The Rule, as to Gardening in general, is, that hot and dry Earth should be *till'd* in Summer, either a little before, or while it rains, or soon after; and that neither too often nor too deep: In hot Weather 'tis not to be perform'd, unless water'd soon after: But for moist, cold, and strong Earth, it must never be *till'd* in Time of Rain, but rather in the greatest Heats. As to Arable Lands, that which is clayey, stiff, cold, and moist, is generally thrice *till'd*; in Spring, Summer, and at Seed Time, for Wheat; and four Times for Barley.

These repeated Ploughings or Fallowings are very advantageous to the Soil, both as they destroy Weeds, and as the Ground is hereby laid in Ridges, which prevents its being over drench'd in wet Seasons, saves it much from Blights, and bleak Weather, and makes the Land lighter and fitter for the Seed to take Root in, and to imbibe the nitrous Dew and Influences of the Air, &c. See FALLOWING and VEGETATION.

*TILT*. See JOUST and TOURNAMENTS, CARROUSELS and QUADRIL, &c.

*TILT-Boat*, a Boat cover'd with a *Tilt*, i. e. a Cloth, or Tent, for the Sheltering of Passengers: Such is that which carries Passengers between *London* and *Gravesend*.

*TIMAR*, *TIMARISM*, a Lordship or Tract of Ground, which the Grand Signior gives the *Syablis*, in Use Fruit, i. e. to enjoy during Life, for their Subsistence. See SPANISH. *Mensuki* calls it a Pension, Stipend, or Revenue, granted to old Soldiers who have deserv'd well, in Lands and Possessions of Cattle, Towns, Villages, Fields, or in Tithes, and other Fruits and Incomes, with the Præference, Jurisdiction, or Lordship of the said Places.

The *Timar* is a kind of Fief granted for Life. — The whole Ottoman Empire is divided into *Sangiackes* or *Baneries*, under which, all such as hold *Timars*, who are call'd *Timariots*, are bound to lift themselves, when summon'd upon any Expedition. See TIMARIOT.

*Timars* may be resign'd as Benefices among us, only obtaining the Consent of the Beglerbei, or Governor of the Province.

Indeed, the *Timars* of above 10000 *Apers per Annum*, call'd *Zaim*, the Grand Vizier alone grants Dispensations. See ZAIM.

*TIMARIOTS*, those who enjoy Lands and Benefices on the Tenure and Condition of *Timars*. See TIMAR.

The *Timariots* are oblig'd to serve in War, personally, with as many Men and Horses for Service, as their *Timar*, by the Estimate made thereof, contains Times 2500 *Apers*, or 11 Pounds Sterling; and to maintain them constantly mounted and arm'd, after their Manner, to be ready to march at all Hours when commanded; and that on Pain of Death; nothing, not even Sickness itself, being allow'd to excuse them.

Beside this Service, they likewise pay an Acknowledgment of one Tenth of their Revenue. — If they have any Children of Age to bear Arms, and fit for the Service, after their Decease, or in Defect hereof, if they have any Relations, that have the least Interest; the *Timar* is us'd to be continu'd to them on the same Conditions; otherwise, it is transfer'd to others.

If the Revenue thus held of the Grand Signior exceed 15000 *Apers*, or 66 Pounds Sterling, they who hold it, are not call'd *Timariots*, but *Subassys*, or *Zaims*; and have the Administration of Justice in the Place, under the Sangiac of the Province.

The *Timariots* have different Appointments, from 4 or 5000 *Aspers*; equal to about 22 Pounds Sterling; to 20000 *Aspers*: But unless their *Timar* exceed 8000 *Aspers*, they are never oblig'd to march, except when the Grand Signior goes in the Army in Person; on which Occasion none are exempted.

The Origin of the *Timariots* is refer'd to the first Sultans, who being Masters of the Provinces or Lands of the Empire, erected them into Baronies or Commanderies; to reward the Services of their bravest Soldiers; and especially to raise and keep on Foot a Number of Troops without disburſing any Money.

But it was *Soliman II.* that first establish'd the Order and Discipline among these Barons, or Knights of the Empire; and by his Order it was, that the Number of Horsemen each should maintain, was regulated.

This Body has always been not only exceedingly powerful, but great and illustrious, throughout all the Empire: But Avarice, the ordinary Fault of the Orientals, has occasion'd their Declension of late Years.

The Viceroy and Governors of Provinces manage their Matters so at Court, that *Timari*, even out of their Jurisdiction, are given to their Domesticks, or to such as will give the most Money for them.

There are two Kinds of *Timariots*; the one appointed by the Porte, the other by the Viceroy of the Country: But the Revenues of both are less than those of the *Zaimis*, and their Equipage and Tents less in Proportion. See *ZAIMS*.

Those who have their Patents from the Court, have from 5 or 6000 *Aspers*, to 19999 *Aspers per Annum*; if they have one *Aſper* more, they become *Zaimis*. Those who receive their Patents from the Viceroys, have from 3 to 6000 *Aspers per Annum*.

This Cavalry is better disciplin'd than that properly call'd the *Spahis*, tho' the *Spahis* be the nearest and briskest. These last only fight in Platoons; whereas the *Zaimis* and *Timariots* are divided into Regiments, and commanded by Colonels, under the Direction of Balthaws.

The Balthaw of *Aleppo*, when in the Army, is Colonel General of this Militia.

TIMBER, includes all Kinds of fell'd and season'd Woods, us'd in the several Parts of Building; as Carpentry, Joinery, Turnery, &c. See WOOD and BUILDING.

The Kinds of *Timber* are numerous: We shall only mention some of the most usual; from *Evolv'n's Spines*, &c.

1<sup>o</sup>. *Oak*; the Uses whereof need no enumerating: To endure all Seasons and Weathers, there is no Wood like it: Hence its Use in Pales, Shingles, Poſts, Rails, Boards, &c. For Water-works it is second to none; and where it lies expos'd both to Air and Water, there is none equal to it.

2<sup>o</sup>. *Elm*: This fell'd between *November* and *February*, is all Spine or Heart, and no Sap; and is of singular Use in Places where it is always wet or dry: Its Toughness likewise makes it of Use to Wheel-wrights, Mill-wrights, &c. nor must it be omitted, that its not being liable to break and fly in Chips, makes it fit for Dressers and Planks to chop on.

3<sup>o</sup>. *Beech*: Its chief Use is in Turnery, Joinery, Upholstery, and the like, as being of a clean, white, fine Grain, not apt to bend or split: Yet it is sometimes, especially of late, us'd for building *Timber*; and if it lie constantly wet, is judg'd to out-last *Oak*.

4<sup>o</sup>. *Ash*: Its Use is almost universal: 'Tis good for Building, or other Occasions where it may lie dry: It serves the Carpenter, Cooper, Turner, Plough-wright, Wheel-wright, Gardener; as also at Sea for Oars, Hand-Spikes, &c.

5<sup>o</sup>. *Fir*: commonly known by the Name of *Deal*, is of late much us'd in Building, especially within Doors, for Stairs, Floors, Waincot, and most Works of Ornament.

6<sup>o</sup>. *Walnut-Tree*, is of universal Use; excepting for the Out-sides of Buildings: None better for the Joiners Use; it being of a more curious brown Colour than *Beech*, and less subject to Worms.

7<sup>o</sup>. *Chestnut-Tree*, next to *Oak*, is the *Timber* most sought for by Joiners and Carpenters: 'Tis very lasting.

8<sup>o</sup>. *Service-Tree*, us'd in Joinery, as being of a delicate Grain, and fit for Curioſities: It also yields Beams of considerable Bigness for Building.

9<sup>o</sup>. *Poplar*, *Ash*, and *Alpen*, differing very little from one another, are much us'd of late instead of *Fir*: They look as well, and are rougher and harder.

10. *Alder*; much us'd for Sewers or Pipes to convey Water. When always wet it grows hard like a Stone; but where sometimes wet, and sometimes dry, it rots immediately.

#### Felling of TIMBER.

The Season usually commences about the End of *April*; in regard the Bark then generally rises the freeliest; so that

where a Quantity of *Timber* is to be fell'd, the Statute requires it to be done then for the Advantage of Tanning. See TANNING.

However, the Opinions and Practices of Authors are very different, as to the best Season for felling *Timber*: *Vitruvius* recommends an Autumnal Fall; others advise *December* and *January*: *Cato* was of Opinion, that Trees should have bore their Fruit e'er fell'd; at least their Fruit should be first ripe; which falls in with the Sentiment of *Vitruvius*.

In effect, tho' *Timber* unbar'd' be most obnoxious to Worms, yet we find the wild *Oak*, and many other Kinds, if fell'd too late, when the Sap begins to be proud, to be very subject to Worms; whereas, about Mid-Winter, it neither casts, rises, nor twines.

It were happy, therefore, if a Method of Tanning without Bark could be invented, that Trees being fell'd more early, the *Timber* might be the better season'd.

The Ancients had a great Regard to the Age of the Moon in the felling their *Timber*: If their Rules avail ought, they are these: Fell *Timber* in the Wain, or four Days after new Moon: Some say, let it be the last Quarter. *Pliny* orders it to be in the very Article of the Change; which happening in the last Day of the Winter Solstice, the *Timber*, says he, will be immortal. *Columella* says, from the 20th to the 28th Day. *Cato*, four Days after the Fall. *Vegetius*, from the 15th to the 25th for Ship *Timber*; but never in the Increase, Trees then abounding with Moisture, the only Source of Putrifaction.

Some even have a Regard to the Temper and Time of the Day; the Wind to be low, neither East nor West; neither in frosty, wet, nor dewy Weather; and therefore never in the Forenoon.

Lastly, some Regard is had to the Species: *Fir* is best fell'd when it begins to spring; both as it then quits its Coat best, and as the Wood, according to *Theophrastus*, is by that Means render'd wonderfully durable in Water. *Elm*, says *Mr. Worlidge*, is to be fell'd between *November* and *January*; in which Case it will be all Heart; at least, the Sap will be very inconsiderable: This, he adds, is the only Season for felling *Ash*.

Some Authors add further, that in felling *Timber*, Care is to be taken only to cut it into the Pith, and so to let it stand till dry; by which Means the Moisture is evacuated in Drops, which would otherwise occasion Putrifaction.

#### Seasoning of TIMBER.

After felling, and sawing it, some advise it to be laid up very dry, in an airy Place, yet out of the Wind and Sun, at least free from any Extremities of either; And that it mayn't decay, but dry evenly, they order it to be stamb'd over with Cows Dung.

'Tis not to stand upright, but to lie all along, one Piece over another, only kept apart by short Blocks interpos'd, to prevent a certain Moldiness, which they are apt to contract in Sweating on one another; from which frequently arises a kind of Fungus, especially if there be any lappy Parts remaining.

Others advise Boards, Planks, &c. to be laid in some Pool, or running Stream for a few Days, to extract the Sap from them, and afterwards to dry them in the Sun or Air. By this means, tis said, they will be prevented from either chapping, casting, or cleaving; but against shrinking there is no Remedy. *Mr. Evelyn* particularly recommends this Method for *Fir*.

Others again, are for burying them in the Earth; others in Wheat; and others for scorching and seasoning them in Fire, especially Piles, Poſts, &c. that are to stand either in Water or Earth.

*Sir Hugh Platt* informs us, that the *Ventusians* burn and scorch their *Timber* in the flaming Fire, continually turning it round with an Engine, till it has got a hard, black, crusty Coal upon it.

#### Preserving of TIMBER.

When Boards, &c. are dry'd, season'd, and fix'd in their Places, Care is to be taken to defend and preserve them; so to which the securing them with Linseed Oil, Tar, or the like Oleaginous Matter, contributes much.

The *Dutch* preserve their Gates, Portcullises, Draw-Bridges, Sluices, &c. by coating them over with a Mixture of Pitch and Tar, whereon they strew small Pieces of Cockle and other Shells, beaten almost to Powder, and mix'd with Sea Sands; which incrusts and arms it wonderfully against all Assaults of Wind and Weather.

*Timber* fell'd before the Sap is perfectly at rest, is very subject to the Worms; to prevent, or cure which, *Mr. Evelyn* gives us the following Secret, as most approv'd. Put common Sulphur in a Cucurbit, with as much *Aqua-fortis*, as will cover it three Fingers deep; distil it to a Dryness, which is perform'd by two or three Rectifications.

Lay the Sulphur remaining at Bottom on a Marble, or in a Glass; and with the Oil it dissolves into, anoint the *Timber*. This, he adds, not only infallibly prevents or cures the Worminess; but preserves all Kinds of Woods, and even many other Things, as Ropes, Nets, and Mats from Putrefaction, either in Air, Water, Snow, &c.

For such as would go a shorter Way to work, two or three Anointings with Linseed Oil may do very well. As to Poiss, &c. that are to stand in the Ground, the burning the Outfides to a Coal is a great Preservative.

As to the Chops or Clefts green *Timber* is liable to after working, a very great Eye-sore in many fine Buildings, they are clos'd by anointing, supping, and fraking it with the Fat of powder'd Beet-Broth, twice or thrice repeated. Some Carpenters use Grease and Saw Dust mingled for the same Purpose. But the former Method is excellent, only it is not to be us'd while the *Timber* is green.

*Timber-Trees*, the Wood of *Timber*, e'er yet fell'd; particularly that of Oak, &c. See **TIMBER** and **TREE**.

For the *Raising, Planting, Transplanting, Pruning*, &c. of *Timber-Trees*. See **SEMINARY**, **PRUNING**, **TRANSPLANTING**, &c.

*Timber Measure*. *Timber* is usually measur'd and estimat'd by the *Load* or *Tun*; which is a solid Measure containing 40 Feet of round *Timber*, or 50 of hewn *Timber*. The Denomination of *Load*, &c. we suppose arises hence, that 40 or 50 solid Feet of such *Timber* weighs about a *Tun*, i. e. 20 hundred Weight, which is usually accounted a *Cart Load*.

1<sup>o</sup>. For the *Measuring of round Timber*; the Practice is to gird the Tree about, in the Middle of the Length, and folding the Line twice, to take one Length or Quarter of the whole, and account that for the true Side of the Square: Then, for the Length, 'tis counted from the But-end of the Tree, so far up as the Tree will hold half a *Foot Girt*, as they call it; i. e. so long as the Line, twice folded, is half a *Foot*.

The Dimensions thus taken, the Quantity of *Timber* is had, either by multiplying the Side of the Square into itself, and that Product by the Length; by the Method of Cross-Multiplication. See **CROSS-MULTIPLICATION**.

Or, more easily, and speedily on *Gunter's Line*, by extending the Compasses from 12, to the Side of the Square in Inches; for that Extent turn'd twice (the same Way) from the Length in Feet, will reach to the Content in Feet. See **GUNTER'S SCALE**.

Or, better still, on *Coggeshall's Sliding Rule*, by setting 12 on the *Girt Line D*, to the Length in Feet on the *Line C*. Then against the Side of the Square, on the *Girt Line D*, taken in Inches, you have on the *Line C* the Content of the *Timber* in Feet. See **COGGESHALL'S SLIDING RULE**.

Note, 1<sup>o</sup>. This Method of measuring round *Timber*, tho' common, is yet erroneous; and the Content found hereby, 'tis demonstrat'd, is less than the true Content or Measure in the Ratio of 11 to 14. How to avoid this Error, and measure it justly, we have shewn under the Use of *Coggeshall's Sliding Rule*.

2<sup>o</sup>. If the Tree have any great Boughs that are *Timber*, as the *Parasite* is, i. e. which will hold *Foot girt*, they are commonly measur'd, and added to the rest: The Solidity of the whole being thus found, they divide it by 40, which brings it into *Loads*.

3<sup>o</sup>. In measuring round *Timber* for Sale, they usually cast away an Inch out of the Square for the Bark, if Oak; so that a Tree 40 Inches square, they only account as if 39; but for Ash, Elm, Beach, &c. an Inch is too much.

4<sup>o</sup>. For the *Measuring of hewn or squared Timber*; the Practice is, to find the Middle of the Length of the Tree, and there to measure its Breadth, by clapping two Rules, or other straight Things, to the Sides of the Tree, and measuring the Distance between them: In the like Manner they measure the Breadth the other Way. If the two be found unequal, they add them together, and take half the Sum for the true Side of the Square.

The Dimensions thus taken, the Content is found either by Cross-Multiplication, *Gunter's Scale*, or the *Sliding Rule*, after the Manner already directed.

The Content divided by 50, gives the Number of *Loads*. Note, if the *Timber* be unequally sided, this Method of measuring it is erroneous; always giving the Content more than the Truth, and the more so, as the Difference of the Sides is greater; yet Custom has authoriz'd it.

To measure such *Timber* justly, a mean Proportional should be found between the unequal Sides; and this Mean be accounted the Side of the Square.

For the measuring of *Taper Timber*, &c. *Timber* of other Forms, as *Cubes*, *Prisms*, *Pyramids*, &c.; See the Methods under the Article **SCISSING RULE**.

*Timber of Skins*, is *Forry Skins*. *Hec Coivitas* (sc. *Cestria*) *non reddens de forma 45 Libras & tres Timbras pellium Martenarum* IL. Edw. Conf.

*TIMBER*, in Falconry. To *timber*, is to nestle, or make a Nest, as Birds of Prey do. See **NEST**.

*TIMBERS of Ermine*, in Heraldry, are the Ranks or Rows of Ermine in Nobleman's Coats. See **ERMINE**.

*TIMBRE*, or *TIMMER*, in Heraldry, the Crest of an Armoury; or whatever is placed a-top of the Escutcheon, to distinguish the Degree of Nobility, either Ecclesiastic or Secular. See **CREST**.

Such is the *Papal Tiara*, *Cardinals Hat*, the *Cross*, *Mitre*, *Coronet*, *Mortier*; and particularly the *Casks* or *Helmets*, which the Ancients call'd more especially *Timbres*, from their resembling a kind of Bell without a Clapper, which the French call *Timbres*; or because they're found'd like those *Timbres* when struck. This is the Opinion of *Loiseau*, who derives the Word from the Latin, *Tintinnabulum*. See **CASE**.

**TIME**, a Succession of Phenomena in the Universe; or a Mode of Duration, mark'd by certain Periods and Measures; chiefly by the Motion and Revolution of the Sun. See **MONE** and **DURATION**.

The Idea of *Time* in the General, Mr. *Lock* observes, we acquire by considering any Part of infinite Duration, as set out by periodical Measures: The Idea of any particular *Time* or Length of Duration, as a Day, an Hour, &c. we acquire first by observing certain Appearances at regular, and seemingly, equi-distant Periods.

Now, by being able to repeat those Lengths or Measures of *Time* as often as we will, we can imagine Duration, where nothing really endures or exists; and thus we imagine to *Morron*, next Year, &c.

Some of the later School Philosophers define *Time* to be the Duration of a Thing, whose Existence is neither without Beginning nor End; by which, *Time* is distinguish'd from *Eternity*. See **ETERNITY**.

*Aristotle* and the Peripateticks, define it *Numerus motus secundum prius & posterius*; or a Multitude of transient Parts of Motion, succeeding each other, in a continual Flux, in the relation of Priority and Posteriority.

Hence it should follow, that *Time* is Motion itself, or at least the Duration of Motion, consider'd as having several Parts, some whereof are continually succeeding to others: But on this Principle, *Time*, or temporal Duration, would not agree to Bodies at rest, which yet no Body will deny to exist in *Time*, or to endure for a *Time*.

To evade this Inconvenience, the *Epictoreans* and *Cartesians* made *Time* to be a sort of Flux, different from Motion, consisting of infinite Parts, continually and immediately succeeding each other, and this from Eternity to Eternity; but others directly explode this Notion, as establishing an Eternal Being, independent of God. For how should there be a Flux, before any thing exist'd to flow? And what should that Flux be, a Substance or an Accident?

*Time* may be distinguish'd like *Place*, into *Absolute* and *Relative*. See **PLACE**.

*Absolute TIME*, is *Time* consider'd in Itself, and without any relation to Bodies or their Motions. This flows equally, i. e. never proceeds either faster or slower; but glides on in a constant, equable Tenor.

*Relative or Apparent TIME*, is the sensible Measure of any Duration, by means of Motion. For since that equable Flux of *Time* does not effect our Senses, nor is any way immediately cognizable thereby; there is a Necessity for calling in the Help of some nearly equable Motion to be a sensible Measure, whereby we may determine its Quantity, by the Correspondency of the Parts of this, with those of that.

Hence, as we judge those *Times* to be equal, which pass while a moving Body, proceeding with an equable Velocity, passes over equal Spaces; so we judge those *Times* to be equal, which flow while the Sun, Moon and other Luminaries perform their Revolutions, which, to our Senses, are equal.

But since the Flux of *Time* cannot be accelerated, nor retarded; whereas all Bodies move sometimes faster and slower, and there is, perhaps, no perfectly equable Motion in all Nature: It appears hence to follow, that absolute *Time* should be something truly and really distinct from Motion. For let us suppose the Heavens and Stars to have remained without Motion from the very Creation; does it hence follow, that the Course of *Time* would have been at a Stand? Or, rather, would not the Duration of that Quiescent State be equal to the very *Time* now elapsed?

Since absolute *Time* is a Quantity uniformly extended, and in its own Nature most simple; it hence comes to be represented by Mathematicians, to the Imagination, under the most simple, sensible Magnitudes, and particularly right Lines and Circles, with which it bears a near Analogy, in respect of Genesis, Similarity, &c.

'Tis not, indeed, necessary, that *Time* should be measured by Motion; any constant periodical Appearance in seemingly equidistant Spaces, as the freezing of Water, the blowing of a Plant, &c. returning at set Periods, might do as well. In effect, Mr. *Lock* mentions an *American People*, who count their

their Years by the coming and going away of Birds. See PERIODS.

Some Authors distinguish *Time* into *Astronomical* and *Civil*.

*Astronomical Time*, is that taken purely from the Motion of the heavenly Bodies, without any other regards.

*Civil Time*, is the former *Time* accommodated to Civil Uses; and form'd and distinguish'd into *Years, Months, Days, &c.* See DAY, MONTH, WEEK, YEAR, &c.

In this Sense, *Time* is the Subject of Chronology. See CHRONOLOGY.

*Time*, in Music, is an Affection of Sound, whereby we denominate it *long* or *short*, with regard to its Continuity in the same Degree of Tune. See SOUND.

*Time* and *Tune* are the great Properties of Sound, on whose Difference, or Proportions, Music depends; Each has its several Charms; where the *Time*, or Duration of the Notes is equal, the Differences of *Tune* alone are capable to entertain us with endless Pleasure. See TUNE.

And of the Power of *Time* alone, i. e. of the Pleasures arising from the various Measures of long and short, swift and slow; we have an Instance in the *Drum*, which has no Difference of Notes, as to *Tune*. See DRUM, ACCENT, &c.

*Time*, in Music, is consider'd, either with respect to the absolute Duration of the Notes, i. e. the Duration consider'd in every Note by itself, and measured by some external Motion foreign to the Music; or in respect to which, the Composition is said to be *quick*, or *slow*: or it is consider'd, with respect to the relative Quantity or Proportion of the Notes compared with one another. See NOTE.

The Signs or Characters by which the *Time* of Notes is represented, are shewn under the Article, CHARACTERS in Music; where the Names, Proportions, &c. are also express'd.

A *Semi-breve*, for Instance, is mark'd to be equal to two Minims, a *Minim* to two Crotchets, a Crotchet to two Quavers, soon, and still in a duplicate Ratio, i. e. in the Ratio of 2 : 1. Now, where the Notes respect each other, thus, i. e. where they are in this Ratio; the Music is said to be in *Duple*, i. e. *double* or *common Time*.

When the several Notes are Triple each other, or in the Ratio 3 : 1; that is, when the *Semi-breve* is equal to three Minims, the *Minim* to three Crotchets, &c. the Music is said to be *triple Time*.

Now, to render this Part as simple as possible, the Proportions already shew'd among the Notes, are fix'd and invariable; and to express the Proportion of 3 : 1, a Point (.) is added on the right Side any Note, which is deem'd equivalent to Half of it; and by this means a pointed *Semi-breve* O becomes equal to three Minims, &c. so of the rest.

From hence arise several other Ratios constituting new Kinds of triple *Time*; as 2 : 3 and 3 : 4, &c. but these Mr. *Mallet* observes, are of no real Service, and are not perceived without a painful Attention. For the Proportions of the *Times* of Notes, to afford us Pleasure, must be such as are not difficultly perceived; on which account, the only Ratios fit for Music, besides that of Equality, are the *Double* and *Triple*.

*Common* or *duple Time*, is of two Species; the first, when every Measure is equal to a *Semi-breve*, or its Value in any Combination of Notes of a lesser Quantity.

The second, where every Bar is equal to a *Minim*, or its Value in lesser Notes. The Movements of this Kind of Measure are various; but there are Three common Distinctions; the first *slow*, signify'd at the beginning by the Mark C; the second *brisk*, signify'd by G; the third *very quick*, signify'd by D.

But what that *slow*, *brisk* and *quick* is, is very uncertain, and only to be learnt by Practice. The nearest Measure we know of, is to make a Quaver the Length of the Pulse of a good Watch; then, a Crotchet will be equal to two Pulses, a *Minim* to four, and the whole Measure of *Semi-breve* to eight. This may be repeat'd the Measure of *brisk Time*; for the *slow*, 'tis as long again, and the *quick*, only half as long.

The whole Measure, then, of common *Time*, is equal to a *Semi-breve* or a *Minim*: But these are variously sub-divided into Notes of less Quantities. See MEASURE.

Now to keep the *Times* equal, we make use of a Motion of the Hand or Foot, such as: Knowing the true *Time* of a Crotchet, we shall suppose the Measure or Bar actually sub-divided into four Crotchets for the first Species of common *Time*; then the Half Measure will be two Crotchets; therefore, the Hand or Foot being up, if we put it down with the very beginning of the first Note or Crotchet, and then raised with the Third; and then down to begin the next Measure; this is call'd *beating of Time*.

By Practice, we get a Habit of making this Motion very equal, and consequently of dividing the Measure or Bar into equal Parts, up and down; as also of taking all the Notes in the just Proportion, so as to begin and end them precisely with the beating. In the Measure of two Crotchets, we beat down the first, and the second up. Some call each Half of

the Measure in common *Time*, a *Time*; and so they call this the Mode or Measure of two *Times*, or the *Duple* Measure.

Again, some mark the Measure of two Crotchets with a 2 or 3, signifying it to be equal to two Notes, whereof four make a *Semi-breve*; and some mark it 4 for Quavers.

For *Triple Time*; see TRIPLE TIME.

*Time* in Fencing, There are three Kinds of *Time*; that of the Sword; that of the Foot, and that of the whole Body. All the *Times* that are perceived out of their Measure, are only to be consider'd as Appeals or Feints, to deceive and amuse the Enemy.

<p><i>Time</i> in Grammar  <i>Time</i> in Mechanics  <i>Periodical Time</i> in Astronomy  <i>Equation of Time</i></p>	}	See	{	<p>TENSE.              MOTION.              PERIOD.              EQUATION.</p>

*Time-keeper*, or *Time-Measure*. See CHRONOMETER.  
*TIN*, a whitish Metal, softer than Silver, yet much harder than Lead. See METAL.

The Chymists, &c. hold *Tin* an imperfect Metal, generated of two different Seeds, viz. that of Silver and that of Lead; which renders it a kind of Compound of both; and accordingly it is frequently found in Lead and Silver Mines.

*Tin*, however, has also its proper Mines, of which our Counties of *Cornwall* and *Devonshire* are an abundant Evidence: The greatest Part of the *Tin* consumed in *Europe*, is procured from thence; and *Cambden* even supposes this Abundance of *Tin* in those two Provinces, to have given the original Denomination *Britain* to the whole Country. In the *Syrian* and *Chaldee*, *Tin* is call'd *Bragmanac*; the Primitive whereof is *Bratman* or *Britman*, whence *Britain*.

The principal Characters or Properties of *Tin*, enumerated by *Boerhaave*, are, That it is the lightest of all Metals; very little ductile or elastic; the most fusible and volatile of all Metals; scarce dissoluble by Acids, unless the weaker Sorts; and easily and intimately miscible with other Metals, the Ductility whereof becomes diminish'd by such Mixture.

The same Author concludes, that Sulphur is a prevailing Ingredient in *Tin*, and deduces several of its particular Properties therefrom. He adds, that could the Metal be perfectly purged of this heterogeneous Sulphur, 'tis probable it would be found no other than Silver.

Several Authors had before noted a great Conformity, in divers Particulars, between the two Metals; as, that both grow bitter when dissolved by Acids; that when fused together, there is scarce any separating them again, nor even by Lead. Add, that Mr. *Boyle* and others, give us several Instances of Silver being actually procured in considerable Quantity from *Tin Ore*. See SILVER.

Yet some Naturalists judge the Analogy greater between *Tin* and Lead; and contend that *Tin* is only Lead, under a less Degree of Coction; but if there be some Marks of Agreement between them, there are as many of Disagreement. The Calx of Lead, for instance, easily fuses and vitrifies, but that of *Tin* not without the last Difficulty: If *Tin* and Lead be mix'd by a vehement Fire, a vehement Collocation ensues, and they both run into a Calx: Add, that *Tin* is easily revived; but Lead with great Labour. See LEAD.

The Method of getting, preparing, &c. the *Tin* in the *Cornish* Mines, much the best and most considerable in the World; is given us in the *Philosophical Transactions*.

The working of the *Tin*-Mines is very hard and difficult; not only by reason of the great Depth which the Veins descend to, even as low as 50 Fathoms; but also because the Rocks, through which Passages are frequently to be cut, are often so hard, that the Workmen can't dig a Four in a Week. Nor is the soft, shaking Earth found in the *Tin*-Mines, much less inconvenient to the Workmen; both by reason of staid, malignant Vapours it exhales, and of the Currents of Water often met withal therein: all these Disadvantages together render it impracticable for the Workmen to hold it above four Hours together.

The mineral Stones or Gleebe being dug and drawn out of the Mine, is there broke into Pieces with large Iron Mallets; then brought to a Stamping Mill, where 'tis still pounded smaller with Stammers, much like those of Paper Mills; and the Water passing through it washes away the earthy Parts, leaving the Metallic ones behind: The Lotion is repeated twice, to make the better Separation.

This done, they dry it in a Furnace on Iron Plates; and grind it very fine in a Grinding Mill; then wash it again; then dry it: In this State, the metallic Matter is call'd *Black*, or *Black Tin*.

To convert it into *Tin*, i. e. into *white Tin*, they carry it to a Furnace or blowing House; where, by means of a Charcoal Fire, kept up by huge Bellows work'd with the Water, it is melted; after it has pass'd all their Preparations, and is become cold, they forge it; which is the last Thing done to it in the Works.

The Drofs or Scoria scum'd off the *Zin* in Fusion, being melted down with fresh Ore, runs into Metal; and even the Causality, *i. e.* the Matter wash'd and separated from the Metal in the Mill, being thrown up in Heaps, after resting Six or Seven Years, they fetch it over again, and it yields as good *Zin* as any of that of *Germany*.

The Workmen distinguish several Kinds of *Zin*; as *Mass-Zin*, which is the best Sort, a Fool whereof, weighs 80 Pounds; and *Mine-Zin*, which is the next, a Fool thereof weighing about 52 or 50 Pounds. The *Zin* got from the soft, gravelly Earth, they call *Pryan Zin*, to distinguish it from that got from the Stones, which is better by almost Half.

Two Pounds of black *Zin*, when melted, yield about one of *White*.

There is a Curiosity in these *Cornish* Mines, which the Lover of Natural History will be pleas'd to hear; and 'tis this: That in digging, at the Depth of 40 or 50 Fathoms, they frequently meet with large Trees, still entire. See *SUBTERRANEANS*.

*Chirrey*, in his Natural History, goes back so far as the Deluge to place them there; but without having recourse to so great Antiquity, they who believe that the Mines, when exhausted of their Ore or Mineral Matter, renew and fill again in course of Time, will solve the Difficulty, by supposing, that in the first Working of these Mines, these Trees had been let down to serve as Props and Pillars. See *DELUGE*.

But there are other People who think this Renewal of the Mines itself a Difficulty as great as the former. However, what the former Author adds, *viz.* that in some Places in the Mines, they likewise find Pick-axes, &c. with wooden Shafts, as also brass Nails, and even a Medal of *Domitian*, seems to countenance the Opinion. See *MINE*.

The Chymists call *Zin*, *Jupiter*: But from what Analogy between the Metal and the Planet, we leave them to explain. See *JUPITER*.

By the Analyses made of this Metal, they hold it compounded of Earth, Sulphur, a metallic Salt, and Mercury.

The chief chymical Preparations from *Zin*, are Salt of *Zin*, Flower of *Zin*, and Diaphoretic of *Zin*.

Salt of *TIN*, or of *Jupiter*, is *Zin* calcin'd; and distill'd Vinegar pour'd thereon; from which, by means of Fire, and then of a cool Place wherein 'tis put, a very white Salt is drawn. See *SALT*.

Flower of *TIN*, is a kind of white Cosmetic, or Paint, for the Complexion; drawn with Sal Ammoniac, by means of Sublimation. See *FLOWER*.

Diaphoretic of *TIN*, is fine *Zin*, and Regulus of Antimony melted, first together, and then both with Salt-petre, Whence, after various Lotions, is drawn a Powder, held to be sovereign against various Diseases.

Cerufs of *TIN*, is a white Powder, procured from *Zin*, whereof a Fucus is made, call'd *Spanish White*.

This Cerufs is not made with Vinegar, as that of Lead is; but with the Urine of a young Person: The Powder is also used to colour Delft Ware.

Cake of *TIN*, is what we properly call *Besoardicum Joviale*. See *BESOARDICUM*.

*Tin* of Glass, is what we properly call *Bismuth*. See *BISMUTH*.

For the use of *Tin* in the Composition of Pewter; see *PEWTER*.

#### Method of Assaying *TIN*.

To find whether *Tin* be soft and ductile, or harsh and brittle; there are two Kinds of Assays; the First, is by putting the *Zin* in a hot, brass Mould, and there melting it. If the Metal be harsh, it will be taken out heavier than before; otherwise it will be lighter. The Second, is by casting the melted *Zin* into a little Mould, made of the Thunder-stone. This Mould has a little Canal of moderate Length, which conducts the Matter into a Cavity, capable of containing half a Billiard Ball: If the *Zin* be harsh, it appears whitish towards the Entry of the Mould, otherwise 'tis tinged superficially with a very faint, bluish Brown.

TINCTURE or *Essence*, in Pharmacy and Chymistry, a Separation of the finer and more volatile Parts of a mixt Body, made by means of a proper Menstruum dissolving the same. See *MENSTRUUM* and *DISSOLUTION*.

TINCTURE is particularly applied to the Extraction, or Separation of a Colour from a mixt, and the Impression it makes in a Liqueur, or Menstruum which takes away a Part of its parent Substanc, and by that means becomes a sharer in its Colour, Virtues, &c.

Thus in Pharmacy, we have Cephalic Tinctures, Antiscorbatic Tinctures, Stomachic Tinctures, Anticholic Tinctures, Invigorating Tinctures, &c.

Tinctures are drawn from Roses, from Corals, &c. See *EXTRACTION*.

To make a Tincture, the Matter is usually bruised, put in a Matriß, and the Menstruum, which commonly is

Spirit of Wine, pour'd on it, to the Height of two or three Fingers above it. Then the Glass is clos'd, and set for Digestion, in a Sand Heat during four or five Hours, till the Spirit is well impregnated, and has received a high Colour. See *DIGESTION*.

Thus are Tinctures of odoriferous Vegetables, as Cinnamon, &c. drawn; and the same Menstruum serves for those of Metals and Minerals.

The Tinctures of Metals, so much talk'd of by the Chymists and Alchymists, are not proper Tinctures; they are only Dissolutions, wherein the Metal is divided and attenuated to a greater Degree, than it is in its natural and ordinary Dissolvent.

If the Tincture were irreducible; that is, if the Metal were dissolv'd to such a Degree, as that it could not be brought back again into Metal; or, which comes to the same, if the Principles which compose it were dissipated, it would be what the Chymists have so long and so earnestly wish'd for, and fought with such infinite Pains, especially with regard to Gold; the Irresoluble Tincture whereof, is what should be call'd *Aurum Potabile*. See *GOLD*.

But no such Tincture has ever yet been discover'd: The Porable Gold in use among us, being only Gold extremely divided; and the Case is the same with the Tinctures of other Metals. See *METAL* and *MINERAL*.

The Intention of metalline Tinctures, is to rarify and extend the Sulphur of the Metal as much as possible; and so render the fix'd and earthy Parts, as subtle and volatile as may be: If they are designed to be of Use in Medicine, some harmless and agreeable Intermedium is to be used. See *STEEL*.

The Alchymists give the Name of *Grand Mineral Tincture* to the Philosophers Stone; from an Opinion, that all which is required to that Operation, is to give the Colour or Tincture of Gold to fix'd Mercury. See *PHILOSOPHERS Stone*.

Marble, Alabastr and Bones, receive Tinctures from Lixiviums, and sharp Juices; and Mr. *Boyle* thinks there is reason to hope the same may be done of precious Stones; Rock Crystal, 'tis certain, is tinged by Subterraneous Juices; so is Saphyr itself. See *STONE*.

In the Memoirs of the French Academy, mention is made of certain Liqueurs, *e. gr.* Salts drawn from Wheat, which will extract Tinctures, even out of some precious Stones. 'Tis added, they are the more capable of producing this Effect, as they give a greater Degree of Redness to the Solution of Vitriol.

TINCTURE is also applied by the Heralds, to the Colours in an Escutcheon, or Coat of Arms; under which may be likewise reduced the two Metals, *Or* and *Argent*, because often represented by Yellow and White. See *COLOUR* and *METAL*.

TINEA, in Medicine, a Disease call'd by the *Arabs* *Witres Sabafati*, and in *English* usually a *scall'd Head*.

The *Tinea* is a Disease of the Leprous Kind: Authors usually reckon three Species of it, *viz.* a *dry*, *moist*, and *lupinus*; which, in reality, are only so many Degrees of the same Disease. See *LUPINA*.

*Turner* defines it an Ulcer arising in the Heads of Children, from a vicious, corrosive, or saline Humour, which preying on the Cutaneous Glands, in Time destroys their Texture.

In the first Stage it is cover'd with white, dry, scurfy, or squamous Matter: In the second the subjacent Flesh appears granulated: And in the third it is ulcerous.

It has its Name *Tinea*, Moth, from the Similitude of the Holes eat by that Insect on Paper, &c.

The internal Remedies proper for the *Tinea*, are Mercurials, proper Cathartics, and Dietetics, or Edulcorants; and sometimes a Salivation, especially by Uncia, has been efficacious, after all other Methods have prov'd vain. The Externals are Fomentations made of Roots of *Oxyphasium*, *Birchwort*, *Horß-Radish*, *Warmwood*, &c. boil'd in Water and straw'd; to which are added, Spirits of Wine camphorated, &c. *Liniments* of Hogs Lard, white Precipitate Mercurial Ointments, with powder'd Brimstone; and sometimes Powder of *Roman* and white Vitriol, red Precipitate, &c.

TIN-Glass, a mineral Matter, white, smooth, and, as to Appearance, resembling *Zin*; but hard, sharp, brittle, and dispos'd into shining Scales, as it were Pieces of Glass, whence its Name. See *MINERAL*.

*Tin-Glass* is the same with what we otherwise call *Bismuth*. See *BISMUTH*.

TINNING, the covering or lining any thing with melted *Zin*, or with *Zin* reduc'd to a very fine Leaf.

Looking Glasses are foliated or *tin'd* with thin Tables of beaten *Zin*, the whole Bigness of the Glass; apply'd and fasten'd thereto by means of Quicksilver. See *FOLIATING* and *LOOKING-Glass*.

Kettles, Saucapans, and other Kitchen Utensils, are *tin'd* with melted *Zin*; and Locks, Bits, Spurs, &c. with Leaf *Zin* by Help of Fire.

The Plumbers use to *tin* or whiten their Sheets of Lead; in order to which they have a *tinning Furnace*, fill'd with live

live Coal, at the two Sides whereof two Men are plac'd, who hold up the Sheets over the Fire to heat; and the Tin-leaves being laid over them, as fast as the Sheets grow hot, and the Tin melts, they fix it on by rubbing and stretching it with Tow and Rosin. See PLUMBERY.

**TINNITUS Auris**, *Tingling of the Ear*, a Disease pretty frequent in the Ear, consisting in the Perception of a Sound which is not, or, at least, which is not external.

This Perception is occasion'd by the beating of an Artery in the Ear, by an Inflammation, or Abscess of the Tympanum or Labyrinth, by the Admission of foreign Bodies, by Commotions of the Cranium, Blows on the Ear, &c. Extraordinary and irregular Motions of the Animal Spirits are also found to occasion the *Tinnitus*, as we find in Deliriums, Phrenesies, Vertigos, &c. The Tingling of the Ear is one of the Diagnostic Signs of the Plague.

**TIPSTAVES**, or *Beffous*, are the Wardens of the Fleet's Officers, attending the King's Courts, with a painted Staff, for the taking into Custody such Persons as are committed by the Court; and to attend such Prisoners as go at large by Licence. See BASTON.

By this Name also are the Judges Officers call'd, who carry a Rod, or Staff, tip'd with Silver, and take Charge of such Prisoners, as are either committed or turn'd over at the Judge's Chambers. See VERGE.

**TIRE**, or, as the Seamen pronounce it, **TERR**, of Guns, is a Rank of Guns plac'd along upon a Ship's Side, either above upon Deck, or below; the former of which are call'd the *upper Tires*, the latter the *lower Tires*. See SHIP.

**TITANS**, in the ancient Mythology, the Sons of Uranus, or *Cælus*, and *Vesta*, i. e. of Heaven and Earth, according to *Hesiod* and *Apollodorus*; or, which comes to the same Thing, of *Aëther* and *Earth*, according to *Hygginus*.

*Apollodorus* reckons five *Titans*, *Oceanus*, *Cæus*, *Hyperion*, *Cronus*, and *Jupiter*; all elder Brothers of *Saturnus*; *Hygginus* reckons six, all, except *Hyperion*, different from the former; their Names, *Briareus*, *Gyges*, *Steropes*, *Atlas*, *Hyperion*, and *Probus*; but he seems to include the hundred-handed Giants in the Number, which *Apollodorus*, and the Generality of Mythologists, distinguish from the *Titans*.

*Cæus*, by the same Wife, *Vesta*, had *Briareus*, *Gyges*, and *Cæus*, the hundred-handed Giants, and had chain'd them up in *Tartarus*; *Vesta*, the Earth, their Mother, resenting this Treatment, rais'd the *Titans* against their Father, her Husband: All, excepting *Oceanus*, made War upon him, and dethron'd him, setting up *Saturnus* in his Place.

*Saturnus*, it seems, prov'd no more favourable to them than his Father; but continu'd the Giants in their Prison.

Upon this, *Jupiter* revolted against *Saturnus*; serving him as he had done *Cæus*; and rescu'd the three Giants; who afterwards prov'd of great Service to him in the War the *Titans* wag'd against him.

This War lasted ten Years; but at length the *Titans* were vanquish'd; *Jupiter* remain'd in peaceable Possession of Heaven, and the *Titans* were bury'd under huge Mountains thrown on their Heads.

*Hygginus* gives another Origin of the *Titans*: He derives 'em from *Titan*, *Saturnus*'s elder Brother, by *Cæus* and *Vesta*, who, tho' presumptive Heir of Heaven, yet finding his Father and Mother more inclin'd for *Saturnus* than him, surrender'd to him his Right of Succession, on Condition he should not bring up any Male Child, that the Empire of Heaven might revert to his own Issue the *Titans*.

But *Jupiter*, *Neptune*, and *Pluto* having been afterwards sav'd by the Artifice of *Ops*; *Titan* and his Sons, the *Titans*, made War on *Saturnus*, vanquish'd, and imprison'd him: Thus he continu'd in the Power of his Enemies, till *Jupiter* being grown up, made War on the *Titans*, and deliver'd his Father.

*F. Petron*, in his Antiquity of the *Celtæ*, makes them the same with the *Titans* in Mythology; and their Princes the same with the *Giants* in Scripture: He adds, that the Word *Titan* is perfectly *Celtic*, and derives it from *Tir*, Earth, and *Dev* or *Ten*, Men: And hence the *Greeks* call them very properly *Titanes*, q. d. *Terrigenæ*, Earth-born.

The Word *Titan* is also us'd by the Poets for the Sun; in which Case it is likewise *Celtic*; only of another Etyymology, being form'd from *ti*, Houle, or Habitation, and *tan*, Fire.

*Hesychius* observes, that the Word *Titan* is likewise us'd for *Sesamite*: He adds, further, that 'tis one of the Names of Antichrist; in which Sense it must be wrote *Taitan* in *Greek*, to contain the Numeral Letters of 666; which in the Apocalypse xiii. 18. is the Number of the Beast.

**TITE**, or **TIGHT**: The Seamen say a Ship is *tite*, when she is so staunch as to let in but very little Water. This is known by the Smell of the Water pump'd out; for if she let in little, it will always stink; otherwise not.

**TITHES**, or **TITHS**, *Tenth*, *Decime*, *Dixmes*, the tenth Part of all Fruits, both Prædial, Personal, and Mix'd; allotted to the Clergy for their Maintenance. See PARISH, CLERGY, &c.

Of *Tithes* there are three Kinds, viz. 1<sup>o</sup>. *Personal Tithes*; which are those due or accruing from the Profits of Labour; Art, Trade, Navigation, and Industry of Man. See PERSONAL.

2<sup>o</sup>. *Prædial Tithes*, which arise either from the Fruits of the Ground; as Corn, Hay, Underwood, Flax, Hemp, &c. or from the Fruits of Trees; as Apples, Pears, Plumbs, Cherries; or from the Fruits of Gardens. See PRÆDIAL.

3<sup>o</sup>. *Miscellaneous Tithes*, which are such as arise from BEASTS, and other Animals fed with the Fruits of the Earth; as Cattle, Milk, Wool, Lambs, Calves, Poultry, &c. See MIXT.

*Prædial Tithes*, again, are either great or small: The great *Tithes* are those of Corn, Hay, and Wood; small *Tithes* are those of Flax, &c. which are *prædial*; and those of Wool, Milk, Cattle, Lambs, Poultry, &c. which are *mix'd*. See PARSON, RECTOR, VICAR, &c.

The Custom of giving or paying *Tithe* is very ancient: In Gen. xiv. 2. *Abraham* gives *Abimelech* the Tenth of all the Spoils he had taken from the four Kings he had defeated: In Gen. xxviii. 22. *Jacob* makes a Vow at *Bethel*, to give the Tenth of all the Riches he shall gather in that Sojourn, to God.

But these *Tithes* were free and voluntary; and, beside, differ'd in divers other Respects from what was afterwards call'd *Tithes*: What *Melchisedech* receiv'd, was only the Tenth of the Spoils, not of *Abraham*'s Possessions; and this once, not annually; and beside, not as Maintenance, which *Melchisedech* wanted not, but as HUNTING: Add, that this was only from one Priest to another; for *Abraham* had not only a Priest in his Loins, but was a Priest himself. — And as to *Jacob*, who was also a Priest, what he did was the Effect of a Vow, voluntarily taken, to offer the Tenth of all he should possess; not to any other Priest, but to God himself upon an Altar.

*Tithe* was first legally enjoin'd by *Moses*, Exod. xii. Lev. xxvii. 30. Num. xviii. 21. Dent. xiv.

That Legislator oblig'd the *Israelites* to several Kinds of *Tithes*; as, 1<sup>o</sup>. The first *Tithe*, תרומת העומר, which was a *Tithe* of all the Fruits, given to the *Lewites*: This was not taken till after the Oblation call'd תרומת הברכה had been made. See LEVITE.

2<sup>o</sup>. The second *Tithe* was a tenth Part of the nine remaining after Payment of the first *Tithe*. This *Tithe* was set apart in each Family; and the Master of the Family was oblig'd to carry it to *Jerusalem*, and to spend it there; or, in Case he could not, he was to redeem it, or convert it into Money, in which Case he was to add a Fifth to it, and carry the Money to *Jerusalem*. The *Rabbins* say, that if he did not redeem it himself, that is, if he did not substitute his own Money in lieu of it, but sold it to another, he was only requir'd to carry the bare Price to *Jerusalem*, without any Addition.

3<sup>o</sup>. The *Tithe of the Tithe*, was the tenth Part of all the *Tithes* that had been given the *Lewites* by the People; for the *Lewites*, after they had got all their *Tithes* of the People, divided it into ten Parts; and in their Turn, gave a *Tithe* to the Priests.

This *Tithe* the *Rabbins* call תרומת התרומה, the Oblation of the *Tith*, or תרומת התרומה, *Tithe of Tithe*, or תרומת התרומה, the *Tithe* of sanctify'd Things. — And thus the *Lewites* were oblig'd to carry to the Temple; the rest was reserv'd for their own Subsistence.

4<sup>o</sup>. The *Tithe of the third Year*, was another Kind of *Tithe*, not much different from the second *Tithe*, excepting that it was less troublesome, by Reason they were not oblig'd to carry it to *Jerusalem*. Every seventh Year God appointed the Ground should lie and rest, nor should the Owners even gather the Fruits which it produc'd spontaneously: That Year, therefore, they paid no *Tithe*, but only the six preceding ones. See SABBATH.

Now, every third of these six Years, i. e. on the third, and the sixth, they rais'd, as usually, the first *Tithe*; and after that a second. — But this second they did not carry to *Jerusalem* either in Kind or in Money; but kept it by them to be spent by the *Lewites*, the Strangers, the Fatherless, and the Widows of the Place, Dent. xiv. 28, 29.

This was also call'd the *Tithe of the Poor*, and the third *Tithe*; and these third Years it was paid on, were call'd the *Tithe*-Years.

All these *Tithes* amounted to above one Sixth of the Revenue of each Person: For if, for Instance, a Master of a Family reap'd 6000 Measures of Wheat, and 100 were first taken away for the first Fruits or Oblation, he had only 5900 left: From this 5900, taking away the first *Tithe*, there remain'd 5310, the Tenth whereof is 531; which being taken, leaves 4779 for the Proprietor; who, consequently, has given 1121, viz. 121 more than a Sixth of the whole.

Of the 590 which the *Lewites* receiv'd for the first *Tithe*, 59 went to the Priest for the *Tithe of Tithes*; so that they were left 531 for their own Subsistence, and that of their Families.

These Matters are all further explain'd in the *Tithmas*, wherein there are two Books of *Tithes*, the Book of Benedictions, טבחה, in the Commentaries of *Barremra*, *Maimonides*, R. *Scholomah Jarchi*, in *Sealiger*, *Amama*, *Selden*, *Frischewich*, *Quenstedt*, *Varenius*, *Hortinger*, *Sigainis*, *Caneus*, *Goodwin*, *Leidecker*, &c.

Under the new Law, 'tis not Jesus Christ that establish'd *Tithes*, as 'twas God himself did it under the old Law by the Ministry of *Moses*: The Christian Priests, and the Ministers of the Altar of the new Covenant, liv'd, at first, wholly of the Alms and Oblations of the Devout. See OBLATIONS, &c.

In after Times the Laity gave a certain Portion of their Revenues to the Clergy, but voluntarily, and not out of any Constraint or Obligation: The first Instances we have of it, are in the IVth and Vth Centuries.

This Gift was call'd *Tithe*; not that it was really a tenth Part of their Income, or near so much; but only in Imitation of the *Tithes* of the old Law.

In the following Age, the Prelates in their Councils, in Concert with the Princes, made an express Law to the Purpose; and oblig'd the Laity to give a full tenth Part of their Revenues, their Fruits, &c. to the Ecclesiasticks.

This the Church enjoy'd without Disturbance for two or three Centuries; but in the VIIIth Century the Laity got hold of Part of these *Tithes*, either by their own Authority, or by Grants and Donations of the Princes; and appropriated them to their own Uses. See APPROPRIATION.

Some time afterwards they restor'd them, or apply'd them to the founding of Monasteries or Chapters; and the Church consented, at least tacitly, to this Restitution.

In 1179, the third Council of *Lateran*, held under *Alexander III.* commanded the Laymen to restore all the *Tithes* they yet held, to the Church.

In 1215, the fourth Council of *Lateran*, held under *Innocent III.* moderated the Matter a little; and, without saying any thing of the *Tithes* which the Laity already possess'd, forbade them to appropriate or take any more for the future.

*Fra. Paolo*, in his Treatise *de materia Beneficentia*, is of Opinion, that the Custom of paying *Tithes* under the new Law, began in *France*; and affirms, that there are no Instances of it before the VIIIth and IXth Centuries: But he must be mistaken; for in the 2d Council of *Marisbon*, held in 585, 'tis said expressly, that the Christians had a long Time kept inviolate that Law of God, whereby *Tithe* of all their Fruits was enjoy'd to be given to holy Places, &c.

In effect, *Origen*, *Hom. XI.* on *Numb.* thinks, that the old Laws of *Moses*, touching the first Fruits and *Tithes*, both of Cattle, and of the Fruits of the Earth, are not abrogated by the Gospel; but ought to be observ'd on their ancient footing. The Vth Canon of the Council of *Macon*, orders *Tithe* to be paid to the Ministers of the Church according to the Law of God, and the immemorial Custom of the Christians, and that upon Penalty of Excommunication; which is the first Penalty we find impos'd on such as would not pay *Tithe*.

On these Grounds it is that many among the modern Clergy hold their *Tithes* to be *Jure Divino*.

Others, on the contrary, plead, that the Recompence to be given Church Ministers, is differently ordain'd by God, according to the Differences he has put between his two great Dispensations, the Law and the Gospel: Under the Law he gave them *Tithes*, under the Gospel, having left all Things in his Church to Charity, and Christian Freedom, he has given them only what shall be given them freely, and in Charity: That the Law of *Tithes* is in Force under the Gospel, all the Protestant Divines, except some among the *English*, deny; for tho' Hire to the Labourer be of moral and perpetual Right, yet the special Kind of Hire, the Tenth, can be of no Right or Necessity, but to the special Labour for which God ordain'd it: That special Labour was the Levitical and Ceremonial Service of the Tabernacle, *Numb. xviii. 21, 31.* which was abolish'd; and the Right therefore of the special Hire must be abolish'd too.

That *Tithes* were Ceremonial, is evident from their not being given to the *Levites* till they had been first offer'd as a Heave Offering to the Lord, *v. 24, 28.*

He, then, who by the Law brings *Tithes* into the Gospel, brings in likewise a Sacrifice and an Altar; without which, *Tithes*, by the Law, were unanctify'd and polluted, *v. 32.* And therefore were never thought of in the first Christian Times, till Ceremonial Altars and Oblations had been brought back.

The Jews themselves, ever since their Temple was destroy'd, tho' they have Rabbies and Teachers of the Law, yet pay no *Tithes*, as having no proper *Levites* to whom, nor Altar whereupon, to hallow them; which argues, that the Jews themselves never look'd on *Tithes* as Moral, but merely Ceremonial. Add, that *Tithes* were not allow'd to the Priests and *Levites* merely for their Labours in the Tabernacle; but in Consideration of this likewise, that they

were not allow'd to have any other Part or Inheritance in the Land, *v. 20, 24.* and who, by that Means, for a Tenth, lost a Twelfth.

In effect, for the first three hundred Years after Christ, no mention is made in all Ecclesiastical History of any such Thing as *Tithes*; tho', in that Time, Altars and Oblations had been recall'd, and the Church had miserably Judaized in many other Things. The Churchmen confess'dly liv'd all that Time on Free will Offerings; nor could the Defect of paying *Tithes* be owing to this, that there were wanting Civil Magistrates to injoin it, since Christians, having Lands, might have given out of them what they pleas'd, and the first Christian Emperors, who did all Things by Advice of the Bishops, supply'd what was wanting to the Clergy, not out of *Tithes*, which were never propos'd, but out of their own Imperial Revenues.

The first Authority produc'd, setting aside the Apostolical Constitutions, which few of the Patrons of *Tithes* will insist on, is a Provincial Synod at *Chalce* in 356, where *Tithes* are voted to be God's Rent: But before that Time, divers other Abuses and Complaints had got ground, as Altars, Candles at Noon, &c. And one Complaint begot another; as 'tis certain that *Tithes* suppose Altars.

'Tis alleg'd, that *Tithes* are of early and solemn Force among us; having been paid by Statute ever since the *Saxons* King *Abelstan*, An 928: To which it may be said, that *Rome-See*, or *Peter Pence*, had been likewise paid to the Pope by Statute above 200 Years longer, *viz.* from the Year 725. And by the Way it is to be noted, that these ancient *Tithes* among our Ancestors, kept a nearer Analogy to their Original in the Mosaic Law; for the Priests had but a third Part, the other two Thirds being appointed for the Poor, and to adorn and repair the Churches, as appears from the Canon *Eber* and *Elfric*.

The Custom of paying *Tithe*, or of offering a Tenth of what a Man enjoys, or of what he reaps from it, has not only been practis'd under the old and the new Law, but we also find something like it among the Heathens.

*Xenophon*, in the 5th Book of the Expedition of *Cyrus*, gives us an Inscription upon a Column near the Temple of *Diana*, whereby the People were warn'd to offer the tenth Part of their Revenues every Year to the Goddess.

*Paulinus*, lib. 5, and *Dionysius Siculus*, *Biblioth. Hist.* lib. 11, tell us, that a Tenth of the Spoils were offer'd to the Gods. And *Festus de Verb. signif.* assures us, that the Ancients us'd to give *Tithes* of every thing to their Gods: *Adicima quoque veteris Diis suis offerebant.*

Impropriated and Appropriated *TITHES*, call'd also *Issoff's Tithes*, are those alienated to some Temporal or Ecclesiastical Lord, united to their Fee, and possess'd as secular Goods. See IMPROPRIATION.

By the Council of *Lateran*, held under *Alexander III.* in 1179, the Alienation or Intodation of *Tithes* is prohibited for the future: Whence all Intodations made since that Time are generally held by the Canonists illegal.

Some attribute the Original of these impropriated *Tithes* to *Charles Martel*; and hold him damn'd for first giving the Revenues of Benefices to secular Nobles: But *Baronius* will have this a Fable, and refers their Origin to the Wars in the Holy Land; which is also the Opinion of *Pasquier*.

The Tribute, it seems, which the *Romans* impos'd on all the Provinces of their Empire, was a tenth Part of all the Fruits: Hence several Authors observe, that the *Franks* having conquer'd the *Gauls*, and finding the Imposition establish'd, they kept it on Foot, and gave those *Tithes* in Fee to their Soldiers: And this, say they, was the Origin of inteff'd, or impropriated and appropriated *Tithes*. See FEE and BENEFICE.

But the Truth is, they are not so ancient; nor do we find any mention of them before the Reign of *Hugh Capet*; even the very Council of *Clermont*, held in 1097, as hot as it was in the Interests of the Church, does not say one Word of them; which yet would undoubtedly have made loud Complaints of such an Usurpation, had it been then known.

The *Tithes* of Grounds newly broke up and cultivated, are call'd *Decime Novales*, and always belong to the Vicar, as well as the small *Tithes*. The Novelty is confin'd to forty Years before the Demand. See VICAR.

TITHING, from the *Saxons*, *Teebings*, Decury, a Number or Company of Ten Men, with their Families; knit together in a kind of Society, and all bound to the King, for the peaceable Behaviour of each other. See DECURIA.

Of these Companies there was one chief Person, who from his Office was call'd *Teebingsman*; and at this Day in the West *Tithingmen*, tho' now no more than a Constable; is the old Custom of Tenmentals, or *Tithings*, being long since diffus'd. See CHIEF-PLEDGE, FRANK-PLEDGE, DECURNER, TRITHING, TENMENTALE.

TITILLATION, the Act of *Ticling*, i. e. of exciting a sort of pleasurable Idea, by a gentle Application of some soft

Body, upon a nervous Part; and which usually tends to produce Laughter. See LAUGHTER.

The Word is *Latin*, *Titillatio*, signifying the same Thing, *TITLE*, *Titulus*, an Inscription put over any thing, to make it known. See INSCRIPTION.

The Word is particularly used for that in the first Page of a Book, containing the Subject thereof, the Author's Name, &c.

What tortures abundance of Authors, is to find specious *Titles* for their Books: A *Title* should be simple, and yet clear: These are the two genuine Characters of this kind of Composition. Assuming *Titles* are a Prevention against the Author.

The *French* are much addicted to Fanfaronnades in their *Titles*; Witness that of *M. le Pay's Amities, Amours, Amourettes*; or that Improvement hereon, *Fleurs, Fleurons, Fleurettes*, &c.

*TITLE*, *Titulus*, in the Civil and Canon Law, is a Chapter or Division of a Book. See CHAPTER, &c.

A *Title* is subdivided into Paragraphs, &c. See PARAGRAPH, &c.

Each of the 50 Books of the Digest consists of a Number of *Titles*; some of more, others of less. See DIGEST.

*TITLE* is also an Appellation of Dignity, Distinction or Pre-eminence; given to Persons possess'd of the same. See DIGNITY.

The *Titles* of Order or Dignity, *Loysius* observes, should always come immediately after the Name, and before the *Titles* of Office.

The King of *Spain* has a whole Page of *Titles*, to express the several Kingdoms, and Signories he is Master of. The King of *England* takes the *Title* of *King of Great Britain, France and Ireland*: The King of *France*, the *Title* of *King of France and Navarre*: The King of *Sweden* entitles himself *King of the Swedes and Goths*: The King of *Denmark*, *King of Denmark and Norway*: The King of *Serania*, among his *Titles*, takes that of *King of Cyprus and Jerusalem*: The Duke of *Lorraine*, the *Title* of *King of Jerusalem, Sicily*, &c. See KING, &c. See also the following Article.

The Cardinals take a *Title* from that of some Church in *Rome*; as of *St. Cecilia, St. Sabina*, &c. and they are call'd Cardinals of the *Title* of *St. Cecilia*, &c. See CARDINAL.

The Emperor can confer the *Title* of *Prince or Count* of the Empire; but the Right of Suffrage in Assemblies of the Empire, depends on the Consent of the Electors. See EMPIRE.

The *Romans* gave their *Strippo's* the *Titles* of *Africanus, Asiaticus*, &c. and to others, they gave those of *Macedonianus, Numidicus, Creticus, Particus, Daciicus*, &c. in Memory of the Victories obtained over the People so call'd. The King of *Spain*, after the like manner, gives honourable *Titles* to his Cities, in Recompence for their Services, or their Fidelity.

*TITLE* is also a certain Quality ascribed in way of Respect to certain Princes, &c. See QUALITY.

The Pope has the *Title* of *Holiness*; a Cardinal Prince of the Blood, that of *Royal Highness* or *Most Serene Highness*, according to his Nearness to the Throne; other Cardinal Princes, *Most Eminent Highness*; an Archbishop, *Grace*, and *Most Reverend*, a Bishop, *Right Reverend*; Abbots, Priests, Religious, &c. *Reverend*. See HOLINESS, EMINENCE, GRACE, REVERENCE, &c. See also POPE, CARDINAL, &c.

As to secular Powers, to the Emperor is given the *Title* of *Imperial Majesty*; to Kings, *Majesty*; to the King of *France*, *Most Christian Majesty*; to the King of *Spain*, *Catholic Majesty*: The *Italians* give the King of *Poland* that of *Orthodox Majesty*; to the King of *England*, is given *Defender of the Faith*; to the *Turk*, *Grand Signior*, and *Highness*; to the Prince of *Wales*, *Royal Highness*; to the Dauphin of *France*, *Serene Highness*; to Electors, *Electoral Highness*; to the Grand Duke, *Most Serene Highness*; to the other Princes of *Italy and Germany*, *Highness*; to the Doge of *Venice*, *Most Serene Prince*; to the Republic or Senate of *Venice*, *Signory*; to the Grand Master of *Malta*, *Eminence*; to Nuncios and Embassadors of Crown'd Heads, *Excellency*. See EMPEROR, KING, PRINCE, DUKE, &c. See also HIGHNESS, SERENITY, EMINENCE, EXCELLENCY, &c.

The Emperor of *China* among his *Titles*, takes that of *Tien su*, Son of Heaven.

The Orientals are exceedingly fond of a Number of *Titles*: The simple Governor of *Schiras*, for Instance, after a pompous Enumeration of Qualities, Lordships, &c. adds the *Titles* of *Flower of Courtesy*; *Nourger of Consolation*, and *Relief of Delight*.

*TITLE*, in Law, is a Right which a Person has to the Possession of any thing. See RIGHT.

It is also an authentic Instrument, whereby he can prove, and make appear his Right.

A Prescription of Twenty Years, with a *Title*, is good; and of Thirty without a *Title*. See PRESCRIPTION.

There must be at least a colour'd *Title*, to come into Possession of a Benefice; otherwise the Person is deem'd an Intruder. See BENEFICE.

*TITLE*, in the Canon Law, is that by Virtue whereof a Beneficiary holds a Benefice; such is a Collation of an Ordinary, or a Provision in the Court of *Rome* founded on a Resignation, Permutation or other legal Cause.

The *Title* of a Benefice, or Beneficiary, is either a *True* or a *Colourable* one: A *True* or *Valid Title*, is that which gives a Right to the Benefice; such is that given by a Collator who has a Right to confer the Benefice to a Person capable thereof, the usual Solemnities being observ'd. See COL-LATOR, &c.

A colourable *Title* is an apparent one, i. e. such a one as appears Valid, and is not. Such would that be founded on the Collation of a Bishop, in Case the Benefice in Question were not in his Collation.

By the Canons, a colourable *Title*, though false, produces two very considerable Effects. 1<sup>o</sup> That after peaceable Possession of three Years, the Incumbent may defend himself by the Rule of *Triennali Possessione*, against such as would displace the Benefice with him. 2<sup>o</sup> That in Case he be prosecuted within three Years, and obliged to surrender the Benefice; he shall not be obliged to restore the Fruits.

*TITLE* is also used in several ancient Synods and Councils, for the Church to which a Priest was ordained, and where he was constantly to reside. *Nullus in Presbyterium, nullus in Diaconum, nisi ad certum Titulum Ordinetur. Concil. Laudov. An. 1125.*

There are many Reasons why a Church might be call'd *Titular*, *Title*; the most probable, *Conrad* takes to be this, That in ancient Days, the Name of the Saint, to whom the Church was dedicated, was engraven on the Porch, as a Token that the Saint had a *Title* to that Church; whence the Church itself became afterwards call'd *Titular*. See CLERICAL *TITLE*.

*TITLES*, or *Titular Churches*, *M. Fleury* observes, were formerly a particular Kind of Churches at *Rome*. See CHURCH.

In the VI. and VII. Centuries, there were four Sorts of Churches in that Metropolis, viz. *Patriarchal, Titular, Diaconal* and *Oratorial*.

The *Tituli, Titular*, were, as it were, Parishes, each assigned to a Cardinal Priest, with a certain District or Quarter depending thereon, and a Font for the Administration of Baptism, in Case of Necessity. See QUARTER, CARDINAL, &c.

*Clerical* or *Sacerdotal TITLE*, is a yearly Revenue or Income, of the Value of 50 Crowns, which the Candidates for Priesthood were anciently obliged to have of their own; that they might be assured of a Subsistence. See ORDINATION, &c.

By the ancient Discipline, there were no Clerks made, but in Proportion as they were wanted for the Service of the Church; which is still observ'd with regard to Bishops; none being consecrated, but to fill some vacant See. See BISHOP, PRIEST, &c.

But, for Priests, and other Clerks, they began to make vague Ordinations in the *East*, as early as the Vth Century: This occasion'd the Council of *Chalcedon* to declare all vague and absolute Ordinations null.

Accordingly, the Discipline was pretty well observ'd, till towards the End of the XIth Century; but then it began to relax, and the Number of Priests was exceedingly increased; either because the People became desirous of the Privileges of the Clericacy; or because the Bishops fought to extend their Jurisdiction.

One of the great Inconveniences of these vague Ordinations, was Poverty, which frequently reduced the Priests to sordid Occupations, and even to a shameful Begging. To remedy this, the Council of the *Lateran*, laid it on the Bishops, to provide for the Subsistence of such as they should Ordain without *Title*, till such time as they had got a Place in the Church, that would afford them a settled Maintenance.

There was also another Expedient found out to elude the Canon of the Council of *Chalcedon*; and it was appointed, that a Priest might be ordained on the *Title* of his Patrimony: That is, it was not necessary he had any certain Place in the Church, provided he had a Patrimony sufficient for a creditable Subsistence.

The Council of *Trent* retriev'd the ancient Discipline in this respect; forbidding all Ordinations, where the Candidate was not in peaceable Possession of a Benefice sufficient to subsist him; and allowing no Body to be ordained on Patrimony or Pension, unless where the Bishops declare it to be expedient for the Good of the Church: So that the Benefice is the Rule, and the Patrimony the Exception.

But this Rule is not regard'd, even in some Catholic Countries, particularly *France*, where the Patrimonial *Title* is the most frequent; and the *Title* is even fix'd to a very moderate Sum; as 3*l.* 15*s.* *per Annum Sterling*. Indeed at *Paris*, and in some other Dioceses 150 Livres are required.

As to Religious, the Profession they make in a Monastery serves them for a *Title*; in regard the Convent is oblig'd to maintain

maintain them. And as to Mendicants, they are ordained upon the *Title of Poverty*.

Those of the House, and Society of the *Sorbome*, are also ordained without any *Patrimonial Title*, and on the sole *Title of Poverty*; it being supposed a Doctor of the *Sorbome* can never want a Benefice. See *SORBOME*.

**TITUBATION, or TREPIDATION**, in Astronomy, a kind of Libration or Shaking, which the ancient Astronomers attributed to the Crystallin Heaven; to account for certain Inequalities, which they observed in the Motion of the Planets. See *TREPIDATION*.

**TITULAR or TITULARY**, a Person invested with a Title, in Virtue whereof he holds an Office, or Benefice; whether he perform the Functions thereof or not. See *OFFICE* and *BENEFICE*.

An Officer is always reputed *Titular*, till he have resigned his Office, and the Resignation have been admitted.

In this Sense, the Term is used in Opposition to *Steward*, and to a Person only acting by Procuration or Commission. See *PROCURATOR*, &c.

**TITULAR** is sometimes also applied adjectively, to a Person who has the Title and Right of an Office or Dignity; but without having Possession, or discharging the Function thereof.

It is sometimes also used, abusively, for a Person who assumes and pretends a Title to a Thing, without either a Right thereto, or a Possession thereof.

**TIMESIS**, in Grammar, a Figure whereby a compound Word is separated into two Parts; and one or more Words interposed between them.

Thus, when Terence says, *Que uno conque animo libitum est facere*, there is a *Timesis* in the Word *quacunq;* being divided by the Interposition of *uno*.

*Lucretius* abounds in *Timesis*; as *Sepe saluatum tacite preterque meantur*: Or, *Dissidio potis est sejungere sequogari*; and, *Dissidius diligit gregatius*.

The Word is form'd from the Greek, *τιμησι*, I cut.

**TOBACCO** or **TABACCO**, a Medicinal Herb, not known in Europe till after the Discovery of *America* by the *Spaniards*; and first Imported about the Year 1560.

The *Americans* of the Continent call'd it *Petma*; those of the Islands, *Tob*. The *Spaniards*, who gave it the Name *Tobacco*, took it from *Tobacco*, a Province of *Jacatan*, where they first found it, and first learnt its Use.

The *French*, at its first Introduction among them, gave it various Names; as *Nicotian*, or the *Embassador's Herb*, from *John Nicot*, then Embassador of *France* II. in *Portugal*, who brought some of it with him from *Lisbon*, and presented it to a Grand Prior of the House of *Lorraine*, and to *Queen Catherine de Medicis*; whence it was also call'd *Queen's Herb* and *Grand Prior's Herb*.

They also gave it other Names; which are now all reduced to the original Name *Tobacco*, or *Tobacco*, for *Tobacco*, given it by *Hernandez de Toledo*; who first sent it into *Spain* and *Portugal*.

#### Culture and Preparation of TOBACCO.

*Tobacco* is cultivated in several Parts of *America*; particularly in the *Caribee Islands*, *Virginia*, &c. where they are forced to mix Ashes with the Soil, to prevent its rising too thick.

After sowing, they water it every Day, and on very hot Days cover it up to prevent its being scorched by the Sun.

When 'tis risen to a convenient Pitch, they transplant it, much as we do Lettice, only at a Distance of three Feet, and in a Soil prepared with great Care: When re-planted, 'tis kept continually Weeding; the Stems frequently cleans'd; and the lowest Leaves and the Suckers it puts forth, taken off, that Ten or Fifteen of the finest Leaves may have all the Nourishment.

The Leaves thus reserved being ripe, which is known by their breaking when bent; the Stalks are cut, and left to dry two or three Hours in the Sun; after which they are tied two by two, and hang up on Ropes under a Shed to be dried by the Air.

When the Leaves are sufficiently dried, they are pull'd from off the Stalks, and made up in little Bundles; which being steep'd in Sea-water, or for want thereof, in common Water, are twisted, in manner of Ropes; and the Twists form'd into Rolls, by winding them with a kind of Mill round a Stick.

In this Condition 'tis imported into *Europe*, where 'tis cut by the *Tobaccoists*, for Smoking; form'd into Snuff, and the like.

Besides the *Tobacco* of the *West-Indies*, there are considerable Quantities cultivated in the *Levant*, the Coasts of *Greece* and the *Archipelago*, the Island of *Malta* and *Italy*. The Marks of good Twist *Tobacco*, are a fine shining Cut, an agreeable Smell; and that it have been well kept.

*Tobacco* is either taken by way of Snuff, as a *Sternutatory*; or as a *Masticatory* by chewing it in the Mouth; or by

smoking it in a Pipe. See *PIPE*, *STERNUTATORY*, *MASTICATORY*, *FUMIGATION*, &c.

'Tis sometimes also taken in little longish Pellets put up the Nose, where 'tis found to produce very good Effects, to attract a deal of Water or Pituita, unload the Head, resolve Catarrhs, and make a free Respiration; for the subtile Parts of the *Tobacco* in Inspiration, are carried into the Tracheas and Lungs, where they loosen the peccant Humours adhering thereto, and promote Expectoration.

Some have left this *Tobacco* in their Noses all Night; but this is found to occasion Vomiting the morrow Morning. Another thing charged on this Way of Application, is, that it weakens the Sight.

*Tobacco* is held a first rate Narcotic. See *OPiate*. When taken in great Quantities in the way of Snuff, 'tis found to prejudice the Smelling, greatly diminishes the Appetite, and in time gives rise to a Phthisis.

That taken in the way of Smoak, dries and damages the Brain. *Borbeus* in a Letter to *Barboline*, mentions a Person, who through Excess of Smoking had dried his Brain to that degree, that after his Death, there was nothing found in his Head but a little black Lump, consisting of mere Membranes.

Some People use the Infusion of *Tobacco* as an Emetic; but 'tis a very dangerous and unjustifiable Practice, and often produces violent Vomiting, Sickness and Stupidity.

*Bates* and *Fuller* give some Receipts, in which *Tobacco* is an Ingredient with mighty Encomiums in Asthmatic Cases.

A strong Decoction of *Tobacco*, with proper Carminatives and Catharticks, given Clyster-wise, sometimes proves of good Effect in what is usually call'd the *Stomachic*; and also in the *Iliaic Passion*. See *COLIC* and *ILIAIC Passion*.

A Drop or two of the Chymical Oil of *Tobacco* being put on the Tongue of a Cat produces violent Convulsions, and Death itself in the Space of a Minute; yet the same Oil used in Linc, and applied to the Teeth, has been a Service in the Tooth-ach; though it must be to those that have been used to the taking of *Tobacco*, otherwise great Sickness, Reachings, Vomiting, &c. happens; and even in no Case is the internal Use of it warranted by ordinary Practice.

A strong Decoction of the Stalks, with sharp pointed Dock and Ailom, is said to be of good Service, used externally, in Cutaneous Distempers, especially the Itch. Some boil them for that Purpose in Urine. The same is said to be infallible in curing the Mange in Dogs.

*Sig. Paulli*, Physician of the King of *Denmark*, in an express Treatise on *Tobacco*, observes that the Merchants frequently lay it in Hog-houses, to the End that becoming impregnated with the volatile Salt of the Excrements, it may be rendered the brisker, more fetid and stronger.

*Anurath* IV. Emperor of the *Turks*; the Grand Duke of *Muscovy*, and the Emperor of *Persia* have prohibited the Use of *Tobacco* in their States. Our King *James I.* wrote a Treatise against *Tobacco*, entitled a *Counterblast to Tobacco*. By a Bull of Pope *Urban VIII.* such are excommunicated, as take *Tobacco* in Churches.

**TOD of Wool**; is mention'd in 12 Cor. c. 23. as a Weight, containing 28 Pounds and two Ounces. See *WOOL*.

It is derived from the *French*, *Toules*, a Wrapper, within which, by Usage, two Stone of Wool is folded.

**TOES**, by Anatomists, call'd *Digiti pedis*, are the extreme Divisions of the Feet, answering to the Fingers of the Hand. See *FOOT*.

The *Toes* of each Foot consist of 14 Bones; the great *Toe* having two, and the rest three each. They are like the Bones of the Fingers, but shorter. See *FINGER*.

In the *Toes* are found, twelve Ossæ Sclerimoidæa as in the Fingers. See *SCLERIMOIDÆA*.

The Gour chiefly seizes the great *Toe*. See *GOUR*.

**TOFT**, **TOFTUM** or **TOFTA**, in our Law-books, a Parcel of Land, or a Place where a Messuage hath flood, but is decay'd or casually burnt, and not re-edified.

**TOGA**, in Antiquity, a large woollen Gown or Mantle, without Sleeves, used among the *Romans*, both by Men and Women.

In process of Time, none wore the *Toga* but lewd Women, whence that of *Horace*.

*In Matronis, peccasse togata.*

The *Toga* was of divers Colours, and admitted of various Ornaments: There was that call'd *Toga Domestica*, worn within Doors; *Toga Forensis*, worn Abroad; *Toga Militaris*, used by Soldiers, tucked up after the *Gabinian* Fashion; and *Toga Picta*, or *Triumphantis*, wherein the Victorious triumphed, embroidered with Palms; that without any Ornament, was call'd *Toga Pura*.

The *Toga* was sometimes wore open, call'd *Aperta*: Sometimes girt or tucked up, call'd *Præclata*; And this Circumference or Girding again, according to *Symonius*, was of three Kinds: *Laxior*, or the loose Kind, where the Tail trailed on the Ground; *Strictior*, the close Kind, wherein it did not reach

so low as the Feet; and *Gabinia*, where one of the Skirts or Lappets was girt round the Body.

*Saginus* distinguishes the *Togæ* or *Roman* Gowns into *Pura*, *Candida*, *Palla*, *Pileæ*, *Prætexta*, *Trabea* and *Pallidamentum*. See *PÆRTEXTA*, *PALUDAMENTUM*, &c.

The *Togæ Pura* was also call'd *Virilis*. See *Virile*.

The *Togæ Togæ*, or Right of the *Togæ*, was the same with the Right of a Roman Citizen, i. e. the Right of wearing a Roman Habit, of taking, as they explain'd it, Fire and Water through the Roman Empire. See *CITIZEN*.

**TOILES**, are Snare or Nets set by Hunters for catching of wild Beasts.

**TOILET**, a fine Cloth, of Linnen, Silk, or Tapistry, spread over the Table in a Bed-chamber or Dressing Room, to undress and dress upon.

The Dressing-Box, wherein are kept the Paints, Pomatums, Effences, Patches, &c. the Pin-cushion, Powder-Box, Brushes, &c. are esteem'd Parts of the Equipage of the Ladies *Toilet*.

That of the Men, consists of a Comb-Case, Brushes, &c. To make a Visit to one at his *Toilet*, is to come to enquire him while he is dressing or undressing.

Satin, Velvet, Brocade, Point de France, &c. are now ordinarily us'd for *Toilets*; and formerly they were much plainer; whence the Name, which is form'd from the *French, Toilette*, a Diminutive of *Toile*, any thin Stuff.

**TOISE**, a French Measure, containing six of their Feet, or a Fathom. See *PAYNOM*; see also *MEASURE*.

**TOISON d'OR** is a Term in Heraldry for a Golden Fleece, which is sometimes borne in a Coat of Arms. See *GOLDEN FLEECE*.

**TOL-BOOTH**, or **TOLL-BOOTH**, a Place in a City where Goods are weigh'd, to ascertain the Duties or Imports thereon.

**TOLERATION**, in Religion, a Term which has made a great Figure in the Disputes among the Protestants; who have been exceedingly divided about the Measures of *Toleration*, or the Degrees to which Hereticks and Schismatics are, or are not, to be suffer'd.

All who have reason'd consistently from the Principles of the Reformation, have been for *Toleration*; as well perceiving they had no Right to oblige any body to follow their particular Sentiments; but the Difficulty was, the setting Bounds to this *Toleration*.

M. *Bafigne*, and some others, distinguish *Civil Toleration* from *Ecclesiastical*. The latter allows of different, and even opposite Sentiments in the Church; and the first permits them in Civil Society.

By *Civil Toleration*, is meant Impunity and Safety in the State, for every Sect which does not maintain any Doctrine inconsistent with the Peace and Welfare of the State. This *Civil or Political Toleration*, implies a Right of enjoying the Benefit of the Laws, and of all the Privileges of the Society, without any Regard to Difference of Religion.

*Ecclesiastical Toleration*, is an Allowance of certain Opinions, which not being Fundamentals, don't hinder those who profess them from being esteem'd Members of the Church. But as to the Quality and Number of these Fundamental Points, they never could, nor, in all Probability, ever will, be agreed upon.

**TOL**, in Law, a Term signifying to desert, or take away; from the *Latin, tollere*. Thus to *toll* the Entry, is to take away the Right of Entry.

**TOLL**, a *Saxon* Term, tho' deriv'd originally from the *Latin, tollere*, to take away: It has two Acceptations, 1<sup>o</sup>. It denotes a Liberty to buy and sell within the Bounds of a Manor.

2<sup>o</sup>. A Tribute or Custom paid for Passage, &c. See *PASSAGE*, *TRIBUTE*, &c.

Some interpret it to be a Liberty, as well to take, as to be free from *Toll*; for they who are enfranchis'd with *Toll*, are Custom-free.

Of this Freedom from *Toll*, the City of *Cowentry* boasts an ancient Charter, granted them by *Leofric* or *Laricæ*, Earl of the *Mercians*, in *Edward* the Confessor's Time, who, at the Importunity of *Godwin* his Lady, granted this Freedom to the City.

Some Records make mention of *Toll-thore*, or *Tbur-toll*, which is Money paid for Passage in or through some Highways, or over Ferries, Bridges, &c.

*Toll Traversers*, for passing over a private Man's Ground.

*Toll Turn*, paid at the Return of Boats from Fairs and Markets, tho' they were not sold.

By the ancient Law, the Buyers of Corn and Cattel in Fairs or Markets ought to pay *Toll* to the Lord of the Market, in Testimony of the Contract there lawfully made in open Market; because privy Contracts were held unlawful. See *IN-TOLL* and *UT-TOLL*.

**TOMAN**, or **TOUMAM**, a kind of Money of Account, us'd among the *Persians* in the keeping of their Books, and to facilitate the Redaction of Money in the Payment of considerable Sums.

The *Toman* consists of fifty *Abassi's*, or a hundred *Mamoudi's*, or two hundred *Chayez*, or ten thousand *Dinars*; which amount to about three Pounds or seven Shillings Six-pence Sterling. See *MOKEY*.

*D'Herbort* derives the Word from the Language of the *Moguls*, which it signifies the Number *ten thousand*.

*Even Arabichab* says, that the Word *Toman*, when us'd to express a Weight, or Money, contains ten thousand Silver Arab *Drachmas*, call'd *Methkal*; which are a Third lighter than the *Attic*. See *DRACHMA*.

The *Mogols*, &c. frequently use *Toman* for ten thousand Men; and say, *g. gr.* that the City *Samarcan* contains seven *Tomans* of People fit to bear Arms; and that of *Andekhan* nine *Tomans*.

**TOMB**, includes both the *Sepulchre*, wherein the Deceased is interr'd; and the *Monument* erected to preserve his Memory. See *SEPUCHRE* and *MONUMENT*.

Among the *Romans*, none but the Emperors, Vestals, and Persons signaliz'd by great Actions, were allow'd to have *Tombs* in the Cities; the rest were all in the Country, near the High-Roads; whence those common Words, *Siste, & alii, Viator*; which are still retain'd in the Inscriptions of our Monuments in Churches, &c. tho' the Occasion be no more. See *VIATOR*.

At *Anchiales* is still seen the *Tomb* of *Sardanapalus*, with this Inscription in Verse: *Sardanapalus vult Anchiales and Tarius in one Day; Go, Passenger, eat, drink, and be merry; the rest is nothing*.

The Word *Tomb* is form'd from the Greek, *τομῆ*, *Tomus*, *Sepulchre*; or, according to *Morogæ*, from the *Latin, Tombe*, which signified the same Thing.

The *Romans* had a kind of empty *Tomb*, call'd *Cenotaphium*, or an *imaginary Tomb*, wherein no Deceased was laid. It was us'd to be built in Favour of Persons perishing at Sea, in remote Countries, &c. where no Sepulture could be had.

The Occasion hereof was a superstitious Notion, that the Souls of those whose Bodies were not bury'd, wander'd an hundred Years by the Banks of the Rivers of Hell, e'er they were admitted to pass over.

The *Keremissars* being made, the same Ceremonies were practis'd as at real Funerals. The *Cenotaphia* were inscrib'd with the Words *ob Honorem, or Memoriam Sacrum*; whereas other *Tombs*, wherein the Ashes were really deposited, were inscrib'd *D. M. S. q. a. Sacred to the Manes*.

When the Words *Tacito Omnia* were added, it declar'd the Ashes inclos'd therein infamous for some Crime.

**TOME**, is a bound Book; or Writing that makes a just Volume.

All the Works of such an Author are compiled, and reduc'd into one, or more *Tomes*. There are *Tomes* in Folio, in Quarto, in Octavo, Duodecimo, &c.

The Councils printed in the *Louvre* are in XXXVII *Tomes*. *Salmeron* has wrote the Life of Christ in XII *Tomes*. See *VOLUME*.

**TOMENTUM**, properly signifies Flocks, or Locks of Wool; but by Botanists is us'd for that soft downy Matter which grows on the Tops of some Plants, hence denominated *Tomentosa*; as, *Gramen Tomentosum, Carduus Tomentosus*, &c.

M. *Winflow* observes a kind of *Tomentum* in the secretory Vessels of the Glands; and from this, accounts for the Secretion of the various Fluids from the Blood. See *GLAND* and *SECRETION*.

**TONDIN**, in Architecture. See *TORX*.

**TONE**, or **TUNE**, in Music, a Property of Sound, whereby it comes under the Relation of *Grave* and *Acute*; or, the Degree of Elevation any Sound has, from the Degree of Swiftness of the Vibrations of the Parts of the sonorous Body. See *SOUPN*.

For the Cause, Measure, Degree, Difference, &c. of *Tones*. See *TUNE*.

The Variety of *Tones* in human Voices, arises partly from the Dimensions of the Wind-pipe, which, like a Flute, the longer and narrower it is, the sharper is the *Tone* it gives; but principally from the Head of the Larynx, or Knot of the Throat, call'd *Ponsus Adami*; the *Tone* of the Voice being more or less grave, as the Rima, or Cleft thereof is more or less open. See *VOICE*.

**TONE**, is particularly us'd in Music for a certain Degree or Interval of *Tune*, whereby a Sound may be either rais'd or lower'd from one Extreme of a Concord to the other; so as still to produce true Melody. See *INTERVAL* and *CONCORD*.

Musicians, beside the *Concords*, or harmonical Intervals, admit three lesser Kinds of Intervals, which are the *Measures* and component Parts of the greater; and are call'd *Degrees*: The *Nature*, *Origin*, *Use*, &c. whereof, see under the Article *DEGREE*.

Of these *Degrees*, two are call'd *Tones*, and a third a *Semitone*; their Ratio's in Numbers are 8:9, call'd a *greater*

greater Tone; 9: 10, call'd a lesser Tone; and 13: 16, a Semitone.

The Tones arise out of the simple Concords, and are equal to their Differences: Thus the greater Tone 8: 9 is the Difference of a Fifth and a Fourth: The lesser Tone 9: 10 the Difference of a lesser Third and Fourth, or of a Fifth and sixth greater: And the Semitone 15: 16, the Difference of a greater Third and Fourth. See SEMITONE.

Of these Tones and Semitones every Concord is compounded, and consequently is resolvible into a certain Number thereof: Thus, the lesser Third consists of one greater Tone and one Semitone; the greater Third of one greater Tone and one lesser Tone. See THIRD.

The Fourth of one greater Tone, one lesser Tone, and one Semitone. See FOURTH.

The Fifth of two greater Tones, one lesser Tone, and one Semitone. See FIFTH, &c.

For the Use of these Tones, &c. in the Construction of the Scale of Music; See SCALE.

TONGUE, in Anatomy } See { LINGUA.  
TONOVE-grafting } See { GRAFTING.  
TONOVE-Ty'd } See { RANULA.

TONIC, in Medicine, is apply'd to a certain Motion of the Muscles, wherein the Fibres being extended, continue their Extension in such Manner, as that the Part seems immovable, tho' in reality, it be in Motion. See MUSCLE.

Such is the Case in a Man standing, in Birds plaining or swimming thro' the Air, &c.

Galen says, that the Muscles act even when at rest; for after having made any Contraction to fix themselves in a certain State or Disposition; the preserving of that Contraction is what we call the Tonic Motion.

The Word is form'd from the Greek *tonos*, to stretch.

TON } See { TEN.  
TONNAGE } See { TUNNAGE.

TONSILS, in Anatomy, call'd also Amygdale, or Almonds, are two round Glands, situate near the Root of the Tongue, on each Side the Uvula, under the common Membrane of the Fauces, with which they are cover'd.

Each of them has a large oval Sinus, which opens into the Fauces, and in it are a great Number of lesser ones, which discharge themselves thro' the great Sinus, of a mucous and slippery Matter into the Fauces, Larynx, and Oesophagus, for the moistening and lubricating these Parts. When the Muscle Oesophagus aëthet, it compresseth the Tonsils. See AMYGDALÆ.

TONSURE, the Art or Act of cutting the Hair, and shaving the Head. See HAIR.

The Tonsure was anciently a Mark of Insanity in France; insomuch, that when they would render any Prince incapable of succeeding to the Crown, they cut off his Hair, and shav'd him.

The Word is form'd from the Latin *tondere*, to shave.

TONSURE, in the Romish Church, is us'd for the Entrance or Admission into Holy Orders. See ORDERS.

In Propriety, Tonsure is the first Ceremony us'd to devote a Person to God and the Church, by presenting him to the Bishop, who gives him the first Degree of the Clericcate, by cutting off Part of his Hair, with certain Prayers and Benedictions.

Some hold the Tonsure a particular Order; others, as *Jayssou*, only the Mark and Form of Ecclesiastical Orders in general.

The Tonsure suffices to make a Clerk: The rest is only to qualify him for the holding a Benefice.

A Person is capable of the Tonsure at seven Years of Age; hence a Benefice of simple Tonsure, is such a one as may be enjoy'd by a Child of seven Years old. The Tonsure is the Basis of all the other Orders.

TONSURE is particularly us'd for the Corona, which Priests, &c. wear, as the Mark of their Order, and of the Rank they hold in the Church. See CROWN.

The Barbers have the Measures and Dimensions of the different Kinds of Tonsures, or Clerical Crowns; to be practis'd according to the different Degrees and Orders.

A Clerk's Tonsure, a Sub-deacon's Tonsure, a Deacon's Tonsure, a Priest's Tonsure, are each successively bigger than other.

Various are the Ceremonies and Customs the Beard has been liable to: *Kingston* assures us, that a considerable Branch of the Religion of the Tartars consists in the Management of their Beards; and that they wag'd a long and bloody War with the Persians, and declar'd them Infidels, tho', in other Respects, of the same Faith with themselves, merely because they would not cut their Whiskers after the Mode or Rite of the Tartars.

*Athenæus*, from *Chryssippus*, observes, that the Greeks always wore their Beards till the Time of Alexander; and that the first who cut it at *Athens*, ever after bore the Addition of *aspes*, shaven, in Medals. *Plutarch* adds, that *Alexander* commanded the Macedonians to be shaven, left the

Length of their Beards should give a Handle to their Enemies: However this be, we find *Philip*, his Father, as well as *Antyatas* and *Archelaus*, his Predecessors, represented on Medals without Beards.

*Pliny* observes, that the Romans did not begin to shave till the Year of Rome 454, when *P. Titinius* brought over a Stock of Barbers from Sicily: He adds, that *Scipio Africanus* was the first who introduc'd the Mode of shaving every Day.

Among that People, it became the Custom to have Visits made in Form at the cutting of the Beard for the first Time: The first fourteen Roman Emperors shav'd, till the Time of the Emperor *Adrian*, who retain'd the Mode of wearing the Beard. *Plutarch* tells us, he did it to hide the Scars in his Face.

Formerly there was a great deal of Ceremony us'd in blessing the Beard; and there are still extant the Prayers us'd in the Solemnity of consecrating it to God, when an Ecclesiastic was shaven.

Persons of Quality had their Children shav'd the first time by others of the same, or greater Quality, who, by this Means, became Godfather, or adoptive Father of the Children. See ADOPTION.

Anciently, indeed, a Person became Godfather of the Child by barely touching his Beard: Thus Historians relate, that one of the Articles of the Treaty between *Alaric* and *Clovis* was, that *Alaric* should touch the Beard of *Clovis* to become his Godfather. See GOD-FATHER.

As to Ecclesiastics, the Discipline has been very different on the Article of Beards: Sometimes they have been enjoin'd to wear them, from a Notion of too much Softness and Effeminacy in shaving, and that a long Beard was more suitable to the Ecclesiastical Gravity; and sometimes, again, they were forbid it, as imagining Pride to lurk in a venerable Beard.

The Greek and Romish Churches have been long together by the Ears about their Beards: Since the Time of their Separation, the Romanists seem to have given more into the Practice of shaving, by Way of Opposition to the Greeks; and have even made some express Constitutions de radendis Barbis.

The Greeks, on the contrary, espouse very zealously the Cause of long Beards, and are extremely scandaliz'd at the beardless Images of Saints in the Roman Churches.

By the Statutes of some Monasteries it appears, that the Lay Monks were to let their Beards grow, and the Priests among them to shave; and that the Beards of all that were receiv'd into the Monasteries, were blest with a great deal of Ceremony.

To let the Beard grow is a Token of Mourning in some Countries, and to shave it in others. *Le Comte* observes, that the Chinese affect long Beards extravagantly; but Nature has balk'd them, and only given them very little ones, which, however, they cultivate with infinite Care: The Europeans are strangely envid'd by them on this Account, and esteem'd the greatest Men in the World.

The Russians wore their Beards till within a very few Years, when the late Czar enjoin'd them all to shave; but notwithstanding his Injunction, he was oblig'd to keep on Foot a Number of Officers to cut off by Violence the Beards of such as would not otherwise part with them.

*Chryssippus* observes, that the Kings of Persia had their Beards wove or matted together with Gold Thread; and some of the first Kings of France had their Beards knotted and button'd with Gold. See PEARL.

TOOLS, are simple Instruments, us'd in the more obvious Operations; and particularly in the making of other more complex Instruments. See INSTRUMENTS.

Tools are divided into Eight Tools, Spring-Tools, Pointed-Tools, &c. See STEEL and TEMPERING.

TOOTH. See TEETH.

TOOTH-ACH. See ODONTOLOGY.

The Tooth-ach usually proceeds from a Caries which rots the Bone, and eats it hollow. For the Causes, &c. of this Caries; See TEETH.

Sometimes it proceeds from a Defluxion of a sharp Matter upon the Gums. For the Tooth-ach, a Paste made of soft Bread, and the Seed of *Stramonium*, laid on the Tooth affected, abates the Pain. If the Tooth be hollow, and the Pain great, a Composition of equal Quantities of Opium, Myrrh, and Camphire, made up into a Paste with Brandy or Spirits of Wine, and about a Grain or two put into the hollow Place, puts a Stop to the Caries, and blunts the acute Pain of the Nerve; by which it often gives immediate Relief.

Chymical Oils, as those of Origanum, Cloves, Tobacco, &c. are also of Service, destroying, by their hot Caustic Nature, the Texture of the sensible Vessels of the Tooth affected; tho', from too liberal an Use of them, frequently proceeds a Defluxion of Humours, and Impostumation.

A Blister apply'd behind one or both Ears, seldom fails to cure the *Tooth-ach*, especially when attended with a hot De-fluxion of Humours, and swelling of the Gums, Face, &c. Liniments of Ointment of Marshmallows, Alder, &c. mix'd with Rum, Brandy, or Spirit of Wine, camphorated, are good, us'd outwardly, to abate the Swelling.

Mr. *Chefelden* mentions one cur'd of the *Tooth-ach* by applying a small cauterizing Iron to the Anhelix of the Ear, after he had undergone Bleeding, Purgings, Salivation, Scars, &c. to no Purpose: The Case was very remarkable; for when he was seiz'd with it, a Convulsion of that whole Side of his Face follow'd, whenever the Pain became acute, or he attempted to speak.

*Sevelius*, in his Treatise of Butter, maintains, that there is no better Means of keeping the Teeth fair and sound, than by rubbing them over with Butter: An Opiate not much less distasteful than that of the *Spaniards*, who wash their Teeth every Morning with Urine.

To prevent and cure the Scurvy in the Gums, 'tis recommended to wash the Mouth every Morning with Salt and Water; and to hinder the Teeth from spoiling or growing carious, some use only Powder of Hartshorn to rub the Teeth with, and then wash the Mouth with cold Water: 'Tis allow'd, this is preferable to other Dentifrices, on this account, because their hard Particles are apt to abrade that fine smooth Polish, with which the Surface of the Teeth is cover'd, and which is their Preservative from the ill Effects of Air, Alments, Liquors, &c. which occasion Ailments of the Teeth when worn off.

Dentifrices are usually compounded of Powders of Hartshorn, red Coral, Bone of the Curle Fish, burnt Alum, Myrrh, Dragon's Blood, &c. Some commend Powder of Bricks, as sufficient to answer all the Intentions of a good Dentifrice. See DENTIFRICE.

TOPARCHY, a little State, or Petty, consisting only of a few Cities, or Towns; or a petty Country govern'd and possess'd by a *Toparch*, or Lord.

*Judea* was anciently divided into ten *Toparchies*. See *Phny*, lib. 5. c. 14. and *Joseph*. lib. 3. de *Bel. Jud.* lib. 5. c. 2, &c.

The last mention'd Author calls the Cities of *Scotes*, *Jamala*, and *Phelachides*, which *Herod* left by Testament to his Sister *Salome*, a *Toparchy*.

*Procopius* only gives the Quality of *Toparchy* to the Kingdom of *Eteffia*, to *Algarns*, the *Toparch* or Lord whereof there is a Tradition, that *Jesus Christ* sent his Picture, with a Letter.

The Word is form'd from the Greek, *τοπος*, Place, and *αρχη*, Command, Government.

TOPAZ, a precious Stone; the third in Order after the Diamond. See PRECIOUS STONE.

The *Topaz* is transparent; its Colour, a beautiful Yellow, or Gold Colour: It is very hard, and takes a fine Polish.

It is the true Chrysolite of the Ancients; and is found in several Parts of the *Indies*, in *Ethiopia*, *Arabia*, *Peru*, and *Bohemia*. See CHRYSOLITE.

The Oriental *Topazes* are most esteem'd; their Colour borders on the Orange: Those of *Peru* are softer, but their Colour much the same: The Yellow of those of *Bohemia* is a little blackish; they are the softest of all, and their Polish the coarsest. Those of *Madagascar* were in much Esteem, but are now held good for little.

*Tavernier* mentions a *Topaz*, in the Possession of the Great Mogul, weighing 157 Carats, which cost 20500 Lib. Sterling: And *Boissac de Boer*, in his Treatise of precious Stones, affirms to have seen in the Cabinet of the Emperor *Ruisolpus*, whose Physician he was, a *Topaz* above three Foot long, and six Inches broad. Probably it might be some Marble a little transparent, of a *Topaz* Colour.

The *Topaz* is easily counterfeited; and there are fictitious ones, which, to the Eye, don't come behind the natural ones.

If we might believe the Ancients, the *Topaz* has very notable Virtues; but those are now in Discredit: And yet the *Topaz* is of some Use in Medicine, reduc'd into an impalpable Powder, and apply'd in Water. See GEM.

Some say, it takes its Name *Topaz* from an Island in the Red Sea, of the same Name, where it was first found by *Juba*, King of *Mauritania*; but it was known to the *Hebrews* before, as appears from the 18th Psalm.

TOPHUS, in Medicine, a stony Concretion in any Part of an Animal Body; as in the Bladder, Kidneys, &c. (See STONE) or in the Joints, &c. See GOVU.

Dr. *Roxy*, in a Treatise, just publish'd, of the *Urinary Passages*, takes the Stone to arise from the Attraction of volatile and saline Particles; of which Particles the Stone, when view'd with a Microscope, seems to be made up: He thinks the Fault of these Aggregates of saline Particles, ought generally to be suppos'd to begin in, or proceed from, the Passille of the Kidneys, and not from the Sediment of Urine in the Bladder.

The Reason why Wine-drinkers are more subject to the

Stone, and other Concretions, than Malt or Water-drinkers, he supposes to be the volatile and saline, or earthy Particles contain'd in the Wine in greater Quantities than in the Ale, &c. A Calculus, he observes, reduc'd to a Caput Mercurium, will, upon the Affusion of warm Water, dissolve, and entirely mix; but in a short Time will again settle, and the Particles thereof so closely unite or attract, as that, by repeated Affusions, they cannot be brought again to dissolve. See LITHONTRIPTIC.

TOPIC, in Rhetoric, a probable Argument, drawn from the several Circumstances and Places of a Fact, &c. See PLACE, &c.

TOPICKS, or TOPICA, expresses the Art or Manner of inventing and managing all Kinds of probable Argumentations: *Aristotle* has wrote *Topicks*; and *Cicero* a kind of Comment on them, to his Friend *Trebatius*, who, it seems, did not understand them.

But the Criticks observe, that the *Topica* of *Cicero* agree so little with those eight Books of *Topicks* which pass under the Name of *Aristotle*, that it follows necessarily, either that *Cicero* was much mistaken; which is not very probable; or that the Books of *Topicks* attributed to *Aristotle*, are not wholly his.

*Cicero* defines *Topica*, or *Topica*, to be the Art of finding Arguments, *Disceptatio Inventionum Argumentorum*. See ARGUMENT.

Rhetoric is divided into two Parts, Judgment, call'd also *Dialectic*; and Invention, call'd *Topica*. See RHETORIC.

The Word is form'd from the Greek, *τοπος*, of *τοπος*, Place; its Subject being the Places, which *Aristotle* calls the *Seats*, of Arguments.

TOPIC, in Medicine, *Topicks*, or *Topical Remedies*, are what we otherwise call *External Remedies*, i. e. such as are apply'd externally to some diseas'd and painful Part. See MEDICINE.

Such are Plaisters, Cataplasms, Blisters, Unguents, Salves, Collyriums, &c.

The Gout is never cur'd by *Topicks*: They may assuage the Pain for a Time; but for a Cure, the Source of the Evil must be attack'd with Internals. See GOVU.

The Word is form'd from *τοπος*, Place.

TOPOGRAPHY, a Description or Draught of some particular Place, or some small Tract of Land; as that of a Manor or Tenement, Field, Garden, House, Castle, or the like; such as Surveyors set out in their Plots, or make Draughts of, for the Information and Satisfaction of the Proprietors. See MAP, SURVEYING, &c.

*Topography* differs from Chronography, as a Particular from more General; Chronography being a Description of a Country, a Diocese, Province, or the like. See CHRONOGRAPHY.

The Word is form'd from *τοπος* and *γραφω*, I describe.

TORCH, *Tōda*, a Sort of Luminary; being, properly, a kind of Staff, or Stick, of Fir, or other resinous and combustible Matter, as Pine, Linden, &c. more, or less thick, and from seven to twelve Foot long; encompass'd at one End with six Wax Candles, which being lighted, yield a kind of gloomy Brightness. See LUMINARY.

*Torches* are us'd in some Church Ceremonies, particularly at the Processions of the Holy Sacrament in the *Rossio* Church, and at the Internments of the poorer People.

Formerly they were us'd at the Funerals of those of the first Rank; but *Tapens* and *Flambeaux* are now us'd in their stead. See FLAMBEAU and TAPEN.

TORCULAR, or TORCULARIS, among Chirurgeons, a Contrivance for stopping of Bleedings in Amputations. See AMPUTATION.

TORCULAR *Herophili*, in Anatomy, a Name given to a Part in the Duplicatures of the Dura Mater; form'd of a Concourse of a Branch of the longitudinal Sinus, with the lateral Sinus's. See DURA MATER and SINUS.

It has its Name *Torcular* from its resembling a Press or Screw: *Herophili* is added from the Discoverer's Name.

TORRE, *Torus*, in Architecture, a thick round Moulding us'd in the Bases of Columns. See BASE.

'Tis the Bigness that distinguishes the *Torus* from the *Astragal*. See ASTRAGAL.

The Bases of *Tuscan* and *Doric* Columns have but one *Torre*, which is between the Plinth and the Listel. In the *Attic* Base there are two; the upper, which is the smaller; and an under.

The Word is form'd from the Greek, *τορος*, a Cable, whereof it bears some Resemblance; or from the Latin, *Torus*, a Bed, as being suppos'd to represent the Edge of such Matters as swell out with the Weight of the incumbent Column.

It is also call'd a *thick Baton*; sometimes its Contour resembles half a Heart; in which Case it is call'd *Boguerre*. See BAGUERRE.

TOREUMATOGRAPHY, a Greek Term, signifying the Knowledge, or, rather, the Description of ancient Sculptures, and Basils-Relievs's.

The *Italian* Engtavers have given a great deal of Light to this Science. See SCULPTURE and ENGRAVING.

TOREUTICE, *τορυτική*, that Part of Sculpture, call'd Turning. See SCULPTURE and TURNING.

The Word is form'd of the *Greek*, *τορυ*, or *τορ*, Lath, of *τορ*, *τερο*, *περι*.

TORIES, or TORYS, a Party or Faction in *England*, opposite to the Whigs. See FACTION.

These two celebrated Parties, which have so long divided our Country, will make a considerable Article in the *English* History, nothing inferior, in many Respects, to that of the *Greeks* and *Goths*. — The Division has gone so deep, that it is presum'd, no *Englishman*, who has any Concern or Principles at all, but inclines more to one Side than the other: For which Reason, we shall borrow our Account of them from the Mouths of Foreigners, who may be suppos'd more impartial; and particularly from *M. de Cœ*, a *French* Officer, some time in the Service of *England*, who has wrote the History of *Whiggism* and *Toryism*, printed at *Leipsic*, Anno 1717; and *M. Rapin*, whose *Dissertation sur les Whigs & les Torys*, printed at the Hague the same Year, is well known.

During the unhappy War which brought King *Charles I.* to the Scaffold; the Adherents of that King were first call'd *Cavaliers*, and those of the Parliament *Round-Heads*; which two Names were afterwards chang'd into those of *Tories* and *Whigs*, on the following Occasion.

A kind of Robbers, or Banditti in *Ireland*, who kept on the Mountains, or in the Islands form'd by the vast Bogs of that Country, being call'd *Tories*; a Name they still bear indifferently with that of *Rapparees*; the King's Encourages accusing him of favouring the Rebellion in *Ireland*, which broke out about that Time, gave his Partizans the Name of *Tories*: And, on the other Hand, the *Tories*, to be even with their Enemies, who were closely leagu'd with the *Scots*, gave them the Name of *Whigs*, which is that given in *Scotland* to another Kind of Banditti, or rather of *Panicks*, in that Country. See *WHIG*.

The *Cavaliers*, or *Tories*, had then principally in View the Political Interests of the King, the Crown, and the Church of *England*: And the *Round-Heads*, or *Whigs*, propos'd chiefly the maintaining the Rights and Interests of the People, and of Protestantism. Nor have the two Factions yet lost their first Ideas; tho' their first Names, *Cavalier* and *Round-Head*, be now entirely disus'd.

This is the most popular Account; and yet 'tis certain the Names *Whig* and *Tory* were but little known till about the Middle of the Reign of King *Charles II.* *M. de Cœ* relates, that it was in the Year 1678, that the whole Nation was first observ'd to be divided into *Whigs* and *Tories*; and that on Occasion of the famous Deposition of *Jeremy* *Oates*, who accus'd the Catholics of having conspir'd against the King and the State. — The Appellation *Whig* was given to such as believ'd the Plot real; and *Tory* to those who believ'd it fictitious.

We should here, confine ourselves to the *Tories*; and for what regards the *Whigs*, refer to that Article; but since by comparing and confronting the two Parties together, both the one and the other will appear in the stronger Light, it would be imprudent to separate them; so that we rather chuse to say the less under the Word *Whigs*, and refer thence hither.

The Factions we are speaking of, may be consider'd either with Regard to the State, or to Religion.

The *State* *Tories* are either violent or moderate: The first would have the Sovereign to be absolute in *England*, as in other Countries, and his Will to be a Law. This Party, which is not very numerous, has yet been considerable; 1<sup>o</sup>. On Account of its Leaders, which have been Lords of the first Rank, and generally Ministers and Favourites, 2<sup>o</sup>. In that being thus in the Ministry, it engag'd the Church *Tories* to maintain stilly the Doctrine of Passive Obedience. 3<sup>o</sup>. Because the King has usually thought it his Interest to support them.

The moderate *Tories* would not suffer the King to lose any of his Prerogatives; but neither would they sacrifice those of the People. These, says *M. Rapin*, are true *Englishmen*; have frequently sav'd the State, and will save it again whenever it shall be in Danger, either from the violent *Tories*, or from the Republican *Whigs*.

The *State* *Whigs*, again, are either Republican or Moderate: The first, according to our Author, are the Remains of the Party of the long Parliament, who took in Hand to change the Monarchy into a Commonwealth: These make so slender a Figure, that they only serve to strengthen the Party of the other *Whigs*. The *Tories* would persuade the World, that all the *Whigs* are of this Kind; as the *Whigs* would make us believe that all the *Tories* are violent.

The moderate *State* *Whigs* are much in the same Sentiments as the moderate *Tories*; and desire the Government may be maintain'd on its ancient Foundation: All the Difference is,

that the moderate *Tories* lean a little more to the Side of the King, and the moderate *Whigs* to that of the Parliament and People. These last are in a perpetual Motion to prevent the Rights of the People from being broke in upon; and have sometimes taken Precautions at the Expence of the Crown.

Before we consider our two Parties with Regard to Religion, it must be observ'd, that the Reformation, as carry'd on to a greater or less Length, divided the *English* into Episcopals, and Presbyterians or Puritans: The first contended, that the Episcopal Jurisdiction should be continu'd on the same Footing, and the Church in the same Form, as before the Reformation: The latter maintain'd, that all Ministers or Priests had equal Authority; and that the Church ought to be govern'd by Presbyteries, or Consistories of Priests and Lay Elders. See PRESBYTERIAN, &c.

After long Disputes, the more moderate of each Party relax'd a little of their Strictness, and thus form'd two Branches of moderate *Whigs*, and moderate *Tories*, with regard to Religion; but there was a much greater Number kept to their Principles with inconceivable Firmness: And these constituted two Branches of rigid Episcopals and Presbyterians, subsisting to this Day; and now compris'd under the general Names of *Whigs* and *Tories*; in regard the first join the *Tories*, and the latter the *Whigs*.

From what has been observ'd, we may conclude, that as the Names *Tory* and *Whig* have a Regard to two different Objects, they are equivocal, and of consequence ought never to be apply'd without expressing in which Sense 'tis done; — For the same Person may be, in the different Respects, both *Whig* and *Tory*.

A Presbyterian, for Instance, who wishes the Ruin of the Church of *England*, is certainly, on that Score, of the Party of *Whigs*; yet if he oppose the Attempts some of his Party would make against the Royal Authority, it can't be deny'd but he is effectually a *Tory*.

After the like Manner, the Episcopals ought to be esteem'd as *Tories* with Regard to the Church; and yet how many of them are *Whigs* with Regard to the Government?

For the rest, the general Motives that have form'd and kept up the two Parties, appear, in the main, to be no other than the private Motives of particular Persons: Self-Interest is the Primum Mobile of their Actions: Ever since the Rise of these Factions, each has struggled earnestly to get the Advantage over the other; inasmuch as from such Superiority accrue Places, and Honours, and Promotions, &c. which the prevailing Party distributes among its own Members, exclusive of the contrary Party.

As to the Characters commonly attributed to the *Whigs* and *Tories*: The *Tories*, says *M. Rapin*, appear fierce and haughty: They treat the *Whigs* with the last Contempt, and even somewhat hardly, when they have the Advantage over them: They are very hot and vehement, and proceed with a Rapidity which yet is not always the Effect of Heat and Transport, but has its Foundation sometimes in good Policy: They are very subject to change their Principles, as their Party prevails, or gives Way.

If the rigid Presbyterians prevail'd in the *Whig* Party, it would not be less hot and zealous than that of the *Tories*; but 'tis said they have not the Direction thereof; which gives Room to affirm, that those at the Head of the *Whig* Party are much more moderate than the Chiefs of the *Tories*: Add, that they usually conduct themselves on fix'd Principles, proceed to their End gradually, and without Violence; and their Stomachs is not less founded on good Politics, than the Halliocs of the *Tories*. — Thus much, says our Author, may be said to the Advantage of the moderate *Whigs*, that, in the general, they maintain a good Cause, *viz.* the Constitution of the Government as by Law establish'd. See *WHIG*.

TORMINA, in Medicine, a Term used to express Pains in the General; but particularly a Species of Pain call'd *Tormina Ventris*, or *Abis*; in *English*, the Gripes. See GRIPES.

Young Children are very often troubled with Gripes; 'tis upon this account, that Nurses, in order to prevent or remedy them, usually mix with their Spoon-meats, a little Brandy or some Carminative Seeds, as Carus Seeds, &c. See CHILDREN.

Some Children breed their Teeth with violent Gripes, which is apt to turn to Convulsions of the Bowels. See DENTITION.

In Adults, the dry Gripes is usually cured by the Exhibition of warm Catharticks, such are Tincture of *Hiera Picra*, Elixir *Solutis*, Tincture of *Rhubarb*, &c. with the Assistance of Opium.

TORNADO, a sudden and violent Storm at Sea. See WHIRLWIND.

TORNESOL, *Tournesol*, or *Turnsol*, called also *Heliotrope*, and *Sun-flower*, and by the Botanists *Ricinioides*, [ L 11 ] a Plant

a Plant whose Flower is said to follow the Motion of the Sun; and to turn still towards it.

Some say, 'tis hence it takes its Name, and account for the Effect, by supposing that its heavy Stalk, warm'd and soft'n'd with the Heat which is strongest on that Side toward the Sun, inclines naturally towards the flame; but others take the Opinion to have had its Rise from the Name, which was given it by Reason of its Appearance in the Time of the greatest Heats, when the Sun is in the Tropick.

Some have imagin'd the Sun-flower of use in Medicine; but its Reputation that Way is now out of Doors. Its principal Use is in Dying; In order to which, its Juice is inspissated and prepared with Calx and Urine, into blue Cakes; used also for Smarck, instead of Smalt. See BLUE, SMALT, &c.

Its Juice likewise furnishes the Colour wherewith the People of *Languedoc* and some other Parts of *France*, where it grows, prepare what they call the *Tournefol en Drapeaux*, or *Tournefol en Rags*. The Process wherof, is owing to M. *Niffote* of the Royal Academy of Sciences, and is as follows;

The Summits or Tops of the Plant being gather'd in the beginning of *August*, are ground in Mills, not unlike our Oil Mills; Then, being put up in Bags, the Juice is express'd with Presses.

This Juice having been expos'd to the Sun about an Hour, they dip Linnen Rags therein, and hang them out in the Air till they be well dried again. When, moistening them for some time, over the Vapour of about ten Pound Weight of quick Lime flak'd in a sufficient Quantity of Urine, they lay them out again to the Sun to dry; to be again dip'd in the Juice of the *Ricinioides*.

When they are dried for the last Time, they are in their Perfection; and are thus sent into most Parts of *Europe*, where they are used to tinge Wines and other Liquors, and give them an agreeable Colour.

The Dutch prepare a kind of *Tournefol* in Paste or Cakes, or Stones; pretended to be the Juice of that Plant inspissated; But there is Reason to think it a Cheat; and to be the Juice of some other Plant prepared after the like Manner; the *Tournefol* being no Plant of their Growth.

TORPEDO, in Natural History, a Sea-fish, fam'd both among the Ancient and Modern Naturalists, for a remarkable Numbness wherewith it strikes the Arm of such as touch it.

Various are the Accounts given us of this singular Fish; some Authors raising the Effects it produces, to a kind of Miracle; and others treating them as little better than Chimeras; some solving the Appearance this Way, and some that. But M. *Reaumur*, of the French Academy of Sciences, has at length cleared the Point, and set the Matter in a satisfactory Light.

The *Torpedo* is a flat Fish, much of the Figure of the *Thorn-back*; sufficiently described in most Treatises of Fishes, and commonly enough found about the Coasts of *Provence*, *Gascony*, &c. where the People eat it without any Danger. See its Figure represented in Tab. Natural History, Fig. 9.

#### Phenomenon of the TORPEDO.

Upon touching it with the Finger, it frequently, though not always happens, that the Person feels an unusual painful Numbness, which suddenly seizes the Arm up to the Elbow, and sometimes to the very Shoulder and Head.

The Pain is of a very particular Species, and nor to be described by any Words; yet Messieurs *Lorenzini*, *Borelli*, *Redi* and *Reaumur*, who all felt it severally, observe it to bear some Resemblance to that painful Sensation felt in the Arm, upon striking the Elbow violently against a hard Body; though M. *Reaumur* assures us, this gives but a very faint Idea thereof.

Its chief Force, is at the Instant it begins; it lasts but a few Moments and then vanishes entirely. If a Man don't actually touch the *Torpedo*, how near soever he holds his Hand; he feels nothing; If he touch it with a Stick, he feels a faint Effect; If he touch it through the Interposition of any pretty thin Body, the Numbness is felt very considerably; if the Hand be press'd very strong against it, the Numbness is the less, but still strong enough to oblige a Man speedily to let go.

#### Theory of the Phenomenon of the TORPEDO.

There are different Ways of accounting for this Effect: The first is, that of the Ancients, who contended themselves with ascribing a *Torpedific* Virtue or Faculty to this Animal.

The second, will have this Effect produced by the *Torpedo*, to depend on an Infinity of Corpuscles issuing continually out of the Fish, but more copiously under some Circumstances than others: This is the Opinion most generally received; being adopted by *Redi*, *Perrault* and *Lorenzini*.

They explain themselves thus; As the Fire emits a Quantity of Corpuscles, proper to heat us; so the *Torpedo* emits

a Quantity of Corpuscles fit to numb the Part they infuse themselves into; whether it be by their entering in too great abundance, or by their falling into Tracks or Passages very disproportionate to their Figures.

The third Account, is that of *Borelli*, who looks on this Emission of Corpuscles, as imaginary: He says, That upon touching the Fish, it puts itself into a violent Tremor or Agitation, and that this occasions a painful Numbness in the Hand that touches it. But M. *Reaumur* assures us, That notwithstanding all the Attention he could view this Fish withal, when ready to strike the Numbness, he could perceive nothing of this Trembling or Agitation.

The last and juicest Hypothesis, is that of M. *Reaumur*: The *Torpedo*, like other flat Fishes, he observes, is not absolutely flat, but its Back, or rather all the upper Part of its Body, a little Convex: When it did not, or would not, produce any Numbness in such as touch'd it, its Back, he found, always preserv'd its natural Convexity; but whenever it would dispose itself to resent a Touch or Thrust, it gradually diminish'd the Convexity of the back Parts of the Body; sometimes only rendering them flat, and sometimes even concave.

The very next Moment, the Numbness always began to seize the Arm; the Fingers that touch'd, were oblig'd to give back, and all the flat and concave Part of the Body was again seen Convex: And whereas, it only became flat insensibly, it return'd to its Convexity so swiftly, that one could not perceive any Passage from the one to the other State.

The Motion of a Ball out of a Musket, is not, perhaps, much quicker than that of the Fish re-assuming its former Situation; at least the one is not more perceivable than the other.

'Tis from this sudden Stroke, that the Numbness of the Arm arises; and accordingly, the Person when he begins to feel it, imagines that his Fingers have been violently struck. 'Tis the mere Velocity of the Stroke that produces the Numbness.

The Wonder is, how so soft a Substance, as that of the Fish, should give so rude a Blow: Indeed a single Stroke of a soft Body could never have done it; But in this Case, there is an Infinity of such Strokes given in an Instant. To explain the admirable Mechanism hereof, we must give a View of the Parts whereto it depends.

The Mechanism, then, consists in two very singular Muscles, *b, b*, described by several Authors, who have given the Anatomy of the *Torpedo*. *Redi*, and after him *Lorenzini*, call them the *Musculi Falcati*; their Form is that of Crescentics, and they together, take up almost Half the Back of the Fish; the one on the right Side, and the other on the Left. Their Origin is a little above the Mouth; and they are separated from each other by the Bronchia, into the last of which they have their Insertion.

What is singular in them, is their Fibres; if, with the Authors above-mentioned, we may give that Name to a Sort of lesser Muscles as big as Goose's Quills; of an Assembling wherof the two great Muscles are form'd. These lesser Muscles are hollow Cylinders, their Length nearly equal to the Thickness of the Fish, and ranged a-side of each other; all perpendicular to the upper and lower Surfaces of the Fish, accounting these Surfaces as two nearly parallel Planes. The exterior Surface of each of these Cylinders, consists of whitish Fibres, whose Direction is the same with that of the Cylinder: But these Fibres only form a kind of Tube, whose Parietes are not above the Thickness of a Leaf of Paper. The Cavity of the Tube is full of a soft Matter, of the Colour and Consistence of Pap, divided into Twenty-five or Thirty different little Masses, by so many Partitions, parallel to the Base of the Cylinder, which Partitions are form'd of transverse Fibres: So that the whole Cylinder is in some measure compos'd of Twenty-five or Thirty smaller Cylinders placed over each other, and each full of a medullary Substance.

We need only now, remember, that when the *Torpedo* is ready to strike its Numbness, it slowly flattens the outer Surface of its upper Part; and the whole Mechanism, whereon its Force depends, will be apparent. By that gradual Contraction, it bends, as it were, all its Springs; renders all its Cylinders shorter, and at the same time augments their Bases, or, which amounts to the same, stretches all the little Inclosures which divide the soft Matter. In all Probability, too, the large Fibres, or little Muscles, in that Moment, lose their cylindrical Form, to fill the Vacuities between them.

The Contraction being made to a certain Degree, all the Springs unbend; the longitudinal Fibres are lengthen'd, the transverse ones, or those which form the Inclosures, are shorten'd; each Inclosure, drawn by the longitudinal Fibres which are lengthen'd, drives the soft Matter it contains, upwards; in which it is apparently assisted by the undulatory Motion, which is in the transverse Fibres when contracting.

If then, a Finger touch the *Torpedo*, it instantly receives a Stroke, or rather several successive Strokes, from each of the Cylinders whereto it is applied. As the soft Matter is distributed into divers Inclosures, 'tis more than probable, all the Strokes are not given precisely at the same Moment: Nay, were there no Inclosures to separate the Matter, its Impression would

would give Strokes, in some measure, successive: For all Parts of soft Bodies don't strike at once; the Impression of the last does not take till after the first have done acting. But these several Inclosures serve to augment the Number of the Springs, and, of Consequence, the Velocity and Force of the Action.

These quick re-iterated Strokes given by a fossifh Matter, shake the Nerves, suspend, or change the Course of the Animal Spirits, or some Fluid equivalent: Or, if you had rather, these Strokes produce an Undulatory Motion in the Fibres of the Nerves, which either disorganize with that they should have, in order to move the Atm. And hence the Inability we are under of using the same, and the painful Sensation which accompanies it.

Hence it is, that the *Torpedo* does not convey its Numbness to any Degree, except when touch'd on these great Muscles; so that the Fish is very safely taken by the Tail, which is the Part by which the Fishermen catch it.

The Authors who have accounted for the Effect of the *Torpedo* from *Torporific* Effluvia, have been obliged to have recourse to the same two Muscles; but then they only make them Reservoirs of the Corpufcles, whereby the Numbness is effected.

*Lorenzini*, who has observed the Contraction as well as *Reaumur*, pretends that all its Use, is to express those Corpufcles from out of the hollow Fibres of these Muscles wherein they are imprison'd; but this Emanation of Corpufcles admitted by most Authors, is disprov'd by *M. Reaumur*, from the following Considerations;

1<sup>o</sup> In that no Numbness is convey'd, if the Hand be at the smallest Distance from the *Torpedo*: Now, to use their own Comparison, if the *Torpedo* numbs as the Fire warms, the Hands would be affected at a Distance from the one as well as the other.

2<sup>o</sup> In that the Numbness is not felt till the Contraction of the Muscles is over; whereas were the Cause in *Torporific* Particles express'd by the Contraction, the Effect would be felt in the time of the Contraction.

3<sup>o</sup> In that were the Numbness the Effect of *Torporific* Particles, it would be convey'd by degrees, as the Hand warms by degrees.

Lastly, in that the *Torpedo* conveys its Numbness to the Hand, thro' a hard, solid Body, but does not do it thro' the Air.

Were the only Use the *Torpedo* makes of its Faculty, the saving itself from the Fishermen, as some have suppos'd, it would signify but little; for 'tis very rare that it escapes their Hands. *Pliny*, *Aristotle* and most Naturalists, therefore agree, that it likewise serves it for the catching of other Fishes: All we know for certain, is, that it lives on other Fishes, and that 'tis generally found on Banks of Sand, &c. probably, to serve it as a Foundation or Support for the exerting its Faculty.

*M. Reaumur* had no Fishes alive to examine what the *Torpedo* would do to them; but an Animal, next a-kin to a Fish, he tried it on, viz. a Drake, which being shut up a while in Water with the Fish, was taken out dead; doubtless from its too frequent Contacts on the *Torpedo*.

In the History of *Alyssians*, we are assur'd, that if the *Torpedo* kill living Fishes, it seems to bring dead ones to life again; dead Fishes being sent to sit, if put in the same Vessel with it: But this is much less credible than what is told us in the same History, that the *Alyssians* used *Torpedo's* for the Cure of Fevers, by tying down the Patient to a Table, and applying the Fish successively upon all his Members, which puts the Patient to cruel Torment, but effectually rids him of his Disease.

*Bellon* assures us, that our own *Torpedo's* applied to the Soles of the Feet, have prov'd successful against Fevers.

*M. du Hamel* in his Memoirs of the Academy of Sciences, Anno 1671, mentions a kind of *Torpedo's*, which he compares to Conger Eels: *M. Richer*, from whom he has the Account, affirms on his Knowledge, that they numb the Arm strongly, when touch'd with a Staff, and that their Effects even go to the giving Vertigo's.

TORQUE, in Heraldry, a round Roll of Cloth twist'd and stuff'd; such is the Bandage frequently seen in Armories about the Heads of Moors, Savages, &c.

It is always of the two principal Colours of the Coat. The Torque is the least Honourable of all the Enrichments worn on the Helmet by way of Crest. See CREST.

TORREFACTION, in Pharmacy, a kind of *Affusion*, wherein a Drug is laid to dry on a Metal Plate plac'd over Coals, till it become friable to the Fingers.

*Torrefaction* is particularly us'd, when, after reducing some Drug, as Rhubarb, or Myrabolans into Powder, 'tis laid on an Iron or Silver Plate, and that plac'd over a moderate Fire till the Powder begin to grow darkish; which is a Mark those Remedies have lost their purgative Virtue, and have acquir'd a more astringent one. See RHUBARB, &c.

The Word is form'd from the Latin *torrefacere*, to roast. Formerly, they us'd to torrefy Opium, to get out some malignant Parts fancy'd to be in it, or they durst use it in

Medicine; but the Effect was, that its volatile Spirits and Sulphur, wherein its greatest Virtue consists, were hereby evaporated. See OPIUM.

TORRENT, TORRENS, in Geography, an impetuous Stream of Water, falling suddenly from Mountains wherein there have been great Rains, or an extraordinary Thaw of Snow; and making great Ravages in the Plains. See RIVER, &c.

TORRICELLIAN, a Term very frequent among physical Writers, us'd in the Phrases, *Torricellian Tube*, and *Torricellian Experiment*, on account of the Inventor, *Torricelli*, a Disciple of the great *Galileo*.

The *TORRICELLIAN Tube* is a Glass Tube, as A B, about three Foot long, and  $\frac{3}{4}$  of an Inch in Diameter, represented (Tab. Pneumaticks, Fig. 6.) whose upper Orifice A is hermetically sealed.

The *TORRICELLIAN Experiment*, is perform'd by filling the *Torricellian Tube* A B with Mercury; then stopping the Orifice B, with the Finger; inverting the Tube; and plunging that Orifice in a Vessel of stagnant Mercury C. See MERCURY. This done, the Finger is removed, and the Tube remain'd perpendicular to the Surface of the Mercury in the Vessel.

The Consequence is, that Part of the Mercury falls out of the Tube into the Vessel, and there only remains enough in the Tube to fill from 28 to 31 Inches of its Capacity, above the Surface of the stagnant Mercury in the Vessel.

Those 28, &c. Inches of Mercury, are sustain'd in the Tube by the Pressure of the Atmosphere on the Surface of the stagnant Mercury; and according as that Atmosphere is more or less heavy, or as the Winds blowing upwards or downwards, heave up, or depress the Air, and so increase or diminish its Weight and Spring; more or less Mercury is sustain'd from 28 Inches to 31. See AIR and ATMOSPHERE.

The *Torricellian Experiment* makes what we now commonly call the *Barometer* or *Weather-Glass*. See BAROMETER.

TORRID Zone, the Tract of Earth lying under the Line, and extending on each Side to the Two Tropicks; or to 23 Degrees and a Half of Latitude. See TROPIC, ZONE, &c.

The Ancients believed the *Torrid Zone* uninhabitable; but from the late Navigations, we learn, that the excessive Heat of the Day there, is temper'd by the Coldness of the Night.

TORT, in Law, an *Injustice* or *Injury*; as *de son Tort* means, in his own Wrong, &c. Hence also *Tort-feasor*, &c. The Word is pure French.

TORTEAUX, in Heraldry. See TOURTEAUX.

TORTOISE-Shell, the Spoils or Cover of a Testaceous Animal, call'd a *Tortoise*; us'd in Inlaying, and on various other Occasions, as for Snuff-boxes, Combs, &c. See TESTACEOUS and SHELL.

There are two Kinds of *Tortoises*, viz. the Land and Sea *Tortoise*.

The Sea *Tortoise*, again, is of four Kinds, viz. the *Fresh Tortoise*, the *Caret*, the *Cochabanna*, and the *Logger-hu*: But 'tis the *Caret* alone furnishes that beautiful Shell, so much admired in Europe.

The Shell of the *Caret* is thick, and consists of two Parts, the upper, which covers the Back, and the lower, the Belly: The Two are joined together at the Sides by strong Ligaments which yet allow of a little Motion.

In the Fore-part is an Aperture for the Head and fore Legs; and behind, for the hind Legs and Tail.

'Tis the under Shell alone is us'd: To separate it from the upper, they make a little Fire beneath it, and as soon as ever 'tis warm, the under Shell becomes easily separable from the upper, with the Point of a Knife, and is taken off in Laminae or Leaves, without killing the Animal, which, 'tis said, being turn'd to Sea again, gets a new Shell.

The whole Spine of the *Caret* consist in 13 Leaves, 8 of them flat, and 5 a little bent: Of the flat ones, there are 4 large ones, about a Foot long, and 7 Inches broad.

The best Shell is thick, clear, transparent, of the Colour of Antimony, sprinkled with Brown and White. When us'd in Marquetry, &c. the Workmen give it what Colour they please, by means of colour'd Leaves, which they put underneath them.

In Generation, *Rondeletius* observes, the Embraces of the Male and Female *Sea Tortoise*, continue for a whole Lunar Month; and that they squirt Water out of the Nostrils, in the same Manner as the Dolphin. On the *Brazilian* Shore, they are said to be so big, as sometimes to dine Fourcore Men: And that in the *Indian* Sea, the Shells serve the Natives for Boats. *De Laet* adds, that in the Island of *Cuba* they are of such a Bulk, that they will creep along with Five Men on their Backs.

TORTOISE in the Military Art. See TESTUDO.

TORTURE, a grievous Pain inflict'd on a Criminal, or Person accus'd; to make him confess the Truth. See QUESTION.

The Forms of *Torture* are different in different Countries. In some they use Water, in others Iron, in some the Wheel or Rack, in some the Boot, Thumbkins, &c. See RACK. In

In *England*, the use of all *Torture* is abolish'd, both in Civil and Criminal Matters; and even in Cases of High Treason; tho' something like it still obtains, where the Criminal refuses to plead. See *PAINES* *fort & sure*.

In *France*, the *Torture* is not practis'd in Civil Matters: But by an Ordinance of 1670, if a Person be accus'd of a Capital Crime, he may be put to the Question, *i. e.* to the *Torture*, if there be considerable Proof against him, and yet not Proof enough to convict him. See *PROOF*.

There are two Kinds of *Torture*; the one *Preparatory*, appointed before Sentence pass'd; the other *Definitive*, decreed by a Sentence of Death.

The *Preparatory Torture*, is order'd *Mautibus Judicis*, so that if the Accus'd don't confess, he cannot be condemn'd to Death, but only *ad omnia circa Martem*.

The *Definitive Torture*, is that a condemn'd Criminal is put to, to make him confess his Accomplishes. The Ordinary *Torture* is given at *Paris* with Six Quarts of Water, and the little *Trestle*; and the Extraordinary, with Six other Pots, and the great *Trestle*.

In *Scotland*, the *Torture* is given with the Boot. See *BOOT*.

In some other Countries, by heating the Criminal's Feet; in others, with Wedges, &c.

The *Torture*, says *M. Bryere*, is a sure Expedient to destroy an Innocent Person of a weak Complexion, and to save a Criminal of a robust one. — It was a noble Saying of an Ancient, *They who can, and they who cannot bear the Torture, will equally lie*.

**TOTTED.** A good Debt to the King is, by the foreign Apposer, or other Officer in the *Exchequer*, noted for such by writing the Word *tot*, *q. d. tot pecunie Regi debetur*, whence it is said to be *totted*.

Also that which is paid is to be *totted*. See *EXCHEQUER*.

**TOTUM.** See *WHOLE*.

**TOUCAN**, in *Astronomy*, a Constellation of the Southern Hemisphere. See *CONSTELLATION*.

**TOUCH**, in *Music*, An Organ is said to have a good *Touch*, when the Keys close, and lie down well; being neither too loose, nor too stiff. See *ORGAN*.

*Touch the Wind*, in the Sea Language, is when the Steer's-man at the Helm is bid to keep the Ship as near the Wind as may be. See *STEEERAGE*.

**TOUCHING** is sometimes us'd for the Sense of *Feeling*. See *FEELING*.

**TOUCHING**, in *Geometry*. A right Line is said to *touch* a Circle, when it meets it in such Manner, as that being produc'd it does not *cut*, but falls without the Circle. See *TANGENT*.

**TOUCHSTONE**, a black polish'd Stone, us'd to try Metals upon. See *STONE*.

The Ancients call'd it *Lapis Lydius*, the *Lydian Stone*, from *Lydia*, a Country of *Asia minor*, whence it was brought.

The Moderns call it *Touchstone*, in regard the Proof they make of Metals, is by *touching* or rubbing the Metal to be try'd on the Stone, and comparing the Colour of the Mark it leaves thereon, with the Mark of another Piece of Metal of the same Species, whose Goodness is past doubt. See *METAL*.

**TOUR**, *Tour*, a *French* Term, often us'd among *English* Writers, for a Journey. Thus we say the *Tour* of *Paris*, of *Rome*, &c.

**TOUR of Hair**, a *Tress*, or *Border* of Hair, going round the Head, which mingled dexterously with the natural Hair, lengthens and thickens it. See *HAIR*.

These *Tours* are for Men. — The Women likewise use *Tours*, and false Hair, either to hide their Age, or to supply the Thinness of their natural Hair on the Forehead and Temples.

The Form is different according to the Mode; sometimes rais'd and curl'd, sometimes straight and laid flat along the Forehead. See *PERUQUE*.

The Word is pure *French*, signifying literally a *Round*, or something that goes around.

**TOURN**, in *LAW*. See *TORN*.

**TOUT** *temps prêt & uncore* *q. d.* always ready, and so at the present Time is a kind of *Met* in Way of Excuse or Defence, for him that is sued for any Debt or Duty belonging to the Plaintiff. See *PLEA*.

**TOW**. Whatever is drawn by a Ship or Boat with a Rope, is said to be *towed* after her.

**TOWAGE**, the halcing or drawing a Ship or Barge by Men or Beasts, or by another Ship or Boat, sail'd to her; in order to make her enter a Port, ascend a River, or the like.

The Term is also us'd for the Money, or other Recompence, given by Bargemen to the Owner of the Ground next the River where they *tow* a Barge or other Vessel, for the Liberty of passing along the Side thereof.

The Word is probably deriv'd from the *Saxon*, *Tean*, to draw.

**TOWER**, a tall Building, consisting of several Stories, and usually of a round Form.

Before the Invention of Guns, they us'd to fortify Places with *Towers*; and to attack them with moveable *Towers* of Wood, mounted on Wheels, to fit the Besiegers on a Level with the Walls, and drive the Besieg'd from under the same.

These *Towers* were sometimes 20 Stories, and 30 Fathom high: They were cover'd with raw Skins, and an hundred Men employ'd to move them.

*Towers* are also built to enable one, by their Elevation, to view to a great Distance.

These are of all Figures; as, square, round, pentagonal, &c. See *PIRARS*.

In *Uben* is a famous *Tower* of *Porcelain*, whereof the *Dutch* relate Wonders. See *PORCELAIN*.

*Towers* are also built for Fortresses, Prisons, &c. as the *Tower* of *London*, the *Towers* of the *Basilie*, &c. See *FORTIFIED PLACE*.

The *Tower* of *London* is not only a Citadel, to defend and command the City, River, &c. but also a Royal Palace, where our Kings with their Courts have sometimes lodg'd; a Royal Arsenal, wherein are Arms and Ammunition for 60000 Soldiers; a Treasury for the Jewels and Ornaments of the Crown; a Mint for coining of Money; the great Archive, wherein are preserv'd all the ancient Records of the Courts of *Westminster*, &c. and the chief Prison for State Criminals. See *ARSENAL*, *MINT*, &c.

In the midst of it is the great square, white *Tower*, built by *William* the Conqueror; — Within the *Tower* is a Parochial Church, exempt from all Jurisdiction of the Archbishop, and a Royal Chapel, now diffus'd.

The chief Officer of the *Tower* is the *Constable*, under whom is the *Lieutenant*, who acts by his Direction, and in his Absence. He has by Grant of several of our Kings, *Utram Legatum*, two Gallons and a Pint of Wine, out of every *Vedil*; and a certain Quantity out of every Boat laden with *Lobsters*, *Oyllets*, and other Shell Fish, and double the Quantity out of every Alien's Boat, passing by the *Tower*: To him also belongs a Fee of 200*l.* for every Duke committed Prisoner; 200*l.* for every Peer not a Duke, and 50*l.* for every Commoner. See *CONSTABLE*, &c.

Under the *Constable*, and, in his Absence, under the *Lieutenant*, are a *Goalman Porter*, and the *Warders*.

The first has Charge of the Gates, to lock and unlock them, and deliver the Keys every Night to the *Constable*, or *Lieutenant*, and receive them of him next Morning: He commands the *Warders* who are upon the *Day's* *Wait*; and at the Entrance of a Prisoner has for his Fee *Vestimenta Superiora*, or else a Composition for the same, which is usually 30*l.* for a Peer, and 5*l.* a-piece for others.

Note, The ancient Allowance from the King to a Duke or Marquis, Prisoner in the *Tower*, was 12*l.* a Week, now but 4*l.* To all other Lords anciently 20*l.* a Week, now 2*l.* 4*s.* 5*d.* To Knights and Gentlemen anciently 4*l.* a Week, now 13*s.* and 4*d.* And to inferior Persons, now 10*s.* per Week.

The *Yeomen Warders* of the *Tower* are 40, who are accounted the King's Domestic Servants: Their Duty is to attend State Prisoners, and to wait at the Gates: Ten of them to be upon the *Day's* *Wait*, to take account of all Persons that come into the *Tower*, to enter their Names, and the Names of those they go to: Two of them are on the Watch all Night. See *WARDER*.

In the *Tower* is likewise kept a Court of Record every *Monday*, by *Prescription*, for the Liberty of the *Tower*, of Debt, *Trespas*, and other Actions of any Sum. See *COURT*.

Beside the ancient Liberty of the *Tower*, which adjains to it; the old Artillery Garden by *Spirite Fields*, and the *little Almonies*, are within the *Tower* Liberty; within which the Gentleman Porter has the same Power and Authority, as *Sheriffs* within their respective Counties. See *ORDNANCE*, &c.

*Hollow Tower*, in Fortification, is a Rounding made of the Remainder of a *Breife*, to join the Courin to the Orillon.

**TOWN**, a Place inhabited by a considerable Number of People; of an intermediate Degree between a City and a Village. See *VILLAGE*, &c.

'Tis very hard to give a tolerable Definition of a *Town*, in regard the Idea is a little arbitrary and unfix'd. A *Town* is generally without Walls, which is the Character that usually distinguishes it from a City: But this does not hold universally. See *CITY*.

We have several Kinds of *Towns*; Borough *Town*, Market *Town*, County *Town*. See *BOROUGH*, &c.

**TOXICA**, a Sort of Poison, said to be us'd by the *Indians* to their Arrows, in order to render Wounds made by them incurable. See *POISON*.

The *Indians* are suppos'd to poison their Arrows, Daggers, &c. with the Virus of *Vipers*, the mischievous Effects whereof continue a long Time after the Matter is quite dry'd up. See *VIPER*.

**TRABEATION**, in the ancient Architecture, the same with *Entablature*. See **ENTABLATURE**.

It consists of three principal Members or Divisions, viz. the Architrave, Frieze, and Cornice; each of which consists of divers lesser Members and Ornaments. See **ARCHITRAVE**, **FRIEZE**, &c.

The Proportion, Members, &c. are different in the several Orders. See **ORDER**; see also each Order apart, **TUSCAN**, **DORIC**, &c.

**TRACE**, a Mark or Impression which any thing leaves behind it in passing over another.

*Traces of the Brain*, among the Cartesian Philosophers, are those Impressions, more or less deep, which sensible Objects make on the fine Fibres of the Brain, by means of the Organs of Sense. See **BRAIN**.

These Impressions are also call'd *Traces of the Object*: The Course of the Animal Spirits serves to keep them up, and to renew them. See **SPIRIT**.

The Vivacity of the Imagination arises from the prodigious Quantity of *Traces* of different Objects in the Brain, which are so link'd together, that the Spirits cannot be sent into one of them, but they run into all the rest; by which Means the Ideas occasion'd by the Application of the Spirits to those several *Traces*, are all excited, as it were, at once. See **IMAGINATION**.

Memory, according to the same, consists in the *Traces* which the Animal Spirits have inspect'd. See **MEMORY**, **HABITUDE**, &c.

*Trace of a Horse*, among Hunters, is her Footing in the Snow; distinct from her other Treadings, call'd *Doubling* and *Pricking*, &c.

*Traces* are also the Tracks of ravenous Beasts, as Wolves, wild Bears, &c.

**TRACHEA**, in Anatomy, a large Artery, call'd also *Aspera Arteria*, and popularly the *Wind-pipe*; being the Canal or Tube which carries the Air into the Lungs, for the Use of Respiration and Speech. See **RESPIRATION** and **VOICE**.

It is compos'd wholly of Cartilages, Membranes, little Veins, Arteries, and Nerves: *Gales* gave it the Name *Trachea*, *τετραχια*, because of its being rough and uneven; or which Account the *Latins* also call'd it *Aspera*.

The Head or Cover of the *Trachea Arteria* is call'd the *Larynx*. See **LARYNX**.

Its Cartilages are in Form of Rings, flat on one Side, and not finishing the whole Circle, but representing the Figure of an ancient Greek Sigma, whence they are call'd *Sigmatides*. See **ASPERA**.

In the *Philosophical Transactions*, is a Letter by Mr. John Keen, recommending the more frequent Use of Laryngotomy, or Opening of the Wind-pipe upon pressing Occasions; which he urges from a remarkable Case of a Person who had the *Trachea*, or Wind pipe, cut quite thro' beneath the Pomum Adami, cur'd by litching the Wound, and using proper Medicines. See **LARYNGOTOMY**.

**TRACHOMA**, in Medicine, a Roughness or Asperity of the inner Part of the Palpebrae; attended with an itching, Redness, and frequently with Pusiles, resembling Millet-Seed.

Its Degrees are the *Sycosis* and *Zylois*. See **SYCOsis**, &c.

**TRACT**, from the *Latin*, *Tractus*, properly denotes an Extent of Ground, or a Portion of the Surface of the terraqueous Globe. See **TERRAQUEOUS**, &c.

**TRACT**, or **TRACTATE**, from the *Saxon*, *Tracta*, or the *Latin*, *Tractatus*, does also signify a small Treatise, or written Discourse, upon any Subject. See **TREATISE**.

**TRACT**, in Hunting, denotes the Trace or Footing of a wild Beast.

**TRACTION**, *drawing*, the Action of a moving Power whereby the Moveable is brought nearer to the Mover; call'd also *Attraction*. See **ATTRACTION**.

**TRACTRIX**, in Geometry, a Curve Line; call'd also *Catenaria*. See **CATENARIA**.

**TRADE**, *Traffic*, *Commerce*, the negotiating, buying, selling, exchanging, &c. of Commodities, Bills, Money, &c.

For the Origin, Progress, &c. of *Trade*. See **COMMERCE** and **NAVIGATION**.

**TRADE-WINDS**, are certain regular Winds at Sea, blowing either constantly the same Way, or alternately this way and that; thus call'd from their great Use in Navigation and the *Indian Commerce*.

The *Trade-winds* are of different Kinds; some blowing three or six Months of the Year one Way, and then the like Space of Time the opposite Way; very common in the *Indian Seas*, and call'd *Monsoons*. See **MONSOON**.

Others blow constantly the same Way: such is that general Wind between the Tropicks, which off at Sea is found to blow all Day long from East to West.

For the Phenomena of each, with their Physical Causes, see **WIND**.

Dr. Lister has a Conjecture in the *Philosophical Transactions*, that the *Tropical*, or *Trade-winds*, arise, in great Part, from the daily and constant Breath of a Sea Plant, call'd the *Sargisso*, or *Leucocis Marina*, which grows in vast Quantities from 36° to 18° North Latitude, or elsewhere upon the deepest Seas. — For the Matter of Wind coming from the Breath of one only Plant, must needs be constant and uniform; whereas the great Variety of Trees and Plants at Land, furnishes a confus'd Matter of Winds. Hence, he adds, it is, that these Winds are briskest about Noon; the Sun quickening the Plant most then, and causing it to breathe faster, and more vigorously. Lastly, the Direction of this Wind from East to West, he attributes to the general Current of the Sea; for a gentle Air is observ'd to be constantly led along with the Stream of a River: Nor must it be omitted, that every Plant is, in some Measure, a Heliotrope, and bends itself, and moves after the Sun, and consequently emits its Vapour thitherward; so that the Direction of the *Trade-wind* is, in some measure, also owing to the Course of the Sun.

Dr. Gordon has another Hypothesis: The Atmosphere, which surrounds the Earth, and moves along with it in its Diurnal Motion, he supposes to keep Pace therewith; that Part of it, at least, which is near the Earth; if the remoter Part should be judg'd to loze Ground.

If then there were no Changes in the Atmosphere's Gravity, he supposes it would always go along with the Earth from West to East in an uniform Motion, altogether insensible to us: But the Portion of the Atmosphere under the Line being extremely rarify'd, its Spring expanded, and so its Gravity and Pressure much less than the neighbouring Parts of the Atmosphere; it is incapable of the uniform Motion towards the East, and must therefore be press'd Westwards, and make the continual Breeze from East to West, between the Tropicks.

**TRADITION**, the Act of delivering a Thing into the Hands of another.

The Sale of a Moveable is completed by a simple *Tradition*. See **SALE**.

**TRADITION**, in Matters of Religion, is apply'd to those Laws, Doctrines, Relations, &c. which have been handed down to us from our Fore-fathers, without being written.

Taking *Tradition* in this Sense, for every thing relating to Faith, or the Rites and Ceremonies of Religion thus deriv'd down to us from the Primitive Church, there are two Kinds, viz. *Apofstolical* and *Ecclesiastical Tradition*.

*Apofstolical Tradition*, which is what we properly call *Tradition*, is defin'd by the *Romanists*, to be the unwritten Word of God, descended from the Apollites to us, thro' a continual Succession of the Faithful.

By this *Tradition*, say they, it is that the Holy Scriptures have been kept entire, both as to the Letter, i. e. the Text, and as to the Spirit or Sense thereof: This *Tradition*, the Council of *Trent* declares to have the same Authority with the Holy Scripture itself; and pronounces every one who rejects it a Heretic.

*Ecclesiastical Traditions*, are certain Statutes and Regulations regarding the Rites, Customs, and Circumstances of Religion, introduc'd since the Time of the Apollites, by Councils, Popes, &c. and continu'd to our Time thro' a constant Observance of the Church.

The *Romanists* make another Division of *Tradition*, viz. into *Written* and *Unwritten*.

*Written Tradition*, is that wherof we find some Traces in the ancient Fathers and Doctors.

*Unwritten Tradition*, is that wherof we find no Signs or Footsteps in any of the Fathers extant.

The Church of *Rome* pretends to be the Depository of each Kind: *Tradition*, she holds to be absolutely necessary in the Church; grounding this Necessity on the Promise of Infallibility which Jesus Christ is pretended to have made her.

Yet others of that Communion deny *Tradition*, how excellent soever it may be for the Reclaiming of Hereticks, to be absolutely necessary; maintaining, that the Church would not be less infallible, nor less the Rule of Doctrine, &c. if the Fathers had never wrote at all.

**TRADITIONARY**, **TRADITIONARIUS**, a Name given among the *Jews*, to such of them as acknowledge *Tradition*, follow it, and explain the Scriptures thereby; in Opposition to the *Caraites*, who refuse any thing but the pure Scriptures themselves. See **CARAITES**.

The *Traditionaries* are what we more usually call *Rabbins*, or *Talmudists*. See **RABBIN** and **TALMUD**.

Hillel those among the *Traditionaries*, and *Sabanmai* among the *Textuaries*. See **TEXTUARY**.

**TRADITORES**, a Name given in the first Ages of the Church, to such Christians, as, in Times of Persecution, to avoid Death and Martyrdom, deliver'd up the sacred Writings to the Persecutors.

The Enemies of Religion, even under the old Law, made their utmost Efforts to deprive the World of the Holy Scriptures: In that cruel Persecution which Antiochus caus'd against the Jews, the Books of the Law were very sollicitously sought after, torn, and burnt, and such as kept them put to Death; as we read in the first Book of *Maccab.* cap. iv. 59, and 60.

*Dionysius* renew'd the same Impiety, by an Edict publish'd in the 19th Year of his Empire, commanding all the sacred Books to be brought to the Magistrates, and burnt.

Many weak Christians, and even some Bishops, overcome by the Fear of Punishment, carry'd in their Books to the Persecutors; which the Church detesting, made very severe Laws against them, and gave them the infamous Name of *Traditores*, from *Trado*, I deliver.

As the great Pretence of the Schism of the Donatists was, that the Catholics tolerated the *Traditores*; it was decreed in the Council of *Arles*, held in 314, that such as should be found guilty of having deliver'd up any of the Holy Books, or Vessels, should be depos'd from the Order of the Clergy, &c.

**TRADUCIANS, TRADUCIANI**, a Name the *Pelagians* anciently gave to the Catholics, because of their teaching, that original Sin was transmitted from Father to Children, or that it was communicated to the Children by the Father in the Way of Generation. See ORIGINAL SIN.

The Word is form'd of the Latin, *tradux*, which was made Use of to express that Communication; and which comes from *trahere*, I transmit, or make pass from one to another.

At present, some give the Appellation *Traducian* to such as hold that the Souls are retransmitted to the Children by the Father.

**TRADUCTION**, the *Translating*, or turning out of one Language into another. See TRANSLATION.

The Word is form'd of *trans*, beyond, and *duco*, I lead, draw.

**TRAFINE**, among Surgeons, an Instrument, call'd also *Trepanium, Anabapiston, Moschus*, &c. See TREPANIUM and MOSCHUS.

**TRAFFIC**. See TRADE and COMMERCE.

The principal *Traffic* in *Muscovy*, and the North, is in Furs and Skins: The great *Traffic* of the Dutch in the East is in Spices: The *Traffic* of Money is mostly carry'd on at the Exchange.

The Word is form'd from the French, *Trafic*, and that from the Italian, *Trafico*, which is again borrow'd from the Arabic.

**TRAGACANTH, or ABRAGANTH**, a kind of Gum oozing out at Incisions made in the Trunk and larger Branches of a Plant, or little Shrub, of the same Name. See GUM.

The naked Hillocks of Mount *Ila* in *Candia*, *M. Tournefort* tells us, produce a deal of the Plant *Tragacantha*, which gives the Gum spontaneously towards the End of *June*, and in the following Months; when the nutritious Juice of the Plant, thicken'd by the Heat, bursts most of the Vessels it is contain'd in.

This Juice coagulates in Threads, which make their Way into the Pores of the Bark, where being push'd forwards by new Juice, they get thro' the Bark, and are at length harden'd in the Air, either into little Lumps, or into twisted Pieces in Form of little Worms, more or less long according to the Manner they are form'd of.

It should seem too that the Contraction of the Fibres contributes to the Expression of the Gum: Those fine Fibres, like those of Hemp, laid bare and trampled under Foot by Men and Horses, contract themselves, and facilitate the Expression of the extravasated Juice.

The Plant grows also in several Places of the *Levant*, particularly about *Aleppo*.

The Word is form'd of the Greek, *τραγος*, Goat, and *ακανθα*, Thorn, by Reason the Plant is best with Thorns.

The Gum is of different Colours, and Qualities; some being white, other some greyish, some red, and some almost black. The white is the best. It must be chosen clear, smooth, and twisted like little Worms.

It dissolves easily in any aqueous Menstruum, which it will give the Consistence of a Syrup in, in the small Proportion of a Dram to a Pint. It is smooth and softening, and therefore good to obtund the Acrimony of any Humours, which makes it of Service in such Coughs as proceed from Catarrhs and Diffusions of Rheum. It is also very strengthening in some Seminal Weaknesses, and prevalent against the Whites in Women.

**TRAGEA**, in Pharmacy, a Term frequently used to express Powders grossly beat; but now obsolete. See POWDER.

**TRAGEDY**, a Dramatic Poem, representing some signal Action, perform'd by illustrious Persons, and which has frequently a fatal Issue or End. See DRAMA.

*Aristotle* more Scientifically defines *Tragedy*, the Imitation of one grave and entire Action, of a just Length; and which,

without the Assistance of Narration, by raising of Terror and Compassion, refines and purges our Passions.

This Definition has given the Critics some Perplexity; and *Cornelius* declares he cannot reconcile *Aristotle* with himself: The Instances *Aristotle* cites, he thinks, ruin his own Definition. He even denies the purging our Passions to be the End of *Tragedy*.

Our English Authors are more favourable to the Definition: By the purging our Passions, they understand not the extirpating them, but the reducing them to just Bounds; for by showing the Miseries that attend a Subjection to them, it teaches us to watch them more narrowly; and by seeing the great Misfortunes of others, it lessens the Sense of our own.

*Tragedy*, in its Original, *M. Hædlin*, observes, was only a Hymn sung in Honour of *Bacchus*, by several Persons, who, together, made a Chorus of Music, with Dances and Instruments. See CHORUS.

As this was long, and might fatigue the Singers, as well as tire the Audience; they beought themselves to divide the singing of the Chorus into several Parts, and to have certain Recitations in the Intervals.

Accordingly, *Thespis* first introduced a Person upon the Stage with this View: *Æschylus* finding one Person insufficient, introduced a Second to entertain the Audience more agreeably, by a kind of Dialogue: He also cloath'd his Persons more decently, and first put them on the Buskin. See CORYMBUS.

The Persons who made these Recitations on the Scene, were call'd *Actors*; so that *Tragedy* at first was without Actors. And what they thus rehear'd, being things added to the singing of the Chorus, whereof they were no necessary Part, were call'd *Episodes*. See EPISODE.

*Sophocles* found that two Persons were not enough for the Variety of Incidents; and accordingly introduced a Third: And here the Greeks seem to have stopp'd; at least 'tis very rare that they introduce four Speakers on the same Scene. See PERSON.

*Tragedy* and Comedy were at first confounded with each other; But they were afterwards separated; and the Poets applied themselves to the cultivating of *Tragedy*, neglecting Comedy. See COMEDY.

When *Tragedy* was got into a better Form; they changed the Measure of its Verse, and endeavour'd to bring the Action within the Compass of a Day, or of a Revolution of the Sun. See UNITY.

For the several Parts of *Tragedy*; see ACT, SCENE, ACTION, FABLE, CHARACTER, MANNERS, &c.

The English received the first Plan of their Drama from the French; among whom it had its first Rise towards the End of the Reign of *Charles V.* under the Title of *Chant-Royal*, which were Pieces in Verse, compos'd in Honour of the Virgin, or some of the Saints, and sung on the Stage; call'd by the Title of *Chant-Royal*, because the Subject was given by the King of the Year, or the Person who had bore away the Prize the Year preceding. See CHANT.

The Humour of these Pieces run wonderfully among the People, inso-much that in a little time there were form'd several Societies, who began to vie with each other: One of these, to engage the Town from the rest, began to intermix various Incidents, or Episodes, which they distributed into *Acts, Scenes*, and as many different Persons as were necessary for the Representation.

Their first Essay was in the *Beauges. Maur*; and their Subject the Passion of Our Saviour. The Prevot of *Paris* prohibiting their continuing of it, they made Application to Court; and to render it the more favourable to them, erected themselves into a Fryary or Fraternity, under the Title of *Brothers of the Passion*; which Title has given some Occasion to suspect them to have been an Order of Religious, or Friars of the Passion.

The King, on seeing and approving some of their Pieces, granted them Letters of Establishment in 1402; upon which they built a Theatre; and for an Age and a Half, acted none but grave Pieces, which they call'd *Moralities*; till the People growing weary of them, they began to intermix Farces or Interludes taken from profane Subjects.

This Mixture of Farce, and Religion, displeasing many; they were re-establish'd by an Act of Parliament in 1548, on Condition of their acting none but profane, lawful and decent Subjects, without intermeddling with any of the Mysteries of Religion; and thus were the Brothers of the Passion depossid'd of their religious Character; upon which they mount'd the Stage no more in Person; but brought up a new Set of Comedians, who acted under their Direction.

Thus was the Drama establish'd; and on this Foundation arriv'd in *England*. In process of Time, as it was improv'd, it became divided into Branches, agreeable to the Practice of the Ancients, and the Nature of Things, viz. into *Tragedy* and Comedy, properly so call'd, and this last again, was sub-divided into pure Comedy and Farce; see each under its proper Head, COMEDY, &c.

**TRAGI-COMEDY**, another kind of Dramatic Piece, representing some Action pass'd among eminent Persons, the Event whereof is not unhappy or bloody; and wherein its sometimes admitted a Mixture of less ferrous Characters.

The Ancients, M. *Dacier* observes, knew nothing of such Compositions, wherein the Serious and Comic are blended: Nor does the Epithet M. *Carville* gives them of *Héroic Comedies*, excuse their Irregularity.

Their Foundation is certainly bad; for endeavouring both to make us laugh and cry in their turns, they endeavour at contrary Emotions, which the Heart can never undergo; every thing that disposes for the one, indisposing for the other.

The *Tragi-Comedy* was formerly very common on the *English Stage*: Scarce such a thing in the 17th Century, as a pure Tragedy without a spice of Comedy, or Farce to make the People laugh. Now, that the Stage and our Tastes are brought nearer to the Model of Nature and the Ancients, the *Tragi-Comedy* is disused. *Tragi-Comedy* is the only Case, wherein Comedy is allow'd to introduce Kings and Heroes. See **COMEDY**.

**TRAGUS**, in Anatomy, one of the Protuberances of the Auricle, or external Ear; call'd also *Hircus*, because usually hairy. See **EAR**.

The *Tragus* is that Protuberance next the Temple; that on the opposite Side, to which the left Lobe of the Ear is annex'd, is call'd the *Antitragus*.

**TRAJAN Column**, a famous historical Column, erected in Rome, in Honour of the Emperor *Trajan*. See **COLUMN**.

'Tis of the *Tylosan Order*, though somewhat Irregular: Its Height is Eight Diameters, and its Pedestal *Corinthian*; it was built in a large Square there, call'd the *Forum Romanum*.

Its Base consists of 12 Stones of an enormous Size, and it is raised on a Sockle or Foot of Eight Steps. Within-side, is a Stair-case, illuminated with 44 Windows. 'Tis 140 Foot high, which is 35 Foot short of the *Antoine Column*; but the Workmanship of the former is much more valued.

'Tis adorn'd from top to bottom with Bas-reliefs, representing the great Actions of that Emperor against the *Dace*.

Several learned Men have explain'd the Bas-reliefs of the *Trajan Column*, and among others *Guaricus* and *Fabretti*.

The late King of France, *Louis XIV.* had Models of all the Bas-reliefs taken off in Plaster of *Paris*.

**TRAJECTORY** of a Comet, is its Path or Orbit; or the Line it describes in its Motion. See **ORBIT**.

'Tis, *Hewelius*, in his *Cometographia*, will have to be very nearly a right Line; but Dr. *Halley* rather concludes it to be a very excentric Ellipsis. See **ELLIPSIS**.

Sir *Isaac Newton* in Prop. 41. of his third Book, shews how to determine the *Trajectory* of a Comet from three Observations; and in his last Proposition, how to correct a *Trajectory* graphically described. See **COMET**.

**TRAIL-Board**, in a Ship, is a curved Board on each Side of her Beak, which reaches from the Main-stem to the Figure, or the Brackets. See **SHIP**.

**TRAIN**, the Attendance of a great Person; or, the Trail of a Gown, or Robe of State.

In Falconry, it is the Tail of an Hawk. See **TAIL**.

**TRAIN** is likewise used for the Number of Bees which a Watch makes in an Hour, or any other certain Time. See **WATCH-Work**, &c.

**TRAIN** is also used for a Line of Gun-powder, laid to give fire to a Quantity thereof, in order to do Execution, by blowing up Barre, Works, Buildings, &c. See **Gun-Powder**, **MINE**, &c.

**TRAIN of Artillery**, includes the great Guns and other Pieces of Ordnance belonging to an Army in the Field. See **GUN**, **CANNON**, **ORDNANCE**, &c.

**TRAIN Oil**, the Oil procured from the Blubber of Whales, by boiling. See **OIL** and **WHALE**.

**TRAIN-Bands**, or **TRAINED-Bands**, a Name given to the Militia of *England*. See **MILITIA**.

**TRAINING a Lead**, among Miners, is the searching for, and pursuing a Vein of Ore. See **VEIN**.

**TRAMBLING the Tin Ore**, among Miners, is a washing it very clean; which is done with a Shovel, and in a Frame of Boards. See **TIN**.

**TRAMEL**, an Iron Instrument, wherewithal to make a Horse amble. See **AMBLING**.

It is also taken in many Places for an Iron moveable Instrument in Chimneys, to hang Pots over the Fire.

**TRAMEL-Net**, is a long Net, wherewith to take Fowl by Night, in Champlain-Countries; much like the Net used for the Low-bell, both in Shape, Bigness and Masses.

To use it, they spread it on the Ground, so as the nether or farther End, fitted with small Plumets, may lie loose thereon. Then the other Part being bore up by Men, placed at the Fore-ends, it is thus trailed along the Ground. At each Side, are carried great blazing Lights, by which the

Birds are raised; as they rise under the Net, they are taken. See **LOW-Bell** and **HAND-Net**.

The Word comes from the *French*, *Tremail*, form'd of the *Latin Tremaculum* or *Tremaculum*, of *Macula*, by reason it is compos'd of three Rows of Masses.

**TRAMONTAN**, **TRAMONTANE** or **TRAMONTAIN**, something beyond, or on the further Side the Mountains.

The Term is particularly apply'd by the *Italian* Poets, to all such as live on the other Side the *Alps*, i. e. all out of *Italy*; as the *Germanus*, *Vienisij*, *French*, &c.

The *French* Lawyers give the same Title of *Tramontane* or *Ultramontane* Doctors to the *Italian* Canonists, *Gomes*, *Hofstiensis*, *Peuorm*, &c. who go upon Rules and Maxims, too favourable to the Court of *Rome*, and contrary to those of *France*, &c.

The Word is form'd from the *Italian*, *tra*, of the *Latin*, *trans*, which signify beyond; and *mont* or *mont*, Mountain.

On the *Mediterranean*, and in *Italy*, a North Wind is call'd a *Tramontane Wind*: and some call the Pole Star, the *Tramontane*.

Hence the Proverb, To lose the *Tramontane*; that is, to be out of one's Aim, to be disconcerted.

**TRANCHE** is used by the *French* Armors, to express that Manner of Parition call'd among us *Party per bend Dexter*. See **PARTY** and **BEND**.

A Scutcheon is said to be *tranche*, cut, when it is divided in two Diagonally; the Division coming from the Dexter Angle of the Chief, to the Sinister Angle of the Point a When it is divided contrary-wise, it is said to be *saile*.

**TRANSACTION**, a Negotiation, particularly an Accommodation, or a Dispatch of some Business, or of a Dispute between two Parties, by a mutual and voluntary Agreement or Contract between them.

*Philosophical TRANSACTIONS*, are a kind of Journal of the principal Things that come before the Royal Society of *London*. See **JOURNAL** and **ROYAL SOCIETY**.

The *Transactions* contain the several Discoveries and Histories of Nature and Art, made by the Members of the Society, or communicated by them from their Correspondents; the several Experiments, Observations, &c. made by them, or transmitted to them, &c.

They were first set on Foot in 1665 by Mr. *Oldenbourg*, Secretary of the Society, and continued by him till the Year 1679. After his Death, Dr. *Hook*, the succeeding Secretary, continued them under the Title of *Philosophical Collections*; But Dr. *Grew*, appointed to the same Office in 1689, resumed the former Title of *Philosophical Transactions*, which was retain'd by his Successor Dr. *Ploet*, and subsists to this Day.

They were publish'd every Month, with great Care, by Mr. *Oldenbourg*, and the first Secretaries; but after Dr. *Ploet*, they were frequently interrupted. In the Year 1700 Dr. *Steno* resorted their regular Publication, Monthly; in time they relapsed, and only came out once in two Months; from that they fell to 3, 4 and 6 Months. They are now publish'd more frequently and regularly, by the Care of Dr. *Jurins*.

**TRANGLE**, in Heraldry, the Diminutive of a Fesse, commonly call'd a *Zer*. See **BAR** and **FESSE**.

**TRANSCENDANT**, or **TRANSCENDENTAL**, something raised, or elevated beyond other Things; or which passes and *transcends* the Reasons and Circumstances of other inferior Beings, so as not to be intimately and essentially included under them.

The Term is particularly apply'd to the Object of Metaphysics, which considers Being in general, or *Transcendens* Beings, as God and Angels; and Truths consisting in pure Speculation. See **METAPHYSICS**.

The Logicians and Metaphysicians, call *Transcendental* Terms, those which are so general and of a Signification so extensive and universal, that they pass through all the Categories, and agree to all kinds of Things; such are the Terms *Ens*, *Unum*, *Verum*, *Bonum*, *Res*. See **ENS**, &c.

**TRANSCENDENTAL Quantities**, among the School-men, &c. are particularly apply'd to the Continuation of the Existence, Duration, or Time of a Being. See **DURATION** and **TIME**.

**TRANSCENDENTAL Quantities**, among Geometricians, are undetermined ones; or such as cannot be express'd on fix'd or any constant Equation: Such is a *Transcendental Curve*, or the like. See **TRANSCENDENTAL Curve**.

M. *Leibnitz* has a Dissertation in the *Acta Erudit. Lipsj.* wherein he endeavours to shew the Origin of such Quantities, *vis.* why some Problems are neither Plain, Solid, nor Surfeld, nor of any certain Degree, but do *transcend* all algebraical Equations. See **PROBLEMS**.

He also shews how it may be demonstrated without a Calculus, that an algebraic Quadratrix for the Circle or Hyperbols, is impossible: For if such a Quadratrix could be found, it would follow, that by means thereof, any Angle, Ratio or Logarithm might be divided in the given Proportion of one right Line to another, and this, by one universal Construction; and, consequently, the Problem of the Section of an Angle,

or the Invention of any Number of mean Proportionals, would be of a certain Degree. See CIRCLE, QUADRATURE, QUADRATURE, &c.

Whereas the different Degrees of algebraical Equations; and, therefore, the Problem, understood in general of any Number of Parts of an Angle or mean Proportionals; is of an indefinite Degree, and transcends all Algebraical Equations. See EQUATION.

**TRANSCENDENTAL Curve**, in the higher Geometry, is such a one as cannot be defined by any Algebraic Equation, or which, when express'd by an Equation, one of the Terms thereof is a variable or flowing Quantity. See CURVE.

These Curves are the same with what *Des Cartes*, and, after his Example, several others, call *Mechanical Curves*; and which they would have excluded out of Geometry; but *Sir Isaac Newton* and *M. Leibnitz*, are of another Sentiment. For, in effect, in the Construction of Geometrical Problems, one Curve is not to be prefer'd to another, as is defined by a more simple Equation; but as it is more easily described than that other. See GEOMETRICAL Line.

And some of these *Transcendental* or *Mechanical Curves*, are found of greater Use than all the Algebraical ones together, except the Circle. See MECHANICAL.

Add, That *M. Leibnitz*, in the *Acta Eruditor. Lips.* gives us a kind of *Transcendent Equations*, whereby these *Transcendental Curves* are actually defined, and which are of an indefinite Degree; that is, are not always the same in all the Points of the Curve.

Whereas Algebraists, use to assume some general Letters, or Numbers, for the Quantities sought; in these *Transcendental Problems*, *M. Leibnitz* assumes general or indefinite Equations for the Lines sought; e. g. putting  $x$  and  $y$  for the Abscissa and Ordinate, the Equation he uses for a Line sought, is,  $a + b x + c y + x y + f x x + g y y$ , &c. = 0. By the help of which indefinite Equation, which in reality is Finite; for it may always be determin'd, how far soever 'tis necessary to raise it; he seeks the Tangent; and that which results, comparing with the given Property of Tangents, he finds the Value of the assumed Letters,  $a, b, c$ , &c. and thus defines the Equation of the Line sought.

If that Comparison above-mentioned, do not proceed, he pronounces the Line sought, not to be an Algebraical, but a *Transcendental one*.

This suppos'd, he goes on to find the Species of *Transcendency*; for some *Transcendentals* depend on the general Division or Section of a Ratio, or upon the Logarithms; others upon the Arks of a Circle, and others on more indefinite and compound Enquiries.

Here, therefore, besides the Symbols  $x$  and  $y$ , he assumes a Third, as  $v$ , which denotes the *Transcendental Quantity*; and of these Three, forms a general Equation for the Line sought; from which he finds the Tangent, according to the differential Method, which succeeds even in *Transcendental Quantities*. What he finds he compares with the given Properties of the Tangent; and so discovers, not only the Values of  $a, b, c$ , &c. but also the particular Nature of the *Transcendental Quantity*.

And though it may sometimes happen, that the several *Transcendents* are so to be made use of, and these of different Natures too, one from another; also though there be *Transcendents of Transcendents*, and a Progression of these in Infinitum, yet we may be satisfied with the most easy and useful one; and for the most Part may have recourse to some peculiar Artifices for shortning the Calculus, and reducing the Problem, to as simple Terms as may be.

This Method being applied to the Business of Quadratures, or to the Invention of Quadratics, in which the Property of the Tangent is always given; 'tis manifest not only how it may be discover'd, whether the indefinite Quadrature may be algebraically Impossible, but also how, when this Impossibility is discover'd, a *Transcendental Quadratrix* may be found; which is a Thing which had not before been shewn. So that it seems, that Geometry is by this Method carried infinitely beyond the Bounds, to which *Viete* and *Des Cartes* brought it: Since by this means a certain and general Analysis is establish'd, which extends to all the Problems which are of no certain Degree, and consequently not comprehended within Algebraical Equations.

Again, in order to manage *Transcendental Problems*, where-ever the Business of Tangents or Quadratures occurs, by a Calculus, there is hardly any that can be imagin'd shorter, more advantageous, or universal; than the Differential Calculus, or Analysis of Indivisibles and Infinites.

By this Method we may explain the Nature of *Transcendental Lines* by an Equation, e. g. Let  $A$  be the Ark of a Circle, and  $x$  the versed Sine: Then will  $A =$

$\int dx$   
 $\sqrt{2x - xx}$  and if the Ordinate of the Cycloid be  $y$ , then will

$y = \sqrt{2x - xx} + \int dx$   
 $\sqrt{2x - xx}$  which Equation perfectly

expresses the Relation between the Ordinate  $y$  and the Abscissa  $x$ , and from it all the Properties of the Cycloid may be demonstrat'd.

This is the Analytical Calculus, extended to those Lines which have hitherto been excluded, for no other Cause, but that they were thought incapable of it. See GEOMETRICAL Line.

**TRANSCOLATION**, in Pharmacy, the same with Filtration or Percolation. See FILTRATION, &c.

**TRANSCRIPT**, a Copy of any Original Writing; particularly that of an Act or Instrument, infer'd in the Body of another. See COPY.

In this Sense, we say *Transcript of a Fine*, &c. See FINE, DUPLICATION, &c.

**TRANSCRIPTIO Recognitionis facta coram Josticiariis Risenantibus**, &c. is a Writ for the certifying a Recognizance into Chancery, taken before the Justices in Eyre. See RECOGNIZANCE.

**TRANSCRIPTIO pedis suis levati mittenda in Cancellarium**, is a Writ for the certifying the Foot of a Fine, levied before the Justices in Eyre, &c. into Chancery. See FINE.

**TRANSEAT**, in the Schools, &c. a Term purely Latin, signifying *Let it pass*, or suppose a Proposition to be true, without granting it.

Hence the Proverb, *Transit, Græcum est, non legitur*: The Diction is said to have taken its Rise from some ancient Commentators, or Glossographers of the Civil Law, who not understanding Greek, pass'd over all the Words that occur'd in that Language, without explaining them.

In the *Roman Chancery*, a *Nisi Transsit* is a kind of Opposition made to the sealing of a Bull, or to the Delivery of some other Instrument, till the Parties against whose Interest it is directed, have been heard against it.

**TRANSELEMENTATION**, in the Schools, a Change of the Elements or Principles of one Body into those of another. See ELEMENT.

Such is that which the *Roman Catholics* contend for in the Eucharist; where the Elements of Bread and Wine are changed into those of Flesh and Blood. See TRANSUBSTANTIATION.

*Transubstantiation*, where-ever it happens, is always allow'd Miraculous; or an Effect beyond the ordinary Powers of Nature. See MIRACLE.

**TRANSFER**, in Commerce, &c. an Act whereby a Person surrenders his Right, Interest or Property in any thing moveable or immovable, to another.

The Term is principally used in the Commerce of Stocks; for the signing and making over Subscriptions, or Shares therein, to such as purchase them of the Proprietors. See SUBSCRIPTION, &c.

In the *South Sea Company*, the *Bank, East India*, &c. *Transfers* are made, by erasing the former Proprietors Names, and entering the Stock under the Name of the Purchaser, under his proper Letter of the Alphabet. See COMPANY, BANK, &c.

In order to a *Transfer*, 'tis required the Party bring another with him to swear he is the same Person to whom the Stock is enter'd. A Counterfeit in this Case is by Act of Parliament made a capital Crime.

The Lawyers say, that the Sale, or Donation of an Inheritance, &c. *Transfers* the Property, Rights, &c. thereof.

**TRANSFIGURATION**, among Divines, that miraculous Change wrought by *Jesus Christ*, in Presence of *St. Peter*, *St. James* and *St. John*, on Mount *Thabor*, where he appear'd in his Glory, in the middle of *Moses* and *Elias*. See the Description thereof in *St. Matthew*, c. xvii.

The Term is also applied to a Feast held in the *Romish Church* on the Sixth of *August*, in Commemoration of that Miracle.

**TRANSFORMATION**, a Change of Form; or a Metamorphosis. See METAMORPHOSIS.

The Chymists have been a long Time seeking the *Transformation* of Metals, that is, their *Transmutation*, or the Manner of changing them into Gold. See TRANSMUTATION.

Among the Mysticks, by *Transformation*, is understood a Change of the Consumptive Soul, whereby it is in some measure deified or converted into the Substance of God, and wherein it is, as it were, lost and swallow'd up in the Divinity, so as not to perceive its own Distinction from God.

The Sense of the Word *Transformation* is very liable to be abused; and, in effect, the Quietists and Quakers have abused it. But many of the Mysticks use it innocently enough; meaning no other by it than what *St. Paul* did when he said, *Vivo ego, jam non ego, civis vero in me Christus*.

**TRANSFORMATION** is also sometimes used for what we more properly call *Transubstantiation*. See TRANSUBSTANTIATION.

**TRANSFUSION**, the Act of pouring a Liquor out of one Vessel into another.

The Word is compounded of the *Latin* Preposition *trans*, beyond, further, and *fundis*, I pour.

In the Preparations of Chymistry and Pharmacy, there are frequent *Transfusions* of Liquors, Syrup, &c.

*Transfusion* of the Blood, is particularly us'd for the letting out the Blood of one Animal, fo as to be immediately receiv'd into the Body of another. See BLOOD.

Dr. *Lewer* is usually accounted the Inventor of this *Transfusion*, and the Experiment said to have been first publickly made by him at *Oxford* in 1665, and the Description thereof publish'd in his excellent Book of *Cardes*.

Yet we are inform'd from good Hands, that it had been propos'd at *Paris* in 1658; that another of our Countrymen had had the Idea before; and that it had been known in *Germany* several Years. — 'Tis certain there is a Passage in *Libanius*, wherein the *Transfusion* is exactly describ'd as now practis'd: 'Tis true he disapproves of it; and only mentions it to ridicule it.

The Use most naturally expected from the Operation, is, that one Animal may live of the Blood of another; so that those which want Blood, or have corrupt, morbid Blood, may be supply'd from others with a sufficient Quantity, and of such as is good and laudable.

However, 'tis certain the Operation has no Place in the present Practice of Physic; but whether that be the Fault of the Operation itself, or owing to the Indolence and Averseness of People to run into new Methods, we will not undertake to say.

The Method of *transfusing*, Dr. *Lewer* gives us to the following Effect: Take up the carotid Artery of the Dog, or other Animal whose Blood is to be *transfus'd* into another of the same, or a different Kind; separate it from the Nerve of the eighth Pair, and lay it bare above an Inch. Make a strong Ligature on the upper Part of the Artery; and an Inch nearer the Heart another Ligature with a running Knot, to be loosen'd and fasten'd as Occasion requires. Draw two Threads between the two Ligatures; open the Artery, put in a Quill, and tie up the Artery again upon the Quill by the two Threads, and stop the Quill by a Stick.

Then make bare the Jugular Vein of the other Animal, for about an Inch and half in Length, and at each End make a Ligature with a running Knot; and in the Space between the two Knots, draw under the Vein two Threads, as in the other.

Open the Vein, and put into it two Quills, one into the descending Part of the Vein, to receive the Blood from the other Dog, and carry it to the Heart: The other Quill put into the other Part of the Jugular, towards the Head, through which the second Animal's own Blood is to run into Dishes. The Quills thus ty'd fast, stop them up with Sticks till there be occasion to open them.

Things thus dispos'd, fasten the Dogs on their Sides towards one another, in such Manner, as that the Quills may go into each other: Then untie the Quill that goes down into the second Dog's Jugular Vein, as also that coming out of the other Dog's Artery; and by the Help of two or three other Quills put into each other, as there shall be occasion, insert them into one another.

Then slip the running Knots, and immediately the Blood runs through the Quills as through an Artery, very impetuously.

As the Blood runs into the Dog, untie the Quill in the upper Part of his Jugular, for his own Blood to run out at, tho' not constantly, but as you perceive him able to bear it, till the other Dog begin to cry, and faint, and at last die.

Lastly, Take out both Quills out of the Jugular, tie the running Knot fast, and cut the Vein asunder, and sew up the Skin: The Dog thus dismiss'd, will run away as if nothing ail'd him.

In the *Philosophical Transactions*, we have Accounts of the Success of various *Transfusions* practis'd at *London*, *Paris*, in *Italy*, &c. Sir *Edward King transfus'd* 47 Ounces of Blood out of a Calf into a Sheep; the Sheep after the Operation appearing as well and as strong as before.

Mr. *Cove transfus'd* 14 or 16 Ounces out of a mangled into a found Dog: The Effect was, that no Alteration was observ'd in the found Dog, but the mangled one was cur'd.

M. *Goyan transfus'd* the Blood of a young Dog into the Veins of an old one almost blind with Age, and scarce able to stir; which yet, two Hours afterwards, leap'd and frisk'd about.

M. *Denis transfus'd* the Blood of three Calves into three Dogs, which all continu'd brisk, and eat well as before. — The same Person *transfus'd* the Blood of four Weathers into a Horse 26 Years old, which thence receiv'd much Strength, and a more than ordinary Appetite.

At *St. Germain's* at *Udine*, the Blood of a Lamb was *transfus'd* into the Veins of a Spaniel 14 Years old, which had been quite deaf for three Years, and so feeble as scarce to be able to walk at all. — After the Operation he leap'd from the Table, and went about the House to seek his Mother. — Two Days afterwards he ran up and down the Streets with

other Dogs: His Stomach grew strong, and he recover'd his Hearing.

**TRANSGRESSION**, *Transgressio*, an Offence against some Law, or a Breach or Violation thereof. See LAW.

The Term is chiefly us'd in respect of the Laws of God. In the Doctrine of Original Sin, all Mankind are supposed to share with *Adam* in the Guilt of his first *Transgression*. See ORIGINAL SIN.

*Moses* threatens the *Transgressors* of his Law with abundance of Temporal Punishments. See PUNISHMENT.

The Word is compounded of *trans*, beyond, and *gradari*, to go.

**TRANSGRESSION**, in our Law, a Writ usually call'd a Writ or Action of *Trespas*.

Of this *Trespass* there are two Sorts: One Vicountial, thus call'd because directed to the Sheriff, and not returnable; but to be determin'd in the County. See VICOUNTIAL.

Its Form differs from that of the other; as waunting the Words *quare et & armis*, &c.

The other is term'd a Writ of *Trespas*, and to be sued in the *Common Pleas* and *King's Bench*. See TRESPASS.

**TRANSIRE**, in Stat. Anno 14. Car. II. is us'd for a Custom-house Warrant, or a Let-pais; from the Verb *transire*, I go forth.

**TRANSIT**, **TRANSITUS**, in Astronomy, signifies the Passage of any Planet, just by, or over any fix'd Star; and of the Moon, in particular, covering or moving over any other Planet. See STAR and PLANET.

*Mercury*, *Venus*, &c. in their *Transits* over the Sun, appear like dark Specks. See MERCURY and VENUS.

The Word comes from the *Latin*, *transire*, to pass over; form'd of *trans* and *eo*, I go beyond.

**TRANSITION**, in Music, is when a greater Note is broken into lesser, to make smooth the Roughness of a Leap, by a gradual Passage to the Note next following; whence it is commonly call'd the *breaking of a Note*; being sometimes very necessary in Musical Compositions. See NOTE and PASSAGE.

**TRANSITION**, in Rhetoric, (which some will have to be a Figure, tho' others, with *Quintilian*, deny it) is a kind of Connexion in Discourse, whereby the several different Parts and Members thereof are join'd, so as to constitute one regular Whole.

*F. de Colonia* makes two Kinds of *Transitions*; the one perfect, the other imperfect.

A *perfect Transition*, is such wherein we briefly intimate what is said, and what remains to be said; as, *Now that we have spoke of War, there remains something to be said of Peace.* — *Satis multa de Turpitudine: Atque deinceps, quod proposui, de periculo.* — *Uti Epistole respondit: Venio ad alteram.* — *Sed hoc Veteris; illud recens: Consilium meo Consilio Interfutura.*

An *imperfect Transition*, is such wherein only one of the two is express'd; as, *Let us now consider the Consequences of, &c.* *Popularet hic locus ut dicere de — sed finis sit; neque enim pro lacrymis jam loqui possunt; & hic se lacrymis defendi nequeat.*

**TRANSITIVE**, in Grammar, an Epithet given to such Verbs, as signify an Action which passes from the Subject that does it, to, or upon another Subject which receives it. See VERB.

Under the Head of *Verbi Transitive*, come what we usually call Verbs Active and Passive: Other Verbs, whose Action does not pass out of themselves, are call'd Neuters, and by some Grammarians *Intransitive*. See NEUTER.

In the *Hebrews*, the Verb *וָיָאֵל*, *hajab*, in the *Greek*, *ἀπαύει*, and in the *Latin*, *sum*, are Verbs purely Neuter or *Intransitive*; or, as the *Latin* and *Greek* Grammarians more usually express it, Verbs substantive, signifying the mere Existence of the Thing, without the active or *transitive* Conjugations.

**TRANSITORY**, in Law, &c. a Term opposite to Local. See LOCAL.

**TRANSLATION**, the Act of transferring or removing a Thing from one Place to another. See PLACE.

As the *Translation* of a Bishop, a Council, a Seat of Justice, a Parliament; the *Translation* of the Relicks of a Saint; the *Translation* of the Empire, &c.

The Word is form'd of *trans*, beyond, and *latio*, of *ferre*, to carry.

The *Translations* of Bishops from one See to another, are prohibited by the Council of *Nice*, which renders them null, and appoints the *translated* Bishop to return to his former Church. — The Council of *Sardica* excludes *translated* Bishops from Communion. It had been observ'd, that no Bishop was ever remov'd from a greater Church to a lesser; and that those who thus quitted their Churches, only did it out of Ambition or Avarice.

This Discipline was observ'd for 900 Years; and the first Instance of any *Translation* of a Note, was that of Pope *Fornosa*, who was Bishop of *Porto*. One of his Successors took hold of this Precedent to have him taken out of his

Grave; and a Council held soon after, forbid this *Translatio* to be made a Precedent.

However, the same Church allow'd of some legitimate Causes of *Translatio*s; as, the apparent Advantage of the Church; Under which Pretence, *Translatio*s soon became so frequent, that for 500 or 600 Years last past, they have been esteem'd a Kind of Common Law. See BISHOP.

The *Translatio* of a Religious from one Order to another, cannot be effected without the Consent of the Pope; 'Tis added, that it is not allow'd to *translat*e from a severer Rule to a laxer one.

TRANSLATION is also us'd for the Version of a Book, or Writing out of one Language into another. See VERSION.

*Translat*ors frequently endeavour to excuse themselves at the Expence of their Language; and ask Pardon for it, as if it were not rich and copious enough to express all the Force and Beauties of the Original.

This is the *English* Tongue accus'd of the Poverty and Dryness which is in the *Translat*or's own Genius; and the Faults charg'd on that, which should only lie at their own Doors.

The *Italians* have a Proverb, *Traduttore, Traditore*: A *Translat*or, a Traytor.

TRANSMARINE, TRANSMARINUS, something that comes from, or belongs to, the Parts beyond Sea. See FOREIGN and EXOTIC.

TRANSMIGRATION, the Removal or Translation of a whole People into some other Country, by the Violence of a Conqueror.

Some *translat*e the leading of the Children of *Israel* Captive into *Babylon*, the *Transmigration* of the *Israelites*, &c. See MIGRATION.

TRANSMIGRATION is particularly us'd for the Passage of a Soul out of one Body into another; the same with what we otherwise call METEMPSYCHOSIS.

The *Siamese*, F. *Tachard* informs us, from a Belief of the *Transmigration* of Souls into other Bodies, forbear killing any Beasts; lest, by that Means, they should dispossess the Souls of their deced'd Relations.

TRANSMISSION, in Opticks, &c. the Act of a transparent Body passing the Rays of Light through its Substance, or suffering them to pass; in which Sense the Word stands in Opposition to REFLECTION. See REFLECTION.

*Transmissio* is also frequently us'd in the same Sense with REFRACTION, by Reason most Bodies in *transmitt*ing the Rays, do also reflect them. See REFRACTION.

For the Cause of *Transmissio*n, or the Reason why some Bodies *transmit*, and others reflect the Rays. See TRANSPARENCY and OPACITY.

The Rays of Light, Sir *Isaac Newton* observes, are subject to Fits of easy *Transmissio*n and each Reflection. See RAY and LIGHT.

TRANSMUTATION, the Act of transforming, converting or changing one Nature into another. See CONVERSION and TRANSFORMATION.

The Term is chiefly us'd in Chymistry and Medicine: 'Tis greatly question'd, whether the *Transmutatio*n of Silver into Gold, and of Tin into Silver, so much sought by the Chymists, be possible or not. See GOLD, &c.

The purest and subtilest Parts of the Food are *transmut*ed or assimilated into the proper Substance of the Body. For the Manner how, see NUTRITION.

Nature, Sir *Isaac Newton* observes, seems delight'd with *Transmutatio*n: He goes on to enumerate several Kinds of *Natural Transmutatio*n; gross Bodies and light, he suspects, may be mutually *transmut*ed into each other; and adds, That all Bodies receive their active Force from the Particles of Light which enter their Composition. See LIGHT and FIRE.

For all fix'd Bodies, when well heated, emit Light as long as they continue so; and again, Light intermingles itself and inheres in Bodies as often as its Rays fall on the solid Particles of those Bodies. See OPACITY.

Again, Water, which is a fluid, volatile, tasteless Salt, is by Heat *transmut*ed into Vapour; which is a kind of Air; and by Cold, into Ice, which is a cold, transparent brittle Stone, easily dissolvable; and this Stone convertible again into Water by Heat, as Vapour is by Cold. See WATER, VAPOUR, ICE, &c.

Earth, by Heat, becomes Fire; and by Cold, is turn'd into Earth again: Dense Bodies, by Fermentation, are rarified into various kinds of Air; and that Air by Fermentation also, and sometimes without, reverts into gross Bodies. See AIR, &c.

Quick-silver sometimes puts on the Form of a fluid Metal; sometimes it appears in Shape of a pellucid, fragile Salt, called *Sublimans*; sometimes of a pellucid volatile, white, tasteless Earth, called *Astureus Dulcis*; by Distillation it becomes Vapour, and by Agitation in vacuo, shines like Fire, &c. See MERCURY and PHOSPHORUS.

All Bodies, Beasts, Fishes, Insects, Plants, &c. with all their various Parts, grow and increase out of Water, and aqueous and saline Tinctures; and by Putrefaction, all of

them revert into Water or an aqueous Liquor again. See WATER.

Further, Water expos'd a while to the open Air, puts on a Tincture, which in Process of Time has a Sediment and a Spirit; and before Putrefaction, yields Nourishment both for Animals and Vegetables. See NUTRITION and VEGETATION.

TRANSMUTATION, in Alchymy, the Act of changing or exalting imperfect Metals into Gold or Silver. See METAL, GOLD, &c.

This is also call'd the *Grand Operatio*n, and is to be effected with the Philosophers Stone. See PHILOSOPHERS STONE.

Some Alchymists hold, that the *Transmutatio*n should rather be call'd the *Perfection* of imperfect Metals; as holding all Metals intended by Nature to arrive equally at this Perfection, inasmuch as they are compos'd of the same Matter; and that 'tis only the Impurity of their Matrices, that is, of the Place wherein they are form'd by Nature, that has prevented their arriving thereto. See METAL.

The Elixir being project'd on any of those Metals, it is suppos'd to purge, and separate the impure Parts from the pure, and to join itself wholly to the Mercury (which is the pure Part,) as being of the same Nature. See PROJECTION.

Whether or no Metals are *transmut*able into one another, is a Point strongly disput'd among the Philosophers; the Alchymists strenuously asserting the Affirmative. See ALCHYMY.

Some Metals 'tis commonly allow'd may be chang'd into others, e. g. Iron into Brass or Copper, and Lead into Tin; but *Cardan* and some others deny even this, and argue further, that tho' Iron and Brass, as being nearly alike in Weight and Tenacity, &c. provided their Colour and Hardness could be chang'd, might be converted into one another, either really, or, at least, apparently, yet would the *transmut*ing or ripening of those Metals into Gold or Silver be still impossible; both as those Metals are all to be first calcin'd, after which they can never be brought again to their pristine Purity; and as there is a Generation requir'd, which is not the Work of Art, but Nature.

*Cardan de Metall. Lewery, Dickenson*, and others, give us Accounts of the various Impurities of *Alepti* in the Buficels of *Transmutatio*n; some, for Instance, fixing Mercury with Verdigrise, and then heightening the Colour with Cadmia, Turmeric, &c. But this, if try'd with the Coppel, all goes off in Fumes; and, in effect, nothing produc'd thus Way ought to be adjudg'd true Gold, unless it endure Coppelling, Cementation, Purification, with Antimony and the Depart. See PURIFICATION, ESSAYING, &c.

Add, that it must have the Malleability, extreme Ductility, and specific Gravity of Gold, which is to Water as 18 and half to 1. See WEIGHT.

The Trick of *transmut*ing Cinnabar into Silver is thus: The Cinnabar being bruis'd grossly, is stratify'd in a Crucible with granulated Silver, and the Crucible plac'd in a great Fire; and after due Time for Calcination, taken off: then the Matter being pour'd out, is found to be Cinnabar turn'd into real Silver, tho' the Silver Grains appear in the Number and Form they were put into the Crucible; but the Mischief is, coming to handle the Grains of Silver, you find them nothing but light friable Bladders, which will crumble to Pieces between the Fingers.

Mr. *Boyle* in his Scept. Chymist. tells us, that two Friends of his did, by urging Mercury in a skilfully manag'd Fire, turn it almost Weight for Weight into Water; but does not say what was the specific Gravity of the produc'd Water, nor of the remaining *untransmut*ed Mass of Mercury. — He likewise assures us, that Rain Water being distill'd and redistill'd by a Friend of his, near 200 times, did, after each Distillation, leave, at the Bottom of the Glass Body, a considerable Quantity of a white Earth; and that more plentifully in the latter Distillation than the former.

This he believ'd to be a certain Quantity of Water actually *transmut*ed into Earth; adding, that it was above twice as heavy specifically as common Water, and of so fix'd a Nature, that it lay a considerable Time in a red hot Crucible, without losing any thing of its Weight, or emitting any Smoak.

TRANSMUTATION, in Geometry, the Reduction, or Change, of one Figure or Body into another of the same Area, or Solidity, but of a different Form; as a Triangle into a Square; a Pyramid into a Parallelopiped, &c. See FIGURE, &c.

TRANSMUTATION, in the higher Geometry, is us'd for the Converting a Figure into another of the same Kind and Order, whose respective Parts rise to the same Dimensions in an Equation, admit the same Tangents, &c. See TRANSFORMATION.

If a rectilinear Figure be to be *transmut*ed into another, 'tis sufficient that the Intersections of the Lines that compose it, be transferr'd; and Lines drawn thro' the same in the new Figure. See REDUCTION.

If the Figure to be *transmut*ed be Curvilinear, the Points, Tangents, and other right Lines, by means whereof the Curve

Curve Line is to be defin'd, must be transferr'd. See CURVE.

TRANSUTATION of Plants. See SEED.

TRANSOM, among Builders, the Piece that is framed across a double light Window. See WINDOW.

TRANSOM among Mathematicians, denotes the Vane of a Cross-staff; or a wooden Member fixed across it, with a square Socket whereon it slides, &c. See VANE and CROSS-STAFF.

TRANSOM, in a Ship, is a Piece of Timber which lies athwart the Stern, between the two Fashion Pieces, directly under the Gun-room-port.

TRANSPARENCY, or *Diaphaneity*, in Physics, a Quality in certain Bodies, whereby they give Passage to the Rays of Light. See LIGHT.

The *Transparency* of natural Bodies, as Glass, Water, Air, &c. some have imputed to the great Number, and Size of the Pores or Interstices between the Particles of those Bodies: But this Account is exceedingly defective; for the most solid and opaque Body in Nature, we know, contains a great deal more Pores than it does Matter; a great deal more, sure, than is necessary for the Passage of so infinitely fine and subtle a Body as Light. See PORE.

*Aristotle, Des Cartes, &c.* place *Transparency* in the Rectitude or Straightness of the Pores; by means of which, say they, the Rays are enabled to make their Way through, without striking against the solid Parts, and being reflected back again: But this Account, Sir *Isaac Newton* shews, is lame; & the Quantity of Pores in all Bodies being sufficient to transmit all the Rays that fall on them, howsoever those Pores be situated with respect to each other.

The Cause, then, why all Bodies are not *transparent*, must not be ascribed to their wanting Rectilinear Pores; but either to the unequal Density of the Parts; or to the Pores being fill'd with some foreign Matters, or their being empty; by means of which, the Rays in passing thro', undergoing a great Variety of Reflections and Refractions, are perpetually diverted this way and that, till at length falling on some of the solid Parts of the Body, they are extinguish'd and absorbed. See RAY and REFLECTION, &c.

Thus, Cork, Paper, Wood, &c. are Opaque; whereas Glass, Diamonds, &c. are *transparent*: The Reason is, that in the neighbourhood of Parts equal in Density, such as those of Glass, Water, Diamond, &c. are with respect to each other; the Attraction being equal on every Side, no Reflection or Refraction ensues; but the Rays which enter'd the first Surface of the Bodies, proceed without Interruption quite through the Body; those few only excepted, which chance to meet with the solid Parts. But in the Neighbourhood of Parts, that differ much in Density, such as the Parts of Wood and Paper are both in respect of themselves, and of the Air or the empty Space in their Pores; as the Attraction will be very unequal, the Reflections and Refractions must be very great; and therefore the Rays will not be able to make their Way through such Bodies, but will be perpetually deflected, and at last quite stopp'd. See OPACITY.

TRANSPARENCY, in Heraldry, the same as *Adumbration*. See ADUMBRATION.

TRANSPIRATION, the insensible, or almost insensible Passage of an excrementitious Matter through the Pores of the Skin; called also *Perspiration*. See PERSPIRATION.

There are an Infinity of these *transpiratory* Pores in the Skin; the most considerable whereof, are the Orifices of the Ducts arising from the millitary Glands. See PORE and SKIN.

The Cause of *Transpiration*, is the Circulation and Heat of the Blood.

Insensible *Transpiration* is found very much to exceed all the sensible Evacuations put together. *Sancitorio* even shews, in his *Medicina Statica*, that a Person loses more in one Day by *Transpiration*, than by all the other Outlets, in Fifteen. He adds, that if the Food taken in one Day weigh Eight Pounds, the *Transpiration* will be Five of them.

Cold prevents *Transpiration*, by its constringing the Pores of the Skin, and thickening the Liqueurs circulating in the cutaneous Glands: Heat, on the contrary, augments *Transpiration*, both by its opening the excretory Ducts of the Glands, and by its increasing the Fluidity and Velocity of the Humours. See COLD, &c.

M. *Dodart*, from a Number of Experiments made for 33 Years together, assures us that we *transpire* much more in Youth than in Age. — In some Persons, the *Transpiration* is so copious, that they void but very little of the coarser Excrements, though they eat very heartily.

*Transpiration* is absolutely necessary in the Animal Oeconomy, to purify the Mass of Blood, and discharge it of a Number of uselefs heterogeneous Particles which might corrupt it. Hence it is, that upon a Stoppage of the usual *Transpiration*, there arise so many Indispositions, particularly Fevers, Agues, Itch, &c.

*Transpiration* is also of use to the Organ of Feeling, in that it prevents the Papillæ of the Skin from being dry'd,

either by the Air, or by the continual Touches of external Bodies.

TRANSPIRATION is also used by some Authors, for the Entrance of the Air, Vapours, &c. through the Pores of the Skin into the Body.

*Casari*, by this kind of *Transpiration*, accounts for the Prodigy of a Woman, whose daily Urines weigh'd 27 Pounds; though all the Foods he took, both dry and liquid, did not exceed Four Pounds. — Dr. *Baynard* suspects some such *Transpiration* to be the Cause in hydropical Persons. See DROPSY.

TRANSPLANTATION or TRANSPLANTING, in Agriculture and Gardning, the Removing of Trees or Plants, from the Places where they were sowed or bred up, and planting them in other. See PLANTING and REPLANTING.

In the *Transplanting of Foreign Trees*, Care is to be taken to preserve the Roots, and even the fine Hairs or Filaments thereof, with the Earth that sticks thereto; these Filaments being the Mouths that suck the Nourishment, and transmit it to the Tree. See ROOT and VEGETABLE.

The Pits or Poffes, into which the Trees are *transplanted*, should be left open for some time before hand, that the Rain, Frost and Sun may dissolve the compacted Salt, render the Earth friable, and qualify it for nourishing the Tree. — The same may be done, in some measure, by burning Straw in the new Pits, and drenching the Mould with Water in dry Seasons, and by enriching the Ground with Manure. See MANURE.

*Pliny* was of Opinion, no Tree should be removed under two, or above three Years old. *Cato* would have none *transplanted* less than Five Fingers in Diameter: But we are, now, able to *transplant* Trees of all Ages and Sizes, without Danger.

To *transplant* old Trees, was reckon'd so difficult, that *Veteream Arborum transplantatæ* is become a Proverb for a difficult Enterprise; and yet we are inform'd of a Grove of Six hundred Coco Trees of 80 Years Growth, and 60 Foot high to the lowest Bough, *transplanted* by Count *Maurice*, to his Paradise of *Friburg*: And a great Person in *Devonshire*, Mr. *Evelyn* tells us, *transplanted* Oaks, as big as Twelve Oxen could draw, to supply a Defect in an Avenae.

For the *Transplantation* of grown Trees, Mr. *Evelyn* gives the following Method, as practis'd with good Success by the Lord *Firebriding*: Choose Trees about the Thickness of a Man's Thigh; remove the Earth from about them, cut through all the side Roots, till the Tree may be, by force, brought down on one Side; so that the tap Roots may be conveniently come at to be cut off with the Ax: then redress the Tree, and let it stand cover'd with the Mould from which it was loosn'd, till next Year, or longer; and by that time it will have drawn new tender Roots fit for *transplanting*, and may be taken up at a fit Season.

Otherwise, for very large Trees, e'er the hard Frosts come on, make a Trench about the Tree, at such Distance from the Stem, as you judge sufficient for the Root; dig so deep, as almost to undermine it; place Blocks, and Quarries of Wood to sustain the Earth, and cast in as much Water as may fill the Trench or sufficiently wet it, unless the Ground were very moist before. Thus let it stand till some hard Frost bind it firmly to the Roots, and then convey it to its new Station, which may be preserv'd from freezing, by placing store of warm Litter in it: so close the Mould the better to the straggling Fibres, and place the Earth taken out of the Pit about the Root of the new-planted Tree.

The common Rules for *Transplanting*, are, 1<sup>o</sup> The lighter the Soil is, the deeper are the Trees to be planted. 2<sup>o</sup> If the Soil be Gravel, or Sand, mix Clay with it, and vice versa. 3<sup>o</sup> The best Season, is either *October* or *February*; in warm, moist, clear Weather. 4<sup>o</sup> The large Roots to be abated, to prevent the Necessity of digging too deep; but the small Fibrous ones to be spared. 5<sup>o</sup> In taking up the Trees to observe how the Roots grow, and in *Transplanting*, to dispose them in the same Order, and place the Tree to the same Aspect. 6<sup>o</sup> To defend young Trees after *Transplantation*, both from Wind and Sun, till the Roots be fix'd, and they begin to shoot. 7<sup>o</sup> If the Soil you *transplant* into, be good, don't top the Trees, but lop all the Boughs to one single one, the most upright and promising among them: But if the Soil be poor, top them, and when they are shot out again, lop off all the Branches to one. See PRUNING.

TRANSPLANTING of Fruit-Trees. After a Summer's Growth of Fruit Seedlings in the Seminary, such are pull'd up as are above a Foot high, and *transplanted* into a Nursery; the rest to be left in the Seed-Plot till another Year. See SEMINARY.

When drawn up, the Sprigs are to be cut off, from about the Top, the Strings from the Roots, and the Extremities, both of the Top, that it mayn't run too fast upwards, and of the tap or heart Root, that it may not pais directly downwards; left it go beyond the good Soil. The Holes, or Pits to be so deep, as that the Plants may stand somewhat deeper in the Ground, than when in the Seed-plot; close  
the

the Mould about them, and if it be a dry Time, water them the first Day, and cover the Soil with old Fern.

Mr. Bradley gives us a new Method of *Transplanting* Trees of all Kinds and Ages with Safety, either while they are in Blossom, or with Fruit upon them; thus: The Holes to receive the Trees, are to be prepared before the Trees are taken up; and the Earth which comes out of the Holes to be made very fine, and put into large Tubs and mix'd with Water, till it be about the Consistence of thin Butter. Then the Holes wherein the Trees are to be planted, are to be fill'd with this thus-temper'd Earth, before the earthy Parts have time to settle.

The Advantage hereof is, that the Trees thus planted, have their Roots immediately inclosed and guarded from the Air; and the warm Season of the Year disposing every Part of the Tree for Growth and Shooting, it will lose very little of its Vigour. — In Winter it does not succeed.

The same Author adds, that in consideration of the Circulation of the Sap, it is as necessary to preserve the Vessels of Trees entire, as those in Animal Bodies: And therefore in *transplanting* Trees in the Summer Seasons, 'tis not proper to cut off any of the Branches, or wound any of the Vessels, till they have renewed their Roots, which it is of absolute Necessity to wound in *Transplanting* them. For the wounded Roots, he has provided a Plaster of a Mixture of Gums to prevent the Canker and Rot, and promote their Healing.

*TRANSPLANTATION*, in Natural Magic, is used for a Method of curing Diseases, by transferring them from one Subject to another; much in Vogue among certain Philosophers. See SYMPATHETIC.

This *Transplantation* is effected, either by the Use of a certain Medium, called on that account a *Magnet*; or without, by simple Contact.

The first Kind, which is that most properly call'd *Transplantation*, is when the Patient's Excrement being mix'd up with Earth, the Disease is *transplanted* into a Vegetable, arising from a Seed sown in the said Compost; or, when the Parings of the Nails of a gouty Person, are inclosed in an Auger-hole made in a Plant, particularly an Oak.

Here the Patient's Excrement is the Magnet, and the vital Spirit of the Plant arising from the Seed, is the Mumia which the Magnet receives; and the Case is the same, in the Parings of the Nails, and the vital Spirit of the Oak. See MUMIA.

The second Kind of *Transplantation*, properly call'd *Approximation*, is, when a Flinger seiz'd with a Parisis or Whitlow, is cured by rubbing in a Car's Ear, which is held to receive the Pain.

In this Case, the sound Subject receives the vital Spirits, unites with them, and corrects their morbid State: And, as certain Diseases are got by Approximation; the infected Spirits of a diseas'd Body, insinuating themselves into a sound one, and thus infecting the same; so they are cured by Approximation; when the Spirits of a diseas'd Person entering a sound Body, the latter corrects and retrieves the morbid State of the former.

*Transplantation*, by means of the Magnet, is of five Kinds, *viz.* *Insemination, Implantation, Inposition, Irration and Infection*; each whereof, see under its proper Article, INSEMINATION, IMPLANTATION, &c.

*TRANSPORT-SHIP*, is a Vessel whereon to convey Provisions, warlike Stores, Soldiers, &c. See VESSEL.

*TRANSPORTATION*, the Act of conveying, or carrying a thing from one Place or Country to another. See EXPORTATION.

In Matters of Commerce, *Transportation* is of equal Import with *Re-exportation*, *viz.* the taking up of Commodities in one foreign State or Kingdom, bringing them hither, and paying Duties for them; and then conveying them into some other foreign State, &c. by which it is distinguish'd from *Importation* and *Exportation*; where the Commodities are either carried originally out of, or brought finally into, our own Kingdom. See IMPORTATION and EXPORTATION.

Our *Transportation* or *Re-exportation* of Wooll, Butter, Hides, Tallow, Herrings, Beef and Salmon, which we transport from *Ireland*, to other Provinces, being the Concerns of our Merchants, and paying Duties to His Majesty, have been reckon'd at 300,000 *l. per Annum*.

'Twould be tedious to enumerate the Value of our *Transportations* from Denmark, Sweden, Spain, Portugal, the Straights, Turkey, Guinea, &c. the most considerable, is from the *East Indies*. In the Infancy of that Trade, *viz.* in the Year 1613, of Pepper only, besides what we consumed at Home, we *transported* in one Year to other Countries, after it had paid Duty here, to the Value of 200,000 *l.* and of late Years our *Exportation* of what we bring from thence, after we have supplied ourselves, is computed at 500,000 *l. Sterling*. See NAVIGATION and COMMERCE.

