architectural and artistic point of view, and this they did with loud expressions of accord. But we may not give more space to these proceedings. We can only add that many of the delegates and visitors, particularly the English, were much delighted to Mr. Gratian—our consul—for great kindness and attention. The Baron Nottebohm, the Danish consul, gave the members a splendid banquet at his country residence. The President of the Académie d'Archéologie de Belgique, and the Bourgmestre de la Ville d'Anvers, entertained them; the former in the Grand Hall of Harmony, where the Congress held its sittings; and the latter at his private residence. Concerts, to which they were all invited, were held every evening, and endeavours were made in all quarters to render the visit agreeable as well as instructive.

THE PARADE GROUND AND THE SPADE.

The readers of that great novelist who has had no successor, will not have forgotten the characteristic scene in which the extremely respectable clerk of a London merchant finds himself, with no less surprise than discomfiture, the inmate of a Scottish prison. Under all the embarrassing novelty of the position the precise habits of the counting-house assert the force of a second nature; and when a small sum in addition is required in order to simplify matters, the drawing of the line beneath the two numbers that are to be cast is as duly and accurately performed as in the sacred columns of the ledger itself. Those of our readers who learned arithmetic from the pages of "Bonycastle," may yet realise the mingled feelings of wonder, suspicion, and disgust with which the ancient systematic teachers of the mysteries of "sums" and of cyphering, first beheld men like Angustus De Morgan run up five columns of figures at a time, one for each digit, and give an accurate result before on the old method one would have done more than set down nought and carry one.

The total change in method of thought which is illustrated by such a contrast pervades every branch of social activity. It is probable that no preceding century, taken as a whole, has witnessed so much change in men's minds and in ordinary habits as has taken place within the last thirty or forty years. In the great centres of population the change is, of course, most apparent, but even in the remotest rural districts the same influence is traceable. The red cloaks of the peasant women, which transformed the Welsh farmers' wives into regular troops in the apprehension of the French invaders of Fishguard at the close of the last century, have now altogether disappeared. We look in vain for the habitual dress of the ploughboy of forty years past, the "smock-frock" that had come down to him from Saxon England. Those anti-social cages of steel ribbons, absurdly known by the name of crinolines, have invaded the remotest rural districts under various forms of ingenious discomfort and ugliness, and the village children are becoming far too cosmopolitan to greet a decent stranger by a bob at the forelock.

The *laudator temporis acti* who, while refusing to travel, has found the England of the eighteenth century to be travelling far from his disappointed and lingering vision, has been long wont to console himself for hateful innovations by a glance at those institutions for which he pays the most. "Thank God," was a memorable ejaculation, "we have a House of Lords." "Thank God," it is now more appropriate to remark, "we have the traditions of the service and the regulations of the army." As to the navy we have less consolation. Nor even is the contemplation of the army a subject of unmingled self gratulation. If we look at Hogarth's "March to Finchley," we shall find that the uniform of the British

soldier, though still proudly distinguished by the appoplectic eotck, the compulsory use of the distinctive tattoo of the razor, and the white cross-belt that answer the double purpose of contracting the chest and furnishing an admirable lull-eye for the enemy, has undergone considerable change since "George the Third was King." Especially have we made so great a stride in the introduction of the formidable artillery which has given a just fame to Sir W. Armstrong, that we are likely steadily to refuse to consider any further evidence on so noisy a subject for another official generation. But in the navy the new element has made wild work with the venerable traditions of the past. The floating castles which, twenty-five years since, were regarded as chief among the wonders of human handiwork, are now looked on as so many arks, and instead of relying on our wooden walls we are girding ourselves round with walls of iron.

There has, however, always been one essential difference between our land and our sea services,—a difference inherent in their nature, and to which the popularity of the naval officer may in great part be attributed. Preparation for defence is of the essence of all military order; but the preparation which is requisite in an inland garrison, in the native country of the troops, and in a time of profound peace, is apt to sink into a matter of formalism and routine,—of stocks and pipeclay. On board ship it is otherwise. An enemy may be at any moment alongside,—not an enemy who will rush up the ropes with cutlass and marling-spike, but one who may lay the vessel itself on its broadside with a lurch, or pour with irresistible force through the unclosed port-holes. The winds and waves of our stormy seas have been since the time of the Armada, to say nothing of earlier history, at once the best guardians of our freedom and the best educators of our adventurous youth. A squall may come on at any time, and for two or three days out of every week the energetic activity of the sailor may expect to be tested in a manner calculated not only to keep him alert, but to call for and to develop his bodily strength. Thus, while the professional activity of the soldier can only be exercised by conventional appeals to his duty in time of peace, the professional activity of the sailor is ever on the alert. The grand object to be dominated by the navy is the sea, and hostile vessels come in only as a portion of that great host of difficulties over which we expect the "meteor flag" to triumph. A ready aptitude for whatever may occur thus comes to form a portion of the sailor's character. Jack is at home, proverbially so, under all circumstances. A party of English sailors were amusing themselves in the streets of Naples by experiments in horsemanship, or in whatever may be the proper term to use when the animal mounted was of the humbler rank of an ass. Not relishing the vigorous thumps administered by his rider, the first animal of the cavalcade exerted so successful a kick as to send Jack flying clean over his head. The sailor alighted on his hands, and ran briskly forward in that inverted posture as if it had been perfectly natural for him to go along with his heels in the air. This was only a trivial illustration of the manner in which the education of rough weather makes the sailor instantly at home under the most novel circumstances.

With this difference between the nature of the emergencies peculiar to the land and sea services, it naturally occurs that a review by land differs from one by sea in everything but in name. A naval review is always a bit of actual service. The wind will not come to order. The handling of vessels, even under steam, is a real bit of work. The military review, on the other hand, especially the military review of the earlier part of the century, served to bring into strong relief the difference in the meaning of the adjectives "military" and "warlike." The affair was merely a parade on a large scale,—a matter of buttons and well-brushed coats, of promptitude in the manipulation of the fire-arm, and of mechanical exactitude in marching and wheeling. The length of the pig-tail is no longer an item requiring exact admeasurement; but the pig-tail school is not extinct among our older officers. We do not wish to speak with any disrespect of the unrivalled steadiness of the British march, the firm, united, unbroken tread, as unshaken under fire as in the parade, which excites the admiration even of soldiers formed under the most opposite systems of drill. But it is more than questionable how far the slow march is in arrear of the *Annis Domini*. The most brilliant courage, the most perfect sang

froid under fire, prove no protection against the rifle. That part of the military code which most wisely and justly sentences officers to punishment for undue exposure of their lives in presence of the enemy, demands a fuller extension. So long as it took a hundred and fifty shots to produce a wound, coolness and unwavering discipline won the day. It was by these reliable qualities in the British soldier that the greatest captain of the present century won its most decisive battle. He calculated that his troops would keep their ground to the last man, and that the expenditure of life before French cannon and musketry could not reach the last man before the arrival of Blucher or of night-fall. But if both armies had been provided with breech-loading small-arms and with rifled cannon Waterloo could not have been fought as it actually was fought. What change the Great Duke would have made in his dispositions we have not the advantage of learning from his genius or from that of his colossal opponent; but we may yet derive a lesson from the grave of Wellington. Eminently, while on active service, the duke was a practical man. It was his habit to weigh possibilities, to seize first the leading features of the position, to leave as little as possible to luck, and to make the main chance secure. It was thus that he prepared his famous lines of defence in Portugal, and at a time when actual fighting formed more of the business of war than it does at the present day, gave the first important check to the combinations of Bonaparte, not by the bayonet so much as by the spade.

We cannot doubt that if a soldier such as was Wellington in his prime were now at the head of the British army the importance of the spade in all future warfare would be brought out into strong relief. With the increased precision of aim and rapidity of fire of modern arms a battle becomes more a question of time than was formerly the case. The defence involves endurance more than courage. Let troops be kept on an exposed position for so many minutes, and they will be mown down to a man. In all the great battles of modern times, the seizure of some partially covered position has usually been the object of the most obstinate struggle. The feature of war remains unchanged, unless by the increased rapidity with which the torrents of blood will flow around the post that is selected as the key of the position. But in the occupation of open positions, which dominate the field, but which are now exposed, as was not the case formerly, to the fire of rifled shell and shot, will be found the main difference in the features of modern battles. Points of command essential to the tactical movement of the hour will be tenable only for so many minutes, because in so many minutes every soldier thus exposed will be shot. It is obvious that the resource in this emergency is the spade. The art of self-defence must, as in the Spartan times, be made the first duty of the soldier. To stand to be shot may be magnificent, but it is not warlike. We must learn to stigmatise it as unmilitary. The general who can most rapidly intrench his troops will remain master of the field. We do not speak of the painful and elaborate system of entrenchment which was practised in the American civil war, although it was the spade which enabled General Lee so long to hold his own against forces so immeasurably out-numbering his battalions. But a rapid mode of throwing up a pick and shovel, such as make our "navvies" as adroit as so many moles, is as essential to the safety of the troops, and ought to form as integral a portion of the military education of the infantry as the use of the rifle itself.

The subject has been formally brought under the notice of the Horse Guards, and of course with the usual result. The first objection made is, that the soldier is unaccustomed to handle the spade, and that an addition to his drill of a severe form of manual labour will render the service unpopular, and interfere with recruiting. Tell him that it is for his own protection that he is thus called on to instruct himself, and his reply will be,—to decline to enlist.

To this objection there is one complete reply. The soldier must have extra pay for extra labour. This can be effected, not only without addition to the army estimates, but in a manner that would become popular both among officers and men, by affording a rate of pay very far in advance of the military rate, on a self-supporting basis. Our navigators readily earn their 5s. and 6s. a day. The education of a navigator consists

in putting a spade into his hand, and telling him to fill so many barrows of earth a day. At first he does it very badly; he works slowly and clumsily; he does less than half as much as his neighbour, and he is tired to death by sunset. A week or two of practice makes an immense difference; in three months a pick may be put into his hand; in six months he is a skilled earth workman; in twelve he is fit to be a ganger.

Now, if working parties of troops were detailed for the execution of civil or military works, commencing under the guidance of picked civil workmen, who would soon be replaced by non-commissioned officers, very little time would pass before the military executors became as skilled as the civil. If a preliminary outlay seem requisite for clothes and tools, this outlay would be replaced long before the close of the year, and the proper price of the work done would be such as most amply to remunerate all engaged. We speak from large experience of civil works, and we can appeal to the testimony of engineer officers, who know the inefficiency of recruits at any skilled work, and who also know the rapidity with which efficiency is attained under instruction and practice. We do not say to what extent the army might thus, while increasing tenfold its military or rather its warlike efficiency, be rendered a self-supporting institution, but we are confident that the suggestion merited a better reception than the reply from the Horse Guards, that the plan was deserving of attention, but that we have too few men in the army to allow of its adoption. It is this very scarcity of our precious personnel of war that will, sooner or later, (let us hope before some great affliction has demonstrated its necessity,) render the adoption of some such plan an essential part of our military system.

CONCERNING THE BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, AT DUNDEE.

THE meeting at Dundee has been more successful than at first seemed probable. The proceedings in the sections were, as they always are, interesting; the hospitality connected with the excursions was gratifying to all who took part in them; and, whilst, notwithstanding many well-known faces were absent from Dundee, the tickets issued and the amount realized at the meeting were beyond the figures at Nottingham. Moreover, the city authorities did so much during the week, as to remove to a considerable extent the impressions that were produced on visitors from London, on their arrival, or by the first twenty-four hours' residence. The Provost himself was indefatigable; and one, or perhaps two of the three local secretaries, soon after our notice of last week was written, came out into the light: to Mr. Henderson at least, we are indebted. More might have been done, it is admitted, as to the arrangements of the opening-day; but we are assured that any omissions were owing to the in-suggestiveness of those who alone know—the general and assistant secretaries of the Association—what is required in details, from having had experience, or at least ought to know. When the Association goes, next year, as is decided, to Norwich, there must be some arrangement by which lodgings may be kept within reasonable limits of price, and by which persons employed by the local secretaries to ascertain available accommodation may not apparently play into the hands of those letting the lodgings, as to the terms, and may scotch altogether the difficulties of a town, and do something towards preventing the proprietors of taverns and the purveyors of refreshments from becoming every day more extortionate. The list of lodgings at Dundee was worse than useless: inquiries were directed by it to places that could not be found, and to one place that could not be found, and to one place that was a cellar. The lodgings, when found, were from 20s. to £1. 10s. per week, for two small rooms; and of what we saw, the more expensive were the least desirable. As it was, effects of some of the preliminary arrangements, and the original defects of the places of residence, remained, or were operative to the last. The majority of the elements in Bonnie Dundee have certain deficiencies that would prevent persons from the month of the kingdom from settling in the city, whatever otherwise the inducements. Excepting in hotels and public institutions, and in houses built by the more wealthy people for their own residence, one requisite seems to be always un-

provided in the plan, and non-existent in fact. A certain odour, not that of sanctity, or else a smell of burnt lavender as a substitute provided and preferable, is apt to be met with. On the first morning a general chorus of complaint was sounded in the reception-room in the Exchange buildings; which apartment, by the way, soon became almost unbearable, from the demand upon certain accessories of the building that have been alluded to as wanting elsewhere. The system of residences in flats is very general; and, of course, this has the advantages which our readers are well aware of. The "stair," in such cases, usually ascends direct from near the street entrance-doorway, to which last there is no door. The consequences, in many cases, need not be mentioned; and should there be nothing more objectionable, and the stone steps be scrupulously clean to the eye, there is stench that is disgusting, due to the fact that the population of the tenements is largely feline. We may say that the flea of this part of Scotland is of a bigness and an agility unknown in the southern part of the island; that is to say, if we may bear witness to the zoological fact after sleepless nights, and succeeding days of discomfort like that which was the lot of the carriers in Shakespeare's "Henry IV." As regards the worst defects, alluded to, of the dwellings, the authorities of the city are no doubt anxious to correct them. Sewerage and water-supply have been attended to: the water moreover seems good. The most-recently built of the tenement dwellings, as those erected by the Messrs. Baxter, in Lyon-street, of which we may again speak, are very superior to others. We have no doubt of the anxiety of the city-authorities to remedy what is defective; but at present the system of the removal of ordure from the houses is disgusting; albeit as to what comes under the comprehensive designation "dust" in a London-house, we advocate the French system of depositing it in the street, combined with perfect street-cleaning, in lieu of the hoarding it in or close about houses, which is general in London.

Of the city itself much more might be said; but our present business is with the Association.

The opening meeting was held in the Kinnaird Hall, a room built as a Corn Exchange, and for public meetings, and said to be 130 ft. by 60 ft. on the ground, and 40 ft. in height, and estimated as affording space, with its end-gallery, for from 2,500 to 3,000 persons. On this occasion there were side-galleries, temporarily erected. The ceiling has sloping sides and a central platform, and is carried by iron ribs of the semi-circular-arch form; the lighting, by day, is through the sloping sides. By night the arrangement provides for sun-burners; but on the evening in question, gaseliers were substituted, and the room was almost unbearable. Before the proceedings commenced Sir David Brewster failed, and had to be carried out. The original sun-burners have now taken the place of some of the gaseliers, and with advantage; but on each of the lecture-nights the room has been still hot and uncomfortable.

The chair was taken, in the absence of Mr. Grove, the former president, by Sir Roderick Murchison, who, with questionable taste, said that the choice of president this year had been made on the principle of alternating men of rank with men of science. The address of the Duke of Buccleuch, which followed, was an argumentative exposition of the advantages of science, and of the importance of its being taught in schools and universities; and anywhere else than at the British Association for the Advancement of Science, would have been highly creditable to the person who delivered it. It resembled in no respect the addresses of former years in being a review of the scientific progress of the year. Therefore, it seems to us that the Association this year will have failed of one of its most important functions. The duke said, he had never in his life attempted to pen, beforehand, a speech or address to be delivered, and that in this case he must have had recourse to the pens and to the heads of others, whilst he preferred speaking from his own heart and head. There is much in this that is creditable to the duke; but the man who is not capable of utilizing the labours of others, whilst acknowledging them, and of making his own individuality, as well as acquaintance, to some extent, with every branch of science, clear at the same time, is not fitted for the post of president of the Association.

There is frequent error, in several ways, in the practice of men in such a position as that of the

president of the British Association, men of science or others. Whilst not forgetting that there is no natural demarcation of branches of science, distinguishing them from other branches, they assume that an individual mind is held, by the public, capable of grasping the whole. It would be far better,—indeed it is essential for the annual address at the meeting of the British Association,—that the utmost use should be made of the assistance of the man most competent in his department, and that such assistance should be openly acknowledged. This was the course pursued by the great Humboldt in his *Cosmos*. Lord Brougham, although there is no doubt of the writership of his addresses on subjects which were all taken in by his comprehensive mind, was accustomed for many years to be kept up with the progress of different branches of science by chosen persons regularly attending him with the object. In each of these courses there is recognised that for which we contend. If the proper man be chosen for the presidency, the address will be that of the individual, none the less that all requisite assistance is both used and acknowledged, whilst it will be, what the address this year was not, a report of the state of each science and of the existing relations in the whole.

We should mention that at the meeting of the General Committee, in the morning, a very important report from a committee was read, on Scientific Education in Schools. It is too long for our reference to more than one or two of the many important points in it. It showed that those boys upon whom the ordinary school education produced slight effect could be stimulated by instruction in science, and that science would be found a most valuable element in the education of those who showed aptitude for literature. It referred to the opinion as concurred in by schoolmasters, that much more knowledge and intellectual vigour might be obtained by most boys during the many years they spend at school, than what they do obtain. So far from the valuable results of a classical education being diminished, the report maintained that the exclusively classical education failed deplorably for the majority of minds. The report said: "As a general rule, the small proportion of boys who leave our schools for the Universities consists undeniably of those who have advanced farthest in classical studies, and judging the existing system of education by these boys alone, we have to confess that it frequently ends in astonishing ignorance." As to the notion of excessive strain upon the minds of boys, the report alluded to the same objections as once opposed to the introduction of modern languages and mathematics; and it remarked that change involving play of a new set of faculties often produced a sense of positive relief.

A distinction is made in the report between scientific information and scientific training. Both of these should co-exist in a school professing to offer the highest liberal education; whilst at every school there should be comprehensive elementary instruction in science. But the report clearly contemplates much more than the merely elementary instruction. It considers the claims of experimental physics, chemistry, and botany, and says of chemistry that pursuit of this science "affords a corrective of each of the two extremes against which real educators of youth are constantly struggling." For, on the one hand it loads even sluggish or uncultivated minds from simple and interesting observations to general ideas and conclusions, and gives them a taste of intellectual enjoyment and a desire for learning. On the other hand, it checks over-confidence in mere reasoning, and shows the way in which valid extensions of our ideas grow out of a series of more and more rational and accurate observations of external nature." Further on in the report, reference is made to the fact that many boys of thirteen or fourteen are sent to the public schools almost totally ignorant of the elements of arithmetic. With a view to the furtherance of the objects, the following suggestions are made:—

- I. That in all schools natural science be one of the subjects to be taught, and that in every public school at least one natural-science master be appointed for the purpose.
- II. That at least three hours a week be devoted to such scientific instruction.
- III. That natural science should be placed on an equal footing with mathematics and modern languages in effecting promotions, and in winning honours and prizes.
- IV. That some knowledge in arithmetic should be required for admission into all public schools.
- V. That the Universities and Colleges be invited to assist in the introduction of scientific education, by making natural science a subject of examination, either

at matriculation, or at an early period of a University career.

VI. That the importance of appointing lecturers in science, and offering entrance scholarships, exhibitions, and fellowships for the encouragement of scientific attainments be represented to the authorities of the Colleges.

With reference to the last two recommendations, co-operation of the Universities is necessary, although not more than 35 per cent. even of the boys at the great public schools proceed to the University, because the curriculum of a public school is almost exclusively prepared with reference to the Universities. Attached to the report are Appendices, giving particulars of the scientific education within the present sphere of the Universities, including London, and of the College of Preceptors, and also particulars of what is done in the French and German schools, as well as ample information as to the teaching of science at Rugby and Harrow.

On the following day the sections got to work. Some of the papers which were read on subjects directly interesting to our readers we shall print or refer to.

Besides the proceedings in the Sections, there were two lectures to large audiences in the Kinnaird Hall, one of them by Mr. Archibald Geikie, on "The Geology of Scotland with Relation to the Picturesque Features of the Country," and the other by Professor Alexander Herschell, F.R.S., on "Meteors and Meteorites." Each of these lectures was illustrated by large diagrams and views, and the latter one by some very remarkable experiments. On two other evenings there were *soirées* in the Volunteer Drill Hall; which were attended each by upwards of 2,000 persons. The only defects in the arrangements were insufficient width of entrance-and-exit-way, and very inadequate provision for overcoats and umbrellas. This drill-shed is a large structure, of the railway-shed character, as built, but which on this occasion was made to assume a highly-effective appearance. It was erected partly for the purpose to which it was applied during the meetings of the British Association, and partly for that which its name indicates. There seems to be some idea of making the structure eventually, longer than it now is.

On the nights of the *soirées*, the entrance where carriages set down was approached by crossing a forecourt, ornamented with plants and coloured lamps; and across the whole end of the building ran a temporarily-erected porch, glass-roofed, and decorative in appearance. Double flights of steps were in the centre; whilst other flights of steps at the ends of the loggia, were reserved for pedestrians. The walls of this hall were covered with paintings, about six hundred in number, some of them copies of old masters, though not always acknowledged to be such, but many of them works of the highest order of excellence; and many interesting objects were dispersed about the ample area of the hall. After one of the *soirées*, there was a ball in the Kinnaird Hall. There was an agricultural show; there was a flower-show in the Baxter Park; and there were numerous places of interest thrown open for the inspection of visitors. On the Saturday there were excursions to St. Andrew's, to Rossie Priory and Fingask Castle, to Falkland Palace, and to Glamis. Eight or ten others were to be made this Thursday. On each day, each one of the excursions offered such temptations, that scarcely a member of the Association was there who did not regret his or her inability to go to all. A comparison of notes on Saturday night showed that every one had been gratified.

The more formal business of the Association concluded on Wednesday.

COST OF THE NEW VESTRY-HALL, ST. LUKE'S.
In accordance with a request of the vestry, the clerk has laid before the Board a detailed account of the money expended in the erection of the new Vestry-hall. It contains the following, with other items:—Cost of site, 1,650*l.*; building, 6,416*l.* 2*s.* 10*d.*; expended at the laying of the foundation stone, 70*l.*; Mr. Stett, for first drawing, 365*l.* 5*s.*; for second ditto, 273*l.* 6*s.* 1*d.*; some additional painting, 10*l.* 15*s.* 9*d.*; carpenters' work, exclusive of the building contract, two items, of 10*l.* 15*s.* 2*d.* and 145*l.* 14*s.* 6*d.*; gas-fittings, Mr. Jeal, 247*l.* 7*s.*; a marble slab, 43*l.* 9*s.* 4*d.* The total was 10,272*l.* 19*s.* 3*d.* The clerk said the guardians had to pay half of that amount, namely, 5,136*l.* 9*s.* 8*d.* That body had already paid 1,650*l.* for the site, and 3,000*l.* cash.

VENTILATION.

THE Drummond School was opened in May, 1864, for the reception and education of orphan daughters of soldiers.* Thirty children, the youngest of seven years, were selected, medically inspected, and admitted within the next few months, and a female staff placed in charge of them.

Not very long after the entire number of children was assembled, slight ailments occurred, which were attributed to change of climate and diet, and other ordinary causes; but this conclusion was in time discovered to be inexact, as these tendencies did not pass away with longer residence, and ordinary health was not in all cases resumed. These illnesses were in themselves, with one or two exceptions, unimportant, except from indicating that something was amiss in the sanitary conditions of the school: they comprised sick headaches, deranged *primæ viæ*, sore throats, sore eyes, glandular enlargements, colds, feverish attacks. One girl was removed with incipient lateral curvature, another died from gastro-biliary fever, which rapidly assumed a very low type; and, lastly, porrigio showed itself. No exception could apparently be taken to the mansion; it was situated in a most healthy position, the rooms were of good size and airy, and in the dormitories the beds were so arranged as to be one yard apart. Ventilators likewise had been introduced into the walls of the school, and other rooms, under the direction of Col. Dumford, of the Royal Engineers; and in fine weather the windows were kept partially open, and everything done to keep the house sweet.

In August, 1866, the governors at my request sanctioned the ventilation of the sleeping apartments in the manner I am about to describe.

Since then, that is during the last year, a most gratifying change has taken place; only two cases have been presented to me for treatment, one of acute dyspepsia after the Christmas holidays; another of scarlet fever, which ran a very mild course after the Easter holidays.

This result, both novel and striking, can be attributed to no other cause than the thorough ventilation of the above-mentioned rooms, which was carried out by a most competent officer, Mr. Daly, of the Royal Engineer Department.

The removal of impure air from a room can be effected by offering to it a ready outlet and dynamically replacing it with pure air; the problem to be solved is how to compass this object without creating a draught, which may be detrimental to health, or which shall interfere with the personal comfort of the inmates. I do not know that there is any novelty in the mode adopted at the Drummond School, but a little care is required to secure all the objects contemplated and in the best way.

Each room was ventilated quite independently of its neighbours. From such room bores or perforations were made, exactly opposite to each other, close up to the ceiling, through walls and partition walls, right through to the open air in front and rear of the building; into these perforations tubes or conduits were inserted which passed from the room completely to the outside of the building. Some of these tubes were, of course, very short, as they had only to clear the thickness of the outside wall; those opposed to them, proceeding from the other side of the room, were long, as they had to extend through the partition walls, from the inside of the room, close to the ceilings of the interposed passages and rooms, until the outside of the building was reached in the exactly opposite direction. These conduits were 15 in. by 4 in. in the clear: the wider and shallower they are the better, so that the section do not much exceed 60 square inches, lest the change of air in the room in windy weather be too rapid. They were made of well-seasoned yellow pine, ploughed and tongued, and the joints put together with white lead, so as to be perfectly air-tight.†

* Mr. Drummond, a merchant of Dublin, who had formerly been in her Majesty's service, bequeathed a sum of 20,000*l.* to establish this school; a further sum of 2,231*l.* was raised by subscription, and expended in purchasing, repairing, and improving two private dwelling-houses (twin houses), situated in a large garden, on an agreeable site overlooking the River Liffey. The interest of Mr. Drummond's magnificent bequest was reserved for the exclusive support and education of the orphan children.

† The recreation-room and dormitories of the Royal Herbert Military School have been most successfully ventilated in this manner. The conduits are of frame-work, covered with canvas and deeply coated with paint; they have discharge their office well. Some of the conduits which open into the recreation-room pass over twelve yards through rooms and passages. When the frames of the zinc plates at the inlets were first put up (some years

Outside the house the inlets or outlets, as the case may be, of these tubes or conduits were furnished with perforated iron gratings, the perforations being $\frac{1}{2}$ in. diameter and $\frac{3}{4}$ in. apart; the holes were punched, "not drilled," the face of the plate with the "burrs" or projections made by the punching being kept on the outside, whereby wet blown against the front of it is prevented running into the tube through the holes: the gratings were $\frac{3}{8}$ in. thick. On the inner side, opening into the rooms, perforated zinc, with holes $\frac{1}{2}$ in. diameter, are fixed fair with the face of the walls, and draught-boards, which experience has shown should be perfectly horizontal, 2 in. or 3 in. wider than the zinc plate, and project into the room about 10 in., are fixed under the apertures, to guide the air into the room, direct it across the room to the opposite aperture, and prevent its descending immediately on introduction. This draught-board performs an important office and cannot be dispensed with. These ventilating apertures, with their special conduits, should be from 15 ft. to 18 ft. apart, so that two sets will fully ventilate a tolerably large room. It is not necessary, excepting for about 18 in. of the part directly entering or leaving the room, that these long tubes should be perfectly straight; they can without detriment take a little excursion, so as to clear a staircase or inconveniently obtruding partition-wall; but the less friction to the air that is permitted within them the better.

Most people have a vague notion that, beated air expanding and ascending, all that is necessary to provide for ventilation is to favour the escape of impure heated air at the top of the room and to permit the entrance of a cooler stratum of pure air below: no doubt pure dry air would be obedient to this law, but the air in a room may be in conditions in which the interchange may be interrupted, nay entirely arrested, unless the difference of temperature be very high,—high to a degree that should never be permitted, so high indeed that it may prove exceedingly prejudicial to health.

My attention was first drawn to this deviation from received principles, many years ago, in the East. I was, late one night, during the prevalence of cholera, called to visit some soldiers of the 95th regiment, in a large, lofty barrack-room: the floor area, however, allotted to the men was so restricted that the soldiers' beds were all but touching. As the corporal moved forward with the lantern, I observed that the flame became small and red; but when he, by my directions, raised the lantern above his head, the flame resumed its ordinary appearance. I moved gently to an undisturbed part of the room, and found on raising myself a foot or two that the air above was tranquil and comparatively pure; but, lowering my head to a level with the men's bodies, I felt it to be oppressive, tainted, and sickening. The presence of this bank of ungenial air enshrouding the men I attributed at the moment to the presence of watery vapour, the *halitus* from their breath and transpiration from their bodies. All who have observed on a damp morning in some manufacturing town the heated air and smoke arrested in its upward movement, and banging like a cap over the huge factory chimney, will realize the idea that suggested itself to my mind as I regarded it.*

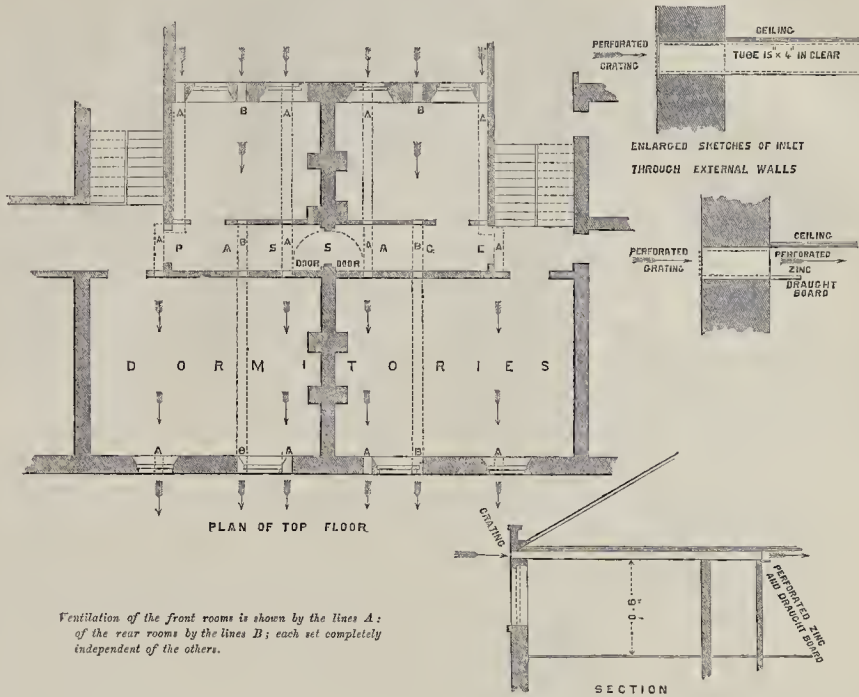

There is something very curious in the tendency of air, in the ordinary conditions in which we find it, to arrange itself in strata. In the atmosphere, free as every particle of air is to obey the forces acting on it, to adapt itself as it listeth, we perceive this stratifying disposition in the flat bottoms of cumuli, in the horizontal sheets of stratus,† and cirro-stratus. In the East, journeying up to the sanitary stations on the hills, we see it in the early mornings as we mount our horses and glance back on our ride of yesterday, in the flat-topped dense fog, which fills the deep valleys rife with malaria, in the

ago) I caused them to be furnished with slides to regulate the quantity of admitted air; these were soon found to be unnecessary, even in the stormy weather of midwinter, and have been withdrawn. In the dormitories, the air of which was formerly much tainted, but now very far indeed, I have found, after several years' experience, that the minimum space which, consistently with due regard to maintenance of health, can be allotted to each boy is 45 square feet. The average age of these boys is 10 years; a larger apportionment would, therefore, be required for full-grown persons.

* I wrote by the next mail to Sir John Webb, describing what I had witnessed, and pointed out the propriety of securing a greater amount of lateral space to men in barracks. By return mail he informed me that my suggestion would be carried out in a new barrack about to be erected for Artillery at Portsmouth.

† "Meteorology." Sir John Herschel. Pp. 89, 200.

VENTILATION OF ROOMS.

Ventilation of the front rooms is shown by the lines A : of the rear rooms by the lines B ; each set completely independent of the others.

intervals of the mountain spurs. Mr. Glaisher, in his balloon ascents and descents, is stated to have passed through some 2,000 ft. of air of uniform temperature into other strata indifferently of higher or lower thermal state.* Mr. Clibborn, of the Royal Irish Academy, has favoured me with another singular instance in "a peculiar effect produced in the old library by the mode of heating it under the bookcases with small iron pipes, heated so highly with water that they would char dust and blacken paper sometimes, so that we expected an accident, until I adopted a method of cooling them by means of hundreds of iron saddles made of bits of hoop-iron, a plan which I found wonderfully efficacious in cooling the pipes and heating the air in the room moderately and agreeably, instead of the hot dry air we had previously. Now this air used to accumulate and form a stratum of the height of the long table in the middle of the room, provided the place was still and no one walked about; your head and body would feel cool, but your legs and feet oppressively warm; you would be reading and all quiet, and in a moment the cold air from the great lantern at the top would tumble down, and you would feel a great shock,† as if a blast of cold air struck you from some window or door suddenly opening. At night, on one occasion, when we were at work at the Catalogue, moving very little, having books on the table and eight large candles burning on it, the night being very cold we had the hot-water pipes very warm, when suddenly

the cold air fell from the lantern, and the hot air flew up suddenly into its place with such rapidity that all the candles were blown out." Mr. Clibborn likewise observes, that this stratification is by no means absent from private dwelling-houses; the separating plane of the strata being usually on a level with the upper edge of the fireplace.

We thus can readily comprehend that in still rooms, such as they ever are at night, we have no guarantee in loftiness of ceiling for the purity of the air we are breathing. It is, besides, highly objectionable to admit in any great quantity cold air by ventilators at the baseboard of the room; I have had on many occasions to close them up, as I have found coughs, sore throats, and sore eyes clearly traceable to them. In the mode of ventilation I have been describing these untoward results never occur.

In our variable climate it is exceedingly rare to find the air perfectly still. Wind is always being propelled in one direction or another, and never so completely end on to a dwelling-house but that it will sensibly press on either the front or the rear. It will be obvious then, that no matter how the wind may blow, an unequal pressure will be exerted on one or other face of the house, and that the effort at equilibrium will carry a current through the tubes or conduits from the windy to the lee side, directly across the upper part of the room to be ventilated. The friction of this current on the volume of air in the room very soon sets the mass in gentle motion, revolving on a horizontal axis; part of the introduced air becomes entangled with the revolving mass, and keeps up a supply of pure air to the room; while, in like manner, a portion of the mass disengages itself, and passes out with the current, thus removing a part of the impure air previously circulating in the room.

A little care is required to adapt the average in-flowing current to the size of the room, so that it may not cool the room too palpably. I have adopted a section of 60 square inches in the Drummund School, the ceiling being only

9 ft. from the floor, and with this have had the ventilators open all the last severe winter, and have not found that the temperature was inconveniently lowered, or comfort at all interfered with.

ROBERT TEMPLETON, Dep. Inspector General, Royal Hibornian Military School.

THE ARCHITECT OF THE HOUSES OF PARLIAMENT.

BEFORE the claim for Mr. Pugin in this respect had reached its present shape, we said, on receiving an anonymous note from one obviously not personally concerned in the discussion, and possessing no special knowledge of the case, that "persons making this claim (a sort of claim always to be looked at with the greatest suspicion, especially when death has removed the chief person concerned) should refer to the statement made in our pages by Mr. Pugin himself on a similar occasion; to which we could add the recollection of an indignant personal denial by Sir Charles Barry and Mr. Pugin both."‡ Mr. E. Pugin considered this a personally offensive allusion,† although, in truth, it was meant to apply generally and not to be offensive to any individual.

Our observation, in its general application, we now reiterate. Claims of this kind go to destroy all confidence between principal and assistants, and to lessen the chances of men who, not having work to do themselves, are glad, at certain stages of their career, to sell assistance to those who have. Admit what seems evident, that Pugin was, for a certain time during the progress of the Houses of Parliament, Barry's chief and very valuable assistant. Go even further and say, simply for argument's sake, that he was the designer of the building: he accepted the position for his own purpose, and undertook to

* Vide on this subject Prof. Tyndal's charming volume on heat and motion.

† Non-commissioned officers have several times mentioned to me this horrid descending blast through the upright ventilating shafts in the barrack-rooms, but I never thoroughly comprehended the drift of their explanations until these observations of Mr. Clibborn reached me. I may mention that these ventilating shafts with louvre tops have utterly failed in every instance: we had four of them in the Royal Hibornian Military School dormitories, as many in the recreation-room, which never did any good whatever.

* P. 493, ante.

† P. 535.

do what he did for a certain remuneration, which he received. To claim for him now something much more than he agreed to receive, is a breach of contract and a breach of faith.

But if Pugin himself is to be believed, there is no ground whatever for seeking to claim for him the title of architect of the Westminster Palace, and it may be worth while to restate the circumstances which enable us to say this positively.

In the *Builder* of August 30th, 1845,* we printed the complaints of some English decorators, who considered themselves ill-treated with reference to the Parliament House, in the course of which the writer said:—

"Messrs. Crace have both the honour and the profit accruing from the painted decorations of the House of Lords, which are being executed by foreign and English artists, from designs furnished by Mr. Pugin, and under his direction, to the exclusion of the only two artists who were qualified for employment, according to the decision of the committee."

Immediately after the appearance of this statement, the conductor of this Journal received from Mr. Pugin, and printed, the following letter:—

"Sir,—As it appears by an article in the last number of the *Builder*, as well as in notices contained of late in other periodicals, that a misconception prevails as to the nature of my employment in the works of the New Palace at Westminster, I think it incumbent on me, in justice to Mr. Barry, to state that I am engaged by him, and by him alone, with the approval of the Government, to assist in preparing working-drawings and models, from his designs, of all the wood-carving and other details of the internal decorations; and to procure models and drawings of the best examples of ancient decorative art of the proper kind, wherever they are to be found, or specimens for the guidance of the workmen in respect of the taste and feeling to be initiated; to engage with artists and the most skilful workmen that can be procured in every branch of decorative art; and to superintend personally the practical execution of the works upon the most economical terms compatible with the nature of it and its most perfect performance. In fulfilling the duties of my office I do not do anything whatever on my own responsibility; and I do not do anything of the works upon the designs of Mr. Barry's designs, and submitted to him for his approval or alteration previous to their being carried into effect: in fine, my occupation is simply to assist in carrying out practically Mr. Barry's own designs and views in all respects. Trusting to your fairness in giving insertion to this letter in your next number, I am, sir, &c.

London, Sept. 3rd, 1845. + A. WELBY PUGIN."

Mr. John Crace also wrote a letter, in which he says,—

"I can state distinctly that not one single foreigner, or has been engaged upon the decorations of the New House of Lords; that after receiving the sketches from Mr. Barry, I have drawn them out full-size with my own hands, and have entirely directed the execution of them under Mr. Barry's immediate instructions and control."

At the same time Sir Charles, then Mr. Barry, called upon us, and denied emphatically the correctness of the statement that had been made. Amongst other things he said,—we remember it distinctly,—that, to avoid the possibility of such ascription, Mr. Pugin made few drawings, excepting from his, Mr. Barry's, own rough sketches, and none that he (Barry) did not to some extent or other work upon. Mr. Pugin had already said the same thing in his letter, and reiterated it *vice versa* on another occasion. We might extract other evidence from our own pages; we might quote the testimony already given by Mr. Wolfe, Mr. Barks, Mr. Wright, Mr. Ferrey, Mr. Talbot Bury, and others, and examine some of the statements made on the other side; but there is no occasion for it. Mr. Pugin told us himself, distinctly, that he had no right whatever to be considered the architect of the Houses of Parliament, and that his occupation was simply to assist in carrying out Mr. Barry's designs in all respects.

We shall be glad if we hear no more of the claim that has been set up, and we express that hope with equal regard for the fame of Pugin as for the fame of Barry.

THE SEWAGE QUESTION.

ANOTHER Report of the Royal Commissioners, Messrs. Rawlinson, Harrison, and Way, on the rivers Aire and Calder, has been printed. On the general question of the best means of preventing the pollution of rivers, they say in this report,—

"Sewage interception is always practicable. Where it can be applied fresh to the land there is least nuisance and least cost to the ratepayers. Where the solids are extracted by mechanical depositing, there is pecuniary loss on the operation, and running streams receiving the effluent water are still polluted, the pollution being greater as the volume in the stream is relatively small. No arrangements for treating sewage are satisfactory except its direct application to land for agricultural uses.

Our experience of the weakness inherent in unaided and uncontrolled local authorities at present constituted

* Vol. iii., p. 416.

† Vol. iii., p. 426.

convinces us that a central board appointed by a State department is necessary to the efficient protection of running waters." "In order to prevent the pollution, and to legally control the management of rivers, their basins or watersheds must be placed under supervision, irrespective of any arbitrary divisions of county, parish, township, parliamentary, municipal, or local government Act boundaries; or, indeed, of any artificially established division. Running waters flow on from their source to the sea, and if the upland waters are polluted by town sewage and by refuse discharged from manufactories, as in the West Riding of Yorkshire, the entire length of a river is necessarily polluted, and will require to be covered or protected. Towns situated midway or on the lower branches of rivers, as Leeds, Manchester, Salford, and many other places, will establish and carry out local improvements, and would clarify their sewage and other refuse fluid to little practical purpose, if the towns, villages, and manufactories on the same river with themselves and its tributaries are not placed under restrictions against sending down pollutions. This state of things applies equally to villages, and even to single mills and factories as to large towns; it prevents local authorities, as also manufacturers, from taking up the question of separate purification."

"At Crofton, at South Norwood, and at some other towns, it has been forbidden by injunction for the local authorities to pass town sewage into running waters below a defined standard of purity, and the result has been, after the failure of all other systems, a clarification of such sewage by irrigation, which not only proves successful for the purpose desired, namely, to prevent river pollution, but in its operation is a source of profit to the ratepayers. However that be, the question of profit or loss in abating nuisances, and in preventing either the undue pollution of the streams by sewage, or the sea-shore, by town and house sewage, or by working mines and carrying on trades and manufactures, ought not too closely to be taken into account, as in some cases restrictive measures rigidly enforced, namely, to prevent river whist in other there might be a small loss, if that can be fairly called loss which is more than compensated by gain to the community at large. Some, as well as to pay for the means and appliances necessary to render sewage innocuous to running waters, as they can to pay for the sewers and drains which are necessary to their sanitary well-doing. We have expressed in this report that abuse and pollution of running waters are of wide extent and meet entire watersheds, so that it may be inferred that any local remedy must be capable of being applied as widely as the pollution extends. Some districts, grow if left unpolluted than others, as, for instance, the great woollen and worsted trades are established; these the abuses and pollutions of running waters have become a serious nuisance, and even trade is seriously injured in consequence. The long catalogue of pollutions and of floodings, as set forth in the evidence and in the appendix to this report, indicates the extent to which such abuses may further be allowed to be controlled. Every witness we examined admitted the existence of many great evils, and remedial measures are in the evidence over and over again suggested, the reiterated stipulations being, that such measures shall be as general as the trades to be affected by them, and that their enforcement shall be by Government authority."

On the sewerage of towns, and the application of the sewage to the soil, the Commissioners remark that the sewerage of towns is a complex question, and requires to be specially studied, so as to effect the greatest amount of good at the least risk of polluting water-courses. Natural streams, as small brooks, should not be arched over and formed into sewers, neither should rivers be made the receptacles of sewage. The largest proportion of rain-water may in all cases be turned over the surface into the natural streams: it will not be necessary to form duplicate systems of sewers and drains, but it will require intelligent and careful attention to preserve surface gradients and natural outlets for storm-waters, and where these have been tampered with, to restore and improve them. The sewers and drains of a town should provide for the removal of subsoil-water, the sloop and waste-water from houses, and the contents of waterclosets. These sewers and drains may have storm-overflows in connexion with natural streams of the district, so arranged as to prevent flooding of houses or bursting of these sewers during thunderstorms. All dry-weather sewage and moderate falls of rain as finds its way to the sewers will flow down with the sewage to the outlet, and be a manageable volume either to apply by gravity, or to be pumped to land for agricultural uses. The remark may be made that, when the sewers overflow, the streams will be polluted; this is true, but the pollution will be a minimum, the sewage will be in extreme dilution, and the natural streams of the district will be in flood, and most probably muddy by grit and silt washed in from road-surfaces, and by fine particles of soil from the banks and the surfaces of the land. Floods caused by heavy rains ever have been turbid, and ever will be turbid.

The only general rules applicable to sewage irrigation in all cases, they remark, are that the works should be simple and cheap. Land to be irrigated does not require costly work in shaping and levelling; neither need there be expensive tanks to receive and store sewage. Heavy clay land, which has been ridge-and-furrow ploughed, may have the surface brought to an uniform slope by lowering the ridges and filling in the furrows, so as to prevent sewage, when applied,

falling into each furrow as into a conduit, leaving the ridges comparatively bare. Such work may cost about 5l. per acre. Small fields may have needless hedges removed, so as to have larger areas at command. Under-draining may or may not be necessary; this must be settled after an examination of the subsoil to be dealt with. If under-draining be adopted, deep drains answer best, and these should be laid so as to extract water and admit air. Where the surface-conduits will allow of interception, sewage-water from drains may be turned on to the land three or four times with advantage and with a certainty of extracting more of the salts of sewage. Sewage meadows ought to be laid out on a plan similar to that adopted for water meadows. Carriers should contour the surface, at intervals apart, in proportion to the character of the soil and the slope of the surface. Where main open carriers may be considered a nuisance, as near houses, roads, or foot-walks, they may be covered conduits having cheap outlet-valves at a chain apart; carriers in the fields may be open grips formed with plough or spade, and such as to be broken up if necessary when a change of crop is made. A cheap main carrier can be formed with common agricultural drain tiles, hntT-jointed, laid half in and half out of the ground; a single pipe or length of pipes can then be removed by hand at any point to allow of irrigation, and these same pipes can be readily replaced again. Where foul smells are complained of as coming from sewage-irrigated lands the causes are in the state of the sewage and in the mode of using it. If old and putrid sewage is stored in large tanks, or is conveyed in large open ditches which are never cleaned, there will be offensive taint. Fresh sewage does not give off so offensive a taint, and if conveyed at once by covered conduits to land, all nuisance ceases immediately. Cast-iron piping and hose and jet application are costly to provide and expensive to manipulate. If they are adopted, some special reason must have been urged to warrant this form of extra outlay, as for lawns and fields near houses, or for gardens. The produce from properly irrigated land will be from five to tenfold that of the same land from ordinary cultivation. Sewage evenly and regularly applied to the growth of Italian rye-grass, on any soil, will produce from 30 to 60 tons weight of green grass on each statute acre per annum.

The celebrated Craigentun meadows near Edinburgh, principally sea sand, have produced from forty to sixty tons per annum to each acre, and let by auction at rents varying from 25l. to 35l. the acre. At South Norwood and at Worthing clay land out of which bricks are made is irrigated with town sewage, and produces from forty to fifty tons of Italian rye-grass to each acre. In neither case is the land underdrained; and Mr. Marriage, of Crofton, prefers to irrigate without draining. The respondents would by no means be understood to undervalue the advantage of draining clay lands in general. Sewage irrigation may be carried on throughout the entire year, and grass may be cut at Christmas. In early spring, and weeks before ordinary cultivation will produce green crops fit to cut, from four to five tons per acre may be got from sewage-land. At such times the grass sells at 15s. and 20s. per ton on the field. Six or seven crops of grass may be cut during the year.

It has been asserted that sewage-grown grass is unwholesome, and will not make good hay. The grass is, however, not only wholesome, according to the commissioners, but cows fed upon it give richer milk from which first-class butter may be made. The chemist proves by careful analysis that both milk and butter are better than samples produced from the same land in its ordinary state of meadow. Hay made from sewage-grown grass is also sweet and nutritious if properly got, but there is great difficulty in fully drying it during ordinary seasons.

The Leamington Congress papers have been prepared for the press by Mr. Hitchman, an extreme advocate for the earth-closet system which the Congress itself ignored, and which, as we have before said, however useful in country places, would become a horrible nuisance, and, indeed, utterly impracticable as a sanitary system, in towns, and worse than the abominable cesspool system which our towns have just been getting rid of, but which correspondents of the daily press would fain have us return to, because it is still carried on in one special form at Milan. A correspondent of the *Times*, Mr. Burchell, who rightly opposes the Milan scheme, points attention to the experiment at West Worthing. There, he remarks, the solid portion of the sewage,

which constitutes the real sullage, is separated from the water or fluid part before the soluble salts which are contained in the sullage are dissolved, and is then carried away without the slightest annoyance either in its removal from the sewers or in its cartage, and in a manner which renders it conveniently available for fertilizing purposes. We have already given particulars of the system in use here.

The process by which this is accomplished, and which has now been in operation for upwards of twelve months, consists in the use of closed portable filters, which are placed on the sewers in such manner as that the whole of the sewage rises and enters the filters from beneath, the solid portion deposits itself and is retained in a manure-box enclosed in the filter, and the fluid part passes through and is purified by the filtering medium. The filter is lifted daily from the sewer and immediately replaced by another. This operation is performed in the early morning, but it has frequently been done in the daytime; it occupies not more than from five to ten minutes, and, he says, does not occasion the slightest annoyance to the occupiers of the houses or to any casual passer by. The fluid or water which runs from the filter is found to be sufficiently pure to admit of its flowing at once into the sea.

TOWN SURVEYORS.

It has often been debated whether the town surveyors should have a private practice in addition to their remuneration from the local public treasury. What is necessary is, that a town surveyor should be independent of the caprices of the local authorities of towns, and of their cabals of private interests. Seeing this necessity our legislators have made it a law of the "Towns Improvement Clauses Act," that the appointment and removal of the surveyor, as well as the amount of his salary, shall be subject to the approval of the Home Secretary. This, it may easily be conceived, is obnoxious to some sort of members, and to some others who in all other things are reasonable but in those which have a colour of centralized authority.

The wisdom of the provision is profound; but that is not considered when the Bill of the Special Act is being framed, and in too many cases a clause in the Special Act excludes the application of this clause in the General Act. And the surveyors of those towns and cities in the local Acts of which the Act above mentioned is not incorporated at all are under the same disadvantage.

It is easy to cavil at this, and say that where a surveyor understands his duties and his position he will get on very well with the local authority, and he and the Corporation or Board, as it may be, will pull together and do their proper work without interference from any Secretary of State. That state of things happily exists in some places, but long experience proves that they are few in number and the practice exceptional.

The general state of things in this respect is that the surveyor, whatever his salary, for it is so where the salary is 1,000*l.* as well as where it is 100*l.*, finds himself under so many diverse influences that his natural inclination to be courteous induces him to lend an ear to all requirements, and so to become involved in the petty questions of the hour. The salaries paid are never liberal. Where they are large it is to men of good standing in the engineering profession that they are paid, and who would probably have earned by independent practice as much as, or more than, their salaries as surveyors; and of whom is required an amount of work in attending committees and preparing schemes for their approval, and after getting them approved carrying them out with such poor assistance as is afforded by the small salaries to clerks and assistants, that renders the salary, however apparently large, really a poor one, and only worth keeping because the recipient has got into a groove out of which he has not the courage to struggle; and, in fact, he becomes a mere drudge, swayed this way and that by the various committees and their separate interests. This being so with what might be called good salaries, how is it with small ones? The same with the difference that there is less of it in degree; but not in kind.

To those people who are unacquainted with the practice of municipal government it would seem an easy thing for the surveyor to have his duties defined, and, granting that he complied with them, to take things easily. But that,

often attempted, always results in disaster. The composition of municipal authorities—they must be taken as they are, and not as one would wish them to be—is such that unless the surveyor takes high ground no real improvement of the state of towns can be brought about. And it is emphatically the improvement of towns in respect of the health of the people that makes it so necessary that there should be surveyors at all. If it were the only object of the authorities to beautify the town architecturally they would do better by consulting an architect from time to time as their requirements might arise; if to improve the course of a river, to prevent or alleviate floods, if to build a bridge, if to do any work for the mere convenience of the inhabitants, they would have no difficulty in employing the proper engineer to do it for them. But it is because it is so necessary to employ an engineer continually from day to day to attend to the daily requirements of the inhabitants, that one is appointed as a permanent surveyor. The water supply of a town may be looked upon as a work extraneous to the surveyor's duties; so may, in some cases, the main drainage or sewerage; but neither of these works can be properly initiated and carried out without the intelligent co-operation of the resident surveyor. In the greater number of towns, however, of moderate size, these works are very properly undertaken by the surveyor himself. But it is when the great works of water-supply and sewerage are completed, that the more proper and daily work of the surveyor begins. It is when the houses are to be drained into the sewers, and how the house drainage is to be done, so as to render the outlay on the main sewers profitable, or them of any use whatever, that the efficient town surveyor shows himself; for it is a fact that very large sums of money have been spent, and the ratepayers heavily hardened in laying down sewers in towns that have not been at all proportionately benefited by them, for they have merely carried off more readily the rainfall, and that would have passed away in the greater number of cases by its old channels, or, at the best, might have been carried off by surface drains constructed at much less cost. The chief use of the sewer is to take away the house drainage,—the refuse organic matter,—from the proximity of dwelling-houses. Whether the rainfall also be turned into the sewers, is a question of economy, affected by the question, how is the sewage to be dealt with when carried to the outfall? This is one of the numerous considerations required of the town surveyor, which renders it necessary that he should possess an adequate knowledge of hydraulic engineering.

Seeing now the high qualities required to constitute a town surveyor, it is worth while to consider whether such qualities co-exist in the same individual in general with those lower ones which qualify the man for an easy agreement with the caprices of public bodies; or whether they are not rather such as are incompatible with it, and for that reason disadvantageous to the surveyor, whose tenancy of office depends entirely on the will of the body under whom he acts.

For these reasons it is very desirable that the town surveyor should be independent of that body to a degree sufficient to warrant him in pursuing the course that leads to the real improvement and the permanent prosperity of the town, and in doing something instead of dawdling his time away in the pursuit of the *l'avis fatuus* pleasing everybody. The surveyor often finds it the pleasantest way, and the way that pleases many of the constituted authorities, to do nothing, or only that which may be regularly ordered in proper form of minute and resolution of the Board or the council. But that is a delusion, and leads to disaster. Many members of almost every municipal body are elected for the sole purpose of preventing anything being done. "How not to do it," is the art they study, and too many are proficient in it. If our towns were in such a state that the people could live in them with any pleasure and ease, and not be called upon by nature continually to fight against the insidious poison that enters their bodies with every inspiration, and gives them unrest and disquietude, then, indeed, the gentleman who might get up in his place at the Board and resist mere wanton outlay of money to gratify the fancy of some of his townsmen, might be admirable and useful in his day; but it is the misfortune of these same gentlemen that they do not distinguish between a true and a false economy.

The true economy of the public money is to spend it freely on those things that enable the people to cheerfully return more into the treasury, and feel that they live in the town, and exist miserably in it. Our people are not afflicted with the fatal mistake that the poor Italians, they say, labour under, of suspecting the sanitary inspector to be a secret poisoner, and resist his interference to their own destruction. An English labourer knows well enough when he is in a good atmosphere, and when he is not; but his necessities compel him to endure great hardships and suffer cruel wrongs done to him by the very persons who are constituted by the law of the land his governors in the place in which he lives. Let him work in an atmosphere where he can breathe freely, and in one where he can pass his hours of rest in quietude and get up cheerfully in the morning to his work again, and he will not curse the collector of his rates and everybody and thing about him.

If that be true of the labourer it must be so also of the gentleman, for their ills and happiness in this respect are common.

It is an ascertained fact that, where the sanitary inspector has been able, by having had the drainage of the town previously well carried out, to supplement the uses of the drainage by careful and considerate operations and advice, to so instruct the poorer inhabitants of the town in the habits that conduce to their prosperity, they welcome him as their best friend, and he effectually prepares the way for the coming rate-collector. The result of it all is, that the registrar of deaths returns a continued diminution of deaths from preventible diseases every quarter, taking them generally and with consideration of the varying influences of the seasons of the year. It is evidently desirable that the town surveyor should be, to a certain degree, independent of the caprices of the local authority.

MONUMENTAL.

The large monument to Luther at Worms will not be inaugurated for a year. This composition by Heitschel consists of twelve statues, eight medallion portraits, thirty-four coats of arms, and twenty-two bas-reliefs!

The city of Liège, with the concurrence of the Belgic Government, is about to raise a monument to Charlemagne. The *Revue Artistique* says the monument will include an equestrian statue of the monarch, and six statues representing principal persons belonging to the Carolingian family. All the statues will be of bronze.

A monument of the Empress Catherine II., which was to have been placed at Tsarskoe-Sélo, is now ordered to be erected in St. Petersburg. The site chosen is in the centre of the square partly formed by the Alexandra Theatre and the Public Library. The figure, which is rather over life-size, stands on a pedestal containing bas-reliefs. The artist was Mr. Mikéchine, of St. Petersburg.

FONT, ST. THOMAS'S CHURCH, DUDLEY.

The font which we illustrate is at present in the French Exhibition, at the close of which it will be set up in St. Thomas's Church, Dudley. It was commissioned by the Earl of Dudley, and is one of many magnificent gifts which the Earl has made to that town and neighbourhood. The style of the font and cover is late fourteenth century, and is intended to harmonize with that of the church it will enrich. The total height is about 10 ft. The font is executed in Gann stone, and contains sculptured representations of the Baptism of our Lord, "Suffer Little Children, &c.," the Presentation in the Temple, and the Baptism of the Eunuch. At the angles are the four evangelists; and in niches between these are angels, with instruments of praise. The ornamental details, together with those on the oak cover, are rich and carefully executed. The sculptor was Mr. Forsyth. Mr. E. Blore, F.S.A., gave his assistance in the architectural design.

TOWN SURVEYOR FOR HARRGATE.—At an adjourned meeting of the Harrgate Improvement Commission, held on the 9th inst., Mr. J. Richardson, C.E., Assistant Surveyor of Leeds, was elected surveyor for that town.

FONT, ST. THOMAS'S CHURCH, DUDLEY.

ST. ANDREW'S, HAVERSTOCK HILL, LONDON.—MR. CHAS. F. HAYWARD, ARCHITECT.

Plan.

**ST. ANDREW'S, HAYERSTOCK-HILL,
ST. PANCRAS.**

The first designs for the Church of St. Andrew, Haverstock-hill, were matured by the architect as long as ten years ago, but since this time many disappointments have been met with, first in failures to procure an appropriate site, and then to raise sufficient funds to warrant commencing anything beyond a temporary church to be converted into schools, as soon as the permanent building could be erected. Indeed, owing to the poverty of the now district, as the wants increased, so seemed the prospect of supplying them to diminish, till at last some generous but anonymous donor, placed a sum at the disposal of the committee of the Bishop of London's fund sufficient to carry out one work, and St. Andrew's pressing claims were allowed the precedence, on condition of the plans being modified to come within the amount of 4,500l. Thus the architect's ideas were controlled by the strictest economy, as the amount of accommodation to be afforded was fixed at the utmost limit such a sum could be properly considered to permit with any hope of making a good substantial building, and one worthy in any degree of the objects to which it was to be dedicated.

The design resulting is a large building, containing nearly all the seats under one roof, the aisles being narrowed to mere passageways, and the transepts being shallow. Provision is added for a future western gallery if ever required. Internal effect has been chiefly aimed at, and the simplicity of roofing has been relied upon for giving dignity to an otherwise low-looking building, the total height being about 48 ft. from floor to ridge. The pulpit, reading-desk, and seats are carefully wrought in Plymouth marble, and the *tout ensemble* of the interior is more striking than could be expected. The brickwork is common grey stock, with Malm dressings, and the same is used also for the interior, stone columns alternating with piers of brickwork. The contract was carried out by Messrs. Dove, Mr. Charles F. Hayward being the architect engaged.

**WAGES OF BRICKLAYERS' LABOURERS
IN AMERICA, AND IRISH
EMIGRATION.**

THERE has recently been a strike among the labourers of the building trade in New York. The wages were enormously high before, in proportion to those ruling on this side of the Atlantic; but the ultimatum of the men last on strike was 21 dollars per week for 60 hours' work,—that is to say, six days' work of ten hours, with one hour and a half meal-time out of the ten hours. Taking the dollar at 4s. 4d., this would give 4l. 11s. per week, or 236l. 12s. per annum,—being something like treble the salary of a junior clerk in the English Civil Service, or of an ordinary curate of the Church of England. If the expense of living in New York were in proportion to this scale of wages, the apparently (but in that case not really) high rate of wages would be naturally accounted for; but such is not the case in America. An Irish labourer with his family knows how to live in New York very nearly as cheaply as in London, and that his present rate of wages leaves him a very large balance over and above his necessary expenses, even allowing for a little extra indulgence in drink. These facts are at once sufficient to explain the remittances continually received in Ireland from friends and relatives in America, to enable them to emigrate to the land of promise, and fully accounts for the exodus which is now taking place, without the necessity of referring it to the "hard terms of grinding landlords," or to the dread of another potato famine. The fact that 12s. a week at home, are exchanged for 91s. a week in America, at a cost of less than 4l. for a fortnight's passage, sufficiently explains the rapidity and earnestness of the rate of emigration, without their seeking for causes, especially when it is given into consideration that the 4l. necessary for the voyage is generally furnished by friends already in America to those who cannot raise it alone.

It may be well to inquire whether the labourers obtain this high rate of wages make a lever to their savings to lift them into a higher position, as skilled artisans, or small landowners. An unsatisfactory answer is, that if in nineteen cases out of twenty they do not succeed in raising themselves, they are often thrifty, and succeed

in hoarding considerable sums of money; but the great bulk, from the present fearfully defective system of education in Ireland, can neither read nor write, and the consequence is, that their extreme ignorance prevents them from bettering their social position: so that even when possessing some hundreds of pounds of honestly-earned and thriftily-saved money, they continue to be hod-men and mortar-makers, without the slightest hope of improving their status in society. It is from this class that immense sums have been obtained by designing men in the mistaken while in the receipt of this exceptionally high rate of wages, that the Irish labourer in America is continually enabled to command a still higher rate by means of systematic strikes—as he is well able to afford a six weeks' or even a six months' strike, if necessary, without inconvenience to himself,—while he well knows the vital importance of labour-power to his employer, in a country where every kind of labour is so scarce, and where, especially, the hardy muscular frame and cheerful disposition of the Irish peasant are fully appreciated.

How it is, with continual strikes, combined with this extremely high rate of wages, that the building business of New York can be carried on, appears a mystery; the more especially as these seeming impediments do not for a moment interfere with the general activity of the business, as important lines of buildings, and immense detached warehouses, hotels, and private houses are springing up every day, in every quarter of the city. The explanation may, perhaps, be found in the present value of house property in the great American cities. I get my information on this point from *The Philadelphia Inquirer* of the 8th ult., in the advertisements for the sale or purchase of houses. These advertisements might be difficult to find in the immense mass of announcements of various forms which fill a leading American journal, but for the simple though ingenious method adopted of placing a small wooden of a house, about 4 in. square, at the head of each advertisement connected with house property, which at once attracts the eye of the seller or purchaser of houses, and saves much hunting among hundreds of other advertisements. At the head of the list figures, "A very desirable large residence in Logan-square," the price of which is announced as 25,000 dollars; this is, upwards of 5,000l. Now, if that same large residence be about the size of the houses in Princes-square or Leicester-square, Bayswater, the price obtainable by the builder is more than double the present market price of houses in those English localities, and probably more than what the actual builders sold them for in the first instance; a fact which at once explains how American builders can afford to pay their labourers four guineas a week. But the reader may say, it is possible that the house in Logan-square, Philadelphia, is more like the houses about Lancaster-gate, Hyde Park; yet, that is scarcely an answer, because, except in some parts of Paris, there can be no other site in the world of equal value to the frontage to Hyde Park, and it is the prestige and value of that situation that makes the houses alluded to worth from 5,000l. to 6,000l. and upwards—a matter which has nothing to do with the builder's legitimate profit, except when he has been a land speculator as well.

But it is not at all probable that the house in Logan-square is at all equal to the Lancaster-gate houses, as we shall see; for instance, a house somewhat more of that character is also advertised as "an elegant cast stone mansion, with 40 ft. front, on Chestnut-street, West Philadelphia," the price of which is stated at 30,000 dollars. It is true that the garden is 240 ft. deep at the back; but, then, West Philadelphia is a suburb, and the site, whether small or large, would not form an important item in the total value, which is equal to nearly 6,000 guineas, and is consequently, in proportion to English prices, most excessively high. That neither of the houses mentioned is, in fact, a very large house, may be inferred from the prices set on smaller residences, the dimensions of which are accurately defined. For instance, "a new dwelling with ten rooms" equivalent to our ordinary ten-roomed house, which sells at our ordinary price, is priced at 9,550 dollars, or nearly 2,000l. There is evidently, then, a good margin out of which the American builder can pay very high wages to his labourers; though, certainly, the rates mentioned above appear remarkably high, even considering the present value of building property in the States. H. N. H.