*TRANSPORTATION* is also a kind of Punishment; or, more properly, an Alleviation or Commutation of Punishment, for Criminals convicted of Felony, who, for the first Offence,

unless it be an extraordinary one, are ordinarily *Transported* to the Plantations, there to bear hard Labour for a Term of Years, within which if they return, they are executed without further Trial. See FELONY, PUNISHMENT, &c.

*TRANSPOSITION*, in Algebra, the bringing any Term of an Equation over to the other Side. See TERM.

Thus if  $a + b = c$ , and you may make  $a = c - b$ ;  $b$  is said to be *transposed*. See EQUATION.

*TRANSPOSITION*, in Grammar, call'd also *Hyperbaton*, a disturbing or dislocating of the Words in a Discourse; or a changing of their natural Order of Construction, to please the Ear, by rendering the Contexture more easy, smooth, and harmonious. See HYPERBATON.

A *Transposition*, which renders the Sense perplex'd, is vicious.

The Construction of the ancient Languages being much more Artful than that of the Modern ones; allow'd of much greater and more frequent *Transpositions*. The *English, French, &c.* scarce ever allow of them but in Oratory and Poetry; in which Cases they serve to give a Force and Energy to the Discourse or the Verse, and to prevent their languishing. See CONSTRUCTION.

*TRANSPOSITION* in Music, is a changing of the Notes of a Piece of Music. See NOTE.

Of this there are two Kinds; the first with respect to the Clef, the second with respect to the Key.

*Transposition with respect to the Clef*, consists in the changing of the Places or Seats of the Notes or Letters, amongst the Lines and Spaces; but so as that every Note is set at the same Letter. See CLEF.

This is done either by removing the same Clef to another Line; or by using another Clef, but with the same Signature, by reason the Piece is still in the same Key. See CLEF.

The Practice is easy in either Case: In the first, you take the first Note at the same Distance above or below the Clef-Note, in its new Position as before; and all the rest of the Notes in the same Relations or Distances from one another; so that the Notes are all set on Lines and Spaces of the same Name.

In the second, or setting the Music to a different Clef, 'tis to be observed, the Places of the three Clef Notes are invariable in the Scale, and are to one another in these Relations, *viz.* the Mean a 5th above the Bass, and the Treble a 5th above the Mean. Now to *transpose* to a new Clef, *e. gr.* from the Treble to the Mean; where-ever that new Clef is set, we suppose it the same individual Note, in the same Place of the Scale, as if that Piece were that Part in a Composition to which this new Clef is generally appropriated; that so it may direct to the same Notes we had before *transposition*: Now, from the fix'd Relations of the three Clefs in the Scale, it will be easy to find the Seat of the first *transposed* Note; and then all the rest are to be set at the same mutual Distances they were at before. See SCALE.

Suppose, *e. gr.* the first Note of a Song be *a*, a 6th above the Bass-clef; where-ever that Clef is placed, the first Note must be the greater 2d above it, because a greater 2d above the Mean is a greater 6th above the Bass-clef, the Relation of those two being a 5th. — So that the first Note will still be the same individual *a*.

The Use of this *Transposition* is, that if a Song being set with a certain Clef, in a certain Position, the Notes go far above or below the System of five Lines; they may, by the Change of the Place of the same Clef in the particular System, or by taking a new Clef, be brought more within the Compass of the Lines.

*Transposition from one Key to another*, is a changing of the Key; or a setting all the Notes of the Song at different Letters, and performing it, consequently, in different Notes upon an Instrument. See KEY.

The Design hereof is, that a Song which being begun in one Note, is too high or low, or otherwise inconvenient for a certain Instrument; may be begun in another Note, and from that carried on in all its just Degrees and Intervals.

The Clef and its Position here remain the same; and the Change is of the Notes themselves, from one Letter, and its Line or Space, to another.

In the former *Transposition*, the Notes were express'd by the same Letters, but both removed to different Lines and Spaces: In this, the Letters are unmoved, and the Notes of the Song transferr'd to, or express'd by other Letters, and consequently set upon different Lines and Spaces, which, therefore, requires a different Signature of the Clef.

*TRANSPOSITION* of Equation. See EQUATION.

*TRANSUMPTIO*, TRANSMPTION, in the Schools, a Syllogism by Concession or Agreement, us'd where a Question propos'd is transferr'd to another, with this Condition, that the Proof of this latter shall be admitt'd for a Proof of the former.

That *Aristotle* in his Book *de Celo*, undertaking to shew that all the Stars are round, transfers the Question to the Moon, and proves her Roundness from her Increasing and Waning;

Waining; supposing it a Thing admitted by his Opponents, that the Stars are all alike.

**TRANSUBSTANTIATION**, in Theology, the Conversion or Change of the Substance of the Bread and Wine, in the Eucharist, into the Body and Blood of Jesus Christ. See **EUCCHARIST**.

*Transubstantiation*, taken in its general and literal Sense, implies any Change of one Substance into another; thus, the Change of *Moses's* Rod into a Serpent; of the Waters of the Nile into Blood; of *Lot's* Wife into a Pillar of Salt, were preternatural *Transubstantiations*; and the Change of the Food we eat, into the Substance of our Bodies, is a natural *Transubstantiation*. See **SUBSTANCE**.

But the Word in its proper Sense, as a Term, is restrain'd to the miraculous Change which the *Romish* Church holds is wrought in the Sacrament, by the Consecration of the Priest.

One of the great Articles of that Church, rejected by the Reform'd, is that of *Transubstantiation*; the latter maintaining the *Transubstantiation* to be only figurative, and the former real.

The Reform'd interpret *of, is*, in the Text, *Hoc est Corpus meum*, This is my Body, by significant; *q. d.* this signifies my Body: But the Council of *Trent* stand upon strenuously for the literal Sense of the Verb: Thus, in Can. 1. Sess. 13. of that Council, 'tis expressly decreed, that in *Transubstantiation*, the Body and Blood of our Lord Jesus Christ are truly, really, and substantially under the Species of Bread and Wine.

'Tis added, that by truly, we mean properly, and not only by Signification, as if the Eucharist were no more than a Sign of the Body and Blood of Jesus Christ: That by really, we mean in Fact, and not only in a Figure, as if the Eucharist were only a Figure and Representation of the Body and Blood of the Saviour of the World: And that by substantially, we mean in Substance, and not only in Virtue and Energy. --- Thus is truly oppos'd to a simple Sign; really to a Figure; and substantially to Energy.

**TRANSVERSALIS**, in Anatomy, a Name given to several Muscles, &c. in respect of their Situation, Progress, &c. as the

*TRANSVERSALIS Abdominis*, a Muscle which lies under the Obliqui, and arises from the Cartilago Xiphoides, from the Extremities of the false Ribs, from the Transverse Apophysis of the Vertebrae of the Loins, and fix'd to the inner Side of the Spine of the Ilium, and inserted in the Os Pubis, and Lines Albae.

This, with the Obliqui, (which see) unites its Tendons, as it approaches the *Lines Albae*, and is the only Muscle that is cut in the Operation of the *Bubonocoele*: It has a fine and thin Membrane that closes exactly its Ring or Hole, through which the Vessels pass.

*TRANSVERSALIS Colli*, is a Part of the *Transversalis Dorsii*, which some divide into three, viz. the Sacer, Semispinatus, and *Transversalis Colli*.

It arises from the Os Sacrum, and from all the transverse Processes of the Vertebrae of the Loins, Back, and Neck, except the two first; and is inserted by so many distinct Tendons to all their superior Spines: It moves the whole Spine obliquely backwards.

*TRANSVERSALIS Pedis Placentini* comes from the Bone of the Metatarsus, that sustains the Toe next the little Toe, and passing across the other Bones, is inserted into the Os Sesamoideus of the great Toe: Its Use is to bring all the Toes close to one another.

*TRANSVERSALIS Penis* arises from the Ischium just by the Erethores, and runs obliquely to the upper Part of the Ball of the Urethra.

It helps to press the Veins upon the Back of the Penis, against the Os Pubis, which is the Cause of Erection. See **ERECTION**.

*TRANSVERSALIS Dorsii*  
*TRANSVERSALIS Lumborum* } See { **SEMISPINATUS**.  
*TRANSVERSALIS Femoris* } See { **SACER**.  
 } See { **QUADRATUS**.

*TRANSVERSALIS* is also a Name given to a Suture of the Cranium, because of its traversing or crossing the Face from one Side to 'other. See **SUTURE**.

It arises at one of the lesser Angles of the Eye, and passing along the Bottom of its Orbit, and the Root of its Nose, terminates in the other lesser Angle.

**TRANSVERSE**, something that goes across from Right to Left, or from Corner to Corner.

Thus Bends and Bars in Heraldry are *transverse* Pieces or Bearings. See **BEND**.

The Diagonals of a Parallelogram or a Square are *transverse* Lines. See **DIAGONAL**.

Lines which make Intersections with Perpendiculars, are also call'd oblique or *transverse* Lines. See **LINE**, **PERPENDICULAR**, **OBLIQUE**, &c.

**TRANSVERSE Axis**, or *Diameter*, call'd also the *first* or *principal Axis*. See **AXIS** and **LATUS Transversum**.

The *Transverse Axis* of an *Ellipse*, is the longer Axis, or that which *traverses* it lengthwise, in contradistinction to the *Conjugate* one. See **ELLIPSES** and **CONJUGATE**.

The *Transverse Axis* of an *Hyperbola*, is the Line D K, Tab. Conicis, Fig. 17. cutting the Curve in the Points D and K. See **HYPERBOLA**.

**TRANSVERSE Muscles**, in Anatomy, are certain Muscles arising from the *transverse* Processes of the Vertebrae of the Loins. See **VERTEBRÆ** and **LOINS**.

**TRANTRERY**, in some Customs, is the Money arising by Amendments of Ale-sellers and Victuallers, for breaking the Allice of Bread and Ale. See **ASSIZE**.

Particularly at *London*, and other *Mansions* in *Hertfordshire*.

**TRAVERSE** or **TRANSVERSE**, something that goes athwart another, i. e. crosses and cuts it obliquely. See **TRANSVERSE**.

**TRAVERSE** is particularly used for a Piece of Wood or Iron placed transversely, to strengthen and fortify another. Such are those used in Gates, Windows, &c.

To plane a Board against the Grain, is also call'd among Joiners, &c. to *TRAVERSE* it.

**TRAVERSE**, in Gunnery, signifies to turn or point a Piece of Ordnance which Way one pleases, upon her Platform. See **ORDNANCE**, **CANNON**, &c.

The laying and removing a Piece of Ordnance or a great Gun, in order to bring it to bear, or lie level with the Mark; is also call'd *traversing* the Piece. See **GUNNERY**, &c.

**TRAVERSE** is sometimes also used in Heraldry, for a Partition of an Escutcheon, of the Figure adjoining, which they Blazon parted *per pale Traverse*, Argent and Gules.

**TRAVERSE**, in Navigation, is the Variation or Alteration of a Ship's Course, occasion'd by the shifting of the Winds, Currents, &c. See **COURSE**.

*Traverse Sailing*, is us'd when a Ship having set Sail from one Port, towards another, whose Course and Distance from the Port fail'd from, is given or known, is, by reason of contrary Winds, or other Accidents, forced to shift and fall on several Courses, which are to be brought into one Course, to learn, after so many Turnings and Windings, the true Course and Distance made from the Place fail'd from, and the true Point or Place where the Ship is; that for the Wind coming fair, it may be known how to shape a Course for the Place intended. See **SAILING**.

This may be perform'd Geometrically two Ways: The First, by drawing new Meridians, through the Extremity of every Course, parallel to the first Meridian, or North and South Lines at first made: and setting off every Course with a Sweep of 60, as if it were a Question in Plain Sailing. You may also let fall Perpendiculars to every new Meridian, from the Point that the Ship fail'd to upon that Course, by which you have the Course, Distance, Difference of Latitude and Departure to every Course. To illustrate this by an Example: A Ship being bound for a Port distant 120 Miles N. E.; E. falls S. E. 30 Miles, then N. E. by N. 40, then E. by N. 25, then N. N. E. 44; 'tis requir'd to find the Course and Distance made good, and also the Course and Distance to the Port bound for.

Draw the Line HK (Tab. Navigation, Fig. 17.) at pleasure, for a Meridian, or North and South Line, and therein assume a Point, as at A, for the Port fail'd from; then with 60 of the Chords, and one Foot in A, draw the Arch L m, upon which set off two Points (because the Course is S. S. E.) from L to m, and draw the Line A m, upon which set off the Distance 30, from A to B; then is the Ship at B: Thus letting fall the Perpendicular B K, AK 27° 7' is the Difference of Latitude, and BK 11° 5', the Departure for the first Course.

For the second Course, with the Distance K B, draw the Parallel BN, and thereby with the Chord of 60, as before, set off the Second Course and Distance, N. E. by N. 40, from B to C, and let fall the Perpendicular CL, then is the Ship at C, the Difference of Latitude upon that Course is BL 33: 3, and Departure CL 22: 2.

Proceed in the same manner for the third Course, with the Parallel CO, set off E. by N. 25, from C to D, and draw the Line DP, from which set off the last Course, N. N. E. 44, then is your Ship at E.

Since, then, the Ship came from A, and is now at E, the Line A E measured on the same equal Parts, upon which all the other Distances were taken, will be found 91 Miles, and the Arch R Q, measured on the Rhumbs, five Points, viz. N. E. by E. so that the Ship is now 91 Miles N. E. by E, from the Port bound for.

To find her Course and Distance to the Port bound for, set off 4 half Points upon the Arch R Q, from R to S, and from A through S draw the Line A S F; upon which set off

120, the Distance from the Port failed from the Port bound for, from A to F, then is F the Port bound for; now the Port bound for being at F, and the Ship being but at E, the Line E F measured on the same equal Parts that the rest was taken from, will be found to be 31, and the Arch T U measured on the Chords, is  $35^{\circ} 12'$ , or N. E. by N. somewhat easterly, &c.

This Method is useful, where the Courses tend generally one way, without interlocking one another; but if they often cross, 'tis best to have recourse to the 2d Method, which is without new Meridian.

In order to this, observe how many Points are between the Point next to be laid down, and the Point opposite to the Course last laid down; for that is the Point for lying down; then, with the Chord of 60, and one Foot in the Point the Ship is last come to, describe an Arch; upon which set off the Points found by the above said Rule, and through that draw the Line for the next Course, &c. For an Example;

Draw a North and South Line, as in the former, as the Line R M, Fig. 17; in which assume a Point, as at A, for the Port fail'd from; then from A set off the first Course and Distance, viz. N. N. W. 68, from A to B, and for the second Course, with the Chord of 60, and one Foot in B, draw the Arch T W, upon which to set off the next Course S. S. W. 70, observe the Rule above delivered, viz. To take the Number of Points between the Point opposite to the last Course failed, and the Point you are next to sail. The Reason of which Rule is this: If from A to B your Course be N. N. W. the Back from B to A, must needs be S. S. E. the opposite Point, and then if you were to fail S. by E. it must be one Point to the Southward of that S. S. E. Line; if South, it is two Points, and consequently the next Course being S. S. W. I set off 4 Points, upon which set off 70 Miles, from B to C, and then is your Ship at C: For the third Course, if from B to C be S. S. W. then from C to B N. N. E. but the next Course being E. half N. the Points between N. N. E. and E. half N. are five Points and an Half, and therefore with the Chord of 60 and one Foot in C, draw the Arch x y, upon which set off five Points and an Half, from x to y, and through y draw the Line C D, upon which set off 90 Miles from C to D, then is your Ship at D.

After the same Manner lay down all the rest, as D E W. N. W. half N. 70, then E F South 25, then F G, E. half S. 45; and lastly G H, South 30, which is the last Course.

Thus your Ship being at H, and the Port failed from at A, the Line A H 28 Miles, is the Distance made good; and the Angle at A is four Points, viz. S. E. but the Port intended for, being S. W. 55. Set it from A to K, and the Ship being at H, the Line H K, 62 Miles, is the Distance from the Ship to the Port bound for; and the Course is found by measuring the Angle at H  $71^{\circ} 48'$  or W. S. W. more than a Quarter Westerly, &c.

To work a TRAVERSE by the Tables of Difference of Latitude and Departure.

This is the principal Use those Tables are intended for; and the Way of working a *Traverse* hereby, is equal to the best for Exactness, and superior in Point of Expedition.

Make a little Table with six Columns, the First for the Course, the Second for the Distance, the Third for the Northing, the Fourth for the Southing, the Fifth for the Easting, the Sixth for the Westing. Then find the Difference of the Latitude and the Departure to every Course, and set them in their proper Columns; as where the Course is Northerly, set the Difference of the Latitude under Northing, or in the North Column; and where the Course is Southerly, set the Difference of Latitude in the South Column.

Again, where the Course is Easterly, set the Departure in the East Column, and when Westerly, set it in the West Column; then adding up each Column by itself, subtract the North and South Columns, the greater from the lesser, the Remainder is the Northing or Southing made good. Also subtract the East and West Columns, the bigger from the lesser, the Remainder is the Easting or Westing made good; then have you the Difference of Latitude and Departure given, to find the Course and Distance.

In the first Example above specified, the first Course is S. S. E. 30 Miles, or two Points 30 Miles; for which, I find the Difference of Latitude  $27^{\circ} 7'$ . Now the Course being between South and East, I place my Difference of Latitude in the South Column, and my Departure  $11^{\circ} 5'$  in the East Column, leaving the North and West Columns blank.

Then for the Second Course, N. E. by N. or three Points 40 Miles, my Difference of Latitude,  $33^{\circ} 3'$  is to be placed in the North Column, and the Departure  $22^{\circ} 2'$  in the East Column, because the Course is between the North and East.

Then the third Course being E. by N. or seven Points, 25 Miles, I place my Difference of Latitude,  $4^{\circ} 9'$  in the North Column, and Departure  $24^{\circ} 5'$  in the East Column.

And so for the fourth Course N. N. E. or two Points 44 Miles, I place my Difference of Latitude  $4^{\circ} 6'$  in the North Column, and my Departure,  $16^{\circ} 8'$  in the East Column; then adding up each Column, the Sum of the Northing Column is  $78^{\circ} 8'$ , and the Sum of the South Column is  $27^{\circ} 7'$ , which subtracted from the Northing  $78^{\circ} 8'$ , the Remainder  $51^{\circ} 1'$ , is the Difference of Latitude made good, which is Northing, because the Northing was the greater Number.

Again, the Sum of the Easting Column is  $75^{\circ} 0'$ , which, because there is no Westing to subtract from it, is the Easting made good. Thus you have the Northing  $51^{\circ} 1'$ , and the Easting  $75^{\circ} 0'$  given, to find Course and Distance; and though you cannot find in the Table the exact Number of  $51^{\circ} 1'$ , and  $75^{\circ} 0'$  together, yet find the nearest you can, which is  $75^{\circ} 4'$ , and  $50^{\circ} 9'$ , over which at the Top, you find  $34$  Degrees for the Course, which is N. E. by N.  $0^{\circ} 15'$  easterly, and the Distance 91 Miles.

TRAVESTY or TRAVESTI, a Term which some late Authors have introduced into Poetry. The Word is originally French, being a Participle, of the Verb *Travestir*, to disguise one's self, or to appear in Masquerade. Hence *Travesty* comes to be applied to the disguising of an Author, or the Translating him into a Style and Manner different from his own; by which means it becomes difficult to know him.

G. Barriſſa Lalli, has travestied Virgil, or turn'd him into Italian Burlesque Verse. Scarron has done the same in French, and Caton and Phillips in English Verse. See BUALESQUE.

Castro is charged with having travestied the Bible, by reason of the Difference of Air and Style between his Version and the Original.

TRAU MATICKS, *Tranquillantes*, Vulneraries; are Herbs or Drugs good for the curing of Wounds. See VULNERARY.

TRAYL-BASTON, TRAIL-BASTON (*q. d. trabe baculum*, drag a Club or Staff). See JUSTICE of *Trail-baston*.

Edward I. in his 32d Year, sent out a new Writ of Inquisition, called *Trail-baston*, against the Intruders on other Mens Lands, who to oppress the right Owner, would make over their Lands to great Men; against Barrreners hired to beat Men; Breakers of Peace; Ravishers; Incendiaries; Fighters; false Assisors and other Malefactors; which Inquisition was so strictly executed, and such Fines taken, that it brought in a world of Treasure to the King.

TRAYTOR, TRAITOR, TRADITOR, a Betrayer of his King and Country; or one guilty of High Treason. See TREASON and TRADITOR.

TRAYTEROUS *Position*, is particularly understood of a Tenet, which some formerly held, of the Legality and Property of taking Arms by the King's Authority against his Person and those commission'd by him; which is condemn'd by Statute 14 Car. II.

TREACLE, in Pharmacy, &c. See THERIACA.

TREASON, *Treabery*; the Act of Infidelity to one's lawful Sovereign.

*Treason*, in our Laws, is of two Sorts, viz. *High* and *Petty* *Treason*.

*High* TREASON or TREASON *Parvum*, is an Offence committed against the Security of the King or Kingdom, whether by Imagination, Word or Deed. Such are, To compass or imagine the Death of the King, Queen or Prince; or to Defoul the King's Wife, or his Eldest Daughter unmarried, or his Eldest Son's Wife; or to levy War against the King in his Realm; to adhere to his Enemies; Counterfeit his great Seal or Money; to kill the King's Chancellor, Treasurer, Justices of either Bench, Justices in Eyre, of Assize, or of Oyer and Terminer, being in their Place during their Office; diminishing or impairing current Money; saying that the King is a Heretic or Papist, or intends to introduce Popery, &c. Anno 13 Car. II.

'Tis a Maxim, That *In majori Prædicatione, omnes sunt Principales*; there are no Accessories in *Treason*, all are Principals.

Also, that *Voluntas non reputatur pro facto, nisi in causæ Prædicationis*; the Will is never taken for the Deed in any Case, but that of *High* *Treason*: Though some *High* *Treasons* are much more heinous than others, yet the Punishment appointed by Law, is the same in all (Clipping and Coining only excepted) which is, that the Traitor be laid upon a Hurdle or Sledge, drawn to the Gallows, there hanged, but cut down while alive, the Entrails pulled out and burnt before the Criminal's Face; then his Head and Quarters cut off, and impaled where the King shall judge meet. Add to this, that he forfeits all his Lands and Goods whatever, to the King; his Wife loses her Dowry; his Children their Nobility, and all Right of Inheriting.

Even an Idiot or Lunatic, though judg'd incapable of most Crimes, shall be punished as a Traitor, if he go about to kill the King.

For *Petty* TREASON. See PETTY *Treason*.

This Kind gives Forfeiture of Escheats to every Lord within his Manor. See ESCHIEAT.

There is also mention made of *Accumulative and Confrictive Treason*, in the Statute 14 Car. II.

**TREASURE**, *Treasurum*, *thesauri*, Store of Money in reserve. See TREASURER and TREASURY.

**TREASURE-FIND**, q. d. *Treasure found*, in Law, is when any Money, Gold, Silver, Plate, or Bullion, is found in any Place, and none knows to whom it belongs.

This should, naturally, fall to the Finder; but particular People have made particular Provisions for it. — The Jews gave it the Proprietor of the Place where it was found; The Roman Jurisprudence was various with regard hereto; sometimes it was given to the Master of the Grounds; sometimes to the Finder; and sometimes it was adjudged to the public Treasury.

In France and England, the general Usage is to have such *Treasure* sequestr'd to the King, unless where the Benefit thereof is expressly granted or made over by the King to some other.

In some Places in France, it is divided into three Parts; one for the Prince, one for the Proprietor of the Land, and one for the Finder.

*Britus* says, 'tis every Subject's Part, as soon as he hath found any *Treasure* in the Earth, to make it known to the Coroner of the County, &c.

This was anciently call'd *Findaringa*, of finding the *Treasure*, L.L. *Hon. I.*

The Punishment for concealing *Treasure* found in England, is Imprisonment and Fine; but if any Mine of Metal be found in any Ground, it always appertains to the Lord of the Soil, except it be a Mine of Gold or Silver, which anciently always belong'd to the King, in whose Groundsoever they were found: But by an Act of Parliament, the King now, hath only the Pre-emption.

**TREASURER**, an Officer to whom the *Treasure* of a Prince or Corporation is committed to be kept and duly disposed of in the Payment of Officers and other Expences. See TREASURY.

Of these there is a great Variety. — His Majesty of Great Britain, in Quality of Elector of Brunswick, is Arch-Treasurer of the Roman Empire. — In the States of Poland are two *Grand-Treasurers*; that of the Kingdom of Poland, and that of the Dutchy of Lithuania.

In England, the principal Officers under this Denomination are the Lord High Treasurer, the Treasurer of the Household; Treasurer of the Navy, of the Wardrobe, of the King's Chamber, &c.

Anciently we had likewise a Treasurer of the Exchequer; Treasurer of Wars, &c. — In the Romish Countries, the Title *Treasurer* is also given, somewhat abusively, to an Ecclesiastic, who has the keeping of the Relicks, and the Charters, and Archives of a Church, or Monastery.

This Dignity succeeds, in some measure, to that of the ancient Deacons, who had the like Charge in the Primitive Church. See DEACON.

Lord High Treasurer of England, is the Third great Officer of the Crown. See CROWN.

He receives the Office, by Delivery of a white Staff to him from the King, and holds it during the King's Pleasure: Anciently, he received it, by Delivery of the Golden Keys of the Treasury.

Under his Charge and Government, is all the King's Revenue kept in the Exchequer. See REVENUE and EXCHEQUER.

He has the Check of all the Officers, any way employ'd in collecting Imposts, Customs, Tributes or other Revenues of the Crown. He has the Gift of all the Customers, Comptrollers and Searchers Places, in all the Ports of London; and the Nomination of the Escheators in every County. See CUSTOM-HOUSE, &c.

He, alone, or others in Commission with him, leteth Leases of all the Crown Lands, gives Warrants to certain Persons of Quality to have their Wine Customs-free, &c.

The ancient Salary was 383 l. but at present 8000 l. The Office of Lord Treasurer, is now in Commission. See TREASURY.

**TREASURER of the Household**, is an Officer, who, in the Absence of the Lord Steward, has Power, with the Comptroller and other Officers of the Green Cloth and the Steward of the Marbalses, to hear and determine Treasons, Felonies and other Crimes committed within the King's Palace. See HOUSEHOLD, GREEN CLOTH, &c.

**TREASURER of the Navy**, is an Officer who receives Money out of the Exchequer, by Warrant from the Lord High Treasurer, or the Lords Commissioners executing that Place; and pays all Charges of the Navy, by Warrant from the principal Officers of the Navy. See NAVY.

**TRFASURY**, the Place wherein the Revenues of a Prince are receiv'd, preserv'd, and disburs'd.

In England, the Treasury is a Part of the Exchequer, by some call'd the Lower Exchequer. See EXCHEQUER.

The Officers of his Majesty's Treasury, or the lower Exchequer, are, the Lord Treasurer, a Chancellor, a Secretary, two Chamberlains, an Auditor, four Tellers, a Clerk of the Pells, Officers of the Receipt, a Tally-cutter, &c. See each Officer under his proper Article, CHANCELLOR, TELLER, TALEY, &c.

At Rome under the Emperors, there were two Kinds of Treasuries, the one call'd *Aerarium*, wherein the Monies destined to support the Charges of the Government were kept; the other *Fiscus*, wherein were preserv'd those intended for the particular Subsistence of the Emperer and his Court. In effect the *Aerarium* belong'd to the People, and the *Fiscus* to the Prince. See FISCUS.

We have still a Resemblance of this Difference among us; but it is confounded in France, &c. where the King disposeth absolutely of the public Treasury, &c.

**Lords of the TREASURY**. In lieu of one single Director, and Administrator of his Majesty's Revenues, under the Title of Lord High Treasurer; it is frequently thought proper to put that Office in Commission, i. e. to appoint several Persons to discharge it, with equal Authority, under the Title of *Lords Commissioners of the Treasury*. See TREASURER.

**TREAT**, in our old Law books, from the French, *Traitor*; signifies as much as taken out, or withdrawn: Thus a Juror was challenged, because he could not dispend 40 l. and therefore was *Treat* by the Statute. *Old. Nat. Br.* or discharged.

**TREATISE**, *TRACTATUS*, a set Discourse in Writing, on any Subject.

The *Treatise* is supposed more exact, formal and methodical than an Essay; but less so than a System. See ESSAY, &c.

**TREATY**, a Covenant between several Nations; or the several Articles or Conditions stipulated and agreed upon between Sovereign Powers. See ALLIANCE.

There are *Treaties* of Peace, of Marriage, of Confederacy, of Neutrality, of Capitulation, and of Commerce and Navigation. See PEACE, CONFEDERACY, &c.

The celebrated *Treaties* are those of Nimegue, of Munster, of the Pyreneans, of Westphalia, of Ryswick, of Utrecht, of Hanover, of Vienna, &c.

*Treaties* of Commerce are usually follow'd by various Treaties, to adjust the Duties of Exportation and Importation of Merchandizes into the respective Dominions of the contracting Power.

The last Treaty of Peace, Commerce, Navigation, &c. between England and France, was sign'd at Utrecht the 11th of April, 1713, and consists of 39 Articles, most whereof are regularly executed between the two Nations, only some of the more particular ones cannot yet be executed, by Reason of some Difficulties in the Treaty. See TARIFF.

**TREATY**, in Commerce, is a Convention or Contract agreed on, and the Clauses and Conditions thereof regulated between two or more Persons. The Word is understood of any thing that may enter into Commerce by way of Purchase, Sale, Exchange, &c. There are *Treaties* for the Buying of Merchandize, for the Freightening of Vessels, for the Assurance of Goods, &c. See POLICY.

**TREBELLIANICA**, or *TREBELLIAN Fourth*, in the Roman Jurisprudence, a Right belonging to an Heir indituted by Testament. — If the Testator, after appointing a full and general Heir, spent and dispos'd of all his Effects in Legacies; or if he went *ultra Dotalitem*, beyond three Fourths thereof; in that Case, the Heir was allow'd to retrench and detain one fourth Part of the Legacies to his own Use.

In like Manner, if the Testator charg'd his Heir with a Feoffment of Trust, and to restore the Succession to another; in that Case, the Heir might likewise retain a Fourth of the whole Succession, that the Quality of Heir might not be render'd wholly vain and fruitless.

**TREBLE**, in Music, the highest or acutest of the four Parts in Symphony, or that which is heard the clearest in a Concert. See MUSIC, GRAVITY, and SYMPHONY.

In the like Sense we say, a *Treble Violin*, *Treble Hautboy*, &c. See VIOLIN, &c.

In Vocal Music, the *Treble* is usually committed to Boys and Girls. — Their Part is the *Treble*. See PART.

The *Treble* is divided into *first* or *highest Treble*, and *second* or *base Treble*. — The half *Treble* is the same with Counter-tenor. See HARMONY.

**TREBUCHET**, *TRIBUCH*, *TRIBUCHETUM*, a Tumbril, or Cucking-hood. See CUCKING-STOOL.

**TREDECIME**. See ASPECT.

**TREE**, *Arbor*, the first and largest of the vegetable Kind, consisting of a single Trunk, out of which spring forth Branches and Leaves. See VEGETABLE, &c.

Standards, or *Trees in full Air*, are such as naturally rise a great Height, and are not top'd. — For the Choice of *Trees* of this Kind to be transplanted out of a Nursery, *Quintensy* recommends us to such as are straight, six Foot high

high at least, and five or six Inches thick at Bottom, and three or four at Top; the Bark pretty smooth and shining, as a Token of their Youth, and of the good Soil they grew in. See TRANSLANTING, NURSERY, &c.

**Dwarf Trees**, are such as are kept low, and never suffer'd to have above half a Foot in Stem. — These are us'd to be kept vacant or hollow in the Middle, that the Branches spreading round about the Sides, may form a kind of round Bowl or Bush. See DWARF.

**Wall Trees**, are those whose Branches are stretch'd out, and nail'd against Walls. See WALL and ESPALIER.

For **Dwarf** and **Wall Trees**, these are to be choic'd out of the Nursery for Transplantation as are straight, and consist of a single Stem, and a single Grass, rather than two or three Grafts in several Branches: Their Thickness at Bottom should be two or three Inches.

**Fruit Trees**, are such as bear Fruit. See FRUIT.

**Timber Trees**, are those whose Trunks are tall and straight, whereof Beams, Masts, &c. are us'd to be made. See TIMBER.

**Coniferous Trees**, are those whose Fruit is of a conical Figure, as the Pine, Fir, Larch, &c. See CONIFEROUS.

These are also call'd **Resiniferous**, by reason Coniferous Trees are generally cover'd with a Bark that abounds in Resin.

Mr. Ray, and other Authors, speak of several Trees of prodigious Bulk. — The Jesuit *d'Acosta*, in his History of the Indies, lib. iv. c. 3. mentions a hollow Tree at *Taccoboye*, three Leagues from *Gauze* in New Spain, nine Fathoms within-side near the Ground, and sixteen without-side. He adds, that 'tis under this Tree the Barbarians assemble to perform their religious Ceremonies, dance round their Idols, &c. — *Herrera* mentions another, which sixteen Men, joining Hands, cannot fathom. — *F. Kircher*, in his *Lazius*, p. 50. affirms, he has seen a Tree near *Gouano*, which would lodge a whole Family of 25 Persons in its Cavity. The common People have a Tradition, that it was planted by *Augustus*.

In the Indies there are very large Forests consisting only of one single Tree, whose Branches falling to the Ground, take Root, and put forth new Trees: The Fig Tree and Parrotuvier are of this Kind.

*M. Louvillier* mentions Trees in Peru, one Part of whose Branches produce Fruit one half the Year, and the other Part the other half.

In China is a Tree which bears Tallow, whereof that Nation make their Candles. See TALLOW.

There are two or three very remarkable Phenomena in the Growth of Trees, which have escap'd the Observations of the Naturalists of all Ages, except those of our own: These are the *Perpendicularity of their Trunks*, or Stems, to the Horizon; and the *Parallelism of their Joints* to the Spot of Earth they grow on. An Account of each, see under the ARTICLES PERPENDICULARITY and PARALLELISM.

For the Planting, Transplanting, Semination, Pruning, Felling, Grafting, &c. of Trees; see the respective ARTICLES, PLANTING, TRANSLANTING, SEMINATION, PRUNING, FELLING, GRAFTING.

Mr. Ray distinguishes the Trees and Shrubs of our native Growth in England, into, I. Such as have their Flower disjoint'd, and remote from the Fruit. These are,

1°. **Nuciferous ones**, or such as bear Nuts; as the Walnut Tree, the Hazle-nut Tree, the Beech, the Chestnut, and the common Oak. See NUT.

2°. **Coniferous ones**, or such as bear a squamous or scaly Fruit, of a kind of conical Figure, and of a woody or hard Substance, in which are many Seeds, which, when they are ripe, the Cone opens or gapes in all its several Cells or Partitions, and lets them drop out: Of this Kind are the Scotch Fir, Male and Female; the Pine, which in our Gardens is call'd the Scotch Fir; the common Alder Tree, and the Birch Tree.

3°. **Bacciferous ones**, or such as bear Berries; as the Juniper and Yew Tree. See BACCIFEROUS.

4°. **Lanigerous ones**, or such as bear a woolly, downy Substance; as the black, white, and trembling Poplar, Willows, and Osiers of all Kinds.

5°. Such as bear their Seeds, (having an imperfect Flower) in leafy Membranes and Cases; as the Horn-beam, or Hard-beam, call'd, in some Places, the Horn-beech.

II. Such as have their Fruits and Flowers contiguous; which are either with the Flower plac'd on the Top of the Fruit, or adhering to the Base or Bottom of the Fruit.

Of the former Kind, some are **Possiferous**, as Apples and Pears; and some **Bacciferous**, as the Sorb or Service Tree, the White or Haw-thorn, the wild Rose, Sweet-brier, Currants, the great Bilberry-bush, Hoxey-suckle, Ivy, &c.

The latter Kind are either such as have their Fruit moist and soft when ripe, as 1°. **Pruiferous ones**, whose Fruit is pretty large and soft, with a Stone in the Middle, as the black Thorn or Sloe Tree, the black and white Bullace Tree, the common wild Cherry, the black Cherry, &c.

2°. **Bacciferous ones**; as the Strawberry Tree in the West of Ireland, Mistletoe, Water Elder, the Dwarf, a large Laurel, the Viburnum or way-faring Tree, the Dogberry Tree, the Sea black Thorn, the Berry-bearing Elder, the Privet, Barberry, common Elder, the Holly, the Buckthorn, the Berry-bearing Heath, the Bramble, and the Spindle Tree or Prickwood.

Or such as have their Fruit dry when ripe; as the Bladder-Nut Tree, the Box Tree, the common Elm and Ash, the Maple, the Gale or Sweet Willow, common Heath-Broom, Dyers Weed, Furze or Gortie, the Lime Tree.

**Diana's Tree**, *Arbor Diane*, among the Chymists, is a kind of Vegetation of Mercury, which after a long Process shoots out into Branches, with the Appearance of Leaves, and even Flowers. See DIANA'S Tree.

*Arbor Martis*, or **Tree of Mars**, is another very singular Vegetation, first discover'd accidentally by the younger *Leuwenhoek*. See VEGETABLE.

The Manner of the Discovery was this: On a Dissolution of Iron-filings in Spirit of Nitre, contain'd in a Glass, he pour'd Oil of Tartar per Deliquium: Upon this the Liquor soon swell'd very considerably, tho' with a very small Fermentation; and was no sooner at rest, than there arose a Sort of Branches adhering to the Surface of the Glass, which continuing to grow, at length cover'd it all over.

The Form of the Branches was so perfect, that one might even discover a kind of Leaves and Flowers thereon; so that this Vegetation has as good a Title to the Appellation of *Arbor Martis*, as the former has to that of *Arbor Diane*. See *Hist. Acad. Royal. An. 1706*.

**TREDDLE**, or **TRAEDE**, *Chalazone*, in Natural History. See CHALAZA, EGG, CICATRIGULA, &c.

**TREMOR**, *Trembling*, in Medicine, a Disease nearly akin to a Convulsion, wherein there is something of a convulsive Motion accompanying a voluntary or natural Motion. See CONVULSION.

A Tremor is frequently found to arise upon the more violent Passions, particularly, Anger, Gluttony, Venery, &c. but this is accidental and transitory.

A Tremor is sometimes apt to degenerate into other worse Diseases, viz. Palsy, Apoplexy, Lethargy, Spasmus, &c. In old Men it is incurable.

*Tremor of the Heart*. See PALPITATION.

The Medicine commonly made use of in Tremors and other nervous Distempers, by the Name of *Palsy Drops*, is no other than *compound Spirit of Lavender*. The most successful Way of using it, is by taking 30 or 40 Drops twice or thrice a Day, dropt on Loaf Sugar or a little Bread. — 'Tis suppos'd, that by this Way the most spirituous and efficacious Parts make their Way directly by the Nerves of the Pallat, &c. without undergoing the Course of the Circulation, as it is said to do when taken in a liquid Vehicle.

**TRENCH**, a Ditch cut or dug in the Ground, to drain off the Waters in a Meadow, a Morass, or the like; or to divert the Course of a River.

Many of the Bogs in Ireland have been drain'd, and made good Ground, by only digging Trenches around them. See Bog.

**TRENCHES**, in Fortification, are Moats or Ditches, which the Besiegers cut to approach more securely to the Place attack'd; whence they are also call'd Lines of Approach. See DITCH, APPROACH, &c.

These Trenches are of several Sorts, according to the Nature of the Soil; for if the adjacent Territory be rocky, the Trench is only an Elevation of Bains, Gabions, Woolpacks, or Shouldrings of Earth, cast round about the Place: But where the Ground may be easily open'd, the Trench is dug therein, and border'd with a Parapet on the Side of the Besieg'd. See PARAPET, &c.

The Breadth of the Trench is from eight to ten Foot, and the Depth from six to seven; and 'tis cut in Talas, or slope. See TALUS.

The Trenches are to be carry'd on with winding Lines, in some Manner parallel to the Works of the Fortress, so as not to be in View of the Enemy, nor to expose its Length to their Shot, which they call *Explosive*; for then it will be in Danger of being Enfilad'd, or scour'd by the Enemy's Cannon: This carrying of the Trenches obliquely, they call carrying them by *Coudees* or *Traversees*.

They call it *Opening the Trenches*, when the Besiegers begin to work upon the Line of Approaches, which is usually done in the Night, and sometimes within Musket-shot, and sometimes within half, or whole Cannon-shot of the Place, if there be no rising Ground about it, the Garrison strong, and their Cannon well serv'd.

The Workmen that open the Trenches, are always supported by Bodies of Men against the Sallies of the Besieg'd; and sometimes those Bodies lie between them and the Place, as also on their Right and Left.

The Pioneers sometimes work on their Knees; and the Men that are to support them lie flat on their Faces, in order

to avoid the Enemies Shot; and the Pioneers are likewise usually cover'd with Mantlets, or Sauciffons.

They say, *Monat the Trencher*, that is, go upon Duty in them: To *Relieve the Trencher*, is to relieve such as have been upon Duty there.

The Enemy is said to have clear'd the *Trenches*, when they have driven away or kill'd the Soldiers who guarded them.

The *Tail of the Trench*, is the Place where it was begun; and the *Head* that to which it is carry'd. See **HEAD**.

To *Trench the Ballast*, is a Sea Phrase, signifying to divide the Ballast into several *Trenches* in a Ship's Hold. See **BALLAST**.

**TRENCHÉ**, in Heraldry. See **TRANCHE**.

**TRENCHING Plough**, is an Instrument for cutting out the Sides of *Trenches* and *Drains*, or the Sides of *Turf*, &c. See **PLOUGH**.

**TRENTAL, TRIENTAL, or TRICENNAL**, a *Rovish* Office for the Dead, consisting of thirty Masses, rehears'd for thirty Days after the Parry's Death: Thus call'd from the *Italico, trenta, triginta, thirty*.

This mention'd *Anno primo Ed. VI. Et volo, & ordino, quod Executors mei ordinarum seu ordinare faciant unum Trental pro salute Animæ meæ*.

**TREPANUM**, a Chirurgion's Instrument, call'd also *Aulapagistion* and *Machulus*. See **MACHULUS**, &c.

It is in Form of a Trebra or Wumble, only the Handle indented somewhat in Manner of a round Saw.

Its Use is for the Cure of Wounds, Contusions, and Fractures of the Cranium, when they don't go beyond the second Table; for by means hereof, an Amputation or Exfoliation is made of what Part, or Quantity of a Bone one pleases. See **CRANIUM**, **FRACTURE**, **TREPANNING**, &c.

It has usually a sharp Nail in the Middle of its Circumference, serving to keep it firm and steady during the Operation. — It should also have a kind of Cope to rise and fall as Occasion requires, that it mayn't go deeper in the Bone than is necessary.

There are also two-pointed *Trepans*, others Triangular, Quadrangular, and Hexagonal, for the Cure of Caries of the Bones. — There are also perforative *Trepans*, and exfoliative ones.

**TREPANNING**, in Chirurgery, the Operation of relieving Cuts, Contusions, Corruptions, and Fractures in the Skull; by means of an Instrument call'd the *Trepanium*. See **TREPANUM**.

*Trepanning* is a very dangerous and difficult Operation; not to be us'd, unless when the Chips and Prominences of the Bones prick; when the upper Table is entire, but depressed, and the lower broken; and when the extravasated Blood would endanger the Person's being suffocated. See **CRANIUM**.

The Manner of *Trepanning*, or Opening the Skull, is thus: The Hairs being shaven off, the Skin is to be cut thro' to the Pericranium, avoiding, as much as possible, the Muscles of the Temples, and the Sutures of the Skull: And for this Time the Wound is to be bound up, unless there be so little Blood spilt, that the Pericranium may at the same time be pull'd up from the Bone.

After a few Hours, stop the Patient's Ears, and take one of the Instruments call'd a *Milde Trepanium*, or *Machulus*; fix its Point in the Skull, but so far off the Fracture, that it touch it not, much less the Suture, with its Teeth; tho' some Surgeons don't mind to avoid the Sutures, but assure us, they have perforated them as successfully as any other Part.

Then, holding the Instrument fast with the left Hand, turn it round with the right, till you have cut a pretty deep Hole: After this take a Female *Trepanium*, which has no Point in the Middle, and turn it round as before: In the mean time, take away the Dust or Chips that proceed from the Perforation, and moisten the Instrument in Oil and Water to make it cool and slippery.

The Blood appearing, will shew you are now gone as deep as the second Table, i. e. beyond the Skull, to the *Dura Mater*; in which Case you must press very gently, lest that Membrane be inadvertently hurt.

When the Bone begins to wag, put something in between the Sides of the Wound; loosen it, and take it out with a Pair of Surgeons Pincers or Forceps.

After the Operation is over, the Part is to be wash'd gently with weak red Wine; and proper Dressings apply'd thereon, as Honey of Roses, Acreas Linniment, Oil of St. John's Wort, &c. — If the *Dura Mater* be corrupted, add, as Occasion requires, Spirits of Wine, Tincture of Myrrh and Aloes, Venice Turpentine, Honey, *Aegyptiacum*, &c.

Mr. *Chefelden* takes Notice, that the Sinus's and Spine in the Os Frontis, make it very dangerous, if not impracticable, to apply a *Trepanium* to the middle and lower Part of the Forehead.

**TREPIDATION**, in Medicine, a *Tremor*, or Trembling of the Members and Nerves of the Body. See **TREMOR**.

The first Symptom of Madness in Dogs, is a *Trepidation* of the Members, &c. See **HYDROPHOBIA**.

**TREPIDATION**, in the ancient Astronomy, is a Libration of the eighth Sphere; or a Motion which the *Prolemaic* System attributes to the Firmament, to account for certain almost insensible Changes and Motions observ'd in the Axis of the World; by means whereof the Latitudes of the fix'd Stars come to be gradually chang'd, and the Ecliptic seems to approach reciprocally, first towards one Pole, then the other. See **PROLEMAIC**, &c.

This Motion is also call'd the Motion of the first Libration. See **LIBRATION**.

**TRESPASS**, in Law, signifies any Transgression of the Law, under Treason, Felony, or Misdemeanor of Treason, See **TRANSGRESSION**.

For a Lord of Parliament to depart from thence without the King's Licence, is neither Treason nor Felony, but *Trespas*. See *Stansford Pl. Cor.*

The Word *Trespas*, however, is generally us'd either for that Wrong or Damage which is done to the King in his Forest, or by one private Man to another.

According to this Signification, it is of two Sorts; *Trespas general*, otherwise call'd *Trespas vi & armis*, where Force or Violence is us'd: And *Trespas special*, otherwise call'd *Trespas upon the Case*; which should be that done without Force. — But the two are sometimes confounded.

In an Action of *Trespas*, the Plaintiff always sues for Damages, or the Value of the Hurt done him by the Defendant. See **DAMAGES**.

There is also *Trespas local* and *Trespas transitory*. *Trespas local* is that which is to annex'd to the Place certain, that if the Defendant join Issue upon a Place, and traverse the Place mention'd in the Declaration, and aver it; it is enough to defeat the Action.

*Trespas transitory*, is that which cannot be defeated by the Defendant's Traverse of the Place, because the Place is not material. See **TRAVERSE**.

The Action of *Trespas, quare clausum fregit*, ought to be local.

**TRESSURE**, in Heraldry, a Diminutive of an *Orle*, usually suppos'd to be half the Breadth thereof. See **ORLE**.

It is usually born stony, and counter-stony; and sometime double, as in the Figure adjoining; and sometimes triple.

**TRESTLE**, of the French *Trestois*, is explain'd by *Mansuet* to be three Stools, or a three-footed Stool; particularly a wooden Frame to bear up Tables, Scaffolds, &c.

**TRET**, in Commerce, an Allowance made for the Waste or the Dust that may be mix'd with any Commodity; which is always 4 Pounds in every 104 Pounds Weight. See **TARE**.

**TREVE de Dieu**, *Trevis*, *Trevisis*, *Trevis*, or *Traya Dei*, a Phrase famous in the Histories of the 13th Century; when the Disorders and Licences of private Wars between particular Lords and Families, oblig'd the Bishops of France to forbid such Violences within certain Times, under Canonical Penances.

Those Intervals they call'd *Trevis de Dieu*, q. d. Truce of God, a Phrase frequent in the Councils since that Time. See **TARCE**.

The first Regulation of this Kind was in a Synod held in the Diocese of *Elon* in *Normandy*, Anno 1027, where it was enact'd, That throughout that County, no Person should attack his Enemy from the Hour of Nones on Saturday, to that of Primes on Monday, that Sunday might have its proper Honour: That no Body should attack, at any Time, a Religious or Priest walking unarm'd, nor any Person going to Church, or returning from the same, or walking with Women: That no Body should attack a Church, or any House within thirty Paces around it. — The whole under Penalty of Excommunication, which, at the End of three Months, was converted into an Anathema.

**TRIA prima**, among Chymists, the three Hypothetical Principles, viz. Salt, Sulphur, and Mercury; of which they hold all Bodies to be primarily made, and into which they are all held reducible by Fire. See **PRINCIPLE** and **ELEMENT**. See also **SALT**, **SULPHUR**, and **MERCURY**.

**TRIAD**, *Trias, ternis*, a Term sometime us'd for a Trinity. See **TRIAS**.

**TRIAL**, in Law, the Examination of any Cause, whether Civil or Criminal, according to the Laws of the Realm, before a proper Judge. See **CAUSE** and **PROOF**.

Of this there are divers Kinds: Matters of Fact, *i. e.* being to be try'd by the Jurors; Matters of Law by the Justices; Matters of Record by the Record itself. See **JURY**, **JUDGE**, **JUSTICE**, **RECORD**, &c.

A Lord of Parliament indicted of Treason or Felony, shall be try'd, without any Oath, by his Peers, upon their Honours and Allegiance; but in Appeal, at the Suit of any Subject, they shall be try'd *per bonos & legales homines*. See **PEER**.

If ancient Demetrius be pleaded of a Manor, and deny'd, this shall be try'd by the Record of Doomsday. See DEMETRIUS and DOOMSDAY.

Bairday, Excommunication, Lawfulness of Marriage, and other Ecclesiastical Matters, shall be try'd by the Bishop's Certificate.

Before Trial in a Criminal Case, 'tis usual to ask the Criminal how he will be try'd? which was anciently a very pertinent Question, tho' not so now; in regard there were formerly several Ways of Trial, *viz.* by *Battel*, *Ordeals*, and *Jury*. See *BATTEL*, *ORDEAL*, and *JURY*.

When the Criminal answer'd by God, and his Country, it shew'd he made Choice to be try'd by a Jury. — But there is now no other Way of Trial. This is also call'd *trying per pais, per patriam*.

For the ancient Manner of Trial by Combat and great Office; See *COMBAT*, *DUEL*, and *ASSIZE*.

TRIANGLE, in Geometry, a Figure comprehended under three Lines, and which of Consequence has three Angles. See *FIGURE* and *ANGLE*.

If the three Lines or Sides of the Triangle be all right, it is said to be a *Plane* or *Rectilinear Triangle*. See *PLANE* and *RECTILINEAR*.

If all the three Sides of the Triangle be equal, (as ABC Tab. Geometry, Fig. 68.) it is said to be *equilateral*. See *EQUILATERAL*.

If only two of the Sides of the Triangle be equal, (as in DEF, Fig. 69.) it is call'd an *Isosceles*, or *Equicrural Triangle*. See *ISOSCELES*, &c.

If all the Sides of the Triangle be unequal to each other, (as in ACB, Fig. 70.) the Triangle is said to be *Scalenous*. See *SCALENOUS*.

If one of the Angles (as K of Fig. 71.) of a Triangle KML be a right Angle, the Triangle is said to be *Rectangular*. See *RECTANGLE*.

If one of the Angles (as N Fig. 72.) be obtuse, the Triangle is said to be *Obtusangular*, or *Amblygonous*. See *OBTUSANGLE*.

If all the Angles be acute, (as in ACB, Fig. 68.) the Triangle is said to be *Acutangular*, or *Oxygonous*. See *ACUTYANGLE*, &c.

If the three Lines of the Triangle be all curves, the Triangle is said to be *Curvilinear*. See *CURVILINEAR*.

If some of the Sides be right, and others curve, the Angle is said to be *Mixtilinear*. See *MIXTILINEAR*.

If the Sides be all Arches of great Circles of the Sphere, the Triangle is said to be *Spherical*. See *SPHERICAL TRIANGLE*.

#### Construction of TRIANGLES.

1<sup>o</sup>. Two Sides, as AB and AC, Fig. 73. being given in Numbers, or otherwise, together with the Quantity of the Angle intercepted between them, A; to construct a Triangle — Assume AB as a Base; and in A make the given Angle: On the other Leg set off the other given Line AC; lastly, draw BC: Then will ABC be the Triangle requir'd.

Hence, two Sides with the intercepted Angle being determin'd, the whole Triangle is determin'd. — Wherefore, if in two Triangles ACB and acb; a = A; and ab : ac :: AB : AC, the Triangles are determin'd in the same Manner, and are therefore similar; consequently c = C and b = B, ab : bc :: AB : BC, &c.

2<sup>o</sup>. Three Sides, AB, BC, and CA, Fig. 70. being given, any two whereof, as AC, AB, taken together, are greater than the third, to construct a Triangle — Assume AB for a Base; and from A, with the Interval AC, describe an Arch *g*; and from B, with the Interval BC, describe another Arch *x*: Draw the right Lines AC and BC. Thus is the Triangle construct'd.

Hence, as if any three given right Lines, only one Triangle can be construct'd; by determining the three Sides, the whole Triangle is determin'd.

Wherefore if in two Triangles ACB and acb; AC : AB :: ac : ab; AC : CB :: ac : bc; the Triangles are determin'd in the same Manner, and consequently are similar, and therefore are mutually equiangular.

3<sup>o</sup>. A right Line, as AB, and two adjacent Angles A and B, which, taken together, are less than two right ones, being given; to describe the Triangle ABC. — On the given Line AB, make the two given Angles A and B: Continue the Sides AC and BC till they meet in C. Then will ABC be the Triangle requir'd.

Hence, one Side and two Angles being given, the whole Triangle is determin'd. — Wherefore if in two Triangles A = a and B = b, Fig. 73. the Triangles are determin'd after the same Manner, and therefore are similar.

#### Measurement of TRIANGLES.

To find the Area of a Triangle. — Multiply the Base A B Fig. 74. by the Altitude Cd; half the Product is the Area of the Triangle ABC.

Or thus: Multiply half the Base A B by the Altitude CD; or the whole Base by half the Altitude; the Product is the Area of the Triangle.

E. gr. AB = 342	AB = 342	1/2 AB = 171
Cd = 234	CD = 117	Cd = 234
1368	2394	684
1026	342	513
684	342	342
2) 80028 (	40014	40014 Area
arc as	40014	

Or, The Area of any Triangle is had by adding all the three Sides together, and taking half the Sum; and from that half Sum, subtracting each Side severally, and multiplying that half Sum and the Remainder continually into one another, and extracting the Square Root of the Product.

Hence, 1<sup>o</sup>. If between the Base, and half the Altitude; or between the Altitude, and half the Base, be found a mean Proportional; it will be the Side of a Square equal to the Triangle.

2<sup>o</sup>. If the Area of a Triangle be divided by half the Base, the Quotient is the Altitude.

#### General Properties of Plane TRIANGLES.

1<sup>o</sup>. If in two Triangles ABC and abc, Fig. 73. the Angle A = a; and the Sides AB = ab, and AC = ac; then will the Sides BC = bc, and C = c, the Angle B = b; and therefore the whole Triangles will be equal and similar.

2<sup>o</sup>. If one Side of a Triangle ABC (Fig. 75.) be continu'd to D; the external Angle DAB will be greater than either of the internal opposite ones B or C.

3<sup>o</sup>. In every Triangle, the greatest Side is oppos'd to the greatest Angle, and the least to the least.

4<sup>o</sup>. In every Triangle, any two Sides taken together are greater than the third.

5<sup>o</sup>. If in two Triangles, the several Sides of the one be respectively equal to the Sides of the other, the Angles will likewise be respectively equal; and consequently the whole Triangles equal and similar.

6<sup>o</sup>. If any Side, as AC (Fig. 76.) of a Triangle ACB be continu'd to D, the external Angle DCA will be equal to the two internal opposite ones y and z taken together.

7<sup>o</sup>. In every Triangle, as ABC, the three Angles A, B, C, taken together, are equal to two right ones, or 180<sup>o</sup>.

Hence, 1<sup>o</sup>. If the Triangle be rectangular, as MKL, (Fig. 71.) the two oblique Angles M and L, taken together, make a right Angle, or 90<sup>o</sup>; and therefore are half Right, if the Triangle be Isosceles. — 2<sup>o</sup>. If one Angle of a Triangle be oblique, the other two taken together are oblique likewise. — 3<sup>o</sup>. In an Equilateral Triangle, each Angle is 60<sup>o</sup>. — 4<sup>o</sup>. If one Angle of a Triangle be subtracted from 180<sup>o</sup>, the Remainder is the Sum of the other two; and if the Sum of two be subtracted from 180<sup>o</sup>, the Remainder is the third. — 5<sup>o</sup>. If two Angles of one Triangle be equal to two of another, either together or separately; the third of the one is likewise equal to the third of the other. — 6<sup>o</sup>. Since in an Isosceles Triangle DFE (Fig. 69.) the Angles at the Base y and v are equal; if the Angle at the Vertex be subtracted from 180<sup>o</sup>, and the Remainder be divided by 2, the Quotient is the Quantity of each of the equal Angles: In like Manner, if the double of one of the Angles at the Base y be subtracted from 180<sup>o</sup>, the Remainder is the Quantity of the Angle at the Vertex.

8<sup>o</sup>. If in two Triangles, ABC, and abc, Fig. 73. AB = ab, A = a and B = b; then will AC = ac, BC = bc, C = c, and the Triangle ACB equal and similar to the Triangle abc. — Hence, if in two Triangles, ACB and acb, A = a, B = b and BC = bc; then will C = c; consequently A = ac, AB = ab; and the Triangle ACB = acb.

9<sup>o</sup>. If in a Triangle DEF the Angles at the Base y and v, Fig. 69. be equal, the Triangle is Isosceles: Consequently, if the three Angles be equal, it is equilateral.

10<sup>o</sup>. If in a Triangle ABC, (Fig. 77.) a right Line DE be drawn parallel to the Base; then will BA : BC :: BD : BE :: AD : EC. And BA : AC :: BD : DE. Consequently the Triangle BDE similar to BAC.

11<sup>o</sup>. Every Triangle is inscribable in a Circle. See *CIRCLE*.

12<sup>o</sup>. The Side of an equilateral Triangle, inscrib'd in a Circle, is in Power triple of the Radius. See *RADIUS*.

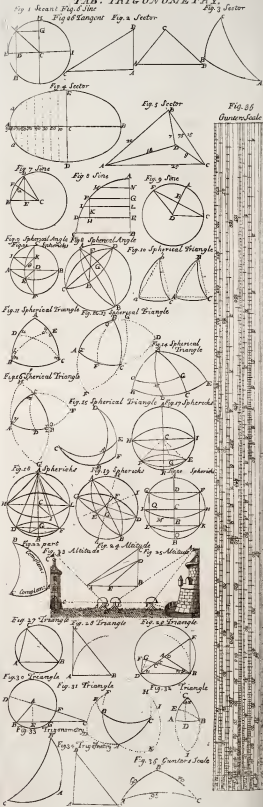

13<sup>o</sup>. Triangles on the same Base, and having the same Height, that is between the same parallel Lines, are equal. See *PARALLEL*.

14<sup>o</sup>. Every Triangle, as CFD, Fig. 41. is one half of a Parallelogram ACDB on the same, or an equal Base CD, and of the same Altitude, or between the same Parallels; Or a Triangle is equal to a Parallelogram upon the same Base, but half the Altitude; or half the Base, and the same Altitude. See *PARALLELOGRAM*.

**TAB: TRIGONOMETRY.**

15°. In every Triangle, as well plane as spherical, the Sines of the Sides, are proportional to the Sines of the opposite Angles.

16°. In every plane Triangle, as the Sum of two Sides is to their Difference, so is the Tangent of half the Sum of the opposite Angles, to the Tangent of half their Difference. See TANGENT.

17°. If a Perpendicular be let fall upon the Base of an oblique angled Triangle; the Difference of the Squares of the Sides is equal to double the Rectangle under the Base, and the Distance of the Perpendicular from the Middle of the Base.

18°. The Sides of a Triangle are cut proportionally, by a Line drawn parallel to the Base.

19°. A whole Triangle, is to a Triangle cut off by a right Line, as the Rectangle under the cut Sides, is to the Rectangle of the other two Sides.

20°. In a right lined Triangle, a Line drawn from the right Angle at the Top perpendicular to the Hypotenuse, divides the Triangle into two other right lined Triangles, which are similar to the first Triangle, and to one another.

21°. In every right angled Triangle, the Square of the Hypotenuse is equal to the Sum of the Squares of the other two Sides. See HYPOTHENUSE.

22°. If any Angle of a Triangle be bisected, the bisecting Line will divide the opposite Side, in the same Proportion as the Legs of the Angle are to one another. See BISECTION.

23°. If the vertical Angle of any Triangle be bisected, the Difference of the Rectangles, made by the Sides and the Segments of the Base, is equal to the Square of the Line that bisects the Angle.

24°. If a right Line BE, Fig. 78. bisect an Angle ABC of a Triangle, the Square of the said Line BE = AB + BC - AE + EC. *Newt. Arith. Univerf.*

*Properties of Spherical Triangles.* See SPHERICAL Triangle.

*To divide a Triangle into any given Number of equal Parts:* Divide the Base CD (Fig. 77.) into as many equal Parts as the Figure is to be divided into; and draw the Lines A 1, A 2, &c.

TRIANGLE, in Trigonometry.—The Solution or Analysis of Triangles, is the Business of Trigonometry. See TRIGONOMETRY.

The several Cases thereof are reducible to the following Problems.

*Solution of Plane TRIANGLES.*

1°. *Two Angles A and C (Tab. Trigonometry, Fig. 27.) being given, together with the Side AB opposite to one of them; to find the Side BC opposite to the other.*

The Rule or Canon is this: As the Sine of the Angle C, is to the given Side AB, opposite to the same; so is the Sine of the other Angle A, to the Side requir'd. The Side BC, therefore, is commodiously found by the Logarithms, from the Rule for finding a fourth Proportional to 3 Numbers given. See LOGARITHM.

For an Example: Suppose C = 48° 35', A = 57° 28', AB = 74. The Operation will stand thus:

Log. of Sine of C	9.8750142
Log. of AB	1.8692117
Log. of Sine of A	9.9258681

Sum of Log. of AB }  
and of Sine of A } 11.7950998

Log. of BC 1.9200956. The Number corresponding to which, in the Table of Logarithms, is 83, the Quantity of the Side sought.

2°. *Two Sides AB and BC, together with the Angle C, opposite to one of them given; to find the other Angle A and B.*

The Rule is this: As one Side AB is to the Sine of the given Angle opposite thereto C; so is the other Side BC, to the Sine of the Angle requir'd opposite thereto.

*E. gr.* Suppose AB = 94, BC = 69, C = 7° 15'.

Log. of AB	1.9731279
Log. of Sine of C	9.9788175
Log. of BC	1.8388491

Sum of Log. of Sine }  
of C and of BC } 11.8176666

Log. of Sine of A 9.9444387. The Number corresponding to which, in the Table of Logarithms, is 61° 37'. Now the given Angle C being 7° 15', the Sum of the two; 133° 52' subtracted from 180, the Sum of the three, gives 46° 8' for the other Angle sought B.

In like Manner, suppose, in a right angled Triangle, (Fig. 28.) that beside the right Angle, A, is given the Hypotenuse

BC, 49, and the Cathetus A C, 36, to find the Angle B; Then will the Operation stand thus:

Log. of BC	1.6901961
Log. of whole Sine	10.0000000
Log. of AC	1.5563025

Log. of Sine of B 9.8661064. The corresponding Number to which, in the Table of Logarithms, is 47° 16' 3 consequently, C = 42° 44'.

3°. *Two Sides BA and AC, together with the included Angle A being given; to find the two remaining Angles.*

I. If the Triangle ABC be rectangular; take one of the Sides including the Right Angle, as AB, for Radius; then will CA be the Tangent of the opposite Angle B: The Rule then is;

*As one Leg AB, is to the other AC; so is the whole Sine to the Tangent of the Angle B.*

*E. gr.* Suppose BA 79, and AC 74;

Log. of BA	1.8976271
Log. of AC	1.7323938
Log. of whole Sine	10.0000000

Log. of Tang. of B 9.8347667; The corresponding Number to which, in the Table of Logarithms, is 34° 21'; consequently the Angle C is 55° 39'.

II. If the Triangle be oblique, the Rule is; *As the Sum of the given Sides AB and AC, Fig. 29. is to this Difference; so is the Tangent of Half the Sum of the sought Angles C and B, to the Tangent of Half the Difference.* Adding, therefore, the Half Difference, to the Half Sum; the Aggregate will be the greater Angle C; and subtracting the Half Difference from the Half Sum; the Remainder is the less Angle B.

*E. gr.* Suppose AB = 75, AC 58, A 108° 24'; Then will

AB 75	AB 75	A + B + C	179° 60'
AC 58	AC 58	A 108	24
Sum 133		Differ. 17	B + C 71 36
		B + C	55 48

Log. of AB + AC	2.1218516
Log. of AB - AC	1.2104489
Log. of Tang. B + C	9.8580694

Sum of Log. 12.0835183  
L. of Tang. C - B 8.9646667. The corresponding Num-

ber to which is 5° 16'.

B + C = 35° 48'	B + C = 35° 48'
C - B = 516	C - B = 5° 16'
C = 41 4	B = 30 32

4°. *The Three Sides, AB, BC and CA (Fig. 30.) being given, to find the Angle A, B and C.*

From the Vertex of the Angle A, with the Extent of the least Side AB, describe a Circle: Then will CD be the Sum of the Legs AC and AB; and CF their Difference. The Rule then is,

As the Base BC is to the Sum of the Legs CD; so is the Difference of the Legs CF, to the Segment of the Base CG. — This Segment, thus found, being subtracted from the Base CB, the Remainder is the Chord GB. Then, from A to the Chord GB let fall the Perpendicular AE; thus will BE = E G = 1/2 GB.

Thus, in a rectangular Triangle, AEB, the Sides AB and BE, being given; Or, in an obliquangled Triangle, ACE the Sides AC and CE being given: the Angles B and A are found.

*E. gr.* Suppose AB = 36, AC = 45, BC = 40.

AC = 45	AC = 45
AB 36	AB = 36
AC + AB = 81	FC = 9

Log. of BC =	1.6020600
Log. of AC + AB	1.9084850
Log. of FC =	0.9542425
Sum of Log. =	2.8627275

Log. of CG = 1.2606675 The corresponding Number to which, in the Tables, is 18.

BC = 4000	EG = 1089
CG = 1822	CG = 1822
BG = 2178	CE = 2911
BE = 1089	

Log. of AB =	3.5563025
Log. of whole Sine =	10.0000000
Log. of EB =	3.0370279

Log. of Sine of EAC = 9.8108297; to which the corresponding Number in the Tables is 40° 18'; therefore ACE 49° 42'; and CAB 57° 54'.

*Solution of right angled spherical TRIANGLES, by the common Rules.*

I. In a right angled spherical Triangle, any two Parts beside the right Angle, being given, to find any of the rest.

1<sup>o</sup> Consider whether the Parts, which come to the Question, be conjunct or disjunct (See PART.) If the disjunct be opposite to each other; as, if the Hypotenuse BC, and the Angle C, Fig. 31. be given for the opposite Leg AB; then the Rule is;

As the whole Sine is to the Sine of the Hypotenuse BC; so is the Sine of the Angle C, to the Sine of the opposite Leg AB.

2<sup>o</sup> If the disjunct Parts be not opposite to each other; as, if AB, and the adjacent Angle B be given for the opposite Angle C; the Sides of the Triangle are to be continued one Way, till they become Quadrants, that you may thus have a new Triangle, wherein the Parts that come into the Question, are mutually opposite to each other; as, in our Case, the Triangle EBF, wherein we have given BF, the Complement of the Leg AB, and the Angle B for EF, the Complement of the Angle C. The Rule then is;

As the whole Sine is to the Sine of BF; so is the Sine of the Angle B to the Sine of EF, or Co-sine of C.

3<sup>o</sup> If the Hypotenuse be not among the conjunct Parts, as if the Legs AB and AC be given for an Angle opposite to one of them; the Rule is,

As the Sine of AC is to the whole Sine; so is the Tangent of AB, to the Tangent of O.

4<sup>o</sup> But if the Hypotenuse be found among the conjunct Parts; as if the Hypotenuse BC, and the Angle C be given to find the adjacent Side AC; The Sides of the Triangle are to be continued one way, till they become Quadrants, that we may have a new Triangle, wherein the Hypotenuse is not among the Parts that come into the Question; e.g. in our Case, the Triangle EBF, wherein are given the Complement EB of the Hypotenuse BC, and the Complement of the Angle C, and the Angle F the Complement of the Leg AC. Since then, in the Triangle EFB, the Hypotenuse does not come in the Question; the Rule is as before.

As the Sine of EF, or Co-sine of C, is to the whole Sine; so is the Tangent of EB, or Co-tangent of BC, to the Tangent of F, or Co-tangent of AC.

5<sup>o</sup> When the Sides of a Triangle are to be continued, 'tis the same thing, which way forever they be produced, provided no acute Angle come into the Question; otherwise, the Sides are to be continued through the other oblique one. If both be in the Connection, the Sides are to be continued through that adjacent to the Side in Question.

By this means, a Triangle is always obtained, wherein the Thing required is found, either by the Rule of Sines or Tangents.

*Solution of right angled spherical Triangles, by one caselick Rule.*

Consider, as before, whether the Parts that come in Question be conjunct or disjunct. See PART.

If either one, or both the Sides, including the right Angle, come into the Question; for it, among the Data, write its Complement to a Quadrant. — Since, then, by the catholic Rule, deliver'd under the Article Trigonometry; the whole Sine, with the Sine Complement of the middle Part, is equal to the Sines of the disjunct Parts, and the Co-tangents of the conjunct Parts; from the Sum of those Data, subtract the third Datum; the Remainder will be some Sine or Tangent, the Side or Angle corresponding to which, in the artificial Canon of Triangles, is the Side or Angle sought.

This universal Rule being of great Service in Trigonometry, we shall apply it to the various Cases thereof, and illustrate it with Examples; which Examples, in the Case of separate Parts, will at the same time illustrate the common Method; but in the Case of contiguous Parts, admit of other Solutions.

1<sup>o</sup> Given the Hypotenuse BC 60° and the Angle C 23° 30', to find the opposite Leg AB (Fig. 31.)

Since AB is the middle Part, C and BC are disjunct (See PART); the whole Sine, with the Co-sine of the Complement A B, i. e. with the Sine itself of A B, is equal to the Sines of C and BC.

Therefore, from Sine of C	96006977
Sine of BC	99375306

Sum	195383103
Subtract whole Sine	100000000

Remain Sine of A B 95382303. The corresponding Number to which, in the Canon, is 20° 12' 6".

2<sup>o</sup> Given the Hypotenuse BC 60° and the Leg AB 20° 12' 6" to find the opposite Angle C.

'Tis evident from the preceding Problem, that from the Sum of the whole Sine, and the Sine of the Leg A B, the Sine of the Hypotenuse BC is to be subtracted; the Remainder is the Sine of the Angle C. The Example, therefore, of the former Case is easily converted into an Example of this.

3<sup>o</sup> Given the Leg A B 20° 12' 6" and the opposite Angle C 23° 30', to find the Hypotenuse BC.

'Tis evident from the first Case, that from the Sum of the whole Sine, and the Sine of A B is to be subtracted the Sine of the Angle C, and the Remainder is the Sine of the Hypotenuse B C.

4<sup>o</sup> Given the Hypotenuse BC 60°, and one Leg AB 20° 12' 16" to find the other Leg.

Since BC is the mean Part, and AB and AC are disjunct Parts, the whole Sine, with the Co-sine of the Hypotenuse BC, are equal to the Sines of the Complements; i. e. to the Co-sines of the Legs AB and A C.

Therefore from whole Sine	100000000
Co sine of BC	96989700

Sum	196989700
Subtract Co-sine of A B	99712379

Remains Co sine of AC 97265421. The Corresponding Number to which, in the Canon, is 32° 11' 34"; therefore AC 57° 48' 26".

5<sup>o</sup> Given the Legs A C 57° 48' 26" and AB 20° 12' 6"; to find the Hypotenuse B C.

'Tis evident from the preceding Case, that the whole Sine is to be subtracted from the Sum of the Co-sines of the Legs A B and A C; the Remainder is the Co-sine of the Hypotenuse B C. The Example, therefore, of the preceding Case is easily applied to this.

6<sup>o</sup> Given the Leg A C 50° 48' 26" and the adjacent Angle C 23° 30' to find the opposite Angle B.

Since B is the middle Part, and A and C disjunct Parts; the whole Sine, with the Co-sine of B, is equal to the Sine of C, and the Sine of the Complement, i. e. to the Co-sine of A C;

Therefore from Sine of C	96006977
Co-sine A C	97265421

Sum	19327418
Subtract whole Sine	100000000

Remains Co-sine of B 93272418. The Number corresponding to which, in the Canon, is 12° 15' 56"; therefore B 77° 44' 4".

7<sup>o</sup> Given the Leg A C 57° 48' 26" and the opposite Angle B 77° 44' 4" to find the adjacent Angle C.

'Tis evident from the preceding Case, that the Co-sine of A C is to be subtracted from the Sum of the whole Sine, and the Co-sine of B; the Remainder is the Sine of C. The former Example, therefore, is easily accommodated to the present Case.

8<sup>o</sup> Given the oblique Angles B 77° 44' 4" and C 23° 30', to find the Leg adjacent to the other, A C.

From Problem the Sixth, 'tis evident that the Sine of C is to be subtracted from the Sum of the whole Sine, and the Co-sine of B; and that the Remainder is the Co-sine of A C. The Example of the sixth Problem is easily applied to this.

9<sup>o</sup> Given the Leg A C 57° 48' 26" and the adjacent Angle C 23° 30', to find the opposite Leg A B.

Since AC is the mean Part, and C and A B conjunct Parts; the whole Sine, with the Sine of A C, is equal to the Co-tangent of C, and the Tangent of A B.

Therefore from whole Sine	100000000
Sine of A C	99275039

Sum	199275039
Subtract Co-tangent of C	105616981

Remains Tangent of A B 95658058. To which the corresponding Number in the Canon, is 20° 12' 6".

10<sup>o</sup> Given the Leg A B 20° 12' 6" and the opposite Angle C 23° 30', to find the adjacent Leg A C.

From the Sum of the Co-tangent of C, and the Tangent of A B, subtract the whole Sine; the Remainder is the Sine of A C.

11° Given the Legs A B 20° 12' 6", and A C 57° 48' 26", to find the Angle C, opposite to one of them.

From the Sum of the whole Sine, and Sine A C, subtract the Tangent of B A; the Remainder is the Co-tangent of C.

12° Given the Hypotenuse B C 60°, and the oblique Angle C 23° 30', to find the adjacent Leg A C.

Since C is the middle Part, and B C and A C conjunct Parts; the whole Sine, with the Co-sine of C, will be equal to the Co-tangent of A C.

Therefore from whole Sine	10000000
Co-sine of C	99623978

Sum 199623978

Subtract Co-tangent of B C 97614394

Remains Tangent of A C 102009584. The Number corresponding to which, in the Tables, is 57° 48' 26".

13° Given the Leg A C 57° 48' 26", and the adjacent Angle C 23° 30', to find the Hypotenuse B C.

From the Sum of the whole Sine, and the Co-sine of C, subtract the Tangent of A C, the Remainder is the Co-tangent of B C.

14° Given the Hypotenuse B C 60°, and the Leg A C 57° 48' 26", to find the adjacent Angle C.

From the Sum of the Co-tangent of B C, and Tangent of A C, subtract the whole Sine; the Remainder is the Co-sine of C.

15° Given the Hypotenuse B C 60°, and one Angle C 23° 30', to find the other, B.

Since B C is the middle Part, and B and C disjunct Parts, the whole Sine, and the Co-sine of B C will be equal to the Co-tangents of B and C.

Therefore from whole Sine	10000000
Co-sine of B C	96989700

Sum 196989700

Subtract Co-tangent of C 10366981

Remains Co-tangent of B 93372719; The corresponding Number to which, in the Canon, is 12° 15' 56"; therefore B is 77° 44' 4".

16° Given the oblique Angles B 77° 44' 4" and C 23° 30', to find the Hypotenuse.

From the Sum of the Co-tangents of C and B, subtract the whole Sine; the Remainder is the Co-sine of B C.

*Solution of oblique-angled spherical TRIANGLES.*

1° In an oblique-angled spherical Triangle A B C, (*Tab. Trigonometry Fig. 32.*) two Sides A B and B C being given, together with an Angle A, opposite to one of them, to find the other C: The Rule is,

As Sine of the Side B C, is to the Sine of the opposite Angle A; so is the Sine of the Side B A, to the Sine of the opposite Angle C.

Suppose, for Example, B C 39° 29'; A 43° 20'; B A 66° 45'; then will

Sine of B C	98033572
Sine of A	983647
Sine of B A	99632168

197996939

Sine of C 99633677. The corresponding Number to which, in the Tables, is 82° 34' 7".

2° Given two Angles C 82° 34' 7", and A 43° 20', together with the Side A B 60° 45', opposite to one of them C; to find the Side B C opposite to the other of them A. Say,

As Sine of Angle C, is to Sine of the opposite Side A B; so is Sine of Angle A, to Sine of opposite Side B C. — The former Example may suffice for the present Case.

3° Given two Sides A B 66° 45', and B C 39° 29', together with an Angle opposite to one of them A 45° 20'; to find the Angle included by them B.

Suppose the Angle C to be acute, since the other, A, is also acute; the Perpendicular B E falls within the Triangle. In the re-angled Triangle A B E, therefore, from the given Angle A, and Side A B, find the Angle A B E. Since B E is assumed as a lateral Part in the Triangle A E B, the Angle E B C is the middle Part, and the Side B C a conjunct Part; The Co-sine of the Angle E B C will be found by subtracting the Co-tangent of A B from the Sum of the Co-sine of the Angle A B E, and the Co-tangent of B C. If then the Angles A B E and E B C be added together; or, in case the Perpendicular fall without the Triangle, be subtracted from each other, you will have the Angle required.

Ex. gr. whole Sine	10000000
Cofine of A B	95963154

Sum	195963154
Cotang. of A	100252805

Cotang. of A B 95710149. The Number corresponding to which, in the Tables, is 20° 25' 35". A B therefore is 69° 34' 25".

Cofine of A B E	95428300
Cotang. of B C	100141529

Sum	196269829
Cotang. of B	96330085

Cofine of E B C 9978544. The Number corresponding to which, in the Tables, is 80° 26'. Therefore A C is 79° 9' 59".

4° Given two Angles A 43° 20', and B 79° 9' 59", together with the adjacent Side A B 66° 45'; to find the Side B C opposite to one of them.

From one of the given Angles B, let fall a Perpendicular E B, to the unknown Side A C; and, in the re-angled Triangle A B E, from the given Angle A, and Hypotenuse A B, find the Angle A B E; which subtracted from the Angle A B C, leaves the Angle E B C. But if the Perpendicular should fall without the Triangle, the Angle A B C should have been subtracted from A B E. Since as the Perpendicular B E is taken for one of the lateral Parts, the middle Part in the Triangle A B E, is the Angle E, and the conjunct Part B C; the Co-tangent of the Side B C is found by subtracting the Cofine of E B A, from the Sum of the Co-tangent of A B, and the Cofine of E B C. — The Example of the preceding Case is easily apply'd to this.

5° Given two Sides A B 66° 45', and B C 39° 29', with the Angle A opposite to one of them, 43° 20'; to find the third Side A C.

Letting fall, as before, the Perpendicular B E; in the re-angled Triangle A B E, from the given Angle and Hypotenuse A B, find the Side A E. Since, assuming B E for a lateral Part in the Triangle A E B, A B is the middle Part, and A E the separate Part; and in the Triangle E B C, B C, is the mean Part, and E C a disjunct Part; the Cofine of E C is found by subtracting the Cofine of A B from the Sum of the Cofines of A E and C B. If then the Segments A E and E C be added together; or in case the Perpendicular fall without the Triangle, be subtracted from each other; the Side A C will be had.

6° Given two Sides A C 65° 30' 46", and A B 66° 45', together with the included Angle A; to find the third Side B C opposite thereto.

Letting fall the Perpendicular B E, find, in the re-angled Triangle, the Segment A E; which subtracted from A C, leaves E C. If the Perpendicular fall without the Triangle, A C is to be subtracted from A E; since by assuming the Perpendicular B E for a lateral Part in the Triangle A E B, A B becomes a middle Part, and A E a separate Part: In the Triangle E B C, C B is the middle Part, E C a separate Part; The Cofine of B C is found, by subtracting the Cofine of A E from the Sum of the Cofines of A B and E C.

7° Given two Angles A 43° 20', and B 79° 9' 59", together with the Side C B 39° 29', opposite to one of them; to find the Side A B adjacent to both.

Letting fall the Perpendicular C D from the unknown Angle C, to the opposite Side A B; and that falling within the Triangle, from the given Angle B, and the Hypotenuse B C, seek in the re-angled Triangle B C D for the Segment B D. Since assuming the Perpendicular C D for a lateral Part in the Triangle C D B, D B is the mean Part, and the Angle B a conjunct Part; and in the Triangle C D A, A D is the middle Part, and the Angle A a conjunct Part: The Sine of the Segment A D is found, by subtracting the Co-tangent of the Angle B from the Sum of the Sine of D B, and the Co-tangent of the Angle A. If then the Segments A D and D B be added; or in case the Perpendicular fall without the Triangle, be subtracted from each other, the Resid will be Side A B required.

8° Given two Sides A B 66° 45', and B C 39° 29', with the included Angle 79° 9' 59"; to find the Angle A opposite to one of them.

Letting fall the Perpendicular C D, find the Segment D B, as in the preceding Problem. This subtracted from A B leaves A D. If the Perpendicular fall without the Triangle, A B is to be added to D B; since by assuming the Perpendicular C D for a lateral Part in the Triangle C D B, B D is the middle Part, and the Angle B a conjunct Part; and in the Triangle C D A, A D is the middle Part, and the Angle A a conjunct Part: The Co-tangent of the Angle A is found by subtracting the Sine of D B from the Sum of the Co-tangents of the Angle B, and of the Sine of A D.

9° Given two Angles A 41° 20', and B 79° 9' 59", together with the adjacent Side A B 66° 45'; to find the Angle C opposite to the same

From one of the given Angles B, letting fall the Perpendicular BE, to the opposite Side AC; in the rectangled Triangle ABE, from the given Angle A, and Hypotenuse AB, we find the Angle ABE; which subtracted from ABC, leaves the Angle EBC. In case the Perpendicular fall without the Triangle, ABC is to be subtracted from ABE; since by affixing BE for a lateral Part in the Triangle CEB, the Angle E is the middle Part, and the Angle CBE the disjoint Part; and in the Triangle ABE, the Angle A is the middle Part, and the Angle ABE the disjoint Part: The Cosine of the Angle C is found by subtracting the Sine of the Angle ABE, from the Sum of the Cosine of the Angle A, and of the Cosine of EBC.

10°. Given two Angles A  $43^{\circ} 20'$ , and C  $82^{\circ} 34'$ , together with a Side BA  $66^{\circ} 45'$ , opposite to one of them; to find the other Angle.

From the fought Angle B, let fall a Perpendicular BE; and in the right angled Triangle AEB, from the given Angle A, and Hypotenuse BA, find the Angle ABE; since affixing the Perpendicular EB for a lateral Part in the Triangle ECB, the Angle E is the middle Part, and the Angle CBE a disjoint Part; and in the Triangle ABE, the Angle A is the middle Part, and the Angle ABE a disjoint Part: The Sine of the Angle EBC is found by subtracting the Cosine of A from the Sum of the Cosine of C, and of the Sine of ABE. If then ABE and EBC be added, or in case the Perpendicular fall without the Triangle, be subtracted from each other, the Residue will be Angle requir'd ABC.

11°. Given the three Sides; to find an Angle opposite to one of them.

I. If one Side AC, Fig. 16. be a Quadrant, and the Leg AB less than a Quadrant, find the Angle A. Continue AB to F, till AF become equal to a Quadrant; and from the Pole A draw the Arch CF, to cut the Arch AF at right Angles in F. Since in the rectangled Triangle CAF, we have given the Hypotenuse FC, and the Side AF, or its Complement A to a Quadrant; we shall find the Perpendicular CF, which being the Measure of the Angle CAB, that Angle is found of course.

II. If one Side AC be a Quadrant, and the other AB greater than a Quadrant, seek again the Angle A: From AB subtract the Quadrant AD, and from the Pole A describe the Arch CD, cutting the Arch CD at right Angles in D. Since in the rectangled Triangle CDB, the Hypotenuse BC, and Side DB, or Excess of the Side A B beyond a Quadrant, is given, the Perpendicular CD will be found as before, which is the Measure of the Angle A requir'd.

III. If the Triangle be Isosceles, and AC=CE, and the Angle ACF be requir'd; bisect AF in D, and thro' D and C draw the Arch DC. Since CD is perpendicular to AF, the Angles A and F, and ACD and DCF are equal; by the Hypotenuse AC, and Leg AD, given in the rectangled Triangle ACD, we find the Angle ACD; the double whereof is the Angle requir'd ACF: and from the same Data may the Angle A or F be found.

IV. If the Triangle be Scaleneus, and the Angle A, Fig. 32. be requir'd; from C let fall the Perpendicular CD, and seek the Semi-difference of the Segments AD and DB, by Laying, As the Tangent of half the Base AB, is to the Tangent of half the Sum of the Legs AC and CB; so is the Tangent of their Semi-difference, to the Tangent of the Semi-difference of the Segments AD and DB: Add then the Semi-difference of the Segments to the half Base, to find the greater Segment; and subtract the same from the same for the less. Thus having in the rectangled Triangle CAD, the Hypotenuse AC, and the Side AD, the Angle A is found thence. After the same Manner is B found in the other CDB, from CD and DB given.

12°. Given the three Angles A B and C, to find any of the Sides.

Since in lieu of the given Triangle, another may be affix'd, whose Sides are equal to the given Angles, and the Angles to the given Sides; this Problem is resolv'd after the same Manner as the preceding one.

TRIANGLE, TRIANGULUM, in Astronomy, a Name common to two Constellations, the one in the Northern Hemisphere, call'd simply *Triangulum*, or *Triangulum Cælestis*; the other in the Southern Hemisphere, call'd *Triangulum Australe*. See CONSTELLATION.

The Stars in the Northern Triangle, in Ptolemy's Catalogue are 4; in Tycho's as many; in the *Britannicæ* 24: The Longitudes, Latitudes, Magnitudes, &c. whereof, are as follow:

Stars in the Constellation TRIANGULUM.

Name and Situation of the Stars.	R.	Longitude			Latitude.			Mag.

Informes between the Triangle and the Rays TAD, which are subdivisions among the Stars of Ann.

TRIANGULAR Compasses, are such as have three Legs or Feet, whereby to take off any Triangle at once. See COMPASSES.

These are much us'd in the Construction of Maps, Globes, &c.

TRIANGULAR Numbers, are a kind of Polygonous Numbers; see POLYGONOUS Number; being the Sums of Arithmetical Progressions, the Difference of whose Terms is 1: Thus,

Of Arithmetical Progress 1 2 3 4 5 6  
are form'd Triang. Numb. 1 3 6 10 15 21.

TRIANGULAR Quadrant, is a Sector furnish'd with a loose Piece, whereby to make it an Equilateral Triangle. See SECTOR.

The Calendar is graduated thereon, with the Sun's Place, Declination, and other useful Lines; and by the Help of a String and a Plummer, and the Divisions graduated on the loose Piece, it may be made to serve for a Quadrant. See QUADRANT.

TRIANGULARIS, in Anatomy, a Name given to two Muscles, in respect of their Figure. See MUSCLE.

The *Triangularis Pectoris*, which has sometimes the Appearance of three or four distinct Muscles, arises from the Inside of the Sternum, and is implanted into the Cartilages which join the four lowest true Ribs to the Sternum.

The Action of this Muscle is very obscure; since both the Origination and Insertion are at Parts not moveable, but together. — Dr. Drake conjectures it may conduce towards the forming the necessary incurvature of the Sternum, and by its Over-tension in Children, while the Cartilages are soft, may occasion that morbid Accrimation of the Sternum seen in rickety Children. — Others suppose it may contract the Cavity of the Thorax in Expiration.

TRIANGULARIS Labii. See DEPRESSOR Labii Superioris.

TRIARI, in the Roman Militia, a kind of Infantry, arm'd with a Pike and a Shield, a Helmet and a Cuirass.

They were thus call'd, because they made the third Line of Battle.

Polybius distinguishes four Kinds of Forces in the Roman Army: The first, call'd *Pilati*, or *Velites*, were a raw Soldierly, lightly arm'd. — The *Hastati*, or Spear-men, were a Degree older, and more experienc'd. — The third, call'd *Principes*, Princes, were still older, and better Soldiers than the second. — The fourth were the eldest, the most experienc'd, and the bravest: These were always dispos'd in the third Line, as a Corps de Reserve, to sustain the other two, and to restore the Battle, when the others were broken or defeated.

Hence their Name of *Triarii*; and hence the Proverb *ad Triarios ventum est*, to shew that one is at the last and hardest Struggle.

The *Triarii* were also call'd *Possignani*, because rang'd behind the *Principes*, who bore the Standard in a Legion. See PRINCIPES.

TRIAS Harmonica, or the Harmonical TRIAD, in Music, a Compound of three radical Sounds, heard all together; two whereof are a Fifth, and a Third above the other, which is the Fundamental. See CONCORD, &c.

The *Triad* is properly a Consonance form'd of a Third and a Fifth; which, with the Base, or fundamental Sound, makes three different Ternus, whence the Name *Trias*. — That of *harmonic* is doubtless given it from that wonderful Property of the Fifth, which divides itself naturally into two Thirds, both excellent, and perfectly harmonical; so that this one Sound

Sound dispos'd between two others, makes two Thirds at once, and of Consequence a double Harmony. See FIFTH.

Hence it is, that in *Trips*, particularly, this Concord is prefer'd to that which divides the Octave into a Fifth and a Fourth: In regard that, if there be a Concord on one Side, there is a Discord on the other; whereas here the Harmony is complet on both Sides.

Of the three Sounds which compose the harmonical *Triad*, the gravest is call'd the *Fundamental*, or *Bass*; the acutest, i. e. that which makes the Fifth, and which terminates the Concord upwards, is call'd the *extremest* or *highest* Sound; and that which divides the Fifth so agreeably into two Thirds, is call'd the *harmonical Mean*.

The Division of the Fifth into two Thirds, may be perform'd two Ways, viz. 1<sup>o</sup>. Harmonically, when the greater Third is lowest, and the less a top; in which Case the *Triad* is perfect and natural.

2<sup>o</sup>. Arithmetically, when the less Third is lowest, and the greater a top; in which Case the *Triad* is imperfect and flat. Both are good; but the latter not to be often us'd.

TRIBE, *TRIBUS*, in Antiquity, a certain Quantity or Number of People; when a Division is made of a Nation into Quarters or Districts.

The City of *Athens* was divided into ten Tribes. — The Jewish Nation into twelve Tribes, the Descendants of the twelve Sons of *Jacob*, viz. the Tribes of *Judah*, of *Ruben*, *Gen*, *Asher*, *Dan*, *Naphthali*, *Ephraim*, *Manassah*, *Simeon*, *Levi*, *Issachar*, *Zebulun*, and *Benjamin*.

These, in effect, make thirteen Tribes, from twelve Patriarchs; by Reason the Posterity of *Joseph* was divided into two Tribes, that of *Manassah*, and that of *Ephraim*. See PATRIARCH.

There were ten of these Tribes that revolted and follow'd *Jeroboam*.

The Roman People was at first only divided into three Tribes; and from this Number *tres*, *tribes*, it was that the Word *Tripe*, *Tribus*, took its Rise. — This Division was accommodated by *Romulus*, to the several Nations he had united: The first consisted of the *Albans*, the second of the *Sabins*, and the third of a Mixture of Fugitives, who came to seek an Asylum at *Rome*.

*Servius Tullius* fearing this Partition might occasion Seditions, divided the Inhabitants of *Rome* by Cantons, not by Nations; accordingly, he distributed the City into four Quarters or Tribes; and by Reason a great Number of Citizens had retir'd into the Country about, of those he compos'd 26 other Tribes; so that from his Time the Roman People consisted of 30 Tribes.

In after-times, the Number of Tribes was increas'd to 35; but they then ceas'd to be rang'd according to the Quarters of the City. — The Distribution depended on the Censors, who form'd their List at Discretion, frequently confounding the Country Tribes with those of the City.

A Man was never absolutely a Roman Citizen, unless he had the *Jus Tribus*, i. e. till he were insit'd to the Honours of the Magistrature, as also to a Right of voting in Assemblies of the People: And this was what they call'd *Jus Quiritium*.

Hence, the Inhabitants of the municipal Cities, were only imperfect Citizens; as being of no Tribe. See CIRTZEN.

The Freedmen were oblig'd to purchase this Right of Tribe, which did not otherwise belong to them, tho' they were Citizens of *Rome*. See LIBERTUS.

The Names of the 35 Tribes were, 1<sup>o</sup>. the *Palatina*. 2<sup>o</sup>. the *Suburana*. 3<sup>o</sup>. the *Collina*. 4<sup>o</sup>. the *Esquilina*. 5<sup>o</sup>. the *Romulia*. 6<sup>o</sup>. the *Emilia*. 7<sup>o</sup>. the *Crustaniana*. 8<sup>o</sup>. the *Carolina*. 9<sup>o</sup>. the *Fabia*. 10<sup>o</sup>. the *Galeria*. 11<sup>o</sup>. the *Lenonata*. 12<sup>o</sup>. the *Alentia* or *Menesina*. 13<sup>o</sup>. the *Orculaniana*. 14<sup>o</sup>. the *Papiria*. 15<sup>o</sup>. the *Politia*. 16<sup>o</sup>. the *Popilia*. 17<sup>o</sup>. the *Publilia*. 18<sup>o</sup>. the *Sergia*. 19<sup>o</sup>. the *Vergentia*. 20<sup>o</sup>. the *Valentia*. 21<sup>o</sup>. the *Claudia*. 22<sup>o</sup>. the *Stellantina*. 23<sup>o</sup>. the *Transtiberina*. 24<sup>o</sup>. the *Arvenfis*. 25<sup>o</sup>. the *Sabatina*. 26<sup>o</sup>. the *Pamphylia*. 27<sup>o</sup>. the *Publilia*. 28<sup>o</sup>. the *Marcia*. 29<sup>o</sup>. the *Septimia*. 30<sup>o</sup>. the *Onsentina*. 31<sup>o</sup>. the *Falerina*. 32<sup>o</sup>. the *Anagnina*. 33<sup>o</sup>. the *Terentina*. 34<sup>o</sup>. the *Velina*. 35<sup>o</sup>. the *Quirina*. In ancient Authors and Inscriptions, we meet with the Names of others; viz. *Pinaria*, *Sappinia*, *Camilla*, *Cestia*, *Clventia*, &c.

TRIBRACHYS, in the ancient Profody, a Foot of Verse, consisting of three Syllables, and those all short, as *Melinus*. The Word is form'd from the Greek, *τρεῖς*, three, and *βραχυς*, short.

TRIBUCH, and TRIBUCHET, a Tumbrel, or Cucki-foot. See CUCKING-FOOT.

TRIBUNAL, *Judgment-Seat*, the Seat of a Judge. See JUDGE.

The *Tribunus* in a Court of Justice, is properly the Seat or Bench wherein the Judge and his Associates are plac'd. See BENCH.

The Word is *Latin*, and takes its Origin from a Seat rais'd from the Ground, wherein the *Tribune* of the Roman People was plac'd to administer Justice. See TRIBUNE.

*Tribunal*, *Tribuna*, or *Tribune*, among the Ancients, was also a Place from whence the People were harangued.

Among the *Romans*; it was an Eminence near the Temple, in the Place call'd *Pro Rostris*, where the People were harangued in *Tribus*.

The French Architects likewise use the Word *Tribune* for a Gallery or Eminence in a Church, or other Place, wherein the Music is plac'd for a Symphony or Concert.

TRIBUNE, *TRIBUNUS*, *Militum* or *Militaris*; an Officer in the Roman Army. See TRIBUNUS.

TRIBUNE, *TRIBUNUS Plebis*, in Antiquity, a Roman Magistrate, chosen out of the Populace, to protect them against the Oppression of the Great, and to defend the Liberty of the People against the Attempts of the Senate and Consuls.

The *Tribunes* of the People were first establish'd in the Year of *Rome* 259. The first Design of the Creation, was to shelter them from the Cruelty of *Ulurens*, and to engage them to quit the *Avantur* Mount, whither they had retir'd in Displeasure.

Their Number, at first, was but two; but the next Year, under the Consulate of *A. Posthumus Aruncinus*, and *Cassius Vestellinus*, there were three more added; and this Number of five was afterwards increas'd by *L. Trebulus* to ten.

The Appellation *Tribune* was given them, by reason they were at first chosen out of the *Illustres* of the Army. See TRIBUNUS.

The *Tribunes* were, as it were, the Leaders and Guardians of the People. — They call'd Assemblies of the People when they pleas'd; and in those Assemblies frequently annull'd the Decrees of the Senate. Nothing could be concluded without their Consent, which they express'd by subscribing the Letter *T* at the Bottom of the Decree. They had it in their Power to prevent the Execution of any Decree, without giving any Reason for it, and merely by subscribing *Veto*.

They sometimes call'd the Consuls and Dictator to account for their Conduct, before the People.

*Augustus* himself was *Tribune* for 37 Years; *Tiberius* assum'd the same Quality; as likewise did his Successor, signifying the Year of their *Tribunate* on their Medals and Coins: But their Design, herein, was only to possess themselves of all the Authority, that there might be no-body to oppose them. See TRIBUNICIAN.

TRIBUNICIAN, a Term among Antiquaries and Medallists. — The *Tribunician Power*, was the Dignity, Office, or Authority of a *Tribune of the People*. See TRIBUNE.

This Power was assum'd by the Emperors; and makes one of the chief Titles they bear on their Medals: The Quality was first introduc'd by *Augustus*, to keep the Sovereign Authority over the other Magistrates, without either taking that of Dictator or King. Indeed it was offer'd to *Julius Cæsar*, but he despis'd it. *Augustus* is the first who us'd it; and his Successors follow'd his Example. — They reckon the Years of their Empire on their Medals by those of their *Tribunician Power*.

This Power was sometimes given them for a certain Number of Years; and sometimes for ever. Sometimes the Emperors would communicate the Power to such as they plac'd, or as they intended to succeed them: And *Tiberius* held it fifteen Years with *Augustus*. But this Practice only obtain'd till the Time of *Valerian* and *Gollian*. After them we only find T. R. P. II. in *Claudius*; T. R. P. V. in *Aurelian*; and T. R. P. in *Probus*.

This, however, is to be understood of Medals; for in Inscriptions we find it after that Time.

Cardinal *Noris* and *F. Pagi* have disput'd about this *Tribunician Power*, wherein it consist'd. — The first maintains, that it did not at all differ from that of the ordinary Tribunes, which consist'd in three Things, 1<sup>o</sup>. In a Right of opposing all the Acts and Resolutions of the other Magistrates. 2<sup>o</sup>. In that it render'd their Person sacred and inviolable. 3<sup>o</sup>. In a Right of making Edicts and Laws.

*F. Pagi* asserts, that it made an Addition to the Power of the Tribunes; that the Privilege it had of making Edicts, was more ample than that of the ordinary Tribunes; besides, that it carry'd with it a Power of coining the Senate at Pleasure.

*M. Spanheim* is of *F. Pagi's* Opinion: He believes that the *Tribunician Power* had much the Advantage of the Tribunes, 1<sup>o</sup>. In that it was peculiar to the Patricians, and did not reduce the Person who held it to the Degree of a Plebeian. 2<sup>o</sup>. In that it was not confin'd to the City of *Rome* alone, like the other, but extend'd throughout the Empire; as well as the *Proconsular Power*, which was usually annex'd to it. 3<sup>o</sup>. That the Dignity of the Tribunes was inferior to that of the Pretors; whereas the *Tribunician Power* of the *Cæsars*, confer'd, according to *Tacitus*, a Sovereign Authority over all Magistrates, and render'd such as it was communicated to, equal to the Emperors, and even their Collegues in the Empire: Besides the Power of opposing the Enterprises of all the other Magistrates; and that

that it render'd their Persons sacred, and gave them a Right to assemble and discuss the Senate, which were Rights the *Tribunician Power* held in common with the *Tribunes*.

*P. Harlequin* thinks we should distinguish two *Tribunician Powers*; the one Civil, the other Military; but the Proof he brings thereof is very weak. *M. Spohnius* says, his Distinction is only founded on vain Conjectures, none of which deserve Notice.

The Learned are greatly divided as to the Month and Day whereon the *Tribunician Power* commenced: *Sigovius* and *Petavius* will have it begin on the 1st of *January*; Others, as *Perissinus*, on the 5th of the Calends of *July*; *M. Tournay* on the 4th of the Ides of *December*; *Omphrius*, *Cardinal Neri*, *F. Poggi*, &c. on the Day of the Emperor's Accession to the Empire; with this Difference, that *F. Poggi* takes it to be on the 5th of the Calends of the Month whereon the Prince was proclaim'd; and that this Day was, for this Reason, held sacred among the *Romans*.

*P. Harlequin* thinks, that on Medals the *Tribunician Power* commences on the Anniversary of the Building of *Rome*, viz. the 11th of the Calends of *May*; excepting on the *Greek Medals*, where it begins in *September*, in regard this Month, which began the *Greek Year*, was near the Time when the *Tribunician Power* was first conferr'd.

Of all these Sentiments the most probable is that of *Omphrius*, &c. setting aside the Restriction of *F. Poggi*. See *M. Spohnius*, *Dissert. XII. Tom. II. p. 429*.

**TRIBUNUS** *Milium* or *Militaris*, or *Military Tribune*, an Officer in the *Roman Army* who commanded in chief over a Body of Forces, particularly a Legion; much the same with our Colonel, or the *French Mestre de Camp*. See **LEGION**.

There is some Distinction of the *Tribunes*, into *Laticlavus*, and *Angusticlavus*: Those born of noble Families were allow'd, after they were made *Tribunes* of a Legion, to take the *Laticlavus*. See **LATICLAVUS**.

The rest were only to wear the *Angusticlavus*; whence *Suetonius* takes Care to inform us, that his Father was *Tribunus Laticlavus* of the 11th Legion.

Over these *Tribunes* of Legions and Cohorts, there were other *Tribunes* who commanded in the Absence of the Consuls, and who were invested with a Consular Authority. — *Julius* will have these to be much the same as the Marshals of *France*, or, at least, Lieutenants General.

*Romulus* likewise establish'd a *Tribune* of the Cavalry, *Tribunus Equitum*, who was the same with the *Majorer Equitus* under the Dictators, the first Officer after the Kings. See **MAJORER EQUITUS**.

The *Tribunes* of the Soldiers, were of an elder standing than those of the People; those latter being elected out of the former.

*Varro* will have it, they were call'd *Tribunes*, because, at first, they were only three in Number in each Legion, when the Legion consisted of three thousand Men, taken out of the three Tribes then on Foot.

In Proportion as the Legion was increas'd, the Number of *Tribunes* was likewise increas'd to the Number of six.

At first, the Election lay in the General of the Army; but in the Year of *Rome* 291, it was appointed, that the People should nominate one Part, and the General another: The latter were call'd *Rufuli*, from *Revilus Rufus*, who pass'd the Law.

Those chose by the People in the Comitia, were call'd *Comitarii*: They were indifferently either Patricians or Plebeians; and had the same Marks of Honour as the Consuls themselves. — The *Tribune of the Praetorian Cohorts* was the Captain of the Guards. See **PRETORIAN**.

The Term *Tribune* was also apply'd to various other Officers; as the *Tribunus Aerarii*, *Tribune of the Treasury*: — The *Tribune of the Colonies*, the Officer who commanded them: The *Tribunus Fabricarum*, those who had the Direction of the making of Arms: The *Tribuni Marinarum*; *Tribuni Navales*, *Tribuni Voluptatum*, mention'd in the *Troaspolis Code*, as Intendants of the Publick Shews and other Diversions.

The Title *Tribune* was also given to the chief of a Tribe. See **TRIBE**.

**TRIBUTE**, **TRIBUTUM**, a Duty or Tax which one Prince or State is oblig'd to pay to another, as a Token of Dependence; or in Virtue of a Treaty, and as a Purchase of Peace.

The *Romans* made all the Nations they subdu'd pay them *Tribute*. — *Maboues* laid it down as a Fundamental of his Law, that all the World should pay him *Tribute*.

In the States of the Grand Signior, Christian Children are taken in Way of *Tribute*, to make Janizaries. See **JANIZARY**.

**TRIBUTE** is sometimes also us'd for a personal Contribution, which Princes levy on their Subjects by Way of Capitation or Poll-Money. See **TAX**.

In this it differs from an *Impost*, which is properly what is laid on Merchandizes. See **IMPOST**.

**TRIBUTARY**, one who pays *Tribute* to another, in order to live in Peace with him, or share in his Protection. See **TRIBE**.

The Republic of *Ragusa* is *Tributary* to the Grand Turk; so is the Cham of Little *Tartary*, &c.

**TRICEPS**, in Anatomy, a Muscle of the Thigh, having three Originations, and as many Insertions; and which may therefore, be conveniently divided into three Muscles, all arising from the Os Pubis, and inserted into the *Linea Aspera* of the Thigh Bone, whereof they possess the greatest Part. See **MUSCLE**.

They serve as Adductors, and draw the Thighs together.

**TRICUSPIDES**, in Anatomy, an Epithet given to three Valves, situate at the Entrance of the *Vena Cava* into the Heart. See **VALVE**.

They open from without inwards, so as to let the Blood of the *Cava* pass into the Heart, but prevent its Reflux into the *Cava*. See **HEART**.

They are thus call'd, from their Figure, which is triangular: Some fancy them to be of the Figure of three Tongues; and call them *Triglotides*.

**TRIDENT**, **TRIDENS**, an Attribute of *Neptune*; being a kind of Scepter which the Painters and Poets put in the Hands of that God, in form of a Fork with three Teeth; whence the Word. See **SCYTHRA**.

The Poets still tell us, that *Neptune* makes the Earth open, whenever he strikes it with his *Trident*.

**TRIDENT**, among Mathematicians, is us'd for a Kind of Parabola, by which *Cartes* constructed Equations of six Dimensions. See **PARABOLA**.

**TRIMETERIS**, a kind of Cæfura of a *Latin Verse*, wherein, after the first Foot of the Verse, there remains an odd Syllable, which helps to make up the next Foot; as in this Verse,

*Ille latus niveum molli folius Hyacintho.*

**TRIENNIAL**, an Epithet applied chiefly to Offices or Employments, which last for three Years.

Thus we say, a *Triennial Government*: Most regular Manufacteries have *Triennial Superius*; they elect new ones at the End of each three Years.

In 1695, an Act was made for *Triennial Parliaments*, i. e. for Parliaments which should be dissolved, and the Members be elected anew every three Years. Till that Time, the King had it in his Power to prorogue and continue his Parliaments as long as he pleas'd. — This opened a Door to Corruption, which the *Triennial Bill* was intended to prevent.

The *Triennial Act* has, from some other Views, been since Repeal'd: The great Struggles usual at Elections, the great Ferment it usually puts the Nation into, the great Expences upon that Occasion, with other Considerations, determined the Legislature, in 1717, to change *Triennial Parliaments* for Septennial ones. See **PARLIAMENT**.

**TRIENS**, in Antiquity, a Term us'd for two different Things; 1<sup>o</sup> A Copper Money, of the Value of one Third of an As. — On one Side, it bore a *Janus's* Head, and on the other, a Water-Rat. This was the Piece of Money us'd to be put in the Mouths of the Deceas'd, to pay *Charon* his Fare for their Passage into the other Life. See **MONEY** and **COIN**.

2<sup>o</sup> The *Triens* was also a drinking Cup; and that which was ordinarily us'd. — It was a fourth Part of the *Septary*. See **TRAY**.

**TRIFOLIUM** or **TRIFOIL**, any three-leaf'd Grass: That which is most us'd in Medicine, is the *Trifolium Aquaticum*, or Buck-Bean, which is very detergent, and us'd with Success in Scorbutic, Rheumatic and Scrophulous Habits. The way of using it is generally to make a pretty strong Infusion of the dry'd Herb, in form of Tea.

**TRIGA**, in Antiquity, a kind of Car, or Chariot with three Horses. See **CAR**, &c.

The *Triga*, in reality, was only drawn by two Horses; so that it was properly a Biga; but it had, besides, a third Horse tied to the others, like a led Horse, for Change. See **BIGA**. *Statius* calls the third Horse *Equus famulus*; *Helysius*, *æquus*; and *Dionysius Halicarnassensis*, *æquus*.

We don't find the *Triga* on any ancient Monument; but it was a long time in use among the *Romans*, at their *Ludi Circenses*. — The *Greeks*, who first introduced it, soon abandon'd it.

**TRIGAMY**, a third Marriage; or the State of a Person who has been married three Times. See **MARRIAGE**.

In the ancient Church, *Trigamy* was only allowed to such as had no Children by their former Marriages.

If, having Children by one or both the former, they married again, after 40 Years of Age, they were excluded from Communion for five Years. — If they were only forty Years old, the Penance was but four Years. See **BIOGRAPHY**.

**TRIGLYPHIS**, in Architecture, a sort of Ornament consist- ed at equal Intervals in the *Doric Frieze*. See **FRIZE**, &c.

They consist of two entire Gutters or Channels, cut to a right Angle, call'd *Glyphes*, and separated by two Interfices, call'd, by *Vitrucius*, *Shanks*, from two Half Channels at the Sides. See *GLYPHES*.

The ordinary Proportion of *Triglyphs*, is to be a Module broad, and one and a Half high. — But this Proportion, *M. le Clerc* observes, sometimes occasions ill-proportion'd Intercolumnations in Portico's; for which Reason he chuses to accommodate the Proportion of his *Triglyphs* to that of the Intercolumns. See *INTERCOLUMNATION*.

The Intervals between the *Triglyphs*, are call'd *Metopes*. See *METOPES*.

Under the Channels, or *Glyphes*, are placed Gutts or Drops, See *GUTTS*.

The *Triglyphs* make the most distinguishing Character of the *Doric Order*. — Some imagine them originally intended to convey the Guttæ that are underneath them: Others fancy they bear some Resemblance to a Lyre, and thence conjecture the Order to have been originally invented for some Temple sacred to *Apollo*. See *DORIC*.

The Word is form'd from the Greek *τρίγωνον*, three Engravings, from *τρία*, *Sculpo*.

**TRIGON**, **TRIGONUS**, in Geometry, a Triangle. See **TRIANGLE**.

The Word is form'd from the Greek *τρίγωνον*, *Triangle*.

**TRIGON**, in Astrology, is an Aspect of two Planets, wherein they are 120 Degrees distant from each other; call'd also *Trine*. See **TRINE**.

The *Trigons* of *Mars* and *Saturn*, are held Malefic Aspects. See **ASPECT**.

**TRIGON**, **TRIGONON**, in Music, is a Musical Instrument, us'd among the Ancients.

The *Trigon* was a kind of triangular Lyre, invented by *Ibycus*. See **LYRE**.

**TRIGONOMETRY**, the Art of finding the Dimensions of the Parts of a Triangle unknown, from other Parts known; Or, the Art whereby, from any three Parts of a Triangle given, all the rest are found. See **TRIANGLE**.

Thus, *e. gr.* from two Sides *A B* and *A C* and an Angle *B*, we find by *Trigonometry*, the other Angles *B* and *C* with the third Side *B C*. Tab. *Trigonometry* Fig. 1.

The Word literally signifies the measuring of Triangles; form'd from the Greek, *τρίγωνον*, *Triangle*, and *μετρον*, Measure; yet does not the Art extend to the measuring of the Area or Surface of Triangles, which comes under Geometry: *Trigonometry* only considers the Lines and Angles thereof.

*Trigonometry* is of the utmost Use in various mathematical Arts. — 'Tis by means hereof, that most of the Operations of Geometry and Astronomy are perform'd; without it the Magnitude of the Earth and the Stars, their Distances, Motions, Eclipses, &c. would be utterly unknown. — *Trigonometry*, therefore, must be own'd an Art, whereby the most hidden Things, and those remotest from the Knowledge of Men, are brought to light. A Person ignorant hereof, can make no great Progress in mixt Mathematicks; but will often be gravell'd, even in Natural Philosophy, particularly in accounting for the Phenomena of the Rain-bow, and other Meteors.

*Trigonometry*, or the Solution of Triangles, is founded on that mutual Proportion which is between the Sides and Angles of a Triangle; which Proportion is known, by finding the Proportion which the Radius of a Circle has to certain other Lines, call'd *Chords*, *Sines*, *Tangents* and *Secants*. See **RADIUS**, **CHORD**, **SINE**, **TANGENT** and **SECANT**.

This Proportion of the Sines and Tangents to their Radius, is sometimes express'd in common or natural Numbers, which constitute what we call the *Tables of natural Sines, Tangents, &c.* — Sometimes it is express'd in Logarithms, and in that Case, constitutes the *Tables of artificial Sines, &c.* See **TABLES**.

Lastly, sometimes the Proportion is not express'd in Numbers; but the several Sines, Tangents, &c. are actually laid down upon Lines or Scales; whence the *Line of Sines, Tangent, &c.* See **LINE** and **SCALE**.

*Trigonometry* is divided into *Plain* and *Spherical*: The first considering rectilinear Triangles; and the second, Spherical ones. — The First is of obvious and continual Use in Navigation, Measuring, Surveying and other Operations of Geometry. See **MEASURING**, **SURVEYING**, **SAILING**, &c.

The Second is only learn'd, with a View to Astronomy and its kindred Arts, Geography and Dialling. — It is generally esteem'd exceedingly difficult, by reason of the vast Number of Cases wherewith it is perplex'd; but the excellent *Wolffius* has removed most of the Difficulties. That Author has not only shewn how all the Cases of rectangled Triangles may be solv'd the common Way, by the Rule of Sines and Tangents; but has likewise laid down an universal Rule, whereby all Problems, both in Plain and Spherical rectangled Triangles are solv'd: And even obliquangular Triangles, he teaches to solve with equal Ease. — His Doctrine, see under the Article **TRIANGLE**.

**Plain TRIGONOMETRY**, is an Art whereby, from three given Parts of a Plain Triangle, we find the rest.

The great Principle of *Plain Trigonometry*, is, that in every Plain Triangle, the Sides are, as the Sines of the opposite Angles. — See this Principle applied to the Solution of the several Cases of Plain Triangles, under the Article **TRIANGLE**.

**Spherical TRIGONOMETRY**, is the Art whereby, from three given Parts of a Spherical Triangle, we find the rest. *E. gr.* whereby from two Sides and one Angle, we find the two other Angles, and the third Side. See **SPHERICALS**.

The Principles of *Spherical Trigonometry*, as reform'd by *Wolffius*, are as follow:

1<sup>o</sup> In every rectangled Spherical Triangle, *ABC*, reſtangular at *C*, the whole Sine is to the Sine of the Hypotenuse, *B C*, Tab. *Trigonum*. Fig. 33. as the Sine of either of the acute Angles, as *C*, is to the Sine of the Leg, opposite thereto *A B*; Or, the Sine of the Angle *B*, to the Sine of its opposite Leg *A C*; whence we deduce, that the Rectangle of the whole Sine into the Sine of one Leg, is equal to the Rectangle of the Sine of the Angle opposite thereto, into the Sine of the Hypotenuse.

2<sup>o</sup> In every right angled Spherical Triangle *ABC*, Fig. 31. none of whose Sides is a Quadrant; if the Complements of the Legs *AB* and *AC* to a Quadrant, be consider'd as the Legs themselves, the Rectangle of the whole Sine into the Cosine of the middle Part, is equal to the Rectangle of the Sines of the disjunct or separate Parts.

Hence, 1<sup>o</sup> If the Sines be artificial, that is, the Logarithms of the natural ones; the whole Sine, with the Co-sine of the middle Part, will be equal to the Sines of the disjunct Parts.

— 2<sup>o</sup> Since, in the rectilinear Triangle *ABC* (Fig. 34.) the whole Sine is to the Hypotenuse *BC*, as the Sine of the Angle *B* or *C* to the Sine of the opposite Leg *AC* or *AB*: if, instead of the Sines of the Sides, we take the Sides themselves; here, too, the whole Sine, with the Co-sine of the middle Part *A C* or *AB*, will be equal to the Sines of the disjunct Parts *B* or *C* and *BC*; *i. e.* to the Sine of *B* or *C*, and *BC* itself.

This, *Wolffius* calls *Regula Sinuum Catholica*, or the first Part of the Catholic Rule of *Trigonometry*; by means whereof of all the Problems of either *Trigonometry* are solv'd, when the thing is effected by Sines alone. — My Lord *Neper* had the first Thought of such a Rule: But he us'd the Complements of the Hypotenuse *BC* (Fig. 22.) and the Angles *B* and *C* for the Hypotenuse, and Angles themselves: So that the Tenor of his Catholic Rule of Sines is this:

The whole Sine, with the Sine of the middle Part, is equal to the Co-sines of the disjunct, or, as he calls them, opposite Parts. — But, in this, that Harmony between Plain and Spherical *Trigonometry*, visible in *Wolffius's* Rule, does not appear.

3<sup>o</sup> In a rectangled Spherical Triangle *ABC* (Fig. 33.) none of whose Sides is a Quadrant; as the whole Sine is to the Sine of the adjacent Leg *A C*; so is the Tangent of the adjacent Angle *C* to the Tangent of the Leg *AB*.

Whence, 1<sup>o</sup> as the Co-tangent of the Angle is to the whole Sine, as the whole Sine is to the Tangent of the Angle *C*, so is the Sine of *A C* to the Tangent of *A B*; therefore the Co-tangent of the Angle *C*, will be to the whole Sine, as the Sine of the Leg adjacent thereto, *A C*, is to the Tangent of the opposite one *A B*. 2<sup>o</sup> The Rectangle, therefore, of the whole Sine, into the Sine of one Leg *A C*, is equal to the Rectangle of the Tangent of the other Leg *A B*, into the Co-tangent of the Angle *C*, opposite to the same. And, in like manner, the Rectangle of the whole Sine, into the Sine of the Leg *A B*, is equal to the Rectangle of the Tangent of the Leg *A C* into the Co-tangent of the Angle *B*.

4<sup>o</sup> In every right-angled Spherical Triangle, *ABC* (Fig. 31) none of whose Sides is a Quadrant; if the Complements of the Legs *AB* and *AC* to a Quadrant, or their Excesses beyond a Quadrant, be consider'd as the Legs themselves; the Rectangle of the whole Sine, into the Co-sine of the middle Part, will be equal to the Rectangle of the Co-tangents, of the conjunct Parts.

Hence, 1<sup>o</sup> If the Sines and Tangents be Artificial; the whole Sine, with the Co-sine of the middle Part, is equal to the Co-tangents of the contiguous Parts. 2<sup>o</sup> Since in a rectilinear, right-angled Triangle, we use the Tangents, when from the Legs *AB* and *AC* (Fig. 34.) given, the Angle *C* is to be found; and in that Case the whole Sine is to the Co-tangent of *C*, *i. e.* to the Tangent of *B*, as *AB* to *AC*; therefore, also, in a rectilinear Triangle, if for the Sines and Tangents of the Sides be taken the Sines themselves; the whole Sine, with the Co-sine of the middle Part, *i. e.* with *A C*, is equal to the Co-tangents of the conjunct Parts, *i. e.* to the Co-tangent of *C*, or Tangent of *B* and the Side *A B*.

This, *Wolffius* calls *Regula Tangentium Catholica*, and constitutes the other Part of the Catholic Rule of *Trigonometry*; whereby all Problems in each *Trigonometry*, where Tangents are required, are solv'd.

My Lord *Neper's* Rule to the like Effect, is thus: — That the whole Sine, with the Sine of the middle Part, is equal to the Tangents of the contiguous Parts.

'Tis, therefore, a Catholic Rule, which holds in all *Trigonometry*; that in a rectangled Triangle, (notatis notandis, *i. e.*

the Complements of the Legs A B and A C, being consider'd as Legs themselves, and in recilinear Triangles, the Sides themselves being taken for the Sines and Tangents of the Sides) *The whole Sine with the Co-sine of the mean or middle Part is equal to the Sines of the adjacent or separate Parts, and the Co-tangents of the adjacent to conjugious Parts.*

For an Illustration and Application of this Rule, in the Solution of the various Cases of Spherical Triangles; see TRIANGLE.

TRIHING or TRICHING, from the Saxon, *Tribinga*, an Extent containing three or four Hundreds, or the third Part of a Shire or Province. See TITHING.

The Word is also used for a Court held within that Circuit, which was the same with what we now call a *Court-Less*, which is above a Court Baron, and inferior to the County Court. See COURT, LEYS, &c.

TRILLION or TRILION, in Arithmetic, the Number of a Billion of Billions. See NUMERATION.

After Billions, we reckon by Trillions, which makes a Class of Numeration, and are divided, like the other Classes, into three Places: Thus we say *Trillions*; *Tens of Trillions*; *Hundreds of Trillions*, &c.

TRIM, in the Sea Language. — *To Trim a Boat*, is to set the Passengers so as to keep the Boat even on both Sides.

TRIM of a Ship, is her best Poiture, Proportion of Ballast, and hanging of her Masts for sailing.

Hence, to find the best way of making a Ship sail swiftly, is to find her *Trim*.

TRIMACRUS, Τριμακρος, in the ancient Profody, a Foot in Verse, consisting of three long Syllables. See FOOT.

TRIMILCHI, from the Saxon *Trimile*, a Name by which the English Saxons called the Month of *May*; because they milked their Cattle three times a Day in that Month.

TRIMMERS, in Architecture, Pieces of Timber, fram'd at right Angles to the Joints, against the Ways; for Chimneys and Well holes for Stairs.

TRINE *Dimension*, or *Three-fold Dimension*, includes Length, Breadth and Thickness. See DIMENSION.

The *Trine Dimension* is peculiar to Bodies or Solids. See BODY, &c.

TRINE in Astronomy, is the Aspect or Situation of one Star with regard to another, when they are distant 120 Degrees, as the Arch A B (Tab. Astronomy, Fig. 3.) which is a Third of a Circle, and its subtense A B, a Side of an equilateral Triangle A B inscribed in the Sphere. See ASPECT.

It is also called *Trigon*, and signified by the Character Δ. See TRIGON.

TRINGLE, in Architecture, a Name common to several little square Members, or Ornaments; as Roglets, Listels and Plat-bands. See ROULET, LISTEL, &c.

The Word is *French*, where it signifies the same thing.

TRINGLE is particularly used for a little Member fix'd exactly over every Glyph, under the Plat-band of the Architecture; from whence hang down the Gutte or Pendant Drops. See TRIOLYTH and GUTTE.

TRINITARIANS, a Term used very variously, and arbitrarily — Frequently it stands as a common Name for all Hereticks, who have Sentiments on the Mystery of the Trinity, contrary to those of the Catholic Church. See TRINITY.

Sometimes it is more immediately restrain'd to some one or other particular Class of Hereticks: Thus the *Trinitarians* are frequently confounded with the *Unitarians*. See UNITARIANS.

Sometimes it is even applied to the Orthodox themselves, in Contradistinction to the *Antitrinitarians*, who deny or impugn the Doctrine of the Trinity: Thus the Socinians and others us'd to call the Athanasians, *Trinitarians*.

TRINITARIANS are also an Order of Religious, instituted in Honour of the Trinity, for the Redeeming of Christian Captives from the Infidels; vulgarly call'd *Marturians*, and Brothers of the *Redemption*. See MARTURIAN.

They are cloth'd in White, and bear on the Stomach a Cross, partly Red and partly Blue; by which three Colours, White, Red and Blue, is supposed to be represented, the Mystery of the Trinity.

The *Trinitarians* make it their Business to go and ransom Christians held in Slavery in the Republicks of *Algiers*, *Tunis* and *Tripoly*, and the States of *Morocco*. — They have a Rule peculiar to themselves; though several Historians rank them among the Observers of the Rule of St. *Augustin*.

The Order had its Rise in 1198, under the Pontificate of Innocent III. The Founders were *John de Matha* and *Felix de Valois*: The first of *Fansen* in *Provence*; the second, not of the Royal Family of the *Valois's*, as some have imagin'd; but thus call'd, in all probability, as being a Native of the Country *Valois*.

*Gautier de Chabillon* was the first who gave them a Place in his Lands to build a Convent; which afterwards became the Chief of the whole Order: *Honorius III.* confirm'd their Rule. *Urban IV.* appointed the Bishop of *Paris* and others,

to reform them: they did it; and the Reform was approved in 1267, by *Clement IV.*

This Order possess'd about 250 Convents, divided into Thirteen Provinces; whereof six are in *France*, three in *Spain*, one in *Italy*, and one in *Portugal*. — Formerly, there was one in *England*, another in *Scotland*, and a third in *Ireland*.

In the general Chapters held in 1573 and 1576, a Reform was order'd, and begun some time afterwards by *Julian de Neautenville*, and *Claude Aleph*, two Hermits of St. *Michael*, but now permitted by *Pope Gregory* to take the Habit of the Trinity; upon which their Hermitage was converted into a House of the Order.

In 1609, *Pope Paul* allow'd them to build new Houses, and to introduce the Reform into the old One. In 1635 *Urban VIII.* by a Brief, appointed the Cardinal de *Rochejaucourt* to introduce the Reform into all the Houses of the Order, which was done accordingly, by a Sentence containing the Reform in Eight Articles, the Principal whereof were, That they should observe the primitive Rule approved of by *Clement IV.* should abstain from Flesh, use woollen Shirts, have Masses at Midnight, &c. In 1554 there was also a Reform made among those of *Portugal*.

The Habit of the *Trinitarians* is different in different Countries; and that of the Reform'd different from the rest.

*Bare-foot TRINITARIANS*, are a Reform of this Order, made in *Spain* at a general Chapter, held in 1594, where it was resolv'd, That each Province should establish two or three Houses, where the primitive Rule should be observ'd, and where the Religious should live up to a greater Austerity, use coarser Cloaths, &c. and yet should have the Liberty of returning to their ancient Convents when they thought fit.

*Don. Alvarez Bafon*, intending to found a Monastery at *Valdepeñas*; and desiring to have it held by bare-foot Religious; it was agreed to add Nudity of Feet to the Reform; that the *Trinitarians* might have the Benefit of that Establishment. The Reform afterwards grew into three Provinces, and was at length introduced into *Poland* and *Russia*, and thence into *Germany* and *Italy*.

There are also bare-foot *Trinitarians* in *France*, establish'd by *F. Jeron Hallier*, who being sent to *Rome* to solicit the first Reform mentioned above; not content therewith, he carried it further, and obtain'd a Permission of *Pope Gregory*, to add a coarse Habit, and Nudity of Feet thereto. He began with the Convent of St. *Denis* at *Rome*, and those of *Six* in *Provence*.

In 1670 there were Houses enough of this Reform to make a Province; and accordingly they held their first general Chapter the same Year. See PROVINCE.

There are also Nuns of the *Trinitarian* Order, establish'd in *Spain* by St. *John de Marba* himself, who built them a Convent in 1201. — Those who first took the Habit were only Oblats, and made no Vows; but in 1201 the Monastery was fill'd with real Religious, under the Direction of the Infanta *Constantia*, Daughter of *Peter II.* King of *Aragon*, who was the first Religious, and the first Superior of the Order.

There are also *Bare-foot Nuns* of this Order, establish'd at *Madrid* about the Year 1612, by *Frances de Rosero*, Daughter of *Julian de Rosero*, Lieutenant-General in the *Spanish Army*. Her Design being to found a Monastery of *Bare-foot Augustines*, she assembled a Number of Maids for that End, lodging them, for the Time, in a House belonging to the Monastery of *Bare-foot Trinitarians* in the Neighbourhood.

Here, attending at the Church of those Fathers, and being under the Direction of *F. John Baptist* of the Conception, their Founder; the Knowledge of that Father, and the Services he did them, made them change their Resolution of becoming *Augustines*, and demand of their Director the Habit of his Order; which he gave them.

But the Order opposing their Design, and refusing to take them under its Jurisdiction, they address'd themselves to the Archbishop of *Toledo*, who allow'd them to live according to the Rule of that Order; so that they took the Habit anew in 1612, and began their Noviciate.

Lastly, there is a third Order of *Trinitarians*. See THIRD ORDER.

TRINITY, TRINITAS, TRIAS, TRIAD, in Theology, the ineffable Mystery of three Persons in one God; Father, Son, and Holy Spirit. See PERSON and MYSTERY.

'Tis an Article in the Christian Faith, that there is one God; an Unity in Nature and Essence, and a Trinity of Persons. — The Term *Trinity* implies the Unity of three, the Unity of three divine Persons really different, and the Identity of an indivisible Nature: The *Trinity* is a Ternary of divine Persons of the same Essence, Nature, and Substance.

Theology teaches, that there is in God one Essence, two Processions, three Persons, four Relations, five Notions, and the

the Circumcession; which the Greeks call *Perichoresis*. Of each whereof we shall enlarge a little.

There is, then, one single *Essence*, one divine Nature, which is Infinite, Eternal, Spiritual; which sees all Things, which knows all Things, which is every where, All-mighty, and which created all Things of nothing. See *God*.

In this God there are two *Processions*, or Emanations, viz. that of the Son, and that of the Holy Spirit: The first is call'd *Generation*, and the second *Spiration*. See *GENERATION*, &c.

The Son proceeds from the Father by way of Knowledge; for God in knowing himself eternally, necessarily and infinitely, produces a Term, an Idea, a Notion or Knowledge of himself, and all his adorable Perfections, which is call'd his *Word*, his Son, who is equal to him in all Things, eternal, infinite, and necessary as his Father.—The Father regards the Son as his Word, and the Son has a Regard to the Father as his Principle: And in thus respecting each other eternally, necessarily, and infinitely, they love each other, and produce an Act of their mutual Love: The Term of that Love is the Holy Spirit, who proceeds from the Father and the Son by way of *Spiration*, Love, and Impulsion; who is also equal in every Thing to the Father and the Son. See *FATHER*, *SON*, and *SPIRIT*.

Each divine Procession establishes two *Relations*: The one, on the Side of the Principle, or that from whence; and the other, on that of the Term, or that to which.—Hence, as there are two Processions in God, there must be four Relations; the Paternity, the Filiation, the active Spiration, and the passive.

The *Paternity* is a Relation founded in what the School Divines call the notional Understanding; in which the Father stands related to the second Person, the Son.—The Filiation is the Relation wherein the second Person, viz. the Son refers to the Father.

The *active Spiration*, is the Relation founded in the notional Act of the Will, whereby the first and second Persons regard or refer to the third: The passive Spiration or Procession, taken in its strict Sense, is the Relation whereby the third Person regards, and is refer'd to the first and second.—Hence it appears, that there are in God four Relations, as we have already said; and five Notions, as we shall shew hereafter.

*Person* is defin'd an individual, reasonable, or intellectual Substance; or, an intellectual and incommunicable Substance. See *PERSON*.

The Hypothesis, or Subsistence, is what constitutes the Person.—There are, then, in the Holy Trinity, three Persons, Father, Son, and Holy Spirit, which have all Things in common, except their Relations; whence that Axiom in Theology comes to have Place, in the divine Persons there is no Distinction where there is no Opposition of Relation: And hence it follows, that if Power be sometimes attributed to the Father, Wisdom to the Son, and Goodness to the Holy Spirit; or if Sins of Infirmitv or Weakness be said to be against the Father, Sins of Ignorance against the Son, and Sins of Malice against the Holy Spirit, it is only spoke by way of Appropriation, and not of Property; for all those Things are in common: Whence that Axiom, The Works of the Holy Trinity are common and undivided, (i. e. they agree to all the divine Persons) but not their Productions *ad intra*, (as they are call'd) by Reason they are Relative.

By Appropriation we mean the giving of some common Attribute to a certain divine Person, on account of some Suitableness or Agreement. Thus, in the Scriptures, in the Apostles, and the *Nicean Creed*, *Omnipotence* is attributed to the Father, because he is the first Principle, and a Principle without Origin, or higher Principle.—*Wisdom* is attributed to the Son, because he is the Term of the divine Understanding to which Wisdom belongs: *Goodness* is attributed to the Holy Spirit, as being the Term of the Will to which Goodness belongs.

Some Divines give other Reasons of such Kind of Appropriations and Appropriations, viz. that it is to shew off those Imperfections from the divine Persons which are found in the Creatures: For created Fathers are weak, drooping, and impotent; wherefore to ward off this Imperfection from the third Person, he is peculiarly said to be *Allmighty*.

Again, created Sons are usually imprudent; wherefore to remove this Imperfection from the second Person, he is said to be *wise*, or *Eternal Wisdom*.

Lastly, great Minds or Spirits, among created Beings, are frequently wicked; wherefore to remove this Imperfection from the third Person, *Goodness* is attributed to him.

The Father is the first Person in the Holy Trinity, by reason the Father, alone, produces the Word, by the way of *Understanding*; and with the Word produces the Holy Spirit, by way of *Will*.

Here it is to be observ'd, that the Holy Spirit is not thus call'd from his Spirituality, that being common and essential to all three Persons; but from the passive Spiration, which is peculiar to him alone.

Add, that when one Person in the Holy Trinity is call'd *first*, another *second*, and another *third*, it must not be understood of a Priority of Time, or of Nature, which would imply some Dependence; but of a Priority of Origin and Emanation, which consists in this, that one Person produces the other in such Manner, as that the Person which produces cannot be, or be conceiv'd, without that produc'd.

From these Things it follows, that in the Holy Trinity there are five *Notions* (understanding by Notion the peculiar Manner whereby one divine Person is distinguish'd from another). The Notion, then, whereby the Father is distinguish'd from the Son and Holy Ghost, are *Inamissibility* and *Paternity*.—That whereby the Son is distinguish'd from the two other divine Persons, is *Filiation*.

*Active Spiration* distinguishes the Father and the Son from the Holy Spirit; and *passive Spiration* is that whereby the Holy Spirit is distinguish'd from the Father and Son.

The *Circumcession* or *Perichoresis*, is the intimate Inexistence of the divine Persons, or their mutual in-dwelling in each other: For tho' they be really distinct, yet are they Consubstantial; whence it is that Jesus Christ says in St. John, cap. xiv. *Believe ye not that I am in the Father, and the Father in me?* Identity of Essence, which the Greeks call *homoion*, and Consubstantiality, with a Distinction of Persons, are necessary to this Circumcession.

Many of the Heathens seem to have had a Notion of a Trinity.—*Stench. Enghel. de Perce. Philos.* lib. 1. cap. 3. observes, that there is nothing in all Theology more deeply grounded, or more generally allow'd by them, than the Mystery of the Trinity. The Chaldeans, Hebrews, Phoenicians, Greeks, and Romans, both in their Writings and their Oracles, acknowledg'd that the supreme Being had begot another Being out all Eternity, which they sometimes call'd the *Son of God*, sometimes the *Word*, sometimes the *Mind*, and sometimes the *Wisdom of God*, and asser'd it to be the Creator of all Things.

Among the Sayings of the *Magi*, the Descendants of Zoroaster, this is one; *Πατρις ἰσχυροῦς πνεῦμα καὶ τὸ ἐκπέφασκεν ἑαυτῷ: The Father first of all Things, and deliver'd them to the second Mind*.—The Son was call'd the *Animus Mundi*. See *ANIMA*.

The *Aegyptians* call'd their Trinity *Hemphes*, and represented it by a Globe, a Serpent, and a Wing dispos'd into one Hieroglyphic Symbol.—*Kircher, Gale, &c.* suppose the *Aegyptians* learn'd their Doctrine of the Trinity from *Joseph* and the *Hebrews*.

The Philosophers, says St. Cyril, own'd three Hypostases or Persons.—They have extended the Divinity to three Persons; and even, sometimes, us'd the Term *Tris, Trinitas*: They wanted nothing but to admit the Consubstantiality of the three Hypostases, to signify the Unity of the divine Nature, in exclusion of all *Explicitly* with regard to Difference of Nature; and not to hold it necessary to conceive any Inferiority of Hypostases.

In effect, *Plato*, and some of his Followers, speak of a Trinity in such Terms, that the primitive Fathers have been accus'd of borrowing the very Doctrine from the Platonic School; but *P. Montaigne*, who has examin'd the Point, asserts, that nothing can be more stupid, than to suppose the Platonic Trinity brought into the Church; and to have Recourse to the Platonism of the Fathers to discredit their Authority with regard to this Opinion. See *PLATONIC*.

*Fraternity or Fratercity of the Holy Trinity*, is a Society instituted at Rome by S. Philip Neri in 1548, to take Care of Pilgrims coming from all Parts of the World to that Capital to visit the Tombs of S. Peter and S. Paul. See *FRATERNITY*.

In order to this, they had a House wherein they entertain'd them for the Space of three Days, and not only them, but poor People who were on the Recovery, and who being turn'd too hastily out of the Hospitals, were expos'd to Relapses.

It was first set on Foot in the Church of S. *Saviour in Campo*; and consisted only of fifteen poor Persons, who met in that Church the first Sunday of each Month, to practise the Exercises of Piety prescrib'd by the Founder, and to hear the Exhortations he there gave.

In 1528 Pope Paul IV. gave the Fraternity the Church of St. *Benevise*, to which they gave the Title of the Holy Trinity. Since that Time, they have built close by it a very ample Hospital for Pilgrims, and Persons on the Recovery.

The Fraternity is now very considerable, and most of the Noblesse of Rome, of either Sex, have done it the Honour to be of it.

*Congregation of the Holy Trinity*, is a Congregation of twelve Priests establish'd in the Hospital of the Fraternity just mention'd, to take Care of Pilgrims and others entertain'd therein.

The frequent Change of Priests in the Hospital occasioning a deal of Diversity in the Spiritual Conduct and Instruction of the Pilgrims; to render it more uniform, the Guardians and Administrators establish'd a Congregation of twelve

twelve Priests, who lodge in a Quater of the Hospital, as in a Monastery, and live there in Community.

*Order of the Holy TRINITY.* See TRINITARIAN.

*TRINITY Sunday*, is the next Sunday after *Whitsun-sunday*; thus call'd, because on that Day was anciently held a Festival, (as it still continues to be in the *Romish Church*) in Honour of the Holy Trinity.

The Observation of this Festival was first enjoyn'd by the Council of *Arles* in 1260.

*TRINITY House*, is a kind of College at *Deptford*, belonging to a Corporation of Sea-faring Persons, who have Power, by the King's Charter, to take Cognizance of such as destroy Sea-Marks, to correct the Faults of Sailors, &c. and to take Care of several other Things belonging to Navigation and the Seas, the Examination of young Officers, &c. Anno 8<sup>th</sup> Elze.

*TRINUMGELD*, *TRINI-NIGON-GILD*, a Compensation us'd among our *Saxons* Ancestors for great Crimes, which were not absolv'd but by paying a Fine thrice nine Times. See *GELD*.

*TRINODA Necessitas*, in our ancient Customs, were *Expeditio*; *Pontis*, & *Arvis Reparatio*; going to the Wars, repairing of Bridges, and of Castles.

These were the three Excoptions anciently infer'd in the King's Grants of Lands to the Church, after the Words that freed them from all secular Service. See *PONTAGE*.

*TRINODIA terra*, in our ancient Writers, denotes a Quantity of Land containing three Perches. See *PRAEC.*

*TRINOMIAL*, or *TRINOMIAL ROOT*, in Mathematicks, is a Root consisting of three Parts, connected together by the Sign +. See *ROOT*.

Such is  $x+y+z$ . See *BINOMIAL*.

*TRIO*, in Music, a Part of a Concert, wherein there are only three Persons sing; or a musical Composition consisting of three Parts.

*Trios* are the finest Kind of Composition; and these and *Recitativo's* are what please most in Concerts.

*TRIOCTILE*, in Astrology, an Aspect or Situation of two Planets with regard to the Earth, when they are three Octaves, or eight Parts of a Circle distant from each other.

This Aspect, which some call the *Sesquiquadrans*, is one of the new Aspects super-added to the old ones by *Kepler*. See *ASPECT*.

*TRIONES*, in Astronomy, *βίος αερατικός*, *q. d.* ploughing Oxen; a Sort of Constellation or Assemblage of seven Stars in *Ursa Minor*; popularly call'd *Charis's Waine*. See *URSA MINOR*.

From the *Septem Triones* the North Pole takes the Denomination *Sytemetrica*. See *NORTH*, &c.

*TRIOURS*, in LAW, such as are chosen by the Court to examine whether a Challenge made to the Panel, or any of them, be just or no. See *JURY*.

*TRIP*, a Sea Term. A Ship is said to bear her Topails *a-trip*, when she carries them hoisted up to the highest.

*TRIPARTITION*, is a Division by three, or the taking the third Part of any Number or Quantity. See *PARTITION* and *DIVISION*.

Hence *Tripartite*, *Tripartitus*, something divided into three Parts, or made by three Parties: an Indenture *Tripartite*, &c. See *INDENTURE*.

*TRIPLE*, *Three fold Ratio*. See *RATIO*.

*TRIPLE*, in Music, is one of the Species of Measure or Time. See *TIME*.

*Triple Time* consists of many different Species; whereof there are in general four, each of which has its Varieties. — The common Name of *Triple* is taken hence, that the whole or half Measure is divisible into three equal Parts, and beat accordingly.

The first Species is call'd the *simple Triple*, whose Measure is equal either to three Semibreves, to three Minims, three Crotchets, three Quavers, or three Semiquavers; which are mark'd thus,  $\frac{3}{4}$  or  $\frac{3}{8}$ ,  $\frac{3}{16}$ ,  $\frac{3}{32}$ ; but the last is not much us'd, except in Church Music.

In all these, the Measure is divided into three equal Parts or Times, call'd thence *Triple Time*, or the Measure of three Times, whereof two are beat down, and the third up.

The second Species is the *mix'd Triple*: Its Measure is equal to six Crotchets, or six Quavers, or six Semiquavers, and accordingly mark'd  $\frac{6}{4}$ , or  $\frac{6}{8}$ , or  $\frac{6}{16}$ ; but the last is seldom us'd.

Some Authors add other two, *viz.* six Semibreves, and six Minims, mark'd  $\frac{6}{4}$  or  $\frac{6}{8}$ ; but these are not in Use.

The Measure here is usually divided into two equal Parts or Times, whereof one is beat down, and one up; but it may also be divided into six Times, whereof the first two are beat down, and the third up; then the next two down, and the last up; *i. e.* each half of the Measure is beat like the *simple Triple*, (on which Account it may be call'd the *Compound Triple*); and because it may be thus divided either into two or six Times, (*i. e.* two Triples) 'tis call'd *mix'd*, and by some the Measure of six Times.

The third Species is the *Compound Triple*, consisting of nine Crotchets, or Quavers, or Semiquavers, mark'd  $\frac{9}{4}$ ,  $\frac{9}{8}$ ,  $\frac{9}{16}$ ; the first and last are little us'd; some also add  $\frac{9}{32}$ , which are never us'd.

This Measure is divided either into three equal Parts or Times, whereof two are beat down, and one up; or each third Part may be divided into three Times, and beat like the *simple Triple*; on which Account it is call'd the Measure of nine Times.

The fourth Species is a Compound of the second Species, containing twelve Crotchets, or Quavers, or Semiquavers, mark'd  $\frac{12}{4}$ ,  $\frac{12}{8}$ ,  $\frac{12}{16}$ , to which some add  $\frac{12}{32}$  and  $\frac{12}{64}$ , which are never us'd; nor are the first and third much us'd, especially the latter.

The Measure, here, may be divided into two Times, and beat one down, and one up; or each half may be divided, and beat as the second Species, either by two or three; in which Case it will make in all twelve Times, and hence is call'd the Measure of twelve Times.

The French and Italian Authors make a great many more Species and Divisions of *Triple Time*, unknown, or, at least, unregarded by our English Musicians, and therefore not so necessary to be dwelt upon here.

*TRIPPLICATE Ratio*, is the Ratio which Cubes bear to each other. See *CUBE*.

This Ratio is to be distinguish'd from *Triple Ratio*, and may be thus conceiv'd.

In the Geometrical Proportionals 2, 4, 8, 16, 32; as the Ratio of the first Term (2) is to the third (8), Duplicate of the first to the second; or as 4, the Square of 2, is Duplicate of 16, the Square of 4; so the Ratio of 2 to 16, the fourth Term, is *TriPLICATE*; or as 8, which is the Cube of 2, to 64, the Cube of 4. — And this *TriPLICATE Ratio* is compounded of all the preceding Ratio's. *HARRIS*.

*TRIPPLICATIO*, *TRIPPLICATION*, in Civil Law, is the same with *Surjoinder* in Common Law. See *SURJOINDER*.

*TRIPPLICITY*, among Astrologers, is the Division of the Signs, according to the Number of the Elements; each Division consisting of three Signs.

*TRIPPLICITY*, a Term frequently confounded with *Trine Aspect*; tho', strictly speaking, the two are very different Things.

*TriPLICITY* is only us'd with regard to the Signs; and *Trine*, on the contrary, with regard to the Planets. — The Signs of *TriPLICITY* are those which are of the same Nature, and not those which are in *Trine Aspect*. — Thus *Leo*, *Sagittary*, and *Aries* are Signs of *TriPLICITY*, because those Signs are all suppos'd fiery. See *SIGN*.

*TRIPLOIDES*, of the Greek, *τριάδος*, a Surgeon's Instrument, with a three-fold Basis, us'd in the restoring great Depressions of the Skull. See *TRIPANUM*.

*TRIPOD*, or *TRIPUS*, in Antiquity, a sum'd sacred Seat or Stool, supported by three Feet, whereon the Priests and Sybils were plac'd to render Oracles. See *ORACLE*.

'Twas on the *Tripos* that the Gods inspir'd them with that divine Fury and Enthusiasm, wherewith they were seiz'd at the delivering their Predictions. See *ENTHUSIASM*.

M. *Spanheim* observes, that on *Roman Medals*, the *Tripos* expresses some Priesthood, or sacerdotal Dignity. — A *Tripos* with a Crow and a Dolphin, is the Symbol of the *Duomviri*, deputed for the keeping of the Sybillin Oracles, and for the consulting them on Occasion.

*TRIPUDIUM*. — In the Laws of *Hen. I.* occurs this Passage. — *In quibus vero causis triplicem litem haberet, ferat judicium Tripodii, i. e.* Co Solid: The Meaning whereof is, that as for a small Offence, or for a trivial Cause, the Composition was twenty Shillings; so for a great Offence, which was to be purg'd *tripliciter lada*, the Composition was three times twenty Shillings, *viz.* Tripodii.

*TRIPOLI*, or *TRIPOLY*, call'd also *Alana*, a kind of Chalk, or white soft Stone, bordering a little on red, us'd in polishing the Lapidaries, Goldsmiths, Coppersmiths, and Glass-grinders Works. See *GLASS*, *GRINDING*, *POLISHING*, &c.

Some imagine *Triполи* to be a common Stone, burnt and calcin'd by the sulphurous Exhalations which happen to be under the Mines where it is found; Of these Mines there are a Number in divers Parts of *Europe*, particularly in *Italy*, where the *Triполи* is very good. — Others take it for a Native Earth.

*TRIPPING* is a Term in Heraldry. See *PASSANT*.

*Tripping*, in Heraldry, denotes the quick Motion of all Sorts of Deer, and some other Creatures represented with one Foot up, as it were on a Trot.

*TRIPHTHONGUE*, in Grammar, an Assemblage or Concourse of three Vowels in the same Syllable, as *uoe*. See *SYLLABLE*.

*Quintilian*, lib. I. cap. 6. asserts, that there never was any Syllable of three Vowels, but that one of them was always turn'd

turn'd into a Confusant: *Scoppius* asserts the contrary: -- However this may be in the *Latin* and *Greek*, which were the only Languages *Quintilian* understood; 'tis certain there are several Languages in *Europe*, wherein *Triphthongs* are in Use. See *Diphthong*.

**TRIPOTES**, in Grammar, defective Nouns, which have only three Cases. See *CASE*.

Such are the Words *Tantuscula*, *Tantandem*, *Tantidem*, and *Sordis*, *Sordem*, *Sorde*.

The Word is compounded of *tripis*, three, and *potis*, Case.

**TRIEME**, **TRIREMIS**, in Antiquity, a Galley with three Ranks of Oars on a Side. See *GALLEY*.

**TRIS-Diapason**, in Music, a Concord, otherwise call'd a *Triple Eighth* or *Fifteenth*. See *CONCORD*.

**TRISACRAMENTALES**, **TRISACRAMENTARIANS**, an Appellation given to a Sect in Religion, who admit of three Sacraments, and no more. See *SACRAMENT*.

There have been several *Trisacramentarians* among the Protestants, who allow'd of Baptism, the Eucharist, and Absolution, for Sacraments. — The *English* are often misrepresented by Foreigners as *Trisacramentarians*, from an Opinion that they allow Ordination a Sacrament. See *ORDINATION*.

**TRISAGION**, or **TRISAGIUM**, in Church History, a Hymn, wherein the Word *holy* is repeated three Times. See *HYMN*.

The proper *Trisagion* is those Words *holy, holy, holy, Lord God of Hosts*, which we read in *Isaiah* vi. 3. and in the *Apocalypse*.

From these Words, the Church form'd another *Trisagion*, which is recited in *Latin* and *Greek*, in the respective Churches, to this Effect: *Holy God, holy Fort, holy Immortal! have Mercy upon us*.

*Petrus Fulvensis* to this *Trisagion* added, *Thou who wast crucify'd for us, have Mercy upon us*: Thus attributing the Passion not to the Son alone, but to all the three Persons of the *Trinity*, and pronouncing Anathema to all such as would not say the same.

The Use of this latter *Trisagion*, (exclusive of the Addition of *Fulvensis*) began in the Church of *Constantinople*, from whence it pass'd into the other Churches of the East, and afterwards into those of the West. — *Damasceus*, *Codin*, *Balsamon*, and others, say it was in the Time of the Patriarch *Proclus* that it was first introduc'd, and on the following Occasion: There being a violent Earthquake in the 35th Year of the younger *Theodosius*, the Patriarch made a grand Procession, wherein, for several Hours together, was sung the *Kyrie Eleison*, *Lord have Mercy upon us*. While this was in Hand, a Child was taken up into the Air, where, it seems, he heard the Angels a singing the *Trisagion* just mention'd. He return'd soon after, and told what he had heard: Upon which they began to sing that Hymn, and the more willingly too, as they attributed the Troubles they were then under to the Blasphemies which the Hereticks of *Constantinople* utter'd against the Son. — *Alepiades*, *Cedrenus*, *Pope Felix*, *Nicophorus*, &c. relate the same Story.

*Petrus Fulvensis*, Patriarch of *Antioch*, and a zealous Partizan of *Nestorius*, endeavour'd to corrupt the Hymn, by adding, *who suffer'd for us*; but in vain: It still subsists in its primitive Purity, both in the *Latin*, *Greek*, *Ethiopic*, and *Mesopotamian* Offices. See *PATRIFASSIONS*.

The Word is compounded of the *Greek*, *tripis*, three, and *agion*, *sanctus*, *holy*.

**TRISECTION**, or **TRISSECTIO**, a dividing of a Thing into three. See *DIVISION*, *SECTION*, &c.

The Term is chiefly us'd in Geometry, for the Division of an Angle into three equal Parts. See *ANGLE*.

The *Trisection of an Angle* geometrically, is one of those great Problems, whose Solution has been so much sought by Mathematicians for these two thousand Years; being, in this respect, on a Footing with the Quadrature of the Circle, and the Duplicate of the Cube Angle. See *PROBLEM*.

Several late Authors have wrote of the *Trisection* of the Angle, and pretend to have found out the Demonstration thereof; but they have all committed Paralogisms. See *ANGLE*.

**TRISMEGISTUS**, an Epithet or Surname given to that of the two *Hermes*' or *Mercurius*, Kings of *Thebes*, in *Aegypt*, who was contemporary with *Moses*.

*Mercury*, or *Hermes Trismegistus*, is the latter of the two; the former having reign'd about the Time of the Deluge. — They are both of them represented as Authors of many Arts and Institutions of the *Aegyptians*. See *HERMETIC*.

The Word is form'd from *tris*, three, and *megis*, great.

**TRISOLYMPIONICES**, among the Ancients, a Person who had thrice bore away the Prize at the Olympic Games. See *OLYMPIC*.

The *Trisolympionics*, or *Trisolympionicks*, had great Privileges and Honours allow'd them. — Statues were erected to them, of the Kind call'd *Ionicæ*, which were modell'd to the Size and Form of their Persons. See *STATUE*.

They were exempted from all Charges and Incumbrances, and could never be mark'd with Infamy.

The Word is compos'd of *τρις*, *tris*, three, *Ολυμπος*, *Olympic Games*, and *νικη*, *Victory*.

**TRISOS**, of the *Greek* *τρεος*, a Convulsion of the Muscles of the Temples, causing the Teeth to gnash. See *CONVULSION*, &c.

**TRISFAST**, **TRISFASTON**, in Mechanics, a Machine with three Pullies; or an Assemblage of three Pullies. See *PULLY*.

The *Trisfaston* is a Species of *Polysfaston*. See *POLYFASTON*.

The Word is compounded of *τρις*, three, and *φασον*, *trabs*.

**TRISTRIS**, **TRISTIS**, and **TRISTIA**; in our old Law-Books, is an Immunity, whereby a Man is excus'd from attending on the Lord of a Forest, when he is dispos'd to chafe within the Forest; and is also not compell'd to hold a Dog, follow the Chase, nor stand at a Place appointed, which otherwise he might be under Pain of Amercement. *Madox. sive quæst.* *Ec. de Chirog.* *Loudesprey.* *Duchiel* & *Tristri*, *de omnibus Abstercuratis*, *Ec. Privileg. de Semplingham*.

**TRISYLLABLE**, or **TRISYLLABLE**, in Grammar, a Word consisting but of three Syllables. See *WORD* and *SYLLABLE*.

**TRITE**, in Music, the third musical Chord. See *CHORD* and *DIAGRAM*.

**TRITHEISM**, the Opinion of the *Tritheists*, or the Heresy of believing three Gods. See *GOD* and *TRINITY*.

*Tritheism* consists in admitting not only of three Persons in the Godhead; but of three Substances, three Essences or Hypostases, and three Gods. See *PERSON*, *HYPOSTASIS*, &c.

Several People out of Fear of giving into *Tritheism* have become Sabellians; and several others, to avoid Sabellianism, have commenc'd *Tritheists*; so delicate and subtle is the Medium. See *SABELLIAN*.

In the famous Controversy between *Dr. South* and *Dr. Sherlock*, the first is judg'd to have run into Sabellianism, by a too rigorous asserting of the Unity of the Godhead; and the latter into *Tritheism*, by a too absolute maintaining the *Trinity*.

*John* the Grammarian, surnam'd *Philologus*, Lover of Labour, is held the Author of the Sect of the *Tritheists*, under the Emperor *Phocas*; at least it appears he was a zealous Advocate thereof. — *Leontius* and *Georgius Pappus* wrote against him.

**TRITON**, in Poetry, a Sea Demi-God, held by the Ancients to be an Officer or Trumpeter of *Neptune*, attending on him, and carrying his Orders and Commands from Sea to Sea. See *GOD*.

The Poets and Painters represent him as half Man, half Fish, terminating in a Dolphin's Tail, and bearing in one Hand a Sea-shell, which serv'd as a Trumpet.

Some of the Ancients make him the Son of *Neptune*, and the *Nymph Salacia*; *Hesiod* of *Neptune* and *Amphitrite*; *Nonnus* in his *Book de Piscationibus*, makes him the Son of *Ocean* and *Thetys*; and *Lycophron* the Son of *Neptune*.

But tho' *Hesiod*, and the Mythologists, only speak of one *Triton*, yet the Poets have imagin'd several; giving some of them for Trumpeters to all the Sea-Gods, particularly to *Neptune* and *Venus*; accordingly they were frequently introduc'd on the ancient Theatres, and in the *Naumachia*.

In effect, the *Tritons* not only officiated as Trumpeters in *Neptune's* Retinue; but were also suppos'd to draw his Chariot, i. e. the Sea-shell wherein he rode over the Waters, as we find in *Virgil Æneid* X. 209. *Ovid Metam.* l. 333. and on a Medal of *Augustus*.

The Fable of the *Tritons*, no doubt, took its Rise from Sea or Men-men; for that there are such Things as Sea-men, would form a Thing scarce to be doubted, after what we have said under the Article *MAN-MAN*.

The Poets ordinarily attribute to *Triton* the Office of calming the Waves, and of making Tempests cease. — Thus in the 1st of the *Metamorphoses* we read, that *Neptune* desiring to recall the Waters of the Deluge, command'd *Triton* to found his Trumpet, at the Noise whereof the Waters all retir'd.

**TRITONE**, **TRITON**, in Music, a false Concord, consisting of three Tones, or a greater Third, and a greater Tone. See *CONCORD*.

Its Ratio, or Proportion in Numbers, is of 45 to 32. In dividing the Octave, we find, on one Side, the false Fifth, and the *Tritone* on the other. See *OCTAVE*.

The *Tritone* is a kind of redundant Third, consisting of three Tones, whence its Name; or, more properly, of two Tones, with a greater Semitone, and a lesser, as of *ut* to *fa*, of *fa* to *si*, &c. — But it is not, as many imagine, a greater Fourth; for the Fourth is a perfect Interval, which does not admit of any Majority or Minority: Nor must the *Tritone* be confounded with the false Fifth; for the *Tritone* only comprehends four Degrees, viz. *ut, re, mi, fa*, whereas the false

falsc Fifth comprehends Five, *ovo. fa. sol. la. si. ut*; besides, that among the Six Semitones, which compose the *Tritono* chromatically, there are three greater and three lesser; whereas among the Six Semitones, which compose the falsc Fifth, there are only two lesser, and four greater. See THIRD, FOURTH, FIFTH, &c.

**TRITURATION**, in Pharmacy, *Grinding*; the Art of reducing a solid Body into a subtile Powder; call'd also *Levigation*, *Pulverisation*, &c. See POWDER, LEVIGATION, &c.

The *Trituration* of Woods, Barks, Minerals, and other hard and dry Bodies, is perform'd in Metalline Mortars.

The same Term is also applied to the comminuting, braising and dividing of humid Matters, into little Parts: — The *Trituration* of moist Bodies is perform'd in Marble, or Stone Mortars, with Pestles of Wood, Glass, Ivory, &c.

The Word is form'd from *tri* and *terro*, I wear.

*Trituration*, *Boerhaave* observes, has a wonderful Force to dissolve some Bodies, and will render them as fluid, as if they were fused by the Fire. — Thus if you grind the Powder of Myrrh, and Salt of Tartar together, they will dissolve each other. By rubbing new and bright Filings of Iron in a Mortar, with double their Weight of clean Sulphur, the Iron will be dissolved, so as by diluting it with Water to afford the *Vitriolum Martis*. See IRON and VITRIOL.

Gold long ground in a Mortar, with Salt of Tartar, will yield a kind of Tincture; and rubbed with Mercury, in a Mortar of Glass, it entirely dissolves into a Purple Liqueur, and becomes a most powerful Medicine.

Dr. *Langelatte* has wrote a curious Treatise of the great Effects of *Trituration* in Chymistry; and describes a peculiar Way he employ'd to grind Gold, whereby he could render it as fluid as the Fire does, and make an Aurum Potabile, by the bare Motion of a Mill. See GOLD and POTABLE.

That Author, in the *Philosophical Transactions*, mentions his way of grinding Gold, and describes two Engines, or Philosophical Mills for the Purpose, with one of which, in the Space of Fourteen natural Days, he reduced a Leaf of Gold to a dusky Powder, and putting it into a shallow Retort placed in a Sand Heat, he thence obtained, by gradually increasing the Fire and giving a strong one at last, a few very red Drops, which, digested *per se*, or with tartarized Spirit of Wine, afforded a pure and genuine Aurum Potabile.

The Success of this Operation, the Doctor attributes, in a great measure, to the Salt of the Air, which in grinding, plentifully mixes and unites itself with the Gold.

**TRITURATION**, in Medicine, is us'd for the Action of the Stomach, on the Food. See STOMACH, &c.

Some Physicians have maintain'd, that Digestion was perform'd by *Trituration*, and not by *Fermentation*, i. e. that all the Stomach does, is to grind and comminute the Food into smaller Parts to fit it for Nutrition, without any other Alteration therein. See the Article DIGESTION, where the Doctrine is laid down at large.

This System was much talk'd of some Years ago, being countenanced by Dr. *Pitcairn*, and others; but seems now much declined.

The Doctrine of *Trituration* is not new: — *Erifftratus* maintain'd it in all its Latitude many Ages ago; and the Moderns have only revived it.

It was first broach'd in the Time of *Hippocrates*, that is, in a Time when Anatomy was but little known; and 'twas this that render'd it current. — An Opinion was entertain'd by loose Physicians of those Times, that the Stomach was only the Receiptacle of the solid or dry Foods; that those Foods, after having been diluted, and broke in the Mouth, were again broke more perfectly in the Stomach, and by this means alone were converted into Chyle: but that the Drink, by reason of its Liquidity, not being subject to be broken, went to the Lungs, and not the Stomach, where, by reason of its abundance, it would rather have prejudic'd the Digestion than have aid'd it.

*Hippocrates*, we read, in the fourth Book of *Distastes*, stood up strenuously against an Opinion so visibly contrary to Reason and Experience; and he informs us, That if he gave himself this Trouble, 'twas because the Error had already got a good number of Partizans. — It could not stand long against the Reasons of *Hippocrates*; and its Defeat was followed by the intire Ruin of the System of *Trituration*, which had its Foundation thereon.

But *Erifftratus* retriev'd it again; and the Doctrine, after having been supported for some time, fell anew into Obivion; whence some late Authors have in vain endeavour'd to recover it.

**TRIUMPH**, **TRIUMPHUS**, a Ceremony or Solemnity, practis'd among the ancient *Romans*, to do Honour to a victorious General, by affording him a magnificent Entry into their City.

The *Triumph* was the most pompous Spectacle known among the Ancients: Authors usually attribute its Invention to *Bacchus*; and tell us, that he first triumph'd upon the Con-

quest of the *Indies*; and yet this Ceremony was only in use among the *Romans*.

The *Triumph* was of two Kinds, the lesser and the greater. — The lesser *Triumph* was granted upon a Victory over some unequal or unworthy Enemy; as over Pyrates, Slaves, &c. — This they call'd *Ovatio*; because the only Sacrifices offer'd herein, were Sheep. See OVATIO.

The greater *Triumph*, call'd also *Carulis*, and, simply, The *Triumph*, was decreed by the Senate to a General, upon the conquering of a Province, or gaining a signal Battle.

The Order and Oeconomy of the *Triumph* was thus: — The General having dispatch'd Couriers with Tidings of his Success, the Senate met in *Bellona's* Temple to read his Letters: — This done, they sent him the Title of *Imperator*, with Orders for him to return, and to bring his victorious Troops along with him. When he was arriv'd near the City, the General and principal Officers took Oath of the Truth of the Victory; and the Day of *Triumph* was appointed.

The Day being arriv'd, the Senate went to meet the Conqueror without the Gate call'd *Capena* or *Triumphalis*, and march'd in order before him to the Capitol. — He was richly clad, in a Purple Robe Embroider'd with Figures of Gold, setting forth his glorious Achievements: His Buskins were beset with Pearl, and he wore a Crown, which at first was only Laurel, but afterwards, Gold: One Hand bore a Laurel Branch, and the other a Truncheon. He was drawn in a Car or Chariot, adorn'd with Ivory and Platts of Gold, drawn usually by two white Horses, though sometimes by other Animals; as that of *Pompey*, when he triumph'd over *Africa*, by Elephants; that of *Mark Anthony*, by Lions; that of *Heliogabalus*, by Tygers; that of *Aurelian*, by Deer; that of *Nero* by Heteromorphid Mares, &c.

At his Feet were his Children, or, sometimes, on the Chariot Horses. — 'Tis added, that the public Executioner was behind him, to remind him, from Time to Time, that these Honours were Transitory, and would not screen him from the Severity of the Laws, if he should ever be found delinquent.

The Cavalcade was led up by the Musicians, who had Crowns on their Heads: after them came several Chariots, wherein were Plans of the Cities and Countries subdued, done in Relievo: They were followed by the Spoils taken from the Enemy, their Hoefes, Arms, Gold, Silver, Machines, Tents, &c. After these came the Kings, Princes or Generals subdued, loaden with Chains, and followed by Mimicks and Buffoons, who insulted over their Misfortunes. — Next came the Officers of the conquering Troops, with Crowns on their Heads.

Then appear'd the triumphal Chariot; before which as it pass'd, they all along strew'd Flowers; the Music play'd in Praise of the Conqueror amidst the loud Acclamations of the People, crying *Io Triumpho*.

The Chariot was follow'd by the Senate clad in white Robes, and the Senate by such Citizens as had been set at Liberty or Ransom'd.

The Procession was clos'd by the Sacrificers, and their Officers and Utensils, with a white Ox led along for the chief Victim.

In this Order they proceeded through the triumphal Gate, along the *Via Sacra* to the Capitol, were the Victims were slain.

In the mean time, all the Temples were open; and all the Altars loaden with Offerings and Incense; Games and Combats were celebrated in the public Places, and Rejoycings appear'd every where.

What was horrible amidst all this Mirth, was, that the Captives, when arriv'd at the Forum, were led back to Prison and Strangled; it being a Point of Religion with them, not to touch the Victims till they had taken full Revenge of their Enemies. — The Rites and Sacrifices over, the *Triumph* treated the People in the Capitol, under the Porticos, and sometimes in *Hercules's* Temple.

**TRIUMPHAL** *Crowns* or *Garlands*, See CROWNS.

It is said to have been taken from *Apollo's* crowning his Head with a Laurel, after killing the *Delphick* Serpent. — It was as much esteem'd by the *Romans*, as if it had been Gold.

**TRIUMVIR**, one of three Persons who govern absolutely and with equal Authority in a State.

The Word is little us'd but in the *Roman* History. — *Cesar*, *Crassus* and *Pompey* were the first *Triumvirs*, i. e. the first who divid'd the Government of the Republic among them. See TRIUMVIRATE.

There were also other Officers, call'd *Triumvirs*, *Triumviri*; as the *Triumviri Capitales*, created in the Year of *Rome* 465, to take Care of Prisoners, and look to the Execution of Criminals.

*Triumviri Monetales*, who were Magistrates created at the same time, to look to the Coinage of the Money; whence that Mark still extant on many ancient Coins, *MIVRI*. — These Officers were very considerable, and chosen out of the Knights.

Knights. They made Part of the *Centauri*. The Title they bear on Medals, is *IIIVIR AAA FF. Triumvir Auro Argentis Aere Flando, Feriendo*, which signifies that they had the Direction of the casting and striking of Gold, Silver and Brass.

There were also — *Triumviri Aedibus resediendis*, Officers appointed to look to the Reparation of Temples. — *Triumviri Colonis deducendis*, for the conducting and settling of Colonies. — *Triumviri* for the raising of Troops. — *Nocturnal Triumviri*, to prevent or extinguish Fires. — *Triumviri* to review the Forces, &c.

In the *Aedilian* Family, we read of one *M. Aelius IIIVIR VALETU*, that is, *Triumvir of Health*, or a Magistrate of Health. — *M. Spauheim* takes him to have been a Commissioner establish'd to perform Sacrifice to the Gods of Health, to Dedicate their Temples, &c.

*Quintus* and *Vallant* read *Triumvir Valentudis*; *Patin*, *Triumvir Valentuarius*; but *M. Spauheim*, with much more Reason, reads *Triumvir Valentus*; in like manner, as to a Medal of the *Aquilian* Family, we read *IIIVIR VIRTUS*, signifying, that one *M. Aquilius* had been made *Triumvir*, to repair the Temple of *Virtus*, and *Aelius*, that of *Health*.

**TRIUMVIRATE**, an absolute Government administer'd by three Persons, with equal Authority. See **TRIUMVIR**.

There were two famous *Triumvirates* at Rome. — *Pompey*, *Cesar* and *Crassus* established the first; and *Augustus*, *Mark Anthony* and *Lepidus*, the second.

This latter *Triumvirate* gave the last Blow to the Liberty of the Republic. *Augustus* having vanquish'd *Lepidus* and *Anthony*, the *Triumvirate* sunk into a Monarchy. See **MONARCHY**.

**TRIUNE**, *q. d. tres in Uno*, Three in one, a Term sometimes applied to God, to express the Unity of the God-head, in a Trinity of Persons. See **TRINITY**.

**TROCHAIC**, **TROCHAICUS**, in the *Latin* Poetry, a kind of Verse consisting of *Trochees*; or wherein that Foot predominates; as the *Iambic*'s do in the *Iambic*. See **IAMBIC** and **TROCHEE**.

The XVIIth Ode of the II. Book of *Horace*'s Odes, consists of Strophes of two Verses, the first whereof is *Trochaic Dimeter Catalectic*; i. e. *Trochaic*, composed of three *Trochees*, besides a Syllable at the End.

*Nos ebur neque Aurum —  
Largiora fletibus.*

**TROCHANTER**, in Anatomy, a Name given to two Apophyses fruste in the upper Part of the Thigh-bone. See **APOPHYSES**.

The larger, which is above, is call'd the *great Trochanter*; and the smaller, beneath, the *less Trochanter*. See **FEMUR**.

The Word literally signifies *Rotator* or *Roller*, from the *Greek*, *τροχω*, *rota*, I run, I turn round. — That Appellation was given to those Apophyses, by reason they receive the Tendons of most of the Muscles of the Thigh, amongst which are the *Obrotators* which move it round. See **OBROTATOR**.

**TROCHEE**, **TROCHEUS**, in the *Greek* and *Latin* Poetry, a kind of Foot, consisting of two Syllables, the first long, the latter short — Such are the Words *uade* and *masa*. See **FOOT**.

The *Trochee* is the Reverse of the *Iambus*; and has a just contrary Effect; the latter being light and sprightly, and the former weak and languid, as all those Measures are, which move from a long to a short Syllable. See **IAMBIC**.

Some call the *Trochee*, the *Chore*, *Choreus*, because proper for Songs and Dances.

**TROCHE**, **TROCHISCUS**, in Pharmacy, a Form of Medicine, made to be held in the Mouth to dissolve.

The *Troche* is properly a dry Composition, the chief Ingredients whereof, after having been brought into a very subtile Powder, are incorporated with some proper Liqueur, as distill'd Waters, Wine, Vinegar or Mucilages; and reduced into a Mass, which is moulded into little Cakes or Balls of any Form, at Pleasure, and dried in the Air far from the Fire.

There are *Troches* of various Kinds, and for various Intentions; as Purgative, Alternative, Aperitive, Corroborative, &c.

*Latin* Authors call them *Pastilli*, *Rotule*, *Placeotule*, *Orbes* and *Orbientia*; and the *English*, frequently, *Lozenges*.

The chief *Troches* are of *Agnic*, *Liquorice*, *Nutmeg*, *Amber*, *Rhubarb*, *Capers*, *Myrrh*, *Rosin*, *Campbor*, *Squillae*, *Vipers*, &c.

Those of *Coloquintida*, are call'd *Troches* of *Albania*, from the *Arabs*, who call *Coloquintida*, *Haudal*.

**TROCHILUS**, **TROCHILE**, in Architecture, a large hollow Member, whose Cavity is composed of two *Arches*; such is that *HK I*, *Tab. Architect.* Fig. 13.

The *Trochilus* is usually call'd by the *Modern Architects*, *Scotia*. See **SCOTIA**; and by our *English* Workmen, *Ceement*. See **CEMENT**.

**TROCHITE**, or **TROCHITES**, in natural History, a kind

of figur'd fossil Stones, resembling Plants; vulgarly call'd *St. Catherine's Seeds*. See **FOSSIL** and **STRONIA**.

They are usually of an opaque, dark Colour, break like *Flint*, polish'd and shining, and are easily dissolv'd in *Vinegar*. — Their Figure is generally *Cylindrical*, sometimes a little *Tapering*, the Circumference smooth, and both the flat Sides cover'd with fine *Radii* drawn from a certain Hole in the Middle to the Circumference. See *Tab. Natural History*, Fig. 12.

Two or three or more of these *Trochite* join'd together, constitute what the *Naturalists* call an *Entrochus*. See **ENTROCHUS**.

The *Trochite*, or single *Joints*, are so set together, that the *Rays* of one enter into *Furrows* in the other, as in the *Sutures* of the *Skull*. — They are found in great Plenty in the Bodies of the *Rocks* at *Broughton* and *Stock*, two Villages in *Croson*, at all Depths under Ground; in *Mendip Hills*, &c. sometimes only sprinkled here and there, and sometimes in large Strata or Beds of all Magnitudes, from the Size of the smallest Pin, to two Inches about.

They are generally found ramous or branchy, larger Branches arising from the *Stem*, or *Cylinder*, and smaller from these. The Branches being deeply inserted into the *Stem*, the tearing them off leaves great Holes therein.

*Dr. Lister* has discover'd a sort of little Fragments amongst them, which he takes to have been the *Apices* of the *Plants*; and another Sort, which he supposes to have been the *Roots*. — In effect, the *Trochite* are generally allow'd to be the Bodies of *Rock-Plants*, such as *Coral* is. See **ROCK-PLANT**.

*Mr. Beaugout* in the *Philosophical Transactions*, assures us, he has found that all the *Cliffs* in some Mines, are made up of these *Stone-plants*, some whereof have been converted into *Lime-stone* *Rocks*, while in their tender Growth; while others becoming *Spar*, compose Bodies of that Substance; and considering that all the *Cliffs* for a very large Circumference in some Places, consist wholly of these *Plants*; we may say, there have been, and, in all probability, still are whole *Fields* or *Forests* of these under Ground, as there are of *Coral* in the *Red Sea*. See **CORAL**.

In the *Courts* between the *Cliffs*, are found these *Plants* at all Stages and Degrees of Maturity, growing up in the gritty *Clay*, and rooted in the *ripe* *moist* *Stones*, many of them of the *Form* and *Dimensions* of a *Tobacco-pipe*, some yet crude or raw *Clay*, others of the *Consistence* of *Lime-stone*, others still harder, with the evident Beginnings of *Circles* and *Sutures*; and others full grown, and become perfect *Spar*, which is their *Point of Maturity*. See **SPAR**.

The *Pith* continues still white and soft; as the whole *Plant*, no doubt, was at first; and is continually refreshed by the *mineral* *Streams* and *Moisture* which have free Access to it through *Five* hollow *Slits* or *Feet* in the figured *Roots*, or through the *Mass* of *Clay* usually lying under the plain *Roots*.

Nor can it be denied, but these *Stone-plants* have true *Life* and *Growth*. — In the Curiosity of their *Make*, they may vie with most of the *Vegetable Kingdom*, and are shaped and formed like them, having *Stem*, *Branches*, *Roots*, an inward *Pith*, as likewise *Joints* and *Rannings* in their *Girt*, and sometimes *Cells* to supply the Place of *Veins* and *Fibres*: Why, then, mayn't they be allow'd as proper *Vegetations*, as other *Plants*?

Indeed 'tis highly probable, these *Rock-plants* are *Lapides sui Generis*, and not parts of *Animals* or *Plants* petrified, as many Authors have imagin'd. — If the figured *Roots*, whereon they sometimes grow, give any Suspicion they might have belong'd to an *Animal*, particularly a *Species* of the *Stella Arborescens*; the *Trunks* clearly evince the contrary, and can never be look'd on as Parts of an *Animal*: nor are they reducible to any known *Species* of *Vegetables*. *Mr. Beaugout* tells us, he has by him above 20 different *Species* of *Trochites*, all of them wonderfully regular, and not to be paralleled by any *Vegetable* he knows of in *Nature*: and 'tis inconceivable how many *Species* diffus'd through many Parts of the *Earth*, should come to be lost. See **PLANT**, **TRIPEDICTION**, **CORNU Ammonis**, &c.

**TROCHLEA**, one of the *mechanical Powers*, usually call'd a *Pulley*. See **PULLEY**.

Hence the *Cavity* in the *Bone* of the *Arm* or *Shoulder*, wherewith, when the *Arm* is stretched forth, the *Process* of the *undermost* and *lesser* of the *long Bones* of the *Cubitus* enters, is also call'd *Trochlea*. See **CUBITUS**, &c.

**TROCHLEARES**, in Anatomy, a Name given the oblique *Muscles* of the *Eye*, because serving to pull the *Eye* obliquely upwards or downwards, as if it turn'd like a *Pulley*. See **OBLIQUUS** and **EYE**.

**TROCHOID**, **TROCHOIDES**, in Geometry, a *Curve*, whose *Generis* may be thus conceived. — If a *Wheel* or *Circle* be moved with a two-fold Motion at the same time, the one in a *right Line*, and the other circularly about its *Centre*; and these two Motions be equal, i. e. describe two equal *Lines* in the same *Time*: And if in the *Radius*, which at the beginning of the Motion, reaches from the *Centre* of the *Wheel*, or the first *Point* of the *Line* which describes the *Circumference*;

If, I say, in this Radius a Point be taken any where except in the Centre, this Point will describe a Curve, one Part whereof will be below the Line described by the Centre, and the other above it. — This Line, thus described by the Point taken in the Radius, is call'd the *Trochoid*.

The right Line which joins the two Extremities of the *Trochoid*, and which is either the Path the Wheel makes, or a Line parallel to that Path, is call'd the *Base of the Trochoid*.

The *Axis of the Trochoid*, is the Diameter of the Wheel, perpendicular to the Base in the middle of the Motion; or that Part of the Radius between the *Trochoid* and its Base. — The Point wherein the *Axis* is cut into two Parts by the Line described by the Centre of the Wheel, is call'd the *Centre of the Trochoid*; the uppermost Point of the *Axis*, the *Vertex of the Trochoid*; and the Plane, comprehended between the *Trochoid* and its Base, the *Trochoidal Space*.

The *Trochoid* is the same with what we otherwise call the *Cycloid's* Properties, &c. whereof, see under the Article *CYCLOID*.

The Word is form'd from the Greek, τροχός, Wheel, and ἄξον, Form.

**TROGLODYTES**, ΤΡΟΓΛΟΔΥΤΑΙ, in the ancient Geography, a People of *Aethiopia*, said to have lived in Caves under Ground.

*Pemp. Meta* gives a strange Account of them. — He says they did not so properly speak as *strick*; that they liv'd on Serpents, &c.

*Troeros* calls them *Ichtthyophagi*. *Mustapus* takes them to be the same with those call'd in Scripture *Ghannanims*. *Pinitimus* in *Strabo*, will have them wrote without the *t*, *Trogodites*.

The Word is form'd of the Greek, τροχον, Caverna.

**TROGLODYTES** are also spoke of as a Sect of Jewish Idolaters. See *SECT*.

The Prophet *Ezekiel* relates, cap. viii. v. 8. 9. 10, &c. that God, among other Abominations of the *Israelites* which he set before him, shew'd him seventy old Men, who with their Centres in their Hands, adored secretly, all kinds of Animals and Reptiles painted on the Wall.

*Philastrius* on this Vision of the Prophet, erects these Idolaters into a Sect of *Israelites*, who, hiding themselves under Ground and in Caves, adored all kinds of Idols: And the Editor of *Philastrius* calls this Sect *Trogodytes*, from τροχον, a Cave, and ἴδω, I penetrate, as believing, on the Credit of *Philastrius*, that those of this Sect hid themselves in Caves.

And yet the Prophet plainly shews, that it was in secret Parts of their Houses, and not in subterraneous Caverns, that these *Israelites* idolatrised.

The Word *Trogodytes*, then, is feign'd; so is the Sect.

**TROIA** or **TROJAN Games**, *Ludi Trojani*, were Games instituted by *Alexander*, Son of *Aeneas*; and which afterwards pass'd to the *Romans*, and were celebrated in the Circus by the Youth of *Rome*. See *GAMES* and *CIRCUS*.

One of the Number who presided over the Solemnity, was call'd the *Princeps Juventutis*; and was always of one of the first Families in *Rome*. See *PRINCE*.

At first, 'tis supposed, they only engaged on Foot and on Horseback; because *Virgil*, who describes these Games in the *Aeneid*, lib. V. only speaks of Horses and Cavaliers, without any mention of Biggs and Quadrige, which were not in Use at *Rome*, till long after *Alexander*. — And yet *Dion*, speaking of *Cæsar's* Games, says, the Youth there combated in Chariots: But 'tis thought by some, that these were not the *Trojan Games*, but Courses and Combats of a different Kind, proper for young People of a more advanced Age.

**TROLLING**, among Anglers. — *To Troll*, is to fish for Pikes with a Rod, whose Line runs on a Reel. See *PIKE-FISHING*.

**TROCHONNE** & *dembetree*, in Heraldry, denotes a Cross or other Thing cut in Pieces and dissembled, yet so as all the Pieces keep up the Form of a Cross, though set at a small Distance from one another. See *CROSS*.

**TROPAGE**, ΤΡΟΠΑΓΙΟΝ, an ancient Custom or Toll pay'd for the weighing of Wool.

The Word comes from *Trova*, an old Name for a Beam to weigh withal. Hence

**TROATOR**, an Officer of the City of *London*, whose Business it was to weigh the Wool brought into that City.

**TRONE-WEIGHT**, was the same with what we now call *Troy-weight*. See *WEIGHT*.

**TROOP of Horse**, is a small Body of Horse, under the Command of a Captain; answering to a Company of Foot. See *COMPANY* and *CAPTAIN*.

**Independent Troop**, is a *Troop* that is not imbody'd with, or joined to any Regiment. See *REGIMENT*, *GUARD*, &c.

**To beat the Troop**, is the second Beat of a Drum, whereby the Foot are advertis'd to march. See *DRUM*.

**TROPE**, ΤΡΟΠΗ, in Rhetoric, a kind of Figure of Speech, whereby a Word or Diction is changed from its proper and natural Signification into another, with some Advantage. See *FIGURE*.

As, when we say an *Ass*, for a stupid Person; *Thunderbolt of War*, for a great Captain, to wash the Black-more white, for a fruitless Undertaking.

This Change of Sense is never to be used, but where it gives a Force and Dignity, or renders the Discourse more significant, weighty and graceful.

'Tis call'd *Trope*, from the Greek, τροπή, verso, I turn, change, in regard the Words are here transferred from the Things they properly impart, to others which they only import indirectly; and that *Tropes* only signify the Things they are applied to by reason of the Connexion and Relation those Things have with those others, whose proper Names they are.

This Change or Inversion is perform'd various Ways; but chiefly four; whence arise four principal *Tropes*, viz. the *Metaphora*, *Metonymia*, *Synecdoche* and *Ironia*; each whereof, see under the proper Articles, *METAPHORA*, *METONYMIA*, *SYNECDOCHE*, &c.

Some Authors confound the Term *Trope*, with *Figure*; but they are very different Things. — Most Authors, as *P. de Colonia*, &c. make *Figure*, the *Genus*, and *Trope*, a *Species*; defining *Figure* to be any Ornament in Discourse, whereby it is raised above the common Language; and *Trope* to be that peculiar kind of Ornament which consists in the Change of the Sense, &c.

But *Vossius* makes *Trope* and *Figure* to be two collateral and independent Things; defining *Trope* to be the Change of the Sense, &c. and *Figure*, to be any Ornament, except what becomes so by such Change, &c. See *FIGURE*.

'Tis in the *Tropes*, principally, that the Richness and Variety of a Language consists; and yet those should never be used but to express what could only be represented imperfectly, in common and proper Terms. — *Tropes* should always be clear; they are vicious, if they be obscure, or too far-fetch'd. The Idea of the *Trope* should be so connected with that of the proper Name, that they should follow each other; so that in exciting the one, the other should be awakened of course.

Besides the four capital *Tropes* above-mentioned, there are several inferior ones: When the *Trope* is too bold, 'tis call'd an *Hyperbole*; when continued, 'tis an *Allegory*; when too obscure, an *Ænigma*; when it hocks us, or is too remote, a *Catachresis*. See *HYPERBOLE*, *ALLEGORY*, *ÆNIGMA*, &c.

Add to these, other *Tropes*, as the *Metalepsis*, *Antonomasia* and *Luxus* or *Extemperatio*. See *METALEPSIS*, &c.

Some also refer the Six Kinds of Irrition, to the *Tropes*, viz. the *Sarcasms*, *Dialysms*, *Charientisms*, *Apeisms*, *Alytherisms* and *Mimesis*; but without sufficient Reason. See *SARCASMS*, &c.

**TROPHY**, ΤΡΟΦΑΙΟΝ, among the Ancients, a Pile or Heap of Arms of a vanquish'd Enemy, rais'd by the Conqueror in the most eminent Part of the Field of Battel.

The Word is also used for an artificial Representation of such a Pile in Marble, Stone or other Mater. — Such were the *Trophies of Marsius* and *Sylla* in the Capitol, &c.

The ancient *Trophies* consist of Greek and Roman Arms; and the Modern ones of Arms of the various Nations now in use; as in those insulated ones near *Blenheim*, in the *Fauxbourg*, *S. Antoin*, and in the Castle of *Verfailles*.

Some are done in Basso-Relievo, as those of the *Trojan Column*, and the Attic of the Court of the *Louvre*.

*Trophies* are likewise frequently exhibited on Medals of the Emperors, struck on occasion of Victories; wherein, besides Arms and Spoils, are frequently seen, one or two Captives by the Sides of the *Trophy*.

*Trophies*, M. *Vaillant* observes, were, originally, nothing but Trunks of Trees, which the Victor planted on the most eminent Part of the conquer'd Province, and which were hung with the Spoils of the Enemy, to perpetuate the Memory of his Defeat.

The Word is form'd from the Latin, *Trophæum*, which *Vossius* deduces from the Greek, Τροπή, the Flight of an Enemy.

**TROPHY-Money**, a Duty of 4*s.* paid Annually by the House-keepers or the Trained Bands, for the Drums, Colours, &c. of their respective Companies. See *MILITIA*.

**TROPICKS**, ΤΡΟΠΙΚΑΙ, in Astronomy, two immoveable Circles of the Sphere, drawn through the Solstitial Points, parallel to the Equator. See *CIRCLE* and *SPHERE*.

Such are the Circles *ME* and *NL*, Tab. Astronomy, Fig. 52. See *SOLSTITIAL Point*.

Or, the *Tropicks* may be defined two Circles parallel to the Equator, at such Distance therefrom, as is equal to the Sun's greatest Recess from the Equator towards the Poles; or to the Sun's greatest Declination; or the Obliquity of the Ediptic. See *DECLINATION*, *OBLIQUITY*, &c.

That of the *Tropicks* drawn through the beginning of *Cancer* E, is called the *Tropic of Cancer*. See *CANCER*.

And that through the beginning of *Capricorn*, the *Tropic of Capricorn*. See *CAPRICORN*.

They have their Name from the Greek, *τροπή*, *Turn*, Conversion, as being the Limits of the Sun's Way, or Declination towards North and South; so that when the Sun is arriv'd at either of them, he *turns* the other Way.

Hence, 1<sup>o</sup>. Since the Declination of the Ecliptic is the Arch EA or LD; EN will be the Distance of the Tropicks which is double the greatest Declination.

2<sup>o</sup>. Wherefore if the Sun's Meridian Altitude be observ'd, both in the Winter and Summer Solstice, and the latter be subtracted from the former, the Remainder will be the Distance of the Tropicks; half whereof is the greatest Declination of the Ecliptic. See ECLIPTEIC.

TROPICS, in Geography, are two lesser Circles of the Globe, drawn parallel to the Equator, thro' the Beginnings of Cancer and Capricorn. See CANCER and CAPRICORN.

These Tropicks are in the Planes of the Celestial Tropicks, and at the Distance of 23<sup>o</sup> 29' from the Equator, which is the Sun's greatest Declination. See CIRCLE and GLOBE.

TROPISTS, or TROPICI, the Name of a Sect.—St. Athanasius, in his Letter to Serapion, gives this Appellation to the Macedonians, who were also call'd Pneumatomachi in the East, and Patristians in the West. See PNEUMATOMACHI, &c.

The Reason of the Name Tropist was, that they explain'd the Scripture altogether by Tropes and Figures of Speech. See TROPE.

The Romanists also give the Appellation Tropists to those of the Reform'd Religion; in regard of their constructing the Words of the Eucharist figuratively. See TRANSUBSTANTIATION.

TROPITES, TROPITE, a Sect, who, according to Philastrius, maintain'd that the Word was turn'd or chang'd into Flesh, or into Man.

This Opinion they founded on that Passage of St. John, misunderstood; *The Word was made Flesh*; as if it import'd, that the Word was converted into Flesh, and not that he was cloth'd with our Flesh, and our Nature.

TROP, in the Manage, one of the natural Paces of a Horse, perform'd with two Legs in the Air, and two on the Ground at the same time, cross-wise, like St. Andrew's Cross; and continuing so alternately to raise the hind Leg of one Side, and the fore Leg of the other Side at once, leaving the other hind and fore Leg upon the Ground till the former come down.

In this Motion, the nearer the Horse takes his Limbs from the Ground, the opener, the evener, and the shorter his Pace will be. — If he takes up his Feet slovenly, it is a Sign of Stumbling and Lameness; if he tread narrow, or crooks, it betokens interfering or falling; if he tread long, it shews over-reaching; if he step uneven, it bespeaks Soil and Weariness.

TROBADOURS, or TROUVOURS, or TROUVERS, a Name anciently, and to this Day, given the ancient Poets of Provence. See POETRY.

Some will have the Name borrow'd from *trouver*, to find, by reason of their Invention; tho' others take them to have been call'd *Troubadours*, by reason they sang their Poems on an Instrument call'd a *Troupe* or *Trump*.

The Poetry of the *Troubadours* consisted in Sonnets, Pastorals, Songs, Syrventes or Satyrs, which were much to their Taste; and in Tensons, which were Love Disputes.

*Jeau de Notre Dame*, commonly call'd *Nostredamus*, a Procurer in the Parliament of Provence, wrote an ample Discourse of these Poets. — He makes their Number seventy-six.

*Pasquier* tells us, he had an Extract of an ancient Book belonging to Cardinal *Besubo*, entitled, *Los Noms dignels qui firent Tensons & Syrventes*, which made their Number ninety-six, among which was an Emperor, viz. *Frederick I.* and two Kings, viz. *Richard I. of England*, and a King of *Araven*, with a Dauphin, several Counts, &c. Not that all these had compos'd entire Works in Provincial; some of them had not brought forth any thing beyond Epigrams.

*Petrarch* speaks with Applause of several *Troubadours* in the IVth Chapter of the Triumph of Love. — The Italian Poets are said to have borrow'd their best Pieces from the *Troubadours*. *Pasquier* declares expressly, that *Dante* and *Petrarch* are, indeed, the Fountains of the Italian Poetry; but Fountains which have their Sources in the Provincial Poetry.

*Benebe*, in his History of Provence, relates, that about the Middle of the XIIIth Century, the *Troubadours* began to be esteem'd throughout Europe, and that their Credit and Poetry was at the highest about the Middle of the XIVth. He adds, that it was in Provence that *Petrarch* learnt the Art of Rhiming, which he afterwards practis'd, and taught in Italy.

TROVER, in Law, an Action which a Man hath against one that having found any of his Goods, refuseth to deliver them upon Demand.

ACTIONS of Detinue are frequently turn'd into Actions upon the Case, *for Trover* and Conversion. See DETINUE.

TROUGH of the Sea, is the Hollow or Cavity made between the Waves or Billows in a rowling Sea. — Hence, when a Ship lies down there, they say she lies in the Trough of the Sea.

TROUSSEQUIN, in the Manage, a Piece of Wood cut arch-wise, rais'd above the hinder Bow of a great Saddle, and serving to the Bolsters Firm.

TROUT colour'd. — A Horse is said to be of this Colour when he is white, and speckled with Spots of black, bay, or sorrel, especially about the Head and Neck.

TROU-FISHING. See TROUT-FISHING.

TROY-weight, anciently call'd *Trom-weight*. See TROMADE and WEIGHT.

TRUCE, a Suspension of Arms; or a Cessation of Hostilities between two Parties at War.

Truces are frequently concluded between Princes, in order to come to a Peace. — Truces of many Years serve in lieu of Treaties of Peace between Princes, whose Differences cannot be finally adjusted. See TREATY.

The Word, according to *Ménage*, &c. comes from the Latin, *Troge*, which signifies the same Thing. *Cafrenus* derives it from the German, *troson*, or *trovo*, which signifies Faith.

TRUCE of God, or *Troge Dei*. See TRUEDA DEI.

TRUCHMAN, *Dragsman*, or *Dragman*, in the Countries of the Levant, an Interpreter. See DRAGOMAN.

TRUCK, in a Ship, a square Piece of Wood at the Top of a Mast, to put the Flag Staff in.

TRUCKING, in Commerce. See PERMUTATION, EXCHANGE, COMMERCE, &c.

TRUCKS, among Gunners, round Pieces of Wood like Wheels, fix'd on the Axle-trees of Carriages, to move the Ordnance at Sea.

TRUE, something agreeable to the Reality of Things, or to Truth. See TRUTH.

In this Sense we say, the true God, the true Religion, true Gold, &c. in Opposition to false or pretended ones. See FALSEHOOD.

TRUE Place of a Planet, or Star, in Astronomy, is a Point of the Heavens shewn or pointed out by a right Line, drawn from the Centre of the Earth through the Centre of the Planet or Star. See PLACE. See also PLANET, &c.

In this Sense the Word stands oppos'd to *apparent Place*, which is that found by a right Line drawn from the Observer's Eye through the Centre of the Planet or Star. See APPARENT.

This Point in the Heavens is refer'd to the Ecliptick or Zodiac, by the Planet or Stars Circle of Longitude. See CIRCLE of LONGITUDE.

TROFFLES, *Tubera Terre*, in Natural History, a kind of vegetable Productions, not unlike Mushrooms. See MUSHROOM.

The ancient Physicians and Naturalists, rank *Troffles* in the Number of Roots, Bulbs, or Cloves; and define them to be a Species of Vegetables, without Stalks, Leaves, Fibres, &c.

They are produc'd most in dry chapp'd Grounds, and that, as *Pliny* says, chiefly after Rains and Thunder, in Autumn. — Their Duration he limits to a Year. — Their Colour is uncertain; some being white, others black, &c.

In Italy, France, &c. they eat them as a great Dainty, either fry'd in Slices with Oil, Salt and Pepper, or boil'd over and again in their own Broth. — The Hogs are exceedingly fond of them, and are frequently the Means of discovering the Places where they are; whence the common People call them *Swine-bread*.

The modern Botanists rank *Troffles* in the Number of Plants; tho' they want most of the usual Parts thereof. — All we know of their Growth, is, that they are at first no bigger than a Pea, reddish without, and within whitish; and that as they ripen, the white Part grows more dusky and black, only there are still left a Number of white Streaks, which all terminate at Places where the outer Coat is crack'd, or open; and which, in all Probability, are the Vessels that convey the Nourishment into the *Troffles*.

In these Vessels is found a whitish Matter, which, when view'd with a Microscope, appears to be a transparent Parenchyma, consisting of Vesicles; in the Middle whereof are perceiv'd little round black Grains, separate from each other, suppos'd to be the Seed of the *Troffles*. See SEED.

When the *Troffle* rots in the Ground thro' Excess of Ripeness, these Grains are the only Thing that remain of them; and these are suppos'd to produce new *Troffles*, which grow one after another.

What confirms the Opinion of their coming from Seed, is, that there have been *Troffles* lately discover'd in England, and this only in *Northamptonshire*; and even only in one Place thereof, viz. near *Rylington*, a Place stock'd with Plants formerly brought from *Languesdoe*; and 'tis only since then, that any *Troffles* have been there observ'd; whence 'tis con-

cluded, that the Seed of these *Truffles* was brought from France among the Roots of the other Plants.

These *English Truffles* were first discover'd by Dr. *Hartow*. — Dr. *Taverner* *Robinson* assures us, they are the true *French Truffles*; the *Italian Truffoli* or *Tartuffole*, and the *Spanish Truffles de Tierra*, being not noted by Mr. *Rey* as ever known on *English Ground*: Indeed, he adds, that he has seen them thrice as large at *Florence, Rowe, &c.*

Those observ'd in *England* are all included in a studded Bark or Coat, and the inner Substance is of the Consistence of the fleshy Part of a young Chestnut, of a Pale Colour, a rank or horne Smell, and aulvoury.

By a Chymical Analysis, *Truffles* are found to abound in a volatile Alkali mix'd with Oil, upon which their Savell, &c. depends. They never rise out of the Ground; but are found usually half a Foot beneath the Surface thereof.

Dr. *Hartow* has observ'd several little Fibres issuing out of some *Truffles*, and insinuating themselves within the Soil, which, in all Probability, do the Office of Roots. — The *Truffles* grow tolerably globular, as receiving their Nourishment all around them; they being to be consider'd, like Sea Plants, encompass'd with their Food, which they suck in thro' the Pores of their Bark or Rind. See *CORAL*.

They are tenderest and best in the Spring, tho' easiest found in Autumn; the Wet fuelling them, and the Thunder and Lightning disposing them to tear toth their Scent, so alluring to the Swine, that some of the Ancients call'd them *Ceramae*.

The Depth at which the *Truffles* lie, Dr. *Robinson* observes, is no Objection to their being of the vegetable Tube; that being a Tuing common to several other Plants that shoot up Stalks, particularly the *Lathyrus tuberosus*, commonly call'd *Chautabalanus* and *Terre Glaucis*, in *English Earth-Nuts*, the Roots of our *Bucatanum*, &c.

The Ancients are exceedingly divided as to the Use of *Truffles*; some affirming them to be wholesome Food, and others pernicious; *Avenius* particularly, who will have them to cause Apoplexies. — For my own Part, says M. *Le-mery*, I am of Opinion they have both good and evil Effects; they restore and strengthen the Stomach, promote the Semen, &c. but when us'd in abundance, they attenuate and divide the Juices immoderately, and by some volatile and exalted Principles, occasion great Fermentations, &c. tho' the Pepper and Salt they are ordinarily eaten withal, do doubtless contribute greatly to those Effects: — Their rich Taste is owing to their not putting forth any Salk; in effect their Principles being united, and, as it were, concentrated in a little Balb, mult yield a richer and more delicious Savour than if the Juices were dispers'd by Vegetation thro' the several Parts of a common Plant. — Some roast the *Truffles* under the Ashes; others pulverize and mix them in Sauces.

The Word is form'd from the *Latin, Tuber, or Tuberculinum*.

**TRUG**, and **TRUG-CORN**, in our ancient Customs. — *Tres Trag frumentii vel avenae facinus 2 Bupelli, intra prebendam ad Hundertan in Ecclesia* Herf. M. S. de temp. E. 3. In the black Book of Hereford, we find *troga frumentii* for a Measure of Wheat: And at *Leuppfer*, at this Day, the Vicar has *Trug-Corn* allow'd him for officiating at some Chapels of Ease, as *Stoke and Dockey* within that Parish. — Haply it may come from the *Saxon, Trug*, which signifies a great hollow Vessel or Trough.

**TRULLIZATION**, in the ancient Architecture, a Term us'd by *Vitruvius* for all Kinds of Couches or Layers of Mortar, wrought with the Trowel in the Inside of Vaults; or for the Hatches made on the Layer of Mortar, to retain the Lining of Stone.

**TRULLUM**, a barbarous Word, signifying *Dome*; chiefly us'd in this Phrase, *The Council in Trullo*. See *COUNCIL*.

This was a Council assembled in the Year 680, against the *Monothelites*, in the Dome of the Palace of *Constantinople*, call'd *Trullum*; the Name whereof it has retain'd.

It was also call'd the *Quinsextum*. See *QUINSEXTUM*.

The *Trullum* was properly a Hall in the Palace of the Emperors of *Constantinople*, where they usually consulted of Matters of State. — The Council held therein was the 6th Oecumenical or General Council, call'd in *Trullo*.

The Term is form'd from the *Latin, Trulla*, Cup; the Hall being so call'd because vaulted.

**TRUMPET**, a musical Instrument, the most noble of all portable ones of the Wind Kind, us'd chiefly in War, among the Cavalry, to direct them in the Service. See *MUSIC*.

'Tis usually made of Brass, sometimes of Silver, Iron, Tin, and Wood. *Moses*, we read, made two of Silver, to be us'd by the Priests, *Numb. x.* and *Solomon* made 200 like those of *Moses*, as we are inform'd by *Josephus*, lib. viii. which shews abundantly the Antiquity of that Instrument.

The Ancients had various Instruments of the *Trumpet* Kind; as the *Tuba, Cornu, and Lisui*; which see under their respective Articles.

The modern *Trumpet* consists of a Mouth-piece, near an Inch broad, tho' the Bottom be only one Third so much. — The Pieces which convey the Wind are call'd the *Branchelets*; the two Places where it is bent, *Potences*; and the Canal between the second Bend and the Extremity, the *Pavilion*; the Places where the Branches take afinder, or are order'd, the *Knots*; which are five in Number, and cover the Joints.

When the Sound of the *Trumpet* is well manag'd, 'tis of a great Compass. — Indeed its Extent is not strictly determinable; since it reaches as high as the Strength of the Breath can force it. — A good Breath will carry it beyond four Octaves, which is the Limit of the usual Keys of Spineas and Organs.

In War there are eight principal Manners of sounding the *Trumpet*: The first, call'd the *Cavalquer*, us'd when an Army approaches a City, or passes thro' it in a March. — The second the *Bate-jelle*, us'd when the Army is to decamp or march. — The third is when they sound to *Horje*, and then to the *Standard*. — The fourth is the *Charge*. — The fifth the *Watch*. — The sixth is call'd the *double Cavalquer*. — The seventh the *Chamade*. — And the eighth the *Retreat*. Beside various Flourishes, Voluntaries, &c. us'd in Rejoycings.

There are also People who blow the *Trumpet* so softly, and draw so delicate a Sound from it, that it is us'd not only in Church Music, but even in Chamber Music: And 'tis on this Account that in the *Italian and German Music* we frequently find Parts entitl'd *Tromba prima*, or 1<sup>st</sup> first *Trumpet*, *Tromba II, seconda*, II<sup>d</sup>, *terza*, second, third *Trumpet*, &c. as being intended to be play'd with *Trumpets*.

There are two notable Defects in the *Trumpet*, observ'd by Mr. *Roberts*, in the *Philosophical Transactions*; — The first is, that it will only perform certain Notes within its Compass, commonly call'd *Trumpet Notes*: The second, that four of the Notes it does perform, are out of Tune. See *NOISE*.

The same Defects are found in the *Trumpet Marine*; and the Reason is the same in both. See *TRUMPET MARINE*.

The Word *Trumpet* is form'd from the *French, Trompette*. *Messager* derives it from the *Greek, τρῦβη, turbo*, a Shell anciently us'd for a *Trumpet*. *Du Gange* derives it from the corrupt *Latin, Truupa*, or the *Fallos, Tromba*, or *Trombetta*; others from the *Celtic, Trompitt*, which signifies the same Thing.

**TRUMPET MARINE**, is a musical Instrument consisting of three Tubes, which form its triangular Body.

It has a very long Neck, with one single String, very thick, mounted on a Bridge, which is firm on one Side, but tremulous on the other. — 'Tis struck by a Bow with the one Hand, and with the other the String is press'd or stopp'd on the Neck by the Thumb.

'Tis the Trembling of the Bridge, when struck, that makes it imitate the Sound of a *Trumpet*; which it does to that Perfection, that 'tis scarce possible to distinguish the one from the other.

And this is what has given the Denomination of *Trumpet Marine*, tho', in Propriety, it be a kind of Monochord.

The *Trumpet Marine* has the same Defects with the *Trumpet*, viz. that it performs none but *Trumpet Notes*, and some of those either too flat or too sharp. — The Reason, Mr. *Fr. Roberts* accounts for, only premising that common Observation of two unison Strings, that if one be struck, the other will move; the Impulses made on the Air by one String, setting another in Motion, which lies in a Disposition to have its Vibrations synchronous to theirs: To which it may be added, that a String will move, not only at the striking of an Unison, but also at that of an 8th or 12th, there being no Contrariety in the Motions to hinder each other. See *UNISON* and *CONCORD*.

Now in the *Trumpet Marine* you do not stop close, as in other Instruments, but touch the String gently with your Thumb, whereby there is a mutual Concurrence of the upper and lower Part of the String to produce the Sound. — Hence 'tis concluded, that the *Trumpet Marine* yields no musical Sound, but when the Stop makes the upper Part of the String an Aliquot of the Remainder, and consequently of the Whole; otherwise the Vibrations of the Parts will stop one another, and make a Sound fainter to their Motion, altogether confus'd. Now these aliquot Parts, be shews, are the very Stops which produce the *Trumpet Notes*.

**TRUMPET HARMONIOUS**, is an Instrument which imitates the Sound of a *Trumpet*, and which resembles it in every thing, excepting that it is longer, and consists of more Branches.

'Tis ordinarily call'd *Sackbut*. See *SACKBUT*.

**SPEAKING TRUMPET**, is a Tube from six to fifteen Foot long, made of Tin, perfectly straight, and with a very large Aperture; the Mouth-piece being big enough to receive both Lips.

The Mouth being apply'd hereto, it carries the Voice to a very great Distance, so as it may be heard distinctly a Mile; whence its Use at Sea.

The Invention of this *Trumpet* is held to be modern; and is commonly ascrib'd to Sir Samuel Morland, who call'd it the *Tuba Stenotrophonica*. — But *Ab. Kircher* seems to have a better Title to the Invention; for 'tis certain he had such an Instrument before ever Sir S. Morland thought of his.

*Kircher*, in his *Pneura*, says, that the Tromba publish'd last Year in *England*, he invented 24 Years before, and publish'd in his *Musurgia*: He adds, that *Jac. Albinus Glabiosus* and *Fr. Eschinardus*, ascribe it to him; and that *G. Schottus* testifies of him, that he had such an Instrument in his Chamber in the *Roman College*, with which he could call, and receive Answers from the Porter.

Indeed, considering how fam'd *Alexander the Great's* Tube was, wherewith he us'd to speak to his Army, and which might be heard distinctly 100 Stadia or Furlongs, 'tis somewhat strange the Moderns should pretend to the Invention; the *Stenotrophonic Horn of Alexander*, whereof there is a Figure preserv'd in the Vatican, being almost the same with that now in Use. See *STENOTROPHONIC*.

*Listening, or Hearing TRUMPET*, is an Instrument invented by *Joseph Landini*, to assist the Ear in hearing of Persons who speak at a great Distance, without the Assistance of any speaking *Trumpet*. See *HEARING* and *EAR*.

*TRUMPETER*, in Anatomy. See *BUCCINATOR*.

*TRUNCATED Pyramid, or Cone*, is one whose Top or Vertex is cut off by a Plane parallel to its Base. See *PYRAMID* and *CONE*.

A *Truncated Cone*, or the Frustum of that Body, is sometimes also call'd a *Curry-Cut*. See *FRUSTUM*. See also *GAUCING*.

The Word is form'd of the *Latin, Truncare*, to cut off a Part from the Whole; whence also *Truncus, Truncion*, &c. In Heraldry they say *Trunked*.

*TRUNCHEON*, of the *French Troncon*, and the *Latin Truncus*; a *Battoon*; or a kind of short Staff us'd by Kings, Generals, and great Officers, as a Mark of their Command. See *BATTOON*.

*TRUNDLE*, is a kind of Carriage with low Wheels, whercon to draw heavy cumbersome Burdens.

*TRUNDLE Shot*, is an Iron Shot about 17 Inches long, sharp-pointed at both Ends, with a round Bowl of Lead cast upon it, about a Hand Breadth from each End. See *SHOT*.

*TRUNK, Truncus*, the Stem, or Body of a Tree; or that Part between the Ground and the Place where it divides into Branches. See *STEM*, *BRANCH*, and *TREE*.

In lopping of Trees, nothing is left but the *Trunk*. See *PRUNING*.

*Trunk* is also us'd for the Stamp, or that Part left over the Root in felling. — Large Trees when fell'd, shoot out from the *Trunk*, and make a Coppie or Underwood.

'Tis by means of the *Trunks* left rotting in the Ground, that the Wastes in Forests are discover'd.

*TRUNK, in Anatomy*, is us'd for the Busto of the human Body, exclusive of the Head and Limbs. See *BUSTO*.

*TRUNK, Truncus*, is also us'd for the Body of an Artery or Vein; in contra-distinction to the Branches and Ramifications thereof. See *VEIN* and *ARTERY*.

The Word is particularly apply'd to certain Parts of the Aorta and Cava. See *AORTA* and *CAVA*.

*TRUNK, in Architecture*, is us'd for the *Foot, or Shaft* of a Column, with that Part of the Pedestal between the Base and the Cornice, call'd the *Dye*. See *SHAFT* and *COLUMN*.

*TRUNK*, is also popularly us'd for the Snout of an Elephant; by Naturalists call'd the *Proboscis* thereof. See *PROBOSCIS*.

*TRUNK Roots* of a Plant, are little Roots which grow out of the *Trunks* of Plants. See *ROOT*.

There are of two Kinds, 1<sup>o</sup>. Such as vegetate by a direct Descent, the Place of their Eruption being sometimes all along the *Trunk*, as in *Mints, &c.* and sometimes only in the utmost Point, as in *Brambles*.

2<sup>o</sup>. Such as neither ascend nor descend, but shoot forth at right Angles with the *Trunk*; which therefore, tho' us to their Office they are true Roots, yet, as to their Nature, are a Medium between a *Trunk* and a *Root*.

*TRUNKED*, among Heraldry, is apply'd to Trees cut off at each End, which are said to be *trunked, or truncated*.

*TRUNNIONS* of a Piece of Ordnance, are those Knobs or Bunches of the Gun's Metal, which bear her up upon the Cheeks of the Carriages. See *GUN*, *CANNON*, *ORDNANCE*, *CARRIAGE*, &c.

*TRUNNION Ring*, is the Ring about a Cannon, next before the *Trunnions*. See *ORDNANCE*.

*TRUSS of Flowers*; is a Term us'd by Florists to signify many Flowers growing together on the Head of a Stalk; as in the *Cowslip, Auricula, &c.*

A *Truss of Hay* consists of fifty-six Pounds, or half an hundred Weight; thirty-six *Trusses* make a Load: But in *June and August* the *Truss* must weigh sixty Pounds, on Forfeiture of 18 s. per *Truss*.

A *Truss of Forage*, is as much as a Trooper can carry on his Horse's Crupper.

*TRUSS* is also us'd for a Sort of Bandage made of Steel or the like Matter, wherewith to keep up the Parts in those who have Hernias or Ruprures. See *HERNIA*, *BANDAGE*, &c.

*TRUSSES*, in a Ship, are Ropes made fast to the Barrels of a Yard, to bind the Yard to the Mast, when the Ship rolls. See *YARD*.

*TRUSSING*, in Falconry, is an Hawk's raising any Fowl or Prey aloft, soaring up, and then descending with it to the Ground. See *HAWK* and *FALCONRY*.

*TRUSTEE*, one who has an Estate, or Money put or intrusted in his Hands for the Use of another.

*TRUTH, Veritas*, a Term us'd in Opposition to *Falshood*; and apply'd to Propositions which answer or accord to the Nature and Reality of the Thing whereof something is affirm'd, or deny'd. See *PROPOSITION*, &c.

Thus, when we say that 4 is the fourth Part of twice 8; that Proposition is *true*, because agreeable to the Nature of those Numbers. See *FALSHOOD*.

*Truth*, according to *Mr. Lock*, consists in the joining or separating of Signs as the Things signify'd by them do agree or disagree one with another. — Now the joining or separating of Signs, is what we call making of Propositions. — *Truth* then, properly, belongs only to Propositions, whereof there are two Sorts, *mental* and *verbal*; as there are two Sorts of Signs commonly made use of, *vis. Ideas* and *Words*. See *IDEA* and *WORD*.

*Mental Propositions*, are those wherein the Ideas in our Understanding are put together, or separated by the Mind perceiving or judging of their Agreement or Disagreement.

*Verbal Propositions*, are Words put together, or separated, in affirmative or negative Sentences: — So that Proposition consists in joining or separating Signs; and *Truth* consists in putting together or separating those Signs, according as the Things they stand for agree or disagree.

*Truth*, therefore, as well as Knowledge, may come under the Distinction of *verbal* and *real*; that being only *verbal Truth*, where Terms are join'd according to the Agreement or Disagreement of the Ideas they stand for, without regarding whether our Ideas are such as really have, or are capable of having any Existence in Nature. — But it is then they contain *real Truth*, when these Signs are join'd as our Ideas agree; and when our Ideas are such, as we know are capable of having an Existence in Nature; which in Substances we cannot know, but by knowing that such have existed. See *SUBSTANCE*.

*Truth* is the marking down in Words the Agreement or Disagreement of Ideas, as it is. — *Falshood* is the marking down in Words the Agreement or Disagreement of Ideas, otherwise than it is; and so far as these Ideas, thus mark'd by Sounds, agree to their Archetypes, so far only is the *Truth* real.

The Knowledge of this *Truth* consists in knowing what Ideas the Words stand for, and the Perception of the Agreement or Disagreement of these Ideas, according as it is mark'd by those Words. See *PROBABILITY*, *EVIDENCE*, &c.

Besides *Truth* taken in the strict Sense before mention'd, which is also call'd *Logical Truth*, there are other Sorts of *Truths*; as,

1<sup>o</sup>. *Moral Truth*, which consists in speaking Things according to the Persuasion of our own Minds; call'd also *Veracity*.

2<sup>o</sup>. *Metaphysical, or Transcendental Truth*, which is nothing but the real Existence of Things conformable to the Ideas which we have annex'd to their Names. See *KNOWLEDGE*. See also *ERROR*, &c.

In this Sense a Clock may be said to be *true*, when it answers the Idea or Intention of the Person who made it.

Others, will have *Metaphysical Truth* to consist in the Agreement of a Thing with the Idea thereof in the divine Understanding.

*TRUTINA Hermetis*, is us'd among Astrologers, for an artificial Method of examining and rectifying a Nativity. See *HOROSCOPE*.

*TRUTINATION*, the Act of weighing or ballancing a Thing. See *WEIGHT* and *BALLANCE*.

The Word is form'd from the *Latin Trutina*, a Pair of Scales.

*TRVAL*. See *TRIAL*.

*Yo TRY*, in the Sea Language. — A Ship is said to *try*, when she has no more Sails aboard but her Main-sail, or the Mizen-sail only.

*TRYPHERA, Tryphera*, in Pharmacy, a Term us'd for several Kinds of Opistes. — The *Great Tryphera* is compos'd

pos'd of Opium, Cinnamon, Cloves, and several other Ingredients: It is used to fortify the Stomach, to stop Fluxes, and for some Diseases of the Womb.

There is also the *Sarsenic Tryphere*, and the *Perfian Tryphere*, thus call'd, because first introduced the one by the *Sarsenians*, and the other by the *Perfians*; they both purge gently.

The Word is form'd from the Greek, *τροπος*, delicate, soft, by reason it makes those who use it, rest.

TUB is used as a kind of Measure, to denote the Quantity of divers Things. — A *Tub of Tea*, is a Quantity of about 60 Pounds. — A *Tub of Camphire*, is a Quantity from 56 to 80 Pounds.

TUBE, *TUBUS*, a *Pipe*, *Conduit* or *Condu*; being a Cylinder, hollow within side, either of Lead, Iron, Wood, Glass or any other Matter, for the Air or some other Fluid to have a free Passage or Conveyance through.

The Term is chiefly used for those used in Physics, Astronomy, Anatomy, &c. On other ordinary Occasions, we usually say Pipe. See PIPE.

In the Memoirs of the *French Academy of Sciences*, M. *Varignon* gives us a Treatise on the Proportions necessary for the Diameters of Tubes, to give precisely any determinate Quantities of Water. — The Result of his Piece turns upon these two Analogies; That the Diminutions of the Velocity of Water, occasion'd by its Friction against the Sides of the Tubes, are as the Diameters; the Tubes being suppos'd equally long; and the Quantities of Water issuing out at the Tubes, are as the square Roots of their Diameters, deducting out of them the Quantity each is diminish'd. See FLUID, FOUNTAIN, FRICTION, &c.

For the TUBES of *Barometers* and *Thermometers*; see BAROMETER and THERMOMETER.

For the Assent of *Liquors in Capillary Tubes*; see ASCENT and CAPILLARY.

*Toricellian Tube*. See TORICELLIAN Tube.

TUBE, in Astronomy, is sometimes used for *Telescope*; but more properly for that Part thereof into which the Lens's are fix'd, and by which they are directed and used. See TELESCOPE.

The Goodness of the Tube, being of great Importance to that of the Telescope; we shall here add its Structure.

*Construction of a Draw-Tube for a Telescope.*

The great Points to be regarded here, are, that the Tube be not troublesome by its Weight, nor liable to warp and disturb the Position of the Glasses: So that any kind of Tube will not serve in every Case: But

1<sup>o</sup> If the Tube be small, 'tis best made of thin brass Plates cover'd with Tia, and form'd into Pipes or Draws, to slide within one another.

2<sup>o</sup> For long Tubes, iron would be too heavy; for which reason some chuse to make them of Paper, thus: — A wooden Cylinder is turn'd, of the Length of the Paper to be used; and of a Diameter equal to that of the smallest Draw. About this Cylinder is roll'd Paper, till it be of a sufficient Thickness: When one Pipe is dry, provide others after the same manner; still making the last serve as a Mould for the next, till you have enough for the length of the Tube desired. Lastly, to the Extremes of the Draws are to be glaz'd wooden Ferrils, that they may be drawn forth the better.

3<sup>o</sup> Since Paper Draws are apt to swell with moist Weather, so as to spoil their sliding; and in dry Weather to shrink, which renders them loose and retarding; in both which Cases, the Situation of the Lens's is easily disturb'd; the best Method of making Tubes, is as follows: Glue Parchment round a wooden Cylinder; and let the Parchment be colour'd Black, to prevent the reflected Rays making any Confusion. Provide very thin Slices of Beech, and bending them into a Cylinder, glue them carefully to the Parchment: Cover this wooden Case with white Parchment; and about its outer Extreme make a little Ring or Ferril: after the same manner make another Draw over the former; and then another, till you have enough for the Length of the Tube.

To the inner Extremes of each Draw, fit a wooden Ferril, that the spurious Rays striking against the Sides, may be intercepted and lost. In those Places where the Lens's are to be put, it will be proper to furnish the Ferrils with Fensile Screws. Provide a wooden Cover to defend the Object Glass from the Dust, and putting the Eye Glass in its wooden Ferril, fasten it by the Screw to the Tube. Lastly, provide a little wooden Tube of a Length equal to the Distance the Eye Glass is to be from the Eye, and fit it to the other Extrem of the Tube.

TUBE Fallopiian } in Anatomy. See { FALLOPIAN-  
TUBA Eustachiana } TUBE. } EUSTACHIANA.

TUBER, or TUBERCLE, in Botany, a kind of round turgent Root, in form of a Knob or Turnip. See ROOT.

The Plants which produce such Roots, are hence denominated *Tuberose* or *Tuberous Plants*.

TUBER or TUBEROSITY, in Medicine, is used for a Knob or Tumour growing naturally on any Part; in Opposition to Tumors which arise accidentally, or from a Disease. See TUMOR.

The same Term is also used for a Knot in a Tree.

TUBERCULES, TUBERCLES, are little Tumors which suppurate and discharge Pus; often found in the Lungs. See LUNGS.

TUBERI *Lactiferi*, in Anatomy, is a Name used by some Writers, for those small Tubes through which the Milk flows to the Nipples of the Mammæ or Breasts. See MILK and MAMMÆ.

TUBEROSE, an Epithet given to such Roots as are round and fleshy, and grow in the Flesh solid and continuous; having neither Skin nor Shell. — Such are the Roots of Saffron, Peony, &c.

TUBILUSTRUM, in Antiquity, a Feast or Ceremony in use among the *Romans*. See FEAST.

This Name was given to the Day wherein they purified their sacred Trumpets; as also to the Ceremony of purifying them: It was held on the fifth and last Day of the Feast of *Minerva*, call'd *Quinquages* or *Quinquagesima*, which was perform'd twice a Year.

The Word is compounded of *Tubus*, and *Lustris*, I purify.

TUBULI *Ventriculares*, a Name sometimes used by Naturalists, for certain small winding Cavities on the out-sides of Shells. See SHELL.

TUFF, a Term used by some Authors for the bushy Part of Trees; or that Part fet with Branches, Leaves, &c. See BRANCH.

*Parallelism of the Tops of Trees*. — All Trees are observ'd naturally to assent to have their Tops parallel to the Spot of Ground they shadow; an Account of which Phenomenon, see under the Article PARALLELISM.

TUILERIE, or TYLERIE, a Tyle-work; being properly a large Building with a Drying-place, cover'd a-top, but furnish'd with Apertures on all Sides, through which the Wind having Admittance, dries the Tyles, Bricks, &c. in the Shade, which the Sun would crack, before they be in the Furnace. See BRICK and TYLE.

The Word is pure French, form'd from *Tuile*.

The Garden of the *Louvre* is call'd the *Tuileries*, as being a Place where Tyles were anciently made, &c. — But the Term *Tuileries* does not only include the Garden; but also a magnificent Palace, whose Face takes up the whole Length of the Garden: And hence it is, that they say, The King lodges in the *Tuileries*; The King has quitted the *Tuileries* for a few Days, to reside in the *Louvre*.

The Palace of the *Tuileries* is join'd to the *Louvre* by a large Gallery, which runs all along the same, and has its Prospects thereon. See LOUVRE.

The *Tuileries* was begun in 1564, by *Catherine de Medicis*, Wife of *Henry II.* in the Time of her Regency; finished by *Henry IV.* and magnificently adorn'd by *Louis XIV.* — The Garden of the *Tuileries* was much improv'd by *Louis XIII.*

TUMBLER, a sort of Dog, called in *Latin*, *Vertagus*, from his quality of tumbling and winding his Body about, e'er he attacks and fastens on the Prey.

These Dogs are often less than Hounds; being lank, leaner, and somewhat prick'd-eared; and by the Form of their Bodies, might be call'd Mungrel Grey-hounds, if they were a little bigger.

TUMBREL, TUMBRELLUM, TURBICETUM, an Engine of Punishment, which ought to be in every Liberty, that has View of Frank-pledge, for the Correction and Cooling of Scolds and unquiet Women. See CURING-SHOW.

TUMEFACATION, the Act of swelling, or rising into a Tumor. See TUMOR.

Inflammations and *Yustefactions* of the Testes, frequently happen in the Gonorrhœa; either from the Weakness of the Vessels, violent Motion, unseasonable Use of Astringents, a Neglect of Purgings, or the like. See GONORRHEA.

TUMOR or TUMOUR, in Medicine, &c. a preternatural Rising or Eminence on any Part of the Body.

Tumor is defined by the Physicians, a Solution of Continuity, arising from some Humor collected in a certain Part of the Body, which disjoyns the continuous Parts, infusates itself between them, and destroys their proper Form.

This has given occasion to the *Arabs* to define a Tumor to be an Indisposition, compos'd of three Kinds of Diseases, viz. an Intemperature, an ill Conformation, and a Solution of Continuity, all which they comprize under the Name *Aposthem*, from the Greek, *αποστημα*. See APOSTHEM.

Tumors may proceed from various Causes. — The Mass of Blood throwing off or discharging itself of any particular Humor, as sometimes happens in the Crisis of a Fever, Pleurisy, Empyema, Babo, &c. will give rise hereto. — And

And according to the Nature of the Humour so discharged, whether Sanguinous, Watery, Bilious, &c. the Tumor is different.

Other Tumors there are, occasioned by Flatulency, as the Tympany, after the same Manner as hydroypical Tumors are occasioned by a Collection of the Lympha, or Serum, in a particular Part.

Ruptures of the Intestines, or their starting from their Places, will likewise cause a Tumor. See RUPTURE.

External Injuries are another general Cause of Tumors. — Thus a Contusion, or a violent Stricture of any Part, a Wound, Fracture, Dislocation, &c. will make it swell, or rise above its natural Level. And the same thing may likewise happen from the Bites of venomous Creatures, &c. See WOUND, ULCER, CONTUSION, BITE, &c.

Tumors, properly so call'd, i. e. Humoral Tumors, or those which contain a fluid Matter, arise either from a Stagnation, i. e. an Obstruction of the Passage of some Fluid, occasioning a slow Congestion; or a Transfusion or Fluxion of an Humor from some other Part; or a Generation of some new Humor. See HUMOR.

Tumors of the first Kind are very numerous, and are usually divided, with regard to the particular Humors they are filled with, into Phlegmous, which come from the Blood. See PHLEGMON and BLOOD.

Erysipelas, which are fill'd with the Bile. See ERYSIPELAS and BILE.

Oedemas fill'd with Pituita. See OEDEMA and PITUITA. And Scirrhus's with Melancholy. See SCIRRUS.

To which may be added, Flatulencies, fill'd with Wind. See FLATULENCY, &c.

Of the second Kind, are critical Tumors. See CRITICAL. And of the third Kind, are Concers, Gangli's, and all Tumors contain'd in a Cystis or Bag. See CANCER, GANGLIO, &c.

Tumors also frequently acquire peculiar Denominations from the Part affected, as Ophthalmia, if in the Eye; Parotitis about the Ears; Paronchia in the Fingers, &c. See OPHTHALMIA, &c.

With respect to the Cure, all Tumors are divisible into Simple and Compound, i. e. into such as are of a kindly Nature, and go off, or are cured in a reasonable Time, by the use of common Means, without the Appearance of any violent or dangerous Symptoms; and such as are more malignant, or prove difficult of Cure, and are attended with bad Symptoms, and affect the adjacent Parts, or the whole Body. — When a Tumor is formed by Fluxion, a sudden Pain, Heat, Tension and Puffation are felt in the Part, and manifest Signs of a Fever appear.

In those form'd by Congestion, the Swelling rises slowly, and the Pain, and other Symptoms, come on gradually, and prove less violent; unless it happen in the Joints, and other of the more sensible Parts.

All Tumors, except those from Ruptures, terminate or are removed, either by Diffusion, Suppuration, Putrefaction, Induration, or Translocation. See DISCUTIENT, SUPPURATIVE, &c.

When a Tumor is dissolv'd, the Part that was affected, appears relaxed, or reduced to its natural Size and Figure, and is free from Pain and Hardness. See DISSOLUTION.

When a Tumor haitens to Suppuration, a considerable Degree of Heat, Pain and Puffation are felt in the Part, and if the Tumor be large, or lie deep, a Fever generally comes on: When the Matter is formed, these Symptoms commonly decrease, and sometimes totally vanish. And now, if the Situation of the Part permits of it, the Tumor appears drawn to a Point, or becomes Conical in the Middle, or most depending Part, where the Matter collect'd commonly proves White. — At this Time, likewise, the Tumor appears to be more contracted, and the Skin of the Part more shrivell'd or flaccid than before: And now, upon Pressure, if the Tumor be superficial, or by vibrating it between the Fingers, the Matter may be felt to quash from Side to Side. See SUPPURATION.

Tumors in the fleshy Parts of the Body, tend to their State, or suppurate faster than Tumors in the Joints, Glands, &c.

When a Tumor is resolv'd by Induration, the Swelling of the Part, and the Pain decrease, as the Hardness comes on. — When it terminates in Putrefaction or Mortification, the Part grows senseless, and turns black and fetid. See MOXIFICATION.

But when a Tumor goes off by Repulsion, or a Return of the Matter into the Blood, it disappears at once; upon which a Fever, or some other acute Disease presently ensues. See REPELLENT.

Windy Tumors, M. Lierre describes as form'd of Air, inclos'd under some Membrane, which it dilates more or less in proportion to the Quantity, and from which it cannot escape; at least not for some time.

The Difficulty is, to conceive how the Air should come

to be collect'd here. — M. Lierre thinks that the most ordinary Cause of windy Tumors, is the gathering of Juices in some neighbouring Part, wherein there is an Obstruction. The Air which is intimately mix'd with all the Juices of the Body, continues to be so while they are in their natural Fluidity and Motion; but if they be collect'd in any Part, and, by Consequence, have their Motion and Fluidity diminish'd, the Air gets its Liberty, and disengages itself from them. Now the Membranes of the Part wherein the Liqueur is collect'd, becoming dilated by this Collection, and their Pores enlarged; the disengag'd Air escapes through them; but the Juice is left behind, as being too much thickn'd by its stay there: It therefore runs under some other neighbouring Membrane, which it raises, swells and extends.

TUN or Ton, originally signifies a large Vessel or Cask, of an oblong Form, biggest in the Middle, and diminishing towards its two Ends; girt about with Hoops; and us'd to put up several kinds of Merchandizes in, for their better Carriage; as Brandy, Oil, Sugar, Skins, Hats, &c.

The Term is also us'd for certain Vessels of extraordinary Bigness, serving to keep Wine in for several Years. — In Germany, there are many scarce ever emptied: The Heidelberg Tun is famous.

Some derive the Word from Antimus, in regard 'tis then Tun as most needed: Du Cange deduces it from Tunna or Tanna, Words us'd in the late Latin, for the same thing; whence also Tunare to Tun.

The Tun, we frequently call a Hoghead. See HOGHEAD.

TUN is also a certain Measure, for Liquids, as Wine, Oil, &c. See MEASURE.

The English Tun contains two Pipes or four Bartzels, or 252 Gallons.

The Tun of Amsterdam contains 6 Acms or Arms; the Acm 4 Ankers; the Anker 2 Stekans, the Stekan 16 Mingles; 12 Stekans are equal to an English Barrel or 63 Gallons. See GALLON.

The Tun of Bourdeaux and Bayonne contains four Barrels, equal to three Paris Maids. — At Orleans and Berry, it is about two Paris Maids. See MAID.

The Tun of Malaga, Alicante, Sevil, &c. is two Bottes, equal to about 36 or 37 Stekans. — The Tun of Lisbon is two Portuguese Bottes, equal to 25 Stekans.

TUN is also a certain Weight, whereby the Contents of Ships, &c. are estimated. See WEIGHT.

The Sea Tun is computed to weigh Two thousand Pounds, or Twenty Quintals or Hundreds Weight; so that when we say a Vessel carries Two hundred Tun, we mean 'tis able to carry Two hundred times the Weight of Two thousand Pounds, i. e. Four hundred thousand Pounds: It being found, by a curious Observation, that the Sea Water, whose Rooms the Vessel fills, when full laden, weighs so much. See BURTHEN.

To find the Burthen and Capacity of a Ship, they measure the Hold or Place where the is loaden; allowing 42 Cubic Feet to the Sea Tun. See HOLD.

The Price of Freight, or Carriage of Merchandizes, is ordinarily settled on the Foot of the Sea Tun: And yet, though the Tun is Twenty hundred Weight, there is some Difference made therein, either on account of the Weight or Cumberfomeness or Bulk of the Commodities, the Space they take up, or the like. See FREIGHT.

Accordingly, at Bourdeaux, four Barrels of Wine are held a Tun; five Barrels of Brandy are estimated two Tuns; three of Syrop are one Tun; four Barrels of Prunes, one Tun; two Dozen of Walnut-tree Tables, one Tun; a Dozen of Planks one Tun; Twenty Bushels of Chestnuts are accounted one Tun; and the like of Wheat or other Grain: Ten Bales of Cork; Five Bales of Feathers, and Eight of Paper, make each one Tun.

A Tun or Load of Timber, is 40 solid Feet, if the Timber be round: If it be hew'd, or square, 50. See TIMBER.

TUN, Ton, in the end of Words or Names of Places, signify a Town, Village, or dwelling Place; from the Saxons, Tun, Sepet, Vallum, Villa, Views, Oppidum; and this from the Saxons Tunn, i. e. an Hill, where they formerly built Towns. See TOWN.

TUN-Greve, from the Saxons, Tungræva, q. d. Villa preposita, a Term anciently us'd for a Reeve or Bailiff, qui in Villa, & que vicinis Maneris, Dominis personam sustinet, singule vice omnia disponit & moderatur. Spelman. See GREVE.

TUNE or TONE, in Music, is that Property of Sounds whereby they come under the relation of Acute and Graves to one another. See GRAVITY, &c.

Though Gravity and Acuteness be mere Terms of Relation, yet the Ground of the Relation, the Tune of the Sound, is something absolute; Every Sound having its own proper Tune, which must be under some determinate Measure, in the Nature of the Thing.

The only Difference, then, between one *Tone* and another, is, in Degrees; which is naturally infinite, i. e. we conceive there is something positive in the Cause of Sound which is capable of less and more, and contains in it the Measure of the Degrees of *Tone*; and because we don't suppose a less or greatest Quantity of this, we conceive the Degrees depending on those Measures to be infinite. See *SOUND*.

If two or more Sounds be compar'd together in this Relation, they are either equal or unequal in the Degree of *Tone*. — Such as are equal are call'd *Unison*, which is

The unequal constitute what we call an *Interval*, which is the Difference of *Tone* between two Sounds. See *INTERVAL*.

*Cause and Measure of TUNE; or that wherein the Tune of a Sound depends.*

Sonorous Bodies, we find, differ in *Tone*, 1°. According to the different Kinds of Matter; thus the Sound of a Piece of Gold is much graver than that of a Piece of Silver of the same Shape and Dimensions; in which Case, the *Tones* are proportional to the Specific Gravities.

2. According to the different Quantities of the same Matter in Bodies of the same Figure; as a solid Sphere of Brass, one Foot in Diameter, sounds acuter than a Sphere of Brass two Foot Diameter; in which Case the *Tones* are proportional to the Quantities of Matter.

Here, then, are different *Tones* connected with different specific Gravities, and different Quantities of Matter; yet cannot the different Degrees of *Tone* be refer'd to those Quantities, &c. as the immediate Cause. In Effect, the Measures of *Tone* are only to be sought in the Relations of the Motions that are the Cause of Sound, which are no where so discernible as in the Vibrations of Chords. See *CHORD*.

Sounds, we know, are produc'd in Chords by their vibratory Motions; not, indeed, by those sensible Vibrations of the whole Chord, but by the insensible ones, which are influenc'd by the sensible, and, in all Probability, are proportional to them. — So that Sounds may be as justly mesur'd in the latter, as they could be in the former, did they fall under our Senses: But even the sensible Vibrations are too small and quick to be immediately mesur'd. — The only Resistance we have, is to find what Proportion they have with some other Thing, which is effected by the different Tensions, or Thickness, or Lengths of Chords, which, in all other Respects, excepting some one of those mention'd, are the same. See *VIBRATION*.

Now, in the general, we find that in two Chords, all Things being equal, excepting the Tension, or the Thickness, or the Length, the *Tones* are different; there must therefore be a Difference in the Vibrations owing to those different Tensions, &c. which Difference can only be in the Velocity of the Courses and Recourses of the Chords, thro' the Spaces wherein they move to and again. — Now, upon examining the Proportion between that Velocity, and the Things just mention'd, whereon it depends, 'tis found to a Demonstration, that all the Vibrations of the same Chord are perform'd in equal Times.

Hence, as the *Tone* of a Sound depends on the Nature of those Vibrations whose Differences we can conceive no otherwise than as having different Velocities, and as the small Vibrations of the same Chord are all perform'd in equal Time; and as 'tis found true in Fact, that the Sound of any Body arising from one individual Stroke, tho' it grow gradually weaker, yet continues in the same *Tone* from first to last; it follows, that the *Tone* is necessarily connected with a certain Quantity of *Tone* in making every single Vibration; or that a certain Number of Vibrations, accomplish'd in a given Time, constitutes a certain and determinate *Tone*; for the frequenter those Vibrations are, the more acute is the *Tone*; and the slower and fewer they are in the same Space of Time, by so much the more grave is the *Tone*; so that any given Note of a *Tone*, is made by one certain Measure of Velocity of Vibrations, i. e. such a certain Number of Courses and Recourses of a Chord or String in such a certain Space of Time, constitutes a determinate *Tone*. See *NOTE*.

This Theory is strongly supported by our best and latest Writers on Music, Dr. Holder, Mr. Alstedon, &c. both by Reason and Experience. — Dr. Wallis, who owns it very reasonable, adds, that 'tis evident the Degrees of Acuteness are reciprocally as the Length of the Chords; tho', he says, he will not positively affirm that the Degrees of Acuteness answer the Number of Vibrations as their only true Cause: But his Diffidence arises hence, that he doubts whether the Thing have been sufficiently confirm'd by Experiment. — Indeed, whether the different Number of Vibrations in a given Time is the true Cause on the Part of the Object, of our perceiving a Difference of *Tone*, is a Thing which we conceive does not come within the Reach of Experiment; 'tis sufficient the Hypothesis is reasonable. See *CONCORD, HARMONY, &c.*

**TUNICA**, a kind of Wastcoat or Under-Garment wore by the Ancients, both at Rome, and in the East.

The common People ordinarily wore only a single *Tunica*; but those of better Fashion wore a *Toga* or *Gown* over it. See *TOGA*.

The Philosophers wore a *Gown* without a *Tunica*, as professing to go half naked.

The *Tunica* was peculiar to the Men; the Under-Garment of the Women not being call'd *Tunica*, but *Stola*. See *STOLA*.

The Senators wore their *Tunica* enrich'd with several little Pieces of Purple, cut in Form of large Nails; whence it was call'd *Laticlavus*: The Knights had lesser Nails on their *Tunica*, which was hence call'd *Angusticlavus*: The common People wore their *Tunica* without any Nails at all. — And 'twas by these three different Sorts of *Tunicas*, that the three different Orders of the Roman People were distinguish'd. See *LATICLAVA, &c.*

Among the Religious, the woollen Shifts, or Under-Garments, are still call'd *Tunicas* or *Tunicines*.

**TUNICA**, or **TUNIC**, in Anatomy, is a Term apply'd to the Skins or Membranes which coat or inclose the Vessels, and divers other of the less solid Parts of the Body. See *MEMBRANE*.

The Eye consists principally of a Number of *Tunics* rang'd over one another; as the *Tunica Albuginea*, the *Tunica Cornea*, the *Tunica Retiformis*, &c. See *EYE, &c.*

**TUNICA VAGINALIS**. See *VAGINALIS*.

**TUNNAGE**, or **TONNAGE**, a Duty or Custom due for Merchandise brought or carry'd in Tuns, and such like Vessels, from or to other Nations; thus call'd, because rated at so much per Tun. See *CUSTOM*.

*Tunnage* is properly a Duty impos'd on Liquids according to their Measures; as Poundage is that impos'd on other Commodities according to their Weight. See *POUNDDAGE*.

They were both first settled by Authority of Parliament under King Edward III; were re-establish'd in 1560, under the Reign of King Charles II. for his Life, upon abrogating all the Laws made under Oliver Cromwell, and re ordaining the Execution of the ancient Laws and Regulations; and have been continu'd and renew'd by the Parliaments ever since. — By an Act made in the first Year of the Reign of Queen Anne they were continu'd for 96 Years, expiring in the Year 1798.

This Duty at first was 4*l.* 10*s.* Sterling per Tun, for French Wines brought into the Port of London by the English; and only three for that brought in the other Ports — For the same Wine imported by Strangers to London, this Duty was 6*l.* and that brought into the other Ports 4*l.* 10*s.* Sterling.

Rhenish Wine, in Virtue of the same Act, paid 7*l.* 10*s.* Sterling; and Spanish, Portuguese, Malawsey, and Greek Wines, the same as the French Wines.

But there have been divers additional Duties added since. — As, the additional Duty of the old Subsidy, Seigniorage Duty of ancient Insigns of Tunnage, Duty of additional Insigns, Orphan Money, new Subsidy, &c.

**TUNNAGE** is also used for a certain Duty paid the Mariners by the Merchants, for unloading their Ships arriv'd in any Havens, after the Rate of so much a *Tun*. See *DUTY*.

**TUNNEL**, or **FUNNEL**, an Instrument thro' which any Liquor is pour'd into a Vessel. — Part of the Draught of a Chimney above the Mantle piece, is also call'd by the same Name. See *CHIMNEY*.

**TUNNEL-Net**, is a kind of Net much used for the catching of Partridges; thus call'd from its Form, which is a Cone 15 or 18 Feet long.

To use it, a Covey of those Birds being found, a Compass is taken, and the Net pitch'd at a good Distance from them, according to the Situation of the Ground. — Then, with a natural or artificial Stalking Horse, they are surround'd, and gently driven towards the Net, never coming on them in a direct Line, but by Windings, Turnings, &c. See *STALKING*.

**TUNNING**, a Part of the Process of Brewing, or rather an Operation which is the Sequel thereof. See *BREWING*. The *Tunning of Beer*, &c. is perform'd various Ways; some being of Opinion 'tis best tun'd as it cools, or begins to come; while others let it stand longer to become riper.

The most regular Method is to cleanse and *tun* just as it comes to a due Ferment, and gets a good Head; for then it has the most Strength to clear itself. — What works over is to be supply'd with fresh Beer of the same Brewing.

**TURBAN**, or **TURBENT**, the Head-dress of most of the Eastern and Mahometan Nations. See *HAT, CAP, &c.*

A *Turban* consists of two Parts, viz. a Cap, and a Shaft of fine Linnen, or Taffaty, artfully wound in divers Plaits about the Cap.

The Turks call the Shaft *Turbent*; whence we have form'd the Word *Turban*.

The Cap is red or green, without any Brim, pretty flat, tho' roundish a-top, and quilted with Cotton, but does not cover the Ears. — About this is wrapp'd a long Piece of fine,

fine, thin Linen or Cotton, in several Weavths variously dispos'd.

There is a good deal of Art in the giving a *Turban* the fine Air; and the making them up makes a particular Trade, as the making of Hats does among us.

The *Esars*, who pretend to be descended of the Race of *Mohomer*, wear their *Turbans* quite green: Those of the other *Turks* are ordinarily red, with a white Shaft. — Your *gentle People* are to have frequent Changes of *Turbans*. — *M. de Tournefort* observes, that the *Turbans*, all Things consider'd, is a very commodious Dress; and that he even found it more easy to him than his *French Habit*.

The Grand Signior's *Turban* is as big as a Bushel, and so exceedingly respected by the *Turks*, that they dare scarce touch it. — It is adorn'd with three Plumes of Feathers, enrich'd with Diamonds and precious Stones; He has a Minister on Purpose to look to it, call'd *Zulbeyglan*.

That of the Grand Vizier has two Plumes; so have those of divers other Officers, only smaller, one than another; others have only one; and others none at all. — The *Turban* of the Officers of the Divan is of a peculiar Form, and call'd *Mage-mesek*.

The Shaft of the *Turks Turban*, we have observ'd, is white Linen; that of the *Persians* is red Woollen. These are the distinguishing Marks of their different Religions: *Sybi*, King of *Persia*, who was of the Sect of *Ali*, being the first who stain'd that Colour, to distinguish them from the *Turks*, who are of the Sect of *Omar*, and whom the *Persians* esteem Heretics. See *MAHOMETAN*, &c.

The Word is form'd from the *Arabic* *تور*, *tor*, or *تور*, *tor*, or *تور*, *tor*, which signifies to encompass; and *تور*, *band* or *band*, which signifies Shaft, or Scarf, or Band; so that *Durbent*, or *Turbent*, or *Turbent* only signifies a Scarf, or Shaft, ty'd round; it being the Shaft that gives the Denomination to the whole *Turban*.

**TURBARY, TURBARIA**, a Right to dig Turf in another Man's Ground; from *Turba* an old *Latin* Word for a Turf. See **TURF**.

Common of *Turbary*, is a Liberty which some Tenants have by Prescription to dig on the Lord's Waste. See **COMMON**.

**TURBARIA** is sometimes also taken for the Ground where Turfs are digg'd. See **TURF**.

**TURBARIA Brvaris**, particularly denotes a Flaw Turf, or Heath Turf, mention'd in a Charter of *Hamon de Massy*.

**TURBITH**, or **TURETH**, **TURBETHUM**, a Medicinal Root, brought from the *East Indies*, particularly *Cambays*, *Sarar*, and *Goa*; tho' others will have it, that the true *Turbeth* comes chiefly from *Ceylon*.

The *Turbeth* of the Moderns bears so little Resemblance to that of the Ancients, that 'tis difficult to suppose them the same. — That sold by our Druggists is longish, about the Thickness of the Finger, resinous, heavy, and of a brownish hue without, and whitish within. — 'Tis brought to us cloven in the Middle, length-wis, and the Heart or woody Matter taken out.

When in the Ground it shoots out Vines, some whereof creep along the Ground, and the rest wind about the neighbouring Trees and Shrubs.

*Turbeth* is a violent Purgative, and is us'd in the Dropsy, Palsy, and Apoplexy. See **PURGATIVE**.

It yields a deal of resinous Matter in a spirituous Menstrum, which *Dr. Quincy* observes, does not affect the larger Passages much; but is very active in the smaller Vessels, and glandular Contortions, which it wonderfully clears of all viscid Adhesions. See **PURGATIVE**.

Some Apothecaries, either thro' Ignorance or Parsimony, substitute white Thapsia, which they call *grey Turbeth*, for the true *Turbeth*; tho' both as to Taste, Colour, and Qualities, they are very different.

It is commonly suppos'd to take its Name *Turbith* from the Violence of its Operation, as *disturbing* the whole Oeconomy.

**Mineral TURBITH**, or **TURBETHUM Minerale**, is a Name which the Chymists give to a yellow Precipitate of Mercury, which purges violently. See **MERCURY** and **PRECIPITATE**.

The Method of preparing it is thus: — On the dry Powder gain'd by dissolving Mercury in Oil of Vitriol, pour a proper Quantity of warm Rain Water, and the Powder will immediately turn of a yellow Colour. Continue to wash this Powder by repeated Affusions of Water, till the Liqueur comes away as insipid and colourless as it was pour'd on, leaving a beautiful yellow Calx at the Bottom of the Vessel, which being gently dry'd at the Fire, is call'd by the Name of *Turbith mineral*.

This Powder is call'd *Mineral Turbith* from the Resemblance it bears to the vegetable *Turbith* of the *Arabians*, in strongly purging the most internal Recesses of the Body; for tho' it is insipid upon the Tongue, yet it is possess'd of very considerable Virtues. — Being boil'd with Water, it loses more of its Salts, and thereby grows milder, and more

safe; so it does by being deslagrated twice or thrice, or distill'd with Spirit of Wine.

A very few Grains of this *Turbith* will prove emetic and purgative. — It is also account'd an excellent Medicine in the Cure of the Venereal Disease: But as it operates with considerable Violence, it ought not to be given, unless the *Vitæra* are known to be found. See **PURGATIVE**.

This appears to have been the grand Secret of *Paracelsus*, which, in his scarce *German* Book of Hospital Medicines, he praises so extravagantly for the Venereal and all Chronical Diseases. — *Sydenham* also commend's it in Venereal Cases, given in the Quantity of six or eight Grains, in strong Habits of Body, so as to prove emetic; but when imprudently us'd, it is apt to give the Dysentery. See **VENEREAL Disease**.

**TURBINATED**, is a Term frequently apply'd by Naturalists to Shells, and other Bodies; to denote them of a Conical Figure, representing a *Peur* or a *Top*. See **SHALL**.

**TURBO**, in Meteorology, a *Whirlwind*. See **WHIRLWIND**.

**TURCOISE**, or **TURQUOIS**, in Natural History, a precious Stone, of a blue Colour; ordinarily opaque, but sometimes a little transparent. See **PRECIOUS STONE**.

There are *Turcoises* both *Oriental* and *Occidental*, of the new Rock and the old.

The *Oriental* partakes more of the blue Tincture than the green; and the *Occidental* more of the green than the blue. — Those of the old Rock are a deep blue, and those of the new Rock more whitish, and don't keep their Colour.

The *Oriental* ones come from *Persia*, the *Indies*, and some Parts of *Turky*; and some even suppose that 'tis hence they derive their modern Name *Turquoise*. — The *Occidental* are found in various Parts of *Europe*, particularly *Germany*, *Bohemia*, *Silesia*, *Spain*, and *France*.

*Turcoises* all grow of a round or oval Figure: They cut easily; and besides Seals, which are frequently engrav'd on them, some are form'd into Crucifixes, or other Figures near two Inches high; tho' *Boetius* mistakenly affirms, that none have been known to exceed the Bigness of a Walnut.

The Ancients attribute a Kind of Sympathetic Virtue to the *Turquois*. — 'Tis commonly suppos'd, that it changes Colour, or breaks, at the Death, Sickness, or even Misfortune of the Person who bears it; that it disagrees with marry'd People, and even breaks on their Fingers; that it marks all the Changes and Accidents that happen in the Body of the Wearer, by correspondent Changes in its Colour; and that it is for this Reason the Ladies have forborne the Use of it. — *De Boer* endeavours to account for all these Effects from natural, and even probable Causes.

The *Turquois* is easily counterfeited; and that so perfectly, that 'tis impossible to discover the Deceit, without taking it out of the Cellar.

The *Greeks* and *Latins* call it *Calais*, and *smaragd*; and it appears to have had a Place in the Rationale of the High Priest of the *Jews*.

In the Memoirs of the Academy of Sciences, we have a very curious Account of the Formation of the *Turquois*, the Manner of giving it the blue Colour, &c. by *M. Reaumur*. — The *Turquois*, he observes, is one of the softest of precious Stones, its Hardness scarce exceeding that of a Crystal, or a transparent Pebble; tho' some are much harder than others; and still the harder, *cæteris paribus*, the more valuable, by Reason of the Vicinity of the Polish, which is always proportionable to the Hardness.

*Reaumur*, a Jeweller, and the Author of a scarce Treatise call'd *Mercure Indien*, estimating the several precious Stones, sets a hard *Turquois*, whose Blue is neither bright nor deep, on the Foot of the most perfect *Emeralds*, that is, on a Level with a Diamond. — Those with any Defect he only values at a *French Crown* the Carat.

*Tavernier* assures us, there are two Mines of *Turquoises* known in all the Earth, and those are both in *Persia*; the one call'd the *Old Rock*, near a Town call'd *Neaburg*, three Days Journey to the North East of *Medeah*: The other call'd the *New Rock*, is five Days Journey. — The latter, he adds, are but little valued; and the King of *Persia* has for many Years prohibited the digging in the former for any but himself. — *M. Reaumur* takes the *old Rock* to be now exhausted; in effect the common Division of *Turquoises* into the *old Rock*, or *Oriental*, and *new Rock*, or *Occidental*, is very arbitrary and precarious. — All the best, and most perfect, grow they where they will, in *India* or *Europe*, are reckon'd among the former, and the rest among the latter.

Near *Sinore*, in the lower *Languedoc*, are several considerable Mines of *Turquoises*; but that fine blue Colour admir'd in the *Turquois*, is not natural to these Rocks; the prevailing Colour being sometimes white, and sometimes much like that of *Tripoli* and *Fenice*. The other precious Stones are dug out of the Mine with all their Colour, to the Force whereof nothing can be added, tho' it may frequently be

be diminish'd, as we see Fire bring down the too deep Colour of the Saphir, and quite take away that of a pale Saphir: These *Turquoises*, on the contrary, are naturally whitish or yellowish, of a Colour as common as that of a Free-stone; and by opposing them for some Time to the Action of the Fire, they assume a blue Colour.

It seems a Paradox, and yet M. *Reaumur* has made it exceeding probable, that *Turquoises* are originally the Bones of Animals. — In the Mines in France, Pieces have several times been found in the Figure of Teeth, Bones of the Arms, Legs, &c. And *Turquoises* which are yet imperfect or ill form'd, are apparently compos'd of Laminae or Leaves like those of Bones, between which some petrifying Juice insinuating itself, binds them close together: And still, the softer, and more imperfect the Stones are, the more distinguishable are the different Directions of the Fibres and Laminae, with their Intersections, and the greater Resemblance they bear to fractur'd Bones, and the less to any kind of Stones known.

To give them the blue Colour, they dry them awhile in the Air, then heat them gradually in a Furnace made after a particular Manner. If they be heated too hastily, the Humidity between the Laminae, wanting Time to evaporate all, will separate into Scales or Flaws. Some of the Stones require a greater Degree of Heat to bring them to their Colour than others; and even in large Pieces, several Parts ordinarily require several Degrees of Heat.

On this Account a world of Care is to be taken in the Heating them; for the Fire, which gives them their Blue by Degrees, if they be expos'd beyond a certain Degree, takes it away again.

M. *Reaumur* accounts for their taking a blue Colour by Heat, very well: When fresh cut out of the Rock, it seems, their Substance is found sprinkled and freak'd all over with Spots, Veins, little Circles, &c. of a black-blue Colour: These he takes to be Remains of a deep bluish Matter, which the Fire rarefying, spreads and diffuses throughout the whole Substance of the Stone. — This Matter, again, he concludes to have been either originally the Juice contain'd in the Bones, since mix'd and coagulated with the petrifying Juice, or some other Mineral Matter insinuated into the Pores of the Stone.

The great Defect of all *Turquoises* is, that in Time they lose their blue Colour, and become green; and then cease to be of any Value.

TURP, or PEAT, a blackish sulphurous Earth, us'd in several Parts of *England*, *Holland*, and *Flanders*, as Fuel. See FUEL.

In *Flanders*, their *Turf* is dug or pared from off the Surface of the Earth, and cut in Form of Bricks. — The *Grass*, a Species of Grass growing very thick on the *Turf* Earth, contributes greatly, when dry, to the Maintenance of the Fire.

The *Dutch* draw their *Turf* from the Bottom of the Dikes or Canals which run across most of their Lands; by which Means they not only supply the Defect of Wood, which is very great in most of the United Provinces, but also keep their Dikes clear and navigable: This *Turf* Earth is very black. As they take it up from the Bottoms of the Dikes, they spread it about the Edges, of such a Thickness, as may be reduc'd to three Inches when moderately dry'd. — In this Condition they cut it into Pieces or *Turfs* seven or eight Inches long, and three broad; and, to complete the drying, lay them up in Heaps, and at last in Stacks.

In the North of *England*, *Scotland*, &c. *Turf* or *Pear* is dug out of a soft, moist, rotten Earth, call'd *Pear-Moss*: For the Formation whereof, see Moss.

They dig horizontally from the Surface, to the Depth of about four Foot, with a Spade, which at once fashions and takes them out in Parallelopipeds nine or ten Inches long, and three square; which are spread on the Ground to drain as fast as dug; and then set up an end three or four against each other, for the Wind to blow thro' them; and at last stack'd or housed.

The Pits or Dikes in a few Years fill up again, and afford a fresh Crop.

TURFING Spade, among Husbandmen, is an Instrument us'd to under-cut the *Turf*, after it is mark'd out with a Trenching Plough.

TURGESCENCE, a Swelling or growing *turged* or bloated. — From the *Latin*, *turgere*.

TURIONES, the first young tender Shoots which Plants do annually put forth. See GRASS, CYON, &c.

TURKY COMPANY. See COMPANY.

TURLUPINADÉ, a Term us'd chiefly among the *French* for a low dry Jest, or Witticism. — The Occasion of the Name is deriv'd from a famous Comedian at *Paris*, call'd *Turlupin*; whose Talent, like that of our *Pinketman*, consisted chiefly in raising a Laugh by miserable Puns and Points.

TURLUPINES, TURLUPINI, a Sect of Heretics, or rather of People who made publick Profession of Impudence, going naked, without so much as covering their Privy Parts,

and having to do with Women, like the Cynicks, in open Market.

They call'd their Sect the *Fraternity of the Poor*, and spread themselves over *England* and *France*.

They are said by some to have had their Name *Turlupin*, quod est tantum habitare loca quae lupis expulsa erant.

They attempted to settle themselves at *Paris* in 1372, but were a great Part of them burnt, with their Books; as is related by *Goggin* and *du Tillet* in the Life of *Charles V.*

TURMERIC, a Root us'd by the Dyers to give a yellow Colour, call'd in *Latin*, *Curcuma Officinaria*. See DYEING.

'Tis yellow both within and without Side, very hard, as if petrify'd, and not unlike, either in Figure or Size, to Ginger. — The Leaves it produces are like those of white Helicore; its Flowers rise in Manner of a Spica or Ear; and its Fruit rough like our new Chestnuts.

'Tis brought chiefly from the *East-Indies*; tho' the Island *Madagascar* does likewise afford it. — You are to chuse that which is big, new, refinous, hard to break, and heavy.

Some People have mistakenly imagin'd there was a Native red *Turmeric*; their Error was owing to this, that the yellow Root, as it grows old, turns brown; and when pulveriz'd reddish.

'Tis much us'd by the Glovers, &c. to dye their Gloves; as also by the Founders, &c. to give a Gold Colour to their Metals. — The *Indians* use it to dye their Rice, and other Foods, of a yellow Colour; whence some call it *Indian Saffron*.

Our Dyers don't find that it gives so steady a Yellow as the *Luteola* or Greening Weed; but 'tis admirable to brighten and lighten the Red Colours dyed with *Cochineal* or *Vermillion*; as *Scarlet*, &c.

*Turmeric* is us'd in Medicine by Way of Decoction, Infusion, Powder, &c. with other Ingredients, in the Jaundice, Hypochondriac, Leucophlegmatic, and Cachectical Constitutions.

TURN, is us'd for a circular Motion; in which Sense it coincides with Revolution. See REVOLUTION.

TURN, in Clock or Watch Work, particularly denotes the Revolution of a Wheel or Pinion. See WHEEL, PINION, &c.

In Calculation, the Number of *Turns* which the Pinion hath in one *Turn* of the Wheel, is commonly set down as a Quotient in common Arithmetic, thus, 5|60(12, where the Pinion 5 playing in a Wheel of 60, moveth round 12 times in one *Turn* of the Wheel: Now, by knowing the Number of *Turns*, which any Pinion hath in one *Turn* of the Wheel it worketh in, you may also find how many *Turns* a Wheel or Pinion hath at a greater Distance; as the Contrat-wheel, Crown-wheel, &c. by multiplying together the Quotients, and the Number produc'd, is the Number of *Turns*; as in this Example:

$$\begin{array}{r} 5) 55 \quad (11 \\ 5) 45 \quad 9 \\ 5) 40 \quad 8 \end{array}$$

The first of these three Numbers has 11 *Turns*, the next 9, and the last 8. If you multiply 11 by 9, it produceth 99; that is, in one *Turn* of the Wheel 55, there are 99 *Turns* of the second Pinion 5, or the Wheel 40, which runs concentrical, or on the same Arbor with the second Pinion 5. — If you multiply 99 by the last Quotient 8, it produceth 792, which is the Number of *Turns* the third Pinion 5 hath.

TURN is also us'd for the Sheriffs Court, kept twice a Year, *viz.* a Month after *Easter*, and within a Month after *Michaelmas*. See SHERIFF and COURT.

From this Court none are exempted but Archbishops, Bishops, Earls, Barons, Religious Men and Women, and all such as have Hundreds of their own to be kept.

It is a Court of Record in all Things that pertain to it; and is also the King's Leet through all the Country, whereof the Sheriff is Judge; this Court being incident to his Office.

It is call'd the Sheriff's *Turns*, because he takes a *Turn* or Circuit thro' the Shire, holding the same in several Places. See SECTA REGALIS.

TURN-pike, a Gate set up across a Road, watch'd by an Officer for the Purpose, in order to stop Travellers, Waggon, Coaches, &c. to take Toll of them, towards repairing, or keeping the Roads in repair. See ROAD.

TURN-pike is also us'd in the Military Art, for a Beam stuck full of Spikes, to be plac'd in a Gap, a Breach, or at the Entrance of a Camp; to keep off an Enemy.

The *Turn-pike* is a Spar of Timber, twelve or fourteen Feet long, and about six Inches Diameter; of a hexangular Form; and bored with Holes, one right under another, about an Inch Diameter; the Axis of the Holes being six Inches one from another, and to go in from each Side. — The Spikes or Prickets that are driven into the Holes, are five or six Feet long, pointed with Iron; and with Wedges or Nails fasten'd hard into the Holes.

Two of these fasten'd together with an Iron Chain and Staple, six Inches long, are of great Use to stop the Enemy in the Breaches or elsewhere.

Those intended to be thrown in Breaches, must be made of Oak &c. and need not be so big, or the Pickets so long.

**TORNADO** or **TORNADO**, a Wind which on some Coasts blows all Night from the Shore. See **WIND**, **WHIRLWIND**, **TRADE-WIND**, **MONSOON**.

**TURNAMENT** or **TOURNAMENT**, a martial Sport or Exercise, which the ancient Cavaliers used to perform, to shew their Bravery and Address.

The first **Tournaments** were only Courts on Horseback, wherein the Cavaliers tilted at each other with Canes, in manner of Lances; and were distinguish'd from Jousts, which were Courses accompanied with Attacks and Combats with blunted Lances and Swords.

Others say, it was a **Tournament**, when there was only one Quadril or Troop; and that where there were several to encounter each other, it was a *Joust*; but 'tis certain the Two became confounded together in process of Time; and least we find them so in Authors. See **JUST**.

The Prince who publish'd the **Tournament**, used to send a King at Arms with a safe Conduct, and a Sword to all the Princes, Knights, &c. signifying that he Intended a **Tournament** and a *Clasping of Swords*, in the Presence of Ladies and *Damozels*; which was the usual Formula of Invitation.

They first engaged Man against Man, then Troop against Troop; and after the Combat, the Judges allotted the Prize to the *Best Cavalier*, and the *best Sinker of Swords*; who was, accordingly, conducted in Pomp, to the Lady of the **Tournament**, where, after thanking her very reverently, he saluted her, and likewise her two Maids.

The **Tournaments** made the principal Diversion of the XIIIth and XIVth Centuries. — *Mausler* says, it was *Henry the Fowler, Duke of Saxony*, and afterwards *Emperor*, that first introduced them; but it appears from the Chronicle of *Tours*, that the true Inventor of this famed Sport, was one *Geoffrey, Lord of Preunili*, about the Year 1066.

From France they pass'd into England and Germany. — *The Historia Byzantina* tells us, That the *Greeks* and *Latins* borrowed the Use thereof from the *Franks*; and we find mention made of them in *Cantacuzanus*, *Gregorius*, *Bessarion* and others of the late Greek Authors.

*Budens* derives the Word from *Trojanus agmina*; others from *Trojanentum, quasi ludus Troje*. *Monsieu* deduces it from the *Latin*, *Torneus*, or the *French*, *Tournoi*, in regard the Combatants turn'd and twined this way and that. *M. Paris* calls them in *Latin*, *Haspiludus*; *Neuburgensis*, *Meditationes Militares*; others *Gladiature*, others *Decussiones luctuere*, &c.

*Pope Eugenius II.* excommunicated those who went to **Tournaments**, and forbid them Burial in holy Ground. — *K. Henry II. of France* died of a Wound received at a **Tournament**. — One *Chibaux*, who had assisted at a **Tournament** under *Charles VIII.* said very happily; *If it be in Earnest, 'tis too little; if in Jest, too much.*

'Tis to the Exercise of **Tournaments** that we owe the first Use of Armouries; of which, the Name Blazony, the Form of the Escutcheons, the Colours, principal Figures, the Mantlings, Labels, Supporters, &c. are undeniable Evidences. See **ARMS**.

In Germany, 'twas anciently a Custom to hold a solemn **Tournament** every three Years, to serve as a Proof of Nobility. — For the Gentleman who had assisted at Two, was sufficiently blazon'd and publish'd, i. e. he was acknowledged Noble, and bore two Trumpets by way of Crest on his **Tournament** Cask. — Those who had not been in any **Tournaments**, had no Arms, though they were Gentlemen. See **NOBILITY**, **DESCENT**, &c.

**TURNETUM**, in our old Law-books, a Duty paid to the Sheriff for holding his Turn or County-Court. See **TURN** and **SHERIFF**.

**TURNING**, a Branch of Sculpture; being the Art of fashioning hard Bodies, as Brass, Ivory, Wood, &c. into a round or oval Form, in a Lathe. See **LATHE**.

*Turning* is performed, by putting the Substance to be turned, upon two Points, as an Axis; and moving it about on that Axis; while an edge Tool set steady to the Outside of the Substance, in a Circumvolution thereof, cuts off all the Parts that lie farther off the Axis, and makes the Outside of that Substance Concentric to the Axis.

The Invention of *Turning* appears to be very ancient. — *Scene*, indeed, to do Honour to the Age, will have it brought to Perfection by the Moderns; but if what *Pliny*, and some other ancient Authors relate, be true, that the Ancients turned those precious Vases, enrich'd with Figures and Ornaments in Relief, which we still see in the Cabinets of the Curious; it must be owned, that all that has been added in these Ages, makes but a poor Amend for what we lost of the manner of *Turning* of the Ancients. See **SCULPTURE**.

The principal Instruments used in *Turning*, beside the Lathe, are Chisells and Mandrels of various Forms; *The Description whereof, see under their proper Articles.*

**TURNSOLE**, **TOURNISOL** or **TURNSOL**. See **TORNISOL**. **TURBENTINE**, **TURBENTINA**, a transparent Gum or Resin flowing either Naturally or by Incision, from several fatty resinous Trees; such as the *Terebinthus*, Larch, Pine, Fir, &c. See **GUM** and **RESINIFEROUS**.

We distinguish several Kinds of **Turpentine**; as that of *Chio*, that of *Venice*, that of *Bourdeaux*, that of *Cyprus*, *Strasbourg*, &c.

The **Turpentine** of *Chio*, which is the only genuine Kind, and that which gives the Denomination to all the rest, is a whitish Resin, bordering a little on the Green, very clear and a little odoriferous; drawn by Incision from a Tree called *Turbinthus*, very common in that Island, as also in *Cyprus*, and some Parts of *France* and *Spain*.

The Gum must be chosen of a Solid Consistence, almost without either Taste or Smell, and not at all Tenacious, which distinguishes it from the false **Turpentine** of *Venice*, commonly substituted for it, which has a strong Smell, a bitter Taste, and sticks much to the Finger. — This **Turpentine** of *Chio* is indispitably the best; but its Scarcity occasions it to be little in use.

The **Turpentine** of *Venice*, is falsely so called, for though there was a **Turpentine** anciently brought from *Venice*, yet that now so called, comes all from *Dauphine*. — 'Tis liquid, of the Consistence of a thick Syrop, and whitish; and flows either spontaneously, or by Incision from Larches, Firs and Pines, chiefly in the Wood of *Pilarce*.

That flowing naturally, call'd by the *Peasants*, *Bijon*, is a kind of Balsm not inferior in virtue to that of *Peru*, to which it is frequently substituted. — That drawn by Incision, after the Tree has ceas'd to yield spontaneously, is of very considerable Use, in several Arts, and 'tis even of this that *Varnish* is made. See **VARNISH**.

It must be chosen White and Transparent, and Care be taken it hasn't been counterfeited with Oil of **Turpentine**.

The **Turpentine** of *Bourdeaux* is white and thick as Honey. — It does not come from the Tree in the Manner it is sent to us; but is properly a Composition, wherein, among other Ingredients, is a white hard Sort of Resin called *Galipot*. See **PITCH**.

The **Turpentine** of *Strasbourg*, *Dautsch*, &c. is that most commonly used among us; and is prefer'd, by our People, to that of *Venice*, which it is distinguish'd from, by its green Hue.

The Uses of **Turpentine** in Medicine, are innumerable. — 'Tis a great Vulnerary, and very Detergent, and as such is prescribed in all Abscesses and Ulcerations, &c. It promotes Expectoration, and as such is prescribed in Distases of the Lungs and Breast: But it is most famous for clearing the Urinary Passages, and as such prescribed in Obstructions of the Reins, in Gonorrhoeas, &c.

**Oil of TURBENTINE**. — There are two Kinds of Oils drawn from **Turpentine** by Distillation; the first White, the second Red; both esteem'd as Balsoms proper for the Cure of Wounds, Chilblains, &c. But they are so little used among us, that 'tis not easy to procure either of them.

What is commonly sold under the Name of *Oil of Turpentine*, or *Exberil Oil*, is only a Distillation of the Resin call'd *Galipot*, fresh from the Tree. — It is used with Success in the Cure of green Wounds, as also by the Painters, Farriers, &c. — To be good, it must be clear and white as Water, of a strong penetrating Smell, and very inflammable.

**TURUNDA**, in Chirurgery, a Tent; or any thing to be thrust into an Orifice or Cavity. See **TENT**, &c.

**TUSCAN**, in Architecture, the first, simplest, and most Massive of the five Orders. See **ORDERS**.

The *Tuscan Order* takes its Name from an ancient People of *Lycia*, who coming out of *Asia* to people *Italy*, first executed it in some Temples, which they built in their new Plantations.

*Vitruvius* calls the *Tuscan*, the *Rustic Order*; with whom *agrippa M. de Capua*, who in his Parallel, says, it ought never to be used but in Country-houses and Palaces. *M. le Clerc* adds, that in the manner *Vitruvius*, *Palladio* and some others, have order'd it, it does not deserve to be used at all. But in *Vignola's* Manner of Composition, he allows it a Beauty, even in its Simplicity; and such as makes it proper not only for private Houses, but even for public Buildings, as in the Piazzas of Squares and Markets; in the Magazines and Granaries of Cities; and even in the Offices and lower Apartments in Palaces.

The *Tuscan* has its Character and Proportions, as well as the other Orders; but we have no ancient Monuments, to give us any regular *Tuscan Order* for a Standard.

*M. Perrault* observes, that the Characters of the *Tuscan* are nearly the same with those of the *Doric*; and adds, that the *Tuscan* is, in effect, no other than the *Doric*, made somewhat stronger, by the shortning of the Shaft of the Column,

Columns, and simpler, by the small Number, and Largeness of the Mouldings. See **DORE**.

*Vitruvius* makes the whole Height of the Order 14 Modules, wherein he is followed by *Vignola*, *M. le Clerc*, &c. — *Servio* only makes it 12. — *Palladio* gives us one *Tufcan* Profile, much the same as that of *Vitruvius*; and another too rich: On which *Sido Scamozzi* is likewise faulty. Hence it is, that that of *Vignola*, who has made the Order very regular, is most follow'd by the Modern Architects. See **COLUMN**.

Of all the Orders, the *Tufcan* is the most easily executed; as having neither *Triglyphs* nor *Dentils*, nor Modifications to confine its Intercoliums. — On this account the Columns of this Order may be ranged in any of the five Manners of *Vitruvius*, viz. the *Picostyle*, *Stylos*, *Enstyle*, *Diastyle* and *Areostyle*. See **INTERCOLUMNATION**.

For the *Parts and Members* of the *Tufcan Order*, their *Proportions*, &c. see **CAPITAL**, **BASE**, **PEDESTAL**, **FREEZE**, &c.

**TUSCULAN**, in Matters of Literature, a Term frequently used in the Phrase *Tusculan Questions*. — *Cicero's Tusculan Questions*, are Disputations on several Topics in Moral Philosophy, which that great Author took Occasion to denominate from the *Tusculanum*, a Country Seat or Villa, where they were compos'd, and where he lays the Scene of the Dispute.

They contain Five Books; the First on the Contempt of Death; the second of enduring Pain; the third on asswaging Grief; the fourth on the other Perturbations of the Mind; and the last, to shew that Virtue is sufficient to a happy Life.

**TUSKES** or **TUSKS** of a Horse. See **TEETH**.

**TUSSIS**, in Medicine, a Cough; a Disease affecting the Lungs, occasioned by a sharp ferrous Humor, velicating the Fibrous Coat thereof, and urging it to a Diachage by Spitting, &c. See **LUNGS**.

When the Humor is so subtle, that the Lungs cannot lay hold of it, to throw it off; or when the Humor is so thick that it will not give Way, it is said to be a *dry Cough*.

Dry Coughs are the most dangerous. — *Hippocrates* says, the Cough ceases, if the Testicles swell. See **COUGH**.

**TUT**, in Armory, &c. an Imperial Ensign of a golden Globe, with a Cross on it.

**TUTELARY**, **TUTELARIS**, one who has taken something into his Patronage and Protection. See **PATRICKION**.

'Tis an ancient Opinion, that there are tutelary Angels of Kingdoms and Cities, and even of particular Persons, call'd *Guardian Angels*. See **ANGEL**, **DEMON**, **GENIUS**, &c.

The ancient *Romans*, 'tis certain, had their tutelary Gods, whom they call'd *Penates*. See **PENATES**.

And the *Romish* Church to this Day, holds an Opinion not much unlike it. — They believe that every Person, at least every one of the Faithful, has, from the Time of his Birth, one of those *Tutelary* Angels attached to his Person, to defend him from all Temptations; and 'tis on this, principally, that their Practice of invoking Angels is founded.

*F. Anthony Macedo*, a Portuguese Jesuit, of *Comimbra* has publish'd a large Work in Folio, on the tutelary Saints of all the Kingdoms, Provinces and great Cities of the Christian World: *Drei Tutelares Orbis Christiani*, at *Lisbon* 1687. See **PATRON**, **SAINTE**, &c.

**TUTOR**, in the Civil Law, is one chose to look to the Person and Estate of Children, left by their Fathers and Mothers in their Minority. See **GUARDIAN**, **MINOR** and **POVERTY**.

By the Custom of *Normandy*, the Father is the natural Tutor of his Children. — A Person nominated Tutor, either by Testament, or by the Relations of the Minor, may decline that Office, if he have Five Children alive; if he have any other considerable Tutorage; if he be under 25 Years of Age; if he be a Priest, or a Regent in an University; if he have any Law Suit with the Minors, &c. See **TUTORAGE**.

The Marriage of a Pupil, without the Consent of his Tutor, is invalid. — Tutors may do any thing for their Pupils, but nothing against them; and the same Laws which put them under a Necessity of preserving the Interest of the Minors, put them under an Incapacity of barring them. See **PUPIL**.

**TUTOR** is also used in our Universities, for a Member of some College or Hall, who takes on him the instructing young Students in the Arts and Faculties.

**TUTORAGE**, **TUTELA**, in the Civil Law, a Term equivalent to Guardianship in the Common Law; signifying an Office imposed on any one, to take care of the Person and Effects of one or more Minors. See **MINOR**.

By the *Roman* Law, there are three Kinds of Tutorage. — The *Testamentary*, which is appointed by the Father's Testament: The *Legal*, which is appointed by the Law to the nearest Relation; and the *Dative*, which is appointed by the Magistrate.

But in all Customary Provinces, as *France*, &c. all Tutorages are Dative and Elective; and though the Father have

by Testament, nominated the next Relation to his Pupil, yet is not that Nomination of any Force, unless the Choice be confirm'd by that of the Magistrate, &c.

By the *Roman* Law, Tutorage expires at 14 Years of Age; but in *France* not till 25 Years. A Minor quits his Tutorage, and becomes free by Marriage; in which Case a Curator is given him. See **CRUTOR** and **GUARDIAN**.

**TUTTY**, **TUTIA** or **Lapis Tutia**, a metallic Soot, thrown off from Brass, in the Furnace; and form'd into Concave Flakes of different Sizes and Thickness; very hard, greyish, and full of little protuberant Grains as big as Pin Heads.

It is found adhering to Rolls of Earth suspended for that Purpose over the Furnaces of the Founders in Brass, to receive the Fumes of the melted Metal. See **BRASS** and **FOUNDRY**.

Tutty is now brought chiefly from *Germany*. Anciently it came from *Alexandria*.

To prepare the Tutty for Use, they heat it red Hot three times in a Crucible, among burning Coals; and quench it as often in Rose-water: Then they grind it on a Porphyry Stone, mixing with it as much Rose-water, or Plantain-water as is necessary, till it be brought to a very fine Powder: Then they make it up into little Troches, and thus dry it.

Tutty is very defective. Its principal Use is in Dis-eases of the Eyes, particularly Inflammations; in order to which, it is diluted with Rose-water or Plantain-water, in form of a Collyrium. See **COLLYRIUM**.

Some use it incorporated with fresh Butter, in form of an Unguent.

In the *London Dispensatory*, it gives Title to a Composition call'd *Ointment of Tutty*, good for Eye Dis-eases, and frequently used by Surgeons with other Defecatives to cicatrize Ulcers. — 'Tis also good in the Hemorrhoids. See **THIRD-NIGHTS-GESSE**.

**TWA-NIGHTS-GESSE**, in our ancient Customs. See **THIRD-NIGHTS-OWN-HYND**.

If the *Twa-Nights-gesse* did any harm to any, his Host was not answerable for it, but himself.

**TWELF-HINDUS**, in our ancient Customs, the same with *TWANS*. See **THANE**.

Among the *English Saxons*, every Man was valued at a certain Price; and where an Injury was done, either to the Person or Goods, a pecuniary Mulct was imposed, and paid in Satisfaction of that Injury, according to the Worth and Quality of the Person to whom it was done. — And hence all Men were ranked in three Classes; which see in **HINDENA**.

Those who were worth 1200 s. were call'd *Tweolf-hindi*, and if an Injury was done to them, Satisfaction was to be made accordingly.

**TWELFTH DAY** or *Tide*, the Festival of the *Epiphany*, or the Manifestation of Christ to the Gentiles; so call'd, as being the *Tweelfth-day*, exclusively, from the Nativity or *Christmas-day*. See **EPHAPHANY**.

**TWELVE-MONTH**, the Space of a Year, according to the Calendar Months. See **YEAR** and **MONTH**.

**TWELVE-MEN**, *Duodecim homines Legales*, otherwise call'd the *Jury* or *jurissey*, is a Number of Twelve Persons, or upwards to Twenty-four; by whose Oath, as to Matters of Fact, all Trials pass, both in Civil and Criminal Cases, through all Courts of the common Law in this Realm. See **JURY** and **TRIAL**.

In Civil Cases, when Proof is made of the Matter in Question, the Point of Fact, whereon they are to give their Verdict, is deliver'd to them; which is call'd the *Issue*. — Then they are put in mind of their Oath, and are by the Judge's summing the Evidence, sent out of Court by themselves, to consider on the Evidence on both Sides, till they be agreed.

In Causes Criminal, there are two Sorts of Inquests: One call'd the *Grand Inquest*, the other the *Inquest of Life and Death*.

The first is so call'd, because it consists of Sixteen Persons at least; or because all Causes Criminal or Penal pass through their Hands; whereas the other Inquest is especially appointed for one or more Matters.

Those of the Grand Inquest are call'd by *Bracton*, *duodecim Milites*, because they were wont to be Knights; if so many could be had.

Their Function is to receive all Presentments of any Offence, and accordingly to give their general Opinion of them, by writing either the Words *Billa vera* upon the Hill of Presentment, which is an Indictment of the Party presented; or else *Nonsumus*; which is a doubting of the Fact presented. See **ENQUEST** and **INDICTMENT**.

**TWI-FOLLOWING Ground**, in Husbandry, is the Tilling or Ploughing it a second Time. See **TILLING** and **FOLLOWING**.

**TWI-HINDI**, among our *Saxon* Ancestors, were Men valued at 200 s. See **TWELPHINDS**.

These Men were of the lowest Degree; and if such were killed, the Mulct was 20 s. — Thus in *Leg. II. l. c. 9. de Twibindi dominis interfectis, vestra debet reddi secundum legem*.

*legens*. — Where, Note, that this was not an Introduction of a new Law, but a Confirmation of the Old, made in the Reign of King Alfred.

**TWINS.** See GEMINI, DIDYMI, &c.  
It has been greatly disputed, which of two Twins is to be esteemed the Elder. — The Faculty of Montpellier have given it, that the latter borne is to be reputed the Elder; because first conceived; But by all the Laws which now obtain, the first-born enjoys the Privileges of Seniority; and the Custom is confirm'd by the Instance of *Ephai* and *Joseph*.

But if two Twins be born fo intermix'd, that one cannot distinguish which of the Two appeared the first; it should seem that neither the one nor the other can pretend to the Right of Primogeniture, which ought to remain in Succession, by reason of their mutual Concourse.

In such Case, some would have the Decision left to the Father, and others to the Heir of a Lot. Sometimes there are born Three Twins, as in the Instances of *Horati* and *Coriarii*; and sometimes there have been known Four, or even Five or more. See FORTUS, EMEYO, &c.

**TWIST of a Rope, Cord, &c.** See ROPE, CORDAGE, CABLE, &c.

**TWIST**, is also used in Architecture, for a Piece of Timber, otherwise called a *Girdler*. See GIRDER.

**TWIST**, again, is used for the Inside, or flat Part of a Mao's Thigh, upon which a true Horseman rests when on Horse-back. See THIGH.

To **TWIST a Horse**, is violently to wring or twist his Testicles twice about, which causes them to dry up, and deprives them of Nourishment, and reduces the Horse to the same State of Impotency with a Gelding. See GELDING.

**TWISTING of Silk, &c.** see SILK, &c.

**TYCHONICK System**, or *Hypotesis*, is an Order or Arrangement of the heavenly Bodies, of an intermediate Nature between the *Copernican* and *Ptolomaic*, or participating alike of them both. See SYSTEM.

It takes its Name from *Tycho Brahe*, a noble Dane; of whom his Account is hereafter given, under the Article URANIBOURG.

In this System, the Earth is, with *Proxyma*, placed in the Middle, and suppos'd immovable; and the Sun and Moon to revolve in Orbits, respecting the same as a Centre: But the other five Planets are suppos'd, with *Copernicus*, to revolve round the Sun as their Centre. — So that the Orbits of the three superior Planets include the Earth, but not those of the inferior ones; by reason they are nearer to the Sun than the Earth is.

Accordingly, the Heavens are here suppos'd to be fluid; and to consist of three different Orbs or Spheres; the first moveable, suppos'd to make a Revolution in 24 Hours; the second the Sphere of the Planets; and the third the Firmament, or Region of fix'd Stars.

See the *Disposition of the heavenly Bodies in this System*, represented in *Plate Astronomy*, Fig. 45.

Some later Astronomers finding the *Ptolomaic* System disagree with the Phenomena; and not daring to make the Earth move; but at the same time disliking the *Tychonic* Notion of two Centres, one of them moveable, viz. the Sun; and the other fix'd, the Earth; have fram'd a new System out of the *Ptolomaic* and *Tychonic*, call'd the *Semi-Tychonic*; wherein, not only the Sun and Moon, but *Jupiter* also, and *Saturn*, are suppos'd to move in Excentrics or Deficients, respecting the Earth as a Centre, tho' revolvant at the same time in their respective Epicycles. — But even here, the inferior Planets are still suppos'd to move round the Sun as their Centre; their Phases, observ'd with the Telescope, being no otherwise accountable for.

**TYLE or TILE**, in Building, a sort of this fictitious Stone, used in the Roofs, &c. of Houses; or, more properly, it is a kind of fat, clayey Earth, kooden and moulded of a just Thickness, dried and burnt in a Kilo, like a Brick, and used in the Covering of Houses. See BRICK and COVERING. It is thus call'd from the *French*, *Tuile*, of the *Latin*, *Tegula*.

*Tyles* are made, says *M. Leybourn*, of better Earth than Brick-earth, and something nearer akin to the Potter's Earth. — According to Stat. 17 *Edu*. IV. the Earth for *Tyles* should be cast up before the first of *November*, shired and turned before the first of *February*, and not made into *Tyles* before the first of *March*; And should likewise be tried and sever'd from Stones, Marle and Chalk.

For the Method of *Burning them*, see BRICK.

As to the applying of *Tyles*; some lay them dry, as they come from the Kilo, without Mortar or any thing else; Others lay them in a kind of Mortar made of Leam and Horse-dung. — In some Parts, as in *Kent*, they lay them in Mofs.

There are various Kinds of *Tyles*, for the various Occasions of Building; as *Plain*, *Thick*, *Ridge*, *Roof*, *Crest*,

*Gutter*, *Pan*, *Crooked*, *Flemish*, *Corner*, *Hip*, *Dormer*, *Dormer Scallop*, *Astragal*, *Traverse*, *Paving* and *Dutch Tyles*.

*Plain* or *back Tyles*, are those in ordinary Use for the Covering of Houses. They are square'd flat, while yet soft, in a Mould. — They are of an oblong Figure, and by Stat. 17 *Edu*. IV. are to be 10 1/2 Inches long; 6 1/2 broad, and Half an Inch and Half a Quarter thick. But these Dimensions are not over-strictly kept to.

*Ridge*, *Roof* or *Crest Tyles*, are those used to cover the Ridges of Houses; being made circular breadth-wise, like a half Cylinder. — These are what *Pliny* calls *Laternis*; and are, by Statute, to be 12 Inches long, and of the same Thickness with the *Plain Tyles*.

*Hip* or *Corner Tyles*, are those which lie on the Hips or Corners of Roofs. — As to Form; they are first made flat, like *Plain Tyles*, but of a Quadrangular Figure, whose two Sides are right Lines, and two Ends, Arches of Circles, one End being a little Concave and the other Convex; the convex End to be about Seven times as broad as the concave End; so that they would be Triangular, but that one Corner is taken off: Then, before they are burnt, they are bent on a Mould, breadthwise, like *Ridge Tyles*. — They have a Hole at their narrow End, to nail them on by; and are laid with their narrow End upwards. By Statute, they are to be 10 1/2 Inches long, and of a convenient Breadth and Thickness.

*Gutter Tyles*, are those which lie in Gutters or Valleys in Cross-buildings. — They are made like *Corner Tyles*, only the Corners of the broad End are turned back again with two Wings. — They have no Holes in them, but are laid broad End upwards, without any nailing. — They are made in the same Mould as *Corner Tyles*, and have the same Dimensions on the convex Side. Their Wings are each 4 Inches broad and 8 long.

*Pan*, *Crooked*, or *Flemish Tyles*, are used in covering of Sheds, Lean-to's, and all kinds of flat-roofed Buildings. — They are in Form of an oblong Parallelogram, as *plain Tyles*; but are bent breadth-wise forwards and backwards, in Form of an S, only one of the Arches is at least three Times as big as the other; which biggest Arch is always laid uppermost; and the lesser Arch of another *Tyle* lies over the Edge of the great Arch of the former. — They have no Holes for Pins, but hang on the Laths by a Knot of their own Earth: They are usually 14 1/2 Inches long, and 10 1/2 broad.

*Dormer*, or *Dormer Tyles*, consist of a plain *Tyle*, and a triangular Piece of a plain *Tyle*, standing up at right Angles to one Side of a plain *Tyle*, and swept with an Arch of a Circle from the other End, which End terminates in a Point. — Of these *Tyles* there are two Kinds; the triangular Piece, in some, standing on the right, in others on the left Side of the plain *Tyle*. — And of each of these, again, there are two Kinds; some having a whole plain *Tyle*, others but half a plain *Tyle*. But in them all, the plain *Tyle* has two Holes for the Pins, at that End where the broad End of the triangular Piece stands.

Their Use is to be laid in the Gutters, betwixt the Roof and the Cheeks or Sides of the Dormers, the plain Part lying on the Roof, and the triangular Part standing perpendicularly by the Cheek of the Dormer. — They are excellent to keep out the Wet in those Places, and yet are not perhaps known any where but in *Staffes*. — The Dimensions of the plain *Tyle* Part are the same as those of a plain *Tyle*, and the triangular Part is of the same Length, and its Breadth at one End 7 Inches, and at the other nothing.

*Scallop* or *Astragal Tyles*, are in all respects like plain *Tyles*, only their lower Ends are in Form of an Astragal, viz. a Semicircle, with a Square on each Side. — They are us'd in some Places for Weather *Tyling*.

*Traverse Tyles*, are a kind of irregular plain *Tyles*, having the Pin-holes broke out, or one of the lower Corners broke off. — These are laid with the broken End upwards, upon Rafters, where pinn'd *Tyles* cannot hang.

*Flemish* or *Dutch Tyles*, are of two Kinds, ancient and modern. — The first were used for Chimney-foot Foot-places: They were painted with antick Figures, and frequently with Pictures of Soldiers, some with Compartments, and sometimes with Mosaicque Devices; but came much short, both as to the Design and Colours of the modern ones.

The modern *Flemish Tyles* are commonly used, plaister'd up in the Jaumbs of Chimneys, instead of Chimney-Corrections. — These are better glaz'd; and such as are painted (for some are only white) much better perform'd than the ancient ones.

But both Kinds seem to be made of the same whitish Clay as our white glazed Earthen Ware. — The ancient ones are five Inches three Quarters square, and about three Quarters of an Inch thick: The modern ones fix Inches and half square, and three Quarters of an Inch thick.

**TYLERY.** See TYLLERIE.  
**TYLWITH**, in Matters of Heraldry and Descent, is sometimes us'd for a Tribe or Family branching out of another;

ther; which the modern Herolds more usually call the second or third Houfe.

**TYMBER** of *Skins*, is the Number of forty Skins. See **TIMBER**.

**TYMPAN**, or **TYMPANUM**, in Architecture, the Ground or Area of a Pediment; being that which is in a Level with the Naked of the Frieze. Or it is the Space included between the three Cornices of a triangular Pediment, or the two Cornices of a circular one. See **PEDIMENT**.

Sometimes the *Tympan* is cut out, and the Part fill'd with an Iron Lattice to give Light; and sometimes it is enrich'd with Sculpture, in Bas Relief, as in the West Front of St. Paul's, in the Temple of *Castor* and *Pollux* at Naples, &c.

The Word **TYMPAN** is also us'd for that Part of a Pedestal call'd the *Trunk* or *Dye*. See **PEDESTAL**. See also **DYE**.

**TYMPAN**, among Joiners, is also attributed to the Panels of Doors. See **PANNEL**.

**TYMPAN**, among Printers, is a Frame belonging to the Press, cover'd with Parchment, on which every Sheet is placed, in order to be printed off. See **PRINTING Press**.

**TYMPAN** of an *Arch*, in Architecture, is a triangular Space or Table in the Corners or Sides of the Arch; usually hollow'd and enrich'd, sometimes with Branches of Laurel, Olive-tree, or Oak; or with Trophies, &c. sometimes with flying Figures, as Fame, &c. or sitting Figures, as the Cardinal Virtues. See **ARCH**.

**TYMPANITES**, or **TYMPANT**, in Medicine, a Stituous Tumor, or Swelling of the Abdomen, or Belly; very hard, equable, and permanent; whereby the Skin is stretch'd so tight, that when struck, it gives a Sound like that of a Drum. See **TUMOR**.

The *Tympanites* is a Species of a Dropsy; but what the Cause and Seat of the Disease is, or what the morbid Matter is that occasions the Tumor, Physicians are not at all agreed. See **DROPSY**.

Wind certainly makes a principal Part of the morbid Matter; but this is scarce ever found without Water, excepting at the Beginning; so that some will not allow of any Difference between the *Tympany* and the *Ascites*.

Some suppose it to arise from a watery Humour extravasated and rarify'd into Vapour; and by a Property common to it with common Air, corrupting the Parts.

But this *Boerhaave* makes a particular Kind of *Tympanites* or Water Dropsy; and adds, that it is cured like the *Ascites* or Water Dropsy, by Tapping, &c. See **TAPPING** and **ASCITES**.

Others will have the *Tympanites* to arise from the Air's insinuating itself thro' Perforations in the putrid Intestines. — A *Tympanites* from this Cause, *Boerhaave*, who makes it a peculiar Class, observes, is almost always incurable.

*Willis* sets aside this latter Cause, and accounts for the Disease from an Irregularity in the Animal Spirits belonging to the Viscera, which rushing tumultuously into the nervous Fibres, blast them up: Thus is the Peritoneum inflated, the Intestines distended, and the Mesentery, and other Viscera, render'd turgid; and while this is doing, that the Vacuities left in the tumify'd Viscera may be fill'd up, a Quantity of the Humour contain'd in them is rarify'd into Vapour, which presently spreads in Blasts through the vacant Places.

Others account for the *Tympanites* from a Convulsion of the Muscles of the Abdomen, &c.

*Litre* has propos'd a new System of the *Tympanites*, built on a great Number of Observations. — According to him, it does not proceed from any Convulsion of the Abdominal Muscles, nor from any Air contain'd in the Cavity thereof, or in the Thorax, the Mesentery, or Epiploon; but from the Air inclus'd in the Stomach and Intestines, which swells them excessively.

This Air, always carry'd into those Parts with the Food, maintains a kind of Equilibrium therein; opposing, on the one Hand, the too great Pressure on that long Canal when empty of Food; and finding, on the other Side, in the Spring of the Coats of the Stomach and Intestines, an Obstacle capable of preventing its too great Dilatation.

If this Equilibrium chance to be destroy'd by the Irritation of the Fibres, whose Spring in that Case prevails over that of the Air; this latter is expell'd either upwards or downwards, or both; (whence Belching, &c.) But if the Equilibrium come to be broke by the Force of the Air, render'd superior to that of the Fibres, by those latter being less destitute of Spirits, from the Blood's being impoverish'd after a long Sickness; in that Case, the Air, rarifying itself beyond Measure, swells the Cavities it is contain'd in.

If it be demand'd, Why when the Stomach and Intestines are so full of Wind, none of the Wind escapes, either thro' the Anus, or by the Mouth, which uses to be expell'd by those Passages?

*M. Mer* solves the Paradox thus: According to this Theory, the Fibres, both of the Stomach and Intestines have lost their Spring, at least in Part, and are in an imperfect Palsy; but the Winds evacuated either by the Anus or Mouth, are Winds which those Viscera expel out of their Cavities, by

putting them in a State of Contraction capable of surmounting the Forces which oppose the Egress of the Matters contain'd in those Cavities. — These Forces are two Sphincters, one whereof shuts the upper Orifice of the Stomach, and the other the Anus: But paralytic Viscera, i. e. Viscera destitute of Spirits, in which alone consists the Strength of the Muscles, cannot overcome the Resistance of those two Muscles: Whence the Wind, therefore, cannot escape thro' its usual Out-lets.

The *Tympanites* rarely kills of itself; but frequently degenerates into an *Ascites*. — Catharticks rather aggravate than alleviate it: Antihystericks, Anticorbuticks, Chalybeats, and Strengtheners are of use, before it be fallen into an *Ascites*. Equal Quantities of Loak and Elder Leaves mix'd analytically, is a fam'd Empirical Medicine, which has often prov'd effectual when every thing else had fail'd.

'Tis usual to apply Carminatives to the Belly, as the Emplaster of Camin-Seed, &c. and also to use Carminatives mix'd with Catharticks, Diuretics, &c. internally: But if the Disease proceed from a Paralytic Cause, destroying the Tone of the Fibres of the first Passages, what is of Use in rectifying of Paralytic Disorders, where the Tension of the Fibres are insufficient, will doubtless for the same Reason be of Use here. See **PALSY**.

**TYMPANUM**, *noymen*, *Drum*; a musical Instrument, which among the Ancients, consisted of a thin Piece of Leather or Skin, stretch'd upon a Circle of Wood or Iron, and beat with the Hand. See **DRUM**.

**TYMPANUM**, *TYPAN*, in Mechanicks, is a kind of Wheel plac'd on an Axis or Cylindrical Beam, on the Top of which are two Levers or fix'd Staves, for the more easy turning the Axis about, in order to raise a Weight requir'd. See **WHEEL**.

The *Tympanum* is much the same with the Peritrochium; but that the Cylinder of the Axis of the Peritrochium is much shorter and lesser than the Cylinder of the *Tympanum*. See **PERITROCHIUM**.

**TYMPANUM** of a Machine, is also us'd for any hollow Wheel, wherein one or more People, or other Animals, walk to turn it; such as that of some Cranes, Calanders, &c. See **WHEEL**.

**TYMPANUM**, in Anatomy, or *Membrana TYMPANI*, is a thin tender Skin or Membrane, stretch'd upon a Bony Circle, in the Meatus Auditorius of the Ear, which it shuts; and suppos'd to be the immediate Organ of Hearing. See **E.A.R.**

The *Tympanum*, popularly call'd the *Drum*, with respect to the erect Posture of the Body, is situate obliquely, facing downwards; whence it is that we hear Sounds coming from below, better than those from above. See **DRUM**.

Its external Surface is a little hollow'd in the Middle. — It is compos'd of two Membranes; or, as others will have it, of only two or more Lamellae. — It has a Perforation, or, at least, a disengag'd Part, which admits of the Passage of Wind, and, in some, of Smoak from the Meatus *Palata*.

Behind it is a Cavity of the Os Petrosium, call'd *Tympani Cavitas*, and by some simply *Tympanum*; wherein are four little Bones, viz. the *Malleolus*, *Incus*, *Stapes*, and *Os Orticulare*: Which see under their respective Articles, **MALLEOLUS**, &c.

Within the *Cavitas Tympani*, *Vicuffens* has discover'd a very fine thin Membrane, serving to shut the Door of the Labyrinth, and prevent the internal Air from having any Communication with the external. — The *Alveolaris Tympani* has a remarkable Branch of a Nerve passing on its internal Surface between the *Incus* and *Malleolus*, call'd the *Chorda Tympani*. See **CHORDA**.

The *Tympanum*, *Dr. Willis* takes to be a kind of preparatory Instrument to Hearing; and its Office to be to receive the first Impressions of the Sound, or the sensible Species, and to convey them duly modify'd and proportion'd to the Sensorium. See **SOUND**.

Its Office, in effect, with respect to the Sense of Hearing, seems to be the same as that of the Pupil of the Eye with regard to Seeing: Each of them prevent the Ingress of too many Rays, temper and soften them, and deliver them, as it were, commensurate to the Sensory; upon which, if they should fall immediately, they might be apt to spoil its delicate Constitution. See **PUPIL**.

The *Tympanum*, it's true, does not hear; but it contributes to the better and safer Hearing. — That it may do the Office of a Porter the better, 'tis necessary its Expanse should, like the Pupil, be contracted and relax'd on Occasion; and to this purpose serve the four little Bones above mention'd, which have the same Use in straining and relaxing, as the Braces of the War Drum have in that Instrument. — By means of this Extension and Retraction, the *Tympanum* is made to correspond to all Sounds loud or longuid; as the Pupil does to all the Degrees of Light. See **HEARING**.

But what makes the Use of the *Tympanum* appear the less considerable, is, that there are Influences where the Hearing has been perfect without any Use of a *Tympanum*. — *Mr. Chesden* relates, that he broke the *Tympanum* in both Ears of

of a Dog, yet it did not destroy his Hearing; tho' for some time afterwards he receiv'd strong Sounds with great Horror: He adds, that Mr. St. Andre assur'd him, that a Patient of his had the Tympanum destroy'd by an Ulcer, and the Auditory Bones cast out, without destroying his Hearing.

TYPANY, or TYMPANITES, in Medicine. See TYMPANITES.

TYPE, a Copy of a Model, or a Figure of Character either engraven or printed. See MODEL, CHARACTER, &c.

The Term *Type* is less in use than its Compounds *Prototype* and *Archetype*, which are the Originals that are made without Models. See PROTOTYPE, &c.

The Word is form'd from the *Greek*,  $\tau\upsilon\pi\omicron\varsigma$ , Figure.

TYPE is also a School Term, much used among Divines, signifying a Symbol, Sign, or Figure of something to come.

In this Sense, the Word is commonly used with relation to *Antitype*,  $\alpha\upsilon\tau\omicron\tau\upsilon\pi\omicron\varsigma$ , which is the Thing itself, whereof that is a *Type* or Figure. See ANTI-TYPE.

Thus *Abraham's* Sacrifice, the Paschal Lamb, &c. were *Types* or Figures of our Redemption: The Brazen Serpent was a *Type* of the Cross, &c.

These *Types* were not simple Conformities or Analogies, which the Nature of Things sets on foot between them; nor arbitrary Images arising merely from the casual Resemblance of Things; but there is further requir'd a particular Institution of God to make a *Type*; a particular Declaration of his that it is so.

*Gale* divides *Types* into historical and prophetic. — The first are those used by the Prophets in their Agitations and Visions: The second, those wherein Things done, or Ceremonies instituted in the Old Testament, prefigure Christ, or Things relating to him in the New Testament.

The ancient Fathers, as well as the modern Critics, have been greatly divided about the Nature and Use of *Types*, and typical Representations, in the Old Testament; and 'tis this makes one of the great Difficulties in understanding the ancient Prophecies, and in reconciling the new and old Testament together. See PROPHECY.

There is no denying but that there were *Types* which the divine Wisdom instituted to be the Shadows and Figures of Things to come; and yet People run into an Excess that Way: Some looking for *Types* in every thing; like *Origen*, who discover'd Mysteries in the very Caldrons of the Tabernacle. — One should be contented with the more sensible and obvious ones; nor propose any without proving them as much as possible, and shewing that they were really intended for *Types*, in order to justify the Solidity of the Reasoning of the Apostles, who argu'd from them.

A late Author maintains, that not the Fathers only, but *St. Paul* himself was of the Opinion, that "Christianity" was all contained in the *Old Testament*, was implied in the "Jewish History and Law; both which are to be reputed *Types* and Shadows of Christianity." — In order to which, he quotes *Hebrews* viii. 5. x. 1, and *Co. ii.* 16, 17. — He adds "That the Ritual Laws of *Moses*, being in their own Nature no other than *Types* and Shadows of future good Things, are to be consider'd as having the Effect of Prophecies." — This is likewise the Sense of *Mr. Whiston* and others; but the same Author even quotes our Saviour speaking in behalf of this *Typical* Reasoning, in that Passage, *Matthew* xi. 13, where he affirms, that "The Law" prophecies; and that he came to fulfil the Law as well as the Gospel, *Matthew* v. 17. *Discourse of the Grounds and Reason of the Christian Religion.*

An ingenious Divine takes this Occasion to observe, that had the Ancients, with the modern Retainers to the *typical* Way, expressly design'd to have expos'd Christianity, they could not have done it more effectually than by thus making every thing *Types* and Prophecies. — 'Tis no wonder, he adds, that Atheists and Deists scoff at the Credulity of Christians, and reject what is supported by such Folly and Absurdity.

Not that he denies the Reality of such Things as *Types*. — 'Tis manifest, there were many under the *Old Testament*, such were *Zachariah's* Staves, Beauty and Bands, *c. xii.* 7, 10, 14; such was *Holbah's* Adulterous Wife, *c. i.* 2; and such were his Children, *v. 4, 6*. — The Prophets design'd by these to prefigure future Events; but in these Instances the Reader is at once, by the Declaration of the Prophet, made to understand as much, and not left to his own Conjectures about them, after the Events are over.

In effect, all that is urg'd from Scripture for the *typical* or allegorical Interpretations of the Jewish Law, History, Ceremonies, &c. 'tis asserted, may be set aside, without any Violence to the sacred Text, which may be explain'd on more natural and intelligible Principles, and more consistently with Grammar. See ALLEGORICAL.

The Word  $\tau\upsilon\pi\omicron\varsigma$ , we have observed, literally denotes no more than a Copy or Impression of any thing; and accordingly, in our Translation, we find it sometimes render'd by *Print*, sometimes by *Figure*, sometimes by *Fashion*, and

sometimes by *Form*. — Hence, also, the Word is figuratively applied to denote a moral Pattern; in which Sense it signifies no more than *Example* and *Similitude*.

Again, the Word *τύπος*, in Scripture, signifies any thing form'd according to a Model or Pattern; and thus in the Epistle to the *Hebrews*, the Tabernacle, and Holy of Holies being made according to the Pattern shewn to *Moses*, are said to be *Antitypes* or Figures of the true Holy Place. — In the like Sense, *St. Peter* speaking of the Flood and the Ark, whereby Eight Persons were saved, calls *Baptism* an *Antitype* thereto; by which he expresses no more than a *Similitude* of Circumstances.

The other Words used in Scripture to imply a future Event, prefigured by some foregoing Act, are — *τύπος*, render'd by Imitation and Example; and *σῆμα*, Shadow.

This last Word is frequently used by *St. Paul*, and applied to the Jewish Law, Ceremonies, Priest, &c. which are represent'd as only *Shadows* of Things to come, or of heavenly Things. 'Tis from such general Expressions, that People were led to mistake the Apostles Design in these Comparisons, and to assert, that all the *Mosaic* Rites were *Types*, or design'd to signify future Events; and that the Gospel is to be found in the Pentateuch. — Whereas *St. Paul's* Intent appears no other than to shew the great Advantage of the Gospel over the Law in several Particulars, wherein it has as much Pre-eminence as the Substance has over the *Shadow*.

If the *Shadows* of Things to come, signify a Prefiguration of future Events, what are those Events to which the Jewish New Moons, *Col. ii.* 16. or the Jewish Meats and Drinks, have a respect? Or, how did the Law of *Moses*, made up of Commands about Persons, Times, Places, and Sacrifices, prefigure a Dispensation, where regard to Sacrifices, holy Persons, Times and Places, are so far from being enjoy'd, that they are declared useless? Can a particular holy Place in the Law, be design'd a Prefiguration of a State, where all Places are equally Holy?

Such being the Import of all the Terms used in the *New Testament* Writers seeming to imply any Prefiguration of future Events under the Gospel, we may observe,

1<sup>o</sup> That to argue from *Types*, is only to argue from Examples or Similitudes, and, consequently, all Inferences drawn from such Reasoning, are no farther conclusive, than Reasonings from Similitudes are. — The Intent of Similitudes is only to help to convey some Ideas more clearly or strongly; so that to deduce Consequences from a Simile, or infer any thing from other Parts of the Simile than what are plainly similar, is absurd.

2<sup>o</sup> It cannot be proved that the Ceremonies of the *Mosaic* Law, were ever design'd to prefigure any future Events in the State of the *Messiah's* Kingdom. — No such declared Prefigurations are mention'd in the Writings of the *Old Testament*; whatever Notions prevailed among the Writers, who immediately followed. 'Tis granted, that the Apostles argu'd from the Rites in the *Mosaic* Institution; but it appears to have only been by way of Illustration and Analogy.

There is certainly a general Likeness in all the Dispensations of Providence; an Analogy of things in the Natural as well as the Moral World, from which it is easy arguing by way of Parity, and 'tis very just and usual for to do: But that one of these Dispensations was therefore given to prefigure another that was future, can never be proved, unless it be expressly declared. — The Land of Promise, we know, was to be a Place where the Jews were to enjoy Rest from their Labours; God likewise did, himself, rest the Seventh Day from his Works: Yet, whoever imagin'd God's Rest from the Creation to be prefigurative of the Jews Rest in *Canaan*; and is it not equally reasonable to say, that God's Rest on the Seventh Day, prefigur'd the Entrance of the Jews into *Canaan*, as to say, that the Jews Rest in *Canaan* prefigur'd the Rest mention'd by *David* in the *Psalms*!

This will equally imply, that all the following Events in the uniform Course of God's Government, similar to any preceding ones, were design'd to be prefigur'd; in which Sense, it will readily be own'd, that the Rest of the Jews was *Typical* of the Rest of Christians.

'Tis in the same manner we are to understand *St. Paul's*, where he says, "That Christ our Passover is sacrificed for us." And thus we are to understand *John* the *Baptist*, when he calls our Saviour the "Lamb of God." — There was this Similitude of Circumstances, that Christ was slain on the same Day with the Paschal Lamb; that he died about the same time of the Day when the Priests began their Hallel; that not a Bone of the one, or the other was broken. Add, that as the Paschal Lamb was without Blemish, so was Christ without Sin. — From these and other Circumstances, the Apostles applied the Term *Passover* to Christ.

Thus, also, are we to account for what *St. Paul* calls the Baptism of the Children of *Israel* in the Cloud, and in the

Sea; and for the Comparison betwixt the High Priest entering the Holy Place every Year, and Christ entering into Heaven. See QUOTATION.

TYPE is also a Name given to an Edict of the Emperor *Constantine*, publish'd in 648, to impose a general Silence both on the Orthodox and the Monothelites.

The *Type* ow'd its Original to *Paul* Patriarch of *Constantinople*, who persuaded that Emperor to take away the *Ectesis* compiled and hung up in all the public Places by *Heraclius*; (as occasioning great Complaints from the Orthodox, by its favouring the Monothelites) and to publish an Edict to impose Silence on both Parties.

But such kinds of Pacifications are held inexcusable in Matters of Religion; accordingly Pope *Theodore* soon procur'd the Patriarch *Paul* to be depos'd: The *Type* was examin'd in the Council of *Rome* in 649, and condemn'd; and an Anathema pronounc'd against all such as admitted either the impious *Ectesis* or *Type*. See ECESIS.

It had the Name *Type*, as being a kind of Formulary of Faith; or rather a Form whereon Men were to regulate their Conduct.

TYPE, TYPUS, is sometimes also us'd for the Order observed in the Intermixtion of Pulses, Fevers, &c. See PULSE and FEVER.

TYPHOIDES, in Medicine, an ardent or burning Fever. See FEVER.

TYPHOMANIA, in Medicine, a Disease of the Brain, wherein the Patient not being able to sleep, tho' greatly inclin'd thereto, lies with his Eyes shut, talks absurdly, and flings himself this Way and that.

If he be pull'd, or the like, he just opens his Eyes, looks about, and sinks again into a kind of dozing, which is interrupted by a Train of disagreeable Imaginations.

A *Typhomania* frequently takes Place in Fevers, Phrenzies, and the like Diseases. — 'Tis also call'd a *Coma Vigil*. See COMA.

The Word is form'd from the *Greek*, τυπος, Smock, and τυπις, Madess.

TYPOGRAPHY, the Art of Printing. See PRINTING.

The Word is form'd from the *Greek*, τυπος and γραφω, scriptura, Writing.

TYRANT, TYRANNUS, among the Ancients, denoted simply a King or Monarch. See KING and MONARCH.

But the ill Use several Persons invested with that sacred Character, made of it, has alter'd the Import of the Word; and *Tyrants* now carries with it the Idea of an unjust and cruel Prince, who invades the Peoples Liberty, and rules in a more despotick Manner than the Laws of Nature or the Country do allow of.

The Term *Tyrants*, we are told, became odious among the *Greeks*, those zealous Lovers of Liberty, almost as soon as introduc'd: But *Donatus* assures us, it was never taken so among the *Romans* till the latter Ages of that Empire.

TYRIAN Purple. See PURPLE.

TYRO. See TYROCINIUM.

TYROCINIUM, TYROCINY, a Novitiate or Apprenticeship in any Art or Science. See NOVICE and NOVITIATE.

We have several Writings under the Title of *Tyrociniums*: *Tyrocinium Olynthicum*, *Tyrocinium Chirurgicum*, &c. containing the Rudiments of those Arts, accommodated to the Apprehensions of Beginners.

The Word is form'd of *Tyro*, a raw, fresh-water Soldier. TYROSIS, in Medicine, a Coagulating or Curdling of Milk in the Stomach; after the Manner of Cheese. See CURDLING and COAGULATION.

The Word is form'd of the *Greek*, τυρος, *Cheese*, Cheese. See CHEESE.

TYTH, or rather TITHE. See TITHE.

TYTHING and TYTHING-Men. See DECENNA, TEMMENTALE, HUNDRED, WAFFENTAR, &c.

## V A C

## V A C

**U,** THE twentieth Letter in the Alphabet, and the fifth Vowel. See LETTER, and VOWEL.

Besides the Vowel U, there is a Consonant of the same Denomination, wrote V, or U. See CONSONANT.

The Pronunciation of the U, as now used among the English, French, &c. is borrow'd from the ancient Gauls: for all the other Western People, with the Romans, pronounce it ou.

V is also a Numeral Letter, and signifies five; according to the Verse,

V, vero quinque dabit tibi, si recte numerabis.

When a Dash was added a-top,  $\bar{V}$ , it signified 5000.

V. R. among the Romans, stood for *Voti Reges*, as you desire: which was the Mark of a Vote, or Suffrage for the passing of a Law. See ROGATIO; see also A.

VACANCY, or VACUUM, in Philosophy, an empty Interval, or Space void of Matter. See VACUUM.

VACANCY, in Law, &c. a Post or Benefice wanting a regular Officer, or Incumbent. See OFFICER, &c.

The Canonists hold, that the Kind of Vacancy is to be express'd in the Impetration of a Benefice. See BENEFICE. A Future Vacancy, or Voidance of a Spiritual Living, some Writers call *Vacatura*.

Devolution is a Species of Canonical Vacancy. See DEVOLUTION.

VACANT Effects, *Prædia Vacua*, are such as are abandon'd for want of an Heir, after the Death or Flight of their former Owner. See RESIGNATION, &c.

In our Law-Books, *Vagantes Terræ*, for *Vacantes*, express forsaken or uncultivated Lands.

A Benefice is said to be vacant, in *Curia Romana*, when the Incumbent dies in Rome, or within 20 Leagues thereof; tho it be only by Accident that he was there.

The Pope nominates to all Benefices vacant in *Curia Romana*; excepting those of the neighbouring Bishopsricks.

VACATION, *Non-Term*, in Law, is all the Time, respectively, included between the End of every Term, and the Beginning of the next succeeding one. See TERM, and *Non-Term*.

This Intermission was call'd by our Ancestors *Pax Dei*, and *Ecclesie*; and sometimes the *Times or Days of the King's Peace*.

Among the Romans, it was call'd *Iustitium*, or *Feria*, or *Dies Nefasti*. See DAY; see also FASTUS.

The Time from the Death of a Bishop, or other Spiritual Person, till the Bishoprick or other Dignity be supplied by another, is also call'd *Vacation*. See PLENARY.

Cicero, in his *Orations*, mentions a Law, whereby the Priests were exempted from Service in all Wars, except only Upstarts and Civil Tumults; which Exemptions he calls *Vacationes*.

VACUUM, VACUITY, in Physics, a Space empty, or devoid of all Matter, or Body. See SPACE, and MATTER.

Whether there be any such Thing in Nature as an absolute Vacuum; or whether the Universe be completely full, and there be an absolute Plenum; is a thing has been controverted by the Philosophers of all Ages. See PLENUM.

The Antients, in their Controversies, distinguish two Kinds; a *Vacuum Coætervatum*, and a *Vacuum Interpersum*, or *Disseminatum*.

*Vacuum Coætervatum* is conceiv'd as a Place destitute of Matter: Such, e. g. as there would be, should God annihilate all the Air and other Bodies within the Walls of this Chamber.

The Existence of such a Vacuum is maintain'd by the Pythagoreans, Epicureans, and the Atomists, or Corpuscularians; most of whom assert such a Vacuum actually to exist without the Limits of the sensible World. But the modern Corpuscularians, who hold a *Vacuum Coætervatum*, deny that Application; as conceiving, that such a Vacuum must be Infinite, Eternal, and Uncreated. See UNIVERSE.

According, then, to the later Philosophers, there is no *Vacuum Coætervatum* without the Bounds of the sensible World; nor would there be any Vacuum, provided God should annihilate divers contiguous Bodies, than what a-

mounts to a mere Privation, or Nothing: The Dimensions of such a Space, which the Antients held to be real, being by these held to be mere Negations; that is, in such a Place, there is so much Length, Breadth, and Depth wanting, as a Body must have to fill it. To suppose, that when all the Matter in a Chamber is annihilated, there should yet be real Dimensions; is to suppose Corporeal Dimensions without Body, which is absurd.

The Cartesian, however, deny any *Vacuum Coætervatum* at all; and assert, that if God should immediately annihilate all the Matter, e. g. in this Chamber, and prevent the Ingress of any other Matter, the Consequence would be, that the Walls would become contiguous, and include no Space at all. They add, that if there be no Matter in a Chamber, the Walls can be conceiv'd no otherwise than as contiguous; those Things being said to be contiguous, between which there is not any thing intermediate: But, if there be no Body between, there is no Extension between; Extension and Body being the same thing: and if there be no Extension between, then the Walls are contiguous; and where's the *Vacuum*?

But the Reasoning is built on a Mistake, viz. that Body and Extension are the same thing. See EXTENSION, and SPACE.

*Vacuum Disseminatum*, or *Interpersum*, is that suppos'd to be naturally interspers'd in, and among, Bodies, in the Pores of the same Body, and in the Interstices between different Bodies. See PORE.

'Tis this kind of Vacuum which is chiefly disputed among the modern Philosophers: The Corpuscularians strenuously asserting it; and the Peripateticks and Cartesian as flimsily impugning it. See CORPUSCULAR, CARTESIAN, &c.

The great Argument the Peripateticks urge against a *Vacuum Interpersum*, is, that there are divers Bodies frequently seen to move contrary to their own Nature and Inclination; and for no other apparent Reason, but to avoid a Vacuum: whence they conclude, that Nature abhors a Vacuum; and give us a new Class of Motions ascrib'd to the *Fuga Vacui*, or Nature's flying a Vacuum. See FUGA.

Such is the Rise of Water in a Syringe, upon drawing up the Piston; such also is the Ascend of Water in Pumps, the Swelling of the Flesh in a Cupping-Glass, &c.

But since the Weight, Elasticity, &c. of the Air, have been ascertain'd by late Experiments; those Motions and Effects are universally ascrib'd to the Gravity, and Pecture of the Atmosphere. See AIR; see also SYRINGE, PUMP, CUPPING GLASS, &c.

The Cartesian deny not only the Actual Existence, but even the Possibility of a Vacuum: and that on this Principle, That Extension being the Essence of Matter, or Body, wherever Extension is, there is Matter: But mere Space, or Vacuity, is suppos'd to be extended; therefore it is material. Whoever denies an empty Space, conceives Dimensions in that Space, i. e. conceives an extended Substance in it; and therefore admits a Vacuum, at the same time that he admits it.

On the other hand, the Corpuscular Authors prove, not only the Possibility, but the Actual Existence of a Vacuum, from divers Considerations; particularly, from the Consideration of Motion, in general; and that of the Planets, Comets, &c. in particular; from the Fall of Bodies; from the Vibration of Pendulums; from Rarefaction and Condensation; from the different Specific Gravities of Bodies; and from the Diffusibility of Matter into Parts.

1<sup>o</sup>. 'Tis argued, that Motion could not be effected without a Vacuum. See MOTION.

This is what Lucretius urg'd long ago,—*Principium quoniam cedenadi nulla daret res—undique materies quoniam stipata fuisset.*

The Force of this Argument will be increas'd from the two following Considerations, viz. first, that all Motion is either in a straight Line; or in a Curve, which returns into it self, as the Circle, and Ellipsis; or in a Curve that does not return into it self, as the Parabola, &c. And, secondly, that the moving Force must always be greater than the Resistance.

For, hence it follows, that no Force, even the infinite, can produce Motion where the Resistance is infinite; consequently, there can be no Motion either in a straight Line, or a

non-returning Curve; because in either of those Cases, the Protrusion, and consequently the Resistance, would be infinite. There remains, therefore, only the Motion in a revolving Curve practicable; which must either be a Revolution upon an Axis, or an annular Motion round a quiescent Body; both which are, again, impossible in an Elliptic Curve; And consequently, all Motion must be in Circles geometrically true; and the revolving Bodies must either be Spheres, Spheroids, Cylinders, or Portions of them, exactly geometrical; or otherwise, their Revolutions in a *Plenum* would be impossible: But such Motions, or such figur'd Bodies, we do not know in Nature. Therefore there is a *Vacuum*.

2<sup>o</sup>. The Motions of the Planets and Comets demonstrate a *Vacuum*: Thus Sir I. Newton argues; 'That there is no such fluid Medium as Ether, (to fill up the porous Parts of all sensible Bodies, as the Air and interstellar Parts, and so make a *Plenum*)' seems probable; because the Planets and Comets proceed with so regular and lasting a Motion thro' the Celestial Spaces, both from and to all Parts: For hence it appears, that those Celestial Spaces are void of all sensible Resistance, and consequently of all sensible Matter. For the resisting Force of fluid Mediums, arises partly from the Attrition of the Parts of the Medium, and partly from the Inactivity of Matter. Now that Part of the Resistance of any Medium, which arises from the Tenacity or Attrition of its Parts, may be less'n'd by dividing the Matter into smaller Parts, and by rendering those Parts more smooth and slippery: But that Part of the Resistance which arises from the Inactivity of Matter, is always in proportion to the Density of the Matter; nor can be diminish'd by dividing the Matter, nor by any other means, except by diminishing the Density thereof.

Consequently, if the Celestial Regions were as dense as Water, or Quicksilver, they would resist almost as much as Water or Quicksilver; but if they were perfectly dense, without any *interpers'd Vacuity*, tho' the Matter were ever so fluid and subtile, they would resist more than Quicksilver does; a perfectly solid Globe, in such a Medium, would lose above half its Motion, in moving three Lengths of its Diameter; and a Globe not perfectly solid, such as the Bodies of the Planets and Comets are, would be stop'd still sooner. Therefore, that the Motion of the Planets and Comets may be regular and lasting, it is necessary the Celestial Spaces be void of all Matter, except perhaps some few and much rarified Effluvia of the Planets and Comets, and the passing Rays of Light. See RESISTANCE, MEDIUM, PLANET, COMET, &c.

3<sup>o</sup>. The same great Author deduces a *Vacuum* from the Consideration of the Weights of Bodies; thus; 'All Bodies about the Earth gravitate towards the Earth; and the Weights of all Bodies equally distant from the Earth's Centre, are as the Quantities of Matter in those Bodies.—If the Ether, therefore, or any other subtile Matter, were altogether destitute of Gravity, or did gravitate less than in proportion to the Quantity of its Matter: Because, (as Aristotle, Des Cartes, and others argue) it differs from other Bodies only in the Form of the Matter; the same Body might by the Change of its Form gradually be converted into a Body of the same Constitution with those which gravitate most in proportion to the Quantity of Matter: and on the other hand, the most heavy Bodies might gradually lose their Gravity, by gradually changing their Form; and therefore the Weights would depend upon the Forms of Bodies, and might be chang'd with 'em; which is contrary to all Experiment. See WEIGHT.

4<sup>o</sup>. The Descent of Bodies proves that all Space is not equally full; for the same Author goes on, 'If all Spaces were equally full, the Specific Gravity of that Fluid with which the Region of the Air would in that Case be fill'd, would not be less than the Specific Gravity of Quicksilver, or Gold, or any other the most dense Body; and therefore, neither Gold, nor any other Body, could descend therein. For Bodies do not descend in a Fluid, unless that Fluid be specifically lighter than the Body. But by the Air-Pump, we can exhaust a Vessel, till even a Feather shall fall with a Velocity equal to that of Gold in the open Air: The Medium, therefore, thro' which the Feather falls, must be much rarer than that thro' which the Gold falls.' See DESCENT.

The Quantity of Matter, therefore, in a given Space, may be diminish'd by Rarefaction; and why may not it be diminish'd in *infinitum*? Add, that we conceive the solid Particles of all Bodies to be of the same Density; and that they are only rarefiable by means of their Pores: 'Whence a *Vacuum* evidently follows.' See RAREFACTION, PORES, and PARTICLE.

5<sup>o</sup>. 'That there is a *Vacuum*, is evident from the Vibrations of Pendulums: For since those Bodies, in Places out of which the Air is exhausted, meet with no Resistance to retard their Motion, or shorten their Vibrations; 'tis evident there is no sensible Matter in those Spaces, or in the occult Pores of those Bodies. See PENDULUM.

For, as to what Des Cartes argues of his *Materia Subtilis*, that its Tenacity prevents its Resistance from being sensible, and that a small Body striking against a greater, cannot in the least move, or resist the Motion of that other; but is reflected back again with all its Momentum: 'tis contrary to all Experience. For Sir Isaac proves, that the Density of fluid Mediums, is proportionable to their Resistances very nearly; and that they are exceedingly mistaken, who suppose the Resistance of Projectiles to be infinitely diminish'd, by dividing the Parts of the Fluid, even in *infinitum*. (*Princip. Lib. II. Prop. 38.*) When, on the contrary, 'tis clear the Resistance is but little diminish'd by the Subdivision of the Parts (*Ibid. Prop. 40.*) and that the resisting Forces of all Fluids are nearly as their Densities. For why should not the same quantity of Matter, whether divided into a great number of subtile Parts, or into a few larger ones, have the same resisting Force? If then there were no *Vacuum*, it would follow, that a Projectile moving in the Air, or even in a Space whence the Air is exhausted, should move with as much difficulty as in Quicksilver; which is contrary to Experience. See PROJECTILE.

6<sup>o</sup>. 'That there are *interpers'd Vacuities*, appears from Matter's being actually divided into Parts, and from the Figures of those Parts: For, on Supposition of an absolute Plenitude, we do not conceive how any Part of Matter could be actually divided from that next adjoining, any more than it is possible to divide actually the Parts of absolute Space from one another: for by the actual Division of the Parts of a *Continuum* from one another, we conceive nothing else understood, but the placing those Parts at distances from one another which in the *Continuum* were at no distance from one another: But such Divisions between the Parts of Matter, must imply *vacuities* between. See DIVISIBILITY.

7<sup>o</sup>. As for the Figures of the Parts of Bodies, upon the Supposition of a *Plenum*, they must either be all Rectilinear, or all Concavo-convex; otherwise, they would not adequately fill Space; which we do not find to be true in Fact.

8<sup>o</sup>. The denying a *Vacuum* supposes what it is impossible for any one to prove to be true, *vis.* That the material World hath no Limits. See UNIVERSE.

Since, then the Essence of Matter does not consist in Extension, but in Solidity, or Impenetrability, the Universe may be said to consist of solid Bodies moving in a *Vacuum*: Nor need we at all fear, lest the Phenomena of Nature, most of which are plausibly accounted for from a Plenitude, should become inexplicable when the *Plenum* is set aside. The principal ones, such as the Tides; the Suspension of the Mercury in the Barometer; the Motion of the Heavenly Bodies, of Light, &c. are more easily and satisfactorily accounted for from other Principles. See TIDES, &c.

VACUUM, or VACUUM *Boyleannum*, is also used, somewhat abusively, to express that approach to a real *Vacuum*, which we arrive at by means of the Air-Pump. See AIR-PUMP.

Thus, any thing put in a Receiver so exhausted, is said to be put in *Vacuo*: and thus, most of the Experiments with the Air-Pump, are perform'd *in Vacuo*, or *in Vacuo Boyleano*.

Some of the principal Phenomena observ'd of Bodies in *Vacuo*, are; That the heaviest and lightest Bodies, as a Guinea and a Feather, fall here with equal Velocity:—That Fruits, as Grapes, Cherries, Peaches, Apples, &c. kept for any time in *Vacuo*, retain their Nature, Freshness, Colour, &c. and those wither'd in the open Air, recover their Plumpness in *Vacuo*:—All Light and Fire becomes immediately extinct in *Vacuo*:—The Collision of Flint and Steel in *Vacuo*, produces no Sparks:—No Sound is heard, even from a Bell rung in *Vacuo*:—A square Viol, full of common Air, will clos'd, break in *Vacuo*; a round one does not:—A Bladder half full of Air, will heave up 40 Pound weight in *Vacuo*:—Cats, and most other Animals, readily expire in *Vacuo*.

By Experiments made in 1704, Mr. Derham found, that Animals which have two Ventricles, and no *Foramen Ovale*, as Birds, Dogs, Cats, Mice, &c. die in less than half a Minute; counting from the first Exhalation: A Mole died in one Minute; a Bat liv'd seven or eight. Insects, as Wasps, Bees, Grasshoppers, &c. seem'd dead in two Minutes; but, being left in *Vacuo* 24 Hours, came to life again in the open Air: Snails continu'd 24 Hours in *Vacuo*, without appearing much concern'd.

Seeds planted in *Vacuo* don't grow:—Small Beer dies, and loses all its Taste in *Vacuo*:—Lukewarm Water boils very vehemently in *Vacuo*:—Air, rushing thro' Mercury into a *Vacuum*, throws the Mercury in a kind of Shower upon the Receiver, and produces a great Light in a dark Room. See ATTRITION, &c.

The Air-Pump can never produce a precise *Vacuum*; as is evident from its Structure, and the manner of its working: in effect, every Exhalation only takes out a part of the Air: so that there will still be some left, after any finite Number of Exhalations. Add, that the Air-Pump has no longer any effect,

effect, than while the Spring of the Air remaining in the Receiver, is able to lift up the Valves: When the Rarefaction is come to that degree, you can come no nearer to a Vacuum.

Sir I. Newton, observing that a Thermometer suspended in Vacuum, and in that State removed to a warm or a cold Room, receives the Heat or Cold, rises, or falls, almost as soon as another not in Vacuum; takes thence occasion to suspect, that the Heat of the warm Room is convey'd thro' the Vacuum by the Vibrations of a much subtiler Medium than Air, which remain'd in the Vacuum after the Air was drawn out. (Opt. p. 325.) See MEDIUM, HEAT, &c.

VADARI, in the Civil Law, denotes a Person to pledge, undertake, or give Security in behalf of another; that he shall, on a certain Day, appear in Court, to prosecute, or answer.

If he fails, his Surety has *Actioem Vadimonii deserti* against him; that is, an Action for deserting his Bail. See VADIMONIUM, and BAIL.

Properly speaking, the *Vadari Remm*, among the Romans, was the Act of the Plaintiff himself, who hereby demand'd Surety or Bail from the Defendant, that he would appear before the Praetor on a certain Day.

VADE-MECUM, or VENI-MECUM, a Latin Term, us'd in English to express a Thing that is very handy and familiar; and which one usually carries about with him.

'Tis chiefly apply'd to some favourite Book: Some make *Virgil*, others *Horace*, their *Vade-mecum*, or *Veni-mecum*; others an *Epitetus*, others a *Thomas à Kempis*, &c.

This is what the Greeks call an *εγχειριδιον*, or *Manual*. The Arabs have a Phrase of equal import, *viz. Habib al seir*, Friend of the Journey. In Latin it is best express'd by *Comes*; as, *Comes Theologus*, *Comes Rusticus*, &c.

VADIMONIUM, in the Civil Law, a Promise, or Bond for appearance before the Judge upon a Day appointed. See VADARI.

VAGABOND, a Person that wanders about, having no certain Dwelling; or a sturdy Beggar, &c. mention'd in divers Statutes.—*De Vagabundis & aliis hominibus mendicantibus qui se nominant.*—*Travelling Men*, &c. Charta 22. Hen. VI.—*Item utemur quod nullus vagabundus vagetur seu deambulet de nocte in Villa seu Suburbio post pulsationem campanae nostrae comunitatis, vocata Coverfeu, & si aliquis ibidem espiator post pulsationem dicte campanae, ducatur ad Gaudium Domini Regis, & ibi morabitur sigis; in Crastinum ut Notitia persone sue habeatur, &c.* MS. Cod. de Leg. & Stat. Bargi villae Mountgomer. Temp. Hen. II.

VAGINA, a Latin Term, literally signifying a Sheath, or Scabbard; us'd on divers Occasions.

VAGINA, in Architecture, is us'd for the lower Part of a *Terminus*; because resembling a Sheath, out of which the Statue seems to issue. See TERMINUS.

The *Vagina* is that long Part between the Base and the Capital; and is found in divers Manners, and with divers Ornaments.

VAGINA, in Anatomy, a Canal, or Cavity leading from the *Pudendum* to the *Uterus*, or Womb of Women. See UTERUS.

The *Vagina Uteri*, or *Matricis*, is a membranous Part, reaching from the *Rima*, or Aperture of the *Labia*, to the Neck of the Womb. See LABIA.

It lies upon the *Rectum*, to which it finally adheres; and under the Urinary Bladder: its length is ordinarily seven or eight Inches.

Its inward Substance is nervous, and exquisitely sensible; the outer membranous, and loose: At its Orifice it is much narrower than elsewhere; especially in Virgins.

Thro' its whole Course it is full of *Ruge*, or Wrinkles; especially in the upper internal Surface: which *Ruge* the use of Vencry renders less apparent, and frequent Parturition almost obliterates: Which shews, that they were intended to render the Part more easily defendible for Parturition.

Along the whole Tract of the *Vagina* are Pores, or *Ostia*, or little Ducts seen, which in the Act of Vencry emit a Liquor, that has been by many mistaken for Seed. See SEED.

The *Vagina* has a Constrictory Muscle, inserted under the *Clitoris*; which with a broad Series of Fibres embraces and constricts the lower Part of the *Vagina*, and puts the Dimension of the Part, in some measure, in the Power of the Mind. See MATRIX.

VAGINE Uteri Sphincter. See SPHINCTER Uteri, &c.

VAGINALIS Gula, in Anatomy, a Name some Anatomists give to the muscular Coat of the *Gula*; as supposing it a proper Muscle, conspiring with the *Oesophagus* in thrusting the Aliment down, when entred. See GULA, DEGLUTITION, &c.

VAGINALIS Tunica, the same with what we otherwise call'd the *Elythroides*. See ELYTHROIDES.

VAGUM, in Anatomy, a Name given to the eighth Pair of Nerves of the *Medulla Oblongata*, call'd the *Par va-*

*gum*, because dispens'd to divers Parts of the Body. See PAR, and NERVE.

VAIR, in Heraldry; a kind of Fur, or Doubling, consisting of divers little Pieces, Argent and Azure, resembling a *Dutch U*, or a Bell-glass. See VAIRY.

Vairs have their Point Azure, opposite to their Point Argent, and the Base Argent to the Azure.

When there are only two, or three Vairs, the ancient Herald's call it *great Vair*; and when there are more, *small Vair*.

*Vair* is intended to represent a kind of Skin, us'd antiently by the Kings of France in lieu of a Fur, and wherewith the Gowns of the *Présidents à Mortier*, the Councilors of the Court, the Herald's Coats, &c. were lined, till the XVth Century.

It was properly the Skin of a kind of Squirrel, call'd also in French *Vair*, and in Latin *Sciurus*, which was white underneath, and Dove-colour a-top. It is describ'd by *Aldrovandus* under the Name of *Servus Vario*, and is the same, according to *Gesner*, with the *Mus ponticus* of *Aristotle* and *Pliny*; which the Latins call *Varus*, or *Varius*, from the Variety of its Colour. Its two Skins join'd together, make the Figure of the *Vairs* in Armories; being naturally white and azure.

*Vair*, *Colombiere* observes, is a second Fur, antiently us'd as a Lining of the Garments of great Men; consisting of little Pieces, few'd by the Farris on white Skins; and because these Pieces were usually blue, those who first settled the Rules of Heraldry, decreed, that this Fur, in its natural Blazon, should always be Argent and Azure. So that if it be absolutely laid, (such a Family bears *Vair*); it is supposed to be Argent and Azure.

Regularly, there must be but four Rows or Ranks of *Vair* in the Shield; if there be either more, or less, the Number must be specify'd. The smallest Number, being three Rows, is call'd *Bessroy de Vair*; and the most, being five or six, is call'd *Mens*, or *small Vair*.

The *Bessroy* is also known by the first Figure on the Dexter-side of the Escutcheon, being always of Metal, and in form of a Belt; whereas that of mere *Vair* is in shape of a Gias.

VAIRY, VAIRE, VERRY, or VARRY, is apply'd to a Coat, or the Bearings of a Coat, when charged or chequer'd with *Vairs*. See VAIR.

When the Colours are Argent and Azure, 'tis *Vairy proper*; if they be otherwise, the Colours are to be expressly nam'd; *Vairy* of such a Colour or Metal; he bears *Vairy Or*, and *Gules*. This is particularly call'd *Vair compassé*.

The Bearings are likewise said to be *Vairy* when they are charged with *Vairs*. When Chiefs, Crozies, Pale, Fesses, &c. happen to be *Vairy*, the number of Ranks are to be specify'd.

*Vairy Gowns* are observed by *Julius Pollux* to have been the Habit of the antient Gauls, as Ermins were of the *Armenians*. See ERMIN.

VAIRY COTY, or VAIRY TASSY, or POTENT Counter-potent; is a Bearing in Heraldry of the Figure adjoining. In blazon, the Colours must be express'd; as Azure, Argent, &c.

VALECT, VALET, VADELECT, VADLAT, and VASSET, in our Law-Books; is, according to *Camden*, a Servitor, or Gentleman of the Privy-Chamber: but, according to *Selden*, antiently signify'd the young Heirs which were to be knighted, or young Gentlemen of Quality and Descent.

But the Term is now apply'd to those of the Rank of Yeomen.—In the Accounts of the *Inner Temple*, it is us'd for a Bench's Clerk, or Servant: The Butlers of the House corruptly call 'em *Varlets*.

VALENTINIANS, an antient and famous Sect of *Gnosticks*; thus call'd from their Leader *Valentinian*. See GNOSTIC.

VALERIAN, the great *Sea-wall*, a Plant, whose Root is of considerable use in Medicine.

There are various Kinds of *Valerian*; but the only one in use is that cultivated in Gardens, call'd the *large Valerian*, or *Valeriana Hortensis*; and by *Dioscorides*, *Phyc, folio cistari*.

It has its Name, according to some, from one *Valerius*, who first brought it into use; according to others, from *Valere*, to have great Virtues:

It is warm and aromatick, but somewhat of a fecid Scent; Its efficacy, as a Sudorific, is supported by the Testimony of both antient and modern Practice. It has been reckon'd by some Detractive, so much as to make it Diuretick, and good in all Obstructions of the *Viscera*. It is extoll'd also for strength-

strengthening the Optic Nerves, and refusing decay'd Sight; but the present Practice acknowledges it not in any such Intentions. It sometimes does Wonders in hysterical Affections; especially where those of the kind kind are good, and the Spirits are too impetuous in their Motions, so as to occasion Convulsions. It is also assist'd with Camphire, and some other things of the like Nature which are very powerful in breaking thro' the minutest Obstructions, to cure obdurate Agues.

It is efficacious in all nervous Cases; and particularly the Epilepsy; by which Virtue in it seems to have been first discover'd by *Fabius Columna*, who prescrib'd it for that Purpose in Pouder.

*M. Morebant*, in the Memoirs of the Academy of Sciences, has confirm'd this Virtue by many Instances within his Knowledge: And what is very remarkable, is, that in the two Observations he enlarges most upon, the Patients voided great Quantities of Worms. His Custom was, always to purge before he administer'd it.

**VALESIAN, VALESIANI**, ancient Sectaries, so called from one *Valens*, a Person unknown to *Epiphanius*, who makes mention of this Sect, *Her.* 58. tho he owns we know but very little of 'em; only this, that they admitted none into their Society but Eunuchs: at least, if any were admitted before Castration, they oblig'd 'em not to eat any Meat till the Operation was perform'd.

For, then, being no longer subject to the Motions of the Flesh, they allow'd 'em to eat any kind of Meats.

**VALET**, a French Term, antiently wrote *Varlet*.

In France, *Valet* is a common Name for all domestic Servants, employ'd in the lower, and more servile Offices; including what we call *Grooms, Footmen, Coachmen, Bailiffs*, &c.

But the Word is not used among us in this Sense, nor any otherwise than in the Phrase *Valet de Chambre*; which is a Servant, whose Office is to dress and undress his Master, to look to his Bed Chamber, wait on him at Table, &c. the same with what we otherwise call a  *Gentleman*.

In the History of *Lewis XII.* by *Scève*, we always find *Varlet de Chambre du Roi, Varlet de la Gardrobe*, &c. But *Varlet*, like *Knave*, and divers other Words, is now degenerated into a Word of reproach.

*Valet, Valedt, Valedt, Vodiat, and Vallet*, Camden observes, were antiently used at our Court for a Gentleman of the Privy Chamber.

*Selden*, in his *Titles*, relates, that *Valets* antiently signify'd young Gentlemen, and Heirs of great Estates and Quality; especially such as were to be knighted. See **VALECR.**

**VALETUDINARY**, *Valerudinarius*, a Term sometimes used by the Writers of Medicine, for a Person of a weak, crazy, sickly Constitution, frequently out of order, &c.

*Dr. Cheyne*, by all means, directs the weakly, the studious, the sedentary, and the *valetudinarij*, to a low, spare Regimen. See **FOOD, EXERCISE, DIET, &c.**

**VALID**, a Term applied to Acts, Transactions, Expeditions, &c. which are clothed in all the Formalities requisite to their being put in Execution, and to their being admitted in a Court of Justice.

A Contract by a Minor is not *valid*, or is *invalid*: A Marriage is not *valid*, unless perform'd with the Solemnities enjoin'd.

**VALLAR, VALLARIS**, in Antiquity, an Epithet given to a kind of Crown, which the Roman Generals bestow'd on him who in attacking the Enemies Camp first broke in upon the Enemies Lines. See **CROWN**.

The Word is form'd from *Valium*, a Stake with Branches, whereof they made the Pallisade of a Camp, call'd *Lorica*.

The *Corona Vallaris* was the same with what was otherwise call'd *Corona Castellensis*, from *Castra*, a Camp. *Anlus Gellius* assures us, that it was of Gold, as the Mural and Naval Crowns were: yet, tho they were made of that precious Metal, they were not the most valued: For *Pliny*, *Lib. XXII. cap. 5.* gives the Preference to the *Corona Obsidiensis*, which yet was only of Gramen, or Grass.

**VALLEY, VALE**, in Geography. See **MOUNTAIN**.

**VALORE Maritaggi**, *Value of Marriage*, a Writ which antiently lay for the Lord, after having proffer'd suitable Marriage to an Infant who refused the same; to recover the Value of the Marriage. See **MARRIAGE**.

**VALUE**, in Commerce, the Price or Worth of any Thing.

*Intrinsic Value*, is the proper, real, and effective Value of any Thing; and is used chiefly with regard to Money; the popular Value whereof, may be rais'd and lower'd at the Pleasure of the Prince; but its *real*, or *intrinsic Value*, depending wholly on its Weight and Fineness, is not at all affected by the Stamp, or Impression thereon. See **MONEY, &c.**

'Tis generally on the Foot of this *intrinsic Value*, that Species are receiv'd in foreign Countries; tho in the Places where they are coin'd, and where the Sovereign Power makes 'em current, they generally pass for much more. See **PAY.**

'Tis, in good measure, on the difference of those two *Values*, one whereof is, as it were, arbitrary, and the other, in some sort, natural; and that the difference of Exchanges depends: and those still rising and falling, as the Rate at which a Species is current, comes nearer or farther off the just Price of the Metal whereof it consists. See **EXCHANGE**.

In Bills of Exchange, *Value* is us'd to signify the Nature of the Thing, (as ready Money, Merchandizes, Bills, Debts, &c.) which is given, as it were, in Exchange for the Sum specify'd in the Bill.

From four different Manners of expressing this *Value*, some distinguish four Kinds of Bills of Exchange: The first bears *Value received*, simply and purely, which comprehends all Kinds of *Value*; the second, *Value received in Money*, or *Merchandize*; the third, *Value of my self*; and the fourth, *Value underbond*.

The first is dangerous, and the fourth but little used: accordingly, to have the *Value* well express'd, and to prevent the ill Consequences of Oversight therein, 'tis well provided by the *French Ordinance of 1673*, that Bills of Exchange shall contain the Name of the Person to whom the contain'd Sum is to be paid; the Time of Payment; the Name of him who has given the *Value*; and whether it was receiv'd in Money, Merchandize, or other Effects. See **BILL of Exchange**.

**VALUE, VALOR, VALENTIA**, in Law, &c. *West* gives us a nice Difference between *Value* and *Price*.—The *Value*, (*says he*) of Things in which Offences are committed, is usually compris'd in Indictments; which seems necessary in Theft, to make a difference from petty Larceny, and in Trespass, to aggravate the Fault, and increase the Fine: But no Price of Things *ferre Nature* may be express'd, as of Deers, Hares, &c. if they be not in Parks and Warrens. And where the Number of Things taken is to be express'd in the Indictment, as of young Doves in a Dove-house, there must be said *Preterit*, or *ad Valentiam*: but of divers dead Things, *ad Valentiam*, and not *Preterit*: Of Coin not current, it shall be said *Preterit*; but of Coin current, neither *Preterit* nor *ad Valentiam*; the Price and *Value* being certain.

**VALVE, VALVELA**, in Anatomy, a thin Membrane, applied, like a Door or Shutter, on divers Cavities and Vessels of the Body; to afford a Passage to some Humour, or other Matter, going one way, and prevent its Re-flux towards the Part whence it came. See **VESSEL, &c.**

The Veins and Lymphatics have *Valves*, situate from Space to Space, which open towards the Heart, but keep close on that Side toward the Extremities, i. e. they let the Blood and Lymph pass towards the Heart, but prevent their returning to the extreme Parts, whence they came. See **VEIN, and BLOOD**.

The Heart has also its *Valves*, placed at the Entrance of the Vessels arising out of it. Those at the Entrance of the *Vena Cava* and Pulmonary Vein, let the Blood pass on to the Heart, and prevent its return: On the contrary, those at the Entrance of the *Aorta* and Pulmonary Artery, let the Blood pass out of the Heart, and prevent its flowing back again. See **HEART, and CIRCULATION**; see also **CAVA, &c.**

In the *Jejunum Intestinum* there are *Valves* which retard the Descent of the Chyle. See **INTESTINES**.

The Colon has a thick *Valve*, to prevent the Excrements from passing into the *Ileon*; and several other *Valves*, to retard the Descent of the Excrements. See **COLON, and EXCREMENT**.

The *Valves* in the Body acquire different Denominations from their different Forms, and other Circumstances; as *Sigmoides, Semilunares, Mitrales, Triangulares, &c.* See each under its respective Article, **SIGMOIDES, MITRALES, &c.**

Some attribute the Discovery of the *Valves* in the Veins to *Fra. Paolo. Rayssé* has a particular Treatise on the *Valves of the Lymphatic and Lacteal Vessels*. See **LACTEAL, &c.**

**VALVE, Valvula**, in Hydraulics, Pneumatics, &c. is a kind of Lid, or Cover of a Tube, or Vessel, so contriv'd as to open one way; but which, the more forcibly 'tis press'd the other way, the closer it shuts the Aperture: so that it either admits the Entrance of a Fluid into the Tube, or Vessel, and prevents its return; or admits it to escape, and prevents its re-entrance.

*Valves* are of great use in the *Air-Pump*, and other Wind-Engines; in which they are ordinarily made of Pieces of Bladder. See **AIR Pump**; and **WIND-GUN**.

In Hydraulic Engines, as the Emboli of Pumps, they are frequently of Leather; their Figure round, and are fitted to the Bottoms; or other Parts of the Barrels, &c. to shut the Apertures. See **EMBOLUS**.

Sometimes they are made of two round Pieces of Leather, inclosed between two others of Brass; having divers Perforations, which are cover'd with another piece of Brass, moveable upwards and downwards, on a kind of Axis, which goes thro' the middle of them all.

Sometimes they are made of Blais cover'd over with Leather, and furnish'd with a fine Spring, which gives way upon a Force apply'd against it: but, upon the ceasing of that; returns the Valve over the Aperture. See PUMP, &c.

*Constantine Varole*, a *Boulognese*, and Physician of *Gregory XIII.* who dy'd in 1570, was the first who observ'd the Valve in the Colon. *Bart. Eustachio*, a Native of *Sau Severino in Italy*, discover'd, about the same time, the Valve at the Orifice of the Coronary Vein, and that remarkable one at the Orifice of the lower Trunk of the *Vena Cava*, near the right Auricle of the Heart: Tho he did not take it for a Valve, but merely for a Membrane.

*Sig. Lancisi*, Physician to the late Pope, who first publish'd *Eustachio's* Works, takes the Use of this Valve to be to prevent the Blood of the upper *Vena Cava* from striking with too much violence against that of the lower: And *Monfieur Winslow*, who has consider'd it very diligently in the Memoirs of the Royal Academy of Sciences, is much of the same Opinion.

But as it gradually dwindles in Children, and at length becomes quite lost in Adults, still diminishing as the *Foramen Ovale* does; it should seem to have some other Office; and that, chiefly, regarding the Circulation of the Blood in the *Fetus*.

In effect, by means hereof, *M. Winslow* reconciles the two opposite Systems of the Circulation of the Blood in the *Fetus*, deliver'd under the Article *Circulation*. See CIRCULATION of the Blood; and FORTUS.

VALVULA, Valve. See VALVE.

The great Valve, in Latin *Valvula Major*, is the upper Part, and, as it were, the Lid of the *Isthmus* between the *Tesles*, and the first Vermicular Process of the *Cerebellum*: Its Substance is medullary. Its Use is to prevent the Lymph from falling on the Nerves at the Base of the *Cranium*.

In the *Tesulum* and *Istum*, the inner Tunic being larger than the outer, is much corrugated; the loose Folds of which, have been thought in some measure to do the Office of Valves; and have therefore been call'd *Valvule Conniventes*. *Drake's Anat.* p. 49.

The Lacteals, opening into the Intestines, receive the prepared fluid Part of the Chyle; and appear at Intervals, as it were, grip and straiten'd; and when press'd, do not admit of a Reflex towards the Intestines: tho the Liquor be easily propell'd towards the Glands: Which argues, that there are Valves in 'em, tho too minute to be sensible to the Eye. *Id. ibid.* p. 56.

The Word is form'd from the Latin *Valve*, folding Doors. VAN, or VANT, or VAUNT, of the French, *avant*, or *avant*, before; a Term us'd in Composition with several Words in our Language.

VAN-Couriers, are Light-arm'd Soldiers, sent before to beat the Road, upon the Approach of an Enemy. See R. CONNOITRE.

VAN-Esse, a Ditch dug without the Counterfarp, and running all along the Glacis; usually full of Water. See DITCH.

VAN, or VANT, or VAUNT-Corps. See CORPS.

VAN-Guard, is a Military Term, signifying the first Line of an Army, drawn up in Battails.

It is the same with the *Front* of an Army, and gives the first Charge upon the Enemy. See FRONT.

Every Army is compos'd of three Parts, a *Van-guard*, *Rear-guard*, and *Main Body*.

VANES, or Mathematical Instruments, are Signs made to move and slide upon Cross-staves, Fore-staves, *Devis's* Quadrants, &c. See CROSS-STAFF, FORE-STAFF, &c.

VANES, or PANES of Feather.} FEATHER.

VANES of Windmills.} WINDMILL.

VANILLA, or BANILLA, a little black Seed, growing in length Pods; us'd in the *West-Indies*, *France*, *Spain*, &c. as a principal Ingredient in the Composition of Chocolate; to give it Strength, and an agreeable Flavour. See CHOCOLATE.

It is also used to perfume Tobacco withal. See TOBACCO. It is supposed to strengthen the Brain, and Stomach; to attenuate viscid Humours, provoke Urine, and the Menfes.

VAPORATION, in Chymistry, a Term applied to the Action of Vapour. See VAPOUR.

The Chymists have a Bath call'd a *Vaporatory*, or *Balneum Vaporationis*, or *Vaporis*; whereby the Warmth or Humidity of a Vapour is made to act on some other Body, that is to be warm'd, or moisten'd. See BALNEUM, HEAT, &c.

VAPOROSUM *Balneum*, or VAPOUR-BATH, in Chymistry, a Term applied to a Chymist's Bath, or Heat, wherein the Body is plac'd so as to receive the Fumes of boiling Water.

The *Balneum Vaporosum* consists of two Vessels, dispos'd over one another in such manner, as that the Vapour rais'd from the Water contain'd in the lower, heats the Matter enclosed in the upper. See HEAT.

The *Vapour-Bath* is very commodious for the distilling of odoriferous Waters, and the drawing of Spirit of Wine.

We also use the Term *Vapour-Bath*; when a sick Person is made to receive the *Vapours* arising from some liquid Matter plac'd over a Fire. See BATH.

VAPOUR; in Meteorology, a thin Vesicle of Water or other humid Matter, fill'd or inflated with Air; which being rais'd to a certain degree by the Action of Heat, ascends to a certain height in the Atmosphere, where it is suspended, till it return in form of Rain, Snow, or the like. See RAIN, and SNOW.

An Assemblage of a Number of Particles, or Vesicles of Vapour, constitutes what we call a Cloud. See CLOUD.

Some use the Term *Vapour*, indifferently, for any Fumes emitted, either from moist Bodies, as Fluids of any kind; or from dry Bodies, as Sulphur, &c. But *Sir I. Newton*; and other Authors, better distinguish between humid and dry Fumes, calling the latter *Exhalation*. See EXHALATION.

For the Manner wherein VAPOURS are rais'd, and again precipitated; see DEW, RAIN, HEAT, COLD, and BAROMETR.

For the Effect of VAPOUR in the Formation of Springs, &c. See SPRING, and RIVER.

The quantity of Vapour rais'd from the Sea by the Warmth of the Sun, is far greater than one would imagine. *Dr. Halley* has attempted to estimate it.

In an Experiment made with that view, and described in the *Philosophical Transactions*, he found that a Quantity of Water no warmer than Air in Summer, lost in Vapour in the Space of two Hours, no less than  $\frac{1}{12}$  part of an Inch in depth: Now, for  $\frac{1}{12}$  in two Hours, taking, for the easier Calculation,  $\frac{1}{24}$  in the twelve Hours that the Sun is up each Day, it will raise  $\frac{1}{24}$  of an Inch from the Surface of the Sea.

On this Supposition, every 10 square Inches of the Surface of Water, yield in Vapour, per Diem, a Cubic Inch of Water; and each square Foot, half a Wine Pint; every Space of four Foot square, a Gallon; a Mile square, 6914 Tuns; a square Degree, suppos'd of 69 English Miles, will evaporate 33 Millions of Tuns; And if the *Mediterranean* be estimated at 410 Degrees long, and four broad, Allowances being made for the Places where it is broader, by those where it is narrower, there will be 160 square Degrees at Sea; and consequently the whole *Mediterranean* must lose in Vapour, in a Summer's Day, at least, 3280 Millions of Tuns.

And this Quantity of Vapour, tho very great, is only the Remains of another Cause, which cannot be reduced to Rule; we mean the Winds; whereby the Surface of the Water is lick'd up, sometimes faster than it exhales by the Heat of the Sun; as is well known to those that have consider'd those drying Winds. See EVAPORATION.

VAPOURS, in Medicine, a Disease, call'd popularly the *Hypo*, or *Hypochondriacal* Disease; and in Men, particularly, the *Spleen*. See SPLEEN.

'Tis supposed to be owing to a subtle Vapour, rising from the lower Parts of the Abdomen, particularly the *Hypochondrium*, to the Brain; which it distills, and possesses with wild, delicious, but generally disagreeable Imaginations. See HYPOCHONDRICAL Disease.

Vapours, suppos'd to be emitted from the Womb, in Women, are what we otherwise call *Hysterical Affections*, or *Suffocations*, or *Fits of the Mother*. See HYSTERICAL, &c.

VAPOUR-BATH. See VAPOROSUM Balneum.

VARI, in Medicine, little, hard, ruddy Tumours, whitish about the Tips, and of the size of an Hemp-seed; frequently found on the Face and Neck of young People; chiefly such as are much addicted to Venery.

If the red be very lively, the Cure is somewhat difficult; and tho the Pustles be taken away, the Redness remains:

To which, if an Inflammation and Hoarseness be added, 'tis a Symptom of an approaching Leprosy. See LEPROSY.

VARIABLE, in the new Doctrine of Infinites, is a Term applied chiefly by the foreign Mathematicians, to such Quantities, as either increase, or diminish, according as some other Quantity either increases or diminishes.

Thus, the Semiordinates and Abscisses of a Circle, &c. are *Variable Quantities*; because, if the one increase, the other increases likewise. See SEMIORDINATE, &c.

They are thus call'd, in contradistinction to *constant*, or *given*, or *stable Quantities*; which are always the same, tho others change; as the Semi-diameter of a Circle, which remains the same, tho the Abscisses and Semiordinates increase.

*Variable Quantities*, are usually denoted by the last Letters of the Alphabet, x, y, z. See QUANTITY.

Our English Authors, instead of *variable*, and *constant* Quantities, generally use the Terms *fluent*, and *stable* Quantities. See FLUENT.

The infinitely small Quantity whereby a *variable* Quantity is continually increasing, or diminishing, is called the *Fluxion*, or *Difference*; the Calculation whereof, is the Subject of the new *Methodus Differentialis*, or *Doctrine of Fluxions*. See DIFFERENTIAL, and FLUXION.

VARIANCE, in Law, an Alteration or Change of Condition in a Person, or Thing; after some former Concern or Transaction therewith.

Thus, if the Commonalty of a Town make a Composition with a Lord, and afterwards Bailiffs be granted by the King to the same Town; there, if the Lord commence any Suit for breach of the Composition, he must vary from the Word *Commonalty*, used in the Composition; and use *Bailiffs* and *Commonalty*.

The Term *Variance* is also used for an Alteration of something formerly laid in a Plea. See PLEA.

VARIATION, in Geography, Navigation, &c. a Term apply'd to the Deviation of the Magnetical Needle, or Compass, from the true North-Point, towards either East, or West; call'd also the *Declination*. See DECLINATION.

The Variation or Declination of the Needle, is properly defin'd, the Angle which a Magnetic Needle, suspended at liberty, makes with the Meridian-Line on a horizontal Plane. See NEEDLE.

In the Sea Language, the Variation is usually call'd *North-Easting*, or *North-Westing*. See COMPASS, &c.

All Magnetic Bodies, we find, range themselves, in some sort, to the Meridian; but 'tis rare they fall in precisely with it: In one Place, they decline from the North to the East, and from the South to the West; and in another Place, on the contrary, from the North to the West, and from the South to the East; and that, too, differently, at different Times. See MAGNET, and MAGNETISM.

Various are the Hypotheses fram'd to account for this extraordinary Phenomenon: We shall only mention some of the later and more probable. The first is that of *Gilbert*, which is follow'd by *Cabeus*, &c.

Their Notion was, that 'tis the Earth, or Land, that draws the Needle out of its Meridional Direction; and hence they argued, that the Needle vary'd more, or less, as it was more or less distant from any great Continent: consequently, that if it were placed in the middle of an Ocean, equally distant from equal Tracts of Land, on each side, Eastward and Westward, it would not decline either to the one or the other; but point justly North and South.

Thus, in the *Azores* Islands, which are equally distant from *Africa* on the East, and *America* on the West, there is, in effect, found no Variation: but, as from the *Azores* you fall towards *Africa*, the Needle begins to decline from the North to the East; and that still more and more, till you reach the Shore.

If you still proceed Eastward, the Declination gradually diminishes again; by reason of the Land left behind on the West, which continues to draw the Needle.

The same holds till you arrive at a Place where there are equal Tracts of Land on each side, and there, again, there is no Variation.

The Observations of our Mariners in their *East-India* Voyages, seem to confirm this System: As they proceed towards the Cape of *Good Hope*, the Variation is still Eastward; at length, arriving at the Cape *De las Aguilas*, q. d. of the *Needles*, the Meridian-Line, then, dividing *Africa* into two equal Parts; there is no Variation at all: But as they proceed further, and leave the *African* Coasts on the West, the Variation becomes Westward.

But the Misfortune is, the Law does not hold universally: In effect, a great Number of Observations of the Variation, in various Parts, made and collected by *Dr. Halley*, overturn the whole Theory.

Others, therefore, have recourse to the Frame and Compages of the Earth, consider'd as interwove with Rocks and Shelves; which being generally found to run towards the Poles, the Needle comes to have a general tendency that way; but which seldom going perfectly in the Direction of the Meridian, the Needle, of consequence, has commonly a Variation. See EARTH.

Others hold various Parts of the Earth to have various degrees of the Magnetic Virtue; as some are more intermix'd with heterogeneous Matters, which prevent the free Action or Effect thereof, than others. See MAGNETISM.

Others ascribe all to Magnetic Rocks, and Iron Mines, which affording more of the Magnetic Matter than other Parts, draw the Needle more. See IRON, &c.

Lastly, others imagine Earthquakes, or High Tides, to have disturb'd and dislocated several considerable Parts of the Earth, and so chang'd the Magnetic Axis of the Globe, which originally was the same with the Axis of the Globe itself.

But still, that great Phenomenon, the Variation of the Variation, i. e. the continual Change of the Declination in one and the same Place, which the modern Observations do abundantly evince, is not accountable for, on any of these Foundations; nor even consistent with 'em.

*Dr. Halley*, therefore, gives us a new System; the Result of a great Number of Observations; and even of a great Number of Voyages made, at the publick Charge, on this very Account: The Light that excellent Author has let into this obscure Part of Natural History is very great; and the Consequences thereof in Navigation, &c. very considerable. Add, that he has reduced the divers Variations of divers Places to a precise Rule, or Order, which before appear'd all precarious, and arbitrary.

His Theory, therefore, will deserve a more ample Detail.—The Observations it is built on, as laid down in the *Philosophical Transactions*, are as follow.

Observations of the Variations of the Needle, in divers Places, and at divers Times.

From these Observations the learned Author gathers, 1<sup>st</sup>, That throughout all Europe, the Variation, at this Time, is West; and more in the Eastern Parts thereof than the Western, increasing that way.—2<sup>d</sup>, That on the Coasts of America, the Variation is Westward; increasing all the way as you go Northerly along the Coast; so as to be above 20 Degrees at *Newfoundland*, nearly 30 Degrees in *Hudson's Straights*, and not less than 37 Degrees in *Baf-*

*fin's Bay*: And that as you sail Eastward from this Coast, the Variation diminishes. Hence, he argues, somewhere between Europe and the North Part of America, there must be an Easterly Variation, or at least no Variation.—

3<sup>d</sup>, That on the Coast of Brazil, there is East Variation; increasing as you go to the Southward, so as to be 12 Deg. at *Cape Frio*, and 20 Degrees and half over against *R. Plata*; and thence sailing South-westerly, to the Straights of

of *Magellan*, it decreases 17 Degrees, and at the West Entrance about 14 Degrees.—4th, That Eastward of *Brazil*, this Easterly Variation decreases, so as to be very little at *St. Helena* and *Ascension*, and to be quite gone, and the Compass point true about 18 Degrees of Longitude West from the Cape of *Good Hope*.—5th, That to the Eastward of the aforesaid Places, a Westward Variation begins, and governs in all the *Indian Sea*, arising to 18 Degrees under the Equator, about the Meridian of the Northern Part of *Madagascar*; and 27 Degrees and a half in 29 Degrees South Latitude, near the same Meridian: Easterly from thence, the West Variation decreases, so as to be not much above 8 Degrees at *Cape Comorin*, and about 3 Degrees upon the Coast of *Java*; and about the *Molucca Islands* to be quite gone; as also a little to the Westward of *Van Diemen's Land*.—6th, That to the Eastward of the *Moluccas* and *Van Diemen's Land*, in South Latitude, there arises another Easterly Variation, which seems not so great as the former, nor of so large Extent; for that at the Island *Rotterdam*, it is sensibly less than upon the East Coast of *New Guinea*; and at the Rate it decreases, it may well be supposed, that about 20 Degrees further Eastward, or 23 Degrees East Longitude from *London*, in the Latitude of 20 Degrees South, a Westerly Variation begins.—7th, That the Variation taken at *Baldovia*, and at the West Entrance of the Straights of *Magellan*, shews, That the East Variation noted in the third Observation, is decreasing apace; and that it cannot well extend many Degrees into the *South Sea*, from the Coast of *Peru* and *Chili*, leaving room for a small Westerly Variation in that Tract of the unknown World that lies in the mid-way between *Chili* and *New Zealand*, and between *Hounds Island* and *Peru*.—8th, That in sailing North-west from *St. Helena*, by *Ascension*, as far as the Equator, the Variation continues very small East, and as it were, constantly the same: So that in this Part of the World, the Course, wherein there is no Variation, is evidently no Meridian, but rather North-west.—9th, That the Entrance of *Hudson's Strait*; and the Mouth of *R. Plata*, being nearly under the same Meridian, at the one Place the Needle varies 29 Degrees and a half West; at the other 20 Degrees and a half East.

#### Theory of the VARIATION of the Needle.

From the Circumstances above rehearsed, the learned Author takes occasion to assert, 'That the whole Globe of the Earth is one great Magnet, having four Magnetical Poles, or Points of Attraction; near each Pole of the Equator, two; and that in those Parts of the World which lie near adjacent to any one of these Magnetical Poles, the Needle is govern'd thereby; and the nearest Pole being always predominant over the more remote.'

The Pole which at present is nearest to us, he conjectures to lie in or near the Meridian of the Lands-End of *England*, and not above 7 Degrees from the Arctic Pole: by this Pole, the Variation in all *Europe* and *Tartary*, and the North Sea, are principally govern'd; tho' the still with some regard to the other Northern Pole, whose Situation is in the Meridian, passing about the Middle of *California*, and about 15 Degrees from the North Pole of the World; to which the Needle has chiefly respect in all the *North America*, and in the two Oceans on either side thereof, from the *Azores* Westwards, to *Japan*, and farther.

The two Southern Poles, he imagines, are rather farther distant from the South Pole of the World: The one about 16 Degrees therefrom, in a Meridian some 20 Degrees to the Westward of *Magellan's Straights*, or 95 Degrees West from *London*: This commands the Needle in all *South America*, in the Pacific Sea, and the greatest Part of the Ethiopick Ocean.—The other seems to have the greatest Power, and largest Dominions of all, as it is the most remote from the Pole of the World, being little less than 20 Degrees distant therefrom, in the Meridian which passes thro' *New Holland* and the Island *Celebes*, about 120 Degrees East from *London*: This Pole is predominant in the South Part of *Africa*, in *Arabia* and the Red Sea, in *Persia*, *India*, and its Islands; and all over the Indian Sea, from the Cape of *Good Hope* Eastwards, to the middle of the great South Sea that divides *Asia* from *America*.

Such seems to be the present Disposition of the Magnetical Virtue, throughout the whole Globe of the Earth. It remains to shew, how this Hypothesis accounts for all the Variations that have been observ'd of late; and how it answers to the several Remarks drawn from the Table.

1<sup>o</sup>, Then, it is plain, that as our *European* North Pole is in the Meridian of the Land's-End of *England*, all Places more Easterly than that, will have it on the West side of their Meridian; and consequently the Needle, respecting it with its Northern Point, will have a Westerly Variation; which will still be greater as you go to the Eastwards, till you come to some Meridian of *Russia*, where

'twill be greatest, and from thence decrease again. Accordingly, in fact, we find that at *Brest* the Variation is but 1 Degree 3 Quarters; at *London*, 4 Degrees and an half; and at *Dantzick* 7 Degrees, West. Again, to the Westward of the Meridian of the Land's-End, the Needle ought to have an Easterly Variation; were it not that (by approaching the *American* Northern Pole, which lies on the West side of the Meridian, and seems to be of greater force than this other) the Needle is drawn thereby Westward, so as to counter-balance the Direction given by the *European* Pole, and to make a small West Variation in the Meridian of the Land's-End it self. Yet, about the Isle *Terceira*, 'tis supposed our nearest Pole may so far prevail, as to give the Needle a little Turn to the East; tho' but for a very little Space; the Counter-balance of those two Poles permitting no considerable Variation in all the Eastern Part of the Atlantic Ocean; nor upon the West Coast of *England* and *Ireland*, *France*, *Spain*, and *Barbary*: But to the Westward of the *Azores*, the Power of the *American* Pole, overcoming that of the *European*, the Needle has chiefly respect thereto; and turns still more and more towards it, as you approach it. Whence it comes to pass, that on the Coast of *Virginia*, *New England*, *Newfoundland*, and in *Hudson's Straights*, the Variation is Westward; that is, increases as you go from thence towards *Europe*: and that it is less in *Virginia* and *New England*, than in *Newfoundland* and *Hudson's Straights*.

2<sup>o</sup>, This Westerly Variation, again, decreases, as you pass over the *North America*, and about the Meridian of the middle of *California*, the Needle again points due North; and from thence Westwards to *Tedoo* and *Japan*, 'tis supposed the Variation is Easterly; and half Sea over, not less than 15 Degrees: And that this East Variation extends over *Japan*, *Tedoo*, East *Tartary*, and part of *China*, till it meet with the Westerly, which is govern'd by the *European* North Pole, and which is the greatest; somewhere in *Russia*.

3<sup>o</sup>, Towards the South Pole the Effect is much the same; only that here the South Point of the Needle is attracted. Whence it will follow, That the Variation on the Coast of *Brazil*, at the River of *Plata*, and so on to the Straights of *Magellan*, should be Easterly; if we suppose a Magnetical Pole situated about 20 Degrees more Westerly than the Straights of *Magellan*. And this Easterly Variation doth extend Eastward over the greatest Part of the Ethiopick Sea; till it be counterpois'd by the Virtue of the other Southern Pole; as it is about mid-way, between the Cape of *Good Hope*, and the Isles of *Tristan d'Acunha*.

4<sup>o</sup>, From thence Eastwards, the *Asian* South Pole becoming prevalent, and the South Point of the Needle being attracted thereby, there arises a West Variation, very great in Quantity and Extent; because of the great Distance of this Magnetical Pole of the World. Hence it is, That all the Indian Sea, as far as *Hollandia Nova*, and farther, there is constantly a West Variation; and that under the Equator it self, it arises to no less than 18 Degrees, where 'tis most. Add, that about the Meridian of the Island of *Celebes*, being likewise that of this Pole, this Westerly Variation ceases, and an Easterly begins, which reaches to the middle of the South Sea, between the middle of *Zelandia Nova* and *Chili*; leaving room for a small West Variation, govern'd by the *American* South Pole.

5<sup>o</sup>, From the whole it appears, That the Direction of the Needle in the Temperate and Frigid Zone, depends chiefly upon the Counterpoise of the Forces of two Magnetical Poles of the same Nature: As also why, under the same Meridian, the Variation should be in one Place 29 Degrees and a half West, and in another 20 Degrees and a half East.

6<sup>o</sup>, In the Torrid Zone, and particularly under the Equinoctial, respect must be had to all four Poles, and their Positions well consider'd; otherwise it will not be easy to determine what Variations shall be; the nearest Pole being always strongest: yet not so, as not to be counter-balance'd sometimes by the united Forces of two more remote: Thus, in sailing from *St. Helena* by the Isle of *Ascension*, to the Equator, on the North-west Course, the Variation is very little Easterly, and in that whole Tract unalterable; because, the South *American* Pole (which is considerably the nearest in the aforesaid Places) requiring a great Easterly Variation, is counterpois'd by the contrary Attraction of the *North American*, and the *Asian* South Pole; each whereof, singly, are, in these Parts, weaker than the *American* South Pole: and upon the North-west Course, the Distance from this latter is very little varied; and as you recede from the *Asian* South Pole, the Balance is still preserv'd by access towards the *North American* Pole. In this Case, no notice is taken of the *European* North Pole; its Meridian being little remov'd from those of these Places, and of it self requiring the same Variations we here find.

After the same manner, may the Variations in other Places, under and near the Equator, be accounted for: So that

that the Hypothesis must be allow'd very adequate, and sufficient for the Phenomena.

*Theory of the Variation of the VARIATION.*

From the Observations abovemention'd, it seems to follow, that all the Magnetical Poles have a Motion Westward: but if it be so, 'tis evident, that it is not a Rotation about the Axis of the Earth; for then the Variations would continue the same, in the same Parallel of Latitude (the Longitude only changed) as much as the Motion of the Magnetical Poles: But the contrary is found by Experience; for there is no where, in the Latitude of 51 and an half North, between *England* and *America*, a Variation of 11 Degrees East, at this time; as it was once here at *London*. Wherefore, it seems that our *European* Pole is grown nearer the Arctick Pole than it was heretofore; or else, that it has lost Part of its Virtue.

But whether these Magnetical Poles move altogether with one Motion, or with several; whether equally, or unequally; whether circular, or libratory: If circular, about what Centre; if libratory, after what manner? are Things yet unknown.

This Theory seems yet somewhat obscure, and defective: To suppose four Poles in one Magnetical Globe, in order to account for the Variation, is a little unnatural; but to conceive those Poles to move, and that by such Laws as to solve the Variations of the Variation, is still more extraordinary. In effect, the Solution appears as implicate and arbitrary as the Problem.

The Author, therefore, found himself under a Necessity to solve the Phenomena of his Solution; and with this View, presented the following Hypothesis.

The external Parts of the Globe, he considers as the Shell, and the internal as a *Nucleus*, or inner Globe; and between the two he conceives a fluid Medium. That inner Earth having the same common Centre, and Axis of diurnal Rotation, may turn about with our Earth each 24 Hours. Only the outer Sphere having its turbating Motion some small Matter either swifter or slower than the internal Ball; and a very minute difference in length of Time, by many Repetitions, becoming sensible; the internal Parts will by degrees recede from the external; and not keeping pace with one another, will appear gradually to move, either Eastward or Westward, by the difference of their Motions.

Now, supposing such an internal Sphere, having such a Motion, the two great Difficulties in the former Hypothesis are easily solv'd: For if this exterior Shell of Earth be a Magnet, having its Poles at a distance from the Poles of diurnal Rotation, and if the internal *Nucleus* be likewise a Magnet, having its Poles in two other Places, distant also from the Axis; and these latter, by a gradual and slow Motion, change their Place in respect of the External: We may then give a reasonable Account of the four Magnetical Poles abovemention'd, as likewise of the Changes of the Needle's Variations.

The Period of this Motion being wonderful great, and there being hardly an hundred Years since these Variations have been duly observ'd; it will be very hard to bring this Hypothesis to a *Calculus*; especially since, tho' the Variations do increase and decrease regularly in the same Place, yet in differing Places, at no great distance, there are found such casual Changes thereof, as can no ways be accounted for by a regular Hypothesis; but seem to depend upon the unequal and irregular Distribution of the Magnetical Matter within the Substance of the external Shell or Coat of the Earth, which deflect the Needle from the Position it would acquire from the Effect of the general Magnetism of the whole. Of which, the Variations at *London* and *Paris* give a notable Instance; for the Needle has been constantly about 1½ more Easterly at *Paris* than at *London*: Tho' it be certain, that according to the general Effect, the Difference ought to be the contrary way; notwithstanding which, the Variations in both Places do change alike.

Hence, and from some other things of like Nature, it seems plain, that the two Poles of the external Globe are fix'd in the Earth; and that if the Needle were wholly govern'd by them, the Variations thereof would be always the same, with some Irregularities upon the Account just now mention'd. For the internal Sphere having such a gradual Translation of its Poles, does influence the Needle, and direct it variously, according to the Result of the attractive or directive Power of each Pole; and consequently, there must be a Period of the Revolution of this internal Ball; after which, the Variations will return again, as before. But if it shall in future Ages be observ'd otherwise, we must then conclude, that there are more of these internal Spheres, and more Magnetical Poles than four; which, at present, we have not a sufficient number of Observations to determine, and particularly in that vast *Mer del Zur* which occupies so great a Part of the whole Surface of the Earth.

If then two of the Poles be fix'd, and two moveable, it remains to ascertain, which they are that keep their Place.

The Doctor thinks it may be safely determin'd, that one *European* North Pole is the moveable one of the two Northern Poles, and that which has chiefly influenc'd the Variations in these Parts of the World: For in *Hudson's Bay*, which is under the Direction of the *American* Pole, the Change is not observ'd to be near so fast, as in these Parts of *Europe*, tho' that Pole be much further removed from the Axis. As to the South Pole, he takes the *Asian* Pole to be fixed, and consequently the *American* Pole to move.

This granted, 'tis plain the fixed Poles are the Poles of this external Shell or Cortex of the Earth; and the other the Poles of the *Magnetical Nucleus*, included and moveable within the other. It likewise follows, that this Motion is Westwards; and, by consequence, that the aforesaid *Nucleus* has not precisely attain'd the same Degree of Velocity with the exterior Parts in their diurnal Revolutions; but so very nearly equals it, that in 365 Revolves, the Difference is scarce sensible. That there is any difference, arises hence, That the Impulse whereby the diurnal Motion was impress'd on the Earth, was given to the external Parts; and from thence, in time, communicated to the internal; but not so, as yet perfectly to equal the Velocity of the first Motion impress'd on, and still conserv'd by, the superficial Parts of the Globe.

As to the precise Period, we want Observations to determine it; tho' the Author thinks we may with some Reason conjecture, that the *American* Pole has moved Westward 46 Degrees in 90 Years; and that the whole Period thereof is perform'd in about 700 Years.

Mr. *Whiston*, in his *New Laws of Magnetism*, raises several Objections against this Theory; which see under the Article *MAGNETISM*.

*To observe the VARIATION or Declination of the Needle.*

Draw a Meridian-Line, as directed under the Article *MERIDIAN*: Then, a Style being erected in the middle thereof, place a Needle thereon, and draw the right Line it hangs over. Thus will the Quantity of the Variation appear. See *COMPASS*.

Or thus: As the former Method of finding the Declination cannot be applic'd at Sea, others have been thought of; the Principal whereof follow. Suspend a Thread and Plummet over the Compass, till the Shadow pass thro' the Centre of the Card: Observe the Rhumb, or Point of the Compass, which the Shadow touches when 'tis the shortest. For the Shadow is then a Meridian-Line: Consequently the Variation is shewn.

Or thus: Observe the Rhumb wherein the Sun or some Star rises and sets: Bisect the Arch intercepted between the rising and setting; the Line of Bisection will be the Meridian-Line: Consequently, the Declination is had as before. The same is had from two equal Altitudes of the same Star, observ'd either by Day or Night.

Or thus: Observe the Rhumb wherein the Sun, or a Star rises and sets; and from the Latitude of the Place, find the Eastern or Western Amplitude: For the difference between the Amplitude, and the distance of the Rhumb observ'd, from the Eastern Rhumb of the Card, is the Variation sought.

Or thus: Observe the Altitude of the Sun, or some Star, *S I*, (Tab. *Navigation*, Fig. 16.) whose Declination is known; and note the Rhumb in the Compass to which it then corresponds. Since then in the Triangle *ZPS* we have three Sides, viz. *ZP*, the Complement of the Elevation of the Pole *PR*; *SI*, the Complement of the Declination *DS*; and *ZS*, the Complement of the Altitude *SI*; the Angle *PSZ* is found by Spherical Trigonometry, (see *TRIANGLE*;) the contiguous one to which, viz. *AZS*, measures the Azimuth *HI*. The difference, then, between the Azimuth, and the Distance of the Rhumb observ'd from the South, is the Variation sought.

Note, To have the Eastern or Western Amplitude accurately, regard must be had to the Refraction; the Laws whereof are abundantly deliver'd under the Article *REFRACTION*.

For the more commodious observing in what Rhumb of the Compass the Sun, or a Star is seen, it will be proper to have two little Apertures, or glass Windows opposite to each other under the Limb thereof; with a Telescope Sight fitted to one of them, and to the other a fine Thread.

VARIATION OF THE VARIATION, or Declination, is the Change in the Declination of the Needle, observ'd at different Times in the same Place.

This Variation, first, 'tis said, discover'd by *Gassendus*, is found to observe one and the same Law pretty regularly.

It is suppos'd owing to the difference of Velocity of the Motions of the internal and external Parts of the Globe. We want Observations of two or three hundred Years, to determine the Quantity of this Variation in any certain Time: but from what Observations we have, Dr. *Halley* computes it to be at about 2½ Degrees in 50 Years: So that in 700 Years it will come round; and every Place have the same Variations it had.—See more at large under *VARIATION*, and *MAGNETISM*.

VARIATION of Quantities, in Algebra. See COMBINATION, and PERMUTATION.

VARIATION, in Astronomy. The Variation of the Moon, called also the *Rejection of her Light*, is the third Inequality observ'd in the Moon's Motion; whereby, when out of the Quadratures, her true Place differs from her Place twice equated. See PLACE, EQUATION, &c.

Sir I. Newton takes the Moon's Variation to arise partly from the form of her Orbit, which is an Ellipsis; and partly from the Inequality of the Parts of Space which the Moon describes in equal Times, by a Radius drawn to the Earth. See MOON.

To find the greatest Variation, observe the Moon's Longitude in the Orients; and for the Time of Observation, compute the Moon's Place twice equated: The difference between the computed and the observ'd Place, is the greatest Variation.

Tycho makes the greatest Variation 40' 30": Kepler makes it 51'; Sir I. Newton makes the greatest Variation at a mean distance between the Sun and the Earth, to be 35' 9"; at the other Distances, the greatest Variation is in a Ratio compounded of the duplicate Ratio of the Times of the Moon's Synodical Revolution directly, and a triplicate Ratio of the Distance of the Sun from the Earth inversely. *Phil. Nat. Princ. Math. Prop. XXXIX. Lib. iii.*

VARIATION, in the Italian Musick, is understood of the different Manners of playing or finging a Tune, or Song; whether by subdividing the Notes into several others, of lesser Value, or by adding Graces, &c.—In such manner, however, as that one may still discern the Ground of the Tune thro' all the Enrichments; which some call *Embroideries*.

Thus, e. g. the divers Couples of Chacons, Spanish Follies, Gavots, French Passacailles, &c. are so many Variations: So also many Diminutions of Courants, Gavots, and other Pieces for the Lute, Harpsichord, &c. are real Variations.

VARICIFORMES *Parasitæ*, in Anatomy, a Name some Authors give to two Vesicles near the Bladder; by reason of their many Turnings; serving to work the Seed the better. See PARASITÆ.

VARICOSUM *Corpus*, in Anatomy, the same as *Corpus Pyramidale*. See PYRAMIDALE *Corpus*.

VARIATION, among Botanists and Florists, the Art or ART of streaking or diversifying the Leaves, &c. of Plants and Flowers with several Colours.

Variation is either Natural, or Artificial.

Of Natural Variation there are three Kinds; the first shewing it self in yellow Spots here and there in the Leaves of Plants; call'd by the Gardeners the *yellow Bloach*.

The second, call'd the *white Bloach*, marks the Leaves with a great number of white Spots, or Stripes; the whitest lying next the Surface of the Leaves, usually accompany'd with other Marks of a greenish white, that lie deeper in the Body of the Leaves.

The third, and most beautiful, is where the Leaves are edg'd with white, being owing to some Disorder or Infection in the Juices, which stains the natural Complexion or Verdure of the Plant.

Variation is in it self a Disease; and these are only so many Species, or rather Degrees thereof.

In the yellow, the Disease is the slightest: The white is a sure Sign of a deep Infection, and Weakness in the Plant; which is further evinc'd by this; that no two Leaves are ever mark'd exactly like. This sometimes degenerates into the third, or edg'd Kind; which is a total and immovable Disease, that lays hold not only of the Leaves, but of the Wood, and even the Fruit, Seed, &c.

In the two first Kinds, there is a possibility of recovering the Plants to their native Verdure, by inarching 'em into a healthful Stock of the same Species, and letting the Stocks stand a Year or two join'd together; by which means, the Juices of the strong Stock overpowering the Dis temper, throw off the morbid Humours by Perspiration: But the third Kind is incurable; no Art can recover the edg'd Plant to produce plain green Leaves again.

Artificial Variation, is perform'd by inarching, or inoculating a striped, or variegated Plant into a plain one of the same sort: as a variegated common Jessamin, into a plain, common, Spanish, Brazil, or Indian Jessamin. See INOCULATION, and ABLACTATION.

A single Bud, or Eye, Mr. Bradley observes, being plac'd in the Escutcheon of a dis temper'd Tree, where it can only receive Nourishment from the variated Juices, will become variegated proportionably to the Nourishment it draws; and will partake more of the white or yellow Juice, than if a Branch should be inarch'd: the Bud having nothing to nourish it, but the Juices of the Plant it is inoculated on; whereas, a Cyon inarch'd is fed both by the striped Plant, and the healthful one.

As to the natural Stripes, or Variations, there are some particular Circumstances to be observ'd; 1<sup>o</sup>, That some Plants only appear variegated, or blouch'd in the Spring and Autumn; the Strains disappearing as they gather Strength in Summer: Of this Kind are Rue, Thyme, and Pot Marjoram.

2<sup>o</sup>, Some Plants are continually blouch'd in the spongy Part of their Leaves; the Sap-Vessels all the Time remaining of a healthful green: Such are the Alaternus, Orange-Mint, &c. which being strengthen'd by rich Manure, of being inarch'd into healthful Plants, throw off the Dis temper.

3<sup>o</sup>, In other Plants, the Disease is so rooted and inveterate, that it is propagated with the Seed: Such are the Archangel, Water Betony, Bank Cress, Borage, Striped Salary, and Sycamore. The Seeds of which produce striped Plants.

VARIOLÆ, in Medicine, a contagious Disease, popularly called the *Small Pox*.

It is call'd *Variole*, as shewing it self in Pustles, or little Tumors like *Varices*; or as variegating the Skin. See *Small Pox*.

VARIORUM, in Matters of Literature, a Term or Phrase of Abreviation, used for an Edition of a Classic Author, printed in Holland, with the Notes of divers Authors thereupon; *Cum Notis Variorum, or Cum selectis Variorum Observationibus*. See EDITION.

In this Sense, we say, *Plautus Variorum*; a Set of *Dutch Variorum*, &c.

The *Variorum*, for the generality, are the best Editions. The Word is the Genitive Plural of the Latin *Varius*, different, divers.

VARIX, in Medicine, a little Dilatation of a Part of a Vein, so as to make it bulge out, or thrust the Skin above its natural level. See VEIN.

Sometimes, it is confin'd to one single Branch of a Vein; and sometimes it extends to several; and sometimes runs crooked, and bent, in various Knots and Circumvolutions.

It happens chiefly to the Crural and Hemorrhoidal Veins; sometimes, also, to those in the Testes, and in the Abdomen and Breasts of pregnant Women, and such as give fault.

It is supposed owing to the too great abundance or thickness of the Blood; or to the Relaxation of the Membranes of the Veins; immoderate Labour, Sprains, Cramps, too great Pressure or Stricture by Bandages; and Stagnations of the Blood from a Plethora, Cachochymia, &c. may give occasion thereto.

Melancholic Persons, and those who feed on coarse Meats, are most subject to them: The generality of Women with Child have *Varices* on their Thighs and Legs, occasion'd by the *Fetus* compressing the Iliac Veins; and by that means preventing the Reflux of the Blood to the Heart.

*Varicæ* happening spontaneously, and proving of a moderate size, are rarely dangerous; but even are allow'd serviceable in case of the Hemorrhoids. When immoderate, they sometimes occasion a Cachexy, Dropsy, or Consumption.

The Cure is to be attempted by Evacuations, as Phlebotomy and Catharticks; external Applications, as discutient Pomentations, Cataplasms, Embrocations, Bandages, &c. Or, lastly, where the Case grows dangerous, by Incision.

The Word is pure Latin, form'd from the Verb *Variare*; by reason of the Turns and Meanders of the Veins, which the Tumor sometimes follows.

*Hernia VARICOSA*, in the Testes, is known by the Situation of the Tumor, the Course of the Vein, Relaxation of the Part, or its appearing inflated with Air, distended, and painful. See HERNIA.

It is remedy'd by a proper Truss, or Bandage, with the Medicines above-mention'd.

VALETTE. See VALET.

VARNISH, or VERNISH, a thick, viscid, shining Liquor; used by Painters, Gilders, and various other Artificers, to give a gloss and lustre to their Works, as also to defend 'em from the Wearth, Dust, &c.

There are several Kinds of Varnish in use; as the *Siccative*, or *Drying Varnish*, made of Oil of Aspin, fine Turpentine, and Sandarac, melted together.

*White Varnish*, call'd also *Venetian Varnish*; made of Oil of Turpentine, fine Turpentine, and Mastic.

*Spirit of Wine Varnish*, made of Sandarac, White Amber, Gum-Elemy, and Mastic; serving to gild Leather, Picture Frames, &c. withal.

*Gilt Varnish*, made of Linseed Oil, Sandarac, Aloes, Gum-Gutta, and Litharge of Gold.

*China Varnish*, made of Gum-Lacca, Colophony, Mastic, and Spirit of Wine.

And, lastly, the Common Varnish; which is only common Turpentine, dissolved in Oil of Turpentine.

Besides these Varnishes, there are *hard* and *soft Varnishes*, or Grounds, used by the Etchers and Engravers. See ETCHING.

**VARNISH**, is also used for a kind of shining Plaster, wherewith Pottery Ware, Delft Ware, China Ware, &c. are cover'd, to give them a Smoothness and Lustre. Melted Lead is the *Varnish* us'd for the first; and Smalt for the second.

The true *Varnish* used by the *Chinese* and *Japanese*, to give that imitable Lustre to their Porcelain, is one of the grand Secrets in that Manufacture; and the only thing wanting, to make *Delft* and *French* Ware vie with the *Chinese*. Several have described the Preparation thereof; particularly *Kircher*: but none ever succeeded in the Trial. See **PORCELAIN**.

**VARNISH** is also a Term given to the Colours which antique Medals have got in the Earth. See **MEDAL**.

The Value of a Medal is heighten'd by a Beauty which Nature alone is able to give, and Art has never yet attain'd to counterfeit: we mean, the Colour or *Varnish* which certain Soils tinge the Medal withal; some with a blue, almost as beautiful as that of a Turquoise; others with an imitable Vermilion Colour; others with a certain shining polish'd brown, infinitely finer than our Brazil Figures.

The most usual *Varnish* is a fine green, which hangs to the most delicate Strokes without effacing them; much more accurately than the finest Enamel does on Metals.

Bronze alone is susceptible of it; for as to Silver, the green Rust that gathers on it always spoils it; and it must be cover'd off with Vinegar, or Lemon Juice.

There is also a *false*, or *modern Varnish*; which the Falsifiers of Medals give to their Counterfeits, to give them the Air of Antiquity: 'Tis discover'd by its being softer than the natural *Varnish*, which is as hard as the Metal it self.

Some lay their spurious Medals under-ground, where they contract a degree of *Varnish* that may impose on the less knowing: Others use Sal Armoniac, mix'd with Vinegar; others burnt Paper.

**VAS, Vessel.** See **VESSEL**.

**VAS-BREVE**, q. d. *Short Vessel*, in Anatomy, a Vessel at the bottom of the Stomach; thus called from its shortness. See **STOMACH**.

It finds divers little Branches from the bottom of the Stomach to the Spleen; or, according to the Use the Antients imagin'd to be of, from the Spleen to the Stomach: For their Notion was, that by means of this Vessel, the Spleen supplied the Stomach with an acid Juice; which acting on the inner nervous Membranes of the stomach, caus'd the Sensation of *Hunger*; and at the same time mixing with the Foods contain'd therein, assisted by its acid quality in the Dissolution thereof. See **SPLEEN**, **HUNGER**, &c.

But upon examining the little Branches of this Vessel more accurately, we find they don't pierce into the Stomach, and that they are no more than Branches of Veins, serving to return the Blood into the Splenic Vein; whence it passes into the *Vena Porta*. See **SPLENIC**, and **PORTA**.

**VASA ADIPOSA, Preparantia**, &c. See **ADIPOSA**, **PREPARANTIA**, &c.

**VASA CONCORDIA**, among Hydraulic Authors, are two Vessels, so constructed, as that one of them, the full of Wine, won't run a Drop, unless the other, being full of Water, do run also.

Their Structure and Apparatus may be seen in *Wolfstus*, *Element. Mathes.* T. II. Hydraul.

**VASCULAR**, in Anatomy, is applied to any thing consisting of divers Vessels, Veins, Arteries, &c.

Thus, we say, The *Vascular* and *Valvular* Texture of the Lungs.

All the Flesh in an animal Body is found to be *Vascular*, none of it Parenchymous, as the Antients imagin'd. See **FLESH**, **PARENCHYMA**, &c.

**VASCULAR, VASCULARIUS**, in Antiquity, was the Denomination of a kind of Tradesmen, or Artificers, among the antient Romans.

The *Vasculari* were properly a kind of Goldsmiths, or Workmen who made Silver and Gold Vessels without Reliefs, or Figures of different Matter thereon.

Hence, according to *Salmassius*, it is, that *Cicero* in his Vith Oration against *Verres*, distinguishes *Vascularius* from *Celator*.

In the Art called by the *Greek* *Ἐραυρῆσις*, which was the Art of Superadding Ornaments of precious Stones, or rich Metals, to Vases of other Metals; the *Vascularii* and *Celatores* were different; the first being those who made the *Vase*, the second those who added the Ornaments: But in the Art called *Troponis*, or the Art of cutting Bas Reliefs, or stamping other Figures on Metal; the *Vascularii* were also *Celatores*, or Engravers: that is, they who made the *Vase*, made also the Reliefs, or Figures wherewith it was enrich'd.

**VASCULIFEROUS Plants**, are, according to the Botanists, such as besides the common Calyx, have a peculiar Vessel or Case to contain the Seed; which is sometimes divided into Cells. See **PLANT**.

These have always a Monopetalous Flower; either uniform, or difform. See **MONOPETALOUS**.

The former, have their Seeds all divided, 1<sup>o</sup>, into two Partitions, as the *Hypocyanus*, *Nicotiana*, *Priapeia*, and the *Geutiana*. 2<sup>o</sup>, Into three Partitions, as the *Convolvulus*, *Speculum Veneris*, *Trachelium*, *Rapunculus Campanula*, *Rapunculus Corniculatus*, &c. 3<sup>o</sup>, Into four Partitions; as the *Stramonium*.

Those of the latter Kind, which have a difform Monopetalous Flower, as the *Lunaria Pinguicula*, *Antirrhinum*, *Aristolochia*, *Scrophularia*, *Digitalis*, *Pedicularis*, *Melampyrum*, *Euphrasia*, &c.

**VASE**, a Term of equal import with the Latin *Vas*, whence it is form'd; and the English *Vessel*.

It is applied to the antient Vessels, dug from under-ground, or otherwise found, and preserv'd in Cabinets, &c. as Vessels of Sacrifice, Urns, &c. and to other more modern Vessels which are rather of Curiosity and Shew than Use; as those of Crystal, Porcelain, &c.

**VASES**, in Architecture, are certain Ornaments, plac'd on Corniches, Sodies, or Pedestals; representing the Vessels of the Antients; particularly those used in Sacrifice, as the *Presericulum*, *Simulacrum*, Incense-Pots, and Flower-Pots: all which are occasionally enrich'd with Basso Relievo's.

They are commonly plac'd there to crown or finish Facades, or Frontispieces. See **CROWNING**.

They are frequently call'd *Aerteria*; and are usually insulate. See **ACROTERIA**.

*Vitruvius* mentions a kind of *Theatrical Vases*, made of Brass, or Earthen Ware, call'd *Ecbeis*; which they dispos'd in private Places, under the Steps and Seats of the Theatres, to aid and increase the Reflection and Resonance of the Actors Voices, &c. See **THEATRE**.

'Tis said, there are *Vases* of this Kind in the Cathedral Church of *Milan*.

**VASE** is particularly used in Architecture, to signify the Body of the *Corinthian* and *Composite* Capital; call'd also the *Tambour*, or *Drum*; and sometimes the *Campana*, or *Bell*. See **CORINTHIAN**, and **CAMPANA**.

**VASE** is also sometimes used among Florists, for what they otherwise call the *Calyx*.

The *Vase*, or rather *Calyx* of a Tulip, is the Top, or Head of a Tulip; the Leaves whereof form a kind of *Vase*, or Cap. See **CALYX**.

Goldsmiths, Pewterers, &c. also use *Vase* for the middle of a Church Candlestick; which is usually of a roundish Figure, bordering somewhat on that of a *Vase*.

**VASSAL**, in our antient Customs, a Person who vow'd Fidelity, and Humage to a Lord, on account of some Land, &c. which he held of him, in Fee. See **FEALTY**, **HOMAGE**, **LORD**, &c.

The *Vassal*, *Vassallus*, was also call'd *Piratus*, *Lord's-man*, and *Fee-man*; but now the Denomination is chang'd into that of *Tenant in Fee*. See **TENANT**.

They sometimes also used the Term *Vassour* for *Vassal*; whence *Vassour*. See **VAVASSOUR**.

If a *Vassal* offended his Lord grievously, either in Person, or in Honour, he committed the Crime of Felony; which carry'd with it a Confiscation of his Fee. See **VASSALAGE**.

A *Rear VASSAL*, is he who holds of a Lord, who himself is *Vassal* of another Lord. See **MESNE**.

**VASSAL** was also antiently used for *Soldier*; by reason Fees, at first, were given to none but Military Men. See **FE**.

*Du Cange* will have the Word to come from *Vassus*, which antiently signify'd a Servant or Domestic of a Prince, and sometimes the *Comites*, or *Assessores* in publick Trials.

*Ménage*, after *Cujas*, takes *Vassal* to have been form'd of *Gesse*, or *Gessus*; an antient Gaulish Word, signifying Fellow, or Companion in Arms; from *Gesse*, or *Gessum*, or *Jessum*, a kind of Javelin us'd among them.

*Vassus* derives *Vassal* from *Vas*, *Pledge*; whence also he will have it to be, that they are sometimes call'd *Fideles*.

**VASSALAGE**, the State of a *Vassal*; or a Servitude and Dependency on a superior Lord. See **VASSAL**.

Antiently, they distinguish'd between *Liege Vassalage* and *Simple Vassalage*.

*Liege Vassalage* only belong'd to the King; as carrying with it an Obligation on the side of the *Vassal*, to serve his Lord in War against all Persons whatever.

In all *Simple Vassalage*, the Fealty, or *Liege Vassalage*, was still reserv'd to the King.

Some also make *Active Vassalage*, and *Passive*: The first is the Right of Fealty residing in the Lord; the second, the Service and Duties incumbent on the Tenant.

**VASTO**, in Law, a Writ that lies for the Heir, against the Tenant for Life, or Years, for making waste; or for him in the Reversion, or Remainder.

**VASTUS**, in Anatomy, a Name common to two Muscles of the Leg, distinguish'd into *internal*, and *external*; thus call'd from their largeness: both of 'em serving to extend the Leg.

*VASTUS Eteranus*, springs from the Root of the great *Trochanter*, and from the *Linea Affera*; outwardly tendinous and inwardly fleshy; and descending obliquely forwards, becomes, *vice versa*, tendinous inwardly and fleshy outwardly; all meeting the Tendon of the *Rectus*, it grows quite tendinous, and is inserted together with it.

*VASTUS Internus*, arises likewise partly tendinous, and partly fleshy, from the *Linea Affera*, immediately below the less *Trochanter*, upon the outside of the *Tibia*; and is continued almost to the lower *Apophyses* thereof, on the inside; whence it descends obliquely, and growing tendinous, is inserted with the former.

**VAT**, or **FAT**, a kind of Vessel, used to hold Wine, Ale, Beer, Syder, or any other Liqueur, in the time of its Preparation.

**VATICAN**, is properly the Name of one of the seven Hills whereon *Rome* stands: On the Foot hereof is the famous Church of *St. Peter*, hence called the *Vatican*; and a magnificent Palace of the Pope, which has the same Denomination.

Hence arise divers figurative Expressions; as, the *Tribunet* of the *Vatican*, &c. the Pope's Anathema, &c.

The Library of the *Vatican* is one of the most celebrated in the World: It is particularly remarkable for its Manuscripts. Towards the beginning of the last Century, it was greatly augmented by the addition of that of the Elector *Palatine*. It is open to all the World three or four times a Week.

In it are shown a *Virgil*, *Terence*, &c. above a thousand Years old; the Manuscript whereon the Edition of the Septuagint was made; and abundance of Rabbinical Manuscripts. See **LIBRARY**.

The Word, according to *Anulus Gellius*, is derived from *Vaticinium*, Prophecy; by reason of the Oracles and Predictions which were used to be deliver'd there by the Inspiration of an ancient Deity, called *Vatennus*; who was supposed to abide the Organ of Speech in new-born Children; and whom others will have to be no other than *Jupiter*, consider'd in that Capacity.

**VATICINATION**, the Act of Prophecy or Divining. See **DIVINATION**, and **PROPHECY**.

**VAVASOR**, or **VALVASOR**, or **VAVASOUR**, or **VALVASOUR**, in our ancient Customs, a Diminutive of *Vassal*, or *Vassor*; signifying a *Vassal* of a *Vassal*, or one who held a Fee of another *Vassal*. See **VASSAL**.

Next, *Camden*, and others, hold *Vavasar* to be a Dignity, yet below that of a Baron: He adds, that the Word is form'd of *Vas fortissimum* ad *Valentinum*, a Vessel chosen for Safety, and Health.

Some derive the Word à *vaivois*, quasi obligatus sit ad servare ad valvas *Domini*, vel dignus sit eas intrare; as being a Person oblig'd to wait at his Lord's Door, or worthy to enter thereat: But the Etymology is ridiculous enough.

*Du Cange* says, they were call'd *Valvasores*, and *Vatonsini*; and were of two Kinds: the great, call'd *Valvasores*, who held of the King; such were Counts and Barons: and the lesser, call'd *Vatonsini*, who held of the former.

**VAVASORY**, the Quality of the Lands, or Fee held by a *Vavasar*.

There are *base Vavasories*, and *frank*, or *noble Vavasories*; according as it hath pleas'd the Lord to make his *Vavasar*.

*Base Vavasories* are those for which the Lord of the Fee owes Summage, Light-horse, Rents, or other Services.

*Free Vavasories* are such as are exempt from these Services. *Quod dicitur de Baronis non est observandum in Vavasariorum, vel alius minoribus feudis quam Baronum, quia caput non habent feudum Baronum.* Bract. Lib. II. cap. 39.

**VAUDOIS**, or **VALFENSES**, or **WALTENSES**, a Name given to a Sect of Christians, who made their first appearance about the Year 1160; or, as others will have it, about the Year 1118.

The Occasion of their Rise is thus deliver'd: 'In an Assembly of several of the more considerable Citizens of *Lyon*, one of 'em fell down suddenly dead in the middle.

' Upon which, *Pierre Valdo*, who was one of the Number, being struck with the Accident, distributed a large Sum of Money among the Poor on the Spot. This drawing a great number of People to follow him, he exhorted them to embrace a voluntary Poverty, after the Example of *Jesus Christ* and his Apostles: And as he was a Man of some learning, he expounded to 'em the New Testament in the vulgar Tongue.

' The Clergy soon began to cry out on him as a rash Intruder: but he, despising their Reprimands, still held on; and even went farther. For the Accusations of the Priests having exasperated him, he began to declaim against 'em; he expos'd their corrupt Lives and Morals; and even, by degrees, came to censure some of the Corruptions in the Discipline and Doctrine of the Church.' And this prov'd some of the way to the Reformation.

The *Vaudois* had their Name from this *Valdo*, whose Retainers they were. They were also call'd *Lyonists*, and *Sabatens*, or *Inhabatens*, or *Enabatens*.

**VAULT**, *Fornix*, in Architecture, an arch'd Roof, so contriv'd, as that the several *Fouffers*, or *Vault-Stones* whereof it consists, do by their Disposition sustain each other. See **ARCH**.

*Vaults* are to be prefer'd, on many Occasions, to *Soffits*, or flat Ceilings, as they give a greater Rise and Elevation; and besides, are more firm and durable. See **CEILING**, **ROOF**, &c.

The Antients, *Salmastius* observes, had only three Kinds of *Vaults*: The first, the *Fornix*, made *Circulo-wis*; the second, *Tetastudo*, *Tortoise-wis*, call'd by the French *Cul de Four*; or *Oven-wis*: The third *Concha*, or *Trumpet-wis*, as growing narrower and narrower.

But the Moderns subdivide these three Sorts into a great many more, to which they give different Names, according to their Figures and Uses: Some are *Circular*, others *Elliptical*, &c.

The Sweeps of some, again, are larger, others less Portions of a Sphere: All above Hemispheres are call'd *high*, or *surmounted Vault*; all that are less than Hemispheres, are *low*, or *subjoin'd Vault*, or *Tetastudines*, &c.

In some the Height is greater than the Diameter; in others 'tis less: There are others, again, quite flat, only made with Haunches; others *Oven* like, or in form of a *Cul de Four*, &c. others growing wider as they lengthen, like a *Trumpet*.

There are likewise *Gothic Vault*, with *Ogives*, &c. Of *Vaults*, again, some are *single*, others *double*, *cross*, *diagonal*, *horizontal*, *ascending*, *descending*, *angular*, *oblique*, *pendent*, &c. See **OGIVE**, **GROIN**, **PENITENTIVE**, &c.

*Master-Vaults*, are those which cover the principal Parts of Buildings; in contradistinction to the *lesser*, or subordinate *Vaults*, which only cover some little Part; as a Passage, a Gate, &c.

*Double Vault*, is such a one as being built over another, to make the exterior Decoration range with the interior, leaves a Space between the Convexity of the one, and the Concavity of the other; as in the Dome of *St. Peter's* at *Rome*.

*Vaults with Compartments*, are such whose Sweep, or inner Face, is enrich'd with Panels of Sculpture, separated by *Piat-bands*: These Compartments, which are of different Figures, according to the *Vaults*, and usually gilt, on a white Ground, are made with *Succ*, on *Brick Walls*; as in the Church of *St. Peter's* at *Rome*; and with *Plaster*, on *Timber Vault*.

### Theory of VAULTS.

A Semicircular Arch, or *Vault*, standing on two *Piedroits*, or *Imposts*, and all the Stones that compose them, being cut and placed in such manner, as that their Joins, or *Beds*, being prolong'd, do all meet in the Centre of the *Vault*; 'tis evident, all the Stones must be in form of *Wedges*, *i. e.* must be wider and bigger a-top than at bottom; by virtue of which, they sustain each other, and mutually oppose the Effort of their Weight, which determines them to fall.

The Stone in the middle of the *Vault*, which stands perpendicular to the Horizon, and is call'd the *Key* of the *Vault*, is sustain'd on each side by two contiguous Stones, just as by two inclined Planes: and of consequence, the Effort it makes to fall, is not equal to its Weight.

But still, that Effort is greater, as the inclined Planes are less inclin'd; so that, if they were infinitely little inclin'd, *i. e.* if they were perpendicular to the Horizon, as well as the *Key*, it wou'd tend to fall with its whole Weight; and wou'd actually fall; but for the *Mortar*.

The second Stone, which is on the right or left of the *Key-Stone*, is sustain'd by a third; which, by virtue of the Figure of the *Vault*, is necessarily more inclin'd to the second, than the second is to the first; and of consequence, the second, in the Effort it makes to fall, employs a less Part of its Weight than the first.

For the same Reason, all the Stones, reckoning from the *Key-Stone*, employ still a less and less Part of their Weight, to the last; which resting on a horizontal Plane, employs no part of its Weight; or, which is the same thing, makes no effort to fall; as being entirely supported by the *Impost*.

Now, in *Vaults*, a great Point to be aim'd at, is, that all the *Fouffers*, or Stones, make an equal effort towards falling: To effect this, it is visible, that as such (reckoning from the *Key* to the *Impost*) employ a still less and less Part of its whole Weight, the first, for Instance, only employing one half; the second, one third; the third, one fourth, &c. there is no other way to make those different Parts equal, but by a proportionable Augmentation of the whole, *i. e.* the second Stone must be heavier than the first; the third than the second, &c. to the last; which should be infinitely heavier.

*M. de la Hire* demonstrates, what that Proportion is, in which the Weights of the Stones of a Semicircular Arch, must be increased, to be in *Equilibrio*, or to tend with equal Forces to fall; which is the firmest Disposition a *Vault* can have.

Before him, the Architects had no certain Rule to conduct themselves by; but did all at *random*. Reckoning the Degrees of the Quadrant of the Circle from the Key-Stone to the Impost; the Extremity of each Stone will take up so much the greater Arch, as it is farther from the Key.

M. *de la Hire's* Rule is, to augment the Weight of each Stone, above that of the Key-Stone, as much as the Tangent of the Arch of the Stone, exceeds the Tangent of the Arch of half the Key. Now, the Tangent of the last Stone, of necessity becomes infinite, and of consequence its Weight should be so too: but as Infinity has no place in Practice, the Rule amounts to this, that the last Stones be loaded as much as possible, that they may the better resist the Effort which the Vault makes to separate 'em; which is call'd the *Shoot* or *Drift* of the Vault.

M. *Parent* has since determin'd the Curve, or Figure which the *Extrados*, or outside of a Vault, whose *Intrados*, or inside, is spherical, must have, that all the Stones may be in *Equilibrium*.

Key of a VAULT, is a Stone, or Brick, in the middle of the Vault, in form of a truncated Cone; serving to bind or fasten all the rest. See KEY.

The *Reins* of a VAULT, or the filling up, are the Sides which sustain it.

The *Pendentive* of a VAULT, is the Part suspended, between the Arches or *Ogives*. See PENDENTIVE.

The *Impost* of a VAULT, is the Stone wherein the first *Vaufoir*, or Stone of the Vault, is laid. See IMPOST, &c.

VAULT, or VOLV, in the Manage, an Action of a Horse, wherein he turns round, or makes a Circle side-ways, going round a Centre.

There are some *Vaults* wherein the Horse makes two parallel Circles, the one with his fore Feet, and the other with his hind; and others, wherein the Horse making Curvets and Capriols, his Haunches follow his Shoulders, and only make one Circle, or Oval, about a Pillar or Centre.

An *inverted*, or *backward Vault*, is that wherein the Horse, turning likewise side-ways, has his Head towards the Centre, and his Tail towards the Circumference: So that the great Circle is form'd by the fore-Feet, and the little one by the hind-Feet.

A *Demi-Vault*, or *Half-Vault*, is when the Horse only goes half the Circle, and comes back again the same way.

Vault is also used for the Manages practis'd on the wooden Horse, to learn to mount and unmount with Ease and Expedition.

VAUNT-Lay, among Hunters, a setting of Hounds, or Beagles in a readiness where the Chace is to pass; and casting 'em off before the rest of the Kennel come in. See RELAY.

VAYVODE, or VALVODE. See WAYVODE.

UBIQUISTS, UBIQUITARIES, or UBIQUITARIANS, a Sect of Heretics, which rose and spread it self in *Germany*; and whose distinguishing Doctrine was, that the Body of Jesus Christ is every where, or in every Place.

*Brentius*, one of the earliest Reformers, is said to have first broach'd this Error, in 1560. *Melancthon* immediately declar'd against it; maintaining, that it introduc'd, with the *Eutychians*, a kind of Confusion into the two Natures of Jesus Christ; and protested that he would oppose it as long as he liv'd.

On the other hand, *Andrew* and *Flaccius Illyrius*, *Offender*, &c. espous'd *Brentius's* Party; and asserted, the Body of Jesus Christ to be every where.

The Universities of *Leipsick* and *Wirttemberg*, and the generality of Protestants, set themselves against this new Heresy, but in vain: The *Ubiquitarians* grew stronger and stronger. Six of their Leaders, *Smidelin*, *Selmecker*, *Musculus*, *Clemtinus*, *Clytrens*, and *Cornerus*, having a Meeting in 1577, in the Monastery of *Berg*; they there compos'd a kind of *Credo*, or *Formula* of Faith; wherein the *Ubiquity* was establish'd as an Article.

All the *Ubiquists*, however, are not agreed: Some of 'em, and among the rest the *Strudel*, hold that Jesus Christ, even during his Mortal Life, was every where: Others maintain, that 'tis only since his Ascension that his Body is every where.

*G. Hornius* will only allow *Brentius* to be the first Propagator of *Ubiquitism*; his first Inventor, according to him, was *John of Welpshalla*, a Minister at *Hambourg*, in 1552.

In the University of *Paris*, *Ubiquist* is a Term applied to such Doctors in Theology as are not restrain'd to any particular House; either to that of *Nauarre*, or *Sorbonne*.

The *Ubiquists* are called simply *Doctors in Theology*; whereas the others add, of the House of *Sorbonne*, or *Nauarre*, &c. See SORBONNE.

The Word is form'd from the Latin Adverb, *ubique*, every where.

UBIQUITY, more properly call'd *Omnipresence*; an Attribute of the Godhead, whereby he is always, intimately present to all Things; gives the *Essé* to all Things; knows, preserves, and works all, in all Things. See GOD.

For since God cannot be said to exist in all Places; as plac'd therein, (since, then, he would need something to his Existence, viz. Place; and would have Extension, Parts, &c.) he must be conceiv'd to be every where, or in all Things, as a first, universal efficient Cause, in all his Effects.

He is present, therefore, to all his Creatures, as a pure Act, or an Exercise of an active Virtue, which knows, preserves, governs, &c. every thing. Nor are, even finite Minds, present otherwise than by Operation. See PRESENCE.

UDDER, UARR, in Comparative Anatomy, that Part in Brutes wherein the Milk is prepared; answering to the *Mammae*, or Breasts, in the human Kind. See MAMMÆ, and MILK.

VECTIS, in Mechanics, one of the Powers; more usually call'd the *Lever*. See LEVER.

VECTOR, in Astronomy, a Line suppos'd to be drawn from any Planet moving round a Centre or the Focus of an Ellipsis, to that Centre, or Focus.

This, by some Writers of the new Astronomy, is called *Vector*, because it is that Line by which the Planet seems to be carried round its Centre; and with which it describes Areas, proportional to the Times. See PLANET.

VEDETE, in the Military Art, a Sentinel on Horseback, detach'd from the main Body of the Army, to discover and give notice of the Enemy's Designs. See RECONNOITRE.

VEER, a Sea Term, variously used. *Veering out a Rope*, denotes the letting it go by hand, or letting it run out of it self: Thus, they say, *Veer more Cable*; that is, let more run out: But they do not use the Word for the letting out of any running Rope, except the Sheet.

The Word *Veer* is also used in reference to the Wind; for when it changeth often and suddenly, they say, *the Wind veereth*.

Also, when a Ship, under sail, hath her Sheet *veered* out, they say, *She goes veering*; that is, at large, neither by a Wind, nor directly before it, but between both; which they also call *Quartering*. See WIND, and QUARTERING.

VEGETABLE, in Physiology, a Term applied to all Plants, consider'd as capable of growth, i. e. to all natural Bodies which have Parts organically form'd for Generation, and Accretion, but not Scatulation. See PLANT.

In *Vegetables*, there is suppos'd to be a Principle of Life, commonly call'd the *Vegetative Soul*. See VEGETATIVE, and VEGETATION.

*Borhaave* very scientifically defines a *Vegetable* to be a Body generated of the Earth; to which it adheres, or is connected, by Parts called *Roots*, thro' which it receives the Matter of its Nourishment, and Increase; and consists of Juices, and Vessels, sensibly distinct from each other: Or, a *Vegetable* is an organical Body, compos'd of Vessels, and Juices, every where distinguishable from each other; to which grow *Roots*, or Parts whereby it adheres to some other Body, from which it derives the Matter of its Life, and growth.

This Definition furnishes a just and adequate Idea of a *Vegetable*: for by its consisting of Vessels and Juices, it is distinguish'd from a Fossil; and by its adhering to another Body, and deriving its Nourishment therefrom, it is distinguish'd from an Animal. See FOSSIL, and ANIMAL.

A *Vegetable* is defined an *Organical Body*, because consisting of different Parts, which jointly concur to the Exercise of the same Function. See ORGANICAL.

*Adhering by some of its Parts to another Body*; for we know of no Plant that is so absolutely vague and fluctuating, but has still a Body it adheres to; tho' that Body may be various, e. g. Earth, as in our common Plants; Stone, as in Rock Plants; Water, as in Sea Plants; and Air, as in some Mucilages. See ROCK-PLANT, SEA-PLANT, &c.

As to those few Plants which appear to float with the Water, their manner of growth is somewhat anomalous: M. *Tournefort* has shewn, that all Plants do not arise strictly from Seeds; but that some, instead of Semen, deposit, or let fall a little drop of Juice, which sinking in the Water, by its Gravity reaches the bottom, or some Rock, &c. in its way; to which it sticks, strikes Root, and shoots into Branches: Such is the Origin of Coral. See CORAL.

Add, that the Root of a Plant may have any Situation at pleasure, with respect to the Body thereof; nor needs it either be lowest, or highest, &c. Accordingly, in Aloes, Coral, Mosses, Fungus, &c. the Root is frequently uppermost, and its growth downward.

The vascular Structure of *Vegetables*, is render'd very apparent, by an Experiment of *Mr. Willoughby*: Cutting off some pretty big Branches of Birch, and making a sort of Basin, or Reservoir on the End thereof with some soft Wax; upon filling this with Water, and holding the Branch upright, the Water, in a few Minutes, sunk into the Vessels of the Wood, and running quite thro' the Length, drop'd out considerably fast; continuing so to do, so long as the Water was pour'd on.

The same succeeds in a Sycamore, Walnut, &c. tho' the Flax here is not so copious. *Phil. Transact.* N<sup>o</sup> 70.

There are Secrets whereby the Growth of *Vegetables* is surprisingly promoted. Mr. Boyle mentions a Virtuoso, who entertain'd his Friends at the End of their Meal with a Salad of Lenticis, which he found in their presence, immediately before they sat down to Table.

The Chymists have furnish'd us with some very extraordinary *Vegetables*; as the *Arbor Diane*, *Arbor Martii*, &c.

In effect, Gold, Silver, Iron, and Copper, being prepared in Aqua fortis, there rises out of 'em a kind of Tree, which vegetates, or grows, to the naked Eye, and spreads into Branches, Leaves, &c. the whole height of the Water; till all the Matter is spent therein. See TREE.

This Water the Chymists call *Flint-Water*; the Secret whereof has been communicated by *Robertus Cassius*, a Greek Chymist.

VEGETATION, the Act whereby Plants receive Nourishment, and grow. See PLANT, VEGETABLE, &c.

Plants, we learn from the Microscope, consist of different Parts, Vessels, &c. analogous to those of Animals: And each kind of Vessel is supposed to be the Vehicle of a different Humour, or Juice secreted from the Mass of Sap; which is consider'd as the Blood, or common Fund of them all. See SAP, and BLOOD.

Dr. Grew assigns the Offices of the several Vessels: Those placed on the inner Verge of the Bark, he calls *Lympheducts*, and supposes 'em destin'd for the Conveyance of the most aqueous or watery Liquor; those, Mr. Bradley calls, the *new forming Vessels*, which are annually produced, and help to increase the Bulk of the Tree.

Those in the middle of the Bark, Dr. Grew calls *Lactiferous*, or *Resiniferous* Vessels; their use, according to Bradley, is to return the superfluous Sap: These Vessels, Grew observes, are the principal *Viscera* of Plants; and adds, that as the *Viscera* of Animals are but Vessels conglomerated; so the Vessels of a Plant are *Viscera* drawn out at length. See VISCERA.

To the Nutrition of Plants, as well as Animals, it seems necessary that there be a Concourse of two specifically distinct Fluids; and a learned Author maintains an Intermixture of two such Humors in every Part of a Tree, like that which we observe in Linsley-woolsey: Every Part of Sap being impregnated with other Tinctures, and continually filter'd from Fibres of one kind to those of another. From this Mixture, many of the Phenomena of the Ripening, Odours, Colours, &c. are accounted for.

#### Theory of VEGETATION.

The Process of Nature in the *Vegetation* of Plants, is very accurately deliver'd by the excellent *Malpighi*, to the Effect following.

The Egg (or Seed) of the Plant being excluded out of the Ovary, (call'd *Pod*, or *Husk*) and requiring further fostering and brooding; is committed to the Earth. See SEED, and EGG.

There, that kind Mother having receiv'd it into her Bosom, not only does the Office of Incubation, by her own warm Vapours and Exhalations, join'd with the Heat of the Sun; but, by degrees, supplies what the Seed requires for its further growth; as abounding every where with Canals and Sinus's, wherein the Dew, and Rain-Water, impregnated with fertile Salts, glide, like the Chyle and Blood in the Arteries, &c. of Animals.

This Moisture meeting with the new deposited Seed, is percolated, or strain'd thro' the Pores or Pipes of the outer Rind, or Husk (corresponding to the *Secundines* of *Fetus's*) on the inside whereof be one or more, commonly two, thick Seminal Leaves, (answering to the *Placenta* in Women, and the *Corydons* in Brutes). See SECUNDINE, PLACENTA, &c.