**SOUTH HAYLING, HAMPSHIRE.
COMPETITION.**

As we suspected would be the case, the plan for making the competitors themselves select the best designs would not work satisfactorily on the 7th instant, and it was agreed to refer the selection to Mr. Longcroft, solicitor, who had been named in the particulars referee in the event of difference. That gentleman accordingly awarded the first premium to Mr. A. Gordon Hennell, Chancery-lane; the second to Mr. Crickmay, Weymouth; and the third to Mr. Milne, Sydenham. Mr. Fuller handed the premiums to them, and afterwards entertained the competitors who were present. When drinking the health of the unsuccessful competitors, Mr. Longcroft expressed a wish to couple with that least honourable mention of two designs of great merit, "We hide our Time" (Mr. J. H. Metcalfe, architect, London, and Mr. Manrice Young, landscape gardener, Godalming, Surrey), and "Live and let Live," (Mr. Whitaker, Westminster) to which, of course, the representatives of each responded, and the proceedings then terminated.

It has been for some time past in contemplation to connect Hayling Island with Southsea and Portsmouth by a steam floating-bridge, in substitution of the existing ferry. This long talked-of matter would, however, be unnecessary, if we were all as independent as an Australian gentleman who visited Southsea a last week. This gentleman having read a vivid description of the natural beauty of Hayling, was determined to visit the island, which he knew was only separated from Cumberland Fort and the neighbourhood by a narrow channel,—the entrance to Langstone Harbour. Walking to this channel, he found on his arrival that the ferryman was absent, and he therefore took off his clothes, strapped them on his back, and swam across,—a feat which any one acquainted with the force of the tide at this spot will readily appreciate. How much longer will the local authorities remain insensible to the necessity of improving the communication, and realizing the profit which a steam-bridge could not fail to produce?

We believe that Mr. Hennell, who obtained this first premium, will be asked to advise as to the realisation of his plans; and it will be seen by an advertisement in another column that designs are in preparation for the immediate erection of another hotel at Hayling, the contract for which is to be put up to public tender. The capabilities of Hayling as a watering-place were dwelt upon by Mr. Longcroft at the meeting, and if judiciously managed, and with a liberal expenditure of capital, the property may prove a satisfactory and lucrative investment.

**TRADES' UNIONS AND ANTI-TRADES'
UNIONS.**

THERE are trades' union worthies at Manchester who are quite a match for those of Sheffield. The Trades' Union Commissioners are now at work among the brick-making fraternity, and the confessions of fire raisings, hamstringing horses, explosions, shootings, breaking bones, and murdering, not to speak of needling clay, and wholesale destruction of bricks and other property, are as hideous as anything which came out in the revelations of villainy at Sheffield. The method of the Commission is clearly a most effectual one for compelling the murderers and incendiaries to confess their diabolical deeds: the only pity is that this very confession secures them against the punishment they so richly deserve. It is needless going into the details: they all come to just what we have stated. The officers of the commission have been more than once frustrated in their attempts to get at the authorised doings of unions as regards the expenditure of blood-money, or money for breaking human bones, fire-raising, or exploding infernal machines in workmen's dwellings and amongst their wives and children. On the fifth day of their proceedings, however, the chairman at the opening of the court, said he wished to make an announcement publicly. The ex-commissioners had got in their possession the box belonging to the Manchester Brickmakers' Union. It could only be opened by several keys, which they were told by the witnesses were in the possession of certain members of the society. He would now give notice that if those who had

got these keys chose to come forward and attend the court by ten o'clock on Wednesday morning, and have the box opened in that way, well and good; but the examiners would certainly get access to the box; and if, after this notice, no key was forthcoming, they would have the box broken open. There was plenty of time for this communication to go forth to the proper quarters, and the examiners were determined to do as he had stated. No one came forward, however, with the keys at the time appointed.

The Leeds master builders have laid a statement of their views before the Trades' Union Commission and the public, in which they first of all express a desire to recognise and adopt the following principles:—

1. 'Free trade in labour.' Every workman has the right to sell, and every employer to purchase his labour on such terms as they mutually agree upon. Labour should form no exception to the law of free trade, which is sufficient to regulate the price of all other commodities. 2. The high or low rate of wages depends not upon the price of provisions, but on the demand and supply of labour. When many labourers are looking out for work wages will fall, and they will rise when many employers are looking out for labourers. 3. That all combinations, whether of workmen to force up or employers to keep down the price of labour, are injurious and should cease, because they interfere with the natural price of the production of labour.

Defining "labour as it should be," they say that if these principles be correct, and were carried out, then it follows that every workman would be at liberty:—

1st. To work without joining any combination or union for such wages as he demands for his labour at the time enabled him to obtain from an employer. 2nd. To work any number of hours which his desires or necessities led him to undertake. 3rd. To work at any kind of employment within the result of all his skill and experience, which was at the time in greatest demand, although differing from his own particular branch of trade. 4th. To work piece or contract work, and by so doing increase, in proportion to his skill and industry, his weekly earnings, and share with his employer the profits of his labour. 5th. To embrace any opportunity for improving his individual position, or of obtaining increased remuneration for his services. The result of all this would be:—6th. That each workman would find his own level. The skilful and industrious would merit and receive his just reward, while the incompetent and idle would be left in the rear. A greater amount of work would be done in the same time, and at less cost, and thus the wealth and prosperity of the country be greatly increased.

Describing "labour as it is," the masters say that the working of trades' unions has brought about results the reverse of the above, for by their rules neither employer nor workman can be free agents. They then sum up the restrictions which are imposed by the unions.

The results of these restrictions, the masters say, in conclusion, are disastrous alike to the artisan, the employer, and the country. The use of machinery is frequently prohibited; or, when large sums have been invested in it, it may at any time be laid idle and unproductive by a sudden strike of the operatives. The employer is thus prevented from calculating with certainty the cost of his productions, is liable for broken contracts, and subject to most serious losses. What is a loss to the artisan and his employer, the Leeds masters add, cannot but be a loss to the country. Apart from the more violent outrages of trades' unionists, from which Leeds seems happily to have been free, the Leeds masters have in this statement furnished the Commission with a compendious statement of the whole case, the heads of which embrace most of the illustrations that have been adduced and the general views that have been expressed by employers and their representatives during this inquiry.

The audacity and revengeful feeling, though not violence, exercised against masters, even at Leeds, by trades' unions may be judged of by the fact, that a master hatter, Mr. Branton, has been denied "for life" the privilege of employing union men. Another, Mr. Barker, had his business suspended for two years, because he employed non-union men.

Sir Daniel Gooch, M.P., one of the Trades' Union Commissioners, who is also one of the members for the borough of Cricklade, presided at the annual dinner of the Foresters' Court, at New Swindon. The society, which comprises several hundreds, is composed almost entirely of working men connected with the Great Western Company's locomotive works at Swindon. The hon. baronet, who commenced life as a working man—a fact to which he has before alluded,—in responding to the toast of his health, said,—

"A little less than two years ago they had conferred upon him the honour of permitting him to enter the society. As one of the members of the Royal Commission appointed to inquire into the system of trades' unions, he had had to turn his attention very particularly to the effects of these upon society and the working classes. The revelations that had been made before the Commission respecting the outrages committed at Sheffield were not,

as it would appear, confined to Sheffield. Scarcely less serious or mysterious were those which had taken place in the neighbourhood of Manchester. In fact, it seemed to be a part of a system. Men, for instance, had come forward—men holding influential positions in trades' unions, and stated before the Commission that it was monstrous that one man should be paid better than another; that intelligence, skill, industry, should go for nothing; and that the levelling system should prevail which made every man alike, whether deserving or undeserving, and quite sure that no one here would maintain any such doctrine. What was the great charm of England? It was this, that any man, no matter what or who he was, by industry, perseverance, and merit, might rise to the highest station in the land? Could that be done by any levelling system? He hoped the working classes would look upon this matter as of far more importance to this country than even the question of reform, for it had to deal both with them and with the capitalists—the lovers of trade."

Twelve months since a contest arose among the miners and ironworkers of Staveley as to whether trades' unionism or the principle of free labour should prevail, and the result has been that the non-unionists have succeeded in conquering their opponents. This new state of things has been brought about in a great measure by the firmness of Mr. Markham, managing director of the Staveley Coal and Iron Company. The workmen, to mark their sense of the benefits, both pecuniary and social, which they have received through the efforts of Mr. Markham, have subscribed together and purchased a testimonial, which has just been presented to him in the presence of a very large and influential gathering of miners and employers of labour. The testimonial consists of a silver claret-jug and waiter, and an inkstand. The cost of the testimonial has been upwards of 53*l.*, the subscribers being limited to 6*d.*, from working men only. The claret-jug, which was chased, bore the inscription:—

"Presented to Chas. Markham, esq. by 2,566 of the workmen of the Staveley Coal and Iron Company, Limited, in grateful acknowledgment of the zeal and ability displayed by him in vindicating the rights of the workmen to freedom of labour, by his action against the oppression of trades' unions, and also in appreciation of his uniform kindness to his workpeople. August, 1867."

Alongside this movement for the presentation of a testimonial to Mr. Markham, there has been another to the establishment of a Mechanics' Institution in the lecture-hall of the Workmen's Dining-hall at Barrow-wood. In furtherance of the latter movement, a tea party was arranged to come off previously to the presentation. A large number partook of tea in a tent near the dining-hall. The party afterwards adjourned to the Staveley Works' School-room, which was soon densely packed with workmen and visitors. The chair was taken by Mr. B. Whitworth, M.P. for Drogheda, one of the directors of the Staveley Company. Among the visitors on the platform were the Duke of Devonshire, Mr. W. Jackson, M.P., Mr. Allport (general manager of the Midland Railway Company), and various other influential gentlemen.

THE NEW HOURS OF LABOUR BILL.

The Act for regulating the hours of labour for children, young persons, and women employed in workshops, and for other purposes relating thereto, enacts that—"Child" shall mean a child under the age of 13 years; "young person" shall mean a person of the age of 13 years and under the age of 18 years; "woman" shall mean a female of the age of 18 years or upwards; "parent" shall mean parent, guardian, or person having the custody of or control over any such child or young person; "employed" shall mean occupied in any handicraft, whether for wages or not, under a master or under a parent as herein defined; "handicraft" shall mean any manual labour exercised by way of trade or for purposes of gain in or incidental to the making any article or part of an article, or in or incidental to the altering, repairing, ornamenting, finishing, or otherwise adapting for sale any article; "workshop" shall mean any room or place whatever, whether in the open air or under cover, in which any handicraft is carried on by any child, young person, or woman, and to which and over which the person by whom such child, young person, or woman is employed has the right of access and control; "the court" shall include any justice or justices, sheriff or sheriff substitute, magistrate or magistrates, to whom jurisdiction is given by this Act. This Act shall not apply (1) to any factory, or part of a factory, or other place subject to the jurisdiction of the inspectors of factories, in pursuance of any Act of Parliament already passed, or which shall be passed during this present session of Parliament. (2) To any bakehouse as defined by the Bakehouse Regulation Act, 1863.

No child under the age of 8 years shall be employed in any handicraft. No child shall be employed on any one day in any handicraft for a period of more than 6½ hours, and such employment shall take place between the hours of six in the morning and eight at night. No young person or woman shall be employed in any handicraft during any period of 24 hours for more than 12 hours, with intervening periods for taking meals and rest amounting in the whole to not less than 1½ hour, and such employment shall take place only between the hours of five in the morning and nine at night. No child, young person, or woman shall be employed in any handicraft on Sunday, or after two o'clock on Saturday afternoon, except in any workshop not more than five persons are employed in the same establishment, and where such employment consists in making articles to be sold by retail on the premises, or in

repairing articles of a like nature to those sold by retail on the premises. No child under the age of 11 years shall be employed in grinding, in the metal trades, or in finishing cutting.

If any child, young person, or woman is employed in contravention of this Act, the following consequences shall ensue:—First, the occupier of the workshop in which such child, young person, or woman is employed shall be liable to a penalty of not more than 3*l.* Second, the parent or the person deriving any direct benefit from the labour of having the control over the child, young person, or woman shall be liable to a penalty of not more than 20*s.* unless it appears to the court before whom the complaint is heard that the offence has been committed without the consent, connivance, or wilful default of the parent or person so benefited or having such control.

In every workshop where grinding, glazing, or polishing is carried on, or any superintendant of a workshop, or any dust is generated and inhaled by the workmen to an injurious extent, it shall be lawful for the local authority or the inspector of factories to require a fan or other mechanical means as may from time to time be approved by one of Her Majesty's Principal Secretaries of State under the provisions of the Factory Acts, to be provided for the occupier of the workshop within a reasonable time, under a penalty not exceeding 10*l.* nor less than 5*l.*

If, on the complaint of any officer of health, inspector of nuisances, or other officer appointed by a local authority, or if, on the complaint of any police officer, it appears to the justice of the peace that there is reasonable cause for believing that any of the provisions of this Act or of the Sanitary Act, 1866, are contravened in any workshop, the occupier of the workshop shall be liable to a penalty to empower the complainant to enter into such workshop at any time within 48 hours from the date of such order, and to examine such workshop; and any person who, after being so examined, touches any matter within the provisions of this Act or of the Sanitary Act, 1866, so far as relates to such workshop, any person whom he finds in such workshop. Any person refusing admission to an officer so empowered, or obstructing him in the discharge of his duty, shall for each offence incur a penalty not exceeding 2*l.*

Under penalties against employers and parents, every child who is employed in a workshop shall attend school for at least ten hours in every week during the whole of which he is so employed.

Some of the schedules appended to the Act relate to temporary and permanent exceptions to its enactments, and to its application to England and Wales, Scotland, and Ireland.

NUMEROUS CASUALTIES FROM LIGHTNING.

The reports of deaths and injuries to persons and property during the late thunder-storms throughout the country are unprecedented, at least in our recollection. At Ibury, near Banbury, one man was killed in a rickyard, and another man and a boy seriously injured. At West Bronwich, a man was killed in his cottage. At Oxhey, in Saddleworth, a man was struck and killed while travelling along with an electric machine on his back. Near Knighton, in Salop, a farm labourer was killed while on a ladder and his son struck, but not injured. At Penegoes, near Mynyddueth, the lightning passed down chimney and killed another farm labourer: his wife was struck, but not seriously injured; a pig and a duck were killed in the yard, and five others shattered. Two children were killed, and five others injured, at Smallburgh, in a school-room, while about to go to church: the bell-turret was first struck. At Exeter Ross, a man and horse were killed in a field. Lightning ran through a house at Heath Town, Wolverhampton, doing damage, but not injuring any of the family of a spindle-maker who were in the house at the time. A valuable horse was killed near a place called Whitehall, and another nearly killed. Rails on a branch of the Bolton Railway were torn up for some distance, the stump of a tree smashed, and a horse killed. Near Bonolo in Haute Garonne, a man was killed by a fall of fire, and various others stunned. The *Giornale d'Udine* relates that a thunderbolt fell on the church of Anfagnano, in the district of Palmo. Four women were killed on the spot; and seventeen other persons experienced violent shocks, and were more or less injured. At Boxford a farmhouse chimney was struck and the house extensively damaged, a duck killed, and a man hurt. At Wombwell Mill, colliery a cottage chimney was struck, and three shivered. The railway station at Wigton was set on fire through the telegraph wires and lead gas pipes conducting the electricity, melting the pipes, and then setting fire to the gas. The flames were got under before much damage was done. At Kirkaldy, in Scotland, the lightning struck the stalk of Messrs. Brown's engine works, and rent it from top to bottom. The roofs of the workshops suffered very much from the falling of the bricks. The church at St. Fés-Saint-Simon, France, has been greatly injured by lightning, which struck the clock tower and, although leaving the bell hanging, rent the foundation: descending into the church, it set on fire the flooring, destroyed the windows and several paintings, flattened a tin vessel on the altar, and drove in the door of the tabernacle.

thence it went to the side altar and mutilated a figure of the Virgin. The edifice has been so much injured as to be no longer fit for divine worship. At Sanzet (Lot) the wife of the bell-ringer and her son had ascended to the church tower to toll the bells, in accordance with a belief very general among the peasantry there, that by doing so the effects of the lightning might be neutralised. They had scarcely commenced when the building was struck, and the woman killed on the spot. The son escaped uninjured. The timber work of the helly was set on fire, but the flames were extinguished before any serious damage had been done.

FROM SCOTLAND.

Edinburgh.—The town-council, as improvement commissioners, have met, under the presidency of Lord Provost Chambers, who said he trusted the Act would be carried out gradually, and only piece by piece. His feeling, he said, was that they should proceed, in the first place, only to the carrying out of two streets, leaving others to be judged of afterwards, as circumstances arise. He referred to the street in Market-street to the top of Leith-wynd, and the street widening North College-street. He left to his successors in office to initiate anything more than that. These streets would not displace a large number of the poor classes of the inhabitants, and, besides, they would be very useful. There was at present a great demand for sites for houses of the better class, connected with manufactures and trade. Their first duty was to appoint an *interim* clerk, to put the Act into operation; and he would venture to suggest that they should invite Mr. Marwick, city clerk, to take the work. The next thing was to appoint a collector, and he would suggest that the collector of police should be appointed for the duty. A committee should also be appointed, and he would simply name the Lord Provost's committee, to serve under the City Improvements Act. Bailie Handyside seconded the proposals of the Lord Provost; and Mr. Marwick was appointed *interim* clerk.

Glasgow.—Contracts are about to be taken for the removal of the present Hutchesonston Bridge and the construction of a new one. Besides the insecurity caused by undermining from the great alteration on the bed of the river, there were other reasons which rendered it desirable that a more convenient and commodious bridge should be erected. The chief of these were the narrowness of the roadway and the steepness of the bridge and approaches. In the new structure the steep approaches will be done away with. The spacious roadway of the bridge will be practically level, the gradient not being more than 1 in 70. The architectural character of the work will be entirely different from that of the other bridges which span the Clyde at Glasgow, as it will be chiefly constructed of iron. The bridge will measure 40 ft. in length and 60 ft. in breadth, and will comprise three spans, the centre one being 114 ft. and the side ones 108 ft. In order to guard against the dangerous effects of alteration in the river beds, the piers and abutments will be founded on cast-iron cylinders, each 10 ft. diameter, going right through the alluvial bed of the stream to the hard substratum of shale covering the coal measures, a depth of about 86 ft. below low water. These cylinders will be filled with hydraulic concrete, forming columns of artificial stone, to about 15 ft. from low-water mark, after which they will be filled in with solid masonry. Above the low-water level the piers and abutments will be built of white granite, with the exception of the shaft of the central piers, which will be of red polished granite, surmounted by enriched capitals. The abutment piers will be carried up 11 ft. above the roadway, forming massive rectangular towers flanking each side of the entrances to the bridge. These towers and the pedestals of the piers will be surmounted by standards of a rich design, bearing each a cluster of three globular gas-lamps. Circular recesses are left in the outside elevations of the towers for the reception of large medallion busts, in marble or bronze, as shall afterwards be decided; and the elevations of the towers and pedestals next the roadway will be filled in with panels of red polished granite. The towers will be ornamented by a bold cornice, and will harmonize with the massive architecture of the adjacent court-houses. The arches connecting the piers

will be of wrought-iron, of a slightly elliptical form. They will be relieved with ornamental cast-iron work. The ironwork will be painted and decorated in harmony with the general style; and the armorial shields, lamps, standards, and bosses of consoles will be bronzed and relieved with gilding. The bridge is to be completed in two years. The engineers are Messrs. Bell & Miller.

Hamilton.—The Combination Poor-house, erected for the accommodation of the parishes of Avondale, Blantyre, Cambuslang, Dalsert, Glassford, Hamilton, East Kilbride, and Stonehouse, has just been opened for the reception of inmates. The building, which is in the Elizabethan style of architecture, has been in progress for upwards of two years, and occupies a site granted by the hurch of Hamilton, near the cavalry barracks, in Bothwell-road. The ground on which the poor-house is erected, with its surroundings, is about six acres in extent. There is accommodation for 170 inmates, for all of whom single beds are provided. There are besides three dormitories, giving additional accommodation for thirty-four boys and girls. The shares in the poor-house are divided according to the necessities of the different parishes. The dining-hall and chapel, measuring 40 ft. by 22 ft., forms a division between the two sexes, and is convenient to both. The interior of the house is abundantly supplied with lavatories and bath-rooms, and all the apartments are thoroughly lighted and ventilated. The heating of the building is effected on approved methods. The ceilings are lofty, the height of the one above ground-floor being 11 ft. 3 in.; above upper floor, 11 ft.; and above attic floor, 9 ft.; while the cubic feet of space allowed to each inmate is said to be slightly above the maximum amount allowed by the Board of Supervision. The drainage of the poor-house is also said to be effective. The designs of the building were prepared and carried out by Mr. J. Graham Peat, architect, Hamilton. The estimated cost of the work was 5,500*l.*, or at the rate of 32*l.* 7*s.* for each pauper inmate.

Wick.—The British Fishery Society, who are proprietors of Pultneytown, on the south shore of Wick Bay, are engaged in constructing a new harbour on a large scale, from the designs of Messrs. Stevenson, of Edinburgh, in the Bay of Wick, well known for its extensive fisheries of 1,000 boats, and also for its stormy seas. This work has now been going on for some years, but, owing to the great depth of water in which the breakwater is founded (being about 30 ft. at low water), and the interruption to the work in consequence of the heavy seas raised by easterly winds, the progress is slow, being only about 200 ft. per annum. The contractors are Messrs. A. & K. Macdonald, of Glasgow. This work will extend for a distance of 1,500 ft. into the Bay of Wick. It is proceeding satisfactorily, and, although as yet only about half finished, already shelters a considerable portion of the bay.

RAILWAY MATTERS.

The extension line of the Midland Railway Company has been opened from Bedford to London. The goods terminus of the company at Agar Town, into which the line runs, has been for some time in use, but hitherto it has been worked by a branch from the Great Northern, by means of which system the Midland line is now in communication with the metropolis from Hitchin. At present this extension will be employed only for the goods and merchandise traffic, the passenger and mineral traffic being as before carried on at the stations of the Great Northern at King's Cross. Since the completion of the Midland to Bedford, the Great Northern have received tolls for the traffic put upon their line at Hitchin to the amount of about 60,000*l.* a year. By the arrangement which exists between the two companies the agreement could not be terminated except upon seven years' notice. When the Midland had obtained its parliamentary powers in 1864 the requisite notice was given, and this will expire in 1871, the Great Northern receiving until that date a minimum of 20,000*l.* a year in the shape of tolls, which will continue to be earned by the goods and minerals which will still be put upon the line until the terminal passenger station is completed in the New-road. The works for this station are being pushed vigorously forward, but the building, with the large hotel adjoining, will probably not be completed for twelve months.

A large new station has been opened on the North London Railway, in Lee-street, Kingsland-road. The new Haggerston Station commands that neighbourhood, and also the Downham-road and De Beauvoir Town, which places are situated too far off from the Dalston Junction to profit by the latter. The new station, while proving a great accommodation to a numerous colony of clerks and others resident in the suburb of Kingsland, will be a convenient point for Kingsland passengers requiring to reach the west-end of London.

The North-Eastern Railway Company have just completed the Hutton Viaduct, formed of iron girders and masonry. The trains run upon the girders, instead of between them.

Mr. C. W. Dixon, C.E., of Wakefield, and of Wickham Market, Suffolk, has just patented an elastic compensating wheel for facilitating the rounding of curves and preventing vibration and shaking. It is said this invention will cause a great saving to railway companies in the item of wear and tear.

PENZANCE PUBLIC BUILDINGS.

A LARGE pile of buildings in Penzance, of which we have before spoken, has been inaugurated. The architect is Mr. John Matthews, the town surveyor. The front elevation is in the Italian style of architecture, and is composed of a centre and two wings, each of which projects about 15 ft. The entire length of this elevation is 135 ft.; it is raised 3 ft. above the road, and is 52 ft. in height. The basement is composed of rusticated work, extending along the whole front. The chief floor is approached by a flight of steps, eleven in number, each 21 ft. wide, leading to a granite terrace 68 ft. long by 13 ft. wide. On this terrace are the principal entrances. The central entrance consists of an arched doorway, having on each side two massive three-quartered coupled columns of the Roman Doric order, with moulded entablature in full. These four columns are each cut from one piece of granite, and are 14½ ft. high, with moulded caps and bases in solid granite. The whole of the front elevation is executed in massive white granite from Messrs. Freeman's quarries at Lamorna.

The eastern elevation is 122 ft. long, 56 ft. high, and consists of three blocks, a centre, and two wings. In this elevation the dressings are of Lamorna granite, and the filling-in is of granite from Chun Castle quarries. This latter is of brownish tint.

The central portion of the buildings is entirely the property of the Penzance Public Buildings Company (Limited). Inside the principal entrance on the terrace is a handsome vestibule of 18 ft. by 17 ft., laid with castile tiles in an ornamental design. From this vestibule open on the right and left the reading-rooms of the Penzance Institute and the Gentlemen's News-room. Massive chandeliers hang from the ceilings of each room. The institute room is furnished by Mr. William Bennetts, builder, of Penzance. The fittings in the library are designed by Mr. Matthews, and executed in Archaic deal by Mr. Bennetts. A light projecting gallery runs round three sides of the room, to afford access to the upper lines of shelving. Five bays are erected in the room, each 8 ft. deep, and 8 ft. wide, which will receive six leather-covered tables for the use of members. Over the chimney-piece at each end of the room are arches with fretwork, to receive the portraits of the late Mr. Joseph Carne, and the late Mr. Foxell. The length of the whole of the shelving in the room is 2,408 ft.

The large hall, the crowning feature of the building, is 80 ft. in length, 40 ft. in width, and 40 ft. in height, from the floor to the crown of the ceiling. It is lighted by fifteen large windows. The ceiling is elliptical in shape, and is divided into seven compartments by moulded perforated arches. From each arch are suspended five star-shaped gas-burners. The organ is placed at the south end of the hall, in a large arch-headed recess. The organ is decorated in gold, on grey, neutral-tinted green, and brown ground. Around the organ is an orchestra and platform calculated to accommodate a chorus of 120 persons. On each side and at the north end of the room is a balcony projecting about 7 ft., supported by iron cantilevers with front balustrades. At the north end and at the back of the balcony is a gallery to hold 185 persons. The body of the room will seat 650 persons, making a total of 1,045 persons who can be comfortably seated. The ground

floor has three wide entrances with folding doors, also entrances to both balcony and gallery by staircases on the right. Just below the entrance to the balcony of the large hall are the Masonic Hall and ante-room, lighted from east and south. Ascending a flight of stairs a room is seen, intended as the museum of the Penzance Natural History and Antiquarian Society, 34 ft. long, 27 ft. wide, and 17 ft. high. The eastern wing is the property of the Penzance Town Council. The council chamber is 28 ft. long, 20 ft. wide, and 18 ft. high.

To the north of the committee-room is the Guildhall, which is 47 ft. long, 31 ft. wide, and 21 ft. high. It has a paneled ceiling, and is lighted by four star-lights of twelve jets each. The entrance to the Guildhall for all officials is the principal entrance, while suitors and the public enter at the northern end. About 400 persons may be seated in the hall. Over the Guildhall are commodious offices for officials of the town council, local board of health, and for other borough purposes.

The western wing is the property of the Royal Geological Society of Cornwall. The principal entrance leads into the fossil museum of the Society, a room of 28 ft. by 27 ft., and 16 ft. high. The geological museum is 50 ft. long, 28 ft. wide, and 21 ft. high.

Hot-water pipes are laid on throughout the centre and east wing of the buildings. Messrs. Weekes & Co., of Chelsea, are the contractors. The water is heated by a tubular boiler fixed in the basement, and the whole of the buildings can be heated at one time, or any portion can be heated separately. The contractors who have erected the building are Messrs. Jacob Over & Son, of Falmouth. The cost of the entire work, including fittings and furnishing, will not be more than 15,000l. Mr. Youman has acted as contractors' foreman at Penzance, and Mr. James as clerk of the works on the part of the town.

THE NEW WORKHOUSE FOR ST. MARTIN'S-IN-THE-FIELDS.

On Monday evening, at the meeting of Guardians of St. Martin's, Mr. R. Colbett in the chair, the minutes of a special meeting of the Board were read, setting forth that the plan of Mr. Cross for the new workhouse was adopted, in preference to a plan of Messrs. Barton & Cotton, by 7 votes to 6. Whereupon Mr. Lamb protested against the correctness of the numbers as recorded in the minutes. A letter to that effect was read from Mr. Scott (a Guardian) also protesting against the decision of the Chairman at the special meeting. Mr. Barton said he withdrew from the said meeting on the same grounds. Mr. Scott contended that the special meeting was convened to consider the plans only, and not to decide upon them; and, therefore, he considered that the ruling of the Chairman was not correct. After some further discussion, the minutes of the special meeting were signed as being correct, and Mr. Barton gave notice of a motion to rescind the resolution of the special meeting, adopting the plan of Mr. Cross; and the whole subject will be discussed at the next meeting of the Board.

COAL BRICKS.

A BRICK-MACHINE, capable of making bricks not only of clay but of coal dust concreted with a patent composition, has been invented by Mr. George Arnott, of Gloucester, who thus describes the machinery, for which he has received protection from the Patent Office:—

"I have a pug-mill erected, with a large screw running down the centre, and to each side of the pug-mill are fastened strong steel plates, which pass through the arms of the screw, so that when either coal or clay is passed into the top, it is ground and thoroughly well mixed before reaching the bottom, when it fills a double row of square iron moulds or frames, which are endless, being hinged together, and which rows of moulds pass over two square tumblers (one at each end of the machine), which tumblers are worked by means of an iron rod from the main shaft and a ratchet-wheel, and at every revolution of the main shaft the rod takes hold of one of the notches in the ratchet-wheel, drags two boxes or moulds out of the pug-mill, passes them under the iron plungers or presses next to the mill, where they are pressed and marked with trade-mark, &c.; and at the same time the next two plungers beyond pass to a endless band running the bottom of the machine on to an endless band running the cross or contrary way to the plier or man who takes them off, so that at every revolution of the main shaft either two coal or clay pressed bricks are made. At the low rate of sixty revolutions per minute, one of these machines would make 7,200 per hour. All the labour they require is one man to feed and another to take away."

The Uskside Engineering Company, of Newport, Monmouthshire, it seems, have nearly completed one of these machines for the Compressed Coal Company, whose extensive new works are situated at Whitecroft, near Lydney, Gloucestershire, formed for the purpose of using up the heretofore worthless small coal thrown up from the pits in the Forest of Dean. The coal-

bricks, after coming from the mill, are soaked in a rock-oil, and afterwards waterproofed; so that whenever a fire is needed, either for house or other purposes, all that has to be done is to break one of the bricks, place it in the grate or elsewhere, and set light to it. The cost, we are informed, will be very considerably below the price now charged for ordinary coals.

THE SEWAGE OF TOWNS.

SIR,—Permit me to occupy a small space in your valuable columns with a few remarks on this important subject.

First, I beg leave to introduce two new distinctive words, which are more euphonious than the terms now used, and will be convenient in discussions,—*aguine*, signifying the liquid portion, and *cloacine*, the solid portion, of the refuse of towns.

Secondly, I submit that, in dealing with the refuse of towns, *aguine* should be disposed of separately as valuable, and even deleterious.

Thirdly, I hold that without an admixture of decayed vegetable matter, *cloacine* and sand or clay will not make good earth. For what is earth? Is not the best earth or mould a compound, with a large proportion of decayed vegetable matter? As I write, leaves are falling, and will in due time become incorporated with the soil on which they fall. It seems to me that in considering earth as a disinfectant, this point has been often overlooked, and should be remembered.

A. J.

HAND-WRITING ON STONE.

SIR,—Will you allow me to communicate a fact which I think will be found interesting and new? On one of our conversational evenings in Canon-row "Architectural Museum," I wanted to get something rather more interesting to visitors than heavy books of prints; and to do so I called on Sir C. Barry, who was always very kind to me, and asked him to lend me for the evening his *first sketch* in pencil, so I understood, of the House of Parliament, which he said he had kept carefully as a memento of the beginning of a great work. He told me he could not oblige me that evening, but that he would do so on another occasion, and that he would show me (I asked him also for it) a *Bay* (a geometrical drawing, not a sketch) of the South Front which I so much admired, and thought the finest bit of modern Gothic in existence. These drawings must be still in existence, and I cannot help thinking how very interesting, apart from all controversy, they would now be if exhibited as specimens of architectural handwriting by a master himself. Controversy always comes of imperfect information, and absence of facts on one or both sides. If there be any doubt as to the authorship of a letter, the production of it immediately dispels that doubt, and the work and individuality of the writer and author at once, and without any possibility of mistake, declares themselves, for it is impossible for one man to write exactly like another. On stone it is the same: it is impossible for two men to write alike on stone; that feat can only be accomplished through the medium of a clerk, &c. a third person.

C. E. A.

NICE WORK AT ST. MARTIN'S, EXETER.

SIR,—A few years ago you very justly exposed to ridicule the unprincipled and dishonest mode of pointing stone walling, which prevails to such an extent in Exeter and the neighbourhood; doing it in the "tuck and point" fashion of brickwork, and not only that, but actually showing sham joints where no joints exist, and converting rough masonry, so as to look like regular range work!

Happening to be passing through Exeter a few days ago, I could not have believed that such a thorough ignorance of good workmanship and pure taste in this age of progress and correct treatment could exist, had I not myself seen the restoration, as it is called, now going on at the Church of St. Martin (it is close to the Clarence Hotel). A good Perpendicular tower, built of the red conglomerate stone, and some other from the neighbourhood, has been exposed to view by the removal of the old rough-cast. Instead of raking out the joints, and pointing them as the stones happen to be shaped, and replacing defective stones by others of the like sort, and removing any brickwork, with which in the worst days of church repairs the walls may have been cobbled, the whole surface is now being disguised by making good the deficiencies and plastering them over with compo. False joints are marked out; the string-course at the midway set-off is rounded off smooth, every member of the moulding being obliterated; and, to crown the whole, the battlements are absolutely capped with pieces of square coping, and the string-course immediately below the battlements is made of a sort of chimney-piece cornice on a flat deal board or some other wood painted white! I cannot for a moment be supposed that the work has been entrusted to any architect, but that the whole is being done under the direction of amateurs; for the city may be proud of, at least, two profes-

sional gentlemen of note, if not more; and, besides this, there is an architectural association second to none in the kingdom, and in no place is there better work being done than in progress at the new museum, the Church of Mary Major, and a new church on St. David's Hill. With such examples before them, and such advantages within their reach, how could the parishioners of St. Martin's allow such abominations which are now being perpetrated and perpetuated on what might have been made a good specimen of a small Devonian tower of the fifteenth century? Close by its side is a glorious specimen of a four or five-light (I forget which) window, occupying the western end of this little church. Do the churchwardens intend to immortalize their names in letters of gold inside the church with the date of this work of retrograde restoration? Perhaps some one else will tell you what is going on inside the walls. I had not the heart to enter, but walked off to my inn in sorrow and disgust.

A VISITOR.

SHAPE OF BELLS FOR PUBLIC CLOCKS.

In a communication published in the *Builder* of the 2nd of March last, I made the following statement:—"Everybody knows that for house-clocks, &c., bells of the hemispherical form are very properly used. Nevertheless, if you want a bell for a tower, or turret, to produce a good volume of sound, and a fine quality of tone that shall be heard at a reasonable distance, it must be made of the long-established shape and proportion of our best church bells. And we know the reason why. Bells of the hemispherical form weighing about 4 cwt. may answer for cemeteries for obvious reasons. But the sound of heavier bells of that form is generally *tubby*, extremely doleful, and offensive."

Now, in the interest of a science to which I have directed some attention, allow me to say here is an example worth recording. A clock and a bell have recently been placed in the tower of the town-hall of Northampton; and this bell, on which the clock strikes the hours, is of the hemispherical shape alluded to, its weight being about 8 cwt. What, then, is the result? Why—though no blame attaches to the respected founders, or clock-makers—this metallic saucer speaks for itself in confirmation of the above statement. It yields a sound so peculiarly dull and disagreeable to the musical ear, that people may well exclaim, "Stop that dreadful bell!"

THOS. WALESBY.

DRY ROT.

SIR,—An important beam in the basement-story of my house has got infested with dry rot; can you suggest any remedy? The beam is about 29 ft. long, made of bog-elm, the most incorruptible of timbers. It had been in its present position upwards of fifty years without showing any decay, but about four years ago I had to build a new wall under one end of it, and not wishing to inclose the beam in new work I put a piece of oak under it. About a year ago this piece of oak was observed to be covered with dry rot, which was spreading along the beam. I took out the oak, and cut off all the decayed part of the beam and washed the beam, first with hot whitewash and afterwards with strong solution of copper; but the rot is spreading with alarming rapidity. The air of the room is very confined, and the beam could not be taken out without much difficulty.

J. M. B.
*Removing the parts affected, and a wash of diluted sulphuric acid, have been found useful in similar cases.

THE ESTIMATION OF AN INCOMPLETE CONTRACT.

SIR,—There must of necessity be a right way, as well as a wrong way, of making an estimate of the value of works done under a broken contract, but I cannot find that any two builders agree upon the *modus operandi*.

In a recent case in this town (Plymouth) certain builders tendered for the erection of a villa residence within a short distance of the town: the highest tender was 3,175l., and the lowest 2,150l.—the latter being accepted.

Owing to the failure of one of the contracting parties, the works were stopped when the walls were built and the roof-timbers in place.

To avoid any litigation, it has been agreed to submit two questions to arbitration: the one to a lawyer as to what damages are due by reason of the breach of contract; the other to a surveyor as to the actual value of the work performed.

Should the works be measured according to the present value of work and material without any reference to the contract? or, should they be measured with reference to the contract and the schedule of prices upon which such contract was founded?

Should the amount due be the value of the work already performed, or should it be the amount stated in the contract less the value of work to be performed? *

J. W. B.
*The works should be measured and valued with reference to the contract and the schedule of prices upon which the contract was founded: the amount due is "the amount stated in the contract less the value of work to be performed." The question of damage done by breach of contract is to be separately considered.

NEW TOWN HALL, MANCHESTER.

WE are authorized by the mayor to state that, in deference to an opinion expressed in our columns and elsewhere, the following circular has, by order of the Town-hall Sub-committee, been addressed to the architects who have sent in plans in competition for the new town-hall:—

"Town-hall, Manchester, 6th September, 1867.
SIR,—You will no doubt have observed in the papers that the plans or designs sent in for the new Town-hall, with the following mottoes or devices, have been selected for the second or final competition, viz., St. Michael, 'Ring out the Old, Ring in the New,' a circle with a ring, 'Time trieth Truth,' 'Polysynth,' 'Municipal,' Three Hebrew characters, 'An Bon Drou.'

Considerable anxiety having been expressed on the part of the public to see the competing plans, I have, at the request of the new Town-hall Committee of the Council, to ask you to inform me *through the present week* whether you are willing that your plans should, with or without your name being attached thereto, be for fourteen days publicly exhibited.

I need hardly say that it is not proposed to exhibit the designs selected for the second competition, and unless a large proportion of the architects intimate their desire to have the plans exhibited, no public exhibition will take place.
I am, Sir, &c.,
ROBERT NICHOLS, Mayor."

The designs of the eight architects selected for the final competition will most likely be exhibited after the award is made; but at present such a course is deemed undesirable. There is much diversity even among the successful competitors in the manner of arranging the plan of the building, the shape of the land offering great scope for the ingenuity of architects, and an exhibition of the designs at this time would be a disadvantage, it is urged, to those who have succeeded in arranging the best plans.

The letters already received, in answer to the circular of the mayor, are chiefly in favour of an exhibition.

THE SMOKE NUISANCE.

SIR,—I take the liberty of asking your assistance in calling attention to some clauses of an Act of Parliament which has been passed with a view of suppressing the nuisance arising from the smoke of furnaces; indeed, of attaining the same end *throughout the country generally* as has been already accomplished in London and its immediate vicinity.

The Act is the 29th & 30th Vic. c. 90, and is entitled an "Act to amend the law relating to the Public Health;" it was passed on the 7th of August, 1866, but the clauses relating to the consumption of smoke did not come into operation before the 7th August, 1867: this was, of course, done in order that the owners of furnaces might have time to make such alterations as would abate the nuisance.

In this city and neighbourhood (Rochester), however, I do not think that one alteration has been made; and, from what I can observe, the same is the case everywhere; indeed, I am sure the existence of such an Act is not at all generally known.

If you would kindly look at the Act and publish some observations upon it in the *Builder*, you would be doing a great public good; for in no other way can its provisions become so widely known.
W. H. NICHOLSON.

SCIENTIFIC EDUCATION.

THE Oxford local examination certificates, awarded for the Manchester district, have been distributed in the Free Trade Hall, by Earl Granville, K.G.

The statistics in a report of the committee for conducting the examinations in the Manchester centre included the following among other details.—In the Manchester centre, though the number of candidates was less than in the previous year, the number of those who passed showed a considerable increase. There were examined this year, 212; last year, 223; passed this year, 145; last year, 136; per centage of success this year, 68; last year, 62. Of these there were seniors examined, 37 this year, 45 last year; passed, 28 this year, 32 last year; per centage of success, 76 this year, last year, 71. Of juniors 175 were examined this year, 178 last year, 117 passed this year, 107 last year; per centage of juniors this year, 67, last year, 60. In the seniors, Manchester had passed 8 per cent. above the averages of the country, and in the juniors (in which it was last year below the average of the country) it was this year 2 per cent. above. Manchester sent one-ninth of all the seniors; it had more than one-seventh of the aggregate honours. In the number of senior candidates, Manchester still maintained its position next to London. London sent 81; Manchester, 37; Liverpool, 30; Northampton, 23; Oxford, 19. In junior candidates, Manchester, which took the lead of all the centres last year, was now exceeded by London, but it still sent more than one-sixth of the whole number of juniors. In junior honours Manchester fell below the average of the whole country. In preliminaries, the per centage of seniors in the country was 51 per cent. last year, 68. Manchester had passed 76 per cent. against 80 last year. In juniors for the whole country, 77 per cent. against 73; for Manchester 81, against 72. The whole of the failures of the seniors here occurred in the preliminaries, though some of them had gained honours in one or more of the sections. Oxford had wisely, from the first, dealt very strictly with this part of the subject, and had the satisfaction of seeing a gradual rise from less than 40 per cent. in 1858, the first year, to about 80 per cent. in the present year. This year, for the first time, failures in the handwriting were found, 32 numbers at the foot of the junior lists. The total number of these was 78, of which 42 belonged to Manchester. In the Manchester seniors, in English, 34 had passed out of 37; in languages, 30; five or more being in the first division out of 12 in the second. In mathematics the number was much less than last year. Among the Manchester juniors, Latin had been successfully taken up by 148 (last year, 105); French, 78 (last year, 71); Greek, 32 (last year, 19); German, 5 (last year, 8); chemistry, 6 (last year, 9). Of 20 centres, only 8 sent in candidates for chemistry, and the whole number of candidates, senior and junior, was only 114, of whom not one-half had passed the examination, the report alluded to with pleasure to the offer of valuable scholarships in connexion with these examinations by Balliol College, Oxford, and Owens College, Manchester.

Miscellaneous.

TAUNTON HIGH CROSS.—Dr. Kinglake purposes erecting, at his own cost, a cross at the northern end of the Parade at Taunton, and Messrs. Sheehrocks, the builders, have commenced the work, by putting up a hexagonal enclosure. The donor has had a design prepared, as nearly as possible, we are told, a *fac simile* of the High Cross beneath which the Duke of Monmouth was proclaimed king in 1685. It will be 32 ft. in height. Lamps will be attached to the cross, which is to stand on three steps, and a drinking-fountain will be placed at the base.

OPENING OF THE BLACKMORE MUSEUM.—A museum, which has been founded in the city of Salisbury by Mr. William Blackmore, of Liverpool and London, has been opened. The building containing the collection, which has been erected at the cost of the founder, who is a native of the town, is of early Medieval character, and consists of the museum and north entrance-porch, with curator's room on the south side. The building is fitted for gas. The varied collection of objects in the Blackmore Museum mainly comprises specimens belonging to the stone age of different countries, with similar implements in use among existing races of mankind.

WALCOT CEMETERY CHAPELS.—The condition of these chapels being very unsatisfactory, Mr. Clark, of Bristol, architect and surveyor, was requested to report to the Burial Board on the subject, and he informs the Board that he finds the upper stage of the tower and spire in a dilapidated and dangerous state, the first cause of which is the failure of the freestone head of the doorway leading from the staircase turret to the tower, it being of freestone hardly 6 in. thick, and not sufficient to support the superincumbent weight; that the danger has also been accelerated by the imperfect manner in which the masons' work has been erected, and the deficiency of proper bonders to tie the work together. Other defects in the chapels are also pointed out, and remedies proposed. Meantime, however, the architects of the chapels, Messrs. Hickes & Isaac, have spontaneously offered to rebuild the spire at their own cost, and the Vestry have approved of their proposal, and referred the matter to the Burial Board.

THE HOLBORN IMPROVEMENTS.—The demolition of Middle-row, Holborn, has been commenced, and in a short time the block of buildings will be removed, and a long needed metropolitan improvement, talked of for half a century or more, effected at last.

SURVEYOR TO THE WATLINGTON HIGHWAY BOARD.—This Board, at their meeting on the 4th inst., appointed Mr. Richard Eades, of Redditch, as their surveyor. Five selected candidates attended the Board, the whole of whom had their travelling expenses paid them.

SINGLE-SPAN CHURCHES.—A correspondent, "J. Y.," writes,—I may add to the information contained in your article on single-span churches that an example occurs at Monferrand, near Clermont Ferrand, in the Puy de Dome. The date (from remembrance) is of the fourteenth century, and the span about 40 ft. Chapels are built as projections from the north and south walls.

HOME FOR FATHERLESS BOYS.—At Stockwell the foundation stones of three dwellings for orphans have been laid by a lady (Mrs. Hillyard), who has contributed 20,000*l.* for the purpose. The homes will consist of terraces of houses, each house capable of accommodating eighteen or twenty boys, and presided over by a nurse; and it is considered that this plan will preserve, as far as possible in a large institution, the idea of a family, and will enable the trustees to proceed with other houses, as their funds will permit. It is also proposed to build a large school-room and dining-hall on the orphanage ground. The houses will cost from 500*l.* to 600*l.* each, and the trustees have accepted a builder's tender for the erection of three at once. A large shed has been built, which will serve for holding meetings on the ground, and can be afterwards used as a covered playground for the boys.

THE ATLANTIC TELEGRAPH COMPANY.—The report presented at a meeting of the shareholders states that 205,317*l.* have been earned by the cables during the past year; that towards the close of the financial year the revenue has had to bear the expense of two accidents to the cable of 1866, both, it is believed, the result of crushing by icebergs. The Anglo-American Company have deducted 21,896*l.* 16*s.* from the revenue in respect of these two events. Notwithstanding these large deductions, there remained to the credit of the revenue account a balance amounting to 23,133*l.* 16*s.* 10*d.* and out of this the board proposed to declare a dividend for the year ended 27th July ultimo, at the rate of 4 per cent, free of income-tax, upon the first 8 per cent. Preferential Stock. The directors intend to reduce their charges to a certain extent, though not so far as has been urged upon them. Messages will be sent at an average of about 5*l.*, instead of the 10*l.*, to which the original 20*l.* had been reduced. The charges urged are 7*s.* 6*d.* a word, or about 2*l.* 10*s.* per message.

THE INTERNATIONAL WORKMEN'S CONGRESS AT LAUSANNE.—About sixty delegates from England, France, Germany, Italy, &c., appear to have attended the meetings of this Congress, and their proceedings, though not altogether orderly and deliberative, show that the trades-union principles, though not under that name, are rapidly pervading the Continent. Some of the decisions of the Congress are rather startling;—for example, the "equivalence of functions,"—that is to say, that "the eight hours' labour of a carpenter or shoemaker is of equal economical value with the eight hours' labour of an astronomer or poet." They do not seem to have as yet decided, however, that the eight hours' labour of the weak or indolent is of equal economic value with the eight hours' labour of the strong or active; but no doubt they are of opinion, with our own trades-unions, that the eight hours' labour of the stupid and unskilful are of the same economical value with the eight hours' labour of the talented and skilful. No chance here for the man with "seven talents" to double them: he must hurry them in the ground alongside of the "one talent" of his less willing or able fellow-workman, or share with him his "seven talents," so that truly his fellow-workman will be the hard task-master. The Congress are inclined to approve of strikes because they tend to raise wages, although they do not approve of wages at all. One of the French delegates stated that "the aims of the International Working Men's Association tended to replace the present unsatisfactory state of things by a system of practical justice."

LEEDS EXHIBITION.—The Executive Committee of the National Exhibition of Works of Art to be held at Leeds in 1868, have received a notification from the Secretary of State for India that a selection of works of Indian art will be made by Dr. Forbes Watson. The many and beautiful objects of Oriental art therein will form a most attractive and important section of the Exhibition.

FRENCH ENTERPRISE IN GREECE.—At Port Mandri a French company are at present diligently smelting down the old scorie, slag, and refuse from the ancient lead mines, and extracting as much as 30 tons of metal a day. The work is said to pay well, and the lead chiefly goes to England. It is calculated that there is a sufficient quantity of scorie between Cape Colonna and Port Mandri to supply the works for fifteen years to come.

THE CLOCK-TOWER AT LONDON BRIDGE.—A correspondent suggests that a good place to which to remove the Wellington clock tower would be to the middle of New Southwark Park. He says,—"During an hour's stroll over the park ground a few days since, I was asked by at least six persons to tell them the time. The great question (there) appeared to be, not the interview at Salzburg, not the captives at Magdala, but—'What's o'clock?'"

AN AMATEUR THEATRE PROPOSED FOR LONDON. A meeting has been held with the view of raising a company to build a theatre for amateurs, on the site of Old Lyons Inn, Strand, apparently part of the property purchased for the ill-fated Strand Hotel. A capital of 20,000*l.* was named. The working expenses were put down at 2,345*l.* *per annum.* An ordinary theatre in Newcastle-street might or might not pay,—we need not now go into that question,—but to suppose that the amateur actors of London could support it, and pay the shareholders a return for their capital, seems to us a wild idea.

GAS.—The following are dividends declared at the last meetings of various gas companies, viz., 10 per cent. by the Richmond Gas Company; 7½ per cent. by the West Ham Company; 6½ per cent. by the Hartlepool Gas and Water Company; 10 per cent. by the Cardiff Gaslight and Coke Company; 10 per cent. by the Belper Gas and Coke Company; and 8½ per cent. by the Sunderland Gas Company. The Gas Company at Hereford have reduced the price of gas for the public lamps to 3s. per 1,000 cubic feet. The *Hereford Times* urges a reduction to the same figure to private consumers, and advocates the purchase of the works by the corporation.

SUCCESSIVE DEATHS FROM FOUL AIR.—By a singular combination of ignorance and devotedness five persons have lost their lives at Flint. A boy was amassing himself at the chemical works of Musprat & Co. by winding up and down a bucket used for baling out water from a shaft communicating with a drain. Whilst thus occupied the bucket caught somewhere in the shaft, and the boy got down a ladder to liberate the bucket. Poisonous gas which had collected overcame him, and he fell to the bottom. A carpenter went to rescue him and shared the same fate, as did three others in succession, and a sixth volunteer only escaped by being rapidly drawn to the top. The five were afterwards got out with grapnels, but they were all dead. Experience and warning seem to be of no use to the public in such cases as this.

ORGANS.—The *Musical Standard* says,—"Messrs. Hill are carrying out some important works at the large organ in St. Peter's, Cornhill. The additions consist of a bordoun on the pedals, and the completion of the pedale, which was formerly of one octave only. Nothing has been done to the organ in the way of repairs or additions since 1840. The tuning is being altered to equal temperament. The church will not be reopened until the 22nd instant at the earliest.—The organ in the church of St. Mary-le-Bow is to be rebuilt by Mr. Holdich. At St. Botolph's, Aldersgate, Mr. Speechley, of Camden-town, is rebuilding the organ, which is expected to be ready in about three weeks (organ-builders' time). Messrs. Gray & Davison are completing further alterations in the organ at St. Botolph's, Bishopsgate,—the works they effected in the instrument on its removal in 1866 including the extension of the swell to tenor C and the addition of couplers, and other mechanical accessories. At St. Margaret's, Westminster, Messrs. Hill have instructions to complete the organ, we are glad to announce.

MILITARY GYMNASIUM, PORTSMOUTH.—On the 2nd inst. Sir George Buller laid the foundation-stone of a gymnasium, on the left side of the new line of road across the mill-dam. Colonel Hadden explained to Lieutenant-General Sir G. Buller and the company present the object of the new building, namely, the improvement of the soldiers, and providing for them the means of innocent amusement; and as this was the first erection of the kind in Portsmouth, he considered it a fitting and pleasing opportunity of calling attention to it.

DEFACING A MONUMENT.—At the Bromsgrove Sessions lately, a boy, aged thirteen, was charged with damaging the tomb of Sir John Talbot and his two wives in Bromsgrove parish church. Defendant pleaded guilty to the charge. Mr. E. Housman, for the churchwardens, said the tomb injured was an alabaster one, and it was supposed that in an idle moment the boy had scratched away some of the letters. The churchwardens would only ask the hench to express an opinion as to what punishment they would inflict upon future offenders, as it was thought probable they would have to charge others for indecent scribbling on the organ, and other offences. Defendant was discharged on paying expenses. The tomb referred to is the one which was used as evidence in the great Shrewsbury case, and concerning which it was stated by a writer in the *Athenaeum*, about two years ago, that the alabaster letters had been chiselled away, and obliterated by means of paint, in order to destroy evidence.

AMERICAN TUBE WELL.—A number of gentlemen recently assembled upon the cricket-ground of the Manchester Club, Old Trafford, to witness the sinking of a well upon a system first introduced into this country, of which Mr. Newton, of Blackfriars-street, Manchester, is local agent. Water was reached in five minutes from the commencement of the operations, and in twenty-two minutes a depth of 10 ft. had been reached; the pump had been fitted to the top of the well, and a flow of water obtained. The well consists of an iron pipe 1½ in. in diameter, about 12 ft. long, pointed at one end, and perforated with holes about 16 in. up the pipe from the pointed extremity. A moveable iron clamp is fitted round the pipe, and, upon the principle of pile-driving, a 56 lb. hollow weight round it is raised, and allowed to drop upon the clamp: thus the pipe is driven into the ground. Earth, sand, &c., first enter the pipe through the holes, and when these are pumped out, the theory is that pebbles rest against the pipe and form a natural filter. About 5*l.* is the cost for the completion of a well 15 ft. deep. When rock is reached the operation is more costly if it be necessary to bore the rock. One of these wells, to the depth of 15 ft. has been sunk in the Manchester Botanical Gardens. The inventor accompanied the Northern army in the late American war, and procured an unfailing water supply. He has sunk many wells in the States: one at Ithaca, New York, is said to be 120 ft. deep.

RATTENING.—The derivation of this term has excited some discussion. A writer in *Notes and Queries* says,—"In 'Hallamsire,' the district of which Sheffield is the capital, and, indeed, in Yorkshire generally, by the common people, *rat* is pronounced *rat'n*, and hence the secret mischief done by one workman to another in trade disputes was called *rattening*,—that is, doing on a larger scale what the "varmint" does on a smaller, such as "blending the scales and springs" of the grinder or the bellows of the blade forger, and other like injuries. These wrongs were generally perpetrated during the night, and when in the morning the sufferer asked who had done the mischief, the reply was, "The rats had been!" I believe this is the origin of a phrase with which I have been familiar for more than half a century, and which recent painful circumstances have made sadly familiar wherever an English newspaper is read. Of course, it has happened, in this as in other cases, that an expression used at first in a limited meaning has come to be used as signifying trade outrages of whatever kind. I will not say it would be impossible to split a grinding-stone in the way described by Dr. Vaughan, but I never heard of such a case. I close with a literal illustration of my etymology. An amateur in fancy engineering said to me the other day, "I have been rattened; I had just put a new cat-gut band upon my lathe, and last night the rats carried it off, and, I suppose, have eaten it!"

A HINT FOR THE AMALGAMATED ENGINEERS.—An official return, just published at Berlin, gives some curious particulars relative to the manufacture of railway locomotives in Germany. It appears, according to the *Pall-mall Gazette*, that in 1864 the number of locomotives on the German railways was 4,768, 574 of which were manufactured abroad, while Germany now not only builds her own locomotives, but sent 1,000 last year to other countries, such as Switzerland, Italy, France, and Russia. The number of engines now used on the railways of Germany is 5,250, 340 of which have to be replaced every year, it being calculated that a locomotive seldom lasts longer than 15 or 16 years. The largest of the German factories is that of Borsig, of Berlin, which has built 2,000 railway-engines since it was first established in 1841. Of the others, the principal are that of Maffei, in Bavaria, that of the Austrian railway companies at Vienna, Egerstorff's at Hanover, and Henschel's at Cassel.

TENDERS

For a pair of semi-detached residences, in Birkbeck-road, Acton. Mr. G. Billington, architect:—
Eydmann £1,999 0 0
Waters 1,806 0 0
Bick & Son 1,815 0 0
Harding (accepted) 1,735 0 0

For alterations and repairs to No. 48, Wimpole-street, for Mr. W. Benson, Mr. W. Baker, architect. Quantities furnished by Messrs. Richardson & Wagner:—
Henderson £1,939 0 0
Phillips 1,847 0 0
Scribner & White 1,841 0 0
Keyes & Head 1,737 0 0
Easton & Chapman (accepted) .. 1,721 0 0

For alterations and repairs, at Gloucester House, Lark-hall Rise, Clapham. Mr. H. W. Buid, architect:—
King & Son £731 10 0
Mills & Son 725 0 0
Colls & Son 615 0 0
M'Lachlan 683 10 0
Notley 550 0 0

For alterations and additions at 191, Upper Ebury-street, Finsbury, for Mr. E. E. Price. Mr. Parker, architect:—
Sanders £635 0 0
Wilson 631 0 0
Thompson 631 0 0
Dear 497 0 0

For farm-houses and home-steads, for Earl Suffolk, Charlton, near Malmesbury, Wilt., exclusive of building stones, sand, &c. Mr. T. S. Lansdown, architect:—
Claridge £6,577 0 0
Hollins & Co. 6,660 0 0
Liddlat 6,406 0 0
Smith 6,118 0 0

For additions to Bentham House, Purton, Wilts, for Mr. W. J. Bassett, exclusive of building stones, bricks, lime, sand, and slate. Mr. T. S. Lansdown, architect:—
Liddlat £420 0 0

For Wroughton Schools, near Swindon, exclusive of old materials to be re-used. Mr. T. S. Lansdown, architect:—
Phillips £545 0 0
Harris 515 0 0
Hawkins 495 0 0

For alterations and additions, Tockenham Rectory, near Wootton Bassett, Wilts. Mr. T. S. Lansdown, architect:—
Brown £1,068 0 0
Wheeler 895 0 0
Frampton 875 0 0
Towns 860 0 0
Barrett 849 0 0
Carter 830 0 0
Liddlat 825 0 0

For parsonage-house, in the parish of Holy Trinity, Kentish Town, inclusive of amounts for rain-water tank and hot-water supply. Messrs. Beck & Lee, architects. Quantities supplied by Messrs. Pain & Clark:—
Manley & Rogers £2,397 0 0
Browne & Robinson 2,302 0 0
Ashby & Sons 2,290 0 0
Colls & Son 2,275 0 0
Conder 2,262 0 0
Woodward 2,230 0 0
Webb & Son 2,191 0 0
Foster 2,149 0 0

For new buildings, Norton-folgate. Messrs. J. Young & Son, architects:—

	Refuge.	Residence.
Ashby & Horner	£8,961	£1,995
Jackson & Shaw	6,557	1,989
Ashby & Sons	6,549	1,984
Jackson	6,418	1,917
Conder	6,184	1,931
Braun	6,145	1,932
Webb & Sons	5,912	1,868
Henshaw	5,904	1,794
Hart (accepted)	6,422	1,767

For dwelling-house, at Sydenham-hill, for the Rev. J. R. Brook:—
Hills & Son £1,768 0 0
Colls & Son 1,099 0 0
Gammou 1,677 0 0
Clemens 1,628 0 0
Jerrard 1,675 0 0
Shapley & Webster 1,640 0 0

The Builder.

VOL. XXV.—No. 1285.

Public Works in Spain.

COMMISSION was nominated by the Spanish Government to draw up a report upon the state of public works in Spain, for the purpose of laying the information thus gathered together before the world, as it is represented by the great Parisian Exposition. This report is now before us, and we find it confirms the generally received impression of the rapid progress made by the Spaniards since the commencement of this century. The commissioners excuse themselves for not having made the account so full as it might have been, by pleading the insufficiency of means at their disposal, the short period of time allowed them, and the unfavourable season of the year for the production of photographs of public works. The survey of modern Spanish enterprise forwarded by them to Paris, consists of four parts; in the first being an "album graphique," of the most notable works; the second, a collection of photographs of the same; the third, a collection of models; and the fourth, the report under notice. When we recollect that in 1820 there was no school of engineers in Spain, and that the public works there were undertaken by empirics without scientific knowledge; and at the same time bear in mind the comparatively small sums that could be devoted to constructional improvements, we must allow that Spain has done tolerably well, especially in some branches. The maritime lighting department, consisting of a hundred and forty-nine lighthouses, appears to be, perhaps, the most noticeable perfection. After this come the roads, the railways, and the ports in the succession we have given them; to which the commissioners add, with special pride, mention of the canal of Isabel II., by the means of which Madrid is provided with water, and of the Canal d'Urgel, works of merit and importance, projected and directed by Spanish engineers. The roads, in 1864, consisted of lengths amounting to 14,926 kil., of which the road known as Las Cabrillas, with the magnificent bridge over the Cahriel, and those between Sahagun and Rivadesella and Granada and Motril, are the most noticeable. The railways have a total of 7,018,587 kilometres. The ports at which most has been done are Barcelona, Tarragona, Valencia, Cartagena, and Almeria. Besides these lines of communication, navigation, and irrigation, and the ports mentioned, with their lighthouses, quays, and other maritime constructions, there is the department of civil constructions, comprising all the edifices serving for public instruction, for the administration of justice and charity, such as schools, libraries, prisons, hospitals, theatres, &c., in a word, all works executed with the funds of the Treasury or with those of the provinces and communes. All public works, generally, are under the control of the minister of public works (*Ministerio de Fomento*); some ex-

ceptional instances, however, being amenable to the minister of finance (*Hacienda*) and the minister of the interior (*Gobernacion*). The minister of public works has for his staff the corps of *Ingenieurs des Ponts et Chaussées*, supplemented by that of the *Conducteurs* or *Ayudantes de obras públicas*. When a construction is simply for the benefit of a province or municipality the cost is generally defrayed by the place interested, the exceptions being cases in which the Treasury affords a grant to assist the local improvers. The acceptance of such a grant brings the supervision of the works into the department of the Government, *Ministerio de Fomento*. There are two modes of execution recognised. The Government department either takes a work in hand or permits a company to do so, allowing it, as compensation for their expenditure, the profits of the undertaking for a certain number of years. This concession system is that which is most frequently adopted, as the administration is not always furnished with the large sums required for the prosecution of costly works. The minister of public works enjoys the assistance of two consulting corps. The first of these councils (*Junta Consultiva*) is composed of inspectors-general of the corps of engineers; and the second (*La Commission des Phares*) is presided over by an inspector-general of the first class, aided by several inspectors of the second class of the *Corps des Ponts et Chaussées*, and by some of the superior officers of the marine department.

The Spanish school of engineers was definitely founded in 1834, and the *Corps des Ingenieurs* was created in 1835. The latter is a corporation numbering 340 individuals: 5 inspector-generals of the first-class, 15 of the second-class; 30 engineers-in-chief the first-class, 50 of the second; 80 ordinary engineers of the first-class, 120 of the second; 15 assistant-engineers of the first-class and 25 of the second. In the details of the service these engineers are aided by the subalterns (*ayudantes y sobrestantes*) before mentioned. The surface of the country upon which they have to carry on their operations presents many difficulties. Its contour has been likened to the trunk of a cone, rising in platforms, the summit of which, if carried up, would be high in the air above Madrid; but this simile has also been objected to as conveying an idea of greater regularity than really exists. It enables us, however, to form a rough conception of the difficulties to be encountered and vanquished by the corps in question, as they lay down their long lines of communication on the vast mountainous promontory. There are thirty-three railways in Spain, if we may include four large tramways in the list, twenty-two of which are in the hands of railway companies. A general survey of these has been made, and a project of rectification made out, in which districts that are now beyond railway communication may be brought into it, and centres of production and consumption linked together by the same accommodation. These proposed additions are nearly all very short lengths, varying from one to three or four hundred kilometres, the whole not amounting to more than 3,331 kilom. Owing to the mountainous nature of the country, bridges and tunnels follow each other in some sections in rapid succession. Within about 10 kilometres on the line between Cordone and Malaga, for instance, there are twelve tunnels and six large bridges, spreading heights and spanning gorges and fissures as sombre as those of the Alpine chain. The second section of the Saragossa and Barcelona line, which extends from Cervera to Tarrasa, has sixteen tunnels, eleven bridges, and a viaduct of eighteen arches in a run of 94 kilometres.

The commission of *phares* was created in 1842, at the suggestion of the engineers forming the *Direction Générale des Chemins, des Canaux,*

et des Ports. It has under its charge all the business relating to lighting and signalling in Spain, in the islands of Baléares and the Canaries, and on the coasts of Africa. The most remarkable of the lighthouses are those at Santander, La Corogne, Cadiz, Almeria, Murcia, Tarragona, Barcelona, Ibiza, Majorca, and Minorca, which vary in height from 30 mètres to 61 mètres. Of these some are fixed lights and others revolving. Thus a first-class light can be either revolving, with an eclipse from minute to minute, or fixed; second-class lights permit of the same choice; whilst fourth and fifth class lights are generally longer in their revolutions, the scintillations being at intervals of three minutes' duration. Nine of the most important towers are represented by careful models in the Exposition. The materials employed in their construction are nearly always stone for the towers and for the staircases within, though, in some few instances, the latter are made of iron. To preserve the stone from the action of the salt in the sea-water a coating of oil-paint is used. Three lighthouses in Spain differ from this construction. They are those at Fangar Point, Baña Point, and the Isle of Buda. Following what is known as the Mitchel system, they are built of iron on a foundation of piles. For the sake of economy, say the Commissioners, these were made in England, but from the designs and under the superintendence of Spanish engineers. They were lighted for the first time in 1864.