These Seed-Leaves consist of a great Number of little *Vesiculae*, or Bladders; with a Tube, corresponding to the Navel-string in Animals. See UMBILICUS.

Into these *Vesiculae* is receiv'd the Moisture of the Earth, strain'd thro' the Rind of the Seed; which makes a slight Fermentation with the proper Juice before contain'd therein.

This fermented Liquor is convey'd by the Umbilical Vessel to the Trunk of the little Plant; and to the Gem or Bud, which is contiguous thereto: upon which, a *Vegetation* and increase of the Parts succeeds.

Such is the Procedure in the *Vegetation* of Plants; which the illustrious Author exemplifies in a Grain of Wheat; as follows:

The first Day the Grain is sown, it grows a little turgid; and the *Secundine*, or Husk, gapes a little in several Places; and the Body of the Plant, being continued by the Umbilical Vessel to a conglobated Leaf, (which is call'd the Pulp or *Flois* of the Seed, and is what constitutes the *Flower*) swells; by which means, not only the Gem, or Sprout, (which is to be the future Stem) opens, and waxes green; but the Roots begin to banch out; whence the *Placenta*, or Seed Leaf, becoming loose, gapes.

The second Day, the *Secundine* or Husk, being broke thro'; the Stem, or Top of the future Straw, appears in the outside thereof, and grows upwards by degrees: In the most time, the Seed-Leaf guarding the Roots, becomes turgid with its *Vesiculae*; and puts forth a white Down. And the Leaf being pull'd away, you see the Roots of the Plant bare; the future Bud, Leaves; and rest of the Stalk, still laying hid. Between the Roots, and the ascending Stem; the Trunk of the Plant is knit by the Navel-knot to the Flower-Leaf; which is very moist, tho' it still retains its white Colour, and its natural Taste.

The third Day, the Pulp of the conglobated or round Leaf, becomes turgid with the Juice which it has receiv'd from the Earth, fermenting with its own.

Thus the Plant increases in bigness, and its Bud or Stem becoming taller, and from whitish, turns greenish: The lateral Roots also break forth greenish, and pyramidal from the gaping Sheath, which adheres closely to the Plant; and the lower Root grows longer, and hairy, with many Fibres shooting out of the same.

Indeed, there are hairy Fibres hanging all along on all the Roots, except on their Tips; and these Fibres are seen to wind about the saline Particles of the Soil, little Lumps of Earth, &c. like Ivy; whence they grow curled. Above the lateral Roots, there now break out two other little ones.

The fourth Day, the Stem mounting upwards, makes a right Angle with the Seminal Leaf: The last Roots put forth more; and the other three, growing larger, are clothed with more Hairs, which finally embrace the Lumps of Earth; and where they meet with any Vacuity, unite into a kind of Net-work. The Conglobate, or Flower-Leaf, is now softer; and when bruis'd yields a white sweetish Juice, like Barley Cream. By stripping it off, the Root and Stem of the Plant are plainly seen, with the intermediate Navel-knot, whose outer Part is solid, like a Bark, and the inner more soft, and medullary.

The fifth Day, the Stalk still rising, puts forth a permanent or stable Leaf, which is green, and folded; the Roots grow longer, and there appears a new Tumor of a future Root: The outer, or Sheath-Leaf is loosen'd; and the Seed-Leaf begins to fade.

The sixth Day, the Stable-Leaf being loosen'd, the Plant mounts upwards; the Sheath-Leaf still cleaving about it like a Bark. The Seed-Leaf is now seen sinuous, or wrinkled, and faded; and this being cut or freed from the *Secundine*, the Flesh, or *Pericarpium*, is found of a different Texture; the outer Part, whereby the outside of the Seed or Grain is heaved up, being more solid; but the inside vesicular, and fill'd with Humor: especially that Part next the Navel-knot. All the Leaves being pull'd off, the Roots torn, and the Flower-Leaf remov'd, the Trunk appears; wherein, not far from the Roots, the Navel-knot bunches out, which is solid, and hard to cut: Above, there is the Mark of the Sheath-Leaf, which was pull'd off; and underneath, as in an Arm-pit, the Gem is again hid. The hind Part of the Plant shows the breakings forth of the Roots, likewise the faded *Placenta*, &c.

After the eleventh Day, the Seed-Leaf, as yet sticking to the Plant, is crumpled, and almost corrupted; within, it is hollow; and about the *Secundine*, the mucous and white Substance of the Seed being continu'd to the Navel-knot, forms a Cavity. All the Roots becoming longer, put forth new Branches out of their Sides: The Seed-Leaf withers, and its Vessels are empty'd: The Internodes, or Spaces between the Knobs, grow longer; new Gems appear; and the middle Root grows several Inches long.

After a Month, the Roots and Stalk being grown much longer, new Buds break out at the first Knot, and little Tumors banch out, which at length break into Roots.

For other *Circumstances*, see GENERATION, SAP, SEED, RADICLE, PLUM, PERPENDICULARITY, PARALLELISM, &c. As to the *Vegetable Matter*, or the Food whereby Plants grow, there is some doubt: The common Opinion, among Naturalists, is, that Water is the great *vegetable Food*; which is confirm'd by an easy Experiment.

A Sprig of Balm, Mint, or the like Plant, is set in a Phial of pure Water, without any Mixture of Earth; yet the Sprig grows, puts forth Roots, Leaves, and Branches.

Agreeable to which, is another fam'd Experiment of *Van Helmont*; who drying 200 Pounds of Earth, and planting a Willow which weigh'd five Pounds therein, he water'd it only with Rain, or distill'd Water; and to secure it from any other Earth, cover'd it with a perforated tin Cover: At five Years end, weighing the Tree, with all the Leaves it had borne in that time, he found it to weigh 169 Pounds 3 Ounces; yet the Earth was only diminish'd two Ounces. See WATER.

To ascertain this Point, Dr. Woodward has made some very good Experiments; which, at the same time, give light to many other *Circumstances* of *Vegetation*. His Experiments are most of 'em with Sprigs of Mint, and some other

Plants, nicely weigh'd, and inclos'd in equal glass Phials, well cover'd up with Parchment; leaving only room for the Stems to ascend thro' it; and fill'd with Water; some with Spring Water, others with Rain Water, others with Thames Water.

At the End of 77 Days he took 'em all out again; weigh'd 'em, as also the Water left; and computed the Weight of Water expended on 'em, and the Proportion of the Increase of the Plant, to the Expence of the Water.

The next Year, viz. 1692, he made fresh Experiments with the same Phials, and the same sort of Plants, weigh'd as before, only some were fill'd with *Hyde-Park* Conduit Water alone, others with the same Water, and a certain Proportion of Garden-Earth dissolv'd in it; and others in the same Water dissolv'd.

At the End of 56 Days, he weigh'd the Plants, Water, &c. and computed what each Plant had gain'd, what Quantity of Water was expended on the Plant, and the Proportion of the Increase of the Plant, to the decrease of the Water.

The Result of all which Experiments, he gives us in the following Observations and Reflections:

1<sup>o</sup>. *In Plants of the same Kind, the less they are in bulk, the smaller Quantity of the fluid Mass, in which they are set, is drawn off; the Consumption, where the Mass is of equal thickness, being pretty nearly proportion'd to the Bulk of the Plant.*

In effect, the Water seems to ascend up the Vessels of Plants, in much the same manner as up a Filter: and it is no great wonder that the larger Filter should draw off more Water than the smaller; or that a Plant that hath more and larger Vessels, should take up a greater Share of the Fluid in which it is set, than one that has fewer can: Nor is this noted as a thing very considerable in it self, but chiefly with regard to what follows.

2<sup>o</sup>. *Much the greater Part of the fluid Mass thus drawn off, and convey'd into the Plant, does not settle or abide there; but passes thro' their Pores, and exhales up into the Atmosphere.* That the Water in these Experiments ascended only thro' the Vessels of the Plants, is certain; since some Glasses, which had no Plants in them, the disposed in like manner as the rest, remain'd at the end of the Experiment as at first, and without any Diminution of Water: and that the greatest Part of it flies off from the Plant into the Atmosphere, is as certain.

The least Proportion of the Water expended, was to the Augment of the Plant, as 46 or 50 to 1; and in some 200, 200, nay, in one, as 700 to 1.

This continual an Emission of Water, in so great Plenty, from the Parts of the Plant, affords a manifest Reason, why Countries that abound with Trees, and the larger Vegetables especially, should be very obnoxious to Damps, great Humidity in the Air, and more frequent Rains, than others that are more open and free. The great Moisture in the Air, was a great Inconvenience and Annoyance to those who first settled in America; which, at that time, was overgrown with Woods and Groves: But as these were burnt and destroy'd, to make way for Habitations, and Culture of the Earth; the Air mended, changing into a Temper much more serene and dry than before.

Nor does this Humidity go off pure, and alone, but usually carries with it many Parts of the same Nature with those whereof the Plant, thro' which it passes, consists: The Cras, indeed, are not so easily borne up into the Atmosphere, but are usually deposited on the Surface of Leaves, Flowers, and other Parts of the Plants; whence our Mannas, our Honies, and other gummy Exudations of Vegetables: But the finer and lighter Parts are with greater ease sent up into the Atmosphere; whence they are convey'd to our Organs of Smell, by the Air we draw in Respiration; and are pleasant or offensive, beneficent or injurious to us, according to the Nature of the Plants from whence they arise. And since these owe their Rise to the Water that ascends out of the Earth, thro' the Bodies of Plants; we cannot be far to seek for the Cause why they are more numerous in the Air, and a greater Quantity of Odours is found exhaling from Vegetables, in warm humid Seasons, than in other.

3<sup>o</sup>. *A great Part of the terrestrial Matter that is mix'd with Water, ascends up into the Plant, as well as the Water.* There was much more terrestrial Matter, at the End of the Experiment, in the Water of the Glasses that had no Plants in them, than in those which had Plants. The Garden-Mold dissolv'd in some of the Glasses, was considerably diminish'd, and carry'd off; nay, the terrestrial and vegetable Matter, was borne up in the Tubes fill'd with Sand, Cotton, &c. in that quantity, as to be evident, even to Sense; and the Bodies in the Cavities of the other Tubes, that had their lower Ends immers'd in Water, wherein Saffron, Cochineal, &c. had been infus'd, were ting'd with yellow, purple, &c. To look abroad a little towards our Shores, and Parts within the Verge of the Sea, these will present us with a large Scene of Plants, that along with the Vegetable,

take up into them mere Mineral Matter also, in great abundance; such as our Sea-Parlaim, the several sorts of Algas, of Sempifers, and other marine Plants: Those contain common Sea Salts, which are the same as the Fossil, in such plenty, as not only plainly to be distinguish'd on the Palace, but may be drawn out of them in considerable quantity: nay, some affirm, There are Plants found that will yield Nitre, and other Mineral Salts.

The Vegetable Matter being very fine and light, is surprisingly apt, and disposed to attend Water in all its Motions and follow it into each of its Reccrifes; as appears not only from the Influences above allegd'd, but many others: percolate it with all the Care imaginable, filter it with never so many Filtrations, yet some terrestrial Matter will remain. Dr. Woodward has filter'd Water thro' several Sheets of thick Paper, and after that thro' very close fine Cloth, twelve times doubled; and this over and over, and yet a considerable Quantity of this Matter discover'd it self in the Water after all. Now, if it thus passes Interstices that are so very small and fine, along with the Water; it is the less strange, it should attend it in its Passage thro' the Duets and Vessels of Plants: It is true, filtering and distilling of Water, intercepts, and makes it quit some of the earthy Matter it was before impregnated withal; but then, that which continues with the Water after this, is fine and light, and such, consequently, as is in a peculiar manner fit for the Growth and Nourishment of Vegetables. And this is the Case of Rain Water: the quantity of terrestrial Matter it bears up into the Atmosphere, is not great; but what it doth bear up, is chiefly of that light Kind, or Vegetable Matter, and that, too, perfectly dissolv'd, and reduc'd to single Corporcules, all fit to enter the Tubules and Vessels of Plants: On which accounts it is, that this Water is so very fertile and prolific.

The Reason why all the terrestrial Matter mix'd with the Water, does not ascend into the Plant, is, that the mineral Matter makes a great deal of it, which is not only gross and ponderous, but scabrous and inflexible; and so not dispos'd to enter the Pores of the Roots: Besides a great many of the simple Vegetable Particles, by degrees, unite, and form small Clods, or Molecules, which stick to the Extremities of the Roots of those Plants; and others of them, entangled in a looser manner, form the Nubecule, or green Bodies, so commonly observed in stagnant Water: These, when thus conjoin'd, are too big to enter the Pores, or ascend up the Vessels of Plants; which singly they might have done.

Hence it is, that in Agriculture, be the Earth never so rich, good, and fit for the Production of Corn, or other Vegetables; little will come of it, unless the Parts of it be separated and loose: And 'tis on this account, such Plains are bestow'd in the digging, tilling, ploughing, following, harrowing, and breaking the clodded Lumps of Earth: And 'tis the same way that Sea Salt, Nitre, and other Salts, promote Vegetation.

Some Authors imagine Nitre essential to Plants; and that nothing in the Vegetable Kingdom is transferr'd without it: But the Doctor assures us, that by all the Trials he has been able to make, the Thing seems to him quite otherwise; and when contiguous to the Plant, Nitre rather destroys than nourishes it. But Nitre, and other Salts, certainly loosen the Earth, and separate the concreted Parts thereof; by that means, fitting and disposing them to be assumed by the Water, and carried up into the Seed or Plant for its Formation and Increase. 'Tis every body's Observation, how apt all sorts of Salts are to be wrought upon by Moisture, how easily they run with it; and when these are drawn off, and have deserted the Lumps wherewith they were incorporated, those must moulder immediately, and fall asunder of course: The hardest Stone we meet with, if it happen, as it frequently doth, to have any sort of Salt intermix'd with the Sand of which it consists, upon its being expos'd to a humid Air, in a short time dissolves and crumbles all to pieces; and much more will clodded Earth, or Clay, which is not of so compact and solid a Constitution.

The same way is Lime likewise serviceable in this Affair: The Husbandmen say, it does not fatten, but only mellow the Ground: by which they mean, it doth not contain any thing in it self that is of the same Nature with the Vegetable Mould, or afford any Matter fit for the Formation of Plants, but merely softens, and relaxes the Earth; by that means, rendering it more capable of entering the Seeds and Vegetables set in it, in order to their Nourishment, than otherwise it would have been. The Properties of Lime are well known, and how apt it is to be put in a Ferment and Commotion by Water; nor can such Commotion ever happen when Lime is mix'd with Earth, however hard and clodded that may be, without opening and loosening it.

4<sup>o</sup>. *The Plant is more or less nourish'd, in proportion, as the Water in which it stands, contains a greater or smaller Quantity of proper terrestrial Matter in it.* The

Truth of this Proposition, is discernable thro' the whole Process of this Author's Experiments. The Mint in one of his Glasses, was of much the same Bulk and Weight with that of two or three others: But the Water in which the first was, being River Water, which was apparently stor'd more copiously with terrestrial Matter, than the Spring or Rain Water wherein the others stood, occasion'd it to arrive at almost double the Bulk that either of them had, and with a less expence of Water too: So likewise the Mint in another Glass, in whose Water was dissolv'd a small Quantity of good Garden-Mould; tho' it had the Disadvantage to be less, when first set, than either of the Mints in two other Glasses whose Water was the very same with the first, only had none of the Earth mix'd with it; yet, in a short time, the Plant not only overtook, but much outstrip'd the others.

The Reason why the Proportion of the Increase of the Plant is limited to the quantity of proper terrestrial Matter in the Water, is, that all, even Vegetable Matter, is not proper for the Nourishment of every Plant: Nor do there want good Indications, that every Kind of Vegetable requires a peculiar and specific Matter for its Formation and Nourishment; yea, each Part of the same Vegetable: and that there are very many and different Ingredients to go to the Composition of the same individual Plant. If, therefore, the Soil wherein any Vegetable or Seed is planted, contains all, or most of these Ingredients, and those in due quantity; it will grow and thrive there; otherwise it will not: If there be not as many sort of Corpuscles, as are requisite for the Constitution of the main, and more essential Parts of the Plant, it will not prosper at all; if there are these, and not in sufficient plenty, it will never arrive to its natural Stature: or, if there be any the less necessary and essential Corpuscles wanting, there will be some failure in the Plant; it will be defective in Taste, Smell, Colour, or some other way.

Indeed, 'tis inconceivable how one uniform, homogeneous Matter, having its Principles, or original Parts, of the same Substance, Constitution, Magnitude, Figure, and Gravity; should constitute Bodies so unlike in all those respects, as Vegetables of different Kinds are; nay even as the different Parts of the same Vegetable: That one should carry a resinous, another a milky, a third a yellow, a fourth a red Juice in its Veins; one afford a fragrant, another an offensive Smell; one sweet to the Taste, another acid, bitter, acerb, austere, &c. that one should be nourishing, another poisonous; one purging, another astringent. And this Argument makes equally strong against those who suppose mere Water the Matter out of which all Bodies are form'd. A Cataputa in one of the Glasses receiv'd but little Increase, only 3 $\frac{1}{2}$  Grains all the while it stood, tho' 2501 Grains of Water were spent upon it: But this might possibly be owing not to the Water's wanting Matter fit for the Nourishment of that particular Plant; but to the Water's being an improper Medium for it to grow in: Too much of that Liquor, in some Plants, may probably hurry the terrestrial Matter thro' the Vessels, too fast for them to lay hold of it.

But a farther Proof of this Doctrine, is, That the Soil, once proper for the Production of some sort of Vegetable, does not ever continue to be so; but in tract of time loses its Property; and sooner in some Lands, and later in others: If Wheat, for Example, be sown upon Land proper for that Grain, the first Crop will succeed very well, and perhaps the second, and the third, as long as the Ground is in heart, as the Farmers call it; but in a few Years it will produce no more, if sow'd with that Corn: Some other Grain it may, as Barley; and after this hath been sown so oft, that the Land can bring forth no more of it, it may afterwards yield some good Oats; and perhaps Pease after them. At length it becomes barren; the Vegetative Matter that at first it abounded with, being reduced by the successive Crops, and most of it borne off: Each sort of Grain takes forth that peculiar Matter, that is proper for its own Nourishment.

It may be brought to bear another Series of the same Vegetables; but not till it is supplied with a new Fund of Matter, of the like sort with what it first contain'd; either by the Ground's lying fallow for some time, till the Rain hath pour'd a fresh Stock upon it; or by the manuring it. That this Supply is of the like sort, is evident from the several Manures found best to promote the Vegetation; which are, chiefly, either Parts of Vegetables, or of Animals: Of Animals, we say, which either derive their own Nourishment immediately from Vegetable Bodies, or from other Animals that do so; in particular, the Blood, Urine, and Excrements of Animals; shavings of Horns, and Hoofs; Hair, Wool, Feathers, calcin'd Shells, Lees of Wine and Beer, Ashes of all sorts of Vegetable Bodies, Leaves, Straw, Roots, and Strubble, turned into Earth by ploughing, or otherwise, to rot and dissolve there. These are our best Manures; and being vegetable Substances, when reftor'd back again into the Earth, serve for the Formation of other like Bodies. See MANURE, and COMPOST.

The like is obfervable in Gardens, where the Trees, Shrubs, and Herbs, after their continuing in one Station, till they have deriv'd thence the greater Part of the Matter fit for their Increase; will decay and degenerate; unless either fresh Earth, or some fit Manure be applied to them: 'Tis true, they may maintain themselves there for some time, by lending forth Roots further and further, to an Extent all around, to fetch in more Provision; but at last, they must have a fresh Supply brought to them, or they themselves remov'd or transplanted to some Place better furnish'd with Matter for their Subsistence. And accordingly, Gardeners observe, that Plants that have stood a long while in a place, have longer Roots than usual; part of which they cut off, when they transplant to a fresh Soil, as not now of any further use to them.

All these Instances point forth a particular Terrestrial Matter, and not Water, for the Subject to which Plants owe their Increase: Were it Water only, there would be no need of Manures, or transplanting; the Rain falls in all Places, in this Field and that, indifferently; on one side of an Orchard and Garden, as well as another; Nor could there be any Reason, why a Tract of Land should yield Wheat one Year, and not the next; since the Rain showers down alike on each.

5<sup>o</sup>. Vegetables are not form'd of Water, but of a certain peculiar terrestrial Matter. A little Distillation shews, that there is a considerable Quantity of this Matter, contained both in Rain, Spring, and River Water: and the Experiments above mention'd, shew that the much greatest Part of the fluid Mass that ascends up into Plants, does not settle or abide there, but passes thro' the Pores of them; and exhales into the Atmosphere; and that a great Part of the terrestrial Matter, mixed with the Water, passes up into the Plant along with it; and that the Plant is more or less augmented, in proportion, as the Water contains a greater or smaller quantity of that Matter: From all which, we may reasonably infer, that Earth, and not Water, is the Matter that constitutes Vegetables.

One of the Springs of Mint decw up into it 2501 Grains of the fluid Mass, and yet had receiv'd but 3 $\frac{1}{2}$  Grains of Increase from it: A second, tho' it had at first the Disadvantage to be much less than the third; yet, being set in Water wherewith Earth was picotissfully mixed, and the other in Water without any such Earth, it had vastly outgrown it; weighing at least 145 Grains more than that did: A fourth Plant, tho' at first a great deal less than the fifth, yet being set in the foul cras Water, that was left in the Still, after that in which the last was set was drawn off, had gain'd in weight, at the end, above double what that in the finer and thinner Water had. The Proportion of the Augment of that Plant, which thro'w most, was to the fluid Mass spent upon it, but as 1 to 46; in others, as 1 to 60, 100, 200, and in the Cataputa, but as 1 to 714. One of the Springs took up 39 Grains of Water 8-day, one Day with another; which was much more than the whole Plant originally, and yet it gain'd not  $\frac{1}{2}$  of a Grain a-day in weight: And another took up 253 Grains a-day, which was near twice as much as its original weight; and after all, the daily Increase of the Plant was no more than 2 $\frac{1}{2}$  Grains.

6<sup>o</sup>. Spring and Rain Water contain near an equal Charge of Vegetable Matter; River Water more than either of them. These Proportions hold in the main, but a strict and just Comparison is hardly to be expected; inasmuch as in all probability, the Water that falls in Rain, contains at some times a greater share of terrestrial Matter, than that which falls at other times; a more powerful and intense heat, of necessity, hurrying up a larger quantity of that Matter, along with the humid Vapours that form Rain, than one more feeble and remiss possibly can. The Water of one Spring may flow forth with an higher Charge of this Matter than that of another: this depending partly upon the quickness of the Ebullition of the Water, and partly upon the quantity of that Matter latent in the Strata, thro' which the Fluid passes; and the greater or less Laxity of those Strata: For the same Reason, the Water of one River may abound with it, more than that of another; nay, the same River, when much agitated and in Commotion, must bear up more of it, than when it moves with less Rapidity and Violence. That there is a great quantity of this Matter in Rivers, and that it contributes vastly to the ordinary Fertility of the Earth; we have an illustrious Instance in the Nile, the Ganges, and other Rivers, that yearly overflow the neighbouring Plains: their Banks shew the fairest and largest Crops of any in the World.

7<sup>o</sup>. Water serves only for a Vehicle to the terrestrial Matter which forms Vegetables; and does not it self make any addition to them. Where the proper terrestrial Matter is wanting, the Plant is not augmented, tho' never so much Water ascend into it: Water, then, is not the Matter that composes Vegetable Bodies; it is only the Agent that conveys the Matter to them, that distributes it to their several Parts for their Nourishment: That Matter is sluggish and inactive;

inactive, and would lie eternally confin'd to its Beds of Earth, without advancing up into Plants; did not Water, or some like Instrument, fetch it forth, and carry it into them.

This Fluid is capacitated for the Office here assign'd it, several Ways; By the Figure of its Parts, which, as appears from many Experiments, is exactly and mathematically spherical; their Surfaces being perfectly polite, and without any the least Irregularities. It is evident, Corpuscles of such a Figure are easily susceptible of Motion, and far above any others whatever; and consequently the most capable of moving and conveying other Matter that is not so active: then, the Intervals of Bodies of that Figure, are, with respect to their Bulk, of all others, the largest, and so the most fitted to receive and entertain foreign Matter in them; besides, as far as the Trials hitherto made inform us, the constituent Corpuscles of Water, are each singly consider'd, absolutely solid, and do not yield to the greatest external Force: This secures their Figure against any Alteration, and the Intervals of the Corpuscles must be always alike. By the latter, it will be ever disposed to receive Matter into it; and by the former, when once received, to bear it along with it. Water is farther capacitated to be a Vehicle to this Matter, by the Tenacity and Fineness of the Corpuscles of which it consists: We hardly know any Fluid in all Nature, except Fire, whose constituent Parts are so exceeding subtle and small, as those of Water are: they will pass Pores and Interstices, that neither Air nor any other Fluid will. This enables them to enter the finest Tubes and Vessels of Plants, and to introduce the terrestrial Matter, conveying it to all Parts of them; whilst each, by means of Organs it is endu'd with for the purpose, intercepts, and assumes into it self such Particles as are suitable to its own Nature, letting the rest pass on thro' the common Ducts.

80. Water is not capable of performing this Office to Plants, unless assisted by a due quantity of Heat. This must concur, or Vegetation will not succeed. The Plants set in the Glasses in October, and the following colder Months, had not near the Quantity of Water sent up into them, or so great an additional Increase, by much; as those that were set in June, July, and the hotter Months. It is plain, Water has no power of moving it self, or rising to the vast height it doth, in the more tall and lofty Plants; so far from it, that it doth not appear from any Discovery yet made, that even its own Fluidity consists in the intestine Motion of its Parts; whatever the Cartesian think. Indeed, we need nothing more to solve all the Phenomena of Fluidity, than such a Figure and Disposition of Parts, as Water has: Spherical Corpuscles must stand so very ticklish upon each other, as to be susceptible of every Impression; and tho' perpetually in Motion, must be always ready and liable to be put into it, by any the slightest Force imaginable: 'Tis true, the Parts of Fire, or Heat, are not capable of moving themselves, any more than those of Water; but they are more subtle, light, and active, than those are, and so more easily put into Motion. See FLUIDITY.

That the Concourse of Heat in this Work is really necessary, appears not only from the Experiments before us, but from all Nature; from the Fields and Forests, Gardens and Orchards: We see in Autumn, as the Sun's Power is gradually less and less, so its Effects on Plants is remitted, and Vegetation slackens by little and little. Its Failure is first discernible in Trees; which being raised highest above the Earth, require a more intense heat, to elevate the Water charg'd with Nourishment, to their Tops; so that for want of fresh Support and Nutrient, they shed their Leaves, unless secured by a very firm and hard Constitution indeed, as our Ever greens are: Next, the Shrubs part with theirs; and then the Herbs, and lower Tribes: the Heat being, at length, not sufficient to supply even these, tho' so near the Earth, the Fund of their Nourishment. As the Heat returns the succeeding Spring, they all recruit again, and are furnish'd with fresh Supplies and Verdure: But first, those which are lowest, and nearest the Earth, and that require a lesser degree of Heat to raise the Water with its earthy Charge into them: then the Shrubs and higher Vegetables, in their turns; and lastly, the Trees. As the Heat increases, it grows too powerful, and hurries the Matter with too great Rapidity, thro' finer and more tender Plants: These, therefore, go off, and decay; and others that are more hardy and vigorous, and require a greater degree of heat, succeed in their Order. By which Mechanism, provident Nature furnishes us with a very various and differing Entertainment; and what is best suited to each Season, all the Year round.

As the Heat of the several Seasons affords us a different Face of Things, so the several distant Climates show the different Scenes of Nature, and Productions of the Earth. The better Countries ordinarily yield the largest and tallest Trees, and those, too, in a much greater Variety than the colder; even those Plants common to both, attain to a much greater Bulk in the Southern, than the Northern Climes:

nay, there are some Regions so cold, that they raise no Vegetables at all to a considerable size; this we learn from Greenland, Iceland, and other Places of like cold Situation and Condition: In these there are no Trees, and the Shrubs are poor, little, and low. Again, in the warmer Climates, and such as do furnish Trees, and the large Vegetables, if there happen a Remission or Diminution of the usual Heat, their Productions are impeded in proportion: Our cold Summers give us Proof enough of this; for tho' at such times the Heat we have, is sufficient to raise the Vegetative Matter into the lower Plants, our Corns, Wheat, Barley, Pease, and the like; and we have plenty of Strawberries, Raspberries, Gooseberries, Currants, and the Fruits of such Vegetables as are low and near the Earth; and a moderate Store of Cherries, Mulberries, Plums, &c. and some others that grow at somewhat greater height; yet our Apples, Pears, Walnuts, and the Productions of the taller Trees, have been fewer, and those not so thoroughly ripen'd, and brought to that Perfection, as they are in more benign and warm Seasons: and indeed, in Trees of the same Kind; those that keep closest to the Earth, always produce the most and best Fruit: For which Reason it is, that the Gardeners check and restrain the Growth of their better Fruit-Trees, and prevent their running up to too great a height. As to our Grapes, Apricots, Peaches, Nectarines, and Figs, they being transplanted hither out of hotter Countries, it is the less wonder we have a Failure of them in cold Summers. Nor is it the Sun, or the ordinary Emission of the Subterranean Heat only, that promotes Vegetation, but any other indifferently according to its Power and Degree; as we find from our Stoves, Hot-Beds, &c. See HEAT, COLD, WATER, EARTH, SOIL, TREE, DWARF, PRUNING, &c.

VEGETATIVE, a Term applied to that Principle, or Part in Plants, by Virtue whereof they receive Nourishment, and grow, or vegetate. See VEGETATION.

The Philosophers speak of three Kinds of Souls, the Vegetative, Sensitive, and Rational. See SOUL.

The Vegetative Soul, is that Principle whereby Trees and Plants live, grow, produce their Kind, &c. See PLANT.

This Vegetative Principle is differently seated in different Plants: An ingenious Author observes, that generally speaking, its Place is exactly between the Trunk, and Root; at least, this appears to be the Place in most of the Scimitiferous Tribe; which, if cut down near that Place, rarely shoot again.

In other Plants, as the Elm, and many edible Plants, it seems to reside wholly in the Roots; which, if cut into ever so many Parts, yet, those being planted in the Ground, soon grow. See ROOT, and PLANTING.

In others, as the Willow Kinds, it seems to be diffus'd all over, both Root, Trunk, and Branches; inasmuch that if cut into a thousand Pieces, there is no destroying 'em without splitting 'em in the middle; and scarcely then. See FOSCUENITY.

Lastly, in others, as the Cereus, Ficus, &c. it is seated in the Body, Branches, and Leaves; any of which being put into the Ground, strike Root immediately, and grow.

The Office of this Vegetative Principle, is to concoct the indigested Salts which ascend thro' the Roots; and to assimilate 'em to the Nature of the Plant. See VEGETATION.

VEHICLE, in its literal Sense, signifies somewhat that carries, or bears a Thing along: Thus, in Anatomy, the Serum is said to be the Vehicle that conveys the Globules of the Blood. (See BLOOD.) And in Pharmacy, any Liquid to dilute another with, or to administer it in, to a Patient, is called a Vehicle. Water is the Vehicle of the nutritious Matter of Vegetables. See VEGETATION.

VEIL, a piece of Stuff, serving to hide, or prevent the Sight of any thing.

In this Sense, we read of a large Veil, or Curtain, in the Temple of Jerusalem, miraculously rent at the Passion of our Saviour. See TEMPLE.

In the Romish Churches, in time of Lent, they have Veils, or large Curtains over the Altar, Crucifix, Images of the Saints, &c.

The Term Veil is also used for a large piece of Crap, worn on the Head by the Nuns; as the Badge of their Profession: Hence, to take the Veil, is to commence Religious.

The Novices wear white Veils, and those who have made the Vows, black Veils. See NOVICES.

The Prelate before whom the Vows are made, bestows the Veil, and gives it the Religious. See RELIGIOUS, BENEDICTION, &c.

VEIN, VENA, in Anatomy, a Name given to several Vessels, or Canals, which receive the Blood from the divers Parts of the Body, to which the Arteries have convey'd it from the Heart; and carry it back to the Heart again. See BLOOD, &c.

The Veins are only a Continuation of the extreme Capillary Arteries, reflected back again towards the Heart. See CAPILLARY, and ARTERY.

In their Progress, uniting their Channels as they approach it, they, at last, all form three large *Veins*, or Trunks, viz. The *Vena Cava descendens*, which brings the Blood back from all the Parts above the Heart. See CAVA.

The *Vena Cava ascendens*, which brings the Blood from all the Parts below the Heart. See HEART.

And the *Porta* which carries the Blood to the Liver. See PORTA, &c.

The *Anastomosis*, or Inoculation of the *Veins* and *Arteries*, was first seen by the Microscope, in the Feet, Tails, &c. of Frogs, and other amphibious Animals, by *Leuwenhoeck*; but has since been observ'd in other Animals, particularly the Omentum of a Cat, by Mr. *Cowper*, &c. See ANASTOMOSIS, CIRCULATION, &c.

The Coats of the *Veins* are four, the same with those of the *Arteries*; only the muscular Coat is as thin in all the *Veins*, as it is in the Capillary *Arteries*; the Pressure of the Blood against the Sides of the *Veins*, being less than that against the Sides of the *Arteries*; because the Force of the Heart is much broke in the Capillaries. See PHLEBOTOMY.

In the *Veins* there is no Pulse, because the Blood is thrown into them with a continued Stream, and because it moves from a narrow Channel to a wider. See PULSE.

But they have a Peristaltic Motion, which depends on their muscular Coat. See PERISTALTIC.

The Capillary *Veins* unite with one another, as has been said of the Capillary *Arteries*; only their Course is directly opposite: for instead of a Trunk distributed into Branches and Capillaries, a *Vein* is a Trunk form'd out of a Concourse of Capillaries. See CAPILLARY.

In all the *Veins* which are perpendicular to the Horizon, excepting those of the *Uterus* and the *Porta*, there are small Membranes, or Valves: sometimes there is only one, sometimes there are two, and sometimes three, placed together, like so many half Thimbles stuck to the Sides of the *Veins*, with their Mouths towards the Heart.

These, in the Motion of the Blood towards the Heart, are press'd close to the Sides of the *Vein*; but that the *Veins*, against any reflux of the Blood that way from the Heart, and thereby sustain the Weight thereof in the great Trunks. See VALVES.

The *Veins* are distinguish'd, with respect to their Situation, into *superior* and *inferior*, *ascending*, and *descending*; *right*, as the *Mesenteria*, and *left*, as the Splenic Branch; *internal*, as the *Mesenteria*; and *external*, as the *Humeral*.

Many of them, likewise, acquire Denominations from the Parts wherein they are found; as, the *Jugulars*, *Pleurotica*, *Renal*, *Iliac*, *Hypogastric*, *Epigastric*, *Axillary*, *Cervical*, *Umbilical*, *Sural*, *Suavica*, *Saphena*, *Mediana*, *Cephalic*, *Thoracic*, *Subclavian*, *Intercostal*, *Coronal*, *Diaphragmatic*, *Coccal*, *Hemorrhoidal*, *Cervical*, *Tymal*, *Mamillary*, *Gastric*, *Stomachic*, *Esoplic*, *Splenic*, &c.

They are also distinguish'd from their particular Offices, into *Spermatic*, *Emulgent*, &c. all which see exhibited in Plate Anatomy—and their particular Descriptions under their proper Articles—

**VEIN** is also apply'd to the Streaks, or Waves of divers Colours, appearing on several sorts of Woods, Stones, &c. as if they were really painted; and which the Painters frequently imitate in painting Waincoats, &c.

Marble is generally full of such *Veins*. See MARBLE.

*Lapis Lazuli* has *Veins* like Gold. See LAPIS.

*Ovid*, speaking of the Metamorphoses of Stones into Men, says,

*Que modo vena fuit, sub eodem nomine manfit.*

*Veins*, in Stones, are a Defect, proceeding usually from an Inequality in their Consistence as to *hard*, and *soft*; which makes the Stone crack, and shiver in those Parts.

**VEIN**, is also applied, in the same Sense with *Stratum*, to the different Dispositions and Kinds of Earth met withal in digging. See STRATUM.

Thus, we say, a *Vein* of Sand, another of *Rock*, &c. a *Vein* of Ocher, Vitriol, Allom, Calamine, Coal, &c.

Mineral Waters acquire their different Qualities by passing thro' *Veins* of Vitriol, Sulphur, &c. See MINERAL.

In the same Sense, we say, a *Vein* of Gold, Silver, Quick-silver, &c. meaning certain Parts of the Earth, wherein the Ore or Glube of those Metals is found; and which is distributed into divers Branches, like the *Veins* in the Body. See ORE, MINE, &c.

*Tavernier* gives us a Description of the *Veins* in the Diamond Mines in *Golconda*, with the manner of digging them. See DIAMOND.

In digging of Coal-Pits, they meet with a Variety of *Veins*, the Order, &c. of which, is different in different Places: In the *Philosophical Transactions*, N<sup>o</sup> 360. the *Veins* in those famous Coal-Mines at *Mendip*, in *Superjctoire*, are observ'd to be, (below the Turf, or Loam, or Malm, a reddish *Fire-stone*; the Coal *Cloves*, which is a blackish Rock;) the *Striking Vein*, a hard Coal for mechanic Uses; five Foot below which, is the *Castlead Vein*,

22 Foot thick, intermix'd with Lumps of Stone; at a like distance below which, is the *three Coal Vein*, divided into three Kinds of Coal, and about three Foot thick.

The *Veins* hitherto mention'd are frequently work'd in the same Pit.—The next is *Peaw Vein*, which is intermix'd with Cackle-shells and Fern Branches, usually wrought in a separate Pit: tho' its depth below the *three Coal Vein* be only about five Foot, yet the Cliff between is very hard, and liable to Water: This *Vein* is about a Yard thick; and the like distance below it, is the *Smith's Coal Vein*: beneath which is the *Shelly Vein*; and under that a *Vein* of ten Inches, little worth, and seldom wrought. See COAL.

The same *Veins* are found in a Place seven or eight Miles apart.—All the *Veins* lie obliquely, or shelving, like the side of a House: The Obliquity, or *Pitch*, as they term it, is about 22 Inches in a Fathom; which, when it rises to the Land, is call'd *Crop*, and in some Places *Buffeting*.

In digging to the South-west, they oft meet with *Ridges*, which cause the *Vein* to *trap up*; i. e. being cut off by the *Ridges*, they find it over their Heads, when they are thro' the *Ridge*: On the contrary, working thro' a *Ridge* to the North-east, they say it *traps down*; i. e. they find it under their Feet.

**VEJOURS**, in Law, are those sent by the Court to take View of any Place in question, for the better Decision of the Right. See VIEW.

It is also used for those sent to view such as Essoign themselves *De malo licti*; whether in truth they be such as that they cannot appear, or whether they counterfeit.

**VELAMEN**, in Surgery, the Bag, Skin, or Bladder of an Impothame, or Swelling. See CYSTIS.

**VELAMENTUM** *Bonyheinum*, a Name some Anatomists give to the velvet Membrane, or Skin of the Intestines. See INTESTINE.

**VELARIUS**, in Antiquity, an Officer in the Court of the Roman Emperors.

The *Velarii* were a kind of Ushers, whose Post was behind the Curtains, *Vela*, in the Prince's Apartments; as that of the Chancellors was at the Entry of the Balustrade, *Cancelli*; and that of the *Offitarius* at the Door.

The *Velarii* had a Superior, of the same Name, who commanded them; and we find in two Inscriptions, quoted by *Salmastius* in his Notes on *Papirus*; and by a third in *Gruter*. The first is,

D. M.  
T. CL. HALLUS  
PRÆPOSITUS VELARIORUM—  
DOMUS AUGUSTANÆ  
FEC. SIBI ET FILIIS SUI S. L.  
POST. EORUM.

*Salmastius*, and others, for **HALLUS**, which is in the Stone whereon the Inscription is, at *Rome*, put **THALLUS**: Tho' we find mention of the same *Hallus* as a Samaritan by *Nation*, and *Tiberius's* Freedman, in *Jesephus*; which shews that the *Velarii* and their Chief were very antient Officers, and in use among the first Emperors.

**VELITES**, in the Roman Army, a kind of antient Soldiers, who were arm'd with a Javelin, a Cask, Cuirass, and Shield.

**VELEITY**, in the School Philology, is defined by some, to be a languid, cold, and remiss Will. See WILL.

Others say, it implies an Impotency of obtaining what we require: Others will have it a slight Desire for something, which a Person does not matter much, or is too indolent to seek: as, *Catus amat Piscem, sed non vult tangere Lympham*.

**VELICATION**, among Physicians, the Act of Twitching.

*Velications* are particularly used for a sort of sudden Convulsions that happen to the Fibres of the Muscles. See FIBRE, and CONVULSION.

**VELOCITY**, in Mechanicks, *Swiftness*; is that Affection of Motion, whereby a Moveable is dispos'd to run over a certain Space in a certain Time. See MOTION.

It is also call'd *Celerity*; and is still proportional to the Space moved. See CELERITY.

The greatest *Velocity* wherewith a Ball can descend, by virtue of its specific Weight, in a resisting Medium, is that which the same Ball would acquire by falling in an unresisting Medium, thro' a Space which is to four thirds of its Diameter, as the Density of the Ballo to the Density of the Fluid. See DESCENT.

*Huygens*, *Leibnitz*, *Bernoulli*, *Wolffius*, and the foreign Mathematicians, hold that the *Momenta*, or Forces of falling Bodies, at the End of their Falls, are as the Squares of their *Velocities* into the Quantities of Matter; the *English* Mathematicians, on the contrary, maintain 'em to be as the *Velocities* themselves into the Quantities of Matter. See MOMENTUM.

*Velocity* is conceiv'd either as *absolute*, or *relative*: The *Velocity* we have hitherto consider'd, is *simple*, or *absolute*, with respect to a certain Space mov'd in a certain Time.

*Relative*, or *relative Velocity*, is that wherewith two distant Bodies approach each other, and come to meet in a longer or a less time: Whether, only one of 'em moves towards the other at rest, or whether they both move; which may happen two ways; either by two Bodies mutually approaching each other in the same right Line, or by two Bodies moving the same way in the same Line, only the Foremost slower than the other; for by this means, this will overtake that. And, as they come to meet in a greater or less Time, the *relative Velocity* is greater or less.

Thus, if two Bodies come nearer each other by two Foot, in one Second of Time; their respective *Velocity* is double that of two others, which only approach one Foot in the same Time.

#### VELOCITIES of Bodies moving in Curves.

According to *Galileo's* System of the Fall of heavy Bodies, now admitted by all Philosophers, the *Velocities* of a Body falling vertically, arc, each Moment of its Fall, as the Roots of the Heights from whence it has fallen; reckoning from the beginning thereof.

Hence that Author gather'd, that if a Body fall along an inclined Plane, the *Velocity* it has at the different Times, will be in the same Ratio: For since its *Velocity* is all owing to its Fall, and it only falls as much as there is perpendicular height in the inclined Plane; the *Velocity* should be measur'd by that height, as much as if it were vertical.

The same Principle likewise led him to conclude, That if a Body fall thro' two contiguous inclined Planes, making an Angle between them, much like a Stick when broke, the *Velocity* would be regulat'd after the same manner, by the vertical Height of the two Planes taken together: For 'tis only this height it falls; and from its Fall it has all its *Velocity*.

The Conclusion was universally admitted, till the Year 1693, when M. *Varignon* demonstrat'd it to be false: From his Demonstration, it should seem to follow, that the *Velocities* of a Body falling along the Convexity of a Curve, for Instance, of a Cycloid; ought not to be as the Roots of the Height; since a Curve is only a Series of an Infinity of infinitely little contiguous Planes, inclined towards one another. So that *Galileo's* Proposition would seem to fail in this Case too, and yet it holds good; only with some Restriction.

All this Mixture of Truths and Errors, so near a-kin to each other, shew'd that they had not got hold of the first Principles; M. *Varignon*, therefore, undertook to clear what related to the *Velocities* of falling Bodies; and to set the whole Matter in a new light: He still supposes *Galileo's* first System, that the *Velocities* at the different times of a vertical Fall, are as the Roots of the correspondent Heights. The great Principle he makes use of to attain his End, is that of Compound Motion. See COMPOUND MOTION.

If a Body falls along two contiguous inclined Planes, making an obtuse Angle, or a kind of Concavity between 'em; M. *Varignon* shews, from the Composition of those Motions, that the Body, as it meets the second Plane, loses somewhat of its *Velocity*; and of consequence that it is not the same at the end of the Fall, as it would be, had it fell thro' the first Plane prolonged: So that the Proposition of the Roots of the Heights assert'd by *Galileo*, does not here obtain.

The Reason of the loss of *Velocity*, is, that the Motion, which was parallel to the first Plane, becomes oblique to the second, since they make an Angle: This Motion, which is oblique to the second Plane, being conceived as compounded, that Part perpendicular to the Plane, is lost by the opposition thereof; and part of the *Velocity* along with it: Consequently, the loss of the perpendicular there is in the oblique Motion, or, which is the same thing, the loss of the two Planes are from being one, i. e. the more obtuse the Angle is, the less *Velocity* does the Body lose.

Now, all the infinitely little, contiguous, inclined Planes, whercof a Curve consists, making infinitely obtuse Angles among themselves, a Body falling along the Convexity of a Curve, the loss of *Velocity* it undergoes each instant is infinitely little: But a finite Portion of any Curve, how little soever, consisting of an Infinity of infinitely little Planes, a Body moving thro' it, loses an infinite Number of infinitely little Parts of its *Velocity*: and an Infinity of infinitely little Parts, makes an Infinity of a higher Order, i. e. an Infinity of infinitely little Parts, makes a finite Magnitude, if they be of the first Order, or Kind; and an infinitely little Quantity of the first Order, if they be of the second; and so in infinitum. Therefore, if the Losses of *Velocity* of a Body falling along a Curve be of the first Order, they will amount to a finite Quantity, in any finite Part of the Curve, &c. See CURVE.

The Nature of every Curve is abundantly determin'd by the Ratio of the Differences of the Ordinates to the correspondent Portions of the Axis; and the Essence of Curves in general, may be conceiv'd as consisting in this Ratio, which is variable a thousand ways. Now this finite Ratio will be likewise that of two simple *Velocities*, by whose Concurrence a Body will describe any Curve: And of consequence, the Essence of all Curves in the general, is the same thing as the Concurrence or Combination of all the Forces, which taken two by two, may move the same Body. Thus we have a most simple and general Equation of all possible Curves, and all possible *Velocities*. See CURVE.

By means of this Equation, as soon as the two simple *Velocities* of a Body are known, the Curve resulting from 'em is immediately determin'd. It is observable, that on the Foot of this Equation, an uniform *Velocity*, and a *Velocity* that always varies according to the Roots of the Heights, produce a Parabola, independent of the Angle made by the two projectile Forces that give the *Velocities*: Consequently, a Cannon Ball, tho' either horizontally or obliquely to the Horizon, must always describe a Parabola. The best Mathematicians, till then, had much ado to prove, that oblique Projections form'd Parabolas, as well as horizontal ones. See PROJECTILE, and PARABOLA.

To have some measure of *Velocity*, the Space is to be divided into as many equal Parts, as the Time is conceiv'd to be divided into: For the quantity of Space corresponding to that Division of Time, is the Measure of the *Velocity*.

For an Instance; Suppose the Moveable A, (Tab. *Mechanicks*, Fig. 45.) travel a Space of 80 Feet in 40 Seconds of Time; dividing 80 by 40, the Quotient 2 shows the *Velocity* of the Moveable to be such, as that it passes over an Interval of two Feet in one Minute: The *Velocity*, therefore, is rightly express'd by  $\frac{2}{1}$ ; that is, by 2.

Suppose, again, another Moveable, B, which in 30 Seconds of Time travels 90 Feet; the Index of its Celicity will be 3. Wherefore, since in each Case the measure of the Space is a Foot, which is supposed every where of the same length; and the measure of Time a Second, which is conceiv'd every where of the same Duration: the Indices of the *Velocities* 2 and 3, are homogeneal: And therefore, the *Velocity* of A is to the *Velocity* of B, as 2 to 3.

Hence, if the Space be  $= s$ , and the Time  $= t$ , the *Velocity* may be express'd by  $\frac{s}{t}$ ; the Space being in a Ratio of the Time and the *Velocity*. See MOTION.

VELOM, a kind of Parchment, finer, evener, and whiter than the common Parchment. See PARCHMENT.

The Word is form'd from the French *Velin*, of the Latin *Vitellinus*, belonging to a Calf.

VELVET, a rich kind of Stuff, all Silk, cover'd on the outside with a close, short, fine, soft Shag; the other side being a very strong, close Tissue, or Web.

The Nap or Shag, call'd also the *Velvetting*, of this Stuff, is work'd of part of the Threads of the Warp, which the Workman puts on a long narrow channel'd Ruler, or Needle; and which he afterwards cuts, by drawing a sharp steel Tool along the Channel of the Needle, to the Ends of the Warp.

The principal and best Manufactories of *Velvet* are in France: there are others in Italy, particularly at Venice, Milan, Florence, Genoa, and Lucca; others in Holland, set up by the French Refugees; whercof that at *Haerlem* is the most considerable: But they all come short of the Beauty of those of France; and accordingly are sold for 10 or 15 per Cent. less. There are even some brought from China, but they are the worst of all.

The Word *Velvet* is form'd of the French *Velours*, which signifies the same thing; and which comes from *Vellu*, a thing cover'd with Hair.

There are *Velvets* of various Kinds; as, *Plain*, that is, uniform and smooth, without either Figures or Stripes; *Figured*, that is, adorn'd and work'd with divers Figures; tho' the Ground be the same with the Figures; that is, the whole Surface *velveted*. See FIGURED.

*Ramage*, or branch'd *Velvet*, representing long Rinds, Branches, &c. on a Satin Ground, which is sometimes of the same Colour with the *Velvet*, but more usually of a different one. Sometimes, instead of Satin, they make the Ground of Gold and Silver; whence the Denominations of *Velvets with Gold ground*, &c.

*Shorn Velvet*, is that wherein the Threads that make the *Velvetting*, have been rang'd in the channel'd Ruler, but not cut there.

*Strip'd Velvet*, is that wherein there are Stripes of divers Colours, running along the Warp; whether those Stripes be partly *Velvet* and partly Satin, or all *velveted*.

Lastly, *Flower'd Velvet*, is that wherein the Ground is a kind of Taffety, and the Figures *Velvet*.

*Velvets* are likewise distinguish'd, with regard to their different Degrees of Strength and Goodness, into *Velvets* of four Threads, three Threads, two Threads, and a Thread and

and half: the first are those where there are eight Threads of Shag, or *Felveting* to each Tooth of the Reed; the second have only six, and the rest four.

In general, all *Felvets*, both work'd and figur'd, shorn and flower'd, are to have their Warp and Shag of Organifin, spun and twisted, or thrown in the Mill; and their Wool of hoil'd Silk, not raw; and are of the same breadth.

VENA, VEIN, in Anatomy. See VEIN.

VENA CAVA.

VENA PORTA, &c. } See { CAVA.

VENA PULMONALIS. } See { PORTA, &c.

VENA SCISSA, the opening of a Vein, call'd also *Ple-*

*botomy*; and popularly *Bleeding*. See PHLEBOTOMY, &c.

VENA LACTEA.

VENA LYMPHATICA, &c. } See { LACTEAL.

VENA PRÆPUTII, &c. } See { LYMPHATIC.

VENAL, or VENOUS, among Anatomists, something that

bears a Relation to a Vein. See VEIN.

The Extremities of the Cava and Pulmonary Veins, where they enter the Arteries of the Heart, are call'd *Venous Sinus's*. See CAVA, and PULMONARY; see also HEART, and CIRCULATION.

VENAL, VERNALIS, is also us'd for something bought with Money, or procur'd by Bribes.

Thus, we say, *Venal Bards*; Courtizens and Flatterers are *Venal*; Justice in *Turks* is *Venal*, it must be bought of the Bawlers.

In *England*, there are several Offices in the Revenue, Policy, &c. *Venal*: But this *Venality* of Offices is no where so considerable as in *France*, where all Offices of Judicature are bought of the King, and only municipal Officers are elective. See OFFICE.

Offices in *England* are *venal* only by a kind of Connivance; in *France* it is a thing solemn, and authoriz'd.

The *Venality* was first introduc'd by Louis XII. who, to clear those immense Debts contracted by his Predecessor Charles VIII. without burdening his People with new Taxes, bethought himself to sell the Offices; and, in reality, made a vast Sum thereby.

Francis I. made an advantage of the same Expedient to get Money, and sold his Posts openly: Under the same King, it was only account'd a kind of Loan; but that Loan was no more than a Name to disguise a real Sale. The Parliament not being able to resist the *Venality* of Offices, always made the Buyer take an Oath that he did not buy his Post, either directly or indirectly; but there was a tacit Exception made, of Monies lent the King for being put into them. At length, the Parliament finding its oppositions were in vain, and that the Traffick of Offices was publickly authoriz'd, abolish'd the Oath in 1597.

The Word is borrow'd from the Latin *Vendit*, to be sold. VENDEE, in Law, the Person to whom any thing is sold; in contradistinction to *Vendor*, or the *Seller*.

VENDITION *Expensas*, is a Writ Judicial, directed to the Under-Sheriff; commanding him to sell Goods, which he hath formerly, by Commandment, taken into his Hands; for the satisfying a Judgment given in the King's Court.

VENERING, or VENERING, a kind of Marquetry, or Inlaying; whereby, several thin Slices, or Leaves of fine Woods of different kinds, are applied and fasten'd on a Ground of some common Wood.

There are two Kinds of Inlaying; the one, which is the more ordinary, goes no further than the making of Compartments of different Woods; the other requires a deal more Art, and represents Flowers, Birds, and the like Figures.

The first Kind is what we properly call *Venering*; the latter we have already describ'd, under the Article MARQUETRY.

The Wood intended for *Venering*, is first saw'd out into Slices, or Leaves about a Line thick: In order to saw 'em, the Blocks or Planks are placed upright, in a kind of Sawing-Press; the Description whereof may be seen under the Article PRESS.

These Slices are afterwards cut into narrow Slips, and fashion'd divers ways, according to the Design propos'd: Then the Joints being carefully adjust'd, and the Pieces brought down to their proper thickness, with several Planes for the purpose; they are gl'u'd down on a Ground or Block of dry Wood, with good strong *Englisch* Glue.

The Pieces thus jointed and gl'u'd, the Work, if small, is put in a Press; if large, 'tis laid on the Bench, cover'd with a Board, and press'd down with Poles or Pieces of Wood, one end whereof reaches to the Ceiling of the Room, and the other bears on the Board.

When the Glue is quite dry, they take it out of the Press, and finish it; first with little Planes, then with divers Scrapers; some whereof resemble Rasps, which take off the Denis, &c. left by the Planes.

When sufficiently frap'd, the Work is polish'd with the Skin of a Sea-Dog, Wax, and a Brush and Polisher of Shave-grass: which is the last Preparation. See EBONIST.

VENEREAL, something belonging to *Venus*. See VENUS.

A *Venerereal* Person, is one addicted to *Venerery*, or *Venerereal* Pleasures.

VENEREAL Disease, call'd also the *Lues Venerea*, *French Disease*, *Foul Disease*, *French Pox*, *Great Pox*, &c. is a contagious Disease, contracted by some impure Humor, generally receiv'd in Coition; and discovering it self in Ulcers and Pains, about the Genital and other Parts. See POX.

It is generally said to have made its first Appearance in *Europe*, in the Year 1493; tho' there will have it much older, and contend for its being known to the Antients, only under other Names.

Mr. Becket, particularly, has attempted to shew, that it is the same with what among our Forefathers was call'd the *Leprosy*; and which in many of our ancient *Englisch* Writings, Charters, &c. is call'd *Brenning*, or *Burning*.

In order to prove his Point, he has search'd the Records relating to the Stews antiently kept on the *Bank-side*, *Southwark*, under the Jurisdiction of the Bishop of *Winchester*. See STEWS.

Among other Constitutions of these Stews, dated 1162, it was appointed, *That no Stew-holder should keep any Woman that hath the perillous Infirmity of BURNING*. And in another Vellom Manuscript, now in the Custody of the Bishop of *Winchester*, dated 1430, it is again order'd, *That no Stew-holder keep no Woman within his House that hath any Sickness of BURNING, but that she be putte out, upon the Payne of making a Fine unto the Lord of a hundred Shillings*. See BURNING, and BURNING.

To confirm this Account, Mr. Becket quotes a Description of the Disease from a Manuscript of *John Arden* Esq; Surgeon to K. Richard II. and K. Henry IV. *Arden* defines the Disease call'd *Brenning*, *Incendium*, to be, *a certain inward Heat and Excoriation of the Urethra*: which Definition, Mr. Becket observes, gives us a perfect Idea of what we now call a *Clap*; agreeable to the late and most exact anatomical Discoveries, and free of all the Errors of *Platerus*, *Rondeletius*, *Barbolin*, *Wharton*, and other later Writers on this Disease. See CLAP.

As to the Leprosy being the same with this *Venerereal Disease*, it must be own'd, there are a good many Symptoms in the one Disease, which quadrate well enough with those in the other; but then the Symptoms in each are so peculiar, that a great deal of Stress can't be laid hereon. See LEPROSY.

The common Tradition is, that the *Venerereal Disease* first broke out in the *French Army*, when it lay encamp'd before *Naples*; and that it was owing to some unwholesome Food: On which account, the *French* call it the *Neapolitan Disease*; and the *Italians*, the *Mal Fraucesto*.

But others go much higher, and suppose it to be the Ulcer *Job* complain'd of so grievously; and accordingly, in a Missal printed at *Venice* in 1542, there is a Mass in honour of S. *Job*, to be said by those recover'd of this Disease; as being supposed to owe their Deliverance to his Intercession.

But the Opinion which prevails most among the more knowing of our Physicians, is, that the Disease is of *Indian* Extraction; and that it was brought hither by the *Spaniards* from the *American* Islands, where it was very common, before ever the *Spaniards* set footing there: Whence the *Spaniards* call it *Servia des Indias*, or *Las Yucas*: notwithstanding what *Herrera* says, that the *Spaniards* carry'd it to *Mexico*, instead of bringing it thence.

*Lister*, and others, take it to have had its first Rise from some of the Serpentine Kind; either from a Bite thereof, or from some of their Fleish taken as Food: This is pretty certain, that Men bitten or stung by Scorpions, are greatly cas'd by Coition; but the Woman, *Pliny* assures us, receives a deal of damage thereby; which is no slender Argument, of the Disease's arising from some Person so poison'd.

He adds, there is no room to doubt, but that the *Lues* arose from some such Cause; for upon any venomous bite, the Penis becomes vehemently extended; and the Patient being seiz'd with a *Satyriasis*, breaths nothing but Rage and Lust: Nature, in effect, seeming to direct him to Coition for a Remedy.

But what proves a Remedy to the wounded Person, proves a Disease to the Woman: And from Women thus infected, other Men, who have to do with 'em, become infected in their turns; and thus has the Disease been propagated.

The first Symptoms generally arising after an Affair with an infected Person, are a Heat, Swelling, and Inflammation about the Penis or Vulva, with a hotness of Urine.

The second or third Day usually brings on a Gonorrhœa, or Dripping, which denominates it a *Clap*; and which in a few Days more is follow'd by a Cordœ. See GONORRHEA, and CORDÆ.

Tho' sometimes there is no Gonorrhœa, or Clap; but the Poison rather makes its way thro' the Cutis to the Groid; and there

there arises Bubos, with various malignant Pustles in all Parts of the Body. See BUBO.

Sometimes, also, there happen callous Ulcers, call'd *Shankers*, in the *Scrotum* and *Perineum*; and sometimes a cancerous and callous Ulcer between the Prepuce and Glans; and in some the Testicles swell. See SHANKER.

Add to these, violent nocturnal Pains, Nodes, Heats in the Palms of the Hands, and Soals of the Feet; and hence Fissures, Excoriations, Condyriomata, &c. about the Anus; falling of the Hair; ruddy, yellow, or livid Spots, Hoarseness, Relaxation and Erosion of the Uvula, Ulcer of the Palate, Ozena, tingling of the Ears, Deafness, Blindness, Itch, Consumption, &c. But 'tis rare all these Symptoms happen to the same Person.

The *Venerical Distaste*, *Sydenham* observes, is communicated by Copulation, Lactation, Handing, Saliva, Sweat, the genital Mucus, and the Breath: And in whatever Part it is receiv'd, it there discovers it self first. When the Infection is receiv'd along with the Milk from the Nurse, it commonly shews it self in Soreness and Ulcers of the Mouth.

The Method of Cure is various, according to the various Symptoms and Stages: For the first Stage, viz. a *Gonorrhoea Virulenta*, or Clap. See CLAP, and GONORRHOEA.

Dr. *Pitcairn's* Method is this: After two or three Vomits, he directs *Mercurius Dulcis*, for some Days, twice a day; when the Mouth grows fore, let alone the Mercury for three or four Days, and purge every other Day. As the Mouth grows well again, repeat the use of Mercury; and thus alternately, till the Symptoms cease. See MERCURY.

For a confirm'd *Lues*, Mercurial Salivation is generally held the only effectual Cure: Tho' Mercurial Frictions, applied in such Quantity, and at such Intervals as not to raise a Salivation, is held by some to be not only easier and safer, but even more successful, in this Disease, than Salivation it self. See SALIVATION.

Dr. *Sydenham* tells us, he uses to salivate immediately, without any preliminary Evacuation, or Preparation of the Body at all. His Method is this: He prescribes an Unguent of *Oil of Assage*, *Porcin*, *Saines-seam*, and *Bit of Mercury*. With a third Part of this, he orders the Patient to anoint his Arms and Legs, for three Nights successively, with his own Hands; so as not to touch either the Arm-pits, the Groin, or the Abdomen.—After the third Unction, the Gums usually swell, and a Pyralism comes on.—If it does not come to the time, he exhibits Turkish Mineral gr. viii. in Conserve of Red Roses; which occasioning a Vomiting, raises the Pyralism. And if, afterwards, the Salivation abate, ere the Symptoms are quite disappear'd, he orders it to be promoted with a fresh Dose of *Mercurius Dulcis*. The Diet and other Regimen, to be the same as in a Catharsis.

*VENERIS Oestrus*, the *Transport of Love*, expresses the utmost Ecstasy of Desire, or Enjoyment, in Coition. See OESTRUM.

Some are of Opinion, that infectious Women are the most apt to communicate the Poison, when they are thus excited with Desire; whereas, with Indifference, they may admit the same Intercourse without giving the Infection.

*VENERIS Oestrus*, in Anatomy, the same as CLITORIS.

*VENERY*, is used for the Act of Copulation, or Coition of the two SEXES. See COITION, and GENERATION.

It takes its Name from *Venus*, the supposed Deity of the Passion of Love.

*VENERY*, is also the Art or Exercise of hunting wild Beasts; which are also call'd *Beasts of Venery*, and *Beasts of Forest*. See HUNTING.

Such are the Hare, Hart, Hind, Boar, and Wolf. See BEASTS.

*VENIA*, among our ancient Writers, denotes a kneeling, or low Prostration on the Ground; used by Penitents. *Walsingham*, p. 196. *Rege interim prostrato in longa venia*.

*Per venias centum verrant karbis pavimentum.*

*VENIAL*, a Term in the *Romish* Theology, applied to slight Sins, and such as easily obtain Pardon. See SIN.

In confessing to the Priest, People are not oblig'd to accuse themselves of all their *Venial* Sins.

The thing that gives the greatest Embarras to the *Romish* Casuists, is to distinguish between *Venial* and *Mortal* Sins. The Reformed reject this Distinction of *Venial* and *Mortal* Sins; and maintain, that all Sins, how grievous soever, are *Venial*; and all Sins, how slight soever, are *Mortal*: And the Reason they urge, is, that all Sins, tho' of their own Nature *Mortal*, yet become *venial*, or pardonable, by virtue of our Saviour's Passion, to all such as fulfil the Conditions on which it is offer'd in the Gospel.

To which the *Romish* answer, that one of these Conditions is Confession. See CONFESSIO.

*VENIRE Facias*, in Law, is a Judicial Writ, lying where two Parties plead, and come to Issue: for then, the Party Plaintiff, or Defendant, shall have this Writ directed to the Sheriff, to cause twelve Men of the same Country to say the Truth upon the Issue taken: And if this

Inquest come not at the Day of the Writ return'd; then shall go an *Habeas Corpus*, and after that a Distress, until they come.

*VENIRE Facias tot Matronas*. See *VENTRE Inspiciendo*. *VENISON*, or *VENAISON*, the Flesh of Beasts of Game, or of Animals to be caught in the way of Gaming, i. e. by Hunting, &c. as Deer, Hare, &c. See GAME.

The Word is form'd of the Latin *Venatio*, Hunting. See HUNTING.

*Beasts of VENISON*. See BEAST.

*VENOM*. See POISON.

The Terms *Venom* and *Poison* only differ from each other in this, that the latter is used where the noxious Matter is taken inwardly, as in Foods, Drinks, &c. and the former, where it is applied outwardly, as in Stings, and Bites of Serpents, Scorpions, Vipers, Spiders, &c.

The Pike is said to have a *venomous* Tooth. All *venomous* Beasts, in the general, have that Quality in a greater degree, when bred in mountainous and dry Places, than when in wet and marshy Places; the Southern more than the Northern; those hungry and enraged, than others; and in Summer more than Winter.

*VENOUS*, *Venustus*. See VENAL.

*VENOUS Artery*, *Arteria VENOSA*. See ARTERY, LUNGA, CIRCULATION, &c.

*VENT*, *VENT-Hole*, or *Spiracle*, a little Aperture, left in the Tubes or Pipes of Fountains, to facilitate the Wind's escape; or, on occasion, to give them Air; as in frosty Weather, &c. for want of which they are apt to burst. See FOUNTAIN.

A *Vent*, taken in this Sense, is the End of a Pipe, placed erect, and reaching above ground; being usually solder'd to the Elbows of the Pipes.

The *Vents* of large Pipes, are always as high as the Surfaces of the Reservoir; unless there be a Valve in them.

The Word is form'd from the Latin *Ventus*, Wind.

*VENT* is also used for a little Hole, pierced in Vessels of Wine, Beer, &c. that are in tap; and which admits Air enough to make the Liqueur run, but not so much as to corrupt and spoil it.

*VENT*, again, is apply'd to the Covers in Wind-Furnaces, whereby the Air enters, which serves them for Bellows; and which are stop'd with Registers, or Slides, according to the degree of heat requir'd; as in the Furnaces of Glass-Houses, *Edifiers*, &c. See BELLOWES, FURNACE, &c.

Lastly, the Word *VENT* is used for a Pipe of Lead, or Potter's Ware; one end whereof opens into the Cell of a Necessary House, and the other reaches to the Roof of the House; to give room for the corrupt fetid Air to exhale.

There are also *Vents*, or Apertures made in the Walls which sustain Terraces, to furnish Air, and give a Passage for the Waters.

This kind of *Vent* the *Italians*, and we from 'em, call a *Barbacane*. See BARBACANE.

*VENTER*, *Belly*, in Anatomy, a Cavity in the Body of an Animal, containing *Viscera*, or other Organs, necessary for the Performance of divers Functions. See VISCERA, &c.

Physicians divide the human Body into three *Venters*, Regions, or Cavities; the first the *Head*, containing the Brain, &c. See HEAD.

The second the *Breast*, or *Thorax*, as far as the Diaphragm; containing the Organs of Respiration. See THORAX.

The third, which is what we commonly call the *Venter*, or *Belly*, is that wherein the Intestines and the Organs of Generation, and Digestion, are contain'd; called by Anatomists the *Abdomen*. See ABDOMEN.

This last, call'd also the *lower Venter*, is subdivided into three Regions; the first and highest whereof, call'd the *Epigastric Region*, reaches from the *Cartilago Xiphoides* near to the Navel; the second, call'd the *Umbilical*, comprehends the Space of three or four Fingers breadth, about the Navel, containing the Reins and Loins; and the third, the *Hypogastric*, which reaches to the *Pubenda*, and is what we properly call the *lower Venter*: *Hippocrates* calls it *stern*. See HYPOGASTRIC, EPIGASTRIC, &c.

Its two Sides are call'd *Bia*, the *Flanks*; and its lowest Extreme the *Groin*; in Latin *Inguen*, and in Greek *βασίς*.

*VENTER*, or *Belly*, is also popularly us'd for the exterior Part of the *lower Venter*: In which Sense, we say, the Navel is in the middle of the *Venter*, &c.

It is also used for the *Ventricle*, or Stomach; because that Part is enclosed in the Cavity thereof. See VENTRICLE.

In this Sense it is, that *Jonas* is said in Scripture to have been three Days in the Whale's Belly.

Lastly, *Venter* is also used for the Womb, or *Uterus* of Women: And hence the Writ *De Ventro Inspiciendo*.

Hence, also, in the Civil Law, we say, *Partus sequitur Ventrem*, the Child follows the Belly; meaning, that its Condition is either free or servile, according to that of its Mother. See MARRIAGE.

They also say, to appoint a *Curator for the Belly*, with regard to posthumous Children yet in the Mother's Womb. See **POSTHUMOUS**.

With regard to Princes, the *Venter* or *Belly* has been sometimes crown'd, in form.

**VENTER**, or *Belly* of a Muscle, is the fleshy or body Part thereof; as contradistinguish'd from the two Tendons, its Extremes; one whereof is call'd the *Head*, and the other the *Tail* of the Muscle. See **MUSCLE**.

**VENTER Draconis**, *Dragon's Belly*, in Astronomy, the middle of a Planet's Orbit; or that Part most remote from the Nodes, i. e. from the *Dragon's-Head* and *Tail*; being the Part which has the greatest Latitude. See **ORBIT**, and **NODE**.

The Moon has five Degrees of Latitude, when in the *Dragon's Belly*, and is 90 Degrees distant from the Nodes. See **LATITUDE**.

Of these two Points, in each Orbit, that towards the South is also call'd the *Southern Limit*, and that towards the North, the *Northern Limit*. See **LIMITS**.

**VENTER Equinus**, or *Horse's Belly*, among Chymists, is a Dangleh, wherein are enclosed certain Vessels for particular Operations to be perform'd by means of the gentle heat thereof. See **FIRE**, and **HEAT**.

**VENTER**, in our Customs, is used for a Partition of the Effects of a Father and Mother, among Children born, or accruing from different Marriages.

This Partition is so order'd, as that a single Child of one Marriage, or *Venter*, takes as much as several of another Marriage, or *Venter*: In order to which, the Estate is divided into so many Parts as there have been *Venters*, or Marriages.

**VENTER** is also used for the Children whereof a Woman is deliver'd at one pregnancy.

Thus, two Twins are said to be of the same *Venter*.— Many People take for a Fable what is related of the Countess of *Holland*, viz. that she had 365 Children at one *Venter*, all living, and baptiz'd; and yet the Story is very gravely related by abundance of Authors; and the Post or Balon is still shewn in the Church where they were baptiz'd; with a kind of Monument of the Fact, thereon. See **FORTUS**.

**VENTIDUCTS**, in Building, call'd by the Italians *Ventidotti*, and by the French *Prifins des Vents*, or *Palais d'Esle*; are Spiesacles, or subterraneous Places, where fresh, cool Winds being kept, are made to communicate, by means of Ducts, Funnels, or Vaults, with the Chambers or other Apartments of a House; to cool them in sultry Weather.

These are much in use in *Italy*, &c. See **BUILDING**, **HOUSE**, &c.

**VENTOSITY**, in Medicine. See **FLATULENCY**.

**VENTRE Espiando**, a Writ for the search of a Woman that says she is with Child, and thereby holds Land from him that is otherwise next Heir to her.

**VENTRICLE**, *q. d. Little Belly*, in Anatomy, a Diminutive of *Venter*; signifying a Cavity smaller than what we express by a *Venter*; or rather, signifying a Division of a *Venter*; or some smaller Cavity, contain'd in a larger. See **VENTER**.

There are two Cavities in the Heart, adjoining to the Auricles; and four in the Brain; call'd *Ventricles*; which see explain'd under the Articles **HEART**, and **BRAIN**.

The right *Ventricle* of the Heart, in relaxing, admits the Blood by the right Auricle from the *Cava*; and contracting, drives it out into the pulmonary Arteries: The left, receiving the Blood by the left Auricle, from the Lungs, drives it out into the *Aorta*. See **CAVA**, **AORTA**, and **LUNGS**; see also **SYSTOLE**, **DIASTOLE**, **CIRCULATION**, &c.

**VENTRICLE**, or **VENTRICULUS**, by way of Eminence thus call'd, is the same thing with the *Stomach*. See **STOMACH**.

For the *Alison of the Ventricle in Vomiting*, see **VOMITING**.

**VENTRILOQUOUS**, **VENTRILOQUUS**, call'd also *Gastrolinguus*, and *Engastrimythus*, a Term applied to Persons who form their Speech by drawing the Air into the Lungs; so that the Voice proceeds out of the Thorax; and, to a By-stander, seems to come from a distance. See **ENGASTRIMYTHUS**, &c.

Such a Person we had lately in *London*, a Smith by Profession, who had the Faculty in such Perfection, that he'd make his Voice appear, now, as if it came out of the Cellar, and the next Minute, as if in an upper Room; and no body present perceive that he spoke at all: Accordingly, he has frequently call'd a Person first up, then down Stairs; then out of doors, then this way, then that, without stirring from his Seat, or appearing to speak at all.

*Rolandus*, in his *Aglossotomographia*, mentions, that if the *Mediastinum*, which is naturally a single Membrane, be divided into two Parts, the Speech will seem to come out of the Breast; so that the By-standers will fancy the Person possess'd. See **ENGASTRIMYTHUS**.

The Word is a Compound of *Venter*, and *loquor*, I speak.

**VENTURINE**, in Natural History. See **ADVENTURINE**.

**VENTURINE**, or **ADVENTURINE**, is likewise used for the finest and slenderest Gold Wire, used by Embroiderers, &c. See **GOLD WIRE**.

When reduced into Powder, as fine as it can be clip'd, or filed, this Powder may be strew'd on the first Layer of pure Varnish, made use of in Japoning, after the Varnish is dry, in order to lay any Colour over it. See **JAPONING**.

**VENUE**, or **VENEW**, in Law, a neighbouring or near Place.—*Locus quem vicini habitant.*

Thus, we say, Twelve of the Assize ought to be of the same *Venew* where the Demand is made. See **ASSIZE**.

—And also return in every such *Pannel upon the Venire Facias*, six sufficient Hundreders, at the least, if there be 50 many within the Hundred where the *Venire lies*. Stat. 25. Hen. VIII. See **VIARE**.

**VENUS**, in Astronomy, one of the inferior Planets; denoted by the Character ♀. See **PLANET**.

*Venus* is easily distinguish'd by her brightness, which exceeds that of all the other Planets, and which is so considerable, that in a very dark Place she projects a sensible Shadow. Her Place is between the Earth and Mercury.

She constantly attends the Sun, and never departs from him above 47 Degrees: When the goes before the Sun, that is, rises before him, she is call'd *Phosphorus*, or *Lucifer*, or the *Morning Star*; and when the follows him, that is, sets after him, *Hesperus*, or *Vesper*. See **PHOSPHORUS**, **VEPER**, &c.

The Semidiameter of *Venus*, is to that of the Earth, as 10 to 19; her Distance from the Sun is  $\frac{1}{2}$  of the Earth's distance from the Sun: her Excentricity 5; the Inclination of her Orbit 3° 25'. See **INCLINATION**, **EXCENTRICITY**, &c.

Her periodical Course round the Sun, is perform'd in 224 Days 17 Hours; and her Motion round her own Axis, in 23 Hours. See **PERIOD**, and **REVOLUTION**.

Her greatest Distance from the Earth, according to *Gaffui*, is 38000 Semidiameters of the Earth; and her smallest 6000. See **DISTANCE**.

Her Parallax is 3 Minutes. See **PARALLAX**.

*Venus*, when view'd thro' a Telescope, is rarely seen to shine with a full Face, but has Phases just like those of the Moon; being now gibbous, now horned, &c. and her illuminated Part constantly turn'd towards the Sun, i. e. it looks towards the East when *Phosphorus*, and towards the West when *Hesperus*. See **PHASES**.

*De la Hire*, in 1700, thro' a Telescope of 16 Feet, discover'd Mountains in *Venus*; which he found to be larger than those in the Moon.

And *Cassini* and *Campani*, in the Years 1665 and 1666, discover'd Spots in her Face: from the Appearances of which, he ascertain'd her Motion round her Axis. See **SPOTS**. Sometimes she is seen in the Disk of the Sun, in form of a dark, round Spot. See **TRANSIT**.

In 1671, and 1686, *Cassini*, with a Telescope of 34 Feet, thought he saw a Satellite moving round this Planet, and distant from it about  $\frac{1}{2}$  of *Venus's* Diameter. It had the same Phases as *Venus*, but without any well defin'd Form; and its Diameter scarce exceeded  $\frac{1}{2}$  of that of *Venus*.

*Dr. Gregory* thinks it more than probable that this was a Satellite; and supposes the Reason why it is not usually seen, to be the unfitness of its Surface to reflect the Rays of the Sun's Light; as is the Case of the Spots in the Moon; of which, if the whole Disk of the Moon were compos'd, he thinks, that the Planet could not be seen as far as to *Venus*. See **SATELLITE**.

The Phenomena of *Venus*, evidently shew the Falsity of the *Ptolemaic System*: For that System supposes, that *Venus's* Orb, or Heaven, enclaves the Earth; passing between the Sun and Mercury. And yet all our Observations agree, that *Venus* is sometimes on this side the Sun, and sometimes on that; nor did ever any body see the Earth between *Venus* and the Sun: which yet must frequently happen, if *Venus* revolved round the Earth in a Heaven below the Sun. See **SYSTEM**, **EARTH**, &c.

**VENUS**, in Chymistry, is used for the Metal *Copper*. See **COPPER**.

Its Character is ♀; which, say the *Adopti*, expresses it to be Gold, only join'd with some corrosive and arsenical Menstruum; which removed, Copper would be Gold. See **GOLD**.

*Venus* is universally allow'd, by the Chymists, &c. to be one of the most powerful Medicines in Nature: Of this, is said to have been compos'd the famous *Butler's Stone*, which cured most Diseases by only licking it.—Of this is compos'd that noble Remedy of *Van Helmont*, viz. the Sulphur of Vitriol, or *Eos Vitrioli*, fix'd by Calcination, and Cohobation.—Of the *Eos Vitrioli* of *Venus*, is likewise compos'd *Mr. Boyle's Arcanum*, the *Calcebar Vitrioli*. See **VITRIOL**.

'Tis certain, Copper is a most excellent Emetic, and a noble Antidote against Poisons; for it is no sooner taken than it exerts its force: whereas other Vomitories lie a

good while in the Stomach : But one single Grain of Ruff of Venus immediately vomits. See EME<sup>R</sup>IC.

Hence, Syrups that have stood over-night in Copper Vefels, create a vomiting.

It is also an excellent Medicine in Chronical Cafes : Hence a famous Physician is recorded to have cur'd Charles V. of a Dropsy by the Use of Copper.

Venus is difsoluble by all the Salts known, both Acid, Alkaline, and Nitrous ; nay, even by Water and Air, consider'd as they contain Salt. See DISSOLUTION, SALT, &c.

'Tis from this common Reception of all Menstruums, that Copper is call'd Venus, q. d. *mercurius publica*, a common Prostitute : The others take the Denomination to have been occasion'd by its turning of a Sea-green Colour, when dissolved by Acids.

*Montus* of VENUS, *Montus VENERIS*, among Anatomists, is a little hairy Protuberance, in the middle of the *Pubes* of Women ; occasion'd by the more than ordinary Collection of Fat under the Skin in that Place. See PUBES.

Among Chirurgeons, the *Mount of Venus* is a little Eminence in the Palm of the Hand, at the Root of one of the Fingers.

VERB, in Grammat, a Word serving to exprefs what we affirm of any Subject, or attribute to it ; as the Words *is, understand, hears, believes, &c.* See WORD.

The Verb is thus called of the Latin *Verbum*, Word, by way of Eminence ; as being the principal Word of a Sentence. See SENTENCE.

The common Definition given by Grammarians, is, that a Verb is a Word which betokens being, doing, or suffering.

To conceive the Origin and Office of Verbs, it may be observed, that the Judgment we make of any thing, as when I say the *Earth is round*, necessarily includes three Terms. See TERM.

The first, call'd the *Subject*, is the Thing we affirm of, e. g. *Earth*. See SUBJECT.

The second, call'd the *Attribute*, is the Thing affirm'd, e. g. *round*. See ATTRIBUTE.

The third, *is*, connects those two Terms together, and expresses the Action of the Mind, affirming the Attribute of the Subject. This last is what we properly call the *Verb*, and which some of our later Grammarians, particularly the Port Royalists, chuse to call by a more significant Word, *Affirmation*. See AFFIRMATION.

The Reason is, that its principal Use is to signify *Affirmation* ; that is, to shew that the Discourse wherein that Word is used, is the Discourse of a Man, who does not only conceive Things, but judges and affirms somewhat of them.

By this Circumstance, a Verb is distinguish'd from Nouns which also signify an Affirmation, as *affirmans affirmatio* ; those only signify an Affirmation, as that, by a Reflection of the Mind, is render'd an Object of Thought : so, that they don't shew that the Person who uses 'em affirms, but only that he conceives an Affirmation.

The principal Use of Verbs is to signify Affirmation ; they also serve to exprefs the other Motions of the Soul : as to desire, pray, command, &c. but this they only do by changing the Mood, or Inflexion ; which we shall consider under the Article MOOD.

Here, we only consider the Verb in its primary Signification, which is that it has in the Indicative Mood.

On this Footing, the Verb should have no other use, but to mark the Connection which we make in the Mind, between the two Terms of a Proposition ; but the Verb *esse, to be*, is the only one that has retain'd this Simplicity : nor, in strictness, has this retain'd it, but in the third Person ; as *est, is*.

In effect, Men being naturally inclin'd to shorten their Expressions, to the Affirmation they have almost always added other Significations, in the same Word : Thus, e. g. they add that of some Attribute, so as that two Words make a Proposition ; as in *Petrus vivit*, *Peter lives* : where *vivit* includes both the Attribute and Affirmation ; it being the same thing to say *Peter lives*, as that *Peter is living*. And hence the great Variety of Verbs in every Language.

For, had the People been contented to give the Verb its general Signification, without any additional Attribute, each Language would only have needed one Verb, viz. the Verb Substantive *est, is*.

Again, on some Occasions, they also superadd the Subject of the Proposition, as *Sumus homo, I'm a Man* ; or *vivo, I live* : And hence the diversity of *Persons* in Verbs. See PERSON.

Again, we also add to the Verb, a Relation to the Time with regard to which we affirm ; so that one single Word, as *causasti*, signifies that I attribute to the Person I speak, the Action of Sipping, not for the present Time, but for the past : And hence the great diversity of *Tenses* in most Verbs. See TENSES.

The diversity of these Significations, or Additions in the same Word, has perplex'd and deceiv'd many of our best Authors in the Nature of a Verb ; and led 'em to consider it,

not according to what is essential to it, which is *to affirm* ; but according to some of its accidental Relations.

Thus, *Aristotle*, taking up with the third of those additional Significations, defines *Verb* to be *Vox significans cum tempore* ; a Word signifying something with Time.

Others, as *Buxtorf*, adding the second Relation, define it, *Vox flexilis cum tempore & persona* ; a Word admitting of divers Inflexions, in respect of Time and Person.

Others, taking up with the first of the additional Significations, which is that of the Attribute, and considering that the Attributes Men ordinarily add to the Affirmation, were Actions and Passions ; have suppos'd the Essence of a Verb to consist in signifying *Actioni, or Passioni*.

Lastly, *Scaliger* imagin'd he had made a great Discovery in his Book of the *Principles of the Latin Tongue*, in saying, that the Distinction of Things into *Permanentes, and Fluentes*, into what remain, and what pass away, is the proper Source of the Distinction between Nouns, and Verbs ; the first being to signify what remains, and the second what passes.

But from what we have said, 'tis easy to perceive, that these Definitions are all false ; and that the only true Definition is, *Vox significans Affirmationem* : This Definition includes all that is essential to the Verb ; but if one would likewise include its principal Accidents, one might define it, *Vox significans Affirmationem, cum designatione Personae, Numeri, & Temporis* ; a Word which signifies an Affirmation, with a Designation of Person, Number, and Tense ; which is what properly agrees to the Verb Substantive *est*.

For as to other Verbs, consider'd as becoming different by the union of certain Attributes, one may define 'em thus ; *Vox significans Affirmationem alicujus attributi, cum designatione Personae, Numeri, & Temporis* ; a Word which expresses the Affirmation of some Attribute, with a Designation of Person, Number, and Time.

Verbs are variously divided ; with respect to the Subject, they are divided into, *Active, Passive, Neuter, &c.* with respect to their Inflexions, into *Regular, and Irregular ; Personal, and Impersonal ; Auxiliary, Substantive, &c.*

VERB *Active*, is a Verb which expresses an Action that falls on another Subject, or Object. See ACTIVE.

Such are *I love, I work, &c.* which signify the Action of Loving, Working, &c.

Of these, Grammarians make two Kinds ; the one call'd *Transitive, &c.* and the other *intransitive, or reciprocal*. See TRANSITIVE, &c.

VERB *Passive*, is that which expresses a Passion ; or which receives the Action of some Agent ; and which is conjugated in the modern Tongues with the Auxiliary Verb *I am, je suis, io so, &c.* See AUXILIARY.

Some don't allow of any Verbs *Passive* in these Languages : The Reason is, that what we call *passive*, is nothing but the Participle of the Verb, join'd with the Auxiliary Verb *to be* ; whereas the Verbs *Passive* of the Latin, &c. have their particular Terminations. See PASSIVE.

VERB *Neuter*, is that which signifies an Action that has no particular Object whereon to fall ; but which of it self takes up the whole Idea of the Action : as, *I sleep, thou yawn'st, he snores, we walk, you run, they stand*.

The Latins call 'em *Neuters*, by reason they are neither Active nor Passive ; tho they have the Force and Signification of both : as *I languish*, signifies as much as *I am languishing* ; *I obey*, as much as *I exercise Obedience, &c.* only that they have no Regimen to particularize this Signification.

Of these Verbs there are some which form their Parts by the Auxiliary Verb *to have* ; as, *I have slept, you have run*.

These, Grammarians call *Neuters Active*.

Others there are, which form their compound Parts by the Auxiliary *to be* ; as, *to come, to arrive, &c.* for we say, *I am come, not I come, &c.* These are call'd *Neuters Passive*.

VERB *Substantive*, is that which expresses the Being, or Substance which the Mind forms to it self, or supposes in the Object ; whether it be there, or not : as, *I am, thou art*. See SUBSTANTIVE.

*Auxiliary, or Helping* VERBS, are those which serve in conjugating Active and Passive Verbs : such are, *I am, I have, &c.* See AUXILIARY.

The Abbot de *Dangeau* distinguishes all Verbs into two general Kinds ; *Auxiliary Verbs, and Verbs* which make use of Auxiliaries.

This Distinction some may tax as not very just ; in regard, *Auxiliary Verbs* sometimes make use of Auxiliaries themselves ; but this does not destroy the Division : it only shews, that the *Auxiliary Verb* has two Formalities, or two different Qualities to be consider'd under ; viz. virtue whereof, it constitutes, as it were, two Verbs.

The Verbs which make use of Auxiliaries, he divides into *Active, Neuter, and Pronominal*.

Verbs *Neuter* he distinguishes into *Neuters Active, and Neuters Passive*. *Pronominals* he distinguishes into *Identic, Recit-*

*Reciprocal, Nourished, and Passived.*—But several of these are peculiar to the French Language.

*Verbs*, in the *English*, and most modern Tongues, do not change their Endings, as in *Latin*, to denote the several Times, Modes, &c. of their being, doing, or suffering; but in lieu thereof, make use of *Auxiliaries*; as, *have, am, be, do, will, shall, may, can, &c.*

*Regular Verbs*, are those which are conjugated after some one Manner, Rule, or Analogy. See CONJUGATION.

*Irregular, or Anomalous Verbs*, are those which have something singular in the Terminations, or Formations of their Tenses.

The Irregularities in our *English Verbs*, lie wholly in the Formation of the Preter Tense, and Passive Participle.

The first, and most general Irregularity, took its Rise from the quickness of our Pronunciation, by changing the Consonant *d* into *s*; the Vowel *e*, in the regular Ending *ed*, being cut off, that the Pronunciation might be more ready: Thus, for *swelled, kepted, sended*, we say, *swell, kept, sent*.

*Verbs Imperpersonal*, are those which have only a third Person; as, *it becometh, &c.*

There are also *Reduplicative Verbs*, as *rebound, recall, &c. Frequentative Verbs, &c.*

*VERBAL*, something that belongs to *Verbs*, or even to Words, spake with the Mouth.

Thus, *Verbal Nouns* are those form'd from *Verbs*. See NOUN.

So, a *Verbal Contract*, is that made merely by Word of Mouth; in opposition to that made in Writing. See CONTRACT, &c.

*VERBERATION*, *Smittings*, in Physicks, a Term used to express the Cause of Sound, which arises from a *Verberation* of the Air, when struck, in divers manners, by the several Parts of the sonorous Body first put into a vibratory Motion. See SOUND.

The Word is form'd from the Latin *Verbero*, I smite.

*VERDEGREEN*, *VER-DE-GRIS*, a kind of Rust of Copper, of great use among Painters, for a green Colour. See COLOUR.

*Verdegreen* is prepar'd with Copper Plates, and Husks of Grapes well saturated with Wine, put up in earthen Pots; and ranged, *stratum super stratum*, that is, first Husks, then Copper; and so alternately.

When the Pots are fill'd, they are set in the Cellar; whence, after some time, they are taken out, to gather the *Verdegreen*, which is a green Rust, covering the Plates all over. See RUST, and COPPER.

Some talk of *Verdegreen* made with Vinegar, and other corrosive Salts; but 'tis a Mistake: the best Wine being nothing too good for the purpose.

Accordingly, the greatest Part of the *Verdegreen* consum'd in *Europe*, is made in *Languedoc*, of the Wines of that Country; and is exported in Cakes, about 25 Pounds weight each.

There is but very little quite pure: To be good, it must be very dry, of a deep green, and pretty clear of white Spots.

The Word is form'd from the Latin *Viride aris*: 'Tis also called *Virgo*. Others call it the *Floer*, and others the *Vitriolic Salt of Copper*; tho, in reality, it be the proper Substance thereof. See VITRIOL.

The Apothecaries use to dissolve *Verdegreen* in distill'd Vinegar, and then filtrate, and evaporate it in the Cellar; upon which it shoots into Crystals. These Crystals are used among Chirurgeons, &c. to cut off the fungous Flesh.

The Painters also use it for a green Colour; especially in Works of Miniature. See GREEN, &c.

*VERDERER*, or *VERDEROR*, a Judicial Officer of the King's Forest, whose Business is to look to the Vert, and see it well maintain'd. See VERT.

He is sworn to keep the Offices of the Forest; as also to view, receive, and enroll the Attachments and Presentments of all manner of Trespasses, relating to Vert and Venison therein. See FOREST.

The Word is form'd from the Latin *Viridarius*, which *Ulpian* uses in the same Signification.

*VERDITER*. See VERDITER.

*VERDICT*, is the Answer of the Jury, made upon any Cause, Civil or Criminal, committed by the Court to their Examination. See JURY.

'Tis called *Verdict*, for *Vere dictum*, q. d. *dictum veritatis*, the Dictate of Truth.

A *Verdict* is either *General*, or *Special*.

A *General Verdict*, is that which is brought into the Court in like general Terms as the general Issue: As in Action of Distress, the Defendant pleadeth, No Wrong, no Diffelsin. Then the Issue is general, whether the Fact be wrong, or not: which being committed to the Jury, they, upon Consideration of the Evidence, come in and say, either for the Plaintiff, That it is a wrong Diffelsin; or for the Defendant, That it is no Wrong, no Diffelsin.

A *Special Verdict*, is, when they say at large, that such and such a Thing they found to be done by the Defendant or Tenant; declaring the Course of the Fact, as in their Opinion it is proved; and as to the Law, upon the Fact, praying the Judgment of the Court.

This *Special Verdict*, if it contain any ample Declaration of the Cause from the beginning to the end, is also called a *Verdict at large*.

*Item sumitur quod Balivi & Coronatores Burgi nostri nisi fuerint & ad hoc unum recipere Verdictum duodecim Juratorum ex quocunque Causa, infra Burgum Nostrum predictum, seu ejus Libertatem emergent, sine contingenti, Seneschalli presentia, nullo modo expellata.* MS. Cod. & Stat. Burg. Vill. de Mountgomer. See JUROR.

*VERDITER*, *VERDETER*, or *VERDITURE*, a Drug, used by the Painters, &c. for a green Colour. See GREEN.

*Verditer* is, properly, a native Mineral Substance, of a stony Consistence, and a blue Colour; but spangled with little shining Points like Gems; brought from the Mountains of *Hungary* and *Moravia*; called also *Lapis Armenicus*.

Of this, well ground, and cleans'd by Lotion, should be made the Painter's green called *Verditer*. See COLOUR.

But this Stone is very rare; and the *Verditer* used, is not a native but a fictitious Substance: the proper way of preparing it, we are told, is by casting Wine or Water upon new Copper, just as it comes red hot out of the Furnace, and catching the Steams which rise from it upon Copper Plates. Others say, 'tis prepar'd by dissolving Copper Plates in Wine; much after the manner of *Verdegreen*. But the Method in practice among us, is as follows:

Into an hundred Pounds weight of Whiting, the Refiners pour their Copper Water, and stir them together, every Day for some Hours, till the Water grows pale: Then they pour that away, and set it by for further use; and pour on more of the green Water, and so till the *Verditer* be made: which being taken out, is laid on large pieces of Chalk in the Sun, till it be dry, for the Market.

The Water mention'd to be pour'd off from the *Verditer*, (which remains at the bottom of a Tub) is put into a Copper, and boil'd till it come to the thickness of Water-Gruel: now, consisting principally of Salt-petre reduced, most of the Spirit of Vitriol being gone with the Copper into the *Verditer*; and a Dish full of this being put into the other Materials for Aqua fortis, is re-distill'd, and makes what they call a double Water, which is near twice as good as that made without it.

*VERDOY*, in Heraldry, is applied to a Bordure of a Coat of Arms; charg'd with any Kinds, or Parts of Flowers, Fruits, Seeds, Plants, &c.

*VERDURE*, the Quality of Greenness. See GREEN.

The Word is *French*, form'd of *Verd*, green.

*VERGE*, a Rod, Switch, or Yard; particularly a Stick or Wand, which Persons are admitted Tenants by holding in their Hands, and swearing Fealty to the Lord of the Manor. See INVESTITURE.

On this account, they are call'd *Tenants by the Verges*. See TENANT.

Among Florists, a *dented Verges*, is a jagged edge or outside of a Leaf.

*VERGE* is also the Compass or Extent of the King's Court; within which is bounded the Jurisdiction of the Lord Steward of the King's Household, and of the Coroner of the King's House. See COURT, HOUSEHOLD, &c.

It is thus call'd, from the *Verge*, or Staff which the Marshal bears.

The Lord Steward, by virtue of his Office, without any Commission, judges of all Transgressions, as Treasons, Murders, Felonies, Bloodshed, &c. committed in the Court, or within the *Verge* thereof; which extends every way the Space of twelve Miles from the chief Tunnel of the Court; only *London* by Charter exempted. See LORD STEWARD.

This was antiently called *Pax Regis*, or the King's Peace. See PEACE.

*Court of VERGE*, is a Court or Tribunal, in manner of a King's Bench; which takes cognizance of all Crimes and Misdemeanors committed within the *Verge*.

It is held in the Compting-House, by the Lord Steward, as Judge thereof, assisted by other Officers of the Household; as, the Treasurer, Comptroller, Cofferer, Clerks of the Green-Cloth, &c. See GREEN-CLOTH, &c.

*VERGE of Land*. See YARD LAND.

*VERGERS*, call'd by *fraction*, *Sc. Vergatores Servientes*, are Officers who carry white Wands before the Justices of either Bench; by others call'd *Porters of the Verges*. See PORTER.

*Vergers of Cathedral or Collegiate Churches*, are inferior Officers, who go before the Bishop, Dean, &c. with a *Verge*, or Rod tip'd with Silver.

*VERGILLE*, Confections, whose appearance denote the Approach of the Spring. See SPRING.

According to the Poets, they were the Daughters of *Aelus*; and by the Greeks were call'd *Pleiades*: but the Romans named them *Vergilie*. See *PLEIADES*.

**VERIFICATION**, the Act of proving, or making a thing good.

In the French Law, *Verifying* is used for the recording of the King's Edicts and Decrees by the Parliament.

**VERISIMILITUDE**. See *PROBABILITY*.

**VERJUICE**, a Juice or Liquor, drawn from four Grapes, or Apples, unfit for Wine, or Cyder; or from sweet ones, while yet acid, and unripe. See *CYDRA*.

Its chief use is in Sauces, Ragouts, &c. tho' it is also an Ingredient in some Medicinal Compositions; and is used by the Wax Chandlers to purify their Wax.

It has its Name from a large Grape, call'd *Verjus*, or *Bourdelas*; which is said never to grow perfectly ripe; or rather, which in its utmost Maturity is too austere and sour to be us'd in Wine; whence it is commonly turn'd into *Verjuice*.

There is also a tolerable *Verjuice* made of Crabs, gather'd, laid in a heap to sweat, the Stalks, &c. separated, then stamp'd or ground, and the Crab-mash put in a hair Bag; the Juice squeeze'd out in a Press, barrel'd up close, and set in a warm Place to work for ten or twelve Days.

**VERMES**, in Medicine, a Disease popularly call'd *Worms*; arising from some of those Reptiles being generated, and growing in the Body: whence, frequently, arise Symptoms proceed. See *WORMS*.

The ordinary Place of the Worms is the Intestines: Tho' there is scarce any Part of the Body but is sometimes infected with 'em: For besides the *Vermes Intestinales*, there are *Dentales*, *Gingivales*, *Pulmonarii*, *Cardiaci*, *Sanguinari*, *Urinarii*, *Cutaneous*, *Umbilicales*, Worms in the Liver, the Spleen, &c.

They are all engender'd from the Eggs of some Insect, deposited in something that is taken into the Body by way of Food, or some other way.

There are three Species of Worms, most frequent in the human Body: The *Veretes*, or round and long, mostly found in the *Duodenum*; the *Latui*, or flat, call'd *Tenia*; and the round and short, found in the *Rectum*, and call'd *Ascarides*. See *ASCARIDES*, &c.

Sometimes, indeed, there are anomalous Worms expell'd; as horned, hairy, four-footed, two-headed, &c.

The Symptoms of the Disease are, Vomiting, Head-ach, Heart-burn, Sighing, Swooning, foebic Pulse, heavy Sleep, Deliria, Squinancy, Pleurisy, canine Hunger, and innumerable others; occasion'd by the Animal's sucking, moving, vellicating, gnawing, consuming the Chyle; irritating the Nerves, wounding the Solids, &c.

As to the *Latui*, beside the other common Symptoms, those affected with this have one peculiar to 'em; which is, that with their Stools they discharge several little Bodies, like Gourd Seeds.

Dr. *Tyson*, in the *Philosophical Transactions*, N<sup>o</sup> 146. gives a curious account of the flat Worm, or *Lumbricus latui*; call'd by *Hippocrates* *Tenia*, and in *English*, ordinarily, the *Large Worm*, or *Jointed Worm*.

This Worm is always single: It lies variously convoluted; being sometimes as long as all the Guts, and sometimes vastly exceeds that length.

*Olaus Borrichius* assures us, a Patient of his, in a Year's time, voided 800 Foot of this sort of Worm, tho' he had not yet met with the Head: in voiding, the Patient always perceiv'd it to break off.

Dr. *Tyson* parallels this Case with that of a Patient of his, who voided vast Quantities of this Worm, for several Years together: but in various Pieces; some two, three, four, six, or more Yards long: But all put together, he says, would much exceed the length of that of *Borrichius*.

The Joints in this Worm are very numerous: In one of 24 Foot long, Dr. *Tyson* number'd 507 Joints. Above the middle of the Edges of each Joint, he observ'd a protuberant Orifice.—Those Orifices he takes for so many *Mouths*; the best Microscopes discovering no Mouth in the Head.

The Worm is frequent enough in most Kinds of Animals; as Dugs, Oxen, Crabs, Hearings, Pikes, &c.

Some Authors assert, that it is not one, but many Worms link'd together, and included in a *Spiolum* of the Intestines; and that this *Spiolum* is not animated, but receives its Sense and Motion from *Vermiculi*, or *Cucurbituli* included in it. This, *Gobucinus*, de *Lumbr. Con.* says, he has plainly discover'd: But Dr. *Tyson* abundantly evinces the contrary.

**VERMICELLI**, or **VERMICELY**, is, properly, a kind of Mels, prepar'd of Flower, Cheese, the Yolks of Eggs, Sugar, and Saffron; and reduc'd into little long Pieces, or Threads, like Worms; by forcing it with a Piston thro' a number of little Holes in the end of a Pipe made for the purpose.

It was first brought from *Italy*, where it is in great vogue. In effect, 'tis the great regale of the *Italians*. Other Nations are hardly brought into the Taste of it.

It is chiefly used in Soups and Pottages, to provoke *Vener*.

The Word, in the original *Italian*, signifies little Worms: They also call it *Tagliarini*, and *Millessanti*.

**VERMICULAR**, an Epithet given to any thing that bears a relation, or resemblance to Worms, *Vermiculi*.

Anatomists particularly apply it to the Motion of the Intestines, and certain Muscles of the Body. See *INTESTINA*, &c.

The *Vermicular*, or Peristaltic Motion of the Intestines, is perform'd by the Contraction of the Fibres thereof, from above, downwards; as the Antiperistaltic Motion is by their Contraction from below, upwards. See *PERISTALTIC*.

The Contraction happening in the *Peristaltic*, which others call the *Vermicular* Motion, as resembling the Motion of Worms, does not affect all the Parts of the Intestines at once; but one part after another.

**VERMICULAR Work**, *Opus Vermiculatum*, in Sculpture, a sort of Ornaments used in Rustick Work; consisting of Frets, or Knobs, cut with Points, representing, in some sort, the Tracks made by Worms. See *MOSAIC*.

**VERMIFORMIS**, in Anatomy, a Term applied to various Parts in the human Body; bearing some resemblance to Worms.

Such are the *Processus*, or *Apophyses Vermiformes*; which are the two Extremities of the *Cerebellum*, situate near the fourth Ventricle. See *CEREBELLUM*.

**VERMIFORMES Musculi**, are the four Muscles in each Hand and Foot, which bring the Fingers and Toes towards the Thumbs and great Toes; call'd also *Lumbricales*. See *LUMBRICALES*.

**VERMIFUGUS**. See *WORM-POWDER*.

**VERMILION**, a very bright, beautiful, red Colour; in great esteem among the Antients, under the Denomination *Minium*. See *RED*, and *COLOUR*.

There are two Kinds of it; the one *Natural*, the other *Fossilis*.

The *Natural* is found in some Silver Mines, in form of a ruddy Sand; which they prepare, and purify by several Lotions and Coctions.

The *Artificial* is made of Mineral Cinnabar, ground up with Aqua vite and Urine, and afterwards dry'd.

They also make it of Lead burnt and wash'd; or of Corrusic, prepared by Fire: But this is not properly denominated *Vermilion*, but *red Lead*. See *LEAD*.

'Tis this last, however, that seems to be the real *Minium* of the Antients; and accordingly, the Apothecaries and Painters still give it the Name, to enhance the Price. See *MINIUM*.

The ancient *Greek* and *Latin* Authors, have given us strange fabulous Accounts of this *Minium*; and several of the Moderns have adopted their Dreams: *Theophrastus* attributes the first Invention of making it to *Callias the Athenian*; who hit upon it, in endeavouring to draw Gold by Fire out of a red Sand found in the Silver Mines, in the Year of Rome 249: But *Vitruvius* says, it was discover'd in the *Cilician Fields*; where it was drawn from a red Stone, call'd by the Greeks *Anthraz*.

We have two Kinds of *Vermilion* from *Holland*; the one of a deep red, the other pale: But 'tis the same Stuff at bottom; the difference of Colour only proceeding from the Cinnabar's being more or less ground: when fine ground, the *Vermilion* is pale; and this is prefer'd to the coarser and redder.

It is of considerable use among the Painters in Oil, and Miniature; and likewise among the Ladies, as a *Fucus*, or *Paint*, to heighten the Complexion of such as are too pale. See *PAINTING*, *MINIATURE*, &c.

Among the Antients, the Images of the Gods were painted with *Vermilion* on the Feast-Days; and their Generals on the Days of Triumph. See *CINNABAR*.

*Vermilion* is sometimes also, tho' improperly, used for what we otherwise call *Kermes*, or *Scarlet Grain*. See *KERMES*, &c.

**VERMINATION**, the Act of breeding of Worms, and other Vermine; particularly Bots in Cattel.

**VERMINATION**, is sometimes also used among Physicians, for a sort of *Tormina Venris*, or wringing of the Guts; wherein the Patient is affected, as if Worms were gnawing his Intestines. See *GRIPE*.

**VERMINE**, a collective Name, including all Kinds of little Animals, or Insects, which are hurtful or troublesome to Men, Beasts, Fruits, &c. as Lice, Fleas, Bugs, Caterpillars, Ants, Flies, &c. See *INSECT*, *WORM*, *BLIGHT*, &c.

**VERMIVOROUS Animals**, are such as feed upon Worms. See *ANIMAL*.

**VERNACULAR**, is applied to any thing that is peculiar to some one Country.

Whence, Diseases which reign most in any particular Nation, Province, or District, are call'd *Vernacular Diseases*. See *DISEASE*.

Such are the *Plica Polonica*, *Scorbutus*, *Tarantism*, &c. See *PLICA*, *SCORBUS*, *TARANTISM*, &c.

VERNAL, something belonging to the Spring Season. See SPRING.

Hence, *Vernal Leaves*, are those Leaves of Plants which come up in the Spring, &c. See LEAVES.

VERNAL SIGNS, are those which the Sun is in during the Spring Season, viz. Arics, Taurus, and Gemini. See SIGNS.

VERNAL EQUINOX, is that which happens when the Sun is ascending from the Equator towards the North Pole. See EQUINOX.

VERONICA, a Term abbreviated from *Veronica*, of *Veronica*, q. d. *true Image*; and applied to Portraits or Representations of the Face of our Saviour on Handkerchiefs.

*Veronica's* are Imitations of that celebrated Original one, preserv'd with great Veneration at St. Peter's in Rome; and imagin'd by some to be the Handkerchief laid over our Saviour's Face in the Sepulchre.

The first mention we find of that celebrated Relick, is in a Ceremonial compiled in 1245, dedicated to Pope Celestin, by *Benedict* a Canon of St. Peter's; But there is no mention made of the Time when it was brought to Rome. A Feast is kept in honour thereof in most Churches, on the Tuesday in *Quinquagesima* Week.

It is to be observ'd, that the Name *Veronica* is only given to such Handkerchiefs as represent no more of our Saviour than his Face: For such as represent his whole Body, as that of *Desancon*, which shows his Fore-part at length, and that of *Turin*, which represents both his fore and hind Part, as having cover'd him all over; were never call'd by this Name.

The Painters sometimes make the *Veronica* to be held up by an Angel, but most commonly by a Woman; which Woman the common People imagine to be a Saint, call'd Saint *Veronica*.

On this Principle, some People, towards the Close of the IXth Century, began to fancy there might have been a Woman of that Name in *Jerusalem*, who had presented her Handkerchief to our Saviour, as he went to *Calvary*, to wipe his Face withal, before he, as it was, with Sweat and Blood; and that the Picture of his Face had been miraculously impress'd thereon.

This was no sooner imagin'd by some, than it was believ'd by others: And accordingly, we find by the Travels of *Bernard de Bredembach* Dean of *Metz*, to the Holy Land in 1485, printed in 1502, that it was not long ere her very Hoarie was found out.

From that time the Fiction gain'd ground, and became a current Legend.

It was at length added, that this same Woman, *S. Veronica*, was the Woman troubled with the Flux of Blood in the Gospel: and accordingly, she was soon join'd with *S. Fiacrus*, and invoc'd together with him against the Hemorrhoids.—And hence the Establishment of Feasts in honour of *S. Veronica*, in the Churches dedicated to *S. Fiacrus*.

In some of these Churches, particularly at *S. Giles's* in *Valencienne*, this Saint is commonly call'd *S. Venice*, by Abreviousion from the Genitive *Veronica*: And the Women have a Custom at certain times of the Year, to hang linen Swatches, wherewith they had girt themselves for nine Days, near her Statue.—And 'tis thence, or rather, from our Saviour's Picture express'd on the linen Handkerchief, that the Milliners have taken *S. Veronica*, or, as they call her, *S. Venise*, or *S. Venetia*, or *Venisa*, for their tutelary Saint.

VERRUCA, in Medicine. See WART.

Hence, *Verrucous* is applied to any Excrecencies which have a resemblance to Warts.

VERRY, in Hensdry. See VARRY.

VERSE, in Poetry, a Line, or Part of a Discourse, consisting of a certain Number of long and short Syllables, which run with an agreeable Cadence; the like being reiterated in the Proceeds of the Piece. See POETRY.

This Repetition, according to *F. Bossu*, is necessary to distinguish the Notion of *Verse* from that of *Prose*: for in *Prose*, as well as *Verse*, each Period and Member are Parts of Discourse, consisting of a certain Number of long and short Syllables; only, *Prose* is continually diversifying its Measures, and Cadences; and *Verse* repeats 'em. See PROSE.

This Repetition of the Poets, appears even in the manner of Writing; for one *Verse* being finish'd, they return to the beginning of another Line to write the *Verse* following: and 'tis to this Return, that *Verse* owes its Name; *Verfus* coming from *Vertere*, to turn, or return.

Accordingly, we find the same Name used to signify any thing that is plac'd in a certain, regular Order: *Cicero* uses the Word for a Line in *Prose*; *Virgil* for a Row of Trees, and even of Oars in a Galley. But, as the Regularity of *Verse* carries with it more Charms, and requires a greater degree of Exactness, the Word has, in time, become appropriated to Poetry.

To make *Verse*, 'tis not enough that the Measures and Quantities of Syllables be observ'd, and fix just Feet put, one after another, in the same Line: There are further re-

quir'd certain agreeable Cadences, particular Tenses, Moods, Regimens, and even some Words unknown in *Prose*.

But what is chiefly requir'd, is an elevated, bold, figurative Manner of Diction: This Manner, is a thing so peculiar to this kind of Writing, that without it, the most exact Arrangement of Longs and Shorts, does not constitute *Verse*, so much as a kind of measur'd *Prose*. See VERIFICATION.

The *Greek* and *Latin Verses*, consist of a certain Number of Feet, of a certain Quantity. See FOOT.

Some have attempted to make *French* and *English Verses* on the same Foundation; but without Success. See QUANTITY, and HEXAMETER.

*Vossius* is very severe on the modern *Verse*, and makes it altogether unfit for Music: Our *Verses*, says he, run all as it were on one Foot; without distinction of Members, or Parts, and without regard to the natural Quantities of Syllables. We have no *Rythmus* at all: and we mind nothing but to have a certain Number of Syllables in a *Verse*, of whatever Nature, and in whatever Order. See RYTHMUS.

But Mr. *Maslow* vindicates our *Verse* from this Imputation. 'Tis true, we don't follow the Metrical Composition of the Antients; yet we have such a Mixture of strong and soft, long and short Syllables, as makes our *Verses* flow, smooth or rumbling, slow or rapid, agreeably to the Subject. Instances of all which we have in the following Lines:

- ' Soft is the Strain when Zephyr gently blows;
- ' The hoarse rough *Verse* should like the Torrent roar:
- ' The Line too labours, and the Words move slow,
- ' Flies o'er the unbended Ears, and thins along the Main.

By making a small Change, or Transposition of a Word or Syllable, in any of these *Verses*, any body who has an Ear will find, that we make a great Matter of the Nature and Order of the Syllables.

*Vossius* adds, that the ancient Odes were sung, as to the *Rythmus*, in the same manner as we scan 'em: every *Paes* being a distinct Bar or Measure, separated by a distinct Pause: Tho, in reading, that Distinction was not accurately observ'd.

Lastly, he observes, that their Odes had a regular Return of the same kind of *Verse*; and the same Quantity of Syllables in the same Place of every *Verse*: whereas, in the modern Odes, to follow the natural Quantity of our Syllables, every Stanza would be a distinct Song. See ODE.

'Tis next to impossible to write *Prose*, without sometimes intermixing *Verse* with it; So that *Vaugelas's* Rule, which enjoins us to avoid 'em, is next to impracticable. This may be farther said, that for short *Verses*, they are so little perceiv'd, that 'tis scarce worth while to strain one's self to avoid 'em; and as to long *Verses*, they are chiefly to be avoided in the Ends of Periods; for in the Middle they are scarce felt.

In the general, Rules of this kind must be consider'd as principally regarding numerous *Verses*, and such as are readily distinguish'd by their Cadence: Thus, in *Latin*, 'tis scarce possible to avoid Iambick *Verses*; but Hexameters must by all means be avoided, their Cadence being more sensible and more stud'y'd. See RHYME, &c.

The *Greek* and *Latin Verses*, are Hexameters, Pentameter, Iambicks, Hendecasyllabs, Trochaicks, &c. See each under its proper Article.

The Moderns have invented Heroic, or Alexandrian *Verses*, which consist of twelve or thirteen Syllables. See ALEXANDRIAN.

The Antients have likewise invented various Kinds of *Verses*, or Poetical Devices; as *Centos*; *Eobes*; *Mimorimes*; *Equivocal Verses*, where the same Words contain'd in two Lines carry a different Sense. See CANTO, ECHO, and EQUIVOCAL.

*Reciprocal Verses*, which read the same backwards as forwards. See RETROGRADE.

VERSE, is also a part of a Chapter, Section, or Paragraph, subdivided into several little Articles. See CHAPTER.

The whole Bible is divided into Chapters; and the Chapters subdivided into *Verses*. See BIBLE.

The Distinction of *Verses* in the New Testament, was only made by *Robert Stephens*: And so negligently was it done, that his Son *Henry Stephens* assures us, he work'd at it as he travell'd from *Paris* to *Lions*. Many learned Men find a great many Faults with that Division; and yet 'tis every where follow'd.

M. *Simon* observes, that the *Greeks* and *Latins* meant by *Verse*, a Line, containing a certain number of Words. He adds, that the Authors of those Days, to prevent any thing being added or taken away from their Works, us'd to mark at the End the number of *Verses* they contain'd; but the Books themselves were wrote all running, without any Divisions, Points, &c.

VERSED SINE, of an Arch, is the Segment of the Diameter of a Circle lying between the Foot of the right Sine, and the lower Extremity of the Arch. See ARCH.

Thus, S T, (Tab. *Trigonometry*, Fig. 7.) is the *Verfed* *Sine* of the Arch R T; and A S the *Verfed* *Sine* of the Arch A R, the Complement of the former. See *SINE*.

**VERSIFICATION**, the Art, or Manner of making *Verse*; also the Tune and Cadence of *Verse*. See *VERSUS*. *Versification*, is properly applied to what the Poet does more by Labour, Art, and Rule, than by Invention, and the Genius or *Fuor Poeticus*.

The Matter of *Versification* is long and short Syllables, and Feet compos'd of them; and its Form, the Arrangement of them in correct, numerous, and harmonious *Verses*: But this is no more than a mere Translator may pretend to, and which the *Catilinarian* War, put in *Verse*, might not merit.

'Tis with Reason, therefore, that these simple Matters are distinguish'd from the grand Poetry, and call'd by the Name *Versification*. See *POETRY*.

In effect, there is much the same difference between Grammar and Rhetoric, as between the Art of making of *Verfes*, and that of inventing Poems.

**VERSION**, a Translation of some Book, or Writing, out of one Language into another. See *TRANSLATION*.

**VERT**, in Heraldry, the Term for a green Colour. See *GREEN*, and *COLOUR*.

It is call'd *Vers* in the blazon of the Coats of all under the Degree of Nobles; but in Coats of Nobles, 'tis call'd *Emerauld*; and in those of Kings, *Venus*.

In engraving, 'tis expres'd by Diagonals, or Lines drawn a thwart, beginning at the finisier Corner of the Escutcheon; as in the Figure adjoining.

In lieu of *Vers*, the French Herald's use *Simple*, or *Synople*. See *SINOPLE*.

**VERT**, or green *Hue*, in Forest Law, any thing that grows, and bears a green Leaf within the Forest, that may cover a Deer. See *FOREST*, *GAME*, &c.

It is either *Over-Vert*, or *Nether-Vert*; *Over-Vert* is the great Woods, which in Law-Books are usually call'd *Haut-Bois*.

*Nether-Vert* is the Under-Woods, otherwise call'd *Sub-Bois*.

We sometimes also meet with *Special Vert*, which denotes all Trees growing in the King's Wood, within the Forest; and those that grow in other Men's Woods, if they are such Trees as bear Fruit to feed the Deer.

**VERTEBRALS**, in Anatomy, a Pair of Muscles, serving to stretch out all the *Vertebre* of the Back. See *VERTEBRÆ*.

**VERTEBRÆ**, a Chain of little Bones, reaching from the Top of the Neck, down the Back, to the *Os Sacrum*; and forming a third Part of the human Skeleton, call'd the *Spina Dorsæ*. See *SPINA*.

The *Vertebre* have their Name *à vertendo*; because 'tis on them the Head and Trunk turn: The Greeks call them *Spoudylii*, for the same Reason.

The *Vertebre* are 24 in Number: Seven of 'em belong to the Neck, twelve to the Back, and five to the Loins. See *NECK*, *LOINS*, &c.

They lie not in a straight Line; those of the Neck bend inwards, and those of the Back outwards, for enlarging the Cavity of the Thorax; and those, again, of the Loins bend inwards, and those of the *Os Sacrum* outwards, to enlarge the Cavity of the Basin.

The Body of each *Vertebra* is spongy and cavernous; having in the middle a large Perforation, thro' which the *Medulla Spinalis* passes, and seven Apophyses, or Processes.

The Fore-part of this Body is round and convex; the Hind-part somewhat concave: its upper and lower Sides are plain; each cover'd with a Cartilage which is pretty thick forwards, but thin backwards, by means whereof it is, that we bend the Body forwards; the Cartilages yielding to the Pressure of the Bodies of the *Vertebre*, which in that Motion come closer to one another: Which could not be effected, if the harder Bodies of the *Vertebre* were close to one another.

The Processes of each *Vertebra* are of three sorts: Two transverse, or lateral; in each of which there is a Tendon of the *Vertebral* Muscles inserted: Four oblique ones; by which the *Vertebre* are articulated to one another: and one acute, on the hindmost Part of the *Vertebra*.

These Processes, which are peculiarly call'd the *Spines*, form, with the hinder or concave Part of the Body of the *Vertebra*, a large Hole in each *Vertebra*; and all the Holes answering one another make a Channel for the Descent of the Spinal Marrow, which sends out its Nerves to the several Parts of the Body by Pairs, thro' two small Holes, form'd by the joining of four Notches in the Sides of each superior and inferior *Vertebra*. See *MEDULLA SPINALIS*.

The *Vertebre* are articulated to one another by Ginglymus: For the two descending oblique Processes of each superior *Vertebra* of the Neck and Back, have a little dimple in their Extremities, wherein they receive the Extremities of the two ascending oblique Processes of the inferior *Verte-*

*bre*; so that the two ascending Processes of each *Vertebra* of the Neck and Back are received, and the two descending do receive, except the first of the Neck, and last of the Back; but the ascending Processes of each *Vertebra* of the Loins receive, and the two descending are received; contrary to those of the Neck and Back.

The *Vertebre* are all tied together by a hard Membrane, made of strong and large Fibres: It covers the Body of all the *Vertebre* forwards; reaching from the first of the Neck to the *Os Sacrum*.—There is another Membrane, which lines the Canal, made by the large Hole of each *Vertebra*; which also ties them all together: besides, the Bodies of each *Vertebra* are tied to one another by the intervening Cartilages; and the Tendons of the Muscles, which are inserted in their Processes, tie them together behind.

This Structure of the Spine is admirable; for had it been all one Bone, we could have had no Motion in our Backs; had it been of two or three Bones articulated for Motion, the *Medulla Spinalis* must have been necessarily bruised at every Angle, or Joint; besides, the whole would not have been so pliable for the several Postures we have occasion to put our selves in: If it had been made of several Bones, without intervening Cartilages, we should have had no more use of it, than if it had been but one Bone. If each *Vertebra* had had its own distinct Cartilages, it might have been easily dislocated.—Lastly, the oblique Processes of each superior and inferior *Vertebra*, keep the middle one, that it can neither be thrust backwards nor forwards, so as to compress the *Medulla Spinalis*.

The *Vertebre* of the Neck differ from the rest, in that they are smaller and harder, their transverse Processes perforated for the Passages of the *Vertebral* Vessels, and their acute Processes forked and strait: Add, that the first and second have something peculiar to themselves. The first, call'd *Atlas*, is ty'd to the Head; and moves with it upon the second, semicircularly. See *ATLAS*.

The second is call'd *Epistrophe*, or *Vertebra Dentata*: In the middle, between its two oblique ascending Processes, it has a long and round Process like a Tooth, which is receiv'd into a Sinus of the Atlas; and upon it, the Head, with the first *Vertebra*, turns half round, as upon an Axis. The Extremity of this Process is knit to the Occiput, by a small but strong Ligament. A Luxation of this Tooth is mortal, because it compresses the *Medulla Spinalis*.

The third is call'd *Axix*: The rest have no particular Names.

The *Vertebre* of the Back differ from the rest in this, that they are larger than those of the Neck, and smaller than those of the Loins: Their acute Processes slope downwards upon one another. They have in each side of their Bodies a small Dimple, wherein they receive the round Extremities of the Ribs: The uppermost of 'em is sometimes call'd the *Crest*; the second the *Axillaris*; and the rest *Costales*.

The *Vertebre* of the Loins are the broadest; and the last of them, the largest of all the *Vertebre*.

Tho' each *Vertebra* has but a small Motion, yet the Motion of 'em all is considerable: The Head, we have observ'd, moves only backwards and forwards on the first *Vertebra*, and semicircularly on the second.

The Motion of the other *Vertebre* of the Neck is not so manifest, yet it is greater than that of the *Vertebre* of the Back; because their acute Processes are short and strait, and the Cartilages which are between their Bodies, thicker. The *Vertebre* of the Back have the least Motion of any; because their Cartilages are thin, their acute Processes long, and very near to one another: And they are fixed to the Ribs, which neither move forwards nor backwards. The greatest Motion of the Back, is perform'd by the *Vertebre* of the Loins; because their Cartilages are thicker, and their acute Processes are at a greater distance from one another: For the thicker the Cartilages are, the more we may bend the Body forwards; and the greater distance there is between the acute Processes, the more we may bend backwards.

Such is the Structure and Motion of the *Vertebre*, when in their natural Position: but we frequently find 'em variously distorted. If the *Vertebre* of the Back stick out, it constitutes what we call a *Bunch'd Back*: And in such Cases the Cartilages between the *Vertebre* are very thin and hard, forwards, but considerably thick backwards where the oblique Processes of the superior and inferior *Vertebre* are at a considerable distance from one another, which distance is fill'd up with a viscous Substance.

This inequality of the thickness of the Cartilages happens, either by a Relaxation, or a Weakness of the Ligaments and Muscles fasten'd to the backside of the *Vertebre*: in which Cases, their Antagonists finding no opposition, remain in a continual Contraction.

The *Os Sacrum* does also consist of *Vertebre* in Children; which grow so close together in Adults, that they make but one large and solid Bone, of the Figure of an Isosceles Triangle, whose Basis is ty'd to the last *Vertebra* of the Loins, and the upper Part of its Sides to the *Iliæ*, and its Point to the *Os Coccygis*. See *SACRUM OS*.

VERTEX, in Anatomy, the Crown of the Head; or that Part situate between the *Sinciput* and *Oeciput*. See HEAD.

Hence, also, *Vertex* is figuratively used for the Top of other Things.

Thus, the *Vertex* of a Cone, Pyramid, Conic Section, &c. is the Point of the upper Extremity of the Axis; or the Top of the Figure. See CONE, PYRAMID, &c.

VERTEX of an Angle, is the angular Point; or the Point A, (Tab. *Geometry*, Fig. 1.) wherein the Legs meet. See ANGLE.

VERTEX of a Figure, is the *Vertex* of the Angle opposite to the Base. See FIGURE.

Such is the Point M, (Tab. *Geometry*, Fig. 19.) opposite to the Base K L. See BASE.

VERTEX of a Curve, is the Point A, (Tab. *Geom.* Fig. 51.) from which the Diameter is drawn; and the Intersection of the Diameter, and the Curve. See CURVE.

VERTEX of a Glass, in Opticks, the same with the Pole thereof. See POLE, OPTIC GLASS, &c.

VERTEX is also used in Astronomy, for that Point of Heaven perpendicularly over our Heads; properly call'd the Zenith. See ZENITH.

VERTICAL Circle, in Astronomy, is a great Circle of the Sphere, passing thro' the Zenith Z, and Nadir N, (Tab. *Astronomy*, Fig. 6.) and any other given Point in the Surface of the Sphere. See CIRCLE, and SPHERE.

Thus, the Meridian of any Place is a *Vertical Circle*. See MERIDIAN, &c.

All the *Vertical Circles* intersect each other in the Zenith and Nadir. See ZENITH, and NADIR.

The use of the *Vertical Circles*, is to measure the Height of the Stars, and their Distances from the Zenith, which is reckon'd on these Circles; and to find their Eastern and Western Amplitude, by observing how many degrees the *Vertical* wherein the Star rises, or sets, is distant from the Meridian. See ALTITUDE, AMPLITUDE, &c.

The *Vertical Circles* are also called *Azimuths*. See AZIMUTH.

PRIME VERTICAL, is that *Vertical Circle*, or Azimuth, which passes thro' the Poles of the Meridian; or which is perpendicular to the Meridian, and passes thro' the Equinoctial Points. See PRIME VERTICAL.

VERTICAL of the Sun, is the *Vertical* which passes thro' the Centre of the Sun, at any Moment of Time.

Its use is in Dialling, to find the Declination of the Plane whereon the Dial is to be drawn; which is done by observing how many Degrees that *Vertical* is distant from the Meridian, after marking the Point, or Line of the Shadow upon the Plane, at any time. See DECLINATION.

VERTICAL Angles. Two Angles, as  $c$  and  $x$ , (Tab. *Geometry*, Fig. 18.) are said to be *Vertical*, if the Legs of one of 'em, A E and E C, be only Continuations of the Legs of the other, D E and B E. See ANGLE.

VERTICAL Plane, in Perspective, is a Plane perpendicular to the Geometrical Plane; passing thro' the Eye, and cutting the Perspective Plane at right Angles. See PLANE.

VERTICAL Plane, in Conicks, is a Plane passing thro' the Vertex of the Cone, and parallel to any Conic Section. See PLANE, and CONE.

VERTICAL Line, in Conicks, is a right Line drawn on the *Vertical Plane*, and passing thro' the Vertex of the Cone. See LINE.

VERTICAL Dial, is a Sun-Dial, drawn on the Plane of a *Vertical Circle*; or perpendicular to the Horizon. See DIAL, and DIAL-PLANE.

These are particularly call'd *Oriental*, *East*, *Occidental*, *West*, *Meridional*, *South*, and *Septentrional*, or *North Verticals*, when oppos'd to one, or other of these Cardinal Points of the Horizon. See EAST, WEST, &c.

When they don't look precisely to any of them, they are call'd *Decliners*; And when their Plane, or Surface is not perfectly perpendicular, *Recliners*. See DECLINER, RECLINER, &c.

VERTICAL Point, in Astronomy, the same with VERTEX, or ZENITH.

Hence, a Star is said to be *Vertical*, when it happens to be in that Point which is just over any Place.

VERTICAL Line, in Dialling, is a Line on any Plane perpendicular to the Horizon.

This is best found and drawn on an erect and reclining Plane, by holding up a String and heavy Plummets steadily, and then marking two Points of the Shadow of the Thread on the Plane, a good distance from one another; and drawing a Line thro' those Marks. See DIALLING.

VERTICILLATE Plants, are such as have their Flowers intermix'd with small Leaves, growing in a kind of Whirls about the Joints of a Stalk; as Penny-royal, Horshound, &c. See PLANT.

The peculiar Characteristick of this Genus of Plants, according to Mr. Ray, is, that their Leaves grow by Pairs, one just against another, on the Stalk: the Flower monop-

talous, but usually hanging down with a kind of Lip, or turned something like the form of an Helmet: Four Seeds after each Flower; to which the Perianthium of the Flower serves instead of a *Capsula Seminalis*.

The same Author makes two Species of these *Verticillate* Plants.

1<sup>o</sup>. The *Fruticose*, or such whose Superficies is Perennial: These, again, have either a plain Flower, as the *Chamedrys Vulgaris*, *Tuberosum*, and the *Marum Syriacum*; or a Flower with a Lip, which they call a *Labiated Flower*; or one something in the form of an Helmet, which they call *Galeated*; as the *Sacria Stachas*, *Hysopus*, *Rosmarinum*, *Satureia*, *Marum vulgare*, *Thymum vulgare*, and the *Pellium Montanum*.

2<sup>o</sup>. The *Herbaceae*, or such whose Stalks are not Perennial; these are the *Mentha*, *Verbena*, *Dichamnus Creticus*, *Origanum*, *Majoraus*, *Ocimum*, *Horminum*, *Galeopsis*, *Nepeta*, *Betonica*, *Prunella*, *Stachys*, *Climopodium vulgare*, *Lamium*, *Molca Hedera Terrestris*, *Galeriulata*, *Calamintha*, *Melissa*, *Marrubium Commune*, *nigrum* and *aquaticum*; *Chamaepitys*, *Scaradonia*, *Scordium*, *Engula*, *Sydertis*, *Cardiaca*.

VERTICITY, is that Property of the Loadstone, whereby it turns to some particular Point. See MAGNET.

The Attraction of the Magnet was known long before its *Verticity*. See COMPASS, NEEDLE, &c.

VERTIGO, in Medicine, an Indisposition of the Brain, wherein the Patient sees the Objects about him as if they turn'd round, and fancies he turns round himself; tho' all the while at rest.

Physicians distinguish two Kinds, or rather, two Degrees of *Vertigines*: The first, call'd a *Simple Vertigo*, is when the Body and external Objects appear to turn round, without any great dimness of Sight.

The other, call'd *Scotomia*, or *Vertigo Tenebrosa*, is when the Eyes are darken'd, and as it were cover'd with a Mist. See SCOTOMIA.

Some make a third Stage, viz. a *Vertigo Caduca*, wherein the Patient actually falls down: But this seems scarce to differ from an Epilepsy. See EPILEPSY.

Sometimes the *Vertigo* is seated in the fore-part of the Head, and sometimes in the hind-part: whereof, the latter is much the more dangerous.

*Bellini* accounts for the *Vertigo* very well, from a preternatural Motion in the *Retina*: for 'tis evident, an Object will seem to move circularly, if the Images thereof, pointed on the *Retina*, fall successively on different Parts of the *Retina*. See RETINA.

This they may do, either by the Objects moving while the Eye is at rest, or from the Eye moving while the Objects rest; or, lastly, the Object and Eye being both at rest, the Rays falling on the same Place by the Optic Nerve's being alone in Motion. For since a right and an oblique Incidence do not excite the same Tremors in the Nerves, and the same Species of Motion; if the Optic Nerve only be moved, and the Object be at rest, it will appear to shift its Situation, by the Change of Place in which it was represented. See VISION.

External Causes of *Vertigines*, are a continued turning round of the Body, Drunkenness, too long Fasting, immoderate Exercise, Surprise, Voracity, much use of Pulse, Onions, Leeks, Raddishes, Cabbage, Mustard, &c. and in the general, whatever may press, distend, or contract the Arteries.

The Word is form'd *à vertendo*, from turning.

The first Step in the Cure, is bleeding in the Jugular, or Cupping; then they proceed to an Emetic; then a Veficatory on the Neck, or a perpetual Blister, or Issues; with Sternutatories, and the other Medicines that obtain in the Apoplexy. See APOPLEXY.

VERTILLAGE, in Agriculture, the *Tilling*, or preparing of Ground to receive the Seed, by turning, stirring, or tossing it. See TILLING.

VERTUE. See VIRTUS.

VERTUOSO. See VIRTUOSO.

VERU-MONTANUM, in Anatomy, a Term compounded of the two Latin Words, *Veru*, and *Montanum*; signifying a kind of lirde Valve, in the Place where the Ejaculatory Ducts enter the Urethra. See VALVE, URETHRA, &c.

Its use is, to prevent the Urine, in passing the Urethra, from getting in at those Ducts, and so mixing with the Semen. See URINE, &c.

VERY Lord, and VERY Tenant, are those that are immediate Lord and Tenant, to one another.

—And know ye, that in taking of Leases six things are necessary, viz. Very Lord, and Very Tenant; Service behind; the Day of the taking; Seisin of the Services, and within his Fee; and that a Man is not Very Tenant, until he have assumed to the Lord by some Service. Old Nat. Brev. See TENANT, &c.

**VESICA**, in Anatomy, a *Bladder*; a membranous or flinny Part, in which any Humor is contain'd. See **BLADDER**.  
**VESICA Biliaris**. See **VESICULA FELLIS**.

**VESICA**, among Chymists, is a large Copper Vessel, tin'd on the inside; used in distilling Ardent Spirits: so called, as resembling the Figure of a blown Bladder. See **DISTILLATION**.

**VESICATORY**, an external Medicine, serving to raise a Blister; whence also it is itself, tho' improperly, call'd a *Blister*. See **BLISTER**.

*Vesicatories* are Unguents, Cataplasms, or Plaisters made of sharp, irritating Medicaments, which have a Faculty of drawing the Humours from within, outwards; inflaming and ulcerating the Skin, and raising *Vesicæ*, or Blisters; whence the Name of *Vesicatory*.

We have *Vesicatories* made of Cantharides, Euphorbium, Figs, Sublimatè of Mercury, *Lapis Infernalis*, Mustard, Anacardium, Scille, Briony, Vincgar, Pepper, Leaven, &c. which are incorporated and made up with Honey, Gums, Resins, &c. to bring them to the Consistence requir'd. See **CANTHARIDES**, &c.

*Vesicatories* are a stronger sort of *Sinapisms*. See **SINAPISM**, **CAUSTIC**, &c.

**VESICULA**, *Vesicle*, a Diminutive of *Vesica*; signifying a little Bladder.

The Lungs consist of *Vesiculae*, or *Lobules of Vesiculae*, admitting Air from the *Bronchia*; and not only Air, but also of Dust, &c. See **LOBULE**, and **LUNGS**.

There are several Parts in the Body which bear this Appellation; as the,

**VESICULA FELLIS**, *Cistula Fellsis*, or *Gall-Bladder*; which is an oblong, membranous Vessel, not unlike a Pear both in form and use; situate in the hollow Part of the Liver. See **LIVER**.

It adheres to the Liver, not only by its Vessels, which it receives from it, but likewise by its Membranes, whereof, the External is common to both. The lower Part, which hangs out of the Liver, rests on the *Pylorus* of the Stomach.

Its Trunks, or Membranes, are usually reckon'd five; an outer, or common one, from the *Peritonæum*; an inner one, on that side which adheres to the Liver from the *Capssula of the Porta*, and of the *Porus Biliaris*.

And three proper ones: The first whereof is Vasculous; the second Muscular; and the third Glandulous.

But Dr. *Druke*, viewing a piece of dried Gall-Bladder with a Microscope, found but little Reason for this accurate Distinction; the several Orders of Fibres of the several Coats appearing to be no other than an infinite Perplexity of Vessels diversly ramified.

The Gall-Bladder is usually distinguish'd into the *Fundus*, which is the widest Part; and the *Collum*, or Neck, which is the narrowest.

The Neck of the *Vesicula Fellsis* being prolong'd, terminates in a Duct, called *Meatus Cysticus*, or *Biliaris*; which, at about two Inches distance from the Gall-Bladder, is join'd to the *Meatus Hepaticus*; these, together, form the *Ductus Communis*. See **DUCTUS**, **MEATUS**, &c.

The use of the Gall-Bladder, is to receive the Bile after its being secreted in the Glands of the Liver; and to discharge it by the common Duct into the *Duodenum*.

The Bile found in this Vessel is of a bright yellow, a greater Consistence, and more bitter and acrimonious than that in the *Porus Biliaris*. See **BILE**.

**VESICULÆ SEMINALES**. } See **SEMINALES**.  
**VESICULÆ ADIPOSEÆ**. } See **ADIPOSEÆ**.

**VESPER**, in Astronomy, called also *Hesperus*; is the Planet *Venus*, when she is Westwards of the Sun. See **VENUS**.

**VESPER**, in the *Romish Church*, *Evening Songs*; that Part of the Office which is rehearsed after Noon; answering to our Evening-Prayers; except that it differs more from the Office of the Morning, call'd *Mattins*. See **MATTINS**.

*Sicilian VESPER*, is a famous *Æra* in the *French History*; signifying a general Massacre of all the *French* in *Sicily*, in the Year 1282; to which the first Toll that call'd to *Vespers* was the Signal.

Some will have it to have happen'd on *Easter-Eve*: others on the Day of the Annunciation.

It was rais'd by one *Prochitus* a Cordelier, at the Time when *Charles of Anjou*, Count of *Provence*, was King of *Naples* and *Sicily*.—The Women with Child by *Frenchmen* were not spared.

After the like manner, we say, the *Mattins of Moscow*, speaking of the *Muscovites* assuaging their Prince *Demetrius*, and all the *Poles* his Adherents at *Moscow*, the 27th of *May* 1600, under the Conduct of their Duke *Cbousky*, at six a-clock in the Morning.

**VESPERTILIONUM ALE**, q. d. *Bats Wings*, among Anatomists, two broad membranous Ligaments, with which the bottom of the Womb is ty'd to the Bones of the Flank;

so called, from their resembling the Wings of a Bat. See **UTERUS**.

**VESPERTINE**, in Astronomy. When a Planet sets after the Sun, it is said by some to be *Vesperine*.

**VESSEL**, *Vas*, *Vase*, a Thing proper to hold or contain Liqueur.

Thus, a Tunn, Hoghead, &c. are *Vessels* fit to contain Ale, Wine, &c.

The Chymists use a great diversity of *Vessels* in their Operations; as *Matrasses*, *Pelicans*, *Retorts*, *Receivers*, &c. See **MATRASS**, **PELICAN**, &c.

Among Anatomists, &c. all the Tubes or Canals wherein the Blood and other Juices or Humours are secreted, convey'd, deposited, &c. as the Veins, Arteries, Lymphatics, Spermaticks, &c. are call'd *Vessels*. See **TUBE**, **CANAL**, **DUCT**, **VEIN**, **VESICULA**, &c.

Some even extend the Word to the Nerves; as supposing 'em the Conduits of the Animal Spirits. See **NERVE**.

*Vessels* consist of Membranes variously form'd and dispos'd for the Reception of the Fluids; and these Membranes, again, consist of lesser *Vessels*, or *Vesiculae*: And this, for what we know, without end. See **MEMBRANE**, **FLUID**, &c.

In the new System of many modern Philosophers and Physicians, *Vessel* is a Name common to all the solid Parts of the Body. See **SOLID**.

These Authors explain the whole Animal Oeconomy, Functions, &c. from the different Liquors diffus'd throughout the Body, and the Tubes, or *Vessels* which contain these Liquors. In effect, all we know in the human Body, is either *Vessel*, or Liqueur. See **DIGESTION**.

The Antients, 'tis true, had a Notion, that some Parts of the Body, as the Heart, Spleen, &c. are mere *Parenchyma's*, i. e. a kind of Pulp, or Pith, void of all *Vessels*; but the Moderns, by the advantage of Microscopes, Injections, &c. find that these, and all other Parts of the Body, are mere Congeries, or Masses of *Vessels* interwove. See **PARENCHYMA**, **CARO**, &c.

Some Philosophers even extend the modern System to all Material Beings; owning, only, two Elements, v. g. a Matter infinitely liquid, diffus'd thro' all Nature; and hard, or solid Parts; which are, as it were, the *Vessels* of that Matter. See **ELEMENT**, &c.

The *Vessels* have a considerable share in the vital Actions; all that is requir'd to the Maintenance of Life, being due Quantity of a proper Humour, and its continued Motion along the *Vessels*: This Motion depends, in great measure, on the Action of the *Vessels* themselves; and the Action of the *Vessels* depends on the Contraction of the Fibres, whereby, when stretch'd and distended by the flowing Humour, they shorten themselves again, and dispose themselves into right Lines, still approaching towards the Axis of their Curvature; and thus, they propel their Contents: So that the Force of the *Vessels*, is chiefly to be determin'd from their Figure. See **FIBRE**, **ELASTICITY**, &c.

The Number of *Vessels*, some of our latest and best Anatomists observe, is greatest in Embryo's; and continually decreases as Age comes on. See **FOETUS**.

For, in the Actions whereby Nutrition, &c. are effected, the greater *Vessels* being much distended by their Humours, the smaller *Vesicles*, whereof the Membranes or Coats of the larger are wove, become compress'd and streighten'd, and at length quite dry, and void of Juices; so that growing together, the Fibres become the firmer and stronger by the loss of the *Vesicles*. And hence the Strength, Firmness, Stiffness, &c. of the solid Parts. See **SOLID**; see also **DISEASE**, and **DEATH**.

**VESSELS**, in Navigation, is a common Name for all sorts of Shipping, i. e. all Hoaring Machines, or Vehicles that move in the Water. See **SHIP**.

*Vessels* are frequently distinguish'd into two general Classes, v. g. *high-bottom'd*, or *deck'd Vessels*: which are those that move wholly with wind and Sail, and live in all Seas; as *Pinks*, *Galions*, *Ships*, &c. See **SAILING**.

And *flat-bottom'd Vessels*, which go both by Oars and Sails: Such are *Boats*, *Galleys*, *Præms*, *Wherries*, &c. See **OARS**, **ROWING**, &c. see also **BOAT**, **GALLEY**, &c.

*Floating Vessels*, are usually distinguish'd into *Boats*, *Lighters*, *Barges*, *Barks*, *Fishing Vessels*, *Ships of Trade*, and *Vessels of War*; of each whereof there are divers Kinds and Denominations. See **BOAT**, **BARGE**, **LIGHTER**, **SHIP**, &c.

*Vessels of War*, are a *three-deck'd Ship*, first and second Rate; a *Frigate*, or *two-deck'd Ship*, third, fourth, and fifth Rate; a *one-deck'd Ship*, sixth Rate; (see **RATE**). a *Boom-Vessel*, a *Fireship*, a *Ketch*, a *Machine-Vessel*, a *Smoker*.

A *Vessel* is said to be of *three or four hundred Tons*; meaning that it will carry three or four hundred times two thousand Weight: or, that when immerg'd in Water, it possesses the Space of three or four hundred Tonn of Water; which is equal to the Weight of the *Vessel*, and all the Loading it can carry. See **TUN**, and **BURDEN**.

A *Vessel* is said to *draw ten or fifteen Foot of Water*; meaning, that when loaden, it sinks to deep under Water.

The Form of *Vessels*, is a thing of great Importance, with regard to their Motion, Sailing, &c. and in the determining what Form is most commodious, the new Doctrine of Infinities becomes of apparent Service to Navigation and Commerce.

A Body moving in an immovable Fluid is obliged to sever the Parts thereof; and they resist such Separation. Now, setting aside a certain Tenacity, whereby they are glued together; and which is different in different Liquids; the whole Force of the Resistance depends on that of the Shock, or Impulse: For a Body that is struck, strikes at the same time; but a perpendicular Stroke is that a Liquid resists the most, as being the greatest: And for a Body to move freely therein, it must be of such Figure, as to present it self as obliquely as possible. If it were triangular, and moved Point foremost; 'tis certain all its Parts would strike the Fluid obliquely, but they would all strike it with the same Obliquity; and it were more advantageous, that each should strike more obliquely than its Neighbour.

Now, such a perpetual Augmentation of Obliquity, can no where be had but in a Curve Line; each Point whereof is consider'd as an infinitely small right Line, always inclined to the other little right Lines contiguous to it.

To find what Curve it is whose perpetual Change of Obliquity, or Inclination in all its Parts, renders it of all others the fittest to divide the Fluid easily; is a Problem much more difficult than it appears to be; and, in effect, only to be solved by the new Geometry: The Solution was first given by Sir I. Newton in his Investigation of the Solid of the least Resistance.

That Author, however, did not publish his Analysis; yet the Marquis de l'Hopital hit upon it: And afterwards M. Fatio resolv'd the same Problem; tho' by a much longer and more perplex'd way. See SOLID of the least Resistance.

VEST, and VESTITURE. See INVESTITURE.

VESTALS, in Antiquity, Maids in ancient Rome, consecrated to the Service of the Goddess *Vesta*; and particularly, to watch the sacred Fire in her Temple. See VESTALIA.

*Numa* first instituted four *Vestals*; and *Plutarch* tells us, *Servius Tullius* added two more; which number, six, lasted as long as the Worship of the Goddess *Vesta*.—'Tis true, *S. Ambrose* reckons them seven; but without any Foundation.

The *Vestals* made a Vow of perpetual Virginity: Their Employment was, the Sacrificing to *Vesta*, and keeping up the Holy Fire in her Temple. If they violated their Chastity, they were punish'd with remarkable Severity; being shut up, or buried in a deep Pit, or Cavern, with a lighted Lamp, and a little Water and Milk, and there left to be devour'd by Hunger.—If they let out the Fire, they were whip'd by the *Pontifex Maximus*; and the Fire was re-kindled by the Sun-Beams collected, some say, in Burning-Glasses, and not otherwise.

To be secure of their Virginity, at their Admission, it was provided, That they should not be above six Years old.—They were chosen by Lot, out of twenty Virgins carried by the Pontiff to the *Comitia*, for that purpose.

They were only consecrated for 30 Years; after which time, they were at liberty to go out and be marry'd. If they continu'd in the House after that time, they were only to be assistant in point of Advice to the other *Vestals*.

The first ten Years they were to employ in learning their Functions; the ten following they were to exercise them; and the last ten, to teach them to others.

Their Order was very rich; both on account of the Endowments of the Emperor, and of Legacies of other Persons.

The *Vestals* had a particular Place allotted them at the Amphitheatres and Games of the Circus.—Their Vehicle was the *Carpentum*, or *Pileatum*. See CARPENTUM, &c.

The Veil wherein they sacrificed, was call'd *Suffibulum*.

At first, they were nominated by the Kings; but after the Extinction of Monarchy, by the *Pontifex Maximus*, or High Priest. The oldest of them was call'd *Maxima*, as the first Pontiff was *Maximus*. See PONTIFF.

They had divers Privileges: disposed of their Effects by Testament in their Father's Life-time; had the same Gratification as a Mother of three Children; and whenever they met a Criminal going to Execution, had a Power to pardon him.

The Fire, which the *Vestals* were to watch, was not on an Altar, or a Hearth; but in little earthen Vessels with two Handles, call'd *Copiduncula*.

This Fire was held a Pledge of the Empire of the World. If it went out, 'twas held a very unlucky Prognostick; and was to be expiated with infinite Ceremonies. Among the *Romans*, *Vestals* tells us, it was only to be re-kindled by the rubbing a kind of Wood, proper for the Purpose. But among the *Greeks*, *Plutarch*, in the Life of *Numa*, observes, it was to be re-kindled by exposing some inflammable Matter in the Centre of a concave Vessel held to the Sun.—For it is to be noted, the *Romans* were not the only People

who kept the perpetual Fire of *Vesta*, in imitation of the celestial Fires: but the *Greeks* were possess'd with the same Superstition; particularly the *Dolphians*, *Athenians*, *Tenedians*, *Argives*, *Rhodians*, *Cynicians*, *Milesians*, *Ephossians*, &c.

VESTALIA, Feasts held in honour of the Goddess *Vesta*, on the fifth of the Ides of June, i. e. on the ninth Day of that Month. See FEAST.

On that Day, Banquets were made before the Houses; and Meats sent to the *Vestals*, to be offer'd by them to the Goddess.

The Asses that turn'd the Mills for grinding of Corn, were on this occasion led about the City crown'd with Flowers, and Chaplets form'd of pieces of Bread; and the Millstones were likewise deck'd with Garlands and Crowns.

The Ladies went barefooted in Procession to the Temple of *Vesta*; and an Altar was erected to Jupiter the Baker, *Jovi Pistori*, in the Capitol.

The *Vestalia* had their Name from that of their Goddess *Vesta*, whom the *Greeks* call'd *Estia*, *Fire*, or *Hearth*; whence *Cicero* derives the Latin Name.—Accordingly, the Poets frequently use *Vesta* for Fire, or Flame; as *Jupiter* for Air, *Ceres* for Corn, &c. See GOD, &c.

VESTIARIUS, VESTIARY, in Antiquity, a Master of a Ward-robe; or an Officer under the Greek Empire, who had the Care and Direction of the Emperor's Apparel, Robes, &c.

The *Protovestiarius*, or first *Vestiary*, was the grand Master of the Ward-robe.—But, among the *Romans*, *Vestiarius* was only a Saleman, or Tailor.

VESTIBLE, VESTIBULUM, in Architecture, a kind of Entry into large Buildings; being an open Place before the Hall, or at bottom of the Staircase.

*Vestibles* only intended for Magnificence, are usually between the Court and the Garden: These are sometimes *sumptuous*, that is, have their opposite Sides equally enrich'd with Arches; and sometimes their Plan is not contain'd under four equal Lines, or a circular one, but forms several Van-corps and Rear-corps, furnish'd with Pilasters, &c.

The *Romans* had Places call'd *Vestibles* at the Entrance of their Houses, to shelter People oblig'd to stand at the Door, from the Weather: We have still *Vestibles* of the like kind, in many old Churches, Houses, &c. call'd *Porches*. See PORCH.

*Martinus* derives the Word from *Veste stabulum*; by reason the Fore-part of the House was dedicated to *Vesta*. *Daviler* derives it from *Vestis*, and *ambulo*; by reason People there begin to let their Trains fall.

VESTIBLE, in Anatomy, the Fore-part of the Labyrinth of the Ear. See EAR, and LABYRINTH.

The *Vestible* is a small Cavity, of an irregular Form, placed immediately above the Basis of the Stapes; between the semicircular Channels, and the Cochlea.

In it appear divers *Foramina*; as that of the *Fenestra Ovalis*; the five *Foramina* of the semicircular Canals; that of the Cochlea; and five other very small ones, thro' which so many Nerves pass. See FORAMEN, FENESTRA, &c.

VESTIGIA, a Latin Term, frequently used by English Writers, to signify the Traces, or Footsteps any thing has left behind it. See TRACE.

The Word is particularly applied to the Marks remaining of something Antique, gone to Ruin by Time. See RUINS.

VESTRY, VESTIARIA, a Room adjoining to a Church, where the Priests Veiements and sacred Utensils are kept. See VESTRY-MEN.

VESTRY-MEN, a select Number of the principal Persons of every Parish within the City of London, and elsewhere; who yearly chuse Parish-Officers, and take care of its Concernments. See PARISH.

They are thus called, because they usually meet in the Vestry of the Church. See SECRETARIUM.

VESTRY-CLERK, an Officer who keeps the Parish Accounts. See PARISH.

VESTURE, VESTIMENT, a Garment, or Cloathing. Sometimes, in our Law-Books, it is used metaphorically; as in *Vestura terra*, i. e. *Societas quibus terra Vestitur*; the Corn wherewith the Earth is clothed, or cover'd.

—*Vesture* of an Acre of Land, is the Profit of it, or the Wood, Corn, &c. growing on it.

VESTURE also signifies a Possession, or admittance to a Possession: In which Sense it is borrow'd from the Feudals; with whom *Investitura* signifies a Delivery of Possession by a Spear, or Staff; and *Vestura*, Possession it self. See INVESTITURE.

VETERAN, VETERANUS, in the Roman Militia, a Soldier who was grown old in the Service; or who had made a certain number of Campaigns; and on that account was entitled to certain Benefits and Privileges.

Twenty Years Service, were sufficient to entitle a Man to the Benefits of a *Veteran*.

The Privileges consist in being absolv'd from the Military Oath; in being exempted from all the Functions of a Soldier; in enjoying a certain Salary, or Appointment, &c.

In France, the Term *Veteran* is still retain'd to such Officers as have held their Posts 20 Years; and who enjoy certain of the Honours and Privileges affixed thereto, even after they have laid 'em down.

A *Veteran* Counsellor has a Voice and Seat at Audiences, tho' not at Proceedings by Writing.—A *Veteran* Secretary of the King, acquires the Privileges, &c. of Nobility, to himself and his Children.

*VETERINARIA Medicina*, is sometimes used for Physick or Medicine applied to the Diseases of Cattel. Whence, *VETERINARIUS*, a Farrier, or Horse-leecher.

*VETERNUS*, is used by some Physicians for a Lethargy, or other drowsy Disease. See *LETHARGY*, &c.

*VETITUM Nannium*, in Law, a Parole literally importing a forbidden Distress: as, when the Bailiff of a Lord distrains Beasts, or Goods, and the Lord forbids his Bailiff to deliver 'em when the Sheriff comes to replevy them; and to that End, drives 'em to Places unknown: or when, without any Words, they are so assign'd, as they cannot be replevied. See *DISTRESS*.

Divine Lords of Hundreds and Courts-Baron, have Power to hold Plea of *Vetito Nannio*.—*Matibula de mortuo Mari clamat in Maverio de Moxerodon duos* Law-days, & *Insurgentibus* & *placita de Nannio vetito, sine breve domini Regis*. Int. Record. in thesaur. Scac.

*VI & Armis*, q. d. by Force and Arms, a Law-term used in an Indictment; to denote the forcible and violent Commission of any Crime. See *TRESPASS*, and *INDICTMENT*.

*VI Laica Removenda*, a Writ, lying where debate being between two Parsons, or Provosts for a Church; one of 'em makes a forcible Entry into it, with a number of Laymen, and holds the other out.

*VI Laica Amovenda*, a Writ which is serv'd when a Bishop has certify'd into the Court of Chancery, that the Parson of any Church within his Jurisdiction, is kept out of his Church or Glebe by any Lay-Force.

*VIA, Way*. See *ROAD*.

*VIA Militaris*, in our Law-Books, is used for a Highway; *que publica dici poterit & ducit ad Mare & ad Portum, & quoadque ad Mercata*. Brañton, Lib. IV. c. 16.

*VIA Regia*, in Leg. Hen. I. is defined to be that *que semper aperta, & quam nemo concludere potest cum minus suis, quis ducit in Civitatem vel Burghum vel Portum Regis*. That which is always open, and which no body may shut; by any Threats, as leading to a City, Port, or Town.—Its Breadth the same Laws prescribe to be such, as that two Carriages may meet each other, and sixteen Horsemen arm'd go a-breadth.

*VIA Lactea*, in Astronomy, the Milky Way, or Galaxy. See *GALAXY*.

*VIA Solis*, the Sun's Way, in Astronomy, is used among some Astronomers for the Ecliptic Line; so called, because the Sun never goes out of it. See *ECLIPTIC*.

*VIA Prime*, among Physicians, are the Stomach and Guts; including the whole Length of the Alimentary Duct or Canal, from the Mouth to the *Sphincter Ani*. See *DUCT*; see also *STOMACH*, *INTESTINES*, &c.

In this Sense, we say, An Obstruction in the *Prime Via*.—Purging and Emetic Medicines operate chiefly in the *Prime Via*.—Sudorifics, Alteratives, Cardiacs, &c. suspend their Action till after they have pass'd the *Prime Via*. See *MEDICINES*, *PURGATIVE*, *EMETIC*, &c.

*VIAL*, or *PHIOLE*, a small thin glass Bottle. See *PHIOLE*.

*VIALES*, in Mythology, a Name given, among the Romans, to the Gods who had the Care and Guard of the Roads, and Highways; call'd by the Latins *Vie*. See *GENI*.

The *Dii Viales*, according to *Lactes*, were of the Number of those Gods call'd *Dii Animales*; who were supposed to be the Souls of Men changed into Gods; and were of two Kinds, viz. the *Viales* and *Penates*. See *PENATES*.

The *Viales* were the same with those otherwise call'd *Lares*; at least, some of the *Lares* were deominated *Viales*, viz. such of them as had the more immediate Intendency of the Roads. See *LARES*.

Hence, the two Names are sometimes join'd, and those Highway Deities call'd *Lares Viales*; Witness that Inscription in *Crater*.

*VIATICUM*, among the ancient Romans, was the Allowance or Appointment which the Republick gave to such

of its Officers as were sent into any of the Provinces, to exercise any Office, or perform any Service, or Commission; as also to the Officers of the Army, and even the Soldiers, &c. See *PROVINCE*.

*Tacitus* makes mention of it, Lib. I. *Annal*. c. 57. *Viaticum amicorum ipsiusque Caesaris*; meaning the Appointments which the Republick paid to *Germanicus*, and his Officers.

This *Viaticum*, however, did not consist altogether in Money: The Ring given the Magistrates and Officers sent into the Provinces, was part of it; so were the Clothes, Baggage, Tents, and the rest of their Equipage.

In the *Romish* Church, *Viaticum* is still the Allowance made a Religious, to defray the Expences of a Journey, Mission, &c. See *MISSION*.

The Term is also used for the Communion, or Eucharist, which is given to People in the Pangs of Death; or who are about to make the Voyage of the other World.

The *Viaticum* is not given to Persons executed in course of Justice.

*VIATOR*, in Antiquity, an Officer of Justice among the Romans.

The Term, originally, had no other Signification than that of a publick Messenger, or Servant sent to advertise the Senators and Magistrates when Assemblies were to be held, where their Presence was requir'd. And because in the first Ages of that Empire, the Roman Magistrates lived mostly at their Country-Houses, these Officers being oblig'd to be frequently upon the Road, were call'd *Viatores*, Travellers; from *Via*, Highway.

In process of Time, the Name *Viator* became a common Name for all Officers of the Magistrates; *Lictors*, *Accessarii*, *Scrives*, *Statores*, and *Cryers*: whether it were that these Names and Offices were confounded in one; or whether *Viator* was a general Name, and the rest particular ones, specifying the particular Functions they discharg'd, as *A. Gellius* seems to insinuate, when he says, that that Member of the Company of *Viatores* who binds a Criminal condemn'd to be whipp'd, was call'd *Lictor*. See *ACCENSIS*, *SCRIBES*, *LICTOR*, &c.

Be this as it will, the Names *Lictor* and *Viator* are often used indifferently for each other; and we as often meet with, *Send to seek, or advertise him by a Lictor, as by a Viator*.

None but the Consuls, Pretors, Tribunes, and Ediles, had a right to have *Viatores*.—They were not to be Roman Citizens, and yet were requir'd to be free.

*VIBEX*, is sometimes used by Physicians for a black and blue Spot, occasion'd by a Flux of Blood. See *PETECHIA*, &c.

*VIBRATION*, in Mechanicks, a regular, reciprocal Motion of a Body, e. g. of a Pendulum; which, being suspended at freedom, swings or vibrates, first this way, then that.

For the Bob being rais'd, falls again by its gravity, and with the Velocity thus acquir'd, rises to the same height on the other side: (See *PENDULUM*.) Whence its gravity makes it fall again: And thus its *Vibrations* are continued.

Mechanical Authors, in lieu of *Vibration*, frequently use the Term *Oscillation*. See *OSCILLATION*.

The *Vibrations* of the same Pendulum are all Isochronal; that is, perform'd in equal Time, at least in the same Climate; for towards the Equator they are found somewhat slower.

A Pendulum 3 Feet 3 Inches and 2 tenths of an Inch, according to *Huygens*, or 39.25 Inches, according to Sir *J. Moir* and Lord *Brouncker*, vibrates Seconds, or makes 3600 *Vibrations* in an Hour. See *SECOND*.

The *Vibrations* of a longer Pendulum, take up more time than those of a shorter one, in a subduple Ratio of the Lengths. Thus, a Pendulum 3 Foot long, will make 10 *Vibrations*; while another 9 Inches long makes 20.—For 10 is the half of 20, and 3 Feet, or 36 Inches, are the Square of 6 Inches; which is double of 3, whose Square is 9: so that 10 is to 20 in a Subduple Ratio of 36 to 9.

The same Thing is meant when we say, that the Number of *Vibrations* of Pendulums in a given Time, is in a reciprocal Ratio of their Lengths.

*M. Meunier*, a Priest of Lyons, wrote an express Treatise, to shew, that by means of the Number of *Vibrations* of a given Pendulum, in certain time, one might establish an universal Measure, throughout the whole World; and fix the several Measures in use among us, in such manner as that they might be recover'd again, if at any time they should chance to be lost, as is the Case of most of the ancient Measures, which we now only know by conjecture. See *MEASURE*.

The *VIBERATIONS* of a stretch'd Cord, or Spring, arise from its Elasticity; which Power being of the same kind with that of Gravity, the *Vibrations* of a Cord follow the same Laws as those of Pendulums: Consequently, the *Vibrations* of the same Cord equally stretch'd, tho' they be unequal in length, are equi-diurnal, or perform'd in equal Times; and the Squares of the Times of the *Vibrations* are among themselves, inversely, as the Powers wherby they are

are equally bent and inflected. See **CORD**, **ELASTICITY**, **FIBRE**, &c.

The *Vibrations* of a *Spring*, too, are proportional to the Powers whereby it is bent: These follow the same Laws as those of the *Cord*, or *Pendulum*, and consequently are equal-dial; which is the Foundation of *Spring-Watches*. See **SPRING**, and **WATCH**.

*VIBRATION* is also used in *Physicks*, &c. for divers other regular alternate Motions.

Sensation is supposed to be perform'd by means of the vibratory Motion of the Nerves, begun by external Objects, and propagated to the Brain. See **SENSATION**, **VISION**, **NERVE**, &c.

The several sorts of Rays of Light, Sir *I. Newton* conceives to make *Vibrations* of several bignesses; which, according to those bignesses, excite Sensations of several Colours; much after the same manner as *Vibrations* of Air, according to their several bignesses, excite Sensations of several Sounds. See **COLOUR**, **SOUND**, &c.

Heat, according to the same Author, is only an Accident of Light, occasion'd by the Rays putting a fine, subtil, ethereal Medium which pervades all Bodies, into a vibratory Motion, which gives us that Sensation. See **MEDIUM**, and **HEAT**.

From the *Vibrations* or Pulses of this same Medium, he accounts for the alternate Fits of easy Reflexion and easy Transmission of the Rays. See **LIGHT**, **RAY**, **REFLEXION**, &c.

In the *Philosophical Transactions* it is observ'd, that the Butterfly into which the Silkworm is transform'd, makes 130 *Vibrations* or Motions of its Wings in one Coition.

**VICAR**, **VICARIUS**, a Person appointed as Lieutenant of another; to perform his Functions, in his Absence, and under his Authority. See **LIEUTENANT**.

The Pope pretends to be *Vicar* of *Jesus Christ* on Earth. He has under him a *Grand-Vicar*, who is a Cardinal, and whose Jurisdiction extends over all Priests, both Secular and Regular; and even over Laymen.

The Word is form'd from *Vicarius, qui alterius vices gerit*.

Among the ancient Romans, *Vicarius, Vicar*, was properly a kind of Lieutenant, sent into the Provinces where there was no Governour: So that they were properly the Emperor's *Vicars*, not those of Governours. *Cod. de Offic. Vicar.*

*Italy*, in the Time of the Eastern Empire, was govern'd by two *Vicarii*: The one *Vicar* of *Italy*, who resided at *Milan*; the other of the City, who resided at *Rome*.

*Cassius* observes, that the Word *Vicar* was sometimes, tho' rarely, attributed to the Lieutenant-Generals of Proconsuls, or Governours of Roman Provinces.

**VICAR**, in the Canon Law, a Priest of a Parish the pre-dial Tithes whereof are impropriated, or appropriated; that is, belong either to a Chapter, Religious House, &c. or to a Layman, who receives 'em, and only allows the *Vicar* the final Tithes, or a convenient Salary, antiently call'd *Portio congrua*. See **TITHE**, **APPROPRIATION**, &c.

He is thus call'd *quasi vice fungens Rectoris*, as serving for, or in lieu of a Rector, who would be intitled to the great Tithes. See **RECTOR**.

These *Vicars* were antiently call'd *Perpetui Vicarii*; because not appointed by the Impropriator, and licens'd by the Bishop to read Service; but presented by the Patron, and Canonical Institution given 'em by the Hands of the Ordinary; and so having constant Succession, as Corporations, and never dying.

The Canonists mention four Species of *Vicars*: some *Perpetual*; others appointed for a certain Time, and on some special Occasion, call'd *Morcenarii*; others call'd *Speciales*, appointed not for the whole Cure, but for some certain Place, Article, or Act; others *Generales*, neither perpetual, nor appointed for any certain Act, but for all Things in the general.

**VICAR GENERAL**, was a Title given by King Henry VIII. to *Thomas Cromwell* Earl of *Essex*; with full Power to oversee the Clergy, and regulate all Matters relating to Church Affairs.

**VICE**, **VITIUM**, in Ethics, is ordinarily defin'd an elective Habit, deviating, either in Excess, or in Defect, from a just Medium wherein Virtue is placed. See **VIRTUE**.

'Tis call'd a *Habit*, to distinguish it from *Sin*, which is only an Act: Hence, a *Sin* is look'd on as something transient; and a *Vice* as something permanent. See **SIN**, **HABIT**, &c.

Authors distinguish three States of *Vice*; the first *Incontinentia*, of Incontinence, wherein a Person sees, and approves the Good, but is hurried to Evil by the Violence of his Passions: The second, *Intemperantia*, of Intemperance; wherein even the Judgment is depraved, and perverted. The third, *Fortitudo*, of Obduracy; wherein the Person is totally immers'd in *Vice*, without any sense or feeling thereof.

The State of Incontinence is consider'd as Infirmary, wherein the Person feels the sharpest Stings of Conscience: That of Intemperance, as Malice, wherein the Remorse is not so lively. In that of Obduracy there is none. See **CONSCIENCE**.

**VICE**, in Smithery, and other Arts employ'd in Metals, is a Machine or Instrument, serving to hold fast the Pieces

to be filed, bent, riveted, &c. See **SMITHERY**, &c.

To file square, 'tis absolutely necessary the *Vice* be placed perpendicular, with its Chaps parallel to the Work Bench. See **FILING**.

The Parts of the *Vice* are, the *Face*, or *Plane*, which is its uppermost Part; the *Chaps*, which are cut with a bastard Cut, and well temper'd; the *Screw-pin*, cut with a square strong Worm; the *Nut*, or *Screw-box*, which has a square Worm, and is brazed into the round Box; the *Spring*, which throws the Chaps open; and the *Foot*, on which the whole is mounted.

**Hand-Vice**, is a small kind of *Vice*, serving to hold the lesser Works in, that require often turning about.

Of this there are two Kinds, the *Broad chapt Hand-Vice*, which is that commonly us'd; and the *Square-nos'd Hand-Vice*, seldom us'd but for filing small round Work.

**Vice** is also a Machine used by the Glaziers, to turn or draw Lead into flat Rods, with Grooves on each side, to receive the Edges of the Glass. See **LEAD**.

This Machine consists of two Iron Chaps, or Cheeks, join'd with two cross Iron Pieces.—In the Space between the Chaps, are two steel Wheels, with their Spindles or Axes pass'd thro' the middle; each of which has its Nut, or Pinion with Teeth, that catch into each other: To the lowest is fitted a Handle, whereby the Machine is turn'd.

There are some of these *Vices* double, and that will draw two Leads at once: These have three Wheels. Some Glaziers will turn Lead of different Sizes in the same *Vice*; by changing their Cheeks for each Size.

With another Pair of Spindles, whose Nuts almost meet, they turn Lead for Tiers; which when it comes out of the *Vice* is almost cut asunder, in two thicknesses easy to be parted.

Before the Invention of this *Vice*, which is but a late Thing, they used a Plane: Accordingly, in all the antient Windows, we find the Lead placed, and grooved that way. See **GLASS**.

**Vice** is also used in the Composition of divers Words, to denote the Relation of something which comes intead, or in the Place, of another.

In this Sense, the Word is Latin, *Vice*, instead, place, term, &c.

**Vice-Admiral**, is one of the three principal Officers of the Royal Navy; who commands the second Squadron, and has his Flag set up in the Fore-top of his Ship. See **ADMIRAL**, **NAVY**, &c.

**Vice-Chamberlain**, call'd also in antient Statutes, *Under-Chamberlain*; is a great Officer in the Court, next under the Lord Chamberlain, and in his absence has command and controul of all Officers belonging to that part of the Household call'd the *Chamber*, or above Stairs. See **CHAMBERLAIN**.

**Vice-Chancellor** of an University, is an eminent Member, chose annually, to manage Affairs in the Absence of the Chancellor. See **UNIVERSITY**.

**Vice-Dege**, is a Counsellor of *Venice*, who represents the Doge when sick, or absent; that the Signory may never be without a Chief.

This *Vice-Doge* never takes the Ducal Chair, nor bears the Horn, nor is address'd under the Title of *Serenissimo*; yet, the foreign Embassadors, speaking to the College, use the common Apostrophe of *Serenissimo Principe*: And he performs all the Offices of Doge; and gives Answers to Embassadors without moving his Cap. See **DOGE**.

**Vice-Dominus**, a Viscount, Sheriff, or Vidame. See **VICOUNT**, **VIDAME**, &c.

**Vice-Dominus Abbatie**, or *Ecclesie*, in the Civil and Canon Law, an Advocate, or Protector of an Abbey, or Church. See **ADVOCATE**, and **AVOUE**.

**Vice-Dominus Episcopi**, in the Canon Law, is the Official, Commissary, or Vicar-General of a Bishop. See **COMMISSARY**, &c.

**Vice-Oberent**, a Vicar, Deputy, or Lieutenant. See **VICAR**, **LIEUTENANT**, &c.

**Vice-Comes**, in Law, &c. See **VICOUNT**.

**Vice-Legate**, an Officer whom the Pope sends to *Avignon*, and some other Cities, to perform the Office of a Spiritual and Temporal Governour, at a time when there is no Legate or Cardinal to command there.

All the *Gaule Narbonnoise*, as *Dauphine*, *Provence*, &c. has recourse to the *Vice-Legate* of *Avignon*, for all Ecclesiastical Dispatches; in like manner as the other Provinces address themselves to *Rome*. See **LEGATE**.

**Vice-Roy**, a Governour of a Kingdom, who commands therein, in the Name and Stead of a King; with full and sovereign Authority.

*Naples*, *Scilly*, *Catalonia*, &c. are govern'd by *Vice-Roy*. See **KING**.

**Vice Versa**, a Latin Phrase, frequently retain'd in English Writings; signifying as much as *on the contrary*.

Thus, As the Sun mounts higher and higher above the Horizon, insensible Perspiration increases; and, *vice versa*, as he descends lower, diminishes.

**VICENNALIS**, in Antiquity, something of 20 Years, or that returns after 20 Years.

Among the *Romans*, *Vicennalia* was particularly used for the Funerul Feasts, held on the 20th Day after a Person's decease.

**VICENNALIA**, or **VICENNALES Ludi**, were also the Games, Feasts, and Rejoicings, held every 20th Year of the Reign of a Prince.

On Medals we frequently meet with *Vicennalia Vota*; the Vows put up on that Occasion, for the Safety of the Emperor, and Enlargement of the Empire.

These are express'd by **VOT. X & XX**, in the Medals of *Yacutus, Gallian, and Probus*; **VOT. X. M. XX**, in those of *Valerius Maximianus, and Galerius Maximianus*; **VOT. X. MUL. XX**, in those of *Constantine, Valentinian, and Valens*; **VOT. X. MULT. XX**, in those of *Dionysius, Constantine, Julian, Valentinian, Theodosius, Arcadius, Honorius*; **VOTIS X. MULT. XX**, in those of *Julian, Valentinian, Gratian*; **VOT. X. SIC. XX**, in those of *Valerius Constantinus*; **VOT. XII. FEL. XX**, in the younger *Leianus*; **VOT. XV. FEL. XX**, in *Constantine*. See **VOWS**.

**VICINAGE**, and **VICINETUM**. See **VENUE**, and **VISNE**.

**VICIS** & *Venellis Mundandis*, a Writ lying against a Mayor, Bailiff, &c. for not taking care that the Streets be well cleans'd.

**VICISSITUDE**, from the Latin *Vicissitudo*, a Change or Turn; the succeeding of one thing after another. As the *Vicissitudo* of Seasons, Fortunes, &c.

**VICONTIEL**, } Sec { **VICOUNTIEL**.  
**VICONTIELS**, } Sec { **VICOUNTIELS**.

**VICOUNT**, or **VISCOUNT**, or **VICE-COMES**, in our Law-Books, signifies the same with *Sheriff*; between which two Words, there seems to be no other difference, but that the one came from our Conquerors, the *Normans*; the other from our Ancestors, the *Saxons*. See **SHERIFF**.

**VICOVNT**, or **VISCOUNT**, is also used for a degree of Nobility next below a Count or Earl, and above a Baron. See **NOBILITY**.

*Camden* observes, that this is an antient Name of Office, but a new one of Dignity, never heard of among us till *Henry Vith's* Days, who, in his 18th Year, created in Parliament *John Lord Beaumont, Viscount Beaumont*: But it is much more antient in other Countries.

*De Cange*, indeed, will have the Dignity to have had its first Rise in *England*; but 'tis much more probable, it was first brought over hither by the *Normans*.

The Privileges of a *Viscount*, are, that he may have a Cover of Assay held under his Cup when he drinks, and may have Travers in his own House.—And a *Viscountess* may have her Gown bore up by a Woman, out of the Presence of her Superiors; and in their Presence by a Man. See **CORONET**, &c.

**VICOUNTIELS**, **VICONTIELS**, *Vicomitalia*, in our Law-Books, denotes Things belonging to the *Vice Comes*, or Sheriff; particularly certain Farms, for which the Sheriff pays a Rent to the King, and makes what Profit he can of them.

*Writs* **VICOUNTIEL**, are such as are triable in the County or Sheriff's Court.

**VICONTIELS**, or **VICONTIELS Jurisdiction**, is that Jurisdiction belonging to the Officers of a County; as Sheriffs, Coroners, Echequers, &c.

**VICTIM**, **VICTIMA**, a bloody Sacrifice, offer'd to some Deity, of a living Thing, either a Person, or a Beast, which is slain to appease his Wrath, or to obtain some Favour. See **SACRIFICE**.

The *Greeks* offer'd *Iphigenia* at *Aulis*, for a *Victim* to obtain a favourable Wind.

The Gods of the Heathens had each their proper *Victims*: Thus, the Goat was *Bacchus's Victim*; the Heifer *Nephtune's*. See **GOD**, and **VICTIMARIUS**.

**VICTIMARIUS**, was a Minister, or Servant of the Priests; whose Office was to bind the *Victims*, and prepare the Water, Knife, Cake, and other things necessary to the Sacrifice. See **SACRIFICE**.

To the *Victimarii* it also belonged to knock down and kill the *Victims*: In order to which, they stood close by the Altar, naked to the Waist, but crown'd with Laurel; and holding a Hatchet or a Knife up, ask'd the Priest leave to strike; saying *Agone*? Shall I strike? Whence they were also called *Agones*, and *Cuttellarii*.

When the *Victim* was kill'd, they open'd it, and after viewing the Entrails, took them away, wash'd the Carcase, sprinkled the Floor, &c.

The same *Victimarii* lighted the Fire wherein Books were condemn'd to be burnt. See *Livy*, Lib. XV. cap. 29. and *A. Gellius*, L. I. c. 1.

**VICTORIAN Period**, in Chronology. See **PERIOD**.

**VICTORY**, **VICTORIA**, the Overthrow or Defeat of an Enemy, in War, Combat, Duel, or the like. See **WAR**, **BATTLE**, **COMBAT**, **DUEL**, &c.

Among the *Romans*, Crowns, Triumphs, &c. were decreed to their Generals for the *Victories* they gain'd. See **CROWN**, **TRIUMPH**, &c.

**VICTUALLING Office**, an Office kept on *Tower-Hill*, for the furnishing his Majesty's Navy with *Victuals*. See **OFFICE**.

It is manag'd by seven Commissioners, who have their inferior Officers; as Secretaries, Clerks, &c. beside *Ajents* in divers Parts of *Great Britain, Ireland*, &c. See **NAVY**.

**VICTUS Ratio**, among Physicians, a particular manner of living, for the Preservation of Health, and Prevention of Diseases. See **DIET**, **REGIMEN**, &c.

**VIDAME**, q. d. *Vice-Dominus*, was antiently the Bishop's Deputy in Temporals; as the *Comes* was the King's.

*Vidame* is still a Title of Seignory, or Lordship; attributed to several Gentlemen in *France*: as the *Vidame of Chartres*, of *Amiens*, &c.

The Word, according to *Nicod*, comes from *Vicarius*; and according to *Pasquier*, from *Vice-Dominus*; *dama* signifying *Dominus*, or Lord.

The original Institution of *Vidames*, was for defence of the Temporalities of Bishopsricks, while the Bishops themselves were taken up in Prayer, and other Spiritual Functions.—They also led the Bishop's Forces, when they were oblig'd to go to War, either to defend their Temporalities, or for the *Arrier-Ban*.

They also manag'd and pleaded their Causes in Courts of Justice; distributed Justice among their Tenants; prevented any body's pillaging or damaging the Houses of decess'd Bishops, &c.—In effect, they represented the Bishop, consider'd as a Temporal Lord. See **BISHOP**.

*Pasquier* says, they were the Bishop's Temporal Judges; and had the same Privileges as the *Vicouans*.

By degrees, the *Vidames*; converted their Office into a Fee; and the Bishops their *Vidames*, or Judges, into Vassals, as Kings did their Counts, Dukes, &c. See **COUNT**, **VASSAL**, &c.

Accordingly, the *Vidames of Chartres*, &c. still hold Lands of the Bishops of those Places.

In some antient Charters, the *Vidames* are call'd *Advocates*, or *Advocates*. See **ADVOCATE**.

**VIDIMUS**, in Law, the same with *Imatefimus*; being Letters Patent of a Charter of Feoffment, or some other Instrument not of Record. See **INNOTESCIMUS**.

**VIDUITY**. See **WIDOWHOOD**.

**VIDUITATIS Professio**, the making a solemn Profession of living a chaste Widow; a Custom heretofore observ'd in *England*, and attended with divers Ceremonies. See **WIDOW**, and **WIDOWHOOD**.

**VIEW**, in Law, the Act of *Viewers*, or *Viewers*. See **VIEWER**.

When a real Action is brought, and the Tenant knows not well what the Land is the Demandant asks; he may pray the *View*: which is, that he may see the Land which is claim'd.

This Course of proceeding we receiv'd from the *Normans*, as appears by the *Grand Customary*.—It is used in various Cases; as in Affize of Rent-Service, Rent Charge, Rent-Seek; in a Writ of Nulance; in a Writ *quo Jure*; in the Writ de *Rationabilibus villis*, &c.

**View of Franc-Pledge**, is the Office which the Sheriff in his County-Court, or the Bailiff in his Hundred, performs; in looking to the King's Peace, and seeing that every Man be in some Pledge. See **FRANC-PLEDGE**.

This is called by *Bracton*, *Res quasi sacra quia solam personam Regis respicit, & introducta pro pace, & communi utilitate*.

**VIEW**, in Matters of Opticks, Perspective, &c. See **VISION**, **SIGHT**, **PERSPECTIVE**, &c.

**VIEW**, among Hunters, the print of the Feet of a fallow Deer on the Ground.

To *View a Place*, in the Military Art, is to ride about it before the laying of a Siege, in order to observe the Strength or Weakness of its Situation and Fortification. See **FORTIFICATION**, &c.

**VIEWERS**, in Law, are Persons that are sent by a Court to view a Place or Person in question; as also the Situation of a Place where a Fact was committed; or a Person in case of Sickness, &c.

**VIGIL**, or **EVE**, in Church Chronology, the Day before any Feast, &c. See **FEAST**, and **EVE**.

The Civil Day begin at Midnight, yet the Ecclesiastical, or Scriptural Day, begins at fix a-Clock in the Evening, and holds till fix in the Evening the ensuing Day. See **DAY**.

Hence, the Collect for every Sunday and Holy-Day, by Order of the Church, is to be read at the preceding Evening-Service at fix a-Clock the Day before; from which time the Religious Day was supposed to begin.

And this first part of the Holy-day, from fix a-Clock the Day before, was by the primitive Christians, spent in Hymns and other Devotions; and being often continu'd till late in the Night, were call'd *Vigils*.

These *Vigils* came, by degrees, to be so enlarg'd, that at last all the Day preceeding the Holy-day was call'd by this Name.

**VIGILIA**, that State of an Animal which is opposit to Sleep, and popularly call'd *Waking*, or *Watching*. See **SLEEP**, and **WAKING**.

**VIGINTIVIRATE**, a Dignity among the ancient *Romans* establish'd by *Cæsar*.

This Dignity comprehended four others; for of the *Vigintiviri*, or twenty Men which compos'd the Company, there were three who sat and judg'd of all Criminal Affairs; three others had the Inspection of the Coins and Coinage; four took Care of the Streets of *Rome*; and the rest were Judges of Civil Affairs.

**VILL**. See **VILLAGE**.

**VILLA Regis**, a Title antiently given to those *Villages* where the Kings of *England* had a Royal Seat, and held the Manor in their own Demefn.

**VILLAGE**, **VILLA**, or **VILL**, an Assemblage of Houses, inhabited chiefly by Peasants and Farmers, having usually a Church, but no Market.

The want of a Market distinguishes it from a *Town*, as the Church does from a *Green*, Street, &c. See **TOWN**, &c.

The Word is *French*, form'd of *vil*, or *vilus*, low, mean, contemptible.

Among our *Saxon* Ancestors, *Vill* or *Village* was used in the Sense of the Roman *Villa*; viz. for a Country Farm or Seat, furnish'd with convenient Out-houses, &c. for receiving the Fruits thereof.

Afterwards it came to be taken for a *Manor*, then for part of a *Parish*, or the *Parish* it self. See **PARISH**.

Hence, in several ancient Law-Books, *Vill* and *Parish* are the same thing: Accordingly, *Fortescue*, de *Laudibus Leg. Ang.* writes, That the Boundaries of *Villages*, are not by Houses, Streets, or Walls, but by a large Circuit of Ground, within which may be divers Hamlets, Waters, Woods, &c.

*Fleta* makes this difference between a *Mansion*, a *Village*, and a *Manor*; that a *Mansion* may consist of one, or more Houses; tho it is only to be one Dwelling-place, without any other very near it: for if other Houses be contiguous, 'tis then a *Village*. A *Manor* may consist of one or more *Villages*. See **MANSSION**, and **MANOR**.

For the better Government of *Villages*, the Lord of the Soil has usually a Power to hold a Court-Baron, every three Weeks. See **COURT-BARON**.

**VILLAIN**, in our ancient Customs, the same with *Bondman*. See **BONDMAN**.

In *Doomsday Book* he is call'd *Servus*, Servant, Slave. See **SERVANT**, **SLAVE**, &c.

A *Villain* was one who held Lands in *Villanage*, or on condition of rendering base Services to his Lord. See **SERVICE**.

There were antiently in *England* two sorts of *Villains*, viz. *Villains in Græff*, who were bound immediately to the Persons of their Lords, and to their Heirs; and *Villains regardant to a Manor*: These the Civilians call *Gleba Aferipti*; and they were bound to their Lord, as Members belonging to such a Manor, of which he was owner.

This latter was a pure *Villain*, of whom the Lord took Redemption to marry his Daughter, and to make him free; and he might put him out of his Lands and Tenements at his Will; might beat and chastise him, but not maim him.

There are not properly any such *Villains* now, tho the Law concerning them stands unrevok'd.

The Lands before held in *Villanage*, are now held in free and common Socage. See **TENURE**, **SOCAGE**, &c.

They were call'd *Villains* from *Villus*; because they dwelt in *Villages*: The same were also call'd *Pageuses*, and *Rustici*; and of such servile Condition were they, that they were usually sold with the Farm to which they respectively belong'd.

*Villain Estate*, or *Condition*, is contradistinguish'd to Free Estate. See **FREE ESTATE**.

**VILLAINOUS Judgment**, is that which casts the Reproach and Stain of *Villainy* and Shame on him against whom it is given. See **JUDGMENT**.

Such is that against a Conspirator, &c.

*Lawbard* calls it *Villainous Psement*; and says, it may well be call'd *Villainous*, in regard the Judgment, in such Case, shall be like the ancient Judgment in attain, viz. that the Criminals shall not be of any Credit afterwards; nor shall it be lawful for them, in Person, to approach the King's Court: That their Lands and Goods shall be seiz'd into the King's Hands, their Trees rooted up, their Bodies imprison'd, &c.

**VILLENAGE**, or **VILLAINAGE**, a servile kind of Tenure of Lands or Tenements; whereby the Tenant was bound to do all such Service as the Lord commanded, or were fit for a *Villain* to perform. See **VILLAIN**.

This *Bracton* expresses by, *Sciri non poterit occipere, quale servitium fieri debet manæ*.

*Villanage* is divided into that by *Blood*, and that by *Tenure*.

*Tenure* in *Villanage*, could make no Freeman a *Villain*; unless it were continu'd time out of Mind; nor could free Land make a *Villain* free. See **TENURE**.

*Villanage* is also divided by *Bracton* into *Pure Villanage*, where the Services to be perform'd were indeterminate and arbitrary, as above express'd; and *Socage Villanage*, which was to carry the Lord's Dung into his Fields, to plough his Ground on certain Days, sow and reap his Corn, &c. and even to empty his Jakes; as the Inhabitants of *Bickton* were bound to do to the Lord of *Cinn-Castle* in *Sbroynshire*: which was afterwards turn'd into a Rent, now call'd *Bickton Silver*; and the *Villanous Service* excus'd.

**VILLI**, *Coarse Hair*, in Anatomy, is used in the same Sense as *Fibres*, or *Fibrille*. See **FIBRE**.

In Botany, *Villi* denotes a sort of *Tomentum*, or Down, like the Grain or Shag of *Fluff*; with which, as a kind of Excrecence, some Trees do abound.

**VILLOUS**, **VILLOSA**, is particularly apply'd to one of the Coats or Membranes of the Stomach, call'd *Crufta Villosa*. See **STOMACH**, &c.

It takes its Name from innumerable *Villi*, or fine *Fibrille*, wherewith its inner Surface is cover'd. See **CRUSTA VILLOSA**.

**VINALIA**, in Antiquity, a Name common to two Feasts among the ancient *Romans*; the one in honour of *Jupiter*, and the other of *Venus*. See **FEAST**.

The first was held on the 19th of *August*, and the second on the 1st of *May*.

The *Vinalia* of the 19th of *August* were call'd *Vinalia Rustica*, and were instituted on occasion of the War of the *Latins* against *Alibentinus*; in the Course of which War, that People vow'd a Libation to *Jupiter* of all the Wine of the succeeding Vintage.

On the same Day likewise fell the Dedication of a Temple of *Venus*; whence some Authors have fallen into a Mistake, that these *Vinalia* were sacred to *Venus*. But *Varro*, L.L. V. and *Festus*, in *Verbo Rustica*, distinguish between the two Ceremonies; and expressly assert the *Vinalia* to be a Feast of *Jupiter*.

**VINCULUM**, in Fluxions, denotes some compound Surd Quantity's being multiply'd into a Fluxion, &c.

Thus, in this Expression,  $ax\sqrt{ax-aa}$ , the *Vinculum* is the compound Surd,  $\sqrt{ax-aa}$ , which is  $ax$  into  $ax$ .

**VINDEMIATING**, the gathering of Grapes, or other ripe Fruits; as Apples, Pears, Cherries, &c.

The Word is form'd of the Latin *Vindemia*, Vintage. See **VINTAGE**.

**VINDEMIATRIX**, a Fixed Star of the third Magnitude, in the Constellation *Virgo*; whose Longitude, Latitude, &c. see among the rest of those of **VIRGO**.

**VINDICATION**, *Claiming*, in the Civil Law, an Action arising from the Property a Person has in any thing; or a Permission to take or seize a thing as one's own, out of the Hands of a Person whom the Law has doom'd not to be the true Proprietor.

**VINE**, a Noble Plant or Shrub, of the Reptile Kind; famous for its Fruit, or *Grapes*, and for the Liqueur they afford. See **WINE**.

The Kinds of *Vines* are almost infinite; denominated, either from the Soil and Place where they grow; as the *Bourguignon*, *Bourdelais*, *Italian*, *Mantuan* *Vine*, &c. or from the Form, Colour, Taste, &c. of their Grapes; as the *Acorn*, *Apricot*, *Dumask*, *Birds-bill*, *Muscadine*, &c. See **GRAPE**.

Our Gardeners find, that *Vines* are capable of being cultivated in *England*, so as to produce large Quantities of Grapes; and those ripen'd to such a degree, as may afford a good substantial vinous Juice. Witness the *Vineyards* in *Somersetshire*; particularly that famous one at *Bath*.

In effect, it does not seem so much owing to the Inclemency of our *English* Air, that our Grapes are generally inferior to those of *France*, &c. as to the want of a just culture.

Those fittest for the *English* Climate, Mr. *Mortimer* finds to be the small black Grape, the white *Muscadine*, *Parsley* Grape, *Muscadilla*, white and red *Frontignac*.—Mr. *Bradley* recommends the *July* Grape, the early sweet Water Grape lately brought from the Canaries; the *Arbis*, or *French* sweet Water Grape: All which, if well manag'd, and the Weather favourable, are ripe by the middle of *August*. He also recommends the *Claret* and *Burgundy* Grapes.

The best Soil for *Vines*, according to *Mortimer*, is the hottest Gravel, Sand, or dry rocky Ground; provided it be well water'd and shaded.—At first planting, Mr. *Bradley* recommends chalky Hills, as proper for *Vines*.

To mend a Soil that wants those Qualities, 'tis good to throw in the rubbish of old Buildings, well mix'd with twice as much Earth and sifted about the Roots of the *Vines*. See **VINEYARD**.

Vines are propagated either by Layers, or Cuttings; that is, either by laying down the young Branches as soon as the Fruit is gather'd, or by making Plantations of Slips, or Cuttings, at that time. See PROPAGATION.

Mr. Mortimer says, it may be done any time in the Winter before January; tho' Bradley says, he has done it with success in March and April.

For the Pruning of VINES. } See } PRUNING.  
For the Planting of VINES. } See } VINEYARD.

VINEA, in Fortification. See MANTELET.  
VINEGAR, *Acetum*, an agreeable acid, penetrating Liquor, prepar'd from Wine, Cyder, Beer, and other Liquors; of considerable use, both as a Medicine, and a Sauce. See ACETUM.

Wine, and other vinous Liquors, are said to gain a grateful Sharpness, i. e. to become Vinegar, by having their Salts exal'd by Insolation, or other means; and their Sulphurs weaken'd and depress'd.

Others ascribe the Conversion of vinous Liquors into Vinegar, to the grinding or sharpening of the longitudinal Particles thereof; by which means, they become more tart and pungent.

The Method of making Vinegar has long been kept a Secret among the People of the Profession; who, 'tis said, oblige themselves to each other by Oath not to reveal it. But notwithstanding this, the *Potiosophical Transfusions*, and some other later Writings, furnish us with approved Accounts thereof.

#### Method of making VINEGAR of Cyder.

The Cyder, (the meanest of which will serve the Purpose) is first to be drawn off into another Vessel, and a quantity of the Malt, or Fozz of Apples to be added: The whole is set in the Sun, if there be a Convenience for the Purpose, and at a Week or nine Days end it may be drawn off. See CYDER.

#### Method of making VINEGAR of Beer.

Take a middling sort of Beer, indifferently well Hopp'd; into which, when it has work'd well, and is grown fine, put some Rapes, or Husks of Grapes, usually brought home for that purpose: Mash them together in a Tub; then letting the Rape settle, draw off the liquid Part, put it into a Cask, and set in the Sun as hot as may be; the Bung being only cover'd with a Tile, or Slate-stone: and in about thirty or forty Days, it will become a good Vinegar, and may pass in use as well as that made of Wine, if it be refined, and kept from turning musty.

Or thus: To every Gallon of Spring Water, add three Pounds of Malaga Raisins; which put into an earthen Jar, and place them where they may have the hottest Sun from May till Michaelmas: then pressing all well, tun the Liquor up in a very strong iron hoop'd Vessel, to prevent its burbling: It will appear very thick and muddy when newly press'd; but will refine in the Vessel, and be as clear as Wine. Thus let it remain untouch'd for three Months, before it be drawn off, and it will prove excellent Vinegar.

#### To make VINEGAR of Wine, or vinous Liquors.

Any sort of vinous Liquor, being mix'd with its own Feces, Flowers, or Ferment, and its Tartar, first reduced to Powder; or else with the acid and austere Stalks of the Vegetable from whence the Wine was obtain'd, which hold a large proportion of Tartar; and the whole being kept frequently stirring in a Vessel which has formerly held Vinegar, or set in a warm place full of the Steams of the same, will begin to ferment anew, conceive heat, grow sour by degrees, and soon after turn into Vinegar.

The remote Subjects of acetous Fermentation, are the same with those of vinous; but the immediate Subjects of it, are all kinds of vegetable Juices, after they have once undergone that Fermentation which reduces 'em to Wine: for 'tis absolutely impossible to make Vinegar of Malt, the crude Juice of Grapes, or other ripe Fruits, without the assistance of the vinous Fermentation.

The proper Ferments of this Operation, whereby Vinegar is prepar'd, are, 1<sup>st</sup>, The Feces of all acid Wines: 2<sup>d</sup>, The Lees of Vinegar: 3<sup>d</sup>, Pulveris'd Tartar; especially that of Rhenish Wine, or the Cream or Crystals thereof: 4<sup>th</sup>, Vinegar it self: 5<sup>th</sup>, A wooden Vessel, well drench'd with Vinegar, or one that has long been employ'd to contain it: 6<sup>th</sup>, Wine that has often been mix'd with its own Feces: 7<sup>th</sup>, The Twigs of Vines, and the Stalks of Grapes, Currants, Cherries, or other Vegetables of an acid austere Taste: 8<sup>th</sup>, Bakers Leaven, after it's turn'd acid: 9<sup>th</sup>, and lastly, All manner of Ferments, compounded of those already mention'd.

Vinegar is no Production of Nature, but a Creature of Art: For Verjuice, the Juices of Citrons, Lemons, and the like native Acids, are improperly said to be natural Vinegars; because, when distill'd, they afford nothing but vapid

Water: whereas it is the Property of Vinegar to yield an acid Spirit by Distillation.

#### Method of making VINEGAR in France.

In France they use a Method of making Vinegar different from that above describ'd.—They take two very large oaken Vessels, the larger the better, open at the top; in each whereof they place a wooden Grate, within a Foot of the bottom: upon these Grates, they first lay Twigs, or Cuttings of Vines, and afterwards the Stalks of the Branches, without the Grapes themselves, or their Stones; till the whole File reaches within a Foot of the brims of the Vessels: Then they fill one of these Vessels with Wine to the very top, and half fill the other; and with Liqueur drawn out of the full Vessel, fill up that which was only half full before; daily repeating the same Operation, and pouring the Liqueur back from one Vessel to the other; so that each of them is full, and half full by turns.

When this Process has been continued for two or three Days, a degree of heat will arise in the Vessel which is then but half full, and increase for several Days successively, without any appearance of the like in the Vessel which happens to be full during those Days; the Liquor whereof will still remain cool: and as soon as the heat ceases in the Vessel that is half full, the Vinegar is prepar'd: Which, in the Summer, happens on the fourteenth or sixteenth Day from the beginning; but in the Winter, the Fermentation proceeds much slower; so that they are oblig'd to forward it by artificial warmth, or the use of Stoves.

When the Weather is exceeding hot, the Liquor ought to be pour'd off from the full Vessel into the other twice a day: otherwise, the Liquor would be over-heated, and the Fermentation prove too strong; whence the spirituous Parts would fly away, and leave a vapid Wine, instead of Vinegar behind.

The full Vessel is always to be left open at the top, but the Mouth of the other must be closed with a Cover of Wood; in order the better to keep down and fix the Spirit in the Body of the Liquor; for otherwise, it might easily fly off in the heat of Fermentation.—The Vessel that is only half full seems to grow hot, rather than the other, because it contains a much greater Quantity of the Vine-wings and Stalks than that, in proportion to the Liquor; above which the File rising to a considerable height, conceives heat the more, and so conveys it to the Wine below.

VINEGAR of Antimony, is an acid Spirit, drawn by Distillation from the *Marscasite* of Antimony. See ANTIMONY.

It is commended in continued and malignant Fevers.—The Apothecaries likewise make a kind of Theriacal Vinegar of Dittany, Angelico, Valerian, Cardimuna, Oranges, &c. See ACETUM.

The word *Vinegar* is French; form'd from *Vin*, Wine, and *acere*, sour. See WINE.

VINEYARD, a Plantation of Vines. See VINE.

The best Situation of a Vineyard, is on the Declivity of an Hill lying to the South. See EXPOSURE.

The Vine is propagated by Slips, Layers, or Suckers, planted in a Nursery, and thence transplanted, about February, into the Vineyard.

As to the Soil, it is agreed, nothing can be too dry for them: And as to the sorts of Vines, none but the forward ones to be planted in England.—These are found to ripen very well in open Borders without Walls.

They are to be planted in Lines running North and South, five or six Foot apart; only two Vines in each Hole.—The September following, the Shoots of that Summer to be prun'd shorter, according to their Strength; and the Summer following, the strongest will begin to shew a little Fruit. They are now to be supported with Stakes, &c. so as they may run about a Foot above ground: The higher they run, the less danger they are in of being spoil'd with Wet; but the lower, the sweeter Grapes, and the stronger Wine.

If, notwithstanding due pruning, they don't seem inclinable to bear large Bunches, the Ground to be help'd with a Mixture of Rubbish of some old Building, with Sea-coal Ashes, or Drift Sand.—Thus manag'd, a Vineyard, in five or six Years, will produce good Food of Grapes.

The celebrated Vineyard at Bath, containing about six Acres of Ground, planted with White, Muscadine, and Black cluster Grapes, Mr. Bradley assures us, by such Management, four or five Years ago, yielded 60 Hogheads of Wine at a Vintage: Tho' in the Year 1721, it only yielded three Hogheads.

The same Author mentions a little Vineyard of a private Gardener at Rotherhithe; which, tho' only consisting of 100 Vines, and some of them only of the second Year's growth, yielded at a Vintage 95 Gallons of Wine; which, he adds, had the true Burgundy Flavour, as being made from that sort of Grape: and exceeded any made from any Vineyard on this side Paris. See WINE.

VINTAGE, the Crop of Wine, or what is got from the Vines each Season. See WINE.

The Word is also used for the Time or Season of gathering or pressing the Grapes.

In France, a Decree or Ordinance of the proper Judge, and a solemn Publication thereof, are requir'd, ere the *Vintage* can be begun.

VINOUS, *Vinosus*, something that relates to Wine; particularly the Taste, and Smell thereof. See WINE.

All Vegetables, by a due Treatment, afford a *Vinous* Liquor; as Corn, Pulse, Nuts, Apples, Grapes, &c. See MALT, BREWING, &c.

And a second Fermentation, duly manag'd, turns any *Vinous* Liquor into an acetous one. See VINEGAR.

The proper Character and Effect of FERMENTATION, is to produce either a *Vinous* or an acetous Quality in the Body fermented. See FERMENTATION.

Some of our Countrymen, bound on a Voyage to the *East Indies*, having fill'd several Casks with *Thames*-Water, to carry along with 'em; observ'd an intestine Motion in it, when they came to the Equator; and found it afterwards turn'd into a kind of *Vinous* Liquor, capable of affording an inflammable Spirit by Distillation.

This, without dispute, proceeded from the Flowers, Leaves, Roots, Fruits, and other vegetable Matters, continually falling or wash'd down into that River.—Such Waters are always found in a State of Putrefaction, ere they put on a *Vinous* Nature. See PUTREFACTION.

VINUM, a Liquor, or Drink, popularly call'd *Wine*. See WINE.

VINUM, in Medicine, or *Vinum Medicatum*, is particularly applied to several medicated *Wines*, i. e. Medicinal Preparations, whereof that Liquor is the Basis; such as the *Vinum Marium*, Sea-Wine; made by casting Sea-Water on the Grapes in the Vat.

*Vinum Cydonites*, Quince-Wine; made of Slices of that Fruit, steep'd in Must, or new Wine.

*Vinum Rosarum*, Rose-Wine; made by steeping Roses for three Months in Wine.

*Vinum Strobilites*, or Pine-Apple Wine.—*Vinum Hypsipites*, Hysof-Wine.

*Vinum Aromaticum*, made by infusing Aromatics, or Spices, in new Wine or Must.

*Vinum Pictatum*, pitch'd Wine; made of Pitch infus'd in Must.

*Vinum*, call'd also *Acetum*, *Scilliticum*. See SCILLITICUM.

*Vinum Absynthites*, or Wormwood-Wine; is made of the great or little *Absynthium*, by taking the Apices or Tops of the Flowers, putting them in a *Sacculus*, or Bag, and suspending it in the middle of a Vessel of Wine; which fermenting, extracts the Taste, Smell, and Virtues of the Wormwood.

*Vinum Emeticum*, Emetic Wine; is Wine wherein Glass, Regulus of Antimony, and Crocus Metallorum have been steep'd. See EMEYIC.

It only takes a certain degree of Efficacy from the Matters; nor is it found any stronger at three Months end, than at the end of eight Days.—It purges both upwards and downwards.

*Vinum Hippocraticum*, or Hippocress; so called of *Mania Hippocrati*, or Hippocrates's Sleeve, thro' which it is strain'd; is a sort of spiced Wine, in which Sugar and Spices have been steeped for sometime. See CLEARER, &c.

VIOL, a Musical Instrument, of the same Form with the *Violin*; and struck, like that, with a Bow. See VIOLIN.

There are *Viols* of divers Kinds: The first, and the principal, among us, is the *Bass-Viol*, call'd by the *Italians* *Viola di Gamba*, or the *Leg-Viol*; because held between the Legs.

'Tis the largest of all; and is mounted with six Strings, having eight Stops, or Frets, divided by Semi-tones.

Its Sound is very deep, soft, and agreeable.—The Tablature, or Musick for the *Bass-Viol*, is laid down on six Lines, or Rules.

What the *Italians* call *Alto Viola*, is the Counter-Tenor of this; and their *Tenore Viola* the Tenor. They sometimes call it simply the *Viol*: Some Authors will have it the *Lyra*, others the *Citharra*, others the *Cheitis*, and others the *Tektudo* of the Antients. See LYRA, &c.

2<sup>o</sup>, The *Love-Viol*, which is a kind of Triple *Viol*, or *Violin*; having six brass or steel Strings, like those of the Harpsichord.—It yields a kind of silver Sound, which has something in it very agreeable.

3<sup>o</sup>, A Large *Viol*, with 44 Strings, call'd by the *Italians* *Viola di Bardone*; but little known among us.

4<sup>o</sup>, The *Viola Bastarda*, or *Bastard Viol*, of the *Italians*; not used among us: *Bressard* takes it to be a kind of *Bass-Viol*, mounted with six or seven Strings, and tuned as the common one.

5<sup>o</sup>, What the *Italians* call *Viola di Braccio*, Arm-*Viol*; or simply *Braccio*, Arm; is an Instrument answering to our Counter-Tenor, Treble, and Fifth Violin.

6<sup>o</sup>, Their *Viola Prima*, or First *Viol*, is really our Counter-Tenor Violin; at least, they commonly use the Cliff of

*C fol ut* on the first Line, to denote the Piece intended for this Instrument.

7<sup>o</sup>, Their *Viola Secunda*, is much the same with our Tenor Violin; having the Key of *C fol ut* on the second Line.

8<sup>o</sup>, Their *Viola Tercia*, is nearly our Fifth Violin; the Key *C fol ut* on the third Line.

9<sup>o</sup>, Their *Viola Quarta*, or Fourth *Viol*, is not known in *England* or *France*: Tho' we frequently find it in the *Italian* Compositions; the Key on the fourth Line.

Lastly, their *Violetta*, or little *Viol*; is, in reality, our Triple *Viol*: Tho' Strangers frequently confound the Term with what we have said of the *Viola Prima*, *Secunda*, *Tercia*, &c.

VIOL is also a Term used among Mariners, when a strand Rope is bound fast with Nippers to the Cable, and brought to the Jock-Capstan, for the better weighing of the Anchor. See ANCHOR.

VIOLATION, the Act of *Violating*, i. e. forcing a Woman, or committing a Rape upon her. See RAPE.

*Amnon*, *David's* Son, *violated* his Sister, who was aveng'd by *Abigail*: *Tereus* *violated* his Sister-in-Law *Philocteta*.—To violate the Queen, the King's Eldest Daughter, or the Princess of *Wales*, is High Treason. See TREASON.

VIOLATION is also used in a Moral Sense for a Breach or Infringment upon a Law, Ordinance, or the like.—Thus, we say, A *Violation* of the Law of Nature, of a Treaty of Peace, of one's Oath, &c.—The Law of Nations was *violated* in the Inult offer'd to Mr. S.—the King's Ambassador at *Madrid*.

The Word is also used for a Profanation.—In this Sense, we say, to *violate* a Church, &c. See PROFANATION.

VIOLENT, in the Schools. A Thing is said to be *violent*, when effected by some external Principle; the Body that undergoes it contributing nothing thereto, but struggling against it.

The Body, in such Case, is said to *struggle*, by reason whatever is *Violent*, discomposes and distracts a thing from its natural Constitution, and tends to destroy it.

The Schoolmen all allow, that Man, as being endu'd with Reason, is capable of suffering such *Violence*; but brute and inanimate Bodies are not: *Io Brutum*, &c. *Violentum non cadit*.

VIOLIN, or Fiddle, a Musical Instrument, mounted with four Strings, or Guts; and struck, or play'd with a Bow.

The *Violin* consists, like most other Instruments, of three Parts; the Neck, the Table, and the Soundboard.

At the Sides are two Apertures, and sometimes a third towards the Top, shaped like a Heart.

Its Bridge, which is below the Apertures, bears up the Strings, which are fasten'd to the two Extremes of the Instrument; at one of them, by a Screw, which stretches, or loosens 'em at pleasure.

The Style and Sound of the *Violin*, is the gayest and most sprightly of all other Instruments; and hence it is of all others the fittest for dancing. Yet there are ways of touching it, which render it grave, soft, languishing, and fit for Church or Chamber Musick.

It generally makes the Treble, or highest Part in Comfits.—Its Harmony is from Fifth to Fifth. Its play is compos'd of Bass, Counter-Tenor, Tenor, and Treble; to which may be added, a Fifth Part: Each Part has four Fifths, which rise to a greater Seventeenth.

In Compositions of Musick, *Violin* is express'd by V: two V V denote two *Violins*.

The Word *Violin*, alone, stands for *Treble Violin*: When the *Italians* prefix *Alto*, *Tenore*, or *Basso*, it then expresses the Counter-Tenor, Tenor, or Bass *Violin*.

In Compositions where there are two, three, or more different *Violins*, they make use of *primo*, *secundo*, *terzo*, or of the Characters 1<sup>o</sup> 11<sup>o</sup> 111<sup>o</sup>, or 1<sup>o</sup> 2<sup>o</sup> 3<sup>o</sup>, &c. to denote the difference.

The *Violin* has only four Strings, each of a different thickness, the smallest whereof makes the *Es si mi* of the highest Octave of the Organ; the second, a Fifth below the first, makes the *A mi la*; the third, a Fifth below the second, is *D la re*; lastly, the fourth, a Fifth below the third, is *G re sol*.

Most Nations, ordinarily, use the Key *G re sol* on the second Line, to denote the Musick for the *Violin*; only in *France*, they use the same Key as the first Line at bottom: The first Method is best where the Song goes very low, the second where it goes very high.

The *Violoncella* of the *Italians*, is properly our Fifth *Violin*; which is a little Bass *Violin* with five or six Strings.

And their *Violone* is a Double Bass, almost twice as big as the common Bass *Violin*, and the Strings bigger and longer, in proportion; and consequently, its Sound an Octave lower than that of our Bass *Violin*, which has a noble Effect in great Concerto's.

VIPER, in Natural History, a kind of Serpent, famed not only for the exceeding Venomousness of its Bite, which is one of the most dangerous Poisons in the Animal Kingdom,

dom, but also for the great usefulness of its Flesh in Medicine: Whence *Vipers* come to make a considerable Article in divers Arts.

This remarkable Reptile has the biggest and flattest Head of all the Serpent-kind. Its usual length is about half an Ell; and its thickness an Inch: Its Sound is not unlike that of an Hog.

It has sixteen small immovable Teeth in each Jaw; and, besides, two other large, sharp, hooked, hollow, transparent, canine Teeth, situate at each side of the upper Jaw, which are those that do the Mischief: These are flexible in their Articulation; and are ordinarily laid flat along the Jaw, the Animal never raising 'em but when it would bite.