Spanish legislation has divided the laws concerning Spanish waters into seven chapters. The first relates to the waters of the sea, and the second to the waters of the earth; then follow their beds and currents, their uses, concessions, and general supervision, all of which are full of sub-divisions, such as navigation, loading and unloading of cargoes, fisheries, the fabrication of salt, &c. The terrestrial waters are either pluvial, living or running, stagnant, or subterranean, and the chapter relating to them deals with all these varieties. The *alimentation* of towns, as the French have it, is, of course, an important branch of the subject. The most remarkable work executed in Spain is the canal of Isabel II., constructed for the water supply of Madrid, as before mentioned. It follows the ancient Roman method, that is to say, the water is conveyed on aqueducts built of masonry. Its length is 76 kilometres, and its transverse section is 2-80 m. in height by 2-15 m. in width. Along its course are several important works of constructional interest, as the *Prise du Ponton de la Oliva*, thirty-one tunnels, thirty-two lengths of aqueducts, four grand siphons for the passage of four valleys, and the *dépôt* of water of the Champs des Gardes. The subterranean galleries used in the distribution of the water complete this great undertaking of the Government engineers. Thirty-five fountains and 3,000 *bouches* for watering the roads or extinguishing fires, are supplied with water from this source, besides the liberal allowance accorded to every resident in the capital city. The Government engineers have also projected and carried out water supply works at *Xérés de la Frontéra* and at *Valence*; and have authorized others at *Oviédo*, *Cordova*, *Valladolid*, *Cadiz*, *Lorca*, *Barcelona*, *Albaceti*, and other centres of populations. Sixteen models of aqueducts, bridges, and machinery connected with marine engineering illustrate these works in the Exposition.

The Spanish commissioners inform us that it was not until 1862 that the laws relating to civil constructions were properly framed and digested. This department is now under the auspices of the corps of engineers likewise, and the *Ministerio de Fomento* is the commander-in-chief of it. Of the short period between this re-organization and the creation of the commission no mention is made; but before 1862 three import-

ant works have been taken in hand by the corps in question, viz, the aggrandizement and embellishment of Barcelona, the improvement and embellishment of the Puerta del Sol, Madrid, and plans for the aggrandizement of the same city generally. The project for the improvement of Barcelona was confided especially to Mr. Idefonso Cerdá. Mr. Lucio del Valle was entrusted with the embellishment of the Puerta del Sol,—the Trafalgar-square, if we may say so, of Madrid; and the general improvement of the city, already completed in various quarters, is superintended by Mr. Inspector Carlos Maria de Castro. Among other works recently accomplished are a Survey of Madrid, gardens and monuments in the Plaza del Oriente, the St. Louis fountain, the elevation and distribution of the waters of the Queen's Fountain, a viaduct in Segovia-street, and the lengthening of Bailen-street, all in Madrid, besides projects for two new quarters and further distributions of water in the same city, and the improvement of Bilbao.

In a quaint geographical work, entitled, "A Short Way to Know the World," published at the commencement of the last century, it is written,—

"Madrid, the capital of Spain, is a flourishing city, as big as the Spaniards pretend, as Paris, and of note for the royal seat and supreme court, in possession at present of Philip V.; but for the most part ill-built and the streets filthy; but if there is ever a good house in it, the king has a prerogative which no other prince can have, viz, to claim the best part of it; for the first floor of every house in Madrid belongs to the king, till it be purchased of him by the owner. It is of note, also, for a famous bridge built over the Tago by Philip II.; but the river in summer time is there so shallow that some could not forbear saying, his Catholic Majesty would be obliged to sell the bridge to buy water for the river."

The corps of engineers we have mentioned so frequently has put Madrid upon a different footing; but it has still gigantic tasks before it. Great credit is due to the commission who have so laudably shown the increasing prosperity of their country. They exhibit ninety-nine drawings of bridges, 176 drawings of lighthouses, showing the whole system of lighting the coasts in possession of Spain; a collection of thirty-two drawings relating to the different ports, difficult lengths in the routes of railways, and canal works; six volumes of photographs, illustrating twenty lighthouses, thirty ancient bridges, thirty modern bridges, forty-six iron bridges, forty constructional works on lines of communication, and thirty aspects of the canal of Isabel II. Besides these, the engineering world is informed of a project for a port of refuge on the coasts of Asturias, in three volumes, and of another for a railway from Cadiz to Gibraltar, in five volumes.

THE PUBLIC WORKS OF THE FRENCH EMPIRE.

THE prediction of Louis XIV., or rather the authoritative announcement of that powerful monarch, when the long-coveted crown of Spain had at length encircled the brow of a cadet of the House of Bourbon, that the Pyrenees no longer existed, has not as yet been verified by the march of events. But that which Royal power and family compact have failed to effect has to some extent been accomplished by science. Physical lines of demarcation have lost half their importance, since they have ceased to retard the transmission of intelligence. At a period when the twelve-mile tunnel through the very bowels of the Alps is already pierced for more than half its distance, and when, notwithstanding, the impatient international traffic is demanding the service of the temporary mountain railway constructed by Mr. Fell, we are fast diminishing the importance of mountain frontiers as barriers to the circulation of travellers and tourists. The collapse of speculation has alone prevented the coming off of the interesting duel between the advocates of a ferry over, and those of a tunnel under, the English Channel, supposing the latter, indeed, to have at any time entertained the intention of seriously hacking their own wild proposal. Not a year passes without affording fresh facilities for that mutual acquisition of knowledge as to the habits of the various citizens of Europe, which has made such steady progress since the days of Hogarth and of Gilray. And although, ever and anon, the appearance of the conventional Englishman on the boards of the Paris stage, where we have seen him represented in a short surtout coat furnished with a cape, top-boots, and straps! (an impossible com-

bination which does the greatest credit to the genius of the green-room), or the issue of some literary display of the English as certainly they do not appear to their own eyes, bears testimony to the continued existence of the Channel dividing Dover from Calais, still the process of fraternisation is going on with unchecked rapidity.

While the facilities which steam-communication by sea and by land affords to the pursuit of business or of pleasure thus form a main characteristic of our times, we have perhaps hardly yet fully appreciated the important addition which is at the same time offered to the elements of national education. We do not here refer to education in the merely technical sense, to the newly-imported adaptations of the latest German grammatical confision of either the Latin or the English tongue, or to the clear and systematic, if somewhat superficial, treatises which French ministers of education find time to publish for the benefit of the *lycees* over which they successively preside.

We refer to that broader and more permanent form of social education which consists in studying those conditions of political and of physical life in which other countries differ from our own, and in deducing the lessons as to our own future which such studies are calculated to teach. At no period in the history of the world has social experiment been conducted on so gigantic a scale, and under such widely varying conditions as at present; so that at the very time when the barriers are being cast down, behind which each kingdom or republic has so long enjoyed a more or less isolated existence, and when the man who, like the great father of modern thought, seeks to study on the spot the institutions of other countries before writing on those proper to his own, can most freely gather the incidents on which to base his work, each variety of habit, and each contrariety of principle may be found undergoing a portentous and unexampled development. On one hand we see the flag of the purest absolutism nailed to the mast, and the principles of that authority which, rather less than three centuries ago, literally and positively condemned every man, woman, and child in the Netherlands to be hurled, beheaded, or hurried alive, as unhesitatingly asserted as by the edicts of the execrable Philip II. of Spain. On the other hand, we see the rule of the majority, pure and simple, carried to its most tyrannical extreme by the invention of the "cancans" and the "previous question," and we can watch the results of these two opposite systems in the weekly intelligence that reaches us from the shores of the Tiber and from the western coasts of the Atlantic.

The point to which, on the present occasion, we are most anxious to direct attention, is that of the opposite principles on which the public works of the British and of the French empires are at this moment conducted. And this we do not in the spirit of either self-gratulation or self-depreciation. It is not in order to say, "They manage these matters better in France," or, "Let all the world come and learn of us." It is rather in the pure spirit of inquiry. Something, nay, very much, may be due to the difference of national bent and genius; but the question whether it is better for the Government to charge itself with the conduct of the public works of a country, or whether it is better to leave these works to individual enterprise, is one which it is most important fully to elucidate.

The French Emperor has just decreed a large expenditure for the purpose of country roads, the planting of denuded mountains, and similar purposes; including, no doubt, protection against the destructive inundations which have been so much increased in frequency and in mischief by the reckless destruction of timber, and, at all events, the more important works of irrigation and of drainage. No one who knows France can doubt that the 32,500,000 sterling which it is proposed to apply to these purposes during the next ten years will be, if well laid out, highly reproductive. The expenditure in question is to be divided between the State, the Departments, and the Communes, which are to be benefited not only by the works themselves, but by the encouragement that will be given to local industry in the course of their construction. The sum in itself seems large, but it must be remembered that it amounts to but little more than 700*l.* per week for each of the eighty-nine departments of France,—an expenditure that can hardly be considered, when regarded as thus divided, as in any way excessive, or likely unduly to affect the labour market. The only

question as to which hesitation arises in our mode of viewing the case is as to the mode of thus developing the industrial wealth of the country. It is foreign to our habits, it is contrary to the principles of that school of politicians which among ourselves may almost alone be termed demi-scientific, and it is contrary to the experience which we have derived from such efforts of a like nature as we have ourselves made on such occasions as that of the Irish famine.

On the other hand, it cannot be contended that our own system has effected a very notable triumph. Thirty years is much in the life of an individual; it is comparatively little in that of a nation or of a system. It is now about a third of a century since a great impulse was given to our domestic enterprise by the successful establishment of steam locomotion between London and Birmingham. Since that time private enterprise has expended on our railways a sum equal to nearly three-quarters of the national debt. The public are, perhaps, only beginning to practise to realise the ill-effects of the enormous waste with which this expenditure has been conducted. It has not been the case that the tyranny of the trades' unions or the organization of the *phalanstères* has caused a wasteful remuneration of labour. As far as the actual labourers are concerned, it is probable that at no period of human history has so much hard, steady, persevering labour been called into continuous exercise as that which has executed our iron roads. With us the demoralization has been limited to the more educated classes. The "navy," indeed, may have been too much accustomed to take out the balance of his fortnight's pay at the beer-house, or to indulge in two or three days' oblivion of a month's incessant toil by the too-ready aid of John Barleycorn. But whether he drank out or otherwise spent or saved his earnings, no one can deny that they were fairly won. High as the wages paid to a skilled earth-workman seemed when contrasted with those of an agricultural labourer, there is no doubt that they were not disproportioned to the duty performed. In almost all cases piecework prices gave the workman a higher remuneration than the ordinary day-work tariff. A certain consumption of oxygen was involved, a demand on the muscle that made necessary a more generous diet. So many millions of cubic yards could not be removed without a certain production or liberation of heat, even if the motive force had been other than human labour. As far as the actual operatives, the engineer and his staff of workmen, are concerned, we are convinced that our public works can vie with those of any nation or any time in real economy of construction. It is one thing to wheel a barrowful of earth up a plank, at an inclination of one in ten, and another to send the contents of the same distance in a dozen baskets on the heads of so many women or girls, as is done in the south of France, or in Italy. Our own choice is in favour of our own method of work.

But when we learn the actual scene of the labours of the engineer, the aspect of affairs has entirely changed. In the present silence of Westminster Hall, and disconsolate aspect of Great George-street, it is difficult to realize the stato of things in the good old times of post-chaises-and-four and of express trains busting to depart. Landowners, counsel, witnesses—what a venous host fixed on our railway capital when in its nascent state, that condition in which, as chemists tell us, disturbing action is most powerful. Chief culprit, no doubt, was the legislature, but the legislature itself is only to some extent an embodiment and intensification of the public. Profligate expenditure on properly designed works, or rather in obtaining the necessary authorisation for such works, more profligate expenditure on works which never should have been authorised, have been steadily encouraged, or stolidly winked at, for more than a quarter of a century, by the public opinion so much glorified among us.

The result, long bitterly experienced by the unfortunate shareholders, is now becoming more palpable to the public. A great voice of grumbling is everywhere heard. Here the fares are raised; there the trains are taken off; in a third instance a distance may be certainly accomplished by railway in but little longer time than it could be performed in on foot; in a fourth case any exact calculation of time is out of the question. The old features of the coaching competition of former days are quietly reappearing, to the grief of this more locomotive

ago. Companies which, fighting one another to the last gasp, have striven by every possible blandishment to attract one another's customers, have at last, in the very agony of impecuniosity, come to an agreement which, if made in time, would have saved a third of their outlay, and enabled them to serve at the same time the shareholders and the public. For these two interests, however it may be sought to divide them, are essentially one. If the public encourage waste, the public will have eventually to bear the loss of that waste. A constituency that has disbursed from five to six hundred millions sterling funds indeed no inconsiderable portion of the public; but we are speaking of the customers of our great carriers alone. If a company be encouraged or permitted to expend fifteen millions where ten millions should have sufficed, the travelling public will certainly have, in one shape or another, increased prices or decreased efficiency of service, sooner or later to pay forfeit for that wasted five millions; and this is precisely the stage in railway experience at which we are now arriving.

We cannot, therefore, admit that the political economists of our day, the gentlemen who endeavour to make half science do the duty of whole science, and to decide the course of social action by an appeal to some of its lowest principles, have much cause to congratulate themselves, or to look for the gratitude of the public, on the reflection that they have had altogether their own way with our public works. Still less can we admit that they are entitled to deliver an *ex cathedra* judgment as to the wisdom of the present effort of the French Government to provide for the communications of the rural districts. We are not advocating the French system. We are not expressing an opinion as to its merits or demerits. We have seen France adorning herself with noble cities; we can hardly recognise, in the Paris, the Lyons, the Marseilles of the empire, the strongholds of the revolutionists of even so late a date as the year 1830. But we feel that these palatial buildings may have been erected at too great a cost. We know that the system adopted has incurred a great and a certain risk. We are seeking, therefore, not to enounce opinions, but to collect facts. We are desirous to store up and to systematise the experience which fifteen years of the Imperial policy with respect to the relations between labour and the state has allowed our brilliant neighbours to accumulate. We know, or we are likely to know, the worst as well as the best of the results of our own system. We have, perhaps, seen the best of those of the opposite plan. It may be that we have yet to wait to see the reverse of the medal, the shades as well as the lights of the picture. At all events, in our own forced idleness we cannot do better than to study carefully the different cases of this great problem, and compare the results of labour directed by the State with those of labour directed by private enterprise. It is not out of the usual course of events to suppose that some *via media* may be arrived at, that some leading principles may be detected. That private enterprise, if directed by the exclusively selfish principles, which are so loudly advocated among ourselves, may produce results unfavourable to the best interests of the community, we have palpable and painful proof. That State interference with labour may for a time give prosperity to the operative at the more or less compulsory cost of the trading and renting classes of society, we think France is a witness. Whether or no collapse will follow, and whether the results of such collapse, if it occur, may be more or less disastrous to the entire community than the degree of inefficiency and waste that has hitherto been inseparable from our own system, it is for the future to show. In each case the decision has, to a certain extent, been in the hands of the Government. Legislative sanction is as necessary for the construction of an English as of a French railway. If we think that the prefects and ministers of the empire have interfered too much with the right of private enterprise, if we prefer the distinction which our own civic authorities attain in the way of banqueting—and of any other means of distinction, if such they have—to the edification of the prefect of the Seine, at all events, we cannot point to the imperial sanction of such a scheme as the London, Chatham, and Dover Railway, or to a conglomeration of ill-adjusted lines like those which circumnavigate London Bridge. Our first step is to ascertain the actual facts; our second—and that is as yet a long way off—is to proceed to

apply our knowledge in the best and most practical way. The idea that the Englishman has nothing to learn from the foreigners is becoming decidedly out of date. How much evil we owe to its long, though generally tacit, influence, it would be hard to say.

THE BRITISH ASSOCIATION FOR SCIENCE IN DUNDEE.

In our last notice of the meeting at Dundee, we intimated the intention of referring to papers that were read. But selection from the number is difficult. In every one of the Sections, not excluding Section D ("Biology"), subjects were treated of immediately pertinent to the field of practical architecture; and it is simply astonishing that the profession continues to be so little represented in the Association. There were several engineers in Dundee; but excepting the representative of this journal, and Mr. Mylne and Mr. Ferguson, we know not who there were to testify by their presence that true architecture requires to take cognizance of the progression in science, just as much as of results of archeologic exploration. If architecture is to be living and progressive,—art in fact, and not in name merely,—it must be comprehensive also of all the science that relates to building. Real art in architecture is all but impossible without knowledge of the properties of materials, and of the laws of vision; successful planning of numerous kinds of buildings requires the study of branches of "Economic Science," and the history itself, of art, and the analysis of styles, is but inadequately studied unless with reference to "Ethnology" and the characteristics of races and peoples. Consequently we need offer to our readers no explanation for taking them out of the field of "Mechanical Science" (Section G), and for noting down some of the subjects of papers, in other Sections, which we are unable to report at length.

Let us refer to the Report of the Lunar Committee in the Section (A) of "Mathematical and Physical Science," for the sake of reporting the observation of Sir Wm. Thomson, the president of the Section, on the increasing importance of this subject to the science of geology. He said "the Huttonians would be forced here long to take the subject of lunar volcanoes into account," and that "a great revolution in geological speculation must soon take place."

In the same Section Mr. J. Clerk Maxwell read a paper on a "Real Image Stereoscope, with Illustrations of Solid Geometry." In ordinary stereoscopes the observer places his two eyes opposite two lenses, and sees the *virtual* images of two pictures apparently at the same place. In the real image stereoscope, the observer stands about 2 ft. from the instrument, and looks at a frame containing a single large lens. He then sees, just in front of the lens, a real and inverted image of each of the two pictures, the union of which forms the appearance of a solid figure in the air between himself and the apparatus. A number of figures of mathematical surfaces as defined by their lines of curvature have been engraved, and some of these will be published in the *Quarterly Journal of Mathematics*. Subsequently, a paper on "A New Fact in Binocular Vision" was read by Mr. A. Claudet. Mr. Balfour Stewart read a paper "On the Behaviour of the Aneroid Barometer at different Pressures." It consisted chiefly of an inquiry as to the extent to which an aneroid might be taken as a reliable instrument when exposed to considerable changes of pressure such as occurred in mountain ascents.

In Section B, Chemical Science, the president, Professor Thos. Anderson, referred to the present insufficiency of the atomic theory, at least in the form in which Dalton left it, to explain the facts accumulated in the last twenty or thirty years; which, besides other results, had given the paramount importance formerly ascribed to oxygen, rather to carbon as an element. On the same day, a paper on the Decay of Stone, was read.

Professor Wanklyn read a paper on "The Existence of Putrescible Matter in River and Lake Waters" in which he detailed several analyses which he had made in seeking to detect the presence of organic matter in London water.

Mr. Dugald Campbell then read a note on "Messrs. Wanklyn, Chapman, & Smith's Method of Determining Nitrogenous Organic Matters in Water," which was replied to by Professor

Wanklyn, and caused a good deal of discussion, in which Dr. Angus Smith took a prominent part.

A description of a new anemometer for measuring the speed of air in flues, was read by Mr. A. E. Fletcher, Government Inspector of Alkali Works for the Western District. The instrument makes use of ether, but dispenses with the introduction of any delicate contrivance into the vitiated air; and the construction of the apparatus is based on the fact that a current of air passing across the open end of a straight tube, causes a partial vacuum in it. An application of this principle is seen in a small toy in common use. The anemometer is described in the "Third Report of the Inspector of Alkali Works, 1866," which may, no doubt, be procured from the Queen's printers. With this description is a table to show the speed of currents of air as indicated by the apparatus. The instrument is so sensitive, that on a windy day the effect of each successive gust is observable as variations are caused in the draught of the chimney. By a modification, the apparatus may be used as a wind gauge. Testimony was given, in the Section, to the efficiency of the contrivance.

Mr. Fletcher then showed a "self-registering perpetual aspirator." A small fan placed in an opening in the side of a chimney communicates with a bellows which drives air from the flue through testing bottles, and thus the amount of acid passing through the flue is indicated.

Mr. G. Ansell gave an explanation of "an apparatus for indicating the pressure and amount of fire-damp in mines." The idea embodied in the machine was founded on the law of diffusion announced by Graham, that gases diffuse in the inverse proportion to the square root of their densities, or, more popularly, that light gases diffuse more rapidly than heavy ones. Mr. Ansell here showed by experiment that, when a tube closed at one end by plaster of Paris, is filled with common coal gas, the lighter part of the compound is rapidly diffused through the plaster, as is at once seen by the yellow flame and slight explosion which ensue on bringing a lighted match close to the closed end. Hence, Mr. Ansell said, his proposition. In a pit the case is the reverse of that of the tube. There the gas is ready to escape into the galleries, and the apparatus must, therefore, be modified to suit the varying circumstances. The essential parts of the apparatus may be described as consisting of an alarm-bell and a telegraphic needle,—the former being rung and the latter deflected by an electric current, which is set in motion by the action of the dangerous gas. The means by which this is effected consist of an iron cup, on which is fixed a disc of white Sicilian marble, standing on a U-tube, which contains a quantity of mercury. The marble here represents the plaster which closed the end of the tube in the first experiment, and through it the dangerous gas is diffused. As it does so the mercury is pressed up into the other extremity of the tube, completes the previously broken circuit, and an alarm is given by the ringing of the bell and the deflection of the needle. When the apparatus is intended to indicate a sudden eruption of gas, marble $\frac{1}{2}$ in. thick should be used. When there is a slow accumulation of gas, rising to 10 per cent. ($10\frac{1}{2}$ being the most explosive), the apparatus detects it, and points out the danger. Again, when it is wished to give warning to a man who had left the pit that gas had accumulated in his absence, marble $\frac{1}{2}$ in. thick is used, and the danger is indicated as before. Mr. Ansell stated that he had used the instrument in the Monkland pits at Airdrie, where it had been also used independently by Mr. Mowie. It had been fitted up in the upper part of a gallery where Mr. Ansell and Mr. Mowie were unable to detect any gas. The instrument gave the alarm, and Mr. Ansell remarked that in this case it must be incorrect; but on elevating a light into the upper current, an explosion followed, showing that gas had indeed been there. Mr. Ansell went on to say that when gas was known to be present, it was of great importance to learn whether the percentage is increasing or diminishing. This he has accomplished by means of a modification of the Aneroid barometer. Mr. Ansell thought that he would be able to improve his apparatus by substituting such a corrugated metallic chamber as that in the Aneroid for the column of mercury which was used to make connexion between the poles of the battery.

Professor Anderson believed that this was the first attempt to apply the law of diffusion to

practical purposes, and it was certainly of the highest importance.

Mr. Bell, Newcastle, feared that the very nature of the work of a colliery, which would necessitate the perpetual movement of the apparatus, might impede its use by the workmen; but thought that, in the bands of the coal-viewers, it might be turned to good account, as the accidents most feared by coal-owners were those in which the atmosphere of a whole gallery, or a portion of one, is polluted. This apparatus might be applied to prevent such wholesale catastrophes.

Mr. Ansell mentioned that Mr. Mowie had suggested that the whole apparatus should be enclosed. When this was done the workmen had in no way misused it.

Mr. J. Lowthion Bell read a paper on "The Present State of the Manufacture of Iron in Britain, and its Position, as compared with that of some other Countries." The paper was suggested by the opportunity afforded in the Paris Exposition of comparing the position held by English and foreign manufacturers. Mr. Bell wished, by a comparison of foreign and British iron-masters and their mechanical progress, to discover whether the opinion that our country was advancing less rapidly than some Continental nations, was well founded. He regretted that some of the English specimens showed great slovenliness of workmanship; but, notwithstanding this, and the very fine specimens exhibited by foreigners, after careful investigation, in which he had received all possible assistance, he would maintain that British industry and enterprise had not fallen behind those of the Continent. Mr. Bell referred to the past history of the art as showing which nation had contributed most to its present advanced state. Beginning with the introduction of mineral fuel by Dudley, he spoke of Cort's rolling-mill, and Nilson's application of heated air, to aid in reducing ore, as being really revolutions in the manufacture of iron. He further noticed the improvement of furnaces introduced by the Durham and Yorkshire iron masters, which at once raised the temperature and effected a saving in fuel; the introduction of the steam-hammer for the manufacture of armour-plates; and the discovery by Sanderson that rolled plates would be more suitable. Such were the contributions of this country, which other nations had turned to account as occasion offered. The chief difference between this and other nations consisted in the fuel. Foreign coal, not being so pure as our own, gave rise to various improvements in its cleansing, and in the production of coke. Similarly in France they turned to account the excessive waste of heat, and also the combustion of the gases which burn at the top of the furnace; but our own iron-masters were not less ready to adopt these improvements when the price of coal made it profitable for them to purify it, improve the coke, and turn the gases and waste heat to account. As to steel, Bessemer's improvements were so great as to eclipse all others. Mr. Bell remarked that his personal acquaintance with the manufacture of iron at home and abroad for many years led him to suppose that there had been no change in the relative position of our own and other nations. The present state of trade had led many to suppose that more rapid mechanical progress was being made abroad than in our own country, but this, he was persuaded, was a mistaken conclusion. In this country the royalties to be paid in connexion with mines were excessive as compared with those of the Continent, but this was counterbalanced by the expense to which foreigners were put in procuring fuel. Nor was it true that foreign workmen were better educated than those of Britain: neither can be looked on as superior, scientifically, to the other. Again, in Britain there was greater facility for reaching a seaport, owing to our insular position; but the easier charge for royalty and the lower railway charges compensated for this. This did not, however, account for the disappearance of much of the trade, which was wholly due to the cheaper rate at which labour is obtained abroad. He concluded by showing that on an examination of the economic position of the workmen they stood on almost perfect equality as to the cost of the necessities of life.

Professors Anderson, Williamson, and Odling spoke very highly of Mr. Bell's paper.

In the Geological Section (C) the most interesting part of the proceedings was the address of the president of the Section, Mr. Archibald Geikie, especially if viewed in connexion with his lecture, mentioned in a former notice. The

present state of knowledge of the geology of Scotland was clearly set forth; whilst it was allowed to be seen how much is yet undetermined as to the relative importance of time, and erosion by water, and of sudden upheavals as by volcanic action. In this Section, Mr. J. Wyatt read a lengthy paper on "The Gradual Alteration of the Coast Line in Norfolk." It described the result of observation on the changing coast line; and as others had for years past called attention to the waste and erosion by the sea constantly in progress, the author showed that the geological changes in this part of the island were not all to the loss of the nation. On the contrary, he proved that in West Norfolk there was a continual addition to the area. A secondary object of the paper was to enforce the necessity of accurate records of the changes of coast lines, and the author suggested that this should not be left to individual observation, but should be undertaken by a responsible department of the Government, who should combine the two systems adopted by the Ordnance and Admiralty surveys, and so secure by periodical surveys accurate maps of the changing line of the coasts, the fluctuation of the levels of the sea bottoms, and the nature of the deposits within a given distance of the shore. In the same Section, a paper read by Dr. Clement Le Neve Foster.

The Biological Section (D), presided over by Professor Sharpey, was divided into two departments, viz., "Zoology and Botany," and "Anatomy and Physiology." In the first of these a paper bearing upon a subject of considerable interest to readers of the *Builder* was read by Mr. A. Murray, entitled, "The Entire Administration of the Natural History Collections of the British Museum." It was a meretricious, but apparently needed, exposure of the system of formation of the collections, that has prevailed. This was followed by a paper by Dr. Lauder Lindsay, entitled, "Is Lichen-growth any Criterion of the Age of Pre-historic Structures?" In the other department a paper was read by Dr. Davy, "On the Influence of Air on Vital Action, as tested by the Air-pump." The author described experiments which showed how much longer some animals are capable of resisting privation of air than others. In one instance an egg, an inchoate animal so to speak, was hatched, producing a healthy chicken, after having been acted upon by an air-pump twenty-six days; a young bird expiring in about half a minute, a fish—the minnow—in about half an hour, the frog and toad in about the same time, the earthworm in about an hour and a half; insects, such as the bug, dragonfly, and butterfly, after apparent death for more than an hour, recovering on exposure to the air, and that repeatedly. By other experiments on birds by means of submersion in water, he showed that different species vary greatly in ability to bear exclusion of air: thus while all the snake-birds of which he had made trial expired under water in a minute or less, the buzzard lived about twenty minutes and a half, the common fowl about forty minutes and a half, the goose and duck about ten minutes. Reasoning on the results, he infers that each individual animal has something peculiar in its organisation determining its peculiarities of function or action, peculiarities more readily described than accounted for. He holds the subject to be in a great measure mysterious, nor is he sanguine, referring to the new and ingenious views on the genesis of species, that they will tend, except partially, to enlighten the subject, considering that life itself is a mystery, and the origination of life, as regards Natural Science, an unsolved problem.

DISCOVERY IN SHEFFIELD PARISH CHURCH.—In erecting a new clock, it has been necessary to cut a circular hole in the north side of the tower, for the reception of one of the dials. In doing this a stone was found embedded in the rubble filling of the wall, measuring 11 in. by about 12 in., and about 9 in. deep. The face of this stone was carved with a simple variety of the indented chevron moulding, and had evidently formed a portion of an arch in the Norman church. Judging from analogous cases, this stone, it is thought, had probably been fixed in the chancel-arch, its size indicating that the span of the arch would be 16½ ft. The pattern upon the stone fixes the date of the church as in the twelfth century, thus agreeing with the opinion of Hunter.

ARCHITECTURAL DOINGS IN GERMANY.

Prussia.—In Berlin, the rebuilding of the cathedral, or "dom," has for some time been determined upon, and the first active step in this direction was a public competition by Prussian architects. The conditions these gentlemen had to bear in mind were manifold and difficult, particularly as the preservation of several existing parts was insisted on. Thus the "cappasanto," on the north, which will ultimately be decorated with frescoes by Cornelius, was to be retained; the foundations towards the east, abutting on the Spree, were again to be made use of; the Royal Dispensary, on the south, was not to be interfered with; and whilst certain liberty was given as to the western extension, still the new building was not to exclude a view of the museum from a certain porch in the Palace. Whether these conditions crippled the competing architects too much, or whether the designs submitted were all open to serious objections, we know not, but certain it is that no better design was obtained than one prepared some years ago by the late Professor Stüler, and accordingly his plans are to be carried out. The cathedral, which will be of classic style (Corinthian), will have a length of 230 ft. by a height of 140 ft. to the ridge. A dome 190 ft. high will rise above this, carrying a tower, which, including the cross at top, will be 70 ft. high, giving a total of 400 ft. The cost is not to exceed 3,000,000 thalers, or about 450,000 £.—The new Hôtel de Ville, of which we have a model in the Paris Exhibition this year, is now rapidly advancing towards completion. The style is essentially German Gothic; but the dark brick is effective, and the internal arrangement very complete. The great central tower is unique in its upper treatment, being crowned with a steeply sloping roof, flat-topped at the apex, and forming an octagonal plateau. From the corners of this plateau rise eight strongly curved ribs, terminating in a flag-post, and within this sort of open crown will be hung the clock-bells. We doubt the wisdom of an arrangement whereby the bells will hang utterly unprotected against the inclemency of the weather.—Count Blücher is about to erect a mansion of great size and cost on the "Pariser Platz." Mr. Richter is the architect.

The late political changes in Germany have necessarily had their influence upon this city, which is in reality, though scarcely as yet in name, the capital of Germany. One of the first necessities was the extension of the War Office, and the erection of a new wing on the park side of the present building has been decreed.—Baurath Herrmann (his full title is "Baurath and Oberbaudirector,"—the latter rather a mouthful) has received the order to visit London and Paris, in order to study the Parliamentary houses of both capitals; this, too, is a sign of the political times, as also the fact that the subject competed for at the Academy of Arts this year was "A Design for a House of Parliament for the North German Reichstag." Mr. K. H. Schäffer, architect, of Brandenburg, was the successful candidate.—Some sixty students, who were accompanied by two professors, have just returned to the Academy of Architecture, after their annual sketching tour. They extended their trip as far as Kiel and Hamburg, where they were received with great attention. Among other civilities afforded them, the Hamburg American Steamboat Company gave them a trip down the Elbe, on board the *Germania*. We know from personal experience the value of these annual sketching tours under the guidance of the masters attached to the German "Academies," and recollect meeting a heavy at Nuremberg. Scattered throughout the town, in the churches, on the Schloss, we found them, sitting alone, or by twos, on their camp stools, sketching, and often colouring in too. The masters would go the round, now stopping to correct a perspective sketch, now pointing to peculiar features, perhaps comparing them with others elsewhere; or they would fix a date, or help to take a measurement. The evenings are passed socially, the professors mostly joining the students, and losing no prestige by so doing.—A year or so ago Frankfurt would have had a paragraph to itself: now it must need stake its place here, as elsewhere, under Prussia. We noticed briefly recently that a committee had been formed for the rebuilding of the cathedral. On the evening of the 26th ult., a well-attended meeting was held in the *salle-à-manger* of the Hôtel du Nord, those present being mostly members of the Archaeological Society and the

Artists' Club of Frankfurt. There was but one opinion as to the desirability of reconstructing the dom as soon as possible, but the next two proposals were the subject of warm discussion. The first proposal was that the tower should be restored to its precise form before the fire, but this was met by a counter-proposal that a spire should take the place of the former cupola, which, it was contended, was not in keeping with the character of the tower itself, and should therefore not be replaced. The other proposal was one of ways and means. Some argued that all Germany should be appealed to for funds, inasmuch as the Dom was a national monument, intimately associated with the history of the nation for a thousand years. Others held that the Frankforters had ever helped themselves, and would do so now. The result of the meeting was the appointment of a committee, consisting of the leading members of both societies, for the purpose of considering both questions and reporting thereon. In the meantime we hear of subscriptions coming in from all sides. The King of Prussia has ordered 30,000 dollars (4,500*l.*) to be paid annually to the fund, and the young King of Bavaria, who promises to be as great an art-lover as his grandfather, "old Ludwig," has contributed a donation of 5,000*l.*

Austria.—In Vienna there is comparatively but little doing, owing probably to the slow recovery of the nation from the effects of the late war. The principal object of any interest and size is the new "Conservatorium," which is being erected under the auspices of the Association of the "Friends of Music." The building, which is Renaissance in style, is estimated to cost upwards of 50,000*l.*, and is being executed from the designs of Mr. Theophil Hansen, to whom the first place was accorded in the late public competition for this object. The Emperor, who takes a great interest in the matter, has presented the Society with the site, free of all expense, for ever, and has, moreover, granted them the very questionable proceeds of two "State Lotteries." The Votive Church, for some years in course of construction, has come to a standstill for want of funds, but an effort recently made to meet the remaining expenses has been so far successful that the works are again to be continued. The church, however, will hardly be completed for the next five years, and even then much of the stone carving will necessarily remain in block.

VENTILATION IN AMERICA.

We have received from Mr. L. W. Leeds, of Philadelphia, a pamphlet on Ventilation, being the substance of a course of lectures delivered by him in the Franklin Institute, together with various diagrams and lithographs.* It appears that Mr. Leeds was employed during the late war by the Quartermaster-General and Surgeon-General in directing the introduction of improvements in ventilation in all the Government hospitals, and in making and collecting plans of the buildings under Government control, and is now consulting engineer of ventilation and heating for the Treasury Department, giving him charge of the heating and ventilation of the Treasury buildings, all the custom-houses, marine hospitals, most of the post-offices, and United States court-rooms, these buildings being all under the care of that department.

The following communication accompanied the pamphlet:—

"Although a stranger to you, I feel like addressing an old acquaintance, made so by the constant perusal for many years past of your very valuable paper.

I believe to-day, and have thought for years past, that the *Builder* exerted the greatest influence for the spread of correct and valuable information in sanitary science of any publication now extant, not only in the place of its publication, but in this country as well.

Your frequent articles on Ventilation, and your very urgent appeals for fresh air, greatly interest me. It is with much pleasure, therefore, that I forward you copies of some lectures delivered last winter before the Franklin Institute of this city upon that subject, and which have just been published in the *Journal* of that Institute. No greater satisfaction could be afforded me than the approval by the *Builder* of the views expressed in those lectures.

You will see that I lay much stress on the

necessity for an opening for the exit for the used air on a level with or below the floor, especially for winter. Although it is but a small portion of the year that dependence should be placed mainly on floor exits for the foul air, yet, as that small portion of the time is just when artificial ventilation is most relied upon, and that there is no disadvantage in leaving them open at all other times, I think this provision for floor ventilation thus becomes one of the most important considerations in artificial ventilation.

It has been my endeavour to illustrate clearly, in a simple way, when floor ventilation was necessary, and when ceiling ventilation was best. I have been a strenuous advocate for the necessity for floor ventilation for fifteen years; but, being opposed by all physicians and eminent writers on the subject, I could make but little impression. But within a year or two, a very great change has taken place in this country on this subject. It is now admitted by all thoughtful and intelligent writers upon the subject to be of great practical importance.

The adoption of this principle by the Government during our late war was of great advantage in this respect.

I should infer, from the tenor of frequent communications published in the *Builder*, that you Englishmen have not considered in all its bearings the effect of dispensing with that great charm of an English home, "the fireside." I know the open fire has its great inconveniences, and is entirely inadmissible in many buildings, but I think you have scarcely comprehended the value of an open fireplace alone, even without the fire, for winter ventilation. I think, therefore, the remarks in the lecture upon that subject will apply to you as well as to the Philadelphians.

It seems to me best not to encourage the thoughtless or casual observer to believe that any good ventilating arrangement can ever be made to work automatically. Automatic feeding machines or drinking apparatus, or automatic dressing machines, I think would be more likely to work successfully than any automatic ventilating machine—that would supply us at all times and in all places with air of just the right temperature and just the right quantity to meet all the various changes in the external atmosphere and the constantly varying condition of our physical system. I think we must depend only on the proper education, and on the intelligent, thoughtful care of every one to know and see that he is careful to breathe nothing but pure air all the time."

The lecturer gave a vigorous protest against the want of provision for the supply of fresh air everywhere apparent; and numerous simple experiments are made to show the immense importance of fresh air, and the evils that result from want of it. Their circulation cannot fail to effect much good. Mr. Leeds is quite right in urging the value of the open fireplace. In many cases floor ventilation, we agree with him, is important; but this must by no means be taken to mean that exits for foul air in the upper part of apartments are not absolutely required.

Opinions in these matters, supported equally by large experience, strangely differ. Thus, Dr. Templeton, in the very interesting communication printed in our last number, though he points to the occurrence under certain circumstances of a stratum of foul air next the floor, provides in the system he has carried into practice, for outlets and inlets only at the top;* the friction of the current on the volume of air in the room soon sets the mass in gentle motion, revolving on a horizontal axis, and sweeps out, so to speak, a portion of the impure air previously in the room. In a letter further explaining his views, Dr. Templeton writes,—

"I can best explain the principle thus: suppose a circular pond in a meadow with a stream running tangentially across one point of the circumference and freely communicating with it; the friction of the fluid will very soon excite in it a revolving motion round its centre, acquire to it a portion of fresh fluid from the stream, and detach from it a part of that which has already circulated; the activity of the change depending on the size and velocity of the stream. My stream is fresh air, and the pond the room to be ventilated. It will be seen at a glance how important it is that the stream's course should be as direct as possible. My experiments confirm this."

The papers sent by Mr. Leeds include illustrations of a stove made by his direction for the American Western Hospitals where they burn bituminous coal. Many hundreds were made, and they proved, he says, very satisfactory. This stove includes a water-boiler on the top of it round the amoke pipe, perforated at the sides,

under the cover, for the escape of moisture. The lower part is cased, and fresh air is brought from outside into the chamber thus formed and passes into the room warmed. The objection that occurs to us, without further explanation, is the contact with highly heated metal of the air brought in to supply the apartment. The same objection seems to apply to the arrangement for temporary hospitals illustrated.

We sincerely hope that America will listen to the arguments and statements of Mr. Leeds as to the vital importance of fresh air.

INDUSTRIAL EDUCATION.

WHILE various continental nations are going ahead in manufacturing skill, we seem to be standing still, and to stand still in such a position is to retrograde, all the more especially while other nations are surpassing us. We are glad to observe that a consciousness of our position in this respect is awakening manufacturers themselves to the necessity for being up and astir in the industrial race. Messrs. G. H. Nussey & A. Nussey, of Leeds, manufacturers, have issued a pamphlet, "A Technical Institution for Leeds and District," in which they take an enlightened view of our shortcomings and of what we require to enable us to hold our own in the markets of the manufacturing world. The late wool sales, they state, show effectually the progress of the foreign woollen manufacturers, half the wool having been bought by them for their own consumption, although fifteen years ago foreign buyers were rare. The woollen manufacture is what the authors of this pamphlet are more especially interested in; but the question is one which applies to all our manufactures. Messrs. Nussey suggest that a school of weaving and designing should be established at once in Leeds, and the present local school of art improved. They propose:—

"A building to be erected, with every convenience for lecture-rooms, and workshops, suitable for the various trades taught. The building to be as handsome as possible, compatible with economy—the taste of the inhabitants of a town being much improved by being surrounded with beautiful objects. An efficient staff of professors to be attached. The professors to give free lectures twice a day (say morning and evening) in order that all classes may enjoy the advantages of the institution. Pupils to be taken either as in or out-door pupils; the terms to be as low as possible, only high enough to make that department pay for itself. Comfortable quarters for the boys to be considered as a most important part of the arrangement of the building."

They state that "in our standard textile manufactures, cotton, woollen, worsted, silk, hosiery, and articles of common use, we are almost nowhere," and that it is "in these trades we find the greatest want of technical education." The inventive genius of foreign designers has much to do with the superiority of foreign goods, as in those of silk especially. The Lyons designers, for example, are all educated at the School of Fine Arts and Manufactures, where they are taught to weave, as well as to design and paint flowers, &c. Even the partners in a firm, or one of them at least, must have had artistic education. In short, the sound system of technical and scientific education for workpeople and employers that has been established by foreign Governments, and the great attention that has been paid to the scientific improvements relating to various manufactures, are the chief causes of the advance of manufacturing industry abroad.

The Nottingham manufacturers are astir on the subject. At a special meeting lately of the local Chamber of Commerce, the following motion to the Associated Chambers of Commerce was unanimously resolved upon:—

"That the importance of more extended education in relation to the various arts and manufactures of this country is recognised by us, and it is recommended that an inquiry should be made at the instance of the Government as to the state of education abroad as it affects the industries of various nations, and that a committee be appointed by the associated Chambers to counsel and assist the Government and the Chambers of Commerce in the promotion of industrial education."

The chairman said, that since this motion was drawn up he had ascertained that the Government had made some appointment for the purpose of making inquiries into industrial education abroad. The other day Mr. B. Samuelson, M.P., called upon him and informed him that he was commissioned by the Government to pursue this course of inquiry. He (the chairman) suggested that some gentleman should be associated with him in the important work, and, having communicated with the Government on the subject, they had appointed Pro-

* "Lecture on Ventilation." By Lewis W. Leeds, Philadelphia, U.S.: Lippincott & Co.

* See p. 676, ante.

Professor Leone Levi to assist him. It was high time that the subject was properly taken up, as there could be no doubt that foreign countries were beating us in our manufactures. The reason, as he went on to show, was entirely owing to our present system of education, and he was quite sure that until that system was improved no alteration could take place.

At a meeting of the central council of the Yorkshire Union of Mechanics' Institutions, also under the presidency of Mr. E. Baines, M.P., it has been resolved to institute an inquiry into the present means for the promotion of scientific and art education in Yorkshire, and to ascertain the opinion of the principal manufacturers and others as to what measures are required to increase and extend the means for the technical instruction of the managers and foremen of manufacturing establishments, as well as the more rudimentary scientific education of artisans. In the instructions given by the president to Mr. Henry H. Sales, who is charged with the inquiry, are the following directions:—

"You will inquire chiefly into the instruction given in the classes of the several institutions under these heads: 1. The art of design, and especially mechanical drawing. 2. Mathematics, especially applied to mechanical art. 3. The principles of mechanics. 4. Chemistry, especially applied to dyeing. You will learn distinctly whether the gentlemen whom you consult are of opinion that Mechanics' Institutions are calculated, if properly used, to effect the object in view, or whether it is essential to have some institutions of a higher class, exclusively designed for scientific and art education, and supported partly (and to what extent) by the public funds. You must also endeavour to judge how far our artisans would avail themselves of the opportunities for technical education, if offered; and whether, if evening classes be insufficient, we must look to the means of supporting students during their period of study."

In connexion with this subject we may here remark that a project for transforming the machine gallery at the Paris Exhibition into a gigantic international workshop is said to be just now before the Emperor. In estimating the whole of the steam engines employed at 2,000 horse-power, 4,000,000 francs yearly, it is estimated, might be realised by the rent, and a population of workmen now scattered might be fixed on the banks of the Seine. "It would be," says the Engineer Brissac in conclusion, "a cyclopaen school without rival in the world, which would render to Paris, to France, and to industry, the greatest service."

Technical education in Austria is now being attended to with increasing interest. The Imperial Royal Polytechnic Institution at Vienna, established in 1816, for the object of promoting instruction in the practical sciences, at first formed a kind of preparatory school for artisans, but it has since been gradually extended and improved into what may be termed a scientific university; and since October, 1865, by imperial decree it has been created a "Hochschule," power being given to it to grant diplomas, and the entire course of education being made strictly compulsory, whilst a higher scale of knowledge is demanded from students applying for admission. Most of the students enter at about eighteen or nineteen years of age, having generally previously passed through an education of six annual courses in the Realschulen (Government schools, where solely technical subjects, entirely excluding the ancient languages, are taught), preceded by four annual courses in the Hauptschulen (preparatory Government schools for children).

THE ANCIENT BRITISH REMAINS IN YORKSHIRE AND DERBYSHIRE.

The lateness of the harvest has prevented the resumption of the scientific examination of the Yorkshire tumuli until now. A tumulus examined near Weaverthorpe has given up relics almost if not quite unique. In excavating, quantities of red deer and other animal bones, all split longitudinally, for the marrow, were found. In the centre, in a circular grave of 10 ft. diameter, and nearly 6 ft. deep into the solid chalk, reminding us of the so-called chalk-pits elsewhere found and not yet clearly accounted for, was the skeleton of a Briton, a warrior laid with his weapons beside him. The body was on the left side, with the head towards the north-east, and in a contracted position as usual. The right hand of the skeleton grasped a fine bronze dagger of the round ended (and early) type. The ovate-oblong blade was delicately thin, and the broad end had the three rivets (bronze) which fasten it to the handle, the mark of which still

remained. A flint knife lay upon the dagger, and below it was a double-pointed awl or bodkin, of bronze, — a curious and novel implement. Over the breast were five very large jet buttons, and one of clay; and at the back of the skeleton, in the position it must have held when slung over the shoulder during life, was the fine bronze battle-axe (a model of the old stone axe) having the mark, on the patina, of the wooden handle. Only one tumulus of similar interest to this has been found: that is recorded in Bateman's "Ten Years' Diggings." The inquiries will extend over many months.

An interesting discovery of Celtic funeral urns has been made in the railway cutting near the picturesque hamlet of King's Newton, Derbyshire, in a situation not hitherto suspected as being likely to afford matter for archaeological investigation. The height of the situation, the absence of any covering upon the urns save earth, and the paucity of other relics such as flints or bronze, prove that one of the early tribes had formed here a regular burial-place for the ashes of their dead. Cremation had been practised elsewhere, and the urns then brought to the grave-hill from the distant place where the funeral pyre had been erected. Small vases containing the ashes of infants were found; but in no case did the layer urns contain the smaller vessel called by antiquaries the "incense cup," or any bones except those of human beings. The ornamentation exhibits evidences of considerable taste and ingenuity, one fragment presenting the unusual feature of a double ring of crosses carefully impressed by means of a stamp.

IMPERIAL SCHOOL OF FINE ARTS, PARIS.

This year the subject for the grand prize in architecture was "Un Palais de l'Exposition des Beaux Arts."

The 1st prize was awarded to M. Henri Jean Emile Benard (*élève de Pacard*).

The 2nd prize to M. Pierre Henri Moneux (*élève de Gnepepin*).

Both designs were excellently drawn, and would form a very interesting feature in our architectural exhibition, if their authors could be prevailed upon to send them.

ECONOMIC AND REFORMATORY LABOUR IN PRISONS.

This is a subject we have occasionally urged in the *Builder*, and we do not see why prisoners should not be set to useful and remunerative employment, not only for the benefit of the public, but for their own behoof. It is odd that while such a system has been found practicable in other countries it should usually fail to be so in England. The Howard Association, of which Lord Brougham, Sir John Bowring, and other well-known men are patrons, have issued a circular on this subject, in which they say:—"English prisons are, in too many instances, merely places of temporary detention, and of very inefficient deterrence, inasmuch as many prisoners are re-committed thirty, forty, fifty, or even more times; and their condition, as to food, clothing, and lodging, is superior to that of multitudes of the honest poor outside; thus frequently offering an inducement instead of a discouragement to crime.

The objection sometimes urged, that prison labour would compete unfairly with honest workers outside, will be found, on examination, to be very superficial. For the prisoners, if not trained to remunerative labour, are a dead weight upon the ratepayers whilst confined, and will again be a nuisance and expense to the public when discharged. Further the number of workers in prison would, at most, be very small compared with those outside. In many foreign prisons, the strict enforcement of prison labour is found to be deterrent and preventive, as well as reformatory.

Many imprisonments, especially of poverty-stricken misdoers, are a heavy and wholly unnecessary burden on the community, and might be beneficially avoided by such preventive measures as making fines systematically payable by instalments, as in county-court debts. Prevention is better than cure.

In a few of the best managed of our prisons, as at Bedford, Holloway, Manchester New Bailey, Newcastle, &c., the prisoners earn from 5l. to

10l. each per annum. At many others almost nothing, as, for instance, a *farthing a day* at Exeter gaol. But the convict prisons (especially in Ireland) are far better. Some of the American prisons are wholly self-supporting, and return a net profit to the State, with excellent moral and preventive results in addition. But in the average of English prisons (good and bad together) each prisoner costs 30l. per annum, and earns less than 2l. Yet, to show what can be done in this country (and even by women), the inmates of the female House of Refuge at Greenheys, Manchester (under private management), earn 18l. each per annum."

Mr. Tallack, the secretary of the Howard Association, has sent to the daily papers a petition from convicts in Western Australia complaining of great cruelty and mismanagement by the Governor. The petition is accompanied by a corroborative letter from one of the warders themselves, and it is to be hoped the Government will look into the matter, keeping in view, of course, as they will, the consideration that such convicts cannot, as a class, be the best of characters.

MONUMENTAL.

A STATUE of Lord Clyde, by Baron Macchetti, has been set up on the eastern side of Waterloo-place, near the Duke of York's Column and opposite the Franklin Memorial. The statue is 8 ft. 3 in. in height, and represents the general standing in undress forage-jacket, with his right hand in the pocket, whilst in his left he holds the turbaned species of helmet usually worn by officers in the Indian service during the hot seasons in that part of the world, and in front of which the general's sword is suspended from the waist-belt. The statue stands on its own proper feet without any other support. The pedestal is a massive piece of workmanship. The base, some 12 ft. square, is composed of blocks of grey granite, and on the front part of this is a crowned female, said to be intended for the Empress of India, seated on a couchant lion, and holding in one of her hands an olive or palm branch. Behind this group is a pillar of polished red granite, the floral mouldings being in bronze, supporting the cornice and figure. The entire height from base to summit is 26 ft. The statue looks small compared with the basement, but is a good likeness and easy figure. The sire of the lion may be found in Trafalgar-square. The least satisfactory portion of the design, and this is very unsatisfactory, is the female figure, who sits weakly, with the legs crossed, and is altogether *mesquine*.

Mr. W. Day Keyworth, of Lower Belgrave-place, has just completed a statue of Andrew Marvell, which, with a view to its erection in the new town-hall, Mr. J. Widship intends to present to the corporation of Kingston-upon-Hull, the birth-place of Milton's secretary. The statue, which is 7 ft. high and of Sicilian marble, represents the patriot at the moment when he may be presumed to be rejecting the bribe offered to him by Lord Danby on behalf of the king. The sculptor cites as his authority for the features the portrait of Andrew Marvell in the British Museum, which pictures a fine handsome man in the prime of life.

WATER SUPPLY: SEWER VENTILATION.

The Liverpool Water Committee of the town council have just recommended, and the council adopted the recommendation, that the water engineer, Mr. Duncan, be requested to undertake the execution of the works in connexion with the Yarrow reservoir, the filter-beds, and the diversion of the river Douglas.

Mr. Alderman Cooper said he saw that the highest tender was for 151,000l. and the lowest 88,000l. Now, he wanted to ask the chairman of the water committee whether any communication had been made to the person who sent the lowest tender. He thought trouble might be saved by taking care, when accepting tenders, to have the usual guarantees with them for the performance of the work.

Mr. Beloe said that by some means the amounts of the tenders appeared, to their surprise, in the public newspapers. How the gentlemen of the press obtained their information he had endeavoured in vain to discover. But so it was, the tenders were put in, and the lowest tender was found to be far below the

estimate of Mr. Duncan, and he was not surprised to find that Messrs. S. Sim & Co., instead of giving the securities they otherwise would have done, declined to carry out their tender. They reserved the names of their securities, and their tender was accepted subject to those names being furnished. He thought the withdrawal of Messrs. Sim & Co. was entirely attributable to the publication of those figures in the newspapers. He had the authority of the town-clerk for saying that it was quite open for them to withdraw. The tender has not been accepted unconditionally; on the contrary, it was conditionally, on the guarantee being thought acceptable.

In March last the Liverpool corporation came to the determination to ventilate the sewers of the borough, and without loss of time the work was in rapid progress. At a meeting of the Liverpool Burial Board last week, it was stated that the number of interments during the past month were only 413, when compared with 786 in the same month of last year, showing a decrease of 373, and that ever since the sewers had been ventilated the death-rate had sensibly decreased in the borough.

The new reservoir connected with the water-works of the town of St. Colmb, in Cornwall, has just been completed. It will hold sufficient water for the use of the inhabitants for three months, in the event of no rain falling during that time. The residents seem well pleased with the prospect of having the convenience of an ample supply of water brought to their houses, and regard it as a great public boon, notwithstanding what has been said against the introduction of the Local Government Act.

THE STAGE.

Haymarket Theatre.—As Juliet Mrs. Scott-Siddons has made a considerable advance in public estimation. It is a very excellent performance, superior as a whole to her *Rosalind*. Several crudities observable in her acting on the first night of "Romeo and Juliet" have been overcome, and a full house every night recognises her merits. Mr. Howe plays *Mercutio* with great dash and spirit, and Mr. Kendal *Romeo* with considerable elegance. Some suitable and agreeable scenery has been painted and selected, so that the spectator has no doubt the action is going on, we will not say precisely in Verona, but at any rate in Italy. The balcony scene, with the city in the distance, is, of course, made a striking feature. Tradition points, with or without truth, to a house in a close street in Verona as the residence of old Capulet; but we make no objection to the scene-painter on the present occasion for going a little way out of town.

Lyceum.—"The Lady of Lyons," on Monday, was received with acclamation by a full house. Why, it would be hard to say, for it was certainly not well played; indeed, to tell the truth, it was played very badly. Mr. Fechter, clever actor as he is, managed to make himself look more like the young lady's father than the enthusiastic young poet-lover figured by the author. Miss Charlotte Leclercq (*Pauline*), charming in many things, is not equal to the part; and Mr. G. Jordan, who played *Beaucaire*, must have fancied he was playing *Clavis*, the comic conspirator. There is very little that can be honestly praised in the production, beyond some very pretty landscape scenery, painted by the Messrs. Greive.

Bristol.—The new theatre in Park-street is progressing rapidly towards completion, though much requires to be done in the way of embellishment and decoration. The front, somewhat Italian in style, is of freestone, with Pennant columns at the entrance. The dress-circle will seat nearly 250 persons. On extraordinary occasions the corridor may be used by spectators, as it presents a full view of the stage. What about the draught?

Theatre Royal, Doncaster.—This theatre, the property of the corporation of the town, is reopened for the season, after undergoing a thorough reconstruction from the designs and superintendence of Messrs. Thomas Moore & Sons, architects, of Sunderland, who are also at present engaged upon the building of the new Theatre Royal and Opera House, Leeds, and the new Theatre Royal, Yarmouth. The builder engaged at Doncaster was Mr. Thomas Wood, of that town; decorator, Mr. Jackson, of Leeds. The modelling was by Mr. Alfred Walker, also of

Leeds; the gas arrangements and sunlight, by Mr. G. L. Smith, of Birmingham; and the upholstery, by Messrs. Roberts & Woulldhave, of Leeds.

A Sweet Programme.—An American has invented a tasteful play-bill for the French theatre. The programme and names of artists are printed upon an agreeable paste by means of juice of chocolate, so that the programme can be eaten. This is a new way of having a taste for theatricals, and "devouring their discourse."

ACCIDENTS.

A FATAL accident has happened in the Strand, on the site of the new law courts, or rather in the street immediately fronting the site. A number of workmen were engaged in removing the stone pillars of the archway leading to Clement's Inn, and opposite St. Clement's Church, when the standards—two long poles, crossed—suddenly canted, and fell to the ground, striking a young man on the head, and crushing him to death. He was one of a number of persons who were standing watching the progress of the operation.

A labourer has been killed while engaged at the gasworks, King's-cross, removing the *débris* of a wall that was being knocked down. Part of the wall between the top and the bottom had been removed, the top, however, being left flush. A man who was on the top of the wall stepped inadvertently upon the part from which the underlayers of bricks had been removed, which gave way, but as he was falling a comrade caught hold of him and saved him. He, however, dropped his pickaxe, which, falling a distance of 25 ft., hurried its point through the neck into the chest of the deceased. A verdict of "Accidental death," has been given in this case.

A bricklayer has been killed by a fall from a scaffold in Queen-street, Essex-road, Islington. Deceased was handing boards down from the scaffold, which was being taken down, to another bricklayer, who was standing on the ground, and when he came to the last board, instead of drawing the hoard toward him, and holding on to the pole while he lowered it, he lifted it up and pushed it from him, in doing which he lost his balance and fell into the street, a distance of about 11 ft. No one was to blame. A verdict of Accidental Death was also returned by the coroner's jury in this case.

Twenty houses have been burned and damaged at Rotherhithe, near the water side. The fire appears to have broken out in a bakery carried on in Rotherhithe-street. The fire swept along the street both east and west, and within half an hour twelve of the adjoining houses were in ruins. The flames swept across the street and set fire to a ship's bows and rigging, and it required the incessant exertions of the firemen to prevent it being wholly burned. Several houses in Lavender-lane were also burned down.

At St. Michael's Church, Bishop Stortford, an accident has occurred. Some years ago the large five-light plain window at the east end of the chancel was taken out and a smaller coloured one put in its place, the interstices being rather tastefully filled up with bricks. Workmen had been engaged in cutting away the face of the brickwork to the depth of 4 or 5 inches, and substituting flint stones to match the other parts of the wall. At the time of the accident two bricklayers were upon the scaffold engaged in filling up a portion they had cut away over the top of the window, and immediately below a row of stone coping partly supporting a foot or two of wall, the stone battlements, and a stone cross. Suddenly and without any warning the stone coping, with the superincumbent wall, battlements, &c., fell forward on to the scaffold, which all fell outwards to the road, hurling a lad who was ascending a ladder with a hod of flints on his shoulder, backwards on to the opposite side of the street, and overthrowing the iron railings and stone curbing under the window. One of the bricklayers fell upon the fallen railings and had one of his arms terribly lacerated. The other fell to the ground close to the church wall, and was partly buried by the falling *débris*. All three were taken up insensible.

At the new parish church at Stroud a shed standing in the churchyard, and close to the new church which is in process of erection, was found to be in flames. In about an hour, however, the fire burnt itself out. The shed contained all the workmen's tools, and also a considerable quantity of prepared oak timber intended for the roof of the nave. The whole was destroyed, and the

loss of the timber will necessarily lead to delay in the building of the church. The loss is estimated at little short of 700*l.*, which is wholly uninsured, and will, therefore, fall upon the contractors, Messrs. Wall & Hook. The cause of the fire is not known, but it is conjectured that a cinder from the engine used in the yard may have lain smouldering, and thereby led to the catastrophe.

A fatal accident has occurred at the Norman-ton Station. Workmen have been pulling down the old buildings, and whilst engaged in the work a portion suddenly gave way, and, falling upon the foreman, he was buried in the *débris*.

A church spire has been destroyed by lightning at Sutton-in-Ashfield, Notts, where the parsonage-house had been struck by lightning. During the second storm the lightning struck the spire of the church at the distance of only a few yards from the scene of the previous visitation. No lives were lost, but the spire was shattered, many stones being thrown from it, and the upper portion twisted round. A slight wind will probably complete its destruction.

THE COAL-CELLARETTE.

A CAPITAL notion; and a capital name. You cannot have a coal-cellar in the club-room or the first-floor of an hotel; but you can now, thanks to Mr. Thompson, of Sloane-street, have a coal-cellarette, which will contain a very large quantity of coals, in an ornamental form on a small ground space. The coals are removed from the bottom of the cellarette, and the small being equally consumed with the large, dust and dirt are avoided. Its capacity, too, being made equal to the consumption of a whole floor, it can be used for all the fires, as well as for replenishing the scuttles for the upper floors (as in the case of large hotels), when placed in the corridors.

The form of the cellarette is that of a pedestal, the top being movable for the reception of the coals. It varies in size, is capable of holding from 84 lb. to 40 cwt., and can be mounted upon castors or rollers, rendering it easily movable.

It was patented under the title of the London-derry, but it is more likely to become known under its second title,—Thompson's Coal-Cellarette, which at once explains its purpose. We are not surprised to hear that it is in use at the Bank of England and many other large establishments.

LEEDS MECHANICS' INSTITUTION AND SCHOOL OF ART.

THE new building in Leeds, intended to be occupied as the Mechanics' Institution and School of Art, is making rapid progress towards completion, and will be opened, it is expected, in May next. The first stone was laid on the 31st of August, 1865. It will provide accommodation for the following departments:—

1. The Institution department, offering a well-selected library of upwards of 12,000 volumes; seasonal lectures, illustrative of science, literature, and the arts; a news-room, well supplied with reviews, magazines, daily and weekly newspapers.

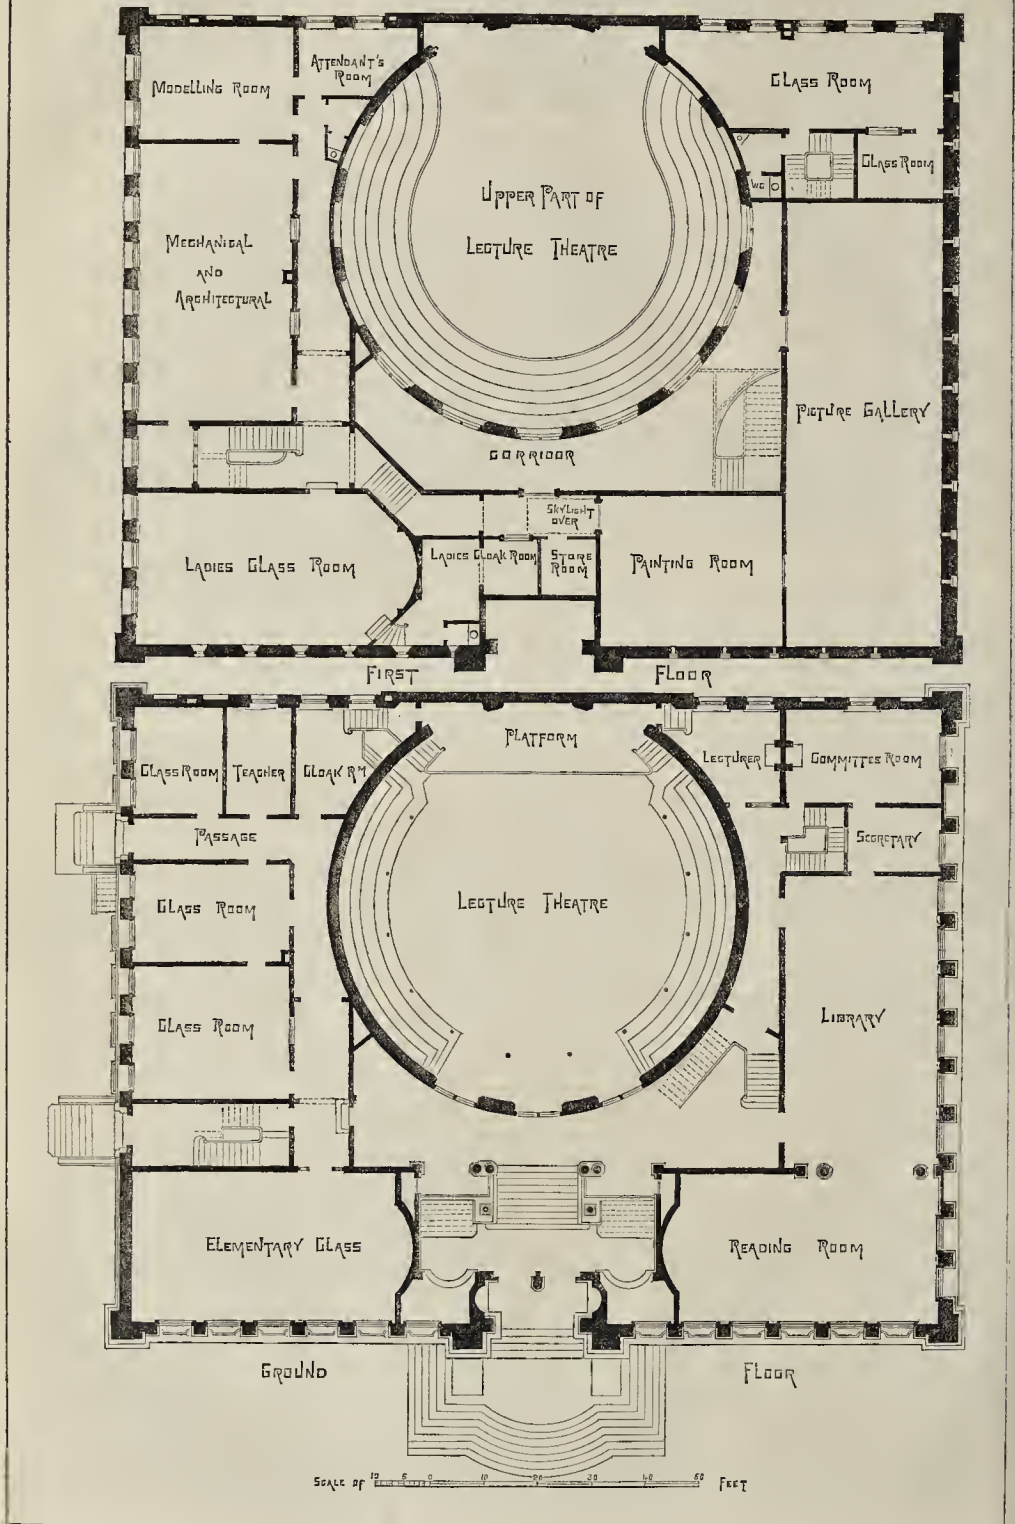

2. Evening classes, for instruction in writing, reading, arithmetic, book-keeping, the higher branches of mathematics, French, German, mechanical and architectural drawing, and chemistry, both theoretical and manufacturing.

3. A school of art, ably conducted by trained masters, affording instruction to above 2,000 pupils in the central and other schools.

4. The scholastic departments,—viz., a girls' school, with upwards of 130 pupils; and a boys' school, with 150 pupils; both these schools are self-supporting, and enable the committee, by the employment of the same teachers, to conduct the evening classes for males and females, at a comparatively small expense.

For the first-mentioned department the principal feature is the lecture-room, a circular hall, 73 ft. in diameter. The room is approached by the principal entrance on the ground-floor, and rises to the top of the building, a height of 52 ft. An ornamental coved ceiling, a roof of somewhat novel construction, with windows immediately below it, completes the architectural features of this hall, which, with the assistance of the gallery, is capable of accommodating 1,500 persons. On the same floor with this hall are situated the reading-room and library, and large, well-adapted rooms for the purposes of

LEEDS MECHANICS' INSTITUTION AND SCHOOL OF ART.

LEEDS NEW MECHANICS' INSTITUTION AND SCHOOL OF ART.—MR. CUTLER'S PROPOSAL, ARCHITECT.

the Ladies' Educational Institution. The boys' school is provided in the south end of the basement floor, while on the north are refreshment-rooms and porter's residence. A tea-room is also placed in this part of the building. It is immediately below the lecture-hall, and like that room, it is circular—the diameter being equally large, and the height 16 ft.

Two rooms for the accommodation of the science classes are to be found on the first and second floors, but the greater part of these portions of the erection is entirely devoted to the School of Art, the importance of which in a large manufacturing town like Leeds it is impossible to over-estimate. On the first floor the following rooms belonging to the school have been placed:—The ladies' class-room, the mechanical and architectural room, the modelling-room, the painting-room, and the picture-gallery. The proportions of the last-named part of the building are as follows:—Length 81 ft., breadth 28 ft., height 24 ft. It is intended to establish in this gallery, partly out of the profits of the National Fine Art Exhibition to be held in Leeds next year, and partly, it is to be hoped, from the munificence of the inhabitants, a fine art collection, which will form one of the permanent, as it will be one of the most valuable, institutions of the town. Mr. Walter Smith, we may mention, is the head-master of the Leeds School of Art. On the second floor the only part available is the south side, the centre being occupied with the top of the lecture-hall, and the north end with a similar portion of the painting-room and picture-gallery; but here space has been found for a suite of boys' classrooms, including lecture-room, elementary classrooms, and masters' room.

The architect of the building is Mr. Onthart Brodric, the architect of the Leeds Town Hall. The style of architecture adopted is Italian. The west and south fronts are of stone—the principal entrance, approached by a circular staircase, being in the first-named. The lecture-hall, as we have said, is entered directly from the doorway, whilst to the right and left are the reading-room and library, and the rooms appropriated to the Leeds Educational Institution. Access to the School of Art can also be gained from this part of the building, but a separate entrance is provided on the north side. The contractor for the masonry is Mr. D. Nichols, Leeds; for the joiner's-work, Mr. W. Britton, Leeds; for the plumber's-work, Mr. John Hall, Leeds; for the painting, Mr. W. Nelson, Leeds; for the iron-founding, Messrs. Nelson & Son, Leeds; for the slating-work, Messrs. Dauber & Son, Hull; for the stone-carving, Mr. Joseph Holmes, Leeds; and the whole is being carried on under the direction of Mr. J. T. Brown, the clerk of the works. The cost will be about £2,000.

FROM SCOTLAND.

Glasgow.—A meeting of the Glasgow City Improvement Trustees has been held to consider a report of their committee, which proposed that for the second year of the operation of the Act the assessment should be limited to 4d. in the pound. The adoption of the report having been moved and seconded, Mr. Bain proposed an amendment, to the effect that the committee be instructed to select a block of buildings for reconstruction; that in the meantime the trustees delay granting powers to borrow more than £10,000, or to purchase property except in the block to be reconstructed; and that the assessment be at the rate of 3d. per pound. Another amendment was proposed by Mr. Lang, enjoining the committee to make no more purchases and borrow no more money without consulting the trustees, and limiting the rate to 2d. per pound; while Mr. Wm. Brown moved for the restriction of the rate to 2d., and of the borrowing powers to £20,000, with an instruction to the committee to confine their efforts in the meantime to a certain specified block. After discussion, Mr. Lang's amendment was withdrawn in favour of Mr. Brown's. On a division, Mr. Bain's amendment was carried against Mr. Brown's by twenty-four votes to five; but when voted against the motion, obtained only nine votes against thirty-five. The report was accordingly adopted.

Fresno.—The new waterworks have been inaugurated with local rejoicings.
Aberdeen.—Lord Provost Nicol, Mayor, and Mr. A. Forbes Irvine, of Drum, Governor of the county, forwarded a joint application to her Majesty on behalf of the committee

for the restoration of Old Machar Cathedral. A letter has just been received from Sir T. M. Biddiph stating that "her Majesty learns with pleasure that an endeavour is being made to preserve and restore such an interesting structure." He is also desired to forward a cheque for 100*l.* whenever the committee feels justified in commencing the work.

THE SOCIETY OF ENGINEERS.

A LARGE party of members and associates of the Society of Engineers visited the extensive engineering works of Messrs. J. Penn & Son, at Greenwich, last week, by permission of the proprietors. Among the company were Mr. W. H. Le Fenre (president of the Society), Messrs. William Adams, F. W. Bryant, William Mac George, Vaughan Pender, George Waller, Francois E. Houghton, Thomas Cargill, P. Thorn, A. Thorn, Lewis Orlick, W. H. Maw, F. C. Young, Alfred Williams (honorary secretary), and Perry F. Nursey (the auditor of the Society), &c. On arriving at the works, the visitors were told off into three parties, each of which was conducted over the works by gentlemen connected with the establishment, who explained the various works going forward in the several departments. After an instructive visit of inspection, the members returned to town, and a number of them dined together at the Bridge House Hotel, London Bridge, in the evening.

THE ARCHITECT OF THE HOUSES OF PARLIAMENT.

SIR,—We provincial pigmies of the profession, pursuing our petty projects amid the deep obscurity of commercial communities, scarce lifting our eyes from our dingy drawing-boards, were when we open both wide in admiration and amaze as some metropolitan Titan deigns to alight among us and undertake some great commission, which, divided, would be a boon indeed to any six of us nobodies; or when we lift one eye perhaps with a hungry glare to note the number of "jobs" which fall to the lot of some lucky local farmer of draughtsmen, acquiring the world-hemorrhage of our craft by cleverly joining his experience at the bench with the handiwork of his clerks;—we, thus drudging through a half century, perhaps, of inglorious toil till Time lays us unsmiling in the earth we have not loaded with our works, yet in our pilgrimage glancing anon at the London papers over our chop and small beer, cannot but fix what we venture to call our minds from time to time on the matters which stir the Olympian heights of architecture.

Thus we, the pigmies, presume to think a little about the hattle waged or waging between a living knight of the holy Roman Empire and the shade of a whilom knight of this British Empire, and eke a giant in architecture; and it seems to us in our pigmy judgment (if allowed the term) that, while loyal to his father's memory, the Roman knight is seeking to prove too much, and that the no less loyal sons of our own much honoured knight are willing to admit too little. It is scarcely seemly, we fancy, that this debate over the names of two so highly distinguished artists should on either hand run into anything like bitterness; and with such knowledge of the merits of the question as some acquaintance with works of each and some memory of the events referred to afford us, we pigmies think that the fame of both architects is safe with their countrymen without any ungenerous endeavours to exalt that of either at the expense of the other. As to the great building in debate, it was always, as we remember, admitted that the architect derived valuable aid from his gifted coadjutor, and it was never in the lifetime of the latter asserted, as far as we can learn, that he claimed more merit in the matter than thus accorded him. If from the letters referred to by his son it appears that he gave more aid than has been generally supposed, we cannot see that the reputation of the friend he assisted can be damaged by admitting the fact.

The plan of the building is acknowledged to be Barry's; the style is surely not Pugin's, but of a phase of Gothic work which he and his school always decried. The composition is derived from the plan, and resembles no work we know of Pugin's. The working out of much of the detail was always acknowledged to be due to his unique skill; and by the partial quotations

published from the correspondence, it would appear that the composition of some compartments must also have been entrusted to him, but we do not see that they can prove more. We all would sympathize with the feelings of a son seeking to have justice done to his father's memory, but that of Pugin needs no better monument than his known works, architectural and literary; and all who enter on such a controversy as that in question should surely, we think, beware lest the fame they seek to enhance be not injured rather than benefited by their endeavours, which cannot but be the case should a shade of egotism or self-love appear to mingle in the efforts made on either side to enlist the sympathies of the public.

AN OBSCURE PROVINCIAL.

GOVERNMENT ARCHITECTS AND GOVERNMENT SURVEYORS.

SIR,—In the *Builder* of the 3rd ult. I find a reference to the payment of architects as employed by Government at the Houses of Parliament, &c.; also an account of a deputation to her Majesty's First Commissioner of Works, who evidently is not aware of the nauges of his office, sprung up of late years to suit individuals and a clique, to the serious detriment of the Crown property and of the public purse.

Objection is made to the proper payment of a first-rate architect. Now, I would ask, why do the Government pay a surveyor 1,000*l.* a year, standing fee, and per-centages in addition, for a few hours' work each week? This is a practice that wants inquiring into. The present surveyor is also allowed to do private practice for the builders, and occasionally dabbles in architecture.

There are plenty of equally able surveyors who would devote all their time to the duties of the office for less money. The practice there as at present pursued certainly needs revision. Moreover, the works required to be done for her Majesty's Office of Works ought to be put to public or partial competition annually, and fairly, and not smuggled to one firm only.

The works at the new Foreign and India Offices want looking to.

A LONDON SURVEYOR.

WAGES OF BRICKLAYERS' LABOURERS IN AMERICA.

A LETTER in the *Builder* for September 14th, with the initials "H. N. H.," upon the subject of emigration, and the inducements held out in the United States for the removal of our building operations to a market where their labours would be more remunerative, requires a few corrections, which, as an architect of many years' practice in America, I venture to think I can supply.

In the first place, "H. N. H." has made a mistake in his estimate of the present money value of the "dollar," which he states as 4s. 4d., a price it never could reach—4s. 2d. being rather more than its par value when in gold; but it must be understood that the current value of the dollar is now only about 3s. 6d., and has been less, so that his statement of the rate of wages must be qualified accordingly.

Had "H. N. H." resided in New York or Philadelphia, he would never have asserted that an Irish labourer can live "very nearly as cheaply there as in London." Some years ago, when the Irish and German emigrants were allowed to take temporary possession of unoccupied tracts of land not yet reached by the onward stretch of building operations, and to build their hovels thereon, such, by saving horse-rent, might have been the case; but it is so no longer—and to be at all decently housed, even in the humblest manner, requires an expenditure for rent that makes a considerable hole in the wages received at the end of the week. As to cost of living, a recent letter from New York gives the following prices:—Coal, 5*l.* 5s. per ton (of 2,000 lb. only); flour, 4*l.* to 5*l.* per barrel (which seven or eight years ago was, to my knowledge, but 1*l.* to 1*l.* 10s.); hutter, 2s. 6d. per lb.; so that the apparently increased wages are quickly swallowed up by the disbursements for the bare necessities of life, to say nothing of the luxuries.

Another error that "H. N. H." has fallen into is in regard to the price of building-land in the principal cities of the United States. The rise in the value of real estate there is something

perfectly wonderful: thus it is no uncommon thing to find a house built upon a lot in a new part of the city and sold for a fair price, and the sum realised insufficient in two years' time to buy the land only of the adjoining lots. Builders in New York, Philadelphia, and Boston make their successful speculations out of the increased value of the land, rather than by legitimate profit on the cost of building; in simple fact building by them is usually considered as the means whereby the value of the land is made to rise, rather than as the end for which the ground was originally purchased. Again, the houses are far more expensive in themselves than the writer seems to suppose. The house he alludes to in Logan-square, Philadelphia, which he considers so dear at 25,000 dollars, is in all probability 70 ft. to 80 ft. in depth, the interior most sumptuous in its arrangements, bath-rooms on every floor, and finished in a manner vastly superior to the average of the residences about Lancaster-gate or any other west-end suburban situation. Furthermore, of this 25,000 dollars, at least 10,000, and probably 12,500, would be the value of the land. The same of the house he alludes to as "an elegant cut-stone mansion, with 40 ft. front on Chesnut-street West, Philadelphia, with a garden 240 ft. deep," and which appears so extravagantly high in price at 30,000 dollars, probably is worth in land alone at least one-third of that sum. A "new dwelling with ten rooms" is in New York or Philadelphia a very different thing from our "ordinary ten-roomed house," and in a good situation 9,550 dollars would be a very reasonable price. So great, in fact, is the value of land in the fashionable parts of New York that numbers of houses are built upon "half-lots,"—that is, with a frontage of 12½ ft. only, and the utmost ingenuity is shown in making these bowing-alleys of houses comfortably habitable. "H. N. H." will probably scarcely believe the fact that as much as 17,000 dollars has been paid for such houses recently in New York. It is not, therefore, the legitimate profit on building that enables a master to pay such apparently high wages to labourers, so much as the extravagant rise that has taken place in everything, wages included.

Having offered these few corrections, the experience of several years spent in the country fully justifies me in agreeing with the writer as to the real position of a labourer in America as compared with what it is in England. The thrifty, long-headed man will thrive anywhere if he has a chance; and in these words is the explanation of the whole matter: he has more chances in America than he can have here. His wages to begin with are somewhat larger, and he may make his expenses less, principally because he can, if he pleases, dispense with the customary lavish outlay in "allowances" and beer, which I notice forms so heavy an item in our workmen's disbursements at home. Then, as he saves a little money, opportunities of prudent investment at high rates of interest are easy to find. In all probability he will own a "lot" (as building sites are called), and by selling at the rise, and buying again elsewhere, the shrewd labourer finds himself in a few years the possessor of a fair independence; and though he may not himself be able to either read or write, he has sense enough to value these blessings for his children, which, thanks to the noble educational institutions of America he can obtain of the very highest excellence for absolutely nothing (in the state of Massachusetts, education, during at least a portion of the year, is not only offered gratuitously, but is even compulsory upon parents). So in the second generation, the thrifty father's savings bear good fruit, and numbers of successful men can be pointed out whose fathers or grandfathers first came to America as builders or carpenters' labourers. One curious observation comes to my memory. The Irish labourer on first arriving is a zealous "son of the Church," and gives of his earnings liberally at the bidding of his spiritual director; but after awhile, as he finds the value of money, he becomes cunning and parsimonious, whilst his children grow up less and less tightly bound to the demands of the priest; so that, although the Roman Church in America is enormous both in number and influence, it is supported mainly by the influx of emigration. The second and third generation become but lukewarm, and the members little more than nominally Romanists, although too indifferent to become proselytes in any great number of any other creed.

To return to the general question. This much

may be said,—The skilled workman need not emigrate on score of wages only. He may undoubtedly find more scope for the establishment in life of his children, and better interest for his savings; but the mere labourer will be very much better paid in America than he can be at home; and, if he is prudent, temperate, has an industrious, sensible wife, and will adapt himself to the habits and climate of his new country, he will be sure to get on. But this success must entirely depend upon himself. As before said, he will have more chances there than here, and his future welfare will be in proportion to the good use he makes of them.

G. W.

TOWN SURVEYORS.

PERMIT me to add one observation to the excellent article hereon in your last issue (p. 673). A slight change in the terms upon which the office is held would effect a most salutary improvement in the status of the officer. At present town surveyors are appointed during pleasure, and are liable to be dismissed by any breath of the local political weathercock. They should be appointed during good behaviour, then they could feel as independent in the honest discharge of the duties of their office as the cornermen of England do, who are so appointed. The law protects persons who hold offices during good behaviour, and if any one public officer desires that protection more than another it is A TOWN SURVEYOR.

ARCHITECTS AND THEIR ASSISTANTS.

We have received a letter from an architectural draughtsman, stating, with reference to a building of some importance now on the eve of completion in Southwark under an architect, that he, the draughtsman, designed such and such portions of it, and that the rest only is the architect's own work; and he gravely asks us "to favour him with a corner in our paper to that effect." If we gave his name it would be for the purpose of making other architects aware of the exact terms on which his assistance is to be had.

A RESTORED ROOD-LOFT DOOR.

SIR,—As a parallel case to the *papier-mâché* bossen in Romsey Abbey Church, mentioned by your correspondent in the 7th? I beg to say that, at Ledenhall Church, Lincolnshire, the rood-loft door is restored by stretching some canvas on a wooden frame fitting the opening, and colouring it to imitate a massive door; the whole being nicely varnished. N. B.

THE CLOSE AT EXETER.

SIR,—I hear, on good authority, that a brick house of the commonest and most ugly description, is at once to be erected, in the Cathedral Close at Exeter, from the design of a national schoolmaster. Surely, sir, there should be taste enough in the capital of the west country to prevent the few remains of antiquity which have been allowed to exist there from being ruthlessly swept away. MONKTON.

"SINGLE-SPAN CHURCHES."

SIR,—What is the object of the poke at me in the concluding paragraph of the article on the above, in your issue of the 7th? I can assure the writer that I am not so far troubled with self-complacency about my work at St. Walburg's, or anywhere else, as to need it. On the other hand, I do not feel to be so far obfuscated as to receive the dictum—that a roof covers a hall, and a vault such a church! Formerly I was assailed because I had built so unusual a thing as a large single-span church; now, however, as the hunters after, and slaves of, precedent, have found numerous old examples, the indictment is changed. I shall be content to wait again, until further explorations, or the acquirement of vision shall have revealed that the men of the Middle Ages, taking common sense for their guide, as well as we, and when they had attained the power of making large and fine roofs of wood, did not hesitate to cover churches with them as well as halls; nay, I believe that this very Westminster Hall was first covered with a vault. So much for the dictum quoted above.

The writer says that "few of the modern attempts to revive this form of church have been successful," and then seems to derive pleasure in insinuating that mine is not of the few. Now, if I am to trust the general verdict, and the testimony of those who use the church, it is a success, as least as much so as one cares to go in for in this age of mediocrity and exaltation of small geniuses, and when the very selected chiefs of our profession are denounced in one universal chorus of critics as imbecile and incompetent.

I suppose the similarity of treatment of a similar subject, namely, the covering in of a large and undivided area, constitutes in the mind of the writer the exact reproduction of Westminster Hall. Shall we satiricize an

exact reproduction of the churches at Angers in the five vaulted single-span church to be built after this article? Surely it ought to be obvious to any one who is an architect, or knows what architecture is, that to design a church of 65 ft. span and 185 ft. long, with sufficient bays and no more, sufficient light and no more, with sufficient air and no more, and in the opinion of the members, sufficiently strong and so more; and in the opinion of the same members, sufficiently extravagant economically that it looks exactly like a reproduction of Westminster Hall? and to do all this at an outlay that would have served with some men to reproduce two or three of the principals of the roof of that same hall, is as great an effort of skill, or greater, than to carry out the ordinary roof of almost entirely novel combination of the principals of this journal early built a single-span church, — Mary's, West Brompton,—and the value of the form has been often urged in these pages.

Mr. Hanson sees more in the observation than was intended to convey. The "poke," as Mr. Hanson terms it, had no occult motive. The writer simply expressed his opinion that the church at Preston is scarcely ecclesiastical in appearance, and, right or wrong, is that opinion still. We are not likely to have assailed Mr. Hanson for building a single-span church. The conduct of this journal early built a single-span church, — Mary's, West Brompton,—and the value of the form has been often urged in these pages.

THE MANAGEMENT OF COMPETITIONS.

WE mentioned last week that the proposal in the case of the Hayling Park competition, to leave the decision to the competitors themselves, had been found unworkable, as we expected would be the case. It may be worth while, for the sake of future essayists on the best mode of managing competition, to point out one of the causes of failure in the present case. It had been proposed that the competitors should not vote for their own designs, but should have one vote each for such of the other designs as they considered entitled to the first, second, and third premiums, and voting papers were prepared to carry out this mode of selection, with all due secrecy and impartiality. The paper was to be signed "Author of" such or such design. Neither the owner of the estate, who suggested this scheme, nor his coadjutors, however, appear to have contemplated that which in fact took place, namely, that although the designs were sent in anonymously, and with the authors' names in sealed envelopes, it was obvious, on an inspection of the drawings, that one, if not two, gentlemen had sent in three designs under different mottoes, and three or four other gentlemen two designs each. The chairman at the meeting adverted to this fact, and suggested that, as it might be supposed that those competitors who had submitted more than one design would obtain an unfair advantage by a plurality of votes, it might perhaps, be expedient to put it to them as a point of honour to state which of their designs they would elect to compete with, and withdraw the other of others from competition.

This led to an animated discussion. The designs had been sent from London, Liverpool, Bristol, Newcastle-on-Tyne, North Wales, Surrey, and other southern counties, Ireland, and other places, far and wide apart. Nearly twenty of the competitors attended the meeting; and, whilst the suggestion of the chairman met with some support, it was on the other hand contended that those gentlemen who had taken the pains to prepare three designs, should not be deprived of a corresponding number of chances for the premiums. Eventually it was unanimously resolved to adopt a proviso, in the conditions, that in case of any dispute, the premiums should be awarded by Mr. Longcroft.

ARCHITECTS' RESPONSIBILITIES.

A CASE of some importance as between architects, contractors, and employers has recently been the subject of investigation in Leeds, between Mr. Henry Hood, of Pepper Hall, York, and Messrs. Dobson & Chorley, architects, Leeds, each party appearing as plaintiff against the other. The actions were originally brought in the Court of Common Pleas. It was, however, agreed to submit the whole of the matters in dispute to the arbitration of Mr. J. A. Pictou, architect.

It appears that in the year 1861, Mr. Hood purchased an estate in Yorkshire, known as the Pepper Hall Estate, and in the autumn of that year sought the services of Messrs. Dobson & Chorley, who undertook to prepare plans and specifications, and superintend the alterations for the usual five per cent. commission. Plans, &c., were accordingly prepared and approved of, and the works let in September and October, in the same year, to several contractors, whose estimates in the aggregate amounted to over 13,000l. Messrs. Longley, Brothers, of Leeds,

Contractors for the masonry and bricklayers' work: J. Hall, Esq., of Leeds, for the joiners' work; and Messrs. Russell & Sons, Darlington, for the plumbers' work. Mr. W. Freeman, of Ripley, was appointed clerk of the works. The works were completed in 1865, and the cost was £11,000. The architect is Mr. W. P. C. G. T. D. of Leeds, who charged commission, exceeded 27,000. The accounts extra work were sent in by the several contractors to Mr. P. C. G. T. D. of Leeds, who certified the same. It is however, to be noted, that Mr. Hood's possession was not until they were certified, and he became aware of the very large sums which he had to pay for the extra work, he had the whole of the accounts investigated; notwithstanding they had been certified, it was discovered that certificates had been given for work which had not been executed in accordance with the plans and specifications. Materials of less quantity and inferior quality than specified had been permitted to be used, in the measurement of bricklayers, masons, joiners, plumbers extra-work quantities were certified, which were actually done. Messrs. Dobson & Chorley, on being called to, refused to entertain Mr. Hood's objections to the accounts, and supported the contractors in their claim. Under professional advice, Mr. Hood had no alternative but to pay those exorbitant charges, and seek his remedy in law against the architects. In the course of their accounts, and they were notified as to their manner of preparing plans, superintending works, and sundry other charges, amounting to 1,600. Mr. Hood, considering the manner in which Dobson & Chorley neglected to exercise proper care and supervision over the contractors, as well as several unprofessional matters on one-half of the balance claimed, proposed to put matters in dispute to the decision of some gentleman of the law, or his own profession. To this proposal Mr. Dobson & Chorley assented, and the arbitration proceedings for the recovery of their balance. Hood at once paid 150, into court, and, under the supervision of the arbitrator, commenced a cross action for neglect, re-pecuniary damages on the grounds before stated. The investigation extended over a period of eleven days, a considerable amount of evidence was tendered on both sides. On the part of Messrs. Dobson & Chorley, it was contended that, so far as their account for professional charges was concerned, they were entitled to be the full amount of the balance claimed, and that their account was based on the sanction of the Royal and other Institutions of British Architects. On behalf of Mr. Hood, it was shown that Dobson & Chorley charged on commission on works for which they had not been sanctioned to do so, and that they carried out alterations carried out long after they had ceased to act, and supervise the works. Evidence was also given, by Mr. Hood, to show that in the contract for the plans and specifications had not been completed, that timber of inferior quality, and of less dimensions than specified, had been used; that the brickwork was of inferior quality, and of less dimensions than specified, had, with one or two exceptions, been used throughout the whole of the buildings. These allegations Dobson & Chorley pleaded, that so far as the contract work was concerned, they were not themselves, was liable to Mr. Hood, and that their alterations, were consequently absolved from liability; and to the excessive measurements allowed in the lead, and the fact, as it appeared from the evidence, that Mr. Chorley, who measured the work, that he had in instances taken the word of Mr. Russell as to the measurements of the work, both as to thickness and quantity; and that some from London Brothers as to the brick and mortar, both of which turned out incorrect. The arbitrator has awarded to Messrs. Dobson & Chorley plaintiffs in the first action—the sum of 18s. 11d. over and above the sum of paid into court; and he further awards to the defendant—plaintiff in the second action—the sum of 265l. 1s. 11d. Each party to pay their respective costs, except as to a trifling amount.

DIMENSIONS OF CHURCHES.

Our volume for 1864 * will be found a compilation from Mr. E. B. Denison, giving the dimensions of a considerable number of our churches and churches. As a supplement to Mr. Samuel Sanders has made the following table:—
Mr. Sanders writes:—
Do not extend the list to churches with an area of less than 8,000 square feet. This limit excludes several ancient churches; for example, St. Andrew's, Heckingham, Lincolnshire, with an area of 7,900 square feet; St. Peter's, Ottery, Devonshire, like Exeter Cathedral, except formed by a tower on either side, and also throughout, area, 7,500 square feet; and St. Peter's, Patrington, which possesses eastern and western towers, area, 6,754 square feet. In preference to the churches in the accompanying list, I mention the Glasgow, Kirkwall, and St. Cross are throughout. St. Patrick's is partly vaulted; Hexham is without nave. Melton Mowbray has no nave. St. Austin Friars, London, and Leominster are of large cruciform churches. Melton Mowbray has east and west aisles to the transepts; Hexham also possesses a west porch. St. James, and St. Edmund's, is without a steeple; the adjoining gateway serves as a substitute. The tower at Hexham, stands detached at some distance from the church. St. Cuthbert's, Wells, has five aisles, or chapels; and St. Martin's, Leicester, have been added to the former is recent; the lofty tower, however, is replaced by a far less conspicuous structure. Long Melford has a large steeple, which is not included in its dimensions as in the list. The choir and transepts of St. John's, Hexham, and Great Grimby, have not been so fully mutilated. I may add, that at Glasgow the aisle does not project beyond the line of the walls above, and that its height and that of Kirkwall are

relatively to the breadth of their avenues, greater than is usual in this country. In the latter church, the proportion of the breadth to the height is 1 to 3. Croydon Church has been gutted by fire.

As in Mr. Denison's list the letter S denotes a spire; the letter C that the steeple, whether tower or spire, stands in a central position; with no letter prefixed, a tower only is understood.

Perhaps some of our readers can give the dimensions of the following large churches:— St. Peter's, Sheffield; St. Giles's, Wrexham; Ashhour, Derbyshire; St. Helen's, Athington; St. Mary's, Shrewsbury; Soham, Cambridgeshire; St. Witley, Oxfordshire; and Terrington St. Clement's, Norfolk.

Church.	Area in Square Feet.	Internal Length.	Internal Width.	Transverse Length of Nave.	Height of Tower or Spire.
Glasgow Cathedral	26,400 319	63	73	86	s. 225 c.
St. Patrick's Cathedral, Dublin	20,610 300	67	187	—	s. 223 c.

THE PLANS FOR WORKING MEN'S DWELLINGS, LIVERPOOL.

Mr. SAMUELSON, in the local Health Committee, having inquired what was being done with regard to the working men's dwellings:—
The Chairman said the matter was referred at the last meeting to the borough engineer, the town-clerk, and Dr. Treuch.
In answer to a question, Mr. Newlands, borough engineer, said he thought he could go through the plans which had been sent in in ten weeks. With three assistants he had made an examination of a plan yesterday, and it took them three hours to go through it. There were seventy-four plans.
After some further conversation, Mr. Alderman Dover threw out a suggestion that Mr. Rathbone's sub-committee should be called together to consider what course it would be best to pursue in reference to the plans.
Mr. Newlands interposed, however, and said he intended to send Mr. Rathbone a statement showing the amount of labour required in examining the plans.
The question was not pursued further.

THE CORRECTORS OF THE PRESS.

A MEETING of the London "Readers" was held on Tuesday last at the Salisbury Hotel, to consider the means of improving their position, and to adopt a memorial to the master printers. Mr. Charles Dickens presided. There were present about 300 "readers" from the principal printing-offices of London, and two resolutions were passed, one expressing the opinion of the meeting that the services of the London readers were not adequately remunerated; and the other adopting the memorial to employers, asking for an increase of 10 per cent. on the present salaries, and stating, in extremely fair and moderate language, and to the effect given above, the reasons why the application was made.
We cordially agree with Mr. Dickens and the other speakers who urged the value of the services of "readers" in printing-offices, not merely to their employers, but to

all who are in any way connected with the press. The reader is too frequently ignored, except for blame. Little consideration is given to the difficulties under which he performs his thankless duties.

We have often mentioned the insanitary "closets" in which many are immured for very long days (and too often nights also) in a most poisonous atmosphere; and in addition to this their work is nearly always performed under great pressure, the tendency being to cram them with more work than can be thoughtfully accomplished in a given time, while they are required to grasp at a glance the meaning of every jumble which a careless writer may inflict upon the printer. We may look now to hear of some improvement in their position.

THE NEW WORKHOUSE FOR ST. MARTIN'S-IN-THE-FIELDS.

On Monday, at the meeting of the Guardians, Mr. Collett, in the chair, Mr. Barton, pursuant to notice, moved, that a portion of the resolution of the Board, of the 4th inst., relating to the acceptance by the Board of the plans of Mr. Cross, be rescinded. Mr. Barton said he brought forward the motion because he thought that the decision of the chairman, at the special meeting at which the plan was accepted, was illegal, as many of the guardians were absent, it being generally understood that the meeting would only select and not decide upon any plan.
Mr. Scott seconded the motion. He said he was the mover of the resolution concerning the special meeting, and he stated that the meeting should confer upon the plans and not decide, and he hoped the matter would be fairly considered.
Some further discussion having taken place, the motion was put and carried by 30 to 4; and it was then resolved that the Board, at its next meeting, should select and decide upon a plan for the new workhouse.

PROCEEDINGS UNDER THE SANITARY ACT.

At the Thames Police Court, Mrs. Caroline Smithers appeared to answer a summons issued against her, by direction of the Board of Works for the Poplar district, for not having complied with the Board's order to carry out certain sanitary works at six houses, situated at HURD'S ROW, Poplar.
Mr. Layton, jun., appeared for the Board, and stated that the proceedings were taken under the authority of the Sanitary Act, and the regulations of the Board approved by Her Majesty's Principal Secretary of State. The defendant was the owner of six houses, at Hurd's Row, Poplar, which had been duly registered, and therefore came under the regulations of the Board. The premises were in a very dirty condition, the roof were out of repair, the ventilation was defective, and the privies had no supply of water. The houses were situated in a very densely populated neighbourhood, and it was absolutely necessary, not only for the inhabitants of the houses in question, but also of the neighbourhood, that the sanitary works required to remedy these evils should be carried out. Mr. Layton desired to inform his worship, not with a view to prejudice this case, but as a matter of fact, that during last year the district was visited with cholera, and the Board had determined to put in force the Acts of Parliament, empowering the carrying out of sanitary measures, to prevent a recurrence of the disease.
Proofs having been given:
The defendant stated she had not the means to pay for putting the houses into repair. She admitted what had been proved in question, but also of the neighbourhood, that the sanitary works required to remedy these evils should be carried out. Mr. Layton desired to inform his worship, not with a view to prejudice this case, but as a matter of fact, that during last year the district was visited with cholera, and the Board had determined to put in force the Acts of Parliament, empowering the carrying out of sanitary measures, to prevent a recurrence of the disease.
Proofs having been given:
The defendant stated she had not the means to pay for putting the houses into repair. She admitted what had been proved in question, but also of the neighbourhood, that the sanitary works required to remedy these evils should be carried out. Mr. Layton desired to inform his worship, not with a view to prejudice this case, but as a matter of fact, that during last year the district was visited with cholera, and the Board had determined to put in force the Acts of Parliament, empowering the carrying out of sanitary measures, to prevent a recurrence of the disease.
Proofs having been given:

The defendant stated she had not the means to pay for putting the houses into repair. She admitted what had been proved in question, but also of the neighbourhood, that the sanitary works required to remedy these evils should be carried out. Mr. Layton desired to inform his worship, not with a view to prejudice this case, but as a matter of fact, that during last year the

Gloucester.—The Earl of Ellenborough is about at once to commence the restoration of the apsidal chapel in Gloucester Cathedral, commonly called St. Paul's Chapel.

Burwash Common.—The new church of St. Philip, Burwash Common, has been consecrated by the Bishop of Chichester. St. Philip's consists of a nave, north and south aisles, chancel, south porch, and a vestry at the north side of the chancel. The chief characteristic is simplicity. The style is First Pointed. The chancel is apsidal, and has simple lancet windows. There are three windows facing the east, and these have been filled with stained glass by Mr. Bailey, of London. The nave is separated from the chancel by an arch, and from the nave by an arcade of three arches. The roof of the church, which is of timber, and open, is supported by pillars of granite, and the pavement is constructed of local tiles, while on the gable, between the nave and the chancel, there is a bell-cot. The walls are built of native sandstone; they are unplastered. The church will seat about 250 persons. The architects were Messrs. Slater & Carpenter, of London. The builders were Messrs. Baldock & Brooker, of Hurstgreen; and the clerk of the works was Mr. E. Piper, of Robertsbridge. All the stonework was executed by Mr. Balcombe, of Ticehurst.

Danbury.—The ancient parish church has been restored and re-opened. Mr. Scott supplied the designs, and Mr. Saunders, of Maldon, was the builder employed. Mr. Chapple acted as clerk of the works. The south aisle has been extended 4 ft. 3 in., and a new north chancel-aisle added. The chancel-stalls have been shortened, lowered, and pierced. In the course of the alterations the ancient roof was discovered, and has been made use of to roof part of the restored building; and the ringing-platform is now above the tower-arch. The whole of the seating is in Riga wainscot, at a cost exceeding a thousand pounds. The carved poppy-heads and elbows, as also the altar-table and lectern, and the other carvings were done by Messrs. Farmer & Brindley. The facing of the east part and west end is of padding-stone and cement: a great part of this stone has been gratuitously supplied by Mr. J. Oxley Parker. The total cost of the restoration will be about 3,750*l.* The church will now seat about 648 people.

Wath.—At a meeting of the committee for effecting the church restoration, it has been decided to instruct Mr. Hadfield, the architect, to accept the tenders of Mr. J. Rodley, mason and builder, Sheffield, for the mason's work; and Mr. Hayball, joiner, Sheffield, for the joiner's work, the tenders amounting together to about 900*l.* It was also resolved to postpone the letting of the plumbers' and glaziers' and painters' work for the present.

Westminster.—Arrangements are in progress for the erection of a new church in Westminster for the accommodation of a new district to be formed out of the parish of St. James's, Piccadilly. It is to be hoped that a site may be obtained for the edifice either in Great Marlborough-street or its immediate neighbourhood, and meanwhile a temporary church has been opened in the southern end of the old Pantheon.

Kirby Lonsdale.—Lord Kenlis, son of the Earl of Beville, has undertaken to defray the entire cost of restoring the parish church of Kirby Lonsdale. It is estimated that the work will cost more than 6,000*l.*

Liverpool.—We hear that a gentleman is about to erect, at his own cost, a church in Parliament-fields, Prince's Park-road, nearly opposite the Greek church now in course of erection.

DISSENTING CHURCH-BUILDING NEWS.

Braintree.—The chief stone of a new Wesleyan chapel has been laid here, in the Payne-road. The new building, which will be in the Gothic style, with tower, at a cost of 1,325*l.*, is to be erected by Messrs. Fermenter, of Bocking, from designs by Mr. Frederick Barnes, of Ipswich. The ground cost 250*l.*, and it was originally intended to erect Sunday-schools in contiguity to the chapel, but it being found that this would interfere with the proposed dimensions the idea was abandoned. The building is of red brick, with Caen stone dressings, and will consist of nave and transepts, with tower and spire at the north-west angle. The vestry and offices are at the back, with entrances from the minister's house. Internally the roofs will

be of open timber, with carved ribs and braces. The fittings will consist of open benches and yellow pine, the whole stained and varnished. The building when completed will accommodate about 400 persons, with facilities for extending the accommodation to 650 persons.

Middleton Cheney.—The memorial-stone of the new Wesleyan chapel, in this village, has been laid. The old chapel being inconveniently small, the new one is being built near the Baptist one, in Queen-street. It will be of brick, with pointed arches, and a porch fronting the street. The contractor is Mr. Kimberley, jun. It is also proposed to erect a school.

Bristol.—A new Congregational chapel and school-rooms have been commenced in Stapleton-road. The chapel will be in the Italian style, with the principal entrance from Stapleton-road, and will provide seat-accommodation for between 900 and 1,000 people. At the end of the chapel will be the minister's and deacons' vestries, and behind the chapel are to be the school buildings, which will have a frontage in a new street from Stapleton-road to Pennywell-road. The cost, including fittings, but exclusive of land, will be, for the chapel and vestries about 2,300*l.*, and for the school and class-rooms, 1,200*l.* The architect is Mr. Hans F. Price, of Weston-super-Mare; and the builder, Mr. James P. Stephens, of Bristol. We understand Messrs. Hall & Sons, of Broadmead, have promised the glass for the buildings, and Mr. Barrett, of Bristol, to do the glazing, free of expense. The sum of 823*l.* 15*s.* 11*q*d. has been already contributed or promised.

WINCHESTER DRAINAGE.

A SPECIAL meeting of the Local Board of Winchester was held on the 17th inst., when the General Purposes Committee presented their report, recommending that the first premium be awarded to the author of the scheme No. 7, bearing the motto "Experience," and that taking into consideration the decided opinion of Mr. Botham, relative to Nos. 1, 5, and 11 plans, no premium be awarded to the authors of these plans. After a long discussion, the report of the committee was adopted by the Board.

The author of the successful plan is Mr. James Lemon, C.E., of Southampton. Mr. Lemon is now carrying out the main drainage of that town.

Books Received.

Sussex Archaeological Collections. Published by the Sussex Archaeological Society. Vol. xix. Bacon: Lewes.

The new volume of the *Sussex Archaeological Collections* maintains the character of the series and the society. Amongst the contents will be found Notes on the lost Towns of Northeye and Hydney, an illustrated account of Ote Hall, one of the Sussex manorial residences; and Fact and Legend concerning Harold. An account is given of the Punishment of Pressing to Death at Horsham in 1735, which is thought to be the date of the last infliction of this dreadful punishment in England. How recently we were barbarians! The account of Slinch Church includes particulars of the coloured decorations it presented.

VARIORUM.

"THE Theories of Copernicus and Ptolemy." By a Wrangler. London: Longmans, Green, & Co. This is an ingenious piece of "wrangling," showing what can be said on both sides of a no longer moot question, and especially on behalf of the Ptolemaic side. Even the revolution of the whole stery system round the earth's axis in twenty-four hours does not daunt the Wrangler, but he does not attempt to incorporate this tremendous idea with the revolution of the self-same stary heavens at one and the same time round the axis of Jupiter in eight or nine hours, and round the other planets at their respective and varying rates of rotation, so far as they are actually known, like Jupiter's. Of course, on the Ptolemaic system, we must close our eyes to the known and actual rotations of all other planets, as well as the earth's, or rather we must not regard our little bit of dirt as one of these planets at all, but as the self-sufficient centre of the whole universe. The organ of cosmical self-esteem, were there any such organ

in the Wrangler's brain, must be "very laudible" if he really desire to uphold the Ptolemaic theory in the face of the Copernican; but only justice to him to repeat that this is an ingenious piece of argumentative wrangling, and that the author makes out a very feeble case for Ptolemy.

Miscellaneous.

THE MONT CENIS RAILWAY.—A correspondent two days ago, wrote:—"The Paris papers the news of an accident on Mr. Fell's rail over Mont Cenis, by the awkwardness of the breaksmen. The carriages, &c., it appears, over a precipice at a curve, the velocity had been too great." There has been no confirmation of this statement, so we conclude it erroneous.

MEMORIAL OF A LORD MAYOR OF LONDON. According to the *City Press*, the North London Railway, in making the approaches to the tunnels in Liverpool-street, removed a brick wall which was a stone with the following inscription:—"Thomas Rowe, miles, cum prator Londinensis, huic locum reipublice in usum licet sepulture communem suo sumptu dedicavit Anno Domini 1569." The wall enclosed a considerable space, on which the terminus stands, but which previously had been used as a garden to some houses contiguous. A parish charity was annually distributed within walls up to two or three years back, the being supposed to be dispensed over a tomb-ground having been once used as a burial-place for which purpose the tablet records its destination. Previously to 1569 the site was swampy, and ill-drained. The railway company removed an immense quantity of bones in digging for foundations.

QUANTITIES: THE HERTFORD UNION WORKHOUSE.—Last week, in our notices to correspondents, we stated in reference to a letter complaining of the architect's refusal to allow the quantities to be taken out by a surveyor was named, that the evidence that the architect was wrong was not very clear. The sequel is to show that we were right. The architect now appears, had an agreement with the Local Board of Guardians that he should furnish quantities to competing builders; and the Board have resolved, by a majority of eighteen to one, to adhere to that agreement. The architect, Peck, had declined to allow the quantities to be taken out by Mr. Timmis, the surveyor appointed, who had gone to various builders like himself, in order to obtain from them authorities to take out the quantities; and Mr. Timmis had, therefore, made a stir as to the matter amongst the guardians, of his influence amongst whom he had boasted, and had written Mr. Peck called "a peculiar letter" to him, in fact had brought the architect up before the guardians with the view of compelling him to allow the quantities to be taken out by Timmis.

BUCKS ARCHAEOLOGICAL SOCIETY: PRESENTATION OF OUR NATIONAL ANTIQUITIES.—The Bucks Archaeological Society have held their annual meeting at Wotton, one of the seats of the Duke of Buckingham. An excursion was made to Boarstall, Brill, and several other places of historical interest. The duke presided at the business meeting, in the course of which Sir Harry Verney, M.P., made some remarks on the destruction of valuable antiquities through neglect, and suggested that these remains should be under the care of local authorities, and supervision of a responsible Minister of Crown. The duke, in acknowledging a vote of thanks for his hospitality, alluded to this subject. He said:—"There are close to Buckingham, buildings erected in great part, by my own family out of the destruction of most ancient Roman remains. Very curious pavements, rooms, so on, have shown that, if the search had been made fifty or sixty years before, we might have laid open the *arcana* of a Roman house, and its domestic arrangements, as perfectly as preserved in Herculaneum and Pompeii. The first thing that would result from Government care would be centralization in London. I would rather to see old relics preserved in their localities, and I really think it will do us better by local associations calling the attention of local residents to them, than by any possible Government provision that can be devised."

HEREFORD CATHEDRAL.—The tower of this cathedral is being re-leaded, the old lead having become useless through visitors cutting their initials on it, a practice to which the dean and archdeacon will for the future put a stop.

HOUSE FLIES.—An American paper says that house flies may be effectually destroyed by taking if a spoonful of powdered black pepper on a spoonful of brown sugar, and one teaspoonful cream: mix them well together, and place the mixture in a room where the flies are troublesome.

ELY CATHEDRAL.—Bishop West's chapel, at the north-east end of Ely Cathedral, is being adorned with an encaustic pavement, by Minton. A large ornamental slab (by Field), embellished with a dated cross and inscription in brass, to the memory of the late Bishop Sparke, is placed in the centre of the floor.

DUBLIN EXHIBITION PALACE.—The affairs of the Company are in such a condition that, at a sitting just held, the question whether the building should be sold for what it would bring was discussed. It was stated that a shareholder had offered, on the part of a purchaser, £100,000 for it, but the purpose to which the offer meant to devote the structure did not inspire. An absolute resolution to sell was adopted, but the matter was held over.

RAILWAY MATTERS.—The Lime-street Station Liverpool—the Liverpool terminus of the London and North-Western line—is now being largely enlarged and improved. A portion of a tunnel is being opened up for station purposes and sidings, and several new platforms are being erected. The Lancashire and Yorkshire Company have also determined upon the opening of their passenger station at Titchfield-street. The importance and practicality of a tunnel beneath the Mersey, in order to bring into more effective union the Birkenhead and Liverpool docks, has been brought before the Mersey Dock Board by Mr. Hawker, civil engineer. Mr. Hawshaw thinks the best point for crossing is between New Brighton and Bootle, as the existing dock lines are thus connected more easily and cheaply, and the rock at New Brighton offers certain facilities for working. He estimates that the allowing for contingencies and excess of rates, would be under one million sterling.

METROPOLITAN POOR ACT.—That important part of this Act which provides for the establishment of dispensaries for the relief of the outdoor poor is now about to be put in force; and information to that effect has been given to the Board of Guardians. The leading principles upon which the new-law Board propose to act.—Those dispensaries must either be in separate buildings, or attached to the workhouse may be set up; but to each there must be a resident dispenser, and qualified medical officers will be directed to prescribe for, at their dwellings, such as are not able to attend the dispensary. The medicines and appliances for these institutions will be provided by the guardians, and the establishment will be under the management of a committee to be elected by the guardians from among themselves or ratepayers to be guardians. The entire cost of dispensaries and the medical officers will be charged out of the common fund to be levied over the metropolis.

GYPSUM MINE AT LICKENBY.—A large quantity of gypsum is now being won of excellent quality. Twenty men are employed in the mine, and work double shifts. The mine—there are two, one for air and the other for drawing the material to hauls,—are about 1000 feet deep. The seam of gypsum is about 5 ft. thick. The super-strata of the gypsum rest on a green shale and thick clay. The workings are on the Newcomen Estate. The veins of gypsum crops out for some distance to the southern shore of the Tees. The workings are very peculiar, and lie like tree-roots in the brown clay, presenting a very peculiarly combed appearance. In one place the veins have completely insulated the stratum, forming small gypsum islands, not unlike a clumid centre-table of larger dimensions than usual has been formed. The stratum seems to dip sharply to the north, and has a lesser dip to the west. Gypsum underlies the whole of the north-eastern portion of Cleveland, (Middlesex) to Coatham, and from the base of the hills to the Tees.

INDUSTRIAL PARTNERSHIPS.—It is intended to hold in Manchester a *réunion* of the friends of industrial partnerships and co-operation, in the week commencing the 22nd instant. The proceedings will comprise a breakfast meeting, to give an opportunity for social intercourse; a conference meeting for discussion; and a demonstration in the evening, the whole being compressed into one day, the 27th instant.

APPLES AND OTHER FRUIT.—The scarcity of good apples and the desirability of cultivating apple and other fruit trees more extensively in this country than appears to have been done of late years, especially by landlords in tenants' gardens, have been a subject of discussion in the *Times*; and Mr. Rosch Smith recommends the planting of railway-cuttings with fruit-trees as a very profitable scheme for adoption by railway companies. We, with others, much regret the scarcity of good fruit, especially of the apple species, and wish much that something were done to restore old times in this respect; but we still retain our objection to the shutting in of railways by trees of any kind. Where they are in cuttings that conceal the country at any rate, well and good: let profitable use be made of these; but we can conceive nothing more tiresome than the miles upon miles of tree-bordered railways along which we have had to pass on Continental railways, and we hope never to see anything of this kind in England. Railway travelling, what with cuttings, tunnels, and rapidity of passage, even in a diversified country, is quite irksome enough already.

TUNNEL DRILL.—A machine for boring tunnels, driving "adits" of mines, &c., has been brought to this country by its inventor, General Haupt, of the United States army. The whole apparatus, which drives a hole in granite or even quartz, at the rate of nearly 4 in. a minute, scarcely occupies, it is said, more space than an ordinary umbrella-stand, and weighs less than six hundredweight. It is a mere powerful frame of steel, which stands in a universal point set in a little bed of iron, and the steam borer is capable of being turned in all directions. Though capable of being worked with the same facility by means of compressed air, General Haupt prefers steam as more economical. The centre of a very small cylinder contains the drill, which is 1½ in. in diameter, but the size of which may be nearly doubled at will. With a pressure of about 25 lb. of steam, the drill is driven forward like an ordinary piston-rod, but at the rate of from 250 to 300 blows per minute. When the drills have penetrated about 28 in., the blasting powder is used, and the drill is easily lifted over the *débris* of stone. General Haupt was the chief engineer of the Hoosac tunnel in Massachusetts.

THE IMPERIAL HOTEL, DOVER.—An important addition to the hotel accommodation of Dover has just been made. The immense building commenced by the Clarence Hotel Company some three years ago has been opened for business. The new hotel stands on a plot of freehold land, facing one side of Clarence Lawn, and commands a grand sea view. The grounds are about an acre in extent, and the house is almost surrounded by some fine old trees. The enclosure will be laid out as ornamental gardens. The building has been erected at a cost of 70,000*l.*, from the design and under the superintendence of Mr. Whichcord, architect, and its principal feature is a lofty tower at the eastern side, under which is the main entrance. The ground-floor, approached from a portico projecting from the tower, has a suite of three large coffee-rooms facing the sea. The principal one of these is 45 ft. by 30 ft.; another, 45 ft. by 25 ft., is to be devoted to the use of ladies, and it is contemplated to add a conservatory to this in the rear to lead into the gardens. Branching away to the right from the vestibule is a long corridor, from which various private saloons open, and at the end of which is situated a large billiard-room, 42 ft. by 25 ft. A stone staircase leads to the upper part of the house, where there are some rooms adapted for receptions, meetings, balls, and other public purposes. The building altogether is nine stories in height, and contains 234 rooms. At present 200 of these are open, of which 75 are bed and dressing rooms. The kitchens have all the improvements in use in similar buildings, most of the cooking being done by steam. The stoves were fitted up by Mr. Jones, of London. Lifts have been provided for lessening the work connected with the establishment.

GAS IN JAPAN.—A company is being organized in San Francisco for the purpose of introducing gas into Japan.

PRESENTATION OF WORKS OF ART TO PUBLIC ESTABLISHMENTS BY THE FRENCH GOVERNMENT.—The usual report of presentations of works of art by the Ministry of the Fine Arts, on the occasion of the Imperial *fêtes*, has just appeared, and is of unusual length: the recipients include churches and chapels in sixty-four departments of France, and in Algeria; more than 200 museums, libraries, and scientific and artistic institutions in the provinces, and various public bodies and institutions.

THE INTERNATIONAL WORKING MEN'S CONGRESS.—The labours of this congress have terminated. It has not had so much of the practical as of the speculative and doctrinal in it. One resolution we may quote:—"The committee acknowledges that machinery is the most powerful means to bring about the material improvement of the working classes. But to attain this it is indispensably necessary that recourse should be had to banks of mutual credit." Working men's societies are also recommended to apply a portion of their reserve or savings-bank funds to the establishment of co-operative productive concerns.

NEED OF SMOKE CONSUMPTION IN THE POTTERIES.—No attention, it appears, has hitherto been paid to the smoke-consuming clauses of the Sanitary Act of 1866 in the Potteries, which so much require amendment in this respect. A year from August, 1866, was allowed to bring the law into operation, and it is full time now that something was done. The local authorities will have the Government authorities down upon them if they do not wake up. The Staffordshire *Sentinel* complains of their shortcomings, and points to various modes and places to show the possibility of carrying out the smoke-consuming clauses of the new Act.

ROLLING ARMOUR PLATES.—One of the heaviest armour plates ever rolled has just been prepared at the Atlas Ironworks of Sir John Brown & Co., Sheffield. The size of this slab of iron which in the furnace was a little over 20 ft. long by about 4 ft. broad, and 2½ in. thick. Its rough weight was over 21 tons. It was built up in the furnace before being rolled, by five mould plates, each 3 in. thick, and one solid plate of 6 in. This mass, when reduced by intense heat to the consistency of dough, was withdrawn from the furnace, and in the course of less than a quarter of an hour was passed between the enormous rollers many times, was reduced to the compact slab of iron of a uniform thickness of 15 in., and then passed on to its bed to cool till it had to have its rough edges planed down to the proper dimensions. The men at work were attired in thin steel leggings, aprons of steel, and a thin curtain of steel wirework dropping over their faces like a large, long vizor. All the rest of their bodies were muffled in thick, wet sack.

NOTTINGHAM SCHOOL OF ART.—A meeting of the subscribers and donors of this school has been held in the large Room of the Institution, to adopt and agree upon the rules and regulations for its future government. Mr. R. Birkin occupied the chair. The chairman said he was sorry there was not a more numerous attendance. He believed that one reason was, because they had a debt about them. He regretted to say that there was a great advance on the part of our French competitors: he considered they were our competitors, as it was tolerably well known that the machinery producing French lace was a Nottingham invention. He was of opinion, from what he saw in the Paris Exhibition, a few months ago—beautiful and cheap articles, whether in silk, clays, or cotton, including some of the best imitations of real lace he had ever seen, that their manufactures in Nottingham must make an effort. He took credit to himself for being a judge, and he never saw better imitations of lace made than those exhibited by the French people. Mr. Mallet said he dared venture to challenge French productions as to novelty and ability (Mr. Birkin—"And price?") As to price they had not the advantage, but there was a movement only waiting for adoption and completion—he meant the new Board of Conciliation and Arbitration—which, if carried out, would, he hoped, remove every obstacle between themselves and foreign competition. The rules of the school were resolved upon as proposed.

THE NEW INFANTRY BARRACKS AT WINDSOR.—The erection of the new additional officers' and soldiers' quarters on the recently-acquired infantry barracks site at Windsor has been commenced.

MANCHESTER TOWNHALL COMPETITION.—The instructions to the architects selected for the second competition have been issued. The sum of 250,000*l.* is named as the amount to be spent, and the designs are to be sent in by the 14th of February next.

COCKROACHES.—In *Science Gossip* for the present month is a hint from a correspondent, who says he has pretty well exterminated these pests by pouring a small quantity of common creosote, of which a gallon may be had at the gasworks for sixpence, into the crevices, and about the places in which the cockroaches usually appear. The only disadvantage is a healthy smell of gas.

THE HERBERT HOSPITAL, WOOLWICH.—According to the newspapers the foundations of the Herbert Hospital have given way in parts, and are being underpinned. "A deep drain has been discovered at the base of the concrete on which the hospital has been erected, and is probably the cause of the disaster." Before the building was finished we mentioned the threatened evil, and were contradicted and reproved in consequence.

MONSTER BRIDGE IN AMERICA.—The foundation stone of the great bridge across the Ohio river at Louisville, Kentucky, has been laid. The total length of the bridge will be 5,220 ft., or nearly one mile. The graded approaches will be 2,500 ft. in length, and the superstructure, consisting of iron suspension trusses, will rest on twenty-five piers and two abutments. The longest span will be 360 ft., 36 ft. longer than the longest span of the Victoria Bridge at Montreal.

STREET ADVERTISING.—The sooner a good deal of this sort of thing is put a stop to the better. Tradesmen's vans, omnibuses, cabs, boardings, live sandwiches,—every available thing is seized hold of and plastered over with advertisements. London is bad enough in these respects, but Paris is going to outdo us in the advertising line. A Frenchman of fertile imagination has just invented the following ridiculous mode of advertising. He proposes to erect along the Boulevards, level with the lamp-posts, a number of lay figures, on which the bootmakers, tailors, hatters, shirtmakers, dress-makers, milliners, jewellers, &c., would, in return for a certain sum, have the right of showing off all they have of newest and best. The promenaders on the Boulevards could in this way judge at once of the beauty and elegance of the advertised article.

THE DURHAM AND NORTHUMBERLAND ARCHITECTURAL AND ARCHEOLOGICAL SOCIETY.—The members of this society have held their fourth and last meeting for the season, on the borders of Durham and Yorkshire. They met at Croft Station, and examined Croft Bridge, the inscription on which is dated 1673. Croft Church was next visited, and in it Mr. Longstaffe gave some historical information respecting the village. The architectural peculiarities of the building were described by the Rev. Mr. Hodgson. The party afterwards proceeded to Haughton-le-Sterne, where the Rev. E. Cheese invited them to luncheon. Here Mr. Longstaffe read a paper on the district. The church was then visited, and was described by Mr. Hodgson as being entirely of Norman character. The party then proceeded to Darlington, and inspected the recent restorations of St. Cuthbert's Church.

DUNN'S FIRE PILLAR.—The invention patented by H. G. Dunn, for the saving of life and property from fire, takes the shape of a letter-pillar proposed to be placed at the corners of streets or inside public or private buildings, factories, ships, or mines. At the call of fire the policeman, fireman, watchman, or other appointed person, opens the door of the box with a key placed in the handle of his rattle, and finds therein hatchet and rope-ladder; he then takes the nozzle of hose, which is also there, drawing the hose after him, which revolves from the centre of the box and is from 200 yards to 300 yards long, so that one at a cross street would serve a length of houses. Many fires might thus be extinguished at their outbreak. The inventor's belief is that no engine would be required, but that the water as turned on would rise to the height required. We are not certain that the practice of the metropolitan water companies justifies that belief.

COLOGNE CATHEDRAL.—Cologne has just celebrated the twenty-fifth anniversary of the date on which the works of the cathedral were resumed. The King was expected, but did not attend, being represented by the Prince Royal. A solemn "Te Deum" was sung in the nave of the church in presence of the population of the town and the numerous members of the society which, founded in 1840 under the name of the Dombanverein, took the works under its patronage. There was afterwards a procession, and in the evening a banquet, terminated by a promenade on the Rhine.

For alterations to the "Dover Castle," Great Dover street, Kent. Messrs. A. Murphy, architect.— Sharpington & Cole (accepted) ... 2115 0 0

For house, stables, and lodge, at Clapham Park. Mr. Notley, architect:—
Horse. Stables. Lodge.
Coils £4,700 £620 £220
Macey 4,696 696 201
Turner & Sons 4,988 878 286
M'Laughlin 4,359 608 213
Hart 4,310 652 198
Newman & Mann 4,055 678 242

For farm premises at Rothwell, Northamptonshire. Mr. R. W. Johnson, architect:—
Sharrman £575 10 0
Barlow & Stanjon 628 0 0
Austin 628 0 0
Wilson 619 0 0
Barlow & Butlin 569 16 0
Haycock 493 15 0

For alterations to dwelling-house, Kettering. Mr. R. W. Johnson, architect:—
Hawthorn £365 0 0
Wilson 352 10 0
Buswell & Henson 339 0 0

For new Temperance Hall at Finedon, Northamptonshire. Mr. R. W. Johnson, architect:—
Whittinger & Wallington £274 0 0
Watkin 900 0 0
Wilson 888 0 0
Barlow & Co. 866 0 0
Perkins 826 0 0
Henson 797 0 0

For new schools at Finedon, Northamptonshire. Mr. R. W. Johnson, architect:—
Watkin £280 0 0
Wilson 265 0 0
Barlow 665 0 0
Henson 669 0 0
Whittinger 639 0 0

For additions to farm premises at Barkley Taorpe, near Leicester:—
Halliday & Cave £1,415 0 0
East 1,310 0 0
Herbert 1,199 0 0
Osborne 1,183 0 0
Neale & Sons 1,122 10 0

For additions and alterations at 50, Westbourne-grove, for Mr. C. Stafford. Messrs. Newman & Billing, architects. Quantities not supplied:—
Ware & Jowl £385 0 0
Phillips 578 0 0
Wicke 545 0 0
French (accepted) 537 0 0

The Builder.

VOL. XXV.—No. 1286.

Harmony in Colour and Sound.

It is a hard saying of Dr. Helmholtz,* that for all the marked analogy that exists between sound and light (light, like sound, is dependent on the undulations of a special medium, and its undulations, like those of sound, are subject to the incidents of interference, and vary in effect according to varied rapidity of vibrations), all this agreement notwithstanding, there is, we are told, one material failure of physiological analogy as between the organs ultimately addressed, the ear and the eye, and in consequence "the eye has no sense of harmony answerable to that of the ear,—it has no music."

Such is the paradox to which an investigator arrives, and so complacently is he apt to accept of who follows too exclusively the clue that has served him for one-half of the labyrinth he investigates. He would usually do well, since the object is not merely to get out of the labyrinth, but to explore it,—to cast himself free from a change from his favourite guide even the more readily because he might reasonably apprehend temptation to favouritism. Let him strike for once independently into a road that at first seems to lead widest away, and so may he, perchance, for the first time master the true bearings of his former track by looking over it from new points of view.

The sense of musical harmony, says Helmholtz, depends ultimately upon this physiological peculiarity of the ear which we have been expounding; and, as there is nothing answerable to this in the eye, as the eye has no power of resolving a compound colour into its constituents (green, for example, into blue and yellow), as the ear distinguishes the overtones,—the harmonics, combined in a note, by a faculty which is the condition of the sense of musical interval,—the eye is excluded from a sense of harmony. And yet is there purely another aspect, a different entrance, to the subject.

The harmony of colour is a matter of experience—the highest of all matters of fact. The discordance, even to painfulness, of some combinations of colour to cultivated and refined senses, is as real as is the painfulness of a wound with a knife. As matter of fact, this is established far on the hither side of any æsthetic speculation; and the pleasures, no less than the pains, from this source, being facts in sensation, must needs have, like all other such, a set of axioms in physics and facts in physiology too, of like diversity to back them and account for

them. We do not need philosophy to explain what the material diversities are upon which the differences of two colours depend, in order to be assured that a difference of such kind there must be; and if combined colours are in some cases delightful, and in others, at least with equal certainty, disagreeable, we justly assume that the primary physical difference affecting tint is susceptible of still another variation, affecting pleasantness; and we hold fast by this conviction, however reluctant physiology may be to go at our bidding on a search for its material vindication, however positively she may avouch on her return from the excursion that none such exists. If the physiological comparisons of Helmholtz are really well founded, we are perfectly entitled, apart from a possible error in his inferences, to enunciate that it is the ear which has a disability as compared with the eye. Taking our stand upon the restricted analogy of the eye, we might rashly infer that, being destitute, as appears, of a power of distinctive appreciation answering to that by which the eye becomes susceptible of harmony, it is the ear that must be condemned as incapable of music. Harmony is a term so constantly associated with sound that we are apt to assume that sound has an exclusive, or at least a prerogative, right to it, and to the idea that it expresses. But this is gratuitous. Harmony is a word that simply translates into Greek, fitting, or adjustment in coincidence,—coincidence in the very widest application, and limited to no one sense, and no sets of senses, and not, indeed, to the senses at all.

The word harmony in itself, then, meaning accurate fitting, it is found consistently used by the ancients to express even a detail so secondary after all in architecture as the wonderfully close jointing of marble ashlar in a Greek temple. But a certain dignity has accrued to the word, and it is, therefore, now the appanage of noblest applications. Thus it is applicable currently to conditions of social life, to tranquil order, or effective discipline,—the order that may "reign at Warsaw," or might be established by a Spartan Harmost,—and to the liveliest and happiest activity, effective co-operation in a family, a firm, or a constitutional government.

The essence of harmony, then, is the exquisite adjustment of differences, of whatever kind, with each other, to whatever agreeable result; and this adjustment is in general form dependent upon apt modification of degrees, of quantities, as amongst the associated elements. The value of the result depends on the delightfulness it realizes; but the process and its theory are no more the property of the ear and the musician than gravitation pertains especially to the bodies most conspicuously heavy, or that prove, it may be, to have the greatest specific gravity.