The Roots or Bases of these Teeth are incapsul'd with a Vesicle, or Bladder, containing the quantity of a large drop of a yellow insipid salivous Juice.

It has only one Row of Teeth; whereas all other Serpents have two: Its Body is not at all fetid; whereas the inner Parts of the Bodies of other Serpents are intolerable.—It creeps very slowly, and never leaps like other Serpents; tho' 'tis nimble enough to bite when provok'd.

Its Body is of two Colours, ash-colour'd, or yellow, and the ground speckled with longish brown Spots.—The Scales under its Belly are of the Colour of well-polish'd Steel.

The Male has two Sets of Genital Instruments, and the Female two Matrices, &c. She brings forth her young living; whereas other Serpents lay Eggs and hatch 'em: On which account, the *Viper* is rank'd among the Viviparous Animals. See VIVIPAROUS.

Her young ones come forth wrap'd up in thin Skins, which break on the third day, and set the Animal at liberty.—She brings forth to the Number of 20 young; but only one each Day.

The Antients, particularly *Pliny*, *Galen*, &c. believ'd that the young kill'd their Mother in the Delivery; but this is not the only Mistake they were guilty of on the Subject of the *Viper*. They held that it eat Cantharides, Scorpions, &c. which render'd its Poison so very dangerous.

*Dr. Mead* observes, that the Antients esteem'd the *Viper* sacred; and that one of the Kings of the *East Indies* caus'd Cottages to be built for their Entertainment, and their Killers to be punish'd with Death.—On Medals, the *Viper* is frequently represented as a Symbol of divine Power; and as such, used by way of attribute to the ancient Physicians.

As to the manner wherein the *Viper* conveys its Poison, Authors are a little disagreed.—*Francisco Redi*, and *Moise Chararras*, have each of 'em wrote very curious Pieces on the Subject, but their Result is very different.

*Redi* maintains, that all the Venom of the *Viper* is contain'd in the two Vesicles, or Bags which cover the Base of the two canine Teeth; whence, upon biting, the yellowish Liquor is squeez'd out into the Wound: where, mixing with the Blood and other Juices, it produces those dreadful Symptoms.

This Hypothesis he maintains by a good number of Experiments, as of Animals, viz. Cocks, &c. being bit with *Vipers* after these Vesicles and their Juice had been taken out; without any Signs of Poison, or any ill Consequence at all.

*Chararras*, on the other hand, maintains, that this yellow Liquor is not poisonous; that he has given it to Pidgeons as Food, without their being at all disorder'd thereby; that the *Viper's* bite he has always found mortal to Animals, even after the Bag has been taken clear out, as well as before: And lastly, that the Poison must lie in the irritated Spirits of the *Viper*, which it exhales in the Ardor of its biting; and which are so cold, that they curdle the Blood, and stop the Circulation.

The Controversy between these two ingenious Authors is very extraordinary: Their Systems are opposite; yet both maintain'd by a great number of well attended Experiments.—The Publick, however, generally give into the Sentiment of *Sig. Redi*; as answering best to the Mechanism of the Parts.

*Dr. Mead* supposes it the true one, in his Essay on the Poison of the *Viper*; and adds to *Redi's* Account, that the Poison in the *Viper's* Bag is separated from the Blood by a conglomerated Gland, lying in the lateral anterior part of the *Os Sincipiti*, behind the Orbit of the Eye; from which Gland is a Duct that conveys the Poison to the Bags at the Teeth. The Teeth, he adds, are rubul'd for the Conveyance and Emission of the Poison into the Wound; but their hollowness does not reach to the Apex or Tip of the Teeth, but ends in a long Slit below the Point, out of which the Poison is emitted.

These Slits, or Perforations of the Teeth, *Galen* says, the Mountebanks of his Days used to stop with some kind of Paste; after which, they would publicly expose themselves to be bitten, without danger.

Account of the Effects of the Bite of the *Viper*, from *Dr. Mead*.

The Symptoms following the Bite of a *Viper*, are an acute Pain in the Place wounded; Swelling, first red, afterwards livid, spreading by degrees; great Faintness; a quick, low, and sometimes interrupted Pulse; Sickness at the Stomach; bilious convulsive Vomiting; cold Sweats; sometimes Pains about the Navel; and Death it self, if the Strength of the Patient, or slightness of the Bite do not overcome it.

If he do overcome it, the Swelling continues inflam'd for some time; and the Symptoms abating, from the Wound runs a sanious Liquor, little Pusles are rais'd about it, and the Colour of the Skin is as if the Patient were Icteric.

By the Microscope, the *Virus* was found to consist of minute Salts in continual Motion; after which, a Number of Spicula or Darts appear'd, resembling, but much finer, a Spider's Web.—This, when mixed with *Syr. Felcol*, inclin'd to red, no ways to green; so that the Juice is not alkalious: But *Mr. Boyle* and *Dr. Puccinum* prove the Blood to be only an Alkali.

Such a small Quantity of the *Virus* seems to have its Effect by wounding the Fibres, and altering the Cohesion of the Globules of Blood, which by the elastic Matter thereof proves a nimble Vehicle to carry the Viperiote Spicula almost every where suddenly.—They will also stimulate and fret the sensible Membranes; whereupon, a more than usual Afflux of the Animal Juices will be carried to the Parts.

The Cure seems very uncertain: *Mr. Boyle* found a hot Iron held near the Place successful; but it proved otherwise with *Monfieur Chararras*.—Again, the Snake-stone from the *East Indies*, immediately applied to the Place, is much commended: But *Signior Redi* and *Monfieur Chararras* found it of no use; yet *Zogliovi* and *Dr. Hevers* give Instances of its good Success.

*Dr. Mead* adds, that the same Stone directly applied to a Pigeon when bitten, saved its Life four Hours; whereas, most of the other Pigeons bitten died in half an Hour.

This Stone is not Natural, but Factitious; its Virtue lies in its Porosity, which is supposed to imbibe the *Virus*.

The *Viper*-Catchers have a Specifick, in which they can so far confide, as not to be afraid of being bitten.—That Specifick is the *Auxungia* of the *Viper* presently rubb'd into the Wound; which consisting of clammy, viscid, penetrating, and active Parts, sheaths the Salts of the *Virus*.

The same Author, applying it to the Nostrils of a Dog bitten, found it well the next Day: When this is not timely applied, and the *Virus* has insinuated into the Blood, the *Sol Viper* is excellent, given and repeated till Sweats be produced. This succeeded well with *Monfieur Chararras*; and *Dr. Mead* relates, that it recover'd one, after the *Virus* had induc'd an universal Icterus.

*Vipers* make a considerable Article in Medicine.—Most Authors agree, that there is no Part, Humour, or Excrement, not even the Gall it self, of a *Viper*, but may be swallow'd without much harm.—Accordingly, the Antients, and, as several Authors assure us, the *Indians* at this day, both of the East and West, eat 'em as we do Eels.

*Curo Viperina*, *Viper's* Flesh, either roasted or boil'd, the Physicians unanimously prescribe as an excellent Restorative; particularly in the Elephantiasis, incurable Consumptions, Leprosy, &c. and *Dr. Mead* thinks they might be less sparing in the Quantity than they are; instead of a little *Viper's* Flesh, he recommends the Broth or Gelly of *Vipers*; or, as the Antients did, to boil and eat them as Fish, or at least to drink *Vinum Viperinum*, i. e. Wine wherein they have been long infus'd.

*Viper's* Flesh is an Ingredient in several of our best Antidotes; as the *Liberiaco Andromach*, &c. See *Theriaca*. The Apothecaries also sell the *Pulvis Viperinus*, which is only dried *Vipers* pulveriz'd, Heart Liver and all, and pass'd thro' a Sieve.—This, to heighten the Price we suppose, they call *Animal Besoard*. See *Besoard*.

The Salts of *Vipers*, whether volatile or fix'd, also their Fat or *Auxungia*, and their Oil, chymically drawn, are Drugs in good repute.

*VIRAGO*, a Maid, or Woman of extraordinary Stature; and who, with the Mien and Air of a Man, performs the Actions and Exercises thereof. See *AMAZON*.

Such were *Semiramis* and *Peasblossom*, among the Antients, &c. *Jeanne d'Arcelle*, commonly call'd the *Maid of Orleans* among the Moderns.

In the Vulgate Version of the Bible, *Eve* is call'd *Virago*, because made of the Rib of the Man.—The *Latin* Translator, by this, aim'd to preserve the Etymology which is in the Hebrew, and of *Vir*, form'd *Virago*; as *Adam*, in the Hebrew Text, call'd *Eve* *Iebad*, of *Ieb*, Man.

The Word is pure *Latin*, and seldom us'd but in the way of Derision.

*VIRGA*. See *YARD*.

**VIRGA**, is particularly used in Law, for a Verge, or Rod, such as Sheriffs and Bailiffs carry as a Badge of their Office. See VERGE.

—*Rauf. ap. Howell, prepositus de Lantiffio, amerciatu pro eo quod habuit in manu sua coram Justiciariis hic virgam nigram & inboustam, ubi habere debuisset virgam albam & honestam certe longitudinis, prout decet.* In scilicet. Itin. de Caroff. 7 Hen. VI.

**VIRGÆ**, in Physiology, a Meteor, call'd also *Cocumelle*, and *Funes Tenoris*; being an Assemblage of several Streams of Light, representing a Bundle of Rods, or Ropes. See METEOR.

It is supposed owing to the Streaming of the Sun-beams thro' certain Rimsle or Chinks, at least thro' the more lax and open Parts of a watry Cloud; happening chiefly in the Morning and Evening.

There is also another Kind, consisting, not of Streams of mere white Light; but, as it were, painted, of various Colours; like those of the Rainbow. See RAIN-BOW.

**VIRGATA Terra**, or **VIRGA Terra**, a Yard Land. See YARD LAND.

*Virgate Terra ex 24 constat acris; quatuor Virgate Hidae Jaciant, quinque Hidae feodum Militis.* See HIDE, and KNIGHT'S Fee.

**VIRGATORES Servientes**, in *Fleta*, are Virgers or Tip-staves that attend the Judges. See VERGER, and SERJEANT at Arms.

**VIRGIN**, a Female who has had no commerce with Man; or, more properly, who has still the *Flos Virginis*, or Maiden-hood. See VIRGINITY.

In the *Roman Breviary*, there is a particular Office for Virgins departed, answering to those for Saints, Martyrs, and Confessors. See OFFICE.

Criticks and Antiquaries are much divided about a Feast held in that Church, in honour of *S. Ursula* and her Companions, who are said in the Ritual, Legend, &c. to have been eleven thousand Virgins.

Some imagine there has been a Mistake in reading the ancient Rituals, wherein XI. M. V. which was only an Abbreviation of *Eleven Virgin Martyrs*, was read according to the Numeral Letters, *Eleven thousand Virgins*. F. Sirmond conjectures, that in the ancient Lists of Martyrs, there were found *S. S. Ursula* and *Undecimilla* V. M. and that in lieu of *Undecimilla*, which is the Name of a Virgin Martyr, the Copists had made *Undecimilla*, which is Eleven Thousand.

By the *Mosaic Law*, the Priests are enjoin'd to take none to Wife but those that are Virgins: The Widow, the Divorced, and the Harlot are to be refrain'd from.

**VIRGIN** is also applied, by way of Eminence, to *Mary* the Mother of our Saviour; as conceiving and bringing him forth, without any Breach of her Chastity.

*Nebrosus* and his Adherents, maintain'd, that the *Virgin* could not with any Propriety be call'd the *Mother* of God; as being really no more than the *Hostess* of God: For that the eternal Word could not be conceiv'd and born of the Womb of a *Virgin*. See NESTORIANS.

This Heresy was condemn'd at the Council of *Ephesus*; yet has it been lately reviv'd in *Holland*, chiefly by a Religious Monk, one *Renouet*.

**VIRGIN** is also used, figuratively, for several Things that retain their absolute Purity, and have never been made use of.

Thus, *Virgin Wax*, is that which has never been wrought, but remains as it came out of the Hive. See WAX.

*Virgin Oil*, is what oozes spontaneously from the Olive, &c. without pressing. See OIL.

*Virgin Gold*, is that Metal such as it is got out of the Ore, without any Mixture or Alloy; in which State it is so soft, that it will take the Impression of a Seal. See GOLD.

*Virgin Copper*, is that which has never been melted down. See COPPER.

*Virgin Mercury*, is that found perfectly form'd, and fluid, in the Veins of Mines; or at least, is got from the Mineral Earth, by mere Lotion, without Fire. See MERCURY.

*Virgin Parchment*, is, properly, that made of a kind of Cap, or Caul, which Children bring into the World on their Heads.—But the Word is also used for that made of the Skin of an abortive Lamb, or Calf. See PARCHMENT, and VELOM.

*Virgin's Milk*. See LAC VIRGINALE.

**VIRGIN'S Thread**, is a sort of Dew, that flies in the Air, like small untwisted Silk; and which falling upon the Ground, or upon Plants, changes it self into a Form like a Spider's Web. See METEOR.

The Matter of it is supposed to be of an earthy slimy Nature. In these Northern Climates, it is most frequent in Summer; the Days being then temperately warm, the Earth not exceeding dry, nor yet over-charg'd with Moisture.

**VIRGINALE Clausurum**, in Anatomy, the same as *Hymen*. See HYMEN.

**VIRGINEUS Morbus**, the *Virgin's Disease*; the Green-Sickness, or *Chlorosis*. See CHLOROSIS.

**VIRGINITY**, the Character or Criterion of a *Virgin*; or that which entitles her to the Denomination. See VIRGIN.

In the first Ages of the Christian Church, *Virginity* grew into great Honour and Esteem; inasmuch, that the Women were admitted to make solemn Vows thereof in publick.—Yet was it held infamous among the *Jews*, for a Woman to die a *Maid*.

The *Vestal*, among the Antients, and the Nuns or Religious among the Moderns, found guilty of a Breach of the Vow of *Virginity*, are allotted a severe Punishment; the first to be buried alive, the latter to be immur'd. See VESTAL, &c.

The Physicians, both ancient and modern, are exceedingly divided upon the Subject of *Virginity*: Some holding that there are no certain Marks, or Testimonies thereof, and others that there are.

*Solomon* says expressly, there are four Things too wonderful for him to know: 'The way of an Eagle in the Air; 'A Serpent on the Rock; 'A Ship in the mid'd of the Sea; and the way of a Man in a Maid'; which our Translators have render'd, less justly, 'the way of a Man with a Maid'.

Yet *Moses* establish'd a Test, which was to be conclusive among the *Jews*.—The Nuptial Sheets, it seems, were to be view'd by the Relations on both Sides; and the Maid's Parents were to preferre them as a Token of her *Virginity*; to be produced, in case her Husband should ever reproach her on that score.

In case the Tokens of *Virginity* were not found thereon, she was to be stoned to Death at her Father's Door.

This Test of *Virginity* has occasion'd abundance of Speculation about the Parts concern'd; but the nicest Inquiries cannot settle any thing certain about 'em.—*Dr. Drake* says expressly, that whatever might be expected among the *Jews*, there is not the same Reason to expect those Tokens of *Virginity* in these Countries: For, besides that the *Hebrews* marry'd extremely young, as is the Custom in all the Eastern Countries; there are several Circumstances which may here frustrate such Expectations, even in Virgins not violated either by any Male Contact, or any Wantonness of their own.

In effect, in these Northern Climates, the inclemency of the Air exposes the Sex to such Checks of Perpiration, as gives a great turn to the Course of the Humours, and drives to much Humidity thro' the Parts, as may extraordinarily supple and relax those Membranes from which the Resistance is expected; and from which, in hotter Countries, it might more reasonably be depended on.

What most commonly passes among us for a Test of *Virginity*, is the *Hymen*: And yet the most curious among the Anatomists are greatly divided, not only about the Figure, Substance, Place, and Perforations of this famous Membrane, but even about the Existence thereof; some positively affirming, and others as flatly denying it. See HYMEN.

As nice a Point as that of *Virginity* is among Anatomists, the Midwives and Matrons treat it with less diffidence.—In the Statutes of the sweet Matrons of *Paris*, containing likewise divers *Formula's* of Reports and Depositions made in Court upon their being call'd to visit Girls that made their Complaint of being deflower'd, they lay down fourteen Marks, wherein to form a Judgment.

*Laur. Jobert*, a famous Physician of *Montpellier*, has transcrib'd three of these Reports: one made to the Provost of *Paris*; another in *Languedoc*; and a third in *Bearn*.—These Reports are very consistent with each other; and contain fourteen Marks of *Virginity*, express'd in their proper Terms; such as were receiv'd among the Women of that Profession, and authoris'd in Court.

*Monsieur Jobert* does not explain those Terms; nor do we find any Explanation of them any where, but in another Report of the 23d of *October*, 1672, inserted in the *Picture of Love* of *Venetie* a Physician of *Roche*; a Copy of which, we shall here give in English.

"We, *Mery Miran*, *Christophette Reine*, and *Jeanne Porte Poulet*, Sworn Matrons of the City of *Paris*, certify to all those whom it may concern, that on the 22d of *October*, in this present Year, at the Appointment of *Monsieur* the Provost of *Paris*, we went into the Street de *Pompierre*, to a House next the Sign of the Silver Key; to view and visit *Olive Tifferand* of the Age of 30 Years, on a Complaint made by her in Court against *James Mandon*, Citizen of *Roche sur Mer*; for forcing and violating her the said *Olive*: And having view'd and examin'd the whole with the Eye and Finger, we find,

"*Les Tonsnes deveses*, that is, the Breasts loose and flaccid, *Mammae marcidæ & flaccidæ*: *Les Barres froissées*, i. e. the Os Pubis brevis'd, *Os Pubis callisum*: *Le Lippion reconnoille*, i. e. the Hair cut'd up, *Pubes in Orbea simu*: *ata*: *L'Entrepre ride*, i. e. the Perineum or Seam wrinkled, *Perineum corrugatum*: *Le Poyvent debiffé*, i. e. the *Vulva* or *Pudendum* tumbled and disorder'd, *Vulva dissoluta & marcescens*: *Les Balanoux pendans*, i. e. the *Labia* hanging down, *Labia pendula*: *Le lippendis pile*,

"i. e.

"i. e. the Edge of the *Labia* barod of Hair, *Labiolum Ora Pili* defecte : les *Babois* abbatues, i. e. the *Nymphæ* beat down, *Nymphæ* depresso: Les *Halicorns* demis, i. e. the *Caruncule* undone, or open'd, *Caruncule* dissolutes : *P. Entrecornes* retourné, i. e. the *Membrans* which connect the *Caruncles* inverted: *Membrans connectens inversa* : le *Barbidan* ecorché, that is, the *Clistoris* excoriatéd, *Clistoris* excoriata : le *Guilboques* fendu, i. e. the Neck of the *Womb* torn, *Collum uteri dilaceratum* : le *Guillemard* elargi, i. e. the *Vagina* stretch'd, or widen'd : *Vagina dilatata* : la *Dame* du *Milieu* retiré, i. e. the *Hymen* broke and gone, *Hymen* deductum : l'arriere fosse ouverte, i. e. the inner *Orifice* of the *Womb* open'd, *Os Internum Matricis* apertum.—Le tout ven et vistre *seuillet par seuillet nous avons trouvé qu'il, y avoit trace de*—The Whole view'd and examin'd Part by Part, we find plainly the *Track* or *Foot-step* of—*Omnibus* *gillatum* *perfectis* & *perferatatis*, &c.—Accordingly we, the said *Matrons*, do certify it to be true, to you, "Monficar le *Prevost*, on the *Oath* we have taken. Done at *Paris* the 23d of *October*, 1671."

In *Peru*, and several other *Provinces* of *South-America*, we are assur'd by *Pedro de Cieca*, the *History* of the *Incas*, &c. that the *Men* never marry but on *Condition* that the next *Relation*, or *Friend* of the *Maid's*, shall undertake to enjoy her before him, and take away her *Virginity*. And our *Countryman* *Levyson*, relates the like of some of the *Indians* *Nations* of *Carolina* : So little is the *Flos Virginis*, priz'd so much among us, valued by them.

*VIRGO*, in *Astronomy*, one of the *Southern* *Signs*, or *Constellations* of the *Zodiac*, into which the *Sun* enters in the beginning of *August*. See *SIGN*, and *CONSTELLATION*.

The *Stars* in the *Constellation* *Virgo*, in *Ptolemy's* *Catalogue*, are 32 : In *Tycho's*, 39 : In *Flemsted's*, 89. The *Longitudes*, *Latitudes*, *Magnitudes*, &c. whereof, are as follows :

Stars in the Constellation VIRGO.

Names and Situations of the Stars.	Signs	Longitude.	Latitude.	Magn.
That preced. <i>Virgo's</i> Head	♍	17 30 05	5 19 13	6
North, in the Top of the Head		19 00 29	6 06 21	5

*VIRGULA Divina*, or *Bacculus Divinatorius*, a forked Branch in form of a Y, cut off a Hazel-tree ; by means whereof People have pretended to discover Mines, Springs, &c. under Ground. See *MINES*, &c.

The Method of using it is this : The Person who bears it walking very slowly over the Places where he suspects Mines or Springs may be, the Effluvia exhaling from the Metals or the Water, impregnating the Wood, makes it dip or incline ; which is the Sign of a Discovery.

We find no mention made of this *Virgula* in any Author before the eleventh Century : but from that-time it has been in Use ; Divers fine Names have been invented for it, some calling it *Caduceus*, others, *Aaron's Rod*, &c.

Some dispute the matter of fact, and deny it to be possible ; others, convinc'd with the great number of Experiments alleg'd in its behalf, look out for the natural Causes thereof.—The *Corpuscles*, say these Authors, rising from the Springs, or Minerals, entering the Rod, determine it to bow down, in order to render it parallel to the vertical Lines which the Effluvia describe in their rise.

In Effect, the mineral, or watery Particles are supposed to be emitted by means of the subterranean Heat, or of the Fermentations in the Entrails thereof : Now the *Virgula* being of a light, porous Wood, gives an easy Passage to those Particles, which, withal, are very fine and subtle ; the Effluvia then driven forwards by those that follow them, and oppress'd at the same time by the Atmospheric incumbent on them, are forced to enter the little Interstices between the Fibres of the Wood, and by that Effort oblige it to incline, or dip down perpendicularly, to become parallel with the little Columns which those Vapours form in their rise.

*VIRGULA*, in Grammar, a Term which the *Latin*, *French*, and many other Authors, use for a Point in Writing, usually call'd by us *Comma*. See *COMMA*.

*Virgula's*, *Fa. Simon* observes, are an Invention of the modern Grammaticians, to give the greater Clearness to Discourse.—The Use thereof was unknown to the ancient *Greeks* and *Romans*, who wrote all without taking off the Pen, so

that their Books lie all together without any Distinction of Points and *Virgulus*. See POINTUS.

**VIRGULTUM**, in our ancient Law-books, is used for an Holt, or Plantation of Twigs, or Osiers.

Sometimes also for a Coppice of young Wood: *Et præterea concedo Virgultum meum & totam communem Domini mei*. Mop. Angl.

In another place of the same Work, it may be taken for *Virgata*, viz.—*Dedit prædictæ Ecclesiæ unam Virgultam Terræ in Menerio de Cumpstone*.

**VIRIDARIO eligendi**, a Writ that lies for the Choice of a Verderer in the Forest. See VERDEROR.

**VIRIDE Aëris**, the same as *Aëris*, or *Ferdogrease*. See VERDEGREENE.

**VIRILE**, something that belongs or is peculiar to Man.

Thus *Virile Member*, *Membrum Virile*, is frequently used for the Penis. See PENIS.

The *Virile Age*, *Ætas Virilis*, is the Strength and Vigour of a Man's Age, viz. from thirty to forty-five Years, which is an Age wherein we are equally remov'd from the Extremes of Youth and old Age. See AGE.

The Civil Lawyers only make one Age of Youth and Virility; and yet their different Temperatures seem to require a Distinction; for which Reason some compare Youth to Summer, and Virility to Autumn. See PŒRERTY.

At Rome, the Youth quitted the *Prætexta* at fourteen or fifteen Years of Age, and took the *Virile Gown*, *Toga virilis*, to flow, it seems, that they then entered on a serious Age. See PRÆTEXTA and TŒGA.

M. *Dacier* will have it, the Children did not take the *Prætexta* till thirteen Years of Age, nor quit it for the *Toga Virilis*, till seventeen.

**VIRILIA**, a Man's privy Members, including the Penis and Testes. See PENIS, &c.

The cutting off the *Virilia*, according to *Bracton*, was Felony by Common Law, and that whether the Party were consenting or not. See EUNUCH.

—*Henricus Hall & A. Uxor ejus capti & detenti in prisona de Ewichester, eo quod restati fuerant quod ipsi absiderunt Virilia Johannis Monachi, quem idem Henricus deprehendit cum prædicta A. Uxore ejus*. Rot. Clausæ 13 Hen. III. See CASTRATION.

**VIRSUNDIANS Ductus**, or *Ductus Virisungii*, in Anatomy, a Canal, more usually call'd, *Ductus Pancreaticus*. See PANCREATICUS. It took its Name, *Virisungianus*, from the Inventor, *Virisung*.

**VIRTUAL**, *Potential*, something that has a Power or Virtue of acting or doing. See VIRTUALLY.

The Term is chiefly understood of something that acts by a secret invisible Cause; in Opposition to actual, and sensible. See POTENTIAL.

**VIRTUAL Focus**, in Opticks, is a Point from which Rays, before converging, begin to diverge, or divaricate. See Focus.

Hence it is also call'd, *Point of Dispersion*, or *Divergence*; in Opposition to the *Focus*, which is call'd the *Point of Concurrence*. See POINT, DISPERSION, DIVERGENT, &c.

Suppose, e. g. the Convexity of a Glass to be *a b c* (Tab. Opticks Fig. 11.) and its Axis *de*; let *fg* be a Ray of Light falling on the Glass parallel to the Axis *de*, and let *d* be the Centre of the Ark *a b c*.

This Ray *fg*, after it has pass'd the Glass, at its Emergence at *g*, will not proceed directly to *b*, but be refracted from the Perpendicular *d g*, and become the Ray *g k*.

Draw then directly *g k*, so that it may cross the Axis in *e*.—The Point *e* so found, Mr. *Molyneux* calls the *Virtual Focus*, or *Point of Divergence*. Dioptr. Nov.

**VIRTUALITY**, **VIRTUALITAS**, in the Schools, is some Mode or Analogy in a Object, which in reality is the same with some other Mode; but out of regard to contradictory Predicates, is look'd on as if really distinct therefrom.

Thus the divine Nature, and the Person of the Word, are two *Virtualities*; for tho' in reality they be the same, yet are they consider'd as things different.—For the Person of the Word is said to have been begotten, and his Nature is said not to be begotten: now begotten, and not-begotten, are contradictory Predicates.

And hence arise what we call *virtual Distinctions*, whereby one *Virtuality* is distinguish'd from another, not one Thing from another.

Thus it is the divine Nature is distinguish'd from the divine Person, and the divine Understanding from the divine Will. See TRINITY.

**VIRTUALLY**, **VIRTUALITER**, in the Schools, is applied to a Mode of Existence.—Thus a thing is said to be *Virtually* any where, when it is deem'd to be there by some *Virtue*, *Influence*, or other Effect produc'd by it.

As the Sun is *Virtually* on Earth, i. e. by his Light, Heat, &c.

A thing is also said to be *Virtually* present when the Virtues or Properties belonging to it, and issuing from it, re-

main.—In which Sense the Forms of the Elements are held to be *Virtually* in mix'd Bodies.

A thing is also said to be a Cause *Virtually*, or a *Virtual Cause*, and that two Ways: the first, when there is no real Distinction between it, and the Effect attributed to it; and yet it is conceiv'd by us as if it were really the Cause thereof.—Thus, Immortality in God, is the Cause of Eternity.

Secondly, when an Effect is not of the same kind with the Cause, and yet the Cause has the Power, or *Virtue* of producing the Effect: thus the Sun is not *formally*, but *Virtually* hot; and Fire is not contain'd *formally*, but *Virtually* in Heat.

**VIRTUS**, **VIRTUS**, a Term used in various significations.

In the General, it denotes *Power*, or *Perfection* of any Thing, whether Natural or Super-natural, Animatè or Inanimatè, Essential or Accessory: hence the *Virtues* of God, Angels, Men, Plants, Elements, &c. See POWER, and FACULTY.

In its more proper and restrain'd Sense, *Virtue* signifies a Habit, which improves and perfects the Haver or Possessor, and his Actions. See HABIT, PERFECTION, &c.

In this Sense, *Virtue* is a Principle of acting, or doing well and readily; and that, either infused from above, such as are the *Theological Virtues*; or acquired by our own Application, as the *Intellectual* and *Moral Virtues*.

For, as there are two Things in Man from which all his Actions proceed, viz. the Understanding, and the Will; so the *Virtue* by which he is perfect'd, or whereby he is dispos'd to do all Things rightly, and to live happily, must be two-fold: the one of the Understanding; the other, of the Will.

That which improves the Understanding is call'd *Intellectual* or *Dialectic*; and that, the Will, *Moral* or *Ethic*.

For, since there are two Things requir'd in order to live a-right, viz. to know what should be done; and, when known, readily to perform it: And since Man is apt to err various Ways in each respect, unless regulated by Discipline, &c. he alone can deport himself rightly in his whole Course of Life, whose Understanding and Will have attain'd their utmost Perfection.

An *Intellectual Virtue*, then, according to *Aristotle*, is a Habit of the reasonable Soul, whereby it conceives, or speaks the Truth; either to affirming, or denying. See TRUTH.

The *Virtues* which come under this Class, are divided into *Speculative*; which are those conversant about necessary Things, that can only be known, or contemplated; and *Practical*, which are conversant about contingent Things, that may likewise be practic'd.

*Aristotle* has another Division of *Intellectual Virtue*, fetch'd from the Subject; as some of 'em are seated in the *Memoria*, or *Contemplative Part*, viz. those conversant about necessary things, as *Science*, *Wisdom*, *Intelligence*. See SCIENCE, UNDERSTANDING, &c.

And others, in the *opinion*, or *Practical Part*; such as those conversant about contingent Things, as *Prudence*, *Art*, &c. See ART, &c.

*Moral Virtue* is defined by *Aristotle* to be an elective Habit, plac'd in a Mediocrity, determin'd by Reason, and as a prudent Man would determine.

The *Scottish* maintain every moral Habit to be indifferent as to good or evil, and capable of becoming, successively, either *Virtue* or *Vice*: *Virtue*, if it have a relation of conformity with right Reason; and *Vice*, if it have not. See VICE.

According to them, therefore, *Virtue* is a Habit subjectively, but not essentially, good: as it is only a relation of Conformity, &c. which is separable from the Entity of the Habit.

The *Thomasists*, on the contrary, assert *Virtue* to be a Habit essentially good; not capable of ministering any thing to any Act positively bad.—And they philosophize thus: Every Habit essentially good, inclines to Acts like those whereby it was acquired; thus, by doing justly we become just; and, by abstaining from forbidden Pleasures, we become temperate. But *Moral Virtue* is produc'd, or acquired by Acts essentially good; good, we mean, both in respect of our Duty, and of the Motive and End: therefore *Moral Virtue* inclines only to good Acts.

Others disallow the *Peripatetic* Notion of *Virtue* as plac'd in a Habit; for a Habit, or Habitualty, they think two Things; a Custom, and Facility; the first as a Cause, and the second as an Effect: so that a Habit is nothing but a Facility acquired by Custom.—They therefore who make *Virtue* a Habit of doing well, must of necessity ascribe it to a frequent Exercise of good Actions.—But this can't be; for the *Virtue* must be before the good Actions; and the Habit, after 'em.—Indeed, whence shou'd the Actions proceed but from *Virtue*? *Virtue* therefore is before the good Actions, and certainly before a Habit resulting from a frequency of good Actions.

Hence, they define *Virtue* to be a firm Purpose or Resolution of doing whatever right Reason demands to be done. For tho a Custom of doing well be requir'd to make a Person esteem'd good among Men; yet it does not follow, that that Custom or Habit is the formal Cause of that Denomination, or the Goodness it self.

Moralists usually distinguish four *Principal*, or, as they are vulgarly call'd, *Cardinal Virtues*, viz. *Prudence, Justice, Fortitude, and Temperance*: The Reason of which Division is founded in this, That for a Man to live *virtuously* and honestly, 'tis necessary he know what is fit to be done; which is the Business of *Prudence*.

That he have a constant and firm Will to do what he judges best; which will perfect the Man, either as it resists too violent Perturbations, the Office of *Temperance*.

Or, as it spurs and urges on those that are to slow and languid, which is the Business of *Fortitude*.

Or, lastly, comparatively, and with regard to human Society; which is the Object of *Justice*.

To these four all the other *Virtues* are refer'd, either as Parts, or as Concomitants.

VIRTUES, in the Hierarchy, the third Rank, or Choir of Angels; being that in order between *Dominations* and *Powers*. See HIERARCHY.

To these is attributed the Power of working Miracles, and of strengthening and reinforcing the inferior Angels in the Exercise of their Functions. See ANGEL.

VIRTUOSO, an Italian Term, lately introduced into English; signifying a Man of Curiosity and Learning; or one who loves and promotes the Arts and Sciences.

In Italy, *Virtuosi* are properly such as apply themselves to the polite Arts of Painting, Sculpture, Tuning, Mathematics, &c. — A Person who makes Profession thereof, is call'd *Virtuoso, quæstus à suo Virtuosò*.

Among us, the Term seems affect'd to those who apply themselves to some curious and quaint, rather than immediately useful Art or Study: As Antiquaries, Collectors of Rarities of any kind, Microscopical Observers, &c.

VIRULENT, a Term apply'd to any thing that yields a *Virus*; that is, a corrosive or contagious Pus. See Pus.

The *Gonorrhæa Virulenta*, is what we popularly call a *Clap*. See GONORRHEA.

VIS, a Latin Word, signifying *Force, or Power*; adopted by physical Writers, to express divers Kinds of Natural Powers: as the

*Vis Inertiae, or Power of Inactivity*, which is defin'd by Sir I. Newton to be a Power implanted in all Matter, whereby it resists any Change endeavour'd to be made in its State, i. e. whereby it becomes difficult to alter its State, either of Rest, or Motion. See INERTIA.

This Power, then, coincides with the *Vis resistendi, Power of resisting*, whereby every Body endeavours, as much as it can, to persevere in its own State whether of Rest, or uniform rectilinear Motion: Which Power is still proportional to the Body, and only differs from the *Vis Inertiae* of the Mass in the manner of conceiving it.

Bodies only exert this Power in Changes brought on their State by some *Vis Impressa*, Force impress'd on 'em. And the Exercise of this Power, is, in different respects, both *Resistance, and Impetus*: Resistance, as the Body opposes a Force impress'd on it to change its State; and *Impetus*, as the same Body endeavours to change the State of the resisting Obstacle. — *Phil. Nat. Princ. Math. Lib. I. See REACTION.*

The *Vis Inertiae*, the same great Author elsewhere observes, is a passive Principle, by which Bodies persevere in their Motion or Rest; receive Motion, in proportion to the Force impressing it, and resist as much as they are resisted. See MOTION.

For the Effect of the *Vis Inertiae* in resisting and retarding the Motion of Bodies, See RESISTANCE, and RETARDATION.

*Vis Impressa*, is defined by Sir I. Newton to be the Action exercis'd on any Body, to change its State, either of resting, or moving uniformly in a right Line.

This Force consists altogether in the Action; and has no place in the Body after the Action is ceas'd. — For the Body perseveres in every new State by the *Vis Inertiae* alone.

This *Vis Impressa* may arise from divers Causes, as from the Percussion, Pressure, and Centripetal Force. See PERCUSSION, &c.

*Vis Centripeta.* } CENTRIPETAL Force.  
*Vis Centrifuga.* } See } CENTRIFUGAL Force.  
*Vis Motrix.* } MOTION.  
*Vis Stimulans.* } STIMULANT.

VISCERA, in Anatomy, a Term of equal import with *Entrails, or Bowels*; including the Heart, Liver, Lungs, Spleen, Intestines, and other inward Parts of the Body. See BODY.

The Word is also frequently used singularly, *Viscus*, to express some particular part of the Entrails; by reason the Word *Entrails* has no Singular.

The Term *Viscus* is pure Latin, being form'd of *Vesici*, to feed; by reason, the Foods, call'd in Latin *Vesica*, undergo divers Preparations in the *Viscera*.

VISCIDITY, or VISCOSITY, the Quality of something that is *viscid, or viscous, i. e. glutinous, or sticky*; like Birdlime, which the Latins call by the Name *Viscus*. See BIRDLIME.

*Viscid Bodies*, are those which consist of Parts so implicated within each other, that they resist a long time a complex Separation, and rather give way to the Violence done them by stretching or extending each way. See PARTICLE, and COHESION.

The too great *Viscidty* of Foods has very ill Effects: Thus, Meats, or *Ferme* not fermented, Gellies, &c. of Animals, tough Cheesc, or Curd too much press'd, produce a Weight or Oppression in the Ventricle; Winds, Yawnings, Crudities, Obstructions of the minuter Vessels in the Intestines, &c. Hence, an Inactivity of the Intestines themselves, a Swelling of the Abdomen; and, hence, a *Viscidty* of the Blood, from the re-union of the *viscid* Particles; Obstructions of the Glands; Paleness, Coldness, Tremors, &c.

VISCOUNT. See VICOUNT.

VISCUS, VISCOSUS, VISCOSITY, in Anatomy. See VISCERA, and VISCIDITY.

VISCUS, in Natural History, &c. See MISLETOE.

VISIBLE, something that is an Object of Sight, or *Vision*; or something whereby the Eye is affected, so as to produce a Sensation. See VISION.

The School Philosophers make two Kinds of *Visibles*, or *Visible Objects*: the one *proper, or adequate*; which are such as are no other way perceivable, but by Sight alone: The other *common*; which are subject to divers Senses, as the Sight, Hearing, Feeling, &c.

Again, the first, or *proper Object of Vision*, is of two Kinds, viz. *Light, and Colour*; for these two are only sensible by Sight. — The first and primary, viz. *Light*, they make the *formal*, and *Colour* the *material Object*. See OBJECT.

The *Cartesians* think they philosophize better, when they say, That Light alone is the proper Object of Vision; whether it flow from a luminous Body thro' a transparent Medium, and retain its first Name, *Light*: or whether it be reflected from opaque Bodies, under a certain new Modification, or Habitudo, and exhibit their Images: or, lastly, whether in being reflected, it is likewise refracted after this or that manner; and affects the Eye with the Appearance of *Colour*.

But, agreeably to Sir I. Newton's Sentiments, Colour alone is the proper Object of Sight: Colour being that Property of Light, whereby the Light it self is *visible*; and whereby the Images of opaque Objects are painted on the *Retina*. See LIGHT, and COLOUR.

*Aristotle, de Anima, Lib. II.* enumerates five Kinds of common *Visibles*, which are usually received for such in the Schools, viz. *Motion, Rest, Number, Figure, and Magnitude*: Others maintain nine, as in the *Verses*,

*Sunt objecta novem Visus communia: Quantum, Indæ Figura, Locus, sequitur distantia, situs, Continuumque & Dilectum, motusque, quiesque.*

Authors reason very variously as to these common Objects of Vision: There are two principal Opinions among the Schoolmen. — The Adherents to the first, hold, That the common *Visibles* produce proper Representations of themselves, by some peculiar Species or Image whereby they are formally perceiv'd independently of the proper *Visibles*.

But the second Opinion prevails most, which maintains, That the common *Visibles* have not any such formal peculiar Species to become *visible* by; but that the proper Objects are sufficient to shew themselves in this or that Place or Situation; and in this or that Distance, Figure, Magnitude, &c. by the Circumstances of their conveyance to the Senfory.

In effect, since these common *Visibles* cannot be represented alone, (for who ever saw Place, Distance, Figure, Situation, &c. of it self) but are always convey'd along with the Images of Light and Colour to the Organ; what necessity is there to conceive any such proper Images, whereby the common *Visibles* should be formally perceiv'd by the Soul? 'Tis much more probable, that from the peculiar manner wherein the Senfitive Faculty perceives a proper Object, it is apprais'd of its being in this or that Situation, or Place; in this or that Figure, Magnitude, &c. How this is effected, may be conceiv'd from what follows.

1. The Situation and Place of visible Objects, are perceiv'd without any intentional Species thereof, merely by the Impulse being made from a certain Place and Situation, either above or below, on the right or left, before or behind; whereby the Rays of the proper *Visibles* are thrown upon the *Retina*, and their Impression convey'd to the Senfory.

For since an Object is seen by those Rays which carry its Image to the *Retina*, and in that Place to which the *visual Power* is directed by the Rays it receives; as it perceives the Impulse of the Rays to come from any Place, &c. it is abundantly admitt'd of the Object's being in that Place and Situation. See **PLACE**.

From this Principle, several remarkable Phenomena of Vision are accountable for; as,

1<sup>o</sup>, That if the Distance between two visible Objects, be seen under an Angle that is insensible; the distant Bodies will appear as if contiguous: Whence, a continuous Body being the Result of several contiguous ones; the Distances of several *Visible*s appearing under an insensible Angle, they will appear one continuous Body: which gives a pretty Illustration of the Notion of a *Continuum*. See **CONTINUITY**.

2<sup>o</sup>, If the Eye be placed above a horizontal Plane, the remoter Parts will appear as if higher and higher, till the last be seen in a level with the Eye. Whence it is, that the Sea, to Persons standing a-shore, seems to rise higher and higher the further they look.

3<sup>o</sup>, If any number of Objects be placed below the Eye; the most remote will appear the highest: If they be above the Eye, the most remote will appear the lowest.

4<sup>o</sup>, The upper Parts of high Objects, appear to stoop, or incline forwards; as the Fronts of Churches, Towers, &c. And Statues a-top of Buildings, to appear upright, must recline, or bend backwards. See further under the Article **HOROPTER**, &c.

II. *The Mind perceives the Distance of Visible Objects, from the different Configuration of the Eye, and the manner wherein the Rays strike the Eye and the Image is impressed thereon.*

For the Eye disposes it self differently, according to the different Distances it is to see, viz. for remote Objects, the Pupil is dilated, and the Crystalline brought nearer the *Retina*, and the whole Eye made more globous: on the contrary, for near Objects, the Pupil is contracted, the Crystalline thrust forwards, and the Eye lengthen'd. See **POUZZ**, **CRYSTALLINE**, &c.

The Distance, again, is judg'd of by the Angle the Object makes, from the distinct or confused Representation of the Object; and the Bristkness or Feebleness, the Rarity or Spikfulness of the Rays.

To this it is owing, 1<sup>o</sup>, that Objects which appear obscure or confused, are judg'd to be the more remote: a Principle which the Painters use, to make some of their Figures appear farther distant than others on the same Plane. See **PERPECTIVE**, &c.

To this it is likewise owing, that Rooms whose Walls are whiten'd, appear the smaller: That Fields cover'd with Snow, or white Flowers, show less than when clothed with Grass: That Mountains cover'd with Snow, in the Night-time, appear the nearer: That opaque Bodies, appear the more remote in the Twilight, &c. See **DISTANCE**.

III. *The Magnitude or Quantity of Visible Objects, is known chiefly by the Angle comprehended between two Rays drawn from the two Extremes of the Object, to the Centre of the Eye.* See **OPTIC ANGLE**.

An Object appears so big as is the Angle it subtends; or Bodies seen under a greater Angle appear greater; and those under a less, less, &c.—Hence, the same thing appears now bigger, and now less, as it is less or more distant from the Eye.

This we call *Apparent Magnitude*. See **MAGNITUDE**.

Now, to judge of the real Magnitude of an Object, we consider the distance: For since a near and a remote Object may appear under equal Angles, the Distance must necessarily be estimated; that if it be great, and the Optic Angle small, the remote Object may be judg'd great, and vice versa.

The Magnitude of *Visible* Objects, is brought under certain Laws, demonstrated by the Mathematicians: as,

1<sup>o</sup>, That the apparent Magnitudes of a remote Object, are as the Distances, reciprocally.

2<sup>o</sup>, That the Co-tangents of half the apparent Magnitudes of the same Objects, are as the Distances: Hence, the apparent Magnitude and Distance being given, we have a Method of determining the true Magnitude: The Canon is this, As the whole Sine is to the Tangent of half the apparent Magnitude; so is the given Distance to half the real Magnitude.—The same Canon, inverted, will from the Distance and true Magnitude given, determine the apparent one.

3<sup>o</sup>, Objects seen under the same Angle, have their Magnitudes proportional to their Distances.

4<sup>o</sup>, The Subtense AB, (Tab. *Opticks*, Fig. 51.) of any Arch of a Circle, appears of equal Magnitude in all the Points D C E G; tho' one Point be vastly nearer than another: and the Diameter D G, appears of the same Magnitude in all the Points of the Periphery of the Circle.—Hence we take a pretty Hint for the most commodious Form of Theatre. See **THEATRE**.

5<sup>o</sup>, If the Eye be fix'd in A, (Fig. 52.) and the right Line BC be moved in such manner, as that the Extremes thereof always fall on the Periphery; it will always appear of the same Magnitude.—Hence, the Eye being placed in any Angle of a regular Polygon, the Sides will appear equal.

6<sup>o</sup>, If the Magnitude of an Object directly opposite to the Eye, be equal to its distance from the Eye; the whole Object will be taken in by the Eye, but nothing more. Whence, the nearer you approach an Object, the less part you see of it. See **FLAME**.

IV. *The Figure of Visible Objects is estimated chiefly from our Opinion of the Situation of the several Parts thereof.*

This Opinion of the Situation, &c. enables the Mind to apprehend an external Object under so or that Figure; more justly than any Similitude of the Image in the *Retina* with the Object can; the Images being frequently elliptical, oblong, &c. when the Objects they exhibit to the Mind are Circles, Squares, &c.

The Laws of Vision, with regard to the Figures of the *Visible* Objects, are,

1<sup>o</sup>, That if the Centre of the Pupil be exactly against, or in the Direction of a right Line; the Line will appear as one Point.

2<sup>o</sup>, If the Eye be placed in the Direction of a Surface, so that only one Line of the Perimeter can radiate upon it; it will appear as a Line.

3<sup>o</sup>, If a Body be opposed directly towards the Eye, so as only one Plane of the Surface can radiate on it; it will appear as a Surface.

4<sup>o</sup>, A remote Arch, view'd by an Eye in the same Place, will appear as a right Line.

5<sup>o</sup>, A Sphere, view'd at a distance, appears a Circle.

6<sup>o</sup>, Angular Figures at a distance appear round.

7<sup>o</sup>, If the Eye look obliquely on the Centre of a regular Figure, or a Circle, the true Figure will not be seen; but the Circle will appear Oval, &c. See **FIGURE**.

V. *The Number of Visible Objects is perceiv'd, not only by one or more Images form'd in the Fund of the Eye; but also by such a Position of those Parts of the Brain, whence the Optic Nerves spring, as the Mind has been us'd to, in attending to a certain Place, and that either single, or manifold.*

Accordingly, when either of the Eyes, with the contiguous Part of the Brain, are forced out of their just Parallelism with the other, e. g. by pressing it with the Finger, &c. all Things appear double: But when they are in their requisite Parallelism, tho' there be two Images in the Fund of the two Eyes; yet the Object will appear single.—Again, one thing may appear double, or even manifold, not only with both Eyes, but even with only one of them open: By reason, the common Concourse of the Cones of Rays reflected from the Object to the Eye, either falls short of the *Retina*, or goes much beyond it. See **NUMBER**.

VI. *Motion and Rest are seen, when the Images of the Objects represented in the Eye, and propagated to the Brain, are either moved, or at rest: And the Mind perceives these Images either moving or at rest, by comparing the moved Image to another, with respect to which it changes place; or, by the Situation of the Eye to the Object being continually chang'd.*

So that Motion is only perceiv'd, in perceiving the Images to be in different Places and Situations: Nor are these Situations perceiv'd, unless effected in time. So that to perceive Motion, a sensible Time is requir'd.—But Rest is perceiv'd by the *visual Faculty*, from the Perception of the Image in the same Place of the *Retina*, and the same Situation for some sensible Time.

Hence, the Reason why Bodies moving exceedingly fast, appear at rest: Thus, a live Coal, swung briskly round, appears a continued Circle of Fire; the Motion not being commensurate with *visible Time*, but much swifter than the same: So that in the Time the Soul requires to judge of any Change of Situation of the Image on the *Retina*, or that it is moved from this Place to that, the Thing it self performs its whole Circuit, and is in its former Place again.

The Laws of Vision, with regard to the Motion of the *Visible*s, are,

1<sup>o</sup>, That if two Objects unequally distant from the Eye, move from it with equal Velocity; the more remote one will appear the slower: Or, if their Celerities be proportionable to their Distances, they will appear to move equally swift.

2<sup>o</sup>, If two Objects, unequally distant from the Eye, move with unequal Velocities in the same Direction; their apparent Velocities are in a Ratio compounded of the direct Ratios of their true Velocities, and the reciprocal one of their Distances from the Eye.

3<sup>d</sup>, A *visible* Object moving with any Velocity, appears to be at rest, if the Space described in the Interval of one Second, be imperceptible at the distance of the Eye.—Hence it is, that a near Object moving very slowly, as the Index of a Clock; or a remote one very swiftly, as a Star; seem at rest.

4<sup>d</sup>, An Object moving with any degree of Velocity, will appear to rest, if the Space it runs over in a Second of Time be to its distance from the Eye, as 1 to 1400: Nay, in fact, if it be as 1 to 1300.

5<sup>d</sup>, The Eye proceeding strait, from one Place to another; & a lateral Object, either on the right or left, will seem to move the contrary way.

6<sup>d</sup>, If the Eye and the Object move both the same way, only the Eye much swifter than the Object, that last will appear to go backwards.

7<sup>d</sup>, If two or more Objects move with the same Velocity, and a third remain at rest; the Moveables will appear fix'd, and the quiescent in motion the contrary way.—Thus, Clouds moving very swiftly, their Parts seem to preserve their Situation, and the Moon moves the contrary way.

If the Eye be moved with a great Velocity, lateral Objects at rest, appear to move the contrary way.—Thus, to a Person sitting in a Coach, and riding briskly thro' a Wood, the Trees seem to retire the contrary way; and to People in a Ship, &c. the Shores seem to recede.

#### VISIBLE SPECIES. See SPECIES.

VISION, the Act of *Seeing*; or of perceiving external Objects by the Organ of Sight. See SEEING, and SIGHT.

*Vision* is well defin'd to be a Sensation, whereby, from a certain Motion of the Optic Nerve, made in the bottom of the Eye, by the Rays of Light emitted, or reflected from Objects, and hence convey'd to the common Sensory in the Brain; the Mind perceives the luminous Object, its Quantity, Quality, Figure, &c. See VISIBLE.

The Phenomena of *Vision*, the Causes thereof, and the Manner wherein it is effected, make one of the greatest and most important Articles in the whole System of Natural Knowledge.—Indeed, a great Part of the Physical, Mathematical, and Anatomical Discoveries and Improvements of the Moderns terminate here; and only tend to set the Benefits of *Vision* in a clearer Light.

Hitherto, refer what Sir I. Newton and others have discover'd of the Nature of Light, and Colours; & the Laws of Inflection, Reflexion, and Refraction of the Rays; the Structure of the Eye, particularly the *Retina*, and Optic Nerves, &c.

It is not necessary we should here give a minute Detail of the Process of *Vision* from its first Principles: The greatest Part is already deliver'd under the respective Articles.—The Eye, the Organ of *Vision*, we have describ'd under the Article EYE; and its several Parts, Tunics, Humours, &c. under their proper Heads, CORNEA, CRYSTALLINE, &c.

The immediate and principal Organ of *Vision*, viz. the *Retina*, according to some, and the *Choroides*, according to others, are distinctly consider'd; as also, the Structure of the *Optic Nerve*, which conveys the Impression to the Brain; and the Texture and Disposition of the *Brain* it self, which receives them, and represents 'em to the Soul. See RETINA, CHOROIDES, OPTIC NERVE, BRAIN, SENSORY, &c.

Again, the Nature of *Light*, which is the Medium, or Vehicle whereby Objects are carried to the Eye, is laid down at large under the Article LIGHT, and COLOURS; and the chief Properties thereof concern'd in *Vision*, under REFLECTION, REFRACTION, &c. And many of its Circumstances under RAY, MEDIUM, &c.—What remains for this Article, therefore, is only to give a general Idea of the whole Process; in which all the several Parts are concern'd.

#### Opinions or Systems of VISION.

The *Platonists* and *Stoicks* held *Vision* to be effected by the Emission of Rays out of the Eyes; conceiving, that there was a sort of Light thus darted out, which with the Light of the external Air, taking, as it were, hold of the Objects, render'd 'em visible; & thus returning back again to the Eye alter'd and new modify'd by the Contact of the Object, made an Impression on the Pupil, which gave the Sensation of the Object.

The Reasons whereby they maintain their Opinion, are fetch'd, 1<sup>o</sup>, from the Brightness and Lustre of the Eye; 2<sup>o</sup>, from our seeing a remote Cloud, without seeing one which we are incomparably withal; (the Rays being suppos'd too brisk and penetrating to be stop'd by the near Cloud, but growing languid at a greater distance, are return'd to the Eye;) 3<sup>o</sup>, from our not seeing an Object laid on the Pupil: 4<sup>o</sup>, from the Eye's being weary with seeing, i. e. by emitting great Quantities of Rays: And lastly, from Animals which see in the Night; as Cats, Lions, Moles, Owls, and some Men.

The *Epicureans* held *Vision* to be perform'd by the Emanation of corporeal Species, or Images from Objects; or, a sort of Atomical Effluvia, continually flying off from the intimate Parts of Objects to the Eye.

Their chief Reasons are, 1<sup>o</sup>, That the Object must necessarily be united to the vivify Faculty; and since it is not united by it self, it must be so by some Species that represents it, and that is continually flowing from Bodies: 2<sup>o</sup>, That it frequently happens, that old Men see remote Objects better than near ones; the distance making the Species thinner, and more commensurate to the Debility of their Organ.

The *Peripateticks* hold, with *Epicurus*, that *Vision* is perform'd by the Reception of Species; but differ from him in the Circumstances: For they will have the Species, (which they call *Intentionales*) to be incorporeal.

This true, *Aristotle's* Doctrine of *Vision*, deliver'd in his Chapter de *Aspectu*, amounts to no more than this; That Objects must move some intermediate Body, that by this they may move the Organ of Sight: To which he adds, in another Place, That when we perceive Bodies, 'tis their Species, not their Matter, that we receive: as a Seal makes an Impression on Wax, without the Wax's retaining any thing of the Seal.

But this vague and obscure Account, the *Peripateticks* have thought fit to improve.—Accordingly, what their Master call'd *Species*, the Disciples understanding of real proper Species, assure, That every visible Object expresses a perfect Image of it self, in the Air contiguous to it; and this Image another, somewhat less, in the next Air; and the third another, &c. till the last Image arrives at the Crystalline, which they hold for the chief Organ of Sight, or that which immediately moves the Soul.—These Images they call'd *Intentional Species*. See SPECIES.

The modern Philosophers, as the *Cartesians* and *Newtonians*, give a better Account of *Vision*.—They all agree, that it is perform'd by Rays of Light reflected from the several Points of Objects, received in at the Pupil, refracted and collected in their passage thro' the Crnats and Humours, to the *Retina*; and thus striking, or making an Impression on so many Points thereof: which Impression is convey'd by the correspondent Capillaments of the Optic Nerve to the Brain, &c.

As for the *Peripatetick Series* or Chain of Images, 'tis a mere Chimera, and *Aristotle's* meaning is better understood without than with 'em.—In effect, letting these aside, the *Aristotelian*, *Cartesian*, and *Newtonian* Doctrines of *Vision* are very consistent: For Sir I. Newton imagines, that *Vision* is perform'd chiefly by the Vibrations of a fine Medium which penetrates all Bodies, excited in the bottom of the Eye by the Rays of Light; and propagated thro' the Capillaments of the Optic Nerves, to the *Sensorium*. And *Des Cartes* maintains, that the Sun pressing the *Materia Subtilis*, wherewith the World is fill'd, every way; the Vibrations or Pulses of that Matter reflected from Objects, are communicated to the Eye, and thence to the Sensory: So that the Action or Vibration of a Medium is equally suppos'd in all. See MEDIUM.

#### Modern Theory of VISION.

In order to *Vision*, we are certain, it is required that the Rays of Light be sent from the visible Objects to the Eye.—What befalls them in the Eye, will be conceiv'd from what follows.

Suppose, e. g. Z the Eye, and ABC the Object, (Tab. *Opticks*, Fig. 53.) Now, the every Point of an Object be a radiant Point, that is, tho' there be Rays reflected from every Point of the Object to every Point of the circumambient Space; each carrying with it its respective Colour, (which we folly imagine to be those of the Object;) yet, as only those Rays which pass thro' the Pupil of the Eye affect the Sense, we shall here consider none else.

And, again, tho' there be a great number of Rays passing from one radiant Point, as B, thro' the Pupil, yet we shall only consider the Action of a few of 'em; as BD, BE, BF.

Now then, the Ray BD, falling perpendicularly on the Surface EDF, will pass out of the Air into the aqueous Humour, without any Refraction, and proceed right to H; where falling perpendicularly on the Surface of the crystalline Humour, it will go on without any Refraction to M; where, again, falling perpendicularly on the Surface of the vitreous Humour, it will proceed strait to the Point O, in the Fund or bottom of the Eye.

Again, the Ray BE passing obliquely out of Air upon the Surface of the watery Humour EDF, will be refracted, and approach towards the perpendicular EP: Thus, proceeding to the Point G, in the Surface of the Crystalline, it will be there refracted still nearer to the Perpendicular.—So also EG, falling obliquely out of Air into a harder Body, will be refracted towards the Perpendicular GR; and falling on the Point L of the Surface of the vitreous Humour, it will still be brought nearer to M.

Lastly, GL, falling obliquely out of a denser, upon the Surface of a rarer Body LMN, will be refracted, and recede from the Perpendicular LT; in receding from which, it is evident it approaches towards the Ray BDO, and may be so refracted, as to meet the other in O.—In like manner, the Ray BF being refracted in B, will turn to I, and

and thence to N, and thence to the others in O.—But the Rays between BE and BF, being somewhat less refracted, will not meet precisely in the same Point O.

Thus will the radiant Point B affect the Fund of the Eye, in the same manner as if the Pupil had had no breadth, or as if the Radiant it self had only emitted one single Ray, such as were equal in Power to all those between BE and BF.

In like manner, the Rays proceeding from the Point A, will be so refracted in passing thro' the Humours of the Eye, as to meet near the Point X: And the Rays from any intermediate Point between A and B, will nearly meet in some other Point in the Fund of the Eye, between X and O.

Upon the whole, it may be asserted universally, that every Point of an Object affects only one Point in the Fund of the Eye; and on the contrary, that every Point in the Fund of the Eye, only receives Rays from one Point of the Object.—This is not to be understood in the utmost rigour. See RADIANT.

Now, if the Object recede from the Eye, in such manner as that the radiant Point B does not decline from the Line BD; the Rays which would proceed from B not enough divaricated, would be so refracted in passing the three Surfaces, as that they would meet ere they reach'd the Point O: On the contrary, if the Object should be brought nearer the Eye, the Rays passing from the Point B to the Pupil, too much divaricated, would be refracted so, as not to meet till beyond the Point O. Nay, the Object may be so near, that the Rays proceeding from any Point may be so divaricated, as that they shall never meet at all.—In all which Cases, there would be no Point of the Object but would move a pretty large Portion of the Fund of the Eye; and thus the Action of each Point would be confounded with that of the contiguous one.

And this would commonly be the Case, but that Nature has provided against it; either by contriving the Eye so as its Bulb may be lengthen'd, or shorten'd, as Objects may be more or less distant; or, as others will have it, so as that the Crystalline may be made more convex or more flat; or, according to others, so as that the distance between the Crystalline and the Retina may be lengthen'd or shorten'd.

The first Expedient is the most probable; on the footing of which, when we direct our Eyes to an Object so remote as that it can't be distinctly view'd by the Eye in its accustomed Figure, the Eye is drawn back into a flatter Figure, by the Contraction of four Muscles; by which means, the Retina becoming nearer the crystalline Humour, receives the Rays sooner; and when we view an Object too near, the Eye being compress'd by the two oblique Muscles, is render'd more globular; by which means, the Retina being set further off from the Crystalline, does not receive the Rays of any Point before they meet.

It may be here added, that this access and recess of the Crystalline, is so necessary to Vision, that whereas in some Birds the Coats of the Eye are of such a bony consistence, that Muscles would not have been able to contract and distend 'em; Nature has taken other means, by binding the Crystalline down to the Retina, with a kind of blackish Threads, not found in the Eyes of other Animals.—Nor must it be omitted, that of the three Refractions above mention'd, the first is wanting in Fishes; and that to remedy this, their Crystalline is not lenticular, as in other Animals, but globular. Lastly, since the Eyes of old People are generally worn flatter than those of young ones; so that the Rays from any Point fall on the Retina ere they become collected into one; they must exhibit the Object somewhat confusely: nor can such Eyes see any but remote Objects distinctly. See PRESBYTIA.

In others, whose Eyes are too globular, the Case is just the reverse. See MYOPIA.

From what has been shewn, that every Point of an Object moves only one Point of the bottom of the Eye; and, on the contrary, that every Point in the Fund of the Eye, only receives Rays from one Point of the Object; 'tis easy to conceive, that the whole Object moves a certain Part of the Retina; that in this part there is a distinct and vivid Collection of all the Rays receiv'd in at the Pupil; and that as each Ray carries its proper Colour along with it, there are as many Points painted in the Fund of the Eye, as there were Points visible in the Object.—Thus is there a Species or Picture on the Retina, exactly like the Object; all the difference between 'em, is, that a Body is here represented by a Surface; a Surface frequently by a Line, and a Line by a Point: that the Image is inverted, the right hand answering to the left of the Object, &c. and that 'tis exceedingly small, and still the more so, as the Object is more remote. See VISIBILIA.

What we have shewn under other Articles, of the Nature of Light, and Colours, readily accounts for this painting of the Object on the Retina.—The matter of Fact is proved by an easy Experiment, first try'd by Des Cartes; thus: The Windows of a Chamber being shut, and Light only

admitted at one little Aperture; so that Aperture apply the Eye of some Animal newly kill'd, having first dextrously pall'd off the Membranes that cover the bottom of the vitreous Humour, viz. the hind Part of the Sclerotics, Choroides, and even part of the Retina; then will the Images of all the Objects without Doors be seen distinctly painted on any white Body, as on an Egg-shell, that the Eye is laid upon.—The same thing is better shewn by an Artificial Eye, or a Camera Obscura. See EYES, and CAMERA OBSCURA.

The Images of Objects, then, are represented on the Retina; which is only an Expansion of the fine Capillaments of the Optic Nerve, and from which the Optic Nerve is continu'd into the Brain.—Now, any Motion or Vibration impress'd on one extreme of the Nerve, will be propagated to the other: Hence, the Impulse of the several Rays sent from the several Points of the Object, will be propagated as they are on the Retina, (i. e. in their proper Colours, &c. or in particular Vibrations or manners of Pressure, corresponding thereto) to the Place where those Capillaments are interwoven into the Substance of the Brain.—And thus is Vision brought to the common Cafe of Sensation.

For such, we know, is the Law of the Union between the Soul and Body; that certain Perceptions of the first, do necessarily follow certain Motions of the last: But the different Parts of the Object do separately move different Parts of the Fund of the Eye; and those Motions are propagated to the Sensory: it follows, therefore, that there must arise so many distinct Sensations at the same time. See SENSATION.

Hence, 1<sup>o</sup>, we easily conceive, that the Perception, or Image in the Mind, must be the clearer, and more vivid, the more Rays the Eye receives from the Object: Consequently, the largeness of the Pupil will have some share in the clearness of Vision. See PUPIL.

2<sup>o</sup>, Considering only one radiant Point of an Object, we may say, that that Point would move the Sense more weakly, or be seen more obscurely, as it is more remote; by reason the Rays coming from any Point, like all Qualities propagated in Orbs, are always diverging; and therefore the more remote, the fewer of 'em will be receiv'd in at the Pupil.—But, as 'tis not a single Point of an Object, but all of them together, that affect the Organ of Sense; and as the Image of the Object still possesses a less part of the Retina as 'tis more remote; therefore, tho' the Rays that flow from any Point of an Object two Miles off, into the Pupil, be rarer or fewer by half than those flowing from the same Point at a Mile's distance; yet the same Capillament of the Optic Nerve, which in the latter Cafe would only be mov'd by that one Point, in the former, will be affected with the joint Action of the neighbouring Points; and therefore the Image be as clear as in the other Cafe.—Add, that the Pupil dilating it self more, as the Object is more remote, takes in more Rays than it would otherwise do.

3<sup>o</sup>, The Distinctness of Vision is somewhat concern'd in the Size of the Image exhibited in the Fund of the Eye.—For there should be, at least, as many Extremes of Capillaments, or Fibres of the Optic Nerve in the Space that Image possesses, as there are Particles in the Object that sends Rays into the Pupil: otherwise, every Particle will not move its separate Capillament: And if the Rays from two Points fall on the same Capillament, 'twill be the same as if only one Point had fell there; since the same Capillament cannot be differently mov'd at the same time.—And hence it is, that the Images of very remote Objects being very small, they appear confus'd, several Points of the Image affecting each Capillament: And hence also, if the Object be of different Colours, several Particles affecting the same Capillament at the same time, only the brightest and most lucid will be perceiv'd: Thus, a Field furnish'd with a good number of white Flowers among a much greater quantity of green Grass, &c. at a distance appears all white.

Our seeing of Objects single, tho' with two Eyes, in each of which is a several Image, or Picture; and our seeing of 'em erect, whereas the Picture is inverted; are two great Phenomena in Vision: which see consider'd under the Article SIGHT.

For the Manner of seeing and judging of the Distance and Magnitude of Objects. See DISTANCE, and MAGNITUDE.

VISION, in Opticks.—The Laws of Vision, brought under Mathematical Demonstrations, make the Subject of OPTICKS, taken in the greatest Latitude of that Word: For among the Writers of Mathematicks, Opticks is generally taken, in a more restrain'd Signification, for the Doctrine of Direct Vision; CATOPTRICKS, for the Doctrine of Reflected Vision; and DIOPTRICKS, for that of Refracted Vision. See OPTICKS, CATOPTRICKS, and DIOPTRICKS.

Direct, or Simple VISION, is that perform'd by means of direct Rays; that is, of Rays passing directly, or in right Lines, from the radiant Point to the Eye. See DIRECT.

Such is that explain'd in the preceding Article VISION, see also RAY.

Reflected VISION, is that perform'd by Rays reflected from Specula, or Mirrors. See REFLEXION.

*The Lenses hereof, see under REFLECTION, and MIRROR.*  
*Refracted VISION, is that perform'd by means of RAYS refracted, or turn'd out of their way, by passing thro' Media of different density; chiefly thro' Glasses and Lenses.*  
*The Lenses of this, see under the Articles REFRACTION, LENS, &c.*

**VISION, among Divines, is used for an Appearance which God occasionally sent his Prophets and Saints; either by way of Dream, or in reality. See PROPHECY, REVELATION, &c.**

Such were the *Visions of Ezekiel, Amos, &c. the Vision of St. Paul, lifted up to the third Heaven, &c. of Joseph, by which he was assur'd of the Purity of the Virgin, &c.*

Many among the *Romish* Saints still pretend to *Visions: the Revelations of S. Bridget* are so many *Visions*.

Hence the Word has come into disrepute, and become a common Name for all Chimeras, or Spectres, which either our own Folly or Fear possesses us with: And hence, a Person that frames to himself wild romantic Notions, is called a *Visionary*.

*Quevedo's Visions, are Descriptions of what pass'd in the Imagination of that Author.*

The *Beatific Vision, is the Act* whereby the Angels and blessed Spirits see God in Paradise. See **BEATIFIC.**

**VISIR, or VIZIER, or VIZIR, an Officer or Dignitary in the Ottoman Empire.**

There are two Kinds of *Vizirs, the first* called by the *Turks, Vizir Azeem, that is Grand Vizir, is first* created in 1370, by *Ammarab I. in order* to ease himself of the chief and weighty Affairs of the Government.

The *Grand or Prime Vizir, is the first* Minister of State in the whole Empire.—He commands the Army in chief, and presides at the Divan, or great Council.—Renegade Christians, have been frequently rais'd to the *Vizirate: Such were Khairadain, Ulug Ali, &c.*

Next to the *Grand Vizir are six* other subordinate *Vizirs, call'd Vizirs of the Bench, who officiate as Counsellors or Assessors in the Divan. See DIVAN.*

**VISITATION, an Act of Jurisdiction, whereby a Superior, or proper Officer, visits some Corporation, College, Church, or other publick or private House, to see that the Regulations thereof be duly observ'd.**

Among us, the Bishop of each Diocese is oblig'd to hold a *Visitation* every three Year, and the Archdeacon every Year; to see that the Discipline be well observ'd, the People well instructed, and take care that neither the Church, nor the Pastors thereof receive any detriment. See **BISHOP, ARCHDEACON, &c.**

Antiently, the *Regarder's Office* was express'd to be the *Visitation of Manners. See REGARDER.*

The Lawyers hold it a Branch of the King's Prerogative, to *visit* the Universities; to inquire into the Statutes, and Observation of them; to expel Delinquents, &c. But some of the Colleges disallow this Privilege; and plead themselves, by Royal Charters, exempt from all Civil and Royal *Visitations. See UNIVERSITY.*

Among the *Romanists, the General* of each Religious Order, is oblig'd to *visit* the several Monasteries of the Order. See **GENERAL, and ORDER.**

In Abbeys that are Chiefs of their Orders, there are particular Officers, call'd *Visitors; who are* dispatch'd into all the Houses and Congregations depending on them, to see that the regular Discipline is observ'd.

In *Spain, there is a Visitor and Inquisitor General.—The Visitation of the Cloister* belongs to the Ordinary.—At *Paris, the Parliament visits* the several Prisons and Prisoners four times a Year.

In a Moral and Religious Sense, *Visitation* is also used for the Afflictions that befall Mankind; as coming from the Hand of God, to try or prove them.—In this Sense, the last Plague among us is frequently call'd the *Visitation*.

**VISIVE, in the School Philosophy, a Term** applied to the Power of Seeing. See **SEEING.**

Authors are exceedingly divided about the Place where the *Fifth Faculty* resides: Some will have it in the *Retina; others* in the *Choroides; others* in the *Optic Nerve; others, as Sir I. Newton, in the Place* where the *Optic Nerves* meet, before they come to the Brain; and others in the Brain itself. See **SIGHT, and SENSORY.**

**VISNE, in Law, a neighbouring Place, or Place** near at hand. See **VENUE.**

**VISUAL, something** belonging to the Sight, or Seeing. See **SIGHT, and SEEING.**

**VISUAL Rays, are Lines of Light, imagin'd** to come from the Object to the Eye. See **RAY.**

All the Observations of Astronomers and Geometers, are perform'd by means of the *Visual Rays, receiv'd* in at the *Sights, or Pinnule of Alhidades, &c. See OBSERVATION, SIGHT, QUADRANT, LEVELLING, &c.*

**VISUAL Point, in Perspective, is a Point** in the horizontal Line, wherein the ocular Rays unite. See **POINT.**

Thus, a Person standing in a straight long Gallery, and looking forwards, the Sides, Floor, and Ceiling seem to meet,

and touch one another in a Point, or common Centre.

**VITA, Life, is a very ambiguous Term: For** both God and Man, and a Soul, and an Animal, and a Plant, are said to live: yet there is not any thing common to all these, beside a kind of active Existence, which, however, is very different. See **ANIMAL, VEGETABLE, &c.**

Life, then, in the general, expresses a kind of active, operative Existence; and is therefore conceiv'd to consist in Motion.—But, particularly,

**VITA Corporis, the Life of a Body, consists** in an uninterrupted Motion therein.—A Body, therefore, said to be living, must consist of various Parts or Members, both internal and external, so fram'd and put together, as to constitute one Whole. And these Members must be mov'd and warm'd by some fluid Substance, permeating the whole Frame; by which Heat and Motion, the vital Functions are to be perform'd.—Such are Nutrition, Generation, Local Motion, &c. See **BLOOD, CIRCULATION, &c.**

**VITA Mentis, the Life of a Mind, is held by the Cartesianists** to consist in a perpetual Cogitation, or uninterrupted Course of Thinking; which seems likewise to have been *Aristotle's* meaning, when he call'd the Soul *ἰσχυρός*; which his Interpreters call *Actus*: Thinking being the only proper Act of the Mind. See **ENTELECHIA.**

But Mr. *Lock* endeavours to refute this Principle. See **THINKING.**

**VITA Hominis, Life of a Man, consists** in a continued Communication of Body and Mind; or in Operations to which both the Motions of the Body, and Ideas of the Mind, contribute.

Thus, e.g. the Mind now thinking of something, on occasion of that Thought, there arises a certain Motion in the Body: And now, again, the Body moves first, which Motion is follow'd by some Thought of the Mind.

In such alternate or reciprocal Operation does the Life of Man consist; consider'd as he is a Compound of Body and Mind. See **SENSATION, MOTION, &c.**

**VITAL, in Anatomy, something** that ministers principally to the constituting or maintaining of Life in the Bodies of Animals.

Thus, the Heart, Lungs, and Brain, are called *Vital Parts. See PART.*

**VITAL Functions, or Actions, are those** Actions of the *Vital Parts, whereby* Life is effected; so as that it can't subsist without 'em.—Such are the muscular Action of the Heart; the secretory Action of the *Cerebellum*; the respiratory Action of the Lungs; the Circulation of the Blood and Spirits, thro' the Arteries, Veins, and Nerves. See **FUNCTION.**

**VITAL Spirits, are the finest** and most volatile Parts of the Blood. See **SPIRITS.**

**VITELLIANI, in Antiquity, a kind of Tablet** or Pocket-Book, wherein People antiently used to write down their ingenious, humorous, and wanton Fancies and Impertinencies: The same as what in *English* we may call a *Trifle-Book. See Martial, Lib. XIV. Epig. viii.*

Some will have them to take their Name from *Vitellius, a* Yolk of an Egg; by reason, the Leaves were rubb'd therewith: Others derive it from one *Vitellius* their Inventor.

**VITRIFICATION, or VITRIFICATION, the Act** of converting a Body into Glass, by Fire. See **GLASS.**

Of all Bodies, Fern-ashes, Sand, Bricks, and Pebbles, vitrify the most easily. Accordingly, it is of the first of these that Glass is principally made.

Gold, held by *M. Homberg* near the *Focus* of the Duke of *Orleans's* large, burning, concave Mirror, at first smok'd, then chang'd, all of it that did not go off in Fumes, into Glass, of a deep violet Colour.—The Glass of Gold weighs less than Gold. *Memoirs of the French Academy, 1702. See GOLD.*

All Metals, and even almost all Natural Bodies, sufficiently heated, vitrify: And this *Vitrification* is the last Effect of the Fire; after which the most intense heat of the largest Burning-Glass, will make no further Alteration. See **BURNING-GLASS, MIRROR, and FIRE.**

*Vitrification, some Authors* will have to be chiefly effected by the Salts uniting and incorporating with the metalline Particles. See **CALCINATION.**

But, according to *M. Homberg, all Vitrification* results from the Earth, which being expos'd to a violent Fire, and intimately penetrated by some other Dissolvent, commences Glass.—Thus, supposing the Principle of Gold to be Mercury, a metallick Sulphur, and an Earth; the *Vitrification* of Gold is easily conceived: the Mercury, being volatile, exhales in Smoke, and leaves behind it the Earth and Sulphur, which are fix'd; the Sulphur dissolves the Earth and vitrifies it.

**VITRIOL, in Natural History, a kind of Fossil, or mineral Salt, chiefly** found in Copper-Mines. See **SALT, and COPPER.**

*Vitriol* is more properly rank'd among the Class of *Semi-metals*, as having a metallic Matter mix'd or combin'd with its Salt. See SEMI-METAL.

*Vitriol* is defined by *Boerhaave*, a saline, metallic, transparent Gleebe; dissoluble in Water, and fusible and calcinable by Fire.

It acquires different Names, according to the different Places where it is dug; and the *Vitriols* of those also, differ from each other in Denomination and Colour, some being *White*, others *Blue*, and others *Green*.

*Roman Vitriol*, for Instance, is *White*; that of *Cyprus*, *Blue*; and that of *Pisa* and *Germany*, *greenish*.

*White Vitriol* partakes but little of any Metal, *Blue* partakes of Copper, and *Green* of Iron. See IRON, &c.

Monfieur *Geoffroy*, the elder, observes, that they all consist of an acid Salt, like that found in *Alum* and *Sulphur*; excepting that in *Alum*, the Acid is mix'd with an absorbent Earth, or Calx: in *Sulphur* it is united with certain fat, bituminous Parts; and in *Vitriols*, with metallic Parts.

According to *Boerhaave*, *Vitriols* consist of a metallic Part with a Sulphur adhering, a menstruous Acid, and Water.

In *Blue Vitriol*, the Metal, wherewith the Acid, &c. is join'd, is Copper. See VENUS.

In *White Vitriol*, commonly call'd *White Coppers*, it is mix'd with *Lapis Calaminaris*, or some ferruginous Earth, intermix'd with Lead or Tin. See COPPERAS.

In *Green Vitriol*, the Acid is join'd with Iron. See MARS.

The Antients give the Name *Chalcitis*, or *Chalcite*, to native *Vitriol*; or that which acquires its full Perfection in the Entrails of the Earth, and which is a kind of mineral Stone, of a reddish Colour.—Of this they observ'd three different States, or Transformations: *Chalcitis*, in its first State, they call'd *Mist*; this afterwards turn'd into *Melanteria*, and that into *Seri*. See CHALCITIS.

The Moderns take this *Chalcitis* to be the same with the *Colcothar* brought from *Sweden* and *Germany*, the best wherof is of a brownish-Red Colour, and a vitriolic Taste, and dissolves easily in Water; and when broke, is of the Colour of shining Copper. See COLCOTHAR.

All the other *Vitriols* above-mention'd, are really factitious, being only a kind of Crystals, drawn, by means of Water, from a sort of Marcasite ordinarily found in Mines, and call'd, by Naturalists, *Pyrites*, or *Quis*. See PYRITES.

*Roman Vitriol* is made by exposing these *Pyrites* to the Air, till such time as they calcine, and change into a greenish acid, vitriolic Calx, or Dust; in such State they are thrown into the Water, and are afterwards, by boiling and evaporation, reduced into that kind of Crystals sent us from *Italy*.

All the other *Vitriols* are made after the same manner, that is, much after the same manner as *Alum* is made in *England*, or Salt-petre in *France*. See ALUM, and SALT-PETRE.

For *Green Vitriol*, they add a great number of pieces of Iron to the Liqueur in the boiling; these raise a great Effulgence. As soon as the Iron is dissolved, they evaporate the Dissolution to a certain Degree; and so let it crystallize.—The Crystals being form'd, there remains a thick, reddish, unctuous Syptic, and astringent Liqueur, which Monfieur *Geoffroy* calls *Eau-mere* de *Vitriol*, as containing all the Principles of the Mineral, tho' dis-united.

The Powder of this *Vitriol* is exceeding styptic, and excellent for the cure of Wounds, and the stopping of Blood.—Its Effects this Way, have been rais'd by the knavery of some, and the credulity of others, to a kind of Miracle; it being this that makes the Basis of the famous *Sympathetic Powder*. See SYMPATHETIC.

The medicinal Virtues of *Vitriol* are very great; but all owing to the Iron, or other metallic Parts mix'd with it, and therefore follow the kind of Metal.

Thus, those of *Green Vitriol* depend on the stypticity or astringency of Iron, or Mars. See MARS, &c.

The *Eau-mere* drawn from *Green Vitriol*, Monfieur *Geoffroy* observes, does not differ any way, essentially, from a great Number of Preparations which the Chymists have given us of *Vitriol*, *Iron*, and the *Lapis Haematites*: As the fix'd and anodyne Sulphurs of *Vitriol* or *Mars*; Arcana, and Magisteries of *Vitriol*; Tinctures, &c. of *Vitriol*, *Mars*, &c. The common Basis of all which is Iron exceedingly subtilized and attenuated. See IRON.

A Solution of *Vitriol* mix'd with a Tincture of Galls, becomes instantly exceeding Black: and 'tis this is the common Writing-ink. See INK.

Monfieur *Lemery*, the younger, has a pretty Hypothesis to account for this Blackness: he imagines, that as the *Vitriol* wherof Ink is made, is Iron dissolved by an Acid, and intimately mix'd therewith; and as Gall is an Alkali, or Absorbent, this Alkali meeting the Acids which hold the Iron dissolved, unites with them, and makes them let the Iron loose, which thereupon revivifies, and resumes its natural Blackness. So that in strictness, 'tis Iron we write withal.

This System is confirm'd hence: that of the five sorts of *Vitriol*, that of *Cyprus* or *Hungary* is the only one whose

Base is Copper; that of the rest is Iron: and accordingly they all serve to make Ink withal, excepting that.

*Vitriol* also enters the Composition of *Aquafortis*. See AQUAFORTIS.

What we call *Calcanthum* is only *Vitriol* rubified, and is not the same with *Colcothar*, as some have imagined. See CALCANTHUM.

Some take the Word *Vitriolum* to be used, quasi vitri oleum, because of its shining Colour; but *Meyerg* rather derives its Name, a *virreo colore*: the *Latins* call it, *Astramentum*; and the *Greeks*, *Calcanthum*.

Some Naturalists hold *Vitriol* to be the Root, or Matrix of Copper; because in the Copper-Mines they never dig deeper than the Gleebe out of which the *Vitriol* is drawn.

*Vitriol* affords several Chymical Preparations, as—*Spirits of Vitriol*, procur'd by first Calcining, then Distilling it.—*Oil of Vitriol*, which comes out after the *Spirit*, by heightning the Fire wherewith that had been rais'd.—What remains after both, is the *Colcothar of Vitriol*.

*Tartar of Vitriol* is had by making *Oil of Vitriol* with *Oil of Tartar per deliquium*; a Salt precipitating to the bottom, which being set to exhale and crystallize, is the *Tartar of Vitriol*. See TARTAR.

From the *Colcothar of Vitriol* is prepared the *Eas Venenis*. See ENX VENENIS.

*Metallic VITRIOLS*: All Metals, it is to be observ'd, may be converted into *Vitriols*, by dissolving 'em with acid *Spirits*, and letting 'em stand; tho' 'tis very difficult to obtain *Vitriol* of Gold or Silver, by reason these Metals are not easily dissolved by the *Spirit*; but *Vitriols* of Iron and Copper are easily had.

*VITRIOL of Mars*, is a Preparation made by dissolving Iron, or Steel, in a proper acid Menstruum, then evaporating or drawing off the Moisture, and bringing the Matter to crystallize, viz. by setting it in a cool place. See MARS.

It is also call'd *Salt of Steel*. See STEEL.

*VITRIOL of Luna*, or the *Moon*, is the Body of Silver chymically opened, and reduced into the Form of Salt by the sharp Points of *Spirit of Nitro*. See LUNA, and SILVER.

*VITRIOL of Venus*, is a Preparation made by a solution of Copper in the *Spirit of Nitro*, evaporated and crystallized; to gain the Salt; call'd also *Vitriol of Copper*. See COPPER, &c.

These factitious *Vitriols* being only Metals dissolved and crystallized in saline Menstruums, are frequently call'd, by way of distinction, *Metallic Vitriols*, and *Metallic Salts*.

*VITRIOLATED*, among Chemists, turned into *Vitriol*, or having *Vitriol* infused in it.

*Tartar Vitriolated*. See TARTARUM VITRIOLATUM.

*VITRIOLIC*, something that has the Quality of *Vitriol*, or partakes of the Nature of *Vitriol*.

In this Sense we say, a *Vitriolic Spring*, *Vitriolic Stones*, *Vitriolic Spirits*, &c.

If Iron be thrown into a *Vitriolic Water*, and the red Rust arising on the Surface of the Iron be melted down, it will be found real Copper; which is an Instance of the Transmutation of one Body into another. See TRANSMUTATION.

*VITRIOUS Humour*, in Anatomy, is the third Humour of the Eye, call'd *Vitrious*, i. e. glassy, from its resemblance to melted Glass. See HUMOUR.

It lies under the Crystalline; by the Impression of which, its fore-part is rendered concave. See CRYSTALLINE, and EYE.

For the Office of the *Vitrious Humour*, see VISION.

Some Authors call the Coats or Membranes that contain this Humour, the *Vitrious Tunics*.

*VITTA*, among Anatomists, a *Fillet* or *Head-band*; is used for that part of the *Amnion* which sticks to the Infant's Head when it is just born. See AMNION.

*VITUS's Dance*, in Medicine. See CHORAE SANCTI VITI.

*VIVA Pecunia*, was anciently used for live Cattle. See PECUNIA.

*VIVA Voce*, q. d. by Word of Mouth. See DEPOSITION.

*VIVARY*, in our Law Books, is sometimes used for a Park, Warren, or Fish-pond, wher'in living Creatures are kept, &c. See PARK, WARREN.

*VIVIFICATION*, in Medicine, the Art of *Vivifying*, that is, of contributing to the Action that gives Life, or maintains Life. See LIFE.

The Chymists also use the Word in speaking of the new Force, Vigour, and Lustre which by this Art they give to natural Bodies, particularly to Mercury; which after having been fix'd or amalgamated, they restore to its first State. See REVIVIFICATION.

*VIVIPAROUS*, in Natural History, an Epithet applied to such Animals as bring forth their Young alive, and perfect: in contradistinction to such as lay Eggs; which are call'd, *Oviparous Animals*. See ANIMAL, OVIPEAROUS, and EGG.

*Vipers* are distinguished from Snakes, in that the latter lay Eggs in Dunghills, to be hatch'd by the Warmth thereof; but the former are *Viviparous*, that is, lay their Eggs

within their Bellies, and bring forth live Vipers. See **VIPER**.

In the *Philosophical Transactions*, we have an Account of a *Viviparous Fly*, of the *Oestrus* or Gad-kind.—Dr. Lister tells us he open'd several Females of this Class, and found, in each, two Bags of live white Worms. The like is hinted by *Aldrovandus*.

Dr. Lister suspects, that all of this Tribe are, in some measure, *Viviparous*. See **INSECTS**.

**VIVO**, in Architecture, the Shaft, or Fust of a Column. See **SHAFT**, and **COLUMN**.

The Term is also us'd in a more particular Sense, for the Naked of a Column, or other Part. See **NAKED**.

**VIZARD**, or **VIZOR**. See **MASK**.

**VIZOR**, or **VIZARD**, in Heraldry. See **GARDE-VISURE**.

**ULCER**, **ULCUS**, in Medicine, a Solution or Discontinuity of Texture, or a loss of Substance in the fleshy Parts of the Body, proceeding from an internal Cause. See **SOLUTION**.

*Galen* defines it an inveterate Erosion of the soft Parts of the Body, by which, instead of Blood, they are brought to yield a kind of Pus, or *Sanies*; which prevents the Consolidation.

*Emulius* defines an *Ulcer*, a Solution of Continuity from some corrosive Sharpness or Acidity, that takes away from the Parts, and turns the proper Nourishment of the Body into a sanious Matter.—A like Solution of Continuity happening in a bony Part, is call'd a *Caries*. See **CARIES**.

*Galen* commonly uses the Words *Ulcer* and *Wound*, indifferently; but the *Arabs*, and the *Moderns* after them, distinguish between the two. See **WOUND**.

Spontaneous *Ulcers*, are generally supposed to proceed from Acrimony, or a corrosive Disposition of the Humours of the Body, whether brought on by Poisons, the venereal Taint, or other Causes.

*Ulcers* are divided into *simple*, and *complicated*: They are again divided, with regard to their Circumstances, into *Putrid*, or *Sordid*, wherein the Flesh all around is corrupted and fetid; *Verminous*, where the Matter being thick, does not flow away, but generates Worms, &c. *Virulent*, which instead of Pus, or *Sanies*, yield a malignant *Virus*, &c.

They are again distinguish'd, with regard to their Form, into *Sinuous*, *Fistulous*, *Varicous*, *Caries*, &c.

When an *Ulcer* happens in a good Constitution, and proves easy of Cure, 'tis said to be *Simple*.

When attended with other concurring Symptoms, as a *Cachymic* Habit, which greatly retards or obstructs the Cure, it is call'd a *Compound Ulcer*.

A *Simple Ulcer* is attended with no other Sign than that of Erosion; but *Compound Ulcers*, happening in a Scorbutic, Dropsical, or Scrophulous Constitution, may be attended with Pain, a Fever, Convulsions, a large and emaciating Discharge of Matter, Inflammation and Swelling of the Part, Callosity of the Lips, a *Caries* of the Bones, &c.

A *Putrid* or *Sordid Ulcer*, is that whose Sides are lined with a tough, viscid Humour, and is also attended with Heat, Pain, Inflammation, and a large Flux of Humours to the Part: With time the *Sordes* increase and change Colour, the *Ulcer* corrupts, its Matter grows fetid, and sometimes the Part gangrenates.—*Putrid Fevers* often give rise to this kind of *Ulcer*.

A *Phagedenic Ulcer*, is an *Ulcer* of a corrosive Nature, eating away the adjacent Parts all a-round; the Lips thereof remaining tumefied. When this kind of *Ulcer* casts deep, and spreads wide, without being attended with a Tumour, but putrifies and grows foul and fetid, 'tis call'd *Noma*; and both, on account of the Difficulty wherewith they heal, are also termed *Dyspulpata*.

*Varicous Ulcers*, are such as being seated in the Veins, and becoming painful and inflammatory, swell up the Part they possess.—These, when recent, being occasion'd by the Use of Corrosives, or proceeding from a ruptured Varix, are often attended with an Hemorrhage.—The Veins adjacent to the *Ulcers* are, in this case preter-naturally distended, and may sometimes be felt interwoven together, like network, about the Part.

*Sinuous Ulcers*, are such as run a-flant or side-ways from their Orifice, and may be known either by searching with the Probe, Wax-Candle, &c. or the Quantity of Matter they discharge in proportion to their apparent magnitude.—These sometimes lie deep, and have several Turnings: they are distinguish'd from *Fistulas* only by their want of Callosity, except in the very Orifice.

*Fistulous Ulcers*, are such as are sinuous, or winding, and attended with great Callosity, and discharge a thin, icrous, and ferid Matter.

Old *Ulcers* are rarely cured without the Use of Internals, which are to be such as absorb and destroy the Acidity; Scurficks especially, Decoctions of the Woods, Arimoniales, Viperines, and Volatiles; but above all things Vomitorics often repeated: In the most obstinate *Ulcers*, mercurial Salivation is often required; Old *Ulcers* are frequently incurable without making an Issue in the opposite Part.

The Cure of simple, shallow *Ulcers*, is commonly affected by applying a Pledgeg armed with *Limentum arcei*, or *Bastlic*, flat, to the Part, a Plaister of *Diachyl. simp.* or *de Minis*, being laid over it, and repeating the dressing once a-day, or seldomer.

If only the Cuticula be lost or eat away, nothing more than a little *Unguent. de Succatu. Rab.* or *Diapomphol.* &c. spread thin upon Lincn, need be applied.

If spongy Flesh should grow up, in either case it may be kept down with a little *Roman Vitriol*, &c. as in case of healing up the *Simple Ulcers* made by the breaking of the common Tumors.

Evacuations are indispensibly necessary in the Cure of *Ulcers* of the compound kind, where the Constitution will admit thereof.

If the *Ulcer* be fistulous, sinuous, cancerous, &c. and the Matter fetid, thin, or sanious, it is found proper to join Calomel with the Purgatives, or to give it in small Doses, between the Reperitions thereof, so as not to salivate.

Besides the Use of evacuating Medicines, it will here also be proper to order a Course of Diet-drink, made with the Sadorick Woods, especially where the *Ulcer* is suspected to be Venereal.—In the mean time proper Dressings are to be used.

When the *Ulcer* obstinately resists this Treatment, a Salivation is generally proposed, and seldom fails to promote the Cure, tho' all other Remedies should have been tried in vain. If the Patient be too weak to undergo the Fatigue of a thorough Salivation, it may be moderated, and kept up the longer, in Proportion to his Strength. See **SALIVATION**.

External Medicines for *Ulcers*, are Digestives, Cleaners, Sarcoticks, and Eputotics.—Monsieur *Belleste* gives us a Medicine of singular Efficacy in the Cure of *Ulcers*; and it is no more than a Decoction of Walnut Leaves in Water, with a little Sugar; in which a Lincn Cloth being dip'd, is to be laid on the *Ulcer*, and this to be repeated every second or third Day. This simple and vulgar Medicine he finds suppurates, deterges, incarnates, resists Putrefaction, &c. more than any other Medicine known.

An *Ulcer* in the Lungs makes what we call a *Phtisis*. See **PHTHISIS**.

The *Venereal Disease* is a grand Source of *Ulcers*; particularly in the Præpuce and Glans, in Men; the Vagina, &c. in Women; and in the Mouth and Palate in both. See **VENEREAL DISEASE**.

*Venereal Ulcers* are of various kinds; those that grow callous and cancerous, are call'd *Shankers*. See **SHANKER**.

**ULCERATION**, a little Aperture, or Hole in the Skin, caused by an *Ulcer*.

Caustic Medicines sometimes occasion *Ulcerations* in the Skin. See **CAUSTICS**.

Arsenic always *Ulcerates* the Parts it sticks to.—A Flux at the Mouth *Ulcerates* the Tongue and Palate. See **SALIVATION**.

**ULIGINOUS**, **ULTIGINOSUS**, implies as much as moist, moorish, fenny. See **FEN**, **BOG**, **MORASS**, &c.

**ULLAGE** of a *Cask*, is so much as a Vessel wants of being full.

**ULNA**, in Anatomy, a long, hard Bone in the Arm, with a Cavity in the Middle; call'd also *Focile Majus*, and *Cubitus*. See **ARM**, and **CUBITUS**.

The *Ulna* lies on the inside of the Fore-Arm, reaching from the Elbow to the Wrist; is big at its upper-end, and grows smaller to its lower-end.

At its upper it has two Processes, which are received into the fore and hind *Synus*'s of the Extremity of the *Humerus*. The foremost Process is small and short; the hindmost, call'd *Olecranon*, is bigger and longer: it flays the Fore-Arm, when it comes to a straight Line with the Arm. See **OLECRANON**.

Betwixt these Processes it has a semi-circular *Sinus*, which receives the inner Protuberance of the lower-end of the *Humerus*, upon which we bend and extend our Fore-Arm; and along the middle of that there runs a small Ridge, by which this Bone is articulated to the *Humerus* by *Ginglymus*.—Had the Articulation here been an *Arthrodia*, the Joint must have been much weaker; but the Hand could have received no more Motion from it than it has now from the Shoulder.

The inside of this upper-end has a small *Sinus*, which receives the Circumference of the round Head of the *Radius*, Its lower Extremity, which is round and small, is received into a *Synus*, in the lower-end of the *Radius*; and upon this Extremity, it has a short and small Process, from which the Ligaments which tie it to the Bones of the Wrist arise; this Process serves to keep the Bones of the Wrist in their place.

**ULNA**, an *Ell* in measure. See **ELL**, and **MEASURE**.

**ULNA FERROSA**, is an old Law-word for the Standard Iron-Ell, kept in the *Exchequer*. See **STANDARD**.

**ULNAGE**. See **ALNAGE**.

**ULNARIS Extensor**, in Anatomy, a Muscle, call'd also *Extensor Carpi*. See **EXTENSOR**.

**ULNARIS Flexor**. See **FLEXOR Carpi**.

**ULTERIOR**, in Geography, is apply'd to some part of a Country, or Province, which, with regard to the rest of that Country, is situate on the farther Side of a River, Mountain, or other Boundary which divides the Country into two Parts.

Thus, *Africa*, with regard to *Europe*, is divided by Mount *Atlas*, into *Cæterior*, and *Uterior*, i. e. into two Portions, the one on this side Mount *Atlas*, and the other on that.

The Word is pure *Latin*.

**ULTIMA Bassia**, q. d. *last Kiffer*, is a Phrase used among some Painters, for the last finishing Touches with the Pencil. See **PAINTING**.

**ULTRAMARINE**, a beautiful blue Colour, used by the Painters, prepared from *Lapis Lazuli*. See **BLUE**, and **LAPIS**.

This Blue is one of the richest and most valuable Colours used in Painting.—The Preparation consists in first calcining the *Lapis* in an Iron Mortar, then grinding it very fine on a Porphyry Stone; then mixing it up with a Paste made of Wax, Pitch, and Oil; and at last washing the Paste well in clear Water, to separate the colouring Part from the rest, which precipitates to the bottom, in form of a subtle, beautiful, blue Powder.

The Water is then pour'd off; and the Powder at bottom dried in the Sun; which is the true *Ultramarine*.

Those who prepare this Colour, have usually four Kinds, which they get by so many different Lotions: The first is still the best; and the rest worse and worse, to the last.

There is *Ultramarine* of the first Kind, sold for 11*l*. Sterling per Ounce; and of the last, for about 12 or 15*s*.

Some derive its Name, *Ultramarine*, q. d. *beyond Sea*, from its being first brought into *Europe* out of *India* and *Persia*: Others say, 'tis because its Colour is deeper than that of the Sea.

The common Opinion is, that the Method of making it was first discover'd in *England*; and that a Member of the *East India Company*, having a Quarrel with his Associates, to be reveng'd of them, made the Secret publick.

*Ultramarine* must be chosen of a high Colour, and well ground which is known by putting it between the Teeth, where, if it feel gritty, 'tis a Sign the Triture is not sufficient.

To know whether it be pure and unmix'd, put a little of it in a Crucible, and heating it red hot, if the Powder hasn't chang'd its Colour after this Trial, 'tis certainly pure: On the contrary, if you perceive any change, or any black Specks in it, 'tis falsify'd.

Beside this, there is another Kind, call'd *Common* or *Dutch Ultramarine*; which is only *Lapis* or *Smalt* well ground, and pulveriz'd; the Colour whereof, when used by the Painters, is much like that of the true *Ultramarine*, tho' much less valud.

**ULTRAMONTANE**, something beyond the Mountains.

The Term is principally used in relation to *Italy* and *France*, which are separated by the Mountains of the *Alps*.

In *France*, the Opinions of the *Ultramontane* Canonists, i. e. of those of *Italy*, are not receiv'd.

The Painters, particularly those of *Italy*, call all those that are not of that Country, *Ultramontane*; or, simply, *Tramontane*. *Poussin* is the only *Tramontane* Painter that the *Italians* seem to envy. See **TRAMONTANE**.

**ULTRAMUNDANE**, *Ultramundanus*, q. d. *beyond the World*; is that Part of the Universe, supposed to be without, or beyond the Limits of our World, or System. See **UNIVERSE**, **WORLD**, &c.

UMBELICUS. } See UMBILICUS.

UMBELICAL. } See UMBILICAL.

UMBELLA, or UMBRELLA. See **PARASOL**.

**UMBELLÆ**, among Botanists, &c. is applied to the round Tufts or Heads of certain Plants, set thick together, and all of the same height.—But *Sparsed* or *thin Umbellæ*, is when they stand at a distance from one another, yet all of an equal height. See **UMBELLIFEROUS**.

**UMBELLIFEROUS Plants**, are such as have their Tops branched, and spread out like an *Umbrella*; on each little Subdivision of which, there is growing a small Flower; such are Fennel, Dill, &c. See **PLANT**.

This Flower is always *Pentapetalous*; and is succeeded by two naked Seeds adjoining to each other, which are the true Characteristics that distinguish these Plants from others.

The *Umbelliferous* is a very large Genus of Plants, and are distinguish'd by Mr. *Ray* as follows:

1<sup>o</sup>, Such as have a compound Leaf, of a triangular and pinnate Form.—The Seeds of these are either broad, flat, and plain, almost like Leaves; as the *Spondylium*, *Pastinaca Latifolia*, *Apium Heracleum Torzylium*, *Oroselinum*, *Trovisianum*, *Apium Cicus folius*, *Daucus Afaticus carvifolius*, *Anethum*, *Pucedanum*, *Trovisia*, *Ferula*, &c. Or with a Seed more tumid, and less compressed and flat than

the former; as the *Cachrys*, *Laserpitium*, *Cicutaria vulgaris*, *Scandix*, *Cerofolium*, *Myrrhis Sativa Angelica*, *Lavulium*, *Siler Montanum*, *Bulbocephalum*, *Sylarum*, *Oenanthe*, *Sium*, *Pimpinella*, *Apium*, *Cicuta*, *Vivipera*, *Saxifraga*, *Cristinum*, *Feniculum*, *Daucus vulgaris*, *Anisum*, *Caucasoli*, *Cerandrum*, *Pastinaca Marina*, &c.

2<sup>o</sup>, Such as have a simple, or undivided Leaf, or at least one only a little jagged; as the *Perfoliata*, *Bupleurum*, *Astrantia nigra*, *Sonchula*, and the *Seseli Zerbipium*.

**UMBER**, among Painters, &c. a kind of Earth, which, dilated with Water, serves to make a dark brown Colour.

It is called *Umbor* from *Umbra*, Shadow; as serving chiefly for the Shadowings of Objects. See **SHADOW**.

**UMBILICAL**, **UMBILICALIS**, or **UMBILICAL**, in Anatomy, something that relates to the *Umbilicus*, or Navel. See **UMBILICUS**, &c.

**UMBILICAL Vessels**, are a Set or Assemblage of Vessels belonging to a *Fœtus*; constituting what we call the *Funiculus Umbilicalis*, or Navel-string. See **FœTUS**, and **UMBILICALIS**.

These *Vessels* are two Arteries, a Vein, and the *Uraebus*. The *Umbilical Arteries* arise from the Iliacs, near their Division into external and internal; and pass thence on each side of the Bladder, thro' the Navel, to the *Placenta*.

By the Number of Conortions, or Convolutions of these Arteries in the Navel-string, our Midwives superstitiously reckon the Number of Children the Woman is to have.

The *Umbilical Vein*, from innumerable Capillaries united into one Trunk, descends from the *Placenta* to the Liver of the *Fœtus*; where it is partly distributed into the *Porta*, and partly into the *Cæca*.

The *Uraebus* is only plainly found in Brutes; tho' there is no doubt but it has place likewise in Mankind. See **URÆBUS**.

The Use of these *Vessels*, is to maintain a Continuity and Communication between the Mother and the *Fœtus*.—Some Authon will even have it, that the *Fœtus* receives its Food and Increase this way; and that it grows, like a Vegetable, from the Mother as the Root, of which the *Umbilical Vessels* are the Stem; and the Child the Head or Fruit of this Plant-Animal. See **CIRCULATION**, **NUTRITION**, **FœTUS**, &c.

**UMBILICAL Region**, is that Part of the Abdomen lying round about the *Umbilicus*, or Navel. See **ABDOMEN**, and **REGION**.

**Funiculus UMBILICALIS**, popularly call'd the Navel-string, is a kind of Serp, form'd of the *Umbilical Vessels*; which being ty'd up in a common Coat, or Membrane, traverses the Secundines, and are inserted at one end into the *Placenta* of the Mother, and at the other into the Abdomen of the *Fœtus*. See **UMBILICAL Vessels**.

The Navel-string is membranous, wreathed, and unequal; arising out of the middle of the Abdomen, and reaching to the *Placenta Uterina*: 'Tis usually half an Ell in length, and as thick as one's Finger.—It was necessary it should be so long and lax, that when the *Fœtus* in the Womb grows strong, it might not break it by its sprawling and tumbling about; and that after it is born, the Secundine, or After-Birth, might be drawn out the better by it.

The way that it passes from the Navel to the *Placenta*, is very unquiet; for sometimes it goes upon the right Hand to the Neck, which having incompos'd, it descends to the *Placenta*; and sometimes it goes on the left Hand up to the Neck, &c. Sometimes it comes not to the Neck at all, but goes first a little up towards its Breast, and then turns round its Back, and from thence passes to the *Placenta*.

This Part, at the Birth, is either broke, or cut away to the Navel; so that its *Vessels*, viz. two Arteries, a Vein, and *Uraebus*, become perfectly useless, as *Vessels*; and drying up, become impervious, and serve only as Ligaments to suspend the Liver.

**UMBILICAL Points**, in Mathematics, the same with *Foci*. See **FOCUS**.

**UMBILICUS**, the *Navel*, in Anatomy, the middle of the Mid-part of the lower Venter, or Belly; being the Place thro' which the *Umbilical Vessels* pass out of the *Fœtus* to the *Placenta* of the Mother.

The Word is pure *Latin*, form'd of *Umbo*, the little bunch in the middle of a Buckler; by reason of its resemblance to the Navel. See **UMBILICAL Vessels**.

**UMBILICUS**, in Mathematics, the same with *Focus*. See **FOCUS**.

**UMBONE**, or *Horn*, among Florists, signifies any pointed Style, or Pistil, in the middle of a Flower. See **PISTIL**.

There is also an *Umbone* call'd *doubly-pointed*, or *dy-pared*, as in the Peony; and sometimes the *Umbone* has four sharp Points, in which Case it is termed, an *Umbone* divided into so many Heads, or cut into three or four Parts.

UMBRELLO. See **UMBELLA**.

**UMPIRE**, a third Person, chosen to decide a Controversy left to an Arbitration, in case the Arbitrators should not agree. See **ARBITRATOR**.

This, some call a *Siv-Arbitrator*.  
*Mynbew* supposes the Word form'd of the French *us pere*, a Father.

UNCASING, among Hunters, the cutting up, or flecing of a Fox.

UNCIA, a Term generally us'd for the twelfth Part of a Thing.—In this Sense, the Word occurs in *Latin* Writers, both for a Weight, call'd an *Ounce*; and a Measure, call'd an *Inch*. See *OUNCE*, and *INCH*; see also *WEIGHT*, and *MEASURE*.

UNCIA *Terre*, or *Agri*, is a Phrase frequently met with in the ancient Charters of the *British* Kings; but what the Quantity of Ground was, is a little obscure.—All that we know for certain, is, that it signify'd a large Quantity, as much as 12 *Modes*. See *MODIUS Terre*.

UNCIAE, in Algebra, are the Numbers prefix'd to the Letters of the Members of any Power, produced from a Binomial, Residual, or Multinomial Root. See *ROOT*.

Thus, in the fourth Power of  $a + b$ , that is,  $aaaa + 4aaa b + 6aabb + 4abbb + bbbb$ , the *Unciae* are 4, 6, 4. See *POWER*, &c.

Sir *I. Newton* gives a Rule for finding the *Unciae* of any Power arising from a Binomial Root. Thus:

Let the Index of the Power be call'd  $m$ ; then will the *Uncia* arise from such a continual Multiplication as this,  $1 \times m = 0 \times m - 1 \times m - 2 \times m - 3 \times m - 4$ , &c. Thus, if the *Uncia* of the Biquadrate, or fourth Power, were requir'd; the Rule is,  $1 \times 4 = 0 (= 4) \times 3 = 6 (= 6) \times 2 = 4 (= 4) \times 1 = 3 (= 1)$ ; which shews, that the *Unciae* are 1, 4, 6, 4, 1. See *POLYGONAL Number*.

*Oribus*: The Terms of any Powers are compounded of certain literal *Factums*, with Numbers call'd *Unciae*, prefix'd; and the *Factums* are found, by making two Geometrical Progressions; the first of them beginning from the requir'd Power of the first Part of the Root, and ending in Unity; and the second beginning with Unity, and ending in the requir'd Power of the second Part: Thus, for a fifth Power of  $a + b$ ;

$a^5$   $a^4$   $a^3$   $a^2$   $a$  first Series,

$1$   $b$   $b^2$   $b^3$   $b^4$   $b^5$  second Series,

and multiplying the Terms of the same Order in either Series into one another: as,  $a^5 + a^4 b + a^3 b^2 + a^2 b^3 + a b^4 + b^5$ , out of which the fifth Power of  $a + b$  is compounded.

The *Unciae*, then, are found by writing the Exponents of the Powers of the second Series, i.e. of  $b$ , under the Exponents of the Powers of the first Series, i.e. of  $a$ ; and taking the first Figure of the upper Series for the Numerator, and the first of the lower for the Denominator of a Fraction, which is equal to the *Uncia* of the second Power; and so for the rest. Thus, for the fifth Power we have,

$\frac{6}{1}$   $\frac{5}{2}$   $\frac{4}{3}$   $\frac{3}{4}$   $\frac{2}{5}$   $\frac{1}{6}$

Accordingly,  $\frac{6}{1} = 6$  is the *Uncia* of the second Term of the sixth Power;  $\frac{6 \times 5}{1 \times 2} = \frac{30}{2} = 15$ , the *Uncia* of the third Term;  $\frac{6 \times 5 \times 4}{1 \times 2 \times 3} = \frac{120}{6} = 20$ , the *Uncia* of the fourth Term;  $\frac{6 \times 5 \times 4 \times 3}{1 \times 2 \times 3 \times 4} = \frac{360}{24} = 15$ , the *Uncia* of the fifth Term;  $\frac{6 \times 5 \times 4 \times 3 \times 2}{1 \times 2 \times 3 \times 4 \times 5} = 6$ , the *Uncia* of the sixth Term;  $\frac{6 \times 5 \times 4 \times 3 \times 2 \times 1}{1 \times 2 \times 3 \times 4 \times 5 \times 6} = 1$ , the *Uncia* of the last Power. See *PRIMAL Numbers*.

UNCIALIS, an Epithet which the Antiquaries give to certain large-sized Letters, or Characters, antiently us'd in Inscriptions and Epitaphs. See *LETTER*, CAPITAL, &c.

The Word is form'd from the Latin *Uncia*, the twelfth Part of any thing; and which in geometrical Measure signify'd the twelfth Part of a Foot, viz. an Inch; which was supposed the Thickness of one of these Letters.

UNCORE, or *UNQVES Prist*, q. d. *still ready*, in Law, a Plea for the Defendant, being sued for a Debt due on a Day past, to save the Forfeiture of his Bond, &c. by affirming, that he tender'd the Debt at the Time and Place, and that there was none to receive it; and that he is yet also ready to pay the same.

UNCTION, the Act of anointing, or smearing with Oil, or other fatty Matter.

Mercurial *Unction*, properly applied brings on a Salivation. See *SALIVATION*.

The Surgeons cure divers Wounds, Ulcers, &c. by repeated *Unctions* with Oils, Unguents, Cerats, &c. See *OIL*, UNGUENT, LINIMENT, &c.

UNCTION, in Matters of Religion, is used for the Character confer'd on sacred Things, by anointing 'em with Oil.

Such is the *Unction* of Kings, Prophets, Priests, &c.—The *Unction* of Kings is suppos'd to be a Ceremony introduc'd very late among Christian Princes: *Onuphrius* says, none of the Emperors were ever anointed before *Justinian* or *Justin*. The Emperors of *Germany* took up the Prac-

tice from those of the Eastern Empire.—King *Pepin* of *France* was the first King who receiv'd the *Unction*. See *CORONATION*.

In the *Rossib* Church, besides an *Unction* at Baptism, on the Forehead, and at Confirmation, on the Head; they have an *Extreme Unction*, given to People in the Pangs of Death, on the Parts where the five Senses reside, being the Parts by which the Perion might have sinn'd. See *EXTREME Unction*.

UNCUTH, q. d. *unknown*, is used in the ancient *Saxon* Laws, for him that comes to an Inn, Guest-wife, and lies there but one Night: In which Case, his Host was not bound to answer for any Offence he committed, whereof he was guilty himself.

—*Prima nocte potest dici* Uncuth, *secundo vero*, Guest, *tertia nocte* Hoghenchine. *Braclton*, Lib. III. See *THIRD Night* *secu* *Hine*.

UNDECAGON, is a regular Polygon of eleven Sides. See *POLYGON*.

UNDECIMVIR, by the *Greeks* call'd OIENAEER, and by *Jul. Pollax*, *Eparcha*; a Magistrate among the antient *Albanians*, who had ten other Collegues, or Fellows in the same Post.

The Functions of the *Undecimviri* at *Athen*, were much the same as those of the *Prevois de Marchausse* in *France*. They took care of the apprehending of Criminals; secur'd 'em in the Hands of Justice; and when they were condemn'd, took 'em again into Custody, that the Sentence might be executed against 'em.

They were choic'd by the Tribes; each Tribe naming its own: And as the Number of Tribes after *Callisthenes* was but ten, which made but ten *Eparche*, a Scribe or Notary was added, which made the Number eleven: Whence their Name OIENAEER, or *Undecimviri*, as *Cornelius Nepos* calls 'em in the Life of *Phocion*.

UNDEE, or UNDY, in Heraldry. See *WAVY*.

UNDEE the Sea, in the Sea Language.—A Ship is said to be so when she lies still, or waits for some other Ships, with her Helm lashed, or ty'd up a-Lee.

UNDEE CURRENTS.—Distinct from the *upper*, or *apparent* Currents of the Seas. Some Naturalists conclude, there are in divers Places *Under-Currents*, which set or drive a contrary Way. See *CURRENT*.

Dr. *Smith*, in the *Philosophical Transactions*, brings the Hypothesis of *Under-Currents* to solve that remarkable Phenomenon, the Sea's setting strongly thro' the *Streights* into the *Mediterranean*, with a constant Current so Leagues broad.—What should become of the vast Quantity of Water pour'd in this way; as also, of that running from the *Ensign*, thro' the *Bosphorus* into the *Hellepont*, and thence into the *Archipelago*; is a Speculation that has long employ'd the Philosophers.

This Author's Conjecture is, That there is an *Under-Current*, whereby as great a Quantity of Water is carried out as comes in.

To confirm this, he observes, that between the North and South Foreland, it is either high or low Water upon the Shore three Hours before it is so off at Sea: A certain Sign, that tho' the Tide of Flood runs aloft, yet the Tide of Ebb runs under-foot, or close by the Ground.

He adds an Account from an able Sailor in the *Baltick* Sound; that going with their Pinnace into the middle Stream, they were carry'd violently away by the Current: But that sinking a Bucket with a large Cannon Bullet to a certain Depth of Water, it gave check to the Boat's Motion; and sinking it still lower, the Boat was driven a-head to the Windward, against the upper Current, which was not above four or five Fathom deep.

Dr. *Halley* solves the Current's setting in at the *Streights*, without overflowing the Banks, from the great Evaporations; without supposing any *Under-Current*. See *VAPOUR*, and *EVAPORATION*.

UNDEE-WOOD, is Coppice, or any Wood that is not accounted Timber. See *COPPICE*, and *TIMBER*.

UNDEE-CHAMBERLAIN of the Exchequer, is an Officer there that cleaves the Talles, and reads the same; so that the Clerk of the Pell, and the Comptrollers thereof, may see that the Entries are true. See *EXCHEQUER*, *TALLY*, *PELLS*, &c.

He also makes Searches for all Records in the Treasury, and bath the Custody of the Doomday Book.—There are two Officers of this Name.

UNDEE-TREASURER of England, *Vice-Treasarius Anglie*, an Officer mention'd in the Stat. 39 *Eliz.* and whom several other Statutes confound with Treasurer of the Exchequer. See *EXCHEQUER*.

In the Vacancy of the Lord Treasurer's Office, he did every thing in the Receipt, that the Lord Treasurer himself does. He also ches'd up the King's Treasury at the End of every Term, and noted the Content of Money in each Chest, and saw it carried to the King's Treasury in the Tower, for the ease of the Lord Treasurer, &c. See *TREASURY*.

UNDER-Sheriff, *Sub vice comes*. See SHERIFF.

UNDER-Setter, is an *Inmate*. See INMATE.

UNDER-TAKERS, were anciently such Persons as were employ'd by the King's Purveyors, and acted as their Deputies. See PERVEYORS.

At present, the Name is chiefly us'd for Upholders, or Persons who furnish out Funerals: And for such as undertake any great Work, as the draining of Fens, &c. Stat. 43 *Elix*.

UNDER-MINING, See SAPPING.

UNDERSTANDING, or *Intellect*, is defined, by the Peripateticks, to be a Faculty of the reasonable Soul, conversant about intelligible Things, consider'd as intelligible. See FACULTY and SOUL.

They also make it twofold, *viz*. *Active* and *Passive*.

*Active Understanding*, they hold, that Faculty of the Soul by which the Species and Images of intelligible Things are framed, on occasion of the presence of Phantasms or Appearances thereof.—For maintaining the Intellect to be immaterial, they hold it impossible it should be dispos'd to think by any disproportionate Phantasms of mere Body, and therefore is oblig'd to frame other proportionate Species of it self; and hence its Denomination *active*.

*Passive Understanding*, is that which receiving the Species framed by the *Active Understanding*, breaks forth into actual Knowledge. See KNOWLEDGE.

The Moderns fret aside the Peripatetic Notion of an *Active Understanding*.—The *Cartesians* then define the *Understanding* to be that Faculty, whereby the Mind conversing with, and as it were intent on, itself, evidently knows what is true in any thing not exceeding its Capacity. See JUDGMENT.

The *Corpuscular Philosophers* define the *Understanding* to be a Faculty, expressive of Things which strike on the external Senses, either by their Images, or their Effects, and so enter the Mind.—Their great Doctrine is, *Nihil esse in Intellectu quod non prius fuerit in sensu*; and to this Doctrine our famous Mr. *Locke*, and most of our late English Philosophers subscribe.

The *Cartesians* cry out aloud against it, between whom and the *Corpuscularians* there is this farther Difference, that the latter make the Judgment to belong to the *Understanding*; but the former to the Will. See WILL.

Hence, according to the most approved Opinion of the *Corpuscularians*, the *Understanding* has two Offices, *viz*. *Perception* and *Judgment*; according to the *Cartesians* only one, *viz*. *Perception*. See PERCEPTION.

*Understanding* is also us'd for the Act, Exercise, or Exertion of this Faculty; or the Action whereby the Mind knows Things, or represents 'em in Idea to itself.

UNDULATION, in Physics, a kind of tremulous Motion, or Vibration, observable in a Liquid; or a sort of wavy Motion, whereby a Liquid alternately rises and falls, like the Waves of the Sea.

And hence it is that this Term takes its rise, *Unda* signifying *Wave*. See WAVE.

This *Undulatory Motion*, if the Liquid be smooth and at rest, is propagated in Concentric Circles, as most People have observed upon throwing a Stone or other matter upon the Surface of a stagnant Water, or even upon touching the Surface of the Water lightly with the Finger, or the like.

The Reason of these circular Undulations is, that by touching the Surface with the Finger there is produced a Depression of the Water in the place of Contact. By this Depression the subjacent Parts are moved successively out of their place, and the other adjacent Part thrust upwards, which lying successively on the descending Liquid, follow it; and thus the Parts of the Liquid are alternately rais'd and depress'd, and that circularly.

When a Stone is thrown into the Liquid, the reciprocal Vibrations are more conspicuous: Here the Water in the Place of Immersion, rising higher, by means of the Impulse or Rebound, till it comes to fall again, gives an Impulse to the adjoining Liquid, by which means that is likewise rais'd about the place of the Stone, as about a Centre, and forms the first undulous Circle; which falling again, gives another Impulse to the Fluid next to it further from the Centre, which likewise rises in a Circle; and thus, successively, greater and greater Circles are produced.

*Undulatory Motion*, is likewise applied to a Motion in the Air, whereby its Parts are agitated after the like manner as Waves in the Sea; as is suppos'd to be the Case when the String of a musical Instrument is struck. See CHORD.

This *Undulatory Motion* of the Air, is suppos'd the Matter or Cause of Sound. See SOUND.

Instead of the *Undulatory*, some Authors chuse to call this a *vibratory Motion*. See VIBRATION.

UNDULATION is also us'd, in Chirurgery, for a Motion ensuing in the Matter contain'd in an Abscess, upon squeezing it.—A Tumor is said to be in a condition for opening, when one perceives the *Undulation*. See TUMOR.

UNGELD, in our ancient Customs, *fi Fritzman*, i. e. *Homo pacis, fugiet & repugnet, & se velit indicare; si occidatur inecat Ungeld*, i. e. no pecuniary Compensation shall be made for his Death, Skinner.—*Ungilda Aker*, mention'd in *Brompton*, has much the same Signification, *viz*. where any Man was kill'd attempting any Felony, he was to lie in the Field unburied, and no pecuniary Compensation to be made for his Death. From the *Saxon*, *un*, without, *gilda saluta*, & *accra*, ager, Field.

UNGUENT, UNGUENTUM, in Chirurgery, a topical Remedy, or Composition, us'd in the dressing of Wounds and Ulcers. See WOUND, &c.

*Unguents*, Liniments, and Cerats, are external Forms applied on divers Parts of the Body, both to cure, and to ease and relieve 'em.—They only differ from each other in Consistence, with regard to which Unguents hold the Medium; being stiffer than *Liniments*, but softer than *Cerats*. See LINIMENT, and CERAT.

Oils are ordinarily the Bases of all three; to which are added Wax, *Asungia*, and several Parts of Plants, Animals, and Minerals, both in respect of the Virtues they furnish, and to give a Consistence to the Oils, and to keep 'em longer on the Part, that they may have more time to act.

The Principal Unguents are *Unguentum Rosatum*, *Unguentum Album*, or white Unguent of Cerats; the *Populeum* made of the Buds of the Poplar Tree; the *Unguentum Apulei*, or *Unguentum Basilicum*, a Suppurative; the *Unguentum Egyptianum*, Caustic; the *Unguentum Aureum*, Incarnative and Cicatrizing; the *Unguentum de Apio*, Mucidative; the *Unguentum Agrippae*, said to be discover'd by King Agrippa. See each under their proper Articles, *POPULUM*, *EGYPTIACUM*, *APOSTOLOLORUM*, &c.

*Pomatums* are also rank'd in the Number of Unguents. See POMATUM.

UNGUIS, a Latin Term, signifying a Nail of the Hand or Foot. See NAIL.

UNGUIS, in Medicine, a Disease of the Eye, occasion'd by a nervous Excrecence on the *Conjunctiva*, beginning at the great *Canthus* and spreading insensibly till it reach the *Pupill*, and at last quite cover it. See CONJUNCTIVA.

The ordinary Cause of the *Unguis* is an excessive Acrimony in the Tears, which corrode the *Conjunctiva*, as is often the Case in an *Ophthalmia*, or after the Small-Pox.

The Greeks call it *στυγίον*. See PERVEYOR.

UNGUIS, in Anatomy, is applied to two Bones of the Nose, being as thin as Scales, and resembling the Nail; whence their Name. See NOSE.

The *Ungues* are the smallest Bones in the upper-Jaw, and are situate close to the great *Canthus* of the Eyes. See MAXILLA.

Some Authors call them *Offa Lachrymalis*, but improperly; there being no *Glandula Lachrymalis* in the *Canthus*. Others call 'em *Orbitaria Offa*.

They are contiguous to four other Bones, *viz*. the Coronal, that of the Nose, the Maxillary, and that part of the *Ethmoides* which forms the Orbit.

UNGUIS, or *Unguiculus*, among Botanists and Florists, is a little Speck, of a different Colour from the rest of the *Petal*, or *Leaves* of Flowers. See PETALA.

It has the figure of a Nail of the Hand; its place is at the Origin, or Root of those Leaves; as we see in the Rose, Poppy-flowers, and divers others.

In preparing of Medicines, the *Ungues*, or *Unguiculi*, are pull'd off the Flowers that enter the Lame.

UNGUIS Oleratus. See BLATTA Bisanata.

UNGULA, in Geometry, is the Section of a Cylinder cut off by a Plane passing obliquely thro' the Plane of the Base, and part of the cylindrical Surface. See MOTION.

UNGULA, in Natural History, the Claw, or Hoof of a Quadruped. See HOOF.

UNGULA Alcis, the Elk's Claw. See ELK.

UNGULA, among Surgeons, a sort of hooked Instrument where-withal to extract a dead Fœtus out of the Womb.

UNICORN, in Natural History, an Animal famous among the Greek Authors, under the Name of *Μονοκέρως*, and among the Latins, English, French, &c. under those of *Unicornis*, *Unicorn*, *Licorne*, &c.

All these Names it takes from its distinguishing Characteristic, the having one Horn only, which is represented as five Palms long, growing in the middle of the Forehead.

This Animal claims a place here, not only as it makes a curious Article in Natural History, but also as it furnishes something to Medicine, Commerce, and Heraldry.

The popular Account is, that it is about the size of a Horse, its Hair short and of a dark-brown colour; very numerous, and therefore keeping mostly in the Woods; and that its true Place is the Province of *Agos* in the Kingdom of *Dametes*, in *Ethiopia*.

*And. Marin*, a learned Physician of *Venice*, has wrote an express Treatise on the *False Opinion* of the Unicorn.

The first Author, according to *Pliny*, who wrote of the *Unicorn*, was one *Crestus*, whom *Aristotle* mentions as a very suspicious Author. *Aelian* only speaks of it in very doubtful Terms. The other Authors on the Subject are *Philostrophus*, and *Salmus*; *Æneas Sylvius*, who is Pope *Pius II.* *Mercus Paulus*, *Alexius*, *Gesner*, *Gerardus ab Horro*, &c. Of these, some say it resembles a Horse, others an Ass, others a Goat, by its Beard; others an Elephant, others a Rhinoceros, others a Grey-hound, &c.

*Manaster* and *Thovet* will have it an amphibious Animal, and its Horn to be moveable at pleasure. Others make all its Strength to consist in its Horn, and add, that when pursued by the Hunters it precipitates its self from the tops of the highest Rocks, and pitches upon its Horn, which sustains the whole Effort of its Fall so that it receives no damage thereby. In effect, the several Authors do all give several Accounts of the Figure and Colour, both of the Animal and of its Horn, and all its Parts.—And hence the more knowing among the Moderns do unanimously hold it a fabulous Animal.

The Legend adds, that it is wonderful fond of chaste Persons; and therefore, in order to take it, a Virgin is placed in its way, whom when the *Unicorn* spies, he lies down by her, and lays his Head on her Lap, and so falls asleep; upon which the Virgin making a Signal, the Hunters come in and take the Beast; which could never be caught any other way, because it would either cast its self head long from a Rock, or die.

What ordinarily passes among us for *Unicorn's Horn*, and is shewn for such in the Collections of Curiosities, and used for such by several Physicians, we are assured by *Pereyra*, in his Account of *Greenland*, to be the Tooth of a large Fish of the Whale Kind, call'd by the Islanders *Narwal*; and, in other Places, *Walrus* and *Robart*; frequent enough in the icy Sea.

This Tooth, or Horn, turn'd, channel'd, and terminating in a Point, as it is, springs out of the middle of the fore-part of the upper-Jaw, where it has a Root a Foot long, as thick as the Horn itself: 'tis the only Tooth the Animal has in the upper-Jaw; and serves it as a Weapon of Defence, wherewith it dares to attack the largest Whale.—It can strike it with such violence as even to pierce the Side of a strong built Ship.

There is a fine Horn of this kind preserv'd in the Repository of *St. Denis* at *Paris*, given by *Aud. Thovet*, and pretended to have been a Present to him from the King of *Momonotapa*, who carried him to hunt the *Unicorn*; which is frequent in that Country: This Horn some have suspected to be an Elephant's Tooth, carved in that manner. At *Strasbourg* there is another, between seven and eight Foot long. In the Repository at *Venice*, there is a good Number; all different from each other.

The Antients held the *Unicorn's Horn* to be a Counterpoison; and, that the Animal used to dip it in the Water, to purify and sweeten it etc it would drink: 'Tis added, that for the same reason other Beasts wait to see it drink before 'em. Thence, as also from the Rarity of the Thing, People have taken Occasion to attribute divers medicinal Virtues thereto.

But *Amb. Paris* has proved it a mere piece of Chicanery, and all the Virtues attributed to it to be false; and yet the Price it has bore is almost incredible: *Andrea Racci*, a Physician of *Florence*, affirms, the Pound of 15 Ounces, to have been sold in the Apothecaries Shops for 136 Crowns, when the same weight of Gold was only worth 148 Crowns.

UNICORN, in Heraldry, is represented *passant*, and sometimes *rampan*: When in this last Action, as in the *English Arms*, it is properly said to be *salissant*, Argent: an *Unicorn* feint sable, armed and unguled, Or. Borne by the Name of *Harding*.

The *Unicorn* is one of the Supporters of the Arms of *England*. See SUPPORTER.

UNIFORM, UNIFORMITY, denotes a thing to be similar, or consistent either with another thing or itself, in respect of Figure, Structure, Proportion, and the like.—In which sense it stands opposed to *Disform*. See SIMILITUDE.

UNIFORM, or *Equable Motion*. See MOTION.

UNIFORM FLOWERS of Plants, are such as are of the same Figure all a-round, having their fore and back-parts, as also their right and left-parts exactly a like. See FLOWER.

When they are otherwise, they are term'd *diffors Flowers*. See DIFFORM.

UNIFORMITY, Regularity, a Similitude or Resemblance between the Parts of a Whole.—Such is that we meet withal in Figures of many Sides and Angles respectively equal and answerable to each other. See REGULAR.

A late Ingenious Author makes Beauty to consist in Uniformity, join'd or combined with Variety. See BEAUTY.

Where the Uniformity is equal in two Objects, the Beauty, he contends, is as the Variety; and where the Variety is equal, the Beauty is as the Uniformity. See DEFORMITY.

UNIFORMITY, is particularly used for one and the same Form of Public Prayers, and Administration of Sacraments, and other Rites, &c. of the Church of *England*, prescribed by the famous Stat. 1 *Edw.* and 14 *Car. II.* call'd the *Act of Conformity*.

UNION, a Junction, Coalition, or Assemblage of several Things in one.

Philosophers are exceedingly to seek about the manner of the Union of Soul and Body, or by what Medium it is that two such heterogeneous Beings are kept so closely together.—'Tis one of the great Laws of this Union, that such and such an Impression on the Brain be follow'd by such and such a Sensation, or Perception in the Soul. See SOUL, SENSATION, MOTION, &c.

UNION, in an Ecclesiastical Sense, is a combining or consolidating of two Churches into one. See CHURCH, BENEFICE, CONSOLIDATION, &c.

This is not done without the Consent both of the Bishop, the Patron, and the Incumbent. See PATRON, &c.

The Canonists distinguish three kinds of Union, that of *Accession*, that of *Confusion*, and that of *Equality*.

The Union of *Accession* is the most usual; by this the united Benefice becomes a Member, and accessory of the Principal.

The Union by *Confusion*, is that where the two Titles are suppress'd, and a new one created including both.

In the Union of *Equality* the two Titles subsist; but equal, and independent.

By Stat. 37 *Hen. VIII.* it is enacted, That an Union, or Consolidation of two Churches may be admitted, provided the annual Value of one of them, in the King's Books, don't exceed 6 *l.* and the distance between them, be not above one Mile.—And by another, Stat. 17 *Car. II.* it is enacted, That the Union of two Churches or Chapels in any City or Town, shall be valid, unless the Value of the Churches, so united, exceed 100 *l.*

UNION, or the Union by way of Eminence, is particularly used, among us, to express the Act whereby the two separate Kingdoms of *England* and *Scotland* were incorporated into one, under the Title of the Kingdom of Great Britain.

This happy Union, in vain attempted by King *James I.* was at length effected in the Year 1707, by the general Consent of the Queen, and the Estates of each Realm.

The Act, or Treaty of Union, consists of Twenty-five Articles; which eleven *English* Commissioners and eleven *Scottish* ones, examin'd, approved, and sign'd on the 23 of *August*, 1706. The Parliament of *Scotland* approved it on the 4th of *February*, 1707; and the Parliament of *England*, the 10th of *March* in the same Year.—On the 17th following, the Queen went to Parliament, where she approved the same Treaty, with the Act of Ratification.

Since that time, there is only one Privy Council and one Parliament for the two Kingdoms: The *Scottish* Parliament is suppress'd, or, rather super-added to the *English*, both of them only constituting one, under the Title of the Parliament of Great Britain.

The Number of Members which by the Articles of the Union the *Scots* are to send into the House of Commons, to represent the Commons of that Country, are 45; and the Number of Peers whereby their Peerage is to be represented, is 16.

The great Officers of the Crown of *Scotland*, before the Union, were the Lord High Chancellor, Lord High Treasurer or Treasurer, Lord Privy-Seal, and Lord Register. Their lesser Officers of State were, the Lord Register, Lord Advocate, Lord Treasurer Depute, and Lord Justice-Clerk.

The four first Officers are dissolv'd by the Union, and instead thereof new Officers are erected, serving for both Counties under that Title of Lord High Chancellor of Great Britain, &c. See CHANCELLOR, TREASURER, &c.

The four latter Offices still subsist. See ADVOCATE, REGISTER, &c.

UNION, in a philosophic Sense, is used, by *Dr. Green*, for one of the three ways of Mixture; being the Joining together of Atomys or insensible Particles so as to touch in a Plane, as is supposed to be the Case in the Crystallizations of Salts, and the like Bodies. See MIXTURE, CRYSTALLIZATION, &c.

UNION-Pearls, are such Pearls as grow in the Couples; the best sort of Pearls. See PEARL.

UNION, in Architecture, is particularly used for a Harmony between the Colours in the Materials of a Building.

UNION, among Painters, expresses a Symmetry and Agreement between the several Parts of a Painting; when, e.g. there is a deal of Relation and Connexion between them, both as to the Figures, and the Colouring: so that they apparently conspire to form one thing. See SYMMETRY.

When this Union is finely manag'd, some call it *Suavity*.

UNISON, in Musick, is the Effect of two Sounds, which are equal in degree of Tune, or in point of Gravity and Acuteness. See TUNE.

Or, *Unison* may be defined a Consonance of two Sounds, produced by two Bodies of the same Matter, Length, Thickness, Tension, equally struck, and at the same time; so that they yield the same Tone, or Note. See NOTE.

Or, it is the Union of two Sounds, so like each other, that the Ear perceiving no difference, receives them as one and the same Sound. See SOUND.

What constitutes *Unisonance*, is the Equality of the Number of Vibrations of the two sonorous Bodies in equal Times: Where there is an Inequality in that respect, and of consequence an Inequality in degree of Time; the unequal Sounds constitute an Interval. See INTERVAL, and VIBRATION.

*Unison* is the first and greatest of Concords; and the Foundation, or, as some call it, the *Mother* of all the rest: Yet some deny it to be any Concord at all; maintaining it to be only that in Sounds, which Unity is in Numbers. See UNITY.

Others restrain the Word *Concord* to Intervals, and make it include a difference of Tune; but this is precarious: for as the Word *Concord* signifies an Agreement of Sounds, 'tis certainly applicable to *Unison* in the first degree.

But the *Unisonance*, or an Equality of Tune, makes the most perfect Agreement of Sound; it is not true that the nearer any two Sounds come to an Equality of Tune, they are the more agreeable.—The Mind is delighted with Variety; and the Reason of the Agreeableness or Disagreeableness of two Sounds, must be ascrib'd to some other Cause than the Equality or Inequality of the Number of their Vibrations. See CONCORD.

'Tis a fam'd Phenomenon in Musick, that an intense Sound being rais'd, either with the Voice or a sonorous Body, another sonorous Body near it, whose Tune is either *Unison* or *Octave* above that Sound, will sound its proper Note *Unison* or *Octave* to the given Note.—The Experiment is easily try'd by the Strings of two Instruments, or by a Voice and a Harpsichord, or a Bell, or even a drinking Glass.

This our Philosophers account for thus: One String being struck, and the Air put in Motion thereby; every other String within the reach of that Motion, will receive some Impression therefrom: But each String can only move with a determinate Velocity of Recourses, or Vibration; and all *Unisons* proceed from equal or equidistant Vibrations; and other Concords from other Proportions. The *Unison* String, then, keeping equal pace with the sounded String, as having the same Measure of Vibrations, must have its Motion continued and still improv'd, till its Motion become sensible, and it give a distinct Sound. Other concurring Strings have their Motions propagated in different Degrees, according to the frequency of the Coincidence of their Vibrations with those of the sounded String: The *Octave*, therefore, most sensibly; then the fifth; after which, the crossing of the Motions prevents any effect.

This they illustrate by the Pendulum; which being set a-moving, the Motion may be continu'd and augmented by making frequent, light, coincident Impulses; as blowing on it when the Vibration is just finish'd: But if it be touch'd by any cross or opposite Motion, and this, too, frequently; the Motion will be interrupted, and cease altogether.—So, of two *Unison* Strings, if the one be forcibly struck, it communicates Motion by the Air to the other: and being equidistant in their Vibrations, that is, finishing them precisely together, the Motion of that other will be improv'd and heighten'd, by the frequent Impulses receiv'd from the Vibrations of the first; because given precisely when that other has finish'd its Vibration, and is ready to return: But if the Vibrations of the Chords be unequal in Duration, there will be a crossing of Motions, less or more, according to the Proportion of the Inequality; by which the Motion of the untouched String will be so check'd, as never to be sensible. And this we find is the Case in all Consonances, except *Unison*, *Octave*, and the Fifth. See CHORD.

UNITARIANS, a Name assum'd by the new Antirritarians; as making Profession to preserve the Glory and Attributes of Divinity to the *One*, only great and supreme God, and Father of our Lord Jesus Christ. See ARIANS, SOCIINIANS, &c.

UNIT, UNITY, in Arithmetick, the Number *One*; or one single, individual Part of discrete Quantity. See NUMBER.

If a Number consist of four or five Places, that which is outermost towards the right hand, is called the Place of *Unites*. See NUMERATION.

Number, in general, is by *Euclid* defin'd to be *unitus* or *unus*, a Multitude, or Aggregate of *Unites*; in which Sense *Unity* is not a Number. See UNITY.

UNITY, the Abstract or Quality, which constitutes or denominates a Thing *unum*, or one.

The School Philosophers generally define *Unity*, by a Thing's being undivided in it self, and divided from every thing else.—Others, more accurately, define it, a Mode of Being, whereby it agrees to any particular being, once; and

make two Kinds of *Unity*, viz. *Unity of Simplicity*, which is both undivided and indivisible; such as is that of God, Angels, and human Souls: The other *Union of Composition*; which, tho' undivided, is divisible in the Being, as consisting of divers Parts: such as that of Man, &c.

Hence, *Unity* is also divided into that *per se*, which agrees to any Being whole Parts are collect'd into one *Substratum*; and *Unity per accidens*, whose Parts are not united into one *Substratum*; as that of a Flock of Sheep, &c.

Some also make a *Singular*, or *Numerical Unity*, and an *Universal Unity*; a *Real*, and an *Imaginary Unity*, &c.

'Tis disputed among Mathematicians, whether or no *Unity* be a Number.—The generality of Authors hold the Negative; and make *Unity* to be only inceptive of Number, or the Principle thereof; as a Point is of Magnitude, and *Unison* of Concord.

*Steuart* is very angry with the Maintainers of this Opinion: and yet, if Number be defin'd a Multitude of *Unites* join'd together, as many Authors define it, 'tis evident *Unity* is not a Number. See NUMBER.

UNITY, among Divines.—The *Romanists* and the Reform'd dispute whether or no the Church be one single Body, all the Members whereof are join'd together, either really, or in Inclination; so that whatever does not appertain to that Body, is no part of the Church: Which is what they call the *Unity of the Church*; and which the *Romanists* maintain is restrain'd to one single Society, or one Communion, under one visible Head; and out of which the Protestants are excluded.

These last, on the contrary, hold, That the *Unity* of the Church may still subsist, without being united under any one visible Head; it being sufficient that all Christians be united by the Bonds of mutual Love, and Charity; and that they be agreed in the Fundamental Points of Religion.

All the difficulty is to fix what those Fundamentals are; some inclining to make the Door of the Church wider than others. See TOLERATION.

UNITY, in Poetry.—In the *Drama* there are three *Unities* to be observ'd; the *Unity of Action*, that of *Time*, and that of *Place*. See DRAMA.

In the Epic Poem, the great and almost only *Unity*, is that of the Action.—Some regard, indeed, ought to be had to that of Time: That of Place there is no room for. The *Unity* of Character is not reckon'd among the *Unities*. See CHARACTER.

The *Unity* of the Dramatic Action, consists in the *Unity* of the Intrigue in Comedy, and that of the Danger in Tragedy; and this, not only in the Plan of the Fable, but also in the Fable extend'd and fill'd with Episodes. See ACTION.

The Episodes are to be work'd in, without corrupting the *Unity*, or forming a double Action; and the several Members are to be so connected together, as to be consistent with that Continuity of Action so necessary to the Body; and which *Horace* prescribes, when he says, —*fit quodvis simplex duxatus & numerus*. See REASON.

The *Unity* of the Epic Action, *M. Dacier* observes, does not consist in the *Unity* of the Hero, or in the *Unity* of his Character, and Manners; tho' these be Circumstances necessary thereto. The *Unity of Action*, requires that there be but one principal Action, of which all the rest are to be Incidents or Dependencies. See HERO, MANNERS, &c.

*F. Bayle* assigns three Things requisite thereto: The first, That no Episode be used but what is fetch'd from the Plan, and Ground of the Action, and which is a natural Member of that Body: The second, that these Episodes and Members be well connected with each other: The third is, Not to finish any Episode, so as it may appear a whole Action; but to let each be always seen in its quality of Member of the Body, and an unfinished Part.

The same excellent Critick examines the *Aeneid*, *Iliad*, and *Odyssey*, with respect to these Rules, and finds 'em strictly observ'd.—Indeed, it took from the Conduct of those divine Poems, that he took the Hint of the Rules themselves. Instances wherein these Rules are all neglected, he gives us in *Statius's Thebaid*.

To the *Unity of Time* it is requir'd, in the Drama, that the Action be included in the Space of a Day.

*Aristotle* says expressly, It must not exceed the Time the Sun is making one Revolution, which is a Natural Day, under pain of Irregularity: Some Criticks will even have it included in the Space of twelve Hours, or an Artificial Day.

Indeed, the ancient Tragic Poets sometimes dispens'd with this Rule; and the modern *English* ones many of 'em disallow it: few of 'em practise it.

In the Epic Poem, the *Unity of Time* is still less establish'd: In effect, there is no fixing the Time of its Duration; in regard, the warmer and more violent it is, the less must be its Continuance: Whence it is that the *Iliad*, representing the Anger of *Achilles*, only contains fury lew'd Days at most; whereas the Action of the *Odyssey* holds eight

Years and an half, and that of the *Æneid* almost seven Years.

But the length of the Poem *Aristotle* gives us a Rule for; which is that it be such as it may be read over in one Day: pretending, that if it exceeds that compass, the Sight will be bewilder'd in it, and that one can't see the End, without having lost the Idea of the Beginning.

As to the *Unity of Place and Scene*, neither *Horace* nor *Aristotle* give us any Rules relating thereto.—It were to be wish'd, indeed, that what is presented to the Audience on the same Stage, which is never shifted, might be suppos'd to have pass'd in the same House, and the same Apartment. But as such a Constraint would cramp the Poet too much; and as such an Uniformity would suit very ill with abundance of Subjects; it has been agreed that what passes any where in the same Town or City, shall be allow'd for *Unity of Place*—At least, if two different Places be unavoidable; yet the Place is never to be chang'd in the same Act. See SCENE.

*UNITY of Possession*, in Law, signifies a joint Possession of two Rights, by several Titles: Thus, if I take a Lease of Land upon a certain Rent, and afterwards buy the Fee Simple; this is an *Unity of Possession*, whereby the Lease is extinguish'd: by reason I, who before had only the Occupation for my Rent, am now become Lord of the same, and am to pay Rent to none but my self.

*Unity of Possession*, in the Civil Law, is the same with *Consolidation*. See CONSOLIDATION.

UNIVERSAL, something that is common to many Things, or it is one Thing belonging to many.

The Word is compounded of *unum* versus *alia*.

The *Romans* are divided among themselves about the Title of *Universal Bishop*, which the Popes have arrogated to themselves; the others of 'em have declined it.—*Baronius* holds the Appellation to belong to the Pope *Jure Divino*; and yet *S. Gregory*, opposing the same Quality given by a Council in 586 to *John* Patriarch of *Constantinople*, asserted expressly, that it did not belong to any Bishop; and that the Bishops of *Rome* could not nor ought not to take it. Accordingly, *S. Leo* refused to accept it, when offer'd him by the Council of *Chalcedon*; for fear, lest giving something particular to one Bishop, they should take from all; since there could not be an *Universal Bishop*, but the Authority of the rest must be diminish'd. See BISHOP, OECUMENICAL, &c.

An *UNIVERSAL Dial*, is that whereby the Hour may be found by the Sun all over the Earth; or under any Elevation of the Pole. See DIAL.

There are also *Universal Instruments*, for measuring all kinds of Distances, as Heights, Lengths, &c. call'd also *Pantometers*, and *Helometers*. See PANTOMETER.

Several learned Authors have had it in view to establish an *Universal Character*; by which the different Nations might understand each others Writings, without learning their Language. See CHARACTER.

UNIVERSAL, UNIVERSALE, in Logick, is either *Complex* or *Incomplex*.—A *Complex Universal*, *Universale Complexum*, is either an *universal Proposition*, as, *Every Whole is greater than its Part*; or whatever raises a manifold Conception in the Mind; as the Definition of a reasonable Animal.

An *Incomplex Universal*, *Universale Incomplexum*, is what produces one only Conception in the Mind, and is a simple thing respecting many; as *Human Nature*, which relates to every Individual wherein it is found.

According to the various Order and Ref.ect this Universe has to many; there are seven Modes thereof assign'd: viz.

*Universals in causing*, such are the common efficient Causes of divers Effects; as *God*, the *Sun*, &c. See CAUSE, &c.

*Universals in distributing*, such are common or *universal Signs*; as *all*, *none*, &c.

*Universals in knowing*, which know all things; as the Understanding, &c.

*Universals in representing*, such are Images, or Ideas of *universal Things*; as the Idea of a House, of a Man, &c.

*Universals in signifying*, such are common Words, signifying many things; as *Animal*, *Stone*, &c.

*Universals in being, or existing*, are Natures existing in several; as *Humanity* in *Peter*, *Paul*, &c. And,

*Universals in predicating*, which existing in many things, are separately predicat'd of 'em all; as, *ens*, and *unum*: These are also call'd *Logical Universals*.

All these Kinds of *Universals*, the two last only excepted, are not *Universals* in themselves, but only with respect to their Objects *confid*, *represent*, &c. So that what we chiefly consider as *Universals*, are the *Universals in essendo*, and *predicando*.

Now in an *Universal*, they distinguish two things, the *Matter*, call'd the *Material Universal*, *Universale Materiale*, which is the one Nature multiplicable in many; as *Humanity* in *Peter*, *Paul*, &c. and the *Form*, call'd the *Formal Universal*, which is the Unity of that Nature.

Wherefore, to constitute an *Universal*, 'tis requisite the Nature be one, yet multiplicable: But what such a Nature is, has prov'd Matter of great Controversy, both among the ancient and modern Philosophers.

The *Platonists* will have *Universals* to be nothing but divine Ideas.—Now by Ideas they mean the Pattern or Form which the Artificer has in view, when he makes any thing: But as this is twofold, *internal*, which is a sort of Image of the Thing to be done, which the Artificer frames in himself; and *external*, which is something out of himself, which the Artificer imitates: the Philosophers have been infinitely perplex'd, to find which of the two *Plato* meant.—The *Peripateticks* insist he meant the *External*; but the *Platonists*, and most of the *Cartesian Divines*, hold for the *Internal*.

The *Stoicks* and *Nominalists* hold this in common with the *Platonists*, that *Universals* are not in the Things themselves, but out of 'em: The *Stoicks*, particularly, for *Universal*, put a kind of formal Conceptions, or Act of knowing; by reason they represent many things at the same time; e. g. Knowledge, representing all Men, is, according to the *Stoicks*, an *Universal*.

The *Nominalists* make Words *Universals*; by reason the same Word represents many things, as the Word *Man* represents all Men: But both *Stoicks* and *Nominalists* make *Universals* to be something extrinsic to Things themselves; by reason whatever exists, or is produced, is singular: so that there is no *Universal* really in Things.

The *Peripateticks*, however, contend that there are *Universal* and *Common Natures* in Things themselves; or that Things and Natures, like each other, form a *Material Universal*.—But as to the Manner wherein they are *universal*, or whence they derive their *Universality*, that is, their Unity and Aptitude of being in many, whether from Nature, or from our Understanding, is matter of dispute among 'em.—If they derive that Unity, wherein their *universal* Form is placed, from Nature; then, there is an *Universal à parte Rei*; which is the Opinion of the *Stoicks*. See SCOTISTS.

If they don't derive it from Nature, but only from our Minds or Understandings, then the Doctrine of the *Thomists* is allow'd; who contend that a formal *Universal* has no other Existence, but by an Act of the Intellect. See THOMISTS.

UNIVERSALISTS, in Polemical Divinity, an Appellation given to such as hold *universal* Grace: In like manner as *Particularists* is given to those who hold *particular* and *efficient* Grace. See GRACE, &c.

The *Armenians* are particularly denominated *Universalists*. See ARMENIAN, and REMONSTRANT.

UNIVERSALITY, the Quality that denominates a thing *Universal*.

The Catholics assert the *Universality* of their Church, both as to Time, and Persons; and maintain this to be a Mark of the true Church; which distinguishes it from all other Societies that pretend to the Name. See UNIVERSAL.

UNIVERSALITY, in the Schools.—Logicians make two Kinds of *Universality*; the one *Metaphysical*, the other *Moral*.

*Metaphysical Universality*, is that which excepts nothing; as this Proposition, *Every Man is mortal*.

*Moral Universality*, is that which admits of some Exception; as, *All old Men praise the Times past*. In suchlike Propositions, 'tis enough the Thing be ordinarily so; it not being strictly requir'd that every old Man should be of that Sentiment.

UNIVERSE, a collective Name, signifying the whole World, or the Assemblage of all Bodies; call'd by the Greeks *κόσμος*; and by the Latins, *Mundus*, and *Univ. sum*; as being no other than an University of Bodies. See WORLD.

The Antients, and after them the *Cartesians*, imagin'd the *Universe* to be infinite.—The Reason they give is, That it implies a Contradiction to suppose it finite, or bounded; since it is impossible not to conceive Space beyond any Limits that can be assign'd it: Which Space, according to the *Cartesians*, is Body; and consequently part of the *Universe*. See SPACE.

But that the *Universe* is finite, appears from the two following Considerations—1<sup>st</sup>, That whatever consists of Parts, cannot be infinite; since the Parts that compose it, must be finite either in Number or Magnitude; which if they be, what they compose must be too: Or, 2<sup>dly</sup>, they must be infinite in Number or Magnitude; but an infinite Number is a Contradiction; and to suppose the Parts infinitely big, is to suppose several Infinities, one bigger than another; which, tho it may pass among Mathematicians, who only argue about Infinities *in posse*, or in Imagination, will not be allow'd in Philosophy.

UNIVERSITY, a collective Term, applied to an Assemblage of several Colleges establish'd in a City, wherein are Professors in the several Sciences, appointed to teach them to Students; and where Degrees, or Certificates of Study

Study in the divers Faculties are taken up. See ART, and SCIENCE.

In each *University*, four Faculties are usually taught; Theology, Medicine, Law, and the Arts and Sciences. See FACULTY.

They are call'd *Universities*, or *Universal Schools*, by reason the four Faculties are supposed to make the World or *Universe* of Study.

In the Eye of the Law, an *University* is held a mere Lay Body, or Community; tho, in reality, it be a mix'd Body, compos'd partly of Laymen, and partly of Ecclesiasticks. See COMMUNITY, COMPANY, &c.

*Universities* had their first Rise in the XIIIth and XIIIth Centuries.—Those of *Paris* and *Bologna* pretend to be the first that were set on foot; but then they were on a different Footing from the *Universities* among us. See SUMMARY, and SCHOOL.

The *University of Paris* is said to have commenced under *Chorembaign*, and to owe its Rise to four *Englishmen*, Disciples of *Venerable Bede*; who going to that City, made a Proposal to set up and sell Learning; and accordingly held their first Lectures in Places assign'd 'em by that Prince: Such is the Account given by *Gaguin*, *Gilles*, de *Beauvais*, &c. Tho the Authors who wrote in those Days, as *Eginard*, *Amon*, *Rhiginos*, *Sigebert*, &c. make not the least mention thereof.

Add, that *Paffquier*, *du Tillet*, &c. declare openly against the Opinion; and assert, that its first Foundations were not laid till *Louis* the Young, and *Philip Auguste*, in the XIIIth Century.—The earliest mention we find made of it, is in *Regardus*, who lived in that Age; and who was Cotemporary with *Peter Lombard*, the Master of the Sentences, the great Glory of that *University*; in Memory of whom, an Anniversary is to this Day observ'd by that Body, in the Church of *S. Marcel*, where he lies buried.

But 'tis certain it was not establish'd all at once: It appears to have been at first no other than a publick School in the Cathedral Church; from which it grew, by little and little, under the Favour and Protection of the Kings, into a regular Body.

In effect, our own *Universities*, *Oxford* and *Cambridge*, seem intic'd to the greatest Antiquity of any in the World; and *University*, *Bristol*, and *Merton* Colleges in *Oxford*, and *St. Peter's* in *Cambridge*, all made Colleges in the XIIIth Century, may be said to be the first regular Endowments of this kind in *Europe*.

For the *University* Colledge in *Cambridge* had been a Place for Students ever since the Year 872; yet this, like many of the other ancient Colleges beyond Sea, and *Leyden* to this Day, was no proper Colledge; but the Students, without any Distinction of Habit, liv'd in Citizens Houses; having only Meeting-Places to hear Lectures, and dispute.

In After-times, there were Houses built for the Students to live in Society; only each to be at his own Charge, as in the Inns of Court. See INN.

These, at first, were call'd *Inns*; but now *Halls*. See HALL. At last, plentiful Revenues were sort'd on several of these Halls, to maintain the Students in Diet, Apparel, &c. and these were call'd *Colleges*. See COLLEGE.

The *Universities of Oxford* and *Cambridge* are govern'd, next under the King, by a *Chancellor*, who is to take care of the Government of the whole *University*, to maintain the Liberties thereof, &c. See CHANCELLOR.

Under him is the *High Steward*, whose Office is to assist the *Chancellor* and other Officers, when requir'd, in the Execution of their Offices; and to hear and determine capital Causes, according to the Laws of the Land, and the Privileges of the *University*.

The next Officer is the *Vice-Chancellor*, who officiates for the *Chancellor* in his absence.—There are also two *Proctors*, who assist in the Government of the *University*; particularly in the Business of School-Exercise, taking up Degrees, punishing Violators of the Statutes, &c. See PROCTOR.

Add, a *publick Orator*, *Keeper of Records*, *Register*, *Beadle*, and *Virger*.

For the Degrees taken up in each Faculty, with the Exercises, &c. requisite thereto, see DEGREE; see also DOCTOR, BACHELOR, &c.

UNIVOCAL, in the Schools, is applied to two or more Name or Terms, that have but one Signification. In Opposition to *Equivocal*; which is, where one Term has two or more Significations.

Or, *Univocal Terms*, are such whose Name, as well as Nature, is the same; in opposition to *Equivocals*, whose Names are the same, but their Natures very different. See EQUIVOCAL.

For a thing to be predicated *univocally* of any others, it is to be attributed to all of them alike, and in the same proper Sense. See PREDICATE, and PREDICABLE.

UNIVOCAL Generation.—The Doctrine of the Antients with respect to Propagation, was, That all perfect Animals were produced by *Univocal Generation*, that is, by the sole Uni-

on or Copulation of a Male and Female of the same Species or Denomination: and, that Infants were produced by *Equivocal Generation*, without any Seed, and merely of the Corruption of the Earth exalted, and as it were impregnated by the Sun's Rays. See EQUIVOCAL, INSECT, &c.

Some Philosophers make a kind of *Intermediate Generation*, between *Equivocal* and *Univocal*, which they call *Analogous Generation*. See GENERATION.

UNIVOCALS, call'd by the *Greeks*, *Synonyma's*, are defined by *Aristotle* to be those Things whose Name is common, and the Reason corresponding to the Name, that is, the Definition of the Ideas affix'd to it, the same.

Thus, under the Name and Definition of *Animal*, Man and Brute are equally included; and Circle and Square in the Reason or Definition of a *Figure*.

Here, the word, as *Figure*, they are to call *Univocum univocans*, or *univocating Univocal*; and the Things included under the univocal Name, *Univoca univocata*, *univocated Univocals*.

UNIVOCATION, in Logicks and Metaphysics.—The School-men have long disputed about the *Univocation* of Being, i. e. whether the general Idea of *Being* agree in the same manner, and in the same sense, to the Substance and the Accident; to God, and the Creature.

UNLAWFUL, *Illegal*, something prohibited by, or contrary to the Terms of a Law, either divine or human. See LAW.

UNLAWFUL Assembly, is particularly used for the meeting of three or more Persons together by Force, to commit some unlawful Act; as to assault any Person, to enter his House, or Land, &c. and thus abiding together, the not attempting the Execution thereof. See ASSEMBLY, RIOT, &c.

By the Stat. 16 Car. II. if five Persons, or more, shall be assembled together, above those of the Family, at any Conventicle or Meeting, under colour of any exercise of Religion, it is *unlawful*, and punishable by Fines, and otherwise, as in that Statute is provided.

UNLIKE Quantities, and Signs in Algebra. See LIKE Signs and Quantities; see also SIGN, and QUANTITY.

UNLIMITED or *Indeterminate Problem*, is such a one as is capable of infinite Solutions.—As, to divide a Triangle given into two equal Parts, to make a Circle pass thro' two Points assign'd, &c. See PROBLEM.

UNLUTING, in Chymistry, the taking away of the Lute, Loam, or Clay, where with a Vessel is cloisd, join'd to another, or the like. See LUTE.

UNMOOR, a Term used at Sea, when a Vessel that before rid, or was held by two Anchors, is began to get them up, and prepared to weigh. See ANCHOR and MOOR.

UNQUESPRIS, a Plea in Law-suit, by which a Man professes himself always ready to perform what the Demandant requires.

UNREEVING a Rope. See REEVE.

UNRIGGING of a Ship, is the taking away the Rigging or Cordage. See RIGGING.

UNSEELING, in Falconry, a taking away the Thread that runs thro' the Hawk's Eye-lids and hinders her Sight. See HAWK, and FALCONRY.

Drawing the Strings of the Hood, to be in Readiness to pull off, is call'd, *Unstriking the Hood*.

VOCABULARY, in Grammar, a Term signifying, a Collection of the Words of a Language, with their Significations; otherwise call'd a *Dictionary*, *Lexicon*, or *Nomenclature*. See WORD.

The *Vocabulary* is, properly, a lesser kind of *Dictionary*, which does not enter so minutely into the Origins and different Acceptations of Words. See DICTIONARY.

The *Italian Vocabulary* of the *Academy de la Crusca*, was forty Years in compiling.

The Word is *French*, form'd of the obsolete term *Vocabile*; of the *Latin*, *Vocabulum*, word.

VOCAL, something that relates to the Voice. See VOICE.

Thus, *Vocal Prayer* is that spoke out, or delivered in words; in contra-distinction to *mental Prayer*. See PRAYER.

In our ancient Customs, *Vocalis* is frequently used for *fo call'd*—*Post hec Morgannus de tribu Walsingham, & alter nomine Madocus vocalis princeps eorum*. Matt. Paris.

The Term is sometimes also used substantively, in speaking of Matters of Election, to signify a Person who has a right to vote.—A Man must have been a Religious a certain number of Years, to be a *Vocal*. See VOTE.

VOCAL Music, is Music fit for Words, especially Verses; and to be perform'd with the Voice. In contra-distinction to *Instrumental Music*, compos'd only for Instruments, without Singing. See MUSIC.

Poetry then makes a necessary Part of *Vocal Music*; and this appears to have been the chief, if not the only Practice of the Antients, from the Definitions which they gave us of Music. See HARMONY, &c.

These *Vocal Music* seems to have had some Advantage over ours, in that the *Greek* and *Latin* Languages were better contriv'd to please the Ear than the modern ones.—In effect, *Vossius* taxes all the *Latin* Languages as unfit for Music,

and says, ' We shall never have any good *Vocal Music* till our Poets learn to make Verses on the Model of the Antients, i. e. till the antient metrical Feet and Quantities are restored. See **VIRSE**, and **QUANTITY**.

But it is to be observ'd, that the *Rythmus* of their *Vocal Music*, was only that of their Poetry; and had no other Forms and Mutations than what the metrical Art afforded. See **MUTATION**.

Their Changes were no other than from one kind of *Meters* or *Verses*, to another; as from *Iambic*, to *Choraeic*. See **MEASURE**, and **RHYTHMUS**.

Their *Vocal Music*, too, consisted of Verses set to musical Tunes, and sung by one or more Voices, in Chorus, or alternately; sometimes with, and sometimes without the Accompaniments of Instruments. See **SYMPHONY**.

For Instrumental Music, in the manner we have defin'd it, 'tis not very clear they ever had any. See **SYNAULIA**, &c.

**VOCATION**, or *Calling*, among Divines, the Grace or Favour which God does any one in calling him out of the way of Death, and putting him into the way of Salvation.

In this Sense, we say, the *Vocation* of the *Jews*; *Vocation* of the *Gentiles*, &c.

There are two Kinds of *Vocation*; the one *external*, the other *internal*.

The first consists in a simple and naked proposing of Objects to the Will.—The second is that which renders the first effectual, by disposing our Faculties to receive those Objects.

**VOCATION** is also used for a Destination to any State or Profession.—'Tis a Rule, that none are to enter the Ecclesiastick or Monastick State, without a particular *Vocation*, or Call. See **ORDERS**, **ORDINATION**, &c.

The *Romanists* hold the *Vocation* of the Reformed Divines null and invalid.—Among our selves, some hold an uninterrupted Succession necessary for the Validity of the *Vocation* of a Priest.

**VOCATIVE**, in Grammar, the fifth Case, or State of Nouns. See **CASE**.

When we name the Person we are speaking to, or address our selves to the Thing we are speaking of, as if it were a Person; the Noun or Name acquires a new Relation, which the *Latins* and *Greeks* express by a new Termination, call'd the *Vocative*.

Thus, of *Dominus*, Lord, in the Nominative, the *Latins* have made *Dominus*, O Lord, in the *Vocative*; of *Antonius*, *Antoni*, &c.—But as this was a thing not absolutely necessary, and as the Nominative Case might serve on such Occasions; this new Case, or Termination, was not universal: in the Plural, for Instance, it was the same with the Nominative; and even in the Singular, it was only practis'd in the second Declension among the *Latins*; and in *Greek*, where it is the most common, it is frequently neglected, and the Nominative used instead of it: as in that Passage in the *Greek Philistis*, quoted by St. Paul to prove the Divinity of Jesus Christ, *θεός εστις, εὐθεός, εὐθεός*. See **THEOLOGY**.

In *English*, and most of the modern Tongues, this Case is ordinarily express'd in Nouns that have an Article in the Nominative, by suppressing that Article: as, *The Lord is my hope—Lord, thou art my hope*: Tho' on many Occasions we use an Interjection.

**VOCIFERATIO**, in our old Law-Books, the same with *Hux* and *Cry*.

—*Qui sacrum plegiatum dimiserit, qui ei obviaverit & gratias sine Vociferatione dimiserit*, &c. **Leg. Hen. 1.**

**VOICE**, *Vox*, a Sound produced in the Throat and Mouth of an Animal, by an Apparatus of Instruments for that purpose. See **SOUND**.

*Voices* are either *Articulate*, or *Inarticulate*. *Articulate Voices*, are those whereof several conspire together to form some Assemblage, or little System of Sounds: such are the *Voices* expressing the Letters of an Alphabet, numbers of which join'd together form *Words*. See **LETTER**, and **WORD**.

*Inarticulate Voices*, are such as are not organis'd, or assembled into Words: Such is the barking of *Dogs*, the braying of *Asses*, the hissing of *Serpents*, the singing of *Birds*, &c.

The Formation of the *human Voice*, with all the Varieties thereof observ'd in Speech, Music, &c. make a very curious Article of Inquiry; and the Apparatus and Organization of the Parts ministering thereto, is something exceedingly surprising.

Those Parts are, the *Trachea*, or Wind-pipe, thro' which the Air passes and re-passes into the Lungs; the *Larynx*, which is a short cylindrical Canal, at the Head of the *Trachea*; and the *Glottis*, which is a little oval Cleft or Chink, left between two semicircular Membranes, stretch'd horizontally within the *Larynx*; which Membranes, tho' capable of joining close together, do generally leave an Interval, either greater or less, between 'em, call'd the *Glottis*.—See particular Descriptions of each of these Parts, under the Article **TRACHEA**, **LARYNX**, and **GLOTTIS**.

The long Canal of the *Trachea*, terminated a-top with the *Glottis*, appears so like a Flute, that the Antients made no doubt but the *Trachea* contributed the same to the *Voice*, as the Body of the Flute does to the Sound of that Instrument.—*Galen* himself fell, in some measure, into the Mistake: He perceived, indeed, that the principal Organ of *Voice* was the *Glottis*; but he still allow'd the *Trachea* a considerable share in the Production of Sound.

*Galen's* Opinion was follow'd by all the Antients after him; and even by all the Moderns, before *M. Zodari*.—But that Author, observing that we don't either speak or sing, when we inspire, or take in the Air, but only when we expire, or expel it; and this the Air coming out of the Lungs, passes always out of the minuter Vesicles of that Part into larger; and at last into the *Trachea* it self, which is the largest of all: that thus its Passage becoming still more free and easy, and this more than ever in the *Trachea*, it can never undergo such a Violence, and acquire such a Velocity in that Canal, as is requir'd to the Production of Sound.—But that, as the Aperture of the *Glottis* is very small, in comparison with the Width of the *Trachea*, the Air can never get out of the *Trachea* by the *Glottis*, without a vast Compression and Augmentation of its Velocity; and that by this means, in passing, it communicates a brisk Agitation to the minute Parts of the two Lips of the *Glottis*, gives 'em a kind of Spring, and occasions 'em to make Vibrations; which communicated to the passing Air, occasions the Sound. See **VIBRATION**.

This Sound, thus form'd, proceeds into the Cavity of the Mouth and Nostrils; where 'tis reflected, and rebounds: And on this Resonance, *M. Zodari* shews, it is, that the Agreeableness of the *Voice* entirely depends.—The different Consistencies, Forms, &c. of the divers Parts of the Mouth, contribute to the Resonance, each in their way; and from this Mixture of so many different Resonances in their due Proportion, results a Harmony in the human *Voice*, inimitable by any Musician.

Hence it is, that when any of these Parts is disorder'd, e. g. the *Nose* stop'd, the *Voice* becomes displeasing.

This Resonance of the Cavity of the Mouth, does not seem to consist in a simple Reflexion, such as that of a Vault, &c. but in a Resonance proportionate to the Tones of the Sound sent into the Mouth from the *Glottis*; and accordingly, we find this Cavity to lengthen and shorten it self, according to the Depth or Acuteness of the Tone.

Now, for the *Trachea* to effect this Resonance, as it was the common Opinion it did; it would be requir'd, that the Air, after its being modify'd and turn'd into Sound by the *Glottis*, instead of continuing its Course from within outwards, should return from without inwards, and thus strike on the Sides of the *Trachea*: Which can never happen, except in those who have a violent Cough, and in ventriquoous Persons. Indeed, in most River-Fowl, which have a very strong *Voice*, the *Trachea* does rebound; but the reason is, that the *Glottis* is placed at the bottom of the *Trachea*, and not at the top, as in Men.

That Canal, then, which at first pass'd for the principal Organ of *Voice*, is found not to be so much as the secondary one, i. e. not that which occasions the Resonance.—It does not serve the *Glottis*, as the Body of a Flute does its Plug; but instead of that, the Mouth serves the *Glottis* as the Body of some other Wind-Instrument not yet known in Music.—In effect, the Office of the *Trachea*, is so other than that of the Port-Vent in an Organ, viz. to furnish Wind.

For the Cause of the different Tones of *Voice*.—As the Organs that form the *Voice* make a kind of Wind-Instrument, we might expect to find some Provision therein, answerable to that which produces the difference of Tones in some other Wind-Instruments. But in the divers Kinds of Wind-Instruments, the Hautboy, Organ, Clarion, &c. there is none.—The Tone, therefore, must be attributed either to the Mouth and Nostrils, which occasion the Resonance, or to the *Glottis*, which produces the Sound: And as all the different Tones are produced in Man by the same Instrument; it follows, that the Part which produces 'em must be capable of Changes answerable thereto.

Now, for a grave Tone, we know, there is more Air requir'd than for an acute one.—The *Trachea*, therefore, to let this greater quantity pass, must dilate and shorten it self; by which shortening, the external Canal, that is, the Canal of the Mouth and Nose, reckon'd from the *Glottis* to the Lips, or Nostrils, is lengthen'd.—For, the shortening of the internal Canal, i. e. of the *Trachea*, brings the *Larynx* and *Glottis* lower down; and of consequence makes its distance from the Mouth, &c. greater: And there is a Change in the length of each Canal, for every change of Tone, and Semitone.—Accordingly, 'tis easy to observe, that the Knot of the *Larynx* alternately rises and falls in all Quaverings, or Shakings of *Voice*, how small soever the difference of Tone may be.

Hence, as the Depth of the Tone of a Hautboy is answerable to the Length of the Instrument; the longest Fibres of the Wood, whose Vibrations make the Resonance, making always the slowest Vibrations, and consequently the deepest Tone: It may appear probable, that the Concavity of the Mouth, by its lengthening for grave Tones, and shortening for acute ones, might serve very well for the Production of the divers Tones: but M. *Dodart* observes, that in that play of the Organ call'd the *humane Voice*, the longest Pipe is six Inches, and yet with all that length it does not make any difference of Tone, but the Tone of the Pipe is precisely that of the Plug; whereas the Concavity of the Mouth of a Man of the gravest Voice, not being above six Inches deep; 'tis evident that can't modify, vary, and give the Tone. See TUNE.

'Tis the Glottis, then, that forms the Tone, as well as the Sound; and the manner of forming the various Tones, is by varying its Aperture.—A piece of Mechanism too admirable not to be here particularly inquir'd into.

The human Glottis, then, represented in Tab. *Nat. Hist.* Fig. 11. is only capable of one proper Motion, viz. that of an Approach of its Lips, A D B and A B D.—Accordingly, the dotted Lines A E B, A F B, A G B, exhibit three different degrees of Approach.—These different Apertures of the Glottis, Anatomists usually attribute to the Action of the Muscles of the Larynx; but M. *Dodart* shews, from their Position, Direction, &c. that they have other Uses; and that the opening and shutting of the Glottis is effected by other means, viz. by two tendinous Cords, or Strings, inclosed in the two Lips of that Aperture.

In effect, each of the two semicircular Membranes, whose Intertice forms the Glottis, is doubled back upon it self; and within each Duplication is a Chord or String, which is fasten'd at one End to the fore-part of the Larynx, and to the hind-part at the other.—'Tis true, they appear more like Ligaments than Muscles; as consisting of white and membranous Fibres, not of red and fleshy ones: But the vast Number of minute Changes in this Aperture, necessary to form the vast Variety of Tones, make an extraordinary kind of Muscle, by whose Contraction they should be effected, absolutely necessary. Common fleshy Fibres, wherein the Blood is receiv'd in large quantity, had been infinitely too coarse for such delicate Motions.

These Strings, which in their State of Relaxation make each a little Arch of an Ellipsis; as they contract more and more, become longer, but less and less curve; and at last, with the greatest Contraction they are capable of, degenerate into two right Lines applied close to each other; so close and so firm, that an Atom of Air can't escape out of the Lungs, how full soever they may be, and how great an Effort soever all the Muscles of the lower Venter may make against the Diaphragm, and by the Diaphragm against these two little Muscles.

The different Apertures of the Lips of the Glottis, then, produce all the different Tones in the six Parts of Musick, viz. *Bass*, *Common pitch*, *Tenor*, *Counter-tenor*, *Treble-Bass*, and *Treble*; and the Manner is thus:

The *Voice*, we have shewn, can only be form'd by the Glottis; but the Tones of the *Voice* are Modifications of the *Voice*; and can only be produced by the Modifications of the Glottis.—Now the Glottis is only capable of one Modification, which is, the mutual Approach or Recess of its Lips: 'Tis this, therefore, produces the different Tones.—Now that Modification includes two Circumstances: the first, and principal, is, that the Lips are stretch'd more and more, from the lowest Tone to the highest; the second is, that the more they are stretch'd, the nearer they approach.

From the first it follows, that their Vibrations will be so much the quicker, as they come nearer their highest Tone; and that the *Voice* will be just when the two Lips are equally stretch'd, and false when unequal; which agrees perfectly well with the Nature of string Instruments.

From the second it follows, that the higher the Tones are, the nearer will they approach each other; which agrees perfectly well with Wind Instruments, govern'd by Reeds, or Plugs.

The Degrees of Tension of the Lips, are the first and principal Cause of Tones; but their Differences are insensible.—The degrees of Approach, are only Consequences of that Tension; but their Differences are more easily assign'd.

To give a precise Idea of the thing, therefore, we had best keep to that; and say, that this Modification consists in a Tension, from whence results a very numerous Subdivision of a very small Interval; which yet, small as it is, is capable, physically speaking, of being subdivided infinitely. See DIVISIBILITY.

This Doctrine is confirm'd from the different Apertures found in dissecting Persons of different Ages of both Sexes.—The Aperture is less, and the exterior Canal always shallower in the Sex and Ages fittest to sing Treble.—Add, that the Reed of a Hautboy, separated from the Body of the

Instrument, being a little press'd between the Lips, will yield a Tone somewhat higher than its natural one; and if press'd still more, will yield another still higher: Aod thus an able Musician may run successively thro' all the Tones and Semitones of an Octave.

'Tis different Apertures, then, that produce, or at least accompany different Tones, both in Natural Wind Instruments, and Artificial ones; and the Diminution of the Aperture, raises the Tones both of the Glottis and the Reed.

The Reason why lessening the Aperture heightens the Tone, is, that the Wind passes thro' it with the greater Velocity; and from the same Cause it is, that if any Reed, or Plug of an Instrument be too weakly blown, its Tone will be lower than ordinary.

Indeed, the Contractions and Dilatations of the Glottis, must be infinitely delicate: By an exact Calculation of the ingenious Author above-mention'd, it appears, that to perform all the Tones and Semitones of a common *Voice*, which is computed to reach to 12 Tones to perform all the Particles and Subdivisions of those Tones, into Commas and other minute or still sensible Parts; to perform all the Shades, or the Differences in a Tone when sounded more or less strong, without changing the Tone: the little Diameter of the Glottis, which does not exceed  $\frac{1}{16}$  of an Inch, but which varies within that Extent at every Change, must be actually divided into 9632 Parts; which Parts are yet very unequal, and therefore many of 'em much less than the  $\frac{1}{16}$  Part of an Inch.—A Delicacy scarce to be match'd by any thing but a good Ear, which has for just a Scale of Sounds, as, asked, to perceive Differences in all these Tones; even those whose Origin is much less than the 963200th Part of an Inch. See HEARING.

VOICE, in Grammar, is a Circumstance in Verbs, whereby they come to be consider'd as either *active* or *passive*, i. e. either as expressing an Action impress'd on another Subject, as *I beat*; or receiving it from another, as *I am beaten*. See VERB; see also ACTIVE, and PASSIVE.

VOICE, in Matters of Elections, denotes a *Vote*, or *Suffrage*. See VOTE, &c.

In this Sense, a Man is said to have a *deliberate Voice*, when he has a Right to give his Advice and Opinion in a Matter of debate, and his Suffrage is taken.—An *active Voice*, when he gives his Vote for the Election of any one; and a *passive Voice*, when the Suffrages may fall on him to be elected.—An *excitatory Voice*, when he may act to procure another to be elected.—A *consultative Voice*, when he can only offer Reasons and Remonstrances, wherein the Chief or Head determines at his own Discretion: Such the Cardinals have, with regard to the Pope; the Masters of Chancery, with regard to the Lord Chancellor, &c.

VOID Space, in Physics. See VACUUM.

VOID, in Common Law. See ANNULLING.

VOIDANCE, VACANCY, in the Canon Law, a Want of an Incumbent upon a Benefice. See VACANCY, &c.

This is twofold, either in *Law*, or *de Jure*; as when one holds several Benefices that are incompatible; or *de Facto*, in *Dead*; as when the Incumbent is dead, or actually depriv'd.

VOIDED, UTTER, in Heraldry, is understood of an Ordinary whose inner or middle Part is cut out; leaving nothing but its Edges to show its Form; so that the Field appears thro' it.

Hence it is needless to express the Colour or Metal of the *voided Part*; because it must of course be that of the Field.

Thus, the *Cross voided* differs from the *Cross flimbriated*, in that this latter does not shew the Field thro' it, as the other does.—And the same is used in other Ordinaries.

VOIDER, in Heraldry, one of the Ordinaries, whose Figure is much like that of the Flaque, or Flanch; only that it doth not bend so much. See FLANCH.

This Armoury, they say, is properly the Reward of a Gentlewoman that has well served her Prince.—It is always born by Pairs.

VOIDING, in Medicine. See EVACUATION.

In the *Philosophical Transactions*, we have an account of one *Matt. Milford*, who voided a Worm by Urine, supposed to have come from the Kidneys. See WORMS.

Dr. *Lifter* mentions true Caterpillars voided by a Boy of nine Years old.—Mr. *Jessop* saw Hexapods vomited up by a Girl.

*Caterina Geilaris*, who dy'd in 1662, in the Hospital of *Altenburg*, for 20 Years voided by Vomit and Stool, Toads, and Lizards. *Ephem. German.* T. I. Obs. 103.

In the same *Ephem.* is an Instance of a Kitten, bred in the Stomach, and vomited up.—Of Whelps, Frogs, *Lacerta Aquatica*, and other Animals, bred the like way.—*Bartolomeo* gives us an Instance of a Worm, bred in the Brain, and voided by the Nose of *O. W.* See VERMES.

VOIR DIRE, in Law.—When, upon a Trial at Law, it is prayed that a Witness may be sworn upon a *Voire dire*; the

the meaning is, he shall upon his Oath speak or declare the Truth, whether he shall get or lose by the Matter in Controversy.—If he be unconcern'd, his Testimony, is allow'd; otherwise, not. See OATH, WITNESS, &c.

VOL, among the French Herald, signifies the two Wings of a Fowl born in Armoury as being the whole that makes the Flight: Accordingly, a *Demoiselle* is a single Wing.

VOLA, the Palm of the Hand. See HAND.

VOLANT, in Heraldry, is when a Bird in a Coat of Arms is drawn flying, or having its Wings spread out.

VOLATILE, in Physicks, is commonly used to denote a mix'd Body whose integral Parts are easily dissipated by Fire, or other heat; but is more properly used for Bodies whose Elements, or first component Parts, are easily separated from each other, and dispers'd in Air. See BODY, COMBUSTION, ELEMENT, &c.

For, as any mix'd Body is said to be fix'd in a double Sense; so may it be said to be *volatile* two ways: whence the same Body, e. g. Mercury, is both *volatile* and *fix'd* at the same time.

Since, as its integral Parts, or those which still retain the Nature of Mercury, are easily separable by Fire, and readily fly away; it is said to be *volatile*: And yet as 'tis very difficult to destroy its Contexture, and resolve it by Fire, or any other Menstruum, into its first Elements, it is said to be *fix'd*.—The same may be said of Sulphur, Antimony, &c.

Minerals, for the generality, are less *volatile* than Vegetables, and Vegetables less than Animals. See *Fix'd*.

The Chymists distinguish between *volatile* Salts, and *fix'd* Salts. See SALTS.

The Capitals of Alchemicks stop and collect the *volatile* Parts of Substances in Sublimation; and make what we call *Flowers*. See FLOWERS.

The Particles of Fluids which do not cohere very strongly together, and are of such Smallness, as renders them most susceptible of those Agitations which keep Liquors in a Fluor, are easily rarify'd into Vapour; and, in the Language of the Chymists, are *volatile*.—Those which are grosser, and so less susceptible of Alterations; or cohere by a stronger Attraction, do not evaporate without a stronger Heat, or perhaps not without Fermentation: These are what the Chymists call *Fix'd Bodies*. Newton. *Optic*. P. 371.

VOLATILE, in Chymistry.—When the Fire decomposes any mix'd Body, the Parts most disposed to receive a great Motion, are soonest loosen'd, and rise up in the Order which the differences of that Disposition give them; the rest remaining immovable at the bottom of the Vessel. See ANALYSIS, FIRE, &c.

Those that rise first, are called *volatile* Parts; such are Phlegm, Oil, Spirit, and Salts, both urinous and alkaline. See SPIRIT, PHEGOM, and SALT.

The Parts remaining, viz. Earth, and Lixivial Salts, are call'd *fix'd*. See EARTH, and VOLATILISATION.

For the making of *fix'd* Salts volatile; see VOLATILISATION.

VOLATILISATION, the Act of rendering *fix'd* Bodies *volatile*; or of resolving 'em by Fire into a fine, subtle Vapour, or Spirit, which easily dissipates, and flies away. See VOLATILE.

All Bodies, even the most *fix'd*, as Gold may be *volatile*; either of themselves, or with the Admixture of some *volatile* Substance, or Spirit; by Distillation, or Sublimation. See DISTILLATION, and SUBLIMATION; see also GOLD, BURNING-GLASS, &c.

In the *Memoirs of the French Academy*, we have a Discourse on the *Volatilisation of the fix'd Salts of Plants*, by M. Homberg.—That admirable Chymist, it seems, by an odd Accident, found *fix'd* Salts spontaneously *volatile* in Soap: Now Soap, we know, is a Composition of Oil, and the alkaline lixivial Salts of the Plant *Kali*.—Upon this, M. Homberg conjectur'd, that the Oil from which the *volatile* Salts seem to derive their Volatility, being intimately mix'd with the *fix'd* Salts of the *Kali* in the Soap, had render'd them *volatile*: So that they cease to be Alkaline, by reason their Pores are now fill'd with the Oil which they have absorb'd.—Oil, in effect, has always somewhat of an Acid in it; which Acid, being join'd to the Alkali, the whole is render'd a kind of intermediate Salt; which yet, as the Acid and Alkali were only join'd by means of the Oil, is still oily or sulphurous.

In consequence of this View, he made divers chymical Operations, whereby he found, that to dispose the *fix'd* Salts of Plants to *volatilise*, the Process is to be begun by making them into a Sapa, and letting that Sapa shoot out little saline Points, or Crystals on its Surface; which Crystals are no other than *fix'd* Salts already *volatile*.—Then, the Remainder of the Matter is to be set over the Fire, after being well imbib'd and penetrated by some new Liquor, proper to assist in a new Sublimation of more *fix'd* Salts to be *volatile*: and this to be repeated till no more Salts will rise.

The Choice of the Liquor wherewith the Sapa is to be saturated, is not indifferent—Water is, of all other, the least fit for the Effect: Oil does well; yet distill'd Oil better than that drawn from Expression; and Spirit of Wine best of all.

By such means, M. Homberg *volatiliz'd* almost half a Quantity of Salt of Tartar, which is a *fix'd* Vegetable Salt. See TARTAR.

VOLATILITY. See SUBLIMATION.

VOLCANO, or VULCANO, in Natural History, a Name given to Mountains that belch, or vomit Fire, Flame, Ashes, Clouds, Stones, &c. See MOUNTAIN.

Such are Mount *Arma* in Sicily, Mount *Vesuvius* near Naples, &c. See ERUPTION.

Near *Guatemala* in South America, are two Mountains, the one call'd *Volcano of Fire*; the other of *Water*.—Out of the first, huge pieces of Rocks are frequently hurl'd with as much vehemence as Balls out of a Canon; and a written Letter may be read by the Light of its Flames, at the distance of three Miles.

Out of the other, vast Quantities of Water are continually spud up. See EARTHQUAKE.

*Volcanos* and *Iguivomous* Mountains, the some of the most terrible Phenomena in Nature, have their Uses; being a kind of Spinnacles, or Tunnels, whereby to vent the Fire and Vapour, that would otherwise make a more dreadful Havock by Convulsions and Earthquakes.

Nay, if the Hypothesis of a central Fire and Waters, be admitted; these Outlets must be absolutely necessary to the Peace and Quiet of the terraqueous Globe.—Accordingly, Dr. Woodward observes, there is scarce any Country much annoy'd with Earthquakes, but has one of these fiery Vents; which are constantly observed to be all in Flames, whenever an Earthquake happens; by which means, they discharge that Fire, which while it was underground, was the Cause of the Disaster.—He adds, that were it not for these *Diverticula*, whereby the central Fire has an Exit, 'twould rage in the Bowels of the Earth much more furiously, and make much greater Havock than it does; and that there are not wanting Instances of Countries that have been wholly freed from Earthquakes, by the Eruption of a new *Volcano* there. See EARTHQUAKE.

VOLERY, a great Bird-Cage, so large, that the Birds have room to fly up and down in it. See AVIARY.

VOLITION, the Act of Willing. See WILL.

VOLLEY, a military Salute, made by discharging a great number of Fire-Arms at the same time.

In the *Philosophical Transactions*, Mr. Robert Clarke gives us an Account of a very remarkable Effect of firing some Volleys of small Shot: 'Upon proclaiming the Peace in 1697, two Troops of Horse were drawn in a Line, the Centre whereof was against a Butcher's Door, who kept a very large, courageous Mastiff Dog, the biggest in the Town.

Upon firing of the first Volley, the Dog, who before lay asleep by the Fire, started up, ran into an upper Room, and hid himself under the Bed.—The Servant being about to beat him down, (as he had never us'd to go up Stairs) a second Volley came; which made the Dog rise, run several times about the Chamber, with violent Tremblings, and strange Agonies.—But immediately a third Volley came; upon which the Dog run once or twice about, fell down, and died immediately; throwing out Blood at Mouth and Nose.'

VOLVO, in Antiquity, a Name which the Romans gave the Slaves, who, in the second *Punic* War, offer'd themselves to serve in the Army; upon a want of a sufficient Number of Citizens. See SLAVE.

The Names *Volvo*, *Volones*, they are said to have had from their offering themselves *voluntarily*.

*Festus* says, 'twas after the Battle of *Canne* that this happen'd: *Macrobius*, *Sat. Lib. I. cap. ii.* places it before that Battle.

*Capitolinus* tells us, that *Marcus Aurelius* form'd Troops or Legions of Slaves, which he call'd *Voluntarii*; and that the like Forces in the second *Punic* War had been call'd *Volones*.—But before *M. Aurelius*, *Augustus* had given the Name *Voluntarii* to Forces which he had raised out of *Liberti*, or Freedmen; as we are assur'd by *Macrobius*, *Sat. Lib. I. cap. ii.*

VOLUME, VOLUMEN, VOLUMEN, a Book, or Writing, of a just bulk to be bound by it self.

The Library of *Ptolemy* King of Egypt, contain'd, according to *Aulus Gellius*, three hundred thousand *Volumes*; and according to *Sabellicus*, seven hundred thousand. See LIBRARY.

*Raymond Lully* wrote above four thousand *Volumes*; wherof we have divers Catalogues extant.—'Tis held, that *Tristramus* wrote six thousand five hundred twenty five *Volumes*; others say, thirty six thousand five hundred twenty nine: But 'tis much more rational to suppose, with *la Croix*, that

that it was the Custom of the *Egyptians* to put all the Books they compos'd under the Name of *Trismegistus*.

The Word had its rise *a volendo*; the antient way of making up Books being in Rolls of Bark, or Parchment. See *ROLL*.

This manner lasted till *Cicero's* Time, and long after that Paper was invented, and Books wrote thereon.—The several Sheets were plac'd, or pass'd End to End, writ'd only on one side; and at the bottom a Stick fasten'd, call'd *Umbraticus*; and at the other end a piece of Parchment, whereon was the Title of the Book in Letters of Gold.

And yet, we are assur'd, King *Artaxas* had, long before, done up some of his Books in the Square form; as having found the Secret of Parchment, which would bear writing on both sides. See *PARCHMENT*.

At present, *Volume* is chiefly us'd in the same Sense with *Tom*, for a Part or Division of a Work, bound separately.—In this Sense, we say, the *Councils* are printed at the *Leisure* in 37 *Volumes*. See *TOME*.

The *VOLUME* of a *Body*, is sometimes also us'd among Philosophers, for its *Bulk*, or the Space inclos'd within its Superficies.

*VOLT*, in the *Manege*, signifies a round or circular Motion, consisting of a Gate of two Treads, made by an Horse going sideways round a Centre; the two Treads marking parallel Tracks, one by the Fore feet, larger; and the other by the Hind feet, smaller: the Shoulders bearing outwards, and the Croup approaching towards the Centre.

*Demi-VOLT*, is a Round of one Tread, or two, made by the Horse at one of the Angles or Corners of the *Volt*, or at the End of the Line of the Passade; so as when he is near the End of this Line, or near one of the Corners of the *Volt*, he changes Hands, to return by a Semicircle.

A *Reverber'd VOLT*, is a Track of two Treads, which the Horse makes with his Head to the Centre, and his Croup out; going sideways upon a Walk, Trot, or Gallop, and tracing out a larger Circumference with his Shoulders, and a smaller with his Croup.

*VOLUMUS*, in Law, the first Word of a Clause in the King's Writs of Protection, and Letters Patent. See *PROTECTION*.

*VOLUNT*, in Law, is when the Tenant holds Lands, &c. at the Will of the Lessor, or Lord of the Manor. See *TENANT*, *VASSAL*, &c.

*VOLUNTARY*, in the Schools.—The generality of Philosophers use *Voluntary* in the same Sense with *Spontaneous*; and apply it to any thing arising from an internal Principle, attended with a due Knowledge thereof.—In which Sense, they say, a Dog moves *Voluntarily* when he runs to the Pot. See *SPONTANEOUS*.

*Aristotle* and his Followers, restrain the Term *Voluntary* to those Actions that proceed from an inward Principle which knows all the Circumstances of the Action.

There are two Things, therefore requir'd to the *Voluntariness* of an Action: The first, that it proceed from an inward Principle; thus, walking for pleasure sake is a *Voluntary* Action; as arising from the Will commanding, and the moving Faculty obeying, which are both internal.—On the contrary, the Motion of a Man drag'd to Prison is not *Voluntary*.

The second, that the Action be perform'd with a perfect Intelligence of the End, and Circumstances thereof: In which Sense, the Actions of Beasts, Children, sleeping People, &c. are not properly *Voluntary*. See *WILL*.

Anatomists distinguish between the *Voluntary*, and *Natural*, or *Involuntary Motions* in the Body: Of the first Kind are those of the Heart, Lungs, Pulse, &c. See *MUSCULAR Motion*.

*VOLUTE*, *VOLETA*, in Architecture, a kind of Scroll, or spiral Contortion, us'd in the *Ionic* and *Composite Capitals*; whereof it is the principal Character and Ornament. See *CAPITAL*.

Some call it the *Ram's-Horn*, from its Figure, which bears a near resemblance thereto.

Most Architects suppose, that the Antients intended it to represent the Bark or Rind of a Tree, laid under the Abacus, and twist'd thus at each Extreme where it is at Liberty: Others will have it a sort of Pillow, or Bolster laid between the Abacus and Echinus, to prevent the latter being broke by the Weight of the former, and the Entablature over it; and accordingly call it *Pulvinus*.

Others, after *Vitruvius*, will have it to represent the Curls or Tresses of a Woman's Hair. See *IONIC Order*.

There are also eight angular *Volutes* in the *Corinthian Capital*, accompany'd with eight other smaller ones, called *Helices*.

There are several Diversities in the *Volute*.—In some, the Lift or Edge, throughout all the Circumvolutions, is in the same Line, or Plane: such are the antique *ionic Volutes*, and those of *Vignola*.—In others, the Spires or Circumvolutions fall back; in others project, or stand out.—Again, in some the Circumvolutions are oval; in others, the Canal of one Circumvolution is detach'd from the Lift of another, by a Vacuity or Aperture.—In others, the Round is parallel to the

Abacus, and springs out from behind the Flower thereof.—In others, it seems to spring out of the Vase, from behind the *Orum*, and rises to the Abacus, as in most of the fine *Composite Capitals*.

Consols, Modillions, and other sorts of Ornaments, have likewise their *Volutes*. See *CONSOL*, &c.

The *Volute* is a Part of great Importance to the Beauty of the Column.—Hence Architects have invented divers ways of delineating it.—The principal are that of *Vitruvius*, which was long us'd, and at last restor'd by *Gouldman*; and that of *Palladio*.—*Daviler* prefers the former as the easier.—The manner thereof is as follows.

Divide the Altitude A B, (Tab. *Architect.*, Fig. 12 *Volute*) into eight equal Parts, and assuming the Fifth Q P, for a Diameter, from the Centre G, with half the Diameter G P, describe a Circle for the Eye of the *Volute*.—Bisect the Radii G P and G Q in 1 and 4, and subdivide the half Parts G 1 and G 4 each into three equal Parts: Then, upon the right Line 1 4, construct a Square 1 2, 3, 4; one of whose Sides 2, 3, coincide on to D; another 3, 4, to E; and the third 1, 2, to C. From G draw right Lines, G 2 and G 3; which divide into three equal Parts.—Then, thro' 6 and 10, draw 6 L and 10 N, parallel to 2 D. And thro' 11 and 7 draw 11 O and 7 K, parallel to 3 E; and thro' 5 and 9 draw 5 H, and 9 M, parallel to 1 C.—Lastly, from 12, 11, 10, 9, 8, &c. strike the Quadrants P O, O N, N M, M L, L K, &c. which will form the *Volute*.

*VOLVULUS*, in Medicine, a Latin Name, which some Authors have given to a Disease otherwise call'd the *Riue Passion*; and by others the *Miserere mei*. See *LIAC PASSION*, &c.

'Tis a kind of Cholice, wherein the Patient voids his Excrements by the Mouth, instead of the *Anus*; by reason the Membranes of the Intestine *Ileon* are drawn within one another, and form Knots, which prevent the ordinary Course of the *Feces*. See *CHOLICE*.

*VOMER*, in Anatomy, a Latin Name, signifying, literally, a *Ploughshare*; us'd by Authors to denote the eleventh Bone of the upper Jaw: by reason of the Resemblance it bears to that Utensil. See *MAXILLA*.

The *Vomer*, or *Vomer Aratri*, is a thin Bone, placed in the middle of the Nose, over the Palate, serving in part the two Nostrils from each other. See *NOSTRIL*.

'Tis small, but hard, and is join'd to the *Sphenoides* and *Ethmoides*, which have each of them little Eminences that are received into the Cavities of the *Vomer*; by which means it is fasten'd in its Place. See *NOSE*.

*VOMICA*, in Medicine, a Collection of Pus in any Part of the Body. See *PUS*.

When this Mias or Collection is in the Lungs, 'tis call'd *Vonica Pulmonum*—When in the Kidneys, *Vonica Reunum*, &c. See *LUNGS*.

The *Vonica* of the Lungs differs from an *Empyema*, which is a Collection of Pus in the Cavity of the Thorax. See *EMPYEMA*.

*Nux Vomica*, *Vomiting Nut*, is a little round, flat, woody fruit, half the bigness of a Farthing; hard as Horn, of a Mosic-colour without, but of various Colours within: sometimes yellow, sometimes white, and sometimes brown.

'Tis not known what the Plant is that bears it.—'Tis a Poison for Dogs, and divers Quadrupeds, which it kills presently, thro' excessive Vomiting. See *POISON*.

*VOMITING*, *VOMITUS*, the Act of casting up, or evacuating by the Mouth what is contain'd in the Stomach. See *EVACUATION*.

This Action has been generally allow'd to be owing principally, to the Contraction of the Fibres of the Stomach, when irritated by the acrimonious Quality, or oppress'd with the Quantity, of its Contents. See *STOMACH*.

But M. *Chirac*, and after him M. *du Vernay*, and others, set aside the Fibres of the Stomach; and advance, That Vomiting is produced wholly by the extraordinary Motions of the Diaphragm, and the Muscles of the lower Venter.—So that the Stomach is here supposed destitute of all Action, and casts back its Contents only by its being compress'd and flattd, from some foreign and accidental Causes.

However, *Borhaave*, and most of our latest Writers, allow both the Stomach, the Diaphragm, and the Muscles of the Abdomen, to have their share in the Action of Vomiting: Accordingly, that excellent Author makes Vomiting to consist in a convulsive and retrograde Motion of the muscular Fibres of the Gullet, Stomach, and Intestines; as well as those of the Abdomen, and the *Septum Transversarium*; which, when in a less degree, produce a *Nausea*, and in a greater a Vomiting. See *NAUSEA*.

By the Contraction of so many Parts, the Stomach comes to be squeez'd, as in a Press; whence it is obliged to give up what is contain'd in its Cavity, and the neighbouring Parts; just as Water is in a Bladder or Sponge, when squeez'd between the Hands.

The Evacuation, too, must be upwards, rather than downwards; by reason the Passage is more open and easy that way,

way, and that the Intestines are pres'd by the Diaphragm, and the Muscles of the lower Venter.

The primary Cause of Vomiting, uses to be the too great Quantity, or too much Acrimony of the Contents, arising from Poisons, Contusions, Compressions, Inflammations, and Wounds in the Brains, Inflammations of the Diaphragm, Stomach, Intestines, Spleen, Liver, Kidneys, Pancreas, and Mesentery; unusual Agitations in Coaches, at Sea, &c. and vomitive or emetic Medicines. See Emetics.

VOMITIVE, or Vomiting Medicines. See Emetics.

VOPISCUS, a Latin Term, used in respect of Twins in the Womb, for that which comes to the perfect Birth. See TWINS.

VORTEX, *Whirlwind*, in Meteorology, a sudden, rapid, violent Motion of the Air, in Gyres or Circles. See WHIRLWIND.

VORTEX, *Vorsage*, is also used for an Eddy, or Whirlpool; or a Body of Water in certain Seas and Rivers, which runs rapidly around, forming a flat of Cavity in the middle.

The ordinary Cause of these Vortices, is a Gulph, or Outlet, whereby the Water of the Sea, &c. is absorbed, or precipitates itself into some other Receptacle; sometimes to some other communication Sea, and sometimes, perhaps, into the vast Abyss of central Water. See WHIRLPOOL, and ABYSS.

An artificial Vortex, expressive of the Phenomena of the natural ones, may be made with a cylindric Vessel, placed, immovable, on a horizontal Plane, and fill'd to a certain height with Water.—In this Water a Stick being plunged, and turn'd round as briskly as may be, the Water is necessarily put into a pretty rapid circular Motion, and rises to the very Edge of the Vessel, and when there arrived, ceases to be further agitated.

The Water thus rais'd forms a Cavity in the Middle, whose Figure is that of a truncated Cone; its Base is the same with the upper Cavity of the Vessel, and its Vertex in the Axis of the Cylinder.

What raises the Water at the side of the Vessel, which occasions the Cavity in the Middle, is its centrifugal Force.—For the Motion of the Water being circular, it respects a Centre taken in the Axis of the Vessel, or, which is the same, in the Axis of the Vortex form'd by the Water; the same Velocity, then, being impos'd on all the Water, the Circumference of a smaller Circle of Water, or a Circle less remote from the Axis, has a greater centrifugal Force than another that is greater, or more remote from the Axis. The smaller Circle therefore drives the greater towards the side of the Vessel, and from this Pressure or Impulsion which all the Circles receive from the smaller ones that precede them, and convey to the greater which follow them, arises that Elevation of the Water along the Edge of the Vessel to the very top, where we suppose the Motion to cease.

With a Vortex thus form'd, M. *Sauvion*, of the Royal Academy of Sciences, made divers Experiments by putting several solid Bodies thereto, to acquire the same circular Motion; with Intent to discover which of them, in making their Revolutions round the Axis of the Vortex, approach towards, or recede from it, and with what Velocity.—The Result was, that the heavier the Body, still the greater was its Recede from the Axis.

M. *Sauvion's* View in this Attempt, was to shew how the Laws of Mechanics produce the celestial Motions; and that it is probably to those Motions that the Gravity or Weight of Bodies is owing.—But, unhappily, the Experiments shew just the contrary of what they should do, to confirm the Cartesian Doctrine of Gravity. See GRAVITY.

VORTEX, in the Cartesian Philosophy, is a System or Collection of Particles of Matter moving the same way, and round the same Axis.

Such Vortices are the Grand Machines whereby these Philosophers solve most of the Motions and other Phenomena of the heavenly Bodies.—Accordingly, the Doctrine of these Vortices makes a great part of the Cartesian Philosophy. See CARTESIANISM.

The Matter of the World, they hold to have been divided at the Beginning into innumerable little equal Particles, each endow'd with an equal Degree of Motion, both about its own Centre and separately, so as to constitute a Fluid. See FLUID.

Several Systems, or Collections of this Matter, they further hold to have been endow'd with a Motion about certain Points, as common Centres, placed at equal Distances; and that the Matters moving round these, compos'd into many Vortices.

Then, the primitive Particles of Matter they suppose, by these intestine Motions, to be as it were ground into spherical Figures, and so to compose Globules of divers Magnitudes; which they call the Matter of the Second Element; and the Particles rubb'd or ground off them, to bring them to that Form, they call the Matter of the First Element. See ELEMENT.

And since there would be more of this First Element than would suffice to fill all the Vacuities between the Globules of the Second, they suppose the remaining Part to be driven towards the Centre of the Vortex, by the circular Motion of

the Globules; and that being there amass'd into a Sphere; it would produce a Body like the Sun. See SUN.

This Sun being thus form'd, and moving about its own Axis with the common Matter of the Vortex, would necessarily throw out some Parts of its Matter, thro' the Vacuities of the Globules of the Second Element constituting the Vortex; and this especially at such Places as are farthest from its Poles; receiving, at the same time, in by these Poles, as much as it loses in its equatorial Parts. And by this means it would be able to carry round with it those Globules that are nearest, with the greater Velocity, and the remoter, with less. And by this means those Globules which are nearest the Centre of the Sun must be least; because were they greater, or equal, they would, by reason of their Velocity, have a greater centrifugal Force, and recede from the Centre. See LIGHT.

If it should happen that any of these Sun-like Bodies in the Centres of the several Vortices, should be so incrustated and weakened, as to be carried about in the Vortex of the true Sun; if it were of less Solidity, or had less Motion than the Globules towards the Extremity of the Solar Vortex; then it would descend towards the Sun, till it met with Globules of the same Solidity, and capable of the same Degree of Motion with itself; and thus, being fix'd there, it would be forever after carried about by the Motion of the Vortex, without either approaching any nearer to, or receding from the Sun; and so become a Planet. See PLANET.

Supposing then all this, we are next to imagine that our System was at first divided into several Vortices, in the Centre of each of which was a lucid spherical Body; and that some of these being gradually incrustated, were swallowed up by others which were larger and more powerful, till at last they were all destroy'd and swallow'd up by the biggest Solar Vortex, except some few which were thrown out in right Lines from one Vortex to another, and so became Comets. See COMET.

But this Doctrine of Vortices, is at best merely hypothetical.—It does not pretend to shew by what Laws and Means the celestial Motions are really effected, so much as by what Means they possibly might, in case it should have so pleas'd the Creator.—But we have another Principle which accounts for the same Phenomena as well, nay better than that of Vortices; and which we plainly find has an actual Existence in the Nature of Things: And this is Gravity, or the weight of Bodies. See GRAVITY.

The Vortices, then, should be cast out of Philosophy, were it only that two different adequate Causes of the same Phenomena are inconsistent. See NEWTONIAN Philosophy.

But we have other Objections against it.—For 1<sup>o</sup>, If the Bodies of the Planets and Comets be carried round the Sun in Vortices, the Bodies of the Parts of the Vortex immediately investing 'em, must move with the same Velocity, and in the same Direction; and besides, must have the same Density, or the same *vis Inertiae*.—But it is evident, that the Planets and Comets move in the very same Parts of the Heavens with different Velocities, and in different Directions. It follows, therefore, that those Parts of the Vortex must revolve at the same time in different Directions, and with different Velocities; since one Velocity and Direction will be required for the Passage of the Planets, and another for that of the Comets.

2<sup>o</sup>, If it were granted, that several Vortices are contain'd in the same Space, do penetrate each other, and revolve with divers Motions; since these Motions must be conformable to those of the Bodies, which are perfectly regular, and perform'd in Conic Sections; it may be ask'd, How they should have been preserv'd entire so many Ages, and not disturb'd and confounded by the adverse Actions and Shocks of so much Matter as they meet withal?

3<sup>o</sup>, The Number of Comets is very great, and their Motions perfectly regular, observing the same Laws with the Planets, and moving in conical Orbits, that are exceedingly eccentric. Accordingly they move every Way, and to all Parts of the Heavens, freely pervading the planetary Regions, and going frequently contrary to the Order of the Signs; which were impossible, unless these Vortices were away.

4<sup>o</sup>, If the Planets moved round the Sun in Vortices, those Parts of the Vortices next the Planets, we have already observed, would be equally dense with the Planets themselves: Consequently the vortical Matter contiguous to the Perimeter of the Earth's Orbit, would be as dense as the Earth itself: And that between the Orbits of the Earth and Saturn, must be as dense, or denser.—For a Vortex cannot maintain itself, unless the more dense Parts be in the Centre, and the less dense towards the Circumference: And since the periodical times of the Planets are in a squisulterate Ratio of their Distances from the Sun, the Parts of the Vortex must be in the same Ratio. Whence it follows, that the centrifugal Forces of the Parts will be reciprocally as the Squares of the Distances.—Such, therefore, as are at a greater distance from the Centre, will endeavour to recede therefrom

from with the less Force. Accordingly, if they be less dense, they must give way to the greater Force, whereby the Parts nearer the Centre endeavour to rise. Thus, the more dense will rise, and the less dense descend; and thus there will be a change of places, till the whole fluid Matter of the *Vortex* be so adjusted, as it may rest in *æquilibrium*.

Thus will the greatest part of the *Vortex* without the Earth's Orbit, have a Degree of Density and Inactivity not less than that of the Earth itself.—Whence the *Comets* must meet with a very great resistance; contrary to all Appearances. *Cotes. præf. ad Newton. princip.* See *COMET*, *RESISTANCE*, *MEDIUM*, &c.

The Doctrine of *Vortices*, Sir *I. Newton* observes, labours under many Difficulties: For a *Planet* to describe Areas proportional to the Times, the periodical Times of the *Vortex* should be in a duplicate Ratio of their Distances from the Sun; and for the periodical Times of the *Planets* to be in a sesquialterate Proportion of their Distances from the Sun, the periodical Times of the Parts of the *Vortex* should be in the same Proportion of their Distances; and, lastly, for the lesser *Vortices* about *Jupiter*, *Saturn*, and the other *Planets*, to be preserved and swim securely in the Sun's *Vortex*, the periodical Times of the Parts of the Sun's *Vortex* should be equal.—None of which Proportions are found to obtain in the Revolutions of the Sun and Planets a-round their Axes. *Phil. Nat. prin. Math. apud Schol. Gen. in Calc.*

Besides, the *Planets*, according to this Hypothesis, being carried about the Sun in Ellipses, and having the Sun in the *Umbilicus* of each Figure, by Lines drawn from themselves to the Sun, do always describe Areas proportionable to the Times of their Revolutions; which that Author shews the Parts of no *Vortex* can do. *Schol. Prop. ult. lib. 2. Princip.*

Again, Dr. *Keil* proves in his Examination of *Barnet's Theory*, That if the Earth were carried in a *Vortex*, it would move faster in the Proportion of 3 to 2, when it is in *Virgo*, than when it is in *Pisces*; which all Experience proves to be false.

**VOTE**, or *Voice*. See *SUFFRAGE*, and *VOICE*.

—In the House of Peers they give their *Votes* or *Suffrages*, beginning at the *Puisne* or lowest Baron, and so to the rest seriatim, every one answering, a-part, *Content* or *non Content*; 3 and if the Affirmatives and Negatives are equal, *seniper præsumitur pro negante*; the Speaker having no casting *Vote* unless he be a Peer.

In the House of Commons they Vote by *Yea's* and *No's*, promiscuously. See *PARLIAMENT*.

**VOTUM**, in our ancient Law-books, is used for *Nuptie*; so *Dies votorum*, is the Wedding-day, *Pleta*, lib. 4. cap. 2. par. 16. *Si donatorius ad alia vota convolverit*, &c.

**VOTUM**, or *Vote*. See *VOU*.

**VOUCH**,—A Person is said to *Vouch* for another, when he undertakes to maintain or warrant him in a thing, or passes his Word in his behalf.

In Law, to *Vouch*, is to call such Person or *Vouches* into Court, to make good his Warrant. See *WARRANT*.

**VOUCHEE**, a Person who is to warranty, or *Vouch* for another, who in respect hereof is call'd *Voucher*. See *VOUCHER*.

**VOUCHER**, in Law, the Tenant who calls another Person into Court, bound to warranty him, and either to defend the Right against the Demandant, or to yield him other Lands, &c. to the value. See *WARRANT*.

This seems in some measure to agree to the Contract, in Civil Law, whereby the Vendee binds the Vendor, sometimes in the Simple Value of the Things bought, sometimes in the Double; to warrant the secure enjoying of the Thing bought.

Yet there is this Difference between the Civil and Common Law in this Point, That the Civil Law binds every Man to warrant the Security of that which he sellth; which the Common Law doth not, unless it be specially covenanted.

The Process whereby the *Vouchee* is call'd, is a *Summons ad Warrantandum*; and if the Sheriff return upon that Writ, that the Party hath nothing whereby he may be summon'd, then goes out another Writ call'd, *Sequentur sub suo periculo*.

A Recovery with a single *Voucher*, is when there is but one *Voucher*; 3 and with a double *Voucher*, is when the *Vouchee* voucheth over; and for a treble *Voucher*. See *RECOVERY*.