When, therefore, we speak of an experienced pleasure as due to harmony of colours, it is clear that we postulate, and surely equally clear that it is with justice, the dependence of our pleasure on degrees and differences, in quality, arrangement, coincidence; on colours, not merely as such, but as adjusted thus or thus relatively to each other. Such a pleasure of the eye manifestly corresponds in the general principle of its conditions with the pleasure derivable from simultaneous sounds adjusted to each other in degree and coincidence, in a manner to be consistent with, to conduce to, enhanced enjoyment,—that is, that are in harmony.

We conclude, then, that either the special faculty of the ear to which Dr. Helmholtz ascribes its competence to appreciate harmony of sounds has not, if it exists, any such prerogative function; or else that the eye is endowed with an analogous faculty which has yet to be searched for, or ultimately it must have some compensating relation to its objects as coloured that makes its sense of harmony,—its musical

competence,—independent of any such condition.

The inquiry, therefore, it is clear, may be taken up independently from the side of vision, and the conditions of visible harmony,—the music of colour,—as matters of experience and experiment, must provide the leading clue; while the physiology of the ear and the conditions of audible harmony become but matters of reference, and when glanced towards for an analogy must be ever jealously repulsed at every attempt to impose dictatorial mandates.

The ancients were, doubtless, justified in the enthusiasm with which they fixed their attention on the hint ascribed to Pythagoras of the mathematical quantitative relations subsisting the consonances of musical notes, and right and sagacious also in their assumption that the analogy must hold good through the whole of nature. But erring in a too cramped comparison, they expected that the music to be detected in the rest of the universe would adhere to details that, in truth, resulted from special and distinctive conditions of sound; and so the theorem became fairly exposed to an objection that, inasmuch as the conditions failed elsewhere, the assumption of music elsewhere than in sound was a mere delusion. It may have been too early in antiquity for such a paradoxical protest, however provoked, to be ventured on, and it is too late now for us to rest in it.

The larger theory, with all its defects, did not do the world ill service; it originated schemes of astronomy, not to say of theology and creation, in which the visible planets were forced with some violence to assume the intervals of the diatonic scale; but it was the conviction,—the primary assumption,—of a harmony that held Kepler to his work: assuredly it led him a strange dance, and desperately did he strain the records of observers on the racks of prejudiced imagination. Practice teaching him independence, however, he waded clear from a slough of more artificial absurdities than ever before did a benefactor of his kind entangle himself in, and came out at last holding high above his head those half-dozed sentences,—the laws of Kepler,—that vindicated his earliest assumption of cosmical harmony at the same time that they convicted of absurdity all his earliest conceptions of it.

When the solar beam was first drawn out before a really philosophical eye, into a sequence of bands comprising every characteristic colour, the ancient prepossession was again prompted to seize upon its theory; and intervals and intensities of colours were soon impressed as rigorously as had been the planets before them; and all was done that could be, and ineffectual but pitiable enough it was, to make them also keep step to the march of sound. In due time light made good its claim to have a vibrating medium, an elastic ether of its own, and was then allowed to escape from the restrictions of the audible gamut; its right was by this time established, to participate in the mathematics of vibration; and pulses, waves, and interferences, as we have seen, are common to the philosophies of the sister senses. But this being so, in the face of common experience and current expression before the claim of the eye to a harmony of its own is given up, we must surrender plausible analogy as well as palpable experience, and in such case it will assuredly be the fault of the expounder if the sacrifice has to be allowed.

The colours of nature are as varied and numerous at least as its sounds; and as sounds are recognised as either noises or notes, accordingly as they affect the ear, or fail to affect it, with a pleasing unity, a certain wholeness of resonance,—by experiment it is found, accordingly as they are due to more or less regular vibrations,—so have colours a difference appreciable by the eye by which we recognise them

* "Ueber die physiologischen Ursachen der Musikalischen Harmonie." Heidelberg.

as more or less pure,—more or less delightful and susceptible of delightful combination. The natural colours of flowers are especially beautiful; and in colour to be beautiful is to be pure. In using the word pure, we may seem to be assuming a theory; but, in truth, we are declaring an experience,—the experience that the beauty of a colour concurs with a certain sense of undisturbed unity, of a leading effect not interfered with and reduced in value by foreign admixture.

And this touches, in fact, upon a main point in dispute. If the eye cannot distinguish pure blue and red in the secondary purple, how is it likely to be able to separate the still more complicated impressions that impair the effect of a colour that ought to be a pure primary. It is sufficient in the first place, so far as the sense of harmony is in question, for the eye to be competent to condemn a colour as defective in clearness, decisiveness, and homogeneity, without pretending or caring to specify the cause. This is what eyes, finely gifted with sense of colour, certainly can do with wonderful nicety, and much more, as certainly as every musical ear appreciates the purity of a note. The test of pleasure approves or condemns with every degree of vigour, from absolute repugnance, to satisfaction, rest in as entirely undisturbed and complete. Moreover, to assist appreciation of present effect, the eye has memory, and the eye has imagination; it can recal and conjure up, if not the actual spectra of impressions of colour, some perfectly serviceable associations with them. Then when intrusive and impairing tints do not betray themselves immediately even to the best and cultivated eyes of an artist, they respond as to a test on the approximation of another tint; and the actual application of the testing colour as it heightens or declines in effect by proximity of the first, makes the existence of a latent peculiar admixture as manifest as the application of a sounding-board makes audible the note of a vibrating rod.

The delightfulness betrays to the sensitive that there must be some cause for it, and for every mode and qualification of the delightfulness, though it is far from giving direct information as to the physical nature of the causes. These qualifications are endless yet most definite, and the eye does not wait for a justifying experiment when it responds to severe provocation, and calls many a bad colour dirty,—the contradiction of pure. We may rejoice when physicists trace and inform us of the causes of the differences, but we want no information from them as to the fact of their existence.

Purity and impurity of tint are quite distinct from darkness or lightness, deepness or its antithesis, and therefore we assume that it depends on a defect of composition in the colour itself. The impure colour is thus of necessity a mixed colour, and the impurity must arise from a defective proportion between the elementary colours involved; the remedy remains to adjust this proportion and so reduce the colour to a pure one. Here, then, the eye recognizes a pure tint as the ear a pure note, and in one case as in the other, the ultimate cause probably depends upon coincident or non-coincident vibrations; but in any case as regards the sensibilities of the organ, it is matter of adjustment—of harmony.

Let us now assume that we are in possession of a pure colour, be it natural or artificial. We may consider it as variable in degree of deepness of tint without its ceasing to be the identical colour. By way of illustration this is effected by successive layers of the same pure pigment: how successfully this can be achieved in practice, it may not be easy to say. The principle, however, is secure; and if, in applying each wash successively, we leave an uncovered margin, we shall or ought to produce a scale of gradation from deepest to lightest tint of the particular colour.

The most natural comparison of the steps of such a scale is to the repetition of a single note from the lowest to the highest pitch; but in the case of a musical note we proceed from octave to octave, and each successive note ascending is produced by double the number of vibrations of its antecedent. It would seem as if there was no such limitation to the degrees of a colour. The limits of musical octaves is reached after comparatively few repetitions, but the gradations of a colour seem infinite. Is it possible that in this sequence there may be degrees which give peculiar excellence by some law of interval? At any rate, tints taken out of such a series are to each other in a relation of harmony that will seem until the physicist can show us otherwise, very fairly analogous to unison in the music of sound.

The frequent application of this harmony in decorative work is familiarly called putting one tint of colour in relief on another of the same.

When we come to compare one colour with another, with others, we are not far from this discovery, that they admit of being all arranged in a sequence that has, at least, an analogy with a scale of notes, as one element of the succession,—one colour as one note,—follows another in easy and agreeable succession, until our circuit comes to an end by our being reconducted to the starting place,—to the colour we commenced with,—by a gradation as easy as that by which we left it.

Further, when a succession of colours has been disposed by no other rule than easy gradation and visible relationship; when green has taken its place between yellow and blue under no other guidance than our sense that it has gradations within itself of which some lose themselves gradually in blue in one direction and the rest verge towards yellow in the other, and so of the rest,—this verdict of the eye is found to be confirmed by the changes that are independent of sensation. The prism arranges colours in the same order as the eye; and no less independently than notes upon a gradually shortening string assume the same order that the ear would give to them though ignorant of their dependence upon strings of certain length or strings at all.

We must carry on our remarks in another number.

IRISH RAILWAYS.

A VERY momentous subject is now occupying the attention of the Government, and was recently debated in Parliament, and that is, the present state and condition of the Irish railways. It appears that upwards of 27,000,000*l.* have been absorbed in the construction of them, and that the great majority of the lines pay little or no dividend. The parties whose capital is embarked in these undertakings are clamorous for the Government to purchase them, or to make some endeavour to improve their financial condition, either by taking them into their own hands, and leasing, or otherwise, to competent parties, who would guarantee a moderate dividend, or by a system of amalgamation to lessen the working expense, so that a better dividend might be realized from the property.

It is stated that the gross income derived at present amounts to 900,000*l.* a year, or 3*l.* per cent. on the gross expenditure; and this railway property may be purchased for 19,500,000*l.*, and it would therefore pay 4*l.* 12*s.* per cent.—not a bad per centage in these days of panic; but if the money could be borrowed at 3 per cent., it would take 634,000*l.* to pay the interest, and leave a surplus of 266,000*l.* to the Government. Again, it is held out that by a system of amalgamation and consolidation of interests a considerable saving may be made in working expenses, amounting, it is said, to at least 80,000*l.* a year, and making a total profit of 346,000*l.* for the purchase, leasing and working the lines upon the most approved system, and which might be applied in the reduction of the fares, or in improved facilities for the traffic, and increasing the accommodation to the population of Ireland.

There can be no doubt that the present lamentable position of the Irish railways has arisen in a great measure, like that of their English contemporaries, from a variety of causes, over which Government and Parliament ought to have exercised a more vigilant supervision and control. It appears from a Parliamentary return, that the legal and Parliamentary expenses of these lines have amounted to the average of upwards of 1,000*l.* per mile, and some lines have paid as much as from 1,500*l.* to even 2,400*l.* per mile, for the discharge of this simple and preliminary business. And this does not include the expenses of the long and costly feud between the London and North-Western and the Great Western, and other lines.

This exceedingly heavy expenditure certainly reflects no credit upon the country; and if Parliament had exercised ordinary vigilance and precaution, this dead weight upon railways might have been considerably lessened or modified. It has been the unwise and variable policy of the Legislature, with reference to railways, that must be ranked as one of the principal causes of their present embarrassed state and depressed financial condition.

Another "Old Man of the Sea" that has ham-

pered and oppressed them has been the enormous sums paid for land and compensation, the sums paid by many of the companies having been almost of a fabulous amount. Land valued at 5,000*l.* previously to a line of railway being projected, has been sold to the company who formed for 120,000*l.* A great portion of the land taken for railway purposes has realized to the fortunate owners prices varying from 2,000*l.* to 10,000*l.* per mile; and it is upon record that the sum paid to one wealthy landholder for his land and to buy off his Parliamentary opposition, so preposterously large that after his death his heir absolutely returned the greater portion of it as conscience-money. In another instance the proprietor of a small piece of land received 5,000*l.* compensation for loss of minerals under it, and the minerals had absolutely been worked out as far as was practicable, the remainder being hopelessly submerged in water. The market value was absolutely nil, but a railway land agent appeared upon the scene, and he converted, as if with the wand of a magician, these fabulous minerals into bright and sterling gold.

The wrongs that have thus been inflicted upon railway property might be multiplied but we have said enough to produce a lasting impression as to one of the great causes of railway depression. Another cause which has operated unfavourably has been an extravagant outlay on works; as if railways had not suffered enough from legislators, lawyers and landholders, the contractors must step in to superadd to the evil, and to heap Pelion on Ossa.

Too much money has been spent in ornamental work of a costly character, where substantial and less expensive work would have sufficed, except to establish reputations; double lines have been made where single ones would have served the purpose; and works have been carried out at a lavish expenditure, and without any attempt at economy; and contractors (once navvies and masons) have realized large and even immense fortunes, and have become the envied purchasers of some of the richest domains of our ancient gentry and aristocracy.

Other evils have arisen from the construction of branch lines on the same expensive system as the main lines, the purchase of contractors' lines at exorbitant prices, and giving unduly considered and ruinous guarantees. There is scarcely one of our main lines whose dividends have not gradually become reduced year by year, from 14, 12, and 10 per cent. from the above causes; and to prevent competition by keeping out other companies from their district,

"Fine by degrees and beautifully less,"

to 5, 4, and even less per cent.; and now every one looks with suspicion on railway securities, and many congratulate themselves, and say, "Thank God, I am not a railway shareholder!"

But, notwithstanding these advices, however, and while the effects from them continue, we must not expect a considerable extension of the railway system in this country until confidence is restored and they are put into a financially good and proper position. There is hope dawning in the future; and in the same way that the Government could relieve a panic or great pressure in the money market, as in May, 1866, they could place railways in that position that would enable them to work out their own redemption.

It is highly desirable that the railway system in this country should be extended and completed, so that every town, and even village, should be placed on the iron web of communication with other parts of the country; otherwise they are completely isolated,—shut out from proper facilities of trade and commerce; and they must inevitably decline in prosperity and population.

It is surely the imperative duty of the Legislature to encourage and foster these undertakings, and to aid their legitimate progress in every way; and means should be taken to secure Acts of incorporation by steps more simple and inexpensive than at present.

Competing lines, with their ruinous contests, should be avoided and discouraged as much as possible, and an independent attitude should be assumed by railway promoters towards landholders; as, wherever railways traverse, the land in the vicinity is greatly increased in value; in fact, landholders have derived more pecuniary benefit from the introduction of railways than any other persons; therefore they should surrender their land at its fair market value; become cordial promoters, not greedy antagonists, hearing in mind that the land wanting the facilities of railway communication loses at least

half its value. Greater circumspection is required in selecting and forming branch lines, the estimated cost of which should be properly and correctly ascertained, not left for contractors to work out, and then to be brought up at their valuation. The works should be substantially and economically carried out, especially adapted for the amount of traffic that is likely to pass over it, and suited to the wants of the country through which it passes.

If most of the stipulations here shadowed forth had been adopted as a rule, and which we expect has been the exception on the Irish lines, we should not have heard of the urgent appeals to the Government of the country to endeavour to relieve them of their pecuniary difficulties; and indeed, I do not see what greater claim they have than many lines in this country similarly circumstanced: probably the latter would be only too happy to meet with a benignant, fatherly Government that would arrange and satisfy their debts, and place them in a more useful position for the future. After the completion of the works, one of the most important items in railway finance is the working expenses: the cost of working the Irish lines has been estimated to vary from 37 to 75 per cent.; but it is said that two of the principal Irish lines cost only 43 per cent., which compares favourably with many of our English lines; if there are any lines whose working expenses exceed the sum named, the companies are conducting the traffic at an enormous sacrifice, requiring immediate provision and retrenchment, which it is just as possible to do on one line as upon another.

From the length of time many of the Irish lines have been constructed and in operation, it is not fairly to be supposed that the traffic of the country is pretty well developed (though there are complaints to the contrary), therefore the only chance of reaping proper returns on the capital invested must be contingent on an amelioration of the lines, and a necessary reduction of the working expenses. It is strange that notwithstanding so many years the railway system of this country has been in operation, there is very little trustworthy data or statistics to enlighten and regulate companies or their officers in the working of them; and I think there ought to be full and complete statistics prepared by every company, to which every shareholder might have ready access, so that in every way the relative expenditure of each line might be compared, which would lead generally to a more economical and uniform rate of expenditure and system of management.

It is not sufficient that Government alone should be furnished with this information, as that too often is shelved in the dull recesses of their offices, or issued in an impermeable Blue Book; it should be published far and wide, and exposed to the broad light of day, so that every party interested may run and read, if he so desire it.

On looking over some statistics we had collected from about twenty-two of the principal lines of railway of this country, we find the working expenses to vary from 37 to 62 per cent., and this great difference ought not to exist, because the circumstances and conditions of the respective lines could not differ so much to make the working expenses of one almost double that of the other; and in the instance of the Irish lines before mentioned, quite double the actual outlay of some lines. The extravagant expenditure in the construction of the works and other causes, are now unhappily producing their effects on the prosperity of the undertakers, and telling fearfully on the dividends; and although the Irish lines compare favourably in that respect with those of England, still they have been too expensively constructed to be worked with sufficient profit, and that is felt strongly through every artery, vein, and nerve of their systems.

The average cost of the English system of railways amounts to the exorbitant sum of £4,638. per mile, and there is only one of the Irish lines that has exceeded that amount, and that is the Dublin and Kingstown, which has cost 45,000. per mile; the Newry and Enniskillen cost 32,534.; and the Cork and Passage cost 4,478.; but the great lines did not cost so much: the Great South-Western (Dublin to Cork), cost 21,368. per mile; and the Midland and Great Western (Dahlin to Galway, &c.) cost only 11,023. per mile, while other lines varied from 10,622. to 21,388.; and the lines from Londonderry to Enniskillen, cost only 8,449., and the Killybeg Junction, 5,863. per mile respectively.

The latter lines compare favourably with the cost of some of the continental lines. In Belgium, for instance, their system of railways averages about 8,800. per mile; the Sardinia railways, from 7,000. to 8,000. per mile; but it has been the especial privilege of the United States to show us the way how to construct cheap railways. It is true they had no heavy Parliamentary expenses, or grasping landholders to deal with, and, so far as the cost goes, they have certainly set us the example how to make cheap railways.

In quoting from an official report of the State of New York, the average cost of constructing their single lines, with turn-outs, or sidings, at intervals, was only 7,448. per mile; and for a mixed gauge (double and single) 9,483. per mile, for the whole of the lines in that State, comprising a length of about 2,341 miles. While in other parts of the United States single lines have been constructed at a much cheaper rate per mile; for instance, the Maine Central, 109 miles long, cost only 2,306. per mile; the Macon and Western, 102½ miles, cost only 3,237.; the Madison and Indianapolis, 132 miles, cost 2,331. per mile; and the "Niagara," 180 miles long, was estimated to cost 3,050. per mile: the first line paid 13½ per cent., the second 12½ per cent., and the third 8½ per cent. dividends.

And our Canadian brethren, with the dread of the Grand Trunk and other lines before their eyes, have taken a leaf out of brother Jonathan's book, as the new line from Halifax to Riviere de Loupe has been estimated to cost only 7,000. per mile, and we have no doubt will be well executed for the money.

Some of the Indian railways have also been cheaply executed: the Scinde has cost from 7,000. to 8,000. per mile; the Great East Indian, 8,500. per mile; the Bombay, Baroda, and Central India, 6,144. per mile; and others equally moderate in price,—and these lines have been carried out under Imperial guarantee and control. Some of these lines, executed under the direction of English engineers, have been well and substantially made; and it must not be inferred that, because we instance the American railways as models of cheapness, they are all that could be wished, and that they possess no defects. We know well there is great room for improvement; but what we would deprecate for Ireland is the heavy cost of construction of the English and their earlier lines, and, on the other hand, the cheapness of the American lines, at the sacrifice of utility. There must be some happy medium, some intermediate point of excellence and cost, between what are known as the European and the American systems,—a combination, or, it may be, various different combinations and adaptations, which will decrease working expenses in a greater ratio than they can possibly increase first cost.

The American system has opened out and developed the resources of a considerable extent of country in virtue of its cheapness, which would not have been possible if the English system of construction had been adopted, and a modification or adaptation of the two systems, avoiding the defects of the one and the great cost of the other, occasioned by elaborate works and other causes, might be usefully employed to complete the Irish system; indeed, it might be applied with advantage in completing the small arterial lines of even our English system.

To show the extravagant manner in which some details of our railway works have been conducted, even the "permanent" way or upper works of our lines have exceeded the entire cost of many of the American lines, and, indeed, of some of the Continental ones. They have varied in many instances from 4,500. to 7,000. per mile; and on the London and North-Western, with a 7½ lb. rail, it cost 8,000. per mile, while the elaborate and complicated works of the Great Western cost 9,000. per mile.

But the American system consists of light works, no heavy cuttings or embankments; the gradient skims over the surface of the earth, just filling up and lowering slight inequalities; their gradients are necessarily short and chopped up, not long and continuous like ours, and they have ventured to ascend steeper gradients than with us, our steepest incline being the Bromsgrove Licker, on the Midland line, which is 1 in 37, while the Americans have had the boldness to mount inclines of 1 in 18 and 1 in 20 on the Virginian Central Railway.

The advantage and importance of steeper gradients is fast gaining ground in the opinion of engineers and scientific men, as evidenced

recently by the construction of the Mont Cenis Railway, which forms an important link connecting the system that traverses France with Italy and the southern part of the Continent.

This line of railway passes along that extraordinary engineering work constructed by the fertile genius of Napoleon I., for military purposes; and in addition to the double line of rails, it has a central rail laid so as to be about 12 in. above the level of the outer rails, and on this central rail horizontal guide-wheels attached to the locomotive and carriages act on either side, so that they are enabled to pass very sharp curves, even of 44 yards radii, and with the additional bite or grip of the rail to ascend the steep incline from Lanslebourg to the summit, a distance of 6½ miles in length, with an inclination of 440 ft. per mile, or 1 in 12, and after passing along the summit level of 3 miles in length, skirting the lake Coma, to descend gradients of 6¼ miles long to Molaretta, at the rate of 376 ft. per mile, or 1 in 14, and from Molaretta to Susa, of 6¼ miles, or 1 in 15.

On the subject of inclines, just as the bulk of our principal lines are completed at an unprecedented cost, we are turning our attention to a cheaper system of railways with steeper gradients when it is almost too late to reap much advantage from them: if these gradients had been taken into consideration at an earlier period of the railway era, we probably should have heard less of railway panics, difficulties, and depression of railway securities.

There cannot be much doubt that one of the greatest drawbacks to the railway system of Ireland is the number of little petty companies that the Legislature has permitted to be organized to construct and conduct their management, with the inordinate number of employes to work the traffic of the respective lines. To manage their 1,638 miles of railway, they have thirty-five companies, and I suppose thirty-five staffs of officers of all kinds, from engineers-in-chief down to stokers and platelayers, with separate rolling stock and working plant; and it appears it has only just dawned upon them that, by a judicious system of amalgamation and consolidation, their boards of management may be considerably reduced, likewise their staff of officers, and other expenses.

To show that this can be easily accomplished, what has been done in this country in the shape of amalgamation, on the London and North-Western Railway, may be pointed out. They work satisfactorily 1,319½ miles; the Great Western, 1,311 miles; and the Midland and other lines have great lengths of railway under their management and control; the whole of these are satisfactorily worked and managed with success, and are not so large as to be beyond the power or scope of single boards of management. The reduction of boards of directors, and staffs, would at once add a considerable per-centage to some that already pay a dividend, and would possibly enable others to pay one that have hitherto been without, and would not detract one iota from a proper system of control and management, the reduced staff of officials would be fully employed, and the greatest available benefit derived from a constant and regular use of the rolling stock and plant.

To accomplish this object the Government, or new companies established under their auspices, might purchase the existing lines at the market value of the stock, form new boards of management and officials, and commence the working of them upon a new, improved, and economical system, regulating the trains according to the amount of the traffic, the density of the population, and the resources and necessities of the country.

It should not be said that railway companies rejected traffic, as is asserted of some Irish lines; their object ought to be to increase and develop it in every way, and convey it at those rates that would be remunerative to the shareholders; at the same time looking at them in a commercial point of view, we would not work a line at a loss, as it cannot be expected that capitalists should establish means of communication, and be compelled to work them *pro bono publico* at a dead sacrifice of the sinews of war, as the profitable employment of that precious commodity alone justifies its uses, and thereby increases the stability, power, and wealth of the nation.

On comparing the map of Ireland, published by the Royal Commission in 1838, and the present one with the lines of railway laid down upon it, it will be found there is very little deviation

from the Government plan as originally laid out, as the present lines are carried out almost identically with it, showing forcibly the advantages the country derived from the preliminary step taken on that occasion. It appears to us, on attentively studying that map, that the Irish lines of railway may be advantageously worked by dividing them into three districts, with boards of directors; and, taking Dublin as a centre and focus of traffic, with the lines radiating from it, I would divide them into the northern and eastern district, the northern and western district, and the southern district.

The northern and eastern district would comprise Dublin to Belfast, with the lines radiating from the latter town, and from Dundalk, and the Irish North-Western line, making a total length of about 622 miles; the northern and western district, comprising the Midland Great Western, and the lines to Meath and Clones, making a total length of about 490 miles; and the southern district, comprising the lines from Dublin to Wexford, Cork, Waterford, and Limerick, with the branch lines, and the lines radiating from the above and other towns, and making a total distance of about 741 miles or thereabouts.

The above divisions would be convenient to work, and much less in length than some of our English lines, that are worked with advantage and success; and our leviathan companies are not even satisfied with the great extent of railway now under their management, as they are adding annually to the lengths, by the construction of new works, or absorbing or amalgamating with other and competing lines.

If the Irish lines of railway, which have cost twenty-seven millions of money, can be bought up for 19,500,000, which is a sacrifice of nearly one-third of their first cost, and these lines now yield a revenue of 900,000 per annum, and by a careful revision of management, the working expenses, be brought within reasonable limits, such as those of their two main lines, or to even say fifty per cent., for the sake of illustration, the Irish lines of railway ought to yield a very handsome revenue, something like 5l. 10s. per cent., and thus to make the Irish railway sought for as an investment.

But from the tone of the discussions at the half-yearly meetings of some of the principal lines, it appears the shareholders are fully alive to the value of their respective properties, as those that pay a moderate dividend are satisfied with things as they are, and would rest thankful; nevertheless not doubting that the Government would pay the full value of their property if they purchased; and it is only those lines that pay no dividend, and are hopelessly involved, that are ready to make heavy sacrifices to be rid of their troubles and responsibilities.

Of course, if a general plan of purchase and amalgamation be carried out, the same course of policy would have to be adopted as was pursued in South Wales under the new Road Act, where the Turnpike Road bonds were taken at their market value; but I have no doubt that the mere supposition or probability of Government purchasing the railways would have a sensible effect on the value of those securities, and considerably enhance the market-price.

Therefore, if any step be taken it should be done promptly; otherwise, from the improved prospects of trade and commerce, the gradual, slowly, but surely approaching period of returning confidence, with a fair harvest, a cheap rate of money, and a plethora of it in the coffers of our capitalists waiting but for the happy moment to employ it with advantage, safety, and success, a much higher price will be demanded for them; and though the shareholders may ask a small sum, comparatively, in the day of their difficulties and depression, this will not satisfy them, nor be accepted, when that period has passed away, and trade and commerce flourish once again, with all their attendant train of blessings in profusion, peace, and happiness.

NEW CORN EXCHANGE, NEWPORT, MONMOUTHSHIRE.—At a meeting of merchants and others interested in the formation of a corn exchange, it has been determined to form a limited liability company to raise a capital of 1,000, in 200 shares of 5l. each. Mr. Hancock, architect, has been requested to draw up a plan for the erection of a building, on a suitable site available for the purpose, at the back of the Steam-packet Inn, Old-green, and close to the High-street market-place. Several gentlemen have already promised to take shares.

THE BRITISH ASSOCIATION IN DUNDEE.

CONTINUING our notice of the proceedings of the Association, we come to the Section E, "Geography and Ethnology." After an address by the President of the Section, Sir Samuel Baker, a paper was read by Lieut. S. P. Oliver, R.A., descriptive of two proposed routes through Nicaragua for interoceanic communication between the Atlantic and Pacific. Various routes, he explained, had been proposed at intervals during the last twenty years, from the Tehmantepec route on the north to the Darien Canal and Humboldt's Atrato River route at the south. Of all these, the only line in operation was the railway between Panama and Aspinwall, successfully worked by an American company since 1855. Of the others, the only routes at all capable of competing with the Panama Railroad were those through Nicaragua. One of these, according to the paper, has been and is partially worked, though unsuccessfully, by the Transit Route via the River San Juan and the Lake. The other, soon likely to be carried out, is that proposed by Captain Pim, R.N., for a railway. The first of the two last-mentioned routes has been more than once advocated as suitable for water-communication—indeed, even for a ship canal—from the Atlantic to the Pacific, in 1850. The other has been only in want of sufficient capital to carry out the terms of the local Government concession. Both these routes, he said, necessarily follow the configuration of the valley through the elsewhere uninterrupted chain of impracticable Cordilleras. Lieut. Oliver then gave a description of the country surrounding the Nicaraguan Lakes. The difficulties of the navigation of the San Juan, against which the Transit Company have to contend, were exemplified on his ascent of the river after having passed the harbour of San Juan del Norte, or Greytown. The steamer they were in, drawing but eighteen inches, at last got aground, and could not be got off, so that they had to take to flat-bottomed boats and canoes. At the divergence of the San Juan with the main stream, or Colorado mouth of the river, about nineteen miles from Greytown, they observed the remains of a futile attempt to dam up the Colorado branch, in order to divert the stream down the San Juan branch—a stupendous undertaking. The low banks and marshes of the delta are such that the closing of the Colorado would cause the flooding of the surrounding country. Mr. Oliver thought that a more direct and easy route might be found, up the valley of the San Juan, across the mountains, to the tablelands of Costa Rica and San Jose. He hoped this would soon be effected, as Captain Pim proposed to explore this unknown river. From San Carlos, the regular transit route, as at present carried out, is by a paddle-steamer to Virgin Bay, sixty miles, then across the narrow neck of land, twelve miles, to San Juan del Sur, making the total length of this route, from ocean to ocean, 165 miles. On the 28th March, Mr. Oliver and his friends started off to follow the party under Mr. Collinson, which was entering its way through the woods to the Rama River. They had been cutting a whole month, so that they had made considerable progress. The cutting, called by the Spaniards *El Picquet*, commenced at the very shore of the lake at San Miguelito; the pathway being hored out at intervals as required for the levelling and survey, did not make the tract a difficult one to follow, but for the first seven miles over savannah and jicaral they found it a better course to follow the regular cattle-route to the nearest rancho. They, therefore, skirted the foot of some hills to the north through occasional thickets of bamboo, and halted first outside the denser forests at the last station, where water was procurable in a grove of stately corozo palm. The mosquitoes drove them nearly mad in the night; and at early daylight they were glad to be off, entering the cutting into the vast and hitherto impenetrable forests of the Mosquito frontier. The path travelled through this part of the cutting was in many places very difficult for the oxen with cerones to pass, and frequent halts took place in order to shift the cerones and rest the beasts. On the 7th of May they came in sight of Captain Pim and his party, who had come in search of them. He accompanied them to their last camp, and at once despatched a pipan full of provisions up to the party still left behind. They proceeded in canoe on the 8th down to the Rama station, where the bulk of the stores was deposited, and, leaving all rapids, found themselves in the

navigable waters of the Rama River, reaching the village of Rama Indiana by night. Here Collinson returned to finish his survey; at Lieut. Oliver's presence being no longer required he accompanied Captain Pim down the Rama to the Atlantic, proceeding on the 9th to Greytown by canoe. Of the engineering details of the line, he said, it was not his province to speak. Mr. Collinson's report would soon appear in full when many erroneous ideas about the course passed over would be done away with. However, too much credit, he affirmed, could not be given to Mr. Collinson and Mr. Deering for their perseverance, energy, and courage with which they prosecuted their survey in the face of more than ordinary difficulties.

Admiral Onmanny asked as to the harbour that might be formed at the ends of the proposed line.

Lieut. Oliver said the engineering question was almost taken out of his hands; but he knew that two harbours were proposed by the engineers—one at Monkey Point, on the east coast, which would be well sheltered from the most dangerous winds that prevailed in that place, and the other at Realejo, on the west, at which there was a splendid bay, capable of sheltering a large fleet.

Subsequently, a paper "On the Physical Geography of Nicaragua," by Captain Marry, of the United States Navy, was read. It showed that without meteorological observations, which might be undertaken through the agency of the Academy of Science established by the late Emperor, and by the Geographical and Statistical Society of Mexico, none of the routes proposed could be adequately considered as to the respective merits. The author compared the Panama and Nicaragua routes, referring to the prevailing winds of the Pacific ocean, and concluded by expressing an opinion favourable to the Nicaraguan route as compared with that of Panama. A paper by Captain Bedford Pim, "On the Mining District of Chontales, Nicaragua," was afterwards read.

To the papers on Ethnology and the Races of Man we shall give attention elsewhere.

In the same section a Report of the Palestine Exploration Fund was read by Captain Wilson R.E. This fund, as our readers may know, was commenced with a subscription of 500l. from Miss Burdett Coutts; which was followed by one of 100l. from the Royal Society, and 100l. from the Royal Geographical Society. The original object was that of a water-supply to the city of Jerusalem. Capt. Wilson's report stated the manner in which the 100l. voted by the British Association last year had been expended. The half of that sum had been used for general purposes, and the other half for instruments. The first sum had been applied towards paying the expenses of Lieut. Warren, R.E., who had charge of the second expedition sent out by the society. The results already obtained might be stated as follows:—The construction of a map, on a scale of 1 in. to a mile, of the highland districts of Judea, the north-east and south-west of Jerusalem, of the Jordan valley for about 16 miles north of the Dead Sea, and of a large portion of the plains of Philistia. These surveys, combined with those made in 1855-56 by Wilson and Anderson, gave, for the first time, materials for a correct map of more than three-fourths of the Holy Land, and do much to remove the reproach that no trustworthy map existed of this most interesting country. The sum of 50l. granted for meteorological instruments has, under the superintendence of Mr. Glaisher, F.R.S., been expended in the purchase of four sets of standard instruments, which have been sent to different cities in Palestine; and the observations taken at these places will, with those taken at Jerusalem, form the basis of an accurate knowledge of the climate of Palestine, so remarkable in many respects.

Captain Wilson then read a detailed paper, giving an account of recent discoveries in and around the site of the Temple at Jerusalem. The writer first referred to the publication of the Ordnance Survey maps of Jerusalem, under the direction of Colonel Sir Henry James, among the most interesting and valuable of which were those of the Haram ash Sharif, the enclosure which contains within its walls the site of the Jewish Temple, and, as some hold, that of the Holy Sepulchre also. The paper gave a minute description of the present appearance of this piece of ground, and of the buildings still remaining upon its surface. With the exception of a deep hollow in front of the Golden Gate, a slight rise towards the north-west corner, and

the raised platform in the centre, the surface of the area is almost level, and has an elevation of 2,419 ft. above the sea. On the platform stands the well-known mosque Kubbat as Sakhra (Dome of the Rock), which contains the sacred rock from which Mahomet is said to have ascended to heaven. At the south-east corner the level surface is formed by the vaults known as Solomon's stables, the age of which has been much disputed. In connexion with the mass of masonry at the south-east angle, Lieut. Warren has made important discoveries (already referred to in the *Builder*). During the progress of the survey, a large arch connecting the Haram area with the causeway was discovered north of the Walling-place. This arch is one of the most perfect and magnificent remains in the city. Much information was also obtained about the ancient water-supply, which was admirably arranged. The water was brought by an aqueduct from the pools of Solomon, and stored in rock-hewn cisterns, with connecting channels and arrangements for overflow, &c. Several of the cisterns were found to be of great size, ranging from 25 ft. to 50 ft. in height.

Lieut. Anderson next read a paper, entitled "Notes of a Reconnaissance of some portions of Palestine." Explorations on horseback were made in different directions over the valley of the Jordan; and, with a prismatic compass, the positions of all the important points were fixed by bearings taken to points previously determined. A map is to be prepared showing all the important features that were seen as they travelled from Jerusalem, through Kefer Saba, to Casarea and Athlit, and southward along the plain of Sharon, including Ramleh, Beit Jehrin, Kebron, &c.

A long discussion followed, in which Sir Henry James, Sir John Bowring, and others took part. The Rev. H. B. Tristram read a paper "On the districts of Palestine as yet imperfectly explored." He said there were many castles which, if visited, would throw great light upon the crissading districts. The place of the murder of John the Baptist and the Moah district were almost *terra incognita*. Of the country of East Moah nothing whatever was known. He hoped that this section of the British Association would go on the principle that nothing was known while aught remained to be known.

In the same Section a paper was read by Mr. Cyril Graham on the "Explorations in Palestine to the east of the Jordan, and on future intended operations." After some opening observations, he said what was proposed was in the first place a trigonometrical survey on a large scale, in which every village, and every mound which marked the site of what was once a village, every glen, every spring, every feature, be it ever so small, of presumptive importance, would be delineated. He continued: "Then we want to know the materials of which old Hermon and the other mountains were composed, the fossil remains of ancient creatures which were embedded in their sides, the nature of the soils, all the trees of Lebanon, all the flowers of Carmel (which cover it like a carpet in the spring of the year), all the fishes of the Sea of Tiberias, and the phenomena of that most wonderful of basins, the Dead Sea. We want, too, a catalogue of the beasts and reptiles, in which the crocodile will appear; of the birds, of the butterflies and beetles, and the smaller entities of creation in all their varieties. In short, we wish that book rewritten, which has not been transmitted to this day, composed by a master of science nearly 3,000 years ago, that treated of plants, from the hyssop which is on the housetop, to the cedar which is upon Lebanon, and of the birds, and the beasts, and the creeping things, and the fishes of that land." He then spoke of the material that was to be expected from the country on the other side of the Jordan.

In Section F, "Economic Science and Statistics," after an address from the President of the Section, Mr. E. Grant Duff, M.P., who referred to the omission of teaching of the principles of Economic Science, from the Universities, to the questions connected with Trades Unions, and to the importance, not merely of "technical education," but of having, like Germany and Switzerland, a really good system of elementary and middle-class education as a foundation, the report of the Committee on Weights and Measures, and Coins, or so much of it as related to the first branch of the subject, was read by Professor Leone Levi; and a paper was read by Mr. James Yates, entitled "Reasons why the Office of Warden of the Standards should include Standard-weights and Measures of the Metric

System, in addition to the Standards of the Imperial Weights and Measures." It appeared from the report that the method recommended to the Board of Trade by the Metric Committee of the Association, by the International Statistical Congress, and by Mr. Ewart's Committee of the House of Commons, and adopted in the Quarterly Account of Births, Deaths, and Marriages, of having items stated in the terms of the Metric as well as the Imperial System, had not been adopted by the Board of Trade, simply on the ground of "clerical difficulties." The mural standard, which had been the subject of so much care, both as to precision and material, the report said, was now completed. The two units now authorized by law—namely, the yard and the metre—are shown together, for comparison, with their divisions, the yard in red and the metre in blue. "By very careful observation," according to the Committee, "it has been found that the measures on this instrument are exact to within the two hundred and fiftieth part of an inch, or the tenth part of a millimetre." The standard is made of white glazed porcelain (porcelain being the material found to be least affected by changes of temperature), and it is fitted into a mahogany frame for suspension on to the walls of Custom Houses, Markets, Chambers of Commerce, and other public buildings.

The report then detailed the proceedings of the Conference with delegates from the Chambers of Commerce, when resolutions were passed in favour of the provision of standards of metric weights and measures, and of the stamping those in general use, so as to avoid the inconvenience which would prevent adoption of the system as permitted, and in favour of an introduction of the system into the public departments, as the Post-office and the Customs, and otherwise. It also gave particulars of the Conference in Paris held in connexion with the special exhibition which the Imperial Commission organized at the suggestion of the Committee and of the International Decimal Association. At that meeting M. Jacobi's report on weights and measures, which had been adopted by the organizing committee, was read. As regards nomenclature, that report was against any material change (and very rightly so); and it is of course equally opposed to the use of old names for new quantities. Neither did it favour the combination of the old and new systems, such as the use of the foot side by side with the metre, even as a measure of transition. M. Jacobi's report, in conclusion, recommended the immediate tuition of the metric system in schools, and its use in statistical and other public documents. At the same conference there was an important discussion as to the state of the standards in France, and as to the exact correspondence of those at the Archives and the Conservatoire des Arts et Meters. A commission being appointed to inquire and report, it was stated that on the 6th of October, 1863, a commission had been charged by the Ministry of Agriculture, Commerce, and Public Works to make a comparison, when the metre at the Conservatoire was found to be 0.0000329 more than a metre. The statements were considered to be "highly satisfactory, as giving every guarantee of exactitude, and completely dispelling every doubt suggested on the subject." The commission appointed by the committee afterwards inspected the metre and kilogram at the Archives and Conservatoire, and made a protocol signifying their satisfaction. The report read in the Section concluded by saying that though the introduction of the metric system throughout the Continent had been accelerated by the Conference, the use of the system in the United Kingdom, though legalized, had made little progress, or even in the education of the people; and the committee of the Section were of opinion, and recommended, that a bill should be introduced in Parliament to make the use of metric weights and measures compulsory after a given and not distant time. Mr. Yates's paper showed that metric weights and measures are now made in considerable quantities in London, Birmingham, and Sheffield; but the manufacturers apply in vain at the proper offices to have them tested. It may be useful here to mention that the report of the English Royal Commission declared the metre to be of the length 39.37079 in., and that, on this, Dr. Craig, the author of an account of the metric system lately published at New York, which Mr. Yates says appears to be written with great skill and care, observes,—"More recent determinations reduce this somewhat; and the figures 39.37 accord very nearly with the average

of the measurements made in this country [North America] and in England, and may be assumed as practically the exact truth." Mr. Yates's paper showed that besides the introduction and promulgation of the system by France, Belgium and Portugal had adopted it, that Germany and Russia were tending in the same direction, and that the United States had introduced the system into the Post-office and the Customs department. There are now, in the States, postal scales graduated in grams; whilst a law ordains that the half-ounce is to be considered equivalent to 15 grams.* Mr. Yates concluded with the recommendation that the recently appointed Standard Commissioners might be made the instruments of expediting the adoption of the metric system in this country.

Mr. Edward Hall mentioned the discrepancies he had found to exist between the centimètres marked on a London 2-ft. rule, and the mural standard on the wall opposite the Senate in Paris of 1862 in mètres in the French department of the Exhibition. He also referred to the inconvenience and confusion which sometimes resulted from the French printers using commas for decimal marks, instead of periods, as in practice here.

Colonel Sykes said that wherever the decimal system had been introduced it had been found to save three-fourths or at least one-half of the labour. He believed that the discrepancy mentioned by Mr. Hall must have been owing to the measure he had applied having been affected by the atmosphere.

Mr. Hall said that the discrepancy he had found was too great to be accounted for on the supposition of Colonel Sykes.

Sir John Bowring spoke in favour of the decimal system, and said that he never knew of a Chinese boy making a mistake in an account, simply because he used his ten fingers, and their different joints, in his calculations.

Sir George Campbell said he believed that if they were to begin on philosophical principles to make a new multiplication-table, they would not use 10 but 12 as a multiple; and it might be for consideration whether, as they proposed to make a change, it should not be a more radical one than had been suggested.

Mr. Manockjee Cursetjee said that the adoption of the metric system would be particularly beneficial in India, where the weights varied every 200 miles.

Professor Levi said it was too late in the day to adopt 12 instead of 10 as a multiple. He regretted that Professor Piazzi Smyth should spend his time in looking at the Pyramids, and in trying to find out what was the use of the casket inside that tremendous amount of bricks. He thought all men of science should co-operate in endeavouring to procure the general adoption of the metric system.

Professor Rogers moved "That this Section recommend to the Committee on Recommendations the propriety of moving the Legislature on the necessity of introducing a knowledge of the metric system into all schools which receive Government aid, and are under Government inspection, at as early a date as possible."

Sir John Bowring seconded the motion, which was unanimously adopted.

Decimal coinage was taken up on the following day; Professor Levi read so much of the Report of the Committee on the "Uniformity of Weights, Measures, and Coins" as related to "Coins" [it might better have been said to coins and accounts]; and Mr. F. P. Fellowes read a paper "On the various methods in which our Coinage may be decimalized; the advantages and disadvantages of each." The report, or portion of report, was confined to the statement of resolutions arrived at in Paris at the International Conference lately held. Mr. Fellowes proposed a scheme making the farthing the unit. Sir John Bowring believed that the adoption of such a method would cause confusion in the monetary system both at home and abroad. He was of opinion that the sovereign should be the decimal unit of all coinage.

Professor Levi gave an outline of what had taken place as to coinage at the International Conference. The first proposal was for the gold

* How long is the stupid system of the English and French international postage-rates to be allowed to be in the rear of all other arrangements in the relations between the two countries? An ordinary letter between Dover and Calais, 21 miles, will cost 3d. postage; whilst the same letter would go, say, 700 miles or more in the United Kingdom, for 1d. The persistence in such a state of things is enough to make every friend of progress in either country lose all hope and heart.—Ed.

five-franc piece as standard, but it was found to be objectionable as being too small and very costly of manufacture. It was considered that a 25-franc piece should form the unit, but as the present sovereign was equal to the value of 25 francs and 20 centimes, its value would require to be reduced, or the present coinage recalled. Such a step would seriously interfere with the commerce of the country. Lastly, the 10-franc piece, which happened to be equal to the value of 100 pence of the most recent form, and had been recommended, in the first instance, as a subsidiary coin only, and were it introduced, the people to be recommended to keep their accounts in denots and pence, and, if successful, they should replace the pound by its present division. The two systems of the pound reduced, and the denot of 10 francs, were essentially international, but with the difference that with the sovereign brought to 25 francs as a unit, calculations would still be rendered necessary for reducing international value from one system into another.

On the last day of meeting of the Section, a paper was read by Mr. P. H. Thoms, entitled "Observations on Community of Language, and Uniformity of Notation, Weights, Measures, and Coinage." The author, by examples, such as those of the Admirable Crichton, and other Scotchmen, who acquired distinction, and even held professorships on the Continent, showed the value of the Latin tongue as a means of communication, and that the growth of French as a prevailing language led to the conclusion, which was by no means to be regretted, that in two or three generations it would become the spoken language of the Continent generally. English would, however, supplant all the other languages of North and South America, and even of India, if not all Asia, besides Australia, New Zealand, and the islands of the Pacific. English would prevail over the southern portion of Africa, and French over the northern. The remainder of the paper was chiefly devoted to advocacy of the views put forward in reports and speeches that we have mentioned.

A not-unimportant paper, as connected with the subject of weights and measures, and we may say with the matter of the supply and purchase of certain building-materials, and entitled "The Measure and Value of Oats," was read by Mr. A. S. Wilson, in the same Section. It showed that, whereas, in various districts, corn was sold by one or other unit of weight, which had usually reference to a weight per bushel, the weight of the measure might differ enormously, because there was no legal or uniform way of filling the bushel. Assuming it is correct that the weight per bushel is an index of quantity of meal per grain of the corn, there should be one uniform way of filling the measure. The author of the paper had adopted the arrangement of a perforated filler placed one-fourth of an inch above the rim of the measure; and he stirred the corn through the holes, thus filling the measure equally all over, constantly from the same height, and without enclosing masses of air. Generally, this mode of filling increases the weight above that from the ordinary basket-filling, from three to eight pounds. Moreover, with certain sorts of oats, the weight generally increases each successive trial with the same sample. "The weight per bushel will thus increase, while the absolute weight diminishes." The paper concluded:—"It appears, therefore, to the writer, that a uniform corn-trade should be based on a uniform unit of weight, the quality or comparative value to be tested in the manner adopted in these experiments, and that the bushel should be wholly set aside."

THE DECAY OF STONE: ITS CAUSE AND PREVENTION.

In the Chemical Section of the British Association for the Advancement of Science, at the Dundee meeting, a paper on the decay of stone was read by Mr. John Spiller, of Woolwich, who has been for several years occupied at intervals in studying the causes of the decay, and in experimenting with such chemical re-agents as appeared to offer any promise of being usefully applied as means of prevention. We report the paper because of the peculiar importance of the subject, though it does not establish much conclusively. The author said:—"At an early stage of the investigation I arrived at the conclusion that the corrosive action of sulphurous and sulphuric acids in the atmosphere, resulting from the combustion of coal fuel, operates, in large

towns especially, in a destructive manner upon dolomite and the numerous class of limestone commonly employed in public buildings. This chemical action, aided no doubt by the simultaneous attack of carbonic acid and moisture, and in the winter season further supplemented by the disintegrating effects of frost, must, I conceive, furnish a sufficient explanation of all the facts observed. I would here remark that Dr. Angus Smith, Mr. Spence, and others, have already directed attention to the immense scale of production of these sulphuric-acids, and have even quoted statistical data showing the extent or degree of pollution of the air from this cause in the manufacturing districts of Lancashire. When it is known that the best class of coal and coke contains usually one per cent. of sulphur, and that this proportion reaches a triple equivalent when stated in the form of the final oxidised product—hydrated sulphuric acid—it follows that a ton of coal of this high quality necessarily evolves during its combustion nearly 70 lb. of oil of vitriol. Here, then, is the origin of the sulphates which we find invariably present in the loosened crust of decayed stones, whether of calcareous or magnesian character. I have tested numerous samples of dolomite, Caen, Bath, and Portland stones fresh from the quarry, and in no instance found more than a trace of ready-formed sulphate, whereas scrapings taken from the decayed portions of the stone of the new Palace at Westminster are bitter to the taste, in consequence of the comparatively large amount of sulphate of magnesia formed during a few years' exposure to the sulphurous gases occurring in a metropolitan atmosphere. Caen stone from several buildings and localities, Portland stone, and even old faces of chalk cliff in the neighbourhood of Woolwich, were in like manner found to contain appreciable quantities of the sulphate of lime, having undoubtedly a similar origin. A close examination into the circumstances attending the decay of stone at the Houses of Parliament invariably shows an increased liability to corrosion under the projecting eaves and mouldings, and at such sheltered parts of the stone surfaces as are usually covered with soot and dust, and are in a position to retain for the longest period the moistures absorbed during a season of rain. The plain ashlar are throughout very much less affected than the buttresses, gables, and other elaborately carved and highly ornamental portions of the work, which appear to be more assailable by reason of their relatively greater superficies. In many places the disintegrated stone exhibits white crystals of the sulphate of magnesia, which, alternately dissolving and recrystallising in the pores of the stone, may be conceived to exert a disruptive action sufficient to account for the scaling and fracture of the dolomite, which has been so often made the subject of complaint and regret. With the view of overcoming some of these difficulties, I submitted a plan to the Royal Commissioners charged with inquiring into the decay of stone at Westminster, in May, 1861, which consisted in the application to the cleaned surfaces of the stone of an aqueous solution of superphosphate of lime, a salt remarkable for its action in hardening the surfaces of chalk, Caen stone, or other calcareous building stone to which it may be applied either by brushing or immersion, and which acts upon the carbonate of lime in the stone, giving rise to the formation of Bodeker's salt (crystallised diphosphate of lime— $2\text{CaO}, \text{H}_2\text{O}, \text{P}_2\text{O}_5 + 4\text{Aq}$). My suggestion received a practical trial in a competition, to which other five candidates were admitted by the Right Hon. the Commissioner of Her Majesty's Works in April, 1864; and, in regard to the work executed on that occasion upon three faces of the Westminster Palace, I fearlessly await the Government report. In the meanwhile, another promising scheme for the treatment of the decayed stone, especially applicable to dolomite, has been submitted by me to the notice of the First Commissioner, but this new proposal has not yet been selected for trial. It consists in the employment of baryta conjointly with the hardening salt, so that a base may be presented which is endowed with the power of destroying the soluble sulphate of magnesia in the pores of the stone, forming with it the remarkably insoluble sulphate of baryta, and at the same time engaging the combinations. On a recent occasion I applied this process on a small scale to some Caen stone facings at St. John's Church, Woolwich, which were badly decayed. With reference to the application of the superphosphate to decayed

Caen stone, I am able to refer to several successful examples of its use. In the year 1862 I applied the process upon some alms-houses forming part of Northfleet College, where the decay has been completely stopped. In 1864 I operated upon a window and buttress of St. John's Church, Woolwich; and in the following year the facade of the Grand Hotel, Brighton, was treated by my process. With respect to Portland stone, the earliest experiments were made at the Army Clothing Establishment, Woolwich, where in 1861 some decayed window-sills were treated, and with perfect success. I have some interesting results to record in connexion with the treatment of Portland stone, which serve to illustrate the increased hardness and strength, and the diminished rate and capacity of water absorption attending the employment of the superphosphate. Small cubes of Portland stone, each 1.3 in. dimension, were treated with the phosphate solution, and left to dry in the air; these were then subjected to gradually increasing pressure, until crushed between plates of lead in the American Testing Machine at the Royal Gun Factory; and the breaking weights of two precisely similar cubes of the native stone were at the same time carefully determined. The results were as follows:—

	Crushing weight.
I. Stone, in original condition,	3,650 lb.
II. Do., do.,	3,800 "
	Mean, 3,725
III. Stone treated with superphosphate,	5,375 lb.
IV. Do., do.,	5,500 "
	Mean, 5,437

Thus acquiring an increased strength amounting almost to 50 per cent. The relative hardness of the stone before and after treatment could be readily ascertained by mutual friction of their surfaces, and also by scratching with a pointed instrument of copper, which metal proved to possess a degree of hardness intermediate between the original and treated Portland stones. The porosity of the stone, as indicated by the amount of water absorbed, in equal intervals of time, proved to be greatly diminished in the case of the treated cubes. On this point several experiments were made, the stone being first weighed in the air-dried condition, and then immersed in distilled water at the temperature of sixty degrees Fahrenheit for the several periods named, and the increase of weight in each case noted:—

"Whit Bed," Portland.			
	Original Stone.	Treated Stone.	
	Gr.	Gr.	
Weight of Cube (dry),	1,431	1,329	
Water absorbed in 5 min.,	70	7	
Do. do. 15 min.,	91	8	
Do. do. 30 min.,	91	7	
Do. do. 1 hour 30 min.,	82	25	
"Base Bed," Portland.			
	Gr.	Gr.	
Weight of Cube (dry),	1,491	1,385	
Water absorbed in 5 min.,	120	20	
Do. do. 15 min.,	122	33	
Do. do. 30 min.,	124	59	
Do. do. 1 hour 30 min.,	125	78	

These results have been further controlled by other experiments, in which the same block was used in the original condition, and again after treatment with the superphosphate. It will be noticed that the advantage of the process is most clearly apparent in the case of the denser and more compact variety of Portland known as the "Whit Bed," which alone is employed for external building purposes. The other, the "Base Bed," is softer, and only fit for internal decoration, and its texture is so porous that in becoming saturated it absorbs nearly 10 per cent. of water. Samples of Mansfield dolomite absorbed amounts of water varying in different specimens from 6 to 8 per cent. After treatment by my process the degree of absorption was reduced one-half, and the results were even more favourable in the case of Caen stone. The cost of materials employed in the treatment of stone according to this plan is very trifling, and bears but a small proportion to the cost of labour necessarily expended upon the cleaning and preliminary preparation of the stone before the solution can be applied. One gallon of solution will cover about 300 ft. superficial, when two coatings are applied upon Caen or Portland stone. The superphosphate employed must not contain any appreciable amount of sulphuric acid, and the specific gravity of the solution, when diluted for use, should be about 1.100.

In the discussion that followed, the President of the Section (Professor Thomas Anderson) said:—"The decay of such magnificent buildings as the Houses of Parliament had been naturally regarded as a most

serious question, along with that of the prevention of further decay. Mr. Spiller's account of the results of his process were, therefore, peculiarly interesting to us, and the observations he had made were of considerable value, inasmuch as they afforded some explanation of the cause of the decay. They could show what was peculiar in the decay, and it showed them how important it was to bear this in mind. At the time when the erection of these buildings was commenced, immense care was bestowed in the selection of the stone; and the peculiar magnesian limestone was selected because it was found that all the buildings erected in the Abbeys Ages were in an entire state of preservation. However, it had been seen that these were not exposed to the atmosphere of large towns and other influences peculiar to such populous places, so that, when the same stone was built in London, it was found not to serve the same end. He was satisfied that the crystallization of the soluble salt on the pores of the stone subjected to wet and dry weather, was a great cause of the disintegration of the stone; but the results obtained by the application of Mr. Spiller's preparation, as illustrated by the several instances shown them that day, were of great importance, and he thought there was little doubt but that the process would meet with general approbation."

Mr. Spence said he thought it was the presence of sulphur among the acids that had the influence on the stone. In London they used a larger quantity of coal than in other cities, but then it was of a better quality than in other towns. In Manchester they used coal with 2 per cent. of sulphur, and as they consumed in that city 2,000,000 tons per year, they paid fifty 120 tons of sulphuric acid into the atmosphere. This was rather a fearful thing did they see it fully. When the first shower that came brought down the acid—it lay under the cornices of the buildings; and he had no doubt the acid then commenced to seize on the stone, especially if there were any iron in it, and to disintegrate it. When this was done, and the influence spread abroad. In speaking of the emission of sulphuric acid from smoke, he had, it was known, some peculiar opinions, and these he had paid. The acid smoke which came mostly from the black smoke, which was the subject of the prosecution. He thought that when the black smoke was cleared away they would have the acid stronger than at present—that is, a smaller amount of smoke would be most mischievous, as there was still as much sulphuric acid, and that, too, in a more concentrated form, for the carbon was all consumed. He hoped they would see this at the times, and perhaps he would be able to carry off the acid in the town's atmosphere, and he thought they would never be right till they got it carried away so far that it would never come near them.

Dr. Gilbert asked Mr. Spiller whether he had got, or thought it would be difficult to get, rid of all the sulphates in his preparation; and on being answered that he had not got a preparation without these, Dr. Gilbert remarked that a Frenchman had made a discovery which might do away with the difficulty.

Professor Asten then made some remarks. He first referred to the different characteristics of stones, such as Oxford and London. There should, he held, be a selection of stones for building purposes, and his opinion was that were they to be preserved, the appliances of any material for that purpose should be made when the stones were taken from the quarry—that when decay once got in it could not be removed from a house—though the same means were sufficient on a stone in a laboratory—but that the stones then cracked and broke up time after time—so that perhaps preservation was impossible, and it might be well to give up the attempt, save on the stones of new buildings.

Mr. Spiller replied, and held that the opinion of Professor Asten's views had been seen from the trial for six years of buildings in London. They had given results which removed from his experiments any appearance of a simple laboratory experiment, and indeed yielded them the most practical results.

Mr. Auzel suggested that the best mode of getting the preparation put on the stone might be to enclose it in a chamber in which the stone was enclosed, and then introduce a fluidic acid into the stone in a gaseous state.

The President, in a few closing remarks, expressed his opinion that the subject was of very great importance, that it could not be too often considered. No doubt many of the methods suggested yet admitted of considerable improvement; but one of the advantages of these discussions was exemplified by the suggestion just made, and there was no doubt that the ideas might be turned to some account. A stone might be treated by a preparation, in the same way as timber was made impervious to water.

NOTES FROM FLORENCE.

ONE must make many walks in and around this city in order to see all that has been undertaken for public improvement. Besides the several new and broad streets, the promising quarter that is fast springing up on the northern side, we should follow the yet unfinished roads, excellent specimens of engineering, that are opening communications between the capital and various points of its vicinity; two of which are especially attractive, one skirting the Arno's right bank eastward, the other winding round the gentle ascent of the hills beyond the southern line of walls, that still remains intact, both these new highways promising to become favourite resorts, both offering the loveliest views of the luxuriant and populous Arno valley at every turn. The new enterprises for conferring substantial benefit upon this capital are numerous. A few days ago the Scottish Company of Leyden intimated to the Municipal Council its readiness to commence immediately the works for its much-desired aqueduct, which is to bring water from the Seine river into the heart of Florence; but the decision by that contracting company in favour of the system

of metallic conduits along the whole extent meets with opposition from another party, who desire to see a construction in masonry. The Council has conceded the ground requisite for three large buildings, beyond three of the city's gates, destined for the lodgings of artisans and families in poor condition, with a moderate rate of rent, on the same method, generally speaking, as the several other establishments for lodgers of such class built during the last two or three years, either within or at short distances beyond the walls of Florence; in this last instance the concession being made to a company at whose head is a capitalist named Barlasina, and with which is connected the engineer undertaking to carry out the works, Signor Fiorucci, a young man of ability, who pledges himself to have these dwellings built on a plan quite his own, with baths for both sexes, illumination by gas, and a supply of water to each floor, from the time that the city itself shall have been secured this same benefit, through means of the aqueduct. One among many things proposed is the formation of a public cemetery at the Certosa, that interesting old monastery, about three miles from Florence, whose inmates must of course share the fate of other such. At S. Miniato works are still going on for extending the area occupied by vaults and monuments; and it is generally thought that as a place of sepulchre the premises of that church no longer answer to the requirements of the enlarged city.

We have commended the principle acted upon in most public works here, of respect for the claims of whatever is historic or artistic, but have to regret one exception, however it may be defended as unavoidable, in the demolition, now in progress, of the arcades for family monuments, extending at an angle from the front of S. Maria Novella, to the entrance of a street that leads to the railway station, and thereby limiting that thoroughfare in a manner very inconvenient. Those monuments are of antiquity, at least as high as the Dominican Church itself, commenced about 1278, and offer interesting examples of the ancient Tuscan style, in the modes of entombment: under each of the centre arches, faced with the usual alternations of black and white marble, is a sarcophagus filling the lower part of the recess, adorned with heraldic devices, beside a central cross in relief, but without any sort of epitaphs. It is satisfactory, however, to see that the new works will not necessitate the destruction of the whole series, and that another species of decorative building, in coloured marbles, ecclesiastical in style, is being raised along the narrower premises still left to the church in a line flanking the enlarged street. The modernization of a stately mansion, the architecture of Brunelleschi, on the Lung-Arno (next door to the house of Alfieri), is a less excusable example of the renovating spirit that now provokes criticism, but for which private, not official, proprietorship is alone responsible. Since the S. Marco Convent was destined for its new appropriation as a museum of sacred art, the project has been advanced of uniting all the Florentine galleries in one great edifice, or rather cluster of edifices, to comprise those cloisters the extensive buildings of the "Accademia," and the royal stable, that occupy a wide space between the convent and the academic premises, and will no longer be wanted for their present purpose after the completion of the much statelier Scuderia, now almost ready, beyond the Porta Romana, on ground adjacent to the Boboli Gardens. When lately submitted to the Minister of Public Instruction, this project met with approval, and was referred for final decision to a committee, at whose head is the chief of the civil engineering department. One might be loath to see the favourite Mount of the Uffizi deprived of the art-treasures that have long attracted all Europe to its walls; but such advantages, as is proposed, would have its advantages; and many of the pictures, as well as sculptures, now in the Uffizi, might be much better placed as to light.

An esteemed antiquary, Professor Gamurrini, has been appointed to succeed to the late Professor Migliorini as "conservator" of ancient monuments in the Florence galleries. In the Uffizi our attention is excited by the addition, since last year, of a few paintings, on sacred subjects, from the earlier Italian schools. In the Mediceo museum at the "Pretorio" the east of Michelangelo's "David" now occupies a permanent place at the centre of the largest and finest among the vaulted halls of that old Gothic building. The frescoes attributed to

Giotto in the refectory of the S. Croce convent may now be seen without difficulty, though that great room has not (as intended) been made actually public, but is used as the magazine for official documents of a ministerial department now established on the premises.

The long history of projects and competitions for the Duomo façade is not yet at an end. We hear of another *expected* exhibition of designs, and of the probable preference for one that has lately attracted much notice, and is now seen in photograph at many shop-windows, by an Englishman named Tassinio, who is, we understand, the son of a well-known engraver. Of rich and imposing effect, and conforming to the character of Italian Gothic in the church it is intended for, this designed façade terminates in a depressed gable at the centre, with lean-to roofs at the sides, and a projecting gallery carried along the whole extent of sky-line, with pointed canopies to the three portals, each adorned with sculptures in canopied niches, as the tympanum above the central door, a relief of the Assumption and colossal statues of Apostles at intervals between those three entrances; the whole receiving splendour from the profusion of sculpture and such elaborate details as to justify a very high estimate of probable expense. The thing has not yet been officially announced, but it is certain that a report of the *third* competition, and the designs then exhibited, is soon to appear from the pen of the secretary to the committee and judges. Many doubt the possibility of giving new impulse to the long-suspended subscription for this work, which had brought in about 100,000 francs, collected in weekly rates, for which persons of every class, rich and poor, had pledged themselves. Years have passed since this mode of collecting was abandoned, and the subscribers have been, in most cases, dissatisfied at finding their money left so long unproductive at the disposal of those who were doing nothing towards the object in view. Perhaps the chief obstacle exists in the but too manifest animosity against all that pertains to the ecclesiastical cause in the Italian mind, as now is the policy of the Italian Government.

A society calling itself the "Italian Association for Instruction of the People" has offered a 5,000 francs prize for the best work as a theme analogous to that of the admirable "Self Help" by Smiles, and with no prescribing of modes of treatment, but the requirement that the writer should efficiently show, not only the benefits of knowledge, but that "man can often do just as much as he wills." Another prize has been liberally offered by Adelaide Ristori (who lately gave two performances at the *ginnal* theatre here) for the best dramatic composition suited to the stage.

The restitution to Italy of all the art works removed by the Austrians from Venice, and all, save one-twelfth, of the historic documents at the same time taken thence to Vienna, is an act of tardy justice we must rejoice to hear of. Such was the determination lately made by a committee at Milan, empowered to decide in this affair, and the small modicum reserved from the documents is confined to such as have reference to possessions still held by Austria south of the Alps. We hear from Cortova of a projected monument to a man of letters, Francesco Benedetti, native of that town, whose story is tragic, for he put an end to his existence at Pistoia in 1821.

OPENING OF THE DOCKS AT BARROW-IN-FURNESS.