There is also a foreign *Voucher*, when the Tenant is impleaded in a particular Jurisdiction of that Court; more pertinently call'd a *Voucher of a Foreigner*.

**VOUCHER**, also signifies a Ledger-book, or Book of Accounts, wherein are enter'd the Warrants for the Accomptant's Discharge. See *BOOK-KEEPING*.

**VOUSSOIR**, *Vault-stone*, in Architecture, a Stone proper to form the sweep of an Arch, being cut somewhat in manner of a truncated Cone, whose Sides, were they prolonged, would terminate in a Centre, to which all the Stones of the Vault are directed. See *VAULT*.

**VOW**, *Votum*, a solemn Promise or Offering of a Man's self to God. See *OATH*.

A Person is constituted a Religious by taking three *Vows*, that of Poverty, that of Chastity, and that of Obedience. See *RELIGIOUS*.

Authors are divided as to the Antiquity of these *Vows*.—'Tis agreed, the ancient Anchorites, and Hermits of the *Thebæide* made none; they did not consecrate themselves to God by an indissoluble Obligation, but were at liberty to quit their Retirement, and return into the World, whenever the Fervor that drove 'em out of it, came to abate. See *ANCHORITE*, &c.

*Vows* were not introduced till long after; and that, to fix the too frequent Inconstancy of such as, after retiring from the World, repeated themselves too soon, or too lightly; and by that means scandaliz'd the Church, and disturb'd the Quiet of Families by their Return.

*Erasmus* will have it, that solemn *Vows* were not introduced till the thirteenth Century, under the Pontificate of *Boniface VIII.*—Others hold 'em as ancient as the Council of *Chalcedon*: But the Truth is, before *Boniface VIII.* there were none but simple *Vows*, and such as might be dispensed withal.—Their *Vows*, till that time, were not deem'd eternal Chains; they were not indissoluble. 'Tis true, they were obligatory Promises, as to Conscience, and the Inconstancy of such as violated them was held an odious Desertion: But as to Law, the Persons were not held to be civilly dead, so as, upon their Return, to render 'em incapable of all Acts of civil Society.

The most common *Vow* was that of Poverty, but this only regarded the Convent, on account of which every Person divested himself of all Property; but the making of *Vows* did not at all exclude 'em from the Rights of Blood, or render 'em incapable of Inheriting.

No Religious, 'tis true, acquired the Property of the Estates that fell to him; they all belong'd to the Monastery, in favour of which he had divested himself of every thing; and the Monastery only left him the Use and Direction of them.—The Popes have frequently confirm'd this Privilege to divers Orders, and permitted the Monks to inherit as much as if they were Seculars, and had made no *Vows*.

At present, the civil Death of a Religious is dated from the Day he makes the *Vow*; and from that time he is utterly incapable of inheriting.—A Religious may reclaim, or protest against his *Vow* within five Years; but, after that, 'tis no longer admitted.—The Failures in the Profession are esteem'd to be purged by his Silence and Perseverance for five Years.—Indeed, to be reliev'd from his *Vow*, 'tis not enough the Party reclaim within the five Years; but he must likewise prove, he was forced to take the Habit.

*Vows*, *Vota*, among the *Romans*, signify the Sacrifices, Offerings, Presents, and Prayers, made for the Emperors and *Cæsars*, particularly for their Prosperity, and the Lastingness of their Empire.

These were, at first, made every five Years, then every fifteen, and then every thirty, call'd *Quinquennialia*, *Decennialia*, and *Vicennialia*.

In divers antique Medals and Inscriptions, we read, *Vot. X. Vic. XX. Vic. mult.* signifying *Voti Decennialibus, Vicennialibus, Multis*, &c.

**VOTIVE Medals**, are those whereon the *Vows* of the People for the Emperors or Emperresses are express'd. See *MEDAL*.

The Public *Vows*, made every five, ten, or twenty Years, are more often found round the Edges of the Medal, than on the Faces thereof, at least in the Western Empire; for in the Eastern the Case is different; witness the Medal of *M. Aurelius* the younger, where the Reverse represents the *Vows* made at the time of his Marriage, *VOTA PUBLICA*. And on Greek Medals, *ΔΗΜΟΤΕΥΧΑ*, which they sometimes express by the two initial Letters, Δ. Ε. according to *F. Hardouin's* Conjecture, which may be admitted, in certain Medals, where the ΔΕΜ. ΕΣ that is, ΔΕΜΑΡΧΙΚΗΣ ΕΞΟΥΣΙΑΣ, does not well agree. Witness also the Medal of *Antoninus*, *VOTA SUSCEPTA DECENNALIA*.

The Origin of *Vows*, and *Votive Medals*, is given by *M. du Cange*, thus:—*Augustus* resigning himself willing to quit the Empire, and having twice, at the Prayers of the Senate, condescended to hold it for ten Years longer, it grew into a Custom, to make fresh Public Prayers, Sacrifices, and Games, for his continuing it, at the ten Years end; and these they call *Decennialia*, or *Vota Decennialia*.

Under the *Baithero* Emperors, these *Vows* were repeated every five Years: Hence it is that, after *Dioclesian's* Time, we find on Medals *VOTIS V. XV.* &c. which Practice continued till the Time of *Theodosius*, when Christianity being well establish'd, a Ceremony that had some Remains of Heathenism in it, was set aside. So that the *VOTIS MULTIS*, on a Medal of *Majorianus*, must be a very different Thing; and no other, doubtless, than a kind of Acclamation, like that, *PLURA NATALIA PÆLICITER*.

**VOWEL**, in Grammar, a Letter which affords a complete Sound of it self; or a Letter so simple as only to need a bare opening

opening of the Mouth to make it heard, and to form a distinct Voice. See **LETTER**.

Such are *a, e, i, o, u*; which are call'd *Vocales, Vowels*, in contradistinction to certain other Letters, which depending on a particular Application of some part of the Mouth, as the Teeth, Lips, or Palate, can make no perfect Sound without an opening of the Mouth, that is, without the addition of a *Vowel*; and are therefore call'd *Consonants*. See **CONSONANT**.

The we ordinarily only reckon five *Vowels*, yet, besides that each of these may be either long or short, which occasions a considerable Variety in the Sound: To consider only their Differences resulting from the different Apertures of the Mouth, one might add four or five more *Vowels* to the Number.—For the *e* open, and the *e* close, are different enough to make two *Vowels*, as in *Sea*, and *Depth*; to also the *o* open, and *o* close, in *Host*, and *Organ*.—Add that the *u* pronounced *ou*, as the *Latin* did, and as the *Italians* and *Spaniards* still do, has a very different Sound from the *u*, as pronounced by the *Greeks*, and as at this Day by the *English* and *French*.—Again, *eo*, in *People*, make but one simple Sound, tho' we write it with two *Vowels*.

Lastly, the *e* mute is originally no more than a *Surd* join'd to a *Consonant* when that is to be pronounced without a *Vowel*, as when it is immediately follow'd by other *Consonants*, as in the Word *Scammum*.—This is what the *Hebrews* call *Sebreu*, especially when it begins the Syllable: And this *Sebreu* is found in all Languages, tho' overlook'd in many of them, particularly the *English, Latin, &c.* by reason it has no proper Character to design it; tho' in some of the Vulgar Tongues, particularly *French* and *Hig-Dutch*, it is express'd by the *Vowel e* adding its Sound to the rest.

Thus, without regarding the Differences of the same Sound or *Vowel* as to length or shortness, one may distinguish ten several Sounds or *Vowels*, express'd by the following Characters, *a, e, i, o, u, ou, u, e*, mate. See **ALPHABET**.

**VOX**, in Law—*Vocem non habere*, is a Phrase us'd by *Braffon* and *Fleta*, for an infamous Person; one who is not admitted to be a Witness.

**UP-LAND**, is high Ground, or, as some call it, *Terra firma*; opposite to such as is moorish, marshy, or low: or it is Pasture-land, which lies so high as not to be overflow'd with Rivers, or Land-floods.

**UPRIGHT**, in Architecture, a Representation or Draught of the Front of a Building; call'd also, an *Elevation*. See **ELEVATION**.

**UPRIGHT**, in Heraldry, is us'd in respect of Shell-Fishes, as *Crevice*, &c. when standing upright in a Coat.—Inasmuch as they want Fins, they cannot according to *Gallin*, be properly said to be *Hauriant*; that being a Term appropriated to scaly Fishes.

**URACHUS**, in Anatomy, a membranous Canal in a *Fetus*, proceeding from the Bottom of the urinary Bladder, t' the Navel to the *Placenta*, along with the umbilical Vessels, whereof it is esteem'd one. See **UMBILICAL VESSEL**.

The Termination of the *Urachus* in the *Placenta*, forms a little oval *Vesicle*, or Bladder, which serves to receive the Urine secreted in the Kidneys of the *Fetus*, and that could not make its way thro' the *Uretbra*, by reason of the resistance of the *Spiracles* of the Bladder, which is not to be overcome but by Inspiration.

The Humour found in the *Vesicle* of the *Urachus*, is still in the greater Quantity, the higher colour'd, and the more like *Urine*; as the *Fetus* is nearer the time of the Birth.

The *Urachus* is not plainly found any where but in *Brutes*; but there is no dispute but that it exists in an Human *Fetus*. See **POEYUS**.

M. *Drebniscart*, a celebrated Professor of Anatomy at *Leiden*, and some others after him, deny the *Urachus* to be hollow: On which Supposition it would not be easy to assign its Use, unless to keep the Bladder suspended to the Navel. But the former Opinion seems the best warranted. See **URINE**.

**URANIBOURG**, a Term often heard among Astronomers, being the Name of a celebrated Observatory, is a Castle on the little Island *Veena*, or *Huena*, in the *Sound*; built by that noble *Dane, Tycho Brahe*, and furnish'd with Instruments for observing the Course and Motions of the heavenly Bodies. See **OBSERVATORY**.

This famed Observatory, finish'd about the Year 1580, did not subsist above seventeen Years; when *Tycho*, who little thought to have erected an Edifice of so short a Duration, and who had even publish'd the Figure and Position of the Heavens which he had chose for the Moment to lay the first Stone in, was oblig'd to abandon his Country.

Soon after this, those to whom the Property of the Island *Huena* was given, made it their Business to demolish *Uranibourg*: Part of the Ruins were dispers'd into divers Places, the rest serv'd to build *Tycho* a handsome Seat upon his ancient Estate, which to this Day bears the Name of

*Uranibourg*.—For as to the ancient *Uranibourg*, there is now no Footsteps remaining. 'Twas here *Tycho* compos'd his Catalogue of the Stars. See **CATALOGUE**.

M. *Picart*, making a Voyage to *Uranibourg*, found *Tycho's* Meridian-Line drawn thereon, to deviate from the Meridian of the World; which confirms the Conjecture of some, That the Position of the Meridian-Line may vary. See **MERIDIAN**.

**URBICARY Provinces**. See **SUBURBICARY**.

**URDEE**, in Heraldry.—A *Crofs urdee*, seems to be the same with what we otherwise call *chebec*. See **CLECHER**.

**URED**, the Blasting or Blighting of Trees or Herbs. See **BLAST** and **BLIGHT**.

**URED**, is sometimes us'd by Physicians for an Itching or Burning in the Skin. See **ITCH**.

**URENTIA**, are sometimes us'd for Medicines of a hot or burning Quality. See **CAUSTIC**.

**URETERS**, in Anatomy, two long and small Canals, which come from the Basin of the Kidneys, one on each side, and terminate in the Bladder; serving to convey the Urine, secreted in the Glands of the Kidneys, into the Bladder. See **KIDNEY**, and **BLADDER**.

They lie between the doubling of the *Peritonaeum*; and descending in the form of an S, pierce the Bladder near its Neck, where they run, first, some space betwixt its Coats, and then open into its Cavity.

They are compos'd of three Coats.—The first is from the *Peritonaeum*; the second is made of small oblique muscular Fibres; and the third, which is very sensible, has several small Glands, which separate a slimy Liqueur, to defend it against the Acrimony of the Urine.

The neighbouring Parts furnish them with Blood Vessels; and they have Nerves from the Intercostals and the *Vertebrae* of the Loins.—Their Cavity is sometimes contracted in three or four places, especially towards the Bladder.

Such as are subject to the Gravel, and given to excessive drinking, have them sometimes so much dilated, that one may put the End of ones little Finger into them. See **STONE** and **GRAVEL**.

Their Obstruction causes a Suppression of the Urine. See **URINE**.

The Word is form'd from the *Greek* *ὑρῆ, meiere*, to make Water.

**URETHRA**, in Anatomy, call'd also *Mensus Urinarius*, a Tube or Canal arising from the Neck of the Bladder, and continued to the *Pudendum*; serving to discharge or carry off the Urine out of the Bladder. See **URINE**.

Some will have it to be only a Production of the Neck of the Bladder itself.—Its length is very different in the two Sexes.—In Man it terminates in the Extremity of the Glans, and is ordinarily a Foot long.—In Woman, 'tis but two Fingers breadth long, and terminates in the *Vulva*; but it is much wider, and more easily dilated here than in the other Sex.

Mr. *Cowper* gives us an Instance of a Woman, wherein the *Hymen* was so firm and impervious, that her Husband finding no Passage thro' it, had open'd himself another thro' the *Uretbra*. See **HYMEN**.

The *Uretbra* is compos'd of two Membranes, and a little spongy Substance like that of the *Corpora Cavernosa*, except at the End which joins the Neck of the Bladder, where the distance between the Membranes is small, and fill'd up with a thin and red glandulous Substance, whose excretory Ducts piercing the inner Membrane, pour into a Pipe a mucilaginous Liqueur which lines and lubricates its Cavity, and prevents the Salts of the Urine from galling it; as having a farther Office in the Male Sex, viz. the Emission of the Seed. See **PENIS**, and **SEED**.

**URIGO**, a burning with a Caustic or Caustery. See **CAUSTIC**, and **CAUSTERY**.

**URIM** and *Tummim*, אֲרִיִּים אֲרִיִּים, q. d. *Lights and Perfections*, the Name of a kind of Ornament belonging to the Habit of the High-Priest, in virtue whereof he gave oracular Answers to the People. See **PROPHETRY**, &c.

The High-Priests of the *Jews*, we are told, consulted God in the most important Affairs of their Common-wealth, and received Answers by the *Urim* and *Tummim*.—What these were is disput'd among the Critics: Some take them to be the twelve precious Stones in the Breast-Plate of the High-Priest, which shone like a Flame of Fire. See **FACTORS**.

Others will have them, the ancient *Teraphim*, or little human Figures carried by the Priest, hid in the Fold of his Robe or Gown, and by which he answer'd the Questions of the *Jews*. See **TERAPHIM**.

*Diodorus Siculus* relates, that there was a like Ceremony in use among the *Egyptians*, whose principal Minister of Justice carried an Image of precious Stones about his Neck, which was call'd *Truh*.

**URINAL**, in Medicine, a Vessel fit to receive and hold *Urine*; and us'd accordingly, for the convenience of sick Persons.

'Tis usually of Glass, and crooked; and sometimes fill'd with Milk, to assuage the Pains of the Gravel.

URINARIA *Fistula*, is the same as *Urethra*; so call'd from its Office, to convey the *Urine*. See URETHRA.

URINARY *Passage*. } See } URETHRA.  
*Mensus URINARIUS*. }

URINARY *Bladder*. } See } BLADDER.  
*Vesica URINARIA*. }

URINE, a liquid Excrement, or Humour, separated from the Blood in the Kidneys, convey'd thence into the Bladder, and discharg'd by the *Urethra*. See EXCREMENT.

The *Urine* is secreted from the Arterial Blood in the Glan'ds of the *Kidneys*; from which arise numerous little pellicular Pipes, and Veins, which receiving the secreted *Urine*, at length join into twelve *Papille*; out of which the *Urine* oozes into a Cavity call'd the *Pelvis*, from whence it runs into the *Ureters* of either side, and thro' them into the *Bladder*; and from that, at length, thro' the *Urethra*, out of the Body. See KIDNEYS, PAPILLE, PELVIS, URETER, BLADDER, and URETHRA.

The Secretion of the *Urine*, then, is not perform'd by any Attraction, as some will have it; or by any Emulsion, as others; or any Fermentation, as others; or any Precipitation, as others: but by the Force of the Heart, and Arteries, whereby the Blood is driven thro' innumerable Turnings and Windings of the Vessels; attenuated by Resistances, opposite Motions, violent Concussions, and various Mixtures, till the more liquid and serous Part thereof, is forc'd thro' Canals smaller than the Blood-Vessels, and so collected and discharg'd. See SECRETION.

The Word *Urine* is form'd from the *Greek* *Uros*, which signifies the same thing.

'Tis more than probable, that the Blood of the Emulgent Artery, convey'd thro' all the little Branches that spread thro' the exterior Membranes of the *Vesicula* whereof the Kidneys are compos'd, being by this means exceedingly divided, and as it were attenuated, enters the *Vesiculae* themselves, and gives them their red Colour; that it is there filtrated, and the serous or *urinous* Parts secreted; and that this Filtration is promoted by the alternate Contractions and Dilatations of the fleshy Fibres that inclose the little *Vesiculae*; and that after the Filtrations, the Parts that remain Blood are resum'd by the Capillary Branches of the Veins; the rest entering the excretory Ducts of the *Vesiculae*, which are the first Receptacle of the *Urine*. *Hist. Acad. de Sciences*, An. 1705.

Monsieur *Morin*, in the *Memoirs of the French Academy*, marks out a new Rout or Course for the *Urine*.—The ordinary one, which is the Passage of any Liquor we drink thro' the Stomach, into the Intestines, thence into the Lacteals, thence into the Receptacle of the Chyle, thence into the Subclavian Vein, thence into the *Cava*, thence into the right Ventricle of the Heart, thence into the Lungs, and thence into the left Ventricle of the Heart; thence into the *Aorta*, thence into the Emulgent Artery, thence into the Kidneys, thence into the *Ureters*, and at last into the *Bladder*; seems too long and circuitous; considering how readily Mineral Waters pass, and what a speedy effect *Asparagus* is found to have.—Besides, that on this Principle, the Liquors we drink mixing with so many other Liquors in their way, should be greatly alter'd thereby; whereas we frequently find a Tincture of *Cassia*, render'd by *Urine* almost as black as when first taken: and the like is observ'd of divers other Liquors.

M. *Morin*, therefore, maintains, that a good part of the Liquor we drink, oozes thro' the Membranes of the Stomach, and falls into the *Pelvis*; where it enters the *Bladder* thro' the Pores thereof, without getting into the Intestines, which are liad with too thick and viscid a Humour to allow it Ingress.

This System is confirm'd hence, That both the Stomach and *Bladder*, even of a dead Animal, are found easily permeable to Water.

Accordingly, Dr. *Morgan* assures us, that if the Contents of the Abdomen be taken out of an animal Body, after it is just open'd; and the Stomach be fill'd with warm Water, while the Parts are yet reaking; the Liquor will pass into the *Bladder*, which will visibly receive it, and be fill'd in proportion as the Stomach empties.

The same Author adds, that if a Ligation be made upon the *Ureters*, while the Animal is yet living, and the Blood continues to circulate; tho' this must cut off all Communication from the Kidneys to the *Bladder*; yet any Liquor with which the Stomach is fill'd will pass into the *Bladder*.

From the whole, tho' some of our best Anatomists hold that a Circulation of the whole Mass of Blood is effected in five Minutes, and others in two; which might account for the quick Passage of the *Urine*; 'tis hard to conceive, but that part of it must go immediately from the Stomach into the *Bladder*.

The general Design of Nature in this new *Urinary Drain*,

is supposed to be to prevent any sudden Plethora; or immoderate Dilatation of the Vessels upon drinking.

As a necessary Consequence of this System, the Author establishes two kinds of *Urines*; the one filtrated immediately out of the Stomach into the *Bladder*; the other making the long Course of the Circulation.

In the *Philosophical Transactions*, we have an Instance given us, by Mr. *Toung*, of a Boy six Years old, that pass'd off almost all his *Urine* by his Navel.

In the same *Transactions*, Dr. *Richardson* gives an Account of a Boy at *North Bury* in *Yorkshire*, who liv'd to seventeen Years of Age without ever making Water; yet was in perfect Health.—He had constantly a *Diarrhœa* on him, but without much uneasiness.—The Obstruction, that Author observes, must have been in his Kidneys; for he had never any Inclination to make Water.

*Urines* are various Kinds and Properties.—After drinking plentifully of any aqueous Fluid, the *Urine* is crude, insipid, void of Smell, and easily retain'd.—That yielded by Chyle well concocted, is sharper, more saline, less copious, somewhat fetid, and more stimulating.—That from Chyle already converted into Serum, is redder, sharper, filter, and more fetid and stimulating.—And that secreted after long Abstinence, from Humours well concocted and wore off the solid Parts, is the least copious, sharpest, saltest, reddest, most fetid, almost purify'd, and of all others the hardest to retain.

The *Urine*, therefore, contains the watery Part of the Blood, its sharpest, subtilist, and most volatile Salt, and that nearest to the alkaline Kind; its sharpest, smallest, and most volatile Oil, and that nearest to Purification; and its smallest most volatile Earth. See BLOOD.

The Sal Armoiac of the Antients was prepar'd from Camel's *Urine*. See ARMOIAC.

And the *Phosphorus*, in use among us, from human *Urine*. See PHOSPHORUS.

Salt-petre is likewise prepar'd from the *Urine*, and other Excrements of Animals. See SALT-PETRE.

The *Indians* scarce use any other Medicine but Cows *Urine*.—The *Spaniards* make great use of *Urine* to clean their Teeth withal: So did the *Celtiberians* of old.

*Urine* is also used in Dyeing, to ferment and warm the Wood.—Old *Urine*, tinges Silver with a fine gold Colour.

The Disorders in the *Urine* are various. See STRANGURY, RETENTION, DIABETES, STONE, NUBECULA, &c.

URINE, in Medicine.—The *Urine* affords one of the principal Criteria, or Signs whereby Physicians judge of the State of the Patient, and the Course of the Disease. See SIGN, SYMPTOM, DISEASE, &c.

In casting, or examining *Urine*, the Things to be consider'd, are, its Quantity, Colour, Smell, Taste, Fluidity, and the Matters swimming therein.

An abundance of *Urine*, indicates a Looseness of the Renal Pipes; a Diminution of Perspiration; Sweat; Saliva; an imperfect Mixture of the Blood, whereby the watery Parts separate easily from the rest; a nervous Indisposition; a copious drinking of some aqueous Liquid, or some Diuretic taken.—Such *Urine* prefigures a Thickness of what is left behind, and its Acrimony; Thirst, Anxiety, Obstructions, and their Effects, a dry, thirsty, hot Consumption.

A contrary State of the *Urine* indicates the Contraries; and prefigures scarce Repletions, Heaviness, Drowsiness, Convulsive Tremors, &c.

A thin, limpid, insipid, colourless, tasteless *Urine*, denotes a great Constriction of the Renal Vessels, and at the same time, a brisk Agitation of the Humours; a strong Cohesion of the Oil, Salt, and Earth in the Blood it self, and an imperfect Mixture of the aqueous Parts therewith; some grievous Indisposition of the Mind, a hysteric or hypochondriac Fit; a Debility of the *Viscera*; Crudity, Pituits, Obstructions of the Vessels; and, in acute Diseases, a want of a Coction and Crisis.—Such *Urine* portends much the same as a too copious *Urine*; and in acute Inflammatory Diseases, a bad Condition of the *Viscera*, Deliria, Phrenœs, Convulsions, Death.

Ruddy *Urine*, without any Sediment, in acute Diseases, indicates a violent Motion and Attrition among the Parts that constitute the Humours, and between the Vessels and the Humours; a close intimate Mixture of the Oil, Salt, Earth and Water in the Humours; and hence a great Crudity of the Disease, and its long Duration, and great Danger.—Such *Urine* prefigures gangrenous Destructions of the finest Vessels; chiefly those of the Brain and *Cerebellum*, and thence Death: a difficult Coction; a slow, doubtful Crisis: And all these the worse, as the *Urine* is redder, and freer of Sediment. If there be a heavy copious Sediment, it shews a strong antecedent Attrition; loose Vessels; sharp, saline, colliquated Blood, unfit for Nutrition; intermitting Fevers; and Scoury.

The Prefiges are, the Durableness of the Disease, wearing of the Vessels, Weakness, colliquative Sweats, Saliva, &c. Atrophy, and Dropsy.—If the Sediment in such *Urine*

be branny, fealy, filmy, &c. it prefaces the like, only worse.

A yellow Urine, with a Sediment as before, denotes a Jaundice, and the Symptoms thereof in the Cutis, Stools, Hypochondriums, &c.

A green Urine, with a thick Sediment, denotes an atrabiliary Temperature, and that the Matter thereof is resolved, and now excreted: consequently Anxieties about the *Præcordia*, Perturbations of Stool, Ilia, and Colic Pains.

Black Urine, denotes the same with green, only in a greater and worse degree.

Blood, Pus, Caruncles, Filaments, Hairs, Anguillæ, Grains, Sand, Parts of Stone, and a Mucus at the bottom of the Urine, denote some Disorder in the Kidneys, Ureters, Bladder, Testicles, Seminal Vesicles, Prostate, and Urethra.

Fatty Urine, generally breeds small Sands, adhering to some viscid Matter, and thus produces a sort of oily Membrane, or Pellicle, which denotes an abundance of Earth, and a heavy Salt in the Blood, and prefaces the Scurvy, Stone, &c.

A Fetid Urine, denotes the Salts and Oils to be attenuated, dissolv'd, and almost purify'd; whence very great danger, both in chronic and acute Diseases.

Urine which when shook, retains its Froth long, denotes a Tenacity of the Mixture, and thence a difficulty of Crisis; and pulmonick Diseases, or Catarrhs in the Head.

But the Urine is chiefly consulted in acute Fevers, where 'tis a very sure Sign: For, 1<sup>o</sup>, Urine with a white, light, equable, turbidated, inodorous Sediment, thro' the whole Course of the Disease to the Crisis, is a very good Prefage.

2<sup>o</sup>, Copious, white, stranguous Urine, with much white Sediment, emitted, at the Time of the Crisis, cures and takes away Abscesses. 3<sup>o</sup>, A thin, ruddy Urine, that does not subside; a white, thin, watery Urine; a thin, equable, yellow Urine; a turbid Urine that does not subside, denotes,

in very acute Diseases, a great Crudity, a difficult Crisis, and a durable dangerous Disease.

URINE, in Agriculture, is of excellent Use as a Manure. See MANURE.

The knowing in Agriculture and Gardening, prefer Urine for Land, Trees, &c. before Dung; as penetrating better to the Roots; and removing divers Infirmities of Plants.

The Decay of the ancient *Kestibb* Pippins, is a thing much complain'd of; and Mr. *Mortimer* observes, they will be quite lost, unless some Persons set themselves to the ancient way of Culture; which, as all ancient Graziers and Gardeners know, was by washing the mossy, worm-eaten, canker'd, and unbound Trees, two or three times in the Month of *March*, with the Urine of Oxen, &c. gather'd in earthen Vessels, plac'd under the Planks of the Stalls wherein they were fatt'd.

In *Holland*, and in divers other Parts, they preserve the Urine of their Beasts, &c. with as much Care as their Dung.

Mr. *Hartlib*, Sir *Hugh Plat*, Mr. *Mortimer*, &c. make a common Complaint, that so great an Improver of Land, and so remarkable a Strengthen'er of Manure, should be so much disregarded among us.

URINOUS Salts, are the same with what we otherwise call *Alkali Salts*, or *Alkalies*. See ALKALI.

There are two Kinds of *Urinous Salts*, the one fix'd; the other volatile.—The fix'd prevail in Plants, and the volatile in Animals. See SALT.

They are called *Urinous*, in respect of their Taste and Smell, which bear some resemblance to those of Urine.

URN, URSA, a kind of Vase, of a roundish form, but biggest in the middle, like the common *Pitchers*; now seldom us'd, but as Ornaments over Chimney-pieces, in Buffets, &c. or by way of Acrotes, a-top of Buildings, Funeral Monuments, &c. See VASE, and ACROTES.

The great use of Urns among the Antients, was to preserve the Ashes of the Dead, after they were burnt: For which Reason they were call'd *Cineraria*, and *Urne Cineraria*; and were plac'd sometimes under the Tomb-stone, whereon the Epitaph was cut; and sometimes preserv'd in Vaults in their own Houses. See SEPULCHRE, TOMB, and FUNERAL.

URNS were also us'd at their Sacrifices, to put liquid things in. See SACRIFICE.

They were also of use in the *Sortes Prænestinae*, or Casting of Lots. See SORTES.

At *Rome*, too, the Custom was to abscure or condemn the Accus'd, by the Suffrages, or *Calculi*, which the Judges cast into the *Judicatory Urn*. See ABSOLUTION, &c.

*Virgil* represents *Minos* the Judge of Hell, shaking the Urn, to decide the Lots of Mankind.—*Quæstor Minos urnam movet.*

The Urn is still the attribute of *Rivers*, which are painted leaning on Urns, representing their Sources by the Water flowing therefrom.—We find them represented in the same manner on antique Medals, and Relievo's. See RIVER, and ATTRIBUTE.

URN, URNA, was also a Roman Measure, for liquid Things; containing about three Gallons and a half of our Measure. See MEASURE.

UROCRITERIUM, a Casting of Water; a giving Judgment of Diseases by the Sight of the Urine. See URINE.

The Word is compounded of *Uro*, Urine, and *crîterion*, Criterion, Mark, Sign.—Hence also the Words *Uromancy*, *Uroscopy*, &c.

URSA, in Astronomy, the Bear, *Triones*, a Name common to two Constellations of the Northern Hemisphere, near the Pole; distinguish'd by *Major*, and *Minor*. See CONSTELLATION.

URSA *Major*, or the Great Bear, according to *Ptolemy's* Catalogue, consists of 35 Stars; according to *Tycho's* of 56; but in the *Britannic Catalogue* we have 215: The Longitudes, Latitudes, Magnitudes, &c. whereof, are as follow.

Stars in the Constellation URSA Major.

URSA Minor, the little Bear, call'd also *Charles's Wain*, and by the *Greeks*, *Cynosura*; by its neighbourhood to the North Pole, gives the Denomination *αρκτικός*, *Bear*, thence, See *POLAR*, *ARCTIC*, &c.

*Ptolemy* and *Tycho* make it to consist of 8 Stars; but *Mr. Flamsteed* of 14: The Longitudes, Latitudes, Magnitudes, &c. whereof, as laid down in the *Britannic Catalogue*, follow.

Stars in the Constellation Ursa Minor.

URSULINES, an Order of Nuns, which observe the Rule of St. Augustin; and are chiefly noted for taking on them the Education and Instruction of young Maids. See ORDER, and RELIGIOUS.

They take their Name from their Institutress St. Ursula; and are cloth'd in White and Black.

The Ursulines have spread exceedingly in France, &c. within these few Years.—Few Maids but arc put out to School to them.

USAGE, in Law. } Sec } PRESCRIPTION.  
 USAGE, in Language. } Sec } LANGUAGE.

USANCE, in Commerce, in Italian, *Uso*, is a determinate time for the Payment of Bills of Exchange, reckon'd either from the Day of the Bills being accepted, or from the Day of their date; and thus call'd, because regulated by the Usage and Custom of the Places whereton they are drawn. See BILL, and EXCHANGE.

Bills of Exchange are drawn at one or more Usances, either from fight or from date.—The Italians say *Uso doppio*, for double Usance, or two Usances.

This Term is longer or shorter, according to the different Countries.—In France, Usance is fix'd at thirty Days.—At London, Usance is a Calendar Month; and double Usance, two Months.—In Spain, Usance is two Months.—At Venice, Genoa, and Leghorn, three Months.

At Hamburg, Usance of Bills drawn from England, France, and Venice, is two Months after date.—From Antwerp and Nuremberg, fifteen Days after fight.

At Venice, Usance of Bills drawn at Ferrara, Boulogne, Florence, Lucca, and Leghorn, is five Days after fight.—From Naples, Augsburg, Genoa, and Vienna, fifteen Days after fight.—From Mantua, Modena, and Milan, twenty Days after date.—From Amsterdam, Antwerp, and Hamburg, two Months after date; and from London, three Months after date.

At Milan, Usance of Bills drawn from Genoa, is eight Days after fight.—From Rome, ten Days after fight. And from Venice, twenty Days after date.

At Florence, Usance of Bills drawn from Boulogne, is three Days after fight.—From Rome ten Days after fight.—From Venice and Naples, twenty Days after date.

At Rome, Usance of Bills of Exchange drawn in Italy, was, originally, ten Days after fight; but by an Abuse this Term has been extended to fifteen.

At Leghorn, Usance of Bills drawn from Genoa, is eight Days after fight: From Rome, ten Days: From Naples, three Weeks: From Venice, twenty Days after date: From London, three Weeks; and from Amsterdam, forty Days.

At Amsterdam, Usance of Bills drawn from England and France, is a Month after date: From Venice, Madrid, Cadix, and Sevil, two Months.

At Genoa, Usance of Bills from Milan, Florence, Leghorn, and Lucca, is eight Days after fight: From Venice, Rome, and Boulogne, fifteen Days: From Naples, twenty two Days: From Sicily a Month after fight, or two Months after date: From Saratnia, a Month after fight: From Antwerp, Amsterdam, and other Places in the Low Countries, three Months after date.

USE, in Law, the Profit of Lands and Tenements.

A Deed consists of two principal Parts.—The *Premises*, which includes all that comes before the *Habendum*, or Limitation of the Estate; and the *Consequent*, which is the *Habendum* itself; wherein are two Limitations.—The one of the Estate, or Property the Party shall receive by the Deed. The other of the Use, expressing to, or for what Use and Benefit he shall have the same. See DEED.

The Uses were invented upon the Stat. of Westminster *Empores terrarum*; before which Statute, no such Uses were known.—And because, in course of time, many Deceits were invented by settling the Possession in

one Man, and the Use in another, it was enacted, Anno 27 Hen. VIII. That the Use and Possession of Lands should always stand united.

USE, and Custom, in the ancient Law-Books, is the ordinary Method of acting or proceeding in any Cause, which by length of Time has obtain'd the force of Law. See CUSTOM, PRESCRIPTION, LAW, &c.

USER de Action, in Law, is the pursuing, or bringing an Action. See ACTION, and PROSECUTION.

USES and Customs of the Sea, are certain Maxims, Rules, or Usages, which make the Basis or Ground work of the Maritime Jurisprudence; by which the Policy of Navigation, and Commerce of the Sea, are regulated. See NAVIGATION, COMMERCE, &c.

These Uses and Customs consist in three kinds of Regulations:

The first, call'd *Laws or Judgments of Oleron*, were made by order of Queen Eleanor, Duchess of Guienne, at her return from the Holy War; and that chiefly from Memoirs which she had gather'd in the Levant, where Commerce was at that time in a very flourishing Condition.

She call'd them *Rolls of Oleron*, by reason she then resided in an Island of that Name in the Bay of Aquitaine.—They were much augmented about the Year 1266, by her Son Richard, King of England, on his return from the Holy Land.

The second Regulations were made by the Merchants of Wisby, a City in the Island of Gotland in the Baltic, anciently much famed for Commerce, most of the Nations of Europe having their Quarters, Magazines, and Shops therein.

These were compiled in the Teutonic Language, and are still the Rule in the Northern Countries. Their Date does not appear; but 'tis probable they were made since the Year 1288, that the City of Wisby was destroy'd the first time, afterwards restored by Magnus, King of Sweden.

The third Regulations were made at Lubbeck, about the Year 1597, by the Deputies of the Hans Towns. See HANS.

USHER, *Usherius*, from the French, *Huisier*; signifies an Officer, or Servant, who has the Care and Direction of the Door of a Court, Hall, Chamber, or the like.

In the King's Household there are four *Gentlemen-Ushers* of the Privy-Chamber, appointed to attend the Door, give Entrance, &c. to Persons that have admittance thither.—Four *Gentlemen-Ushers*, Waiters; and an Assistant *Gentleman-Usher*.—Eight *Gentlemen-Ushers*, Quarter-Waiters in Ordinary. See CHAMBER.

In the French Court there are two *Ushers* of the Anti-Chamber, or Hall where the King dines in publick.—They wait Sword by side, all the Year, and open the Door to such as are to come in.—There are above sixteen *Ushers* of the Chamber, two of the Cabinet, and one of the *Order of the Holy Ghost*.

The *Ushers* of the Inquisition in Spain and Portugal, see Persons of the prime Quality, who think themselves highly honour'd by only looking to the Doors of the sacred Tribunal. See INQUISITION.

USHER is also used for an Officer in the Exchequer; of which fort three or four do attend the chief Officers and Barons, at the Court at Westminster, and Justices, Sheriffs, and other Accountants; at the pleasure of the Court. See EXCHEQUER.

USHER of the Black-Rod, is an Officer constituted by the Founder of the Order of the Garter. See GARTER.

In a Chapter held at White-hall, 13 Car. II. it was ordain'd, that it should be fix'd to one of the *Gentlemen-Ushers*, daily Waters at Court; the eldest of which always holds the Place; and is call'd *Gentleman-Usher*, and *Black-Rod*.

In relation to the *Order of the Garter*, he is appointed to carry the Rod at the Feast of St. George, and other Solemnities, which he makes use of as an Authority to attach Delinquents, who have offended against the Statutes of the Order, which he frequently doth by touching them therewith.—He wears a Gold Badge, embellish'd with the Emblems of the Order.—He has an House in Windsor-Castle, and other Privileges. See BLACK-ROD.

USNEA, in Natural History, a sort of Plant of the Moss Kind, growing on the Oak, Cedar, and divers other Trees. See MOSS.

USNEA Humana, is a small greenish Moss, growing on human Skulls, that have lain a long time exposed to the Air.

'Tis very stringnt, and held proper to stop Hemorrhages.—It is also an Ingredient in the *Weapon-Salve* of Paracelsus, and Crollius.

USQUEBAUGH, a strong, rich, compound Liquor, chiefly taken by way of Dram; its Basis being Brandy, or refined Spirit of Wine.

The Proccs is somewhat various, and the Ingredients numerous.—We shall give one much commended formerly, as a Specimen.

To two Gallons of Brandy, or Spirits, put a Pound of Spanish Liquorice, half a Pound of Raisins of the Sun, four Ounces of Currants; three of Dates sliced; Tops of Thyme, Balm, Savory, and Mint, and Tops or Flowers of Rosemary, of each two Ounces; Cinnamon and Mace, bruised, Nutmegs, Anis Seeds and Coriander Seeds, bruised likewise, of each four Ounces; Citron, or Lemon and Orange Peel, scraped, of each an Ounce.

All these to be left to infuse 48 Hours in a warm place, often shaking them together: Then set them in a cool place, for a Week; after which the clear Liquor is to be decanted off, and to it an equal Quantity of neat white Port-Wine, and a Gallon of Canary are to be added.—The whole to be sweetened with a proper Quantity of double refined Sugar.

USTION, in Pharmacy, the preparing of certain Substances by burning them. See BURNING.

The Antients made use of the *Ustion* of Horns, Nails, Feathers, and other Parts of Animals, for divers Remedies: And the Moderns still use *Æs Ustum*, which is burnt Copper, or Copper that has undergone the *Ustion*, with Sulphur. See *Æs Ustum*.

The *Ustion* of Minerals, is a more imperfect kind of Calcination. See CALCINATION.

The Word is form'd from the Latin *urere*, to burn. USUCAPTION, *USUCAPPIO*, in the Civil Law, is an Acquisition of the Property of a Thing by a Possession and Enjoyment thereof for a certain term of Years prescribed by Law. See POSSESSION.

Some make a Difference between *Prescription* and *Ustipation*, maintaining that the latter is only used with regard to Moveables, and the former with regard to Immoveables.—But there is no essential Difference between 'em, and accordingly, *Prescription* and *Ustipation*, are generally held Synonyma's. See PRESCRIPTION.

USUFUIT, *USUFUCTUS*, in the Civil Law, the Enjoyment or Possession of any Effect; or the right of receiving the Fruits and Profits of an Inheritance, or other Thing, without a Faculty of alienating or damaging the Property thereof. See POSSESSION, &c.

When the *Ustifruatary* dies, the *Ustifruus* returns to the Proprietor.

The Dowry or Jointure of a Widow is only an *Ustifruatary* due, that is, she only enjoys the *Ustifruus* thereof, and cannot dispose of the Principal. See DOWRY.

All mutual Presents between Man and Wife, only import the *Ustifruus* of the Goods of the first that dies, to the Profit of the Survivor.

The Incumbents of Benefices are only *Ustifruatary*. See BENEFICE.

An *Ustifruatary* has full Right over the Coppice; but can't fell Timber-Trees.

USURER, a Person charged with a Habit or Act of *Ustury*. See USURY.

The Laws of our ancient Saxon and Norman Kings, are very severe upon *Usturers*, or Lenders-out of Money upon Interest.—*Usturarius quoque defendit Rex Edwardus* (Confessor), *no remaneret aliquis in toto regno suo; & si quis inde convulsus esset, quod sanus exigeret, omni substantia propria careret & possessio pro exilio habeatur, quoviam Ustura radix omnium malorum.* Leg. Edv. Confess. cap. 37.

They were indeed allowed to dispose of their Goods before Conviction, and whilst they were living; but after their Death they were confiscate, if it could be proved they lent Money to *Usture* within a Year before their death. *Marr. Paris.* If a Clergyman were an *Usturer*, his Goods were not to be confiscate; but to be distributed to pious Uses.

In those Days *Ustury* was thus defin'd:

*Est Ustura suos quisquis tradit mihi nummos Spe lucri, sensus duplex Ustura vocatur.*

USURIOUS Contract, is any Bargain or Contract, where by a Man is obliged to pay more Interest for Money than the Statute allows. See INTEREST and USURY.

USURPATION, in Law, the Enjoyment of a thing for continuance of time, or receiving the Profits thereof. See USUCAPTION.

USURY, *USURA*, in the general, is an Interest, Gain, or Profit which a Person makes of his Money or Effects, by lending the same; or it is an Increase of the Principal, exacted for the Loan thereof; or the Price a Borrower gives for the Use of a Sum credited to him by the Lender; call'd also *Use* and *Interest*, and in some ancient Statutes, *dry Exchange*. See INTEREST, and EXCHANGE.

The Word *Ustury* is usually taken in an evil Sense, viz. for an unlawful Profit which a Person makes of his Money; in which Sense it is, that *Ustury* is forbidden by the Civil and Ecclesiastical Law, and even by the Law of Nature: In this Sense it also is, that it is held *Ustury* to lend Money on Pawns, to exact Interest for Money without surrendering the Principal, and to stipulate Interest for Money which is not employ'd in Trade, nor brings any Profit to the Person who receives it: But as the Latin Word *Ustura*, at least the Plural thereof *Usture*, may be understood of a lawful Interest, we

don't see why *Ustury* mayn't be used in English, in the latter harmless Sense.

By the ancient Roman Law, People were allow'd to lend out their Money at one per Cent. per Month; which was 12 per Cent. per Annum.—If they received more, they incur'd the Note of Infamy, and the Overplus was charged on the Principal.

This Rate of *Ustury* was allow'd of as low as the Time of Justinian, who moderated it a little by the 66th Law in the Code de *Usturis*. And not long after, the Canon Law forbid all sort of *Ustury* whatever.—In compliance with which Prohibition, the customary Laws don't allow any Interest to be exacted for Money lent on a simple Promise or Obligation; but only by Contract, and upon Alienating the Principal, which the Debtor is to reimburse at Pleasure: Which is a kind of buying an annual Revenue.

So that in Propriety, *unlawful Ustury* consists in extorting an excessive Rate for one's Money, beyond what is prescribed by Law.

*Du Mosnier* indeed makes *Ustury*, taken in the ill Sense, to be a Profit exceed'd for a Loan made to a Person in want; intimating, That it is unlawful to extort Gain from the Assistance given to the Unhappy, or to convert an Office of Humanity into a mercenary one.—The Reason is, that Money is a barren and fruitless Thing in the Hands of a Person whom Necessity obliges to borrow; and that being lent him to be spent, he can make no Advantage of it: Whereas the principal Pretext for requiring lawful Interest, is, that the Person who lends, may share in the Profits thereof with the Person to whom it is lent.

Notwithstanding, most of the ancient Canonists insist on a rigorous Observation of that Precept in *Dentesoro*, *Nou seneraberis fratris tuo*, Thou shalt not lend Money to thy Brother, on *Ustury*: And plead that nothing be required further than the Principal.

However, in Life, we call nothing *Ustury* but what exceeds the Bounds prescribed by the Laws: So that when a Person does not alienate his Principal, or takes Interest beyond what is limited by Statute, these alone are *Ustury*.

By the Stat. 12 Car. 1. no Man is allow'd to take above six Pounds for the Forbearance of one hundred Pounds for one Year, under certain Penalties therein enjoin'd.—And by a later Stat. 1<sup>o</sup> Georgii, no Man shall take above five Pounds for the like Occasion.

UT, a Latin Term signifying, literally, as; much used in the Stating of Ratios and Proportions. See RATIO, and PROPORTION.

Sir I. Newton assigns its Use thus: If indeterminate Quantities of divers kinds be compared together, and one of 'em be said to be *U*, as, any other directly or inversely; the meaning is, that the first is increas'd or diminish'd in the same Ratio as the latter.—And if one of 'em be said to be, *ut, as*, two or more others directly, or inversely, the meaning is, that the first is increased or diminished in a Ratio compounded of the Ratios in which the others are increased or diminished.

Thus, if A be said to be as B directly, and as C directly, and as D inversely, the Meaning is 'tis increased or diminished in the same Ratio with  $\frac{B \times C \times D}{A}$ ; that is, A and  $\frac{B \times C \times D}{A}$  are to each other in a given Ratio. *Phil. Nat. Princ. Math.*

U $\bar{t}$ , in Music, the first of the musical Notes. See NOTE. *U $\bar{t}$ , re, mi, fa*; the Clef of *G, re, sol, ut*; of *C, sol, ut*, &c.

This Note, with the rest, were taken out of the Hymn of St. John Baptist. *Ut queant laxis*, &c. See MUSIC.

*Ut sang thef*, an ancient Royalty, or Privilege, granted to the Lord of a Manor by the King, giving him a Power to punish a Thief dwelling, and committing Theft out of his Liberty; if he be taken within the Lord's Fee.—*Ut sang thef dicitur extraneus Latro veniens aliunde de terra aliena, & qui captus fuit in terra ipsius qui tales habet libertates.* *Britton.*

UTENSIL, a little domestic Moveable, belonging principally to the Kitchen.—Such are Pots, Pans, Plates, &c. *Utensil* is particularly used in War for the Moveables which the Host is obliged to furnish the Soldiers quarter'd with him; which are, a Bed with Bed-clothes, a Pot and a Spoon.—They are likewise to have a place at their Host's Fire, and Candle.

*Utensils* are sometimes furnish'd in Money, and sometimes in Kind. The Word is form'd from the Latin *Utensile*, which signifies the same thing.

UTERINE, *UTERINUS*, something belonging to the Uterus, or Womb of Women. See UTERUS.

Thus *Uterine* Brothers or Sisters, are those born of the same Mother, but different Fathers. See BROTHER, &c.

*Furore Uterinus*, in Medicine, is a kind of Madness, attended with lascivious Speeches and Gestures, and an invincible Inclination to Venery.

The *Furore Uterinus*, is a Complication of hysterical Symptoms, arising from a Turgescency or Inflation of the *Uterine Vessels*. See HYSTERIC.

It is usually suppos'd to confist in some irregular Motion of the Spirits, occasion'd by a hot, lustful Temperament, the Conversion of debauch'd Persons, or the reading of wanton Books, hot Foods, the Abundance and Acrimony of the ferous Matter which moistens the *Pudendum*, Suppression of the Menfes, large Doses of Catharticks, &c.

It has been frequently found, that Maids that were held to be posses'd, were only seiz'd with the *Uterine Fury*.

Before the Paroxysm, the Patient often appears silent and sorrowful, with a Flushing in the Face, and a Respiration and Pulse frequently intermitting, and suddenly varying.—During the Paroxysm they burst sometimes into Laughter, and then into a Fit of Tears, &c.

Bleeding, stiel Suffiments, and other hysterical Medicines, are proper during the Fit.

Men are subject to the Disease as well as Women; so that it might with more Propriety be call'd, the *Furor Venereus*, or *Veneral Fury*.

It had its Name *Furor Uterinus*, from an Opinion, that it proceeded from Vapours rising from the Womb to the Brain.

UTERUS, in Anatomy, the *Matrix* or *Womb* of a Woman; or that Organ of Generation wherein the Business of Conception is perform'd, and wherein the Embryo or *Fetus* is lodg'd, fed, and grows, during the time of Gestation, or till its Delivery.—*Its Description see under the Article MATRIX.*

*Its Office, &c. under GENERATION, CONCEPTION, GESTATION, FOETUS, &c.*

*Vagina UTERI.* See VAGINA.

UTILE, a Latin Term signifying profitable or useful; sometimes used by English Authors in the same Sense.

The *Utile* and the *Dulce*, Profit and Delight, are both to be aim'd at in Poetry; but it is disput'd which of them is to be aim'd at in the first place.—*Cornelle* says expressly, *Dans la Tragedie l'utile n'estre que sous la forme du delectable.* See POETRY.

In the Language of the Philosophers, there is nothing *Utile* but what is just and honest: *Nihil bonum nisi honestum: nihil malum nisi turpe.* Cic. de Fin. lib. 2.

UTLAGATIO, in Law-Term, an Out-lawry. See OUT-LAWRY.

UTLAGATO *captiendo, quando utlogatus in uno comitatu postea fugit in Alium*, a Writ for the apprehending a Man who is outlaw'd in one Country, and flies into another. See OUTLAWRY.

UTLAGH, UTLAGHUS. See OUTLAW.

UTLAND. See INLAND.

UTLARY, or OUTLAWRY. See OUTLAWRY.

UTRUM. See ASSISE.

UTTER, or *Outer Barristers*, are such Candidates as, in regard of their long Study and great Industry bestow'd upon the Knowledge of the Common Law, are call'd out of their Contemplation to Practice, and in the View of the World to take upon 'em the Protection and Defence of Clients. See BARRISTER.

In most other Countries they are call'd *Licentiatos*. See LICENTIATE.

They have their Name *Utter Barristers*, q. d. *Pleaders ouster the Bar*, to distinguish 'em from Benchers, who have been *Readers*, and are sometimes admitted to plead within the Bar; as the King's Council are. See BENCHER, &c.

UVEA, in Anatomy, the third Tunic, or Membrane of the Eye; thus call'd, as resembling a Grape-stone. See EYE.

The hind-part of this Coat, or that next the Orbit of the Eye on each side, is call'd the *Choroides*; and is deriv'd from the *Pis Mater*. See CHOROIDES.

The fore-part is, like the former, transparent, but thinner; and is by Authors reckon'd as a different Tunic, and call'd *Uvas*.

Of the Duplicate of this Part, is form'd that striped, variegated Circle, call'd the *Iris*. See IRIS.

And in its middle is a Perforation, thro' which appears a little black Speck, which is the Sight, or *Pupil* of the Eye; and about which the Iris forms a Ring. See PUPIL.

From the inside of this Membrane, spring certain Fibres, which spread themselves round the crystalline Humour; serving to contract or dilate the Sight at pleasure; and call'd the *Ligamentum Cilare*. See CILIARE, and CRYSTALLINE.

VULVA, a Name some Physicians give to the *Uterus*, or *Womb*.

The Word *Vulva*, is Latin, thus call'd, *quasi Vetus*, a Door. See UTERUS.

*Vulva* is sometimes also, the less properly, used for the *Pudendum Muliebre*. See PUDENDUM.

*Vulva Cerebri*, is an oblong Furrow in the Brain; so called from its likeness, in Figure, to a Female *Vulva*.

VULCANO, among Naturalists. See VOLCANO.

VULGAR *Fractionis*. See FRACTION.

VULGATE, a very ancient Latin Translation of the Bible; and the only one the Church of Rome acknowledges authentick. See BIBLE.

The ancient *Vulgate* of the Old Testament, was translated almost Word for Word, from the Greek of the Seventy. The Author of the Version is not known, nor so much as guess'd at. See SEPTUAGINT.

It was a long time known by the Name of the *Italie*, or *Old Version*; as being of very great Antiquity in the Latin Church.—It was the common, or *vulgar* Version before S. Jerome made a new one; whence its Name *Vulgate*.

*Nobilis* in 1588, and F. *Morin* in 1628, gave new Editions of it; pretending to have restored, and recollated it from the Antients who had cited it.—The *Vulgate* was held by S. *Augustine* to be preferable to all the other Latin Versions then extant; as rendering the Words and Sense of the sacred Text, more closely and justly than any of the rest. It has since been re-touch'd from the Corrections of S. *Jerome*; and 'tis this Mixture of the ancient *Italie* Version and some Corrections of S. *Jerome*, that is now call'd the *Vulgate*, and which the Council of *Trent* has declar'd to be authentick.

'Tis this *Vulgate* alone is used in the *Romish* Church, excepting for some Passages of the ancient *Vulgate* left in the Missal, and the Psalms; which are still sung according to the old *Italie* Version. See BIBLE.

*Vulgate* of the New Testament.—This the *Romish* generally hold preferable to the common *Greek* Text; in regard 'tis this alone, and not the *Greek* Text, that the Council of *Trent* has declar'd authentick: Accordingly, that Church has, as it were, adopted this Edition. The Priests read no other at the Altar, the Preschers quote no other in the Chair, nor the Divines in the Schools.

Yet some of their best Authors, F. *Bouhours* for instance, own, that among the Differences that are found between the common *Greek* and the *Vulgate*, there are some wherein the *Greek* reading appears the more clear and natural than that of the *Latin*; so that the second might be correct'd from the first, if the Holy See should think fit.—But those Differences, for the generality, only consist in a few Syllables or Words: They rarely touch the Sense. Besides, in some of the most considerable, the *Vulgate* is authoris'd by several ancient Manuscripts.

*Bouhours* spent the last Years of his Life, in giving a French Translation of the New Testament, according to the *Vulgate*.

In 1675, a new Edition of the *Greek* Testament was publish'd by the *University of Oxford*; and great Care taken therein, to compare the common *Greek* Text with all the most ancient Manuscripts in *England*, *France*, *Spain*, and *Italy*; and to note the Differences observ'd therein.

In the Preface to this Work, the Editors speaking of the divers Versions of the Bible in the vulgar Tongues, observe of the *Vulgate*, that there is no Version in any Language to be compar'd with it.—And this they justify, by comparing Passages that occur in the most celebrated *Greek* Manuscripts, with the same Passages in the *Vulgate*, where there is any difference between that and the common printed *Greek* Copy.

In effect, 'tis probable, that at the Time the ancient *Italie*, or *Vulgate* Version of the New Testament was made, and at the Time it was afterwards compar'd with the *Greek* Manuscripts by S. *Jerome*; as they were then nearer the Times of the Apostles, they had juster *Greek* Copies, and those better kept than any of those used when Printing was first set on foot, two Centuries ago.

M. *Simon* calls the *Greek* Version of the Seventy, before it was revis'd and reform'd by *Origen*, *L'oe antique Vulgate Greek*.—*Origen's* Correction got the upper hand of the ancient *Greek*, and justify'd it out of use; so that we have now scarce any Copies thereof. See SEPTUAGINT.

VULNERARY, in Medicine, an Epithet given to Remedies proper for the Cure of Wounds, and Ulcers. See WOUND, and ULCER.

There are divers *Vulnerary* Herbs; as *Aristolochia*, or *Birthrow*; *Santals*, or *Self-heal*; *Plantain*, *Moose-Ear*, *Veronica*, or *Finellin*, *Agrimony*, *Vervain*, or *Holy Herb*, &c.

There are also *Vulnerary* Potions, compos'd of various Simples.—*Vulnerary* Balms, Unguents, Plasters, &c. See BALM, &c.

The Word is form'd from the Latin *Vulnus*, Wound.

VULTUS *de Luca*. See VERONICA.

UVULA, in Anatomy, a round, soft, spongy Body, like the End of a Child's Finger; suspended from the Palate, near the *Foramina* of the Nostrils, perpendicularly over the Glottis.

Its use is to break the Force of the cold Air, and prevent its entering too precipitately into the Lungs. See RESPIRATION, &c.

It's form'd of a Duplicate of the Membrane of the Palate; and is call'd by some Authors *Columella*, and by others *Gorgonia*.

It is mov'd by two Pair of Muscles, and suspended by as many Ligaments.—The Muscles are, the *External*, call'd the *Splenoglossibilis*, which draws the *Uvula* upwards and

and backwards; and hinders the masticated Alimcor from passing into the *Foramina* of the Nostrils in Deglutition. See SPHENOSTAPHILINUS.

And the *Internal*, call'd the *Pterygoſtaphylinus*; which draws the *Uvula* upwards and forwards. See PTERYGOSTAPHILINUS.

Both Muscles move the *Uvula* upwards, to give room for swallowing; and serve to raise it, when relax'd and fallen down.—In which Case, 'tis usual to promote its rising, by ap-

plying a little beaten Pepper on the End of a Spoon to it. See DEGLUTITION.

*Barbabin* says, that such as have no *Uvula* are subject to the Pthiſic, and usually die thereof; by reason the cold Air, entering the Lungs too hastily, corrupts 'em.

UXORIUM, in Antiquity, a Fine or Forfeit paid by the Romans for not marrying. See MARRIAGE, POLITICAL Arithmetic, &c.

UZIFUR, in Chymistry, a Name some Authors give to Cinnabar. See CINNABAR.

## W A G

**W**, A Letter peculiar to the Northern Languages, and People; as the *English*, *Dutch*, *Poſſib*, and others of *Ten-tonic* and *Sclavonic* Original. See LETTER, and ALPHABET.

The *W* is also admitted into the *French*, *Italian*, &c. in proper Names, and other Terms borrow'd from the Languages where it is us'd.

In *English*, the *W* is usually a Consonant; and as such, may go before all the Vowels, except *u*; as in *Want*, *Weapon*, *Winter*, *World*, &c. See CONSONANT.

It is sometimes also a Vowel; and as such, follows any of the Vowels *a*, *e*, *o*, and unites with them into a kind of double Vowel, or Diphthong; as in *Law*, *Even*, *Sw*, &c.

The *English* *w* is sounded as the *Latin* *u*, in *quantum*, *suadeo*, *lingua*.—Its Sound is also commonly like the *groſſ*, or full *U* rapidly pronounc'd.—In *French*, the Sound of the *W*, does not differ from that of the single *V*.

WADDING, in Gunnery, a Stopp of Paper, Hay, Straw, old Cloats, &c. forc'd into a Gun upon the Poudet, to keep it close in the Chamber; or put up close to the Shot, to keep it from rolling out. See CHANGE.

WAFI.—To *wafi* a Ship, is to convoy her safe, as Men of War do by Merchant Ships. See CONVOY.

To *make a Wafi*, is to hang out some Coat, Sea-Gown, or the like, in the main Shrouds of the Ship; as a Sign for the Men to come on board, &c. Such *Wafi* is also frequently intended to shew that a Ship is in distress by a Leak, &c. and therefore wants help from the Shore, or from other Ships.

WAFORS.—King *Edward* IV. constituted a triumvirate of Officers with Naval Power, whom the Patent styles *Custodes*, *Conductores*, and *Wafores*; whose business chiefly was to guard our Fishermen on the Coasts of *Norfolk*, and *Suffolk*.

WAGA, or VAGA. See WEIGH.

WAGE, in Law, *Vadare*, from the French *Gager*, *dare pignus*, to pledge; signifies, the giving Security for the Performance of any thing. See PLEDGE.—Thus, to *wage* Law, is to put in Security that you will make Law, at the Day assign'd; and to *make Law*, is to take an Oath, that a Man owes not a Debt which is claimed of him, and also to bring with him to many Men as the Court shall assign, who shall avow upon their Oaths that they believe he swears truly.

WAGGON, a kind of Vehicle, or Carriage in common use.

There are divers Forms of *Waggons* accommodated to the divers Uses they are intended for.

The common *Waggon* consists of the *Shafts*, or *Rads*, which are the two Pieces the hind Horse bears up; the *Welds*; the *Stretts*, which are the cross Pieces that hold the Shafts together; the *Bolster*, being that Part on which the fore Wheels and Axletree turn, in wheeling the *Waggon* a-cross the Road; the *Chest*, or *Body* of the *Waggon*, having the Staves or Rails fix'd thereon; the *Balls*, or *Hoops* which compose the Top; the *Tilt*, the Place cover'd with Cloth at the End of the *Waggon*; besides the *Wheels*, *Axletree*, &c.

The greater the Wheels of the *Waggon*, and their circumference; the easier the Motion; and the less, the heavier, and more uneasy and jogging they go.—The only Reason why the fore Wheels of *Waggons*, &c. are made less than the hind Wheels, is for the Convenience of turning. See WHEEL.

But still, the higher a *Waggon*, &c. is set, the apter it is to over-turn.

The more upright or square the Spokes of the Wheels are from the Box, or Centre, the weaker they are when they

## W A K

come to bear on either side: on which account, as also to secure a Wheel from breaking in a fall, they are made concave, or dishing.

WAGGONER, in Astronomy, a kind of Constellation; call'd also *Charles's Wain*. See CHARLES'S WAIN.

WAGGONER is also used for a Router, or Book of Charts, describing the Seas, their Coasts, &c. See CHART, and ROUTTER.

WAIF, or WAFF, a Term primarily applied to stolen Goods, which a Thief, being pursu'd or overburden'd, flies, and leaves behind him.

The King's Officer, or the Bailiff of the Lord within whose Jurisdiction such *Waifs* or *Waf* Goods were left, (who by Grant, or Prescription, hath the Franchise of *Waf*) may seize the Goods to his Lord's use; except the Owner come with fresh Suit after the Felon, and sue an Appeal within a Year and a Day, or give in Evidence against him, and he be attained.—In which Cases, the Owner shall have his Goods again.

The *Waf* be properly spoken of Things stolen, yet it may also be understood of Goods not stolen: As, if a Man be pursu'd with Hue and Cry, as a Felon, and he flies and leaves his own Goods; these shall be forfeit as Goods stolen; and are properly call'd *Fugitive Goods*. See FUGITIVE.

*Waifs*, *Things lost*, and *Estrays*, are said to be *Pecus vagrans*; and *see nullius in bonis sibi non apparet dominus*. And therefore belong to the Lord of the Franchise where they are found; who must cause them to be cried and publish'd in the Markets and Churches near about: else the Year and Day does not run to the prejudice of him that lost them.

WAINSCOT, in Building, the Timber-Work serving to line the Walls of a Room; being usually in Panels, and painted, to serve in lieu of Hangings. See WALL, &c.

Even in Halls, 'tis common to have *Wainscot* breath high; by reason of the natural Humidity of Walls. See HALL.

Some Joiners put Charcoal behind the Panels of the *Wainscot*, to prevent the Sweating of Stone and Brick-Walls from ungluing the Joints of the Panels.—Others use Wool for the same purpose.—But neither the one nor the other is sufficient in some Houses: The only sure way, is by priming over the back-sides of the Joints with White Lead, Spanish Brown, and Linseed Oil.

*Wainscotting with Norway Oak*, the Workman finding Stuff, is valu'd at six or seven Shillings per Yard square.—*Plain square Wainscotting*, the Workman finding Deal, is valu'd at three Shillings, or three Shillings six Pence per Yard.—*Large biflection Wainscotting*, with *Dantzick* Stuff, is valued at six or seven Shillings per Yard; and *ordinary biflection Work* at three Shillings six Pence per Yard.

Note, In taking Dimensions, they use a String, which they press into all the Mouldings; it being a Rule that they are to be paid for all where the Plane goes.

WAIVE, in Law, a Woman that is outlaw'd. See OUTLAW.

She is called *Waive*, as being forsaken of the Law: and not *Outlaw*, as a Man is; by reason Women cannot be of the *Decorena*, are not sworn in Leets to the King, nor to the Law, as Men are; who therefore are within the Law: whereas Women are not; and so cannot be outlaw'd, since they never were within it.

In this Sense, we read, *Wavaria Mulieris*, as of the same Import with *Utilegatio Viri*.

WAKE of a Ship, is the smooth Water that runs from a Ship's Stern, when she is under sail.

By this, a good Gueſs may be made of the Speed she makes. See RECKONING.

They also judge from this, whether the Ship goes as she looks; that is, whether she makes her way right a-head, as she

the lies; as she doth when her *Wake* is right a-fern: But if this *Wake* be a Point or two to Leeward, they judge that she falls to the Leeward of her Course.

When, in a Ship's staying, she is too quick; they say she does not fall to the Leeward upon a Tack, but when tack'd, her *Wake* is to the Leeward; which is a Sign she feels her Helm well, and is nimble of Steerage.

Also, when one Ship giving chase to another, is got as far into the Wind as she, and falls directly after her; they say, she is got into her *Wake*.

**WAKEFULNESS, WATCHFULNESS, Insomnia;** a Disorder whereby a Person is disabled from going to sleep. See SLEEP.

It is occasion'd by a continual and excessive Motion of the Animal Spirits in the Organs of the Body, whereby those Organs are prepared to receive, readily, any Impressions from external Objects, which they propagate to the Brain; and furnish the Soul with divers Occasions of Thinking. See SPIRIT.

This extraordinary Flux of Spirits may have two Causes: For, 1<sup>o</sup>, the sensible Objects may strike the Organ with too much Force. In which Case, the Animal Spirits being violently agitated, and those Agitations continued by the Nerves to the Brain, they give a like Motion to the Brain it self; the necessary Consequence of which, is, that the Animal must wake. See VIGILIA.

Thus, a loud Shrick, Pains, Headach, Gripes, Coughing, &c. cause waking. Add, that the Soul's being oppress'd with Cares, or deeply engag'd in Thinking, contributes to the same: Since, as it acts by the ministry of the Spirits, any Cares or Meditations that keep those in motion, must produce *Watchfulness*.—Of this Kind are those inveterate *Wakings* of melancholick Persons; some of whom have been known to pass three or four Weeks without a wink of Sleep. See MELANCHOLY.

2<sup>o</sup>, The other Cause is in the Spirits themselves; which have some extraordinary Disposition to receive Motion, or to persist in it: As, from their too great heat, or that of the Brain in burning Fevers, &c. Hence it is, that the Disorder is most frequent in Summer, in the heat of Youth, &c.

Long Fasting has the same Effect; the want of Food subtilizing the Spirits, and drying the Brain.—The same is likewise an ordinary Symptom in old Age, by reason the Pores of the Brain and the Nerves, having been much widene'd by the continual Passage of Spirits, for a great number of Years; the Spirits now pass and repass thro' 'em with too much ease; and need not any extraordinary Motion to keep the Mind awake. See HABITUDE.

There are Instances of *waking* for 45 Nights successively: And we even read of a melancholy Person, who never slept once in 12 Months.—Such Watchings usually degenerate into Madne's. See NARCOTICS, and OPIATE.

**WAKES, VIGILS, or Country-WAKES,** are certain ancient Anniversary Feasts, in the several Parishes; wherein the People were to be awake at the several Vigils, or Hours to go to prayer. See VIGIL.

They are usually observed in the Country, on the Sunday next after the Saint's Day to whom the Parish-Church is dedicated.

*Wax*, who derives the Word from the Saxon *Wax, remanentia*; defines 'em to be the Vigils in the Dedications of Churches, where Men sit drinking in the Choir all Night. See DEDICATION.

**WALKERS,** a sort of Forest-Officers, appointed by the King to walk about a certain space of Ground, committed to their Care and Inspection. See FOREST.

*Walkers* are the same with what we otherwise call Foresters. See FORESTER.

**WALKS,** in Gardening. See ALLEYS.  
To keep the Weeds from growing upon *Walks*, Mr. *Switzer* directs, that the Bottoms thereof be fill'd with Limo-Rubbish, or coarse Gravel, Flint-stones, or other rocky Stuff, eight or ten Inches deep; over which may be laid a like depth of Gravel, not too fine.

To keep 'em the drier, they are to be made round, or convex.—The usual Proportion is, that a *Walk* 20 Foot wide, be four Inches higher in the Middle, than at the Sides; a *Walk* 25 Foot wide, 5 Inches, &c.

After laying a *Walk*, it is to be roll'd, both lengthwise, and cross-wise; and to lay it the firmer, it must have three or four Water-Rollings; that is, when it rains so very fast, that the *Walk* swims with Water: which, when dry Weather comes, will bind as hard as Terrace.

To make the Gravel bind the better, some mix a little Lime with it; which being apt to stick to the Heels of the Shoes in wet Weather, others grind or pound Sea-shells, and lay a thin Coat thereof on the Gravel; which being roll'd, incorporates with the Gravel, and hinders its hanging to the Shoes. Others bear Smiths Cinders to Dust, and others Bricks; hewing the Dust on the *Walks*, which dries up the Moisture, and gives 'em a Colour.

For TERRACE-WALKS. See TERRACE.

**WALL,** in Architecture, &c. a Work of Stone, Brick, Wood, or the like; making the principal Part of a Building; as serving both to inclose it, and to support the Roof, Floors, &c. See BUILDING, HOUSE, &c.

*Walls*, tho' built very thick and strong, and their Foundations laid deep, yet, if carried on frast in a Line, are inclined to lean, or fall; and such as are built crooked, tho' thin and weak, are much more lasting. A *Wall* rais'd over a River, on Arches of Pillars, stands as firm as others, whose Foundation is entire.

Hence it appears, that a *Wall* built much thinner than usual, by only having at every 20 Foot's distance an Angle set out about two Foot, or more, in proportion to the Height of the *Wall*; or by having at the like distance, a Column or Pillaster crooked along with it, six or eight Inches on each side over and above the thickness of the rest of the *Wall*: Such *Wall* will be much stronger than if five times the quantity of Materials were used in a frast Wall.

*Walls* are distinguish'd into divers Kinds, from the Matter whereof they consist; as *Plaster'd*, or *Mud-Walls*, *Brick-Walls*, *Stone-Walls*, *Flint* or *Boulder-Walls*, and *Boarded Walls*.—In all which, these general Rules are to be regarded.

1<sup>st</sup>, That they be built exactly perpendicular to the Ground-work.

2<sup>d</sup>, That the massiest and heaviest Materials be the lowest; as fitter to bear than be borne.

3<sup>d</sup>, That the *Walls*, as they rise, diminish proportionally in Thickness, for ease both of Weight and Expence.

4<sup>th</sup>, That certain Barres, or Lodges, of more strength than the rest, be interaid, like Bows, to strengthen the whole Fabrick.

*Mud* and *Plaster'd Walls* are chiefly in ordinary Timber Buildings.—These *Walls*, being quarter'd and lath'd between the Timber, or sometimes lath'd over all, are plaster'd with Lome, (see LOME;) which being almost dry, is plaster'd over again with white Mortar. See MORTAR.

*Brick Walls*, are the most important and usual among us.—In these, particular Care is to be taken about the laying of the Bricks, viz. That in Summer they be laid as wet, and in Winter as dry as possible; to make them bind the better with the Mortar: That in Summer, as fast as they are laid, they be cover'd up, to prevent the Mortar, &c. from drying too fast; that in Winter they be cover'd well to protect them from Rain, Snow, and Frost, which are all Enemies to the Mortar: That they be laid Point and Joint in the middle of *Walls*, as seldom as may be; but, good Bond made there, as well as on the outside.—Care is likewise to be taken, that the Angles be firmly bound: In order to which, in working up the *Walls* of a Building, 'tis not advisable to raise any *Wall* above three Foot high, ere the next adjoining *Wall* be wrought up to it; that good Bond may be made in the progress of the Work.

Lastly, in Building a House in the City of London, the *Walls* are to be of such thicknesses as are enjoined by the Act of Parliament for rebuilding that City. See HOUSE.

*Flint*, or *Boulder-Walls*, are frequently used in divers Parts for Fence-Walls round Courts, Gardens, &c. and even for *Walls* of Out-houses.—Sir *Henry Wotton* observes, that the building of *Walls* of Flint, is a thing utterly unknown to the Ancients; who observing in that Material a kind of metallic Nature, at least a Fusibility, reserv'd it for nobler U'ses.

These *Walls* are usually rais'd by a right and left-handed Man, who have a Hod of Mortar pour'd down on the Work, which they part betwixt them; each spreading it towards himself, and so they lay in the Flines.—The Mortar for this Work is to be very stiff.

Board-WALLS.	} Sec	{	Wreath-Boarding.
Stone-WALLS.			STONE.
Party-WALLS.			PARTITION.
Fence-WALLS.			FENCE.

**WALL,** in Fortification, &c. See RAMPART.  
**WALLS,** in Gardening, &c.—The Position, Matter, and Form of *Walls* for Fruit-Trees, are found to have a great Influence on the Fruit: Tho' the Authors differ as to the Preference. See GARDEN, ORCHARD, &c.

The Rev<sup>d</sup>. Mr. *Lawrence* directs, that the *Walls* of a Garden be not built directly to face the four Cardinal Points, but rather between 'em, viz. South-East, South-West, North-East, and North-West: In which, the two former will be good enough for the best Fruit, and the two latter for Plums, Cherries, and baking Pears.

Mr. *Langford*, and some others, propose Garden-Walls to consist chiefly of Semicircles; each about six or eight Yards in Front, and including two Trees; and between every two Semicircles, a Space of two Foot of plain Wall.—By such a Provision, every Part of a *Wall* will enjoy a share of the Sun, one time with another; besides that the Warmth will be increas'd, by the collecting and reflecting of the Rays in the Semicircles; and the Trees within be preserv'd from injurious Winds.

As to the Materials of Walls for Fruit-Trees, Brick, according to Mr. *Sotiner*, is the best; as being the warmest, and kindest for the ripening of Fruit, and affording the best convenience for nailing.

Mr. *Lawrence*, however, affirms, on his own Experience, that *Mud-Walls*, made of Earth and Straw temper'd together, are better for the ripening of Fruit than either Brick or Stone Walls: He adds, that the Coping of Straw laid on such Walls, is of great advantage to the Fruit, in sheltering 'em from perpendicular Rains, &c.

M. *Fatio*, in a particular Treatise on the Subject, instead of the common perpendicular Walls, proposes to have the Walls built sloping, or reclining from the Sun; that what is planted against 'em may lie more expos'd to his perpendicular Rays; which must contribute greatly to the ripening of Fruit in our cold Climate.

The Angle of Reclination is to be that of the Latitude of the Place; that when the Sun is in the Meridian at the Equinoxes, his Rays may strike just perpendicularly. See HEAT.

Yet some others prefer perpendicular Walls, and even inclining ones, or such as hang forwards to the Sun; as such receive the Sun's Rays perpendicularly when he is low; as in Spring and Autumn, or in the Evening and Morning; which they imagine of more service than the greatest Heats of the Sun at Midsummer, upon reclining Walls.

Add, that in Autumn the Sun is most wanted to ripen Winter Peas; in order to which, they should be kept dry; which against sloping Walls cannot be; the Dews, &c. lying much longer thereon, than on those that are perpendicular.

One great advantage, however, of M. *Fatio's* sloping Walls, is, that Fruit-Trees, as Vines, &c. being planted against 'em, Melon-Glasses may be set on the Fruit; which will much forward its ripening.

See WALLS, See WATERGAGE.

WALLOON, or WALLOON, a kind of old French; being the Language spoke by the *Walloons*, or the Inhabitants of a considerable Part of the Spanish Low-Countries, viz. those of *Artois*, *Hainault*, *Namur*, *Luxemburg*, and part of *Flanders*, and *Brabant*.

The *Walloon* is held to be the Language of the antient *Gauls*. See GAULISH.

The Romans having subdu'd several Provinces in *Gaul*, establish'd Pretors or Proconsuls, &c. to administer Justice in the *Latin* Tongue.—On this Occasion, the Natives were brought to apply themselves to learn the Language of the Conquerors; and thus introduc'd abundance of the *Roman* Words and Phrases into their own Tongue.

Of this Mixture of *Gaulish* and *Latin* was form'd a new Language, call'd *Roman*; in contradistinction to the antient unadulterated *Gaulish*, which was call'd *Wallon*, or *Walloon*.

This Distinction is kept up to this Day; for the Inhabitants of several of the Low-Country Provinces, say, that in *France* they speak *Roman*; whereas they speak the *Walloon*, which comes much nearer the Simplicity of the antient *Gaulish*. See ROMAN, and FRENCH.

WANLASS, in Hunting.—Driving the *Wanlass*, is the driving of Deer to a stand. See HUNTING.

WAPENTAKE, or WEAPENTAKE, a Division of certain Counties, particularly *Nottingham*, and those beyond the *Trent*; answering to what in other Places is call'd a *Hundred*, or *Century*. See HUNDRED.

Authors differ as to the Origin of the Word.—*Hoveden* brings it from the Saxon *Wapen*, and *teaken*, to take; by reason the Tenants antiently deliver'd their Arms to every new Lord, as a Token of their Homage.

Sir *Thomas Smith* gives a different Account.—He says, that antiently Musters were taken of the Armour and Weapons of the several Inhabitants of every *Wapentake*; and that from such as could not find sufficient Pledges for their good bearing, their Weapons were taken away, and deliver'd to others.

Others suppose the Word of *Danish* Original; and give a different account of its Rise, viz. That when first the Kingdom was divided into *Wapentakes*; he who was the Chief of the Division, and whom we now call *High-Constable*, as soon as he enter'd upon his Office, appear'd in the Field, on a certain Day, on Horse-back, with a Pike in his Hand, and all the chief Men of the Hundred met him with their Lances; who alighting, touch'd his Pike with their Lances, as a Signal they were firmly united to each other, by the touching their Weapons: The Saxon *Wapen* signifying *Weapon*, and *tae*, touching.

WAR, *Bellum*, a Contest, or Difference between Princes, States, or large Bodies of People; which not being determinable by the ordinary Measures of Justice and Equity, is refer'd to the Decision of the Sword.

*Hobbes's* great Principle, is, That the Natural State of Man is a State of *Warfare*; most other Politicians hold War to be a preternatural and extraordinary State.

Civil, or *Intestine* WAR, is that between Subjects of the

same Realm; or between Parties in the same State.—In this Sense, we say, *The Civil Wars of the Romans* destroy'd the Republick: *The Civil Wars of Granada* ruin'd the Power of the *Moor* in Spain: *The Civil Wars in England* begun in 1641, ended in the King's Death, 1649.

King's WAR, *Bellum Regis*.—At the Time when particular Lords were allow'd to make War with one another, to revenge Injuries, instead of prosecuting them in the ordinary Courts of Justice; the Appellation *King's War* was given to such as the King declared against any other Prince, or State; on which Occasion, the Lords were not allow'd to make private War against each other; as being oblig'd to serve the King, with all their Vassals. See VASSAL, &c.

Religious WAR, is a War maintain'd in a State, on account of Religion; one of the Parties refusing to tolerate the other.

The Holy War, is that antiently maintain'd by Leagues and Croisades, for the Recovery of the Holy Land. See CROISADE.

Council of WAR, is an Assembly of great Officers, call'd by a General or Commander, to deliberate with him on Enterprises, and Attempts to be made. See COUNCIL.

On some Occasions, Council of War is also understood of an Assembly of Captains, sitting in Judgment on delinquent Soldiers, Deserters, Coward-Officers, &c.

Place of WAR, is a Place fortified on purpose to cover and defend a Country, and stop the Incursion of an Enemy's Army: Or, it is a Place, wherein are dispos'd the Provisions of War, for an Army incamp'd in the Neighbourhood; or whither an Army retires into Winter Quarters. See PLACE.

Art of WAR. } See MILITARY ART.

Manner of WAR. } SHIP.

WARBLING of the Wings, in Falconry, is when a Hawk, after having mantled herself, crosses her Wings over her Back. See HAWK, and FALCON.

WARD, a Word used in our Law-Books in divers Significations.—Thus, a *Ward*, in *London*, is a part of the City, committed to the special Charge of one of the Aldermen of the City.—There are 16 *Wards* in *London*, which are as *Hundreds*, and the Parishes thereof as *Towns*. See ALDERMAN, HUNDRED, &c.

A Forest is also divided into *Wards*. See FOREST, and HOSPITAL.

A Prison is also call'd a *Ward*. See PRISON, and GOAL. The Heir of the King's Tenant, who held by Knights-Service or in *Capite*, was also call'd a *Ward* during his Nonage. But this last is taken away by the Statute, 12 Car. II. cap. 24. See GUARD, and GUARDIAN.

WARD-HOOK, in Gunnery, a Rod, or Staff, with an Iron-end turn'd Serpent-wife, or like a Screw, to draw the Wads or Ockam out of a Gun, when it is to be unloaded.

WARD, or WARD, call'd also WARDAGIUM, is used in our antient Writers for the Custody of a Town or Castle, which the Tenants and Inhabitants were bound to keep at their own charge. See WARDAGE.

WARDA Ecclesiasticum, denotes the Guardianship of Churches; which is in the King during the Vacancy, by reason of the *Regalia*, or *Temporalities*. See REGALIA, and TEMPORALITIES.

WARDAGE, WARDAGIUM, is sometimes used in our antient Law-Writers, in the same Sense with *Wardpenny*. See WARDPENNY.

Sometimes it also seems to denote a being free from *Wardship*.

WARDECORNE, among our antient Writers, a Duty incumbent on the Tenants, to guard the Castle, by sounding a Horn upon the approach of an Enemy; call'd also *Cornage*. See CORNAGE.

WARDEN, one who has the Charge or Keeping of any Person or Thing, by Office.—Such is the *Warden of the Fleet*, the Keeper of the Fleet Prison; who has the Charge of the Prisoners there; especially such as are committed from the Court of Chancery for Contempt. See FLEET.

Such also are, the *Warden of the Fellowships*, *Warden of the Marches*, *Warden of Peace*, *Warden of the West Marches*, *Warden of the Forest*, *Warden of the Alnage*, *Warden of the King's Wardrobe*, &c. See GUARDIAN; see also JUSTICE, MARCH, WARDROBE, &c.

WARDEN, in an University, is the Head of a College; answering to what in other Colleges we call the *Master* thereof. See COLLEGE.

WARDEN, or Lord WARDEN of the *Cinque-Ports*, is the Governour of those noted Havens; who has the Authority of an Admiral, and sends out Writs in his own Name. See CINQUE-PORTS.

WARDEN of the *Mint*, is an Officer whose Buincle is to receive the Gold and Silver Bullion brought in by the Merchants; to pay them for it, and oversee the other Officers. See MINT.

He is also call'd Keeper of the Exchange and Mint.

WARDER.—The *Women Warders of the Tower*, are Officers, forty in Number, who are accounted the King's

domestick Servants, and are sworn by the Lord Chamberlain: Their Duty is to attend Prisoners of State, and wait at the Gates. See TOWER.

Ten of 'em are usually upon the Day's wait, to take an account of all Persons who come into the Tower; to enter their Names, and the Names of the Persons they go to, in a Book to be perused by the Constable or Lieutenant.

WARDFOH, or WARDFOH, of the Saxon *Ward*, a *Ward*, and *foeb*, *Fee*; denotes the Value of a *Ward*, or Heir under Age; or the Money paid to the Lord of the Fee for his Redemption.

WARDMOTE, in *London*, is a Court so call'd, which is kept in every *Ward* of the City. See MOTE.

WARD-PENNY, WARPEN, WARTIPENNY, was formerly a customary Due, antiently paid to the Sheriff, and other Officers, for maintaining Watch and *Ward*. See PENNY.

It was payable at the Feast of St. Martin; and is still paid within the Manor of *Sutton Colfield* in *Warwickshire*; and with some very singular Ceremonies.

WARDROBE, a Closet, or little Room, adjoining to a Bed-Chamber; serving to dispose of and keep a Person's Apparel in; or for a Servant to lodge in, to be at hand to wait, &c.

WARDROBE, in a Prince's Court, is an Apartment wherein his Robes, wearing Apparel, and other Necessaries, are preserv'd; under the Care and Direction of proper Officers.

His Majesty has a *Great Wardrobe*; a *Removing Wardrobe*; and divers *Standing Wardrobes*, belonging to his Bed-chambers in each of his Palaces, *viz.* at *Whitehall*, *Kensington*, *Windſor*, *Hampton-Court*, and the *Tower*; each under its respective Keeper.

The *Removing Wardrobe* always attends on the King's Person; as also on Embassadors, at Christenings, Malques, Plays, &c.—It is under the Command of the Lord Chamberlain: The under-Officers are, a Yeoman, two Grooms, and three Pages.

The *Great Wardrobe*, is of great Antiquity—Antiently, it was kept near *Puddle Wharf*, in a House purchas'd for that purpose by King *Edward III.* but since the Fire of *London*, it has been kept in *York Buildings*.

The Master or Keeper thereof, is an Officer of great Dignity: high Privileges were confid'd on him by *Henry VI.* King *James I.* enlarg'd the same, and erected the Office into a Corporation.

The Officers are, the *Master or Keeper*, his *Deputy*, and his *Clerk*; beside several under-Officers; and above fifty Tradesmen, all sworn Servants to the King.

This Office is to provide for Coronations, Marriages, and Funerals of the Royal Family; to furnish the Court with Beds, Hangings, Carpets, &c. to furnish Houses for Embassadors, at their first arrival here; Presents for foreign Princes and Embassadors; Furniture for the Lord Lieutenant of *Ireland*, and our Embassadors abroad; Robes for the Knights and Officers of the Garter, Herald, Pursuivants, Ministers of State, Liveries for the Officers of the Bedchamber, and other Servants; Liveries for the Lord Chief Justice, and Barons of the Exchequer; and other Officers in those Courts: As also Yeomen, Warders, Trumpets, Kettledrums, Messengers, Coachmen, Grooms, &c. with Coaches, Harnesses, Saddles, &c. The Watermen, Game-keepers; Linen and Lace for the King's Person; Tiths, &c. for his *Bischof*, &c.

WARDS and Liveries, a Court first erected by King *Henry VIII.* and after augmented by him with the Office of Liveries: But it is now absolutely taken away and abolish'd, by a Statute made 12 *Car. II.* cap. 24. See LIVERY.

WARD-STAFF.—The Manor of *Lambourn* in *Essex*, is held by Service of the *Ward Staff*, *viz.* the carrying a Load of Straw in a Cart with six Horſes, two Oxen, two Men in Harness, to watch the said *Ward Staff*, when it is brought to the Town of *Abridge*, &c. *Cam. tit. Effex.*

WARD-WIFE, is defined by *Hein.* as signifying a being exempted from the Duty of Watching.—Others rather take it for a Duty paid towards the Charge thereof.

The Word is compounded of the Saxon *Ward*, *Vigilia*, Watch; and *Wite*, *Mult.*

WARECTUM, and Terra WARECTA, in antient Writers, signifies Land that has lain long neglected, and untill'd. In antient Records we meet with *Tenopus Warecti*, for the Time wherein Land lies fallow, the following Year; or else the Season of Fallowing. See FALLOW.

WAREN. See WARREN.

WARMTH. See HEAT.

WARN, in Law, to summon a Person to appear in a Court of Justice. See SUMMONS.

WARNING Wheel, in a Clock, is the third or fourth, according to its distance from the first Wheel. See CLOCK.

WARP, in the Manufactures, is the Threads, whether of Silk, Wool, Lincen, Hemp, Cotton, or the like, that are extended lengthwise on the Weaver's Loom; and across which the Workman, by means of his Shuttle, passes the Threads of the Wool, to form a Cloth, Ribband, Fustian, or other Matter. See WEAVING.

For a woollen Stuff, &c. to have the necessary Qualities, 'tis requir'd that the Threads of the *Warp* be of the same kind of Wool, and of the same Fineness throughout; that they be fixed with *Flanders* or Parchment Size, well prepar'd; and that they be in sufficient Number, with regard to the Breadth of the Stuff to be wrought. See WOOL, CLOTH, &c.

To WARP a Ship, is to hale her to a Place, when the Wind is wanting, by means of a Hawser, a Cable, and an Anchor fix'd thereto.

WARRANT, an Act, Instrument, or Obligation, whereby a Person authorizes another to do something, which he had not otherwise a right to do. See WARRANTY, and GUARANTY; see also VOUCHER.

WARRANT of Attorney, is that whereby a Man appoints another to do something in his Name, and warrants his Action. See ATTORNEY.

It seems to differ from a *Letter of Attorney*, which passes under Hand and Seal of him that makes it, before creditable Witnesses; whereas *Warrant of Attorney*, in personal, mix'd, and some real Actions, is put in of course by the Attornies for the Plaintiffs, or Defendants.

Tho, a *Warrant of Attorney*, to suffer a common Recovery by the Tenant or Vouchee, is acknowledg'd before such Persons, as a Commission for the doing thereof directs. See RECOVERY, &c.

In the Court of Common Pleas there is a *Clerk of the Warrants*, who enters all *Warrants of Attorney* for Plaintiff and Defendant. See CLERK.

WARRANTY, WARRANTIA, a Promise, or Covenant by Deed, made by the Bargainer for himself and his Heirs, to warrant and secure the other Party and his Heirs, against all Men, for the enjoying of the Thing agreed on between them.

This Warranty passeth from the Seller to the Buyer; from the Feoffee to the Feoffee; from him that releaseth, to him that is releas'd from an Action real.

The form of it is thus: *Et ego vero prefatus A. & heredes mei predictas quinque acres terre cum pertinentiis suis prefato B. hereditibus & assignatis suis contra omnes gentes warrantizabimus, in perpetuum per presentes.*

Note, under *Heredes*, Heirs, are compris'd all such as the first *Warrantor's* Lands come to, whether by Descent, Purchase, or the like.

Warranty is either *Real*, or *Personal*.—*Real*, when it is annex'd to Lands and Tenements grant for Life, &c. which, again, is either in *Deed*, or in *Law*. See FACTO, &c.

*Personal*, either respects the Property of the Thing sold, or the Quality of it. See PERSONAL, &c.

*Real Warranty*, again, in respect of the Estate, is either *Lineal*, *Collateral*, or *commencing by Dissisin*.

WARRANTIA Charta, a *Writ* that lies for a Person who is infeoff'd in Lands and Tenements, with Clause of *Warranty*; and is implac'd in an Assize, or *Writ of Entry*, wherein he cannot Vouch, or call to *Warranty*.

WARRANTIA Diei, a *Writ* which lies in Case where a Man having a Day assign'd personally to appear in Court to an Action wherein he is sued, is, in the mean time, by Commandment employ'd in the King's Service; so that he cannot come at the Day assign'd.

WARREN, or WAREN, a Franchise or Place privileg'd, either by Prescription, or Grant from the King, to keep Beasts and Fowl of *Warren* in; as *Rabbits*, *Hares*, *Portridges*, *Pheasants*, &c. See BEAST, GAME, HUNTING, &c.

By a Statute 21 *Edw. III.* a *Warren* may lie open, and there is no need of closing it in; as there is of a *Park*. See PARK, &c.

If any Person be found an Offender in any such *Fee-Warren*, he is punishable for the same at Common Law.

Beasts of WARREN. See BEASTS of WARREN.

WART, Ferruca, a little round, hard Excreſcence, arising on the Flesh, like a Pea.

Warts are more frequent on the Hands than on any other Part.—There are divers sorts: The most usual are call'd *Porrucos*; as having Heads like *Leeks*, and consisting of little Threads, resembling the Roots thereof.

Another sort is call'd *Ahrmectia*, which is a little round, callous Eminence on the Hands of young Children; rising suddenly, and disappearing again.

Some Physicians also rank the Corns growing on the Toes under the Class of *Warts*; which the *Latins* call *Clavi*; because occasioning shooting Pains, as if one were prick'd with the Point of a Nail. See CLAVUS.

Warts, if only rooted in the Cutis, are easily taken away; but if they arise from the Tendons underneath, there is scarce any extirpating 'em without great danger.—The Juice of *Chebdon*, *Maf*, or *Ejus*, or *Deus Leonis*, or *Tibymal*, frequently applied, takes off *Warts*.

*Borell* commends Water wherein Sal Armoniac has been dissolv'd; which Dr. *Mapletosi*, late Professor of Physick at *Gresham College*, makes no scruple to say, is the only sure Remedy he knows of in all Medicine.

WASHINGTON, See LOTION, ABLUTION, &c.

*The Washing of the Feet* was a common piece of Civility among the Jews, practis'd upon Strangers, Visitors, &c. at their arrival.

*The Washing of the Feet* of twelve poor People, is an anniversary Ceremony, perform'd both by the Kings of England and France; in commemoration of our Saviour's washing the Feet of his Apostles.

*Arnobius, adv. Gentes*, Lib. VII. mentions a Feast in use among the Antients, call'd *Lovatio Matris Deum*, the Washing of the Mother of the Gods, held on the 30th of March.

*Washing of a Ship*, in the Sea Language, is when all the Guns are brought to one side, and the Men, getting up on the Yards, wash her other side, and scrape her as far as they can reach.

*Washing*, in Painting, is when a Design drawn with a Pen, or Crayon, has some one Colour laid over it with a Pencil, as Indian Ink, Bistre, or the like; to make it appear the more natural, by adding the Shadows of Prominences, Apertures, &c. and by imitating the particular Matters whereof the Thing is supposed to consist.

Thus, they wash with a pale red to imitate Brick and Tyle; with a pale Indian blue to imitate Water and Slate; with green for Trees and Meadows; with Saffron or Freeweb Berries, for Gold and Brails; and with several Colours for Marbles.

These Washes are usually given in equal Teints, or Degrees, throughout; which are afterwards brought down and loosen'd over the Lights with fair Water, and strengthen'd with deeper Colours for the Shadows. See LIGHT, and SHADOW.

*Washings*, or *Washes*, among Goldsmiths, Coiners, &c. are the Lotions whereby they draw the Particles of Gold and Silver out of the Ashes, Earths, Sweepings, &c.

This is either perform'd by simply washing 'em again and again, or by putting 'em in the *Washing Mill*.

To make one of these Washes, they not only gather together the Ashes of the Furnaces, and the Sweepings of the Places where the Works are; but they also break and pound the old earthen Crucibles, and the very Bricks whereof the Furnaces are built: little Particles of Gold, &c. being found to stick to 'em by the crackling natural to those Metals, when in their last degree of heat.

These Matters being all well ground, and mix'd together, are put in large wooden Basons, where they are wash'd several times and in several Waters, which run off, by Inclination, into Troughs underneath; carrying with 'em the Earth, and the insensible Particles of the Metals, and only leaving behind 'em the larger and more considerable ones, which are visible to the Eye, and takes out with the Hand; without more trouble.

To get out the finer Parts, gone off with the Earth, they use Quicksilver, and a *Washing Mill*.—This Mill consists of a large wooden Trough, at bottom of which are two metallic Parts, serving as Mill-Stones; the lower being convex, and the upper, which is in form of a Cross, concave.

A-top is a Winch, placed horizontally, which turns the upper piece round; and at bottom a Bung, to let out the Water and Earth when sufficiently ground.

To have a *Wash*, then, the Trough is fill'd with common Water, into which they cast thirty or forty Pounds of Quick-silver, and two or three Gallons of the Matter remaining from the first Lotion.—Then turning the Winch, they give Motion to the upper Mill-stone; which grinding the Matter and the Quick-silver violently together, the Particles of Gold and Silver become the more easily amalgamated therewith: This Work they continue for two Hours; when opening the Bung, the Water and Earths run out, and a fresh quantity is put in.

The Earths are usually pass'd thro' the Mill three times; and the same quantity of Mercury usually serves all the three times.—When there is nothing left in the Mill but the Mercury, united with the Gold or Silver which it has amalgamated; they take it out, and washing it in divers Waters, they put it in a Ticken Bag, and lay it in a Press, to squeeze out the Water and the loose Quick-silver: the remaining Quick-silver they evaporate by Fire, in a Retort, &c. See GOLD, and SILVER; see also LAVAZERE.

WASSALE, or WASSAL, a Festive Song, sung heretofore from door to door, about the Time of Epiphany. See WASSAL-BOWL.

WASSEL-BOWL, was a large Cup or Bowl, of Silver or Wood, wherein the Saxons at their publick Entertainments drank a Health to one another, in the Phrase *Was-beat*; that is, *Health be to you*.

This *Wassel-Bowl*, seems plainly to be meant by the Word *Vasellum*, in the Lives of the Abbots of St. Albans, by *Mort. Paris*; where he saith, *Abbas solus prandebat supremus in Refectorio habens Vasellum*: 'He had set by him a *Wassel-Bowl*, to drink an Health to the Fraternity; or the *Vasellum Chariatis*.

And hence the Custom of going a *Wasseling*, still used in Suffolk and some other Places, seems to have taken its Name.

WAST, or WASTE, in Law, has divers Significations.—1st, It is used for a Spoil, made either in Houses, Woods, Lands, &c. by the Tenants for Life, or for Years, to the prejudice of the Heir, or of him in Reversion.—Upon this, the Writ of *Waste* is brought for recovery of the Thing wasted, and treble Damages.

*Waste of the Forest*, is, properly, where a Man cuts down his own Woods within the Forest, without Licence of the King, or Lord-Chief Justice in Eyre. See FOREST, and PURLEW.

WASTE is also taken for those Lands which are not in any Man's Occupation; but lie common. See COMMON.

They seem to be so called, because the Lord cannot make such Profit of them as of his other Lands; by reason of the use others have thereof, for passing to and fro.—Upon this none may build, cut down Trees, dig, &c. without the Lord's Licence.

*Year, Day, and Waste*, is also a Punishment or Forfeiture belonging to Petit Treason, or Felony. See YEAR, DAY, &c.

*Waste of a Ship*, is that Part of her between the two Masts; that is, between the Main-mast, and the Fore-mast. See SHIP, and MAST.

*Waste-Boards*, are Boards sometime set upon the side of a Boat, to keep the Sea from breaking into her.

WATCH, a small portable Movement, or Machine, for the measuring of Time; having its Motion regulated by a Spiral Spring. See WATCH-WORK.

*Watches*, strictly taken, are all such Movements as shew the Parts of Time; as Clocks are such as publish it, by striking on a Bell, &c. But commonly, the Name *Watch* is appropriated to such as are carried in the Pocket; and *Clock* to the larger Movements, whether they strike the Hour or not. See CLOCK.

*Spring, or Pendulum Watches*, stand pretty much on the same Principle with Pendulum Clocks; whence their Denomination.—If a Pendulum, describing little Arches of a Circle, makes Vibrations of unequal Lengths in equal Times; 'tis by reason it describes the greater with a greater Velocity. For the same Reason, a Spring put in Motion, and making greater or less Vibrations, as it is more or less stiff, and as it has a greater or less degree of Motion given it; performs them nearly in equal Times. Hence, as the Vibrations of the Pendulum had been applied to large Clocks, to rectify the Inequality of their Motions; so, to correct the unequal Motions of the Balance of *Watches*, a Spring is added; by the Isochronism of whose Vibrations, the Correction is to be effected. See PENDULUM.

The Spring is usually wound into a Spiral; that, in the little compass allotted it, it may be as long as possible; and may have Strength enough, not to be master'd and drag'd about by the Inequalities of the Balance it is to regulate.

The Vibrations of the two Parts, viz. the Spring and Balance, should be of the same length; only so adjusted, as that the Spring, being the more regular in the length of its Vibrations than the Balance, may, on occasion, communicate its Regularity thereto. See SPRING.

*The Invention of Spring or Pocket Watches*, is owing to the Felicity of the present Age.—'Tis true, we find mention made of a *Watch* presented to Charles V. in the History of that Prince: But this, in all probability, was no more than a kind of Clock to be set on a Table; some Footsteps whereof, we have still remaining in the antient Pieces made before the Year 1670.

In effect, 'tis between Dr. Hook and Mr. Huygens, that the Glory of this excellent Invention lies: but to which of them it properly belongs, is greatly disputed: The English ascribing it to the former; and the French, Dutch, &c. to the latter.

Mr. Derham, in his *Artificial Clockmaker*, says roundly, that Dr. Hook was the Inventor; and adds, that he contriv'd various ways of Regulation.—One way was with a Load-stone.—Another with a tender straight Spring, one end whereof play'd backwards and forwards with the Balance; so that the Balance was to the Spring, as the Bob to a Pendulum; and the Spring as the Rod thereof.—A third Method was with two Balances, of which there were divers sorts; some having a Spiral Spring to the Balance for a Regulator, and others without.

But the way that prevail'd, and which continues in Mode, was with one Balance, and one Spring running round the upper Part of the Verge thereof. Tho' this has a Disadvantage, which those with two Springs, &c. were free from; in that a sudden jerk, or confused shake, will alter its Vibrations, and put it in an unusual hurry.

The Time of these Inventions was about the Year 1658; as appears, among other Evidences, from an Inscription on one of the double Balance *Watches*, presented to K. Charles II. viz. *Rob. Hook Inven. 1658. T. Tompion fecit, 1675.*—The

Invention presently got into Reputation both at home and abroad; and two of 'em were sent for by the Dauphin of France.

Soon after this, Mr. *Huygens's* Watch with a Spiral Spring got abroad, and made a great noise in England, as if the Longitude could be found by it.—'Tis certain, however, that his Invention was later than the Year 1673, when his *Book de Horol. Oficinat.* was publish'd; wherein he has not one word of this, tho he has of several other Contrivances in the same way.

One of these the Lord *Brouncker* sent for out of France, where Mr. *Huygens* had got a Patent for 'em.—This Watch agreed with Dr. *Hook's* in the Application of the Spring to the Balance; only Mr. *Huygens's* had a longer Spiral Spring, and the Pallets and Beats were much slower. The Balance, instead of turning quite round, as Dr. *Hook's*, turns several rounds every Vibration.

Mr. *Derham* suggests, that he has reason to doubt Mr. *Huygens's* Fancy was first set to work by some intelligence he might have of Dr. *Hook's* Invention, from Mr. *Oldenburg*, or some other of his Correspondents in England: tho Mr. *Oldenburg* vindicates himself against that Charge, in *Philosophical Transactions*, N<sup>o</sup> 118. and 129.

*Huygens* invented divers other Kinds of Watches, some of them without any String or Chain at all; which he call'd particularly *Pendulum Watches*.

As it was in England that Watches had their first rise; so 'tis there, too, they have arriv'd at their greatest Perfection.—Witness that exceeding Value put on an *English Watch* in all foreign Countries, and that vast Demand made for 'em.

Monieur *Savory*, in his *Diction. de Commerce*, pretends to match the French Watchmakers against the English.—He asserts, "That if the English be in any Condition to dispute it with 'em, they owe it entirely to the great Number of French Workmen, who took shelter here upon the Revocation of the Edict of *Nantz*." He adds, "That three fourths of the Watches made in England, are the Work of Frenchmen." From what Authorities he says this, we know not: But it need not be told Englishmen that it is false; there not being one French Name, that we know of, among all our fam'd Watchmakers: nor, in the Body of Watchmakers, is there one eighth part French.

'Tis certain the French People prefer our Watches vastly to their own; inasmuch, that to have 'em with the more ease, a number of English Workmen were invited over in 1719, and establish'd with great countenance at *Versailles*, under the Direction of the famous Mr. *Lew*.—But the Establishment, tho every thing promis'd well for it, and the French Watch and Clockmakers seem'd undone by it, fell to the Ground in less than a Year's time.—Mr. *Savory* imputes its Fall, intirely, to that strong Prejudice of the French People in behalf of the English Workmen, and to the Opinion that the Watches did not come from England. But the Truth is, the Workmen sent over being most of 'em Men of loose Characters, grew dissolute, quarrell'd with the Priests, insulted the Magistrats, and were dismiss'd, of necessity.

Striking WATCHES, are such, as besides the proper Watch-part, for measuring of Time, have a Clock-part, for striking the Hours, &c.

These are real Clocks; only moved by a Spring instead of a Weight.—Properly speaking, they are call'd *Pocket Clocks*. See CLOCK.

Repeating WATCHES, are such as by pulling a String, &c. do repeat the Hour, Quarter, or Minute, at any time of the Day or Night.

This Repeating was the Invention of Mr. *Barlow*, and first put in practice by him in larger Movements, or Clocks, about the Year 1676.—The Contrivance itself for the other Artills to work, who soon contriv'd divers ways of effecting the same. But its application in Pocket Watches was not known before King *James* the Second's Reign; when the ingenious Inventor above-mention'd, having directed Mr. *Thompson* to make a Repeating Watch, was soliciting a Patent for the same.

The Talk of a Patent engag'd Mr. *Square* to resume the Thoughts of a like Contrivance, which he had had in view some Years before: He now effected it; and being press'd to endeavour to prevent Mr. *Barlow's* Patent, a Watch of each kind was produc'd before the King and Council; upon Trial of which, the Preference was given to Mr. *Square's*.

The Difference between 'em was that *Barlow's* was made to Repeat by passing in two pieces on each side the Watch-Box; one of which repeated the Hour, and the other the Quarter: Whereas *Square's* was made to repeat by a Pin that stuck out near the Pendant; which being thrust in, (as now 'tis done by thrusting in the Pendant it self) repeated both the Hour and Quarter with the same thrust.

WATCH-WORK, is that Part of the Movement of a Clock or Watch, which is designed to measure, and exhibit the Time on a Dial-Plate; in contradistinction to that Part which contributes to the striking of the Hour, &c. which is call'd *Clock-work*. See WATCH.

The several Members of the Watch-part, are, 1<sup>o</sup>, The Balance, consisting of the Rim, which is its circular Part; and the Verge, which is its Spindle; to which belong the two Pallets or Levers, that play in the Teeth of the Crown-Wheel.

2<sup>o</sup>, The Potence, or Potance, which is the strong Strad in Pocket-Watches, wherein the lower Pivot of the Verge plays, and in the middle of which, one Pivot of the Balance-Wheel plays; the bottom of the Potance is the Foot, the middle part the Nose, and the upper part the Shoulder.

3<sup>o</sup>, The Cook, which is the piece covering the Balance.

4<sup>o</sup>, The Regulator, or Pendulum Spring, which is the small Spring in the new Pocket-Watches, underneath the Balance.

5<sup>o</sup>, The Pendulum; whose Parts are, the Verge, Pallets, Cocks, and the Bob.

6<sup>o</sup>, The Wheels; which are, the Crown-Wheel, in Pocket Pieces, and the Swing-Wheel in Pendulums; serving to drive the Balance or Pendulum.

7<sup>o</sup>, The Contrate Wheel, which is that next the Crown-Wheel, &c. and whose Teeth and Hoop lie contrary to those of other Wheels; whence the Name.

8<sup>o</sup>, The great, or first Wheel; which is that the Faly, &c. immediately drives: after which are the second Wheel, third Wheel, &c.

Lastly, between the Frame and Dial-Plate, are, the Pinion of Report, which is that fix'd on the Arbor of the great Wheel; and serves to drive the Dial-Wheel, as that serves to carry the Hand.

#### Theory, and Calculation of WATCH-WORK.

Preliminaries necessary to the calculating the Watch-part of a Movement, are laid down under the ARTICLES MOVEMENT and CLOCK-WORK.

Preliminary Rules common to the Calculation of all Movements, the Clock as well as the Watch-parts; see under the ARTICLE MOVEMENT.

Particular Rules for the Striking-part; see under the ARTICLE CLOCK-WORK.

Those for the Watch-part we have from the Rev. Mr. *Derham*, as follow.

1<sup>o</sup>, The same Motion, 'tis evident, may be perform'd either with one Wheel and one Pinion, or many Wheels and many Pinions; provided the Number of Turns of all the Wheels bear the Proportion to all the Pinions, which that one Wheel bears to its Pinion: or, which is the same thing, If the Number produced by multiplying all the Wheels together, be to the Number produc'd by multiplying all the Pinions together, as that one Wheel to that one Pinion.—Thus, suppose you had occasion for a Wheel of 1440 Teeth, with a Pinion of 28 Leaves; you may make it into three Wheels and Pinions, viz. 4) 36, 7) 8, 1) 5. For the three Wheels, 36, 8, and 5, multiply'd together, give 1440 for the Wheels; and the three Pinions 4, 7, and 1, multiplied together, give 28 for the Pinions.—Add, That it matters not in what order the Wheels and Pinions are set, or which Pinion runs in which Wheel; only for Contrivance-sake, the biggest Numbers are commonly put to drive the rest.

2<sup>o</sup>, Two Wheels and Pinions of different Numbers may perform the same Motion.—Thus, a Wheel of 36 drives a Pinion of 4, the same as a Wheel of 45 a Pinion of 5; or a Wheel of 90 a Pinion of 10.—The Turns of each being 9.

3<sup>o</sup>, If in breaking the Train into Parcels, any of the Quotients should not be liked; or if any other two Numbers to be multiplied together, are desir'd to be varied; it may be done by this Rule.—Divide the two Numbers by any other two Numbers which will measure them; multiply the Quotients by the alternate Divisors; the Product of these two last Numbers found, will be equal to the Product of the two Numbers first given.—Thus, if you would vary 36 times 8, divide these by any two Numbers which will evenly measure them: So, 36 by 4, gives 9; and 8 by 1, gives 8: now, by the Rule, 9 times 1 is 9, and 8 times 4, 32; so that for 36 x 8, you have 32 x 9; each equal to 288. If you divide 36 by 6, and 8 by 2, and multiply as before, you have 24 x 12 = 36 x 8 = 288.

4<sup>o</sup>, If a Wheel and Pinion fall out with cross Numbers, too big to be cut in Wheels, and yet not to be alter'd by these Rules; in seeking for the Pinion of Report, find two Numbers of the same, or a near Proportion, by this Rule: As either of the two given Numbers is to the other; so is 360 to a fourth. Divide that fourth Number, as also 360, by 4, 5, 6, 8, 9, 10, 12, 15, (each of which Numbers exactly measures 360) or by any of those Numbers that brings a Quotient nearest an Integer.—As suppose you had 147 for the Wheel, and 170 for the Pinion; which are too great to be cut into small Wheels, and yet cannot be reduc'd into less, as having no other common measure but Unity: say, as 170:147::360:311. Or, as 147:170::360:416. Divide the fourth Number, and 360 by one of the foregoing Numbers; as 311 and 360 by 6, it gives 52 and 60; divide them by 8, you have 59 and 45; and, if you divide 360 and

416 by 8, you have 52 and 52 exactly. Wherefore, instead of the two Numbers 147 and 170, you may take 52 and 60, or 59 and 45, or 45 and 52, &c.

5<sup>o</sup>. To come to Practice in calculating a piece of Watch-work, first pitch on the Train or Beats of the Balance in an Hour; as whether a swift one, of about 20000 Beats, (the usual Train of a common 30 hour Pocket-Watch) or a slower of about 16000, (the Train of the new Pendulum Pocket-Watches) or any other Train.—Next resolve on the Number of Turns the Fufy is intended to have, and the Number of Hours the Piece is to go: Suppose, e.g. 12 Turns, and to go 30 Hours, or 192 Hours, (i. e. 8 Days) &c. Proceed now to find the Beats of the Balance or Pendulum in one Turn of the Fufy, by the Direction given under the Word BEAT.—Thus in Numbers; 12 : 16 : 1 : 20000 : 26666. Wherefore, 26666 are the Beats in one Turn of the Fufy, or great Wheel, and are equal to the Quotients of all the Wheels into the Balance multiplied together. Now this Number is to be broken into a convenient parcel of Quotients; which is to be done thus: First, halve the Number of Beats, viz. 26666, and you have 13333; then pitch on the Number of the Crown-Wheel, suppose 17: Divide 13333 by 17, and you have 784 for the Quotient (or Turns) of the rest of the Wheels and Pinions; which being too big for one or two Quotients, may be best broken into three. Chuse therefore three Numbers, which when multiplied all together continually, will come nearest 784: As suppose 10, 9, and 9, multiplied continually, gives 810, which is somewhat too much; therefore try again other Numbers, 11, 9, and 8: these drawn one into another continually, produce 792; which is as near as can be, and convenient Quotients.—Having thus contrived the Piece from the great Wheel to the Balance; but the Numbers not falling out exactly, as you first proposed; correct the Work thus: First, (by the Direction given under the Word BEATS) multiply 792, the Product of all the Quotients pitch'd upon, by 17, (the Notches of the Crown-Wheel) the Product is 13464, which is half the Number of Beats in one Turn of the Fufy; then, (by a Rule given under the Word BEAT) find the true Number of Beats in an Hour. Thus, 16 : 12 : 1 : 13464 : 10998; which is half the Beats in an Hour. Then find what Quotient is to be laid upon the Pinion of Report, (by the Rule given under that Word.) Thus, 16 : 12 : 12 : 9, the Quotient of the Pinion of Report.—Having thus found your Quotients, 'tis easy to determine what Numbers the Pinions shall have; for, chusing what Numbers the Wheels shall have, and multiplying the Pinion by their Quotients, the Product is the Number for the Wheels. Thus, the Number of the Pinion of Report is 4, and its Quotient 9; therefore the Number for the Dial-Wheel must be 4 x 9, or 36: so the next Pinion being 5, its Quotient 11, therefore the great Wheel must be 5 x 11 = 55, and so of the rest.

Such is the Method of calculating the Numbers of a 16 hour Watch.—Which Watch may be made to go longer, by lessening the Train, and altering the Pinion of Report. Suppose you would conveniently shorten the Train to 16000; then by the Rule given under the Word BEAT, say, As 26666, or 8000 : 13464 : 12 : 20. So that this Watch will go 20 Hours. Then for the Pinion of Report, say, (by the Rule given under that Word) As 20 : 12 : 12 : 7. So that 7 is the Quotient of the Pinion of Report. And as to the Numbers, the Operation is the same as before; only the Dial-Wheel is but 28, for its Quotient is alter'd to 7.—If you would give 17 Numbers to a Watch of about 10000 Beats in an Hour, to have 12 Turns of the Fufy, to go 170 Hours, and 17 Notches in the Crown-Wheel: The Work is the same, in a manner, as in the last Example; and consequently thus: As 12 : 170 : 1 : 10000 : 121666, which fourth Number is the Beats in one Turn of the Fufy; its half, 70833, being divided by 17, gives 1467 for the Quotients: And because this Number is too big for three Quotients, therefore chuse four, as 10, 8, 8, 6<sup>1</sup>/<sub>2</sub>; whose Product into 17 makes 72808, nearly equal to half the true Beats in one Turn of the Fufy.—Then say, As 170 : 12 : 1 : 72808 : 5069, which is half the true Train of your Watch. And again, 170 : 12 : 12 : 544 (or 170) 144, which expresses the Pinion of Report, and the Number of the Dial-Wheel. But these Numbers being too big to be cut in small Wheels, they must be varied by the fourth Rule, above, thus;

As 144 : 170 : 1 : 360 : 425.  
Or 170 : 144 : 1 : 360 : 305.

Then dividing 360, and either of these two fourth Proportionals, (as directed by the Rule) 425 or 305, by 15, you'll have 24 or 20; then the Numbers of the whole Movement will stand as in the Margin.

17		

Such is the Calculation of ordinary Watches to shew the Hour of the Day: In such as shew Minutes and Seconds; the Process is thus.

1<sup>o</sup>. Having resolv'd on the Beats in an Hour; by dividing the designed Train by 60, find the Beats in a Minute; and accordingly, find proper Numbers for the Crown-Wheel and Quotients, so as that the Minute-Wheel shall go round once in an Hour, and the Second-Wheel once a Minute.—

Suppose, e.g. you should chuse a Pendulum of six Inches to go eight Days, with 16 Turns of the Fufy; a Pendulum of 6 Inches vibrates 9368 in an Hour; and consequently, dividing it by 60, gives 156, the Beats in a Minute. Half these Sums are 4684 and 78. Now the first work is to break this 78 into a good proportion which will fall into one Quotient, and the Crown-Wheel. Let the Crown-Wheel have 15 Notches, then 78 divided by 15, gives 5 1/3 for a Crown-Wheel of 15, and a Wheel and Pinion, whose Quotient is 5, will go round in a Minute to carry a Hand to shew Seconds.—For a Hand to go round in an Hour to shew Minutes; because there are 60 Minutes in an Hour, 'tis but breaking 60 into good Quotients, (suppose 10 and 6, or 8 and 7, &c.) and 'tis done. Thus 4684 is broken, as near as can be, into proper Numbers. But since it don't fall out exactly into the above-mention'd Numbers, you must correct, (as before directed) and find the true Number of Beats in an Hour, by multiplying 15 by 5, which makes 75; and 75 by 60, makes 4500, which is half the true Train. Then find the Beats in one Turn of the Fufy; thus, 16 : 192 : 1 : 4500 : 44000; which last are half the Beats in one Turn of the Fufy. This 44000 being divided by 4500, (the true Numbers already pitch'd on) the Quotient will be 12; which not being too big for a single Quotient, needs not be divided into more; and the Work will stand as in the Margin.—As to the Hour-hand, the great Wheel which performs only one Revolution in 12 Turns of the Minute-Wheel will shew the Hour: or it may be done by the Minute-Wheel.

WATCH, at Sea, signifies a measure or space of four Hours; because half the Ship's Crew watch and do Duty in their turns so long at a time.

The Ship's Company is divided into two Parts, the *Tar-board Watch*, and the *Starboard Watch*.—The Master of the Ship commands the latter, and the chief Mate the former.

Sometimes, when a Ship is in Harbour, they watch but a *Quarter-watch*, as they call it; that is, but a quarter of the Company watch at a Time.

The *Watch-Glass* being four Hours, is used at Sea to shift or change their Watches.—There are also *Half-watch* Hour-Glasses; Minute and Half-minute Glasses; by which last they count the Knots when they heave the Log, in order to find the Ship's Way. See *Log-Line*.

WATER, *Aqua*, in Physics, a simple, fluid, and liquid Body; reputed the third of the four vulgar Elements. See ELEMENT.

Sir I. Newton defines Water to be a fluid Salt; volatile, and void of Taste: But this Definition *Boerhaave* sets aside, inasmuch as Water is a Menstruum or Dissolvent of Salts and Lixiv Bodies, which does not agree with the Notion of its being a Salt it self; inasmuch as, we don't know of any Salt that dissolves another. See SALT.

Whether Water be originally fluid?—The Water be defin'd a Fluid, 'tis a Point controverted among Philosophers, whether Fluidity be its Natural State, or the Effect of Violence: We sometimes find it appear in a fluid, and sometimes in a solid form; and as the former in our warmer Climate is the more usual, we conclude it the proper one, and ascribe the other to the extraneous Action of Cold.—*Boerhaave*, however, asserts the contrary, and maintains Water to be of the Crystalline Kind; since, wherever a certain degree of Fire is wanting to keep it in fusion, it readily grows into a hard Globe, under the Denomination of Ice. See ICE.

Mr. Boyle is much of the same Sentiment.—Ice, he observes, is commonly reputed to be Water brought into a preternatural State by Cold: But, with regard to the Nature of Things, and setting aside our arbitrary Ideas, it might as justly be said, That Water is Ice, preternaturally thaw'd by Heat. If it be urg'd that Ice, left to it self, will, upon the Removal of the freezing Agents, return to Water: It may be answer'd, that, not to mention the Snow and Ice which lie all Summer long on the Alps and other high Mountains, even in the Torrid Zone, we have been assur'd, that in some Parts of Siberia, the Surface of the Ground continues more Months of the Year frozen by the natural Temperature of the Climate, than thaw'd by the Heat of the Sun; and a little below the Surface of the Ground, the Water which

chances to be lodg'd in the Cavities there, continues in a state of Ice all the Year round: So that when in the heat of Summer the Fields are cover'd with Corn, if you dig a Foot or two deep, you shall find Ice, and a frozen Soil.

No pure Water in all Nature.—Water, if it could be had alone, and pure, *Berberae* argues, would have all the requisites of an Element, and be as simple as Fire; but there is no expedient hitherto discover'd for making it such. Rain-Water, which seems the purest of all those we know of, is replete with infinite Exhalations of all kinds, which it imbibes from the Air: So that filter'd and distill'd a thousand times, there still remains Faeces.—Further, the Rain-Water gather'd from the Roofs of Houses, is a Lixivium of Tyles, Slate, or the like, impregnated with the Dungs and Faeces of the Animals, Birds, &c. deposited thereon; and the Exhalations of numerous other Things.—Add, that all the Rain-Water gather'd in Cities, must at last be saturated with the Smoke of a thousand Chimnies, and the various Effluvia of Numbers of Persons, &c. Beside that there is Fire contained in all Water; as appears from its Fluidity, which is owing to Fire alone. See FIRE.

As what is in the Air necessarily mixes it self with Water, it hence appears impossible to have such a thing as pure Water.—If you percolate it thro' Sand, or squeeze it thro' Pumice, or pass it thro' any other Body of the like kind, you will always have Salt remaining.—Nor can Distillation render it pure; since it leaves the Air therein, which abounds in Corpuscles of all sorts. See AIR.

The purest of all Waters we can any way arrive at, is that distill'd from Snow, gather'd in a clear, still, pinching Night, in some very high Place; taking none but just the outer or superficial Part thereof.—By a Number of repeated Distillations hereof, the greatest part of the Earth and other Faeces, may be separated herefrom: And this is what we must be contented to call pure Water.

Mr. Boyle, indeed, relates, that a Friend of his, by distilling a quantity of Water an hundred times, found at length that he had got six tenths of the first Quantity in Earth: Whence he concludes, that the whole Water, by further prosecuting the Operation, might be converted into Earth. See EARTH.

But it should be consider'd, that the Water cannot be removed, or poured into a Vessel, without the Mixture of some Dust therewith; so, neither can the Luting of the Vessel be distill'd, without losing something every time. *Berberae*, therefore, rather concludes, that the Water thus often distill'd, might acquire still new Earth from the Dust floating in the Air, and the Instruments employ'd in the Operation.

That Author assures us, that after distilling some very pure Water, by a gentle Fire, the space of four Months, it appear'd perfectly pure; and yet leaving it to rest in Vessels exactly closed, it would conceive a slender kind of woody Matter, somewhat like the *Stamina* of Plants, or the little Tuffs of a Muclage: and yet, *Sebastus* saw Water, in *Kircher's Museum*, that had been kept in a Vessel hermetically seal'd, upwards of fifty Years, yet still remained clear and pure, and stood to the same height in the Vessel as at first, without the least Sign of Sediment.

*Berberae* adds, that he is convinc'd no body ever saw a Drop of pure Water; that the utmost of its purity known, only amounts to its being free of this or that sort of Matter: and that it can never, for instance, be quite deprived of Salt; since Air will always accompany it, and Air has always Salt. See AIR.

Water in all Places and Bodies.—Water seems to be diffused every where, and to be present in all Space where there is Matter.—Not a Body in all Nature but will yield Water: 'Tis even asserted that Fire it self is not without Water. A single Grain of the most fiery Salt, which in a Moment's Time will penetrate thro' a Man's Hand, readily imbibes half its weight of Water, and melts, even in the driest Air imaginable.—Thus, Salt of Tartar, placed near the hottest Fire, will attract or imbibe Water; and by that means, increase considerably its weight in a small time: So in the driest Summer's-Day, a pewter Vessel with Ice in it, brought up from some cold subterraneous Place into the hottest Room, will immediately be cover'd over with little Drops of Water, gather'd from the contiguous Air, and condensed by the Coldness of the Ice.

'Tis surprising to consider the plenteous Stock of Water which even dry Bodies afford.—Oil of Vitriol, being exposed a long time to a violent Fire, to separate all the Water, as much as possible, from the same; will afterwards, by only standing a few Minutes in the Air, contract fresh Water so fast, as soon to afford it as plenteously as at first.—Hartshorn, kept forty Years, and turn'd as hard and dry as any Metal; so, that if struck against a Flint, it will yield Sparks of Fire; yet, being put into a glass Vessel, and distill'd, will afford one eighth of its Quantity of Water. Bones dead and dried twenty five Years, and thus become almost as hard as Iron; yet, by Distillation, have afforded

half their weight of Water. And the hardest Stones, ground and distill'd, do always discover a Portion thereof.

Eds, by Distillation, yielded Mr. Boyle some Oil, Spirit, and Volatile Salt, besides the *Caput Mortuum*; yet all these were so disproportionate to the Water, that they seem'd to have been nothing but that congeal'd: The same strangely abounds in Vipers, tho' esteem'd very hot in operation; and will, in a convenient Air, survive for some Days the loss of their Heads and Hearts. Human Blood it self, as spirituous and elaborate a Liqueur as it is reputed, so abounds in Water, that out of seven Ounces and an half, the same Author, by Distillation, drew near six of Phlegm; before ever any of the other Principles began to rise. See PHLEGM.

Whether Water be the common Matter of all Bodies?—From Considerations of this kind, *Thales*, and some other Philosophers, have been led to hold, That all Things were made of Water: Which Opinion, probably, had its rise from the Writings of *Moses*, where he speaks of the Spirit of God moving upon the Face of the Waters.—But Mr. Boyle does not conceive the Water here mention'd by *Moses* as the Universal Matter, to be our Elementary Water: we need only suppose it an agitated Congeries of a great Variety of seminal Principles, and of other Corpuscles fit to be subdu'd and fasten'd by them; and it may yet be a Body fluid like Water, in case the Corpuscles it was made up of, were, by their Creator, made small enough, and put into such an actual Motion, as might make them roll, and glide easily over one another.—However, *Basili Valentine*, *Paracelsus*, *Van Helmont*, *Centevoglio*, and others, have maintained the same Principle, viz. That Water is the Elemental Matter or *Stamina* of all things, and suffices alone for the Production of all the visible Creation.—Thus, Sir I. Newton, 'All Birds, Beasts, and Fishes, Insects, Trees, and Vegetables, with their several Parts, do grow out of Water, and watery Tinctures, and Salts; and by Putrefaction return again into watery Substances.'

*Helmont* endeavours to prove this Doctrine from an Experiment; wherein, burning a quantity of Earth, till all the Oil was consum'd, and then mixing it up with Water, to draw out all the Salt; and putting this Earth, thus prepared, into an earthen Pot, which nothing but Rain-Water could enter; yet a Willow, planted therein, grew up to a considerable height and bulk, without any sensible Diminution of the Earth: Whence he concludes, that the Water was the only Nutrimnt of the Vegetable Kind, as Vegetables are of the Animal. The same thing is infer'd by Mr. Boyle from a parallel Experiment: And the whole is countenanc'd by Sir I. Newton, who observes, that Water, standing a few Days in the open Air, yields a Tincture, which, like that of Malt, by standing longer, yields a Sediment, and a Spirit; but before Putrefaction, is fit Nourishment for Animals and Vegetables.

But Dr. Woodward endeavours to shew the whole a Mistake: Water containing extraneous Corpuscles, some of these, he shews, are the proper Matter of Nutrition; the Water being still found to afford so much the less Nourishment, the more it is purify'd by Distillation. Thus, a Plant in distill'd Water will not grow so fast as in Water not distill'd; and if the Water be distill'd three or four times over, the Plant will scarce grow at all, or receive any Nourishment from it. So that Water, as such, does not seem the proper Nutrimnt of Vegetables; but only the Vehicle thereof, which contains the nutritious Particles, and carries them along with it, thro' all the Parts of the Plant. See VEGETATION.

Hence, a Water-Plant, e. g. a *Nasturtium*, brought up in a Vessel of Water, will be found to contain the more Salt and Oil, the muddier the Water is: In effect, Water nourishes the less, the more it is purged of its saponaceous Salts; in its pure State, it may suffice to extend or swell the Parts, but affords no new Vegetable Matter. See VEGETABLE, NUTRITION, &c.

*Helmont*, however, carries his System still further, and imagines, that all Bodies may be re-converted into Water. His Alkalest, he affirms, adequately resolves Plants, Animals, and Minerals, into one Liqueur, or more, according to their several internal Differences of Parts: And the Alkalest, being abstracted from these Liqueurs, in the same Weight and with the same Virtues as when it dissolv'd them; the Liqueurs may, by frequent Cobinations from Chalk, or some other proper Matter, be totally depriv'd of their seminal Endowments, and return at last to their first Matter, insipid Water.

Thus much is confess'd, that mix'd Bodies do all resolve by Fire, into Phlegm or Water, Oil, Spirit, Salt, and Earth; each of which is found to contain Water.

Spirits, for instance, cannot be better represented than by Spirit of Wine, which of all others seems freest from Water: yet, *Helmont* affirms, it may be so united with Water, as to become Water it self. He adds, that 'his materially Water; only under a salphurous Disguise.—According to him, in making

making *Paracelsus's Balsamus-famech*, which is nothing but *Sul Tartari* calcify'd by distilling Spirit of Wine from it till the Salt be sufficiently saturated with its Sulphur, and till it suffers the Liqueur to be drawn off as strong as it was poured on; when the Salt of Tartar, from which it is distill'd, hath retained, or deprived it of the sulphurous Parts of the Spirit of Wine, the rest, which is incomparably the greatest Part of the Liqueur, will turn to Phlegm. In effect, corrosive Spirits, according to Mr. Boyle's Observation, abound in *Water*; which may be observed, by entangling, and so fixing their saline Parts, as to make them corrode some proper Body; or else by mortifying them with some contrary Salt: which will turn them into Phlegm.

And as to Salts; Salt of Tartar well calcin'd, being laid to liquify in the Air, will deposit an Earth; and if it be then committed to Distillation, will yield a considerable Quantity of insipid *Water*; inasmuch, that if it be urg'd with a vehement Fire, the Salt will almost all vanish, and nothing saline remain, either in the *Water*, or the Earth.—Whence *Helmont* concludes, that all Salts might be converted into *Water*. Add, that Sea Salt, recover'd from its own acid Spirit and Oil of Tartar, melts into *Water*, as much as into Oil of Tartar.

Lastly, Oils run, in great measure, into *Water*; and 'tis probable, might be converted wholly into the same. See OIL, SULPHUR, &c.

No Standard for the Weight and Purity of *Water*.—*Water* scarce ever continues two Moments exactly of the same weight, being always varying, by reason of the Air and Fire contain'd therein. Thus, a piece of pure limpid Ice, laid in a nice balance, never continues in *Equilibrio*.—In effect, the Expansion of *Water* in boiling, shews what effect the different degree of Fire has on the Gravity of *Water*.—This makes it difficult to fix the specific Gravity of *Water*, in order to settle its degree of Purity; but this we may say in the general, That the purest *Water* we can procure, is that which is 880 times as heavy as Air. However, neither have we any tolerable Standard in Air; for *Water* being so much heavier than Air, the more *Water* is contain'd in the Air, the heavier of course must it be: As, in effect, the principal Part of the Weight of the Atmosphere, seems to arise from the *Water*. See AIR, and ATMOSPHERE.

#### Properties and Effects of *Water*.

1<sup>o</sup>. *Water* is found the most penetrative of all Bodies, after Fire, and the most difficult to confine; so that a Vessel thro' which *Water* cannot pass, may retain any thing. Nor is it any Objection, that Syrups and Oils will sometimes pass thro' Bodies which hold *Water*; this not being owing to the greater Subtility and Penetration of their Particles, but to the Resin wherewith the Wood of such Vessels abounds, to which Oils and Syrups are as Menstruums; so that dissolving the Resin, they make their way thro' the Spaces left thereby; whereas *Water*, not acting on Resins, is retained. See RESIN.

And yet, *Water* gradually makes its way, even thro' all Woods, and is only retainable in Glass and Metals; nay, it was found by Experiment at Florence, that when shut up in a spherical Vessel of Gold, and then press'd with a huge force, it made its way thro' the Pores even of the Gold; so that the most solid Body in Nature is permeable to *Water*. See CORN.

*Water* is even found more fluid than Air; a Body being reputed more fluid than another, when its Parts will find way thro' smaller Pores: now Air, 'tis known, will not pass thro' Leather, as is evident in the Case of an exhausted Receiver cover'd therewith; whereas *Water* passes with ease.—Again, Air may be retain'd in a Bladder, but *Water* oozes thro'. In effect, 'tis found, that *Water* will pass thro' Pores ten times smaller than Air will. See PORE.

It must not be omitted, however, that M. Homberg accounts for this passage of *Water* thro' the narrow Pores of animal Substances which will not admit the Air, on another Principle, viz. its moistening and dissolving the glutinous Matter of the fine Fibres of the Membranes, and rendering them more pliable and distractile; which are things that the Air, for want of a wetting Property, cannot do.—As a Proof of this Doctrine, he filled a Bladder, and compress'd it with a Stone, and found no Air to come out; but placing the Bladder thus compress'd in *Water*, the Air easily escap'd. *Hist. de l'Acad. Ann. 1700. p. 45.*

2<sup>o</sup>. *Water*, then, may even hence, viz. from its penetrative Power, be argu'd to enter the Composition of all Bodies, both Vegetable, Animal, and Fossil; with this peculiar Circumstance, That it is easily, and with a gentle heat, separable again from Bodies it had united with; which cannot be said of any other Body.—Fire, indeed, will penetrate more than *Water*; but 'tis difficult to procure it again from the Bodies it is once fixed in, as is evident in Red Lead, &c. See MINIMUM, &c.

This Property of *Water*, join'd with its Smoothness and Lubricity, fits it to serve as a Vehicle, for the commodious

and easy Conveyance of the Nutritious Matter of all Bodies; being so fluid, and passing and repassing so readily; it never stops up the Pores, but leaves room for the following *Water*, to bring on a new Supply of nutritious Matter: See NUTRITION.

3<sup>o</sup>. And yet the same *Water*, as little cohesive as it is; and as easily separated from moist Bodies, will cohere firmly with some others, and bind them together into the most solid Masses: To it appears wonderful, that *Water*, which will be shewn an almost universal Dissolvent, should withal be a great Coagulator.

*Water*, we see, mixed up with Earth or Ashes, gives them the utmost Firmness and Fixity.—The Ashes, r. g. of an Animal, incorporated with pure *Water* into a Paste, and bak'd with a vehement Fire, grow into a Coppel; which is a Body remarkable for this, that it will bear the utmost Effort of a Refiner's Furnace.—'Tis, in effect, upon the glutinous Nature of *Water* alone that our Houses stand; for take but this out of Wood, and it becomes Ashes; or out of Tyles, and they become Duft.

Thus, a little Clay dry'd in the Sun, becomes a Powder, which mix'd with *Water* sticks together again, and may be fashion'd at pleasure; and this dried again by a gentle Fire, or in the Sun, and then bak'd in a Potter's Oven, by an intense Fire, becomes little other than a Stone.—So the Chinese or Japan Earth, wherof our Porcelain Vessels are made, which hold all Liqueurs, and even melted Lead it self, is diluted and wrought up with *Water*. See PORCELAIN.

To say no more, all the Stability and Firmness seen in the Universe is owing to *Water* alone.—Thus, Stone would be an incoherent Sand, did not *Water* bind it together; and thus, again, of a fat gravelly Earth, wrought up with *Water* and bak'd or burn'd, we make Bricks, Tyles, and earthen Vessels, of such exceeding Hardness and Closeness, that *Water* it self cannot pass thro' them. And these Bodies, tho' to appearance perfectly dry, and destitute of *Water*, yet, being pulveriz'd and put in a Retort, and distill'd, yield an incredible quantity of *Water*.

The same holds of Metals; for the Parings or Filings of Lead, Tin, Antimony, &c. by Distillation, yield *Water* plentifully; and the hardest Stones, Sea Salt, Nitre, Vitriol, Sulphur, &c. are found to consist chiefly of *Water*, into which they resolve by force of Fire.

The *Lapis Calcarius*, or Lime-stone, being expos'd to the Fire, affords a prodigious Quantity of pure *Water*; and the more of this *Water* is express'd, the more friable does it become, till at length it commences a dry Calx or Lime; wherein, in lieu of the *Water* so expell'd, the Fire, in the Course of Calcination, enters; which is expell'd again, in its turn, by pouring on cold *Water*. Yet, the same *Water* and Calx, temper'd together, produce a Mass, scarce inferior, in point of Solidity, to the primitive Lime-stone. See HEAT.

4<sup>o</sup>. That *Water* is not elastic, is evident hence, that it is incompressible, or incapable, by any Force, of being reduced into less compass: This easily follows from that famous Experiment above-mention'd, made by order of the great Duke of Tuscany.—The *Water*, being incapable of Condensation, rather than yield, transfus'd thro' the Pores of the Metal, so that the Ball was found yet all over the outside; till at length, making a Cleft in the Gold, it spun out with great vehemence.—From this last Circumstance, indeed, some have weakly concluded it was elastic. For the *Impetus* wherewith the *Water* darted forth, was more probably owing to the Elasticity of the Gold, which communicated that Impression to the *Water*.

And hence we see the Reason why Blocks of Marble sometimes burst in cold weather; and why a Vessel fill'd with *Water*, and afterwards, by any means, reduced to a less compass, bursts the Vessel, tho' ever so strong.—This is observable in a piece of brass Cannon, which being fill'd with *Water*, and the Mouth exactly stop'd, so as to prevent all egress of *Water*; if a cold Night happens, sufficient to contract and consolidate Bodies; the metallick Matter undergoing the common Fate, and the *Water* refusing to give way, the Cannon is burst asunder with incredible violence.

Some bring an Argument for the Elasticity of *Water* hence, that hot *Water* takes up more room than cold; but no legitimate Conclusion can be form'd from hence; for in the hot *Water* there is a good quantity of Fire contain'd, which interposing between the Particles of the *Water*, makes it extend to a greater Space, without any Expansion of Parts from its own Elasticity. This is evident hence, that if *Water* be once heated, there is no reducing it to its former Dimensions, but by letting it cool again; which plainly shews, that the Expansion depends not on the Elasticity of Parts, but on the Presence of Fire.—*Water*, then, tho' incapable of Compression or Condensation, may yet be rarified by Heat, and contracted by Cold. See RAREFACTION, &c.

It may be added, that a further degree of Cold, that is, such a one as congeals *Water*, or turns it into Ice, does expand it.—There are other ways to manifest this Expansion of

of *Water* by Freezing.—Mr. Boyle having poured a proper quantity of *Water* into a strong cylindrical earthen Vessel, expos'd it, uncover'd, both to the open Air in frosty Nights, and the Operation of Snow and Salt; and found, that the Ice produced in both Cases, reach'd higher than the *Water* before 'twas froze. Add, that it has been found, that the Rain soaking into Marble, and violent Frosts coming on, have burst the Stones: And even Implements made of Bell-Metal, carefully expos'd to the wet, have been broken and spoiled by the *Water*; which entering at little Cavities of the Metal, was there afterwards froze, and expanded into Ice.

From the whole, we may be enabled to settle something as to the Nature of the component Particles of *Water*; and, 1<sup>o</sup>, That they are, as to our Senses, infinitely small; whence their penetrative Power: 2<sup>o</sup>, Exceeding smooth and slippery, void of any sensible Aperities; witness their Fluidity, and their being so easily separable from other Bodies which they adhere to: 3<sup>o</sup>, Extremely solid: 4<sup>o</sup>, Perfectly transparent, and as such invisible; which we gather hence, that pure *Water*, inclos'd in a Vessel hermetically seal'd, projects no Shadow; so that the Eye shall not be able to discover whether the Vessel have *Water* in it or not; and in that the Crystals of Salts, when the *Water* is separated from them, lose their Transparency.—5<sup>o</sup>, Hard, rigid, and inflexible; as appears from their not being compressible.—If it be ask'd, How a Body so light, fluid, and volatile, and which so easy a Fire suffices to rarefy, should be so stubborn and incompressible? We see no other Cause to assign, but the Homogeneity of its Parts. If *Water* be consider'd as consisting of spherical or cubical Particles, hollow within, and of a firm Texture; here will be enough to account for the whole: Its Firmness and Similarity will make it resist sufficiently; and its Vacuity render it light enough, &c.—The little Contact between Spherules, will account for the Weakness of its Cohesion, &c. See PARTICLE, COHESION, &c.

Salt melted in *Water*, does not fill the Vessel in proportion to its own bulk: Whence it follows, that there are little Spaces between its Particles, to admit those of the Salt.—And hence, again, we gather, that the watery Particles are extremely solid, and inflexible; since, tho they have intermediate Spaces, no force or weight can compress, or crowd them nearer. See SALT.

5<sup>o</sup>, *Water* is the most insipid of all Bodies; the Taste we sometimes observe therein, arising not from the mere *Water*; but from Salt, Vitriol, or other Bodies mixed therewith: And accordingly, all the sapid *Waters* recommended for Medicinal Uses, are found to deposit a Quantity of some of those Salts.

6<sup>o</sup>, *Water* is perfectly insipid, or void of the least Smell.—*Water*, then, neither affects Sight, Taste, nor Smell, provided it be pure; and consequently might remain for ever imperceptible to us, but for the Sense of Feeling.

Whether *Water* be convertible into Air?

It has been disputed, whether or no *Water* be convertible into Air; there being numerous Instances of, at least, an apparent Transmutation.—In the Vapours daily raised, we find *Water* rarefy'd to such a degree, as to take place in the Atmosphere, and help to compose a considerable part of what we call Air; and even to contribute to many of the Effects ascribed to the Air. See VAPOUR, AIR, and ATMOSPHERE.

—But such a Vapour-Air has not the Characters of true permanent Air, being easily reducible into *Water* again. So, in Digestions and Distillations, the *Water* may be rarefy'd into Vapours, yet it is not really changed into Air, but only divided by Heat, and diffus'd into very minute Parts; which meeting together, presently return to such *Water* as they constituted before.

Yet, *Water* rarefy'd into Vapour in an Aeolipyle, will, for a while, have an elastic Power, the great and last Characteristick of true Air, and stream out perfectly like a Blast of Air: The elastic Power of this Steam, is manifestly owing to nothing else but the Heat, that expands and agitates the aqueous Particles thereof; and when the Heat is gone, the Elasticity and other aerial Properties disappear likewise. See ELASTICITY.

Rapid Winds thus made, seem to be no more than mere *Water*, broke into little Parts, and put into motion; since, by holding a solid, smooth, and cold Body against it, the Vapours condensing thereon, will presently cover the Body with *Water*.—Indeed, tho no heat intervenes, Motion alone, if vehement, may perhaps suffice to break *Water* into minute Parts, and make them ascend upwards, in form of Air.—Mr. Boyle observes, that between Lyons and Geneva, where the Rhone is suddenly straiten'd by two Rocks very near each other, that rapid Stream, dashing with great impetuosity against them, breaks part of its *Water* into minute Corpuscles, and gives it such a Motion, that a Mist may be observ'd at a considerable distance, arising from the Place, and ascending high into the Air.

*WATER*, in Geography, Hydrography, &c. is a common, or general Name applied to all liquid transparent Bodies, gliding or flowing on the Earth. See FLUID, LIQUID, &c.

In this Sense, *Water* and Earth are said to constitute one terraqueous Globe. See EARTH.

Some Authors have rashly and injuriously tax'd the Distribution of *Water* and Earth in our Globe as unskillful, and not well proportion'd: Supposing that the *Water* takes up too much room. See TERRAQUEOUS.

An Inundation, or Overflowing of the *Waters*, makes a Deluge. See DELUGE.

Various Kinds of WATERS.

*Water* is distinguish'd, with regard to the Places where it is found, into *Marina*, Sea-*Water*; *Pluvialis*, Rain-*Water*; *Fluvialis*, River-*Water*; *Fontana*, Spring-*Water*; *Putealis*, Well-*Water*; *Cisterna*, those of Cisterns; *Pallustris*, that of Lakes, Morasses, &c.

These sorts of *Water* are each more impure, and heterogeneous than other.

SEA-WATER. See SEA, and OCEAN.

Sea-*Water*, is an Assemblage of Bodies, wherein *Water* can scarce be said to have the principal Part: 'Tis an universal Colluvies of all the Bodies in Nature, sustain'd and kept swimming in *Water*, as a Vehicle.—Dr. Lister considers it as the Fund or Source, out of which all Bodies arise. He gives, in some measure, into the Opinion of *Tales* and *Van Helmont*; and imagines the Sea-*Water* to have been the only Element created at the Beginning, before any Animal, or Vegetable; or even before the Sun himself.—*Fresh-*Water**, he supposes to have arose accidentally after the Creation of these; and to owe its Origin to the Vapours of Plants, the Breath of Animals, and the Exhalations raised from the Sun. *De Four. Med. Ang.*—Dr. Halley is of another Opinion—He takes it for granted, that the Saltness of the Sea, arises from the saline Matter diffus'd and imbib'd by the Rivers in their progress, and discharg'd, with their *Waters*, into the Ocean; and consequently, that the degree of Saltness is continually and gradually increasing.—On this Hypothesis, he even proposes a Method for determining the Age of the World: For two Experiments of the degree of Saltness, made at a large interval of Time, will, by the Rule of Proportion, give the Time wherein it has been acquiring its present degree. *Philos. Transact. N<sup>o</sup> 344.*

The *Water* of the Sea is liable to several periodical Changes. See TIDES.

High-*Water*. }  
Low-*Water*. } See FLUX, EBB, &c.  
Ebb-*Water*. }

RAIN-WATER. See RAIN.

Rain-*Water*, is the *Water* of the Sea, purified by a sort of Distillation; or rather, it is the watery Vehicle, separated from the saline, and other Matters residing therein, by Evaporation. See EVAPORATION.

The *Water* which descends in Rain, is, of all others, the purest, in a cold Season, and a still Sky; and this we may be contented to take for Elementary *Water*.

The Rain-*Water* in Summer, or when the Atmosphere is in Commotion, 'tis certain, must contain infinite Kinds of heterogeneous Matter: Thus, gathering the *Water* that falls after a Thunder-Clap, in a sultry Summer Day, and letting it settle, a real Salt is found sticking at the bottom.—But in Winter, especially when it freezes, the Exhalations are but few, so that the Rain falls without much Adulteration; and hence, what is thus gather'd in the Morning-time, is found of good use for taking away Spots in the Face; and that gathered from Snow, against Inflammations of the Eyes. See SNOW.

Yet this Rain-*Water*, with all its purity, may be filter'd and diffus'd a thousand times, and it will still leave some Feces behind it.

SPRING-WATER. See SPRING.

The *Water* of Springs is the next, in point of Purity.—This, according to Dr. Halley, is collected from the Air it self; which being saturated with *Water*, and coming to be condensed by the Evening's Cold, is driven against the cold Tops of the Mountains; where being further condensed and collected, it gleans down, or distills, much as in an Alembic.

This *Water*, which before floated in the Atmosphere in form of a Vapour, being thus brought together, at first forms little Streams; several of which meeting together, form Rivulets; and these, at length, Rivers.

RIVER-WATER. See RIVER.

This, on some occasions, is to be esteem'd purer than that of Springs.—If the Stream, in descending from its Spring, chance to flow over *Srassa*, or Beds, wherein there is Salt, Sulphur, Vitriol, Iron, or the like, it dissolves and imbibes part thereof.—Otherwise, Spring-*Water* becomes purer and better; for while the River drives on its *Waters* in an uninterrupted Stream, all its Salts, with the Vegetable and Animal Matters drained into it either from Exhalations, or from

from the Ground it washes, gradually either sink to the bottom, or are driven to the Shore: And hence the ancient Poets and Painters represent the Deities of Springs and Rivers, as combing and carding their Waters.

With regard to the Qualities of Water, it is farther distinguishing'd into *Salina*, *Salt-Water*; *Dulcis*, *Fresh-Water*, &c. *Salt-WATER*, or *SEA-WATER*. See *SALT*, and *SEA-WATER*.

*Fresh-WATER*.—It is generally granted that those Waters, *estris paribus*, are the best, as well for wholesomeness, as other various economical Uses, &c. that are froest from Saltiness; which is an admittivous, and in most Cases a hurtful Quality in Waters.—Mr. Boyle therefore contriv'd a very extraordinary Method of examining the Freshness and Saltiness of Waters, by a Precipitant, which could discover one Part of Salt in 1000, nay a or 3000 Parts of Water. See *FRESH WATER*.

The thaw'd Ice of *Sea-Water* is often used in *Amsterdam* for brewing; and *Barboline*, in his Book of *Nivus Ufu*, confirms the Relation: 'Tis certain, says he, that if the Ice of the *Sea-Water* be thaw'd, it loses its Saltiness; as has been lately tried by a Professor in our University.

#### Uses of Water.

The Uses of Water are infinite; in Food, in Medicine, in Agriculture, in Navigation, in divers of the Arts, &c.

As a Food, 'tis one of the most universal Drinks in the World; and if we may credit many of our latest and best Physicians, one of the best too.—For this Use, that which is purest, lightest, most transparent, simple, colourless, void of Taste and Smell, and which warms and cools fastest, and wherein Herbs and Pulse infuse and boil the soonest, is best. See *DRINK*.

*Hippocrates*, in his Treatise de *Aere, Aquis & Locis*, speaks much in behalf of light Water.—*Herodotus* relates, That among the *Americans*, some Nations drank a Water to very light, that all Woods readily sunk therein. And Mr. Boyle mentions some Water brought out of *Africa* into *England*, which was specifically lighter than ours, by four Ounces in a Pint, i. e. by one third. See *WATERPOISE*.

'Tis esteem'd a good Quality in Water, to bear Soap, and make a Lather therewith. This our *River-Waters* readily do, but the Pump and Spring Waters are found too hard for it; yet may these be remedy'd, by barely letting 'em stand for four or five Days.

As a Medicine, 'tis found, internally, a powerful *Febri-fuge*; excellent against Colds, Coughs, Stone, Scurvy, &c. See *FEBRIFUGE*, &c.

Externally, its Effects are no less considerable. See *BATH*, and *BATHING*.

In Agriculture and Gardening, Water is allow'd absolutely necessary to Vegetation; whence *Varro* places it in the Number of the Divinities he invokes in his first Book de *Re Rustica*: *Eriam, say he, precor Lymphas, quoniam sine aqua omnis vitæ est agricultura*. See *WATERING*.

The Charges Water is liable to, and the different Forms it appears under, are numerous.—Sometimes as *Ice*, then as *Vapour*, then as a *Cloud*, *Shower*, *Snow*, *Hail*, *Fog*, &c. See *ICE*, *VAPOUR*, *CLOUD*, *SHOWER*, *SNOW*, *HAIL*, *FOG*, &c. See also *FREEZING*, *TRAWING*, &c.

Many Naturalists have even maintain'd Water to be the Vegetable Matter, or the only proper Food of Plants; but Dr. Woodward has overturn'd that Opinion, and shewn, that the Office of Water in Vegetation, is only to be a Vehicle to a terrestrial Matter, whereof Vegetables are form'd; and does not it self make any Addition to 'em.—All Water, he allows, contains more or less of this terrestrial Matter; Spring and Rain-Water near an equal quantity, and River-Water more than either of 'em. See *VEGETATION*.

Water is of the last Use in Chymistry; being one of the great Instruments by means whereof its Operations are all perform'd. See *CHEMISTRY*, and *OPERATION*.

It acts in various Manners and Capacities, as a Menstruum, a Ferment, a Putrescent, a Vehicle, a Medium, &c.

1<sup>o</sup>, As a Menstruum, it dissolves all Kinds of Salts. See *SALT*, &c.

Air also seems to dissolve Salts; but 'tis only in virtue of the Water it contains.—Nor has any other Body the Power of dissolving Salts, farther than as it shares of this Fluid. See *AIR*, &c.

The Particles of Salts, we have observed, insinuate themselves into the Interstices between the Particles of Water; but when those Interstices are once fill'd, the same Water will not any longer dissolve the same Salt; but it will dissolve a Salt of another Kind, by reason of the different Figure of the Particles, which enter and occupy the Vacancies left by the former: And thus it will dissolve a third, or fourth Salt, &c.—So, when Water has imbib'd its fill of common Salt, it will still dissolve Nitre; and when saturated with Nitre, it will dissolve Sal Ammonic, and so on.

Water also dissolves all saline Bodies, it being the constituent Character of this Class of Bodies, that they are unin-

flammable and dissolvable in Water.—Hence, Water may dissolve all Bodies, even the heaviest and most compact, as Metals; inasmuch as those are capable of being reduced into a saline form; in which State they may be so intimately dissolved by Water, as to be sustained therein.

Water dissolves all *spontaneous* Bodies, i. e. all alkalious Salts and Oils blended together: The Oil it self is not dissolvable in Water, the Admixture of Salt herewith, rendering it saline, brings it under the Power of Water.

Now, all the Humours in the human Body are apparently saline, the none of them are Salt it self; and the same may be said of the Juices of all Vegetables, excepting the Oils; and accordingly, they all dissolve in Water.

Water dissolves Glass it self.—This being melted with Salt of Tartar, becomes soluble in Water. See *GLASS*.

It dissolves all Gums and gummy Bodies; it being a Characteristick of a Gum, that it dissolves in Water; in contradistinction from a Resin. See *GUM*, &c.

Yet, Water mix'd with alkali Salts, dissolves Oils and oily Bodies.—Thus, the more Water pour'd on greasy Wool, be repell'd thereby; yet a strong Lixivium; or alkali Salt being mix'd with the Water; it readily dissolves and absorbs all that was greasy and oleaginous; and thus it is that woollen Cloths are scour'd.

Again, Water does not dissolve Resins; as we conceive a Resin to be no other than an inspissated; or concentrated Oil. See *RESIN*.

Oils and Sulphurs Water leaves untouched; and what is more extraordinary, it repels them; and by repelling, drives the oily Particles into Eddies.—Add, that it seems to repel all oleaginous, sulphurous, fatty, and adipous Bodies, wherein Oil predominates; and hence also it is, that the fatty Parts in our Bodies escape being dissolved by Water.—And 'tis, in all probability, by this means, that Fat is collected in the adipose Cells of all Animals. See *FAT*.

Nor does it dissolve terrene or earthy Bodies, but rather unites and consolidates them; as we see in *Tyles*, &c. See *EARTH*.

After dissolving a Body, the Water unites and hardens together with it; and, if the Body be of the saline Kind, forms Crystals, and retains the Salts in that form. See *CRYSTAL*.

Salts, while thus join'd with Water, assume various Figures; the Crystals of *Sea-Salt*, e. g. are pyramidal; those of Nitre, prismatical; those of *Sol Gemme*, cubical, &c. But, that Water is the Cause of these Salts being in Crystals, is evident hence, That upon separating the Water, the Crystals are no more; their Form is lost, and their Transparency ceases. See *CRYSTALLIZATION*.

2<sup>o</sup>, Without Water there can no Fermentation be rais'd.—Thus, if you grind a Plant into Dust or *Farina*, it will never ferment; even tho' you add Yeast or Spirit of Wine thereto; but Water being pour'd on it, the Fermentation readily arises. See *FERMENTATION*.

3<sup>o</sup>, All Putrefactions, both of Animal and Vegetable Bodies, are likewise perform'd by means of Water alone; and without it there would be no such Effect in all Nature. See *PUTREFACTION*.

4<sup>o</sup>, Water is indispensibly requir'd to Effervescence; which is an intestine Motion, arising between contrary Salts; for no such Motion can arise from a Mixture of contrary Salts, unless there be Water to dissolve and keep 'em in Solution.

5<sup>o</sup>, A farther Use is in the making Separations of oily from saline Parts, which is a thing of the last Service: Thus, any oleaginous Substance, incorporated with Salt, being shook sometime in a proper quantity of Water; the Salts dissolving, will be extracted from the Oil, and imbib'd by the Water; and thus is the Body dulcify'd.—So Butter, by a continued Lotion in fair Water, becomes insipid; and aromatick Oils, agitated a long time in warm Water, lay aside their saline spirituous Parts, and become inert and inodorous.

Spirit of Wine, mix'd with Oil, makes one Body therewith; but if you pour Water thereon, it will repel the Oil, and draw all the Spirit to it self; nay, frequently, what the Spirit had dissolved in other Bodies, Water will separate from 'em, by attracting the Spirit, and letting the other Matters precipitate.

6<sup>o</sup>, Water is of great service in directing and determining the Degree of Fire, or Heat.—This was first discover'd by M. Amontons, from an Observation that Water over the Fire grows gradually more and more hot, till it comes to boil; but then ceases to increase, and only maintains its present degree of heat, even tho' the Fire were ever so much enlarg'd, or were continu'd ever so long.—This, therefore, affords a Standard or fixed Degree of Heat all over the World; boiling Water, provided it be equally pure, being of the same Heat in *Greenland* as under the Equator.

By means hereof, they make Baths of divers Degrees of Heat, accommodated to the various Occasions. See *BATH*, *FIRE*, *HEAT*, &c.

*Water* is of the utmost Use in divers of the *Mechanical Arts* and Occasions of Life; as, in the Motion of Mills, Clocks, and other Machines.—And the Laws, Properties, &c. of this Fluid with respect thereto; as its *Motion, Gravitation, Pressure, Elevation, Action, &c.* And the Construction of divers Engines subservient thereto, or founded thereon; as *Syphons, Pumps, &c.* make the Subject of *Hydraulicks* and *Hydrostaticks*. See *HYDRAULICKS*; see also *FLUID, ASCENT, &c.*

The Quantity of *Water* on this side our Globe, Dr. *Cheyne* supposes to be daily decreasing; 'some part thereof being continually turned into Animal, Vegetable, Metalline, or Mineral Substances; which are not easily dissolv'd again into their component Parts.—Thus, if you separate a few Particles of any Fluid, and fasten them to a solid Body, or keep them asunder one from another, they are no more fluid; to produce Fluidity, a considerable Number of such Particles is requir'd.' See *FLUIDITY*.

Most of the Fluids or Liquors we know of, are form'd by the Cohesion of Particles of different Figures, Magnitudes, Gravities, and attractive Powers, swimming in pure *Water*, or an aqueous Fluid, which seems to be the common Basis of all. Wine is only *Water* impregnated with Particles of Grapes; and Beer with Particles of Barley: All Spirits seem to be nothing but *Water*, saturated with saline or sulphurous Particles: and all Liquors are more or less fluid, according to the greater or smaller Cohesion of the Particles, which swim in the aqueous Fluid. And there is hardly any Fluid without this Cohesion of Particles: not even pure *Water* it self; as is apparent from the Bubbles which sometimes will stand on its Surface, as well as on that of Spirits and other Liquors.' *Philos. Princip. of Reliq.*

*Ascent of WATER.* See *ASCENT*, and *CAPILLARY*.

*Water*, in Natural History, &c. is distinguish'd into *Pure*, call'd also *Elemental*; *Mineral*; and *Artificial*, or *Facitious*.

As to the *Pure*, we have already observ'd, that there is, perhaps, none absolutely so; all *Water* being found to contain more or less Particles, such as are in terrestrial Bodies; not earthy Particles, we mean, but Oils, Salts, &c.

*Mineral Waters*, are those which contain such and so many Particles of different Nature from *Water*, as thence to derive some notable Property beyond what common *Water* has: Or, *Mineral Waters* are those which have contracted some Virtue extraordinary, by passing thro' Beds of Minerals, as Alum, Vitriol, Sulphur, &c. or by receiving the Fumes thereof. See *MINERAL*.

The Kinds of *Mineral Waters* are various, as are the Kinds of Compositions of the Minerals they are impregnated withal. See *FOSSIL*.

Some are *Simple*, as only containing mineral Particles of one sort; others *Mix'd*, of two, three, four, or more sorts.

Hence, we have, 1<sup>o</sup>, *Metallick Waters*, viz. in different Parts, *Goldew, Silver, Copper, Tin, Leadew, and Iron Waters*. See *METAL, FERRUGINOUS, CHALYBEAT, &c.*

2<sup>o</sup>, *Saline Waters*, viz. *Nitrous, Aluminous, Vitriolate*, and those of common Salt. See *SALT*.

3<sup>o</sup>, *Bituminous, Sulphurous, Antimonial, Carbonaceous, and Amber Waters*. See *BITUMEN, &c.*

4<sup>o</sup>, *Earthy and Stony Waters*, viz. *Lime, Chalk, Oker, Cinnabar, Marble, and Alabaster Waters*.

5<sup>o</sup>, *Mercurial Waters*. See *MERCURY, QUICKSILVER, &c.*

This Division of *Mineral Waters* is taken from their Effences; that is, from the Mineral Particles they contain: but the most usual and celebrated Division, is borrow'd from the manner wherein they affect our Senses; with regard to which there are ten Kinds; viz. *acid, bitter, hot, very cold, oily and fat, poisonous, colour'd, boiling, petrifying, insensating, and saline*.

*Acid Waters*, call'd also *Acidule*, arise from the Admixture of Vitriol, Nitre, Alum, and Salt.—These are cold, and very frequent, there being not reckon'd less than 1000 in *Germany* alone: Some of which are fower as *Vinagar*, and used instead thereof; others vinous, and serving for Wine; others astringent, &c. See *ACIDULE*.

*Hot Waters*, call'd *Thermae*, arise from the Admixture of sulphurous Particles and Fumes.—Of these, the hottest is that in *Japan*, which no Fire can bring *Water* to equal; and which keeps hot thrice as long as our boil'd *Water*. See *THERRM, &c.*

*Only and Fat Waters*, arise from a bituminous and sulphu-

reous Matter; as Amber, Petroleum, Pitch, Naphtha, &c. See *NAPHTHA, PETROL, &c.*

*Bitter Waters* are produced from an Impure Sulphur, Bitumen, Nitre, and Copper.—Such is the *Lacus Asphaltites*.

*Very cold Waters*, have their rise from a Mixture of Nitre and Alum; or of Mercury, Iron, &c. The Depth of the Source or Spring too, has some effect.

*Waters which change the Nature of Bodies*.—Of these there is great Variety.

1<sup>o</sup>, Near *Armagh* in *Ireland*, is a Lake, wherein a Staff being fix'd some Months, the Part that stuck in the Mud will be turn'd into Iron; and that Part incompass'd with the *Water* into Hone; the rest remaining as before.—Thus *Gyraldus*, and *Magnius*; but *Bristow* denies it.

2<sup>o</sup>, In the Northern Part of *Ulster* is a Spring, which in the Space of seven Years petrifies Wood, or converts it into Stone.—The like are found in divers other Parts, as in *Hungary, Burgundy, &c.* *Vitruvius* mentions a Lake in *Cappadocia*, which converts Wood into Stone in one Day. See *PETRIFICATION*.

3<sup>o</sup>, There are *Waters* suppos'd to transmute or turn Iron into Copper. See *TRANSMUTATION*.

4<sup>o</sup>, Others are said to change the Colour of the Hair.—*Gyraldus* mentions a Spring in *Ireland*, wherein if a Person were wash'd he instantly became grey.

*Poisonous Waters* are occasion'd by their creeping thro' Arsenical, Antimonial, and Mercurial Earths, or being impregnated by their Fumes.—Such is the *Lacus Asphaltites*, and divers others about the *Alps, &c.* which immediately kill those who drink: But these are moit of 'em fill'd up with Stones; which is one Reason for few are known.

*Saline Waters* are generated two ways; either they are deriv'd from the Sea, by some subterraneous Passage; or are generated from Mineral Salts, which they meet withal in their passage ere they arrive at their Springs. See *SEA*, and *SALT*.

*Boiling or Bubbling Waters*, are produced either by a sulphurous, or a nitrous Spirit, mix'd with the *Water* in the Earth: If it be sulphurous, the *Water* is hot; if nitrous, cold. For all the *Waters* that boil as if hot are not so, but some few are cold: We read both of *Thermae* and *Acidule* that boil.

There are divers other *Waters* that have very singular Properties, not reducible to any of these Classes: Such, 1<sup>o</sup>, is that Spring in *Portugal*, which absorbs all Bodies cast into it, tho the lightest: And not far from it there was anciently another, in which no Bodies, not the heaviest, could sink.—2<sup>o</sup>, In *Andalucia*, we are assur'd by *Euseb. Nierenbergenfis*, there is a Lake which foretells approaching Storms, by making a terrible bellowing, that may be heard 18 or 20 Miles distance.—3<sup>o</sup>, In *Granada* is a Well whose *Water* dissolves Stones.—4<sup>o</sup>, We read of a Spring in *Arcadia*, which render'd those who drank of it abstemious.—5<sup>o</sup>, In the Island of *Cbio* is a Spring, which converts those who drink of it into Fools.—6<sup>o</sup>, There are Springs in divers Parts of *England, Wales, Spain, &c.* which ebb and flow daily with the Flux and Reflux of the Sea; and some are even said to ebb and flow against the Tide.—Add, 7<sup>o</sup>, *Statistical Waters*. See *STATISTICAL*.

Barb-WATER.	} See {	BATH, and BATHING.
Spaw-WATER.		SPAW.
Petrifying-WATER.		PETRIFYING.

*Water*, in Chymistry, by the Chymists call'd more usually *Phlegm*; is the fourth of the five chymical Principles, and one of the passive ones. See *PRINCIPLE*, and *PHLEGM*.

It is never drawn pure and unmix'd; which, Dr. *Quincy* observes, makes it usually a little more detestive than common *Water*.

This Principle, probably, contributes much to the Growth of Bodies, in that it both renders and keeps the active Principles fluid; so that they are capable of being convey'd by Circulation into the Pores of the mixed; and also because it tempers their exorbitant Motion, and keeps them together; so that they are not so easily and soon dissipated.

In all such Bodies whose active Substances are join'd and united pretty closely together, as is common Salt, Tartar, all Plants that are not odoriferous, and in many animal Bodies; this Principle is the first that comes in Distillation: But when *Water* is mixed with volatile Salts, or with Spirit of Wine, or is in any odoriferous Mixture; then the volatile Particles will rise and come away first. See *PRINCIPLE, ELEMENT, &c.*

*WATERS*, in Medicine, Pharmacy, Chymistry, &c. call'd also *Artificial, Medicinal, &c. Waters*; are a Kind of Liquors, procur'd or prepar'd by Art from divers Bodies, principally of the Vegetable Tribe; having various Properties, and serving various Purposes.

These *Waters* are either *Simple*, or *Compound*.

*Simple Waters*, are those procur'd from some one Vegetable Body. See VEGETABLE.

A *Simple Water*, is not supposed to be the mere *Water* or *Phlegm* of the Body it is drawn from, as is evident from the Taste and Smell thereof.—The Intention of making such *Water*, is to draw out the Virtues of the Herb, Seed, Flower, Root, or the like, so as it may be more conveniently given in that form than any other. But the *Phlegm*, or watery Parts of any Medicinal Simple, is no better than common *Water* undistill'd: So that all those Ingredients which in Distillation raise nothing but *Phlegm*, as may be discover'd from the Smell and Taste of what comes over, are not fit for the Still.—On this Principle, a great part of the *Waters* retained in the Dispensatories will appear good for nothing, at least not worth distilling.

The Means whereby this Separation is effected, are either *Evaporation*, *Infusion*, *Decoction*, or *Distillation*.

The first is perform'd by exposing the Vegetable in a cold Still to a gentle Heat, like that of a Summer's Sun; and catching the Effluvia which exhale from it. See HEAT, EVAPORATION, &c.

The Effect of this Operation, is a *Water*, or fluid Matter, which is the most volatile, fragrant, and aromatick Part of the Plant; and that wherein its specifick Virtue resideth.

And thus it is that the aromatick or odoriferous *Waters* of Vegetables are procur'd. See AROMATICK, and ODORIFEROUS.

The second Means, viz. *Infusion*, is perform'd by putting the Vegetable in hot Rain-*Water*, below the degree of boiling; keeping it to this degree by an equable heat, for the space of half an Hour; and then straining or pouring it off. See INFUSION.

The only *Waters* procur'd this way in much use in the modern Practice, are those of Frog-spawn, and Oak-buds.

The third Means, viz. *Decoction*, only differs from the second in this, that the *Water* is kept to the degree of boiling. See DECOCTION.

The fourth Means, viz. *Distillation*, is perform'd by infusing the Subject in an Alembick, by a gentle warmth, for some time, and then increasing the Heat so as to make it boil; and lastly, catching and condensing the Steam or Vapour arising therefrom. See DISTILLATION.

This Process furnishes what we call the *Distill'd Waters*, of so much use in Medicine, &c.

The Vegetable Subjects best fitted for it, are the sapid and odorous, or those of the aromatick Tribe; as Angelica, Aniseed, Baum, Carraway, Coriander, Cummin, Dittany, Fennel, Hyssop, Marjoram, Mint, Roses, Rosemary, Saffron, Sage, Scarygrass, Thyme, Cinnamon, Citron, Juniper, Lime, Myrtle, Orange, Peach, &c.

The Medicinal Virtues of *Waters* prepared after this manner, are the same as those of the respective Plants, &c. they are drawn from.—Thus, the distill'd *Water* of Mint is Stomachic; that of Wormwood, Vermifugous, &c.

The *Materia Medica*, it may be observ'd, affords no Remedies in this way, but for the Intentions either of Cordials, Diureticks, or Diaphoreticks.—Were it practicable to raise a Balsamick, Cathartick, or Opiate in this way, yet would those Properties be much more conveniently brought forth by other Processes; so that nothing is to be look'd for in a distill'd *Water*, but such subtle and light Parts of a Medicinal Simple, as may fall in with the foremention'd Intentions: Indeed, very little comes over under that Division, weighty enough to affect even the urinary Secretions.

The *Simple Waters* of chief Virtue are the following ones, viz. Dill-*Water*, *Aqua Anserini*; Baum-*Water*, *Aqua Melisse*; Angelica-*Water*, *Aqua Angelice*; Mint-*Water*, *Aqua Menthae*; Rosemary-*Water*, *Aqua Rosmarini*; Orange-Flower-*Water*, *Aqua Naphae*; Black-Cherry-*Water*, *Aqua Cerasif. nig.*; Parsly-*Water*, *Aqua Petroselinii*; Camomile, *Chamomilla*. Pennyroyal, *Pulegium*; Fennel-*Water*, *Aqua Foeniculi*; Damask-Rose-*Water*, *Aqua Rosarum dam.*; Hyssop-*Water*, *Aqua Hyssopi*; Rue-*Water*, *Aqua Ruta*; Juniper-*Water*, *Aqua Juniperi bac.*; Elder-*Water*, *Aqua Sambuci flor.*; Lovage-*Water*, *Aqua Levistici*; Carminative-*Water*, *Aqua Carminativa*, &c.

It may be here proper to note, That whatever Properties any Simple has from the Grossness or Solidity of its Parts, which make it act as an Emetick, Cathartick, or Astringent; the Residue left after Distillation will remain in full possession thereof.—Thus, the purging Syrup of Roses, is as well made after the Damask-Rose-*Water* is drawn off, as if the Flowers were juiced, or put into Infusion; because nothing of a Cathartick Quality rises with the *Water*.

Sometimes, the Subject is fermented by the Addition of Yeast, Honey, or the like Ferment, to the hot *Water*, before the Distillation begin: In which Case, if the Ferment added were in sufficient quantity to effect a thorough Fermentation, the Liquid afterwards exhald and drawn off would be thin and inflammable; which makes what we call a *Spiritus*; otherwise, thick, white, lipid, &c. and call'd a *Water*. See FERMENTATION, SPIRIT, &c.

The *Waters* procur'd in this manner, contain the Oil of the Plant in great Perfection; which makes 'em of considerable use in Medicine, further than those rais'd without Fermentation; beside that they keep better and longer; the Spirit in 'em preventing their corrupting or growing starchy.

The *Compound Waters*, or those wherein several Ingredients are us'd, are very numerous, and make a large Article in Commerce; some prepared by the Apothecaries, according to the Dispensatory Prescripts, for medicinal Uses; others by the Distillers, to be drank by way of Dram, &c. and others by the Perfumers, &c.

They are distinguish'd by different Epithets, taken from the *Latin*, *Greek*, *Arabic*, *English*, &c. in respect either of the specifick Virtues of the *Waters*; or the Parts of the Body for the Cure whereof they are intended; or the Diseases they are good against; or the Ingredients they are compounded of; or their different Uses, &c.

The most considerable among the Clafs of *Compound Waters*, we shall here enumerate.—The manner of making 'em, 'tis true, is not always the same; especially those intended for drinking; for which, every one gives his own Method as the best.—Those we here deliver, are taken from such as have the greatest Reputation in preparing these things; or from those who have wrote best of 'em.

We have only three general Remarks to add, with regard to those intended for drinking: 1<sup>o</sup>, That such wherein any thing is infused, as broken Fruits, pounded Herbs, or ground Spices, are always pass'd thro' a Strainer, to make 'em finer and purer.—2<sup>o</sup>, That those made with Brandy or Spirit of Wine, are usually distill'd after the mixing of their Ingredients; which renders these Liquors exceeding strong and dangerous, and confirms the Proverb; *Plures occidit Gula quam Gladius*. In effect, some of 'em are so penetrating, that they burn the Tongue when taken.—3<sup>o</sup>, That the *Waters* that take their Name from any particular thing, as *Cinnamon*, &c. have always some other Ingredients joined with 'em, according to the Taste or Smell requir'd.

*Alexipharmacie*, or *Alexiterial Waters*, are *Waters* that resist Poisons and the Plague.—Such are those of Angelica, Scorsoneria, Citron, Orange, Scordium, Rue, &c. See ALEXIPHARMACIC.

Such also are Treacle-*Water*, Plague-*Water*, Milk-*Water*, Poppy-*Water*, &c.

*Alumna Water*, is a valucary *Water*, thus call'd, by reason the Basis or principal Ingredient thereof is Alumna. See ALUMNA, and VULNERARY.

*Angelica Water*, is usually prepar'd of Brandy, Angelica Roots and Seeds, Carduus, Baum, Fennel-Seed, &c. the whole beat together in a Mortar; infused for a Night, and then distill'd.—It is reputed a good carminative, and Cordial, as also a Cephalic, &c.

*Aniseed Water*.—To eight Parts of Essence of Aniseed distill'd, put three Parts of Brandy, with one of *Water* boil'd; mix the whole together: and if you require it sugar'd, add half a Pint of clarify'd Sugar; but many prefer it without; and strain the whole.

*Apricot Water*.—To a Quart of *Water* put six or eight Apricots, sliced; boil the whole, to extract the Juice; and when cold, add four or five Ounces of Sugar.—When that is dissolved strain it.

*Aromatick Waters*, we have already spok'e of among the *Simple Waters*.

*Arthritic Waters*, are *Waters* good against the Gout, Palsy, Tremors, Pains in the Joints, &c.—Such are those of Foony, Chamæpctis, Bectony, Rosemary, &c. See ARTHRATIC.

*Bryony Water*, is one of the *Compound Waters* prescrib'd in the College Dispensatory; prepared from Bryony-Roots, Rue, Mugwort, Savin, Feverfew, Dittany, &c.—It is a good Hysteric, opens Menstrual Obstructions, &c.

*Carduus Water*, is made from *Carduus Benedictus* pounded in a Mortar, and put in an Alembick.—Then, a sufficient quantity of the Juice of the same sort of Plant, drawn by Expression, is pour'd into the Alembick, that the Herbs swimming in the Juice may be in no danger of sticking to the bottom of the Cucurbit in Distillation. Lastly, sitting on a Capital, and luting the Joints, distill half as much Juice as you put in.—This *Water* is sudorifick; and good against the Plague, Malignant Fevers, &c. See CARDUUS.

*Water of Separation*, or *Depositi*, is only *Aqua fortis*; thus call'd, because serving to separate Gold from Silver. See DEPART. It is also call'd

*Caustic*, *Burning*, or *Strong Water*, and is prepared of a Mixture of Spirit of Nitre and Virriol, drawn by force of Fire; to which are sometimes added Alumna and Arsenic.

It dissolves all Metals, Gold only excepted.—The Invention of *Aqua fortis*, is usually refer'd to the XIIIth Century: Tho' some hold it to have been known in the Time of *Noses*. See *Aqua Fortis*, AURUM POTABILE, &c.

**Cephalic Waters**, are *Waters* proper to strengthen and comfort the Brain.—Such are those of Rosemary, Marjoram, Sage, Pyony, Betony, Baum, &c. See **CEPHALIC**.

**Choleric Water**, is a *Water* wherein red-hot Steel has been quenched.—It is astringent, and good, like Ferruginous or Iron *Waters*, for Diarrhæas, &c. See **CHALYBEAT**, and **MARTIAL**.

**Cherry Water**.—In a Quart of *Water* crush half a pound of Cherries, with four or five Ounces of Sugar. Strain the whole thro' a Cloth, till it be very clear.

**Cinnamon Water**.—In a Quart of *Water* boil half an Ounce of broken Cinnamon; and taking it off the Fire, add a quarter of a Pound of Sugar: Let it cool, and strain it.—*Or thus*: Take a Pound of Cinnamon, three Pounds of Rose-water, and as much White-wine: bruise the Cinnamon, infuse it fourteen Days, then distill it.—The first *Water* that rises is the best; then the second; then the third. See **CINNAMON**.

**Clary Water**, is composed of Brandy, Sugar, and Cinnamon, with a little Amber-graese dissolved in it.—It helps Digestion, and is Cardiac.—This *Water* is render'd either purgative or emetic, by adding Rectified Jilap and Scammony, or *Crocus Metallorum*.—Some make *Clary Water* of Brandy, Juice of Cherries, Strawberries and Gooseberries, Sugar, Cloves, White Pepper, and Coriander-Seed; infused, sugar'd, and strain'd.

**Clove Water**, is prepared of Brandy, and Cloves bruisd therein, and distill'd. See **CLOVE**.

**Cordial or Cardiac Waters**, are *Waters* proper to strengthen, and comfort the Heart.—Such are those of Endive, Chicory, Bageles, Burrigide, Marigolds, &c. See **CARDIAC**, and **CORDIAL**.

**Cosmetic Waters**, are *Waters* proper to cleanse, smoothen and beautify the Skin. See **COSMETIC**.

**Fennel Water**.—Infuse a Handful of Fennel in a Pint of cold *Water*, for an Hour or an Hour and an half; add three or four Ounces of Sugar. Strain it, and drink it.

**Gentian Water**.—Take four Pounds of Gentian Roots, either green or dry'd; mince them small, infuse them in White-wine, or only sprinkle them therewith; then distill them, with the Addition of a little Centaury the lesser. See **GENTIAN**.

It is frequently used as a Stomachic, and is also commended for a Detergent; serving in Dropsies, Jaundice, Obstructions of the *Viscera*, &c.

**Gum Water**, is that made by letting Gum-Arabick, inclosed in a linen Rag, infuse in common *Water*.—The Ladies also make *Water* to gum their Hair, of Quince-Kernels steep'd in *Water*. See **GUM**.

**Hepatic Waters**, are those used to cleanse, strengthen, and refresh the Liver.—Such are those of Chicory, Capillaries, Purslain, Agremony, Fumitory, &c. See **HEPATIC**.

**Honey Water**, is a *Water* prepar'd in Places where much Honey is made, by washing out the Honey-Combs, and the Vessels they have been in, in common *Water*.—This gives it a Honey-Taste, and it afterwards becomes very clear, and the People use it as their common Drink. See **HONEY**.

**Horseradish Water**, *Aqua Raphani*, is prepar'd of the Juices of Scarygrass, Brook-Lime, Water Credits, White-wine, Lemon-Juice, Bryony-Root, Horseradish, Winter's Bark and Nutmeg, digested and distill'd.—It is a good Diuretic; cleansing, and removing Obstructions of the *Viscera*, promoting Perspiration, &c.

**Hungary Water**, is a Liqueur distill'd in *Baino Marie*, from Rosemary-Flowers, and Spirit of Wine well rectify'd.—It has its Name from the wonderful Effects it is said to have had on a Queen of Hungary, at the Age of 72 Years.—'Tis good against Faintings, Palises, Lethargies, Apoplexies, and hysterical Disorders.—There are divers ways of preparing it. See **HUNGARY**.

**Hysterie Waters**, are those proper to strengthen the Matrix, or Womb, and remedy the Disorders that befall it.—Such are those of Bryony, Matricary or Motherwort, Hyssop, Fennel, Baum, Mugwort, Smallage, &c. See **HYSTERIC**.

**Ice, or Frozen Waters**, are certain agreeable and wholesome *Waters*, as Orange *Water*, or the like, artificially froze in Summer-time, particularly in hot Countries, to be used in Collations, &c. as Coolers.—The way of making 'em is thus: The Vessels containing the Liqueurs design'd to be froze, are first fixt in a Pail, in such manner as not to touch each other; then cover'd up, and the void Space in the Pail fill'd with common Ice, beaten, and mix'd with Salt.—Every half Hour they clear out what *Water* the thawing Ice sends to the bottom of the Pail, by means of a Hole at bottom; and at the same time stir up the Liqueurs with a Spoon, that they may freeze into Snow: For were they to float in form of Ice, or icicles, they would have no Taste.—Then, covering the Vessels again, they fill up the Pail with more beaten Ice, and Salt, in lieu of that dissolved and evacuated. The more expeditious the Freezing is requir'd to be, the more Salt to be mix'd with the Ice. See **FREEZING**.

**Imperial Water**, *Aqua Imperialis*, is a *Water* distill'd from Cinnamon, Nutmeg, Citron-Bark, Cloves, *Colemans Aromaticus*, Santal, and divers other Simples, infus'd in White-wine and Baum-*Water*.—It is a pleasant Cordial-Drum, good against Dificases of the Brain, Stomach, and Womb.

**Juniper Water**, is a Compound *Water*, made of Brandy, and Juniper-Berries beaten therein, and distill'd. See **BRANDY**, and **GENEVA**.

**Lime Water**, is common *Water*, wherein Quick-lime has been stak'd; and afterwards filter'd. See **LIME**.

**Milk Water**, *Aqua Lactis*, is prepared of Mint, Worm-wood, Carduus Benedictus, Goats-Rue, and Meadow-sweet, bruisd, infused in Milk, and drawn off by Infusion.—It is held Alexipharmic and Cephalic.

**Aqua Mirabilis**, or the *Wonderful Water*, is prepared of Cloves, Galangals, Cubeb, Mace, Cardomums, Nutmeg, Ginger, and Spirit of Wine, digested 24 Hours, then distill'd.—It is a good and agreeable Cordial; Carminative, &c.

**Nephritic Waters**, are such as strengthen the Reins, and help 'em to discharge by Urine any Impurities therein.—Such are those of the Honey-suckle, Pellitory, Raddish, Beans, Malloes, &c. See **NEPHRITIC**.

The *Nephritic Water* of Dr. Radcliff, popularly called *Dr. Radcliff's Water*, is taken into the last Edition of the College Dispensatory. It is prepar'd from the Kernels of Black Cherries, Peaches, and Bitter Almonds, beaten in a Mortar into a Paste, with Rhenish Wine; and Seeds of Smallage, Treacle, Mustard, Gromwel and Parsley, beaten likewise, and added thereto: To the Mixture are put Juniper-Berries, Garlick, Onions, Leeks, Pimpernel, Horseradish, Calamus Aromaticus, Cinnamon, Wall-Rue, Mace, and Nutmegs: the whole macerated in Rhenish, Spirit of Black Cherries, &c. and thus distill'd.—It is one of the most powerful Detergers and Cleanfers known; good in the Dropsy, Jaundice, Aithma, Pleurisy, &c.

**Ophthalmic, or Eye Waters**, are such as are good in Disorders of the Eyes.—Such are those of Eyebright, Fennel, Vervain, Plantain, Colandine, Cyanus, &c. See **OPHTHALMIC**.

**Orange-Flower Water**, is made of common *Water*, Sugar, and Orange-Flowers, infused for about two Hours.—After the like manner, one may make *Waters* of divers other Flowers; as *Violets*, *Joyntail*, *Jessamine*, *Waterlily*, &c.

**Peach Water**, is made after the same manner as *Apricot Water*; only with Peaches.

**Phlegmatic Water**, is Lime-*Water*, to every Pound whereof is added twenty or thirty Grains of Corroive Sublimate, in Powder.—It serves to cleanse old Ulcers, to eat off fungous Flesh, &c. See **PHLEGMATIC**.

**Plague Water**, *Aqua Epidemica*, is prepar'd from the Roots of Masterwort, Angelica, Pyony, and Butter-but; Viper-Grass, *Virginia Snakeroot*, Rue, Rosemary, Baum, Carduus, Water Germander, Marigolds, Dragons, Goats-Rue, and Mint; the whole infus'd in Spirit of Wine and distill'd.—It is of frequent Use as an Alexipharmic: It revives the Spirits, and promotes a Diaphoresis. It is the Basis of most Juices now prescrib'd, especially in feverish Cases.

**Poppy Water**, is prepared from the Flowers of wild Poppies, infus'd in White-wine, or Brandy, and drawn off in a cold Still.—It is a Cordial, good against the Colic, and by some call'd *Red Plague Water*.

**Pyony Water**, is made of Pyony and Lime-Flowers, Lilly of the Valley steep'd in Canary, and distill'd: To the *Water* thus procur'd, are added the Root of Male Pyony, White Dittany, Birthwort, Mistletoe, Rue, Cistif, Cubeb, Cinnamon, Betony, &c.—It is a good Cordial, and much used in nervous Cases.

**Rose Water**.—Take of Roses three Parts, and of Fennel and Rue each, one Part; chop 'em small, and mix 'em well together; then distil 'em.—This *Water* is excellent for the Eyes, &c.

**Scordium Water**, is prepared from the Juices of Goats-Rue, Sorrel, Scordium, Citrons and Treacle, digested and distill'd.—It is an Alexipharmic.

**Second Water**. See **SECUNDA AQUA**.  
**Specific Waters**, are such as have some peculiar Virtue, appropriate to certain Diseases.—Thus *Puritan Water*, wherein Mercury has been infused, is a Specific against Worms in young Children. See **SPECIFIC**.

**Splenetic Waters**, are those proper against Diseases of the Spleen.—Such are those of the Tamarik, Cuscuta, Hart-tongue, Hops, &c. See **SPLENETIC**.

**Stephens's Water**, *Aqua Stephani*, is made from Cinnamon, Ginger, Galangals, Cloves, Nutmegs, Paradise Grains, Anise-woods, Sweet Fennel, Carraway, Thyme, Mint, Sage, Pennyroyal, Pellitory, Rosemary, Red Rose, Camomile, Origan and Lavender, steep'd in *Galesburg Wine*, or Spirit of Wine, distill'd.—It is a good Cephalic and Cardiac, and is also reputed Hysterical.

**Stomachic Waters**, are such as have the Virtue to cleanse, strengthen, and confirm the Stomach.—As Red *Rose-Water*, *Mint-Water*, *Aniseed-Water*, &c. See **STOMACH**.

**Stygian Water**. See **AQUA REGALIS**.  
**Styptic Water**, is a Dissolution of red Vitriol, or the Colcothar remaining in the Retort after the Spirit has been extracted; with burnt Alum and Sugar-candy.—With thirty Grains of each of these three Drugs, they mix half an Ounce of Urine of a young Man, as much *Rose-Water*, and two Ounces of *Plantain-Water*.—Its Use is to stop Bleeding. See **STYPTIC**.

**Treacle Water**, *Aqua Theriacalis*, is directed by the College Dispensatory to be made of green Walnuts, Rue, Carduus, Marigold, Baum, Butter-bur-Roots, Bardock, Angelica, Masterwort, Water-Germander, Venice Treacle, Mithridate, Canary, Vinogar, and Lemon-Juice, steep'd and distill'd.—It is the most used of any in the Shops; tho' Dr. Quincy decries it as one of the worst concerted of all. Its Intention is to be an Alexipharmachic and Sudorific.

Other Dispensatories give a more simple *Treacle-Water*, made from Treacle, with an equal quantity of Brandy and Vinogar.—It is good for Ulcers, and Erosions of the Mouth; especially if a little *Arseman Bole* be dissolv'd therein. See **TREACLE**.

**Vulnery Water**, is a Water proper for the healing of Wounds, prepared from the Juice of Vulnery Plants. See **VULNERY**.

**WATER**, in Anatomy, &c. is applied to divers Liquors or Humours in the human Body. See **HUMOUR**.

Such is the *Aqua Pleuragmatica*, *Pleuragmatic Water*; which is a soft serous Humour, contained in the *Pericardium*, and wherein the Heart swims. See **PERICARDIUM**.

Anatomists are divided about it: Some will not have it natural, but suppose it separated forcibly during the Pangs of Death: Their Reason is, the difficulty they meet with in tracing its Passage, or how it is carried off.—The latest Anatomists, however, seem to agree to its being a natural and necessary Humour: and one Reason is, that it is found even in the *Pericardium of Fetus's*.

It has likewise been disputed whence it should be separated.—The freshest Opinion is, that it is secreted by some Glands about the Basins of the Heart; and that it distils thence drop by drop, into the Cavity of the *Pericardium*, in such Quantity, as just to supply what is expended daily by the Motion and Warmth of the Heart; and so needs no Evacuation. Its Use is, to moisten, lubricate, and cool the Heart, and prevent any Inflammation that might arise from the dry Friction of the Heart and *Pericardium*. So that it does the same Office to the Heart, that the *Water* does wherein the *Fetus* swims; which without it would not have liberty to move at all. See **HEART**.

**WATER** is also used in divers Ceremonies, both Civil and Religious.—Such is the *Baptismal Water*, *Holy Water*, &c. See **BAPTISM**, &c.

*Holy Water*, is a Water prepared every Sunday in the *Romish Church*, with divers Prayers, Exorcisms, &c. used by the People to cross themselves withal at their entrance, and going out of Church; and pretended to have the Virtue of washing away venial Sins, driving away Devils, preserving from Thunder, dissolving Charms, securing from, or curing Discafes, &c.

The Use of *Holy Water* appears to be of a pretty ancient standing in the Church: witness *S. Jerome*, in his Life of *S. Hilarion*, and *Gregor de Benedic. Cap. x*, &c.

*M. Godeau* attributes its Original to *Pope Alexander*, a Martyr under the Emperour *Adrian*.

Many of the Reformed take the Use of *Holy Water* to have been borrow'd from the *Lustral Water* of the ancient *Romans*. See **LUSTRALIS**.—Tho' it might as well be borrow'd from the Sprinklings in use among the *Jews*. See **NUMBERS** xix. 17.

*Urban Godfrey Siber*, a German, has a Dissertation printed at *Leipsic*, to shew, by Proofs brought from Church-History, that one may give *Holy Water* to drink to Brutes.

**Bitter WATERS of Jealousy**.—In the *Levitical Law*, we find mention made of a *Water*, which serv'd to prove whether or no a Woman were an Adulteress.—The Formula was this: The Priest, offering her the *Holy Water*, denounc'd,—"If thou hast gone aside to another, instead of thy Husband, and if thou be defiled, &c. the Lord make thee a Curse and an Oath among thy People, by making thy Thigh to rot, and thy Belly to swell: And this *Water* shall go into thy Bowels, to make thy Belly to swell, and thy Thigh to rot." And the Woman shall say, *Amen*.—"These Curses the Priest shall write in a Book, and blot 'em out with the bitter *Water*."—"When he hath made her drink the *Water*, it shall come to pass, that if she be defiled, the *Water* shall enter into her and become bitter, and her Belly shall swell, &c."—"If

she be not defiled, she shall be free, and conceive Seed." **NUMBERS** ch. v.

**Water Ordeal**, or *Trial* was of two Kinds; by hot, or by cold *Water*.

**Trial or Purgation by boiling, or hot Water**.—Among our Ancestors, there was a way of proving Crimes, by immersing the Body or the Arm in hot *Water*, with divers Religious Ceremonies. See **TRIAL**, **PURGATION**, &c.

In the Judgment by *boiling Water*, the Accused, or he who perjured the Accused, was oblig'd to put his naked Arm into a Cauldron full of *boiling Water*; and to draw out a Stone thence, placed at a greater or less depth according to the Quality of the Crime.—This done, the Arm was wrapp'd up, and the Judge set his Seal on the Cloth; and at the end of three Days they returned to view it; when, if it were found without any Seal, the Accused was declared Innocent.

The Nobles and great Persons purg'd themselves thus by hot *Water*; and the Populace by cold *Water*.

*F. Mabillon* will have this Ceremony introduced by *Pope Eugenius II.* in lieu of making Oath with the Hand laid on the Relicks of some Saint; which having been abused, was prohibited by *Innocent III.* at the Council of the *Lateran*.

"*Theoberge*, Wife of *Lebnaire of France*, having been accused of Incest, committed before Marriage with her Brother Duke *Habert*; as she could not be convicted by any Witnesses, certain of the Bishops were consulted as to the manner wherein the Judges should proceed in an Affair where the Crime, tho' very dubious, did dishonour to the King.—The Bishops were of Opinion they should have recourse to the *Proof by boiling Water*; which consisted in this, That the Accused, to prove her Innocence, should plunge her Hand into a Basin of *boiling Water*, and take out a Ring put therein. Sometimes, indeed, they substituted another Person to make the Trial, in the room of the Accused: Accordingly, the Rank and Quality of *Theoberge* excusing her from making the Proof her self, she chose a Man to do it for her; who either out of Zeal for the Life and Honour of the Princess, or for Money, flood the Test, and drew out his Hand and the Ring, without harm." *F. Daniel's Hist. of France*.

**Trial or Purgation by cold Water**.—After certain Prayers, and other Ceremonies, the Accused was saddled, or ty'd up all in a Peloton or Lump; and thus cast into a River, Lake, or Vessel of cold *Water*; where, if he sunk, he was held criminal; if he floated, innocent. See **JUDICIUM**, **PURGATION**, **PROOF**, **ORDEAL**, **COMBAT**, &c.

**WATER**, among Jewelers, is properly the Colour or Lustre of Diamonds, and Pearls; thus call'd, by reason they were antiently supposed to be form'd, or concreted, of *Water*. See **GEM**, &c.

Thus, they say, such a Pearl is of a fine *Water*. See **PEARL**.—The *Water* of such a Diamond is muddy. See **DIAMOND**. The Term is sometimes also used, the less properly, for the Colour or Hue of other precious Stones. See **PRECIOUS STONE**.

**Water-Bailiff**, is an Officer antiently establish'd in all Port-Towns, for the searching of Ships; as appears from 28 *Hen. VI.* cap. v.

There is such an Officer still on foot in the City of *London*, who supervises and searches all Fish brought thither; and gathers the Toll arising from the River of *Thames*.—He attends also on the Lord Mayor, and hath the principal Care of marshalling the Goods at the Table.

He also attends Men for Debt, or other Personal or Criminal Matters, on the River of *Thames*, by Warrant of his Superiors, &c.

**Water-Born**, in the Sea Language.—A Ship is said to be *Water-born*, when she is where there is no more *Water* than will barely bear her from Ground; or when lying even with the Ground, she first begins to float or swim.

**Water-Colours**, in Painting, are such Colours as are only diluted and mix'd up with Gum-*Water*.—In contradistinction to *Oil Colours*. See **COLOUR**.

The Use of *Water-Colours*, makes what we call *Limning*; as that of *Oil-Colours* does *Painting* properly so call'd. See **LIMNING**, and **PAINTING**.

**Dead-WATER**, in the Sea Language, is the Eddy *Water* that follows the Stern of the Ship; not passing away so fast as that which slides by her Sides.

**Water-Farvin**. See **FARVIN**.

**Water-Gage**, an Instrument to measure the Depth or Quantity of any *Water*. See **GAGE**, **SOUNDING**, &c.

**Water-Gang**, from the Saxon *Watergang*, a Course or Trench, to convey a Stream of *Water*. See **CANAL**, **TRENCH**, &c.

**Water-Line**, of a Ship, is that Line which distinguishes that part of her under *Water*, from that above; when she is duly laden.

**WATER-Measure.**—Salt, Sea-Coal, &c. while aboard Vessels in the Pool, or River, are measur'd with the Corn-Bushel heaped up; or else five striked Pecks are allow'd to the Bushel.—This is call'd *Water-Measure*; and exceeds *Wine-Measure* by about three Gallons in the Bushel. See **MEASURE, CHALDRON, &c.**

**WATER-Pipe.** See **HYDROMETER.**

Dr. Hook has contriv'd a *Water-pipe*, which may be of good service in examining the Purity, &c. of *Water*. It consists of a round glass Ball, like a Bolt-head, about three Inches in Diameter, with a narrow Stem or Neck,  $\frac{1}{2}$  of an Inch; which being poised with red Lead, so as to make it but little heavier than pure sweet *Water*, and thus fitted to one end of a fine Balance, with a Counterpoise at the other; upon the least Addition of even  $\frac{1}{1000}$ th Part of Salt to a quantity of *Water*, half an Inch of the Neck will immerse above the *Water*, more than did before. *Philosoph. Transact. N<sup>o</sup> 197.*

**WATER-Scape,** of the Saxon *Water-schop*, denotes an Aqueduct. See **AQUEDUCT.**

**WATER-Spout,** a young Sprig, which springs out of the Root or Stock of a Tree. See **SNOOT, STOCK, &c.**

**WATER-Shot,** in the Sea Language, a sort of riding at Anchor; when a Ship is moor'd neither cross the Tide, nor right up and down; but quarter'd betwixt both.

**WATER-Table,** in Architecture, is a sort of Ledge, left in Stone or Brick Walls, about 18 or 20 Inches from the Ground: from which Place, the Thickness of the Wall begins to abate. See **WALL.**

**WATER-Way,** in a Ship, is a small Ledge of Timber, lying on the Deck, close by the Sides; to keep the *Water* from running down there.

**WATER-Wheel,** an Engine for raising *Water* in great quantity out of a deep Well. See **PERSIAN Wheel.**

**WATERING,** in Gardening, &c. the Application of *Water* to the Soil of Plants, &c. when not sufficiently moisten'd with Rain, Dew, &c. See **SOIL, VEGETATION, &c.**

After sowing Seed of any kind, tho' the Ground be ever so dry, they should never be *water'd* till they have been 48 Hours in the Ground; and the Ground is a little fertill'd about 'em; otherwise, a too great glut of Nourishment at first will be apt to hurt 'em. See **SEED, and SOWING.**

Care is to be taken, that the Leaves of young and tender Plants be n't *water'd* at all while the Weather is cold; only the Ground to be wet about 'em.

For hardy Plants and Seeds, if the Nights be cold, *water* in the Forenoon; otherwise in the Evening.

*Water* that comes out of deep Pits, or Wells, should stand a Day in an open Vessel, ere it be apply'd to tender Plants in the Spring. Dung of Sheep, Pidgeons, or Hens, or Ashes, Lime, &c. infused in the *Water*, will forward the Growth of Plants. See **MANURE.**

**WATERING,** in the Manufactures.—To *Water* a *Stuff*, is to give it a Lustre, by wetting it lightly, and then passing it thro' the Press, or the Calendar, whether hot or cold. See **CALENDAR, TARRY, PRESSING, &c.**

**WATTLES,** among Husbandmen, Grates or Hurdles, or Folds for Sheep. See **PARK.**

The Word is also us'd for the Gills of a Cock; and the naked red Flesh that hangs under a Turkey's Neck.

**WAVE, Unda,** in Physics, &c. a Cavity in the Surface of *Water* or other Fluid, with an Elevation aside thereof. See **FLUID, and WATER.**

The Origin of *Waves* may be thus conceived.—The Surface of a standing *Water* being naturally Plain, and parallel to the Horizon; if by any means it be render'd hollow, as at A, (Tab. *Hydrostatics*, Fig. 30.) its Cavity will be surround'd with an Elevation BB; this rais'd *Water* will descend by its Gravity, and with the Celerity acquir'd in descending, form a new Cavity; by which Motions, the *Water* will ascend at the Sides of this Cavity, and fill the Cavity A, while there is a new Elevation towards C; and when this last is depress'd, the *Water* rises anew towards the same Part. Thus arises a successive Motion in the Surface of the *Water*; and a Cavity, which carries an Elevation before it, is mov'd along from A towards C. This Cavity, with the Elevation next it, is call'd a *Wave*; and the Space taken up by the *Wave* on the Surface of the *Water*, and measur'd according to the Direction of the *Wave's* Motion, is call'd the *Breadth of the Wave*. See **RIVER, and UNDULATION.**

The Motion of *Waves*, makes an Article in the New Philosophy; and the Laws thereof being now pretty well determin'd, we shall give the Reader the Substance of what is taught thereon.

1<sup>o</sup> Then, the Cavity, as A, is incompress'd every way with an Elevation; and the Motion abovemention'd expands it self every way; therefore the *Waves* are mov'd circularly.

2<sup>o</sup> Suppose, now, A B, (Fig. 31.) an Obstacle, against which the *Wave*, whose beginning is at C, strikes; and we see to examine what Change the *Wave* suffers in any Point, as E, when it is come to the Obstacle in that Point. In all

Places thro' which the *Wave* passes in its whole Breadth, the *Wave* is rais'd; then a Cavity is form'd, which is again fill'd up; which Change, while the Surface of the *Water* undergoes, its Particles go and return thro' a small Space: The Direction of this Motion is along CE, and the Celerity may be represented by that Line.—Let this Motion be conceived to be resolv'd into two other Motions, along GE and DE, whose Celerities are respectively represented by those Lines. By the Motion along DE, the Particles do not act against the Obstacle; but after the Stroke, continue their Motion in that Direction with the same Celerity; and this Motion is here represented by EF, supposing EF and ED to be equal to one another: But by the Motion along GE, the Particles strike directly against the Obstacle, and this Motion is destroy'd; for tho' the Particles are elastic; yet, as in the Motion of the *Waves* they ran thro' but a small Space, going backward and forward, they proceed so slowly, that the Figure of the Particles cannot be changed by the Blow; and so are subject to the Laws of Percussion of Bodies perfectly hard. See **PERCUSSION.**

But there is a Reflexion of the Particles, from another Cause: The *Water* which cannot go forward beyond the Obstacle, and is push'd on by that which follows it, gives way where there is the least Resistance; that is, ascends: And this Elevation, which is greater in some than other Places, is caus'd by the Motion along GE; because it is by that Motion alone that the Particles come against the Obstacle.—The *Water*, by its Descent, acquires the same Velocity with which it was rais'd; and the Particles of *Water* are repell'd from the Obstacle, with the same Force in the Direction EG, as that with which they struck against the Obstacle.—From this Motion, and the Motion abovemention'd along EF, arises a Motion along EH, whose Celerity is express'd by the Line EH, which is equal to the Line CE; and by the Reflexion, the Celerity of the *Wave* is not chang'd; but it returns along EH, in the same manner, as if taking away the Obstacle, it had mov'd along Ee.

If from the Point C, CD be drawn perpendicular to the Obstacle, and then produced, so that De shall be equal to CD; the Line He continued, will go thro' e: And as this Demonstration holds good in all Points of the Obstacle; it follows, that the reflex'd *Wave* has the same Figure on that side of the Obstacle, as it would have had beyond the Line AB, if it had not struck against the Obstacle.—If the Obstacle be inclin'd to the Horizon, the *Water* rises and descends upon it, and suffers a Friction, whereby the Reflexion of the *Wave* is disturb'd, and often wholly destroy'd: And this is the Reason why very often the Banks of Rivers do not reflect the *Waves*.

If there be a Hole, as I, in the Obstacle BL, the Part of the *Wave* which goes thro' the Hole, continues its Motion directly, and expands it self towards Q Q; and there is a new *Wave* form'd, which moves in a Semicycle whose Centre is the Hole. For, the rais'd Part of the *Wave*, which first goes thro' the Hole, immediately flows down a little at the Sides; and by descending, makes a Cavity, which is surround'd with an Elevation on every Part beyond the Hole, which moves every way in the same manner as was laid down in the Generation of the first *Wave*.

In the same manner, a *Wave* with which an Obstacle, as A O, is oppos'd, continues to move between O N; but expands it self towards R, in a Part of a Circle, whose Centre is not very far from O.—Hence we may easily deduce, what must be the Motion of a *Wave* behind an Obstacle, as M N.

*Waves* are often produced by the Motion of a tremulous Body, which also expand themselves circularly, tho' the Body goes and returns in a right Line; for the *Water* which is rais'd by the Agitation, descending, forms a Cavity, which is every where surround'd with a Rising.

Different *Waves* do not disturb one another, when they move according to different Directions.—The Reason is, that whatever Figure the Surface of the *Water* has acquir'd by the Motion of the *Waves*, there may in that be an Elevation and Depression; as also such a Motion as is requir'd in the Motion of the *Celerity*.

To determine the Celerity of the *Waves*, another Motion, analogous to theirs must be examin'd.—Let there be a Liquid in the recurve cylindric Tube E H, (Fig. 32.) and let the Liquid in the Leg EF, be higher than in the other Leg, by the Distance IE; which difference is to be divid'd into two equal Parts at i. The Liquid by its Gravity descends in the Leg EF, while it ascends equally in the Leg EH: so that when the Surface of the Liquid is arriv'd at i, it is at the same height in both Legs; which is the only Position wherein the Liquid can be at rest: But by the Celerity acquir'd in descending, it continues its Motion, and ascends higher in the Tube GH; and in EF is depress'd quite to l, except so much as it is hinder'd by the Friction against the Sides of the Tube. The Liquid in the Tube GH, which is higher, also descends by its Gravity, and so

the Liquid in the Tube rises and falls, till it has lost all its Motion by the Friction.

The Quantity of Matter to be moved, is the whole Liquid in the Tube; the moving Force, is the Weight of the Column *IE*, whose weight is always double the Distance *Ei*; which Distance, therefore, increases and diminishes in the same Ratio with the moving Force.—But the Distance *Ei* is the Space to be run thro' by the Liquid, in order to its moving from the Position *EH*, to the Position of Rest; which Space, therefore, is always as the Force continually acting upon the Liquid: But it is demonstrated, that it is on this account that all the Vibrations of a Pendulum, oscillating in a Cycloid, are Isochronal; and therefore, here also, whatever be the Inequality of the Agitations, the Liquid always goes and returns in the same Time. The Time in which a Liquid thus agitated ascends or descends, is the Time in which a Pendulum vibrates, whose length is equal to half the Length of Liquid in the Tube, or to half the Sum of the Lines *EF*, *FG*, *GH*. This length is to be measur'd in the Axis of the Tube. See PENDULUM.

From these Principles, to determine the Celerity of the Waves, we must consider several equal Waves following one another immediately, as *A*, *B*, *C*, *D*, *E*, *F*, (Fig. 35.) which move from *A* towards *F*: The Wave *A* has run its breadth, when the Cavity *A* is come to *C*; which cannot be, unless the Water at *C* ascend to the height of the Top of the Wave, and again descends to the depth *C*; in which Motion, the Water is not agitated sensibly below the Line *bi*: Therefore this Motion agrees with the Motion in the Tube above mention'd, and the Water ascends and descends, that is, the Wave goes thro' its Breadth, while a Pendulum of the Length of half *BC* performs two Oscillations, or whilst a Pendulum of the Length *BCD*, that is, four times as long as the first, performs one Vibration. Therefore, the Celerity of the Wave depends upon the Length of the Line *BCD*; which is greater, as the Breadth of the Wave is greater, and as the Water descends deeper in the Motion of the Waves.—In the broadest Waves, which do not rise high, such a Line as *BCD*, does not much differ from the Breadth of the Wave; and in that Case, a Wave moves its breadth, while a Pendulum equal to that Wave oscillates once. See OSCILLATION.

In every equable Motion, the Space gone thro' increases with the Time and the Celerity; wherefore, multiplying the Time by the Celerity, you have the Space gone thro': whence it follows, that the Celerity of the Waves are as the square Roots of their Breadth: For as the Times in which they go thro' their Breadths are in that Ratio, the same Ratio is requir'd in their Celerities, that the Products of the Times by their Celerities may be as the Breadth of the Waves, which are the Spaces gone thro'.

WAVED, or WAVY, a Term in Heraldry, when a Bordure, or any Ordinary or Charge in a Coat of Arms, has its Out-lines indented, in manner of the rising and falling of Waves.

This is also called *Undy*. See UNDY.

To WAVE, is also used in the Sea Language, for the making Signs for a Vessel to come near, or keep off. See SIGNAL. WAVESON, in the Admiralty Law, a Term used for such Goods, as after Shipwreck do appear swimming on the Waves. See FLOTION, JETSON, &c.

WAX, *Cera*, a soft yellowish Matter, whereof the Bees form Cells to receive their Honey. See CELL.

Wax is not the Excrement of this laborious Insect, as the Ancients, and after them many of the Moderns, have imagin'd.

'Tis properly a Juice, exuding out of the Leaves of Plants, and adhering to the Surface thereof; from which it is scrap'd off by the Bees with their rough Thighs, to build their Combs withal.—It is chiefly afforded by Lavender and Rosemary; from which last, any body may gather Wax; and, with the assistance of the Microscope, the Wax may be plainly seen sticking on the Leaves of the Plant.—So that Wax is not an Animal, but a Vegetable Substance.

Naturalists have generally imagin'd the Wax to be gather'd from the Flower, some from the Petals, and others from the Apices; but *Borbaave* affirms it a Juice peculiar to the Leaves, and not afforded by the Flowers, which only yield Honey. See HONEY.

The Honey is form'd of a liquid Matter suck'd into the Body; and only seems to arrive at its Perfection in the Entrails of the little Animal: Whereas the Wax, being a hard Substance, is gather'd only with the fore Legs and Chaps; convey'd thence to the middle Legs, and thence to the middle Joint of the hind Legs, where there is a small Cavity, like the bowl of a Spoon, to receive it; and where it is collected into Heaps, of the shape and size of Lentils.

The Bee arrived at the Hive with its Load of Wax, finds some difficulty in unburdening himself of so tenacious a Matter.—Frequently, being unable to lay it down himself, he calls for Assistance, by a particular Motion of the Legs and Wings; upon which, a number of his Companions fruit run

to his succour, and each with his Jaws takes off a small quantity of the Wax; others succeeding; till their Laden Fellow be quite disburden'd. See HONEY-COMB.

Wax makes a very considerable Article in Commerce; the Consumption thereof, throughout the several Parts of Europe, being incredible.—There are two Kinds, *white*, and *yellow*; the yellow is the native Wax just as it comes out of the Hive, after expressing the Honey, &c. the white is the same Wax, only purify'd, wash'd, and expos'd to the Air. The Preparation of each follows.