SO little was Barrow known quite recently, that after speaking of its progress in the *Builder*, we were asked, from Lancashire itself, where Barrow is. Its locality is the extreme north-west corner of Lancashire, near Ulverston, and facing an island known as Barrow Island, said by tradition to have been the burial-place of the Norse rovers, who, in the "good old times," carried fire and sword round the coasts of Great Britain. For centuries Barrow was a mere dull fishing village, and even ten years ago the entire population did not amount to 1,000 souls, and most of the "bread-winners" of the village were either sailors or fishers. Now it contains a population of nearly 20,000, and is a rapidly-increasing and prosperous town. It has recently been incorporated, and will soon, in all probability, be a flourishing seaport, and the seat of an immense shipbuilding and timber trade. The magic thing which has so rapidly transformed Barrow from stagnation to activity is the great genius of

THE MASONIC HALL AND CLUB BUILDINGS, DUBLIN.

modern days—iron. Hematite iron ore is found in immense quantities at Barrow; and some ten years ago Messrs. Schneider, Hannay, & Co. established works for smelting it there. Assisted by the *apropos* discoveries of Mr. Bessemer, Messrs. Schneider & Co. rapidly increased their business, yearly adding furnace to furnace, and speedily making an immense fortune. These iron-works soon gave employment to a large population, which rapidly increased year by year, until an active, prosperous town superseded the old quiet fishing village. The great natural advantages of Barrow soon attracted the attention of Mr. Ramsden, for several years the managing secretary of the Furness Railway, which was constructed expressly to develop the trading and commercial specialities of the district. Assisted and supported by the Dukes of Devonshire and Buccleuch—who are large local landowners—Mr. Ramsden's efforts were crowned with unprecedented success; and, fostered by such powerful influences,—regulated by rare commercial tact,—Barrow soon attained the rank and dignity of a town; and, when incorporated, Mr. Ramsden was elected the first mayor. In the meantime, Mr. Ramsden became a director of the railway, the Duke of Devonshire being chairman. Connected with every line of railway in the kingdom, Barrow soon attracted the notice of the Midland Railway directors, who resolved to run their line of steamers to Belfast from it, the Furness Railway Company having resolved to make a series of docks by damming up the channel between the town and old Barrow Island.

The plans for these docks were prepared by Messrs. M'Lean & Stillman, of London, engineers, Messrs. Brassey & Field being the contractors. The total cost is about 200,000*l.* In their entirety the Barrow Docks will extend from Crow's Nest Point to Cunniger Point, and be adapted for the accommodation of vessels of all sizes, while Watney Island,—sheltering them from the roughest weather,—will render them safe at all seasons of the year.

The dock, opened so auspiciously, is named after the Duke of Devonshire, and is 30 acres in extent. There is another dock of 33 acres, named after the Duke of Buccleuch, which is to be ready for business early in the ensuing year;

while adjacent to it is a "timber pond," extending over an area of 3½ acres.

Every requisite for making the Barrow Docks useful has been provided by the promoters. Huge capstans and cranes, worked by hydraulic power, and manufactured by Sir William Armstrong, will open the dock-gates and hoist goods into the warehouses, which have a floorage accommodation of 17,000 yards. The quay space extends over 100 acres of ground, while the remaining portions of the island,—about 300 acres,—will afford sites for shipbuilding yards. In fact, Barrow Island will, in all probability, soon become the seat of an immense trade in iron shipbuilding, for the steel and iron can be procured on the spot from the Hematite Iron Company (Limited), who now carry on the business of Messrs. Schneider, Hannay & Co., and it is proposed to establish in connexion with it a manufactory for flax and cordage. Round the island are about 10 miles of sidings connected with the Furness Railway, so that ships can load and discharge with the greatest possible facility and despatch.

MASONIC HALL, DUBLIN.

The accompanying engravings illustrate the new Masonic Hall and Club buildings which are in course of erection in Molesworth-street, Dublin. The front elevation is executed in Ancaster stone, and is divided into three stages: the lower one of the Doric order, the centre of the Ionic, and the upper of the Corinthian. The total height of the building from ground-line to top of pediment will be 73 ft. The whole of the club portion of the building is arranged on the ground-floor. The Grand Lodge room, which is to be on the first floor, will be 72 ft. long, 39 ft. wide, and 32 ft. high; the other portion of this floor is divided into Royal Arch Chapter, Libraries, with regalia and preparation rooms, which are approached by a flight of stone steps 6 ft. wide. The Prince Mason's Chapter and Grand Encampment will occupy the second floor.

The contract was undertaken by Mr. Michael Meade, of Dublin, at 7,600*l.*

The architect is Mr. Edward Holmes, of

Birmingham and London, whose design was selected in public competition.*

* Some extraordinary structures, it appears, are being raised for "the craft" in America. An illustrated American paper, containing four illustrations of the "Grand Masonic Celebration and Dedication of the New Masonic Temple, corner of Tremont and Boylston streets, Boston, Mass.," thus speaks of the edifice:—"Upon entering the building one is reminded of the descriptions which are preserved of those Egyptian temples, miles in circuit, with pillars 80 ft. high and lintels 40 ft. long, which were evidence of the architectural skill of an almost extinct race. The famous temples of Isis and Osiris are celebrated, and the Temple of Apollonopolis is alluded to for its many peculiar features. The Egyptian architecture, with its cylindrical shafts enriched with rings of richest sculpture, crowned with bell-shaped capitals, wrought in the foliage of the palm or papyrus, embracing the caryatid orders, was well adapted to give form to the metempsychosis creed of the people, and many of these marked features have been produced in this hall; while the painting by the artist, Mr. Haberstroh, who, having adorned an Egyptian Hall in Munich, came to this task with no inconsiderable experience, presents the novel combination of colours which forms the peculiarity of this style of decoration. The walls are finished with massive columns, having capitals enriched with leaves of the palm, the Nile lily, and human faces. The ceiling is divided into compartments by heavy beams above each column, which are decorated with various patterns, laid in with blue, red, orange, and green, in unbroken tints. The ceiling is tinted sky-blue, and studded with golden stars, and from the centre hangs a forty-eight light chandelier. The two main pillars at the east end of the hall, between which is the throne of the High Priest, form the most striking feature of this apartment. These pillars are ornamented with hieroglyphics, taken from the western face of the Obelisk Luxor, now standing in the Place de la Concorde, Paris, and refers to Rameses III. (Sesostris), B.C. 1650."

THE MASONIC HALL AND CLUB BUILDINGS, DUBLIN.—MR. EDWARD HOLMES, ARCHITECT.

THE FREEMASONS' ALMSHOUSES,
MELBOURNE.

The foundation-stone of these almshouses has been laid, with all the formalities appertaining to the Masonic order. The Government having granted a piece of land of about five acres and a quarter in extent, fronting the Pant-road and contiguous to the Wesleyan College, a plan was agreed upon to erect buildings which will form the nucleus of a number of charitable institutions for the poor and indigent, the widows and orphans of the brethren. The piece of ground is of a quadrangular form, 650 ft. in depth by 350 ft. in width, and the architects are Messrs. Reed & Barnes. The plan embraces the erection of twenty-four cottages or almshouses, and a centre building to form an orphan asylum. Entering the ground from the Pant-road, the design shows twelve triple semi-detached cottages ranged on the right and left of the quadrangle, which will be planted, and form the chief approach to the orphan asylum and superintendent's quarters, to be erected at the north end of the ground. Each cottage will be replete with every convenience. The first portion of the almshouses has been contracted for by Mr. Thomas Dalton, for 650*l.*, the funds being subscribed by the brethren of the various lodges of the order.

PARIS.

RECENT works have been carried on, to restore to its primitive state the elegant chapel of the ancient College of Beauvais, behind the Market of the Carmes and the Place Maubert. This chapel is a simple structure, without collaterals, terminated by a five-sided apsis, supported by solid counterforts, and pierced with lofty ogival windows. The spire, decorated at its base with an arcature of three lobes, has also been completely restored, and the building has been disengaged on the south side by demolishing an old house in the Rue Jean de Beauvais, which was attached to it. The chapel of the Beauvais College has become the property of the religious order of Dominicans, who have added a cloister and spacious buildings, where they are now installed, after having left the ancient monastery of the Carmes, in the Rue de Vaugirard, which was cleared away for the Rue de Rennes.

A remarkable fountain has been just constructed in the Avenue de l'Observatoire of the Luxembourg gardens, nearly on the site of the ancient gateway. It is composed of two great basins of Jura marble, the upper one having a *jet d'eau*. The parterres of the grand avenue, on the portions laid down in grass, have been furnished with handsome monolith columns of various coloured marbles; on these have been placed Florentine vases, in bronze. These parterres are to be surrounded by candelabra and lighted with gas. The iron gateway which separates the newly transformed garden from the ancient Avenue of the Observatory has been put in place.

The circular railway of Paris is at last being joined in so as to have no break. Between the Batignolles-Clichy station and that of Levallois Perret the works are being actively pursued. This connecting line passes under the Western Railway, crosses the Rue d'Asnières and the Boulevard Malesherbes, near its point of junction with the Boulevard Berthier; then, turning to the south, it cuts the Boulevard Pereire and joins into the old line of Anteuil and the rest of the circular railway. The passage of the line under the Boulevard Malesherbes is attended with much difficulty on account of the levels. In fact, the line passes over the great collecting sewer, but the crown of the arch is higher than the level of the rails. Thus the arch of the sewer will have to be flattened down so as to lower it 1m. at the key.

On the 25th inst. the works for the new water supply from the valley of La Vanne are to be adjudicated at the Hôtel-de-Ville of Paris. It is estimated that this valley, so rich in springs rising from chalky soil, can easily furnish daily to a maximum height, in Paris, of 230 ft., 22,000,000 gallons of water, equal in quality to that of the valleys of the Champagne now delivered into the Menilmontant reservoir. The reservoir for the new supply is to be constructed at Montrouge, on the summit of a rising ground not far from the Barrière Saint-Jacques. Like that of Menilmontant, the Montrouge reservoir will be arched over completely.

On Tuesday, the 27th ult., the roofs of the catacombs of Paris fell in two places, the corner of the Rue de l'Ulm, and underneath the Place du Pantheon. An artist painter who was going to his domicile was dragged down along with the footpath to a depth of 5 ft., and had a narrow escape of his life, escaping unhurt. The usual periodical inspection took place a month ago, and many visitors obtained the favour of accompanying the *cortège* of municipal officials. All the streets have been accurately laid down underground and permanently marked, and the blocks upon which houses stand have been consolidated from time to time by substructures. A budget for this purpose is annually presented to the municipal council. The visitors, usually numbering 100 or 120, and all the persons present, are counted by the guard four times;—on first descending, at the foot of the staircase, at a first lower door, again at the second door, and at the final entrance into daylight again.

The disengagement of the fine tower of Jeausans-Pear, masqued by the houses in the Rue Française, has created such a sensation among antiquaries that the municipal authorities are determined not to leave the work undone; it is to be completely restored, and surmounted by a recreation garden or square, like that of the Tour Saint-Jacques.

The Church of Saint-Jean-Baptiste de Belleville, near the Buttes Cbaumont, is but little known. It was commenced in 1854, and finished in 1859: it was the last work of the architect Lassus. It is seen from all quarters of Paris, being conspicuous from its two spires and three porches situated on an eminence. The town of Paris has lately gifted the nave with stained-glass windows. At right and left of the choir apsidal chapels are being decorated by M. Alphonse Chaignon, pupil of M. Viollet-le-Duc, for the Abbé Demmes, curate of the parish.

On the 18th ult. a statue of Napoleon I. was uncovered. It is due to the chisel of the Comte Payol, eldest son of the illustrious general who fought so bravely at the battle of Montereau, and reaped the principal share of the glory.

The principal statues of Napoleon I. hitherto erected in public places are—1. That of the Place Vendôme, by Lamoignon, in 1808; 2. on the plains of Marengo, erected by the Sardinian Government, inaugurated 14th June, the anniversary of the battle; 3. a statue by Jouffroy, on the "place" of the town of Auxonne; Lyons has a fine statue raised in 1854; 5. Cherbourg possesses one in the Place de l'Hôtel de Ville; 6. Ajaccio, inaugurated lately. Of these principal monuments to perpetuate the memory of Napoleon I., those of Lyons, Cherbourg, and Ajaccio are equestrian.

The following is the consumption in ordinary times of various articles in Paris.—There enter annually 90,052½ tons of flour. These gave about 278,155 lb. of bread. The potatoes consumed in Paris during an average year amount to 885,500 bushels. The poultry and game sold and consumed are classed as follows:—1,090,000 pigeons, 187,000 ducks, 2,585,000 bred rabbits, 1,869,000 fowls, 377,000 capons and hens, 590,000 turkeys, 155,000 partridges, 197,000 wild rabbits, 37,000 hares.

There have been sold for the value of 7,866,437 fr. (314,658*l.*), poultry and game; 5,085,503 fr. (203,420*l.*), of salt-water fish; 479,960 fr. (19,199*l.*), of fresh-water fish; 8,505,384 fr. (340,215*l.*), butter; 4,377,302 fr. (175,092*l.*), eggs. Total, 1,062,584*l.*

M. Petit et Cie. have been entrusted by the municipal authorities of Paris with the execution of the prolongation of the Rue Réaumur, between the Place de la Bourse and the open space in front of the new Opera-house. It is said that the above firm, ordinary contractors for the works of the town of Paris, are to receive for this last section of the Rue Réaumur the sum of 1,120,000*l.*, payable by annuities. This street, 66 ft. wide, will absorb wholly the Rue Ménars, and cut through the Rues des Filles-Saint-Thomas, des Colonnes, de Richelieu, de Grammont, de Choiseul, de la Michodière, du Port Mabon, and Louis-le-Grand. The Jacobite convent of the Filles-Saint-Thomas was founded in 1742, by twenty nuns. Mention of the Filles-Saint-Thomas has revived an anecdote. A *démolisseur* of the opera, Mdlle. Chamery, died in 1812. The funeral *cortège* proceeded to Saint-Roch, the curate of which refused to admit the remains, stating that all comedians should be excommunicated; so the procession went to the church of the Filles-Saint-Thomas, the curate of which performed the service. A few days afterwards a communication, not signed, ap-

peared in the *Moniteur*, to this effect. "The curate of Saint-Roch, in a moment of *déraison*, refused to pray for Mdlle. Chamery, and to admit her into his church; one of his colleagues, a reasonable man, received the *cortège* in the church of Saint-Thomas, where the service was performed. The Archbishop of Paris has suspended the curate of Saint-Roch for three months, in order that he may be reminded that our Saviour ordered him to pray for even his enemies."

The great military road which encircles Paris at its new boundary, close to the fortifications, the width of which was only 12 mètres, has been rapidly transformed into a spacious boulevard, 40 mètres wide, and planted with trees. On the left bank of the Seine this thoroughfare is unbroken, and continues from the Quai de la Gare, on the east, to the Quai de Javel, on the west. On the right bank it will continue from Bercy to the Porte de Bagnelet; then from the Porte de la Chapelle to the Route de la Revolte.

THE NEW CASUAL WARDS FOR
MARYLEBONE PARISH.

IX times gone by, and long before such matters received general attention, we described the miseries of the "Casual Ward." In those days it was thought desirable to give as little comfort as possible, that no inducement might be offered for the return of the lodger. Public opinion, however, gradually brought about a demand for the provision of decent accommodation, and the guardians of the parish of Marylebone have just now completed some wards which meet that demand.

The building is situated at the north-east corner of the workhouse ground, at the back of the old Relief Offices. The entrance passage of the Relief Offices affords access to the new buildings; at the end of this passage is a general waiting-room, and adjoining is another for females only, next to which is the Female Bath-room. The bath-room is 12 ft. long, 9 ft. wide, 18 ft. high, and is lighted by windows in the upper part of the walls. These windows are hinged at the bottom, and open like hop-pers. The baths, of which there are two, are made of Southbridge clay, each in one piece and, having a white glazed surface, present at all times a cleanly appearance. The water for these baths is heated by a stove, which, being in the same room, is under the supervision of the attendant. The stove consists of an upright cylinder, the casing of which is hollow and forms the boiler, while the fire is contained in the central portion of the cylinder; a pipe passes from the upper part of this boiler to a galvanized wrought-iron cistern fixed above, from which another pipe descends to the lower portion of the boiler; thus, by a well-known law causing a continual circulation of hot water to the cistern, which is always ready with upward of 100 gallons of boiling water for the supply of the two baths.

Adjoining this bath-room is the Female Sleeping Ward, 58 ft. long, 18 ft. wide, 15 ft. high to the lowest part of the sloping sides of the roof, and 22 ft. high to the apex. The roof is supported on circular cast-iron ribs, bolted to iron stanchions contained in the thickness of the walls, and which rest on solid stone bases. Running along the whole length of the room is a ventilator, 5 ft. wide. The upright sides of this ventilator are fitted with wide flaps, having very simple apparatus for opening and closing when requisite, the top portion being glazed afford slight to the apartment. On the floor immediately beneath this ventilator is a cast-iron grating covering a brick air-channel. This channel is supplied with fresh air, which passes from the outside of the building by covered channels running under the adjoining floors. It also contains hot-water pipes for heating the apartment in cold weather. The room is well lighted at night by two pendant star burners, the lower parts of which are some 9 ft. above the floor. It will thus be seen that the arrangements for heating, ventilating, and lighting, are so arranged as to be entirely out of the reach of the inmates. Ranged down either side of the apartment are the sleeping benches, affording accommodation for 44 women and 20 children. These benches are generally 6 ft. 6 in. long, and 2 ft. 4 in. wide, but ten of them are made wider to afford accommodation for a woman and two children each. The boards forming the benches are so hung on pivots as to be capable of being turned up every day for the purpose of cleaning

floor under. The head of the bed under a pillow is slightly raised, and is hinged separately, for the purpose of lifting and depositing the clothes of the sleeper; the clothes of each inmate being thus under his own protection. It should also be observed that the head of each bed is some 6 in. from the wall, and a current of air is consequently always to pass under the bed and upwards towards ventilators.

Scripture texts, the Lord's Prayer, and the Commandments, are printed on the walls and ceilings, the red letters and blue tinted and forming a pleasing decoration.

At the end of the room is a door leading out to a lobby to the water-closets. These closets are constructed on the latrine principle, and seem well adapted for the purpose.

The arrangements for the accommodation of males is identical with that described for females, excepting that the shape of the iron stove is so modified as to allow the smoke and heat to pass by an iron flue-pipe through an adjacent disinfecting chamber. If examination it is found requisite, the clothes of the casual are, whether male or female, hung in this heated chamber, and well fumigated with sulphur.

In each side of the main buildings are ranged working sheds, where the casual in the evening picks oakum or performs such other work as may be assigned him. These sheds are at 12 ft. wide and 9 ft. high, and are well lit and ventilated by skylights.

The wards are constructed as "temporary buildings," which means their cost is thrown on the general London rate. They are formed of uprights of iron and wood, plastered internally, and covered with metal externally. The metal appears to be very creditable to the architect, Mr. Saxon Snell. The builders were Messrs. Job & Vaughan, and the total cost was about £700.

It will not be out of place in our pages to describe the course now pursued in Marylebone in reference to Casuals.

Applicants for admission have to apply at the Marylebone-lane, about a quarter of a mile from the Workhouse, for an order. If the master does not impose upon a man with a family, or a tired or aged applicant. On presenting the order at the Workhouse, the casual is at once admitted, and, by certain information has been obtained from him, and duly recorded, he is searched, and prohibited articles taken from him or restored in the morning. The pipes, which are the chief articles found, form a valuable collection. On two occasions only during the past two years were persons found with money concealed upon them, and each of them was taken before a magistrate and committed to prison. The clothing of the casuals is examined, and, if it is clean, it is placed in a small box forming a portion of his bedding mentioned, and thus placed out of the hands of any of his companions, who might otherwise pilfer or change some of the garments. If clothes are filthy, which is the case with the shirts of the poor, they are placed in a disinfecting chamber, and are handed back in the morning thoroughly fumigated.

A casual undergoes the bath process, with an ample supply of hot and cold water, and what his command. He is then supplied with warm woollen night-shirt, conducted to his room which consists of a mattress filled with straw, a flock pillow, and two rugs weighing 15 lb. covering. The strictest silence is maintained in the wards, which are all night under the supervision of paid officers, and prayers are read at night in each ward by male and female readers, especially appointed and paid to be guardians for this purpose. The shirt and covering are disinfected in the morning, and are thus ready for another occupant.

At six o'clock a.m. in summer, and seven in winter, the casuals are ordered to work—the men employed in cleaning the wards or picking oakum. The strong, sturdy, idle men are selected and put to stone haggling—the task of oakum picking. The task of work is distributed by the guardians being, males, to cut two bushels of stone or pick two pounds of oakum. It frequently happens that disorderly fellows, well-known to the officers as professional casuals, will improperly linger at their work, and not have executed a suitable half-hour's labour in the four hours. These characters may be charged before the magistrate with wilfully neglecting to perform

their allotted task of work; and, thanks to the assistance given by the magistrates at the Marylebone Police Court, this class has been pretty well poiced from this parish. Casuals who complain of being ill or unable to resume their journey, are examined by the medical officer, and if he thinks they are proper cases for the Workhouse Infirmary they are at once admitted. The breakfasts and suppers of the casuals consist of 6 oz. of bread, and one pint of gruel each meal; and they are permitted to take with them in the morning the fragments of bread collected from the sick and infirm wards, which previously found its way into the waste tub of the establishment. There is no limit to the number of times a casual may be admitted into the same ward. If he find no employment he may return again at night; and if he show a willingness to work, and cheerfully conform to the rules, an effort is made to provide him with some temporary employment.

It is the wish of the guardians of St. Marylebone that care should be taken to discriminate between the deserving houseless poor and the sturdy idle loafer; and while all is done to render the position of the former as comfortable as the law will allow, it is sought by a strict exaction of the labour test to drive the latter class from depending upon the pockets of the ratepayers for their nightly shelter. Mr. Douglas, the master, appears to devote himself with great earnestness to carrying out these views.

The total number that can be accommodated is about 100. We were not surprised to hear that the number of applicants has fallen off since decent conduct, silence, and other wholesome requirements have been insisted on. On Saturday nights the wards are always full—a circumstance not difficult to understand, when it is remembered that no labour is required to be done on Sunday morning.

COMPETITIONS.

Bedfordshire Middle-Class Schools.—Twenty-nine sets of plans were originally submitted, and four were reserved for consideration and selection, viz., those of Mr. F. Peck, London; Mr. John Usher, Bedford; Mr. John Day, Bedford; and Messrs. Mayhew & Calder, London. Ultimately, they selected Mr. Peck's design as the most suitable for the school buildings. Feeling a difficulty as to the claims of Mr. Usher and Mr. Day for the premium of 50l. for the design and plan the best of those rejected, they liberally paid them each a premium of 50l. For the fourth design they sent thanks.

Tannton.—The Tannton College School Company lately solicited designs from six architects, Mr. Giles, of Tannton, was the successful competitor, Messrs. Norton & Masey getting a premium of 50l., and the Messrs. Francis one of 25l.

Workhouse, St. Martin's-in-the-Fields, London.—The Board of Guardians have selected the design by Mr. Cross, subject to the approval of the Poor Law Board. The building is to be erected at Wimbledon, and will provide accommodation for 201 males and 201 females, including 6 married couples and 40 permanent sick. The cost of the building is estimated not to exceed 28,430l., viz., main building, 24,680l.; infectious wards, 1,500l.; lodge and receiving ward, 700l.; boundary fences and gates, 1,550l.

A WALLHALLA ON THE THAMES.

It was ever urged in our pages that the Thames Embankment would afford admirable sites for the statues of such men as England might wish to honour, while they might be made to form one of the best and noblest adornments of what will be a national highway. Lord Winchelsea has recently given expression to the same suggestion, and it has been well received by the public. He proposes that the line of the Thames embankment be garnished with statues of the worthies of England—simply treated—in bronze; and he thinks that to confer a place in such an array would be striving for in future, as now is the Victoria Cross. We do not think that the man who deserves a statue seldom thinks or cares much about it; but such a setting forth of our good and great men would be an incentive to good deeds nevertheless.

A lady-correspondent, earnest in well doing, writes to us,—"Pray aid in obtaining statues of England's great men for the adornment of the

parapet of the Thames Embankment. I like the notion immensely, and would fain be a 'great man' to go there myself." We hope, however, if the scheme he carried out, that it will not be absolutely necessary to be a great man to obtain a place in the Wallhalla on the Thames, but that our great women will also find there fitting pedestals.

A SHEFFIELD CHAMBER OF INDUSTRY.

A Chamber of Industry has been formed at Sheffield,

"to look to the interest of both capital and labour, in order to bring them into closer union; to give advice in cases of dispute between employers and employes; to study the principles of political economy; and to examine the laws relating to capital and labour."

The business of the Chamber is conducted by an executive of thirteen members, including president, vice-president, secretary, and treasurer, to be elected by a general meeting of the body. The executive have issued an address explanatory of their objects, and in which they say—

"The Sheffield Chamber of Industry owes its origin to a few working men, who have long witnessed with pain and regret the frequency of disputes between masters and workmen, and they believe the Chamber will have a tendency to bring them together for their mutual good. The executive believe that disputes often arise from mistaken notions of the relations of capital and labour, and they propose to inquire into the laws which regulate the production and distribution of wealth. They are also of opinion that the true interest of capital and labour is identical, and that, like manufacture and commerce, they are twin sisters, and ought ever to go hand in hand. It is intended to have lectures on political economy and on other matters relating to capital and labour; also short essays, to be followed by discussion. Efforts will be made to secure the services of the ablest men of the age for these objects. The Chamber will use its influence to establish a Board of Arbitration and Conciliation, and until that is accomplished it will give its counsel, with the consent of both masters and men, to the settlement of trade disputes. . . . Strikes and lockouts are evils prejudicial to employers, workmen, and the public, and it is hoped that all classes will come forward and prevent, as far as possible, their recurrence."

ACCIDENTS.

THE inquest on the body of the young man killed by the falling of a stone pillar in the Strand, as recently reported, has ended in a verdict, "That the deceased met his death by want of proper caution being used by the Messrs. Forster."

A dangerous and curious accident has occurred in Coleman-street, Bunhill-fields. It appears that near the Quaker burial-ground extensive excavations have been made to form the foundation of a large factory. The house adjoining has during the operations been shored up, but it seems that the excavations have weakened it, and the side wall fell into the excavation. In the room, of which the wall formed a side, a woman had lately been confined, and through the aperture she and her child, with all the furniture, were exposed. The frightened woman, however, was soon removed.

A man has been buried alive at Dalston. He was a labourer in the employ of Mr. Morley, a builder, and on Saturday last he and Robert Morley, his employer's son, were engaged in making a tunnel underneath the footpath and garden in front of a new villa, recently built at Navarino-road, Dalston. Robert Morley said, at the inquest, that the old man was told to make an open cutting in order to reach some pipes in connexion with the drainage, but he preferred to make a tunnel. The tunnel was made through a sandy soil 6 ft. below the surface of the earth, and it was 2½ ft. high. It was only intended to make it 5 ft. long, but the deceased while tunnelling made a mistake, missed the pipe, and carried the tunnel 8 ft. farther on. The coroner asked the witness why he was such a goose as to enter an unshored tunnel through sandy soil. The witness said that he trusted to Martin's experience. While they were both in the tunnel, 2½ ft. of the top of it suddenly gave way, and the deceased, who was at the end of it, was instantly hurried alive. Witness was near the opening, and he had just time to get out of the way when the sand fell. It was half an hour before the body of the deceased could be dug out. He was then quite dead. The jury returned a verdict of accidental death.

The stand on the Racecourse at Mallow has fallen. The timber of the stand-house, which was densely crowded with people, was heard cracking, but the noise occasioned only a

momentary panic. A few minutes later, however, again the timber was heard cracking, but this time too late to allow the crowd to avail itself of the warning. Half of the stand sank to the ground, a distance of between 20 and 30 ft., together with the people on it. One boy sustained internal injuries, and cut and bruised heads, faces, lips, and arms were numerous. Hats were crushed, and coats and other garments torn; but no life was lost.

At Newbury, Berks, some men in the employ of Mr. Samuel Elliott, builder, were engaged in digging sand on Wash Common, when the ground fell in upon one of them, and killed him on the spot.

At Stroud a subscription has been commenced on behalf of the contractors, Messrs. Wall & Hook, for the rebuilding of the parish church, who snuffed to the extent of about 700l. by the fire in their shed, which we have already reported. 1,00l. were raised at once. The destruction of all the prepared timber for the roofs will cause some delay in the rebuilding, as seasoned oak is difficult of obtainment, to say nothing of the time required to work it.

Three serious accidents in connexion with buildings have just taken place in Liverpool. While a man, his daughter, and another young person, who reside at No. 18, Johnson-street, were in the back part of the house, washing themselves, a portion of the building gave way and fell upon the three people, inflicting injuries of a very serious nature. The houses in the street are being taken down for corporation improvements. Another accident, resulting in the death of Mr. Bell, master joiner and builder, occurred at Bootle on the same morning. Mr. Bell was upon some scaffolding surrounding a new building at Bootle, when by some means he lost his footing, fell to the ground, and was so frightfully mutilated that he died shortly afterwards. A third accident has happened at the corner of Church and Paradise streets, where some houses are being taken down for the purpose of widening the street. Three men were engaged, on the first-floor of the building, in removing a wall, when another wall opposite to where they were employed gave way, carrying with it to the floor below the three men. Two of them are suffering from scalp wounds and other contusions, while the third is injured in the spine.

At the Parish Church, Leamington, a serious accident has occurred. A considerable portion of the scaffolding surrounding the new wing fell, and three of the workmen were buried in the debris. The men were at work on the scaffold, and fell from 80 ft. to 100 ft. There were only two large stones on the scaffold, and a handbarrow of bricks. Under the scaffold where the poor fellows fell, was a heap of stones, and not only were they seriously injured by falling on these, but also by the planks and woodwork which came down upon them. Mr. Marriott, of Coventry, is the contractor of the works.

THE WINCHESTER DRAINAGE COMPETITION.

SIR,—Knowing that the pages of the *Builder* are always open to vindicate the rights of our profession, and also that several letters have been published in that journal within the last six or eight months relating to the Winchester Drainage Competition, I beg you will allow these few remarks to appear in your columns with regard to the latest transactions in this matter, viz., the special meeting of the Local Board on Tuesday, the 17th inst. At that meeting it was resolved to adopt Mr. Botham's report; that is, to give the first premium of 150l. (which by the bye, is no premium at all, being included in the commission for carrying out the works) to Mr. Lemon, the author of No. 7 plan, and to withhold the second and third premiums on the miserable grounds that the other designs were not according to the printed particulars. So, in fact, they have got designs sent in, and the professional advice, of eleven gentlemen for—nothing, by simply offering three glittering baits; the first of which is a bubble which bursts directly it is laid hold of, and the other two turn out to be as ethereal as the first, and vanish in the end; a cheap (and decidedly nasty) way of getting professional advice.

Last week I saw by your paper that at Dorchester some board or body had offered a premium of 25l. for a church design, and, when several were sent in, had refused to give any premium at all.

Now, sir, are these facts to be established as precedents? Are young engineers, who are obliged to enter these competitions sometimes, to be ridden over roughshod by these local boards and others, because they think they are out of the reach of punishment? Have they never thought that there is a moral obligation in these cases? and when they hold out offers for gentlemen to compete, are they not bound to see their part of the contract carried out as well as the competitors? I would suggest to the Winchester Local Board that there are other trusts and duties entailed upon their office as important as that of saving the city the sum of 150l.

CIVIL ENGINEER.

COWPER'S SUMMER HOUSE AT OLNEY.

ON making a recent visit to the village of Olney, in Buckinghamshire, I was grieved to find that the summer-house in which "The Task" was composed is fast relapsing into ruin and decay. This "nook" or "summer parlor," as the poet has differently designated it, is situated at the bottom of the garden attached to the house in which Cowper resided from 1767 to 1786, and is a small plain rustic building of 1st and plaster, covered with red tiles, and run around the interior with a small bench. In this retreat, which is contiguous to the remains of the tree beneath whose shade the poet was wont to linger in the peaceful summer hours, he isolated himself from the social and domestic interruptions to his literary labour, and it is in obvious allusion to the delicious solitude which he here enjoyed that he writes in the "Task,"—

"To me an unambitious mind content
In the low vale of life that early felt
A wish for ease and leisure, and ere long
Found here that leisure and that ease I wish'd."

And again,—

"Had I the choice of sublimary good,
What could I wish that I possess not here?"

The walls are covered with initial signs and names,—a noble testimony to genius; and amongst others I may select those of Hugh Miller and Sir Walter Scott. The Throckmorton family have attended only to those spots associated with the memory of Cowper which are situated on their estate near Weston, and the summer-house, where one of the noblest poems that adorn the pages of English literature was composed, has fallen into the hands of a baker and confectioner, whose means are inadequate to the placing of the retreat in a proper state of repair. Is sensibility to the beautiful wholly extinct? J. CAMPBELL NUGENT.

SINGLE-SPAN CHURCHES.

SIR,—Let me add to the examples of single-span churches recently mentioned in the *Builder* a notable one in Bordeaux. I saw it a short time since while passing a few hours in that city. Divine service was being performed, and my observations were consequently very superficial, of necessity; but I was much struck by the contrast between the nave and choir—the former spacious and broad, without pillar, or much-projecting column; the latter having an aisle all round it, and separated from it by acutely pointed arches,—the former equally illuminated over its whole area, the latter broken up into a most effective combination of light and shade. The style of this church is Early Decorated throughout, except that over the south transept are two tall spires of elaborate pierced stonework, apparently of later date than the rest of the building.

Cannot our architects design churches for us which, while thoroughly ecclesiastical, would admit of every member of the congregation seeing and hearing the clergyman? Aisles too often prevent both. J. M. A.

BUILDING IN A LONDON GRAVEYARD.

SIR,—Close to Victoria Park Cemetery is a graveyard attached to the Globe-fields Wesleyan Chapel, Mile-end. It is no long time since this burial-ground was in tolerable condition with the usual array of head-stones, &c.; but about a year or eighteen months ago I observed that the stones were being gradually removed and packed in a corner, and the graves levelled. These stones were soon altogether taken away, and about a quarter of the graveyard was used as a cabbage-garden! On the walls of this burial-ground were painted the usual large figures, indicating to the visitors the latitude and longitude of the graves, but as visitors for dead relations in a cabbage-garden might be inconvenient and anomalous, these figures were soon obliterated, and the whole space used for the purpose of a sort of market-garden.

At the present time, six semi-detached villas are springing up in the place of the cabbage, several pairs of which are already erected. In digging out the foundations for these houses, the burial-ground was incised and excavated in a shocking manner. This "resting-place for the dead" is close to the embankment of the Great Eastern Railway; and, as I have to

constantly pass and re-pass it, I have had the opportunity of observing the desecration from the beginning.

There was once a burial-ground attached to Spa-fields Chapel, Ermonth-street, Clerkenwell; recently the gravestones were removed, and make-belief garden was planted, but the shrub and plants could not live; so they were so rooted out to make way for other transformations hidden from the public by a tall boarding which, however, was not sufficiently perfect to prevent the fact of certain excavations having taken place in the graveyard being pretty generally known. S.

CONCRETE HOUSES IN THE METROPOLITAN DISTRICT.

SIR,—Being about to erect some concrete cottages, I should be glad if you or any of your readers would inform me whether there is anything in the Building Act to prohibit it; and, further, whether any concrete houses are known to have been built within the Metropolitan District? The District Surveyor tells me cannot be allowed.

BUILDER.
* We are not aware that anything in the Building Act would prevent the erection of concrete buildings within the Metropolitan district. The requirement that "the thickness of every stone wall in which the beds of masonry are not laid horizontally shall be one-third greater than the thickness prescribed in the rules" might possibly be held to apply. The Board of Works could settle this.

CHURCH DESIGN ABOUT SHEFFIELD.

SIR,—I think your "Commissioner" would do good service in reviewing the designs of the new churches that are springing up in and around Sheffield. Draughtsman's and carpenter's (architect) Gothic very much predominates the exclusion of fine-art architecture, and I feel will not redound much to our credit in the pages of history.

One of the leading "Goths" admitted to me about two years ago that he knew little of Gothic architecture, and now he carries off all the prizes with the aid of experts from London offices, and thereby argues that the "bench" is the sure road to distinction and success. C. E.

THE NEW ENGLISH CHURCH OF BADEN-BADEN.

ON the 14th instant the church of All Saint Baden-Baden, was solemnly opened. The edifice was designed by Mr. Thomas Wyatt, who furnished all the drawings gratis. It has spire and holy. A stained-glass window, presented by Lord and Lady A. Loftus, decorates the east end. It was painted at Munich. The mosaic pavement, reredos, brass railings, and other ornaments, the pulpit of carved oak, the Bible and Books of Common Prayer for the reading-desk and altar, were also the contributions of Lady Loftus, and offered by her as a memorial of her eldest daughter, who died at Baden-Baden some years ago.

The Queen of Prussia, who takes great interest in the English Church, has contributed liberally towards the erection of this church. Her Royal Highness the Crown Princess of Prussia provided a font. The lectern, in the form of an eagle carved in oak, with Gothic stand, having four Evangelists at the four corners of the base is the present of the Grand Duchess of Baden. His Royal Highness the Prince of Wales, during his late visit to Baden, took great interest in everything connected with this church, and sent the treasurer as a donation 1,000 francs.

RESTORATION OF ST. MARTIN'S CHURCH, EXETER.

SIR,—A "Visitor" very justly reprehends the work that is going on at this church, situated it is in the very Cathedral-close, viz. it is the best original Norman and Decorated work.

He is a little hard upon the pointing, which nearly follows the old joints; but does not notice that the old bell-chamber windows have not had their tracery replaced, and some small quantities

foil lights that have been scraped out to circles are left in mutilated condition, when a few pounds would have made them good. These mutilations "cleaned down" are more glaring than before; the "Visitor" does not notice them. What he says about the parapet and cornice is, I fear, too true.

Had he, however, entered the church he would have found that improvements have been already made in the chancel, under a very judicious architect, whose services, then gratuitous, should have been continued now; and assuredly the "abominations" noticed would never have existed. No one can interfere; for, as "there's a divinity doth hedge a king," so there is a deference due always to churchwardens. The "glorious west window" remains, as yet untouched; but a shallow porch, of very singular construction, is about, we fear, to rear its modern gable in front, and somewhat to the injury, of the fine old window.

It is only proper that some one should acknowledge the "Visitor's" just letter, and appreciate the good intentions and just censures of the writer. In doing this, I sign myself

AN EXONIAN,

And Member of the Architectural Society.

PROVINCIAL NEWS.

Yarmouth.—The new fish market and wharfs are now nearly completed. They are situated between Beeching's yard and the lower ferry, and are of considerable extent. The market is 750 ft. long by 40 ft. wide, with a landing wharf of the same width between it and the quay. The former is flagged throughout with granite pitching, and the latter paved with Caithness stone, the whole having a fall to the haven of 3 ft. The market is covered with a span roof, with queen-post trusses, resting on 24 iron pillars, which are set in York stone, embedded in concrete. The roof on the east side is lighted with thirty-six skylights, 10 ft. by 6 ft. each, the west front being open. Along the eastern side are offices for fish-salesmen and telegraph clerks, while in the rear are extensive warehouses, with an intervening space of 80 ft. wide for the storing of swills. These back premises communicate with the wharf by roadways, two of which intersect the covered market. The contracts for the wharf and market amounted to about 8,000l., but as several additions, including the warehouses in the rear, were subsequently made, it is estimated that the entire cost will amount to about 12,000l. The works have been carried out by the corporation.

Stockbridge.—The foundation-stone of the new Parsonage-house has been laid. It is being built by Mr. Henry Reeves, of Rookley House, upon his own lands, expressly for the use of himself and family, consequent on his accepting the position of rector of the parish. The building will cost about 2,000l.

Eastbourne.—The extensive premises at the east end of Teneasy-road, which have been taken by the Eastbourne Royal Marine Baths and Laundry Company, and fitted up "for the purpose of supplying hot and cold sea and fresh-water bath accommodation, and also the means of washing linen and other things, for the visitors and residents, on the best and most approved scientific principles," have been formally opened for business. The building has been appropriated to the purposes of the company under the superintendence of Mr. Atkins, the engineer. The fittings of the bath-rooms are of porcelain, and the bath in one piece (Rufford & Finch's patent).

Torquay.—The foundation stone of a new harbour has been laid at Torquay by Miss Palk, daughter of Sir Laurence Palk, bart., lord of the manor, and M.P. for South Devon. The harbour is estimated to cost 37,000l. On the same day festivities were observed in Torquay in commemoration of Mr. L. H. Palk (son of Sir Laurence) retaining his majority. The plot of land in front of Ellicombe, Torquay, has been presented to the Local Board as a pleasure-ground for the people.

Maidstone.—The re-decoration of the ceiling of the Town-hall by Signor Galli is now completed. Originally the ceiling was painted in distemper instead of in oils, and the consequence was that the paint peeled off in large masses, as Signor Galli has materially changed his design, and he now guarantees that the work shall be durable. The cost is 100 guineas.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

The first annual general meeting of this young institution was held on Monday evening, the 23rd inst., in the hall attached to the offices. Mr. William Henshaw, the president of the Institution for this year, took the chair. The Secretary read a report, which said,—

"The claims that recommend this Institution to the support of the benevolent are many, but we can urge none more forcible than the fact that it represents an educated class, who are engaged in a trade where permanency of employ is very uncertain, and the occupation very sedentary, and who are in many cases unable to make any adequate provision for the necessities of old age, or to meet the requirements of occasional illness, family troubles, or loss of employ. We regret the absence of support by many employers in the trade, but we are buoyed up by the hope that as our principles (non-union ones), are better known, we shall number them amongst our warmest supporters."

The receipts showed an amount to the Relief Fund of 409l. 8s. 6d., and to the Asylum Fund, 227l. 11s., making with interest on the banking account, a total amount of 638l. 13s. 4d.

The disbursements for the year amount to 161l. 1s. 11d.; and the balance at the bank, and in the hands of collectors, to 477l. 11s. 6d.

On the motion of Mr. Conder, seconded by Mr. Pritchard, the report was received and adopted.

Various other resolutions were moved and seconded by Messrs. Courtney, Nightingale, Barle, and Dalziel.

The Chairman considered that the present was an opportunity not to be lost by the builders' clerks. In the working of this their own institution, they had not been interfered with. They had started themselves; they had drawn up their own code of rules; they had had the entire management of it from the commencement, and save with the consent of their support, the employers had not interfered in the slightest degree with whatever they chose to do. From its commencement the objects of the Institution had been most ably advocated, and with what success he would have the balance-sheet to tell. The Society was now well aloft, and it only needed the personal exertions of the clerks to keep it so. It would not do for them to stand aloof, and expect their employers and the trade to keep it up for them; it was such a one as met with their best wishes and entire sympathy, but he could assure them that the warmest support from without would be of no use unless equally balanced by the exertions of those personally interested in its welfare. The past year assured well for the future. They had started at a time, perhaps the worst in the annals of this century, that could possibly have been chosen for such an object, and therefore he considered the success achieved all the more surprising. He wished particularly to call the attention of all present to Rule 5. That rule struck him forcibly the first time he read it. He admired the entire power, when any case of urgent distress is brought to his notice, of a builder's clerk, or his family, through accident, illness, or loss of employ (except through his own misconduct), to grant from the funds of the Institution a sum not exceeding 10l.; also in the case of the death of a builder's clerk leaving his family in destitute circumstances, to grant a sum not exceeding 50l. towards the expenses of his funeral; and a further gratuity not exceeding 10l. towards the assistance of his family. This he thought an admirable feature in the Institution, and it received his warmest support.

After some further observations from the chairman, a vote of thanks to Mr. Thomas Peto Ward, for his exertions in connection with the Institution, was passed unanimously; and the chairman having been warmly thanked, the meeting broke up.

CHURCH-BUILDING NEWS.

Stoodleigh.—The new bells of the parish church have been inaugurated. Previous to their arrival the old ones, under the superintendence of Mr. J. M. Baker, were lowered from the bell-chamber. The date upon the old tenor is 1612, so that it had probably occupied its late position for a period of 255 years. The new frame-work, or the cage, in the bell-chamber, was made by Mr. James Osmond, of this place. The timber is oak; the frame bolted to the beams of the floor. The new peal, which is the gift of the lord of the manor, and patron of the living, Mr. Thomas Daniel, was manufactured by Messrs. Warner. The inscription on each bell, in addition to the maker's name, is Thomas Daniel, esq., donor and patron; John Greenslade, churchwarden. The peal is in the key of A natural, the tenor being the key of C sharp, and in six bells, the treble F sharp. The note of each successive bell was found to be correctly in tune. The ringers of the parishes of Oakford, Bampton, Hunsham, Washfield, and Stoodleigh tried them with "round-ringing," and Mr. C. A. W. Troyte, of Hunsham Court, assisted by some of his own ringers, and Mr. Boswell, foreman to Messrs. Warner, and who belongs to the "College Yonths," rang the "Grandsires." The number of changes on six bells is 720, which should be rung in about twenty-five minutes. In the evening, the company, about 50 in number, had supper at the New Inn.

Wethersfield.—The church which has lately been erected at Blackmore End, in this parish,

has been consecrated by the bishop of the diocese. The building has been long contemplated, but was commenced only sixteen months ago. It is built of red brick, the appearance of the interior being relieved by bands of black. The designs were by Mr. C. Buckeridge, of Oxford. The contract for building was taken by Mr. Runnacles, of Halstead. The edifice is built to accommodate 220 persons, and is seated with open benches, free and unappropriated. The pulpit and font are of stone. The total cost of the building, &c., will be about 1,200l.

Cartmel.—The restoration of the old parish church is completed. The extensive repairs have been in hand during the last four years. The galleries have been removed, and the old pews have given way to seats, made of oak. The lime and whitewash have been chipped off the facings of the stone. The western end of the church has had the ceiling renewed and the walls cemented; and nearly all the windows have been re-glazed.

Stoke.—The foundation-stone of Christ Church has been laid by Lady Lovell here. The site is in Waterloo-road. It will be a Gothic structure, and will consist of a nave, north and south aisles, and an apse at the east end, with tower and spire. At present it is only intended to build the nave, which, including the site, will cost about 3,000l. Over 2,000l. have been subscribed. The architect is Mr. Christian, of London, and the builders are Messrs. Swayne & Son, of Guildford.

Moretton (Herefordshire).—The parish church has been re-opened. The restoration was carried out, under the superintendence of Mr. W. H. Knight, of Cheltenham, by Messrs. Cullis & Collins, contractors, Tewkesbury. The tower is entirely new, as also is the porch, and the exterior walls have been scraped and pointed. New windows of stained glass, with Bath stone dressings, have been inserted. One of these is a three-light window in the east end of the chancel. The centre represents the Ascension, with the Agony in the Garden and the Bearing of the Cross on either side, while in the head of the window above is the dove, with the sacred monograms, "I.H.S.," on the one side, and "A.O." on the other. The reredos consists of a triple arcade, composed of Bath stone and marble, the shafts dividing the compartments having floriated capitals of Derbyshire spar. In the central compartment is a cross of white marble, bearing the sacred monogram, "I.H.S." and studded with caruncles. On either side of the reredos are some symbolical designs in encaustic tiles (Godwin's), the chancel also being paved with plain tiles from the same manufactory. There is an open wooden roof, entirely new, to the chancel, in which a *sedilia* in Bath stone has been inserted on the north side, and the altar-rails are supported by light metal work. The pulpit is of Bath stone, the top part being in marble, as also are the shafts. The lectern is of carved oak, unpainted, and the reading-desk of pine wood, varnished. The pews are made on the open bench principle, but have doors to them; they are of pine wood, relieved with oak panels, the wood used in the latter being taken from the old church. The whitewash has been scraped from the walls, which are now relieved by appropriate Scriptural mottoes in missal printing, while the plaster has been cleared away from the roof,—we are now speaking of the nave and body of the church,—and the old original oak exposed to view. The organ is a new instrument, and the gift, we believe, of the squire's wife, Mrs. Evans.

Killingworth.—The foundation stone of St. John's Church, Killingworth, has been laid. The style will be Early French Gothic, and the plan consists of nave, side aisles, chancel, organ chamber, vestry, north and south porches, tower, and spire. It is intended, however, to erect only the nave, chancel, south aisle, south porch, and vestry at present; leaving the north aisle, tower, and spire for erection at a future period. The building will be of stone from local quarries, the property of Mr. Fanshew, with ornamental bands of red Carlisle stone. It will hold about 350 persons. The roof will be plastered between the timbers, and the passages and halls will be paved with coloured tiles. The contract price is about 1,762l. The builders are Messrs. T. Middlemiss, Son, & Stafford; and the architect, Mr. Bassett Keeling.

Stathem, Leicestershire.—The restoration of St. John's Church has been commenced. The works will comprise the removal of the tower, the removal of the present mislaid pews, opening out the lower-arch, new pulpit and benches, removal of

the organ, complete restoration of the chancel, heating, &c. The new woodwork will all be executed in oak. The works are being carried out from the designs and under the superintendence of Mr. R. W. Johnson, architect, of Melton Mowbray and Leicester.

Wolverhampton.—The memorial stone of the new Church of St. Jude, Wolverhampton, has been laid. The church is being put up on the north side of the Tettenhall Road, nearly equidistant between those of Tettenhall and St. Mark's respectively, and it will form the centre of a district having 2,000 inhabitants, to be made by the division of that of St. Mark's. The scheme originated with the Rev. A. B. Gould, the vicar of the last-named parish, who, upon laying it before Miss Stokes, a benevolent lady, residing in Wolverhampton, received her authority to draw upon her to the extent of 2,000*l.* in support of it, and also to take as a site for the church-buildings any land she possessed in the parish of which Mr. Gould is the vicar. The land taken in is about one acre in extent. The church is in the style of the thirteenth century, and consists of nave, north and south aisles, and chancel, vestry on south side of chancel, organ-chamber on north side of chancel, and a tower, through which is the principal entrance at the west end of south aisle. The height of the tower will be about 70 ft. The walls are faced with Cotswall stone, and the dressings of Box Ground stone; the roof timbers stained and varnished. The seatings provide for 812 adults. The design has been prepared by Mr. Bidlake, of Wolverhampton, architect, under whose superintendence the works will be carried out. The contract has been taken by Mr. Nelson, of Dudley, at 4,250*l.*

Heworth.—The chief stone of a new church has been laid here. The land selected for the site of the church, and also a parsonage, the latter of which will likewise be built, consists of about an acre and a half of ground, situated at the entrance to the village, and immediately adjoining the road leading to Tang Hall. The church, which is to be designated the Holy Trinity, will cost in the erection upwards of 5,000*l.* Its style will be Early English, and it will have a nave and chancel, with a tower and spire. There will be a porch on the north side of the church, an entrance underneath the tower, and another entrance by the vestry. The church will have an open-timbered roof, the rafters of which will be stained and varnished; Westmoreland slates will be used for the covering in of the edifice. There are to be no side aisles, as the interior will be sheltered by one roof of 35 ft. 6 in. span, which will be the breadth of the church, and its length is to be 114 ft. Provision will be made for having an organ chamber underneath the tower. The floor of the nave will be flagged, but encaustic tiles will be employed in the paving of the chancel floor and the sanctuary. The nave and chancel walls will be pierced with two-light windows. The east end of the church will have three single-light windows surmounted by a cinquefoiled window, and the west wall will have four single-light windows of the same character; above which there will be a cinquefoiled window. All the windows will be filled in with cathedral glass, and have coloured margins. The sittings of the church will be open, and stained and varnished, and will accommodate 300 adults and 150 children. Mr. G. F. Jones, of York, is the architect; and the tenders of the following York tradesmen for the execution of the work were accepted, namely:—Mr. Joseph Keswick, mason and bricklayer; Mr. John Holmes, carpenter and joiner; Mr. Francis Rawling, plasterer; Mr. Richard Walker, plumber and glazier; and Mr. Thos. Wood, slater.

DISSENTING CHURCH-BUILDING NEWS.

Llanelli.—The memorial stone of a new Congregational chapel (being the fifth belonging to that body in the town) has been laid at the New Dock, Llanelli. The architect is Mr. John Humphreys, of Morriston, and the builder Mr. David Edwards, of Llanelli. The style of the erection is a mixed one. The dimensions over all are,—length, 53 ft. 3 in., and breadth, 43 ft. The height from the floor to the wall-plates is 28 ft., and to the centre of the pitch in the roof about 8 ft. more. The walls will be of stone from a neighbouring quarry, except the front, which is to be of dressed stone and rock work or pool work. On this side there will be six windows. The principal entrance is a large folding

door in the centre of the front side; this leads into a porch, from whence doors on the right and left hands open into two side aisles, running from top to bottom of the chapel. The ceiling is a concave one, formed in plaster and with panel-work. A gallery, supported on iron pillars and girders, and the front, of cast iron, is to run round two sides of the end of the building. At the end, and facing the entrance, a platform will be erected at a convenient height from the ground, and in front of this a small reading-desk of polished Memel wood will be placed. The pews are to be of yellow pine and red Swedo timber, the top being of polished mahogany, as well as the top of the gallery round the whole of the front. The windows behind the pulpit will be of enamelled glass, and the small lobby-windows are to be glazed in the same material. Seat accommodation is provided for about 600 persons, and it is estimated that the entire cost of the building will be about 1,400*l.*

Plaietow.—The memorial-stone of a new Independent chapel has been laid at Canning Town, Barking-road, Plaietow. The new building, which will cost 1,586*l.* 18s. 9d., is being erected by Mr. R. Stevens, of Poplar, from designs by Mr. J. W. Morris, of the same place. It will be a plain building, with platform pulpit, and vestry underneath, and the interior will be so arranged that galleries can be afterwards erected if necessary. Accommodation will be provided for 495 persons.

Earlisle, Hereford.—A new chapel for the Primitive Methodists has just been opened in this village. The edifice, which is in the Early English style, is built with brick and Bath stone dressings, open sittings, with rostrum set in a dressing, and boarded under slate. The wood-work is stained and varnished. Mr. J. H. Ewins, of Hereford, was the architect.

Lower Cwmbran (Monmouthshire).—The foundation-stone of a new English Wesleyan chapel has been laid here, by Mrs. Bytheway, who officiated in the absence of Mrs. Greenway, of Glantorvan House, Pontypool. The architect for the building is Mr. Samuel Hancock, of Bristol and Newport, Monmouthshire; and the builder, Mr. Joseph Parfitt, of Cwmbran.

ROMAN CATHOLIC CHURCH-BUILDING NEWS.

Doncaster.—The new church of St. Peter has been opened with great ceremony, and in the presence of large congregations. The church occupies the site of the old chapel in Princess-street. The style of architecture is First Pointed, and it is very simply treated. The material used in the work is brick, stone being sparingly introduced for the dressing of doors, windows, and other points of detail. Messrs. M. E. Hadfield & Son, of Sheffield, were the architects; Mr. Rodley, Sheffield, the contractor; Mr. Hayball, of the same place, executed the wood-work. The building has accommodation for 400 people.

Richmond, Yorkshire.—The foundation-stone of the new church of St. Joseph and St. Francis Xavier has been laid. The site selected is in close proximity to the old church. The plan consists of a nave, entered from an extended porch, such as may be seen at Fountains, and as existed at Byland, in this country. The nave is flanked by two aisles, giving a total width of 50 ft., and is terminated by a chancel of apsidal form, the total length being 101 ft. There are a side porch and two confessionals, whilst a sacristy, with a turret and upper chamber, terminates the eastern aisle. The aisles are separated from the nave by circular shafts of red stone and pointed arches, with a clerestory above of circular treceder windows. The roof is framed with arched principals, springing from stone corbels. The plans have been prepared by Mr. George Goldie, of London, the architect of the new Roman Catholic church at York; and the contractors are Mr. Smith, mason, and Mr. Naylor, of Richmond, builder. The cost of the whole will be under 3,000*l.*

Shipley.—The new chapel of St. Mary and St. Walsburga, Shipley, has been opened for divine service. It is two years since the site, an acre in extent, in Victoria Park, was purchased of Mr. Couliffe Kaye. It looks down on the mill and the village of Salsaire, and commands an extensive view of Airedale and its background of undulating hills. A Gothic presbytery has been erected, and between it and the

present chapel there is an extensive plot of ground, intended for a better church at some future time, when the present chapel would be converted into schools. The chapel, which is in plain Gothic style, is 84 ft. by 30 ft., including a small sanctuary.

SCHOOL-BUILDING NEWS.

Hawsker.—Hitherto the extensive township of Hawsker-cum-Stainsacre has been ill-provided with a school-house and place for religious worship. Some time since the farmers and landowners resolved to make an effort to raise a suitable building, and their appeal for aid was soon responded to, that the erection was soon commenced, and it has now been opened. The school is conveniently situated, in a central part of the township, about three-quarters of a mile from the village of Hawsker. It is built of stone, supplied gratuitously from one of Mrs. Cholmley's quarries. The site, including playground, has been granted by the lord of the manor and Mr. Moorsome. The cost of the building, including a house for the teacher, is 550*l.*; and about 150*l.* are still needed to start the institution free from debt. The design of the building was furnished by Mr. E. Smales, architect, and the sole contractor for the erection was Mr. Wood, of Malton. The room is capable of accommodating upwards of 200 pupils.

Hucknall-under-Hathwaite.—The foundation-stone of a new school for the parish of Hucknall-under-Hathwaite, a large village situated between Sinton-in-Ashfield and Alfreton, has been laid by the Dowager Countess Carnarvon. The site of the building is upon a declivity near the road leading from Hucknall to Blackwell. Mr. C. J. Neale, of High Oakham, is the architect. The principal room in the building will be used as a chapel of ease for the use of the village, which possesses no church. Accommodation will be provided for about 300 children of both sexes. The girls' and infants' school will be in dimensions 35 ft. by 22 ft.; and the boys' room, 32 ft. by 20 ft. There will also be a class-room, 22 ft. by 12 ft. It is contemplated to erect two teachers' residences if the funds permit. At present the contemplated expenditure is about 900*l.*

Hanley.—The chief stone of a new ragged school has been laid here. Mr. Snaith, the borough surveyor, who is a member of the committee, prepared the necessary plans without charge, and he has designed a building which will cost about 600*l.* It will consist of one large room, with a moveable partition, two classrooms, and a gallery, and will accommodate about 400 scholars.

Penzance.—The memorial stone of new Wesleyan day and Sunday schools has been laid close to the enlarged chapel in Chapel-street, the front abutting on the thoroughfare to the quay, and having a second approach for the infants' school from Voundervour-lane. They will be built from the plans of Mr. John Trousoun, of Penzance, architect, who was the successful competitor among five for a premium of 10*l.* Messrs. Philip Thomas & Son are the builders. The cost when complete will be about 1,500*l.* The elevation in Chapel-street shows a building of dressed hammer-raised granite, with granite ashlar dressings. This frontage will be 33 ft. high, to the parapet of cut granite, and will have six circular-headed windows and a square porch, surmounted by a bell-turret 12 ft. above the parapet. The carpenters who have contracted for their portion of the work are Messrs. Hill & Jenkin. Mr. James is clerk of the works.

STAINED GLASS.

St. Peter's, Quernmore.—The east window of St. Peter's Church, Quernmore, Lancashire, has lately been filled with coloured glass under somewhat singular circumstances. Mr. Garnett, late M.P. for Lancaster, having been led to visit Cannes, in the south of France, for three successive seasons, assented to a proposal made to him in the spring of last year to join with the chaplain and another layman in providing a coloured window for the English church at Cannes, which was to be enlarged. An order was given in London, and the window was finished and sent out by the *Fairy Vision* for Marseilles, in October last. The ship foundered almost within sight of port, on one of the

dangerous sandbanks off the mouth of the Rhone. The window was insured and an order was sent to London for another, which in due time arrived, and was fixed in the church. The unfortunate *Fairy Vision*, at the bottom of the Mediterranean, was sold to a Greek, who set to work to recover the lost cargo, and while Mr. Garnett was at Hyeres in the spring of this year, the window was fished up and sold by auction at Marseilles. He bought it and sent it home, not much the worse for its five months' dip in the sea, and it is now in Queenmore Church. The window represents leading events in Gospel history.

Books Received.

Mushrooms and Toadstools: How to distinguish easily the Differences between Edible and Poisonous Fungi. By WORLINGTON G. SMITH. London: Hardwicke, Piccadilly. 1867.

Mr. W. G. SMITH is a devoted and enthusiastic student of the Fungus tribe. For many years he has devoted every moment of his leisure to it, and some time ago he received the gold medal of the Royal Horticultural Society for his drawings and dissections of fungi. By means of the little book before us, and two large sheets containing figures, one of twenty-nine edible and the other of thirty-one poisonous species, drawn the natural size, and coloured from living specimens, he seeks, while preventing disasters, to make known the large number of fungi that may be pleasantly eaten. He invites his readers to partake of the homifical feast spread all over the country for those who care to partake. We must, nevertheless, inculcate care. The knowledge generally possessed regarding the immense fungus tribe of this country is embraced in the words mushroom and toadstool.

If we take the mushroom type of fungus as an example, we have, it appears, some 600 species, all possessing a certain general similitude of form. This has caused many to look upon fungi in common as equivocal productions, difficult or impossible to distinguish as permanent species; but when the study is once entered upon in earnest, the student will soon perceive that the species, as a rule, are marked with great distinctness and permanency, rendering the recognition of most of them as certain as any species of flowering plant. Mr. W. G. Smith has done a good work well. He brought to the task an accurate pencil as well as special knowledge.

Examples of Bridges and Viaducts: from the Contract Working Drawings, or Admeasurements. By W. DAVIS HASKOLL. Second edition. London: Lockwood & Co. 1867.

This edition of Mr. Haskoll's "Examples of Bridges and Viaducts" has the advantage of containing more than 500 estimates of over-rail and under-rail bridges, and some sensible observations on the practice of setting out works, and the value of practical knowledge to the engineer. It is a very valuable volume, and may be added usefully to the library of every young engineer. It will be very useful, too, to the colonies.

We will take an item of information from his pages. He has found the average number of bricks laid by one man in a day of ten hours.

- 1,600 in abutments and foundations.
 - 1,400 in arches of large span.
 - 1,100 in 18-in. walls, with joints struck.
 - 1,000 in 14-in. walls, with joints struck.
- He notes, too, that 12 tons of Blue Lias quick lime will make about 47 cubic yards of first-class mortar, 53 cubic yards of second-class mortar, and 81 cubic yards of concrete.

VARIORUM.

"JOURNAL of the Transactions of the Victoria Institute, or Philosophical Society of Great Britain. 1867" (Hardwicke). "Annual Address to the Victoria Institute, May 27th, 1867. By J. Reddie, Hon. Sec." (Hardwicke). Although some members of the Victoria Institute are obliged to reason on restricted principles, no member being admissible who is not a believer in the Bible, and, in fact, at least a nominal Christian, these subjects discussed are of great interest, and are made of discussion liberal, and free from anything like bigotry. The society have a "devil's advocate," as they call him, in Mr. Harrington, who defends the ultra-liberal side

of various questions, and so gives piquancy and life to discussions which would read rather flatly if all the speakers were on one side.—"The Civil Service Geography. By the late J. M. Dalrymple Spence, revised by T. Gray, assistant secretary, Board of Trade" (Lockwood). "Not to make too fine a point of it," this little volume is a crammer, but a very good one. We have heard of a machine by means of which live geese could be stuffed to the throat, and so in time made fit for the roasting to which they were destined. If any machine will stuff Civil Service candidates with grains of geography, and fit them thus far for their examination, this little manual will do it. There are members of the Government, too, of pretty high rank, who are said to be not by any means posted up in their geography: here they will find the pure grain winnowed from all the chaff, and available at any moment. As a help to children at school the book is by no means unsuitable.—"Report of the various Proceedings taken by the London Trades Council and the Conference of Amalgamated Trades in reference to the Royal Commission on Trades Unions and other subjects in connexion therewith" (Kenny, printer, Parkers'-street, Little Queen-street). This is a clear and business-like report of proceedings connected with the trades-union question. Amongst the recorded matter is that relating to the endeavour to obtain a bill to secure the funds of trades-unions from dishonest officials. A temporary bill was introduced into Parliament, but thrown out. No doubt the whole subject of trades unions will come before Parliament next session, and some protection will be granted in this respect.—"Country Life" is a periodical that many people living in the country will value, treating as it does of the farm, the garden, the house, and so forth. "A North Northamptonshire Rector," by the way, who has commenced some jottings in it, when he quotes a line known to every one in this fashion.—"Some one has said that 'man made the town, and God the country,'" does not give a good impression as to the precision of his knowledge.—Hardwicke's *Science Gossip* progresses capitally. It is invaluable for young naturalists, indeed to all living in the country.—Mr. Tegg has published a new edition of Wright's "Eton Greek Grammar," revised by the Rev. John Massie, M.A.—And from the same publisher comes a fresh issue of Strutt's "Sports and Pastimes of the People of England," with Hone's Index: an amusing and valuable book. A really new edition, properly edited and added to, is wanted.—Mr. Wyld, always prompt, has just issued a new Map of Abyssinia, which will be of interest at the present moment. It is well marked with numerous names of places, and appended is an interesting section of the land levels of this mountainous district of country, from the Gulf of Aden to Agameder.

Miscellanea.

OUR INDIAN RAILWAYS.—A leading article in the *Times* of India, of the 19th of August last, relates to serious defects in the management and execution of the railway works in India. The writer says:—"There can no longer be any evasion of the truth that faulty construction is one of the blots of our railway system—the shingle embankment at the Sukkee Nullah, the seven suspected bridges within seventy-five miles between Sheganag and Budnaira, and the utter destruction of the great viaduct on the Bhoroo Ghant, are indications of a general flaw which more or less seems to pervade all railway constructions in India." He complains of the operation of the sub-contract system, and the construction of embankments formed of "shingles," arches of "rubble masonry," and piers composed mainly of rubbish called "concrete." "Happily," he remarks, "some check is already being given to this system. The contract on the Eastern Bengal line has, we believe, been quite regular and satisfactory, and the same may be said regarding the progress already made with the Delhi line. It is imperative that a stop should be put to the illnsory and expensive procedure which is inseparable from the practice of amending contracts."