#### Yellow Wax.

To procure the Wax from the Combs for use; after separating the Honey from them, in the manner describ'd under the Article HONEY; they put all the Matter remaining in a large Kettle, with a sufficient quantity of Water; where, with a moderate Fire, they melt it, and then strain it thro' a linen Cloth, by a Press: are cold, they scum it with a Tyle, or a piece of wet Wood, and cast it, while yet warm, in wooden, earthen, or metalline Moulds; having first anointed 'em with Honey, Oil, or Water, to prevent the Wax from sticking.—Some, to purify it, make use of Roman Vitriol, or Copperas; but the true Secret is to melt, scum it, &c. properly, without any Ingredients at all.

The best is that of a high Colour, an agreeable Smell, brittle, and that does not stick to the Teeth when chew'd. 'Tis often sophisticat'd with Rosin, or Pitch colour'd with Rocou, or Turmeric.

By Chymistry, Wax yields a white thick Oil, resembling Butter; whence the Chymists call it *Butter of Wax*.—From this Oil is drawn a second, as clear as Water: Both the one and the other are excellent for Chilblains.—The Feces remaining in the Bag after expressing the Wax, is used both by Farriers and Surgeons, with succals against Strains.

#### White Wax.

The whitening or bleaching of Wax, is perform'd by reducing the yellow sort, first, into little bits or grains, by melting it, and throwing it, while hot, into cold Water; or else by spreading it into very thin Leaves, or Skins. This Wax, thus granulated, or flattened, is expos'd to the Air on linen Cloths; where it rests Night and Day, having equally need of Sun and Dew. Then they melt and granulate it over again several times; still laying it out to the Air in the Intervals between the Meltings.

When the Sun and Dew have at length perfectly bleach'd it, they melt it for the last time in a large Kettle; or out of which they cast it with a Ladle, upon a Table cover'd over with little round Deuts or Cavities, of the form of the Cakes of white Wax sold by the Apothecaries, &c. having first wet those Moulds with cold Water, that the Wax may be the easier got out. Lastly, they lay out these Cakes to the Air for two Days and two Nights, to render it more transparent and dry.

This Wax is used in the making of Torches, Tapers, Flambeaux, Figures, and other Wax-works. See TAPER, TORCH, &c.

It is also an Ingredient in Plasters, Cerats, and divers Pomatums and Unguents for the Complexion. See CERAT, &c.

Yellow Wax is made soft with Turpentine, yet retains its natural Colour.—Red Wax, is only the white melted with Turpentine and rodden'd with Vermilion or Orcanet.—Verdegreen makes it green; and burnt Paper or Lampblack, black.—Some Travellers tell us of a natural black Wax; assuring us there are Bees, both in the *East* and *West-Indies*, that make an excellent Honey, included in black Cells. Of this Wax it is that the *Indians* make those little Vases, wherein they gather their Balsam of *Tolu*.

Virgin Wax, or *Propolis*, is a sort of reddish Wax, used by the Bees to stop up the Clefts or Holes of the Hive: 'Tis applied just as taken out of the Hive, without any Agg, or Preparation of boiling, &c.—'Tis the most tenacious of any, and is held good for the Nerves. See PROPOLIS.

Sealing Wax, or *Spanish Wax*, is a Composition of Gum Lacca, melted and prepar'd with Rosin and Chaik, and colour'd red with ground Cinnabar. See LACCA.

Wax-Candles. See CANDLE.

WAX-WORK.—Here we must not forget that pretty invention of *M. Boniss*, a Man famous at Paris for his Figures of Wax.—Being by Profession a Painter, he found the Secret of forming Moulds on the Faces of living Persons, even the fairest and most delicate, without any danger either to Health or Complexion: In which Moulds he cast Masks of Wax; to which by his Colours, and glass Eyes imitated from Nature, he gave a sort of Life; inasmuch, as when cloth'd in proper Habits, they bore such a resemblance, that it was difficult distinguishing between the Copy and the Original.

Grafting Wax, is a Composition serving to bind or fix the Bud or Graft in the Cleft of the Stock. See GRAFTING.

Instead of *Grafting Wax*, the Country Gardeners, &c. only use Clay, which they lay over a piece of linen Cloth, and so keep it moist; and to prevent its cracking with the heat of the Sun, they Moist over it. But the Wax ordinarily used, is a Compost of one Pound and an half of Pitch, a quarter of a Pound of Wax, and an Ounce of Oil of Almonds, melted and mix'd together; with the Addition, in Spring or Autumn, of a moderate quantity of Turpentine.

For Cleft-Grafting, Whip-Grafting, and Grafting by Approach, Mr. Mortimer recommends temper'd Clay, or soft Wax; but for Rind-Grafting, Clay and Horse-Dung.

WAX-SHOOT, or WAX-SHOT, *Cerogium*, in our ancient Customs, Money paid twice a Year towards the Charge of maintaining Lights, or Candles in the Church. See LUMINARY.

WAY, *Via*. See ROAD, and VIA.

Roman Ways, are divided into *Consulares, Praetorias, Militares*, and *Publicas*. See MILITARY, &c.

We have four notable ones in England; andiently call'd *Cimini quatuor*, and entitl'd to the Privileges of *Pax Regia*.

The first, *Watling-street*, or *Warlam-street*, leading from Dover to London. *Dunstable*, *Toucester*, *Asterston*, and the *Sovern*, near the *Wrekin* in *Shropshire*, extending as far as *Anglesea* in *Wales*.

The second call'd *Ikeuld-street*, stretches from *Southampton* over the River *Itis* at *Needbridge*, thence by *Camden* and *Litchfield*, then passes the *Derwent* near *Derby*, so to *Bolsover Castle*, and ends at *Tinnmouth*.

The third, call'd *Fosse-Way*, because in some Places it was never perfected but lies as a large Ditch; leads from *Corwall* thro' *Devonshire*, by *Tisbury* near *Stow* in the *Wolds*; and beflds *Coventry* to *Leicester*, *Newark*, so to *Lincoln*, &c.

The fourth, call'd *Ermin* or *Erminee-street*, stretches from *S. David's* in *West Wales*, to *Southampton*.

MILKY WAY. See GALAXY.

WAY of a Ship, is sometimes used for the same with the RAKE, or RUN of her forward and astward on. See RAKE.

But the Term is more commonly understood in respect of her falling.—When she goes apace, they say, she hath a good Way; and they call the Account how fast she falls by the LOG, *Keeping an Account of her Way*. See LOG.

And because most Ships are apt to fall a little to the Leeward of their true Course, they always, in casting up the Log-board, allow something for her *Leeward Way*; which is one Point, or more, according to her Way of falling. See RECRUING.

WAY of the Rounds, in Fortification, is a Space left for the Passage of the Rounds, between the Rampart, and the Wall of a fortify'd Town. See ROUNDS.

This is not now much in use; because the Parapet not being above a Foot thick, it is soon overthrown by the Enemy's Cannon.

WAY-WISER, an Instrument for measuring of the Road, or Distance gone; call'd also *Perambulator*, and *Pedometer*. See PERAMBULATOR, and PEDI-METER.

WAYWODE, is properly a Title given the Governours of the chief Places in the Dominions of the Czar of *Muscovy*.

The *Palatines*, or Governours of Provinces in *Poland*, also bear the Quality of *Waywodes*, or *Waiwodes*. See PALATINE.

The *Poles* likewise call the Princes of *Walachia* and *Moldavia*, *Waywodes*; as ascending them no other than on the Foot of Governours: Pretending that *Walachia* and *Moldavia* are Provinces of *Poland*; which have withdrawn themselves from the Obedience of the Republick.

Every where else they are call'd *Hospodars*. See HOSPODAR.

Do *Congo* says, that the Name *Waywode* is used in *Dalmatia*, *Croatia*, and *Hungary*, for a General of an Army: And *Leunclavius*, in his *Pandoles* of *Turkey* tells us, it usually signifies *Captain*.

WEALD, or WELD, the woody Part of a Country; as the *Weald of Kent*.—It is mis-printed in some Books and Maps, the *Wilds of Kent*, *Suffex*, and *Surry*.

WEANEL, a Country Word, for a young Beest newly weaned, or taken from sucking its Dam.

WEANING, *Abslactio*. See ABREACTATION.

WEAPONS. See ARMS, and ARMOUR.

WEAPON-SERVE, a kind of Unguent, suppos'd to cure Wounds sympathetically, by being applied, not to the Wound, but to the Weapon that made it. See SYMPATHETIC POWDER, and TRANSPANTATION, &c.

WEAR, or WARE, a great Stank, or Dam in a River; sited for the taking of Fish, or for conveying the Stream to a Mill. See FISHING.

WEATHER, the State or Disposition of the Atmosphere, with regard to Moisture or Drought, Heat or Cold, Wind or Calm, Rain, Hail, Frost, Snow, Fog, &c. See ATMOSPHERE, RAIN, HEAT, WIND, HAIL, FROST, &c.

As 'tis in the Atmosphere that all Plants and Animals live and breathe, and as that appears to be the great Principle

of most Animal and Vegetable Productions, Alterations, &c. (See AIR.)—There does not seem any thing in all Philosophy of more immediate Concernment to us, than the State of the *Weather*.—In effect, all living Things are only Assemblages or Bundles of Vessels, whole Juices are kept moving by the Pressure of the Atmosphere; and which, by that Motion, maintain Life. So that any Alterations in the Rarity or Density, the Heat, Purity, &c. of that, must necessarily be attended with proportionable ones in itself.

What vast, yet regular Alterations, a little Turn of *Weather* makes in a Tube fill'd with Mercury, or Spirit of Wine, or in a piece of String, &c. Every body knows, in the common Instance of Barometers, Thermometers, Hygrometers, &c. and it is owing partly to our Inattention, and partly to our unequal, intemperate Course of living, that we don't feel as great and as regular ones in the Tubes, Chords, and Fibres of our own Bodies.

'Tis certain, a great part of the Brute Creation have a Sensibility, and Sagacity this way beyond Mankind; and yet, without any Means or Disposition thereto more than we; except that their Vessels, Fibres, &c. being in other respects in one equable Habitude; the same, or a proportionable Cause from without, has always a like, or proportionable Effect on them: that is, their Vessels are regular Barometers, &c. affected only from one external Principle, viz. the Disposition of the Atmosphere; whereas, ours are acted on by divers from within, as well as without; some of which check, impede, and prevent the Action of others. See BAROMETER, THERMOMETER, HYGROMETER, &c.

We know of nothing more wanting than a just Theory of the *Weather* on Mechanical Principles.—But in order to that, a complete History of the *Weather* will be requir'd.

Were Registers carefully kept in divers Parts of the Globe, for a good Series of Years, we should be enabled to determine the Directions, Breadth, and Bounds of the Winds, and of the *Weather* they bring with them; the Correspondence between the *Weather* of divers Places, and the Dependence between one sort and another at the same Place.—In time, no doubt, we might learn to foretel divers great Emergencies; as, extraordinary Heats, Rains, Frosts, Droughts, Dearth, Plagues, and other epidemical Diseases, &c.

The Members of our Royal Society, the French Academy of Sciences, and divers other Authors of note, have made some Essays this way; but the Dryness and Quaintness of the Subject, induc'd them all to drop it.

Erst *Barbolinus*, for instance, has Observations of the *Weather* of every Day throughout the Year 1671: Mr. *W. Merle* made the like at *Oxford*, for seven Years, viz. the Years 1337, 1338, 1339, 1340, 1341, 1342, 1343. Dr. *Pits* did the same at the same Place, for the Year 1684; Mr. *Hillier*, at *Cape Corse*, for the Years 1686, 1687; Mr. *Hunt*, &c. at *Gresham College*, for the Years 1695, 1696; Mr. *Derham*, at *Upsminster in Essex*, for the Years 1691, 1692, 1697, 1698, 1699, 1703, 1704, 1705; Mr. *Townley* in *Leicestershire*, 1697, 1698; Mr. *Cunningham*, at *Emm* in *China*, for the Years 1698, 1699, 1700, 1701; Mr. *Loeke* at *Ouis* in *Essex*, 1692; Dr. *Schenckler* at *Zurich*, in 1708; and Dr. *Tilly* at *Pisa*, the same Year. See the *Philosoph. Transact.*

The Form of Mr. *Derham's* Observations, we give as a Specimen of a Journal of this kind; observing that he notes the Strength of the Winds by 0, 1, 2, 3, &c. and the Quantity of Rain, as it fell thro' a Tunnel, in Pounds and Centenals.

Phenomena of the Weather, October 1697.

Day.	Hour.	Weather.	Wind.	Barometer.	Rain
17	7	Fair	S. W.	29	5 1/2
	12	Rain	S.W.b.W.	29	3 1/2
	9	Stormy		29	8 1/2 2 1/2

As a Specimen of the Use of such Histories, we shall add some general Remarks drawn from them by Mr. *Derham*; and,—1<sup>o</sup>, That *Foggy Weather* makes the Mercury rise in the Barometer, as well as the North Wind.—The Cause, he suggests, probably enough, to be the Accession of the Load of Vapour to the former Weight of the Atmosphere. See FOG.

*Misting Weather*, he likewise observes to have the like Effect. See BAROMETER.

2<sup>o</sup>, The Colds and Heats in *England* and *Switzerland*, begin and end nearly about the same time: Nay, and any remarkable *Weather*, especially if it continue any while, affects one Place as well as 't'other. See HEAT.

3<sup>o</sup>, That the remarkably cold Days in *June*, Anno 1708, were found in *Switzerland* to precede ours, commonly by about five Days or more; and that the remarkable Heats in the following Months, began to abate in both Places about the same time; only somewhat sooner here than there. See COLD.

4<sup>o</sup>, That tho the Winds in both Places frequently agree, yet they often differ. See WIND.

5<sup>o</sup>, That the Barometer is always lower at Zurich than at Upsinler, by sometimes one, and sometimes above two English Inches; but the common difference is about half an Inch. Which may be solved either by supposing Zurich situated one fourth of a Mile higher above the Level of the Sea, than Upsinler; or else, by supposing that Part of the terraqueous Globe, as lying nearer the Line, to be higher, and more distant from the Centre than ours is, which lies nearer the Pole. See EARTH, MOUNTAIN, &c.

6<sup>o</sup>, That the Barometer generally rises and falls together at far distant Places: Tho this Agreement of the Barometer is not so constant between Zurich and Upsinler, as in Places nearer home, viz. at London and Paris; where, again, the Agreement is not so great as between Upsinler and Lancaster.

7<sup>o</sup>, That the Variations of the Barometer are greatest, as the Places are nearest the Pole.—Thus, e.g. the Mercury at London has a greater Range by two or three Lines than at Paris; and at Paris a greater than at Zurich. In some Places near the Equinoctial, there is scarce any Variation at all. See BAROMETER.

8<sup>o</sup>, That the Rain in Switzerland and Italy is much greater in Quantity, throughout the Year, than that in Essex; yet the Rains are more frequent, i. e. there are more rainy Days in Essex, than at either of those Places.—The Proportion of the annual Rains that fall in the several Places we have any good Observations of stand thus: At Zurich the Depth of the annual Rain, at a Medium, is about 32<sup>1</sup>/<sub>2</sub> English Inches; at Pisa 42<sup>1</sup>/<sub>2</sub>; at Paris 23; at Lisle in Flanders 25<sup>1</sup>/<sub>2</sub> Inches; at Townley in Lancashire 42<sup>1</sup>/<sub>2</sub>; at Upsinler 19<sup>1</sup>/<sub>2</sub>. See RAIN.

9<sup>o</sup>, That Cold contributes greatly to Rain; and that, apparently, by condensing the suspended Vapours, and making 'em descend.—Thus, very cold Months or Seasons are generally follow'd immediately by very rainy ones; and cold Summers are always wet ones. See COLD, and VAPOUR.

10<sup>o</sup>, That high ridges of Mountains, as the Alps, and the Snows they are cover'd withal, not only affect the neighbouring Places by the Colds, Rains, Vapours, &c. they produce; but even distant Countries, as England, often partake of their Effects.—Thus, the extraordinary Colds Decemb. 1708, and the Relaxations thereof, were felt at Italy and Switzerland, several Days ere they reach'd us: An Indication, Mr. Derham thinks, that they were derived from them to us.

Indications or Prognosticks of the Weather.

We don't here mean to obtrude the idle, arbitrary Observations of fanciful People upon our Reader.—That Cloud of popular Predictions from the Brute World, which partly the Sagacity, and partly the Crudelity of our Countrymen have establish'd, we set aside, as not flowing from any natural, necessary Relations, as we know of, in the Things themselves.—Such is the foretelling of Rain and Wind from Water-Fowls rocking to Land, or Land-Fowls to the Water; from Birds pruning their Feathers, Geese gaggling, Crows cawing loud, and flying in Companies, Swallows chattering and flying low, Peacocks crying much, Asses braying, Deer fighting, Foxes and Wolves howling, Fishes playing, Ants and Bees keeping within Doors, Moles casting up Earth, Earth-Worms creeping out, &c.—We shall offer nothing on this Head, but what has some visible Foundation in the Nature of Things; and which lets some Light into the Cause and Reason of Weather it self, or discovers some notable Effects thereof.

1<sup>o</sup>, Then, a thick dark Sky, solum caelum, lasting for some time, without either Sun or Rain, always becomes first fair, then foul, i. e. changes to a fair clear Sky, ere it turns to Rain.—This, the Rev. Mr. Clarke, who kept a Register of the Weather for 30 Years, since put into Mr. Derham's Hands by his Grandson the learned Dr. Sam. Clarke; this, he says, he scarce ever knew to fail: at least, when the Wind was in any of the Easterly Points: But Mr. Derham has observ'd the Rule to hold good, be the Wind where it will. And the Cause is obvious.—The Atmosphere is replete with Vapours, which, the sufficient to reflect and intercept the Sun's Rays from us, yet want Density to descend; and while the Vapours continue in the same State, the Weather will do so too. Accordingly, such Weather is generally attended with moderate warmth, and with little or no Wind to disturb the Vapours, and an heavy Atmosphere to sustain 'em; the Barometer being commonly high.—But when the Cold approaches, and by condensing drives the Vapours into Clouds or Drops, then, way is made for the Sun-beams; till the same Vapours, being by further Condensation form'd into Rain, fall down into Drops.

2<sup>o</sup>, A Change in the Warmth of the Weather, is generally follow'd by a Change in the Wind.—Thus, the Northerly and Southerly Winds, commonly effect'd the Causes of cold and warm Weather, are really the Effects of the Cold or Warmth of the Atmosphere: Of which, Mr. Derham af-

firms us he has had so many Confirmations, that he makes no doubt of it. Thus, it is common to see a warm Southerly Wind suddenly chang'd to the North, by the fall of Snow or Hail; or to see the Wind in a cold frosty Morning, North, when the Sun has well warm'd the Earth and Air, wheel towards the South; and again turn Northerly or Easterly in the cold Evening.

3<sup>o</sup>, Most Vegetables expand their Flowers and Down in Smiling Weather, and towards the Evening; and against Rain, close 'em again; especially at the beginning of their flowering; when their Seeds are tender and sensible.—This is visible enough in the Down of Dandelion, and other Downs: and eminently in the Flowers of Pimpernel; the opening and shutting of which, Gerard observes, are the Countryman's Weather-glass, whereby he foretells the Weather of the following Day.—The Rule is, if the Flowers be close shut up, it betokens Rain and foul Weather: if they be spread abroad, fair Weather. Ger. Herb. Lib. II.

Est & abis [arbor in Tylic] similib, joliosior tamen, roseique floris; quam nullu comprimens, aperire incipit solis exortu, meridie exant. Incolle dormire eam dicunt. Plin. Nat. Hist. Lib. II. cap. 11.

The Stalk of Trefol, my Lord Bacon observes, swells against Rain, and grows more upright: and the like may be observ'd, tho not so sensibly, in the Stalks of most other Plants.—He adds, that in the Stubble Fields there is found a small red Flower, call'd by the Country-People Wincopepe; which opening in a Morning, is a sure indication of a fine Day.

That Vegetables should be affected by the same Causes that affect the Weather, is very conceivable; if we consider them as so many Hygrometers and Thermometers, consisting of an infinite Number of Tracheae, or Air-Vessels; by which they have an immediate Communication with the Air, and partake of its Moisture, Heat, &c. These Tracheae are very visible in the Leaf of the Scabiose, Vine, &c. See PLANT, VEGETABLE, &c.

Hence it is, that all Wood, even the hardest and most solid, swells in moist Weather; the Vapours easily insinuating into the Pores thereof; especially of that which is lightest and dryest.—And hence we derive a very extraordinary use of Wood, viz. for breaking Rocks and Mill-stones. See WOOD.

Their Method at the Quarries is this.—Having cut a Rock into a Cylinder, they divide that into several lesser Cylinders, by making Holes at proper distances round the great one: These Holes they fill with so many pieces of fallow Wood, dried in an Oven, which, in moist Weather, becoming impregnated with the humid Corpuscles of the Air, swell, and, like Wedges, break or cleave the Rock into several Stones.

Indications and Predictions of the Weather from the Barometer. See BAROMETER.

WEATHER-COCK, or WEATHER-VANE, a moveable Vane, in form of a Cock, or other shape; placed on high, to be turn'd round according to the Direction of the Wind, and point out what Quarter the Wind blows from. See WIND.

WEATHER-GLASSES, are Instruments contriv'd to indicate the State, or Disposition of the Atmosphere, as to Heat, Cold, Gravity, Moisture, &c. to measure the Changes befalling in those respects; and by those means to predict the Alteration of Weather, as Rains, Winds, Snow, &c.

Under the Class of Weather-Glasses, are comprehended Barometers, Thermometers, Hygrometers, Menometers, and Anemometers, of each whereof there are divers Kinds: See their Theories, Constructions, Uses, Kinds, &c. under the respective Articles, BAROMETER, THERMOMETER, HYGROMETER, &c.

WEATHER-BOARD, in the Sea Language, that side of a Ship which is to the Windward.

WEATHER-GAGE, at Sea.—A Ship is said to have the Weather-Gage of another, when she is to the Windward of her. See GAGE.

WEATHERING, a Doubling, or getting to the Windward of a Point or Place.

The WEATHERING of a Hawk, among Falconers, is the setting her abroad to take the Air. See HAWK, and HAWKING.

WEAVING, the Art or Act of working a Web of Cloth, Silk, Linnen, or other Stuff, on a Loom, with a Shuttle. See LOOM, SHUTTLE, STUFF, &c.

'Tis difficult to say, with any Assurance, who it is we owe this admirable Invention to, unless we chuse to ascribe it to the Spider, that poisonous, but ingenious little Insect, which draws certain infinitely fine Threads from its own Substance thro' its Anus. See SPIDER'S WEB.

WEAVING of Cloth. WEAVING of Tapestry, &c. } CLOTH. WEAVING of Stockings. } TAPESTRY, &c. } STOCKINGS.

WEB, a sort of Tissue, or Texture, form'd of Threads interwove with each other; some whereof are extended in Y y y length,

length, and called the *Warp*; and others drawn across them, call'd the *Woof*. See *TEXTURE*, *WOOF*, *WARP*, &c.

*Spider's-Web*, or *Cob-Web*, is a very delicate and wonderful Tissue, which that Insect spins out of its own Bowels; serving it as a sort of Toil, or Net to catch Flies, &c. withal.

For the manner wherein the Spider spins his Web; the admirable Mechanism of the Parts subservient thereto, and the Uses thereof; see *SILK*.

Dr. *Lister* tells us, that attending nearly to a Spider weaving a Net, he observ'd it suddenly to desert in the mid-work, and turning its Tail to the Wind, darted out a Thread, with the violence and firmness we see Water spout out of a Jet: This Thread, taken up by the Wind, was immediately emitted some Fathoms long; still issuing out of the Belly of the Animal.—By and by the Spider leap'd into the Air; and the Thread mounted her up swiftly.—After this Discovery, he made the like Observation in near thirty different sorts of Spiders; and found the Air fill'd with young and old, failing on their Threads, and doubtless seizing Gnats and other Insects in their passage: there being often, manifest Signs of Slaughter, Legs and Wings of Flies, &c. on these Threads, as well as in their Webs below.

Dr. *Hullé* discover'd the same thing about the same time.—In a Letter of Dr. *Lister* to Mr. *Ray*, he thinks there is a false Hint of the darting of Spiders in *Aristotle*, *Hist. An.* Lib. IX. cap. 39. and in *Pliny*, Lib. II. cap. 24. But for their failing, the Antients are silent, and thinks it was first seen by him.—In another Letter to Mr. *Ray*, dated Jan. 1670, speaking of the Height Spiders are apt to fly to, he says, "Last October, &c. I took notice that the Air was very full of Webs; I forthwith mounted to the Top of the highest Steeple on the *Münster*, [in *Tork*] and could there discern 'em yet exceeding high above me."

*WEDGE*, *Cawsens*, in Mechanicks, the last of the five Powers or simple Machines. See *MECHANICAL POWER*.

The *Wedge* is a triangular Prism, whose Bases are equilateral acute-angled Triangles. See *PRISM*.

Authors are divided about the Principle whence the *Wedge* derives its Power.—*Aristotle* considers it as two Levers of the first kind, inclined toward each other, and acting opposite ways.—*Guido Ubaldus*, *Mersennus*, &c. will have 'em Levers of the second kind.—But *Fr. de Lanis* shows, it cannot be reduced to any Lever at all. See *LEVER*.

Others refer the *Wedge* to the inclined Plane.—Others, again, with *de Stair*, deny the *Wedge* to have scarce any Force at all; and ascribe much the greatest Part to the Mallet that drives it.

But the latest Authors agree to refer the Effect of the *Wedge* to the *Cochlea*, or *Screw*. See *SCREW*.

Its Doctrine is contain'd in this Proposition.—If a Power be applied to a *Wedge*, in such manner as that the Line of Direction CD, (Tab. *Mechanicks*, Fig. 55.) perpendicular to AB, is to the Resistance to be overcome, as A B to C D; the Power will be equal to the Resistance.

Or thus: If the Power directly applied to the Head of the *Wedge*, be to the Resistance to be overcome by the *Wedge*, as the Thickness of the *Wedge* is to its Height; then the Power will be equivalent to its Resistance; and if increased, will overcome it.

For the Firmness whereby the Parts of the Obstacle, suppose Wood, adhere to one another, is the Resistance to be overcome by the *Wedge*. See *FIRMNESS*, and *RESISTANCE*.

Now, it is evident, that while the *Wedge* is drove into the Wood, the Way or Length it has gone is BA, (Fig. 54.) and D C is the Way or Length gone in the same time by the Impediment; that is, the Parts C and D of the Wood, are so far divided asunder: and according as the *Wedge* is drove down farther and farther along its Height; so the Parts C and D of the Wood, are divided more and more along the Thickness of the *Wedge*.

Hence, if the Thickness of the *Wedge* (that is, the Way of the Impediment, and consequently its Velocity) be to the Height of the *Wedge*, (that is, the Way, and consequently the Velocity of the Power) as the Power to the Impediment or Resistance; then the Momentum of the Power and the Impediment, will be equal the one to the other; and consequently, the Power, being increased, will overcome the Resistance.

Hence, 1<sup>o</sup>, As the Power equivalent to half the Resistance, is to it as *ab* to *Ab*, that is, as the whole Sine to the Tangent of half the Angle of the *Wedge*, *aAb*.—And, 2<sup>o</sup>, as the Tangent of a less Angle is less than that of a greater, the Power must have a greater Proportion to half the Resistance if the Angle be greater, than if less.—Consequently, the acuter the *Wedge* is, the more does it increase the Power.

To the *Wedge* may be refer'd all Edge-Tools, and Instruments which have a sharp Point, in order to cut, cleave, split, chop, pierce, bore, or the like; as *Knives*, *Hatchets*, *Swords*, *Boakins*, &c.

WEDNESDAY. See *MONTH*, *DAY*, &c.

*ASH-WEDNESDAY*. See *ASH-WEDNESDAY*.

*WEED*, a common Name for all rank and wild Herbs, that grow of themselves, to the Detriment of other useful Herbs they grow among. See *PLANT*, *HERB*, &c.

*Fuller's-WEED*. See *THISTLE*, or *TRAZEL*.

*WEED*, in the Miners Language, is the Degeneracy of a Lead or Vein of fine Metal, into an useless *Marcasite*. See *VRIN*, *MINE*, *METAL*, *MARCASITE*, &c.

*WEEDS*, are also a peculiar Habit, wore by the Relicts of Persons deceased, by way of Mourning. See *MOURING*.

*WEEK*, *Septimana*, *Hebdomada*, in Chronology, a Division of Time, comprising seven Days. See *TIME*, and *DAY*.

The Origin of this Division of *Weeks*, or of computing Time by *Sevenths*, is greatly controverted.—Some will have it to take its rise from the four Quarters or Intervals of the Moon, between her Change of Phases, which being about seven Days distant, gave occasion to the Division. See *MOON*, *QUARTER*, &c.

Be this as it will, the Division is certainly very ancient.—The *Syrians*, *Egyptians*, and most of the Oriental Nations, appear to have used it from all Antiquity: tho' it did not get footing in the West, till Christianity brought it in: The *Romans* reckoning their Days, not by *Sevenths*, but by *Ninths*; and the ancient *Greeks* by *Decads*, or *Tenths*.

Indeed, the *Jews* divided their Time by *Weeks*, but it was upon a different Principle from the other Eastern Nations. God himself having appointed 'em to work six Days, and to rest the Seventh; in order to keep up the Sense and Remembrance of the Creation, which being effected in six Days, he rested the seventh. See *SABBATH*.

Some Authors will even have the use of *Weeks* among the other Eastern Nations, to have proceeded from the *Jews*; but with little Appearance of Probability.—'Tis with better Reason that others suppose the Use of *Weeks* among the Heathens of the East, to be a Remain of the Tradition of the Creation, which they had still retain'd with divers others.

This is the Opinion of *Grotius*, *De Veritat. Relig. Christi*. Lib. I. who likewise proves, that not only thro'out the East, but even among the *Greeks*, *Italians*, *Celts*, *Selavi*, and even the *Romans* themselves, the Days were divided into *Weeks*; and that the seventh Day was in extraordinary Veneration.—This appears from *Joseph. adv. Apionem* II. *Pilo de Creativo*, *Clem. Alexandr. Strom.* Lib. V.—*The Heliodorus*, Lib. I. cap. 84. *Pseudostratus*, Lib. III. cap. 13. *Dion. Lib. XXXVIII. Tibullus, Lucian, Homer, Callimachus, Suetonius, Herodorus*, &c. who mention the Custom as very ancient, suppose it to have been deriv'd from the *Egyptians*.

The Days of the *Week* were denominated by the *Jews* from the Order of their Succession from the Sabbath.—Thus, the Day next after the Sabbath they call'd the first of the Sabbath, the next the second of the Sabbath, and so of the rest; except the sixth, which they call'd *Parasceve* or Preparation of the Sabbath. See *PARASCEVE*.

The like Method is still kept up by the Christian *Arabs*, *Persians*, *Ethiopi*, &c.—The ancient Heathens denominated the Days of the *Week* from the seven Planets; which Names are still generally retain'd among the Christians of the West.—Thus, the first Day was call'd *Sun-day*, *Dies Solis*; the second *Mon-day*, *Dies Lune*, &c. a Practice the more natural on *Dion's* Principle, who says, *The Egyptians* took the Division of the *Week* it self from the seven Planets.

In effect, the true Reason of these Denominations is founded in Astrology.—For the Astrologers, distributing the Government and Direction of all the Hours in the *Week* among the seven Planets,  $\text{h} \text{v} \text{♁} \text{♂} \text{♃} \text{♄} \text{♅}$ ; so as that the Government of the first Hour of the first Day fall to *Saturn*, that of the second to *Jupiter*, &c. They gave each Day the Name of the Planet which presided over the first Hour thereof; and that, according to the Order specify'd above; and which is included in the following Technical Verif.

Post SIM SUM sequitur, pallida Luna subest.

Wherein, the Capital Letters, SIM SUM and L, are the initial Letters of the Planets.—Thus, the Order of the Planets in the *Week*, has little Relation to the Order in which they follow in the Heavens: The former being founded on an imaginary Power each Planet has in its turn on the first Hour of each Day. See *PLANET*, *HOOR*, *HOUSE*, *ASCENDENT*, *HOROSCOPE*, &c.

*Dion. Cassius* gives another Reason of the Denomination, fetch'd from the celestial Harmony.—For it being observ'd that the Harmony of the Diatessaron, which consists in the Ratio of 4 to 3, is of great force and effect in Musick; it was judg'd meet to proceed directly from *Saturn* to the *Sun*; because there are three Planets between *Saturn* and the *Sun*, and four from the *Sun* to the *Moon*. See *DIATESSARON*, *HARMONY of the Spheres*, &c.

To find the Accomplishment of *Daniel's* Prophecy of the Messiah, the Destruction, Rebuilding, &c. of the Temple, C. IX. v. 24, &c. The Critics generally agree to understand *Weeks of Years*, instead of *Weeks of Days*. See PROPHECY, YEAR, &c.

*Passion Week*, or the *Holy Week*, is the last *Week* in  *Lent*, wherein the Church celebrates the Mystery of our Saviour's Death and Passion. See *LENT*, and *PASSION*.

It is sometimes also called the *great Week*. Its Institution is generally refer'd, both by Protestants and Papists, to the Times of the Apostles.—All the Days of that *Week* were held as *Fasts*: no Work was done on 'em; no Justice distributed; but the Prisoners were ordinarily set at liberty, &c. even Pleasures otherwise allowed, were now prohibited.

The *Oficulus Charitatis* was now forbore; and divers Mortifications practis'd by all sorts of People, and even the Emperors themselves.

*WEEK*, or *WICK* of a *Candle*, &c. the Cotton Match in a *Candle*, or *Lamp*. See *CANDLE*, *LAMP*, &c.

*WEAVING*. See *TRABE*.

*WEFT*, a kind of *Web*, or *Thing* woven; as a *Wef* of *Tress* of *Hair*. See *WEB*, *HAIR*, *TRESS*, &c.

*WEIF*. See *WAIF*.

*WEIGH*, *WEY*, *WAGA*, a *Weight* of *Cheese*, *Wool*, &c. containing 256 Pounds *Averdupois*.—of *Coro*, the *Weyb* contains 40 *Bushels*; of *Barley* or *Malt*, six *Quarters*. In some *Places*, the *Weyb* of *Cheese* is 500 Pounds. See *MEASURE*.

—Et decimam casti sui de *Herring*, præter unam *peisam* que pertinet ad *Eccliam* de *A. Mon. Angl.* where *peisa* seems to be used for a *Weyb*.

*Coke* mentions eighty *Weighs* of *Bay-Salt*. See *WAGA*.

*WEIGHER*, an Officer in divers *Cities*, appointed to weigh the *Commodities* bought or sold, in a publick *Balance*, &c.

These *Weighers* are generally oblig'd by *Oath* to do Justice to both Parties; and to keep a *Register* of the Things they weigh.—In *Austrians* there are twelve *Weighers* established in a kind of *Office*.

As it was formerly allow'd 'em to touch the *Springs* of the *Balance* in weighing, it was easy for 'em to favour either the *Bayer* or *Seller*, according as the one gave 'em more *Money* than the other.—To prevent which *Abuse*, it was charg'd on 'em, by an *Ordonnance* of the *Bourgeois* in 1719, not to touch the *Balance* in any manner whatever.

*WEIGHING*, the Act of examining a *Body* in the *Balance*, to find its *weight*. See *BALANCE*, and *WEIGHT*.

The *Distillers* in *London* weigh their *Vessels* when full; and for half a *Hoghead*, which is 31 *Gallons* and an half, allow 200 one quarter and 11 Pounds for the *Cask* and *Liquor*.—For a *Funcheon*, they allow 600 one quarter and two Pounds: For a *Cansry Pipe* 800 a half and 17 Pounds.

*WEIGHING-Chair*, a *Machine* contriv'd by *Sanctarius*, to determine the *Quantity* of *Food* taken at a *Meal*; and to warn the *Feeder* when he had eat his *Quantum*.

That ingenious Author having observed, with many others, that a great part of our Disorders arise from the Excess in the *Quantity* of our *Food*, more than in the *Quality* thereof; as also how much a *fix'd* Portion, once well adjust'd, would, if kept regularly, contribute to *Health*; but bought himself of an *Expedient* to that purpose.—The Result was the *Weighing-Chair*: which was a *Chair* fix'd at one Arm of a sort of *Balance*, wherein a *Person* being seated at *meat*, as soon as he had eat his *Allowance*, the increase of *Weight* made his *Seat* preponderate: So that descending to the *Ground*, he left his *Table*, *Victuals*, and all out of reach. See *PERSPIRATION*.

*WEIGHING of the Air*. See *WEIGHT of Air*.

*WEIGHING Anchor*, in the *Sea* Language, is the drawing up the *Anchor* out of the *Ground* it had been cast into; in order to set sail, or quit a *Port*, *Read*, or the like. See *ANCHOR*.

The *Anchor* is weigh'd or recover'd, by means of the *Capstan*. See *CAPSTAN*.

*WEIGHT*, *Gravity*, *Pondus*, in *Phyſicks*, a *Quality* in *Natural Bodies*, whereby they tend downwards, towards the *Centre* of the *Earth*. See *BODY*, *DESCENT*, *EARTH*, &c.

Or, *Weight* may be defined, in a less limited manner, to be a *Power* inherent in all *Bodies*, whereby they tend to some common *Point*, call'd the *Centre of Weight*, or *Gravity*; and that with a greater or less *Velocity*, as they are more or less *dense*, or as the *Medium* they pass thro' is more or less *rare*. See *CENTRE*, *DENSITY*, &c.

In the common Use of *Language*, *Weight* and *Gravity* are consider'd as one and the same thing.—Some Authors, however, make a difference between 'em; and hold *Gravity* only to express a *Nisus*, or endeavour to descend; but *Weight* an actual *Descent*.

But there is room for a better *Distinction*.—In effect, one may conceive *Gravity* to be the *Quality*, as inherent in the *Body*; and *Weight* the same *Quality* exerting it self, either against an *Obſtacle*, or otherwise. See *QUALITY*, &c.

Hence *Weights* may be distinguish'd, like *Gravity*, into *Absolute*, and *Specific*. See *GRAVITY*.

*Sir I. Newton* demonstrates, that the *Weights* of all *Bodies*, at equal distances from the *Centre* of the *Earth*, are proportionable to the *Quantity* of *Matter* each contains.—Whence it follows, that the *Weights* of *Bodies* have not any dependence on their *Forms*, or *Textures*; and that all *Spaces* are not equally full of *Matter*. See *VACUUM*.

Hence also it follows, that the *Weight* of the same *Body* is different, on the *Surface* of different *Parts* of the *Earth*; by reason its *Figure* is not a *Sphere*, but a *Spheroid*. See *SPHEROID*.

The *Law* of this *Difference*, the same *Author* gives in the following *Theorem*.—The Increase of *Weights*, as you proceed from the *Equator* to the *Poles*, is, nearly, as the *Verſed Sine* of double the *Latitude*; or, which amounts to the same, As the *Square* of the *right Sine* of the *Latitude*.

Therefore, since the *Latitude* of *Paris* is 48° 50', that of a *Place* under the *Equator* 00° 00'; and that of a *Place* under the *Pole* 90° 00'; and the *Verſed Sines* of the double *Latitudes* are 11334,00000 and 80000, the *Radius* being 100000; and the *Weight* at the *Pole* is to the *Weight* at the *Equator* as 250 to 229; and the *Excess* of *Weight* at the *Pole* to that at the *Equator*, as 1 to 229: The *Excess* of *Gravity* in the *Latitude* of *Paris*, to that under the *Equator*, will be as 1 x  $\frac{11334}{100000}$  to 229, or 5667 to 2290000; and therefore, the whole *Weights* in those *Places*, will be to each other as 2295667 to 2290000.

Hence, also, as the *Lengths* of *Pendulums* that perform their *Vibrations* in equal *Times*, are as their *Weights*; and the *Length* of a *Pendulum* which in the *Latitude* of *Paris* vibrates *Seconds*, is three *Paris Feet* and eight *Lines*: The *Length* of a *Pendulum* that vibrates *Seconds* under the *Equator*, will be short of a *Synchronous Pendulum* at *Paris*, by one *Line* and an 87000th Part of a *Line*. *Phil. Nat. Princ. Math.* Lib. III. p. 582, &c. See *PENDULUM*.

A *Body* immerg'd in a *Fluid* specifically lighter than it self, loses to much of its *Weight*, as is equal to the *Weight* of a *Quantity* of the *Fluid* of the same *Bulk* with it self. See *FLUID*.

Hence, a *Body* loses more of its *Weight* in a heavier than in a lighter *Fluid*; and therefore weighs more in a lighter than a heavier *Fluid*. See *SPECIFIC Gravity*.

To find the *Weight* of any *Quantity* of a *Fluid*, s. g. of the *Wine* contain'd in a *Hoghead*.—Find the *Bulk* or *Quantity* of the *Liquor* by the *Rules* of *Gauging*. See *GAUGING*.

Suspend a *Cubick Inch* of *Lead* therein by a *Horse-hair* 3 and by a *Balance* note the *Weight* lost.—This will be the *Weight* of a *Cubick Inch* of the *Fluid*.

Wherefore, since in a homogeneous *Fluid* the *Weight* is proportionable to the *Bulk*; and the *Weight* of the *Fluid* will be found by the *Rule* of *Three*.—Thus, if the *Capacity* of the *Hoghead* be 88 *Cubick Feet*, and the *Cubick Foot* of *Wine* 28 Pounds; the whole *Weight* of the *Wine* will be 88 : 68 :: 1 : 5984.

The *Weight* of a *Cubick Foot* of *Water*, has been determin'd by several; but as in different *Springs*, &c. the *Weight* of the *Water* is different, and there is even a difference in the same *Water* at different *times*; 'tis no wonder the *Observations* of the several *Authors* should be found very different.—*Sir Sam. Morland*, by repeated *Experiments*, found a *Cubick Inch* of *Water* to weigh 70 Pounds 2 Ounces. See *WATER*.

*WEIGHT*, *Pondus*, in *Mechanicks*, is any thing to be rais'd, sustain'd, or mov'd by a *Machine*; or any thing that in any manner resists the *Motion* to be produc'd. See *MOTION*, &c.

In all *Machines*, there is a natural *Ratio* between the *Weight* and the moving *Power*.—If the *Weight* be increased, the *Power* must be so too; that is, the *Wheels*, &c. are to be multiplied, and so the *Time* increas'd, or the *Velocity* diminish'd. See *POWER*, and *MACHINE*.

The *Centre* of *Gravity* F, (Tab. *Mechanicks*, Fig. 55.) of a *Body* I H, together with the *Weight* of a *Body*, being given; to determine the *Point* M, in which, lying on an *horizontal Plane*, a given *Weight* G, hung in L, cannot remove the *Body* I H out of its *horizontal Situation*.

Conceive a *Weight* hung in the *Centre* of *Gravity* F, equal to the *Weight* of the whole *Body* I H, and find the common *Centre* of *Gravity* M, of that and the given *Weight* G. If the *Point* M be laid on the *horizontal Plane*; the *Weight* G will not be able to move the *Body* I H out of its *Place*.

Suppose, e. g. F the *Centre* of *Gravity* of the *Staff*, which is distant from its *Extremity* by the *Space* I F 20 *Inches*; the *Bucket* of *Water* to weigh 24 Pounds, and the *Weight* of the *Staff* to be a L F = 15 *Inches*: We shall find L M = L F F. (G + F) = 18, 2 : 22 :: 18 : 22 = 16  $\frac{2}{3}$ , so that 'tis no wonder the *Bucket* hung on the *Staff* I H, laid on the *Table*, does not fall.

The Centre of Gravity C, (Fig. 56.) of a Body A B, together with its Weight G, being given; to determine the Points L and M, wherein Props M, N, are to be placed, that each may bear any given Proportion of the Weight.

In the horizontal Line A E, passing thro' the Centre of Gravity C, assume the right Lines M C and C L in the given Ratio.—Props, then, M, N, placed in these Points, will be press'd in the given Ratio.

Hence, if in the Points M, L, in lieu of Props, you place the Shoulders, or Arms of Porters, &c. They will be able to bear the Burden alike; if their Shares be proportion'd to their Strengths.—Thus we have a way of distributing a Burden in any given Ratio.

WEIGHT, in Commerce, &c. is a Body of a known Weight, appointed to be put in the Balance against other Bodies, whose Weight is requir'd. See WEIGHING, BALANCE, &c.

These Weights are usually of Lead, Iron, or Brass; tho in divers Parts of the East-Indies they are common Flints, and in some Places a sort of little Beans.

The Security of Commerce depending, in good measure, on the Justness of these Weights; there is scarce any Nation but has taken proper Measures to prevent the Falsification thereof.—The surest Means are the stamping, or marking 'em by proper Officers, from some Original or Standard, deposited where recourse may be had to 'em.

This expedient is very ancient; and many Authors are of Opinion, that what among the Jews was called *Shekel of the Sanctuary*, was not any particular Kind of Weight, different from the common one; but a Standard or original Weight, preserv'd by the Priests in the Sanctuary. See *SHEKEL*, and *SANCTUARY*.

Thus, also, in England, the Standard of Weights is kept in the Exchequer by a particular Officer, call'd the *Clerk or Comptroller of the Market*.—In France, the Standard Weight is kept under several Keys in the Cabinet of the *Cour des Monnoyes*. See *STANDARD*.

Most Nations, wherein there is any thing of Commerce flourishing, have their particular Weights; and even sometimes different Weights in the different Provinces, and for the different Kinds of Commodities.

This Diversity of Weights, makes one of the most perplexing Articles in Commerce; but it is irremediable.—The reducing the Weights of different Nations to one, is not only impracticable; but even the Redaction of those of the same Nation: Witness those vain Attempts made for the reducing the Weights in France, by so many of their Kings, *Charlesmaign, Philip the Long, Louis XI. Francis I. Henry II. Charles IX. Henry III. Louis XIV.*

Weights may be distinguish'd into *Antient and Modern, Foreign, and Domestic*.

Modern WEIGHTS.

Weights used in the several Parts of Europe and the Levant.

English WEIGHTS.—By the XXVIIIth Chapter of *Magnus Charta*, the Weights are to be the same all over England; but for different Commodities there are two different sorts, viz. *Troy Weight, and Averdupois Weight*.

The Origin from which they are both rais'd, is the Grain of Wheat, gather'd in the middle of the Ear. See *GRAIN*.

In *Troy Weight*, 24 of these Grains make a *Penny-weight*; Sterling; 20 *Penny-weight* make an *Ounce*; and 12 *Ounces* a *Pound*. See *OUNCE*, *POUND*, &c.

By this Weight we weigh Gold, Silver, Jewels, Grains, and Liquors. See *TROY*.

The Apothecaries also use the *Troy Pound*, *Ounce*, and *Grain*; but they differ from the rest, in the intermediate Divisions.—They divide the *Ounce* into 8 *Drachms*; the *Drachm* into 3 *Scruples*; and the *Scruple* into 20 *Grains*. See *DRACHM*, *SCRUPLE*, &c.

In *Averdupois Weight*, the *Pound* contains 16 *Ounces*; but the *Ounce* is less by near  $\frac{1}{16}$  than the *Troy Ounce*; this latter containing 490 *Grains*, and the former only 448.—The *Ounce* contains 16 *Drachms*—80 *Ounces* *Averdupois*, are only equal to 73 *Ounces* *Troy*; and 17 *Pounds* *Troy*, equal to 14 *Pounds* *Averdupois*. See *POUND*.

By *Averdupois Weight*, are weigh'd *Mercury* and *Grocery Wares*, such as *Metals*, *Wool*, *Tallow*, *Hemp*, *Drugs*, *Bread*, &c. See *AVERDUPUIS*.

Table of Troy Weight, as used by the Goldsmiths, &c. Apothecaries.

Grains.	
24	Penny-weight.
480	20 Ounce.
5760	240 12 Pound.
Grains.	
20	Scruple.
60	3 Drachm.
480	24 8 Ounce.
5760	188 96 12 Pound.

Table of Averdupois Weight.

Scruple.	
3	Drachm.
24	8 Ounce.
584	128 16 Pound.
45008	14536 1792 112 Quintal, or Hundred.
860160	286720 35840 2240 20 Tun.

The Moneyers, Jewellers, &c. have a particular Class of Weights for Gold and Precious Stones, viz. *Carat*, *Penny-weight*, and *Grain*; and for Silver the *Penny-weight* and *Grain*. See *CARAT*; see also *GOLD*, and *SILVER*.

The Moneyers have also a peculiar Subdivision of the *Grain Troy*: Thus;

The	}	into	20 Mites.
			24 Droites.
			20 Perits.
			24 Blanks.

The Dealers in Wool have likewise a particular Set of Weights, viz. the *Sack*, *Wegh*, *Tol*, *Stone*, and *Clove*. See *WEGH*, &c.

The Proportion of these, see under the Article *Wool*.

French WEIGHTS.—Their common or *Paris Pound*, is 16 *Ounces*; which they divide two ways: The first Division is into two *Mars*, the *Mars* into eight *Ounces*; the *Ounce* into eight *Gras*; the *Gras* into three *Penny-weights*; the *Penny-weight* into 24 *Grains*; the *Grain* equivalent to a *Grain* of Wheat.—The second Division of the *Pound*, is into two *Half-pounds*; the *Half-pound* into two *Quarters*; the *Quarter* into two *Half-quarters*; the *Half-quarter* into two *Ounces*; and the *Ounce* into two *Half-ounces*.

The Weights of the first Division are used to weigh Gold, Silver, and the richer Commodities; and the Weights of the second Division for Commodities of less Value.

Grains.	
24	Penny-weight.
72	3 Gros.
576	24 8 Ounce.
1008	192 64 8 Marc.
6216	384 128 16 2 Pound.

Half-ounce.	
2	Ounce.
4	2 Half-quart. Pound.
8	4 2 Quarter Pound.
16	8 4 2 Half Pound.
32	16 8 4 2 Pound.
3200	1600 800 400 200 100 Quintal.

But the *Pound* is not the same throughout France.—At *Lyon*, e.g. the *City Pound* is only 14 *Ounces*: So that 100 *Lyon* Pounds make only 88 *Paris* Pounds.—But beside the *City Pound*, they have another at *Lyon* for Silk, containing 15 *Ounces*.—At *Toulouse*, and throughout the *Upper Languedoc*, the *Pound* is 13 *Ounces* and  $\frac{1}{2}$  of *Paris Weight*.—At *Marseilles*, and throughout *Provence*, the *Pound* is 13 *Ounces* of *Paris Weight*.—At *Rouen*, beside the common *Paris Pound* and *Marc*, they have the *Weight of the Vicinity*; which is 16 *Ounces* and  $\frac{1}{2}$  and  $\frac{1}{2}$ , to the *Paris Pound*.

The Weights enumerated under the two Articles of *English* and *French Weights*, are the same that are used throughout the greatest Part of Europe; only under somewhat different Names, Divisions, and Proportions. See *POUND*, *GROS*, *MARC*, *PENNY-WEIGHT*, &c.

Particular Nations, however, have also certain Weights peculiar to themselves: Thus, *Spain* has its *Arobat*, containing 25 *Spanish* Pounds, or  $\frac{1}{2}$  of the common *Quintal*: Its *Quintal* *Macla*, containing 150 *Pounds*, or  $\frac{1}{2}$  common *Quintal*, or 6 *Arobas*: Its *Adarme*, containing  $\frac{1}{16}$  of its *Ounce*.—And for Gold, it has its *Castilian*, or  $\frac{1}{12}$  of a *Pound*.—Its *Tomin*, containing 12 *Grains*, or  $\frac{1}{2}$  of a *Castilian*.—The same are in use in the *Spanish West-Indies*.

Portugal has its *Arata*, or *Araba*, containing 32 *Lisbon Pounds*: Its *Favetelle*, containing two *Lisbon Pounds*: Its *Rottoli*, containing about 12 *Pounds*. And for Gold, its *Cibo*, containing four *Carats*.—The same are used in the *Portuguese East-Indies*.

*Italy*, and particularly *Venice*, have their *Migliaro*, containing four *Mirae*; the *Mirae* containing 30 *Venice Pounds*: The *Soggio*, containing a sixth Part of an *Ounce*.—*Genoa* has five Kinds of *Weights*, viz. *La. 50 Weights*, whereby all Merchandises are weigh'd at the Custom-house: *Coff Weights*, for *Pistres* and other Species: *The Cantara*, or *Quintal*, for the coarsest Commodities: *The Large Balance*, for raw Silks; and the *Small Balance* for the finer Commodities.—*Sicily* has its *Rottoli*, 32 and a half *Pounds of Messina*.

*Germany*, *Flanders*, *Holland*, the *Hans Towns*, *Sweden*, *Denmark*, *Poland*, &c. have their *Schippont*, which at *Aurwerp* and *Hamburg* is 300 *Pounds*, at *Lubeck* 320; and at *Cönnigsberg* 400 *Pounds*.—In *Sweden*, the *Schippont* for Copper is 320 *Pounds*; and the *Schippont* for Provisions 400 *Pounds*. At *Riga* and *Revel*, the *Schippont* is 400 *Pounds*; and at *Dantzic* 340 *Pounds*: In *Norway* 300 *Pounds*: At *Amsterdam* 300; containing 20 *Lispounds*, each weighing 15 *Pounds*.

In *Muscovy*, they weigh their large Commodities by the *Bercheroff*, or *Berkowits*, containing 400 of their *Pounds*.—They have also the *Poot*, or *Pod*, containing 40 *Pounds*, or  $\frac{1}{2}$  of the *Bercheroff*.

In *Turky*, at *Smyrna*, &c. they use the *Batman*, or *Batmanant*, containing six *Ocques*; the *Ocque* weighing 3 *Pounds*  $\frac{1}{2}$  *English*.—They have another *Batman*, much less, consisting of the former of six *Ocques*, but the *Ocque* only containing 15 *Ounces English*: 44 *Ocques* of the first Kind, make the *Turkish Quintal*.—At *Cairo*, *Alexandretta*, *Aleppo*, and *Alexandria*, they use the *Rotte*, *Rotton*, or *Rottoli*. The *Rottoli* at *Cairo*, and other Parts of *Egypt*, is 144 *Drachms*; being somewhat over an *English Pound*.—At *Aleppo* there are three sorts of *Rottos*; the first 720 *Drachms*, making about seven *Pounds English*; and serving to weigh *Cottons*, *Galls*, and other large Commodities: The second is 624 *Drachms*, used for all Silks but white ones, which are weigh'd by the third *Rotte* of 720 *Drachms*. At *Seyda* the *Rotto* is 600 *Drachms*.

The other Parts of the *Levant*, not named here, use some of these *Weights*; particularly the *Occo*, or *Ocque*, the *Rottoli* and *Rotte*.

To shew the Proportion of these several *Weights* to one another, we shall add a Reduction of the divers *Pounds* used throughout *Europe*, by which the other *Weights* are estimated, to one Standard *Pound*, viz. the *Pound of Amsterdam*, *Paris*, and *Bourdeaux*; as calculated with great Accuracy by *Montieur Ricard*, and publish'd in the new Edition of his excellent *Traité de Commerce*, in 1722.

*Alphabetical Table of the Proportion of the Weights of the chief Cities in Europe, to those of Amsterdam.*

An hundred Pounds of Amsterdam, are equal to	165 l. of Genoa, Caff-Weight.
108 Pounds of Alicani.	102 l. of Hamburg.
105 l. of Antwerp.	106 l. of Leiden.
120 l. of Archangel, or 3 Poedes.	105 l. of Leipfic.
105 l. of Arsebot.	105 l. and $\frac{1}{2}$ of Liege.
120 l. of Avignon.	114 l. of Lise.
98 l. of Bafil in Switzerland.	116 l. of Lyons, City-Weight.
100 l. of Bayonne in France.	106 l. and $\frac{1}{2}$ of Lisbon.
166 l. of Bergamo.	123 l. of Leybora.
97 l. of Berg ap Sona.	109 l. of London, Averdupois-Weight.
95 l. $\frac{1}{2}$ of Bergen in Norway.	105 l. of Louvain.
111 l. of Bern.	105 l. of Lubec.
100 l. of Besancon.	141 $\frac{1}{2}$ l. of Luces, Light-Weight.
100 l. of Bilbao.	114 l. of Madrid.
105 l. of Bois le Duc.	105 l. of Molines.
151 l. of Boulogne.	125 l. and $\frac{1}{2}$ of Marfeilles.
100 l. of Bourdeaux.	154 l. of Messina, Light-Weight.
104 l. of Bour en Bresse.	168 l. of Milan.
105 l. of Bremen.	120 l. of Montpellier.
125 l. of Breslaw.	125 Bercheroffs of Muscovy.
105 l. of Bruges.	100 l. of Nantes.
105 l. of Brujfelt.	106 l. of Nancy.
105 l. of Cadix.	169 l. of Naples.
105 l. of Cologne.	98 l. of Nuremberg.
125 l. of Cönnigsberg.	100 l. of Paris.
107 l. and $\frac{1}{2}$ of Copenhagen.	112 l. and $\frac{1}{2}$ of Revel.
87 Rottes of Constantiople.	109 l. of Riga.
115 l. and $\frac{1}{2}$ of Dantzic.	100 l. of Rochel.
100 l. of Dort.	126 l. of Rome.
97 l. of Dublin.	100 l. of Rotterdam.
97 l. of Etenburgh.	96 l. of Rome, Vicounty-Weight.
145 l. of Florence.	100 l. of S. Mala.
98 l. of Francfort, on the Maine.	100 l. of S. Sebastian.
105 l. of Ghent.	
89 l. of Geneva.	

An hundred Pounds of Amsterdam is equal to  
 158 l. and  $\frac{1}{2}$  of Saragoza.  
 106 l. of Seville.  
 114 l. of Suirna.  
 110 l. of Stetin.  
 81 l. of Stockolm.  
 118 l. of Tblouffe and Upper Laograwe.  
 151 l. of Turin.  
 158 l. and  $\frac{1}{2}$  of Valencia.  
 121 l. of Venice, Small Weight.

WEIGHTS used in the several Parts of the East-Indies, China, Persia, &c.

The *Chinese* WEIGHTS, are—The *Pic* for large Commodities; it is divided into 100 *Catis*, or *Cattis*, the same say into 125; the *Cati* into 16 *Taelis*; each *Tael* equivalent to  $\frac{1}{2}$  of an *Ounce English*, or the *Weight* of one *Rial* and  $\frac{1}{10}$ , and containing 20 *Mas*, or *Messes*; and each *Mas* 10 *Condorins*. So that the *Chinese Pic* amounts to 157 *Pounds Eng.* *Averdupois*, and the *Cati* to 1 *Pound 8 Ounces*.—The *Piccol*, for Silk, containing 66 *Catis* and  $\frac{1}{2}$ : The *Babar*, *Bekaire*, or *Berre*, containing 300 *Catis*.

*Tuangua* has all the same *Weights*, Measures, &c. as *China*. *Japoa* has only one *Weight*, viz. the *Catti*; which, however, is different from that of *China*, as containing 20 *Taelis*.—At *Sarat*, *Agry*, and throughout the States of the Great *Mogul*, they use the *Man*, or *Menn*, whereof they have two Kinds; the *King's Man*, or *King's Weight*; and the *Man* simply: The first used for the weighing of common Provisions, containing 40 *Seris*, or *Serres*; and each *Ser* a juft *Paris Pound*. The *Tavernier* will have the *Ser* near a Seventh less than the *Paris Pound*.—The common *Man*, used in the weighing of Merchandize, consists likewise of 40 *Serres*, but each *Serre* is only estimated at 12 *Paris Ounces*, or  $\frac{1}{2}$  of the other *Ser*.

The *Man* may be look'd on as the common *Weight* of the *East Indies*, tho' under some difference of Name, or rather of Pronunciation; it being call'd *Moo* at *Cambaya*, and in other Places *Mein*.—The *Ser* is properly the *Indian Pound*, and of universal use: The like may be said of the *Babar*, *Tael*, and *Catti* abovemention'd.

The *Weights* of *Siam*, are the *Pic*, containing 2 *Schans* or *Catis*; but the *Siamese Cati* is only half the *Japones*, the latter containing 20 *Taelis* and the former only 10: Tho' some make the *Chinese Cati* only 16 *Taelis*, and the *Siamese* 8.—The *Tael* contains 4 *Batis* or *Ticlis*; each about a *Paris Ounce*: The *Bat* 4 *Selings*, or *Mayons*: The *Mayon* 2 *Fouangs*: The *Fouang* 4 *Payes*: The *Paye* 2 *Clams*: The *Sampaye*, half a *Fouang*.

It is to be observed, that these are the Names of their Coins, as well as *Weights*; Silver and Gold being, there, Commodities, sold, as other things, by their *Weights*. See *Coins*, &c.

In the Isle of *Java*, and particularly at *Bantam*, they use the *Gantau*, which amounts to near 3 *Dutch Pounds*.—In *Goconda*, at *Vijayanar* and *Goa*, they have the *Favetelle*; containing 1 *Pound* 14 *Ounces English*: The *Mogalis*, or *Mangelsa*, for weighing *Diamonds* and Precious Stones; weighing at *Goa* 5 *Grains*, at *Goconda*, &c. 3  $\frac{1}{2}$  *Grains*.—They have also the *Rottoli*, containing 14  $\frac{1}{2}$  *Ounces English*: The *Metricol*, containing the sixth Part of an *Ounce*: The *Vol*, for *Pistres* and *Ducats*; containing the 73d Part of a *Rial*.

In *Persia*, they use two Kinds of *Batmans* or *Mans*; the one call'd *Cabi* or *Clerya*, which is the *King's Weight*, and the other *Batman* of *Tauris*, from the Name of one of the chief Cities of *Persia*.—The first weighs, according to *Tavernier*, 13 *Pounds* 10 *Ounces English*; the second, 6 *Pound*  $\frac{1}{2}$ . According to Sir *J. Chardin*, the *King's Batman* is 13 *Pounds* 14 *Ounces*, and the *Batman* of *Tauris* 6 *Pounds*  $\frac{1}{2}$ .—Its Divisions are, the *Ratel*, or a 16th; the *Derbem*, or *Drachm*, which is the 50th; the *Mesfal*, which is half the *Derbem*; the *Dang*, which is the 6th Part of the *Mesfal*; being equivalent to 6 *Carat-Grains*; and lastly the *Grain*, which is the 4th Part of the *Dang*.—They have also the *Vake*, which exceeds, a little, our *Ounce*: The *Sub-bercy*, equal to the 1170th Part of the *Derbem*: And the *Toman*, used to weigh our large Payments of Money, without telling; its *Weight* is that of 50 *Abaffis*. See *TOMAN*.

*African and American WEIGHTS.*

We have little to say as to the *Weights* of *America*: The several *European Colonies* there, making use of the *Weights* of the States or Kingdoms of *Europe* they belong to. For as to the *Arone* of *Peru*, which weighs 27 *Pounds*, 'tis evidently no other than the *Spanish Araba*, with a little difference in the Name.

As to the *Weights* of *Africa*; there are few Places have any, except *Egypt* and the Coasts of *Africa*, whose *Weights* are enumerated among those of the Ports of the *Levant*, &c.

As to the Coasts beyond *Cape Verde*, viz. *Guinea*, *Congo*, to *Suffola*, *Mojambica*, &c. they have no *Weights*; only,

the *English, French, Dutch, Portuguese and Danish*, have introduc'd their own *Weights* in their respective Settlements.

The *Isle of Madagascar*, indeed, has its particular *Weights*; but it has none that exceed the *Drachm*, nor are they us'd for any thing but *Gold and Silver*.—Other *Commodities* they never weigh.

Antient WEIGHTS.

Jewish WEIGHTS reduc'd to English Troy Weights.

Shekel	l.	oz.	part.	gr.
100	Maneh	00	00	09 1/2
5000	50 Talent	03	09	10 1/2
		180	08	15 1/2

Note, In reckoning Money, 60 Shekels made a Maneh, but in weight 100 Shekels.

Grecian and Roman WEIGHTS reduc'd to English Troy Weight.

Leuces	l.	oz.	part.	gr.	The Subdivisions of the Roman <i>As</i> , <i>Libra</i> , or Pound.
4	Siliqua	0	00	00 1/12	
12	3 Obolus	0	00	00 1/3	1 <i>As</i> , <i>Libra</i> , &c. contain'd 12
24	6 2 Scriptulum	0	00	00 1/2	Uncia, or Ounces.
72	18 6 3 Drachma	0	00	04 1/4	12 <i>Denux</i> 11
96	24 8 4 1/2 Sextula	0	00	03 1/2	10 <i>Dextans</i> 10
144	36 12 6 3 1/2 Sicillus	0	00	04 1/2	9 <i>Dodrans</i> 9

6912	1728 476 288 96 72 48 36 12 Libra	0	10	18 1/2	6 <i>Semis</i> 6
					5 <i>Quincunx</i> 5
					4 <i>Triens</i> 4
					3 <i>Quadrans</i> 3
					2 <i>Sextans</i> 2
					1 <i>Uncia</i> 1

The *Roman Ounce* is the *English Averdupois Ounce*, which they divided into 7 *Denarii*, as well as 8 *Drachms*; and since they reckon'd their *Denarius* equal to the *Atric Drachm*, this will make the *Atric Weights* 1/2 heavier than the correspondent *Roman Weights*.

Note, The *Grecians* divided their *Obolus* into *Chalci* and *Leuces*. Some, as *Diodorus* and *Suidas*, divided the *Obolus* into 6 *Chalci*, and every *Chalcus* into 7 *Leuces*. Others divided the *Obolus* into 8 *Chalci*, and every *Chalcus* into 8 *Leuces*, or *Minuta*.

WEIGHT of Air, is equal to the Elasticity thereof. See AIR, and ELASTICITY.

To find the Weight of a Cubic Inch of Air.—Weigh a round glass Vessel full of common Air, very accurately: exhaust the Air out of it: weigh the exhausted Vessel, and subtract the latter Weight from the former; the Remainder is the Weight of the Air exhausted.

Find, then, the Content of the Vessel by the Laws of Measuring, (See SENARAZ) and the Ratio of the Remaining Air to the primitive Air. See AIR-PUMP.

This done, the Bulk of the remaining Air is found by the Rule of Three; which being subtracted from the Capacity of the Vessel, the Remainder will be the Bulk of Air extracted.—Or, if the Air-Pump be very tight, and the Exhaustion continu'd as long as any Air is got out; the remaining Air will be so small, that it may be safely neglected, and the Content of the Vessel taken for the Bulk of the exhausted Air.

Having, therefore, the Weight and Bulk of the whole exhausted Air, the Weight of one Cubic Inch is easily had by the Rule of Three.

This Method was first used by *Otto Gueric*, and afterwards by *Burchevas de Volder*; who gives us the following Particulars in his Experiment.—1<sup>o</sup>, That the Weight of the Glass spherical Vessel he made use of, full of common Air, was 7 Pounds 1 Ounce 2 Drams 48 Grains; when exhausted of Air, 7 l. 1 oz. 1 dr. 31 gr. and when full of Water, 16 l. 12 oz. 7 dr. 14 gr. The Weight of the Air, therefore, was 1 dr. 32 gr. or 77 gr. the Weight of the Water 9 l. 11 oz. 5 dr. 43 gr. or 74743 gr. Consequently, the Ratio of the specific Gravity between Water and Air, is 74743 : 77 :: 970 1/2 : 1. Now, *Volders*, having found a Cubic Foot of Water to weigh 64 Pound; by inferring, as 970 is to 1, so is 64 Pounds to a fourth Proportional; which found by the Rule of Three, is the Weight of a Cubic Foot of Air, viz. 1 Ounce, 27 Gr. or 507 Grains. See AIR.

The Weight of Sea Water is different in different Climates. Mr. *Boyle* having furnish'd a learned Physician, going on a Voyage to America, with a Hydrostatical Balance; and recommended him to observe, from time to time, the difference of Weight he might meet withal; this Account was return'd him: That the Sea Water increas'd, in Weight the nearer he came to the Line, till he arriv'd at

a certain degree of Latitude, as he remembers, about the 30th; beyond which, it retain'd the same specific Weight, till he came to *Barbados*. *Philosop. Transact.* N<sup>o</sup> 18.

WEIGHTS of Ancel. See ANCEL Weight.

WELDING Heat, a degree of Heat which Smiths give their Iron in the Forge, when there is occasion to double up the Iron, and to weld a Work in the Doublings; so that the Iron shall grow into a Lump thick enough for the Purpose. See IRON, FORGING, &c.

It is also used when two Bars of Iron are to be joined together at the Ends, to make a Length. See HEAT.

WELL, a Hole dug under Ground, below the Level or Surface of the Water collected in the Strata. See STRATA, and WATER.

It is usually of a cylindrical Figure, wall'd with Stone, and lined with Mortar. See SPRING.

Mr. *Blondel* informs the *French Academy* of a Device they use in the lower *Austria*, which is incompar'd with the Mountains of *Sivris*, to fill their Wells with Water, viz. That they dig in the Earth to the depth of 20 or 25 Feet, till they come to a clemmy Earth, which they bore thro', till the Waters break forcibly out: Which Water, in all probability, comes from the neighbouring Mountains, in subterraneous Channels.—*Cassini* observes, that in many Places of *Mosens* and *Bonigne*, they make themselves Wells by the same Artifice.—Mr. *Derham* adds, that the like has been sometimes found in *England*, particularly in *Essex*.

In the *Philosophical Transactions*, we are inform'd by Mr. *Norwood*, that in *Bernaudai*, Wells of fresh Water are dug within 20 Yards of the Sea, and even less, which rise and fall with the Tides, as the Sea it self does.—He adds, that in digging Wells in that Island, they dig till they come almost to a Level with the Surface of the Sea; and then they certainly find either Fresh Water or Salt: If it prove Fresh, yet by digging two or three Foot deeper, they always come at Salt Water. If it be sandy Ground, they usually find Fresh Water; but if hard Lime-stone Rock, salt or brackish. See FRESH Water, &c.

In the Diocese of *Paderborn* in *Westphalia*, is a Well which rises it self twice in 24 Hours; returning always, after six Hours absence, with great Noise, and so forcibly as to drive three Mills not far off. The Inhabitants call it the *Bolderborn*, q. d. the boisterous Spring.—Lay-Well near

Torrey,

*Torbay*, ebbs and flows very often every Hour; the somewhat oftener in Winter than Summer. Dr. *Oliver* observes, its Flux and Reflux sometimes return every Minute, the sometimes not above 26 or 20 times an Hour. *Philosoph. Transact.* N<sup>o</sup> 104.

*Well-Water* is not so wholesome or good for most Uses, as *River Water*. See *WATER*.

*Well-Hole*, in Building, is the Hole left in a Floor for the Stairs to come up thro'. See *STAIRS*.

*Well*, in the Military Art, is a Depth which the Miner sinks into the Ground, to prepare a Mine, or find out and disappoint the Enemy's Mine. See *MINE*, *SAP*, &c.

*WEN*, a Tumor, or Excrescence growing on divers Parts of the Body; consisting of a Cystis, or Bag, fill'd with some peculiar Matter. See *TUMOR*, and *EXCRESCENCE*.

Of this, Physicians usually reckon three Kinds, according to the Matter it is form'd of, i. e. the Humour contain'd therein.—If soft, resembling a Pulp, the *Wen* is call'd *Alberona*; if Honey, *Melicis*; and if Suet, *Steatoma*.

M. *Luttre*, in *Mém. de l'Acad. des Sciences*, adds a fourth Kind, which he calls *Lipoma*; by reason, the *Wen* is form'd of soft Fat.

They are all, usually, of the like Colour with the rest of the Body; begin from very little, and grow gradually. They are not dangerous, but frequently last a long while. Sometimes they degenerate into Abscesses.

The Cure is, to cut off the Cystis by the Root, which is always narrow.

In the *Philosophical Transactions*, we have an Account of a very extraordinary *Wen*, on the lower Jaw of one *Alex. Palmer* of *Keith* in *Scotland*.—It was 27 Years a-growing: at length, its enormous Bulk, and the Pain it gave him, together with its emaciating him exceedingly, determin'd him to have it cut off. Dr. *Bovary* assures us, its Basis was five Inches over, which should seem too large for the whole Face, and that with Blood and all, it weigh'd one or two and twenty Pounds. Its form was Spheroidal; and when measur'd, was 24 Inches about, one way, and 28 another. It seem'd to be an *Alberoma*; being a glandulous Substance, with several big Blood-Vessels in it; and Hair growing on it. It was as sensible as any other Part.—The Hemorrhage, after cutting it off, was stop'd by the Vitriolic Powder, and the ordinary Dressing being us'd, a Cure was completed in six Weeks time.

*WERE*, or *WERRE*, in our old Law-Books, signifies as much as *Eximatio Capitis*, or *Pretium hominis*; that is, so much as was antiently paid for killing a Man. When such Crimes were punish'd with pecuniary Mulcts, not Death, the Price was set on every Man's Head, according to his Condition and Quality.—Were *sumus*, id est, *pretium sine redemptio*, his Ransom. See *RANSOM*.

*WERELADA*, from the *Saxon Were* and *ladian*, to purge; was thus: Where a Man was slain, the Price at which he was valud was to be paid to his Relations. For in the Time of the *Saxons*, the killing a Man was not punish'd by Death, but by a pecuniary Mulct, call'd *Wera*. See *WERE*.

*WERGILD*, *WERGELD*, in our antient Customs, *pretium seu Valor hominis occisi, homicidii pretium*; which was paid partly to the King for the Loss of his Subject, partly to the Lord whose Vassal he was, and partly to the next of kin.—*Quaedam Crimina excedendi unum possunt; que sunt Husbreech, Berner, & Openchech, & Evercom, & Latordfich, & infraclio pacis Ecclesie, vel per Manns Regis per homicidium*, L. L. Hen. I. c. 13.—Where are likewise enumerated the Crimes that might be redeemed per *Wergild*.—*De unquoque fure per totam scotiam est Wergelt 30 Vacce & una Jusuena, sine fuerit liber homo sine feruus*.

The *Wergeld* of an Archbishop and of an Earl, was 15000 Thrimla's Selden's *Titles of Honour*.

If the Party deny'd the Fact, he was to purge himself by the Oaths of several Persons, according to his Degree and Quality.—If the Guilt amounted to four Pounds, he was to have 18 Jurors on his Father's side, and four on his Mother's: If to 14 Pounds, he was to have sixty Jurors. And this was call'd *Werelada*.—*Homicidium Wera solvatur aut Werelada negotur*.

*WEST*, *Occidens*, *Occasus*, in Cosmography, one of the Cardinal Points of the Horizon; diametrically opposite to the East. See *CARDINAL POINTS*, *EAST*, &c.

*West* is, strictly defined, the Intersection of the Prime Vertical with the Horizon, on that side the Sun sets in. See *SETTING*.

To draw a true West-Line. See *MERIDIAN*.

In Astronomy, *West* is chiefly used for the Places in or towards which the Sun or Stars sink under the Horizon.—Thus, we say, the *Sun*, *Stars*, &c. are in the *West*.

The Point the Sun sets in, when in the Equator, is particularly call'd the *Equinoctial West*, or *Point of true West*. See *EQUINOCTIAL*.

In Geography, *West* and *Western* are applied to certain Countries, &c. situate towards the Point of Sun-setting, with

respect to certain others.—Thus, the Empire of *Rome*, antiently, and of *Germany*, at present, are call'd the Empire of the *West*, or *Western Empire*; in opposition to that of *Constantinople*, which is call'd the *Empire of the East*. See *EMPIRE*.

The *Latin* or *Roman Church*, is call'd the *Western Church*; in opposition to the *Greek Church*.—The *French*, *Spaniards*, *Italians*, &c. are call'd *Western Nations*, in respect to the *Africans*; and *America* the *West-Indies*, in respect of the *East-Indies*.

*WEST-WIND*, is also call'd *Zephyrus*, and *Favonius*. See *WIND*.

*WEST-SAXONAGE*, or *WEST-SAXONAGE*, the Law of the *West-Saxons*. See *LAW*, *MARCHENLAGE*, &c.

*WESTPHALIA* *Hann.* See *HAM*.

*WET-GLOVER*, a Dresser of the Skins of Sheep, Lambs, Goats, &c. which are slender, thin, and gentle. See *GLOVE*, *SKIN*, &c.

*WHALE*, in Astronomy, one of the Constellations. See *CETUS*.

*WHALE-BONE*, a Commodity got from the *Whale*, us'd as Stiffening in Stays, Fans, Books, Screens, &c.

There are two Kinds of *Whales*; the one retaining that Name, the other call'd *Cachalot*. Their Difference consists in this, that the *Cachalot* has Teeth, and the *Whale*, properly so call'd, instead of Teeth, has a kind of Whiskers in his Throat, about a Span broad and 15 Foot long, ending in a kind of Fringe, much like Swines Bristles.

They are fet in the Palace, and do in some measure the Office of Teeth.—These Whiskers, split and fashion'd, are what we call *Whalebone*.—The Pizzle or Genital Member of the Animal serves likewise for the same Purpose.

*WHALE-FIBBERY*. See *FISHERY*.

*WHARF*, a Space on the Banks of a Haven, Creek, or Hithe; provided for the convenient loading and unloading of Vessels upon. See *HAVEN*, *HITHE*, &c.

The Fee paid for the Landing of Goods on a *Wharf*, or for Shipping them off, is call'd *Wharfage*.—And the Person who has the Oversight and Direction of the *Wharf*, receives *Wharfage*, &c. is call'd the *Wharfinger*. See *KEXX*.

*WHARKS of Flowers*, among Herbalists, are Rows of lesser Flowers, set at certain Distances about the main Stalk or Spike. See *FLOWER*.

*WHEAT*. See *CORN*.

*WHEEL*, *Rota*, in Mechanics, a simple Machine, consisting of a round piece of Wood, Metal, or other Matter; turning round on an Axis. See *AXIS*.

The *Wheel* is one of the principal Mechanick Powers.—It has place in most Engines; and, in effect, 'tis of an Asssemblage of *Wheels*, that most of our chief Engines are compos'd.—Winch's Clocks, Mills, &c. See *CLOCK*, *MILL*, &c.

Its form is various, according to the Motions it is to have; and the Use it is to answer.—By this it is distinguish'd into *Simple* and *Compound*.

*Simple Wheels*, are those whose Circumference and Axis is uniform, and which are us'd singly, and not combin'd.—Such are *Wheels* of Carriages; which are to have a double Motion: the one circular, about their Axis; the other rectilinear; by which they advance along the Road, &c. which two Motions they appear to have; tho, in effect, they have but one: It being impossible the same Thing should move or be agitated two different ways at the same time.

This one is a spiral Motion, as is easily seen by fixing a piece of Chalk on the Face of a *Wheel*, so as it may draw a Line on a Wall, as the *Wheel* moves.—The Line it here traces is a just Spiral, and still the more Curve as the Chalk is fix'd nearer the Axis.

For a very nice Phenomenon in the Motion of these *Wheels*, see *Aristotle's WHEEL*.

We shall add, that in *Wheels* of this kind, the Height should always be proportion'd to the Stature of the Animal that draws or moves them.—The Rule is, that the Lead and the Axis of the *Wheels*, be of the same Height with the Force that moves them: Otherwise, the Axis being higher than the Beast, part of the Load will lie on him; or, if it be lower, he pulls to disadvantage, and must exert a greater Force. Tho, *Stevinus*, Dr. *Wallis*, &c. shew, that to draw a Vehicle, &c. over wattle, uneven Places, it were best to fix the Traces to the *Wheels* lower than the Horse's Breast.

The Power of these *Wheels* results from the Difference of the Radii of the Axis, and Circumference.—The Canon is this: As the Radius of the Axis is to that of the Circumference, So is any Power, to the Weight it can sustain hereby.

This is also the Rule in the Axis in *Petrivochio*; and, in effect, the *Wheel*, and the Axis in *Petrivochio*; and the same thing; only, in Theory it is usually call'd by the former Name, and in Practice by the latter. See *AXIS* in *Petrivochio*.

*Dented Wheels*, are those whose Circumference, or else Axis, is cut into Teeth, by which they are capable of moving and acting on one another, and of being combin'd together. See *DENTED*, *TEETH*, &c. The

The use of these is very conspicuous in Clocks, Jacks, &c. See **CLOCKWORK**, **WATCHWORK**, &c.

The Power of the *Dented Wheel* depends on the same Principle as that of the *Simple one*.—Tis only that to the simple Axis in *Peritrochis*, which a compound Lever is to a simple Lever. See **LEVER**.

Its Doctrine is compris'd in the following Canon, viz.—*The Ratio of the Power to the Weight, in order for that to be equivalent to this, must be a Ratio compounded of the Ratios of the Diameter of the Axis of the last Wheel, to the Diameter of the first; and of the Ratio of the Revolutions of the last Wheel to those of the first, in the same time.*—But this Doctrine will deliver a more particular Explication.

1<sup>o</sup>, Then, If the Weight be multiply'd into the Product of the Radii of the Axis, and that Product be divided by the Product of the Radii of the *Wheels*, the Power requir'd to sustain the Weight will be found.—Suppose, e. g. the Weight A, (Tab. *Mechanicks*, Fig. 61.) = 6000 Pounds, B C = 6 Inches, C D = 34 Inches, E F = 5 Inches, E G = 35 Inches, H I = 4 Inches, H K = 27 Inches. Then will B C, E F, H I = 120; and C D, E G, I K = 32150.—Hence the Power requir'd to sustain the Weight, will be the Quotient of 6000—120 divided by 32150, viz. 22 $\frac{1}{2}$  of a Pound, very nearly; a small Addition to which will raise it.

2<sup>o</sup>, If the Power be multiply'd into the Product of the Radii of the *Wheels*, and the *Factum* be divided by the Product of the Radii of the Axes; the Quotient will be the Weight which the Power is able to sustain.—Thus, if the Power be 22 $\frac{1}{2}$  of a Pound, the Weight will be 6000 Pound.

3<sup>o</sup>, A Power and a Weight being given, to find the Number of *Wheels*, and in each Wheel the Ratio of the Radius of the Axis to the Radius of the Wheel: so, as that the Power being applied perpendicularly to the Periphery of the last Wheel, may sustain the given Weight.

Divide the Weight by the Power: Resolve the Quotient into the Factors which produce it.—Then will the Number of Factors be the Number of *Wheels*; and the Radii of the Axis will be to the Radii of the *Wheels*, as Unity to the several *Wheels*.—Suppose, e. g. a Weight of 5000 Pound and a Power of 60, which resolves into these Factors, 4 5 5 5. Four *Wheels* are to be made, in one of which the Radius of the Axis is to the Radius of the *Wheel* as 1 to 4.—In the rest, as 1 to 5;

4<sup>o</sup>, If a Power move a Weight by means of two *Wheels*, the Revolutions of the slower *Wheel* are to those of the swifter, as the Periphery of the swifter Axis is to the Periphery of the *Wheel* that catches on it.

Hence, 1<sup>o</sup>, the Revolutions are as the Radius of the Axis F E, to the Radius of the *Wheel* D C.—2<sup>o</sup>, Since the Number of Teeth in the Axis F D, is to the Number of Teeth in the Circumference of the *Wheel* M as the Circumference of that, to the Circumference of this: The Revolutions of the slower *Wheel* M, are to the Revolutions of the swifter N, as the Number of Teeth in the Axis, to the Number of Teeth in the *Wheel* M it catches into.

3<sup>o</sup>, If the *Factum* of the Radii of the *Wheels* G D, D C be multiply'd into the Number of Revolutions of the slowest *Wheel* M; and the Product be divided by the *Factum* of the Radii of the Axes which catch into them, G H, D E, &c. The Quotient will be the Number of Revolutions of the swiftest *Wheel* O. E. g. If G E = 8, D C = 12, G H = 4, D E = 3, and the Revolution of the *Wheel* M be one; the Number of Revolutions of the *Wheel* O will be 8.

6<sup>o</sup>, If a Power move a Weight by means of divers *Wheels*, the Space pass'd over by the Weight is to the Space of the Power, as the Power to the Weight.—Hence, the greater the Power, the faster is the Weight mov'd; and *vice versa*.

7<sup>o</sup>, The Spaces pass'd over by the Weight and the Power, are in a Ratio compounded of the Revolutions of the slowest *Wheel*, to the Revolutions of the swiftest; and of the Periphery of the Axis of that, to the Periphery of this.—Hence, since the Space of the Weight and the Power are reciprocally as the sustaining Power to the Weight, the Power that sustains a Weight, will be to the Weight, in a Ratio compounded of the Revolutions of the slowest *Wheel* to those of the swiftest, and of the Periphery of the Axis of that, to the Periphery of this.

8<sup>o</sup>, The Periphery of the Axis of the slowest *Wheel*, with the Periphery of the swiftest *Wheel*, given; as also, the Ratio of the Revolutions of the one, to those of the other: To find the Space which the Power is to pass over, while the Weight goes any given length.

Multiply the Periphery of the Axis of the slowest *Wheel*, into the antecedent Term of the Ratio, and the Periphery of the swiftest *Wheel* into the consequent Term; and to these two Products, and the given Space of the Weight, find a fourth Proportional: This will be the Space of the Power. Suppose, e. g. the Ratio of the Revolutions of the slowest *Wheel* to those of the swiftest to be as 2 to 7; and the Space of the Weight 30 Feet: And let the Periphery of the Axis of the slowest *Wheel* be to that of the swiftest as 3 to 8. The Space of the Power will be found 280.

9<sup>o</sup>, The Ratio of the Peripheries of the swiftest *Wheel*, and of the Axis of the slowest; together with the Ratio of their Revolutions, and the Weight, being given: to find the Power able to sustain it.

Multiply both the Antecedents and the Consequents of the given Ratio into each other: and to the Product of the Antecedents, the Product of the Consequents, and the given Weight, find a fourth Proportional. That will be the Power requir'd.—Suppose, e. g. the Ratio of the Peripheries 8: 15. That of the Revolutions 7: 2; and the Weight 2000: The Power will be found 214 $\frac{1}{2}$ .—After the same manner may the Weight be found; the Power and the Ratio of the Peripheries, &c. being given.

10<sup>o</sup>, The Revolutions of the swiftest *Wheel* is to perform while the slowest makes one Revolution, being given; together with the Space the Weight is to be rais'd, and the Periphery of the slowest *Wheel*; to find the Time that will be spent in raising it.

Say, as the Periphery of the Axis of the slowest *Wheel* is to the Space of the Weight given; so is the given Number of Revolutions of the swiftest *Wheel* to a fourth Proportional; which will be the Number of Revolutions perform'd while the Weight reaches the given Height.—Then, by Experiment, determine the Number of Revolutions the swiftest *Wheel* performs in an Hour; and by this divide the fourth Proportional found before.—The Quotient will be the Time spent in raising the Weight.

**WHEELS of a Clock**, &c. are the *Crown Wheel*, *Contrat Wheel*, *Great Wheel*, *Second Wheel*, *Third Wheel*, *Striking Wheel*, *Detent Wheel*, &c. See **CLOCK**, and **WATCH**.

**WHEELS of Coaches, Waggon, &c.**—In the *Philosophical Transactions*, we have some Experiments shewing the Advantages of high *Wheels* in Carriages of all Kinds; the Results of the Experiments amount to this:

1<sup>o</sup>, That, four *Wheels* of 4 $\frac{1}{2}$  Inches high, viz. one half of the ordinary Height of the *Wheels* of a Waggon, draw a Weight of 50 $\frac{1}{2}$  l. Averdupoise up an inclined Plane with less Weight by six Ounces, than two of them match'd with two smaller ones of 4 $\frac{1}{2}$  Inches height.

2<sup>o</sup>, That any Vehicle might be much more easily drawn in rough ways, if the fore *Wheels* were as high as the hind *Wheels*, and the Thills fix'd under the Axis.

3<sup>o</sup>, That such a Vehicle would likewise be drawn more easily where the *Wheels* cut in Clay, Sand, &c.

4<sup>o</sup>, That high *Wheels* would not cut so deep as low *Wheels*.

5<sup>o</sup>, That low *Wheels* are indeed best for turning in a narrow Compas.

**POTTER'S WHEEL.** See **POTTERY**.

**Aristotle's WHEEL.** See **ROTA Aristotelica**.

**Measuring WHEEL.** See **PEROMETER**, **PERAMBULATOR**, **WAYWISE**, &c.

**WHEEL** is also a kind of Punishment which great Criminals are put to in divers Countries. See **PUNISHMENT**.

In France, their Assassins, Parricides, and Robbers on the Highway, are condemn'd to the *Wheel*, i. e. having their Bones first broke with an Iron Bar on a Scaffold, they are expos'd and left to expire on the Circumference of a *Wheel*.—In Germany, they break their Bones on the *Wheel* it self.

This cruel Punishment was unknown to the Antients; as is observ'd by *Cicero*.—Tis not certain who was the Inventor.—Its first Introduction was in Germany. 'Twas but rarely practis'd any where else, till the Time of Francis I. of France; who by an Edict of the Year 1554, appointed it to be inflict'd on Robbers on the Highway. *Ricoblet* dates the Edict of the Year 1558, and quotes *Brodens*.

**WHEEL**, in the Military Art, is the Word of Command when a Battalion is to alter its Front, either one way or the other. See **EVOLUTION**.

To *Wheel to the right*, the Man in the right Angle is to turn very slowly, and every one to wheel from the left to the right, regarding him as their Centre; and *vice versa*, when they are to wheel to the left.

When a Division of Men are on the March, if the Word be *Wheel to the right*, or *to the left*, then the right or left-hand Man keeps his Ground, turning only on his Heel, and the rest of the Rank move about quick, till they make an even Line with the said right or left-hand Man.

Squadrons of Horse wheel much after the same manner.

**WHEEL-FIRE**, among Chymists, a Fire us'd for fusing of Metals; properly call'd *Ignis Rotæ*. See **FUSION**, **METAL**, &c.

It is a Fire which covers or encompasses the Crucible, Coppel, or Melting-Pot quite over; a-top, as well as around the Sides. See **FIRE**.

**WHERLICOTES**, a sort of open Chariots, us'd by Persons of Quality before the Invention of Coaches. See **COACH**, **CHARIOT**, &c.

**WHERRY.** See **VESSEL**, **BOAT**, &c.

**WHETSTONE**, a Stone for the whetting or sharpening

Knives, and other Tools upon. See **STONE**, and **HONE**.

**WHEY**, the Scum or watery Part of Milk. See **MILK**.

**WHIFFLER**, of a Company of London, a young Freeman, who goes before, and waits on the Company on occasions of public Solemnity. See COMPANY.

**WHIGS**, a Party or Faction in England, opposite to the Tories. See TORY.

The Origin of the Names of these two mighty Factions is very obscure.—If some little trivial Circumstance or Adventure, which escapes the Knowledge of Mankind, give the Name to a Party, which afterwards becomes famous; Posterity labours in vain to find the Original of such Names: It searches the Sources, forms Conjectures, invents Reasons, and sometimes meets the Truth, but always without knowing it assuredly.

Thus, in France, the Calvinists are call'd *Huguenots*; yet no body was ever able certainly to assign the Cause of that Appellation. See HUGUENOT.

*Whig* is a Scottish, and some say, too, an Irish Word, literally signifying *Whew*.—*Tory* is another Irish Word, signifying a Robber or Highwayman.

Now, under the Reign of King Charles the Second, while his Brother, then Duke of York, was obliged to retire into Scotland, there were two Parties form'd in that Country.—That of the Duke, which was strongest, persecuted the other, and frequently reduced them to fly into the Mountains and Woods, where those unhappy fugitives had often no other Subsistence for a long time but Cows Milk. Hence their Adversaries they call'd *Tories*, *q. d.* Robbers; and the Tories upbraiding them with their Unhappines, and from the Milk whereof they liv'd, call'd them *Whigs*.—From Scotland the two Names came over with the Duke into England.

Others give the Origin and Etymology of the two Words thus.—During the unhappy War which brought King Charles I. to the Scaffold, the Partizans of that Prince were at first call'd *Cavaliers*, and those of the Parliament *Round-Heads*.—Now *Tory* was a Name for a kind of *Banditti* in Ireland, who shelter'd themselves in the Mountains and the Islands form'd by the Bogs; as, then, the King's Enemies charged him with favouring the Rebellion in Ireland, which broke out at that time, they changed the Name *Cavalier* into that of *Tory*.—And these last, to be even with their Enemies, who were thrilly leagu'd with the Scots, changed *Round-Heads* for *Whigs*, the Name of a sort of Enthusiasts in Scotland, who living in the open Fields and Woods, fed much on Milk. *Differt. de Monf. Rapin Thoiras sur les Whigs & les Tories.* Haye Ann. 1717.

**WHINE**, a hunting Term, used in respect of the Cry of an Otter. See HUNTING.

**WHIP**, or **WHIP STAFF**, in a Ship, a Piece of Timber in form of a strong Staff, fasten'd into the Helm, for the Steers-Man in small Ships, to hold in his Hand; thereby to move the Helm and direct the Ship. See HELM and STEERING.

**WHIPPING**, a Term used by Anglers, when they fasten a Line to the Hook, or Red. See ANGLING.

The Word is also taken for the casting in of the Hook, and drawing it gently on the Water.

**WHIRL-POOL**, an Eddy, Vortex, or Gulph, where the Water is continually turning round. See GULPH, EDDY, VORTEX, &c.

**WHIRL-WIND**, a Wind that rises suddenly, is exceedingly rapid and impetuous, when risen, but soon spent. See WIND and HURRICANE.

There are divers sorts of *Whirl Winds*, distinguish'd by their peculiar Names; as the *Prester*, *Typho*, *Turbo*, *Exyrdia*, and *Ecephias*.

The *Prester* is a violent Wind breaking forth with flashes of Lightning.—This is rarely observ'd, scarce ever without the *Ecephias*.—Seneca says 'tis a *Typho*, or *Turbo*, kindled or ignited in the Air. See PRESTER.

The *Ecephias* is a sudden and impetuous Wind breaking out of some Cloud; frequent in the *Aethiopic* Sea, particularly about the *Cape of Good Hope*.—The Seamen call them *Travados*. See TRAVADOS.

The *Exyrdia* is a Wind bursting out of a Cloud with a great quantity of Water.—This only seems to differ in degree from the *Ecephias*, which is frequently attended with Showers.

A *Typho* is an impetuous Wind, running rapidly every way, and sweeping all round the Place.—It frequently descends from on high. The *Indians* call it *Orascan*, the *Turks*, &c. *Olipbant*. 'Tis frequent in the *Eastern Ocean*, chiefly about *Siam*, *China*, &c. and renders the Navigation of those Parts exceeding dangerous. See VORTEX, SPURT, &c.

**WHISPERING**; see HEARING, ATTENTION, &c.

**WHISPERING-PLACES** depend on this Principle, That the Voice being apply'd to one end of an Arch, easily rolls to the other. See SOUND, ARCH, &c.

Accordingly, all the Contrivance in a *Whispering-Place*, is, that near the Person who whispers there be a smooth

Wall, arch'd, either Cylindrically, or Elliptically.—A circular Arch will do, but not so well. See PHONICS.

Places form'd for the Conveyance of *Whispers*, are the Prison of *Dionysius* at *Syracuse*, which increases a soft *Whisper* to a Noise, the Clap of one's Hand to the Sound of a Cannon, &c.—The Aqueducts of *Claudian*, which carry a Voice sixteen Miles: And divers others enumerated by *Kircher* in his *Piscinaria*.

The most considerable in England, are; the Dome of *St. Paul's*, London, where the Ticking of a Watch may be heard from Side to Side; and a very easy *Whisper* be hear all round the Dome.—This, Mr. *Derham* found to hold not only in the Gallery below, but above upon the Scaffold, where a *Whisper* would be carried over one's Head round the Top of the Arch, tho' there be a large Opening in the Middle of it into the upper Part of the Dome.

The famous *Whispering-Place* in *Gloucester* Cathedral, is no other than a Gallery above the East End of the Choir, leading from one Side thereof to the other.—It consists of five Angles and six Sides, the Middlemost of which is a naked Window; yet two *Whisperers* hear each other at the distance of twenty-five Yards.

**WHITE**, one of the Colours of natural Bodies. See COLOUR and BODY.

*White* is not so properly said to be any one Colour, as a Composition of all the Colours.

It is demonstrated by *Sir Isaac Newton*, that those Bodies only appear *White*, which reflect all the kinds of colour'd Rays alike. See WHITENESS.

*Hævelius* affirms it as a thing most certain, that in the Northern Countries, Animals, as Hares, Foxes, Bears, &c. become *White* in the Winter-time; and in Summer resume their natural Colours. See HARE.

Black Bodies are found to take heat sooner than *white* ones; by reason the former absorb or imbibe Rays of all Kinds and Colours, and the latter reflect all. See BLACKNESS.

Thus black Paper is sooner put into Flame by a Burning-Glass, than *white*; and black Clothes hang up by the Dyers in the Sun, dry sooner than *white* ones. See BLACK.

**WHITE PAPER** is that intended for Writing, Printing, &c. in contradistinction to brown Paper, marbled Paper, blotting Paper, &c. See PAPER.

**WHITE PEPPER** is black Pepper blanch'd or *whiten'd*, by shelling off its upper Skin. See PEPPER.

**WHITE WINE** is that of a clear, bright; transparent Colour, bordering on *white*.—'Tis thus call'd, to distinguish it from the red Wines or Clarets.

The generality of *white Wines* are made from *white* Grapes; tho' there are some from black ones. See WINE.

**WHITE WAX**, is yellow Wax blanch'd, and purify'd by the Sun and Dew. See WAX.

**WHITE LINEN**, is Cloth of Hemp or Flax, bleach'd by divers Lyes and Waterings on the Ground. See BLEACHING.

**WHITE SALT** is Common, or Sea-Salt dried and calcined by the Fire, so as not to leave any Moisture therein.—The Chymists call it *decrepitated Salt*.

There are some Salts naturally *white*; and others that need to be *whiten'd* either by dissolving and purifying 'em in clear Water, which is afterwards evaporated; or by means of Fire; or by the Sun. See SALT.

**SPANISH WHITE**, is a kind of Fucus used by the Ladies to *whiten* the Complexion, and hide the defects thereof.—'Tis made of Tin of Glass dissolved in Spirit of Nitre, and precipitated into a very fine Powder, by means of Salt-water. See TIN.

**WHITE LEAD**, is a Rust of Lead; or Lead dissolved with Vinegar; much used by the Painters. See LEAD.

'Tis prepared two ways.—either by reducing the Lead into this Lamine, steeping 'em in strong Vinegar, and every ten days scraping off the Rust form'd on the Surface; and repeating this till the Lead be quite consumed.

Or, by rolling the Lamine into Cylinders like Sheets of Paper, only so as that there be a little Space left between the several Folders Turns.—These Lamine they suspend in the middle of Earthen Pots, at bottom of which is Vinegar.—The Pots being well clos'd, are buried in a Daughill for thirty days; after which being open'd, the Lead is found, as it were, calcined and reduced into what they call *white Lead*, to be broke into Pieces, and dried in the Sun.

'Tis used both in painting in Oil and in Water-Colour, and makes a beautiful Colour in each.—But 'tis somewhat dangerous both in the grinding and using it, as being a rank Poison. See COLOUR.

Of this *white Lead* it is that the Paint used by the Ladies, call'd *Cerusa*, is made. See CERUSA.

**WHITE Friars**, a Name common to several Orders of Monks, from their being clothed in a *white Habit*. See **MONK**, **HABIT**, &c.

Such are the regular Canons of *St. Augustin*, the *Premonstratens*, and *Bernardines*.

**WHITE of the Eye**, is the first Tunic or Coat of the Eye, call'd *Albugines*, and *Conjunctiva*, because serving to bind together or inclose the rest. See **CONJUNCTIVA**, &c.

**WHITE hart Silver**, *Candidi Cervi Argentum*, a Tribute or Mulct paid into the Exchequer, out of certain Lands in or near the Forest of *White-hart*; which has continued from *Henry the Third's* Time, who imposed it upon *Thomas de la Lande*, for killing a very beautiful *white Hart*, which that King had purpoisely spared in hunting. See **HART** and **HUNTING**.

**WHITE Line**, among Prieters, a void Space greater than usual, left between two Lines. See **PRINTING**.

**WHITE Meats**, include Milk, Butter, Cheese, *White-Pots*, Caltards, and other Foods coming of Milk. See **MILK**, **FOOD**, &c.

**WHITE-Pot** denotes Milk or Cream baked with the Yolks of Eggs, fine Bread, Sugar, and Spice, in an Earthen-Pot.

The Cooks furnish us with a Variety of Dishes under this Form and Denomination; *Norfolk White-Pot*, *Wesminster White-Pot*, *Rice White Pot*, &c.

**WHITE Sauce**, in Cookery, a Sauce made of blanched Almonds, and the Breast of a Capon, pounded together with Cloves, Cinnamon, &c.——We also hear of *White Broth*, being a sort of Broth enriched with Sack, and Spices, having blanched Almonds scraped into it, and the whole thickned with the Yolks of Eggs, &c.

**WHITE Line**; see **LINEA Alba**.

**WHITE Rent**, is a Rent or Duty of 8 *sh* payable yearly, by every Tancer in the County of *Devon*, to the Duke of *Cornwall*.

**WHITE Spurs**; see **ESQUIRE**.

**WHITENESS**, *Albedo*, the Quality which denominates a Body *white*. See **WHITE** and **COLOUR**.

*Sir Isaac Newton* shews, that *Whiteness* consists in a Mixture of all the Colours; and that the Light of the Sun is *white*, because consisting of Rays of all Colours. See **RAY**.

From the multitude of Rings of Colours, which appear upon Compressing two Prisms, or Object-Glasses of Telescopes together, it is manifest, that these do so interfere and mingle with one another at last, as after eight or nine Reflexions to dilute one another wholly, and constitute an even, and uniform *Whiteness*: Whence, as well as from other Experiments, it appears, that *Whiteness* is certainly a Mixture of all Colours, and that the Light which conveys it to the Eye is a Mixture of Rays indued with all those Colours. See **LIGHT**.

The same Author shews, that *Whiteness*, if it be most strong and luminous, is to be reckon'd of the first Order of Colours; but if less, as a Mixture of the Colours of several Orders: Of the former sort he reckons white Metals; and of the latter, the *Whiteness* of Froth, Paper, Linen, and most other white Substances.——And as the White of the first Order is the strongest that can be made by Plates of transparent Substances, so it ought to be stronger in the denser Substances of Metals, than in the rarer ones of Air, Water, and Glass.

Gold or Copper mixed either by Fusion, or Amalgamation with a very little Mercury, with Silver, Tin, or Regulus of Antimony, becomes white; which shews, both that the Particles of white Metals have much more Surface, and therefore are smaller than those of Gold or Copper; and also that they are so opaque, as not to suffer the Particles of Gold or Copper to shine through them.——And as that Author doubts not, but that the Colours of Gold and Copper are of the second or third Order, therefore the Particles of *white Metals* cannot be much bigger than is requisite to make them reflect the *white* of the first Order. See **PARTICLE**.

**WHITENING**; see **BLEACHING**.

**WHITENING of Wax**; see **WAX**.

**WHITENING of Hair**; see **HAIR**.

**WHITES**, in Medicine; see **FLUOR ALBUS**.

**WHITLOW**, in Medicine, a Tumor, by Physicians commonly call'd *Paronychia*. See **PARONYCHIA**.

**WHITSON Farrings**; see **PENTECOSTALIA**.

**WHITSONTIDE**—The Season properly call'd *Pentecost*, is popularly call'd *Whitsunday*; some say, because in the Primitive Church, those who were newly baptized came to Church between *Easter* and *Pentecost* in *white Garments*.——*Whitsunday* always falls between the 9th of *May*, and the 14th of *June*, exclusive. See **PENTECOST**.

**WHOLE**, in Arithmetic, &c. See **TOTUM**; see also **PART**, **DIVISION**, **PARTITION**, &c.

**WHOLESOM**; see **FOOD**, **POISON**, **HEALTH**, &c.

**WHOODINGS**, *q. d.* **HOODINGS**, a Sea-Term, used for Planks joined and fastned along the Ship's Sides to the Stern.

**WHORE**; see **MERETRIX**, **HARLOT**, &c.

**WHORLEAT**, of the *Saxon*, *Barr* and *Wbiri*; a kind of Gauntlet, with Straps and leaden Plummetts, used by the ancient *Romans* in their solemn Games and Exercises. See **GAUNTLET**, &c.

This *Whorleat* is the same with what they call'd *Cestus*. See **CESTUS**.

**WHUR**, in Falconry, is the Fluttering of Partridges or Pheasants, as they rise. See **HAWK** and **HAWKING**.

**WIC**, denotes a Place on the Sea-Shore, or on the Bank of a River; tho', in the *Saxon*, it more properly signifies a Street, a Village, or Dwelling-Place, also a Castle. See **WYKE**.

We often meet with it in the *Saxon* Language as a Termination of the Name of a Town which had a complicit Name without it, as *London-wic*, that is, *London Town*, which signifies no more than *London*; as in the *Saxon* Annals it is mentioned, that King *Æthelbert* made *Mellitus* Bishop of *Lunden-wic*.——So *Isswich* is written in some old Charters *Villa de Gippo*, and sometimes *Villa de Gippo Wico*, which is no variance, but the same thing; for *Gippo* is the complicit Name, and *Gipp-wic* is *Gippo Town*.

**WICKER**, of the *Danish* *Wiger*, or two *Teutonic* *Wicken*; a Twig of the Osier-Shrub. See **VANE**, **BARRET**, &c.

**WICKET**, of the *French* *Guchet*, a little Door within a Gate; or a Hole in a Door, through which to view what passes without. See **DOOR**.

**WICKLIFFISTS**, or **WICKLIFFITES**, a Religious Sect who had their Rise in *England*, and their Name from their Leader *John Wickliff*, a Professor of Divinity in the University of *Oxford*.

To that immortal Author it is we owe the first Hint of the great Reformation effected 200 Years after him. See **REFORMATION**.

*Wickliff* maintained, that the Substance of the Sacramental bread and Wine still remained such after Consecration.——He also opposed the Doctrine of Purgatory, Indulgence, the Invocation of Saints, and the Worship of Images. See **TRANSUBSTANTIATION**, **PURGATORY**, &c.

He made an *English* Version of the Bible; and composed two large Volumes call'd *Alphabet*, that is, *Tracts*; which was the Source whence *John Hus* first learn'd most of his Doctrines. See **HUSSITES**.

The Archbishop of *Canterbury* call'd a Council against *Wickliff*, and he was condemn'd therein; but the good Reformer set the Condemnation at nought.——After this, King *Richard* banish'd him out of *England*, but he was afterwards recall'd, and died in his own Country in the Year 1384.

Forty Years afterwards, his Doctrine and the Adherers thereto were condemn'd by the Council of *Constance*; in consequence of which, his Bones were dug up, and the Council condemn'd him of forty Errors.

**WIDOW**, *Vidua*, a Woman that has lost her Husband. See **WOMAN**, **WIFE**, **HUSBAND**, &c.

Some also use the Term *Widower* for a Man who has lost his Wife.—Marriage with a *Widow*, is a kind of Bigamy in the Eye of the Canon-Law. See **BIGAMY**.

*Widow of the King*, was she who, after her Husband's death, being the King's Tenant in *Capite*, was driven to recover her Dower by the *Writ de Dote Assignanda*; and could not marry again without the King's Consent. See **VIDUITY**.

**WIDOW Bench**, is the County of *Suffex*, is that Share which a Widow is allow'd of her Husband's Estate besides her Jointure. See **BENCH**.

**WIDOWHOOD**; see **VIDUITY**.

**WIFE**, *Uxor*, a married Woman; or one join'd with, and under the Protection of, a Husband. See **WOMAN**, **MARRIAGE**, and **HUSBAND**. See also **MATRON**, &c.

A *Wife*, in our *English* Law, is termed *Feme Covertd*; and in the Judgment of the Law is reputed to have no Will, as being supposed entirely under, and subject to that of her Husband: *Uxor fulget radiis Mariti*. See **FEME** and **COVERTURE**.

If any Goods or Chattels be given her, they all immediately become her Husband's.——She cannot let, sell give away, or alienate any thing without her Husband's Consent.——Her very necessary Apparel is not hers in Property.—All her personal Chattels which she held at her Marriage, are so much her Husband's, that after his Death they shall not return to her, but go to the Executor or Administrator of her Husband; except only her *Paraphernalia*, or *Præter-dotalia*, being her necessary Apparel, which, with the Consent of her Husband, she may demise by Will. See **PARAPHERNALIA**.

The *Wife* can make no Contract without her Husband's Consent, and in all Law-Matters, *sine Viri responde non potest*.

The Law supposes in the Husband, the full Power over his *Wife*, as over his Child or Servant; and therefore he must answer for all her Faults, and Trespaffes.

If a *Wife* bring forth a Child during her Husband's Absence, tho' of many Years; yet if he lived all the time *inter quatuor Mena*, within the Island, he must father the Child; and the Child, if first born, shall inherit.

If a *Wife* bring forth a Child begot by a former Husband, or any other Person, before Marriage, but born after Marriage with another Man; this latter must own the Child; and that Child shall be his Heir at Law.

The *Wife*, after her Husband's Death, having no Jointure settled before Marriage, may challenge the third part of his yearly Rents of Land during her Life; and within the City of London, a third part of all her Husband's Moveables for ever.

The *Wife* partakes of the Honours, and Condition of her Husband; but none of the *Wife's* Dignities come by Marriage to her Husband.

Yet, the Husband, for getting his *Wife* with Child, which must appear by its being born alive, shall have all his *Wife's* Lands for Life.

The English Laws are generally esteem'd by Foreigners, as very hard in respect of the Women; and yet *Chamberlain* is of a very different Sentiment, asserting that the Condition of *Wives* in England is better than in any other Country.

*Tertullian* has two Books on the Ornaments and Attire of *Wives*—In the second he labours to prove, that a Christian *Wife* cannot in conscience endeavour to please by her Beauty, which she knows to be naturally liable to raise loose Desires; and that she ought not only to avoid all affected Beauty, but even to conceal and cover her natural Beauty.

*Mid-WIFE*, *Obstetrix*. See DELIVERY, FOETUS, &c. See also VIRGINITY.

WILDERNESS, see DESERT, GROVE, WOOD, &c.

WILD-FIRE, *Ignis Gregalis*, or *Græcus*. See FIRE.

WILD-FIRE *Arrows*, such as are trimmed with *Wild-Fire*, and shot burning, to stick in the Sails or Rigging of Ships in a Fight.

WILD-FIRE, is also a Disease in Cattel; which is infectious, deadly, and even repated incurable. See MURRAIN.

WILL, *Voluntas*, is usually defined a Faculty of the Mind, whereby it embraces or rejects any thing represented to it as Good or Evil by the Judgment. See FACULTY, GOOD, EVIL, &c.

Others will have it to be the Mind itself, consider'd as embracing or refusing; adding, that as the Understanding is nothing else but the Soul, consider'd as *perceiving*; so the *Will* is nothing else but the Soul consider'd as *Willing*, &c. See UNDERSTANDING.

Mr. *Locke* more intelligibly defines the *Will* a Faculty, which the Soul has of beginning, or forbearing, continuing, or coding several Actions of the Mind, and Motions of the body, barely by a Thought or Preference of the Mind, ordering, or, as it were, commanding the doing, or not doing such and such a particular Action—This Power the Mind has, to order the Consideration of any Idea, or the forbearing to consider it; or to prefer the Motion of any part of the Body to its Rest, and *vice versa*, is what we call the *Will*. See POWER.

The actual Exercise of that Power, is what we call *Volition*, or *Willing*; and the doing or forbearing any Action consequent on such Order of the Mind, is call'd *Voluntary*. See VOLITION, VOLUNTARY, &c.

Father *Mallebranch* lays it down, that the *Will* is that to the Soul, which Motion is to the Body; and argues, That as the Author of Nature is the universal Cause of all the Motions in Matter, so he is of all the Inclinations in the Mind: and that as all Motions are direct, unless their Course be diverted and chang'd by some foreign Cause; so all Inclinations are right, and could have no other End, but the Enjoyment of Truth and Goodness, were there not some foreign Cause to determine the natural Impression to evil Ends.

Accordingly, he defines *Will* to be the Impression, or natural Motion, which carries us towards Good indeterminate-ly, and in the general; and the Power the Mind has to direct this general Impression towards any particular Object that pleases it, is what he calls *Liberty*. See LIBERTY and NECESSITY.

*Aristotle* distinguishes two kinds of Acts of the *Will*; viz. *Imperative*, *Willing*, *Volition*; and *assensive*, *Election*—The first, that employ'd about the ultimate End; the latter, about the Means.

The Schoolmen also distinguish the Actions of the *Will* into *Elicit* and *Commanded*—*Elicit* Acts, *Alienæ Elicitæ*, are those immediately produc'd by the *Will*, as really inherent therein; such are *Willing* and *Nilling*—*Commanded* Acts, *Alienæ Imperatæ*, are Effects produc'd by

other Powers, v. gr. the Sensitive, Intellective, or Locomotive Powers, at the Command or Intigation of the *Will*—As to *follow*, *stay*, *fight*, *fly*, &c. See ACTION.

But others will have the former kind properly to belong to the Understanding; and only the latter, to the *Will*.

The Word *Will* is taken in three Senses: 1<sup>o</sup>. For the Power, or Faculty of *Willing*; in which sense it is, we have consider'd it above—2<sup>o</sup>. For the Act, or Exercise of the Power; as when we say, No Man kills his own Destruction—3<sup>o</sup>. For a Habit, or a constant Disposition and Inclination to do any thing—in which sense, Justice is defined a constant *Will* to give every one what belongs to him: *Justitia est constans et perpetua Voluntas jus suum unicuique tribuendi*. Instit. Justin.

Free-WILL. See LIBERTY.

WILL, or *Laß WILL*, in Law, &c. a solemn Act, or Instrument, whereby a Person directs and orders the Disposal of his Goods, Effects, &c. after his Death.

*Wills* are of two kinds: 1<sup>o</sup>. *Will in Writing*, properly call'd also a *Testament*. See TESTAMENT.

And a *Will by word of mouth* only, call'd a *Nuncupative Will*, which being proved by three or more Witnesses, may be of as good force as that in Writing; except for Lands, which are only devisible by Testament in Writing during the Life of the Testator. See NUNCUPATIVE.

*Will* with a *Whiff*, a Meteor known among the People under this Name; but more usually among Authors under that of *Ignis Fatuus*. See IGNIS FATUUS.

WIMPLE, of the Dutch *Wimpel*, a Musket, or plaited Linen Cloth, which Naps wear about their Neck.

The Word is also us'd for a Streamer or Flag. See FLAG, &c.

WIN, is the Beginning or End of the Names of Places, signifies that some great Battle was fought, or a Victory gain'd there.

The Word is form'd from the Saxon *Winge*, *Prelium*, Battle.

WIND, *Ventus*, a sensible Agitation of the Air, whereby a large quantity thereof flows out of one Place or Region into another. See AIR.

The *Winds* are divided into *perennial*, *stated*, and *variable*—They are also divided into *general*, and *particular*.

*Perennial*, or *constant WINDS*, are such as always blow the same way.—Of these we have a very notable one, between the two Tropicks, blowing constantly from East to West; call'd the *general Trade-Wind*. See TRADE-WIND.

*Stated*, or *periodical WINDS*, are such as constantly return at certain Times—Such are the Sea and Land-Breezes, blowing from Sea to Land in the Evening; and from Land to Sea in the Morning. See BREEZE.

Such also are the *blowing*, or *particular Trade-Winds*, which for certain Months of the Year blow one way, and the rest of the Year the contrary way. See MONSOON.

*Variable*, or *erratic WINDS*, are such as blow now this, now that way; as now up, now hush'd, without any Rule or Regularity, either as to Time or Place.

Such are all the *Winds* observ'd in the Inland Parts of England, &c. Tho' several of these claim their certain Times of the Day—Thus the *West-Wind* is most frequent about Noon; the *South-Wind* in the Night; the *North* in the Morning, &c. See WEATHER.

*General WIND* is such a one, as at the same time blows the same way over a very large Tract of Ground, almost all the Year—Such only is the *general Trade-Wind*.

But even this has its Interruptions: For, 1<sup>o</sup>. At Land it is scarce sensible at all, as being broke by the Interposition of Mountains, Valleys, &c. 2<sup>o</sup>. At Sea, near the Shore, it is disturb'd by Vapours, Exhalations, and particular *Winds*, blowing from Landward; so that it is chiefly consider'd as *general*, only at Mid-Sea: Where, 3<sup>o</sup>. It is liable to be disturb'd by Clouds driven from other Quarters.

*Particular WINDS*—Excepting the general *Trade-Winds*, all others are *particular*.

Those particular to one little Canton, or Part, are call'd *Local*, or *Provincial WINDS*—Such is the *North-Wind* on the Western Side of the *Alps*, which does not blow above one or two Leagues lengthwise, and much less in breadth: Such also is the *Pontias* in France. See PONTIAS.

#### Physical Cause of WINDS.

Some Philosophers, as *Des Cartes*, *Robault*, &c. account for the general *Wind* from the diurnal Rotation of the Earth; and from this general *Wind* derive all the particular ones—The Atmosphere, say they, invests the Earth, and moving round it; that part will perform its Circuit fastest, which has the smallest Circle to describe: The Air, therefore, near the Equator, will require a somewhat longer time to perform its Course in from West to East

East, than that nearer the Poles—Thus, as the Earth turns Eastward, the Particles of the Air near the Equinoctial being exceeding light, are left behind, so that in respect of the Earth's Surface, they move Westwards, and become a constant *Easterly Wind*.

This Opinion seems confirmed by this, that these *Winds* are found only between the Tropicks, in those Parallels of Latitude where the diurnal Motion is swiftest—But the constant Calms in the *Atlantick* Sea, near the Equator, the westerly *Winds* near the Coast of *Guinea*, and the periodical westerly Monsoons under the Equator in the *Indian* Seas, declare the Insufficiency of this Hypothesis.

Besides, the Air being kept close to the Earth by the Principle of Gravity, would in time acquire the same degree of Velocity, that the Earth's Surface moves with, as well in respect of the diurnal Rotation, as of the annual about the Sun, which is about thirty times swifter.

Dr. *Halley*, therefore, substitutes another Cause, capable of producing a like constant Effect, not liable to the same Objections, but agreeable to the known Properties of the Elements of Water and Air, and the Laws of the Motion of fluid Bodies.—Such a one is the Action of the Sun's Beams upon the Air and Water, as he passes every day over the Ocean, consider'd together with the Quality of the Soil, and the Situation of the adjoining Continents.

According to the Laws of Statics, the Air which is less rarified or expanded by Heat, and consequently more ponderous, must have a Motion towards those Parts thereof which are more rarified and less ponderous, to bring it to an Equilibrium; also the presence of the Sun continually shifting to the Westward, that part towards which the Air tends by reason of the Rarefaction made by his greatest Meridian Heat, is with him carried Westward, and consequently the tendency of the whole Body of the lower Air is that way.

Thus a general *Easterly Wind* is formed, which being impress'd upon all the Air of a vast Ocean, the parts impel one the other, and to keep moving till the next return of the Sun, whereby so much of the Motion, as was lost, is again restored; and thus the *Easterly Wind* is made perpetual.

From the same Principle it follows, that this *Easterly Wind* should on the North Side of the Equator be to the Northwards of the East, and in South Latitudes to the Southwards thereof; for near the Line, the Air is much more rarified, than at a greater distance from it; because the Sun is twice in a Year vertical there; and at no time distant above  $23\frac{1}{2}$  Degrees: At which distance, the Heat being as the Sine of the Angle of Incidence, is but little short of that of the perpendicular Ray; whereas under the Tropicks, tho' the Sun stay long Vertical, yet he is a long time  $47$  Degrees off; which is a kind of Winter, wherein the Air is cool, as that the Summer Heat cannot warm it to the same degree with that under the Equator. Wherefore the Air towards the Northward and Southward being less rarified, than that in the middle, it follows, that from both Sides, it ought to tend towards the Equator. See *HEAT*.

This Motion compounded with the formerly *Easterly Wind*, accounts for all the Phenomena of the general *Trade-Winds*; which, if the whole Surface of the Globe were Sea, would undoubtedly blow quite round the World, as they are found to do in the *Atlantick*, and the *Ethiopic* Oceans.—But seeing so great Continents do interpolate, and break the Continuity of the Oceans, regard must be had to the Nature of the Soil, and the Position of the high Mountains, which are the two principal Causes of the Variation of the *Wind* from the former general Rule; for if a Country lying near the Sun prove to be flat, sandy, and low Land; such as the Deserts of *Libya* are usually reported to be; the Heat occasion'd by the Reflections of the Sun's Beams, and the retention thereof in the Sand, is incredible to those who have not felt it; whereby the Air being exceedingly rarified, it is necessary, that this cooler, and more dense Air, should run thitherwards to restore the Equilibrium.

This is supposed to be the Cause, why near the Coast of *Guinea*, the *Wind* always sets in upon the Land, blowing Westery instead of Easterly; there being sufficient reason to believe, that the inland Parts of *Africa* are prodigiously hot, since the Northern Borders thereof were so temperate as to give the Antients cause to conclude, That all beyond the Tropicks was uninhabitable by excess of Heat.

From the same Cause it happens, that there are so constant Calms in that part of the Ocean call'd the *Rains*; for this Trade being placed in the Middle, between the Westery *Winds* blowing on the Coast of *Guinea*, and the *Easterly Trade-Winds* blowing to the Westwards thereof; the tendency of the Air here, is indifferent to either, and so stands in Equilibrium between both; and the weight of the incumbent Atmosphere being diminished by the continual contrary *Winds* blowing from hence, is the reason that the Air here holds not the copious Vapour it receives, but lets it fall in so frequent *Rains*.

But, as the cool and dense Air, by reason of its greater Gravity, presses upon the hot and rarified, it is demonstrable, that this latter must descend in a continued Stream, as fast as it rarifies; and that being ascended, it must disperse itself to preserve the Equilibrium; that is, by a contrary Current the upper Air must move from those Parts where the greatest Heat is: so by a kind of Circulation, the North-East *Trade-Wind* below, will be attended with a South-Westery above; and the South-East with a North-West *Wind* above. See *CURRENT, UNDER CURRENT, &c.*

That this is more than a bare Conjecture, the almost instantaneous Change of the *Wind* to the opposite Point, which is frequently found in passing the Limits of the *Trade-Winds*, seems to assure us; but that which above all confirms this Hypothesis, is the Phenomenon of the Monsoons, by this means, most easily solved, and without it hardly explicable. See *MONSOON*.

Supposing therefore such a Circulation as above; it is to be consider'd, that to the Northward of the *Indian* Ocean, there is every where Land, within the usual Limits of the Latitude of  $30$ , viz. *Arabia, Persia, India, &c.* which, for the same reason as the *Mediterranean* Parts of *Africa*, are subject to unsofferable Heats, when the Sun is to the North, passing nearly Vertical; but yet are temperate enough, when the Sun is remov'd towards the other Tropic, because of a Ridge of Mountains at some distance within the Land, said to be frequently in Winter cover'd with Snow, over which the Air, as it passes, must needs be much chill'd.—Hence it happens, that the Air coming, according to the general Rule, out of the North-East, in the *Indian* Sea, is sometimes hotter, sometimes colder, than that which, by this Circulation, is return'd out of the South-West; and by consequence, sometimes the Under-Current, or *Wind*, is from the North-East, sometimes from the South-West.

That this has no other Cause, is clear from the Times, wherein these *Winds* set, viz. in *April*; when the Sun begins to warm those Countries to the North, the South-West Monsoons begin, and blow during the Heats till *October*, when the Sun being retir'd, and all things growing cooler Northward, and the Heat increasing to the South, the North-East ceases, and blow all the Winter, till *April* again. And it is undoubtedly from the same Principle, that to the Southward of the Equator, in part of the *Indian* Ocean, the North-West *Winds* succeed the South-East, when the Sun draws near the Tropic of *Capricorn*. See *TIDE*.

But, the Industry of some late Writers having brought the Theory of the Production and Motion of *Winds* to somewhat of a Mathematical Demonstration; we shall here give it the Reader in that form.

#### Laws of the Production, &c. of WINDS.

If the Spring of the Air be weaken'd in any place, more than in the adjoining places; a *Wind* will blow thro' the place where the Diminution is. See *ELASTICITY*.

For, since the Air endeavours, by its elastic Force, to expand itself every way; if that Force be less in one place than another; the *Nisus* of the more, against the less elastic, will be greater than the *Nisus* of the latter against the former.—The less elastic Air, therefore, will resist with less force than it is urg'd, by the more elastic. Consequently, the less elastic will be driven out of its place, and the more elastic will succeed.

If, now, the Excess of the Spring of the more elastic, above that of the less elastic, be such as to occasion a little alteration in the Baroscope; the Motion both of the Air expell'd, and that which succeeds it, will become sensible. Q. E. D.

1. Hence, since the Spring of the Air increases, as the compressing Weight increases; and compress'd Air is denser than Air less compress'd: All *Winds* blow into rarer Air out of a place fill'd with a denser.

2. Wherefore, since a denser Air is specifically heavier than a rarer; an extraordinary Lightness of the Air in any place, must be attended with extraordinary *Winds* or Storms.

Now, an extraordinary Fall of the Mercury in the Barometer, shewing an extraordinary Lightness of the Atmosphere; 'tis no wonder, if that foretels Storms.

3. If the Air be suddenly condens'd in any place, its Spring will be suddenly diminish'd: Hence, if this Diminution be great enough to affect the Barometer, there will a *Wind* blow thro' the condens'd Air.

4. But since it cannot be suddenly condens'd, unless it have before been much rarify'd; there will a *Wind* blow thro' the Air, as it cools, after having been violently heated.

5. In like manner, if Air be suddenly rarify'd, its Spring is suddenly increas'd; wherefore, it will flow thro' the contiguous Air, not acted on by the rarifying Force—

A *Wind*, therefore, will blow out of a place, in which the Air is suddenly rarefy'd: And on this Principle, in all probability, it is, that,

7. Most Caves are found to emit *Wind*, either more or less—Since the Sun's Power in rarefying the Air, is notorious; it must necessarily have a great influence on the Generation of *Winds*.

The rising and changing of the *Wind* is determin'd experimentally, by means of Weather-cocks, placed a-top of Houses, &c.—But these only indicate what passes about their own Height, or near the Surface of the Earth: *Wolffius* alluring us, from Observations of several Years, that the higher *Winds* which drive the Clouds, are different from the lower ones, which move the Weather-cocks—*Mr. Derham* observes something not unlike this; *Phys. Theol.* l. 1. c. 2.

The Author last mention'd observes, upon comparing several Series of Observations made of the *Winds* in divers Countries, viz. *England, Ireland, Switzerland, Italy, France, New England, &c.* That the *Winds* in those several places seldom agree; but when they do, it is commonly when they are strong, and of long continuance in the same Quarter; and more, he thinks, in the Northerly and Easterly, than in other Points—Also, that a strong *Wind* in one place, is oftentimes a weak one in another; or moderate, according as the places are nearer, or more remote. *Philosoph. Transact.* N<sup>o</sup> 297, and 321.

#### Laws of the Force, and Velocity of WIND.

*Wind* being only Air in Motion, and Air being a Fluid, subject to the Laws of other Fluids; its Force may be brought to a precise Computation: Thus—The Ratio of the specific Gravity of any other Fluid, to that of Air, together with the Space that Fluid impell'd by the Pressure of the Air, moves in any given Time, being given; we can determine the Space which the Air itself, acted on by the same Force, will move in the same time: By this Rule,

1. As the specific Gravity of Air, is to that of any other Fluid; so, reciprocally, is the Square of the Space which that Fluid, impell'd by any Force, moves in any given time, to the Square of the Space which the Air, by the same Impulse, will move in the same time.

Supposing, therefore, the Ratio of the specific Gravity of that other Fluid to that of Air, to be  $\frac{b}{c}$ ; the Space describ'd by the Fluid to be call'd  $f$ ; and that which the Air will describe by the same Impulse,  $x$ . The Rule gives us  $x = \sqrt{bc}$ .

Hence, if we suppose Water impell'd by the given Force, to move two Feet in a Second of Time; then will  $f = 2$ ; and since the specific Gravity of Water to the Air, is as 970 to 1; we shall have  $b = 970$ , and  $c = 1$ ; consequently  $x = \sqrt{970}$ .  $4 = \sqrt{3880} = 62$  Feet. The Velocity of the *Wind*, therefore, to that of Water moved by the same Power, will be as 62 to 2; i. e. if Water move two Feet in a Second, the *Wind* will fly 62 Feet.

2. Add, that  $f = \sqrt{c \times d}$ ; and therefore the Space any Fluid, impell'd by any Impression, moves in any time, is determin'd, by finding a fourth Proportional to the two Numbers that express the Ratio of the specific Gravity, and the Square of the Space the *Wind* moves in, in the given time—The square Root of that fourth Proportional is the Space requir'd.

*M. Mariotte*, e. gr. found, by various Experiments, that a pretty strong *Wind* moves 24 Feet in a Second of Time; wherefore, if the Space which the Water, acted on by the same Force as the Air, will describe in the same time, be requir'd; then will  $c = 1$ ,  $x = 24$ ,  $b = 970$ ; and we shall find  $f = \sqrt{576 \times 970} = 74$ .

3. The Velocity of *Wind* being given, to determine the Pressure requir'd to produce that Velocity; we have this Rule:—The Space the *Wind* moves in one Second of Time, is to the height a Fluid is to be rais'd in an empty Tube in order to have a Pressure capable of producing that Velocity; in a Ratio compounded of the specific Gravity of the Fluid to that of the Air, and of quadruple the Altitude a Body descends in the first Second of Time, to the foresaid Space of the Air.

Suppose, e. gr. the Space the Air moves in a Second,  $s = 24$  Feet, or 288 Inches; call the Altitude of the third  $x$ , and the Ratio of Mercury to Air  $b : c = 13580 : 1$ ,  $d = 181$  Inches;  $x$  will be less than that Number by one Line, or  $\frac{1}{16}$  of an Inch. And hence we see why a small, but sudden Change in the Barometer, should be follow'd with violent *Winds*. See BAROMETER.

The Force of the *Wind* is determin'd experimentally by a peculiar Machine, call'd an *Anemometer, Wind-Measurer*; which being moved by means of Sails, like those of a *Wind-Mill*, raises a Weight, that, still the higher it is rais'd, receding further from the Centre of Motion, by sliding along an hollow Arm fitted on to the Axis of the

Sails, becomes heavier and heavier, and presses on the Arm; till being a Counter-poise to the Force of the *Wind* on the Sails, it stops the Motion thereof. An Index, then, fitted upon the same Axis at right Angles with the Arm, by its rising or falling, points out the Strength of the *Wind*, on a Plane divided like a Dial-Plate into Degrees. See ANEMOMETER.

#### Qualities of WINDS.

1. A *Wind* blowing from the Sea, is always moist: In Summer, 'tis cold; and in Winter, warm: unless the Sea be frozen up—This is well demonstrated thus: There is Vapour continually rising out of all Water, (as appears even hence, that a Quantity of Water being left a little while in an open Vessel, is found sensibly diminish'd) but especially if it be expos'd to the Sun's Rays; in which Case, the Evaporation is beyond all expectation. See VAPOUR.—By this means, the Air incumbent on the Sea, becomes impregnated with a deal of Vapour. But the *Winds* blowing from off the Sea, sweep these Vapours along with them; and consequently are always moist.

Again, Water in Summer, &c. conceives less Heat than terrestrial Bodies expos'd to the same Rays of the Sun; but in Winter, Sea-Water is warmer than the Earth cover'd with Frost and Snow, &c. Wherefore, as the Air contiguous to any Body, is found to partake of its Heat and Cold, the Air contiguous to Sea-Water will be warmer in Winter, and colder in Summer, than that contiguous to the Earth—Or thus: Vapours rais'd from Water by the Sun's Warmth in Winter, is warmer than the Air it rises in; (as appears from the Vapours condensing and becoming visible almost as soon as they are got out into Air.) Fresh Quantities of Vapour, therefore, continually warming the Atmosphere over the Sea, will raise its Heat beyond that of the Air over the Land—Again, the Sun's Rays reflected from the Earth into the Air, in Summer, are much more than those from the Water into Air: The Air therefore over the Earth, warm'd by the Reflection of more Rays than that over Water, is warmer—Hence Sea-Winds make thick, cloudy, hazy Weather.

2. *Winds* blowing from the Continent, are always dry; in Summer, warm; and cold in Winter—For there is much less Vapour arising from the Earth, than from Water. And therefore the Air over the Continent will be impregnated with much fewer Vapours. Add, that the Vapours or Exhalations rais'd by a great degree of Heat out of the Earth, are much finer, and less sensible, than those from Water—The *Wind*, therefore, blowing over the Continent, carries but little Vapour with it; and is therefore dry.

Further, the Earth in Summer is warmer than Water expos'd to the same Rays of the Sun—Hence, as the Air partakes of the Heat of contiguous Bodies; that over the Earth in Summer will be warmer than that over the Water: Therefore the *Wind*, &c.

After the like manner it is shewn, that the Land-Winds are cold in Winter—Hence we see why Land-Winds make clear, cold Weather. See WEATHER.

Our Northerly and Southerly *Winds*, however, which are commonly esteem'd the Causes of cold and warm Weather, *Mr. Derham* observes, are really the Effect of the Cold, or Warmth of the Atmosphere—Hence it is, that we frequently see a warm Southerly *Wind* on a sudden changed to the North, by the fall of Snow or Hail; and that in a cold, frosty Morning, we see the *Wind* North, which afterwards wheels about towards the Southerly Quarters, when the Sun has well warm'd the Air, and again in the cold Evening turns Northerly or Easterly.

For the manner wherein North-Easterly Winds contribute to Bright; see BRIGHT.

For the Effect of Winds on the Barometer, and Thermometer; see BAROMETER and THERMOMETER.

WIND, in Navigation, is the same Agitation of the Air, consider'd as serving for the Motion of Vessels on the Water. See SAILING.

The *Winds* are divided with respect to the Points of the Horizon from which they blow, into Cardinal and Collateral.

Cardinal Winds, are those blowing from the four Cardinal Points, East, West, North, and South. See CARDINAL.

Collateral Winds, are the intermediate *Winds* between two Cardinal Winds—The Number of these is infinite, as the Points from which they blow are; but only a few of them are consider'd in Practice: i. e. only a few of them have their distinguishing Names. See COLLATERAL.

The ancient Greeks at first only us'd the four Cardinal ones; at length, they took in four more—*Vitruvius* gives us a Table of twenty, besides the Cardinals, in use among the Romans.

The Moderns, as their Navigation is much more perfect than the ancient, have given Names to twenty-eight Collateral ones; which they range into *primary* and *secondary*—and the *secondary* they subdivide into those of the *first* and *second Order*. See POINT.

The *English* Names of the *primary Collateral Winds* and *Points* are compounded of the Names of the *Cardinal ones*, *North* and *South* being still prefix'd.

The Names of the *secondary Collateral Winds* of the *first Order*, are compounded of the Names of the *Cardinals*, and the adjacent *primary one*—Those of the *second Order* are compounded of the Names of the *Cardinal*, or the next adjacent *primary*; and the next *Cardinal*, with the addition of the Word (*by*).—The *Latin* have distinct Names for each; all which are express'd in the following Table.

<i>English</i>	Names of the Winds, <sup>1</sup> and Points of the Compass.	Distance of the Parts, &c. From North.
	<i>Latin and Greek.</i>	
1. North.	<i>Septentrio, or Boreas.</i>	0° 0'
2. North by East.	<i>Hyperboreas.</i>	11 15
	<i>Hypaquilo.</i>

For the Use of the Winds in Navigation, &c. See RUMBS, COMPASS, &c.

WIND GUN, a Machine, serving to explode Bullets, and other Shot, with great Violence; by the force of the Air. See GUN.

This Arm charged with Air, has an Effect scarce inferior to that of a common Fire-Arm charged with Gun-Powder; but it discharges itself with a much less Report: And 'tis this, which, in all probability, gave occasion to the Fable of white Gun-Powder. See GUN-Powder.

There are *Wind-Guns* of divers Contrivances; the most easy and portable one, and the most in use is represented, (Tab. PNEUMATICS, Fig. 14.) It consists of a round Metalling Tube 3, 3, open at the end e e, and exactly stop'd at the other end s, like the Barrels of other Guns; 1, 1, 1, 1, is another larger Metal Tube, wherein the former is dispos'd so as to leave a Space between 'em 4, 4, wherein Air may be inclosed. The two Tubes are joined together at the common Aperture e e by a circular Plate exactly folder'd to both, so as to prevent the Air from escaping out of the Space 4, 4, &c. At 8 is a Spring Valve, which opening inwardly, lets the Air pass through from 2 into the Space 1, but prevents its return from 1 to 2. Near the close end of the inner Tube are two Holes 6 and 5; by the first the Space 1 and the inner Tube communicate, so that the Air would pass out of that into this, but that the Passage is stop'd by a Valve opening outwardly; by the latter there is a communication between the open Air, the Space 4, and the inner Barrel; only the Air pent up in the Space can't escape at this Hole by reason of a little Tube exactly folder'd to both Barrels, which stops the communication: nor can Air escape out of the inner Barrel through this little Tube, by reason of a little moveable Pin which exactly fills the Cavity of the Tube.

Lastly, the Part a, a, 2, 2, represents the Body of a Syringe or Sucking-Pump; by which, as much Air as possible, is to be intruded into the Space 4, 4, &c.—After which, a Bullet being put into the Cavity of the inner Barrel, as high as the little Tube 5, the Gun is charged. See SYRINGE.

Now, to discharge it, the little Valve 6 is push'd up by means of the Pin that plays in the little Tube 5. Upon this, the compress'd Air in the Cavity of the outer Barrel 4, rushing through the Hole 6 into the Cavity of the inner Barrel; expels the Bullet with a vast force, sufficient to penetrate a thick Board.

Note, To give the Machine the greater resemblance of a Fire-Arm, the Part 2, 2, a, 2, is usually fashion'd like the Butt-end of a Musquet, and on the Part 28, 28 is fitted a Lock; by turning the Trigger of which, the Pin 5 is made to push back the Valve, and so discharge the Piece.—By the Lock too, it is contriv'd that either the whole Charge of Air may be spent at one Exploſion, or only part of it, and the rest reserved for fresh Bullets. By this piece of Mechanism, we can have half a dozen good, effective Shoots, with one Charge of Air.

WIND-EGG, an adde Egg, or Egg that has taken Wind. See Egg.

WIND-FALL, denotes a Fruit blown off the Tree by the Wind.

WIND-GALL, in Horses, is soft, stultent Tumour or Bladder, arising on the fetlock Joint, and causing great Pain, especially in hot Weather and hard Ways. See GALL.

It is usually owing to a violent Strain, extreme Labour, and Heat, a Horse's standing on a sloping Floor, a Blow from another, or the like.

**WIND-MILL**, a kind of Mill which receives its Motion from the Impulse of the *Wind*. See **MILL**.

The *Windmill*, tho' a Machine common enough, has yet somewhat in it more ingenious than is usually imagined.—Add, that it is usually granted to have a degree of Perfection which few of the popular Engines have attained to, and which the Makers are but little aware of.—Tho' the new Geometry, &c. has furnished ample Matter for its Improvement.

#### Structure of the WIND-MILL.

The internal Structure of the *Windmill* is much the same with that of *Water-Mills*.—The difference between 'em lies chiefly in an external Apparatus for the Application of the Power.

This Apparatus consists of an Axis LF (Tab. PNEUMATICS, Fig. 15.) thro' which pass two Rods or Yards, A B and CD, intersecting each other at right Angles in E, whose length is usually about 32 Feet: On these Rods are form'd a kind of Sails, Vanes, or Flights, in the Figure of Trapeziums, with parallel Bases, the greater whereof HI is about six Feet, and the less FG determined by Radii drawn from the Centre E, to C and H.

These Sails are to be capable of being always turn'd to the Wind, that they may receive its Impression: In order to which, there are two different Contrivances, which constitute the two different kinds of *Wind-Mills* in use.

In the one, the whole Machine is fasten'd upon a movable Arbor or Axis perpendicular to the Horizon, on a Stand or Foot; and turn'd occasionally this way or that, by means of a Lever.

In the other, only the Cover, or Roof of the Machine, with the Axis and Sails turn round.—In order to which,

The Cover is built Turret-wise, and the Turret encompass'd with a Wooden Ring, wherein is a Groove, at the bottom whereof are placed at certain distances, a number of Brads Trackles, and within the Groove is another Ring upon which the whole Turret stands. To the moveable Ring are connect'd Beams *a b* and *fe*; and to the Beam *a b*, in *b* is fasten'd a Rope, which at the other extreme thereof is fitted to a Windlass or Axis in Peritrochio: This Rope being drawn through the Iron Hook G, and the Windlass turn'd, the Sails will be moved round, and put in the direction requir'd.

#### Theory of the Motion of a WIND-MILL, with the Position of the Sails or Vanes therof.

The Angle the Sails are to make with their common Axis, so as the *Wind* may have the greatest Effect, is a Matter of nice Enquiry, and has employ'd the Thoughts of the Mathematicians.

To conceive why a *Wind-Mill* moves at all, the Theory of compound Motions must be suppos'd.—A Body moving perpendicularly against any Surface, strikes it with all its force.—If it move parallel to the Surface, it does not strike it at all: And if it move obliquely, its Motion being compounded of the perpendicular and parallel Motion, only acts on the Surface consider'd as it is perpendicular, and only drives it in the direction of the Perpendicular. So that every oblique Direction of a Motion is the Diagonal of a Parallelogram, whose perpendicular and parallel Directions are the two Sides. Add, That if a Surface, which being struck obliquely has only received the perpendicular Direction, be fasten'd to some other Body, so as that it cannot pursue its perpendicular Direction, but must change it for some other; in that Case, the Perpendicular itself becomes the Diagonal of a new Parallelogram, one of whose Sides is the Direction the Surface may follow, and the other, that it cannot.

Thus, a Rudder fasten'd obliquely to the Keel of a Vessel, being struck by the Current of Water parallel to the Keel, and of consequence obliquely with regard to itself; it will appear, by drawing the Line of perpendicular Impulse, that it tends to tear the Rudder from the Keel, and to carry it away: And that this Direction perpendicular to the Rudder, is oblique to the Keel.—The Rudder, then, would be carried off in an oblique Direction: But, as, in effect, it is so secur'd, that it cannot be torn or carried off; we are only to consider, in this compound Motion, that of the two Directions wherewith it can move without being torn from the Keel; and leave the other which would tear it off, as useless.

Now, the Direction in which it can move without parting from the Keel, is that which carries it circularly about its Extremity as a Centre. So that the effect of the oblique Impulse of the Water on the Rudder, is reduced, first to a perpendicular Impression, which is again reduced to the mere turning the Rudder round; or, if the Rudder be immovable, to the turning of the Vessel.

Now, in an oblique and compound Motion, where only one of the Directions is of service; the greater Ratio the

other has thereto, the less effect will the Motion have; and vice versa.—In examining the compound Motions of the Rudder, we find that the more oblique it is to the Keel, the Ratio of the Direction that serves to turn it to the other, is the greater. But, on the other hand, the more oblique it is to the Keel, and of consequence to the Course of the Water which is suppos'd parallel thereto, the more weakly it strikes. The obliquity of the Rudder, therefore, has at the same time both an Advantage and a Disadvantage; but as those are not equal, and as each of 'em are still varying with every different Position of the Rudder, they become complicated variously, so that sometimes the one prevails, and sometimes the other.

It has been a Point of Enquiry to find the Position of the Rudder wherein the Advantage should be the greatest. M. ROUVAN, in his famous Theory of the Working of Ships, has found that the best Situation of the Rudder is when it makes an Angle of 55 Degrees with the Keel. See **SAILING, STEERING, &c.**

If, now, a *Wind-Mill* expos'd directly to the Wind, should have its four Sails perpendicular to the common Axis wherein they are fitted, they would receive the Wind perpendicularly; and it is visible that Impulse would only tend to over-turn 'em.—There is a necessity, therefore, to have 'em oblique to the common Axis, that they may receive the Wind obliquely.

For the greater ease; let us only consider one Vertical Sail.—The oblique Impulse of the Wind on this Sail is reducible to a perpendicular Impulse: And that Direction, as the Sail cannot absolutely keep to it, is compounded of two; one whereof tends to make it turn on its Axis, and the other to fall backwards. But it is only the first of these Directions can be obey'd. Of consequence the whole Impulse of the Wind on the Sail has no other effect but to make it turn from right to left, or from left to right, as its acute Angle turns this way or that. And the Structure of the Machine is so happy, that the three other Sails are determined, from the same reasons, to move the same way.

The Obliquity of the Sails with regard to their Axis, has precisely the same Advantage, and Disadvantage, with the Obliquity of the Rudder to the Keel.—And M. PARENT, seeking, by the new Analysis, the most advantageous Situation of the Sails on the Axis, finds it precisely the same Angle of 55 Degrees. Yet, in practice this Rule is very little observ'd; as, indeed, being little known. They are usually about 60 Degrees, which is very much out of the way.

#### Elliptical WIND-MILL.

M. PARENT considers further, what Figure the Sails of a *Wind-Mill* shall have, to receive the greatest Impulse from the *Wind*; and he determines it to be a Sector of an Ellipsis whose Centre is that of the Axis or Arbor of the Mill; and the little Semi-Axis, the height of thirty-two Feet. As for the greater, it follows necessarily from the Rule that directs the Sail to be inclined to the Axis 55 Degrees.

On this foot, he assumes four such Sails, each whereof is one-fourth of an Ellipsis; which, he shews, will receive all the Wind, and lose none, as the common ones do.—These four Surfaces multiply'd by the Lever with which the Wind acts on one of 'em, express the whole force the Wind has to move the Machine, or the whole force the Machine has when in Motion.

The same manner of Reasoning apply'd to a common *Wind-Mill* whose Sails are Rectangular, and their Height about five times their Breadth; shews that the *Elliptical Wind-Mill* has above seven times the force of the common one. A prodigious Advantage! And worthy, sure, to have the common Practice set aside for, could so common a Practice be easily changed.

A *Wind-Mill* with six Elliptic Sails, he shews, would still have more force than one with four.—It would only have the same Surface with the four; since the four contain the whole Space of the Ellipsis as well as the six. But the force of the six would be greater than that of the four in the Ratio of 245 to 251. If it were desir'd to have only two Sails, each being a Semi-Ellipsis, the Surface would be still the same, but the force would be diminished by near one-third of that with six Sails; by reason the greatest of the Sectors would much shorten the Lever with which the Wind acts.

#### The best Form and Proportion of Rectangular WIND-MILLS.

But, as Elliptical Sails would be something so new, that there is little room to expect they will come into common Use; the same Author has consider'd which Form, among the rectangular ones, will be the most advantageous, i. e. which, the Product of whose Surface by the Lever of the Wind will be the greatest. And by the Method of Max-

*imis & Minimis*, he finds them very different from the common ones.

The Refalt of his Enquiry is, that the Width of the rectangular Sail should be nearly double its Height or Length; whereas the Height or Length are usually made almost five times their Width.—Add, that as the Height, or Length, is the Dimension taken from the Centre of the Axis; the greatest Dimension of the new rectangular Sail will be turn'd towards the Axis, and the smallest from it: Quite contrary to the Position of the common Sails.

The Force of a *Windmill* with four of these new rectangular Sails, *M. Parent* shews, will be to the Force of 4 Elliptic Sails, nearly as 13 to 23; which leaves a considerable advantage on the side of the Elliptic ones: yet will the Force of the new rectangular Sails be nearly four times as great as those of the common ones.

*M. Parent* likewise considers what Number of the new Sails will be most advantageous, and finds that the fewer Sails, the more Surface there will be, but the less Force.—The Ratio of the Force of a *Windmill* with 4 Sails, will be to another with 4, nearly as 14 to 13. And the Force of another with 2, will be to that with 4, nearly as 13 to 9.

As to the common *Windmill*, its force still diminishes as the Breadth of the Sails is smaller in proportion to the Height. The usual Proportion, therefore, of 5 to 1, is exceedingly disadvantageous.

The Uses of this new Theory of *Windmills* are very obvious.—The more Force a *Windmill* has, the swifter it turns; the more it dispatches, and the less Wind it needs. Add, that on this Theory, one may have a *Windmill*, whose Sail shall be a deal less, and yet the Force a deal greater, than in the common one.

*Wind-Instruments*, in Music, are Instruments play'd by the *Wind*, chiefly the Breast; in contradistinction to String-Instruments, and Instruments of the pulsatile Sound. See *MUSIC*.

The *Wind-Instruments* known to the Antients, were the *Tibia*, *Fistula*, *Syringa* of *Pan*, consisting of seven Reeds join'd side-wis; *Organs*, *Flute*, *Corvus*, and *Lituis*: See *TIBIA*, *FISTULA*, &c. each under the proper Article.

Those of the Moderns, are the *Flute*, *Bagpipe*, *Horn*, *Trumpet*, &c. See *FLUTE*, *BAGPIPE*, &c.

*WIND DROPPY*, } Sec } *TYMPANITES*.  
*WIND COLIC*, } } *COLIC*.  
*WIND TUMORS*, &c. } } *TUMOR*.

*WINDASS*, *WANDASS*, and *WANLASS*, corruptly *WINDLASS*; a Term in Hunting.—Thus, to drive the *Windass*, signifies the chasing a Deer to a Stand, where one is ready with a Bow or Gun to shoot. See *HUNTING*.

—*Omnes illi qui tenuerunt in Bondagii tenua solent vocari Custumarii: Et quotiescumque Dominus ad venandum venerit, illi Custumarii solent fugare Windassum, ad sabulum in Venatione ferarum Bestiarum secundum quantitatem Tenure sue.* MS. de Confectud. Mancii de Sutton Colfield, An. 3. Ed. 2.

*WINDLASS*, or *WINDLESS*, a Machine used to raise huge Weights withal, as Guns, Stones, Anchors, &c. See *MACHINE*.

It is very simple, consisting only of three Pieces of Wood; a Roll or Axle-Tree, and a Pally.—The Pieces of Wood meet a-top; being plac'd diagonally, so as to prop each other.—The Axis or Roller goes thro' two of the Pieces, and turns in them.—The Pally is fasten'd a-top, where the three Pieces join.

Lastly, there are two Levers go thro' the Roll, whereby it is turn'd, and the Rope, which comes over the Pally, is wound off, and on the same.

*WINDLASS in a Ship*, is a Piece of Timber, having six or eight Squares, and fix'd abast the Stern aloft, where the Cables come in from one side of the Ship to the other; used in Metal Ships, and in the *Flemish* Ships, which are lightly mann'd.

This *Windlass* will purchase more by much than any Captain in the weighing of an Anchor, and without any danger to those that heave; because they heave here with Hand-Spikes, put into the Hole at either End of the *Windlass*. See *CAPTAIN*.

*WIND-TACKLE-BLOCKS*, in a Ship, are the main double Blocks or Palleys; which being made fast to the end of a small Cable, serve for the hoisting of Goods into the Ship, &c. See *BLOCK*, *TACKLE*, &c.

To *wind or wend a Ship*, signifies to bring her Head about.

How *winds or wends the Ship*? is a Question ask'd by Mariners concerning a Ship under Sail, signifying as much as, upon what Point of the Compass does she lie with her Head?

*WINDWARD TIDE*, in the Sea-Language, a Tide which runs against the *Wind*. See *TIDE*.

*WINDOW*, *q. d. Wind-Door*, an Aperture or open Place in the side of an House, to let in the Air and Light. See *BUILDING*, *APERTION*, *LIGHT*.

We have various Kinds and Forms of *Windows*; as *Glass Windows*, *Wire Windows*, *Horn Windows*, &c.—*Arch'd Windows*, *Circular Windows*, *Elliptical Windows*, *Square and Flat Windows*; *Round Windows*, *Oval Windows*, *Gothic Windows*, *Regular Windows*, *Rustic Windows*, &c. *Sky-Lights*. See *GLASS*, *GLAZIERY*, *LEAD*, *PLUMBERY*, *VICE*, &c.

*Dormer Windows*, or *Latherns*. See *DORMER* and *LUTHERN*.

*Transom Windows*. See *TRANSOME*.

The chief Rules with regard to *Windows* are.—1. That they be as few in Number, and as moderate in Dimensions, as may consist with other Respects; inasmuch as all Openings are Weakenings.—2. That they be plac'd at a convenient Distance from the Angles, or Corners of the Building; because that part ought not to be open and inflected, whose Office is to support and fasten all the rest of the Building.—3. That Care be taken the *Windows* be all equal one with another in their Rank and Order; so that those on the right hand may answer to those on the left, and those above be right over those below: for this Situation of *Windows* will not only be handsome and uniform; but also the Void being upon the Void, and the Full upon the Full, it will be a strengthening to the whole Fabric.

As to their Dimensions, Care is to be used neither to give them more, nor less Light than is needful; therefore regard is to be had to the Bigness of the Rooms which are to receive the Light. 'Tis evident that a great Room needs more Light, and consequently a greater *Window* than a little Room; and *à contrari*.

The Apertures of *Windows* in middle-sized Houses, may be four and a half, or five Feet between the Jambs; and in the greater Buildings, six and a half, or seven Feet; and their Height may be double the Length at the least.—But in high Rooms, or larger Buildings, their Height may be a third, a fourth, or half their Breadth, more than double their Length.

Such are the Proportions for *Windows* of the first Story; and according to these must those in the upper Stories be less Breadth; but as to Height, they must diminish: the second Story may be one third part lower than the first, and the third Story one fourth part lower than the second. See *STORY*.

*WINDOW*, in Anatomy, &c. See *FENESTRA*.

*WIND TANGHT*, a Sea-Term, implying as much as, stiff in the Wind.

Thus they say, a thing is *tanght*, when it is stiff.—So, too much Rigging, high Ropes, or any thing catching or holding *Wind* aloft, is said to hold a Ship *Wind-tanght*; by which they mean, that she stoops too much in her Sailing, in a stiff Gale of *Wind*. Again, when a Ship rides in a main stress of *Wind* and *Weather*, they strike down her Top-masts, and bring her Yards down, which else would hold too much *Wind*, or be too much distended.

*WINE*, *Vinum*, a brisk, agreeable, and spirituous Juice, drawn from vegetable Bodies, and fermented. See *VEGETABLE* and *FERMENTATION*.

The Character of a *Wine*, according to *Boerhaave*, is, that the first thing it affords by Distillation, be a thin, fatty, inflammable, &c. Fluid; call'd a *Spirit*. See *SPRIT*.

This distinguishes *Wines* from another Class of fermented vegetable Juices, *vis. Vinegars*; which, instead of such Spirit, yield, for the first thing, an acid, uninflamable Matter. See *VINEGAR*.

All sorts of Vegetables, Fruits, Seeds, Roots, &c. afford *Wine*; as Grapes, Currants, Mulberries, Elder, Cherries, Apples, Palsé, Beans, Pease, Turnips, Radishes, and even Grass itself. See *VINOUS LIQUOR*.

Hence, under the Class of *Wines*, or *Vinous Liquors*, come *WINE*, absolutely so call'd, Ale, Cyder, &c. See *MALT LIQUOR*, *ALE*, *CYDER*, &c.

*WINE*, is in a more particular manner appropriated to that drawn from the Fruit of the *Vine*, by stamping its Grapes in a Vat, or crushing and expressing the Juice out of them in a Press, and then fermenting, &c. See *VINE*, and *VINEYARD*.

The Goodness of *Wine* consists in its being net, dry, clear, fine, brisk, without any Taste of the Soil, of a clean, studdy Colour; in its having a Strength, without being heady; a Body, without being sour; and its keeping, without growing hard.

*Wine* being a Liquor mostly of foreign Produce; the divers Names, Forms, Kinds, Distinctions, &c. thereof, are borrow'd from the Countries where 'tis produc'd; the principal whereof, at this day, is *France*: To *Wines* of which

of which Country, a good part of what we have to say of this noble Liquor, will more immediately belong.

*Wine* is distinguish'd from the several Degrees and Steps of its Preparation, into, 1. The *Mere-goutte*, Mother-drop; which is the *Virgin Wine*, or that which runs of itself out at the Top of the Vat wherein the Grapes are laid, before the Vintage enters to tread or stamp the Grapes.—The *Moff*, *Surmoiff*, or *Stuus*; which is the *Wine*, or *Liquor*, in the Vat, after the Grapes have been trod or stamp'd.—The *press'd Wine*, *Vin de Pressage*, which is that squeeze'd with a Press, out of the Grapes half bruised by the treading.—The Husks left of the Grapes, are call'd *Rape* or *Marc*; by throwing Water upon which, and pressing them a-fresh, they make a *Liquor* for Servants Use, answerable to our *Water-Cyder*, and call'd *Boiffon*, *Dranght*; which is of some use in Medicine in the Cure of Disorders occasion'd by viscid Humours.

*Sweet Wine*, *Vin Poux*, is that which has not yet work'd nor build'd.—*Bousu*, that which has been prevented working, by casting it in cold Water.—*Cuve*, *work'd Wine*, or that which has been let work in the Vat, to give it a Colour.—*Coir*, *boiled Wine*, that which has had a boiling e'er it work'd; and which, by that means, still retains its native Sweetness.—*Passé*, or *strain'd Wine*, that made by steeping dry Grapes in Water, and letting it ferment of itself.

*Wines* are also distinguish'd with regard to their Colour, into *White Wine*, *Red Wine*, *Claret Wine*, *Pale Wine*, *Rose* or *Black Wine*.—And with regard to their Country, or the Soil that produces them, into *French Wines*, *Spanish Wines*, *Rhenish Wines*, *Hungary Wines*, *Greek Wines*, *Canary Wines*, &c.—And more particularly into *Port Wine*, *Madera Wine*, *Burgundy Wine*, *Champaigne Wine*, *Falerian Wine*, *Tokai Wine*, *Schiras Wine*, &c.

*Wines*, again, are distinguish'd with regard to their Quality, into *foeces Wines*, *rough* or *dry Wines*, and *rich* or *luscious Wines*, *Vins de liqueur*; of which last, some are exceedingly sweet, others sweet and poignant: all chiefly used by way of *Dram* after Meals, &c.

Such are the *French Fronigniat*, *Madera*, the *Canary*, the *Hungary*, *Tokai*, the *Italian Montefiascone*, the *Persian Schiras*, the *Malassy Wines of Candia*, *Cbio*, *Lesbos*, *Tenedos*, and other Islands of the *Archipelago*, which anciently belonging to the *Greeks*, but now to the *Turks*: these *Wines* are sometimes call'd *Greek Wines*, and sometimes *Turkey Wines*.

#### Method of Making and Fining Wine.

In the Southern Parts of *France* their way is, for *Red Wine*, to tread or squeeze the Grapes between the Hands, and to let the whole stand, Juice and Husks; till the Tincture be to their liking: after which they press it.—But for *White Wines*, they press the Grapes immediately.

When press'd, they run the Must, and stop up the Vessel; only leaving the depth of half a Foot or more empty, to give room for it to work.—At ten days cad, they fill this Space with some other proper *Wine*, that will not provoke it to work again.—This they repeat from time to time; new *Wine* spending itself a little, e'er it be perfect.

About *Paris*, and in the Northern Parts of *France*, they let the Must and Must stand two Days and Nights for *White Wines*, and at least a Week for *Claret Wines*; e'er they run it.—While it continues working, 'tis kept as warm as possible.

Some, upon stopping it up for good and all, roll the Cask about the Celler, to mix it with the Lees; and after resting a few days, rack it off with great Improvement.

To fine it down, they put Shavings of green Beech into the Vessel; having first taken off all the Rind, and boil'd them an hour in Water, to extract their Rankness; and afterwards dry'd them in the Sun, or an Oven: a Bushel of these serve for a Tun of *Wine*. They put it in a gentle Working, and purify it in twenty-four hours. They also give it an agreeable Flavour.—The same Chips being wash'd, serve again and again, till almost quite consumed.

Some sweeten their *Wines* with Raisins of the Sun, trod in the Vat with the Grapes, having been first plump'd, by boiling: Others, by boiling half the Must, scumming it, and tuning it up hot with the other.

For *English Wine*, the Method recommended by Mr. *Mortimer*, is, first to gather the Grapes when very dry, to pick them from the Stalks, then to press them, and let the Juice stand twenty-four hours in the Vat cover'd. Afterwards, to draw it off from the gross Lees, and then put it up in a Cask, and to add a Pint or Quart of strong Red or White Port to every Gallon of Juice; and let the whole work: bagging it up close, and letting it stand till *January*; then bottle it in dry Weather.

By this Method he assures us, he has made *English Wine* as good as any the best and purest *French Wine*, drank either in *Paris* or *Champaigne*.

Mr. *Bradley* chuses to have the *Liquor* when press'd, to stand with the Husks, Stalks, and all, in the Vat to ferment for fifteen days.

He adds, that according as the *Vines* have been manag'd, the *Wine* will be stronger or weaker.—Those, e.g. which run at liberty up high Trees, and are never pruned, make the *smallest Wines*: Those kept tied to Stakes about four Foot high, and which have their Branches kept pruned, make *stronger Wines*: And those nearest the Ground, the *strongest*.

The Force of the fermenting *Wine* is very great; being able, if close stop'd up, to burst thro' the strongest Cask.—The readiest and only way to stop or abate the Fermentation, is by the Fume of burning Sulphur.

Add, that when *Wine* already made is upon the Fret, or, by any Alteration in the Air, begins to ferment again; the way used by the *Vintners* and *Wine-Coopers* to save it, is by the flame of common Sulphur, or a lighted Match dip'd in it; which held under the Cask just ready to burst its Hoops, calms its Fury, and makes it immediately subside. See SULPHUR.

*WINE* is variously denominated, according to its State, Circumstances, Qualities, &c.

*Natural WINE*, is such as it comes from the Grape, without further Mixture or Sophistication.

*Brew'd or Adulterated WINE*, is that wherein some Drug is added to give it a Strength, Fineness, Flavour, Briskness, Sweetness, or some other Quality which it wanted.

*Prick'd, or Eager WINE*, is that turn'd fourth.

*Flat WINE*, is that fallen weak and vapours for want of being drunk in time.

*Sulphur'd WINE*, is that put in Casks wherein Sulphur has been burnt; in order to fit it for keeping, or for Carriage by Sea.

*Colour WINE*, is some thick *Wine*, of a very deep Colour, serving to dye the *Wines* that are too pale, &c. As the *Black Wine* is use among our *Vintners*.

*Chip WINE*, is that pour'd on Chips of Beech-wood, to fine or soften it.

*Rape WINE*, is that put in a Cask half full of fresh Grapes pick'd for the purpose, to recover the Strength, Briskness, &c. it had lost by keeping, &c.

*Burnt WINE*, is that boil'd up with Sugar; and sometimes with a little Spice.

There is also a sort of *Malassy WINE*, made by boiling of Mustadine. See MALASSY.

The Uses of *WINE* are very great; not only as a Drink, but as a Medicine. See DRINK, &c.

Several Physicians recommend it as an excellent Cordial, and particularly serviceable in Fevers, the *Less Venerea*, &c.

*Pliny* mentions *Staphilus* as the first who mixed *Wine* with Water; but *Athenaeus* gives the Credit thereof to *Amphtroion* King of *Athena*.—On this Occasion a Fable was invented; viz. That *Bacchus* having been struck with a Thunderbolt, and being all inflam'd, was presently cast into the Nymph's Bath, to be extinguish'd.

The Age of *Wine* is properly reckon'd by Leaves.—Thus they say *Wine* of two, four, six Leaves, to signify a *Wine* of six, four, or two Years old; taking each new Leaf put forth by the Vine since the *Wine* was made, for a Year.

Among the *Romans*, the Age of *Wines* was, as it were, the Criterion of their Goodness.—*Horace*, in his *Odes*, which one may call *Bacchic Songs*, boasts of his drinking *Falerian Wine*, born, as it were, with him, or which reckon'd its Age from the same Consul.

*Pliny* mentions *Wines* kept above a hundred Years, and yet potable.—Others he speaks of kept two hundred Years, which by this time were reduced to the Consistence of Honey.

But the *Moderns* keep no *Wines* to any such Age. Where they are kept the longest, as in *Italy* and *Germany*, there are scarce any to be found above fifteen Leaves. In *France*, the *Wines* that keep best, as those of *Dijon*, *Nantz*, and *Orleans*, are reckon'd superannuated at five or six Leaves old.

Lees of *WINE*, are the Impurities thereof, or the thick Sediment remaining at the bottom of the Casks, when the *Wine* is drawn out. See LEES and VINEGAR.

*WINE* is also a Name used in Medicine and Pharmacy, for divers Mixtures or Compositions, wherein the Juice of the Grape is a principal Ingredient. See VINUM.

These Medicated *Wines* make a considerable Article in our Dispensatories, in quality of Diet-Drinks; some being denominated from the Ingredients used in 'em; some from the intentions wherewith they are prescribed; and some from their Qualities, &c.

*Bitter WINE*, *Vinum Amarum*, is an Infusion of certain bitter Stomachic Herbs, as *Genstein-Root*, *Juniper-Berries*, *Tops of Centaury*, *Orange* and *Lemon Peel*, in white Port, or other white *Wine*; taken by way of Whet in a Morning, to restore the pall'd Stomach after a Debanch, and bring the Fibres to their due Tension.

*Chalybeate, or Steel Wine*, is prepared of Filings of Steel, and saturo infus'd, and filter'd. It is good for removing Obstructions in the Viscera, as in the Chlorosis, &c.

*Vinum Benedictum, the blessed Wine*, is made of *Crocus Metallorum* and Mace infus'd in Wine. It was formerly a celebrated Emetic, but now almost out of use for its roughness.

*Elicampagne Wine, Vinum Eoulatum*, is an Infusion of the Root of that Plant with Sugar and Currants, in white Port.—It cleanses the Viscera, prevents Disorders and Obstructions of the Lungs; and is good in Asthmatic Cases, Cachexies, &c.

*Hog-lice Wine, Vinum Millepedam*, is prepared of Hog-lice put alive in white Port; and after some infusion, pres'd and strain'd out: To the Liquor is added Saffron, Salt of Steel, &c.—It is recommended against the Jaundice, Dropsy, Cachectic Habits, &c. See MILLEPEDA.

*Pectoral Wine, Vinum Pectorale*, is prepared of Liquorice, Saffron, Coriander-Seed, Carraway, Anise, Salt of Tartar, Penny-royal, and Hyssop-Waters, digested with Canary Wine, and strain'd. It is a good Expectorant; helping to deterge and cleanse the Lungs, &c.

*Emetic Wine, Vinum Emeticum*. See EMETIC.

*Hippocrates's Wine, Vinum Hippocraticum, or Hippocras*. See HIPPOCRAS.

*Viper Wine, Vinum Viperinum*, is a Preparation of female Vipers, infus'd six Months in Canary Wine.—It is a great Restorative, and provokes to Venery; good against Catarrhus Eruptionis, &c. See VIPER.

*Vinum Scilliticum, Wine of Squills*, is an Infusion of these Onions in white Wine for forty days, and then the Squills strain'd out, and the Liquor preserv'd for use. It is a gentle Emetic, good against inundations of Rheum, &c. See SQUILL.

*WINE-Measure*; see MEASURE.

*WING*; see FEATHER and FLYING.

*WINGS*, in Heraldry, are bore sometimes single, sometimes in pairs, in which case they are call'd *Conjoin'd*; when the Points are downward, they are said to be *Inverted*; when up, *Elevated*. See VOX.

*WIND, Ala*, in Botany, the Angle which the Leaves of a Plant, or the Pedicles of the Leaves, form with the Stem, or a Branch of the Plant. See LEAF.

This Angle is commonly acute, and always stands upward.—It has its Name from its resembling the Angle which the Wings of a Bird form with the Body; or rather from the Angle which a Man's Arms makes with his Trunk, which is also call'd *Ala, Wing*.

*WINDS*, in Gardening, are such Branches of Trees, or other Plants, as grow up a-side of each other. See BRANCH.

*La Quintiny* says, the Term is particularly apply'd to Artichokes, whose Wings or *Ala*, are the lesser Heads or Fruits that grow up with the principal one, on the same Stalk.

*WINGS, Ala*, in the Military-Art, are the two Extremes of an Army, ranged in form of Battel; being the Right and Left Parts thereof, and including the Main Body. See ARMY and BATTEL.

The Cavalry are always posted in the Wings; i. e. on the Flanks, or the Right and Left Sides of each Line; to cover the Foot in the Middle. See LINE and FLANK.

*Pan*, one of *Bacchus's* Captains, is said to have been the first Inventor of this Method of ranging an Army; whence, say they, it is that the Antients painted him with Horns on his Head; what we call Wings being by them call'd *Cornua*, Horns. See PANIC.

This at least is certain, that the Method of Arranging in Wings is very antient. The *Romans*, we know, used the Term *Ala*, or *Wings*, for two Bodies of Men in their Army; one on the Right, the other on the Left, consisting each of 400 Horse, and 400 Foot usually, and wholly made up of Confederate Troops.—These were design'd to cover the *Roman Army*, as the Wings of a Bird cover its Body.

The Troops in these Wings they call'd *Alares*, and *Alares Copie*; and we at this day distinguish our Armies into the Main Body, the Right and Left Wings.

*WING* is also used for the two Files that terminate each Battalion, or Squadron, on the Right and Left.—The Files are ranged in the Middle, and the Musketeers in the Wings.

*WINDS*, in Fortification, are the larger Sides of Horn-works, Crown-works, Tenailles, and the like Out-works; including the Ramparts, and Parapets, with which they are bound on the Right and Left, from their Gorge to their Front.

These Wings or Sides are capable of being flank'd either with the Body of the Place, if they stand not too far distant; or with certain Redoubts; or with a Traverse made in their Ditch.

*St. Michael's WING*, is a Military Order in Portugal, instituted, according to the *Jesuit Memoirs*, in 1165; or, according

to *di Michiel* in his *Tesoro Militar de Cavalleria*, in 1171.

Its Institution was *Alphonfus Henry I. King of Portugal*; and the Occasion was a Victory gain'd by him over the King of Sevil and his Sarazens; for which he thought himself beholden to *St. Michael*, whom he had chose for his Patron in the War against the Infidels.

The Banner they bore was a *Wing*, resembling that of the Arch-Angel, of a purple Colour encompass'd with Rays of Gold.—Their Rule was that of *St. Benedict*; and the Vow they made was to defend the Christian Religion, and the Borders of the Kingdom, and to protect Orphans. Their Word, *Quis ad Deum*.

*WINGED*, in Botany, a Term apply'd to such Stems of Plants, as are furnish'd, all their length, with a sort of membranous Leaves. See STEM.

Several kinds of *Tribbles* have winged Stalks, and Branches.

They also use the Term *winged Leaves* for such as consist of divers little Leaves rang'd in the same direction, so as to appear no more than one and the same Leaf. See LEAF.

Such are the Leaves of *Agrimony*, *Acacia*, *Ash*, &c.

*Winged Seeds*, are such as have Down or Hairs on 'em, whereby the Wind taking hold, blows 'em to a distance. See SEED and SEMINATION.

*WINGED*, in Heraldry, is apply'd to a Bird, when its Wings are of a different Colour or Metal, from the Body.

*Winged* is also apply'd to any thing represented with Wings, tho' contrary to its Nature; as a *winged or flying Hart*, &c. See FLYING.

*WINDNOW*, signifies to fan, or separate Corn from the Chaff by Wind.

*WINTER*, one of the four Seasons, or Quarters of the Year. See SEASON, &c.

*Winter* commences on the Day when the Sun's distance from the Zenith of the Place is the greatest, and ends on the Day when its distance is at a Mean between the greatest and least. See SUN.

Notwithstanding the Coldness of this Season, it is proved in Astronomy, that the Sun is really nearer to the Earth in *Winter* than in *Summer*. See EARTH.

The reason of the decay of Heat, &c. see under the Articles HEAT, LIGHT, &c.

Under the Equator the *Winter*, as well as the other Seasons, return twice every Year; but all other Places have only one *Winter* in the Year; which, in the Northern Hemisphere, begins when the Sun is in the Tropic of *Capricorn*; and in the Southern Hemisphere, when in the Tropic of *Cancer*: So that all Places in the same Hemisphere have their *Winter* at the same time.

*WINTER Solstice*; see SOLSTICE.

*WINTER's Bark, Cortex Winteri, or Winteranus*; see CORTEX and CINNAMON.

*WINTER*, among Printers, a part of the Printing-Press. See PRINTING-Press.

*WINTER Rig*, among Husbandmen, signifies to fallow, or till the Land in *Winter*. See FALLOW, &c.

*WIRE*, wrote also *Wyre*, and *Wiar*, is a piece of Metal, drawn thro' the Hole of an Iron, into a Thread, of a Fineness answerable to the Hole it is pass'd through.

*Wires* are frequently drawn so fine, as to be wrought along with other Threads of Silk, Wool, or Hemp: And thus they become a considerable Article in the Manufactures.

The Metals most commonly drawn into *Wire* are Gold, Silver, Copper, and Iron.—And hence we have *Gold Wire*, *Silver Wire*, *Iron Wire*, &c. as in the following Articles.

*Gold and Silver Wires*.—What we call *Gold Wire* is made of cylindric Ingots of Silver cover'd over with a Skin of Gold, and thus drawn successively thro' a vast Number of Holes, each smaller, and smaller; till at last it be brought to a Fineness exceeding that of a Hair.

That prodigious Ductility which makes one of the distinguishing Characters of Gold, is no where more conspicuous than in this gilt *Wire*.—A Cylinder of 28 Ounces of Gold cover'd with a Coat of Gold only weighing one Ounce, *Dr. Halley* informs us, is commonly drawn into a *Wire*, 3 Yards of which only weigh one Grain: Whence 98 Yards of the *Wire* only weigh 49 Grains; and one single Grain of Gold covers the said 98 Yards. So that the ten thousandth part of a Grain is above  $\frac{1}{4}$  of an Inch long.

The same Author computing the thickness of the Skin of Gold, found it to be only  $\frac{1}{174370}$  Part of an Inch.—yet so perfectly does it cover the *Wire*, that even a Microscopos does not discover any appearance of the Silver underneath.

*M. Robaut* observes, that a like Cylinder of Silver cover'd with Gold, a Foot 8 Inches long, and 2 Inches 9 Lines in Circumference, is drawn into a *Wire* 307200 long, i. e. into 11500, its former length.

*Mr. Boyle* relates, that 8 Grains of Gold covering a Cylinder of Silver, is commonly drawn into a *Wire* thirteen thousand Feet long. See GOLD.

The Method of drawing it, see further illustrated under the Article DUCTILITY.

Silver WIRE is the same with Gold WIRE, except that the latter is gilt, or cover'd with Gold, and the other is not. See SILVER.

There are also counterfeit Gold and Silver Wires: The first made of a Cylinder of Copper, silver'd over, then cover'd with Gold; and the second of a like Cylinder of Copper silver'd over, and drawn thro' the Iron after the same manner as Gold and Silver Wire.

Brass WIRE is drawn after the same manner as the former.—Of this, there are divers Sizes suited to the divers Kinds of Works. The finest is used for the Strings of Musical-Instruments, as Spinetes, Harpsichords, Manichords, &c. See COPPER.

The Plomakers likewise use vast Quantities of Wire of several Sizes, to make their Pins. See PIN.

Iron WIRE, is call'd by the French *Fil d'Arche*; the Reason of which, their Authors are not agreed about.—That celebrated Etymologist, M. Menage, derives it from *filum & archicolum*; but others, more conversant in the Commerce thereof, deduce it from one Richard Archai the first Inventor thereof.

There are various Sizes of this Wire, from  $\frac{1}{2}$  of an Inch to  $\frac{1}{16}$  of an Inch Diameter. The smallest Sizes are used to string Musical Instruments withall, particularly Harpsichords, Psalteries, &c.—Vast Quantities of Iron-Wire are brought yearly from the Baltic; partly spent at home, and part exported to France, &c.

Wire drawing.—For the several Manners of drawing Gold and Silver; see DRAWING, GOLD, SILVER, DUCTILITY, &c.

The first Iron that runs from the Stone, when melting, being the softest, and toughest, is preserv'd to make Wire of. See IRON.

WISDOM, *Sapientia*, usually denotes a higher and more refined Knowledge of things, immediately presented to the Mind, as it were by Intuition, without the assistance of Discouraging. See KNOWLEDGE, DISCOURSE, SCIENCE, &c.

In this Sense, Wisdom may be said to be a Faculty of the Mind, or at least a Modification and Habit thereof. See FACULTY, MODIFICATION, HABIT, &c.

Sometimes the Word is more immediately used in a Moral Sense for what we call Prudence, or Discretion; which consists in the Soundness of the Judgment, and a Conduct answerable thereto. See JUDGMENT.

The School-Divines sometimes restrain it to the Knowledge of the more sublime and remote Objects; as that of God, &c. In which sense, Theology is properly said to be Wisdom.

The Word in Latin, is *Sapientia*, which literally expresses the Sense of Tasting; to which Wisdom is supposed to have some Conformity.—The Sight, and other Senses only represent to us the Surface of things: Taste goes deeper, penetrates into the Substances; so that what, e. gr. to the Feeling seem'd cold, to the Taste shall be found hot: So Wisdom arising from a deep Attention to our Ideas, goes further, and frequently judges otherwise than the common Apprehensions of Men would reach to. See UNDERSTANDING, REASON, &c.

WISTA, a Quantity, or Measure of Land among our Saxon Ancestors.

It was different in different Places.—In the *Monasticon*, it is said to be half a Hide, or sixty Acres: In an old Chronicle of the Monastery of *Battle*, it is said to be forty-eight Acres. See HIDE, &c.

WIT, a Faculty of the Mind, consisting, according to Mr. Locke, in the assembling, and putting together of those Ideas with Quickness and Variety, wherein can be found any Resemblance or Congruity; thereby to make up pleasant Pictures and agreeable Visions to the Phantasy. See FACULTY and IMAGINATION.

This Faculty, the same great Author observes, is just the contrary of Judgment, which consists in the separating, carefully, from one another, such Ideas wherein can be found the least difference, thereby to avoid being misled by Similitude, and by Affinity to take one thing for another. See JUDGMENT.

'Tis the Metaphor, and Allusion, wherein, for the most part, lies the Entertainment and Pleasantry of Wit; which strikes so lively on the Fancy, and is therefore so acceptable to all People, because its Beauty appears at first Sight, and there is required no Labour of Thought to examine what Truth or Reason there is in it.—The Mind, without looking any further, rests satisfied with the Agreeableness of the Picture, and the Gaicry of the Imagination; and it is a kind of Affront to go about to examine it by the severe Rules of Truth, or Reason.—Whence it should seem, that Wit consists in something that is not perfectly conformable to 'em. *Essay on Hum. Underst. L. I. c. 11.*

WIT is also an Appellation given to Persons possess'd of the Faculty call'd *Wit, Esprit*.

A French Author, who, in 1595 published a Treatise of *Wit, du bel Esprit*, lays down four Characteristicks thereof.

1. A Man, who, with an open Air, and easy Motions, affects those he converses withal agreeably; and on any Subject that presents itself, advances new Thoughts, and adorns them with a sprightly Turn; is, all the World over, a Wit.

2. Another, who less solicitous about the Choice and Delicacy of his Sentiments, knows how to make himself valued by I know not what Elevation of Discourse; who draws a deal of Attention, and shews a deal of Viracity in his Speaking, and Readiness in his Answers; is likewise acknowledged a Wit.

3. A third, who takes less Care about thinking, than about speaking well; who affects fine Words, tho' perhaps low and poor in Matter; who pleases by an easy Pronunciation, and a certain Tone of Voice, is placed in the same Rank.

4. Another, whose chief Aim is not to make himself esteem'd, so much as to raise Mirth and Laughter: who jokes pertinently, rallies pleasantly, and finds something to amuse himself withal in every petty Subject; is likewise allow'd a Wit.

Yet, it may be observ'd, that in all these Cases, there is nothing of real Wit, as above defin'd; but the whole is Imagination, or Memory at most: The whole is no more than Temperament may give.

A true Wit must have a just Faculty of Discernment; must have, at the same time, both a deal of Energy and of Delicacy in his Sentiments; his Imagination must be noble, and withal happy and agreeable; his Expressions polite and well turn'd; without any thing of Padoe or Vanity in his Discourse, or his Carriage. 'Tis not at all essential to a Wit to be ever hunting after the *Brilliant*; still studying fine Thoughts, and affecting to say nothing but what may strike and surprize.

This is a Fault very frequent in Dramatic Persons: The Duke of *Buckingham* rallies it very justly.

What is that thing which we sheer Wit do call?  
'Tis when the Wit of some great Writer shall  
So overflow; that is, be more at all:  
'T hat even his Foot's speak Sense.

Humour, say our Critics, is the genuine Wit of Comedies. See HUMOUR.

WITCHCRAFT; see SORCERY and MAGIC.

There may, perhaps, be some Foundation for what we call *Witcherpe*—We have infinite Instances and Histories to this purpose; which it were not fair to set aside, merely because they are not reconcilable to our Philosophy; But, as it happens, there seems to be something in Philosophy to countenance them.

All living things, we know, emit Effluvia, both by the Breath and the Pores of the Skin.—All Bodies, therefore, within the Sphere of their respiratory, or expiratory Effluvia, will be affected by 'em; and that, in this or that manner, according to the Quality of the Effluvia; and in this or that degree, according to the Disposition of the emitent and recipient Parts. See EFFLUVIA.

Thus far is incontestable; nor need we produce Instances of Animals exhaling sweet or stinking Smells; of menseulous Women's infectious Looking-Glass with a bloody Tarnish; or the infectious Diseases convey'd by Effluvia, &c. in confirmation thereof.

Now, of all Parts of an Animal Body, the Eye, we know, is the quickest—it moves with the greatest Celerity, and in all the Variety of Directions. Again, its Coats and Humours are permeable as any other part of the Body, (witness the Rays of Light it so copiously receives.) The Eye, therefore, no doubt emits its Effluvia like the other parts. Nay, it must do so. The fine Humours of the Eye must be continually exhaling. The Heat of the perspiring Rays must rarely and attenuate 'em; And that, with the subtle Juice or Spirit of the neighbouring optic Nerve, supply'd in great abundance by the vicinity of the Brain, must make a kind of volatile Matter to be dispens'd, and, as it were, determined by the Eye.

Here, then, we have both the Dart and the Hand to sling it.—The one furnish'd with all the Force and Vehemence, and the other with all the Sharpness and Activity, one would require. No wonder their Effects are great!

Do but conceive the Eye as a Sling, capable of the swiftest and intensest Motions and Vibrations: And, again, as communicating with a Source of such Matter as the nervous Juice elaborated in the Brain; a Matter so subtle and penetrating, that it flies instantaneously thro' the solid Capillaments of the Nerve, and so active and forcible, that it distends and convulses the Muscles, and distorts the Limbs, and alters the whole Habitude of the Body, giving Motion and Action to a Mass of inert, inactive Matter. A Projectile of such a nature, slung by such an Engine as the Eye, must have an Effect wherever it strikes: And the Effect will be limited and modified by the Circumstances of Distance, the Impetus of the Eye, the Quality, Subtility, Acrimony, &c. of

of the Juices, and the Delicacy, Coarseness, &c. of the Object it falls on.

This Theory, we are of opinion, will account for the general Phenomena of *Witchcraft*. 'Tis certain the Eye has always been esteem'd the chief Seat, or rather Organ of *Witchcraft*; tho' without knowing why or wherefore.—The Effect was apparently owing to the Eye; but how, was not dream'd of. Thus, the Phrase, To have an *Evil Eye*, imports as much as to be a *Witch*. And thus *Virgil*,

*Nescio quis teneros oculus mihi fascinat agnos.*

Again, old, sanguine Persons are those most frequently supposed to have the Faculty; the nervous Juice in them being deprav'd and irritated by a vicious Habitude of Body; and so render'd more penetrating and malignant.—And young Persons, chiefly Children and Girls are most affected by it; by reason their Pores are patent, their Juices incoherent, and their Fibres delicate and susceptible. Accordingly, the *Witchcraft* mention'd by *Virgil*, only reaches to the tender Lambs.—Lastly, the Faculty is only exercised when the Person is displeas'd, provoked, irritated, &c. It requiring some extraordinary Stress and Emotion of Mind to dart a Quantity of the proper Effluvia, with a sufficient Impetus to produce the Effect at the distance.

That the Eye has some very considerable Powers, is past dispute. The ancient Naturalists assure us, that the Basilisk, and Ophelaps kill other Animals merely by staring at 'em. If this fall of Credit; a late Author assures us to have seen a Mouse running round a large Toad which stood looking earnestly at it, its Mouth open: Still the Mouse made leis and leis Circles about it; crying all the while, as if compell'd thereto; and, at last, with a deal of seeming Reluctance, ran into the gaping Mouth, and was strait swallow'd.

Who has not observ'd a Setting-Dog; and the Effect of its Eye on the Partridge? The poor Bird, when once its Eyes meet those of the Dog, stands as if confounded, regardless of itself, and castly lets the Net be drawn over it. We remember to have read of Squirrels stupify'd and overcome by a Dog's staring hard at 'em, and thus made to drop out of their Trees into his Mouth.

That Man is not secure from the like Affections, is matter of easy Observation. Few People but have again and again felt the Effects of an angry, a fierce, a commanding, a disdainful, a lascivious, an intreating Eye, &c.—These Effects, no doubt, are owing to the different Ejaculations from the Eyes; and are a degree of *Witchcraft*.

WITE, WITA, or WYTE, in ancient Customs, a Punishment, Forfeiture, Penalty, Fine or Mulct, anciently of XXX Shillings. See WYTE.

Hence *Wite*, or *Wittree*, one of the Terms of Privilege granted our Fortmen; signifying a Freedom or Immunity from Fines or Amercements: Or, as 'tis vulgarly conceiv'd, from being liable to be begg'd for Fools for lack of *Wit*.

*Wita Plena*, signify'd a Forfeiture of fifty Shillings.—*Si Pundereche fat in Curia Regis Plena Wita sit; alibi quinque Marce.*

*Secundum Witam jurare*, was to purge one's self by the Oaths of so many Witnesses, as the Nature of the Crime, and the Punishment, or *Wite*, did require. See PURGATION.

—*Jurat secundum Witam quod nec fuerat furti confcius nec coadjutor in eo.* Leg. Ine.

Hence *Bloodwita*, *Fintwita*, *Legerwita*, *Ferdwita*, *Childwita*, *Wardwita*, *Heingwita*, &c. See BLOODWITA, FINTWITA, &c.

WITHERNAM—Where Goods are taken by colour of Distress, and driven to an Hold, or out of the County; so that the Sheriff cannot upon the Replevin make deliverance thereof to the Party distrain'd: In this Case the *Writ of Withernam*, or *de writto namio*, is directed to the Sheriff, for the taking as many of the Party's Beasts as he did thus unlawfully distrain; or as much Goods of his, till he has made deliverance of the first Distress. See DISTRESS, REPLEVIN, &c.

The Word is compounded of the *Saxon Wither*, *contra*, against, and *Nam*, *castro*, taking; *q. d.* Reprisals. See NAM.

WITHERS of an Horse, the Junction of the Shoulder-Bones at the bottom of the Neck and Main, toward the upper part of the Shoulder. See HORSE.

WITNESS, *Testis*, a Person who certifies, or asserts the Truth of any Fact. See EVIDENCE.

Two Eye-Witnesses, or *de Visis*, not suspected, are deem'd a conclusive Proof. See TESTIMONY.

False Witnesses, Suborners of Witnesses, &c. are punish'd with the Pillory; in several other Countries, with Death.

In a Synod at Rome, under Constantine, in the Year 320, it was decreed, that there should be 72 Witnesses heard, to

condemn a Bishop; which was call'd *libra testium*, a Pound of Witnesses. Accordingly there were 72 Witnesses heard against Pope Marcellinus; who, says the Historian, *erat electi libra occidua*.

Antiently there were Synodal Witnesses, *Testes Synodales*, in each Parish, chose by the Bishop, to enquire into the Heresies, and other Crimes of the Parishioners; and to make Oath thereof on the Relicks of the Saints. See SINASMEN.

Among the Romans it was a Custom to pull or pinch the Ears of Witnesses present at any transaction; that they might remember it when they were call'd to give in their Testimony.

WITTENA-Genote, among our Saxon Ancestors, a Term literally signifying Council, or Assembly of Sages; apply'd to the Great Council of the Land, now call'd the Parliament. See PARLIAMENT.

WOAD, or GOUD, or GAUD, *Ghudo*, *Guadano*, a Drug used by the Dyers, to give a blue Colour; call'd also *Pajel*. See BLUE.

It arises from a Seed, sown annually in the Spring; which puts forth a Plant call'd *Glossum Sativum*, whose Leaves resemble those of Plantain.—They have usually three, four, or five Crops of Leaves every Year; but only the two or three first are of any Value; whereof the first is best, and the rest in their Order.

When the Leaves are ripe, they gather them; and letting them lie some time, put them under the Wheel to bruise or grind them; after which they are laid eight or ten days in Piles or Heaps; and at last reduced into a kind of Balls which are laid in the Shade on Hurdles to dry.

This done, they grind 'em to Powder; and when ground, spread it on a Floor, and water it, which they call *Conching*.

Here they let it smoke and heat, till by torrifing it every day, it become quite dry, which they call *Silvering*. A week after which, it is in a condition to be used in dyeing.

The ancient Britons used to dye their Bodies herewith; and it was from this Plant that Glafe took its Denomination. See GLASS.

A *Woad blue* is a very deep blue, almost black; and is the Base of so many sorts of Colours, that the Dyers have a Scale whereby they compose the divers Casts or Degrees of *Woad* from the brightest to the deepest. See DYING.

WOLD, signifies a plain Down, or open Champain-Ground, hilly, and void of Wood.—Hence the Names, *Stow in the Wold*, and *Catfold in Gloucestershire*; whence also that part of *Leicestershire*, which lies Northward beyond the *Wreke*, is call'd the *Wold of Leicestershire*.

WOLVES Teeth of an Horse, are over-grown Grinders, the Points of which being higher than the rest, prick the Tongue and Gums in feeding, so as to hinder the Chewing of the Meat.

They are seldom met with in young Horses; but if the Teeth be not daily worn by chewing, they will grow up even to pierce the Roof of the Mouth. See TEETH.

WOMAN, *FEMINA*, *Mulier*, the Female of Man. See FEMALE and MAN.

St. *Augustine* calls Women the *Devout Sex*: at least this is the common Opinion; tho' others rather think that in the Prayer usually attributed to that Father, and still recited in the *Romish Church* to the holy Virgin, the Words *intercede pro devoto Feminine sexu*, are to be understood of Women devoted or consecrated to God in Religious Houses, which had been sufficiently express'd by the Words, *Ora pro populo, interceui pro Clero*. See SEX; and also RELIGIOUS, &c.

'Tis a popular Tradition among the *Mahometans*, which obtains to this day, that Women shall not enter Paradise. See PARADISE.

An Anonymous Author, about the Close of the XVIIth Century, published a little *Latin Dissertation* to prove that Women are not Men; that is, are not reasonable Creatures: *Dissertatio persequenda qua Anonymus probare nititur Mulieres homines non esse*.—He also endeavours to prove, what naturally follows from his Principle, *vis*. That Women shall not be saved; that there is no future Life or Happiness for them.

His Proofs are all taken from Scripture, or founded on Scripture.—Tho', after all, his Aim is not so much to degrade Women to the condition of Brutes; as to shew the Ridicule and Weakness of that Principle or Method of the Anabaptists and some others, who, in Points of Controversy, admit of no Proofs or Considerations but what are taken from Scripture alone. This appears from the Conclusion of the Work. *Probat, opinor, lucidissimis SS. Literarum Testimoniis, Multicem non esse hominem, nec esse salvandi: Quod si non effeci, ostendi tamen universo Mundo quo modo hujus temporis Heretici, & presertim Anabaptiste, Sacram solum explicare Scripturas, & sua utantur Methodo ad subsistenda sua execranda Dogmata.*

Yet, *Simon Gedicens*, a *Lutheran* Divine, wrote a serious Confutation of this Piece, in 1593; wherein he rebukes the *Women* to the Expectation of Heaven on their good Conditions.

The ancient *Marcionites* allow'd their *Women* to baptise; as we are assured by *St. Epiphanius*, *Hæc. 42. c. 4*.—The *Montanists* admitted *Women* to the Priesthood, and even the Episcopate. *Epiph. Hæc. 49. c. 2*.—The modern *Quakers* also permit their *Women* to preach and prophesy on an equal footing with the Men. See *MARCIONITE*, *MONTANIST*, and *QUAKER*.

'Tis a Point much controverted, how far Learning and Study become the Sex.—*Erasmus* handles the Question at large in one of his Letters to *Budens*: *Lud. Vices* in his *Institutio Famine Christianæ* has a Chapter express on the same Subject. *Madam Schurmann*, a learned *German* Lady, has gone beyond 'em both, in a Treatise on this Problem; *Nine Famine Christianæ conveniunt studium Literarum?*

Several of the *Women* remarkable for Learning have been also distinguish'd for their want of Conduct: The Reason, no doubt, lay in this, that their first Studies lying in Books of Gallantry and Intrigue, the Imagination was early turn'd that way, and the Memory fill'd with a sort of Ideas, which a favourable Disposition and Age adopted too easily, and improved too fast.—'Tis not that Study in itself, has any natural tendency to produce such Effects; rather the contrary: The close abstracted Researches of Metaphysics, Logica, Mathematics, Physics, Criticism, &c. no doubt, would be one of the surest Means to secure, and establish the Virtue of Continency in a *Woman*.

A *WOMAN* in *England*, as soon as she is married, with all her Moveables, is wholly in *potestate viri*, at the Will and Disposal of her Husband. See *FEME*.

There are divers considerable things relating to *Women*, in the Laws of *England*; which see under the Article *WIFE*.

WONDER; see *MIRACLE*.

The Seven Wonders of the World, as they are popularly call'd, were, the *Egyptian* Pyramids; the *Mausoleum* erected by *Artemisa*; the Temple of *Diana* at *Ephesus*; the Walls and hanging Gardens of the City of *Babylon*; the Colossus or Brazen Image of the Sun at *Rhodes*; the Statue of *Jupiter Olympius*; and the Pharos or Watch-Tower of *Ptolemy Philadelphus*. See *PYRAMID*, *MAUSOLEUM*, *COLOSSUS*, *PHAROS*, &c.

WOOD, *Lignum*, a solid Sublance, whereof the Trunks and Branches of Trees are form'd; and deriving its Growth from certain Juices in the Earth. See *TRUNK*, *BRANCH*, &c.

The Wood is all that part, in a Tree, included between the Bark and the Pith. See *TREE* and *BARK*.

*Dr. Greav*, in his Anatomy of Plants, has discover'd, by means of the Microscope, that what we call Wood in a Vegetable, notwithstanding all its Solidity, is only an assemblage of infinite minute Canals, or hollow Fibres, some of which rise from the Root upwards, and are dispos'd in form of a Circle; and the others, which he calls *Insertions*, tend horizontally from the Surface to the Centre; so that they cross each other, and are interwove like the Threads of a Weaver's Web. See *VEGETATION*, *SAP*, &c.

Woods are distinguish'd into divers Kinds; with regard to their Nature, Properties, Virtues, and Uses.

Of Wood, consider'd according to its Qualities, whether Useful, Curious, Medicinal, &c. the Principal is that call'd *Timber*, used in building Houses, laying Floors, Roofs, Machines, &c. See *TIMBER*.

Woods valued on account of their Curiosity, are *Cedar*, *Ebony*, *Box*, *Calamitane*, &c. which, by reason of their extraordinary Hardness, agreeable Smell, or beautiful Polish, are made into Tables, Combs, Beads, &c. See *EBONY*, &c.

The Medicinal Woods are *Guaiaac*, which the *Spaniards* call *Ligno Sancto*; *Aloes* or *Agilothum*, *Sassafras*, *Neophrisicum*, *Santal*, *Sarsaparilla*, *Appalathum*, *Eagle Wood* or *Pao & Aquilla*, &c. See *ALOES*, *SASSAFRAS*, &c.

Woods used in Dying, are the *Indian Wood*, *Brass*, *Campêche*, &c. See *BRASS*, &c.

Cord Wood is Wood for the Fire, generally made of the Branches or Loppings of Trees, piled up in Order.

This is limited to be below seventeen Inches, and above six Inches thick, and at least three Foot and a half long. See *CORD*.

Fossil, or Subterraneous Wood.—There are divers Places where Wood is found under ground: Whether overturn'd, and buried there from the time of the Deluge, as many suppose; or whether form'd and produced there, as *Jet* is known to be. See *FOSSIL*, *JET*, &c.

Not long ago, there were found in *England*, at above a hundred Foot depth, several huge Oaks with all their Branches on, and which, by their subterraneous Situation, had contracted a black Colour, nothing inferior to *Jet*, join'd with a Hardness which far surpass'd that of any living Oak.—'Tis hard to conceive how such Trees should come there, unless

by a general Subversion of the whole terrestrial Globe at the Flood. See *DELUGE*.

*Mr. Boyle* mentions a huge Oak dug out of a Salt-Mine in *Transylvania*, so hard as not easily to be wrought on by Iron-Tools; yet being expos'd to the Air out of the Mine, became so rotten, that in four days it crumbled between the Fingers. *Difert. de Admir. Hung.* And *Mr. Derham* observes the fame of the Trees lately turn'd up by the Breaches at *Dagenham*, &c. *Philos. Trans. N° 535*. See *Moss*.

WOOD, *Sylva*, in Geography, a Multitude of Trees, extended over a large continued Tract of Land, and propagated without Culture. See *FOREST*.

The generality of Woods only consist of Trees of one Kind.—At *Cape Verd* in *Africa* are Woods of Orange and Lemon Trees; in *Ceylon* are Woods of Cinnamon Trees; in the *Molucca* Islands Woods of Caraway Trees; in the Islands of *Nero*, *Lantour*, *Loagan*, &c. Woods of Nutmeg Trees; in *Brass*, Woods of Brazil Trees, &c. in *Namibia*, Woods of Date Trees; in *Madagascar*, Woods of Tamarind Trees, &c.

WOOD and WOOD, in the Sea-Language, is when two Pieces of Timber are so let into each other, that the Wood of the one joins close to the other.

WOOD-GELD, *Woodgeldum*, in our ancient Customs, the gathering or cutting of Wood within the Forest.—Or it may denote the Money paid for the same, to the Foresters. Sometimes it also seems to signify an Immunity from this Payment by the King's Grant.

*Crompton* says expressly, it signifies to be free from the Payment of Money, for taking of Wood in a Forest. See *GELD*.

Wood-Hay, an ancient Custom at *Exeter*; whereby a Log out of every Seam of Wood brought over *Ex* Bridge, is taken towards the Reparation of that Bridge. *Antiq. of Exeter*.

Wood-Corn, is a certain Quantity of Oats, or other Grain, antiently given by customary Tenants to their Lord, for the liberty to pick up dead or broken Wood.

Wood-Lands, are Places where there are many Woods—the Word is also more generally taken to signify inclosed Countries.

Wood-Mote, the ancient Name of that For-ft-Court, now call'd the Court of Attachment. See *ATTACHMENT* and *FOREST*.

Wood-Plea-Court, is a Court held twice a Year in the Forest of *Clau* in *Shropshire*, for determining all Matters relating to Wood, and the feeding of Cattel there.—Perhaps it was originally the same with *Wood-Mote-Court*.

WOODWARD, an Officer of the Forest, whose Function it is to observe any Offences either in Vert, or Venison, committed within his Charge; and to present the same; and in case any Deer are found kill'd or hurt, to inform the Verderer thereof, and present 'em at the next Court of the Forest. See *FOREST*.

Woodwards may not walk with Bows and Shafts, but with Forest-Bills. *Armenus & Calamus gessare in Foresta non licet, sed (ut referrii ut Verbo) Habetum tantummodo*. *Term. Hil. An. 15 Ed. 3*.

WOOF, among Manufacturers, the Threads which the Weavers shoot a-crofs, with an Instrumēt call'd the *Shuttle*, between the Threads of the Warp; to form the Web. See *WARP*, *WEB*, *WEAVING*, &c.

The Woof is of different Matter, according to the Piece to be wrought.—In *Taffaty* both Woof and Warp are Silk. See *TAFFATY*.

In *Mohais* the Woof is usually Wool, and the Warp Silk.—In *Sattins* the Warp is frequently Flax, and the Woof Silk. See *CLOTH*, *SERGE*, *SATIN*, *VELVET*, &c.

WOOL, the Hair, or Covering of Sheep; which, wash'd, shorn, dress'd, comb'd, spun, wove, &c. makes divers kinds of Stuffs, Cloths, &c. for Apparel, Furniture, &c. See *HAIR* and *MANUFACTURE*.

While the Wool remains in the State it was first shorn off the Sheep's Back, and not sorted into its different Kinds, it is call'd *Fleece*. See *FLEECE*.

Each Fleece consists of Wool of divers Qualities and Degrees of Fineness, which the Dealers therein take care to separate.

The French and *English* usually separate each Fleece into three Sorts; viz. 1. *Mother-Wool*, which is that of the Back and Neck. 2. The Wool of the Tails and Legs. 3. That of the Breast and under the Belly.

The *Spaniards* make the like division into three Sorts, which they call *Prime*, *Second*, and *Third*; and for the greater Ease, denote each Bale or Pack with a Capital Letter denoting the Sort.—If the Triage or Separation be well made, in fifteen Bales there will be twelve mark'd R, that is, *Refine* or *Prime*; two mark'd F, for *Fine* or *Second*; and one S, for *Third*.

The Wools most esteem'd are the *English*, chiefly those about *Leominster*, *Cotswold*, and the Ille of *Wight*; the *Spanish*, principally those about *Segevia*; and the *French* about *Berry*;

which last are said to have this peculiar Property, that they will knot or bind with any other sort; whereas the rest will only knot with their own kind.

Among the Antients, the Wools of *Africa*, *Megara*, *Lacedæa*, *Apulia*, and especially those of *Tarentum*, *Parma*, and *Alino* were the most valued. *Colomella* sets the two last even above that of *Tarentum*, Lib. vii. c. 2. And *Varro* assures us, the People there used to clothe their Sheep with Skins, to secure the Wool from being damaged. *De Re Ruf.* L. II. c. 2.

*Tavernier* affirms, that the Wools in *Asia* are incomparably finer than those of *Europe*; and there is no doubt but that Wool was the Golden Fleece fought at *Colchos*. See GOLDEN FLEECE.

The Art of Preparing and Working Wool is attributed by the Antients to *Minerva*; who accordingly it made the Genius and Protectress thereof. See WOOLLEN.

**English Wool.**—The Wools of *England* have always been in the highest repute; and that more abroad than at home.—Some we have, which manufactured by our own Clothiers, *Chamberlain* observes, does both for softness and fineness, viz with the choicest Silks. *Spanish Wools*, we know, bear a great Price among us; but 'tis certain make the greatest part of that, which, when manufactured, our Clothiers, &c. call *Spanish Cloth*, grows in *England*. Add, that the French can make no good Cloth of their own Wool, without at least one third of *English Wool* mix'd with it.—'Tis allow'd, the goodness of the *Spanish Wools* is owing to a few *English* Sheep sent over into *Spain* as a Present by *Henry II. of England*; or, as others will have it, tho' we think mistakenly, by *Edward IV.* in 1465.

The fineness and plenty of our Wools is owing, in some measure, to the sweet, short Grass in many of our Pastures and Downs; tho' the advantage of our Sheep feeding on this Grass all the Year, without being obliged to be shut up in Folds during the Winter, or to secure 'em from Wolves at other times; contributes not a little thereto.

The Scotch and Irish Wools are commonly sold abroad for *English*; and upon the same footing.—But Foreigners, skil'd in those Matters, find they come far short of it in fineness, tho' at some Markets the Irish is even said to be prefer'd to the *English*.

The yearly Produce of Wool in *England* is calculated by *Dr. Davenant* and *Mr. King* at two Millions Sterling. See WOOLLEN MANUFACTURE.

Antiently, the principal Commerce of the Nation consisted in Wool unmanufactured; which Foreigners, especially the French, Dutch, and Flemish bought of us. Inasmuch that the Customs of *English Wool* exported in *Edward* the Third's Reign, amounted, at 50 s. a Pack, to 250000 l. per Annum. An immense Sum in those days. See COMMERCE.

This excessive Custom on the Export of unmanufactured Wool, set our People to the making it into Cloth themselves.—In which they succeeded so well, that towards the Close of the sixteenth Century, under the Reign of *Queen Elizabeth*, the Exportation of any Wool at all was absolutely prohibited, and this upon pain of having the right Hand struck off. See CONTRABAND.

From that time, *England* has been exceedingly jealous of its Wool; to prompt their Vigilance, the Lords in Parliament are seated on Wool-Packs.—Accordingly, scarce a Parliament but has renew'd and reinforced the Prohibition; particularly, about the middle of the seventeenth Century, the exporting of Wool was made a Capital Crime.

But all these Precautions are ineffectual; the *English* themselves, particularly the Coasts of *Sussex*, making use of the long Winter-Nights to waft over their Wools to *France*: being sure of carrying them to a good Market, they despise the Penalty, with an Intrepidity, that the rest of *Europe* are amaz'd at. See OWLERS.

*M. Colbert*, a Name the French Manufactures and Commerce are infinitely indebted to, had entertain'd a Design of procuring some of our *English* Sheep, and propagating them in *France*; hoping, that by chafing them, in the Provinces of that Kingdom, such Pastures, and such a Sky as they had in their own Island, they might there be perpetuated; and *France* be no longer oblig'd precariously to depend on the clandestine Supplies of Wool from the *English* Owl-ers.—But the Count de *Cominges*, then Ambassador of *France* at the *English* Court, laid the impossibility of having such an Export of Sheep, and the almost equal impossibility of keeping and making them multiply there, so strongly before him; that he abandon'd the Design.

Wool is reckon'd by the Sack, containing two Weights 3 the Weigh six Tod and a half 3 the Tod two Stone; the Stone two Cloves 3 and the Clove seven Pounds. Twelve Sacks make a Last, or 4368 Pounds. See LAST, &c.

A Sack of Wool, or 364 Pounds, is sufficient for four Standard Cloths, to render them true Breadth, i. e. six Quarters and a half 3 true Weights, i. e. sixty Pounds; and true Length, i. e. twenty-four Yards.

For the divers Preparations of Wool, see CARDING, COMbing, SPINNING, WEAVING, SCOWRING, FULLING, DYING, CLOTH, &c.

Wool-Drivers, are those who buy Wool of the Sheep-Masters in the Country, and carry it on Horse-Back to the Clothiers, or Market-Towns, to sell it again.

Wool-Straple, is a City or Town where Wool used to be sold. See STAPLE.

Wool-Winders, are Persons employ'd in winding up Fleeces of Wool into Bundles, to be pack'd and sold by Weight.—These are sworn to do it truly between the Owner and the Merchant.

WOOLLEN MANUFACTURE, includes the several sorts of Commodities into which Wool is wrought; as broad Cloths, long and short Kerseys, Beys, Serges, Flannel, Perpetuanas, Sags, Stuffs, Frieze, Penningons, Stockings, Caps, Roges, &c.—Each whereof see under its respective Article, CLOTH, SERGE, FLANNEL, &c.

The Woollen Manufacture, which now makes the principal Article both in our foreign and domestic Trade, being that which furnishes the Cargoes of our Vessels, that employs our People, &c. may be said to have had its Rise in the sixteenth Century.

Till that time, our Wool was all sold in the Fleece, to such of our Neighbours as came to fetch it.—Among our Customers, however, the principal were the *Flemings* and *Brabanters*, and particularly the Merchants of *Gant* and *Louvain*, who took off vast Quantities to supply two Manufactories that had flourish'd in those two Cities from the tenth Century, and had furnish'd the greatest part of *Europe*, and even *England* itself with all sorts of Woollen Cloths, &c. But the Richness of the Manufactories of *Gant*, and the incredible Number of Hands employ'd therein, having spirited up the Inhabitants to revolt, divers times, against their Sovereigns, on account of certain Taxes which they refused to pay; the Seditious were at length punish'd and dispersed, and part of 'em took refuge in *Holland*, and the rest in *Louvain*.

These last, together with their Art of Manufacturing Cloths, carry'd with 'em their Spirit of Sedition.—And it was not long e'er several of 'em, to avoid the Punishment they had deserved for killing some of the Magistrates, removed into *England*; where they instructed our People how to work their own Wools.

This Establishment is refer'd to the Year 1430; from which time no Endeavours have been spar'd to keep our Wool to ourselves. See WOOL.

The President *Tinnans* makes this Epocha an hundred Years later; and attributes the Establishment of the Woollen Manufactures in *England* to *Queen Elizabeth*, and the Troubles about Religion which the Severity of the Duke of *Alva* and the *Spanish* Inquisition had occasion'd, and kept up so long in the *Low Countries*.—But what that noble Author says, is either to be understood of their Perfection, than their first Establishment; and of the several great Manufactories then set up at *Norwich*, *Colchester*, *Sandwich*, *Hampton*, &c. For in the *English* and *Flemish* Historians we find mention of the Manufactures of *London* long before any part of the seventeen Provinces had attempted to throw off the *Spanish* Yoke.

As this Manufacture now stands, *Dr. Davenant* and *Mr. King* compute the Produce thereof to be eight Millions per Annum; three fourths whereof are consumed at home, and the rest exported. See REVENUE, POLITICAL ARITHMETIC, &c.

So jealous are we now become of our Wools, that besides the Precautions taken to use all our own Wools ourselves; we have added that of selling 'em ourselves, and of carrying 'em to the Places where they are required; not admitting Strangers to come and buy any in *England*. See NAVIGATION.