* "God made the country, and man made the town." Cooper: "The Two."

The Roman writer, Varro, substituting "divine nature" for "God," had said the same thing seventy years before Christ.

THE CO-OPERATIVE PRINCIPLE IN AMERICA.—Co-operative associations are multiplying among the working men of New York. Two co-operative building societies have been formed, and it is proposed to establish a co-operative savings-bank, also a store.

THE LATE M. HEISER, ARCHITECT.—M. Heiser, architect of the Austrian department in the Paris Exhibition, has died. He was only forty-four years of age. M. Heiser received the cross of the Legion d'Honneur, on the 1st of last July, from Napoleon.

THE TREE THAT GROWS GREASE AND TALLOW. In China there grows a tree known as the Grease Tree. It is said that large forests of this vegetable lubricant are to be found there, and they form the source of a considerable local traffic. This tree not very long ago was imported into India, and it is said that the experiment of cultivating it there has proved quite successful. Dr. Jameson, a chemist in the Punjab, has prepared hundredweights of grease from this particular tree, and has forwarded on trial a portion of it to the Punjab railway, to have its qualities tested as a lubricant. The grease thus obtained, it is said, forms an excellent tallow, burning with a clear, brilliant, and white light, emitting no unpleasant odour or smoke.

THE ATMOSPHERE OF THE UNDERGROUND RAILWAY.—In a letter by the secretary to the vestries of St. Marylebone and St. Pancras the writer says:—"It has been suggested that openings might be made at several points in the Marylebone and Euston roads, where important thoroughfares cross this line of road, by means of handsome and ornamental hollow columns, which should be connected with the tunnels, and which should support street lamps similar in principle and fashion to the lamps at each end of the new street in the Borough. Of course such works could only be undertaken by or with the consent of your vestry, and I am, therefore, desirous to ascertain whether the vestry would be prepared to assent." On the reassembling of the vestries the subject will be considered and determined upon.

TRADITIONAL RELIC OF THE SLAYER OF THE GREAT SNAKE OF SLINGSBY.—It has been found necessary to pull down one of the few ancient churches now remaining in Yorkshire—the church of All Saints, Slingsby—in consequence of its decayed condition. The church formerly belonged to the abbot and convent of Whitby. The old church contained a cross-legged effigy of one of the Wylls, who, tradition and the Dods-worth MSS. say, slew the famous snake of Slingsby, which is reputed to have been so terrible that the highway to Malton was diverted one mile to the south, to miss the snake's lair. In the tomb below the effigy a skeleton was found, the bony hand of which wore a splendid and massive gold ring, having the death's head and cross-bones picked out in coloured enamel. The tomb, the skeleton, and the effigy have been preserved, and will be restored to the chancel of a Norman church, which is to be reared on the old site, of which the foundation-stone has just been laid. From below the foundations of the old church coins of the House Tupa Confederation (twelfth century) were dug up.

THE ROCHDALE PIONEERS.—The annual return has been issued of the statements rendered by industrial and provident societies in England, registered under the Act of 1863. 210 neglected to send a statement of the business of the year 1866; 436 complied with the requirements of the Act. The business carried on is that of dealers in provisions, some associations also supplying drapery goods, or boots, or both. The number of members of the 436 societies had reached 173,423 at the close of the year 1866. The shares are commonly 1l. each. At the end of the year the amount of share capital was 1,048,696l., and of loan capital, 118,023l.; the trade liabilities, 334,561l.; the assets and property, 1,009,849l.; and the cash in hand, 192,803l. The Rochdale "Equitable Pioneers," established in 1844, still take the lead. This association had at the end of the year 1866, 6,246 members, and a share capital of 97,489l.; grocery and provisions sold in the year to the amount of 249,122l., cash, realised a profit of 31,931l. There is a quarterly audit by members. The profits were disposed of thus:—For interest, 3,823l.; dividend on the amount of purchases made at the shop, 25,829l.; education, 681l.; reserve fund, 252l.; for depreciation of fixed stock, 1,197l.; charities, 165l.

ARCHITECTURE: UNIVERSITY COLLEGE, LONDON.—Professor Hayter Lewis has issued his programme. The first term in each course will commence on October 8th.

GLoucester Cathedral.—Mr. J. Roddis, of Birmingham, has completed the last of a series of figures, thirty-three in number, for the chapel of St. Andrew, in Gloucester Cathedral, at present being restored under the direction of Mr. Gambier Parry and Mr. Scott, R.A.

JOHNSTONE, SCOTLAND.—The chief stone of a public hall has been laid here. The cost is estimated at nearly 3,000l. The building, the site of which is in Ladovic-square, is intended for a public library and reading-room, and will contain a hall for public lectures. The walls are a few feet above ground.

TRANSPARENT DOOR-PLATES.—Messrs. Drury & Westrap have patented a new knocker, which includes an arrangement by means of which the number of the house or name of occupant can be seen at night. A small opening is cut in the door to fit a plate of ground-glass at the top of the knocker, on which the number or name can be written; a light in the hall would, of course, be necessary to make it obvious at night. For the design of the knocker at present made we can say nothing very flattering; but the transparent part may be found useful by physicians and others, and for houses in the suburbs which have a plot of garden in front, as the number can be seen from a distance.

THE BRADFORD NEW TOWN HALL.—“There is a very general opinion,” says the local *Observer*, “that the town council has made a great mistake in deciding to build their new offices on the west side of Chapel-lane. The objection is manifold. It is argued that the site is inadequate, unsuitable, expensive, and required for other purposes. Further, that we ought not to be satisfied with ‘offices,’ but should go in for a town-hall as pretentious at least as those of Leeds and Halifax, and that on the site chosen such a building is not possible. Also, that a better site in all respects, less costly, equally convenient, and more commodious can be found, upon which temporary offices may be erected if thought advisable, and a grand town-hall eventually.”

THE CHAPELS, BEBINGTON.—At the monthly meeting of the Bebington Burial Board, it appeared from the proceedings of the former meeting that the second premium for the designs for the chapels, &c., had been awarded to Mr. Thomas Holmes, Tramere, and that the tender of Mr. John Dobson, Rock Ferry, had been accepted for the carrying out of the designs of Mr. Hamilton, in accordance with the plans selected for the first premium. It having been stated that some remarks had been made respecting a disparity which it was said existed between the specification for which tenders had been invited and the original one submitted by Mr. Hamilton, the surveyor had been instructed to examine them and report, which he now did to the effect that the two specifications were substantially the same, any small alterations made being principally explanatory, and that in almost every instance their tendency was to increase the cost.

THE RAILWAY CUT ACROSS AMERICA.—The last, the longest, and by far the most costly of the excavations along the line of the Central Pacific Railway is the great tunnel which has just been completed. Of this tunnel while in progress we have already spoken. It is 1,660 ft. in length, and was begun at the east portal on the 16th of September, and on the west portal on the 20th of September last, and the work upon it has therefore occupied about a year. The material which had to be drilled and blasted was granite of the hardest grain. Advantage was taken of a depression in the centre, and a working shaft of 159 ft. was sunk so as to present four working faces. The average rate of progress with powder was about one foot per day to each face, or from 20 ft. to 30 ft. per week in all. In March last the company accepted the services of an experimenter in nitro-glycerine, which article was manufactured on the spot, and the average was increased to nearly 50 ft. per week. The workmen, principally Chinamen, laboured in three gangs for eight hours each, and proved very serviceable in this kind of work. At times the consumption of powder reached 400 kegs per day. The Pacific Railroad is thus making rapid strides to a successful completion.

SPONGE FOR SEAT AND MATTRESS STUFFING.—A grass sponge, hitherto not made use of, has been found to be very suitable for stuffing chairs and mattresses instead of hair. It grows in shallow water among the coral formations of the Bahama and on the coasts of Mexico and Florida. A new trade in this article has been established in New York and Boston amongst the upholsterers. It is used instead of feathers in beds as well as hair in mattresses, and at much less cost,—at least one-half, it is said,—than either. It is prepared by a patented process, in which glycerine is used to render its elasticity permanent.

A LIFE-SAVING MATTRESS.—Experiments have been made in America with the view of testing Golding's Life-saving Mattress. The mattresses in question are intended to take the place of ordinary mattresses on board vessels. The lower portion is composed of cork cuttings encased in canvas, while on top is a second mattress of hair—the whole intended to serve the double purpose of a bed and life preserver. Thus, if a passenger is awakened in the night and finds the vessel sinking he has only to pick up the mattress and jump into the water in order to be safe. The steamer *Silas O. Pierce*, having a party on board, arrived within half a mile of the shore, when five men, each having a mattress, jumped off from the vessel. The beds proved to be exceedingly buoyant, and the men sat on them and paddled themselves ashore by using their hands as paddles.

INCREASE OF LARGE CITIES.—The following statements are from a work entitled “*Étude Médicale et Statistique sur la Mortalité à Paris, à Londres, à Vienne, et à New York, en 1865*,” by Dr. Vacher. In 1865 the population of Paris was calculated at 1,863,000; of London, at 3,028,000; of Vienna, at 560,000; of New York, a year earlier, at 1,025,000. The annual ratio of increase per inhabitant was, in Paris, 0.02 (in other words, 100 inhabitants became 102 in the course of the year); in London, 0.017; at Vienna, 0.016; and at New York, 0.35. The average number of inhabitants in a single house is, for Paris, 27; London, 7; Vienna, 64; and New York, 14; so that Vienna is the most densely peopled town of the four. From these data it appears that the increase of population at New York is equal to that of the three other towns taken together—a circumstance owing, of course, to the stream of emigration constantly flowing in that direction. In 1790 the population of New York was 33,131, and it has since been fully four times doubled. With regard to the other towns, Dr. Vacher attributes their increase to the tendency of the country people to migrate to the large centres of population, for the mere excess of births over deaths cannot account for this increase. Paris has doubled in the course of 32 years, London in the course of 40, and Vienna in the course of 44. Yet the excess of births over deaths in Paris was only 41,931 from 1836 to 1856, while the increase of population during the same period was 305,908. In London, from 1841 to 1861, the excess of births over deaths was 325,189; the increase of population, on the contrary, was 926,026.

TENDERS

For the erection of new schools at Tramere, in connexion with the Birkenhead Union Workhouse. Mr. T. Layland, architect. Quantities supplied by Mr. W. Longson.—

Aldis	£9,298 0 0
Dobson	9,104 0 0
Cameron	8,887 0 0
Burroughs & Son	8,769 0 0
Kirkham	8,750 0 0
Chuck	8,590 0 0
Harkness & Demster	8,528 0 0
Jones & Co.	8,287 0 0
Robert	8,181 0 0
Campbell	8,173 0 0
Bonness	8,100 0 0
Forde	8,066 0 0
Roberts & Robinson	8,048 0 0
Hogarth	7,987 0 0
Calhe	7,959 0 0
Rudebaldh	7,775 0 0
Blakeley	7,683 0 0
Anderson	7,542 0 0
Mullholland	7,535 0 0
Roberts	7,438 0 0
McCormick	7,390 0 0
Corris (accepted)	7,390 0 0

For carrying out, two houses at Thornton Heath, Croydon. Mr. J. Betsey, architect.—

Hall	£1,483 0 0
Nightingale	1,322 0 0
Crabb & Vaughan	1,199 0 0
Loe	1,182 0 0
Brett & Bradbury	1,148 0 0
George	1,127 0 0

For Congregational Church, Eastwood, Notts. Messrs. Bidlake & Tait, architects.—

Thomson	£2,191 0 0
Trow & Sons	1,834 0 0
Wilks	1,823 0 0
T. & H. Herbert	1,823 0 0

For the erection of new workhouse, infirmary, &c., at Hereford. Mr. Fredk. Peck, architect.—

Chappell	£10,500 0 0
Glasscock	8,500 0 0
Moxon & Mutton	8,490 0 0
Elkins & Sons	8,373 0 0
Patterson	8,200 0 0
Smith	8,155 0 0

Grover	11,660 0 0
Cockrell	11,575 0 0
Pearse	11,500 0 0
Baxter	9,978 0 0

For new Berner's Hall, for the Agricultural Hall Company, Islington. Mr. Charles Bird, architect. Quantities supplied by Mr. Green.—

Axford & Whilber	£4,542 0 0
Perry & Son	4,515 0 0
Palman & Fotheringham	4,410 0 0
Wash & Son	4,328 0 0
Sharman	4,300 0 0
Brass	4,146 0 0
Hill & Keddell (accepted)	3,965 0 0

For Masonic Hall, Birmingham. Mr. Edward Holmes, architect. Quantities supplied by Messrs. Batston & Hunt.—

Naden & Son	£17,000 0 0
W. & B. N. Smith	16,950 0 0
Hardwick & Son	15,985 0 0
Matthews	15,853 0 0
Parrell & Son	15,900 0 0
W. & J. Webb*	15,078 0 0
Moffatt	14,896 0 0

* Accepted, the tender of Mr. Moffatt not being in accordance with the proper form.

For pulling down and rebuilding the court and offices of the Coopers' Company, Basinghall-street. Mr. Geo. Barnes Williams, architect to the company.—

Coleman	£4,888 0 0
Myers	4,867 0 0
Ashby & Son	4,824 0 0
Brass	4,778 0 0
Ashby & Horner	4,759 0 0
Rider	4,660 0 0
Browne & Robinson (accepted)	4,527 0 0

For the new London Pottery, Lambeh, for Messrs. J. Stiff & Son. Mr. Jas. Taylor, architect. Quantities by Messrs. Birdseye & Stone.—

Webster	£9,090 0 0
Lalby, Brothers	8,224 0 0
Kilby	8,223 0 0
Holland & Hammen	8,108 0 0
Clendinning	7,729 0 0
Clemence	7,729 0 0

The Builder.

VOL. XXV.—No. 1287.

What is your Name?
Who gave you that Name?

S language is one of the most important of the endowments of the human race, all inquiry into its sources, or into that of any of its branches, must ever be of general interest. Philologists, or philologers as they used to be termed, put forward large claims in its behalf, which we can but allow. Philology, they aver, is one of our most valuable aids, or reliable clues, in the study of ethnology. The names of the geographical features of a

try help us to a knowledge of the race who peopled it, or who were sufficiently civilized upon any decipherable trace behind. In and, for instance, the names of hills, valleys, and places clearly indicate a succession of nations possessing different languages. We who Celtic wave in the names of some of rivers, such as the Avon, Esk, Derwent, and in the names of places containing the Tre, Car, signifying in the Cymric tongue castles, fortified or otherwise; we realize the occupation in the names of places containing in "chester," and its varieties in *castra*, in which we recognise Latin *castra*; we own the Anglo-Saxon names of places that affix the terms *ton*, *ham*, *wick*, or include a reference to natural objects in the Saxon speech, as *ford*, *brook*, *dale*, *hirst*, *wood*, &c.; we note a naming of settlements, in certain cases, in which words having Danish termination are used, such as *hy*, *thorpe*, *dale*, *beck*, *ness*, *thwaite*; and a fifth in the Norman names *Mowson* (*Malroisin*), *Malpas*, *Beaumaris*; in a word, we find in the names of our chief places exact corroboration of known facts of history. If we look abroad, by this clue, the names of places will give us very important information. We have seen this fact pointed out more clearly than by Mr. Picton, who, in a paper read before the Royal Library and Philosophical Society, at the great value of nomenclature in historical researches by various illustrations, mentioned the state of Massachusetts as a sample of the working of the same principle. What has given designations to English names in Massachusetts the rivers and promontories of the country retain their Indian names, just as ours have kept their appellations. There are the rivers Merrimac, Piscataqua, Saco, Ammonoosuc, the lakes Sebago, Winipis-co-gee, and the mountains, Monadnock, Wasect, Ac-cunty, all terms having a meaning in the language of those who named them. Planted amidst this Indian nomenclature are the

settlements of the English emigrants, named after their old homes.—Plymouth, Portsmouth, Cambridge, Manchester, York, Dover, Gloucester, &c. Here, however, the correspondence of the two cases ceases; but the tracks of other settlers may be pursued by the same guidance. Mr. Picton lays it down as a rule that a colony will always betray its origin in the names it gives to the localities and peoples, as the Dutch have done on the shores of New York, at Staten Island, Hoboken, Middleburg, New Amsterdam, the Hudson river; and the French along the banks of the Mississippi, as witness New Orleans, Baton Rouge, Pont Chartrain, Chandeleur, Plaquemines, and St. Louis. Applying this principle to remote times we can make some curious deductions. The Celtic names of our rivers occur in continental countries; and so do the Celtic terms for rock, hill, hollow, lake, valley, whence we may see the existence of an early Celtic population in Europe; and in proper names we may find a clue to the origin of the people apparently akin to the Laps and Fins, whose small remnant now occupies the district around the base of the Pyrenees. "Throughout the north and centre of France," says the philologist we have mentioned above, "the names of places have generally a Celtic base, first Romanised, and then corrupted and contracted into modern French,—as Lutetia Parisiorum (now Paris), Ambiani (now Amiens), Rotomagns (now Rouen). In the south-west of France this Celtic element almost entirely disappears. The base of the names can only be explained from the Euskarian or Iberian terms." Now, if we found Euskarian or Iberian terms occasionally scattered over Europe,—as, indeed, we are supposed to do in the names Britain, Tyne, and Tweed,—may we not lend serious consideration to the suggestion that this Iberian race may have been a pre-Celtic wave passing over Europe? Mr. Picton, however, makes no such suggestion. After showing us the successive occupation or colonization of Spain (the country of rabbits) by the Iberian or Euskarian race, the Phœnicians, Tyrians, Cartaginians, Celts, Romans, Goths, and Moors affirmed by the names of places, and disentangling some names that are composed of two languages, as the Arabic and Phœnician *Guardiana*, he pursues a more intricate question. The root *Ar* or *Ir* or *Er*, common to the appellations of many nations of the great Aryan family, has derivatives in most of their languages expressive of skill and noble qualities. *Ar* meant to plough, in days when to plough or cultivate the land was a work of skilled labour, and the Greeks, Latins, Gaels, Goths, and Anglo-Saxons all framed words to express ploughing from this root, as well as derivations to indicate the idea of refinement. Thus excellence is expressed in the Greek *Agri*, in the Latin *artifex*, for a skilled workman in distinction to a common labourer; in the Gaelic *air-ach*, signifying noble, excellent, rich; in the Anglo-Saxon *ar*, glory and honour; led on by this wide presence of the same term for this quality, Mr. Picton confesses it would be easy, by drawing together all the words containing the syllable *ar*, as in Ararat, Arabia, Ar of Moab, &c., to make the whole world kin; but he is withheld by the consideration that there is another great family of man in which the same root expresses quite a different thing,—namely, the Semitic *ar*, awaking or watching; and so he comes upon two mighty streams of humanity in which the same sound represents distinct ideas.

The names of places have given designation to many articles, such as coffee (*Kafa*), calico (*Calicut*), dimity (*Damietta*), as well as to some actions, such as to roam, a pilgrimage to Rome, sometimes serving as the pretence for a long absence from home; but most especially have they conferred names on man. In the south of England the great majority of surnames are derived from the names of places, the

remainder being made up by a description of the peculiarities of the first person so named, by the affix of the name of the trade of the first person of the family assuming or having a surname conferred upon him, or by the application of some nickname, or by some foreign importation. In the north of England, as in Wales, the majority of surnames are patronymics; and in Scotland and Ireland they are clan or tribo names. The Danes gave us the idea of affixing the word *son* to the paternal name, as Nelson, the son of Niel. The Saxons designated the children of Billa, Wæra, and Walla as Billings, Warings, and Wallings, who, in their turn, as Mr. Picton also points out, called the lauds they acquired by their own names, Billingham, Wallingham, and Wellington; but as these were tribal names and discontinued when association for mutual defence was no longer necessary, the very large proportion of the population were without patronymics when subsequently it became necessary to use them. The curious and comical names of which some persons find themselves possessed, in virtue of this necessity coming to pass in days when refinement was not one of the most striking characteristics of the world, read like nonsense when grouped together.

Nearly every portion of the human body has given a designation to multitudes. We have dozens and dozens of people called Head, a great many more called Foot, plenty of Leggs, some Arms, a few Backs, several Figures, not so many Necks, several families of Blood, more of Bone, and others of Skin, Thew, Hair, Gore, Beard, Whister, Whitehair, Body, Skull, Nail, Shinn, Heel, Lipman, Lightfoot, Hand, and its French representative Main, Wort, Mole, and Mark. All of these cognomens are at this day possessed by respectable London householders. No one appears to have been called after the most prominent of all features, the nose; the only resemblance to the same sound being Nosworthy and Noyes. And a further dignified exception has been made in favour of our internal organs, for we can point to no Mr. Heart, or Kidney, or Liver, or Lung; the nearest approach to any reminder of them being Heartwell, Kidner, Livermore, and Lungby. This reserve is compensated for by a vigorous ring of changes upon some of our limbs. Arms, for instance, are combined in several ways. We have Armstrong, Armstead, Armsworth, Armsby, and Armsford. Legg is less flexible; it only runs into Leggett or Leggett. But head is transformed into Headman, Headland, Headworth, Headen, Heading, Headford, and Headlam. Minor parts are treated with equal freedom. Nail becomes Naylor, Nailor, Neal; bone is twisted into Boner, Bonell, Boning, Bonner, Boniwell, Bonbam, Bonney, and Smallbone; and Hand into Handey, Handside, Hands, Handover, Handman, Handford, Handley, &c. These groups are not taken from the same roots in all cases; thus some of the Bones, doubtless, are descendants of some one surnamed the good, in French, whilst others may have Scottish ancestry who were "bonnie."

Nearly every component part of a house has given names to men. We have Story, Dore, Chambers, Hall, Stair, Step, Roof, Post, Board, Rafter, Gable, Wall, Dormer, Oriel, Slate, Kitchen, Pantry, Ovens, Hinge, Hobbs, Shntter, Key, Lock, Pipe, Pole, Vane, Tower, Lodge, Loft, Court, Yarde, Weatherstone, Stone, Wood, Ivory, Iron, Brick, Brass, Alabaster, Glass, Gold, Silver, Waters, Stairs, Steel, Clay, Flint, Sand, with Horse and the Field, or Appleyard, or Orchard in which it stands. Is not this curious?

Then, again, we have many names identical with those of our household goods. We have Dresser, Fender, Kettle, Potts, Scales, Rugg, Challice, Pitcher, Tubb, Caster, Broom, Box, Bell, Tubbroom, Doll, Cole, Cushion, Irons,

Bedding, Cruse, Davenport (an example, by-the-by, of the case of a piece of furniture being called after a man, as well as *vice versa*), all of which are borne either by merchants, tradesmen, or professional men, occupying respectable positions in the various grades of London society.

Here is another set of names that is comical when viewed as a group, though scarcely striking when taken separately. It is a string of consonants and their varieties. No one would deem Lee anything but an euphonious title, till they saw it strung with its peers, Bee, Dee, Gee, Key, Mee, Sea, Tee, and Rea. We may ask, incidentally, by what mystery of pronunciation the last link in this chain of consonants should be pronounced Ra, when sea is sounded as *see*? The missing consonants are nearly made up in the following variations:—Ceeley, Heeley, Keeley, Neeley, Quelly. Again, the string May, Ray, Day, Jay, Fay, Gay, Kay, Lay, Pay, Nay, Say, Quay, Way, must raise a smile. The set of names that have arisen out of the various offices of ecclesiastical establishments are also curious when seen as a whole, beginning, as they do, with Pope, and running through the various grades of Abbot, Bishop, Priest, Clerk, Prior, Frier, Nun, Monk, Vicar, Parson, Parsons, Parsonage, Parish, with Church, Chapel, Kirk, Temple, Templeman, Palmer, and Tabernacle in great profusion. The same may be said of those beginning with King, and running through the peerage, as in Prince, Duke, Earle, Lord, till they terminate in legions of Knights and Squires; as well as those representing the coinage, Farthing, Penny, Shilling, Dollar, Pound, Sterling, with the odd variation of Twopenny.

A great many of these names have significations that take them out of the groups in which we have momentarily placed them. It is a recognised fact in philology that all names have a meaning in the language in which they were originally conferred. If, therefore, our names have no meaning in our own tongue, we may look for it in another. This is clear to us in the matter of Christian names. We all know that our Christian names are translations from other tongues, principally Greek, Latin, and Hebrew, conveying in a compact form some hope, conviction, or expression of feeling in connexion with the circumstances of the birth or prospects of the little one first named by it. In the soft, sad word, Benoni, for instance, the dying Rachel bequeathed, in her new-born infant's name, a vivid remembrance of her sorrows. We have names founded on foreign bases that are identical in sound to some of our own familiar words having a different meaning to the foreign root. These are probably more numerous than commonly supposed, the correspondence in sound of many names with words giving them a naturalization to which they are not entitled. Some scholarship is, therefore, necessary in determining the exact meaning or nationality of a proper name.

The points of the compass form the nucleus of a large family of names. So do the seasons. The colours, too, are curious when viewed and contrasted as a whole. We have a great many Browns, Greys, and Greens; nearly as many Blacks and Whites; several Lily-whites; several Pinks; not so large a number of Dunns and Hazels; some Scarlets and Rose; only a very few Lavenders and Ambers. The domestic ties have given rise to a still more comical group. We have Child, Young-husband, Hnsband, Bachelor, Strongchild, Nurse, Cook, Youngson, Steward, Widows, Lover, Winnen, Manlove, Houseman, Boy, Bratt, Ladd, Dadd, M'Brude, Maiden, Home; and gallant readers may add Darling, Angell, Love, Paradise, and Eden.

We cannot but note the great number of qualities which are used as surnames. Bigg, Little, Big, Low, Strong, Sturdy, Swift, &c., are all very well, though often misnomers; but the descendants of those who assumed, or upon whom were conferred some examples of the class of name, cannot feel very pleased with them. What young lady can be contented who is known as Miss Giddy, or Miss Dry, Lean, Thin, Vile, Tite, Sharp, Cross, Smellie, Tame, Sly, Wild, or Vice? On the other hand, some of the fair possessors of such cognomina as Sweet, Pretty, Wise, Witty, Tidy, Smart, Neat, Bright, Quick, or Blythe, might be almost reconciled to single blessedness. One could not but feel sorry for a lady converted by the great lottery of life, matrimony, from Virtue to Vice, from Meek to Cutting, from Speedy to Slow, from Pleasant to Tough, from Frank to Reckless, or, for another instance, from Loving to Curt; and yet these are

but a few of the risks in store for her. Miss Single might become Mrs. Double; Miss Strange be developed into Mrs. Savage; the widow Good, in course of time, suffer a seanchage into the widow Crabbe; or Miss Young be converted by a ceremony scarcely lasting more than a quarter of an hour into Mrs. Old. Some of these quality-names, so to speak, must almost entail a necessity for a certain line of conduct on the part of their owners. How could Mr. Moody be jolly, or Mr. Jolly be moody, with propriety? Or Mr. Grave be gay, or Mr. Gay be grave? How could Mr. Hard be easy, or Mr. Easy be Stiff? Why should Mr. Merry ever be sad, or Mr. Broad be otherwise than stout and short?

With so many misnomers the most warm-hearted and generous of beings may be known as Cunning; the ever remote policeman as Cunning; the feeblest invalid as Hale, Sturdy, Strong, Doughty; the most exorbitant of cabmen as Just; the most stiff-necked of individuals as Curling; the rosiest possessor of ringlets as Straight; the fairest of Lucretias as Miss Frail; or, but for the theatrical license with regard to names, a *première danseuse* as Miss Heavysides. Past generations have certainly made a mull in our names, although they may have dubbed their contemporaries with their peculiarities with much pungency. They could scarcely, we will hope, have realized the discomfort of bearing such a name as Greedy, of growing up and dying, known as Greedy. We have among us, however, names that are far more unpleasant than this.

It is difficult not to laugh at the number of animals we are named after. There are few who do not own a Bull, or an Ox, or a Heifer, in their acquaintance. Cow is not so common, for there are but two householders of that name in London, and Calf is still more exceptional. Bullocks, however, are quite so plentiful, and Steer scarcely less so. The nearest approach to sheep, in London, is Sheeppy, if we do not count the numerous Mittons.* Lambs are to be told off by the score. Ram occurs, but is scarce. We have Foale, Colt, Cobb, Kid, Hart, Buck, Stag, Deer, Hare, Goat, Beaver, Roe, and Rabbits for familiar friends. Then we have Hogg, as *natural*, and as Bacon. Nor are we confined to domestic animals. Some of us are flatteringly called after wild beasts: Lion, Tiger, Panther, Badger, Fox, as well as Reynard, Wolfe, to wit.

Our feathered contemporaries furnish us with the fine titles of Peacock, Pheasant, Partridge, Cocks, Wren, Powl, Pigeon, Parrot, Duck, Drake, Dove, Martin, Lark, Kite, Swallow, Swan, Heron, Sparrow, Hawk, Gander, Gosling (and even giblets, but no goose, notwithstanding all that might be said to the contrary); Starling, Daws, Crow, Crane, Jay, Bat, Gull, Rook, Grouse, Wild-geon, Eagle and Woodcock, with Egg and Brace. Some of these birds reappear in various combinations, but none so frequently as Cock, which appears in guise after guise, as in Cox, Cockburn, Wilcox, Hancock, Poccock, Groncock, Adcock, Noccock, Badoock, Bonecock, Hitchcock, Allcock, Toccock, Alecock, Colcock, Cockerell, and almost incognito in Hensman. As if to confirm the theory that we cannot have wings without previously having fins, we find such names as Codd, Salmon, Whale, Seal, Pike, Herring, Roach, Chubb, Sole, Ling, Grayling, Codling, Mullet, Haddock, Sturgeon, Whiting, Cockle, Crab, Leach, and Turtle preserved among us. Wasp, Bee, and Fly are more names associating us with creatures of the air; and Worms, Beetles, Bugg, and Emmett, to the things that crawl upon the earth.

Fruits furnish us with other names. A solution of the eccentricity of the laws of selection on this matter would be easy, if we could have pointed back to Medieval fruit and flower shows, and to the possibility of the *specialité* of a successful contributor sticking to him as an appellation all the days of his life. But we can, in truth, suggest no such origin to the titles Nutt, Raisin, Lemon, Orange, Plum, Peach, Cherry, Biffin, Pears, Pine, Gage, &c. We call our modern pages Buttons and Tiggers, from the profusion of those articles of Birmingham manufacture on their attires in the first instance, and the agile and faline knack of springing upon the foot-board of moving vehicles, with extreme nicety of calculation as to distance in the second; but what peculiarity of costume or custom can account for calling man, woman, or child, Mustard, Salt, Pepper, Butter, Cheese, or Curry? We have a patriarchal precedent for Ham, but

whence Veal? Who was the humourist first called a fellow creature Tripe? Was he a joker, or a retaliating sufferer called Hoggs or Gammon?

We take a few surnames from beverages: Beer, Porter, Godale, Perry, Mead, Port, She and Claret.

Topographical and geographical features us a great many names. Amongst these we call to mind Mountain, Lake, Hill, Way, Road, Ridgeway, Street, Field, Town, L. Townsend, Place, Moss, Moore, Stack, F. Banks, Miles, Vale, Brook, Beck, Acres, A. Dyke, Syke, Cragg, Cave, Woods, Forest, B. Dale, Mills, Waterfall, Pond, Middleditch, I. diebrook, Poole, Dean, Barn, Hedges, B. Marsb. The elements and the weather sented further fields for the eccentric system naming in which our forefathers appeared indulged. Airey, for instance, is an honour name in scientific circles to-day. Eyre, famo to St. John's Wood's residents, might be but variation of the same name, if we did not k that it related to itinerant courts of just from the old French word *erre*, a journey. there are plenty more names that are not t explained away, as well as some that may b treated. Piling them up as they occur we t note Snow, Raine, Hoare, Frost, Fogg, G. Eddy, Dust, Dew, Dewy, Halstone, Day, D. Light, Cloud, Tempest, Moon, Doubleday, D. fire, Mudd, and Mould.

Curious sequences may be made of som our names, as in Pain, Death, Coffin, B. Grave. Sets of precious stones may be loo out, as in Albabaster, Agate, Amber, Diam &c. So may lists of apparel, as Amber, Diam Caps, Stocking, Cotton, Bonnet, Hood, C. Silk. The old Puritanical names found l ing among us that we should scarcely loo out of the "Pilgrim's Progress" are c pointed out. Among London householder streets thronged with pedestrians and noisy the roar and rattle of passing omnibuses cabs, are such quaint names as Makepeace, beloved, Goodchild, Strangeways, Strug Such, Swadling, Goodwill, Goodspeed, Good Goody, Goodfellow, Goodbody, Goodchap, G. day, Kiss, Comfort, Delight, Lightup, Honour, Justice, Wouldhsve, Gladman, G. head, Sneezum, Rich, Late, Last, School Gentry, and Gentle. Some sequences are ously incomplete, as in the last-mentioned t here being no Simple out of Captain Marry novel, and no Fool in the whole metropolis.

The plan of naming a man after his t has the disadvantage of applying only to generation and not to all. A man named S because he was a slater by trade, makes h carpenter, and the surname, is a misnomer once. This custom is still rife with us altho we do not go to the length of perpetuating name of a person's occupation in writing. hoard a steamboat we call the attendant t the passengers "steward" from his office; i hotel we call him waiter; at college we call gyp and scout. The man who cleans our b we inconsistently identify with those articl apparel; and the person who prepares our b we address as cook. In this way, in the day old, arose such names as Silversmith, Har smith, Goldsmith, Cutler, Barber, Draper, S Baker, Taylor, Potter, Constable, Carpen Glover, Cooper, Groom, Coleman, Pack Woodman, Forester, Parker, Page, Tanner, S man, Taverner, Weaver, Workman, Bot Bugler, Hind, Herd, Fisher, Waterman, Ste Stainer, Scrivener, Porter, Plater, Plum Piper, Palmer, Painter, Harper, Miller, For Fuller, Chapman, Chandler, Cheesewright, Ser Dyer, Gardener, Aslman, Farmer, Bato Bowman, Archer, Messenger, Carter, Bowyer.

The custom of calling a man after his b place also gave rise to immediate misnomer. When Alexander de Cheswick removed to t and settled there, his name was a clu his identity, doubtless, but still a misnom more especially for his sons. But, as a rule, plan would answer better for those who left b than for those who remained there, for w would be too confusingly common. That was not, invariably, given to those who rem to other parts of the country, and so p strangers identified by the name of the p from which they came, we have evidence i a case of the landed proprietors whose surna and lands correspond, as the Cresswells, Cresswell, the Crastera of Craster, the Rodd of Roddam, &c., in Northumberland.

If men have taken names from objects, t

* The London Directory gives no *butcher* of that name, but at Brighton there is one.

have also bestowed those honours by themselves upon many articles of their invention. The theodolite has been traced back to D. Corolom Theodolom, or, perhaps, some member of his family, all of whom were mathematicians. But these instances are too numerous to mention. A volume has, indeed, been compiled of words derived from proper names by Mr. Charneck, so large is our stock of them. Etymology has had a fascination for the human mind for centuries. It is a study that advances in intricacy as years roll by, and so, like wine, improves with age. Words that were in every-day use two thousand years ago are now the special possession of the scholar. Greek names that are high-sounding, and are called "high-flown" by us, were simple enough to those who first gave and owned them; such as "a fight of men" (Andromache), "far-famed" (Pentacles), "possessing equal rights" (Isocrates), "strife" (Ptolemy). The first Caesar was merely "long-haired" in the eyes of his Roman name-givers.

THE SOCIAL SCIENCE CONGRESS IN BELFAST.

THE meeting of the Social Science Association at Belfast has gone off very successfully. Politics, Law, Crime, Education, and Trade, appear to have been the chief subjects treated of, wound up, however, with something about Health. The Ulster Hall was the place of the opening meeting, and Lord Duferin, president of the council, delivered the inaugural address before a brilliant assembly. Mr. Hastings, who was active during the week, read a report from the Council.

In the Health Department, under the presidency of Dr. Lankester, coroner for Middlesex, the first especial question for discussion was,—"What measures are necessary to secure efficiency and uniformity in the working of the sanitary laws throughout the kingdom?"

Mr. W. H. Michael read a paper on the subject. He assumed that a uniform system of health legislation should apply to all parts of England and Wales; that the system should be compulsory; that a central body, or Ministry of Public Health, should be established in all cases, or direct local action, and to act as a court of appeal; and that the whole of the kingdom should be divided into districts, each district to be under the control of one local authority, which should have attached to it a medical officer of health. The object of health legislation should comprise,—Prevention and removal of nuisances, regulation and supervision of dwelling-houses, the making and keeping in repair of roads and streets, water supply, public lighting, and, where necessary, private lighting; affecting public improvements and directing private lighting, establishment and supervision of markets, supervision of food, and providing baths and washhouses public recreation grounds, and burial grounds. The writer was of opinion that a general system was required, under which it would be impossible that defects should be unrecognised or no steps taken to provide a remedy. He contended that, in conserving public health, culpable negligence of sanitary precaution must be remedied by some supreme authority; and where it was for the good of an extended district that combined works should be undertaken, the central authority should have power to compel those districts so to be benefited to join in the work, and to share pro rata the expense. In conclusion, the writer suggested that what was at present required in order to secure efficiency and uniformity in the working of the sanitary laws throughout the kingdom, was their consolidation and the adoption of means to enforce them.

Dr. Robert Elliot (Carlisle) next read a paper on Health. The problem was—how most readily to secure efficiency and uniformity in the working of the sanitary laws throughout the kingdom. After reviewing at some length the legislation which has taken place on the sanitary question, and the imperfect manner in which it had been carried out by local Boards, Dr. Elliot went on to observe that he was forced to the conclusion that the source and cause of the unsatisfactory and imperfect action, as compared with what it might and should have been, of our sanitary laws, must be looked for in the fact of our having had combined in one our municipal and our sanitary Boards. He asked either for an extended inquiry by a committee of this Association, or for a petition by the Council to her

Majesty's Government for an investigation into the composition and constitution, history and action, of local Boards of Health in all corporate towns since the adoption of the Public Health Act, with the object of ascertaining how many are interested, directly or indirectly, in continuing what the said Act anywhere prohibits, and how many (if any) members have been proceeded against by the local Board.

At a subsequent meeting the special question proposed in the Section was "In what form and to what extent is it desirable that the public should provide means for the recreation of the working classes?"

Mr. W. Hardwicke, M.D., medical officer of health for the parish of Paddington, replied in a paper which set out by observing that the want of means for recreation was one of the causes why the industrial classes resorted to artificial stimulants. The writer believed it to be a public duty to provide means of recreation. This duty was to be undertaken not in the spirit of the schoolmaster, but with the view to take advantage of a healthy instinct. For this purpose, baths, reading and news rooms, picture-galleries, &c. were necessary. Before these could be properly made it was requisite that a change should be made in the opinions of the people with regard to Sunday.

Miss Barbara Corlett also read an interesting paper on the subject, in which she strongly advocated the establishment of places of recreation for the lower classes, especially for children.

Dr. McGeer said the evils that had been pointed to as to the want of places of recreation suggested to them the necessity of looking to the source of them. He thought that Miss Corlett had very clearly drawn attention to where they should begin first—with the young. With the elder members of society, he feared, they would not be able to do much. He did not think that the blame of not providing amusements should be thrown upon the higher classes of society; for they should remember that a mechanic's intemperate had been established in Belfast, but through the apathy of the people it was allowed to fall into decay. Upon Monday mornings he found that there were seldom less than double the average number of drunken and disorderly cases brought before the magistrates. And why? Because there was no place of recreation for the lower classes to frequent on Sundays, when they were idle.

Mr. H. C. Knight, of Belfast, called attention to an effort being made to establish a "Workmen's Club" in Belfast.

The Rev. W. Mitchell repudiated the idea that clergymen were opposed to lawful recreation on Sundays.

Dr. Martin, of England, was in favour of physical exercise and intellectual improvement, which, if provided, would give them men, in the true sense of the word, with healthy minds and healthy bodies. With regard to "Workmen's Clubs," he thought it was a great mistake to confine their operations to the providing of amusement. After a time, that generally failed; but, when education was combined, it was generally found a success.

Mr. Early, of Scotland, said that, in Glasgow, institutions such as they wished to establish had met with great success. Last winter there had been no less than 900 successful soirées held in Glasgow, and the result was that all the singing-houses, with the exception of two, had been superseded.

Dr. Martin proposed that it should be recommended to the council to consider how best provision could be made for providing places of amusement for children in large towns. Mr. Roper, of Manchester, seconded the motion; and the Chairman said he would convey their wishes to the council.

The congress have also had the fisheries of Ireland under consideration.

Mr. Blake, M.P., read a paper as to the best mode of promoting the extension of Irish fisheries. It stated that, according to the last returns, out of thirty-eight fishery districts, twenty-three were represented as declining, and six showing no signs of improvement. The fisheries of Ireland were, if properly worked, capable of affording support to 500,000 people. He maintained that in the first instance these fisheries should be placed under the management of a special department of three commissioners. A competent staff of inspectors should collect statistics, and afford information to fishermen as to the best mode of capture, and

give instructions in oyster culture, &c. Some present restrictions on fishing, especially on trawling in bays and estuaries, should be removed. Another most important requisite was that better harbours and piers than at present existed should be provided at suitable places. Loans should be granted to small fishing companies. The fishermen should have a little land to support them when not engaged in fishing. The erection of curing-houses would be desirable; and another most important desideratum was increased facilities of transit to market, which he hoped would be afforded by the Government purchasing Irish railways.

In the discussion which followed, the necessity of having a greater number of good harbours of refuge round Ireland was strongly insisted on.

We give notices under separate headings of what was said on some subjects which we particularly concern ourselves.

Public Health.

Sir Jas. Y. Simpson, as president of the Health Section, said in his address that public health might be defined as public wealth. It was important to attend to it, because, in relation to disease, prevention was much better than cure. At the outset he referred in some detail to the great evils which arose from the overcrowding of dwellings in great cities and towns. Nature had everywhere provided a bountiful supply of that most essential requisite for healthy life, pure air. Man everywhere endeavoured to contract this supply, and to put it to corrupt it by the internal arrangement of his dwellings; outside his dwellings also, in entire disregard of the laws of health, in the manner in which manure and sewage are allowed to collect in rural and other districts. He referred to the way in which foul matter was allowed to collect in the inferior class of Irish hovels, in consequence of pipe and other animals being allowed to occupy them with the inmates. Some years ago a doctor, visiting an Irish family located in the upper story of a large house in Edinburgh, found an immense pig, and asked a man in the room how it had been got up-stairs. "Faith, yer honour," the man replied, "she never was below." In the country districts, worst off in these respects, the people were better off than in the towns, and human life more prolonged in the former than in the latter. Cowbyres, and even stables for horses, ought to be banished out of every town. In Westminster there were 1,000 cow-houses vitiating the air required for 30,000 human beings. In Edinburgh, still, they had splendid house-fronts, and confined egress and spaces behind them, in which the air was poisoned by offensive exhalations. A splendid problem for modern science to solve, and statesmen to carry out was, What was to be done with the vast amount of their sewage matter? For it, as well as for everything else, there was a natural use; and he believed the time was coming when they should not toss so much of it into the sea as they did. The true use to make of it was to return it to the soil. The value for each human being was calculated at 10s. a year, which gave 70,000l. worth of sewage wasted every year in Belfast. We have various kinds of hospitals—medical, surgical, obstetrical, &c. There are as yet, unfortunately, no means of making a general estimate of the comparative efficacy and cost of hospital and home treatment. Materials of the kind have been provided with respect to obstetrical hospitals. In the great Rotundo Hospital in Dublin, than which there was not a better in the world, the cost of each patient was about 30s. It was found that the cost of treating the same class at home was about 10s. Now, the pecuniary loss in hospital treatment was a matter of no small moment. The French Government issued a commission of inquiry, which collected statistics on this subject of nearly a million cases from all the hospitals of Russia, Prussia, Sweden, Denmark, Great Britain, Germany, Switzerland, and 900,000 cases of poor patients confined in their miserable hovels. Hospitals afforded by far the greatest advantage in respect of medical advice and care. Yet the conclusion afforded was most startling. The report stated that in hospitals there was one death in thirty, whilst of the same class at home only one in 212 died. It had been found the same all over Europe. With regard to surgical and medical hospitals, the collection of patients, and the exhalations arising from them and their wounds and diseases, into comparatively small spaces, could not but be pernicious. One patient labouring under a contagious disease often caused the spread of it through the

hospital. In the hospital with which he was connected, after a case of cancer had come in, it was often found necessary to stopoperating for a week or ten days, because it was found that, after the arrival and partial treatment of such cases, all the other cuts and dressings and sores began to go wrong. The man treated in a surgical hospital was exposed to more chances of death than the soldier on the field of battle. The great object in hospitals was to increase the amount of pure air for each patient. Any one who went into an empty room which had been shut up for a few days would find it smelling musty in consequence of the decomposition of small material particles. Everything, in fact, was secondary to pure air. Mr. Hepworth Dixon, in an account of the settlement of the sect called Shakers at Mount Lebanon, in America, mentioned some interesting facts. The married women there lived as nuns, and the men as monks. They had no doctors among them, and took close scientific care of ventilation. Every building was provided with shafts, fans, flappers, and vents. Stoves were so delicately adjusted as to keep the temperature in winter within one degree of warmth. The eldest, or queen of the community, told him that they had had only one case of fever during thirty-six years. The head elder said good food and sweet air were their only medicines, and said to him, "Is it not strange that you wise people of the world keep a set of men called doctors, who lie in wait for you, until, by some mistake of habit, you fall sick and then come in and poison you with drugs?" How were our hospitals to be improved? They should be given up or greatly altered. It was now an important point of dispute how many cubic feet of air were required by each individual per day. He had often thought that if their hospitals, from being crowded palaces, with a layer of sick in each flat, were changed into villages or cottages, with one, or, at most, two patients in each room, a great saving of human life would be effected. The village should be so constructed of iron or wood as to be movable, so that it could be placed where required; and in case of epidemics the accommodation could be easily increased. He would pass to another subject, namely, the dreadful mortality among children. Having given statistics of this mortality, he attributed it to the ignorance on the part of mothers and nurses of hygienic laws. One great requisite for infant children was pure air; but it was essential that the air should be warm. Cold air was most destructive. In Belgium, where children had to be brought out for baptism when only a fortnight old, one half more died in winter than in summer. Want of clothing of the neck and arms of the child was also mischievous. What a shame, too, to put children into cold baths—little creatures that should be always warm. In a Highland regiment in which that practice prevailed amongst the wives of the men—hardening it was called—enough of the children did not live to make pipers for the regiment. He then alluded to the mortality caused by the criminal starving by mothers of their illegitimate children. It was recorded of the founding hospitals which formerly existed in Ireland that from 1791 to 1796 the number of children admitted into them was 12,686, and that of these 135 walked alive out of the hospitals and the rest were carried out in the dead-cart. He then referred to Jenner's invaluable discovery of cow-pox. It saved 80,000 lives every year. The Government ought to be able to stamp out the small-pox as well as the cattle plague, but improved regulations were still needed for this. Jenner received 30,000*l.* Had he slain 100,000 men in battle he would probably have got much more, and have been made a duke. The French erected a statue to him at Boulogne. A few years ago one was erected, by subscription, in Trafalgar-square. It had been since removed, with the sanction of the House of Commons, to make room for one of those fighting Napoleons.

Sanitary Condition of Belfast.

Dr. Samuel Browne, R.N., read a paper on "The Progress of Sanitary Inquiry in Belfast." After the close of the years 1847-48, when nearly 15,000 of this community were struck down by fever and dysentery, and 2,500 individuals hurried to untimely graves, the public began to be directed to the inquiry, whether there were not some ascertainable causes which had aided the progress and increased the fatality of the epidemic through which they had passed. A committee organised by the late Dr. Malcolm drew up a report on the sanitary condition of

Belfast, and afterwards an influential committee was appointed for the purpose of carrying out its recommendations. This was the rise of the sanitary reform in this town. It gave me (he said) great satisfaction to be able to inform the congress that the town council, having obtained the requisite legal enactment, have purchased and set apart a large plot of most eligible ground, about forty-three acres, for the purpose of safe and decent sepulture, and are now pushing on the enclosure and laying out the ground with all available speed. In the meantime, the town council have taken the proper steps preliminary to closing all the graveyards within the borough against what may be termed free interments, and, at the same time, of limiting the burials in proprietary grounds by certain fixed salutary rules and regulations. The next important sanitary work to which I call attention is the introduction by the Belfast Water Commissioners of an abundant supply of water. This, I understand, will be on the continuous and high-pressure principle, and is calculated, I believe, to give for all purposes at the rate of about twenty gallons a-day for every inhabitant; besides which, the commissioners have obtained power, by their Act of 1856, to compel the owners of all tenements to introduce a proper water supply. And when it is remembered that there are still 4,227 habitations without it, the action recently taken by the commissioners, and their stated determination to enforce their powers, cannot be too highly commended. The borough, including Ballymacarrett, is divided into seven districts, with one medical attendant for each. There are also three dispensing stations, the two in Belfast having each a qualified apothecary attached. He then gave some suggestions relative to a system of sewerage such as would prevent the present evil effect resulting from floods, and also recommended paving some of the principal thoroughfares instead of macadamising.

A paper on the same subject by Mr. James Kennedy was read, in the course of which he stated:—The Registrar-General reported that last year the death-rate of Belfast exceeded the ratio is reported thus:—Belfast, 1 person out of 32.2 persons; Armagh, 1 out of 50.3; Antrim, 1 out of 64.3; Ballymena, 1 out of 73.8; Banbridge, 1 out of 64.8; Downpatrick, 1 out of 56; Lisburn, 1 out of 54.3; Lurgan, 1 out of 62.5; Dublin North, 1 out of 36.2; Dublin South, 1 out of 35.8; Cork, 1 out of 46.5; and Dundalk 1 out of 59.2 of the population. The ratio of all Ireland is 1 in 62; and thus it is that proportionately twice as many die in Belfast as in Antrim, Ballymena, and Banbridge; 50 per cent. more than in Cork; and nearly twice as many as in all Ireland. Our people have been in the enjoyment of good wages, and of the means that usually promote health and longevity, and yet our death-rate exceeds that of Dublin itself, wherein there is much poverty, and which last year was severely visited by cholera and epidemic. The writer then proceeded to trace the causes of this calamitous state of things:—1. Out of our 937 streets, between 400 and 500 are unpaved, unsewered, and, consequently, uncleaned. These streets are receptacles for stagnant water, and for all manner of filth and dirt. 2. In Belfast we have had since 1845 powers to allocate 1,500*l.* a-year to the widening and sweeping away of our very numerous old lanes and alleys, that are the hotbeds of drunkenness, immorality, disease, and death. During this time, however, our two Boards have spent 100,000*l.* on Acts of Parliament and in litigation, all of which outlay yields no return; but not one shilling has been expended in carrying out the benevolent designs of the Legislature, and which, probably, would have evanuated in little or no pecuniary loss to the town: the legitimate duty was overlooked; the others were observed. 3. For the erection of baths and washhouses the necessary funds have been subscribed long since, and the money still lies unused in the hands of the treasurer. The importance of such establishments in a town like Belfast was universally admitted, and the town council were not ignorant on the subject, as a report which he had before him very clearly showed. 4. Our old streets are hollow in the centre, and badly formed, and are no more than impounding reservoirs for water, mud, and filth. This, he observed, was not the fault of the surveyor, for the funds available for the necessary work were devoted to another purpose. 5. In Belfast we have been obliged to drink the water from the River Lagan, which contains in it the

sewage of many towns, villages, and numerous establishments for dyeing, spinning, and bleaching.

Dr. Lankester said a few words on the paper which had been read. He considered that the most important point with regard to Belfast was a correct death-rate. They found, when discussing the matter, that the death-rate did not show the true state of affairs. They found that the registration of deaths by the Registrar-General was defective not only in Belfast but throughout Ireland, and that thousands of people died whose deaths were never registered. If it was true that there was a death-rate of thirty in the thousand in Belfast the time had come for immediate Government interference. In a healthy community, where people were healthy, and were not dying or calling doctors, money was saved. If they looked at it from a money point of view, the prevention of disease and death ought to induce Corporations to spend money. They had a moral and better population, when they had a healthy population, than when they had a sick and dying population. He appealed to the clergy to do something in the matter, as there were a great many things to be done in Belfast. With regard to the supply of water, he was glad that something was about to be done to provide a better supply. The Lagan water was not fit to drink and they were constantly in peril of typhoid and fever, which, in many instances, had been brought on by drinking bad water. He recollected being in Belfast fifteen years ago, at a meeting of the British Association, and he then passed by that Blackstaff ditch, and he was shocked to see it, but he found that that nuisance still existed. The Sanitary Act was one of terrible power; and, if the Corporation wished, they could compel the owner of every house in Belfast to have it properly cleaned. If the Corporation refused to do that, then they had the power under the 49th section of the Act to appeal to the Secretary of State, who would send down a Commission of Inquiry, who would compel the Town Council to remove the nuisances.

Rev. Hugh Hanna said he wished to call the attention of the Council to over-crowding and sub-letting of houses; and he regretted that the Sanitary Act of 1856 could not deal effectually with this great cause of complaint. Benevolence and wealth were absolutely essential to meet the great evils which existed.

Mr. John Hancock, J.P., Lurgan, said that under the Act of 1856 most extensive powers had been given to all corporate bodies in the United Kingdom. A considerable amount of sanitary reform might be carried out under that Act; but there were still some defects in the Act, which, however, might be remedied. There was no doubt that if the Town Council did not carry out the sanitary operations under the Act the inhabitants had the power to apply to the Lord Lieutenant to compel the Council to do it. He thought that course would not be necessary in Belfast, as a great deal had lately been done by the Town Council, and they had lately taken by a most important step,—that of having proper back-yards constructed in the rear of houses.

The President said he wished to correct the statement made by Mr. Mowatt that Loch Katrine had done no good for Glasgow. The fact was that the death-rate now was only twenty-two in the 1,000, while it was thirty-three in the 1,000 in Belfast. The rate of mortality in Glasgow was much lower than before the water of Loch Katrine was introduced into that town.

Dr. Browne then replied. He said that they had now a population of 147,400, with a death-rate of about 24.9. These numbers had been taken by himself and by the inspectors of the Council, who had taken great care in preparing them. His calculations were made up to the 30th June, and he had got the death-rate from the registrar at the workhouse, so that they had not so large a death-rate as had been propounded in the Section that day. He believed that the greatest necessity existed for their putting these sanitary laws into force at once. Whenever they increased a water supply and improved the sewage, there could be no doubt that there would be a decreased mortality. He believed that in a large town like Belfast they were obliged to have hospitals, but, if they had the means, they might have cottage hospitals, as had been suggested by the President in the morning.

The President said,—I am sure you will agree with me when I offer you thanks to Dr. Browne, through me, for his excellent paper. According to his observations, you lose here every year

three or four people in the 1,000 more than they do in either Bristol or Dublin. If you lose four in the 1,000 out of a population of 150,000, you lose 600 people every year that should not be lost. If the Town Council or any public body allow this mortality by any act of omission, it amounts almost to an act of commission. You would be horrified if the Town Council should order 600 inhabitants to go to a jail or place of execution, and be hung up there; but if they allow this mortality by any act of omission on their part, it comes to much the same.

Mr. Hancock then moved the following resolution:—"That the Council be respectfully requested to renew its exertion to obtain a complete and uniform sanitary code for the United Kingdom of Great Britain and Ireland."

Dr. Macadam seconded the resolution, which was passed unanimously.

Dr. Macadam afterwards read an interesting paper on "Town and Domestic Water Supply."

The reading of the paper led to a brief discussion, and the following resolution was come to:—"The Health Department resolved to recommend to the committee of the Association the desirability of memorialising Government to take into consideration the present mode of obtaining evidence in water and other health Bills, and to suggest that the evidence in such Bills be taken by the referees on the spot where the sanitary measures are required."

Trade Unions.

In another Section Mr. H. Rathbone read a paper on "The Moral to be drawn from Trade Outrages at Sheffield, and the Limits of Personal Freedom." Our great difficulty in inquiring into questions of social science is the liability we are under to mistake facts that are exceptional for facts that are typical. In the case of trade societies there are peculiar difficulties, because, through the ignorance of the habits and customs of certain trades, inquirers are apt to attribute to trade societies actions which are a natural expression of the daily life of that class of workmen. Now, in inquiring into the moral to be learned from the Sheffield trade outrages, there is yet another error to be avoided, and that is the assumption, that because trade societies must sometimes be tempted to do unjust actions, they must necessarily yield to that temptation. Every man who goes into business is himself into the temptation of over-reaching; but it would be hard to condemn business together on this account. The question we ought to ask ourselves is, Are these outrages natural—I do not say necessary—outcomes of trade-unionism, or are they rather to be attributed to the exceptional character of Sheffield workmen and of Sheffield employers? Our glance is at the outrages which took place prior to the repeal of the Combination Law, and showing they were more frequent than at present, he went on to say—think a close examination of the evidence procurable will prove that the practice of committing outrages is on the decline; and though not extinct, unhappily in other places than Sheffield, still the improvement in this respect is great and undeniable. Time will not permit me fully to illustrate the position that, if you effectively to influence any class, whether working men or not, you must address yourself to the leaders in whom they have confidence. Therefore, when worthy members of Parliament search of facts relate interesting conversations with intelligent bricklayers, who have been engaged upon their own houses, and who confidently complain of the tyranny of their unions, a question naturally arises, Why do not these men form a union of their own if they really care what they say? The real remedy against the tyranny of a union lies, I venture to think, in the formation of a free labour union, as has been done at Staveley; for, in my opinion, as in an organized army will have the best of it against a disorganized mob of two or three times its size. Referring to the building trade and the restrictions imposed by the workers, he said, no wise man will employ his capital in a trade, because whenever, through these qualities, he secured a profitable contract, his workmen, taking advantage of the special penalties which he is bound to complete the work by a main time, dishonestly grah all the results of their work, but of his foresight, ability, and command of capital. I do not say this is a mistake of things now, but that, unless great care is taken on the part of the building unions, it will rapidly become so. The probabilities are in the next few years the present power of the

unions of the building trades will be broken up, and then, but not till then, may we hope to solve the mixed question of providing decent habitations for our working men. For philanthropists do not very little until they can prove that to build decent working-men's dwellings will pay a fair return for capital invested. I have taken the building trades as an example, because the mischief of which it is capable is not so easily demonstrated as in other cases. The amalgamated engineers is another most powerful union, with an income, if I recollect right, of some 30,000*l.* a year, and in these trades I have never heard of outrages; but, on the other hand, it is a fact which ought to open the eyes of our engineers that we are importing instead of exporting locomotive engines, and that the Paris Exhibition has demonstrated that in many trades where we considered ourselves quite beyond the reach of competition we are equalled, and in some cases surpassed, by the Continent. To sum up, the moral, I think, to be derived from the trades union inquiry, seems to me to be that—First, when trade outrages occur in a trade, the union should be held responsible as the authorized expression of the public feeling of the trade, and that such outrages would not occur if the public feeling of a trade were not bad. Secondly, the great object of all should be to clear away all the sentimental cobwebs which obscure the question. Labour does not differ from any other commodity, except that it is perishable, and in that resembles fish or any other perishable commodity. As man, selling his day's work, must get as much for it as he can, just as a fisherman selling his fish, which is his night's work, must get as much as he can; the more fish the fisherman has the more he will get for them; and the more work the man does per day the more eventually he will get for it. It may be worth while for a certain body of fishermen to agree to stand out for a certain price, and let the whole take of two or three nights go bad rather than take a lower price; but, as a matter of fact, they do not seem to find that plan answer. Let it now be understood that labour is only a commodity; that employer and employed stand in relation to each other merely as buyer and seller of that commodity; and that the laws of political economy, when rightly understood, are as much the laws of Providence as the laws of gravitation, and I doubt not the good sense of the leaders of our working classes will step in to prevent the danger that now threatens us of sinking in the scale of nations as an industrial people.

Mr. David Smith next read a paper on "Trade Societies," in which he held that lock-outs and strikes were evils deplorable in their consequences to the surrounding community, bringing suffering on those not directly connected with the matter under dispute, and, if indulged in, they ought to be made criminal, and the trade society ordering such ought to be made amenable, and, if possible, made to indemnify the sufferers. In the second place, he considered that trade societies ought to be incorporated, properly legalised, and a constitution given them by Act of Parliament, and simply registered under it as a trade society, in the same way as some of them were registered as friendly societies at the present time. Disputes between employers and their workmen should be referred to arbitration—the award of the arbitrators to be final and binding, and no appeal to be allowed from their decision.

A paper contributed by Mr. Tito Pagliardini, headed "How to put an End to Strikes," was read. The writer stated that the disastrous extent to which strikes and lock-outs had been and were still being carried, inflicting equal injury on masters and workmen, and on the public, proved that the time had come when it behoved all thinking and practical men to reconsider the mutual relations and duties of capital and labour. These long and bitter contests, while causing a lamentable stagnation in public and private works, and great misery to the working classes, generally ending like a protracted and disastrous campaign, leaving the field of battle strewn to no purpose with the victims of a needless and ruthless struggle. As long as the workman had no direct interest in the success of the enterprise he was engaged in, he naturally looked upon his employer as a milch cow whom he must turn to the best account; and whilst his employer's aim was to extract from him the maximum of work for a minimum of pay, the workman's aim was to lengthen out his work, that it might last longer, and to strike for an increase of wages, or for its equivalent, a limitation of time. The legality of

strikes afforded no room for doubt; and since the strong arm of the law could only interfere when the tyranny of the unions assumed the form of open intimidation or violence, it was decidedly high time to seek for some equitable adjustment of these seemingly opposed interests. The writer stated that the regenerating principle he should wish to see introduced into the field of production was that of the association of masters, managers, and men (capital, talent, and labour), so that each might participate in a fair degree in the advantages of any work which was the result of their combined concurrence.

The Children of the Poor.

Mr. Allworthy read a paper on "The Neglected Children of the Poor, and what we owe to them." He said,—The most casual observer must have been struck with the vast number of those who experienced misery untold as their lot. The daily papers frequently contain instances of widespread demoralisation in the treatment of the young, but this was nothing to the crimes daily committed against them, as the majority of outrages was unreported. The natural result of parents' neglect was to consign children to all evil, but, beyond this, thousands of parents train up their children to the most vicious courses, which was the most prolific source of crime, disease, and death. The State should devise laws for preventing, as well as for punishing, crime, and not act, as it hitherto has acted, on the principle of non-intervention. I would propose that inspectors should be appointed to look after the young, and compel parents to show cause, and in cases of cruel treatment to punish the offenders by law. The causes of vice and brutality would thus be made known, besides conferring a great boon upon "the little ones." The education of children is, to a certain degree, provided for by the Act of 1862, and the Factory Acts only allow them to be employed for certain hours. Daily we interfere with individuals and property when the general good is concerned, and, therefore, interference in this matter is not infringing on the liberty of the subject. The expense of this supervision would be very little compared with the gain, and surely no one will deny that a Government should protect the lives of its subjects.

Mr. C. Wolfe Shaw, one of the Honorary Secretaries of the Malone Protestant Reformatory, read a paper on the same subject, having reference principally to the Malone Institution, from which we take the following extracts:—It appears that juvenile crime has been generally declining since the year 1860, which was the time when Irish reformatory schools were first established, and this was urged as a strong argument in favour of the reformatory system. The committals of juveniles to the County Antrim Jail under sixteen years of age, which amounted in 1859 to 151, was only sixty-seven in the year 1865. The paper noticed the fact that so few magistrates throughout the different counties took advantage of the Reformatory Act, as the inspector-general of prisons makes special mention of this in his different reports, on finding so many children under detention in the different prisons he inspected, who, he said, should have been sent to reformatory institutions, instead of allowing them to return to their original pursuits. The report of the working of the Malone Protestant Reformatory was most encouraging. It stated that out of thirty-eight discharged on completion of sentence, only one had fallen back into crime. Those who had emigrated and joined the army kept up a continued correspondence with the officials there, and in several cases sent home money to pay the expenses of other boys to enable them to join them in their new homes.

Technical Instruction.

The Rev. Canon Norris treated of "Technical Instruction." He understood by the term, an education to enable a workman to use his mind as well as his hand and eye over his work. In a thousand ways England was wasting her resources for want of intelligence in their employment. What we wanted was to teach our youth those branches of applied science most nearly related to their future craft. The kind of instruction needed to make an intelligent artisan touched the elementary school on one side, and the workshop on the other. It should not require any preparation beyond what an average village school supplies. It did not imply the learning or practice of an art. The teaching required was something between the science teaching of Universities and that of the commercial teachers. In applied science, we are

defective. There is a broad gulf separating the men of theory from the men of practice. Its subject-matter embraces mensuration, perspective, commercial arithmetic, engineering, &c. For the teaching of these subjects, good manuals were wanted; and to educate the teachers, Normal Colleges, like that of Cluny, in France, were required. Mr. Norris described the steps taken in this country and in Belgium to promote technical instruction. The complete organization which France is giving to this kind of instruction was accomplished in Prussia eleven years ago. The machinery existing in this country included the School of Mines, the School of Naval Architecture, the Royal College of Chemistry, the College of Science in Dublin, and the Glazevine Agricultural Training College, with the staff of South Kensington as a superior Council of Reference. There are now 620 science teachers, and 200 science schools, with 8,000 pupils. The most successful of these were the Hull Navigation School, the Bristol Diocesan Trade School, and the Manchester Mechanics' Institute. The schools at Oldham, Newtonards, Oldcastle, Glasgow, Bolton Mechanics' Institute, Plymouth Science School, and the Stroud Institution were mentioned favourably. The schools at Bristol, Hull, Oldham, and Plymouth were specifically instituted for the teaching of science. Mr. Norris did not see why Town Councils should not be empowered to levy a rate for the establishment of schools of applied science in all large towns, especially the centres of manufacturing industry.

PARLIAMENT SQUARE.

"PARLIAMENT-SQUARE!—Parliament-square!—where is it?"

"In my mind's eye, Horatio!"

We have been street-hunting,—wandering about from Pall-mall to Picnic, from Picnic to Parliament, by palace, prison, and purlieu, to discover the *locus in quo* of "Parliament-square." Directories of posts, places, and "peoples" have been explored with keen eyes, but "Parliament-square" has not as yet reached our note-book.

"London Ancient and London Modern," "The Right Side," "As it is To-day," "To Fulham," "The Town," "Haunted London," "Up and Down the London Streets," and all their piercings and plagiarisms have been examined and cross-examined, but to no purpose. All the "squares," "crescents," and "circuses" have been asked the question, and the unanimous answer has been,—“Never heard of the party before. Must be some new-comer from the country, I suppose. At any rate, we don't know her whereabouts.” We went to Covent-garden, as the oldest member of the family, and found the good lady in a very testy mood. In answer to our kind inquiry she said,—

“My friend, I have not been a square for many years. When that promising young Inigo plazzaded me, he meant me for an Italian model, but that other lordly man of the world, he of the *che sara sara* goat, covered me with fruit and potato sheds, and made me a hideous thing, miscalled ‘a market,’ instead of being a pretty little *plaza* for you. Those who come to see me in my onion and cabbage capacity, insult me with the laughter of contempt, and those who have to use my premises, overload me with their coarse, hoorish anathemas, because my circumstances are so straitened! I am utterly unable to hear the work that he lays upon me. Oh, that it would please the providence of the mighty metropolitan Board to put me out of my misery! Go to Lincoln's-inn-fields; she is my next younger sister—her lot is a heaven-on-earth compared with mine—the stranger you are seeking may have visited her.” And the poor old lady disappeared beneath the deep shadowy portico of St. Paul's Church, and continued to sob and moan until we were out of hearing.

On speaking to Lincoln's-inn-fields, she repeated the name we were inquiring for, and pointed to “that big house at the corner. It has long been jointly occupied by law and gospel, and a prime minister once lived there; they are sure to know something about the square of Parliament as well as the—,” and she laid her fore-fingers at right angles upon one another, and nodded her head towards the “big house.” As we crossed the road she called out, laughingly,—“Try Whetstone Park; perhaps they have ‘squared’ its dimensions to something like what you are looking for.” The

“big house at the corner” we found to be occupied by a highly-positioned legal firm, and the Society for Promoting Christian Knowledge; whilst “Whetstone Park” was a dirty mews, and cab stables, running from one inn-stable to another.

Thus we spent our time, receiving more or less caustic or impertinent answers, and continuing our course on a west-south-west sailing line, from the eastern parts of Bloomsbury until we reached the limits of Tyburnia, when we fell off a point to the head of the Serpentine, and passed down through Belgravia to the Broad Sanctuary, where we rested ourselves. We surveyed the prospect for some time, until at length we were aroused by a rather heavy rap on the shoulder. Upon looking round, we were somewhat astonished to see the smoke-begrimed statue of Canning nod to us; and the brazen image of the great statesman began to speak.

“I knew you,” it said: “as usual, on one of your midnight rambles trying to spy out the nakedness of the land.”

“Hilloa, old friend; why, what in the name of wonder are you doing here? I thought that I missed you from the original place.”

“Oh, I'm all right; it does not much matter where I am, now. At any rate, I have a much better prospect in front of me than an improvised cab-yard, with all its dirt and smell. Listen, there go the dozen. How splendidly Big Ben gives tongue to-night. But what are you doing out so late?”

“Well, I'm trying to find where ‘Parliament-square’ is.”

“Parliament - square! Parliament - square! Well, that is as good a joke as I've heard for some time.”

“Well, where is it?”

“Why, it was a joke of that funny fellow, Lord John Manners. You can see where I need to stand; step out on one side a little.”

“Oh, yes, I see it right enough.”

“Well, when Manners shifted me he had a road cut through the enclosure—and a nice hangle it is;—and, after dinner and trimmings one night, they were asking some questions about me, I think, when he spoke of that wretched lark's-cage patch as ‘Parliament-square!’”

“Oh, you're making fun of me?”

“Not a bit. And now shall I tell you how to make a real, first-class Parliament-square; one that shall be worthy of the name and the country?”

“Let us hear.”

“Begin, then, beside the new Foreign Office, and draw a line from the Park front along to Storey's-gate, down Princes-street, by the end of the Westminster Palace Hotel. Then continue along the line of Dean-street until you reach Peter-street, then turn to the east to Wood-street, and down to the junction of Abingdon-street and Millbank-street.”

“My goodness! that would be a square.”

“Yes; but I have not done yet. I would cross over from the India Office to Richmond-terrace, down to the embankment line, and hack again to Westminster Bridge. I would clear every bit of that ground except Westminster Abbey. Such a change would remove the block from the India Office to Great George-street, Great George-street itself, the Stationery Office, Westminster Hospital, the Westminster Guildhall and Sessions House, St. Margaret's Church, Westminster School,* Dean's Yard, and other lesser places. Richmond-terrace would go on the east side of the plan, Parliament-street, Cannon-row, the Board of Control, and minor buildings. As St. Thomas's Hospital is coming so close to that locality, I would remove Tothill-fields prison into the suburban commons of Wimpoleton, build middle-class houses there, put Westminster Hospital on the play-ground of Vincent-square, and send the Westminster School on an estate of its own somewhere up the river, where boating, football, and cricketing would come more to them by nature than ever it can now. I know the sentimental cry of ‘*genius loci*,’ but after what I saw in my old quarters, and a railway coming under the clock-tower, and within sound of the Speaker's bell, you must not let the ‘*genius loci*,’ nor any other genius, in these days, stand in the way of real improvements. I would, furthermore, lay hold of all the houses from Storey's-gate to the barracks, pull them down, and rebuild them with something of architectural character he-

longing to them. Around this great square I would place such buildings belonging to Government departments as were not already provided for. A new Stationery-office, with something better than a stable-yard front elevation to sadden the eye of the stranger, might arise. I would also ask all our leading architects to give us, each of them, a building that would best illustrate their own particular speciality, and I would then have such a square, that for grandeur, novelty, and originality the modern world has never yet seen. I would make it the Mecca of architecture, and I would have it so contrived that there would be space enough for statues like me for ages to come.

Then what would you have on your “finest site in Europe,” as my friend Peel used to call it? Why, you would stand on the steps of the National Gallery, and looking down the broad vista of Whitehall, the sight would expand upon a plain of architecture that would be making monumental history for our country and our race. And yet, we need not forget the poor. I declare that we have in old, tumble-down, rickety London more wasted space than would serve to house comfortably and cleanly three times the present number of people. Sometimes I step down from this pedestal, when everything is quiet, on a hard-freezing winter night, and stroll through the beck slums of Westminster, and I see houses there that seem to me to be an absolute disgrace to any Government or people, and an allowance of the local self-government, and do-what-you-like-with-your-own-principle, hording on the maniacal. Look at the Millbank Penitentiary. Sixteen acres of ground devoted to the lodgment of the very human poison of society,—ground, too, that lies between what you now call South Belgravia and Parliament—even under the very shadow of the great Victoria tower.

You may say, “How about the expense?” My answer is that, a country with an income of 72,000,000*l.* a year, the colonizer of the world, the very soul of personal and political freedom, and the nursing mother of nations, ought to be able to afford an open space in accordance with the greatness and dignity of her institutions, from which could be viewed that majestic pile under whose roof are made her powerful and far-reaching laws. Such a place can only be satisfactory on the scale of magnitude sketched here. Although it may be best for every nation to pay as it goes on, still there must be exceptional cases in all matters. I know something of the Chancellor of the Exchequer,—Minister of Finance would be a far better name,—and I do think that, if we can afford to spend 100,000,000*l.* in going to war about a neighbour's quarrel, we ought to be able to spend something more than we do on ourselves. You can mention this matter at “the Institute,” and tell them, from me, that in this way they may have a genuine, complete, and English-worthy PARLIAMENT-SQUARE!

THE BRITISH ASSOCIATION FOR SCIENCE.*

PROCEEDING with our report of the more interesting proceedings of Section F, “Economic Science and Statistics,” we have to tell that Sir John Bowring read a paper on “Productive Labour in Prisons, as associated with the Reformation of Criminals,” which was an able argument in favour of effort towards the reformation of criminals, through putting them to remunerative labour,—a trade which taught them if necessary. It was followed by a paper by Mr. James Oldham, C.E., of Hull, on “The Utilization or more profitable Employment of Male Convicts.” This paper began by speaking of the regret felt that the grand old rivers of our country are not in a better state of efficiency, and that, in wet seasons, and during heavy rains, they overflow their banks, inundate our beautiful valleys, and cause great destruction to property and even to life; and Mr. Oldham suggested that about fifty or one hundred convicts should be placed, under a proper guard, on one of the rivers—say, for instance, the Trent—that they should be put on board one or more vessels, fitted for their accommodation and the service required, having suitable steam, tread-wheel, or hand dredgers, barrows, planks, and all other necessary implements and tools for their use, with competent overseers to direct

* We are not to be understood as going all the way with our “brazen” suggestion.

* See pp. 676, 691, 708, ante.

the work of dredging and clearing the beds and channels. The rivers, he said, would be vastly improved as to their draining powers in clearing the country of surplus surface-water, and to a great extent lessening the danger of flooding the valleys, their navigable qualities would be increased; and the matter excavated would go partly to strengthen and improve their banks where required, and partly to fill and lead up low-lying ground, and enrich poor land. On many portions of the rivers the banks could be straightened, and the width of the stream advantageously contracted, and so a considerable extent of land would be reclaimed, thereby adding wealth and general improvement to many districts.

The next point of importance was the safe keeping of the convicts. In this, Mr. Oldham argued, the army might be employed, and advantageously for the soldiers themselves.

Admiral Ommanney had been inspector of the convicts at Gibraltar, where 800 convicts had made a breakwater. In Bermuda, convicts had erected works and dockyards, and made a very substantial naval port; but he was of opinion that departure from a system of employing convicts on Imperial works, only, would be very injudicious, and might interfere with private enterprise.

Captain Verney, and Mr. T. Thornton, also spoke. The latter, in addressing himself to the point of Sir John Bowring's paper, said it appeared to him that the unremunerative character of prison labour, as at present, might be attributed to two causes, one of which had been alluded to by Sir John Bowring. The first of these was the state of our present buildings, which are not constructed so as to admit of many trades being carried on; and the second was the want of some common trade to which all those wanderers on the streets, who constitute to a large extent the present population, might be put. A carefully compiled paper was read by Professor Leone Levi, "On the Condition and Progress of Scotland in relation to England and Ireland in Population, Education, Wealth, Taxation, Crime, Consumption of Spirits, Savings-Banks, &c." We regret that we have not space or even a statement of the whole of the "conclusions." Two of them were:—

"1st. That, as regards population, Scotland and Ireland are increasing at a much slower rate than England; the effect rather of a lower rate of marriages and an excess of emigration than a larger mortality.

"2nd. That, in education, Scotland stands in a higher position than England and Ireland."

Others were to the effect that "property is increasing faster in Scotland than in England and Ireland," that "as regards pauperism, the number of persons receiving public relief in Scotland is less in proportion than in England, though much in excess of Ireland;" that the number of persons committed for trial for notable offences in Scotland is greater in proportion than in England and Ireland; and, though she shows less propensity to offences against property, she stands in an unfavourable position as to offences against the person; that a common assumption that Scotland consumes more spirits than England is unfounded, the quantity of spirit in all spirituous beverages consumed being taken into account, though there is diminished consumption of gin and whisky, which is more than counterbalanced by the greater quantity of spirit consumed in the other beverages, principally ale and wine; and that in so far as the savings of the working classes are reprinted in the capital deposited in the savings banks, the amount per head in Scotland was s. 5d., in England 3s. 5d., and in Ireland 5s. 5d. per head."

Colonel Sykes, M.P., acknowledging that the stupor was a valuable one, would have all the statistics of the subjects on hand to compare the results with the figures, if they would avoid many inaccuracies which commonly arose from statistics.

Mr. Moncrieff, M.P., said the striking diminution in ordinary crime commenced with the Crimean war, but the first impression in the detection of thefts, &c., was perhaps immediately after the discovery of the Australian gold fields, which must have drained off a large portion of

the idle population. Juvenile crime had wonderfully decreased, which was mainly to be traced to the action of reformatories.

Prof. the Rev. J. E. T. Rogers read a paper on "The Funds available for Developing the Machinery of Education," which produced one of the most important discussions in the Section.

Sir John Bowring said that the bearing and importance of the paper could scarcely be overestimated. This question of education had in these days become the question to which the futurity of this great country must look. Professor Rogers had pointed out the cause of the abuses and inefficiencies of our public institutions, and the means of reforming them. The cause of these irregularities and abuses was pretty obvious, when, looking into endowments, they considered the ignorance, the prejudices, the tendencies of the age from which they emanated; for, unfortunately, these endowments naturally represented not our own forwardness but the backwardness of our ancestors. This was not the only mischief: they were turned to fearful political account. He was himself connected with a city in which it was impossible for the child of a freeman not belonging to a political party to obtain the chance of anything like a fair education. Most of these establishments are monkish in their conception, and bring down with them the ecclesiastical organization of the Middle Ages. What they profess to teach they teach very badly, and they do not teach at all that which is the most important and useful to learn. They constantly heard Latin and Greek spoken of as instruments of great value. Now, he ventured to say that the mode in which these languages were taught was absurd, and so little reducible to any useful account that one could scarcely find a boy who could think and write in either of those languages. Within the last few weeks he had occasion to speak to boys who had carried off Latin prizes, and he had desired that they would return thanks in Latin to the donors. It turned out, however, that none of them had any idea of Latin except in the translation of English words into Latin form. The very sweepers of the streets of Rome would have shrugged their shoulders and smiled with contempt at such attempts at the language as fell from the lips of these boys. Students had a very imperfect acquaintance with a foreign language, living or dead, until they could think in that language—until thoughts could present themselves in the peculiar forms and idioms of that language. In the neighbourhood of the Danube, the natives spoke a language very much resembling Latin, and when foreigners came and could not speak to them in other languages they generally resorted to Latin, and, in such circumstances, he had seen learned Professors, who had devoted their lives to the study of Latin, prove that it was a "dead" language, in respect that they could impart to it no living vitality, not being able, in that language, to carry on a flowing conversation with any ease or accuracy. Whatever there might be of eloquence and elegance in the ancient tongue, out of the scale of mathematics and ethics, their ornamental phraseology could represent very little. They could not go to the past for knowledge. If they wanted to find a race wholly occupied in the past, let them go to China, where they found everybody inquiring what their forefathers were, but nobody asking what their own children were to be. Their great duty was not to forget the past, not to suppose the past could give them no good, but to take out of the past what was true and sound and good, and to fling out the masses of ignorance on many points associated with by-gone centuries. Whenever any scheme such as that of his excellent friend, Professor Rogers, was brought to bear, the country would be almost revolutionized; there would be that gradual progress towards prosperity, that gradual development of the national resources, associated with the great principles which would not only unite, as he proposed to unite, the different portions of the kingdom with one another, but would associate them with the whole world. There were only four or five languages of any considerable importance representing in the world the progress and civilization of the times. These languages were French, German, Spanish, and probably Italian. With these five elements almost all that the world knew was most thoroughly accessible. By Greek and Latin they learned nothing of the progress of science. What was wanted here was an educational machinery, universal as that in China, for gathering together great masses of the young people of the nation for training. If they could

only examine and teach the children that came to be examined in Pekin as to what concerned the present and the future, instead of what only bore upon the past, he ventured to say that the machinery of education would place China at the head of the civilized world. There would be little difficulty in establishing similar machinery here. If they could only get a good educational legislation, he did not think there would be much difficulty in getting a good educational executive. When the powers of Government were transferred to the multitude, they were bound to consider with great seriousness the responsibilities of the situation, and to see that the multitude were enlightened, instructed, and intelligent, so as to be able to fulfil well those functions which, probably, with too great a haste, and with too little hesitation, had been placed in their hands.

The discussion was continued by the Rev. Principal Tulloch, of St. Andrews; Mr. W. E. Baxter, M.P.; Mr. Leng, of the *Dundee Advertiser*; Mr. Holyoake; Prof. Rumsay; Prof. Campbell; Col. Sykes, M.P., and others; and it seemed to be admitted on all sides that the system of Privy Council grants was a complete failure, that Scotland could claim to participate in English endowments, and that as regards middle-class and other education the United Kingdom stood in an unfavourable position contrasted with several other countries.

After this, Col. Sykes read an "Analysis of the Report on the State of the Empire of France, presented to the Senate and Legislative Body, February, 1867," which, we believe, will appear in the "Journal of the Statistical Society."

The question of public health was touched in a paper read by Mr. H. J. Ker Porter on "the Prevalence of Spedalske or Leprosy in the Kingdom of Norway," and in one by Mr. P. M. Tait "On the Population and Mortality of Caledonia," as well as in one by Mr. A. Robertson entitled "Statistics of the Social Condition of Dundee." The manufacturers of the town were exhaustively treated of. Mr. A. J. Warden, the most competent person, being the author of an excellent volume on the subject, read a paper on the "Linen Manufacture of Dundee," which was followed by a paper on the "Engineering Trade" of the town, by Mr. G. Orchar; one on the "Iron Shipbuilding," by Mr. H. Gourlay; one on the "Seal and Whale Fisheries," by Mr. J. Yeaman; one on the "Leather Manufacture," by Mr. F. Henderson; and one on the "Confectionary and Marmalade Trade," by Mr. C. C. Maxwell.

The subject "Employer and Employed: Capital and Labour," was that of a paper by P. Mathew: but, time running short, it was only "taken as read." It has been printed in the *Dundee Advertiser*. The writer claims the position of a working-man; and the paper directs attention to the two great impediments in the way of rapid improvement,—first, war between employers and employed, causing outlocks and strikes; and, second, great national warlike preparations. The author says he wrote the paper to extend the utility of association and combination among working-men. Wages-combination, however, he urges, should cease on each side, whilst he has no doubt that combination is necessary to regulate hours of labour, and to see that the sanitary conditions of workshops and factories are what they should be. Alluding to means of regulating labour other than strikes, he refers to co-operation by working men of small capital. Then, apparently disposed to argue very much as we have done on several occasions, he says,—"It is a pity that factories cannot be placed in rural villages," but adds;—"The advantage to the employer of being every day in the market in a large manufacturing town overbalances the advantage, to the employed, which a sanitary rural situation affords, and more especially to their children." "In Germany," he continues, "I have seen the great advantage of manufacturing villages in promoting the well-being of the employed. Here every head of a family had a garden excellently cultivated—as gardens generally are in Germany—and such was the demand for gardens that for a mile around a large village there was nothing but gardens of the manufacturers, who, in fine weather, went out in the evening to tend and cultivate and enjoy their gardens, their dwellings being closely adjacent to the factories for convenience. In this country the employers only have their gardens and rural dwellings, while the employed are subjected not only to indoor labour, but also to city dwellings in crowded ill-ventilated localities, where the human

During the last ten years the change in the habits of the people as regards the consumption of spirituous beverages was as follows:—

	England.	Scotland.	Ireland.
	Per cent.	Per cent.	Per cent.
Spirits.	1857, 1866.	1857, 1866.	1857, 1866.

organism must gradually in the course of a few generations dwindle away and die out. The town of Dundee is in this respect highly defective; and I hope that before leaving the Dundee meeting, a number of the members will accompany me on an excursion through the close alleys and vennels of this town, which have quite as much need of scientific examination as the vestiges of an ancient barbaric age." He then alludes to Robert Owen's experiment at New Lanark, as successful to the extent of securing the health, and the elevation of manners, of its workmen and their families.

A paper was read "On Arbitration in the Nottingham Hosiery Manufacture," by Mr. E. Renals. It showed conclusively, from six years' experience, that beneficial effect had resulted from the establishment of a Board of Arbitration and Conciliation in the Hosiery Manufacture of the Midland Counties; and the writer argued that if such success was possible in a manufacture including so many varieties of goods, difficulty of adjustment could no longer be pleaded as excuse for deferring the adoption of such Comra or Boards in other fields of industry. The particular Board referred to in the paper was founded in December, 1860. The immediate cause of its formation was a strike, for an advance of wages, by the hands employed in one branch of the manufacture. Before resorting to an outlook of those at work, who were maintaining the others, the manufacturers sought a conference with their workmen: the dispute was settled, and the existing Board was formed. The difficulties with which the Board has had to contend, have been caused by the small manufacturers rather than the operatives. The Board now consists of nine manufacturers and nine workmen; and there is a mutual agreement to abide by the decisions. Questions affecting the remuneration for labour are settled generally in advance. One rule of the Board is that no advance or reduction in the rate of payment for work can take place without a month's notice being given. The decisions of the Board are generally arrived at, after discussion, without the necessity for votes being taken. The paper gave illustration of the Board's action. These showed the hold that the Board had obtained on the minds of the workmen as a means of remedying any grievances believed to exist, and proved the advantage to the manufacturer, namely, in securing something like a uniform rate of payment for labour. Within the Board, there is a Committee of Inquiry to whom are referred questions of unusual difficulty. Should there be a determination on the part of any manufacturer not to pay the prices set forth in the authorized list or statement, then the Board itself operates against him through what is in fact a strike, but a strike differing from other strikes inasmuch as it is a strike of masters and workmen both. Instances of such a course being taken are however rare. The results, every way, of the Board's existence seem to have been most satisfactory. In the periods of transition and alteration in trade, it renders essential service; it has caused acts of intimidation to cease; it has abolished the truck system; it has saved the men what would have been their contributions to union-funds; there are no stoppages of labour when demand for the article of manufacture is active; and there is a process of enlightenment always going on. As regards the masters, the advantages, says Mr. Renals, are equally obvious. First, all contracts may be taken with confidence, because the delivery of the goods can be safely guaranteed, and thus orders are prevented being sent to other countries; second, machinery and capital are employed to the fullest advantage during periods of prosperity; third, there is uniformity in the rates of labour, so that any unscrupulous and oppressive employer is prevented from underselling a more liberal and humane manufacturer, and in this way bringing down wages to the lowest level compatible with the bare subsistence of the workmen; and fourth, there has been a discontinuance of those abusive attacks on employers which were formerly so frequent, not one having been published for more than seven years.

The influence exercised on other trades has been most salutary. In the lace manufacture of Nottingham, in which strikes and lock-outs have proved so detrimental, a Board is now being organized. In Leicester, a Board has already been established for the settlement of disputes in the hosiery-trade; and in Sheffield, a chamber of industry, on similar principles, is about to be founded, for the adjustment and prevention of disputes in the trade of that town.

At the conclusion of the reading, Sir John Bowring alluded to the arbitration-system at Lyons, and remarked that this excellent plan was only a development of a principle which had existed twenty years before in Denmark, in the shape of Courts of Conciliation. All disputants had to go to these Courts and state their cases without the exaggerations of counsel; and the cases being often than amicably settled, there was much less resort to the superior courts. The disclosure at recent conferences on these matters were not only degrading and disgusting, but damaging to British reputation. England was bound to give an example of sound political economy. If masters and workmen could be brought together in a conciliatory spirit more frequently, they would at once see that they could no more alter the conditions which ultimately ought to rule, and which ultimately would rule, questions regarding their respective relations, than they could alter the course of the planets or the succession of the seasons.

Mr. Hermann said he at first anticipated a difficulty from the circumstance that these courts had in their decisions no binding effect, and because such decisions were not legal; but when it was considered that the interests of the masters and men were in this way so far combined, and that they were being brought together to discuss questions relating to the trade, he was glad to say that he found the system to be productive of good. The men were made aware of the state of trade; and if labour was greatly wanted, then they received increased wages, and, if not wanted in a great degree, they were made aware that such was the case, and were led to accept the terms of the masters without having recourse to a strike. What was wanted was a knowledge of political economy,—that masters and men should become convinced that their interests were the same and must be.

Mr. Senior also gave corroborative testimony to the success of the Nottingham system; after which Prof. Rogers, who was in the chair, called on Mr. Briggs to speak of the other process by which disputes might be prevented, namely, the principle of co-operation.

Mr. Briggs said he had long been of opinion that strikes were often brought about by reason of the masters and men standing so much aloof from each other, and because the masters did not explain to the men the true position of the trade. The masters did not appreciate the difficulties of the men, and the men did not appreciate the difficulties of the masters. Mr. Briggs then gave the particulars with which our readers are acquainted, of his Limited Liability Company, or Industrial Partnership. They had great difficulties in establishing their system of co-operation, because the men did not appreciate the advantages, and because also the masters in the neighbouring collieries had great fear that they (the Messrs. Briggs) were allowing their men to obtain a much greater insight to the trade than men should be allowed to have; but these difficulties had been overcome, and now they were able to avoid all disputes with their workmen; whereas during the four years precedent there had never been a week without a strike.

Mr. Edward Hall remarked that there were instances of the success of industrial co-operation of a much longer date than that alluded to by Mr. Briggs. In the house-painting establishment of M. Leclaire, Paris, such a system had been in operation for the last thirty or forty years. Conjoined with it there were a mutual aid society, pensions for deserving workmen, a library, lectures, &c., and, what had been referred to, the "annual statement." Nothing whatever was concealed from the men. A complete account of the system had been given in the *Builder* some time ago, and he believed that was the only complete account that had ever been published. M. Leclaire had informed him (Mr. Hall) that in the revolutions which had taken place in France since he established the co-partnership—and there had been two very important revolutions—not one of the men in connexion with it had ever taken part or joined the revolutionists in the streets. It was important to notice that M. Leclaire had sent over men who did work in the decoration of houses in London and in Ireland.

Prof. Rogers, in winding up the discussion, said that political economy should be taught in all schools, and that he had not the smallest doubt that the great mass of masters and workmen were not cognisant of the absolute laws which governed the relations of employers and employed; and to that he attributed the many disputes which so frequently arose.

THE QUEEN'S THEATRE, LONG ACRE.

All playgoers have heard with great satisfaction that Mr. Alfred Wigan is again about to resume the management of a theatre. St. Martin's Hall, as our readers know, has been transformed for that purpose, and is advertised to be opened on the 17th inst. The principal entrance, leading on to the stalls and two tiers of boxes, is in Long Acre, through a loggia, opening into a vestibule 42 ft. by 22 ft., immediately facing which is the grand staircase, a double flight of stairs, 6 ft. wide, leading to the boxes. The stalls have a separate approach by a few steps, and an incline under the pit, without ascending the staircase. The entrances to pit and gallery are in Wilson-street; where, also, at some distance apart, is the royal entrance, opening immediately upon a private staircase to the royal box on the grand tier, and forming also, on ordinary occasions, an exit way from the stalls, level with the street. The entrance to the stage is in Charles-street.

The plan of the auditorium is peculiar. Each tier recedes, so that two balconies are formed. The plan of the front of the dress-circle tier may be described as three-parts of an egg; the upper-box tier similar, but larger in radius; while the gallery tier resolves itself into a complete circle, carried round over the proscenium, and forming as it were, a cornice. The effect of the junction of the square top of the proscenium with this circle does not promise to be pleasing. The audience in the amphitheatre do not occupy more than to the half-circle, the remaining part, where it would, of course, be difficult to see, is occupied by a circular frieze, taking the same line as the circle of the gallery, crowned with cornice. Upon this frieze is a wall-painting, 30 ft. long and 7 ft. deep, by Mr. Albert Moore. This painting, which is in a flat medium, like fresco, represents a group of life-size Greek figures, in various attitudes, listening to and watching the representation of a play which is being enacted.

The better to judge of the size of the new house, we append a table, giving the dimensions of some of the principal London theatres:—

	Length from curtain to front of centre box.	Width between boxes.	Width of proscenium opening.	Height of proscenium.	Height from pit to centre of ceiling.	Depth of stage from curtain line.	Width of stage between walls.

Pit.....	13	2	18	do. 649
Gallery.....	14	1	10	16 do. 610
				Seating..... 1,984
				Standing..... 236
				Total..... 2,220

The decorations have been executed by Messrs. Green & King, and are of a Raffaellesque character. The ceiling consists of a semicircle, prolonged horizontally over the greater part of the auditorium, and beyond this a flat portion raking up over the gallery. The lower-box fronts are painted with arabesques and borders, and are further embellished with gold mouldings and amber satin curtains, resters, and Vandyck valances.

The lighting is effected by a powerful sunburner, manufactured by the patentees, Messrs.

* To grand tier box front. † To upper box front. ‡ Gallery tier.

Strode & Co., placed in the centre of the ceiling, but not depending more than 18 in. below it. There is a large ventilating shaft, 6 ft. in diameter, immediately above the sun-hurrier, carried through the roof, in the centre of which is another fire, specially to take off the combustion from the gas. The same firm has also fitted up the float-light. It consists simply of the Argand burners reversed, with the lights burning downwards, all the combustion being taken away through a large iron cylinder underneath to a flue at the back of the proscenium. A joint on each burner is so contrived that if any one of the glasses breaks it falls, and so shuts off the gas in that burner.

The stage is separated from the audience by a brick wall, carried on an arch over the proscenium, opening up to the roof, and behind the proscenium are stone staircases on either side, leading from the basement to the roof, with communications on every level.

The difficulty of arranging satisfactorily for the multifarious requirements behind the scenes is evident from the lack of width between the walls.

There are two tiers of flies, 9 ft. 6 in. wide, the upper or working flies being about 30 ft. above the stage, and the lower 20 ft. On these last are arranged two dressing-rooms, on either side approached by staircases at the back of the stage, opening on which are four tiers of other dressing-rooms. Under the stalls are placed the green-room, and a large room for the ballet, with two small dressing-rooms, approached by the staircases in proscenium before mentioned.

The painting-gallery is at the back of the stage, on a level with the first tier of flies, having two frames, 36 ft. wide, which can be made available for ascensions of scenery, &c.

The works have been carried out by Mr. Samuel Simpson, contractor, of Tottenham-court-road; the gasworks, except as before mentioned, by Messrs. Jones & Co., of Bow-street; the stall and dress-circle seats by Wadman Brothers, of Bath; and those in the private boxes by Mr. Church, of Bath; Mr. Phipps being the architect.

A BORDER TOWER.

HER MAJESTY'S recent progress through the old classic and historical Border-land has once more brought into full light a number of interesting but forgotten shrines. The beautiful ruins of Melrose and of Jedburgh will, of course, never die, even although time shall have completed the process of their ruthless destruction. But there are numerous objects of interest in the sinking into oblivion and decay; and of these we desire to mention the Fortalice, Peel Houses, and Border Towers—the residences of those famous chieftains who harried under the Bold Buccleuch, and rode with their retainers under the banners of the Earl of Douglas. Staying at Melrose not long ago for a couple of days, we were taken to see one of the most ancient and best preserved of these Border peel houses, and we think some account of our visit, and its relative investigation, may not be without interest to our readers at this season of the year.

Half-way between Melrose and Abbotsoford there is a picturesque village, or, as it is perhaps more properly described in Murray's Handbook, hamlet, called Darnick; which is chiefly famous in consequence of containing the very fine specimen of a Border keep which is known to all true lovers of the Border antiquities as Darnick Tower. On approaching the village the traveller will readily observe this old tower as it raises its grey weather-beaten head over the crest of the railway embankment, half hid in a wood of ancient sycamores and silver birches. The splendour of the halo, so to speak, of Middleval romance with which the genius of Sir Walter Scott has surrounded this district renders every object interesting and romantic; but it is not after the practical man can be so well satisfied with romantic ruins as he can be with an examination of Darnick Tower. The architect will feel interested in its construction, the artist with its picturesque appearance, and the antiquary with its high and most creditable state of preservation. Above all, the historical student will be gratified with the study of its associations, which range in their diversity from scenes of the coarsest intemperance and brutality to incidents and illustrations of the finest and most oblationary poetry with which our annals are adorned.

There is nothing so calculated to excite a feeling of melancholy curiosity in the mind of the traveller as to trace the chain of ruined castles and fortresses which line the valley of the Tweed from Norham Castle at the mouth of the river to Neidpath Castle above Peebles, and far beyond Neidpath to Crichton and Craigmillar in Midlothian. There was an intermediate chain or cordon of fortalices (of which Darnick Tower is the finest remaining type) often clustered together, like Horeburgh and Smallholm, but always so situated that a flag, a light, or a beacon fire could be seen from one to another. Antiquaries can find no better reason for the clustering of these peels, other than the evident one of their having been erected for mutual defence; though it is not improbable that some other reasons, peculiar to the times, may have contributed, such as that of the national security in places more than ordinarily exposed to foreign invasions. But, in any view, they are interesting features of the Border landscape even in their ruins, and must always be examined with respect as well as curiosity; most notably as showing the kind of embattled residences in which the Border gentlemen of former times were obliged to reside when domestic peace was a blessing, only, as it were, snatched at intervals from continual turmoil and interminable feuds.

"The barons and gentlemen," says Foster, in his review of Sir Walter Scott's "Border Antiquities," "had for their residence an inferior kind of fortress, often heard of in Border history, under the denomination of 'strenghts,' constructed upon a limited scale, usually in some situation of natural strength. Having very thick walls, strongly built and cemented, they could easily repel the attack of any desultory excursion, and the village which almost always adjoined, contained the abodes of the retainers, who, upon the summons of the chieftain, took arms either for the defence of the fortress, or for giving battle in the field."

In these circumstances, then, every lord had his castle or fortress, and every laird his peel tower or fortalice. Each dwelt in an embattled keep, of greater or less size and strength, according to his status and means of resistance.

Darnick Tower on one occasion was signalized, as we are told, in a Border legend, by a joyous passage of arms between the Scots of Buccleuch and the Kerrs of Cessford, to obtain the person of the king, wherein Andrew Heiton, of Darnick Tower, turned the tide of battle in favour of the loyal party. One curious fact we must relate: the lady of the tower put her husband in the donjon till she saw which was to prove the conquering party!

For this valorous deed he obtained his charter, which may still be seen signed by Bothwell on the account of Mary, and confirmed under the Great Seal of the Chancellor Lethington. The laird of Darnick was thus constituted an original vassal of the Crown; and this charter was a satisfactory evidence that he had fought in the ranks of the king. And although this charter was not granted by King James V. himself (who was supposed to have favoured the design of the Bold Buccleuch), it was given by Queen Mary, whose councillors were not led by nice political distinctions, and who had great regard to *prima facie* evidences of loyalty in their Border adherents.

The next incident respecting the history of Darnick Tower will lead us to say a few words about Hertford's invasion. After the death of James V. the country was torn by the factions of the Church on the one hand, and the dissatisfied nobles on the other. A promise of marriage had been made between the heir-apparent of England and the youthful Mary of Scotland, but the queen-mother, Mary of Guise, supported by the Regent Arran and the Cardinal Beaton, broke through the contract, and Henry VIII., annoyed at this duplicity, gave immediate expression to his dissatisfaction by entering upon a war. An invasion took place under Hertford; and in 1544 Sir Ralph Evers, with Sir Brian Latoun, were directed to harry the Border towers and churches. Under these instructions Henry's two generals laid waste the whole of Teviotdale and Tweeddale with unexampled ferocity and barbarism: corn was wasted, fields were fired, cattle carried off, towns, towers, and churches were ruthlessly razed, burned down, destroyed, and in some instances obliterated. The Ahley of Melrose suffered severely. The ancient tombs of the Douglasses were defaced. A long and heroic line of Douglasses was hurled on the north-east side of the high altar; but no vestige of these tombs afterwards remained to indicate their names or their deeds of valour.*

* The property and tower of Darnick must have been in the family of Heiton from a period long before the visit of Hertford; but it was after this time that they

During this invasion of Hertford there are plenty of historical evidences that evil days had fallen upon Darnick Tower. We may easily imagine that it had its full share of the battles and skirmishes of the period; and as Hertford's generals were animated by the promised rewards of ferial grants of such fortresses, we may be sure that such places would not escape the general havoc. But, to set all conjectures at rest, Mr. David Laing discovered a MS. account of the Earl of Hertford's invasion, in the library of Trinity College, Dublin, in which the Tower of Darnick is described as one of those which had been "razed and cast down."

The present tower was either the old one repaired (for the word "razed" did not always signify total demolition, an act requiring more time and labour than invaders, in the midst of an angry people, could bestow), or a new one erected on the old site, and probably, as was often the case, with part of the old stones. The repairing or rebuilding of the present tower was probably accomplished by that principal member of the family, Andrew Heiton, soon after the passing of the Act, in the reign of Queen Mary, for the improvement of the kingdom, by planting and rebuilding.

We must now say a few words about the construction. Sir W. Scott tells us that,—

"The smaller gentlemen, whether heads of branches of clans, or of distinct families, inhabited dwellings upon a smaller scale, than the feudal castles, called Peels or Bastle-houses. They were surrounded by an enclosure or barkin, the walls whereof were, according to statute, a yard thick, surrounding a space of at least 60 ft. square. Within this network the laird built his tower, with its projecting battlements, and usually secured the entrance by two doors, the outer of graded iron, the inner of oak, clenched with nails. The apartments were placed directly over each other, accessible only by a narrow temple stair, easily blocked up or defended."

This description is so good a picture of the peel of Darnick as it now stands that it almost supercedes the necessity for our describing it. The apartments all over each other and the stair may still be seen, and, in addition to Sir Walter's account, a door at the top leading out to the battlements, which run entirely round, so that in the very last extremity, and when the inmates were actually driven up out of the apartments, they had still not only a refuge, but a position from which to harass the enemies or whoever remained in the court-yard. Two-thirds of the peels, we may add, of which we have any remains, were built between the middle and close of the sixteenth century in conformity with an Act of the Scottish Parliament, 1535, "For Bigging of Strenghtis on the Bordouris;" and this is the statute to which Sir Walter Scott refers.

At one time this tower, the family property of the Heitons, stood along with two others, both of which are now extinct, and were of inferior dimensions.

It was a palpable mistake in the "Border Antiquities" to denominate this tower as belonging to the Fishers, that of the latter being at the time in ruins. The mistake was the more extraordinary, as Sir Walter Scott had made several attempts to purchase this tower from the late Mr. Heiton, and had he succeeded, intended to convert it into an armoury.

The stone of which Darnick Tower is built appears to be the same as that of Melrose Abbey, a yellow and red sandstone; and if this be the case, the red must have been obtained from Dryburgh. There had been a quarry of red sandstone, formerly worked near Oakendene, on the base of the Eldons, so like the Dryburgh stone, that it is impossible to distinguish the difference. From these sources we are led to understand the stone was derived of nearly all the old buildings in the neighbourhood of Melrose; and there is no other possessed of such fine qualities for carved work. Mr. Currie of Melrose, the well-known sculptor, recently saw a beautiful corbel which had been dug up near this quarry; and, curious to say, its counterpart (a fac-simile), is built into the walls of Darnick Tower. It would be of importance to know how so many fragments of moulded stones came to be built into the rubble walls; our informant is inclined to believe that they must have come from the ruins of a convent, which Sir Walter Scott tells us once stood near the same spot.

The walls of the basement are 4 ft. thick, diminishing to about 3 ft. at the top. The

acquired what was termed their out-fell. Andrew Heiton, the then proprietor, was one of those men of substance selected out of the Crown vassals for receiving land under the provisions of the Improving Act, as appears from two charters by Mary, in 1556 and 1557, signed, the one by Lethington and the other by Bothwell.

DARNICK TOWER. South-west View.

doujon is vaulted; the hall, 9 ft. in ceiling, with narrow windows deeply embrasured; the floor above is 12 ft., and above that the granary reaches to the roof. The beams were originally of oak extremely massive. The tower is square, with span roof, and crow-stepped gables corbelled near the top, and the whole roof is embattled. The slate roof is modern; it had originally been constructed with slabs of stone. The present building, as appears from the monogram over the door, was built in 1569, fourteen years after Hertford's memorable defeat at Ancrum Moor. The other existing tower (incorporated in the house of Mr. Currie), belonged to the family of the Fishers, and was also, along with the other two, destroyed at the same visit of the English. It was partially rebuilt, and the massive walls may still be seen in Mr. Currie's house.

From the sculptors referred to, it appears the builder of Heiton's Tower was one Andrew Heiton, his wife's name Fisher—one of the Fishers of Darnick. The present tower has not been used as a dwelling in the memory of the oldest living in Darnick; but some eighteen months ago the idea of restoring the old tower to something like its former appearance in the interior, and rendering it inhabitable, occurred to Mr. John Heiton, of Edinburgh, the proprietor. Meeting with a suitable tenant, in Mr. Murray, architect, of Newcastle, means were at once taken for its restoration. Assisted by the antiquarian and artistic judgment of Mr. Currie, the work has now been accomplished, and this old Border tower is open to visitors, who may in it see as good a specimen of the old peel house, or laird's dwelling, of 300 years ago, as is to be found in Scotland. Among other restorations we may notice the fitting up of the Heiton crest in the east wall—the hall's head surmounting a shield emblazoned with other three. The interior contains four large square apartments, one above another, some of which have been re-floored, the walls plastered, and all put into thorough repair. Two of the rooms are adorned with sculptures corresponding with the Mediæval character of the building. The original doors and locks are still in use—the former studded strongly with great iron nails, and the latter of prodigious size and strength. One of the most pleasing views of the vale of "fair Melrose" is obtained from the tower which overlooks the "old Ahhays," the windings of the Tweed, the triple Eildons, and the whole valley north and south.

Darnick Tower was among the chief objects of Sir Walter Scott's passion for territorial acquisition; and so well was this feeling understood in the district, that he at length obtained the local sobriquet of "The Duke of Darnick." The late Mr. Heiton, although inclined to dispose of a portion of the lands, was rather reluctant to dispose, even to Sir Walter Scott, of the old

tower, which had been for hundreds of years the peel of the family. Of course, the great novelist could not but respect this noble hereditary *penchant*. But Mr. Lockhart, in his *Life of Scott*, thought fit to indulge in a sneer on the subject. He tells us that the proprietor of the tower having made money in Edinburgh as a builder, was unwilling to part with the tower. He had forgotten the obvious antithesis. Sir Walter had also made money in Edinburgh as a writer. No doubt he had reason to be proud in founding a new family; but surely the Laird of Darnick had at least equal reasons for preserving an ancient one.

According to a tradition delivered from father to son, the Heitons came originally from Normandy, in a company of French knights, about the year 125, to assist the Scots against the English. They were well received by James I., by whom a grant of land was given them in the vicinity of the village of Darnick, where they had settled. The name is a translation into Saxon-Scotch of the French *Hautville*, a word common in Normandy, and serving, according to the usage of the time, as a patronymic derived from the family property or residence. We have an analogous example of the Norman designation in "Heiton," or the "hill," in Roxburghshire. Melrose Abbey has been the burial-place of the Heitons for many generations.

The present proprietor is Mr. John Heiton, of that ilk, a descendant of a long line of Border warriors, who were afterwards holders in Edinburgh; and the heir-at-law is Mr. Andrew Heiton, city architect of Perth, who, we believe, superintended the restorations.

HOP AND MALT EXCHANGE BUILDINGS, NEW SOUTHWARK-STREET, BOROUGH.

This building, the first stone of which was laid August 31st, 1866, is now about being opened for business.

The want of a building of this description has been long felt by the general public, there being no exchange or proper place for carrying on the hop, malt, and seed trades. To supply this want a limited liability company was formed, who, upon the advice of their architect, purchased a freehold site of above half an acre, or 26,000 superficial feet, in New Southwark-street, London Bridge. The company have by a subsequent arrangement obtained additional land to the extent of 21,000 superficial feet, making in the aggregate 47,000 feet, or one acre and a tenth, and having a frontage in the new street of 340 ft., and in Red Cross-street of about 75 ft.

The works have been pushed on without intermission since the commencement, and six-sevenths of the entire area are now covered and carried to the full height. The façade in South-

wark-street has an elevation of about 100 ft. above the level of the pavement, and consists of twelve stories with a double haemset of brick arches carried on iron hollow columns and girders. Of this we have already given some account.*

In consequence of several difficulties the company had to contend with, it was found more to their advantage that the works should be carried on without the assistance of a builder. The company's architect, Mr. R. H. Moore, of Walbrook, City, who, it appears, is a large shareholder, has taken more than ordinary pains to carry out and complete the works.

Great difficulties were encountered in the excavating for the foundations; the whole ground, from 12 ft. below the level of the street paving, was found to be running sand and water, which had to be taken out to a depth of about 23 ft., in order to obtain a proper foundation. From this more than sufficient sand has been procured for the whole of the buildings, as well as ballast and core sufficient for the concrete in all the foundations, basement-floors, &c.

The whole of the main walls (which are one brick in haemset, and half a brick throughout, more than the thickness required by the Building Act) are laid on concrete foundations, 8 ft. wide by 5 ft. deep. The concrete is composed of gravel, ballast, and brick core, mixed with hydraulic lime in the proportion of 6 to 1.

The whole of the bricks used in the building are hard well-burned stocks. All the haemset walls are laid in Portland cement as well as the two tiers of arched cellars, with the entire front, and all walls and piers of a less area on plan than 10 ft. super., the best lias lime being used for all the other portions of the brickwork.

In the front, Portland stone pedestals, about 4 ft. 6 in. high, forming the base of cast-iron ornamental columns, extend along the entire length of front, excepting at the ends and principal entrance to the exchange. The latter is flanked with pillars of Portland stone, in all about 27 ft. high. The caps and entablatures are executed in Connans stone, which harmonizes well with, and is become as hard as, the Portland. The crowning members of the cornice are of Portland stone. From this line to the top of the building, the whole is executed in bricks and Portland cement, excepting the keystones and corbels to all the windows, which are of stone. There is a bold cornice carried on trusses, 3 ft. 6 in. high, surmounting and running the entire length of the front.

The building consists of an exchange-room, 80 ft. long by 50 ft. wide, and 75 ft. high to crowning member of cornice, from which springs an iron roof of 25 ft. radius, with a lantern-light surmounting it, and in which is provided ample ventilation. From the ridge of this lantern to the floor the height is 115 ft. The roof is formed of 3 in. by 3 in. by $\frac{1}{2}$ in. angle-iron in the shape of lattice-girders, each rib being at the springing 3 ft. deep, and diminishing at the top to 18 in. The foot of each rib is securely bolted to strong cast-iron corbels built in the walls to receive them. The ribs are also in pairs (24 in. apart), connected with each other by lattice or trellis tiers of 3 in. by 3 in. by $\frac{1}{2}$ in. metal. The bays between each pair of ribs are 14 ft. wide. The purlins are also of trellis form, and these carry the sash-bars, which are bent to the curve of roof, and are placed about 2 ft. 10 in. apart. The roof is glazed with stout 32 oz. hent sheet-glass.

Around the Exchange are four stories of offices and show-rooms. The three upper floors are approached from ornamental cast-iron galleries running all round. The stone staircases at the opposite angles of the Exchange, and one at the principal entrance, lead up to these galleries, giving easy access to each office. The floors of the galleries are of diamond-shaped pattern, and glazed with small squares of plate-glass, and are carried on ornamental cast-iron brackets of appropriate design, as well as the balcony railing, in both of which the hop leaf and seed have been introduced.

A refreshment-room of first and second class is provided, and also a subscription-room 40 ft. by 35 ft., and 24 ft. high, having a rich ceiling, and supplied with six glass star-lights. An ornamental self-supporting fireproof gallery is carried along one end of this room, affording access to a set of offices fronting the street.

The principal entrance is placed at the end next to the London Bridge side of the street, and nearly opposite the Alliance Bank. There is a

* Lockhart's Life.

* P. 348, ante.

THE HOP AND MALT EXCHANGE BUILDING, SOUTHWARK STREET, BOROUGH.—MR. R. H. MOORE, ARCHITECT.

fine flight of steps within the porch leading to the Exchange. The vestibule consists of a centre and two side arches. The outer pillars are of Portland stone. The inner arcade consists of segmental-arched and panelled ceilings, supported by four elaborately wrought Irish red marble columns, and twelve green marble pillars, all of which were supplied by a Dublin manufacturer. The whole of the caps to the marble columns are carved in Constantine stone, principally in natural foliage.

A large portion of the building being designed to be used as warehouses, a certain portion first-floor is carried on wrought-iron girders throughout the building, so far as the offices extend, making a party separation between them and the warehouses.

The wrought-iron girders are built into the front and on to the walls at the rear, forming a perfect tie to the whole of the front and outer walls; in every other story of the building, from the ground-story to roof, strong iron ties, 7 ft. apart, are built, tying the front and back walls. The floors of all the corridors and passages, as well as the Exchanges (80 ft. by 50 ft.), are laid with eucalyptic tiles.

The area of the warehouse-room for the storage of hop and other produce exceeds 220,000 superficial feet; this area of brick-arched cellars, to which ample access is provided, to compartments over room, each 80 ft. by 50 ft., the size of Exchange, and two 40 ft. by 35 ft. each; and in all exceeding an area of 63,000 ft.

Machinery is being fixed for the purpose of loading and unloading from the warehouses, seven cranes, or jibs, standing about 100 ft. high from where the wagons will stand, worked by a fixed steam-engine of 8-horse power in the first basement. There is a Cornish boiler and upright shafts, which run from the engine to the roof of the building, with about 70 ft. of horizontal shafting, with all proper drums, gearing, &c., to work the jibs. When complete, there will be 240 ft. of horizontal shafting running the entire height of the back of building, to which will work the seven cranes. The engines now fixed is also designed to pump water on to the roof of the building.

Troughs of wrought-iron are now being fixed for the purpose, which will hold several thousand gallons of water. This water, which will be pumped from a deep well in the sand, the company propose using for the supply to the building, the architect having, amongst his other requirements for economy to the company, provided filters for the purpose of preparing it fit for use before it comes into the offices. The large supply which can be obtained by means of the engine being daily at work, hydrants will be fixed for safety from fire, as the cistern at their elevation will be of immense value, and before their contents can be exhausted, a fresh supply can be obtained in case of fire: this will be of a great advantage, as well as an enormous saving to the company by way of water rent. The small remaining portion of the building, part of which is up about half its elevation, will be built to its full height in elevation in about three months, and will consist of warehouses and offices in the front the height of four stories. There will be in all above 100 offices, fifty show-rooms, sixty stands, besides basement offices for wine-merchants and others, with warehouse room for 50,000 bales of hops and other produce, and cellars for about 3,000 barrels of ale or other goods. The cost of the entire building up to the present is 40,000, and it is estimated the part unfinished will cost about 10,000.

It is anticipated that the rents will be not less than 3,000l. per annum; this may be inferred from the fact that the ground and first-floor offices, which are all now let, realize nearly double the original estimate for return on an outlay in all of 120,000l., the first capital of the company.

The interior, as may be seen from our view, presents a striking appearance. The panels under the roof are not yet painted.

RE-NAMING OF STREETS.—The intention of the Hackney authorities to give the name of Church-street to the whole line of Mare-street and Church-street is meeting with great opposition, according to the *Parochial Critic*. The inhabitants are rightly desirous of retaining the name of Mare-street, which it has had 150 years, before which it had from time immemorial the name of Mare-street. A memorial has been signed by 46 inhabitants of Church-street, and another by 90 inhabitants of Mare-street.

THE CHÂTEAU-GAILLARD.*

The history of Château-Gaillard is intimately connected with the lives of Richard Cœur de Lion, its founder; of John, his brother, who basely neglected to support it; and of Philip Augustus, who besieged and captured it. It also plays an important part in the most critical period of the history of Normandy, its loss by the English, and its absorption into the kingdom of France.

The Dukes of Normandy, with their capital at Rouen, and their command of the lower Seine and the ports of the north, were always a dangerous thorn in the side of France; but when they became kings of England, and could bring the forces of the country to fight out a Norman quarrel, their presence upon the Seine hooms a question of life or death with France, and as such Philip Augustus seems from an early period to have regarded it, and to have prepared himself for a deadly struggle with his contemporary, Richard.

The two princes assumed the cross in 1188, and met before the walls of Acre in 1190-1. Philip soon returned to attend to his affairs at home, and Richard, fearing his designs, followed him in October, 1192. The adventures of Richard, and how he was detained in prison, are well known. Philip profited by the opportunity, and especially by the weakness and baseness of John, the natural guardian of his brother's interests.

Philip commenced by the recovery, by treason, of Gisors, a strong place on the Epte, built by Rufus, strengthened by Henry I., and which, after many changes of masters, had come to Philip, and by an oversight been given to Richard as a part of the portion of his sister Alice. Philip re-entered in April, 1193, and with Gisors acquired Le Vexin, the territory between that fortress and Andelys.

In 1194 he took the field on the opposite or left bank of the Seine, possessed himself of Ivry, and, crossing, laid siege to Rouen. The Earl of Montfort, that governor, was too strong for him, and he retired, burning his siege artillery. In April Richard re-appeared upon the scene. The advance of Philip was checked, but the war continued with much ferocity.

In January, 1196, occurred the treaty of Issoudun in Berry, by which France was to retain the Norman Vexin and Gisors, and, on the left bank of the Seine, Ivry, Veron, and Gaillon. Richard was to hold En, Arques, Amale, Drieucourt or Neufchatel, and certain places in Perche, Berry, and Auvergnis. Richard was outwitted. He lost Gisors, the shield of Rouen, and the frontier of the Epte, and he further bound himself not to fortify Andelys, the only point by which he could hope still to retain the Seine and the Andelle, and thus cover Rouen. He, therefore, as the manner was, determined to break faith by fortifying the rock of Andelys, a part of the estate of the church of Rouen, represented by Archbishop Walter, the king's old and trusted counsellor.

As it was certain that France would resist this infraction, and the church would remonstrate, no time was to be lost. His preparations were vast, but they were made silently and rapidly, as became the greatest soldier of his day. The time of his commencement is established by a letter from the Archbishop to his friend Ralf de Diceto, the chronicler, Dean of St. Paul's, in 1196, in which he speaks of ditches and barbicans trespassing upon the property of the church. It will suffice to say that, after an interdict and an appeal to Rome, Walter obtained excellent terms. Richard, meantime, stayed neither for Pope nor bishop, and swore he would not stop for an angel from heaven.

He commenced operations upon an island in the Seine, below the castle. Upon this he constructed a fort, with mural towers and a ditch, in advance of which was a strong palisade. Here he posted himself during the progress of the works. A wooden bridge crossed from the fort to either shore, and as a *tête du pont* to that toward the right bank he constructed what is now the town of Little Andelys. The waters of the Gambon were deepened into a lake, which extended from the Great Andelys downwards, and two streams from which encircled the Little Andelys, which was fortified and provided with two drawbridges, and thus was covered the foot of the rock on its eastern and northern sides. The Andelys defences were strengthened with towers of wood, embattled and looped, and placed at convenient distances.

* See p. 643, ante.

Finally, across the Seine, above the island, was constructed a dam of three lines of piles, just opposite to and commanded by the rock; and again, about four miles up the river, on the right bank, rather above Toeni, was placed a detached work in masonry, which bore the name of "La Boule-en-Avant," or "Boutavant," "*Pulsis in anteriora*," a name given to one of the advanced towers of Corfe Castle.

The actual promontory, upon which the castle itself was to be placed, was about 600 ft. to 800 ft. long, 200 ft. broad, and 300 ft. above the river, and there the ditches were cut and the towers and walls raised, such as they have been described. It was a grand stroke of genius, audaciously conceived and perfectly executed. "*Ecco quam pulchra filia mea anni?*" "Is she not fair, my daughter of a year?" was the royal vaunt, and, as he happily designated it, "C'est Château-Gaillard;" its official name, however, for some time was "Castrum de Rupe;" "Bellum Castrum de Rupe" or "Rupes Andeliciaci;" but Le Breton, Philip's historiographer, and his contemporaries use the more popular and permanent name.

Richard at once reaped the fruit of his exertions. In the war which broke out the presence of Château-Gaillard saved central Normandy, and forced Philip to confine his attacks to the northern provinces. Richard, however, detached from him his ally, the Earl of Flanders, and Philip, heated, fled to Gisors, where he was usarily drowned in crossing the river. Richard brought 100 prisoners to his castle, and soon afterwards (1198) received there his nephew, Henry, Duke of Saxony. In the Record-office is a charter of confirmation to St. Peter's, Chertsey, by Richard, date, *apud ruperum andeliciacum*, 10th January, 10 R.I. (1199); that is, three months before his death, which took place in the following April.

John's first step, in August, was to make a treaty with Renaud, Count of Boulogne, and Philip's marriage and subsequent excommunication gave him a further respite. Philip, when once more in a condition to act, commenced by destroying Boutevaux. The murder of Arthur, which occurred soon afterwards, induced him to draw off his forces from Arques and the north, and to concentrate his efforts in good earnest upon Château-Gaillard, the siege of which he determined to conduct in person.

His first step, advancing down the left bank of the Seine, was to take position upon the peninsula in front of the castle. Here he cast up lines extending from Toeni on one bank to Bernières on the other, to provide for the defence of his rear.

The castle was commanded by Roger de Lacy, the constable of Chester, with a garrison sufficient for its defence, but powerless for operations in the field. Upon Philip's appearance, Roger's first step was to break down the further bridge from the island. Richard would have chosen this time to attack the French before their lines were ready, and drive them into the river, but John lost the golden moment. Thus established and protected in front of the castle, Philip next formed a communication with the right bank, and so prepared to support his attack upon the place, and secured a retreat if molested by a superior force in his rear. He proposed to bridge the river above the island, between it and the stockade, which was first to be broken down, to allow of the navigation of the river. Powerful mangouells, machines for casting missiles, introduced from Turkey, were planted on the left bank, and, thus protected, the piles were cut by divers, notwithstanding a continued discharge of arrows from the castle above. A gap opened, Philip brought down ferry-boats from the upper Seine, and laying planks across these, connected the head of the island with either bank. The fort was not yet taken. To command it, and to protect the bridge, four large barges were anchored above it, and upon them were constructed tall wooden towers. Thus strengthened, the French crossed the Seine, established their head-quarters before the walls of Little Andelys, and so opened an unimpeded communication with Le Vexin, whence they drew provisions.

King John, now seriously alarmed, employed William Mareschal, the great Earl of Pembroke, to relieve the garrison. The earl, with 300 men-at-arms, 3,000 sergeants-at-arms on horseback, and 4,000 infantry, besides a band of tried mercenaries under Algaiz and Marcadens, two of Richard's captains, planned a double attack by land and water, the success of which obviously depended upon their being simultaneous.

The land forces were to attack the lines by night, while the flotilla came down upon and broke the bridge, thus dividing the French army, and reinforcing the fort. Seventy vessels laden with munitions and food for 3,000 men, were prepared at Rouen, and brought down under the command of Martin of Arques and De Brandin. With them was Alan, a well-known Breton seaman and pirate.

Mareschal drew up his men in the peninsula, by night, outside the French lines, and awaited the signal from the boats. This never came; so, as the night was passing, he waited no longer, but advanced on the lines. In so doing he routed a horde of sutlers and camp-followers, who fled across the works, spreading terror and confusion among the troops. These fled towards the bridge, which broke beneath their tumultuous passage. They fled, however, more quickly than they were pursued, for the English were delayed by the lines, the remains of which attest their passive strength. This gave Philip time to come up from his camp to rally and support his troops, and hastily to repair the bridge. The English were driven back.

Some hours after this, at the dawn of day, the flotilla appeared, having been delayed by the navigation. It was met by a force on either bank, and the bridge and towers were armed and ready. The flotilla came down in mid-stream, and the two leading boats struck the bridge; a sharp hand-to-hand fight took place, in the midst of which a heavy oak beam was flung upon the two boats, and sank them in front of the bridge. Upon this the rest took to their own, and retired up the stream, and two more were taken. The failure was complete, and showed the garrison that their reliance must lie on themselves alone.

Philip now attacked the island fort. The stockade in advance of its ditch was hurst, and the fire spread to the fort itself, which surrendered, and was repaired and garrisoned at once by the French, now completely masters of the river and of either bank. Alarmed for their personal safety, the burgesses of Little Andelys, to whom had been trusted the defence of their town, deserted their posts, and fled to the castle, where De Lacy was weak enough to admit them, 1,700 in number: a dangerous addition to a place of small area, and already fully garrisoned. Philip at once took possession of Andelys, the defences of which were very strong, repopled the town, and now, in August, 1203, commenced the actual siege of the castle. Leaving others to make preparations, Philip was compelled to absent himself to besiege Radepe, a castle about five leagues distant, which he reduced in about three weeks, during which time De Lacy attacked Andelys, and a system of single combats was established between the knights of the two nations, who met to perform those feats of arms in the level space below the castle rock.

Philip returned in September, and winter being in prospect, and the period of service of many of his retainers reaching its close, he decided on a blockade. The first step towards effecting this was the formation of lines of contravallation round the west and south of the castle, from the Seine to the Andelys lake. They chiefly took the higher ground, and were out of shot. Besides the usual ditch, bank, and stockade, which composed every field-work, these were strengthened by seven large wooden towers, each with its special ditch and drawbridge. The troops garrisoned these towers, and were lodged in wattle huts along the lines. On the top of the ridge, opposite the southern front of the castle, an open space was left unprotected by earthworks, in contemplation of a future attack. These preparations completed, Philip's person was less necessary, and he departed for the winter. The general course of these works may still be traced.

As the winter came on De Lacy's provisions began to fail, and he turned out 500 aged or infirm persons; and, soon afterwards, an equal number more. On hearing this, Philip ordered no more to be received; and in consequence, a further number of 400 persons put out of the castle were forced to remain in the open ditches exposed to wintry weather and great privations for three months. Very many died, and it was not until the return of Philip in February, 1204, that he allowed the survivors to be relieved.

February was the seventh month of the siege, and Philip, preparing for more active measures, took post upon the southern ridge in front of the salient of the outwork, and in the centre of his

own lines. Here he levelled a platform and opened a covered way towards the castle ditch. A wooden turret was then constructed upon four wheels, and pushed forward to the crest of the counterscarp. When there, it was raised, under cover of large shields, to three stories, so as to overtop the tower. Thus protected, the engineers commenced filling up the ditch. When this was partially done, stimulated by the king's presence, the soldiers jumped down, scrambled up the uncovered part of the scarp, and under a fire from the turret, which kept the battlements partially cleared, succeeded in applying miners to the foot of the tower.

An aperture was quickly made, and thus shelter obtained while the mine was dug, and the wall supported on wood props. These were then set on fire, and the miners withdrawn. In a short time a part of the tower fell. The cloud of dust was the signal for the assault; but the outwork being no longer tenable, De Lacy fired the building within it, and withdrew the garrison into the castle, for the defence of its outer ward, next to be attacked.

Philip proposed, under cover of the outwork, to renew his attack upon the curtain of the southern face of this ward; but in the meantime five resolute men, having observed a window in the wall to the south-west, in the buildings below the chapel, pushed up one of their number, who by aid of a cord drew up the remainder. Once in they gave the alarm. The garrison, uncertain what had occurred, blocked up the door of the building with fascines. These took fire, the flames spread, and so great was the confusion that the garrison, regarding the ward as lost, fled into the inner *enceinte*, while the assailants took refuge from the flames in the chambers within the chalk rock of the counterscarp of the inner ditch, and thence, as the flames somewhat subsided, they rushed out upon the gate, lowered the bridge, and admitted their friends. Thus Philip became master of all but the inner ward, the garrison of which was reduced to 180 fighting men.

The provision of Richard had placed the gates of the middle and inner ward at some little distance, laterally, from each other, and the space between the two wards was here far too narrow to allow of the setting up of an engine. Unfortunately, however, the inner ward gate had no drawbridge. The approach was over a causeway of rock, left when the ditch was cut, and by this causeway Philip at once decided to make his approaches. A "cat" was placed upon the causeway. This was a covered frame, under which two miners abreast were pushed forward to the base of the gate towers, which they proceeded to undermine. De Lacy at once sank a countermine; but Philip placed his most powerful engine at the root of the causeway, and flung his heavy stone missiles at the gate tower with such force, that, being weakened by the mining, at the third blow it came down, and with it a part of the adjacent wall.

De Lacy and his men were seen lining the breach; but the French, equally brave, had greatly the superiority in numbers. They rushed up, and so outnumbered and mixed themselves up with the garrison that these were unable to retire by the narrow exterior stairs to the donjon, and thus, with De Lacy, were taken prisoners, and with them fell the castle on the 8th of March, 1204. There was taken De Lacy himself, and with him 160 prisoners, including forty knights. So fell Châteaun-Gaillard, and with it the English rule in Normandy. De Lacy was well treated, and certainly lost no military reputation by his defeat. Philip repaired and garrisoned the place at once, and the former so completely that, although the particulars are to be identified with great certainty in the earthworks, there is no trace of the ditch having been filled up, or of the main tower of the outworks having been injured by a mine such as that described.

The details of this siege, no less than its general conduct, show very considerable military skill, and the extent to which Middle-Age commanders had learned to apply the maxims of Roman war. Philip's approach by the opposite bank of the Seine, the care with which he fortified his rear, the pains he bestowed upon the communications between both parts of his army, are all steps which show consummate skill, and which a more impetuous and less able commander would have neglected for a direct attack. William Mareschal's attempt to raise the siege, considering the limited force at his disposal and the feeble and treacherous character of his sovereign, was well conceived; but no

doubt he should have known the risk attendant upon a joint attack by land and water, where all depended upon combined and simultaneous action.

Philip's conduct after the establishment of a safe base upon either side of the river was also able. Having thus, and by fortified lines of contravallation, secured his blockading force, he spared his own men and suffered the garrison to waste their resources by lying idle during the winter; and when, this force being thus weakened, he commenced his attack, he allowed no pause, but made one success the immediate step towards another. Looking at the great and still apparent strength of Châteaun-Gaillard, it is difficult to understand how it could ever have been taken by storm.