And hence the establishment of those famous Magazines in *Holland*, the *Levants*, and the *North*, where our Wools are deposited to be vend'd by Factors or Commissioners.—The Magazine in *Holland* has changed place divers times; and it has been successively at *Middleburg*, *Delft*, *Rotterdam*, and *Dort* where it now remains; and where all the Germans come to furnish themselves.—That for the *Levant* is at *Smyrna*; and that for the *North* at *Archangel*.

A Pack, or 240 Pounds Weight of short Wool, 'tis computed, employs sixty-three Persons a Week, to manufacture it into Cloth; viz. three Men to Sort, Dry, Mix, and make it ready for the Stock-Carder; five to Scribble, or Stock-Card it; thirty-five Women and Girls to Card and Spin it; eight Men to Weave it; four Men and Boys to Spoole it; and read Quills; eight Men and Boys to Sower, Bur, Mill or Full it, Row, Shear, Pack, and Press it.

A Pack of large long combing Wool made into Stuff, Serges, Sagathies, &c. for the *Spanish* Trade, will employ for one Week 222 Persons; whose Wages amount to 45 l. 10 s.—Thus, 7 Combers 3 l. 10 s. Dyers 5 l. 150 Spinners 18 l.

20 *Throwers and Doublers* 5 l. 25 *Weavers and Attendants* 12 l.

A Pack of *Wool* made into Stockings will employ for one Week 284 Persons, who will earn 56 l.—Thus, 10 *Combors* 5 l. 5 s. the *Dyer* 1 l. 6 s. 102 *Spinners* 15 l. 12 s. *Doublers and Throwers* 4 l. 10 s. 60 *Stocking Weavers* 30 l.

**WORD, Vox, Vocabulum**, in Language, is an articulate Sound designed to represent some Idea. See SOUND, VOICE, IDEA, &c.

In writing, a *Word* is an assemblage of several Letters, forming one or more Syllables, and signifying some thing, or LETTER and SYLLABLE.

The *Port-Royalists* define *Words* to be distinct articulate Sounds agreed on by Mankind to convey their Thoughts and Sentiments by. See LANGUAGE.

Grammarians divide *Words* into eight Classes, call'd *Parts of Speech*; which are the *Noun, Pronoun, Verb, Participle, Adverb, Conjunction, Preposition, and Interjection*; to one or other of which all the *Words* and Terms in all Languages, which have or may be invented to express our Ideas, are reducible. See each under its proper Article, NOUN, PRONOUN, VERB, &c.

*Words*, again, are divided into *Primitives and Derivatives, Simple and Compound, Synonymous and Equivocal*. See PRIMITIVE, DERIVATIVE, &c.

With regard to their Syllables, *Words* are further divided into *Monosyllables, and Polysyllables*. See MONOSYLLABLE, &c.

The Grammatical Figures of *Words, Tropi Verborum*, which occasion changes in the Form, &c. of *Words*, are *Syncope, Apocope, Apostrophe, Diacresis, Apharesis, Praetibis, Epenthesis, Paragege, Metathesis, &c.* See each in its proper Place, SYNCOPE, APOCOPE, &c. see also TROPE and FIGURE.

The Use of *Words*, we have observed, is to serve as sensible Signs of our Ideas; and the Ideas they stand for in the Mind of the Person that speaks, are their proper Significations.

*Simple and Primitive Words* have no natural Connexion with the things they signify; whence there is no rationale to be given of them: It is by a more arbitrary Institution and Agreement of Men that they come to signify any thing. Certain *Words* have no natural Propriety or Aptitude to express certain Thoughts, more than others; were that the case, there could have been but one Language. See PRIMITIVE.

But in *Derivative and Compound Words* the Case is somewhat different. In the forming of these, we see, a regard is had to Agreement, Relation, and Analogy: Thus, most *Words* that have the same ending, have one common and general way of denoting or signifying things; and those compounded with the same Prepositions, have a similar Manner of expressing and signifying similar Ideas in all the learned Languages where they occur.

For the Perfection of Language, 'tis not enough, Mr. Locke observes, that Sounds can be made Signs of Ideas; unless these can be made use of, so as to comprehend several particular things; for the multiplication of *Words* would have perplexed their use, had every particular thing needed a distinct Name to be signified by.

To remedy this Inconvenience, Language had a farther Improvement in the use of general Terms whereby one *Word* was made to mark a Multitude of particular Existences; which advantageous Use of Sounds was obtained only by the difference of the Ideas they were made signs of; Those Names becoming general, which are made to stand for general Ideas; and those remaining particular, where the Ideas they are used for are particular. See GENERAL Terms.

It is observable, that the *Words* which stand for Actions and Notions quite removed from Sense, are borrow'd from sensible Ideas; as, to imagine, Apprehend, Comprehend, Understand, Adhere, Conceive, Intill, Disguist, Disturbance, Tranquillity, &c. which are all taken from the Operations of things sensible, and apply'd to Modes of Thinking—Spirit, in its primary Signification, is no more than Breath; Angel, a Messenger. By which we may guess what kind of Notions they were, and whence deriv'd, which fill'd the Minds of the first beginners of Languages, and how Nature, even in the naming of things, unawares, suggest'd to Men the Originals of all their Knowledge: whilst, to give Names that might make known to others any Operations they felt in themselves, or any other Ideas, that came out under their Senses, they were forced to borrow *Words* from the ordinary and known Ideas of Sensation. See SENSATION, PERCEPTION, &c.

The Ends of Language in our Discourse with others, are chiefly three: First, to make our Thoughts or Ideas known one to another.—This we fail in, 1. When we use Names without clear and distinct Ideas in our Minds. 2. When we apply received Names to Ideas, to which the common use

of that Language doth not apply them. 3. When we apply them unadvisedly, making them stand now for one, and anon for another Idea.

Secondly, To make known our Thoughts with as much ease, and quickness as is possible.—This, Men fail in, when they have complex Ideas, without having distinct Names for them; which may happen either through the defect of a Language, which has none; or the fault of that Man, who has not yet learned them.

Thirdly, To convey the Knowledge of Things.—This cannot be done, but when our Ideas agree to the reality of things. He that hath Names without Ideas, wants meaning in his *Words*, and speaks only empty Sounds. He that hath complex Ideas, without Names for them, wants dispatch in his Expressions: He that useth his *Words* loosely and unsteadily, will either not be minded, or not understood. He that applies his Names to Ideas, different from their common use, wants Propriety in his Language, and speaks Gibberish; and he that hath Ideas of Substances, disagreeing with the real Existence of things, so far wants the Materials of true Knowledge. See KNOWLEDGE.

*Word, or Watch-Word*, in an Army, or Garrison, is some peculiar *Word*, or Sentence, by which the Soldiers know, and distinguish one another in the Night, &c. and by which Spies, and designing Persons are discovered.

It is used also to prevent Surprizes.—The *Word* is given out in an Army every Night by the General, to the Lieutenant, or Major-General of the Day, who gives it to the Majors of the Brigades, and they to the Adjutants; who give it first to the Field-Officers, and afterwards to a Sergeant of each Company, who carry it to the Subalterns.

In Garrisons it is given after the Gate is shut, to the Town-Major, who gives it to the Adjutants, and they to the Sergeants. See ROUNDS.

*Word*, in Heraldry, &c. See MOTTO.

*WORK-HOUSE*, a Place where indigent, vagrant, and idle People are set to work, and maintain'd with Clothing, Diet, &c.

Such is *Bridewell*, and several other Places about the City and Suburbs; particularly that in *Bishopsgate-street* for employing the poor Children of the City and Liberties, who have no Settlement; and that for the Parish of St. *Margaret's Westminster*, call'd the *Grey-Coat Hospital*. See BRIDEWELL and HOSPITAL.

At *Amsterdam* they have a famous *Work-House*, or House of Correction, call'd the *Raspdyffe*, which, by a Privilege granted in 1602, has alone the Right of Shaving and Cutting the Dyers Woods, as Brasil, Santal, Campeche, Sassafras, &c.

Each Person, tolerably strong, kept in the House, is oblig'd to furnish 150 Pounds of rasp'd Wood per Day; and the weaker, a certain Quantity of Chips. See RASPYFFE.

**WORKS, Opera**, in Fortification, the several Lines, Trenches, Ditches, &c. made round a Place, an Army, &c. to fortify and defend it. See LINE, TRENCH, &c.

The principal *Works* in a Fortrels or fortify'd Place, see under the Articles FORTIFY'D PLACE, FORTIFICATION, &c.

<i>Crown-Work,</i>	} See {	<i>Crown-Work.</i>
<i>Horn-Work,</i>		<i>Horn-Work.</i>
<i>Out-Work,</i>		<i>Out-Work.</i>
<i>Field-Work,</i>		<i>Field-Work.</i>

**WORLD, Mundus**, the Assemblage of Parts which compose the Universe; call'd by the *Greeks*  $\tau\acute{o}$   $\kappa\acute{o}\sigma\mu\acute{o}\varsigma$ , and by the *Latins*, *Universum*. See UNIVERSE.

The Duration of the *World* is a Thing has been greatly disputed.—*Plato*, after *Ocellus Lucanus*, held it to be eternal; and to have flow'd from God, as Rays flow from the Sun. *Aristotle* was much of the same mind: he asserts, that the *World* was not generated, so as to begin to be a *World*, which before was none; and, in effect, his whole eighth Book of *Phys.* and first Book of *de Caelo*, is spent in proving the Eternity of the *World*. See ETERNITY.

He lays down a pre-existing and eternal Matter as a Principle; and thence argues the *World* eternal. His Argument amounts to this, that it is impossible an eternal Agent, having an eternal passive Subject, should continue long without Action. See ARISTOTELIAN.

His Opinion was generally follow'd; as seeming to be the fittest to end the Dispute among so many Sects about the first Cause. See CAUSE.

*Epicurus*, however, tho' he makes Matter eternal; yet shews the *World* to be but a new thing form'd, out of a fortuitous Concourse of Atoms. See *Lucretius*, lib. V. See MATTER, ATOM, &c. See also EPICUREAN, &c.

Some of the modern Philosophers refuse the imaginary Eternity of the *World*, by this Argument: That, if it be *ab Eterno*, there must have been a generation of Individuals in a continual Succession from all Eternity; since no Cause can be assign'd why they should not be generated, *viz.* one from another. Therefore, to consider the Origin of Things, and the

The Series of Causes, we must go back *in infinitum*, i. e. there must have been an infinite Number of Men and other Individuals already generated; which subverts the very Notion of Number. And if the Cause which now generates have been produced by an infinite Series of Causes; How shall an infinite Series be finite, to give room for new Generations?

Dr. Halley suggests a new Method of finding the Age of the World, from the degree of Saltness of the Ocean. See SALTNES, &c.

'Tis another popular Topic of Controversy, Whether the World be finite, or infinite? See the Arguments on both sides under the Article UNIVERSE.

'Tis likewise disputed, Whether it were possible for several Worlds to exist.—Some hold the Affirmative, from an Opinion of the infinite Power of the Deity; it being a setting Bounds to Omnipotency, to say, that he created so many Bodies as first, that he could not create more.

The Cartesians maintain the Negative upon these Principles: That it is a Contradiction to say, there are several Worlds existing at the same time; since this implies several Universes of created Beings, the World being the *res* *universa*. That if there were several Worlds, they must either be at a distance from one another, or contiguous; but neither can be said: For were they contiguous, they would only constitute one; and were they distant, there must be something between. But what can be between? If it be extended, it is corporeal; and instead of separating the several Worlds, will connect 'em into one.

The World is sometimes divided into *Upper*, and *Lower*—The *Lower World*, or Sublunary, is the Globe of our Earth. See EARTH.

The *Upper World* includes the Heavens, and heavenly Bodies. See HEAVEN.

System of the World; see SYSTEM.

Soul of the World; see ANIMA MUNDI.

Map of the World; see MAP.

WORMS, in Medicine; see VERMES.

Sir *Theodore Mayerne* assures us, in the *Philosoph. Transf.* N<sup>o</sup> 211. That the famed Sagar, or Remedy given by *Pontenus*, (a celebrated Chymical Empiric for the Worms in Children, is fifteen Grains of *Mercurius Dulcis* with five Grains of Scammony, or two or three times as much Sugar, made up in Lozenges. He adds, that this Dose, which in France purges grown Persons, is ineffectual in England to Persons of above fifteen Years old, and ought to be augmented.

In the same *Transact.* N<sup>o</sup> 212. we have Accounts of divers remarkable Operations whereby Worms were taken out of divers unsuspected Parts of the Body; the Operators being chiefly Women. *Mrs. Mary Hastings* is there recorded as famous for the discovery of Worms hid in the Face, Gums, Tongue, &c. which she managed with such Address, that she took them out of any part affected with a Goose-Quill.—*Mr. Denis* relates, that he himself was cured of certain odd Tumors on his Tongue by one of those Worm Doctrines, *Mrs. French*; who, piercing the parts affected with a Lancet, drew out five or six Worms at a time.—In less than eight days, he assures us, she took out of his Tongue above a hundred Worms, and thirty out of his Gums. See HYDATIDES.

In *Persia*, &c. there are very long, slender Worms, six or seven Yards long, bred in the Legs and other Parts of Mens Bodies: When arriv'd at a certain Pitch, they put out their Heads, Necks, &c. and withdraw them (if displeas'd or hurt) again, causing intolerable Pains, Fevers, &c. See CRINONES.

*Aristotle* observes, that all Deer have Worms under their Tongues.—Sheep's Noses often abound with them.

WORM, in Chymistry, a long, winding Pewter-Pipe, which Distillers and Apothecaries place in a Tub of Water to cool and condense the Vapours in the Distillation of Spirits. See ALEMBOIC, DISTILLATION, &c.

Formerly, this Worm, or something like it, was placed above the Head of the Still, with a Refrigeratory at the upper end of it, which is useful enough in the Distilling of Spirit of Wine. See REFRIGERATORY.

This the Chymists call a *Serpentine*. See SERPENTINE.

To WORM a Cable, in the Sea-Phrase, signifies to strengthen it by winding a small Rope all along between the Strands. See CABLE, &c.

To WORM a Dog, is to take out a kind of Worm from under his Tongue; which, if let alone, would make him mad.

WORM-SEED, a kind of Worm-Powder, call'd also *Barbottin*, *Semen contra*, *Semen sanctum*, *Semen fontanicum*, and *Abrotanum*, is a kind of Seed proper to destroy Worms generated in a human Body, particularly in Children. See WORMS.

This Seed is small, of a brownish Colour, an oblong Figure, a bitter Taste, and a strong Smell.

The Place where it is produced, is *Persia*, about the Frontiers of *Muscovy*. It is brought to us from *Aleppo*, &c.—Naturalists are not agreed about the Plant that produces it. *J. Bauhin* has a large Dissertation on the Subject.—Some will have it the Species of *Alyssimum*, or *Wormwood* call'd *Santonicum*, or *Marinum Alyssimum*; others will have it the *Tanacetum*, others the *Arcotium*.

*Monf. Tournesfort* gives us the following Account of this notable Drug, in the second Volume of his Travels.—The *Semence* or *Worm-Powder*, is not gather'd like other Seeds.—The Plant grows in the Meadows, and must be let ripen; and the mischief is, that as it grows near to Maturity, the Wind scatters a good part of it among the Grass, where it is lost; and this it makes it so dear.

As they dare not touch it with the Hand for fear of making it spoil the sooner; when they would gather what is left in the Ear, they have recourse to this Expedient.—They take two Hand-Baskets, and walking along the Meadows, sweep the Baskets the one from right to left, the other from left to right, as if they were mowing; by this means the Seed is shook out into the Baskets.

It must be chosen new, greenish, of a sharp, bitter, aromatic Taste, yet disagreeable.

WORMWOOD, a Medicinal Herb, among Physicians, &c. call'd *Alyssimum*. See ALESSYMIUM.

WORMWOOD-HIVE, *Vinum Alyssinum*; see VINUM.

WORSHIP of God, *Cultus Dei*, is what we usually call Religion. See RELIGION.

This *Worship* consists in paying a due Respect, Veneration, and Homage to the Deity, under a certain Expectation of Reward. See GOD.

And this internal Respect, &c. to be shewn and testified by external Acts; as Prayers, Sacrifices, Thanksgivings, &c. See PRAYER, SACRIFICE, &c.

The *Quietists*, and some other mystic Divines, set aside not only all use of external *Worship*; but the Consideration of Rewards and Punishments. See QUIETISM.

Yet, even the Heathens had a Notion, that God did not require us to serve him for ought:—*Dii quoscumque Colendi sunt, sicut Cicero, non intelligo, nullo nec accepto ab illis nec sperato bono.*

The School-Divines divide *Worship* into divers Kinds, viz. *Latria*, that render'd to God; and *Idolatria*, that render'd to Idols or Images. To which the *Romanists* add, *Dulia*, that render'd to Saints; and *Hyperdulia*, that to the *Vrgin*. See IDOLATRY, IMAGE, DULIA, HYPERDULIA, &c.

WORSTED, or WOOLSTED, in Masters of Commerce and Manufacture, is a kind of Woollen-Thread. See WOOL.

*Worsted* is properly a Thread spun of Wool that has been combed; and which in the Spinning is twilled harder than ordinary. See COMBING.

It is chiefly used either to be knit or wove into Stockings, Caps, Gloves, or the like. See STOCKING, &c.

The name *Worsted* is supposed to be borrow'd from a Town thus call'd in *Norfolk*, noted for fine Spinning.—They who write it *Woolsted*, do it on supposition of the Word's being form'd from *Wool*, the Matter of this Thread.

WOULDING, a Sea-Term, for the winding of Ropes hard round about a Yard or Mast of a Ship, after it has been strengthened by some Piece of Timber nailed thereto.

WOUND, *Fulsum*, in Medicine and Chirurgery, a recent Separation made in the soft or fleshy Parts of the Body, from an external Cause, and particularly the Action of some hard and sharp Instrument. See SOLUTION.

Or, it is a Solution of the Continuity of a fleshy Part, made by some penetrating Body; while it yet remains fresh, bloody, and without Putrefaction: By which Circumstances it is distinguish'd from an Ulcer. See ULCER.

A like Separation happening in a bony Part, is call'd a *Fracture*. See FRACTURE. See ALSO FLESH, BONE, &c.

All Wounds proceed either from Puncture, Incision, or Contusion, according to the Nature and Make of the Instrument they were caus'd by. See PUNCTURE, INCISION, and CONTUSION.

Wounds are usually divided, with respect to their Cause, Circumstances, Cure, &c. into *Simple* and *Compound*.—*Simple Wounds* are those made by Puncture, Incision, or Contusion separately; those of the outer Skin, without any considerable loss of Substance, or hurting any remarkable Vessel; and those not complicated with any dangerous Symptoms.

*Compound Ulcers* are those made both by Puncture and Incision at the same time, to which is sometimes also added Contusion; those attended with great loss of Flesh, or the hurt of some considerable Vessel; and those made by convenient Instruments, or attended with violent Symptoms.

The History of a Wound is thus delivered by *Borhaave*—Immediately upon the Solution, the wounded Parts recede further

further and further from each other. The Blood gushes out, at first, with some violence; but stops of itself; then a bloody Scab is form'd in the Cavity of the Wound, and a thin ruddy Humour oozes out; the Lips of the Wound begin to redden, heat, ache, swell, and turn black; and (in great Wounds) a Fever and Thirstiness succeed. On the third or fourth day, there is found a white, viscid Pus; upon which, the heat, redness, tumor, &c. abate, and the Cavity gradually fills up from the bottom upwards, and from the Circumference to the Centre with growing Flesh. Lastly, the Wound dries, and cicatrises.

But note, these Symptoms vary according to the Nature and Cause of the Wound—Thus, if it be by Incision, and a large Blood-Vessel be cut, the Hemorrhage is more violent; especially if it be an Artery; in which case, florid Blood flies out impetuously and by starts: If only a Vein be cut, the Flux is more moderate and equal, and the Blood of a darker Colour—If the Wound be attended with Contusion, the Hemorrhage is small.

In Wounds, where any large Artery is quite cut in two, the Flux usually proves mortal. A lesser Artery cut transversely, flies back against the solid Parts, and will have its Mouths stop'd: If an Artery be not quite cut off, there arises a perpetual Flux; or if that be stop'd, an Anæsthesia.—A Nerve being cut off, flies back, produces a Pain, and Obstruction about the Wound; and below it, a Numbness, and waiting Immobility: The case is much the same in wounded Tendons and Membranes.—Wounds of the temporal Muscle are rarely cured; but generally bring on horrible Convulsions.

The following Wounds are commonly reputed mortal; viz. those of the Cerebellum, and of the Cerebrum, if they be deep enough to hurt the Medulla oblongata; deep Wounds in the spinal Marrow, especially the upper part thereof; those of the Heart, Lungs, Liver, Spleen, Kidneys, Pancreas, Mesentery, Stomach, Intestines, &c. Those of the Cava, Aorta, Carotides, pulmonary, and other large Veins and Arteries. Those of the Bronchia, Thorax, Diaphragm; large Wounds of the Oesophagus, Trachea, and the Bladder, and all inveterate Wounds.

In young Children and aged Persons, Wounds frequently prove mortal which seem'd but slight. Those Wounds generally prove troublesome which happen in an ill state of Body, and especially a low or hardy Diet. All Wounds are reputed more dangerous and difficult of Cure in Winter than Summer; in August than in Spring.

The Cure of Wounds consists in the Uniting of the divided Parts; which is the Work of Nature alone, and which the Chirurgion can only contribute to by removing external Impediments, and applying Medicines familiar to the Part, call'd *Vulneraries* and *Balsamics*. See *VULNERARY*, &c.

The first Step, then, to be taken in a simple Wound, is to cleanse it, and extract any heterogeneous Body that may chance to be lodged therein. Next, the Cavity to be gently wiped with Doils dipt in warm red Wine. The Lips, now to be brought together by the Bandages or Sutures; and the Wound to be covered with a Pledget dipt in Balm of Peru, or Oil of sweet Almonds—The Pain thus eased, and the Symptoms removed, the Wound is to be suppurated, deterged, incised, and cicatrized after the manner of Tumors and Ulcers. See *SUPPURATION*, *DETERGENT*, *INCARNATIVE*, *CICATRISIVE*, &c.

If the Wound be dangerous, the Symptoms violent, and the Body Cachymic, more powerful Means are had recourse to; as, first, Phlebotomy, then gentle Cathartics or Clysters; then vulnerary Drinks, Apozoms, and Pisans, with Cardiacs and Paragogs interposed.

In internal Wounds, Vulneraries and Astringes do well, particularly *Album Grecum*, River Lobsters, Mercurials, &c.

Fresh Wounds are cured ordinarily in three or four days, without any other Means than applying a few Drops of Balsam of Peru—Sometimes, however, Digestives are required.

Gun shot Wounds are usually the worst of all, by reason of the violent Contusion and Secretion of the Parts; which prevent their coming to Digestion for the Space of three or four days.

In the Cure of large Wounds, Bandages and Sutures are required, to fit and dispose 'em for healing. See *SUTURE* and *BANDAGE*.

WREATH, in Heraldry, a Roll of fine Linnen, or Silk, (like that of a Turkish Turbant) consisting of the Colours born in the Escutcheon; placed in an Atticement between the Helmet and the Crest, and immediately supporting the Crest. See *CREST*, &c.

WRECK, or SEA-WRECK, in Natural History, a kind of Herb, growing in the Sea, upon Rocks, and which the Waves tearing off, cast upon Shore.

In some Places it is used to manure the Ground—In Normandy and other Parts they burn it, and of the Ashes make a kind of Soude or Salt-wort, which they use in the

making of common green Glais, to promote the Fusion or Vitification of the Matter. See *GLASS*.

WRECK, or Ship-WRECK, in Law, &c. is when a Ship perishes in the Sea, and no Man escapes alive out of it.

The Civilians term it *Naufragium*—The Goods in the Ship, which are brought to Land by the Waves, belong to the King, or him to whom he assigns the Right thereof.

If a Man, a Dog, or even a Cat escape alive; the Party to whom the Goods belong coming within a Year and a Day, and proving the Goods to be his, shall have them again.

In divers Charters and old Writings, it appears that Wreck antiently not only comprehended Goods; which came from a perishing Ship, but whatever else the Sea cast upon Land; whether it were precious Stones, Fishes, Sea-weed, or the like.

This in the *Stat. Prærog. Reg. c. 11.*—*Rex habebit Weckum Maris per totum regnum, Bialens & Scutrones captas in Mari vel alibi infra Regnum, exceptis quibuslibet Privilegiatis locis, &c.*

This Wreck in the grand Customary of Normandy, c. 17. is call'd *Warech*, and latin'd *Verisum*; and in some of our antient Charters, *Wreche*, *Weres*, *Wreuche*, and *Seufwerp*, q. d. *Sea-up-werp* and *up-werpen*.

WRESTLING, a kind of Combat, or Engagement between two Persons, unarm'd; Body to Body; to prove their Strength and Dexterity, and try which can throw his Opponent to the Ground. See *EXERCISE*, *GAME*, &c.

*Wrestling*, *Palæstra*, is an Exercise of very great Antiquity and Fame—'Twas in use in the Heroic Age; witness Hercules, who wrestled with Anteus. See *PALÆSTRA*.

It continued a long time in the highest Repute; and had very considerable Rewards and Honours assign'd it at the Olympic Games—'Twas the Custom for the Athlete, to anoint their Bodies with Oil to give the less hold to their Antagonist. See *ATHLETA*, &c.

*Ablancon* observes, that *Lycurgus* ordain'd the Spartan Maids to wrestle in public, quite naked; to break them of their too much Delicacy and Niceness; to make 'em appear more robust, and to familiarise the People, &c. to such Nudities. See *GYMNASIUM*, &c.

WRIST; see *CARPUS*.

WRIT, *Breve*, in Law, a Precept of the King, whereby any thing is commanded to be done, touching a Suit, Action, or Process for Justice.

Such are the Summoning of the Defendant, taking a Distress, redressing a Distress, &c.

Writs are variously divided, and in various respects—Some, with regard to their Order, or manner of Granting, are term'd *Original*; and others *Judicial*.

*Original Writs* are those sent out of the High Court of Chancery to summon the Defendant in a Personal, or Tenant in a real Action, either before the Suit begins, or to begin the Suit thereby. See *PROCESS*, &c.

*Judicial Writs* are those sent out by Order of the Court where the Cause depends, upon emergent Occasions, after the Suit begins.

*Judicial Writs* are distinguish'd from *Original*, in that their *Tenore* bears the Name of the Chief Justice of that Court whence they come; whereas the *Original* say, *Tenore me ipso*, in the Name, or relating to, the King.

Writs are also distinguish'd, according to the nature of the Action, into *Real* and *Personal*.—*Real* are either touching the Possession, call'd *Writs of Entry*, or the Property, call'd *Writs of Right*. See *ENTRY* and *RIGHT*.

Some Writs, again, are at the Suit of the Party; some of Office; some Ordinary; some of Privilege—A *Writ of Privilege* is that which a privileged Person brings to the Court for his Exemption, by reason of some Privilege. See *BRIEF*, &c.

The word *Writ* is form'd from the Saxon *Writan*, to write.

WRIT of Rebellion; see *COMMISSION of Rebellion*.

WRITS *Fictoniel*, are such as are triable in the Sheriff's or County-Court. See *VICOUNTIEL*.

WRIT of Assistance issues out of the Exchequer to authorize any Person to take a Constable, or other publick Officer to seize Goods or Merchandise prohibited and uncustomed, &c. *Stat. 14. c. 1.* There is also a *Writ* of this Name issuing out of the Chancery to give a Possession.

WRITER of the Tallies, an Officer of the Exchequer, being Clerk to the Auditor of the Receipts; who writes upon the Tallies the whole Letters of the Tellers Bills. See *TALLY*, *EXCHEQUER*, &c.

WRITING, *Scriptura*, *Scriptura*, the Art or Act of signifying and conveying our Ideas to others, by Letters, or Characters visible to the Eye. See *CHARACTER*, *WORD*, &c.

Writing is now chiefly practis'd among us by means of Pen, Ink, and Paper. See *PAPER*, *INK*, &c.—The Antients had other Methods. See *BOOK*, *BARRE*, *STYLE*, &c.

The Invention of the Art of *Writing* is refer'd to *Cadmus*. See **LETTER** and **GREEK**.

In **LAW**, we say, *Deeds, Conveyances, &c.* are to be in *Writing*.—A Will may either be in *Writing* or by Word of Mouth. See **DEED**, **CONVEYANCE**, **WILL**, &c.

We also say, the *written Law, Lex scripta*, in opposition to common Law, which is call'd *Lex non scripta*. See **LAW**, **STATUTE**, **COMMON LAW**, &c.—We have also *written and unwritten Traditions*, &c. See **TRADITION**.

Authentic *Writings* of any Contract, sealed and delivered, make the Evidence thereof. See **EVIDENCE**, **TESTIMONY**, &c.

*J. Ravennus* has a Treatise entitled *des Inscriptions en Faux*, wherein he shows how to revive and restore old *Writings* almost effaced, by means of Gall's ground in white Wine, and distill'd; and thus rubb'd over the *Writing*.

*LaFayer* has a curious Dissertation on the Proof of *Facts* by comparison of *Hand Writings*, wherein he endeavours to shew this Method of Proof to be very suspicious and fallacious. See **PROOF**, &c.

This Point controverted among the School-Philosophers, what it is that *Writing* properly signifies, or represents; whether Ideas, or Things, or Words; *i. e.* whether it expresses Things themselves, or our Ideas of Things, or the articulate Sounds by which, on other Occasions, we express those Ideas.

The common Opinion is, that *Writing* only represents Words, that its proper Object is the Voice, and that it only signifies Ideas mediately, or secondarily; and by means of those Things themselves.

Others, on the contrary, will have Ideas, Speech, and *Writing*, all equally and immediately representatives of Things. See **IDEA**, **NOTION**, &c.

But the Controversy is impertinent enough.—No doubt our Ideas of Things are the Things themselves; there being no foundation for any distinction between them. See **EXTERNAL**.

And as to *Writing*, some may be said to be real, or significant of Things and Ideas.—As the *Egyptian Hieroglyphics*; the Characters of Chymists, Astronomers, &c. which are a kind of Images, or bear some natural Resemblance or Analogy with the Things they are intended to express. See **SYMBOL**, **HIEROGLYPHIC**, **REAL CHARACTER**, &c.

But the common *Writing* only represents Sounds, which is the first and most natural Language; and accordingly our Orthography is apparently form'd on, or adapted to the

Pronunciation. See **ORTHOGRAPHY** and **PRONUNCIATION**.

Hence, the End of *Writing* is to excite, as it were, certain Sounds, which have been made the arbitrary Signs of certain Ideas.—This they do by virtue of a Combination or Association between such and such Figures made with the Pen, and such and such Inflections of the Voice.

In effect, we have a great many *written Words* which have no Ideas belonging to 'em; as *Scindapsus, Bladri*, &c. which tend no further than to produce Sounds.—Add, that People when they begin to learn to read *Writing*, take it from Sounds which they hear produced by the Person who teaches 'em: An abundant Argument, that *Writing* does not immediately signify Ideas and Things, but first Sounds, and then Things.

**SHORT WRITING**; see **BRACHYGRAPHY**.  
**SECRET WRITING**; see **CRYPTOGRAPHY**, **CYPHER**, &c.  
**HAND WRITING**; see **HAND**.

**WRONG**, in a Logical Sense; see **ERROR**, **FALLACY**, **FALSHOOD**, **TRUTH**, &c.

**WRONG**, in a Legal Sense, *Injury, Tort*. See **INJURY**, **JUSTICE**, **TORT**, **RIGHT**, &c.

**WULVESHEVED**, or **WULVERHEAD**, from the *Saxon, Wulfe, Lupus*, and *Heofed, Caput*, *q. d. Caput Lupinum*, was the Condition of those Out-law'd for Criminal Matters in the *Saxons* time, for not yielding themselves to Justice. For if they could have been taken alive, they must have been brought to the King; and if they for fear of being apprehended, did defend themselves, they might be slain, and their Heads brought to the King; for their Head was no more to be accounted of than a Wolf's Head. *LL. Edw. in Lamb. fol. 127. and Bract. lib. 3. tract. 2. cap. 11.* See **UTLAWRY**.—*Wolfshead* and *Wulferford*, are all one. *Coke on Littl. fol. 28.*

**WYCH-Hoye**, a House in which the Salt is boiled. See **SALT**.

**WYDRAUGHT**, a Water-Course, or Water-Passage; properly, a Sink, or Common-Shore. See **CLOACA**.

**WYKE**, antiently denoted a Farm, Hamlet, or little Village. See **FARM**, **HAMLET** and **VILLAGE**.

**WYTE** or **WYTA**, **WITE** or **WITA**, in our antient Customs, a pecuniary Penalty or Mulct. See **WITE**.

The *Saxons* had two kinds of Punishments, *Were*, and *Wyte*; the first for the more grievous Offences. See **WERE**.

The *Wyte* was for the less heinous ones.—It was not fixed to any certain Sum; but left at liberty, to be varied according to the Case.

**WYTHE**, in **LAW**, the same as *Waif*. See **WAIF**.

## X.

**X**, A double Consonant, and the twenty-second Letter in the *English* Alphabet. See LETTER, CONSONANT, ALPHABET, &c.

The  $\alpha$  of the *Latins*, and  $\xi$  of the *Greeks* are compounded of  $cs$ , and  $x = s$  whence, to this day, the Letter  $x$  in the *English* and *French* has the same Sound with  $c$  or  $k$ .—Thus we pronounce *Alexander*, as if wrote *Alesander* or *Aleksander*. See C, K, S, &c.

The *Italians* have no  $x$  at all in their Language; but, both speak and write *Alessandro*—The *Spaniards* pronounce the  $x$  like our  $c$  before  $a$ ; viz. *Alexandro*, as if it were *Alexandro*. The *Portuguese* pronounce it like our  $ss$ .

In foreign Words used in *English* we sometimes soften the  $x$  into a double  $s$ ; as *Brussels* for *Bruselles*, &c.

The Letter is not known in the *Hebrew*, or other Oriental Languages; but in lieu of it they write the two simple Letters whereof it is compounded—And the like do the modern  *Germans*.

X is also a numeral Letter, and signifies *ten*; as representing two V's placed one a-top of the other. See V.

X *Supra denos numero tibi dat retinendas.*

When a Dash is added over it,  $\bar{X}$ , it signifies *ten thousand*. XENIA, in ancient Customs, were Gifts or Presents made to the Governours of Provinces by the Inhabitants thereof.

The Word occurs pretty frequently in Charters of Privileges; where, *Quisvis esse à Xenis*, denotes an Exemption from making such Presents to Kings and Queens upon their travelling through such Precincts. See MUNUS, &c.

XENODOCHUS, an Ecclesiastical Officer in the *Greek* Church; the same with *Hospitalier*, or a Person who takes care of the Reception and Entertainment of Strangers. See HOSPITALIER.

St. *Nidore*, a Priest and Solitary, furnished the *Xenodochus*, liv'd in the IVth Century—He was thus call'd, because entrusted with that Office in the Church of *Alexandria*.

XEROPHTHALMIA, a kind of *Ophthalmia*, wherein the Eyes itch, and are red, but without swelling or watering. See OPHTHALMIA.

The Word is compounded of  $\xi\eta\rho\epsilon$ , dry, and  $\delta\rho\delta\lambda\mu\alpha\iota$ , Eye.

XEROPHAGIA, XEROPHAGY, in Church-History, the use of dried Foods. See FOOD.

In the first Ages, some not contented with simple Fasting, added the *Xerophagy* thereto; abstaining not only from Flesh and Wine, but also from all fresh, succulent, and vinous Fruits—And some even brought themselves to bare Bread and Water. See FASTING and ABSTINENCE.

*Tertullian* in his Book *de Abstinentia*, c. 9. speaks of the *Xerophagia* as a thing commendable in time of Persecution.

The Word is form'd from  $\xi\eta\rho\delta$ , *secus*, dry, and  $\rho\alpha\gamma\eta$ , I eat.

XESTA,  $\xi\eta\sigma\tau\alpha$ , an *Attic* Measure of Capacity. See MEASURE.

XIPHIAS, a fiery Meteor, in form of a Sword. See METEOR.

It differs from the *Acontias*, in that this latter is longer, and more like a Dart; and the former shorter and broader in the middle. See ACONTIAS.

XV.VIR, *Quindecimvir*; see QUINDECIMVIR.

Authors, and especially the Antiquaries, make use of such Abbreviations, which they borrow from Medals, and other Monuments of Antiquity, where those Names are so express'd.

XILO-ALOES, in Medicine, &c. the *Lignum Aloes*; call'd also *Ayillochum*. See ALOES and AGILLOCHUM.

The Word is compounded of  $\xi\lambda\lambda\omega\sigma$ , *Lignum*, Wood, and  $\alpha\lambda\omega\sigma$ , Aloes.

XILO-Balsammum, a Name which Naturalists, &c. give to the Wood of the Tree which yields that precious Gum known to the *Latins* by the Name of *Opo-Balsammum*, and among us by the Name of *Balm of Gilead*. See BALM.

We have Branches of this Tree brought us from *Cairo*. They are very freight, brittle, unequal, and full of Knots; their Bark reddish without, and greenish within. The Wood is whitish, and full of Pith, and when broke, yields an agreeable smell resembling that of the Balm.

The *Xylo-balsammum* is reputed good to strengthen the Brain, and Stomach, and to expel Poison.

The Word is compounded of  $\xi\lambda\lambda\omega\sigma$ , Wood, and  $\beta\alpha\lambda\sigma\mu\alpha\iota$ , Balm, Balm.

XYNOCIA, a Feast among the ancient *Siberians*, instituted on occasion of *Thebesus's* uniting all the petty Communities of *Attica* into one Common-wealth; the Assemblies whereof were to be held at *Athens*, in the *Prytaneum*. See FEAST.

The Word is form'd of the *Greek*  $\xi\gamma\eta\sigma$  or  $\sigma\eta\gamma$  with, and  $\alpha\iota\sigma\iota\sigma$ , I inhabit.

XYPHOIDES, in Anatomy, a Cartilage at the bottom of the Sternum; call'd also *Enffermitis*. See CARTILAGE and ENSTIFORMIS.

It is about an inch long, and shaped like the Point of a Sword; whence its Appellation, from  $\xi\pi\sigma$ , Sword, and  $\alpha\iota\sigma\iota\sigma$ , Figure. See STERNUM.

XYSTARCHA, in Antiquity, the Master or Director of the *Xystus*. See XYSTUS.

In the *Greek Gymnasium*, the *Xystarcha* was the second Officer—The first was the *Gymnasiarcha*.

The *Xystarcha* was his Lieutenant, and presided over the two *Xysti*, and all Exercises of the *Athletæ* therein. See GYMNASIUM and GYMNASIARCH.

XYSTUS, in the ancient Architecture—A *Xystus*, among the *Greeks*, was a long Portico, either open, or cover'd over; wherein the *Athletæ* practis'd Wrestling, and Running. See ATHLETA, WRESTLING, &c.

The Gladiators who practis'd therein, were call'd *Xystici*. See GLADIATOR.

Among the *Romans*, the *Xystus* was only an Alley, or double Row of Trees, meeting Arbor-wise a-top, and forming a Shade to walk under.

The Word is *Greek*,  $\xi\psi\sigma\tau\epsilon$ , form'd of  $\xi\psi\omega\sigma$ , to polish, shave, rub.

## Y.

**Y**, The twenty-third Letter in the *English* Alphabet, borrow'd originally from the *Greek*  $\upsilon$ . See **L E T T E R** and **A L P H A B E T**.

It is occasionally both **Vowel**, and **Consonant**—As a **Vowel**, some Authors have judged it unnecessary in our Language, in regard its Sound is precisely the same with that of the *i*. Accordingly, it is but little us'd except in Words borrow'd from the *Greek*, to denote their Origin, by representing their *Initials*.

The **Vowel y**, however, has a place even in some Words purely *English*; and that both in the middle thereof, as in *dyng, fryng, &c.* and at the end, as in *lay, &c.*

Some ascribe the use of the *y* in pure *English* and *French* Words, and those that have no *y* in *Latin* or *Greek*, to this, that antiently those Words were pronounced with a double *i*; which having something awkward in it, the *y* was substituted in lieu thereof. See **I**.

Others say, that those Words being antiently wrote, as well as pronounced with a double *i*, which they fill are in the *U* alone, as *paing, paisan, &c.* to avoid their being mistaken for an *a* with two *Dots* over it, they made the second *i* longer than the first, and so form'd the *y*.—Some give a particular Reason why Words ending in *i*, came to be wrote with *y*; viz. that the *Copists* found the Tail of the *y* very commodious or adorn the Margins and Bottoms of Pages wical.

When the *y* follows a **Consonant**, it is a **Vowel**; and when it precedes a **Vowel**, it is a **Consonant**, and should be call'd *ye*, and not *xy*.

The *Rowans* used the *y* for the **Vowel u**, which they had not; their way being to pronounce the common *u* as we do the Diphthong *ou*; and the *Greek*  $\upsilon$  as the *English* and *French* *u*.

In our own, and some other modern Tongues, Authors begin to dispense more and more with the precise Orthography, which requires all Words that have an *Upsilon* in the *Greek* to be wrote with a *y*. And with reason; since our *Greek y* has lost the Sound it had in the Language whence we borrow it. But 'tis certainly ridiculous to cite it, as many do, in Words which indeed have a *Greek* Origin, but have no *U* in the *Greek*; as in *Ecliptic*. See **E C L I P S E**, **E C L I P T I C**, &c.

*Y* is also a numeral Letter, signifying 150, or, according to *Baonius*, 159; as in the Verse:

*Y dat Centenos & quinquaginta Novenos.*

When a Dash was added a-top  $\bar{Y}$ , it signified 150 thousand. *Pythagoras* used the *Y* as a Symbol of human Life; the Foot representing Infancy, and the forked Top, the two Paths of Vice and Virtue, one or 'other of which, People are to enter upon after attaining to the Age of Discretion.

**YACHT**, a kind of Vessel, used by the *English*, furnish'd with Masts and Sails; fit for Sea; and commodiously contriv'd and adorn'd, both withinside and without, to suit it for State-Passengers, &c.

The *Dutch* have also *Yachts*, but not so well prepared to live at Sea—They are seldom us'd but to sail on Rivers and Canals.

The Word seems derived from the *Dutch* *Yacht*, hunting, by reason of the lightness of these Vessels.

**YARD**, *Virga*, a long Measure us'd in *England*, and *Spain*; chiefly to measure Cloth, Stuffs, &c. See **M E A S U R E**.

The *English* *Yard* contains three Foot. See **F O O T**.

It was first fixt by *Henry I.* from the length of his own Arm. See **V I R G A**.

The *English* *Yard* is just seven Nines of the *Paris* Ell; so that nine *Yards* make seven Ells.—To reduce Ells, therefore into *Yards*, say, if seven Ells give nine *Yards*, how many *Yards* will the given Number of Ells give?

*Yards* are convert'd into Ells *Flemish*, by adding a third part; into Ells *English*, by subtracting a fifth part; or multiplying by 8, and cutting off the right-hand Figure.—Ells *English* are convert'd into *Yards*, by adding a fourth. To turn Ells *Flemish* into *Yards*, subtract one Quarter. See **E L L**.

The *Spanish* *Yard* chiefly us'd at *Sevil*, is, in some Places, call'd *Barra*—It contains  $\frac{1}{2}$  of the *Paris* Ell; so that 17 Ells make 24 *Spanish* *Yards*.

**YARD**, in Anatomy, the *Penis*, or Virile Member; serving for the evacuating of the Urine, and Seed. See **P E N I S**; see also **U R I N E** and **S E E D**.

**YARD-Land**, *Virgata Terra*, or *Virga Terra*, is a certain Quantity of Land, various according to the Place—At *Wimbleton* in *Surrey*, it is only 15 Acres; but in most other Counties it contains 20, in some 24, in some 30, and in others 40 Acres. See **A C R E**.

*Virgata Terra* contains 24 Acres; & 4 *Virgate* constitute one *Hidam*, & five *Hidam* constitute one *Fodum* *Militare*. MS. Abbot Malines. See **H I D E**, **K N I G H T**'s **F E E**, **C A R R U C A T E**, &c.

**YARDS**, or *Sail-Yards*, of a Ship, are long pieces of Timber, tapering at each end, fixt a-cross the several Masts to carry the Sails. See **M A S T**.

The Sails are fasten'd to the *Yards* at the Heads; so as to be hoist'd up, and let down together with them, by Ropes call'd *Halliards*. See **S A I L** and **H A L L I A R D**.

The Main *Yard* is that of the Main-Mast—the Mizzen *Yard*, Bolt-sprit *Yard*, &c. are those of the Mizzen, &c. See **M I Z Z E N**, **B O L T - S P R I T**, &c.

They have several Phrases and Words of Command relating to the Management of the *Yards*; as—*Brace the Yard*, which signifies to traverse aft; the *Yard-Arm* whose *Brace* is baled; so that to traverse the *Yard*, is the same as to say, *Brace it aft*.—*Square the Yard*, is as much as to say, let that it hang right a-cross the Ship, and one *Yard-Arm* not traversed more than the other.—*Top the Yards*, &c. make them hang even.

*Yard's-Arm*, is that half of the *Yard* which is on either side the Mast, when it lies athwart the Ship.

*YARDS* are also Places belonging to the Navy, where the Ships of War, &c. are laid up in Harbour. See **N A V Y**, **H A R B O U R**, **S H I P**, &c.

The King's *Yards*, are *Chatham*, *Deptford*, *Woolwich*, *Portsmouth*, *Sherness*, *Plimouth*, and *Harwich*; each of which is provided with several Docks, Wharfs, Lanchers, and Graving Places for the Building, Repairing, and Cleaning his Majesty's Ships. See **D O C K**, **W H A R F**, &c.

In these *Yards* are also lodged great quantities of Timber, Masts, Planks, Anchors, &c. There are also Store-Houses belonging to each *Yard*, wherein are reserv'd vall quantities of Cables, Riggings, Sails, Blocks, &c.

In the several *Yards* are great Rope-Yards, wherein Cables and all sorts of Cordage are made. See **C O R D A G E**, **C A B L E**, &c.

**YAKE**, among Sailors, implies as much as, nimble, ready, quick, expedition.

Hence, to *Be Yake at the Helm*, signifies to set a fresh Man at the Helm.

**YARN**, Span Wool. See **W O O L**, **S P I N N I N G**, **C L O T H**, &c.

**YARRINGLES**, or *Yarrinole Blades*, a kind of Reel, or Instrument with which Hanks of Yarn are wound in Clews, or Balls. See **R E E L**.

**YATCHES**, Vessels with one Deck, carrying from 4 to 12 Guns, with from 20 to 40 Men; being of Burden from 30 to 160 Ton. See **V E S S E L**.

They draw little Water, and are us'd for running, and making short Trips, &c.—Their Makes and Forms are various.

**YAWES**, in the Sea-Language,—A Ship is said to make *Yawes*, when through the fault of him at the Helm, she is not kept steady in her Course; but makes Angles in and out. See **H E L M**.

To prevent this, the *Comer* cries to him at Helm, Steady, Steady. See **C O M E R**.

**YAWNING**, *Opitatio*, an involuntary opening of the Mouth, occasion'd by a Vapour or Ventosity, endeavouring to escape; and generally witnessing an irksome Weariness, or an Inclination to Sleep.

The Remedy *Hippocrates* prescribes against continual *Yawnings*, is to make long Breathing, or Respirations—The same he recommends against the Hiccough. See **H I C C O U G H**.

The nervous Membrane of the *Oesophagus* is the Seat of *Yawning*, which is certain to be produced whenever any irritation determines the Spirits to flow thither in too great abundance.—The Cause of the Irritation is supposed to be some troublesome Humour wetting the inner Membrane of the *Oesophagus*; which Humour proceeds either from the Glands spread throughout that Membrane, or from acid Vapours arising from the Stomach, as from a Boiling-Pot, and which condense on the Sides of the *Oesophagus* as on a Pot-Lid.

On such occasions, the nervous Fibres of the Membrane of the Gullet being irritated, dilate the Gullet; and the Mouth

Mouth is constrain'd to follow the same Motion, as being lined with the same Membrane.

YCONOMUS: see OXONOMUS.

YDRARGYROS, *Hydrargyros*, or *Quicksilver*; see MERCURY.

YEAR, *Annus*, in the full extent of the Word, is a System or Cycle of several Months; usually twelve. See CYCLE and MONTH.

Others define *Year*, in the general, a Period, or Space of Time, measured by the Revolution of some Celestial Body in its Orbit. See TIME and PERIOD.

Thus, the Time wherein the fixed Stars make a Revolution, is call'd the *great Year*. And the Times wherein *Jupiter*, *Saturn*, the *Sun*, *Moon*, &c. finish their Revolutions, and return to the same Point of the Zodiac, are respectively call'd the *Years of Jupiter*, and *Saturn*, the *Solar*, and the *Lunar Years*. See SUN, MOON, PLANET, &c. SOLAR YEAR, LUNAR YEAR, &c.

YEAR, properly, and by way of eminence so call'd, is the *Solar Year*; or the Space of Time wherein the Sun moves thro' the Ecliptic. See ECLIPTIC.

This, by the Observations of *Cassini*, *Bianchini*, and *de la Hire*, contains 365 Days, 5 Hours, and 49 Minutes; which is the Quantity of the *Year* assumed by the Authors of the *Gregorian Calendar*. See SOLAR YEAR.

But, in the Civil, or popular Account, this *Year* only contains 365 Days; except every fourth, which contains 366. See CIVIL YEAR.

The Vicissitude of Seasons seems to have given occasion to the first Institution of the Year.—Man, naturally curious to know the Cause of that Diversity, soon found it was the proximity and distance of the Sun; and upon this, gave the Name *Year* to the Space of Time wherein that Luminary performing his whole Course, return'd to the same Point of his Orbit. See SEASON.

And hence, as it was on account of the Seasons, in a great measure, that the *Year* was instituted; their chief Regard and Attention, was, that the same Parts of the *Year* should always correspond to the same Seasons; i. e. that the beginning of the *Year* should always be when the Sun was in the same Point of his Orbit; and that they should keep pace, come round, and end together.

This, different Nations aim'd to attain by different ways; making the *Year* to commence from different Points of the Zodiac; and even the time of his Progress different. So that some of their *Years* were much more perfect than others, but none of them quite just; i. e. none of them but whose Parts shifted with regard to the Parts of the Sun's Course.

'Twas the *Egyptians*, if we may credit *Herodotus*, that first form'd the *Year*, making it to contain 360 Days, which they subdivided into 12 Months.

*Mercury Trismegistus* added 5 Days more to the Account.—And on this footing, *Ybales* is said to have instituted the *Year* among the *Greeks*. Tho' that Form of the *Year* did not hold throughout all *Greece*—Add, that the *Jewish*, *Syrian*, *Roman*, *Persian*, *Ethiopic*, *Arabic*, &c. *Years*, were all different.

In effect, considering the poor State of Astronomy in those Ages, 'tis no wonder different People should disagree in the Calculus of the Sun's Course.—We are even assur'd by *Diod. Siculus*, Lib. I. *Plutarch* in *Numa*, and *Pliny*, Lib. VII. c. 48. that the *Egyptian Year* itself was at first very different from that now represented. See *Egyptian Year*, *Roman Year*, *Jewish Year*, &c.

#### Various Forms of Solar and Lunar Years.

*Solar Year* is the Interval of Time wherein the Sun finishes his Course through the Zodiac; or, wherein he returns to the same Point thereof whence he had departed. See SUN.

This, according to our Account, is 365 Days, 5 Hours, 49 Minutes; tho' some Astronomers make it a few Seconds, and some a whole Minute less; as *Kepler*, for instance, who makes it 365 Days, 5 Hours, 48 Minutes, 57 Seconds, 39 Thirds: *Ricciolus*, 365 Days, 5 Hours, 48 Minutes; and *Lycho Brabe* 365 Days, 5 Hours, 48 Minutes.

The *Solar Year* is either *Astronomical*, or *Civil*.

The *Solar Astronomical Year* is that determined precisely by the Observations of Astronomy; and is of two kinds, *Tropical*, and *Sidereal* or *Astral*.

The *Tropical*, or *Natural Year*, is the Time which the Sun employs in passing through the Zodiac; which, as before observed, is 365 Days, 5 Hours, 49 Minutes.

The *Sidereal* or *Astral Year*, is the Space of Time wherein the Sun going from any fixed Star, returns to the same.—This consists of 365 Days, 6 Hours, 10 Minutes. See SIDERIAL.

*Civil Year* is that Form of *Year* which each Nation has contriv'd to compute Time by; or, the *Civil*, is the *Tropical Year* consider'd as only consisting of a certain Number of whole Days; the odd Hours and Minutes being set aside,

to render the Computation of Time, in the common occasions of Life, more easy. See CIVIL.

Hence, as the *Tropical Year* is 365 Days, 5 Hours, 49 Minutes, the *Civil Year* is 365 Days. And hence, also, as 'tis necessary to keep pace with the Heavens, it is required that every fourth *Year* consist of 366 Days.

Hence, lastly, the *Civil Year* is either *Common* or *Bissexile*.

The *COMMON CIVIL YEAR* is that consisting of 365 Days. This, therefore, has seven Months of 30 Days each, and five of 31 Days.

*Bissexile* or *Leap Year* is that consisting of 366 Days; or has one Day extraordinary, which Day is call'd the *Intercalary* or *Bissexile Day*. See INTERCALARY.

This *Intercalary*, or additional Day to every fourth *Year*, was first appointed by *Julius Cæsar*, who, to make the *Civil Years* keep pace with the *Tropical ones*, contriv'd, that the 6 Hours which the former came short of the latter, should, in four Years, make a whole Day, and be added after the 23d of *February*, which was their sixth of the Calends of *March*.

Hence, as, in that *Year*, they reckon'd this Day twice over, or had his *sexto Calendas*; the *Year* itself came to be call'd *Bis Sextus* and *Bissexile*.

The *Intercalary Day*, however, among us, is not got in by telling the 24th of *February* twice over; but by adding a Day after the 23th of *February*; which by this means, that *Year*, comes to contain 369 Days. See BISSEXILE.

A farther Reformation in this *Year* was made by *Pope Gregory*. See *Gregorian Year*.

*Lunar Year* is a System of 12 Lunar Months. See LUNAR.

Hence, from the two kinds of *Synodical Lunar Months*, there arise two kinds of *Lunar Years*, the one *Astronomical*, the other *Civil*.

*Lunar Astronomical Year* consists of twelve Lunar *Synodical Months*; and therefore contains 354 Days, 8 Hours, 48 Minutes, 38 Seconds, 12 Thirds. See *SYNOIDICAL*.

*Lunar Civil Year*, is either *Common*, or *Embolimic*.

The *COMMON LUNAR YEAR* consists of twelve Lunar *Civil Months*; and therefore contains 354 Days.

The *EMBOLIMIC* or *Intercalary Year* consists of 13 Lunar *Civil Months*; and therefore contains 384 Days. See *EMBOLIMIC*.

Note, as the difference between the common *Lunar Civil Year* and the *Tropical Year*, is 11 Days, 5 Hours, and 49 Minutes; to have the former keep pace with the latter, there are 34 Months of 30 Days, and 4 Months of 31 Days each, to be inserted in every 100 *Lunar Years*; which still leave behind 'em an Appendix of 4 Hours, 21 Minutes, which in six Centuries make nearly a day more.

Thus far we have consider'd *Years* and *Months* with a view to the Principles of Astronomy, whereon the division is founded. By this, the various Forms of *Civil Years* that have antiently obtain'd, or still do obtain, in divers Nations, are to be examined.

#### Various Forms of Civil Years.

*Antient Roman Year*, was the *Lunar Year*, which, as first settled by *Romulus*, only consisted of ten Months; viz. 1. *March*, containing 31 Days. 2. *April*, 30. 3. *May*, 31. 4. *June*, 30. 5. *Quintilis*, 31. 6. *Sextilis*, 30. 7. *September*, 30. 8. *October*, 31. 9. *November*, 30. 10. *December*, 30; in all 304 Days, which came short of the true *Lunar Year* by 50 Days, and of the *Solar* by 61 Days.

Hence, the beginning of *Romulus's Year* was vague, and unfix'd to any precise Season; which Inconvenience to remove, that Prince order'd so many days to be added yearly as would make the State of the Heavens correspond to the first Month, without incorporating these additional Days, or calling them by the Name of any Month.

*Numa Pompilius* corrected this irregular Constitution of the *Year*, and compos'd two new Months, *January* and *February*, of the days that were us'd to be added to the former *Year*.—Thus, *Numa's Year* consist'd of twelve Months, viz. 1. *January*, containing 29 Days; 2. *February*, 28; 3. *March*, 31; 4. *April*, 29; 5. *May*, 31. 6. *June*, 29; 7. *Quintilis*, 31; 8. *Sextilis*, 29; 9. *September*, 29; 10. *October*, 31; 11. *November*, 29; 12. *December*, 29; in all 355 Days, which exceeds the quantity of a *Lunar Civil Year* by one day; and that of a *Lunar Astronomical Year* by 15 Hours, 11 Minutes, 24 Seconds; but came short of the common *Solar Year* by ten Days; so that its beginning was vague, and unfix'd.

*Numa*, however, desiring to have it fixed to the Winter-Solstice, order'd 21 Days to be intercalated in *February* every second *Year*, 23 every fourth, 22 every sixth, and 23 every eighth *Year*.

But this Rule failing to keep Matters even, recourse was had to a new way of *Intercalating*; and instead of 23 Days every eighth *Year*, only 15 were added; and the Care of the whole committed to the *Pontifex Maximus*; who,

neglecting the *Trust*, let things run to the utmost Confusion. And thus the *Roman Year* stood till *Julius Cæsar* made a Reformation. See *Julian Year*.

For the manner of reckoning the *Days of the Roman Months*; see *CALENDAR*, *NONES*, and *IDES*.

*Julian Year* is a Solar Year containing, commonly, 365 Days; tho' every fourth Year, call'd *Bissextile*, contains 366.

The Months, &c. of the *Julian Year* stand thus; 1. *January*, 31 Days; 2. *February*, 28; 3. *March*, 31; 4. *April*, 30; 5. *May*, 31; 6. *June*, 30; 7. *July*, 31; 8. *August*, 31; 9. *September*, 30; 10. *October*, 31; 11. *November*, 30; 12. *December*, 31.—But every *Bissextile Year* a day is added after the 28th of *February*, which Month, then, contains 29 Days.

The *Astronomical Quantity*, therefore, of the *Julian Year* is 365 Days, 6 Hours, which exceeds the true Solar Year by 11 Minutes; which excess, in 132 Years amounts to a whole Day.—And thus the *Roman Year* stood till the Reformation made therein by *Pope Gregory*. See *Gregorian Year*.

For this Form of the Year we are indebted to *Julius Cæsar*; who, in the Contrivance thereof, was assisted by *Syzygus*, a famous Mathematician, call'd over from *Egypt* for this very purpose; who, to supply the defect of 67 Days which had been lost through the fault of the Pontifices, and to fix the beginning of the Year to the Winter-Solstice, made that Year to consist of 15 Months, or 445 Days; which, for that reason, is used to be call'd the *Year of Confusion*.

This Form of the Year was used in all Christian Nations till the middle of the 16th Century; and still continues to be so not only by several Nations (and among the rest by the *English*, *Swedes*, *Danes*, &c.) but also by the modern Astronomers and Chronologers.—For, since the Error is known, there is no danger from it.

*Gregorian Year* is the *Julian Year* corrected by this Rule, that, whereas on the common footing every secular or hundredth Year is *Bissextile*; on the new footing, three of 'em are common Years, and only the fourth *Bissextile*.

The Error of 11 Minutes in the *Julian Year*, little as it was, yet, by being repeated over and over, at length became considerable; and was grown into 13 Days, by which means the *Equinoxes* were greatly disturb'd.—To remedy this Irregularity, which was still a-growing, *Pope Gregory XIII.* call'd together the chief Astronomers of his Time, and concerted this Correction; and to restore the *Equinoxes* to their Place, threw out the ten days that had been got from the time of the Council of *Nice*, and which had shifted the 5th of *October* to the 15th.

In the Year 1700, the Error of 10 days was grown to 11; upon which the Protestant States of *Germany*, to prevent further Confusion, accepted the *Gregorian Correction*. See *CALENDAR*, *STYLE*, &c.

Yet is the *Gregorian Year* far from being perfect; for we have shew'd that in four Centuries the *Julian Year* gains 3 Days, 1 Hour, 10 Minutes: But 'tis only the three Days are kept out in the *Gregorian Year*; so that here is still an excess of 1 Hour, 10 Minutes, in 4 Centuries; which, in 72 Centuries amounts to a whole Day. See *EASTER*.

*Egyptian Year*, call'd also the *Year of Nubensaffor*, is the Solar Year of 365 Days, divided into twelve Months of 30 Days each, beside 5 Intercalary Days added at the end.

The Names, &c. of the Months are as follows: 1. *Thot*, 2. *Phaophi*, 3. *Atbyr*, 4. *Choiak*, 5. *Tybi*, 6. *Mecheir*, 7. *Phamenoth*, 8. *Pharmuthi*, 9. *Pachon*, 10. *Panunt*, 11. *Epiphi*, 12. *Mesori*; beside the *hikes* *enep* *housen*.

Hence, as the *Egyptian Year*, in every four Years loses a whole Day of the *Julian Year*; its beginning, in the Space of 460 Years, runs thro' every part of the *Julian Year*; which Space elapsed, they meet again.

This Year is used by *Ptolemy* in his *Almagest*; so that the Knowledge thereof, is of use in Astronomy for comparing the ancient Observations with the modern.

The ancient *Egyptians*, we are told by *Diodorus Siculus*, *Lib. II.* *Plutarch*, in the Life of *Numa*, and *Pliny*, *Lib. VII.* c. 48. measured their Years by the Course of the Moon.—At first, they were only one Month; then three; then four, like that of the *Acadians*; and then six, like that of the People of *Assurnavia*. Those Authors add, that 'tis on this account, they reckon each a vast Number of Years from the beginning of the World; and that in the History of their Kings, we meet with some who liv'd 1000 or 1200 Years.

But *Herodotus* is silent on this Point: He only says, that the *Egyptian Year* consisted of 12 Months, as we have above represented it. Besides, we learn from Scripture, that from the time of the Flood the Year was composed of 12 Months: *Cham*, consequently, and his Son *Misraim*, the Founder of the *Egyptian Monarchy*, must have had that Custom; and

it is so very probable his Descendants should alter it.—Add, that *Plutarch* speaks of it with a deal of Uncertainty; and as no more than a Report: And *Diod. Siculus* as only a Conjecture of I know not what Authors, whom he does not name; and who, in all probability, might have framed this Hypothesis to reconcile the *Egyptian Chronology* with that of some other Nations.—His Words are, *'Αελος δ' ἔστιν ἢ παλαιὸς τῶν τῶν ἐπισημοῦν πρὸς λέγειν ἢ, &c.* This Number of Years being incredible, some undertake to say, &c.

*F. Kircher*, however, maintains, that besides the Solar Year, there were some of the *Nomes*, or Cantons of *Egypt*, who used a Lunar one; and that in the remotest Ages there were some who took a Revolution of the Moon, that is, a Month, for a Year; and others, who finding the Year too short, made it two Months, others three, and others four, &c. *Oedip. Ægypt.* Tom. II. p. 252.

A late Author observes, that *Varro* has affirm'd of all Nations, what we have here quoted of the *Egyptians*; and adds, that *Lactantius* takes him to task on that Subject.—We don't know in what Places of *Varro* or *Lactantius* he has seen this: All we can say is, that *Lactantius*, *Divin. Inst.* *Lib. II.* c. 13. where he gives *Varro's* Opinion, only represents him as speaking of the *Egyptians*.—However, *St. Augustin*, de *Civ. Dei*, c. 16. shews, that the Years of the Patriarchs mention'd in Scripture, are like ours, and not one of ours equal to ten of theirs; as, it appears, had been the Opinion of some People.

Upon the *Egyptians* being subdued by the *Romans*, they received the *Julian Year*; tho' with some Alteration: For they still retain'd their ancient Months, with the five *ἡμέραι ἐπιπύρατα*, and every fourth Year intercalated another Day between the 28th and 29th of *August*.—Add, that the beginning of their Year answer'd to the 29th of *August* of the *Julian Year*.

This Year thus reform'd was call'd the *Anni Æliacus*, as being instituted soon after the Battel of *Actium*. See *ACTIAN*.

*Antient Greek Year*, was Lunar; consisting of twelve Months, which, at first were 30 Days a-piece, then alternately 30, and 29 Days, computed from the first Appearance of the new Moon; with the addition of 20 Embolimic Month of 30 Days, every 3d, 5th, 8th, 11th, 14th, 16th, and 19th Years of a Cycle of nineteen Years; in order to keep the New and Full Moons to the same Terms or Seasons of the Year. See *EMBOLEMIC*.

Their Year commenced at the Full Moon next after the Summer Solstice.—The Order &c. of their Months was thus: 1. *Ἰανουαρίων*, containing 29 Days; 2. *Φεβρουαρίων*, 30; 3. *Μαρτυνιαίων*, 29; 4. *Μαιμακτηώνων*, 30; 5. *Πυανεώνων*, 29; 6. *Ποσειδώνων*, 30; 7. *Γαργιλίων*, 29; 8. *Αθήνειων*, 30; 9. *Ἐκατομβαιώνων*, 29; 10. *Μουσικίων*, 30; 11. *Θοργιλίων*, 29; 12. *Σιφιαίων*, 30.

The *Macedonian* had other Names for their Months: so had the *Syro-Macedonian*, *Smyranean*, *Syrian*; so also the *Cypriots*, *Paphians*; and so the *Bitunians*. See *Macedonic Year*.

*Antient Macedonian Year*, is a Lunar Year, only differing from the *Attic* in the Names and Order of the Months; the first *Macedonian Year* agreeing with the *Attic Macedonian*. The Months stand thus: 1. *Διός*, 30 Days; 2. *Ἀρταμίδος*, 29; 3. *Ἀντιπαίδος*, 30; 4. *Παιώνος*, 29; 5. *Διόσκου*, 30; 6. *Πανθίωνος*, 29; 7. *Ἀγριππῆος*, 30; 8. *Δαίμωνος*, 29; 9. *Παιώνος*, 30; 10. *Διός*, 29; 11. *Γιγαντίωνος*, 30; 12. *Τομωρατίωνος*, 29.

*Modern Macedonian Year*, is a Solar Year whose beginning is fixed to the first of *January* of the *Julian Year*, with which it perfectly agrees.

This Year was particularly call'd the *Attic Year*; and the intercalary Month, after *Posideon*, was call'd *πρωτεύων*, or latter *Posideon*.

*Antient Jewish Year* is a Lunar Year, consisting, commonly, of eleven Months, which alternately contain 30 and 29 Days.

It was made to agree with the Solar Year either by the adding of 11, and sometimes 12 Days at the End of the Year, or by an Embolimic Month.

The Names and Quantities of the Months stand thus: 1. *Nisan*, or *Abib*, 30 Days; 2. *Ijar*, or *Zim*, 29; 3. *Sivan*, or *Sivan*, 30; 4. *Thamuz*, or *Tammuz*, 29; 5. *Ab*, 30; 6. *Eul*, 29; 7. *Tisri*, or *Erbasim*, 30; 8. *Marchesvan*, or *Bul*, 29; 9. *Caffen*, 30; 10. *Yelvet*, 29; 11. *Sabat*, or *Sebest*, 30; 12. *Adar*, in the *Embolimic Year*, 30. *Adar* in the common Year was but 29.

Note, in the defective Year, *Caffen* was only 29 Days; and in the redundant Year, *Marchesvan* was 30.

*Modern Jewish Year* is likewise Lunar, consisting, in common Years, of 12 Months, but of 13 in *Embolimic Years*, which in a Cycle of 19 Years are the 3d, 6th, 8th, 11th, 14th, 17th, and 19th.—Its beginning is fixed to the new Moon next the Autumnal Equinox.

The Names, &c. of the Months are, 1. *Tisri*, containing 30 Days; 2. *Marchesvan*, 29; 3. *Caffen*, 30; 4. *Yelvet*,

29 3. *Sbebat*, 30; 6. *Adar*, 29; 7. *Vesdar*, in the *Embolimic Year*, 30; 8. *Nisan*, 30; 9. *Ijar*, 29; 10. *Sivan*, 30; 11. *Tammuz*, 29; 12. *Ab*, 30; 13. *Elul*, 29.

**Syrian Year** is a Solar Year, having its beginning fixed to the beginning of *October* in the *Julian Year*; from which it only differs in the Names of the Months, the Quantities being the same; as follows:

1. *Tisbrin*, answering to our *October*, and containing 31 Days; 2. *Latter Tisbrin*, containing, like our *November*, 30; 3. *Canun*, 31; 4. *Latter Canun*, 31; 5. *Sbatat*, 28; 6. *Adar*, 31; 7. *Nisan*, 30; 8. *Aiyar*, 31; 9. *Asirram*, 30; 10. *Tammuz*, 31; 11. *Ab*, 31; 12. *Elul*, 30.

**Persian Year**, is a Solar Year of 365 Days, consisting of twelve Months of 30 Days each, with 5 *Musteraka*, or Intercalary Days added at the end.

The Months are as follow: 1. *Afrudis* meh; 2. *Ardekhebt* meh; 3. *Cardi* meh; 4. *Thir* meh; 5. *Merdeh* meh; 6. *Schabarr* meh; 7. *Mabar* meh; 8. *Aven* meh; 9. *Adar* meh; 10. *Di* meh; 11. *Beben* meh; 12. *Affir* meh.

This Year is call'd the *Zendgerdic Year*, to distinguish it from the fixed Solar Year, call'd the *Gelalean Year*, which the *Persians* began to use in the Year 1073; and which was form'd by an Intercalation made six or seven times in four Years, and then once every fifth Year.

The *Zendgerdic Year*, it may be observed, is the same with *Nabonassar's Year*—As to the *Gelalean Year*, 'tis absolutely the best and justest of all the Civil Years yet invented, as being found by Calculation to keep the Solstices and Equinoxes precisely to the same days, and answering very accurately to the Solar Motions; which no other Civil Year does, not even the *Gregorian*, for want of so commodious an Inter-calation.

**Arabic and Turkish Year**, is a Lunar Year, consisting of twelve Months, which contain alternately, 30 and 29 Days.

The, sometimes it contains thirteen Months; the Names, &c. whereof are as follow: 1. *Muharram*, containing 30 Days; 2. *Saphar*, 29; 3. *Rabia*, 30; 4. *Latter Rabia*, 29; 5. *Jomada*, 30; 6. *Latter Jomada*, 29; 7. *Rajab*, 30; 8. *Shaban*, 29; 9. *Sammad*, 30; 10. *Shawal*, 29; 11. *Dulkaadab*, 30; 12. *Dulhoggia*, 29; and in the *Embolimic Year*, 30.—An Intercalary Day is added every 2d, 5th, 7th, 10th, 13th, 15th, 18th, 21st, 24th, 26th, 29th, in a Cycle of 29 Years.

**Ethiopic Year**, is a Solar Year perfectly agreeing with the *Astic*, except in this, that the Names of the Months are different.—It commences with the *Egyptian Year*, on the 29th of *August* of the *Julian Year*.

In Months are, 1. *Masfarum*; 2. *Tykymt*; 3. *Hydar*; 4. *Tybas*; 5. *Tyr*; 6. *Jacatit*; 7. *Mazavis*; 8. *Mijazis*; 9. *Gybat*; 10. *Syne*; 11. *Haale*; 12. *Habasse*. Inter-calary Days 5.

**Metonc Year**, **Astic Year**, **Attic Year**, **Zendgerdic Year**, **Gelalean Year**, **Nabonassar's Year**, **Sabbatic Year**, **Annus Sabbaticus**, among the *Antients*, was every seventh Year; during which, the *Jews* let their Land lie at rest. See **SABBATH**.

Every seventh **Sabbatic Year**, i. e. every 49th Year was call'd the Year of *Jubilee*; and held with Solemnity extraordinary. See **JUBILEE**.

**Climacteric Year**, **Platonic**, or **great Year**, } See **CLIMACTERIC**. **PLATONIC**. **HEGIRA**.

**New Year's Day**, or the Day wherein the Year commences, has always been very different, in different Nations, and yet in all held in great Veneration.

Among the *Romans*, the first and last Day were consecrated to *Janus*; on which account it was, that they represented him with two Faces.

To them we owe the Ceremony of wishing a *happy new Year*; which appears to be very ancient—Before the first day was spent, they not only visited and complimented each other, but also presented *Strenae*, and offer'd Vows to the Gods for the Preservation of each other.—*Lucian* represents it as a Practice of a very ancient standing even in his Time; and refers it to *Numa*. See **STRENÆ**, **VOTA**, &c. *Ovid* intimates the same Ceremony in the beginning of his *Fasts*:

*Postera lux oritur linguisque animisque fovete  
Nunc dicenda bene, sunt bona verba die.*

And *Pliny*, more expressly, *Lib. XXVIII. cap. 1. Primum anni incipientis diem levis precationibus innocens festum omnium.*

The *Civil or Legal Year*, in *England*, commences on the Day of the *Annunciation*, i. e. on the 25th day of *March*; tho' the *Historical Year* begins on the Day of the *Circumcision*, i. e. the first of *January*, on which day the *German and Italian Year* also begins.—*Stow* observes, that *William the Conqueror*, having been crown'd on the first of *January*, that thenceforth became the first of the Year for *Historians*, &c. Tho' in all Civil Affairs they retain'd the ancient manner of accounting, which began with the 25th of *March*. See **CIRCUMCISION**, **NATIVITY**, &c.

The part of the Year between those Terms is usually expressed both ways, as 17;  $\frac{5}{4}$  or 17;  $\frac{5}{4}$ .—Since the *Conqueror*, the King's Patents, Charters, Proclamations, &c. are usually dated by the Year of the King's Reign.

The Church, as to her solemn Service, begins the Year on the first Sunday in *Advent*, which is always that next *St. Andrew's Day*, or the 30th of *November*. See **ADVENT**.

The *Jews*, as most other Nations of the East, had a *Civil Year* which commenced with the new Moon in *September*; and an *Ecclesiastic Year*, which commenced from the new Moon in *March*.

The *French Year*, during the Reigns of the *Merovingian Race*, began on the Day wherein the Troops were review'd; which was the first day of *March*.—Under the *Carolingians* it began on Christmas-day; and under the *Capetians* on Easter-day; which, therefore, varied between the 22d of *March* and the 25th of *April*.

And this is still the beginning of their *Ecclesiastic Year*—But for the *Civil*, *Charles IX.* appointed in 1564, that for the future it should commence on the first of *January*.

The *Mahometans* begin their Year the Minute the Sun enters *Aries*.—The *Persians* in the Month answering to our *June*.—The *Chings*, and most of the *Indians*, begin it with the first Moon in *March*.—The *Brachmans* begin it with the new Moon in *April*; on which day they hold a Feast call'd *Samvat Saradi Paudga*, q. d. Feast of New-Year's Day.—The *Mexicans*, according to *d'Alesta*, begin the Year on our 23d of *February*, when the Leaves begin to grow green. Their Year consists of 18 Months of 20 Days each; which making 360 Days, the remaining five days are spent in *Mirth*, and no Business suffer'd to be done, nor even any Service at the Temples.—*Alvares* relates much the same of the *Abyssinians*; who begin their Year on the 26th of *August*, and have five idle Days at the end, which they call *Pagomon*.—At *Rome* there are two ways of computing the Year; the one beginning at the *Nativity* of our Lord: This the *Notaries* use, dating a *Nativitate*. The other in *March*, on occasion of the *Incarnation*: And 'tis by this the Bulls are dated, *Anno Incarnationis*.—The *Greeks* begin their Year of the World from the first of *September*.

YEARS are also distinguish'd with regard to the Epochs whence they are number'd: Thus, *Years of our Lord*, are those reckon'd from the Birth of *Jesus Christ*, which are now 1727. *Years of the World* are those elapsed since the Creation, which *Scaliger* makes to be 5676.—*Years of Rome*, of the *Hegira* of *Nabonassar*, &c. See the difference between these Years under the Article **EPOCHÆ**.

YEAR and Day, in Law, &c. is a Time that determines a Right in many Cases, and is in some an Usurpation, and in others a Prescription. See **PRESCRIPTION**, &c.

Thus in the Case of an *Estray*, if the Owner, Proclamation being made, challenge it not within that time, it is forfeit.

In like manner is the Year and Day given in Cases of Appeal, of Defect, after Entry or Claim, of Non-claim upon a Fine, or Writ of Right, of the death of a Man sore bruised or wounded; of Protections, *Essoins*, in respect of the King's Service; of a Wreck, &c.

YEAR-day and Waste, is a part of the King's Prerogative, whereby he challenges the Profits of the Lands and Tenements of Persons attainted for Petit-Treason, or Felony for the Space of a Year and a Day.

Not only this, but at the end thereof he may waste the Tenements, destroy the Houses, rroot up the Woods, Gardens, Pasture, and plough up the Meadows, unless the Lord of the Fee agree with him for the Redemption of such Waste.

YEARN, in Hunting, signifies to bark, as *Beagles* properly do, at their Prey. See **HUNTING**.

YELLOW, a bright Colour, reflecting the most Light of any, after White. See **COLOR** and **LIGHT**.

There are divers yellow Substances that become white upon wetting and drying them again several times at the Sun: As *Wax*, *Linens-Cloth*, &c. See **BLEACHING**; see also **HAIR**, **WHITENING**, &c.

The same Bodies, if they be already white, and continue a long time in the Air without being wetted; turn yellow.

Paper and Ivory apply'd near the Fire, become successively yellow, red, and black—Silk, when turn'd yellow, is whiten'd with the Fumes of Sulphur. See WHITE, WHITENESS, &c.

YELLOW, in Dying, is one of the five simple and mother Colours. See DYING.

For the finest Yellows, they first boil the Cloth, or Stuff in Allum and Pot-Ashes; then, give the Colour with Goud. See GOUD.

Turmeric likewise gives a good Yellow, tho' not the best—There is also an Indian Wood that gives a yellow Colour bordering on Gold. A fourth sort of Yellow is made with Savoury, but this is inferior to them all.

Greens are usually made of Yellow and Blue mixed. See GREEN.

With Yellow, red of Madder, and that of Goats-Hair prepared with Madder, are made the gold Yellow, Aurora, Teaght colour, Nacarate, Ispabella, and Chamois-colour; which are all Casts or Shades of Yellow.

Painters and Enamellers make their Yellow of Massicot, which is Ceruis rais'd by the Fire; or with Okce. See ENAMEL and ENAMELING.

Liners and Colourers make it with Saffron, and French Berries, Orcaucite, &c.

Bramton observes, it was antiently the Custom to paint a Man's Door yellow, and strew his House with Salt; to declare him Traitor to his King.

The Word is form'd from the Italian giallo, or the German gel, or the Latin galbanus.

YELLOW, or French Berries; see BERRIES.

YELLOW Jaundice; see JAUNDICE.

YELLOW, a Disease in a Horse, the same with that call'd Jaundice in Man. See JAUNDICE.

There are two kinds of it, the yellow and the black.

The Yellows is a very frequent Disorder, say the Farriers, arising from Obstructions in the Gall-pipe, or the little Ducts opening into the same, occasion'd by viscid or gritty Matters lodged therein, or a Pleotitude and Compression of the neighbouring Blood-vessels; by means whereof, the Matter that should be turn'd into Gall, is taken up by the Vein, and carried back into the Mass of Blood; which it tinctures yellow: So that the Eyes, inside of the Lips, and other parts of the Mouth capable of shewing the Colour, appear yellow.

The Effect whereof is, that a Horse will be dull, heavy, and low-spirited; easily jaded by the least Labour or Exercise, &c.

YEOMEN, YEMEN, YOMEN, the first or highest Degree of the Commons or Plebeians of England; and those next in order to the Gentry. See COMMONS and GENTLEMEN.

The Yeomen are properly the Freeholders, who have Land of their own; so call'd from the German Gemen, or Gemain, that is, common.

According to Sir Thomas Smith, a Yeoman is a free-born Englishman, who may lay out of his own free Land in yearly Revenue, to the Sum of forty Shillings Sterling.

The Yeomen of England are capable of holding Lands of their own to a good value; are adjudged capable of certain Offices, as Constables, Church-Wardens, Jury-men, to vote in Elections to Parliament, and to serve in the Army.

The Yeomen were famous in ancient times for Military Valour, being particularly expert at the Management of the Bow; whence the Infantry was compos'd chiefly of them. See ARCHER.

In many Cases, the Law conceives a better Opinion of the Yeomanry that occupy Lands, than of Tradesmen, Artificers, &c. See FREEHOLDER.

By a Statute 2 Hen. 4. it is enacted, that no Yeoman shall take or wear a Livery of any Lord upon pain of Imprisonment, and a Fine at the King's Pleasure.

The Word Yeoman is us'd for Yeomen in the Statute 3 Hen. 8. and in old Deeds it is sometimes written Yeaman.

YEOMAN is also a Title of Office in the King's Household, of a middle Place or Rank between an Usher and a Groom. See USHER and GROOM.

Such are the—Yeomen of the Chantry; Yeomen of the Scullery; Yeomen of the Stirrop, &c. See HOUSEHOLD.

YEOMEN Warders; see WARDERS of the Tower.

YEOMEN of the Guard, properly call'd Yeomen of the Guard of the King's Body, were antiently 150 Men of the best Rank under Gentry, and of larger Stature than ordinary; every one being required to be six Foot high. See GUARD.

At present there are but one hundred Yeomen in constant Duty; and seventy more not in Duty; and as any of the hundred die, his Place is supply'd out of the seventy.

They go clad after the manner of King Henry the Eighth's time—They had Diet as well as Wages, when in Waiting; but this was taken off in the Reign of Q. Anne.

Their Attendance is on the Sovereign's Person, both at home and abroad; and they have a Room allotted for them only, call'd the Guard-Chamber.

The Officers and Yeomen are at the disposal of the Captain, but the Captain at the Appointment of the King.

YERKING, in the Manage, is when a Horse strikes with his hind Legs, or flings and kicks back with his whole hind Quarters; stretching out the two Legs nearly together and even. See AIR, SAULT, &c.

YEST, or Barn, a Head, or Scum rising up on Beer, or Ale, while working or fermenting in the Vat. See BREWING, MALT-Liquor, &c.

It is us'd for a Leaven or Ferment in the baking of Bread; as serving to swell or puff it up very considerably in a little Time, and to make it much lighter, softer, and more delicate—When there is too much of it, it renders the Bread bitter. See BREAD and BAKING.

The use of Yest in Bread is but of late standing among us: 'Tis not above eighty Years since the Avarice of the Bakers first introduced it; and then it was only done by stealth—The Pliny witnesses it to have been us'd by the antient Gauls.

The Faculty of Medicine of Paris, by a Decree of the 24th of March 1688, solemnly maintain'd it noxious to the Health of the People; yet could not that prevent its Progress. See BEER.

YEZDEGERDIC Year, an Epocha thus call'd. See YEAR and EPOCHA.

YGROMETER; see HYGROMETER.

YIELDING and paying, a Law-Terms, form'd by corruption from the Saxon Gieldan, and Gildan, to pay—Hence in Domesday, Gildare is frequently us'd for Solveare, Reddere, the Saxon G being often mistaken for a Y. See GELD and GILD.

YQUETAYA, in Natural History, a Plant in Brasil, long us'd as a Medicine in that Country; and lately discovered to the Europeans by a French Surgeon.

It has been since found in France, where being cultivated and examined by M. Marchant, it appears to be a kind of Scrophulary or Blood-Nettle.

It has this remarkable Property, that it takes away from Senna all its ill taste and smell, which Property of correcting the Infusion of Senna was unknown in the Scrophulary. See SENNA.

To use this Plant, it must be dried ten or twelve days in the Shade, and afterwards expos'd to the Sun till quite dry.

YNCA, YNCAN, or INCA, a Name antiently given to the Kings of Peru, and the Princes of their Blood: The Word signifying literally Lord, King, Emperor, and Royal Blood.

The King himself was particularly call'd Capac Ynca, i. e. Great Lord—His Wife Pallas, and the Princes simply Yncas.

These Yncas, before the arrival of the Spaniards, were exceedingly powerful—Their People rever'd 'em to excess, as believing them to be Sons of the Sun, and never to have committed any fault.

If any Person offended the Royal Majesty in the smallest Matter, the City he belong'd to was totally demolished.

When they travell'd, whatever Chamber they lay in on the Road, was wall'd up as soon as they departed, that no body might ever enter it, after them.—The like was done to the Room wherein the King died; in which, likewise, all the Gold, Silver, and precious Furniture were immured, and a new Apartment built for his Successor.

Their beloved Wives, Domesticks, &c. likewise sacrific'd themselves, and were buried alive in the same Tomb along with him. See the History of the Yncas by Garcilasso de la Vega.

YOAK, or YOKE, in Agriculture, a Frame of Wood, fitted over the Necks of Oxen; whereby they are coupled together, and harness'd to the Plough, &c. See PLOUGH.

It consists of several Parts; as, the Yoke properly so call'd, which is a thick piece of Wood lying over the Neck; the Bow, which compasses the Neck about; the Strappings and Wreakings, which hold the Bow fast in the Yoke; and the Yoke-Ring and Ox-Chain.

The Romans made the Enemies they subdued, pass under the Yoke, which they call'd sub jugum mittere: That is, they made them pass under a sort of Furca Patibularis, or Gallows, consisting of a Pike, or other Weapon laid a cross two others planted upright in the Ground—This done, they treated 'em with Humanity enough, and sent 'em home again. See FURCA.

The same Measure was sometimes dealt 'em by their Enemies, upon the same Occasion—Thus Caesar, Lib. 2. observes, that the Consul L. Cassius had been kill'd by the Swiss, his Army defeated, and made pass under the Yoke.

YOAK of Land, Jugata Terra, in our antient Customs, was the Space which a Yoke of Oxen, that is, two Oxen, may plough in one day. See JUGATA, HIDE, YARD-LAND, &c.

YOIDES, or HYOIDES, in Anatomy, a Bone situate at the Root of the Tongue, and compos'd of divers little Bones united by Cartilages which sometimes ossify. See TONGUE.

It has its Name *ὀστέον*, and sometimes *ὀστέον Ἰψιλοίδης*, from its resembling a Greek *υ*, or *Upsilon*—Some call it *Lambdaoides*, as resembling a *Lambda* inverted.

It is not contiguous to the Extremitie of any other Bone, nor has any Articulation with 'em: on which account it is not shewn in the Skeletons.

Its Use is to fortify the Base or Root of the Tongue, and facilitate the Passage of the Air into the *Trachea*, and the Food into the Gullet.

It has five Pair of Muscles, which move it together with the Tongue. See *LINGUA*.

*YPSILOIDES*, or *YLYPSILOIDES*, in Anatomy, the third genuine Suture of the *Cranium*; thus call'd from its resembling a Greek *υ*, or *Upsilon*. See *SUTURE*.

Some also call it *λμβλοίδης*, *Lambdaoides*. There is also a Bone at the Root of the Tongue call'd *Ypsiloides*, and sometimes *Yoides*. See *YOIDES*.

*YOLK*, or *YELK*, in Natural History, the yellow part in the middle of an Egg. See *EGG*.

The Chicken is form'd out of, and nourish'd by, the *White* alone; till it be grown to some bulk: After which, the *Talk* serves it for Nourishment, which it likewise does, in

part, after it is hatched—For a good part of the *Talk* remains after exclusion; being received into the Chicken's Belly; and being there reserved, as in a Store-house, is by the *Ductus Intestinalis*, as by a Funnel, convey'd into the Guts, and serves instead of Milk. *Willughb. Ornithol. L. I. c. 3.*

This was even known to *Pliny*: *Ipsium Animal ex albo liquore Ovi corporetur: Cibis ejus in Luteo est.* Lib. 10. c. 53.

*YOUNG*; see *GENERATION*, *CONCEPTION*, *GESTATION*, *EMBRYO*, *FORTUS*, *DELIVERY*, *CHILD*, &c. See also *STORGE*, &c.

In the Army, That Regiment, or Officer, is said to be the *Younger* which was last raised, or whose Commission is of latest Date, whatever be the Age of the Man, or however long he may have served in other Capacities.

*YOUNKERS*, among Sailors, are the *young* Men, otherwise call'd *Foremast-men*; whose Business is to take in the Top-Sails, or Top and Yard, for Furling the Sails, Slinging the Yards, &c. and to take their turns at the Helm.

*YOUTH*, *Adolescence*; see *AGE* and *ADOLESCENCE*.

## Z.

**Z**, The last Letter in the Alphabet, and one of the double Consonants, both among the *Latins* and *Greeks*. See **LETTER** and **CONSONANT**.

Its Pronunciation is much more soft and obtuse than the *X*, which makes *Quintilian* call it *Mollissimum*, and *Susvissimum*—Nevertheless, the Sound was not always the same as it is now; which is but, as it were, half that of an *S*.

It had something also in it of the *D*; but only what sounded very smoothly: Thus, *Mexentius* was pronounced as if it had been *Medentius*, &c. See *D*.

The *Z* had also an affinity with the *G*: Thus, *Capella*; *Z*, says he, à *Græcis venit, licet etiam ipsi primo G Græci utebantur*. See *G*.

*Z* was also a Numeral Letter, signifying 2000; according to the Verse:

*Ultima Z tenens suam bis mille tenebit.*

When a Dash was added a-top, *Z̄*, it signified two thousand times two thousand.

**ZAIM**, a Portion of Land, allotted for the Subsistence of a Heroic-man in the *Turkish* Militia; call'd also *Timar*. See **TIMAR** and **TIMARIOT**.

**ZAIRAGIA**, or **ZAIRAGIAH**, a kind of Divination, in use among the *Arabs*. See **DIVINATION**.

It is perform'd by means of divers Wheels, or Circles placed Concentric to one another, and noted with several Letters, which are brought to answer to each other by moving the Circles according to certain Rules.

'Tis also call'd *Zoraidh*, by reason the Circles of this Machine, which are *Mutavaziat*, *Leflek*, &c. correspond to the Orbs of the Planets, and the Atmospheres of each Element.

**ZEAL**, **ZELUS**, ζῆλος, the Exercise of a warm, vehement, animated Affection, or Passion for any thing. See **PASSION**, **INCLINATION**, &c.

Some will have *Zeal* to be properly a mix'd, or compound Sentiment, where one Affection is rais'd or inflam'd by another—On these Principles, it may be defined an Affection arising from Love and Indignation, which cannot bear a thing to be given to another that a Person desires for himself, or one whom he loves and favours—Others make it consist in an eager Study or Desire to keep any thing inviolate; or a Fervour of Mind arising from an Indignation against those who abuse or do evil to a Person beloved.

The *Greek* Philosophers make three Species of *Zeal*—The first, of Envy; The second, of Emulation, or Imitation; The third, of Piety, or Devotion; which makes what the Divines call *Religious Zeal*. See **EMULATION**, &c.

*Josephus* speaks much of a Party or Faction call'd the *Zealots*, or *Zoalots*; which arose among the *Jews* during the War with *Vespasian* and *Titus*. Lib. XIV. c. 6. Antiq. & Lib. IV. c. 12. de Bello Judaico.

**ZEDOARIA**, **ZEDOARY**, a Medicinal Root belonging to a Plant growing in the *East-Indies*, whose Leaves are like those of *Ginger*, only longer and broader. See **ROOT**.

*Zedoary* is of an Ash-colour, has an Aromatic, bitterish Taste; and comes into the Class of *Cephalics*: But it is also reckon'd by many amongst the *Alexipharmics*, wherupon it comes to have a Place in the *Capitals*; and is even said to prevent Infections by holding it only in the Mouth. See **ALEXIPHARMIC**, &c.

On account of its agreeable Bitter, it also is prescribed among *Stomachics*; and for its spicy Warmth is commended in *Cholics*, and *Hysterical Affections*, for promoting the Menfes, &c. See **AROMATIC**.

**ZENITH**, in *Astronomy*, the Vertical Point; or a Point in the Heavens directly over our Head. See **VERTEX** and **VERTICAL**.

Or the *Zenith* is a Point, as *Z* (Tab. **ASTRONOMY**, Fig. 52) in the Surface of the Sphere, from which a right Line drawn through the Spectator's Head, passes through the Centre of the Earth. See **VERTEX** and **VERTICAL**.

Hence, there are as many *Zeniths* as there are different Places on the Earth where the Heavens may be seen; and upon the changing our Place, we also change our *Zenith*.

The *Zenith* is also call'd the *Pole of the Horizon*, because 90 Degrees distant from each Point thereof. See **HORIZON**.

It is also the Pole of all the *Almicantars*, or *Parallels of the Horizon*, whereby the Altitude of the Stars is estimated. See **ALMICANTAR**.

Through the *Zenith* passeth the *Vertical-Circles*, or *Azimuth*. See **VERTICAL CIRCLE**.

The Point diametrically opposite to the *Zenith*, is call'd the *Nadir*; which is the Point directly under our Feet. See **NADIR**.

The *Nadir* is the *Zenith* to our Antipodes; as our *Zenith* is the *Nadir* to them. See **ANTIPODES**.

*ZENITH-DISTANCE*, is the Complement of the Sun, or Stars Meridian Altitude; or what the Meridian Altitude wants of 90 Degrees. See **COMPLEMENT** and **ALTITUDE**.

**ZENSUS**, in *Arithmetic*, a Name which some Authors give to a Square Number; or the second Power. See **SQUARE NUMBER** and **POWER**.

The higher Powers they call *Zensenzenfis*, *Zensicubus*, *Zensicenzenfis*, *Zensardesolidus*, &c. See **POWER**.

**ZEPHYRUS**, or **ZEPHYR**, the West-wind; or a Wind blowing from that Cardinal Point of the Horizon opposite to the East. See **WEST WIND**, and **CARDINAL POINT**.

It is also call'd *Eosmius*, and *Occidens*; and by many confounded with *Africus*.

The Word is *Greek* ζῆφυρος.—The Poets personify it. **ZETETICE**, **ZETETIC Method**, in *Mathematics*, the Method made use of to investigate or find the Solution of a Problem. See **RESOLUTION**, **INVESTIGATION**, &c.

The Word is form'd from the *Greek* ζῆτις, I seek.

The ancient *Pyrrhonians* were sometimes call'd *Zetetic*, q. d. Seekers. See **PYRRHONIANS**.

**ZEST**, the woody, thick Skin, quartering the Kernel of a Walnut.

The Word is also used for a Chip of Orange or Lemmon-Peel; such as is usually squeezed into Ale, Wine, &c. to give it a Flavour.

Hence, to *Zest* an Orange or Lemmon, among Confectioners, is to cut the Peel from Top to Bottom into small Slips, as thin as possible.

**ZETA**, or **ZETECULA**, a little withdrawing Chamber, with Pipes running along the Walls to receive from below either the cool Air or the Heat of warm Water. See **CALEFACT**, &c.

The Word is form'd either of τῆ ζῆτα, to be warm; or of τῆ ζῆτα, vivere, to live.

**ZYGMA**, a Figure in *Grammar*, whereby an Adjective or Verb which agrees with a nearer Word, is also, by way of Supplement, refer'd to another more remote. See **FIGURE**.

Thus, *Terence*—*Utinam aus hic furdus, aus hec muta facta sit*—So *Virgil*—*Hic illius Arma hic currus fuit*. In which Cases, the Words *facta sit* agreeing primarily with *hec muta*, are also made to agree or extend to *hic furdus*: And the Verb *fuit* is not only refer'd to *hic currus*, which it properly respects, but farther to *hic illius arma*.

The *Latins*, it may be here observed, take a liberty in Construction, which some of the nicer Critics among the Moderns, particularly the *French*, will not allow in the modern Tongues. See **CONSTRUCTION**.

The word *Zyagma* is *Greek*, ζῆγμα, which literally denotes a joining together.

**ZIBETHUM**, ζιβηθιον, in *Natural History*, *Gives*; a Perfume like *Musk*, contain'd in a kernelly Bladder in the Grin of a Civet Cat. See **CIVET**.

**ZINDIKITES**, a Sect among the *Mahometans*, denominated from their Leader *Zindik*, whom *Grorius* makes to be one of the *Magi*, and a Follower of *Zoroaster*. See **MAGI**.

The *Zindikites* believe no Providence nor Resurrection—They own no other God but the four Elements; and in this sense assert, that a Man being a Mixture of those simple Bodies, returns to God when he dies.

**ZINK**, or **ZAIM**, a kind of Mineral, or Semi-metal, which some confound with *Bismuth*, and others with *Spelter*. See **BISMUTH**, **SPELTER**, &c.

Others call it *Femalis Antimony*. See **ANTIMONY**. *Zink* is a kind of Mineral-Lead, very hard, white, and brilliant; and which, tho' not ductile enough to denomi-

nate it a Metal, yet stretches a little under the Hammer. See METAL, DUCTILITY, &c.

'Tis found in great Quantities in the Mines of *Goffelaar* in Saxony—That commonly fold is in large, thick, square Cakes; which would make one suspect it had been melted when taken out of the Mine, and cast in Moulds of that Form.

*Zink* is used to purge and purify Tin; much as Lead is to purify Gold, Silver, and Copper. See LEAD.

Founders, Toy-men, &c. also use it with Turmeric to tinge Copper, &c. It gives a fine Gold Colour, tho' not a very lasting one. See COPPER, BRASS, &c.

M. *Homburg* conjectures, with a good deal of Probability, that *Zink* is no other than a natural Mixture of two real Metals, viz. Tin and Iron—What led him to the Opinion was, that *Zink* yields precisely the same Fumes by the Burning-glass, as such a Mixture does. Accordingly, he affures us, he often substituted the one for the other; and this always with the very same Effect.

ZINZIBER 3 see GINGER.

ZIZYPHUM, a Name sometimes given to a kind of Fruit usually call'd *Jujubes*. See JUJUBES.

ZOCCO, ZOCCOLO, ZOCCLE, or SOCLE, in Architecture, a small kind of Stair or Pedestal; being a low, square Piece or Member, serving to support a Bust, Statue, or the like thing that needs to be rais'd. See SOCLE.

The Word is *Italian*, form'd from *Soccus*, a Sandal, or high Shoe. See SOCCUS.

Zocco, or Zoecle, is also used for a low, square Member serving to support a Column, or other part of a Building, instead of a Pedestal, Base, or Plinth. See PEDESTAL, PLINTH, &c.

A continued ZOCCLE is a kind of continued Pedestal whereon a Structure is rais'd; but having no Base or Cornice. See PEDESTAL.

ZODIAC, ZODIACUS, in Astronomy, a Fascia, Belt, or broad Circle, whose Middle is the Ecliptic, and its Extremes, two Circles parallel thereto at such distance from it as to bound, or comprehend the Excursions of the Sun and Planets. See SUN and PLANET.

The Sun never deviates from the Middle of the Zodiac; i. e. from the Ecliptic; the Planets all do, more or less. See ECLIPTIC.

Their greatest Deviations, call'd Latitudes, are the Measure of the Breadth of the Zodiac; which is broader or narrower as the greatest Latitude of the Planets is made more or less—Accordingly, some make it 16, some 18, and some 20 Degrees broad. See LATITUDE.

The Zodiac cutting the Equator obliquely, makes an Angle therewith of 23 Degrees and an half; or more precisely of 23°, 29', which is what we call the Obliquity of the Zodiac, and is the Sun's greatest Declination. See OBLIQUITY and DECLINATION.

The Zodiac is divided into twelve Portions, call'd Signs; and these Divisions or Signs are denominated from the Constellations which antiently possess'd each Part. See CONSTELLATION.—But, the Zodiac being immovable, and the Stars having a Motion from West to East, those Constellations no longer correspond to their proper Signs; whence arieth what we call the Precession of the Equinoxes. See PRECESSION.

When a Star, therefore, is said to be in such a Sign of the Zodiac, it is not to be understood of the Sign, or Constellation of the Firmament; but only of that twelfth Part of the Zodiac, or Dodecatery that bears it. See SIGN, STAR, and DODECATERY.

The word Zodiac is form'd from the Greek ζῳια, an Animal; by reason of the Constellations therein: Others derive it from ζῳια, Life; from an Opinion that the Planets have a great Influence on Animal Life.

*Cassini* has also observ'd a Tract in the Heavens, within whose Bounds most of the Comets, tho' not all of them, are observed to keep; which, for this reason, he calls the Zodiac of the Comets. See COMET.

This he makes as broad as the other Zodiac, and marks it with Signs or Constellations like that; as, *Antinous*, *Pegasus*, *Andromeda*, *Taurus*, *Orion*, the lesser *Dog*, *Hydra*, the *Centaur*, *Scorpion*, and *Sagittary*.

ZONE, ZONA, in Geography and Astronomy, a Division of the Terraqueous Globe with respect to the different Degree of Heat found in the different Parts thereof. See EARTH and HEAT.

A Zone is the fifth Part of the Surface of the Earth, contain'd between two Parallels. See PARALLEL.

The Word is Greek ζωνη, q. d. Belt, Girdle.

The Zones are denominated *Torrid*, *Frigid*, and *Temperate*.

The *Torrid Zone* is a Fascia or Band surrounding the Terraqueous Globe, and termin'd by the two Tropics. See TROPIC.—Its breadth, therefore, is 46°, 58'. The Equator running through the middle of it, divides it into two equal Parts, each containing 23°, 29'.

The Antients imagined the *Torrid Zone* uninhabitable. See TORRID.

The *Temperate Zones* are two Fascie, or Bands environing the Globe, and contain'd between the Tropics and the Antarctic Circles.—The breadth of each is 43°, 4'. See TEMPERATE.

The *Frigid Zones* are Segments of the Surface of the Earth terminat'd, the one by the Antarctic, and the other by the Arctic Circle.—The breadth of each is 46°, 58'. See ARCTIC, ANTARCTIC, &c.

The Difference of Zone is attended with a great diversity of Phenomena.—1°. In the torrid Zone, the Sun passes through the Zenith twice a Year; and his rays from the Equator toward the Pole which is above the Horizon, is twice a Year equal to the height of the Pole.

2°. In the temperate and frigid Zones, the least height of the Pole exceeds the greatest distance of the Sun from the Equator; and therefore to the Inhabitants thereof the Sun never passes thro' the Zenith; yet if on the same day the Sun rises at the same time to a greater height, the height of the Pole is the less, in regard the Inclination of the Circles of diurnal Revolution to the Horizon is less.

3°. In the temperate and torrid Zones the Sun rises and sets every natural Day, by reason the distance of the Sun from the Pole always exceeds the height of the Pole; yet every where but under the Equator, the artificial Days are unequal, and the Inequality is the greater, as the Place is less distant from the frigid Zone. See DAY.

4°. Where the temperate Zones terminate on the frigid, the height of the Pole is equal to the Sun's distance from the Pole, when in the neighbouring Tropic; and consequently once a Year, the Sun in its diurnal Motion performs an entire Revolution, without going down under the Horizon.

5°. Every where in a frigid Zone, the height of the Pole is greater than the least distance of the Sun from the Pole; and therefore during some Revolutions of the Earth, the Sun is at a distance from the Pole less than the Pole's height; and during all that time, does not set, nor so much as touch the Horizon.—Where the distance from the Pole, as the Sun recedes from it, exceeds the height of the Pole, or Latitude of the Place; the Sun rises or sets every natural Day. See DAY, NIGHT, RISING, SETTING, &c.

ZONNAR, a Term corrupted from the vulgar Greek ζωνη, of ζῳια, a Girdle.

The *Zonnar* is a kind of Belt or Girdle of black Leather, which the Christians and Jews of the Levant, particularly those in Asia and the Territories of the Grand Signor, are obliged to wear; to distinguish themselves from the *Mahometans*.

It was *Motowakke* Xth Kalif of the House of the *A'assides* that first enjoined the Christians, &c. to wear the *Zonnar*—The Ordinance to this effect was published in the Year of the *Hegira* 135.

Hence, as most of the Christians of *Syria*, *Mesopotamia*, &c. are either *Nestorians*, or *Jacobites*; those Sectaries, are often call'd *Christians of the Girdle*. See GIRDELE.

ZOOLOGIA, ZOOLOGY, a Discourse or Treatise upon Animals or living Creatures. See ANIMAL.

*Zoology* makes a considerable Article in Natural History; comprehending what relates to the Form, Structure, Method of Living, Feeding, Propagating, &c. of the divers Species of Beate Creatures. See NATURAL HISTORY.

The Word is compounded of ζῳια, Life, and λογος, Speech, Discourse.

ZOOPHORUS, or ZOPHORUS, in the antient Architecture, the same thing with the *Prieae* in the Modern. See PRAEAE.

It was thus call'd in Greek, because antiently adorned with the Figures of Animals; from ζῳια, Animal, and φορος, I bear.

The Greeks sometimes also call the Zodiac, *Zoophorus*, because of the Signs or Constellations therein. See ZODIAC.

ZOOPHORIC Column, is a Statuary Column; or a Column that bears or supports the Figure of an Animal. See COLUMN.

ZOOPHYTA, ZOOPHYTES, ZOOPHYTE, in Natural History, q. d. *Plant-Animal*; a kind of intermediate Body, partaking both of the Nature of a Sensitive and a Vegetable.

Such is the *Planta Pudica* commonly supposed to be; tho' with little foundation. See SENSITIVE PLANT.

The Antients also reputed Sponges to be *Zoophytes*. See SPONGE.

The Word is compounded of ζῳια, Animal, and φυτα, Plant.

The *Fœtus* while in the Womb appears to be a real *Zoophyta*; growing to the Mother by the *Funiculus Umbilicalis*, as Plants do to the Earth by their Stem. See FœTUS, EMBRYO, &c.

*Olearius* mentions a very extraordinary sort of *Zoophyte* grow-

growing near *Samara* on the *Volga*—'Tis a kind of Melon shaped like a Lamb, all the Parts whereof it has, and grows to the Earth, by a Stem which serves it for a Navel-string. As it grows, it changes Place, as much as its Stem will allow of; and it consumes and dries up all the Grains where it grows. When ripe, the Stem withers, and the Body or Fruit becomes cover'd with a downy Skin, which may be dress'd and used as a Fur.

He affirms to have seen of this Skin, and that it was cover'd with a soft curled Wool like that of a young Lamb.

*Scaliger* adds, that this Fruit lives, and grows, till such time as it wants Grains—In some Accounts it is call'd *Agnus Scythicus*, and *Borago*.

**ZOOTOMY**, the Art or Act of Dissecting Animals or living Creatures. See **DISSECTION**.

*Zootomy* amounts to the same with *Anatomy*. See **ANATOMY**.

The Word is compounded of *ζωον*, Animal, and *τομή*, fero, I cut.

**ZOPATA**, or *Sapata*, a kind of Feast or Ceremony held in *Italy*, in the Courts of certain Princes, on *St. Nicholas's Day*, wherein People hide Presents in the Shoes or Slippers of those they would do honour to, in such manner as may surprize 'em the Morrow when they come to dress.

It is done in Imitation of the Practice of *St. Nicholas*, who used in the Night-time to throw Parties of Money in at Windows, to marry poor Maids withal.

*F. Menestrier* has described these *Sapates*, their Origin, and different Usages, in his Treatise *des Ballets Anciens & Modernes*.

The Word *Zapata* is originally *Spanish*, and signifies Shoe.

**ZOPISSA**, a kind of Mixture of Pitch and Tar; scraped off Ships that have been a long time at Sea. See **PITCH** and **TAR**.

This Matter by being gradually penetrated by the Salt of the Sea, becomes partaker of its Qualities; and being apply'd to the Body, externally, is found Resolutive and Dedicative.

The Word is form'd from *ζέω*, *bullire*, to boil, and *πίσσα*, Pitch; *q. d. boil'd Pitch*.

**ZUINGLIANS**, a Branch of antient Reformers, or Protestants; denominated from their Author *Ulric* or *Huldric Zuinglius*. See **REFORMATION**.

This eminent Divine was born at *Wildenhausen*, in the County of *Toggenbourg* in *Switzerland*, in 1487.—After having finished his Studies in Theology, and received the Doctor's Cap at *Basil*, in 1505, he apply'd himself to preaching; and with good Success.

Soon after *Luther* had taken up Arms against *Rome*, *Zuinglius*, being then Minister of the chief Church in *Zurich*, fell in with him; preach'd openly against Indulgences, then against the Intercession of the Saints, then against the Mass, the Hierarchy, the Vows, and Celibate of the Clergy, Abstinence from Flesh, &c.

As to the Eucharist, interpreting *hoc est Corpus meum* by *hoc significat Corpus meum*; he maintain'd, that the Bread and Wine were only bare Significations, or Representations of the Body and Blood of *Jesus Christ*, in which he differ'd from *Luther*, who held a Consubstantiation. See **LUTHERAN**, **EUCCHARIST**, **CONSUBSTANTIATION**, &c.

In a Conference held with the Deputies of the Bishop of *Consians*, in 1523, he procur'd most of the external Ceremonies of Religion to be abolished.—As to Matters of Grace, *Zuinglius* seem'd inclined to *Pelagianism*; giving all to Free-will, consider'd as acting by the mere strength of Nature; in which he differ'd from *Calvin*. See **CALVINISTS**, **GRACE**, **WILL**, **PELAGIAN**, &c.

**ZYGOMA**, in Anatomy, a Bone, by some call'd *Os Jugale*. See **JUGALE**.

The *Zygoma* is no single Bone, but an Union or Assemblage of two Processes or Eminences of Bones; the one from the *Os temporis*, the other from the *Os male*. See **BONE**.

These two Eminences, or *Apophyses*, are joined together by a Suture thence call'd *Zygomatice*. See **ZYGOMATICUS**.

The Word is form'd from *ζυγωωμαι*, I join; so that *Zygoma*, properly speaking, is the Junction of those two Bones.

**ZYGOMATICUS**, an Epithet given to the Suture that binds the two Processes of the *Zygoma* together. See **ZYGOMA** and **SUTURE**.

**ZYGOMATICUS**, in Anatomy, a Muscle that has its Origin in the *Processus Jugalis*, or *Zygoma*; and passing obliquely, is inserted near the Angle of the Lips.—It helps to draw the Lips obliquely upwards. See **LIPS**.

**ZYMOSIMETER**, an Instrument proposed by *Swammerdam*, in his Book *de Respiratione*, wherewith to measure the degree of Fermentation occasion'd by the Mixture of different Matters; and the Degree of Heat which those Matters acquire in fermenting; as also the Heat or Temperament of the Blood of Animals. See **FERMENTATION**, **HEAT**, &c.

The Word is form'd from *ζύμας*, Fermentation, and *μετρον*, Measure.

**ZYTHUM**, or **ZITHUM**, a sort of Malt-Liquor, in use among the antient *Germans*. See **MALT-LIQUOR**.

*Matthiolus* represents the antient *Zythum* and *Curmi* as the same with our Beer and Ale. See **BEER** and **ALE**.

## CYCLOPÆDIA: Or, An UNIVERSAL DICTIONARY of Arts and Sciences, &c.

### B.

#### BOG

**BOG**, a moist, rotten spot of earth, which sinks, and gives way to the weight of the body, formed of grass and plants petrified by some spring; frequent, especially in Ireland.

In which sense, *bog* amounts to much the same with what in other places are called *masses*, *marshes*, *seas*, &c. See *MORASSE* and *FEN*.

Ireland is become infamous for *bogs*: they distinguish between a *turf-bog*, called also *red-bog*, out of which turf or peat is dug; and a *quaking-bog*, which will sink under a man in the place where he stands to a considerable depth, and rise before and behind proportionably: underneath, is frequently clear water, into which a person slips to the middle, upon breaking the surface.—*Quaking-bogs* frequently turn into *turf-bogs*.

Every red *bog* is encompassed with a deep marshy sloughy ground, called the *bounds of the bog*.—Horns and skeletons of moule-deer are sometimes found in *bogs* fourteen foot deep.

The inconveniencies of *bogs* are, that a considerable part of the kingdom is rendered useless by them: they also keep people at a distance from each other, and thus hinder business from going forward. They occasion the roads to be crooked and circuitous to avoid them: they are a great destruction to cattle, the chief commodity of Ireland; which are encouraged by the grass growing on the edges of the *bogs* to venture in, where they are lost: they are also a shelter to robbers and thieves. The smell and vapour arising from them is accounted unwholesome, and the fogs putrid and stinking. Add, that they corrupt the water, both as to its colour and taste.

*Bogs* have also their uses: most of the people in Ireland have their firing from them; the wood being impolitically destroyed, and little pit-coal yet discovered. The Irish could hardly do without some *bogs*.—The natives had anciently another advantage from *bogs*; viz. that by means of them they were preserved from the conquest of the English: and it seems to be from the remembrance hereof, that they still chuse to build near *bogs*.

For the origin and formation of *Bogs*, it is to be observed, that there are few places, in the northern world, but have formerly been as famous for them, as Ireland now is: every wild, ill-inhabited country has them: the *lœca palustris*, or *solitudes*, to which the ancient Gauls, Germans, and Britons, retired when beaten, appear to be no other, than what we now call *bogs*. The like may even still be found in the barren parts of Italy, as Liguria.

The true cause of *bogs*, then, seems to be the want of industry; at least it is certain industry may remove, and much more prevent them. There are many *bogs* of late-standing in Ireland, formed within our own memory, through the miseries of the times, and the desolations of civil war.—It is no wonder if a country famous for laziness should abound with them.

To shew how want of industry causes *bogs*, it must be remembered that Ireland abounds with springs; that these springs are dry, or nearly so, in the summer-time, and that the grass and weeds grow thick about the places where they burst out. In the winter the same springs swell again, and run and soften and loosen the earth about them; and the sward or turf of the earth, which consists of the roots of grass, being lifted up and made fuzzy by the water, becomes dried again in the spring; and does not fall together, but withers in a tuft, and new grass springs through it; which, the next winter is again lifted up: thus the spring is more and more splot; and the sward grows thicker and thicker, till it first make what we call a *quaking-bog*: and as it grows higher and dryer, and the grass roots and other vegetables become more putrid, together with the mud and slime of the water, it acquires a blackness, and grows into what we call a *turf-bog*.

What confirms this account is, that *bogs* are generally found higher than the land about them, and highest in the middle: the chief springs which cause them being commonly about

#### BOO

the middle; from whence they dilate themselves by degrees, as one would blow a bladder; but not always equally, because they sometimes meet with greater obstacles on one side, than on the other.—Add, that if a deep trench be cut through a *bog*, you will find the original spring, and vast quantities of water will run from it, and the *bog* subside; sometimes a dozen or 15, some even say, 30 foot.—Lastly, those hills which have no springs, have no *bogs*; and those which have springs, and want culture, are never without them. In brief, wherever *bogs* are, there are great springs: the turf generally discovers a vegetable substance; it is light, and impervious to water, while the ground under it is very pervious.

True, there are some quaking *bogs* caused otherwise; as, when a stream or spring runs through a flat; if the passage be not tended, it fills with weeds in summer, trees fall across it, and dam it up; then in winter, the water stagnates farther and farther every year, till the whole flat be covered; next, there rises a coarse kind of grass peculiar to these *bogs*; it grows in tufts, and the roots consolidate together, and yearly grow higher, in so much as sometimes to reach the height of a Man: this grass rots in winter, and falls on the tufts, and the seed with it, which springs up next year, and thus makes a new addition: sometimes the tops of flags and grass being interwoven on the surface of the water, and become by degrees thicker, till they lie like a cover on the water; other herbs take root in it, and by a plexus of those roots it becomes strong enough to bear the weight of a man.

Another cause of *bogs* is moss, with which Ireland abounds extremely.—That which grows in *bog* is remarkable; the light spongy turf above-mentioned being nothing but a congeries of the threads of this moss, which is sometimes in such quantities, and so tough, that the turf-spades cannot cut it: in the north of Ireland they call it *old wives tow*; not being much unlike flax. The turf-holes in time grow up with it again, and all the little gutters in *bogs*, are generally filled with it. In reality, to this the *red* or *turf-bogs* seem to be chiefly owing.

For the draining of *Bogs*, to render them fit for pasture or arable, it is not impossible, the same having been performed in England, France, Germany, &c.—People commonly distinguish between *bogs* which have no fall to carry away the water from them, and those which have; the last are reputed drainable, the former not. But Mr. King assures, he never observed one *bog* without a fall sufficient to drain it, nor does he believe there is any. In reality, the great objection against draining, is the charge, which, it is commonly reckoned will amount to much more than would purchase an equal quantity of good ground: for an acre of this last in most parts of Ireland is not worth above 4*s.* per annum, and 14 or 15 years purchase; so that three pound will buy an acre of good land; and it is very doubtful with moss, whether that sum will reduce a *bog*: this reasoning passes current, and is the great impediment of this work.

To this it is answered, that *quaking-bogs*, though land be never so cheap, never fail to be worth draining; one trench will drain many acres; and when dry, it is generally meadow, or the best grazing ground. Again, what is called the bounds of a *red-bog*, never fails to be worth the draining; being done by one deep trench drawn round the *bog*; by this cattle are kept out of the *bog*, and the bounds turned into meadow.—Add, that even *red-bogs* might be made fit for grazing at a much cheaper rate than has hitherto been done, by a proper conduct in the digging of trenches, particularly described by Mr. King.—See *Philos. Transact.* N<sup>o</sup> 170. p. 948. *seq.* & N<sup>o</sup> 330. p. 305. Item N<sup>o</sup> 314. p. 59. *Phil. Nat. Hist. Oxford.* c. 9. §. 81. *seq.* Mortuim. *Huf-kond.* T. 1. l. 1. c. 2. p. 21.

**BOOK** \*, a writing composed on some point of knowledge by a person intelligent therein, for the instruction or amusement of the reader.

\* The word is formed from the *Saxon* *ber*, which comes from

from the Northern *booth*, of *boathans*, a booth or service-tee, on which our ancestors used to write.—*Vid.* Rudbeck *Atlant.* p. 3. *Philol. Transact.* N. 301. p. 2061.

**Book** may be defined more precisely, a composition of some man of wit or learning, designed to communicate somewhat he has invented, experienced, or collected, to the public, and thence to posterity; being wishal of a competent length to make a volume.—*Vid.* Saalbach *Sched. de Libr. Veter.* §. 8. Reimm. *Idea Syst. Antiq. Liter.* p. 230. *Trev. D. Univ.* T. 3. p. 1506. *voe. Lavre.* See also the article **VOLUME**.  
In this sense, *book* is distinguished from *pamphlet*, or single paper, by its greater length; and from *some* or *volume* by its containing the whole writing.—Isidore makes this distinction between *liber* and *codex*; that the former denotes a single book, the latter, a collection of several<sup>2</sup>; though, according to Scipio Maffich, *codex* signifies a book in the square form, *liber*, a book in the roll form.—*Vid.* *Id.* *Orig. l. 6. c. 13.* Maffei *Ist. Diplom.* l. 2. *Bibl. Ital. T. 2. p. 244.* See also *Stalbach Lib. cit.* §. 4. Reimm. *ubi supra*.  
According to the ancients, a *book* differed from an *epistle*, or *letter*, not only in bulk, but in that the latter was folded up, the former only rolled<sup>3</sup>: not but that there are divers *books* now extant under the names of *epistles*.—*Vid.* *Pitisc. L. Ant. T. 2. p. 84. voe. Libri.* See also **EPISTLE**.  
We say an *old book*, a *new book*; a Latin, a Greek *book*: to read, to write, to publish a *book*; the preface, the title, the dedication, the index of a *book*. See **PREFACE**, **TITLE**, **INDEX**, &c.—To *collate* a *book*, is to see that it be perfect, and that none of the sheets be either wanting or transposed.—Book-binders speak of *foliing*, *sewing*, *beating*, *pressing*, *covering*, *gilding*, and *lettering* of *books*. See **BOOK-BINDING**.

A large collection of *books* for use is called a *library*. See **LIBRARY**.—An inventory of a library, in order for the reader finding any *book*, is called a *catalogue*. See **CATALOGUE**.—Cicero calls M. Cato, *hællus librorum*, a glutton, or devourer of *books*<sup>4</sup>. *Geza* holds Plutarch<sup>5</sup>, and Herm. Barbarus, Pliny, the best of all *books*<sup>6</sup>.—Crenius<sup>7</sup> has a discourse on the best or capital *books* of each author: Ter-tullian's best is held to be his *book De Pallis*; St. Augustin's master-piece is that *De Civitate Dei*; that of Hippocrates, the *Coacta præntiones*; of Cicero, *de Officiis*; of Aristotle, *de Animalibus*; of Galen, *de Usu Partium*; of Virgil, the *sixth Æneid*; of Horace, the *first and seventh Epistles*; of Catul-lus, the *comæ Bærentines*; of Juvenal, the *sixth Satyr*; of Plautus, the *Epistæ*; of Theophrastus, the *27th lib.*; Para-celsus's best *book* is his *Chirurgia*; that of Severinus, *de Affectionibus*; of Bædæus, *Commentarii Lingue Græcæ*; of Jol. Scaliger, *de Emendatione temporum*; of Erasmius, the *Adagia*; of Petavius, the *Rationarium temporum*; of Bellarmin, *de Scripturis Ecclésiasticis*; of Salmasius, the *Exercitationes Pliniane*; of Vossius, *Instituta Oratorie*; of Heinsius, *Aristarchus Sacer*; of Casaubon, *Exercitationes in Baronium*.—*Vid.* *Cic. de Finib. l. 3. n. 1.* <sup>2</sup> *Gentzen. Hist. Philol. p. 130.* <sup>3</sup> *Harduin. Pref. ad Plin.* <sup>4</sup> *Cren. de Libr. Script. Optim. Act. Erud. Lips. an. 1704. p. 526.* Barthol. *de Libr. Legend. diff. 3. p. 66.*

It would be of good use to know which is the best *book* on each subject; *e. gr.* the best logic, best dictionary and gram-mar, best physics, best commentary on the bible, or on the institutes, or Genesis, or the epistle to the Hebrews; the best harmony of the Evangelists; best defence of the truth of Christianity, and the like: by which a library might be composed of none but the best *books* of each kind.

The history or *notitia* of **BOOKS** makes the chief part, according to some, the whole of the literary science.—The principal points in the *notitia* of a *book*, are its *author*, *date*, *printer*, *editions*, *versions*, *comments*, *epitomes*, *successes*, *edges*, *confutes*, *condemnation*, *suffragium*, *adversaries*, *vindicatores*, *controversatores*, and the like.

The history of a *book*, is either of its *contents*, which is given by analyzing it, as is done by journalists; or of its *appendages* and *accidents*, which is the more immediate province of those called *literators* and *bibliothecarians*. See **JOURNAL**.

The *contents* of a *book*, are the matters delivered in it; which make the province of the author.—Of these there is one principal matter, called the *subject*; in respect of which the rest are only *incidents*.

The *appendages* of a *book*, are the *title*, *preface*, *epistle dedicatory*, *summaries*, *table of contents*, *index*, and the like, which are the proper province of the editor, unless perhaps the *title-page*, which is frequently usurped by the book-seller. See **TITLE**, &c.

In the *composition* of a *book*, there occur *sentiments*, which are also the materials of it; *method*, the order wherein these are disposed; and *style*, or *expression*, which is the language wherein they are clothed. See **SENTIMENT**, **STYLE**, &c.  
The giving histories, catalogues and bibliothecæ's of *books*, is said to have been first introduced by the Germans: we may add, that it is they who have best succeeded in them; and to whom the chief works of this kind are owing.—J. Alb. Fabricius has given us the history of the Greek and Latin *books*; Wolfius that of the Hebrew *books*<sup>8</sup>; Boetler,

of the principal *books* in each science and faculty: Struvius of the *books* of history, law and philosophy: the abbot Fabricius of the *books* in his own library: Lambecius of those in the Vienna library: Le Long of the *books* of scripture: Mattæire of the *books* printed before the year 1550, &c.—*Vid.* Reimm. *Bibl. German. in præf. §. 1. p. 3.* <sup>1</sup> *Bof. In-trod. ad Nis. Script. Ecclési. c. 4. §. 13. p. 124. seq.*

**Burning of Books**, was a kind of punishment much in use among the Romans, by legal sentence: sometimes the care of the execution was committed to triumviri appointed on purpose<sup>1</sup>; sometimes to the pretors<sup>2</sup>, and sometimes to the ædiles<sup>3</sup>: Labienus, whom from his satirical spirit some called *Rabionus*, is said to have been the first, who underwent the severity of it. His enemies procured a *senatusconsultum*, whereby all his *books*, published during several years, were ordered to be collected and burnt: "The things, (says Seneca) need not appear new and strange, to take revenge on "learning!" *Res nova & insueta! Supplicium de studiis sumi!* C. Cassius Servius, a friend of Labienus, hearing the sentence pronounced, cried aloud, "That they must burn him too, "since he had got all the books by heart!" *Nunc me vivum uri oportet, qui illos didici.* Labienus could not survive his *books*, but shutting himself up in the tomb of his ancestors, pined away and was buried alive.—*Vid.* *Tacit. Agric. c. 2. n. 1.* <sup>1</sup> *Valer. Max. l. 1. c. 1. n. 12.* <sup>2</sup> *Tacit. Annal. l. 4. c. 35. n. 4.* <sup>3</sup> *Senec. Controv. in præf. §. 5.* <sup>4</sup> *Rhodiog. Ant. Lat. c. 13. l. 2.* *Salmuth. ad Pascirol. P. 1. tit. 22. p. 68.* *Pitisc. L. Ant. T. 2. p. 84.* Divers other ancient testi-mones concerning the burning of *books* are given in Reimm. *Idea Syst. Antiq. Liter.* p. 389. *seq.*

For the matter of **BOOKS**.—They were at first written on stones, witness the Decalogue given to Moïses, (which is the oldest book we have any warranted account of) then, on the parts of plants, *e. gr.* the leaves, chiefly of the pal-m-tree; the rinds and barks, especially of the tilia, or phillyra, and the Egyptian papyrus<sup>5</sup>. By degrees, wax, then leather were introduced, especially the skins of goats and sheep, of which at length parchment was prepared: then lead came in use; also linen, silk, horn, and lastly paper itself.—*Vid.* *Calm. Diff. 1. far Genes. Comment. T. 1. ejusd. D. Bibl. T. 1. p. 316.* *Du Pin Bibl. Ecclési. T. 19. p. 381.* Barthol. *de legend. libr. diff. 4. p. 70. seq.* *Hist. Acad. R. Inscr. T. 3. p. 103.* Schwartz *de Ornam. libr. diff. 1.* Reimm. *Idea Syst. Antiq. liter. p. 235. & 286. seq.* *Montfauq. Palæogr. l. 2. c. 8. p. 180. seq.* *Guiland Papyr. Memb. 3.* See also the article **PAPER**.

The parts of vegetables continued long the common matter of *books*: inasmuch that most of the names and terms be-longing to *books*, in most languages, are taken thence: as the Greek *biblos*, the Latin *liber*, *codex*, *folium*, *tabula*, and the English *book* itself.—We may add that vegetable barks appear still in some measure retained for *books* in certain of the Northern countries, as among the Cistern Tartars, where a library was lately discovered by the Russians, of an unusual form as well as matter: the *books* were exceedingly long, but of no breadth; the leaves very thick, and made of barks of trees, smeared over with a double varnish; the ink or writing being white, on a black ground.—*Vid.* *Hist. Acad. R. Inscr. T. 3. p. 6.*

The first *books* were in form of blocks and tables, of which we find frequent mention in scripture, under the appellation *sepber*, which the septuagint render *stones*, *q. d. square-tables*: of which form the *book* of the covenant, *book* of the law, *book* or bill of divorce, *book* of curses, &c. appear to have been.<sup>1</sup>—As flexible matters came to be wrote on, they found it more convenient to make their *books* in form of rolls<sup>2</sup>, called by the Greeks *volu-men*, by the Latins *volu-men*<sup>3</sup>, which appear to have been in use among the ancient Jews, as well as Grecians, Romans, Persians, and even In-dians. And of such did the libraries chiefly consist, till some centuries after Christ.—The form which obtains a-mong us, is the square, composed of separate leaves; which was also known, though little used among the ancients, having been invented by Attalus, king of Pergamus, the same who also invented parchment<sup>4</sup>: but it has now been so long in possession, that the oldest manuscripts are found in it. Montfauq assures us, that of all the ancient Greek MSS. he has seen, there are but two in the roll-form; the rest being made up much after the manner of the modern books.<sup>5</sup>—*Vid.* *Calm. lib. cit.* <sup>6</sup> *Du Pin Bibl. Ecclési. T. 19. p. 382.* <sup>7</sup> *Barth. de Libris legend. diff. 4. p. 95. seq.* <sup>8</sup> *Montfauq. Palæogr. Græc. l. 1. t. 4. p. 26.* Reimm. *Idea Syst. Antiq. liter. p. 227. item, p. 262.* Schwartz *de Ornam. libr. diff. 2.* See also the article **BOOK-BINDING**.

The rolls, or volumes were composed of several sheets, sutured to each other, and rolled upon a stick, or *umbilicus*: the whole making a kind of column, or cylinder, which was to be managed by the *umbilicus*, as a handle; it being reputed a kind of crime to take hold of the roll itself. The outside of the volume, was called *frons*; the ends of the *umbilicus cornua*, horns; which were usually carved and adorned likewise with bits of silver, ivory, or even gold and precious stones. The title *PARAPHRASIS* was stuck on the outside. The whole volume when extended might take a yard and half wide, and fifty long.—*Vid.* *Salmuth. ad Pascirol. P. 1. tit. 42. p. 143. seq.* *Walc. Parerg. Acad. p. 72.* *Pitisc.*

titic. *L. Ant. T. 2. p. 43. voc. libri.* Barth. *Advers. l. 22. c. 18.* Schwartz. *de Ornam. Libror. diff. 2.* Reimm. *Idea Syst. Ant. Liter. p. 242. seqq.* *how p. 751.* To which may be added divers other writers on the form and ornaments of the ancient books recited in Fabric. *Bibl. Antiq. c. 19. §. 7. p. 607.*

To the form of books belongs also the *acrony of the inside*, or the order and arrangement of points and letters into lines and pages<sup>1</sup>, with margins and other appurtenances; this has undergone many varieties; at first, the letters were only divided into lines, then into separate words; which by degrees were noted with accents, and distributed by points and stops into periods, paragraphs, chapters, and other divisions. In some countries, as among the Orientals, the lines began from right, and run to the leftwards; in others, as the Northern and Western nations, from left to the rightward: others, as the Grecians, followed both directions alternately, going in the one and returning in the other, called *baustrophedon*.—In most countries, the lines run from side to side of the page; in some, particularly the Chinese, from top to bottom. Again, the page in some is entire, and uniform; in others, divided into columns; in others, distinguished into text and notes, either marginal, or at the bottom: usually it is furnished with signatures and catch-words; sometimes also with a register to discover whether the book be complete.—To these are occasionally added the apparatus of summaries, or side-notes; the embellishments of red, gold, or figured initial letters, head-pieces, tail-pieces, elegies, schemes, maps and the like.—The end of the book now denoted by *finis*, was anciently marked with a  $\leftarrow$ , called *acronis*; and the whole frequently washed with an oil drawn from cedar, or citron chips strewn between the leaves to preserve it from rotting<sup>2</sup>.—There also occur certain formulae at the beginnings and ends of books: as, among the Jews, the word *Pax, esto fortis*, which we find at the end of the books of Exodus, Leviticus, Numbers, Ezekiel, &c. to exhort the reader to be courageous, and proceed on to the following book<sup>3</sup>.—The conclusions were also often guarded with imprecations against such as should falsify them<sup>4</sup>; of which we have an instance in the Apocrypha<sup>5</sup>.—The Mahometans for the like reason place the name of God, at the beginning of all their books, which cannot fail to procure them protection, on account of the infinite regard had among them to that name wherever found<sup>6</sup>.—For the like reason it is that divers of the laws of the ancient emperors begin with the formula, *In nomine Dei*.—*Vid. Barth. de Libr. Legend. diff. 5. p. 106. seqq.* Montfaucon. *Palaogr. l. 1. c. 4.* Reimm. *Idea Syst. Antiq. Liter. p. 227.* Schwartz. *de Ornam. Libror. diff. 1.* Reimm. *Idea Syst. Ant. Liter. p. 240. seqq.* Schwartz. *de Ornam. Libror. diff. 2.* Reimm. *Idea Syst. Ant. Liter. p. 251.* Schwartz. *ubi supra diff. 3.* Reimm. *l. c. p. 260. seqq.* Fabric. *Bibl. Græc. l. 1. c. 5. p. 74.* Revel. *c. 22. v. 19.* Sale *Prælim. Diss. in Koran sect. 3. p. 59.* Barthol. *lib. cit. p. 117.*

\* At the end of each book the Jews also added the number of verses contained in it, and at the end of the Pentateuch the number of sections; that it might be transmitted to posterity entire: the Masorettes and Mahometan doctors have gone further; so as to number the several words and letters in each book, chapter, verse, &c. of the Old Testament, and the Alcoran. See MASHORA, ALCORAN, &c.

The kinds and denominations of Books, are various; with regard to their use and authority, books may be divided into, *human*, those composed by mere men; *divine*, those sent from heaven, or dictated by God himself, containing his word and will; which latter are also called  *sacred and inspired books*. See REVELATION, INSPIRATION, &c.

The Mahometans reckon one hundred and four divine books, given by God to his prophets, *viz.* ten to Adam; fifty to Seth; thirty to Enoch; ten to Abraham; one to Moses, the Pentateuch (such as it was before the Jews and Christians corrupted it) another to Jesus, the Gospel; another to David, the Psalms; and another to Mahomet, the Alcoran. He that denies these, or any of them, or any part, verse, or even word of them, is deemed an infidel<sup>1</sup>; and God preserve us from infidels!—They make it a criterion of a divine book, that God himself speak in it, not others concerning God, in the third person; as is done in our books of the Old and New Testament, which they therefore reject as compositions merely human<sup>2</sup>.—*Vid. Reiland. de Relig. Mohamm. l. 1. c. 4. p. 21. seqq.* *Id. ibid. l. 2. c. 26. p. 231.*

*Stylite Books*, are those composed by certain pretended prophets, deposited in the capitol, under the care of diviners.—*Vid. Lamet. de Biblioth. c. 13. p. 377.* See also *STYLITE*.

*Canonical Books*, are those received and allowed by the church, as parts of holy scripture.—Such are the books of the Old and New Testament. See CANON, and BIBLE.

*Apocryphal Books*, those excluded out of the canon, yet received and read in churches. See APOCRYPHA.

*Athenic Books*, those which are decisive, and of authority; such, in the civil law, are the code, digest, &c. in our law, the statutes, &c.—*Vid. Bac. de Augm. Scient. l. 8. c. 3. Works T. 1. p. 257.*

*Auxiliary Books*, those less essential, yet of use as subservient to the others; as, in the study of the law, books of institutes, formulae, maxims, reports, &c.

*Elementary Books*, those which deliver the first principles of sciences: such are those under the titles of *rudiments, methods, grammars, &c.* by which they stand contradictorily distinguished from books of a *superior order*, which aim at making further advances in the sciences.—*Vid. Mem. de Trev. an. 1734. p. 804.*

*Library Books*, such as are not ordinarily read over, but turned to, and consulted occasionally: such are dictionaries, comments, corpora, thesaurus, &c.

*Esthetic Books*, those intended for the use of popular and ordinary readers.

*Acrasmatic Books*, those containing more secret and sublime matters, calculated for adepts and proficient in the subject.—*Vid. Reimm. Idea Syst. Antiq. Liter. p. 136.*

*Prohibited Books*, those condemned and forbidden by the superiors of the church, as either containing matters of heresy, or things contrary to good morals.—*Vid. Bingham. Orig. Eccles. l. 16. c. 11. §. 11.* Pauc. *de Var. Msd. Mor. Trad. c. 3. p. 298.* & 250. *Trev. D. Univ. T. 3. p. 1507.* Pfaff. *Introd. Hist. Theol. T. 2. p. 65.* Heuman *Via ad Hist. Lit. c. 4. §. 63. p. 163.* See also the article INDEX.

*Public Books, libri publici*, the records of past times and transactions kept by public authority.—*Vid. Calv. L. Jur. p. 534. voc. Libri.* *Trev. D. Univ. T. 1. p. 1509.* See also ACTS, &c.

*Church Books, or ecclesiastical Books*, those used in the public offices of religion<sup>1</sup>.—Such, in the Latin church, are the *sacramentary, antiphonary, lectionary, psalter, evangelary, or evangelistary, ordo, missal, pontifical, ritual, processional, breviary, registry, &c.*—In the Greek church, the *menologium, embolologium, tropologium, &c.*—Also, the *book of peace, liber pacis*, which is a book given to be kissed in the ceremony of the mass.—The *music-book*, containing the psalms, troparies, and other prayers of that kind; which are used to be sung, with the notes marked to each.—*Book of liturgies, libri liturgiarum*, containing not all the liturgies of the Greek church, but only the four now in use; *viz.* the liturgy of St. Basil, of St. Chrysostom, that of the prebendified, *προνομιανων*, and that of St. James, which is only used in the church of Jerusalem, and that but once a-year<sup>2</sup>.—*Vid. Pfaff. Introd. Hist. Theol. l. 4. §. 8. T. 3. p. 287.* *Trev. D. Univ. T. 3. p. 1507.* *Id. ibid.* See also LITURGY.

The English church-books, in use in the middle of the tenth century, as enumerated in Elfric's canons, were the *bible, psalter, psalm-book, (i. e. epistles) gospel-book, mass-book, song-book*, (elsewhere called *antiphonary*) *band-book, (or manual) kalendar, passion, (or martyrology) pentateuch, and the list-book.*—*Vid. Jahn. Eccles. Læus. An. 957. §. 21.*

The Jewish church-books, were the *books of the law, the hagiographa, the prophets, &c.*—See PENTATEUCH, PROPHET, and HAGIOGRAPHIA.—The first was also called the *book of Moses*, because composed by him; and the *book of the covenant*, because the terms thereof were contained in it. In a more absolute sense, *book of the law* denotes Moses's original or autograph, found in a hole in the temple in king Josiah's time.

Books, again, with regard to their scope and subject, may be divided into—*historical*, those which relate facts, either of nature or mankind—*dogmatical*, those which by down doctrines, or general truths—*miscellaneous*, those of a neutral kind, containing both facts and doctrines—*historico-dogmatical*, those which only rehearse doctrines, or, at most indicate the arguments by which they are proved, as Mallet's *geometry*;—*Scientifico-dogmatical*, those which not only recite the doctrines, but demonstrate them, as Euclid's *Elements*.—*Vid. Wolf. Phil. Rat. Sect. 3. c. 1. §. 744, 750, 751, &c.*

*Pontifical Books, libri pontificales, sacrorum Cereus*, among the Romans, were those appointed by Numa to be kept by the pontifex maximus; describing all the ceremonies, sacrifices, feasts, prayers, and other religious matters, with the manner and circumstances wherewith each was to be celebrated: these were also called, *indigentia*, as containing the names of all the gods, and the occasions, and formulae of invoking each.—*Vid. Liv. l. 1. p. 23.* Lomei. *de Bibl. c. 6. p. 107.* Pitific. *L. Ant. T. 2. p. 85. voc. Libri.*

*Ritual Books, libri rituales*, those which directed the order and manner of founding, building, and consecrating cities, temples, and altars; the ceremonies belonging to walls, gates, tribes, curia, camps, and the like.—*Vid. Lomei. lib. cit. c. 6. p. 111.* Pitific. *ubi supra.*

*Augural Books, libri augurales*, called by Cicero<sup>1</sup>, *remotissimi*, were those wherein the science of foretelling futurity from the flight and chattering of birds were contained<sup>2</sup>.—*Vid. Cic. Orat. pro domo sua ad pontif. Serv. ad Æn. l. 5. v. 738.* Lomei. *lib. cit. c. 6. p. 109.* See also AUGUR, and AUGURY.

*Arauspine Books, libri arauspici*, those wherein the mysteries of divining from the entrails of victims were prescribed.—*Vid. Lomei. ubi supra c. 6. p. 111.* See also ARAUSPICI, &c.

*Acherontic Books, libri Acherontici*, those wherein the ceremonies and discipline of Acheron were contained; sometimes also called *Libri Etrusci*, as being supposed to have been composed by Tages the Etrurian, though others pretend that

he had received them from Jupiter himself: some suppose these to have been the same with the *libri fatales*; others, with the *libri aruspici*.—*Vid. Serv. ad Æneid. l. 8. v. 398. Lomei. de Bibl. c. 6. p. 112. Ptitic. l. c. p. 84. Lindembrog. ad Cæsar. c. 14.*

**Fulgural Books, libri fulgurales**, those written touching thunder and lightening, and the interpretation thereof.—As that composed by the Tuscan nymph Bubo, preferred in the temple of Apollo.—*Vid. Serv. ad Æn. 6. v. 72. Lomei. de Bibl. c. 6. p. 111.*

**Fatal Books, libri fatales**, those wherein the ages, or terms of the life of men were written according to the Hetrurian discipline. These were consulted by the Romans in all public calamities; and instructions taken from them, how to expiate the offending deities.—*Vid. Censor. de Div. Natal. c. 14. Lomei. lib. cit. c. 6. p. 112. Ptitic. ubi supra, p. 85.*

**Black Books**, those which treat of necromancy and witchcraft.

The same denomination is also given to some other books, on account of the colour of their backs, or the darkness of their contents; whence also *red book*, and *dunsday book*. See **DOMESDAY**, &c.

**Good Books**, in the common usage, are those of devotion and piety; as foliologies, meditations, prayers, &c.—*Vid. Shaftesb. Charact. T. 1. p. 165. Item T. 3. p. 327.*

A *good book*, in the bookellers language, is a saleable one; in the language of the curious, a scarce one; in that of men of sense, an useful and instructive one.

Among five principal things which Rabbi Akiba recommended to his son, one was, that if he studied the law, he should take care to do it in a *good book*, lest he should be obliged to unlearn all again.—*Vid. Cren. de Farib. Libror.*

**Spiritual Books**, those which treat more expressly of the spiritual, or christian life, and the exercises thereof, as contemplation, &c.—Such are those of St. John Climax, St. Francis de Sales, St. Theresa, Thomas a Kempis, Gracianus, Dr. Horneck, &c. See **MYSTIC**.

**Profane Books**, such as do not treat of matters of religion. See **PROFANE**.

**Books**, with regard to their authors, may be divided into—**Anonymous**, those without any author's name. See **ANONYMOUS**.—**Cryptonymus**, those whose authors names are concealed in some anagram, or the like.—**Pseudonymus**, those which bear false names of authors.—**Posthumous**, those published after the author's death.—**Genuine**, those really written by the persons whom they pretend for their authors, and still remaining in the state wherein they were left by them.—**Spurious or supposititious**, those pretending to be written by others than their real authors.—**Interpolated**, those which since their composition have been corrupted by spurious additions or insertions.—*Vid. Paich. de Var. Mod. Moral. Trad. c. 3. p. 287. Heuman. Via ad Hist. Liter. c. 6. §. 40. p. 334.*

**Books**, with regard to their qualities, may be divided into—**Clear or perspicuous**, which in the dogmatical kind, are those, where the authors define all their terms accurately, and keep strictly to those definitions in the course of their works.—**Obscure**, those where words are used vaguely, and without defining.—**Prælix**, those which contain more things than were necessary to the author's design; as, if in a *book of surveying*, a man should give all Euclid.—**Useful**, those which deliver things necessary to be known, either in other sciences, or in the business of life.—**Complæat**, those which contain all that is known concerning the subject.—**Relatively complæat**, those which contain all that was known on the subject, at a certain time; or, if a *book* were written with any particular design or view, it may be said to be *complæat*, if it contain neither more nor less than is necessary for the accomplishing that end.—In the contrary cases, *books* are said to be *incomplæat*.—*Vid. Wolf. Log. §. 815. p. 818, 820, 825, &c.*

**Books**, with regard to the matter they consist of, may be divided into—**Paper-books**, those written either on linen and cotton paper, or on the papyrus, of which few are now remaining.—*Vid. Montfauc. Palæogr. Græc. l. 1. c. 2. p. 14. seq.* See also **PAPER**.

**Parchment Books, libri in membrana**, those written on skins or pelts, chiefly of sheep. See **PARCHMENT**.

**Linen Books, libri linteæ**, among the Romans were those wrote on blocks or tables covered with a linen cloth.—Such were the Sibilean *books*, and divers ancient laws, epistles of princes, leagues, annals, &c.—*Vid. Plin. Hist. Nat. l. 13. c. 2. Dempst. ad Rofin. l. 3. c. 24. Lomei. de Bibl. c. 6. p. 106.*

**Leathern Books, libri in coriis**, mentioned by Ulpian<sup>s</sup>, are by Guilandinus taken for such as were written on barks, different from that usually wrote on; which was the tiliæ: by Scaliger, with more probability, for such as were written on certain skins, or certain parts of skins, different from those commonly used, which were the pelts or back-parts of sheep.—*Vid. Ulp. l. 52. ff. de Leg. 3. Guiland. Popyr. membr. 3. n. 50. Salmuth. ad Pancir. P. 2. tit. 13. p. 253. Scallig. ad Guiland. p. 17. Ptitic. L. Ant. T. 2. p. 84. vocen. Libri.*

**Black Books, libri in schedis**, those written on wooden planks or tablets, smoothed for that purpose with an æscia and plane.

—Such were the ordinary *books* among the Romans.—*Vid. Ptitic. loc. cit.*

**Waxen Books, libri in ceris**, mentioned by Pliny, have occasioned some dispute. Herm. Barbarus suspects the term to be a corruption, and inclines to read in *schedis* instead of it, on the authority of some ancient MSS. Others see no need of the emendation, since it is known the Romans sometimes covered their planks, or *schedæ*, with a thin skin of wax, to make them susceptible of erasements and amendments, which the *libri in schedis* were not, and consequently were less fit for works that required elegance and accuracy than the waxen ones, which are also called *ceræ*, or *libri ceræ*.—*Vid. Ptitic. ubi supra.*

**Elephantine Books, libri elephanti**, according to Turnebus, were those written on thin slices or leaves of ivory; according to Scaliger, those made of the guts of elephants; according to others, those wherein the acts of the senate relating to the emperors, were written; according to others, certain huge or bulky *books*, consisting of 35 volumes, containing all the names of the 35 tribes.—*Vid. Salmuth. ad Pancir. P. 2. tit. 13. p. 255. Guiland. Popyr. membr. 2. n. 48. Scallig. ad Guiland. p. 16. Calv. L. Jur. p. 534. voc. Libri. Fabric. Descript. Urb. c. 6. Donat. de Urb. Rom. l. 2. c. 23. Ptitic. L. Ant. loc. cit. p. 84. seq.*

**Books**, with regard to their manufacture and commerce, may be divided into—**Manuscripts**, those written with the hand, whether originally by the authors, called *autographs*, or at second hand by *librarii* or *copists*. See **MANUSCRIPT**, **LIBRARIUS**, &c.—**Printed**, those wrought off from the press. See **PRINTING**.—**Books in quires or sheets**, those not bound or stitched.—**Books in folio**, those wherein a sheet is folded but once, or makes two leaves, or four pages: *Books in 4to.* where it makes four leaves; in *8vo.* where eight; in *duodecimo*, where twelve; in *16o.* where sixteen; in *24o.* where twenty-four.

**Books**, with regard to circumstances and accidents, may be divided into—**Lost**, those which have perished by the injuries of time, or the malice or zeal of enemies.—Such as are divers even of the ancient *books* of scripture, written by Solomon, and others of the prophets.—*Vid. Fabric. Cod. Pseudepigr. Vet. Test. T. 2. p. 171. Joseph. Hyppom. l. 5. c. 120. ap. Fabric. lib. cit. p. 247.*

**Promised Books**, those which authors have given expectations of, which they have never accomplished.—Janf. ab Almeloveen has given a bibliotheca of *books* promised, but still latent, or not published.—*Vid. Struv. Introd. ad Notit. Rei Liter. c. 8. §. 21. p. 754.*

**Fictitious Books**, those which never existed.—Such is the *book de tribus Imperatoribus*, so much talked of by some, supposed to be by others: to which may be added, divers feigned titles of *books* in Baillet and others. Loefcher has published a great number of plans or projects of *books*, many of them good and useful enough; if there were but *books* written to them. M. Duponno has a whole volume of *schemes or projects of books*, containing no less than 3000.—*Vid. Paich. de Var. Mod. Mor. Trad. c. 3. p. 282. Baillet des Satyr. Personif. ° Loefch. Arcan. Liter. ° Projets Littéraires. ° Jour. Liter. T. 1. p. 470.*

**Books in Ana, Anti, &c.** See the articles **ANTI**, **ANA**, &c.

The *scope or design* of **Books** is various; of some, to trace the origins of things discovered; of others, to fix and establish some truth, or raise some doctrine to a higher pitch of subtlety; of others, to remove some scruple or prejudice which had before obtained, or fix more accurate and precise ideas of things; of others, to explain the names and words used in different nations, ages, and sects; of others, to improve our knowledge of facts, and events, and shew the order and ways of providence: lastly, others aim at divers, or all of these ends.—*Vid. Loefch. de Caus. Ling. Hebr. in præf.*

The *uses* of **Books** are numerous: they make one of the chief instruments, or means of acquiring knowledge: they are the repositories of laws, and the vehicles of learning of every kind: our religion itself is founded on *books*: without them, says Bartholin, God is silent, justice dormant, physic at a stand, philosophy lame, letters dumb, and all things involved in *Comæxian darkness*.—*Vid. Barth. de Libr. Legend. Diff. 1. p. 5. Sine libris Deus jam flet, justitia quiescit, tropet medicum, philosophia manco est, litera muta, omnia tenent involuta Cimmeriis.*

The *eloquium* which have been bestowed on *books* are infinite: they are represented, “as the refuge of truth, which “ is banished out of conversation; as standing counsellors, “ and preachers, always at hand, and always disinterested; “ having this advantage over oral instructors, that they are “ ready to repeat their lesson, as oft as we please.”—*Books* supply the want of masters, and even in some measure the want of genius and invention; and can raise the dullest persons, who have memory, above the level of the brightest, without.—An author, who wrote not inelegantly, though in a barbarous age, sums up all their praises.—*Vid. Lucas de Penna op. Morhofi Polyhist. l. 1. c. 3. p. 27. Liber est lumen cordis, speculum corporis, virtutum magister, vitiorum depulsor, coram prudentum, comit itineris, amicus amicus, congerio tacentis, collega & consiliarius presidentis, myrthosum eloquentiæ hortus*

hortus plenus fructibus, pratium floribus distinctum, memoria pen-  
na, visa reconditio; vocatus propter, iustus festinus, sem-  
per praests, nunquam non morigerus, rogatus confertim respon-  
det: arcana revelat, obscura illustrat, ambigua certiorat, per-  
plexas resolvit, contra adversam fortunam desinens, secundae m-  
derator, opti adaugens, iusturam propulsat, &c.

Perhaps their greatest glory is, the affection borne them by  
many of the greatest men of all ages: M. Cato\*, the elder  
Pliny\*, the emperor Julian, and others are on record for an  
excessive devotion to books. The last has perpetuated his  
passion by some Greek epigrams in their praise. Richard  
Bury, bishop of Durham, and lord chancellor of England,  
has a treatise express on the love of books\*.—*Vir. Plin. Epist.*  
*7. l. 3.* \* *Philobiblicum, sive de Amore Librorum.* Fabric. *Bibl.*  
*Lat. Med. Aevi. T. 1. p. 842. seq.* *Mothaff Polyhist. l. 1.*

*de lib. legend. diff. 1. p. 1. seq.*

\* *M. Casseus videtur in bibliotheca selectam multis circumfusum Sto-  
icorum libris. Erat enim, ut scis, in eo inexhauste creditus  
legendi, nec satiari poterat: quippe qui, ne reprehensionem vulgi  
incensum reformidans, in ista curia soleret legere, sepe dum senatus  
congregaret, nihil specie reipublicae detrahere.*—*Vir. Cic. de Divin.*  
*l. 3. n. 11.*

The ill effects attending on BOOKS are, that they employ too much  
of our time and attention; engage us in pursuits of no use  
to the common-wealth, and indispose us for the functions of  
civil life; that they render men lazy, and prevent their exer-  
ting their own talents, by furnishing them on every occa-  
sion with things of the growth of others; and that our natu-  
ral lights become weakened and extinguished, by inuring  
ourselves to see only with foreign lights: besides, that ill men  
are hereby furnished with means of poisoning the people and  
propagating superstition, immorality, enthusiasm, or irrel-  
gion, which will always spread faster, and be received more  
greedily than lessons of truth and virtue.—Many other things  
are added concerning the empancins of books, and the errors,  
fables and follies they are fraught with; which, together  
with the multitude and perplexity of them, is such, that it  
may seem easier to discover truth in the nature and reason  
of things, than in the uncertainty and confusion of books.—  
Add, that books have turned the other instruments of know-  
ledge out of doors, as experiments, observations, furnaces,  
and the like, without which the natural sciences can never  
be cultivated to purpose; and that in mathematics, books  
have so far superseded the exercise of invention, that the gen-  
erality of mathematicians, are now contented to learn the  
solution of problems from others; which is to relinquish  
the chief end of their science: since what is contained in  
mathematical books, is properly the history only of mathem-  
atics, not the science, art or talent of solving questions;  
which is hardly to be had from books; but only from nature  
and meditation.—*Vir. Bac. de Augm. Scient. l. 2. Works.*  
*T. 1. p. 61.*

For the art of writing or composing BOOKS, we have much fewer  
helps and instructions than for the art of speaking; though  
the former be the more difficult of the two; as a reader is  
not so easy to be imposed upon, but has better opportunities  
of detecting faults than a hearer.—A great cardinal, indeed,  
reduces an author's business to a few heads; were they but  
as easily practised as prescribed: "Let him consider who it  
is written, what, how, why, and to whom:" *Quis scri-  
bat, quid scribatur, quomodo, cur & ad quos.*—*Vir. August.*  
*Valer. de caut. in elend. lib.*

To write a good book, an interesting subject must be chosen,  
which is to be long, and closely meditated on; and of the  
sentiments which offer themselves, those which are already  
commonly known, are to be rejected: few or no digressions  
from the main point are to be allowed; quotations  
rarely made, and then only to prove some important truth,  
or embellish the subject with some beautiful and uncommon  
observation; never bringing an ancient philosopher on the  
stage to say what the meanest laquay could have said as well,  
nor making a sermon, unless where the business is to preach.  
—*Vir. Nov. Rep. Lett. T. 39. p. 427.*

The conditions required in a book, are, according to Salden,  
"Solidity, perspicuity and brevity:" the first will be best  
attained, by keeping the piece long by us, often reviewing  
and correcting it by the advice of friends: the second, by  
disposing the sentiments in a due order, and delivering them  
under proper and usual expressions: the third, by throw-  
ing every thing aside that does not immediately concern  
the subject.

Were these rules observed, it would scarce be possible for any,  
except an angel from heaven, to write many books: six thou-  
sand quot *Tiberianum parte vel divinis igni Nilii.*—We should  
hear no more of those volatile authors, who throw off yearly  
six or eight books, for ten or twelve years running; or of  
those voluminous authors, who number their books by scores  
and hundreds; nor of those childish authors, who publish  
books by that time they are able to speak].

\* Severin Lintropius, professor at Copenhagen, has given a  
catalogue of seventy-two books, which he composed within  
the compass of twelve years; containing six volumes in the-  
ology, eleven in ecclesiastical history, three in philosophy,  
fourteen on miscellaneous subjects, and thirty-eight on lic-

rary subjects.—*Vir. Lintrop. Reliq. Interd. Berg. op. Nov. Lit.*  
*Lat. abec. an. 1704. p. 247.*

† Fa. Macedo, a Franciscan Friar, wrote according to his own  
testimony, 44 volumes, 55 panegyrics, 60 Latin speeches,  
105 epigrams, 500 elegies, 110 odes, 212 epistles dedicatory,  
109 familiar epistles, *poemata epica iuxta his mille sexcento*  
*70:* (it is to be supposed he means 2600 poems in heroic or  
hexameters) and in fine 150000 verses.—*Vir. Novus Milti*  
*Macedon. op. Jour. de Scav. T. 47. p. 179.*

‡ The young duke de Maine's works were published at seven  
years old, under the title of, *Orateurs diversifis d'un auteur de*  
*sept Ans*, Paris, 4to. 1682.—*Vir. Jour. de Scav. T. 13. p.*  
*7.*—Dan. Heinius published his notes on Silius Italicus to  
young, that he entitled them, his *Rattles, Crepuscula Silliana.*  
*Lugd. Bat. 1600. 16.*—Caramuel is even said to have writ-  
ten a book on the sphere, before he was old enough to go to  
school: and what is pleasant, he took it chiefly from Sicro  
Boico's treatise of *Sphæra*, before he had learnt a word of  
Latin.—*Vir. Baillet Jugans Celsibus, n. 81. p. 500.*—We may  
add, that Placcius affirms us, he began to make his collection  
while under the tutorage of his uncle, and when he had  
nothing to collect out of, but his uncle's prayer-books.—*Placc.*  
*de Art. Excerpt. p. 190.*

M. Cornet D. de S. used to say, that to write books, a man  
must either be very foolish or very wise: there are doubt-  
less many of both sorts in the number of authors; yet the  
majority seems to consist of those, who are neither the one  
or the other. The custom is much altered since the times  
of the ancients, who carried their scrupulousness in what re-  
lates to the composition of books beyond all that has been a-  
bove expressed: so anxious was the idea they formed of a  
book, that nothing would suffice less than its being a treasure:  
*thesaurus oportet esse, non liber;* no labour, no assiduity  
and exactness was thought enough to fit a work for the public  
view: every sentiment and expression was to be maturely  
weighed, and turned on all its sides; and not suffered to pass,  
unless every word were a pearl, and every page beset with  
gems. So that they put the reader in possession in a single  
hour, of what had cost them perhaps ten years intense  
thought and application.—Such were those books, which  
were reputed *causa digni*, to be inured over with cedar-juice,  
and thus rendered incorruptible, for the instruction of all  
future ages.—With us, the case is otherwise: the ambition  
of being an author possesses every body, even those who have  
nothing to say, or at most, only one thing, and that perhaps  
a trifle, and already said by a hundred others: to furnish  
out a book, we have recourse to various arts, and stratagems;  
a formal method is first chalked out, which like a drag-net  
gathers all before it, old and new, common and uncom-  
mon, good, bad and indifferent, which we adopt with little  
choice; the chief attention being, with Albutius the rhetor,  
to say all on the subject we can, not merely all we ought.

*non que debent, sed que poterant.*

A modern author, let his subject be what it will, generally  
takes occasion to retail his whole stock of knowledge, then  
on hand: if he write, for instance, on the gout, as M. Aig-  
nan, he will give you the nature of all diseases, and their  
causes, and perhaps a system of physics into the bargain, and  
over and above many important doctrines of theology, and  
rules of morality: if, on the building of Solomon's temple,  
as Caramuel, he will not confine himself to architecture;  
but treat of numerous matters relating to theology, mathe-  
matics, geography, history, grammar, &c. Inasmuch, that  
if we may believe the author of a piece inserted in Caramu-  
el's work, if God should permit all the sciences in all the  
universities in the world to be lost, they might be restored  
by means of this book alone.—*Vir. Aignan Trait. de la Goutte,*  
*Par. 1707. 12.* *Jour. des Scav. T. 39. p. 421, seq.* \* *Archib.*  
*test. civil recta & obliqua consil. en el temple de Jerus. 3 vol. folio.*  
*Vegev. 1678.* *Jour. des Scav. T. 10. p. 348, seq. Nov. Rep.*  
*Lett. T. 1. p. 103.*

He sets out with a tedious preamble, perhaps foreign to the  
question; and proceeds on to a digression, which gives rise  
to a second; which carries him such a length, that we lose  
sight of him: he oppresses us with proofs of things that  
needed none; makes objections no body would have thought  
of, and to answer them is sometimes forced to make a disserta-  
tion in form, to which he gives a particular title, and to  
lengthen it out, subjoins the plan of some future work,  
wherein he will treat the point more at large. Sometimes  
he argues in form, accumulates syllogism on syllogism, and  
induction on induction; being careful to note that they are  
so many geometrical demonstrations. At length you come  
to a string of consequences, which you never expected; and  
after twelve or fifteen corollaries, which wherein contradictions  
are not spared, you are surprized for the conclusion to find a  
proposition which had never been mentioned, or at least had  
been utterly put out of your head, or perhaps another which  
has no relation to the subject.

The subject of the book, in all probability, is some trifle;  
perhaps the use of the particle, *and*, or the pronunciation of

the Greek *eta*, or the praise of an ash or a louse, or a shadow, or folly, or idleness, or the art of drinking, or loving, or dressing; or the use and abuse of spurs, or shoes, or gloves, or the like.—Suppose, for instance, it be the last, and let us see how a modern writer of note proceeds to make his *book*.—For method he takes that of the Lullists, and begins with the name and etymology of *glove*; which he gives not only in the language he writes in, but in all the languages he understands, or of which he has dictionaries in his study, oriental or occidental, living or dead; accompanying each with its respective etymon, and sometimes too with its compounds and derivatives, and referring for more thorough knowledge to the several dictionaries from whence he took them; always, most religiously quoting chapter and page. From the name he proceeds at length to the thing, and passes with great pains and exactness through all the common places of arguments, as the matter, form, use, abuse, adjuncts, conjuncts, disjuncts, &c. of *gloves*. On each of which he does not confine himself to give us what is new, singular, or some way uncommon, but thinks himself obliged to exhaust his subject, and give us all he can find. Thus gloves, he informs us, preserve the hands from cold; and proves, that if we go much in the sun without them, our hands will be tanned. He goes on next to show, how chaps on the hands will enfee in winter, if we leave our gloves at home; and how painful as well as unsightly a thing clapped hands are.—Yet must this be allowed an author of merit, and far from being singular in his method of writing. In reality, we all do the same thing, some in a greater degree, and some in a less, with good Mr. Nicolai.—*Vid. Nicolai Dissert. de Christorum Ufu & Abusu. Giess. 1702. 12mo. Novæ Rep. Lett. Aust. 1702. p. 158. 1799.*

The form or method is the spirit or archæus that directs all: one writer supposes his *book* to be a *candle-stick*, and every chapter a *socket*; another reduces his work to the form of a *pair of folding-doors*, which open into two parts, to admit the reader into a dichotomy<sup>b</sup>. M. Waltherus considers his *book*, *officina biblica*, as a *shop*, and divides or ranges the materials of it accordingly, so on many *shelves*, treating his reader throughout as a customer. Another turns his *book* into a *tree*, with its trunk, branches, flowers, and fruits; the twenty-four letters of the alphabet being the *branches*; the several words the *flowers*, and 120 sermons the *fruit*.—*Vid. Wolf. Bibl. Hebr. T. 3. p. 987.* <sup>b</sup> R. Schabtei *Labra Dornicantia* op. Wolf. lib. cit. Item T. 1. in *pref. p. 12.* <sup>c</sup> Cassian. a S. Elio, *Arbor omnium opinionum noratorum, que ex trunco pullantur, tot ramis quæ sunt literæ alphabeti, capis feræ sunt verba, fructus sunt 120 conciones.* *Caen. 1688. fol. V. Giorn. de Parma, an. 1688. p. 60.*

For the origin of *Books*, we have nothing that is clear: the *books* of Moses are doubtless the oldest of all that are extant<sup>a</sup>; but there were *books* before those of Moses, who cites several<sup>b</sup>: Scipio Spambati, and others<sup>c</sup> even talk of *books* before the deluge, written by the patriarchs Adam, Seth, Enos, Caïnan, Enoch<sup>d</sup>, Methusalem, Lamech, Noah and his wife, also by Ham, and Japhet his wife; besides others by the demons or angels; of all which some moderns have found enough to fill an antediluvian library: but they appear all, either the dreams of idle writers, or the impostures of fraudulent ones.—*Vide Mem. Acad. R. Infer. T. 6. p. 32.* <sup>b</sup> *Id. ibid. T. 8. p. 18.* <sup>c</sup> Spambati *Archiv. Vet. Test. Fabric. Cod. Pseudep. V. Test. passim.* Heuman. *Via ad Hist. Liter. c. 3. §. 3. p. 29.*

<sup>a</sup> A *book* of Enoch is even cited in the epistle of Jude, v. 14. and 15: from which some endeavor to prove the reality of antediluvian writings; but the *book* cited by that apostle is generally allowed both by ancient and modern writers to be spurious.—*Vid. Sualbach. Sched. de Libr. Vet. §. 42. Remim. Idea Syst. Ant. Liter. p. 235.*

Of profane *books*, the oldest extant are Homer's poems, which were even so in the time of Sextus Empiricus<sup>b</sup>; though we find mention in Greek writers of about seventy others prior to Homer, as Hercules, Orpheus, Daphne, Horus, Linus, Musæus, Palamedes, Zoroaster, &c. but of the greater part of these, there is not the least fragment remaining, and of the others the pieces which go under their names, are generally held by the learned supposititious.—F. Hardouin goes farther; charging all the ancient *books*, both Greek and Latin, except Cicero, Pliny, Virgil's georgics, Horace's satires and epics, Herodotus, and Homer, as spurious, and forged in the thirteenth century, by a club of persons under the direction of one Severus Archontius<sup>c</sup>.—*Vid. Fabric. Bibl. Græc. L. 1. c. 1. §. 1. T. 1. p. 1.* <sup>b</sup> *Id. ibid. §. 6 p. 4.* Hardouin. *de Numm. Herodot. in Prolus. Act. Erud. Lips. an. 1710. p. 70.*

Among the Greeks, it is to be observed, the oldest *books* were in verse, which was prior to prose: Herodotus's history is the oldest book extant of the prosaic kind.—*Vid. Strab. Geogr. L. 1. Heuman. lib. cit. §. 20. p. 50.* <sup>c</sup> *Id. ibid. §. 21. p. 52.* See *POETRY*, &c.

The multitude of *Books* has been long complained of: they are grown too numerous, not only to procure and read, but to see, learn the names of, or even number. Solomon, three thousand years ago complained, that “of writing *books* there

“was no end.” But modern writers cannot keep within terms of so much moderation: “You may sooner empty the sea, says one, than exhaust the immense ocean of *books*, or number the sands on the shore than the volumes extant. They are not to be told, says another, though like an inhabitant of Mahomet's paradise, a man had seventy thousand heads, and to each head seventy thousand mouths, and to each mouth seventy thousand tongues, which each spoke seventy thousand languages.”—Yet how is the number continually increasing! When we consider the multitude of hands employed in writing, of copists throughout the east in transcribing, and of presses in the west continually pouring in fresh quantities, it seems a kind of miracle the world should be able to contain them! England has more to fear on this score than other countries; since besides our own produce, we have for some years past, drained our neighbours. The Italians and French make great complaints that their best *books* are carried out of the country by foreigners: “It seems, say they, to be the fate of the provinces which composed the ancient Roman empire, to be plundered by the northern nations: anciently they conquered and took possession of the country; of late, they have the inhabitants their lands, and only take their learning.” *Comментар ad nos quædam* (cries Sig. Facciolati) *calidi homines pecunia instructissimi & præclarum illam majorem supercilium, optima volumina, nobis abripunt. Artes etiam, ac disciplinas paulatim abducuntur aliis, nisi studio & diligentia resistamus.*—<sup>a</sup> *Vid. Barth. de Libr. legend. diff. 1. p. 7.* Heuman. *Via ad Hist. Liter. c. 6. §. 43. p. 338. 1799.* <sup>b</sup> Facciolati. *Orat. 1. Mem. de Trev. an. 1730. p. 1793.*

Elementary *books* seem the least to need to be multiplied; since a good grammar, or dictionary, or institutions of any kind, seems hardly to admit of a second in one age, or even many ages. Yet it has been observed, that in France alone, within the compass of thirty years, there have appeared no less than fifty new elements of geometry, as many treatises of algebra, as many of arithmetic, and as many of surveying and measuring; it is added, that within the space of fifteen years, there have been above a hundred French and Latin grammars published in the same country; and of dictionaries, abridgments, methods, &c. in proportion: all which are but an eternal round of the same things, the same ideas, some discoveries, some truths, some falsehoods.—*Vid. Mem. de Trev. an. 1734. p. 804.*

The best of it is, we are not obliged to read them all: Thanks to providence, the good bishop Caramuel's scheme miscarried, which was, to write about an hundred volumes in folio, and then prevail on the civil and spiritual powers to oblige all their subjects to read them. Rängelberg had laid the schemes of no less than a thousand several *books*, which he alone was to have composed, had he lived long enough: and apparently would not have been less eager in obtruding them on the public. Had the same thought entered Hermes Trifancgusius, who according to the account given by Jamblicus, wrote 3652 *books*, people would have had much more reason to complain of the multitude of *books* than they now have.—*Vid. Bail. Enfans Celest. sc. 12. Jugen. del Scav. T. 5. P. 1. p. 373.*

In reality, there are few of the immense number of *books* which deserve seriously to be studied: for the rest, part of them are only to be occasionally consulted, and the rest read for amusement. A mathematician, for instance, ought not to be entirely ignorant of what is contained in the mathematical *books*; but then a general knowledge is sufficient, which may easily be had by running over the chief authors; out of whom references may be made, directing to the places where they may be found, when wanted. For there are many things which are much better preserved in *books* than in the memory; as astronomical observations, tables, rules, theorems, proportions, and in fine whatever does not spontaneously adhere to the memory, when once known. For the less we crowd that faculty, the reader and freer will the wit remain for inventing.—*Vid. Cartes Epist. ad Hegel. op. Hist. Phil. Collect. N° 5. p. 144. seq.*

Thus, a few *books* well-chosen and thoroughly studied, may suffice: many have held the bible alone sufficient for all the purposes of knowledge; others, the alcoran: Cardan requires but three *books* for any person, who does not make a profession of learning; one, to contain the lives and acts of the saints and other virtuous men; another to amuse the mind with pleasing verses; and a third to teach the rules of civil life.—Some have only proposed two *books* for our study, viz. that of scripture, which discovers the will of God; and that of the creation, which shows his power; the latter of which is the key of the former.—But this, under pretence of retrenching superfluities, seems to be running into the opposite extreme. The business is, rather to make a due choice among the multitude, of a number of good ones.—It may be added, that as knowledge is naturally advantageous, and as every man ought to be in the way of information, even a superfluity of *books* is not without its use, since hereby they are brought to obtrude themselves on us, and engage us when we had least design.—This advantage, an ancient father observes, we owe to the multiplicity of *books*

books on the same subject, that one falls in the way of one man, and another best suits the level, or the apprehension of another.—“ Every thing that is written, says he, does not come into the hands of all persons: perhaps some may meet with my books, who may hear nothing of others which have treated better of the same subject. It is of service therefore, that the same questions be handled by several persons and after different methods, though all on the same principles, that the explications of difficulties, and arguments for the truth, may come to the knowledge of every one, by one way or other.”—Add, that the multitude is the only security against the total loss, or destruction of books: it is this has preserved them against the injuries of time, the rage of tyrants, the zeal of persecutors, and the ravages of barbarians; and handed them down, through long intervals of darkness, and ignorance, safe to our days.—*Soloque non novant hæc monumenta mori.*—*Vid. Bac. de Augment. Scient. l. 1. Works T. 1. p. 49.*—*Aug. de Trin. l. 1. c. 3.*—*Barth. lib. cit. Diss. 1. p. 8. seq.*

**Closing and judging of Books.**—Authors are not well agreed on the conditions necessary to denominate a book, good. Some require only good sense in the writer, and an acquaintance with the subject; others with Salden demand solidity, perspicuity, and brevity; others think intelligence and exactness enough: the generality of critics seem to hold, that none of the perfections, which the human mind is capable of, ought to be wanting: but on this footing there is scarce any such thing as a good book; at least none which they themselves will all agree to be such. The more reasonable allow a book to be very good, which has but few faults; *optimus ille, qui minimis urgetur*: at least where the good things in it exceed the bad and indifferent. Nor is a book to be called bad, where the indifferent is the prevailing part, and the good and bad are proportioned equally.—*Vid. Baillet. Jugem. des Scrv. T. 1. P. 1. c. 6. p. 19. seq.*—*Honor. Reflex. sur les Regl. de Crit. diss. 1.* Since the fall of the Latin tongue, authors do not seem so much to aim at the glory of writing well, as of writing good things: so that a book is commonly allowed for good, if it be happily conducted to the end which the author aimed at; whatever other faults it may have: thus a book which is not written on account of style, may be good, though the style be naught. Thus an historian, who is well informed, faithful, and judicious; a philosopher, who reasons justly, and on sound principles; a divine who is orthodox, and departs not from scripture and antiquity; will be allowed good in their kinds, though they be faulty in the less material things.—*Vid. Baillet. lib. cit. c. 7. p. 24. seq.* And thus most books, in one respect or other, will be found good and useful; so that the choice seems difficult; not so much what to take, as what to reject. The elder Pliny used to say, there was no book so bad, but some good might be had from it: *Nullus liber tam malus esse, qui non aliqua ex parte proficiat*. But there are degrees of goodness; and in many books, the good is so thin sown, that it is hardly worth the gathering; or hid so deep, or so beset with thorns, that it will not quit the cost of digging. Virgil could gather gold out of Ennius's dunghill; but every body has not the zeal, or the skill and attention necessary to do the like.—*Vid. Hook. Collat. N<sup>o</sup> 5. p. 127. & 135. seq.*

Plin. *Epist. 5. l. 3.*—*Reimman. Bibl. Arcvorn. in Pref. §. 7. p. 8. seq.*—*Sacchini. de Rat. Libr. Legend. c. 3. p. 10. seq.*

It is better judged in those who recommend a small number of the best books; advising us to read much, but not many: *multum legendum esse, non multa*. But how is the choice to be made?—*Vid. Plin. Epist. 9. l. 7.* To judge of a book, those who have treated of the subject, direct us to observe the title, the author's or editor's name, the number of the edition, the place where, and year when it was printed (which in old books is frequently marked at the end,) and the printer's name, especially if he be a celebrated one: proceed thence to the preface, and look for the author's design, and the occasion of his writing: consider also his country, (each nation having its peculiar genius;) and the person by whose order he wrote, which may sometimes be learned from the dedication: if his life be annexed, run it over, and note his profession, what rank he was of, and any thing remarkable that attended his education, studies, conversation, or correspondences with learned men: not forgetting the eulogies which have been given the author, which often occur at the beginning, or even any critique or censure, especially if made by a man of judgment. If the preface do not give an account of the method of the work, run briefly over the order and disposition of it, and note what points the author has handled, observe whether the things and sentiments he produces be trite and vulgar, or solid and fetched from greater depths. Note, whether he go in the common road, or make any innovation, and introduce any new principle. Observe also his method, whether it be a dichotomy, or according to the four causes, or any other more peculiarly adapted to the subject.—*Vide Barth. Diss. 4. p. 93. seq.*—*Baill. c. 7. p. 228. seq.*—*Struv. Intrad. ad Notit. Rei Liter. c. 5. §. 2. p. 338. seq.*

But it is a small number of books, we have opportunity of thus judging of by perusing them; beside, that when we have read a book over, the judgment comes too late for many purposes: it seems necessary therefore to have other indications, whereby to prevent our being at the charge of procuring, or the pains of perusing a worthless book: divers rules of this kind are given by Baillet, Struvius, Scollius, and others; which though, in reality, no more than presumptions, and frequently liable to be falsified, are not without their use. The journalists de Trevoux object to them all: “ The shortest way, say they, to judge of a book is to refer yourself to those who are so.” Heuman is somewhat more explicit; “ making it a mark that a book is good, when it is esteemed by persons intelligent in the subject it treats of; and when those who commend it receive no advantage from the applause they bestow on it, nor are leagued with the author in any cabal, for espousing any particular principle, system, or party in religion or learning!”—*Vid. Baillet. Jugem. des Scrv. T. 1. P. 2. p. 121. seq.*—*Struv. lib. cit. c. 5. §. 3. p. 370.*—*Scoll. Intrad. Hist. Liter. P. 1. §. 11. p. 9.*—*Bodl. de Criticis boni Libri passim.*—*Wak. Hist. Crit. Ling. Lat. c. 7. §. 6. p. 320.*—*Mem. de Trev. an. 1712. art. 17.*—*Heuman. Conspect. Reipubl. Liter. c. 6. §. 11. p. 280. seq.*

But more particularly, it is an indication that a book is good, if the author be known to excel in that talent more immediately necessary for such a subject; or have already published anything on the same that is esteemed. Thus we may conclude, that Julius Cæsar will teach us the art of war better than Peter Ramus; Cato, Palladius, and Columella, agriculture better than Aristotle; and Cicero oratory better than M. Varro: add, that it is not enough the author be skilled in the faculty, but that he be so in the particular branch of it he treats of; some, for instance, excel in the civil law, yet not in the public law: Salmastius proved himself an excellent critic in his *Exercit. Plinium*. But came much inferior to Milton in his *Disquisitio Regia*. If the book be on a subject that requires great reading, it may be presumed good, if the author have a copious library, or can have access to one; or lived in a place where books were not wanting: though here is a danger too of running into excess of quotations, especially, says Struvius, if the author be a lawyer. If a book which took up a long time in composing, cannot often fail of being good: Thus Villalpandus's commentary on Ezekiel was a work of forty years: Baronius's annals of thirty; Gouffier's Hebrew commentaries of thirty; Paulus Æmilius employed the same time in his history; and Vaugelas in his translation of Q. Curtius. Lamæ was thirty years in his treatise of the temple: Era. Telesforo forty years in his *Idea Argentea ditionis*; and the jesuit Cæira forty years in his poem called *Columbus*.—It is true, they who are so long on the same subject, rarely bring it out uniform and methodical; besides, that they are apt to flag and grow cold in so long a pursuit: men cannot attend to the same thing for so many years without being tired; which will be apt to shew itself in the composition: and hence it has been observed that in those large books so long about, the beginnings glow, the middle-parts are lukewarm, the later ends frigid, *apud castorum voluminum antores, principia fervent, medium tepet, ultima frigent*. But then they must excel in the materials, which have been gathering for so long a tract of time: this is particularly observed of the Spanish writers; and is at least more commendable, than the levity and precipitancy of some of their neighbours. Not but the public are sometimes disappointed in their expectations, from writers who are so long in labour; as was the case in Chapelain's poem *la Puelle*, in the finishing of which he spent thirty years; and concerning which we had that epigram of Monnoir:

*Ille Capellani dulcum expectata puella,  
Post tanta in lucem tempora prodit æmæ.*

Some, it is certain, have carried their scrupulousness to an excess, as Paulus Manutius, who often spent three or four months in writing a single epistle; and Iocrotas, who was three olympiads in writing one panegyric. Books on points of doctrine by eclectic writers, are to be presumed better than those writ by the retainers to particular sects. The age of a writer may give us some indication: books, which require labour, are usually better performed by younger persons, than those who are far advanced in years: thus there is more life in Luther's former pieces, than in those he wrote a little before his death: strength decays, business encreases, we trust too much to our judgment, and are not scrupulous enough in making enquiries. Another indication may be taken from the author's state and condition: Thus history written by a person who was an eye-witness of what he relates, or is concerned in public affairs, or has access to the public records, or other monuments, from whence intelligence may be drawn; or who is not biased by party, or hired by any great man, will be supposed to be good. Thus Sallust and Cicero were well able to write the history of Cætiline's conspiracy, as having some concerns in it; d'Avila, de Comines, Guicciardin, Clarendon, &c. were present

present in the civil wars they describe: Xenophon having an employment in the Spartan fleet, has treated excellently that commonwealth: and Amelot de la Houffaye by living long at Venice, was enabled to explain the secrets of their policy: Camden wrote annals of the affairs of his own time; Thuanus had correspondences with the best writers in every country; and Putendorf had access to the public archives. So, in practical divinity, more regard is due to those who have actually discharged the office of pastors than to others; and in literary matters, we give credit to those who have the direction of libraries. 7. The time or age wherein the author lived may give some light; every age having, according to Barclay, its peculiar genius and excellency. — Vid. Barth. de lib. legend. Diff. 2. p. 45. Struv. lib. cit. c. 5. §. 3. p. 390. Budd. Diff. de criter. boni libri, §. 7. p. 7. Heuman. Conf. Reipub. Liter. p. 152. Struv. lib. cit. §. 4. p. 393. Misc. Lofp. T. 3. p. 287. Struv. lib. cit. §. 5. p. 396. seq. Bail. c. 10. p. 396. Bail. c. 9. p. 378. Barth. Diff. 2. p. 43. seq. Serv. §. 6. Id. ibid. p. 45. Struv. lib. cit. §. 15. p. 430. seq. §. 404. seq. Bail. c. 1. p. 121. seq. Heuman. Via ad Hist. Liter. c. 7. §. 7. p. 350.

Some judge by the bulk or size of books; following the grammarian Callimachus's rule, that every great book is of course an ill one, *magis brevis, magis utilis*: a single leaf of the Sibyl, was doubtless preferable to the vast annals of Volufus: yet Pliny's observation will nevertheless hold true, that "a good book is so much the better by how much it is bigger." *Bonus liber melior est quippe quo major*. Martial gives us a remedy against the largeness of a book, where that is the only complaint: read but a little of it.

*Si minus videat, serapeus coramde longus*

*Esse liber, legit pauca, libellus est.*

Yet is the smallness of a book, a real presumption in its favour: he must be a poor author who cannot furnish a pamphlet, or loose sheet with things curious, and written with spirit: but to support the same through a volume in folio, requires other-guise funds. In reality, in large books it is allowed a man to be sometimes dull: a heavy preamble is expected, and a series of words of course, ere you come to the business; and in the prosecution of which many nodding places are likewise allowed; but smaller pieces are indulged none of these privileges: they must immediately fall into their subject, and treat every part of it in a lively manner: the matter must be thrown close together, and either be new in itself, or in the turn which is given it.—Were the best authors of volumes in form retained to the public piecemeal, we should complain of many flat expressions, trivial observations, beaten topics, and common thoughts, which pass well enough off in the lump.—Vid. Barth. lib. cit. diff. 3. p. 62. seq. Plin. Epist. 20. l. 1. Adfil. in Spectat. N<sup>o</sup> 124.

Consists of BOOKS. } See the article } CENSOR.  
Privileges of BOOKS. } } PRIVILEGE.  
Common Place BOOK. } See the article } COMMON PLACE.  
Text BOOK. } } TEXT.

BOOK, is also used for a part or division of a volume, or large work. See SECTION, &c.

In this sense we say the book of Genesis, the first book of Kings, the five books of Moses, &c.—The Digest is contained in fifty books, the Code in twelve books.

Books are usually sub-divided into chapters, sometimes into sections, or paragraphs: accurate writers quote chapter and book. See CHAPTER, &c.

BOOK, is also used for a list or catalogue of persons names.—

Such among the ancients were the censorial books, *libri censorii*; being tables or registers containing the names of all those who were censured or taxed under Augustus. Tertullian assures us, that our Saviour's name was found in the censorial books of Augustus.—Vid. Tertul. adv. Marcion. l. 4. c. 7. *De censu Augusti quem testem fidelissimum Dominice natiuitatis Romana arcebro custodiant*. Vid. Lomei de Biblioth. p. 104. Pituc. L. Ant. T. 2. p. 84. See also CENSUS.

BOOK-SELLER, a professed trader in books; whether he print them himself, or procure them to be printed by others, for sale. See BOOK.

Booksellers, among us, are the same with *bibliopola*, among the ancients, whose office was distinct from that of *librarii*. See LIBRARI. Petty dealers, or vendors of small ware, like our publishers, were more particularly denominated *libellarii*; whence Statius,—*de copia miseri libellarii*.—Vid. Stat. Sylv. l. 4. Carm. 9. v. 21. Fabr. Theop. p. 1395.

Aethons frequently complain of the arts of booksellers: lord Shaftesbury gives the process of a literary controversy blown up by booksellers. The publication of books depends much on the taste and disposition of booksellers; among the German writers we find perpetual complaints of the difficulty of procuring booksellers; many are forced to travel to the book-fairs at Frankfurt, or Leipzig, to find booksellers to undertake the impression of their works: at Rome, the Argiletum was the mart of books, as Paul's Church-yard, or Fleetstreet among us: whence that of Martial's,

*Argiletum motis habitare tabernas,*

*Cum tibi, parve liber, seruis nostra vacent.*

\* Vid. Schoettg. *diff. de libror. & bibliop.* Salemg. *mem. de liter.* T. 1. p. 174. Charatt. T. 3. p. 10. seqq. Item p. 15. seqq. Item p. 27. Vid. Martial. *Epig.* l. 1. ep. 4. v. 1.

The fairs of Frankfurt and Leipzig are famous for the resort of booksellers, not only from all parts of the empire, but Holland, Flanders, &c. They have each their shop or warehouse, over which is inscribed the name of some celebrated bookseller of former times; *officina Elzeviriana, Frobeniana, Morelliana, Janssoniana*, &c. A like conceit has taken some London booksellers, to inscribe over their door, *bibliopolium*, as if people could not know a shop to be a bookseller's without a Latin name. Even stall-men dignify their stand with *bibliopolium*; and Moorfields may probably, ere long, be surrounded with *bibliopola*.

Formerly, the offices of booksellers and printers were united in the same persons. See PRINTER.—Labbe<sup>s</sup> gives a list of learned booksellers; most of whom were also authors.—Of late days, booksellers have drawn their business into less compass, and leaving the labour of composing books to one set of persons, and that of printing them to another, content themselves with the gainful part; thus ministering to the republic of letters not with the head, or the hand, but the purse only. In which respect, not to mention fame of our own booksellers, the Vander Aa's at Leyden, Gleditsch's and Fritsch's at Leipzig, Mortier's and Wetstein's at Amsterdam, and Halma's at Utrecht, though much below the Stephens's, Aldus's, Vascosan's, Frobenius's, and Morel's, have nevertheless acquired a just fame.—Vid. Struv. *Intrad. in notit. Rei Literar.* c. 11. §. 15. p. 930. Thurman. *Bibl. Acad.* p. 56. seq. Labbe *Biblioth. Biblioth.* p. 233. Struv. *lib. cit.* §. 38. p. 953.

The chief science of booksellers, is the *catanonyma*, or knowledge of books; we mean of the titles, different editions, prices and scarcity of books, without regard to their contents, or qualities, otherwise than as these affect the sale of them.—Vid. Struv. *Intrad. in notit. Rei Literar.* c. 1. §. 1. p. 1. seq. Lang. *Inst. Stud. Theol.* c. 1. memb. 2. p. 98. seq. See also the article BOOK.

An acquaintance with the booksellers marks or signs, frequently expressed on the title-pages of their books, is of some use; by reason many books, especially in the last century, have no other designation either of printer, bookseller, or even city.—The anchor then, is the mark of Rumphelgius at Leyden, and the same with a dolphin twisted round it, of the Manuzzi at Venice and Rome; the *Arim* denotes a book printed by Oporinus at Basil; the *caduceus*, or *pegasus*, by the Wecheliius's at Paris and Frankfurt; the *cranes*, by Cramoisy; the *compass*, by Plantin at Antwerp; the *swan-tain*, by Vascosan at Paris; the *sphere* in a balance, by Jansson or Blaeuw, at Amsterdam; the *lily*, by the Junta's at Venice, Florence, Lyons and Rome; the *mullerry-tree*, by Morel at Paris; the *olive-tree*, by the Stephens's at Paris and Geneva, and the *Elzevirs* at Amsterdam and Leyden; the *bird between two serpents*, by the Frobenius's at Basil; the *truth*, by the Commelins at Heidelberg and Paris; the *Satur*, by Colineus; the *printing-press*, by Badius Ascensius, &c.—Vid. Bail. *Jugem. des Sav. T. 1. P. 2. p. 91. seqq.*

Booksellers are a kind of agents, or curators in the republic letters: in many places, they are ranked among the members of universities, and entitled to the privileges of students; as at Tubingen, Salisburg, and Paris, where they have always been distinguished from the vulgar and mechanical traders, and exempted from divers taxes and impositions laid on other companies.—Vid. Fritsch. *diff. de bibliop.* c. 7. §. 1. seqq. Savar. *D. com. T. 2. p. 535. seq. uv. Libraire.*

The traffic of books was anciently very inconsiderable; inasmuch that the book-merchants both in England, France, Spain, and other countries were distinguished by the appellation *stationers*, as having no shops, but only stands or stalls in the streets, where they exposed their wares to sale.—*Vid. Du Cang. Gloss. Lat. T. 4. p. 951. var. Stationarii.* During this state, the civil magistrate took little notice of the *booksellers*; leaving the government of them to the universities, to whom they were supposed more immediately remainers: who accordingly gave them laws and regulations, fixed prices on their books, examined their correctness, and punished them at discretion.—But when by the invention of printing, books and *booksellers* began to multiply; it became a matter of more consequence; and the sovereigns took the direction of them into their own hands; giving them new statutes, appointed officers to fix prices, and grant licences, privileges, &c.—*Vid. Frisch. diff. de bibloph. c. 4. Id. ibid. c. 5. Thurman. bibl. acad. p. 10.*

Cæviller shews, that the university of Paris had formerly the sole power of creating and appointing *booksellers*, who were to take an oath to the university; and were reputed part of the academical body, and as such entitled to the exemptions of the other members thereof. They were to give security to the university for their behaviour, and produce attestations of their capacity for the discharge of their office: the university also deposed and expelled them at discretion: they were obliged to appear at all assemblies of the university, when summoned, and assist at the public processions thereof: they were obliged to lend their books to be read, or even copied by such as were disposed to borrow, on certain conditions prescribed by the university. If they kept any books by them which were not correct, the university punished them: they were not allowed to buy any book of a student without leave of the rector: nor were they allowed to gain above four deniers in a livre, by any copies sold to the members of the university. Every *bookseller* was obliged to have a catalogue of all his books hung up in the shop, with the prices, as rated by the university: no *bookseller*, who had not taken the oaths to the university, might sell a book of above ten sols value.—*Vid. Chevill. diff. de Orig. de l'imprim. l. 4. Jour. des Sav. T. 23. p. 240. Savar. D. Com. T. 2. p. 530. seq. var. Libraire.*

This state lasted from the thirteenth century till the invention of printing, and even till the end of the fifteenth century; during which time there were only allowed twenty-four *booksellers*, two binders, two illuminers, and two sworn book-writers, or copiers.—But from that time the kings of France began to take cognizance of them: Lewis XI. thought fit to prescribe some new regulations in 1467: under Francis I. the *booksellers* were brought wholly under the royal authority, and received statutes from the king.—*Vid. Savar. lib. cit. p. 531.*

Absl. Frisch, chancellor of Jena, has a dissertation express concerning *booksellers*, de *bibliopoliis*, but it is a jejune piece, and besides, half-filled with passages in High Dutch untranslated: what we find in it any way curious, is some questions and cases, between *booksellers* and authors, which he discusses on the principles of the Imperial and Saxon laws; as,—whether any copy-money be due to an author, who has not been able to finish his book by reason of the difficulty of it?—whether a *bookseller*, who printed the first edition, be entitled to the refusal of the second?—Whether new copy-money be due from the *bookseller* to an author on a new edition of a book?—Whether a *bookseller* may reprint a book without the knowledge and consent of the author?—Whether a number of copies be due to the author over and above the copy-money? which he resolves in the affirmative.—And whether a *bookseller* may seize his books unpaid for, in a student's closet? which he solves in the affirmative.—See further concerning *booksellers*, in the writers on BOOKS and PRINTERS.—More especially in Schoettgenius's, de la Caille's, Chevillier's, and others's, who have written expressly on the subject.—*Vid. Frisch. tract. de Typogr. & Bibliopoliis, Sec. Jen. 1675. 4. diff. 2. c. 6. Christ. Schoettgenius diff. de Librariis & Bibliopoliis antiquorum. Lips. 1710. 4. A notice of it is given in Reimss. Idea syst. antiq. liter. p. 60. Jean de la Caille, Histoire de l'imprimerie & de la librairie, jusque en 1689. Par. 1689. 4. An extract of which is given in Jour. des Sav. T. 17. p. 467. seq. And Chevillier l'Origine de l'imprimerie. Par. 1695. 4. An extract of it is given in Jour. des Sav. T. 23. p. 223. seq. Item p. 235. seq. Fabric. Bibl. Antiq. c. 19. §. 7. p. 607. & Thurman. Bibl. Acad. p. 10. Item p. 56.*

**BRIDGE**, an edifice either of stone or timber, consisting of one, or more arches erected over a river, canal, or the like, for the conveniency of crossing, or passing over from one side to the other. See RIVER, ARCH, &c.

A *bridge* may be considered as a road over water. See ROAD. Janus is made, by some learned men, the first inventor of *bridges*, as well as of ships, and crowns: their reason is, that in several ancient Greek, Sicilian, and Italian coins, there are represented on one side a Janus, with two faces, and on the other, a *bridge*, or a crown, or a ship.

The parts of a *bridge* are the *peers*, or legs, *pillars*; the *arch-*

*is*; the *passage*, or way over for cattle and carriages; the *foot-banks*; on each side for foot-passengers; the *rail* or parapet, which incloses the whole; and the *abutments*, or ends of the *bridge* on the banks. See PEER, BUTMENT, &c.

*Bridges* are a sort of edifices very difficult to execute, on account of the inconvenience of laying foundations, and walling under water. The earliest rules and instructions relating to the building of *bridges*, are given by Leon Baptista Alberti, *Archit. l. 8.* Others were afterwards laid down by Palladio, *l. 3. Serlio, l. 3. c. 4. and Scamozzi, l. 5.* all of which are collected by M. Blondel, *Cours d'Archit. P. 5. l. 1. p. 629. seq.* The best of them are also given by Goldman, *Baukunst. l. 4. c. 4. p. 134.* and Hawkmoor, *Hist. Lond. Bridg. p. 26. seq.* M. Gautier has a piece express on *bridges*, ancient and modern. *Trait. des Ponts. Paris 1716. 12.*

The conditions required in *bridges* are, that they be well-designed, commodious, durable, and suitably decorated.—The *peers* of stone-*bridges* are to be equal in number, that there may be one arch in the middle, where commonly the current is strongest. Their thickness is not to be less than a sixth part of the span of the arch, nor more than a fourth. They are commonly guarded in front with an angular railing or spur, to break the force of the current; though this defence is sometimes also turned semicircularly: in the ancient *bridges*, it is always a right angle; which has the advantage of being stronger and more durable than acute ones. The strongest arches are those whose sweep is a whole femicircle.—For the rails, the heights, ornaments, and the like, they are left to discretion.—It is even complained, that no demonstrative reasons are given of the several proportions of the most essential parts of *bridges*: much of which is still left to the discretion of the builder, to be regulated according to the circumstances, design, place, magnitude, &c. of the designed edifice. M. Gautier wishes, that mathematical persons would take the structure and proportions of *bridges* into their consideration, in order to bring things to more certainty, and precision, founded on unvariable geometrical truth.

Something of which kind has been attempted by M. de la Hire, in *Mem. Acad. R. Scienc. an. 1712. p. 70.* and the Marquis de l'Hopital, in *Act. Erud. Lips. 1695. p. 56.* The breadth of a *bridge*, according to Baptista Alberti, ought to be the same as that of the highway which abuts on it: the breadth of the *peers* is to be one third of the aperture of the arches; the railings to be one half the breadth of the *peers*, and to rise above the greatest height to which the water ever mounts.

In the *bridges* of Avignon, St. Esprit, and Lyons, there is this remarkable, that they are not freight, especially the two former, but bent, having an angle, whose convexity is turned towards the stream, to break the force thereof: the point St. Esprit, Dr. Robinson observes, is bowed in many places, making unequal angles, especially in those parts where the stream is strongest. The great peer in the middle of London-*bridge*, as we are told, was intended to serve for a steadying to the whole machine, instead of making an angle, as in the above-mentioned *bridges*.

The famous *bridge* of Venice, called the *Rialto*, consists but of a single arch, and that a flat or low one; passing for a master-piece of art; being built in 1591, on the design of Michael Angelo: the span of the arch is ninety-eight feet one half, and its height above the water only twenty-three feet.—Poulet also mentions a *bridge*, of a single arch, in the city Munster in Bothnia, much bolder than that of the *Rialto* at Venice. But these are nothing to a *bridge* in China, built from one mountain to another, consisting of one single arch 400 cubits long, and 500 cubits high, whence it is called the *flying-bridge*: a figure of it is given in the *Philosophical Transactions*. Kircher also speaks of a *bridge* in the same country, 360 perches long without any arch; supported only by 300 pillars.

To scour the *peers* of *bridges*, they sometimes diminish the current of the river, either by lengthening its course, by making it more winding (a method sometimes used by the ancients in rendering their rivers navigable) or by stopping the bottom of a rapid river, with rows of banks, stakes, or piles, which break the current.

The *peers* of a *bridge* always diminish the bed of a river: suppose this diminution one fifth, it will follow, that in case of inundations, the bed must be sunk or hollowed one fifth more than before, since the waters gain in depth what they have lost in breadth. Add, that as the quantity of the water remains still the same, it will pass with greater velocity by one fifth in the place where such contraction is: all which conduces to wash away the foundation. The stream thus augmented in velocity, will carry away flints and stones, which before it could not stir. See RIVER.

The foundations of *bridges* are to be laid at the season of the year when the waters are lowest, as in autumn; and if the ground be rocky, hard gravel, or stony, the first stones of the foundation may be laid on the surface, without digging deeper; but if the soil be soft sand, or gravel, it will be necessary to turn off the water, and dig till you come at a firm bottom; at least, if this cannot be done, part of the

C

water

water must be carried off, and the rest kept dry and piled: that side of the river where you are to work is to be inclosed with coffer-dams, and the current to have its liberty on the other side. See FOUNDATION. Palladio's directions are, first, to make choice of that place in a river which has the least depth of water, and where the ground is even and firm, especially rock or gravel floor; secondly, to avoid those places where there are vorages, or whirlpools, and where the bottom is soft sand or gravel, in regard such matters are easily carried away by the violence of water, which in time alters the bed of a river, and saps the foundation of the piers; thirdly, to pitch on a straight part of a river, since otherwise the turns and windings being worn away in time, the bridge is in danger of being left insulate; besides being liable to be choaked up with the silt, and other matters commonly gathered in the turns of rivers.

BRIDGES are either built of stone or timber, according as there is a conveniency, or plenty of the one material or the other in the place.

Stone-BRIDGES, are composed of piers, arches, and buttments, made of hewn stone, sometimes also intermixed with brick; as, the bridge of Tholouse, the plinths whereof are of stone, as also the quoins of the arches, and some bonding courses, and copings; but the rest, as the arches, walls, and buttments, of brick.

Wooden-BRIDGES, called by the Latins, *pontes sublevis*, consist of beams and joists sustained by pincions, well cramped and bound together.

Sturmius has a dissertation express on the structure of a wooden-bridge: *Disp. de Ponte Sublevis*. Francof. 1709.

Ryden-BRIDGES, *pont de junc*, is made of large sheaves of rushes growing in marshy grounds, which they cover over with boards or planks. They serve for crossing ground that is boggy, miry, or rotten.

The Romans had also a sort of subterraneous bridges, made by the soldiers, of bents, or sometimes of casks, leather bottles or bags, or even of bullocks bladders blown up, and fastened together, called *aggegrif*. Pitisc. *L. Ant. T. 2. p. 464. seq. voe. Pontes*. Du Cange *Gloss. Lat. T. 1. p. 350*. M. Couplet gives the structure of a portable bridge, 200 foot long, easily taken asunder and put together again, and which forty men may carry.—*Vid. Du Hamel Hist. Reg. Acad. Scienc. l. 3. sect. 5. c. 4. p. 273*.

Frezier speaks of a wonderful kind of bridge at Apurima in Lima, made of ropes, formed of the bark of a tree.—*Vid. Frez. Voyag. South-Sea, p. 184*.

Pendent, or Hanging, called also *Philosophical BRIDGES*, are those not supported either by posts or pillars, but hung at large in the air, only sustained at the two ends, or buttments.—Instances of such bridges are given by Palladio, and others.—*Vid. Vogel's Modern Bau-Kunst. Tab. 26. seq. Wolf. L. Math. p. 277. voe. Brucke. Kirch. Abhand. Subterr. l. 1. c. 3. T. 1. p. 14*.

Dr. Wallis gives the design of a timber-bridge, seventy foot long, without any pillars, which may be useful in some places where pillars cannot conveniently be erected. *Philos. Transf. N<sup>o</sup> 163. p. 714*. Dr. Plot assures us, that there was formerly a large bridge over the castle-ditch at Tutbury in Staffordshire, made of pieces of Timber none much above a yard long, and yet not supported underneath, either with pillars, or arch-work, or any other sort of prop whatever.—*Vid. Plot Nat. Hist. Stafford. c. 9. §. 88. p. 383*.

Draw-BRIDGES, *Pons subalterius*, is such a one as is made fast only at one end, with hinges; so that the other end may be lifted up; in which case the bridge stands upright, to hinder the passage of a boat, or the like.

There are others made to draw back, to hinder the passage, and to thrust over again to afford a passage. And others, which open in the middle; half of which turns away to one side, and the other to the other; being joined again at pleasure: but these have this inconvenience, that one half of them remains on the enemy's side.

The Marquis de l'Hopital has given the construction of a curve, in which a weight will always be a counter-balance to a draw-bridge; which the younger Bernoulli has shewn to be no other than the cycloid.—*Vid. AE. Erud. Liff. an. 1695. p. 56. seq.*

Flying-BRIDGE, *Pont volant*, or *Pons duclarius*, an appellation given to a bridge made of pontoons, leather boats, hollow beams, casks, or the like, laid on a river, and covered with planks for the passage of an army.

Flying-BRIDGE, *Pont volant*, more particularly denotes a bridge composed of one or two boats joined together, by a sort of flooring, and surrounded with a rail or ballustrade; having also one or more masts, to which is fastened a cable, supported at proper distances by boats, and extended to an anchor, to which the other end is fastened, in the middle of the water. By which contrivance, the bridge becomes movable, like a pendulum, from one side of the river to the other, without other help than the rudder.—Such bridges sometimes also consist of two stories, for the quicker passage of a great number of men; or that both infantry and cavalry may pass at the same time.—*Davil*.

Flying or Floating-BRIDGE, is ordinarily made of two small

bridges, laid one over the other, in such manner, as that the uppermost stretches and runs out, by the help of certain cords running through pulleys placed along the sides of the under-bridge, which push it forwards till the end of it joins the place it is designed to be fixt on. When these two bridges are stretched out at their full length, so that the two middle ends meet, they are not to be above four or five fathom long, because if longer they will break. Their chief use is for surprizing out-works, or posts that have but narrow moats.

In the memoirs of the royal academy of sciences, we find a new contrivance of a floating-bridge, which lays itself on the other side of the river.—*Vid. Hist. Acad. R. Scienc. an. 1713. p. 104*.

BRIDGE of communication, is a bridge made over a river; by which two armies or forts, separated by the river, have a free communication with one another.

BRIDGES of boats, are either made of copper, or wooden boats fastened with stakes, or anchors; and laid over with planks. See BOAT.

One of the most notable exploits of Julius Cæsar, was the expeditious making a bridge of boats over the Rhine: modern armies carry copper boats, called *pontons*, to be in readiness for the making bridges: several of these being joined side by side, till they reach across the river, and planks laid over them, make all plain for the men to march on. See PONTOONS.

There are five bridges of boats at Beauraire, and Rouen, which rise and fall with the water; yet that at Seville is said to exceed them both.

The bridge of boats at Rouen, built in lieu of the stately stone-bridge erected there by the Romans, is represented by a modern writer, as the wonder of the present age; it always floats; and rises, and falls with the tide, or as land-waters fill the river; it is near 300 yards long, and is paved with stone just as the streets are: carriages with the greatest burdens go over it with ease, and men and horses with safety, though there are no rails on either hand. The boats are very firm, and well moored with strong chains; and the whole well looked to, and constantly repaired, though now very old.

## D.

DEGREE, in geometry, a division of a circle, including a three hundred and sixtieth part thereof. See CIRCLE.

Every circle, great and small, is supposed to be divided into 360 parts, called *degrees*: the degree is subdivided into 60 lesser parts, called *minutes*: the minute into 60 others, called *seconds*: the second into 60 thirds, &c.—It follows, that the degrees, minutes, &c. of greater circles, are greater than those of less. See MINUTE, SECOND, &c.

The subdivisions of degrees are fractions, whose denominators proceed in a sexageuple ratio; that is, a first minute is  $\frac{1}{60}$ , a second =  $\frac{1}{3600}$ , a third =  $\frac{1}{216000}$ , &c. But these denominators being troublesome, their logarithms are substituted in common use, as indices thereof. See LOGARITHM.

Thus, a degree, as being the integer or unite, is denoted by  $^{\circ}$ , a first minute or prime by  $'$ , a second by  $''$  or  $'''$ , a third by  $'''$  or  $''''$ , &c. Accordingly 3 degrees, 25 minutes, 16 thirds, are wrote,  $3^{\circ} 25' 16''$ . See SEXAGESIMAL.

But though the ancient Egyptians, to whom this division is usually ascribed, did, by means hereof, free astronomical calculations from fractions; since sexagesimal fractions may be handled as integers; and were very happy in the choice of such a number of degrees in the circle, as admitted of a just division by 2, 3, 4, 5, 6, 8 and 9. Yet Stevinius, Oughtred, Wallis, &c. with good reason, with the sexagesimal fractions set aside, and decimals taken in their room.

For in decimals there is no occasion for reducing lesser fractions into greater, or greater into lesser; which is a tedious article in sexagesimal. Stevinius even holds, that this division of the circle which he contends for, obtained in the wise age, in *Seculo Sapienti*. Stevin. *Cosmog. Lib. 1. Dlg. 6*. See DECIMAL.

The magnitude or quantity of angles is accounted in degrees. Thus, we say, an angle of 90 degrees; of 70 degrees, 50 minutes; of 25 degrees, 15 minutes, 45 seconds. See ANGLE. Such a star is mounted so many degrees above the horizon, declines so many degrees from the equator. See ALTITUDE.

Such a town is situate in so many degrees of longitude and latitude. See LONGITUDE and LATITUDE.

A sign includes 30 degrees of the ecliptic. See SIGN.

DEGREE of latitude, is the space of 365184 English feet included between two parallels of latitude. See LATITUDE.

DEGREE of longitude, is the space between two meridians; the quantity of which is variable according to the latitude. See LONGITUDE.

These expressions are borrowed from the ancients, who were acquainted with a very large extent of earth from east to west,

west, which they accounted the length, and a much less from north to south, which passed with them for the breadth of the earth. See EARTH.

The quantity of a DEGREE of a meridian, or other great circle on the surface of the earth, is variously determined by various observers: the methods too made use of are various. See EARTH.—Ptolemy fixes the *degree* at 68 Arabic miles  $\frac{1}{2}$  accounting  $7\frac{1}{2}$  stadia to a mile. The Arabs themselves, who made an exact computation of the diameter of the earth, by measuring the distance of two places under the same meridian, in the plains of Senar, by order of Almamom, only make 56 miles. Kepler determining the semidiameter of the earth by the distance of two mountains, makes a *degree* 13 German miles: but his method is far from being accurate. Snellius seeking the diameter of the earth, from the distance of two parallels of the equator, finds the quantity of a *degree* by one method to be 57064 Paris toises, or 342384 feet; and by another method, 57057 toises, or 342342 feet. The mean between which two numbers M. Picart found by mensuration in 1669, from Amiens to Malvoisin, the most sure, and makes the quantity of a *degree* 57060 toises, or 342360 feet, which reduced to other measures, gives the quantity of a *degree* of a great circle in

English miles of 5000 feet each	—	73 $\frac{2}{3}$ <sup>a</sup>
Florentine miles of 3000 braccia	—	63 $\frac{1}{2}$ <sup>b</sup>
Common French leagues of 220 toises	—	25
Rhinland perches of 12 feet	—	29556.

However, M. Caffini, at the command of the king of France in the year 1700, repeated the same labour, and measuring the space of 6 *degrees*, 18 minutes, from the observatory at Paris, along the meridian to the city of Colicoure in Rouffillon, that the greatest of the interval might diminish the error, found the quantity of a *degree* to be 57202 toises, or 343742 Paris feet, amounting to 365184 English feet.—On which footing, the quantity of a minute of a *degree* of a great circle of the earth is 5710 Paris feet, and that of a second, 95 feet.

With which account pretty nearly agrees that of our countryman Mr. Norwood, who about the year 1635, measured the distance between London and York, and found it 905751 English feet; and finding the difference of latitudes 2° 28', determined the quantity of one *degree* to be 367196 English feet, or 57300 Paris toises, or 69 English miles, 288 yards. See Newt. *Princ. Phil. Nat. Math.* prop. 19. p. 378. and *Hist. Acad. R. Scienc. An.* 1700, p. 153.

The quantity of a *degree* of great circle, with the distance of any other parallel from the equator being given, the quantity of a *degree* in that parallel is found by this canon: as the whole line is to the cosine of the distance of the parallel from the equator, so is the quantity of a *degree* of the equator to the quantity of a *degree* of the parallel. Suppose, *e. gr.* the latitude of the parallel 51°, and suppose a *degree* of the equator 69 miles.

Log. of whole line	100000000.
Cosine of 51°	97988718.
Log. 69°	18388491.
Log. required	16377201.

The number corresponding to which in the tables is 43  $\frac{2}{3}$  miles, nearly; which being multiplied by 5280, the number of feet in a mile, gives the number of English feet in a *degree* in that parallel.—On which foundation (supposing M. Caffini's proportion of 365184 English feet, or 69 miles, 864 feet to 1 *degree* of a great circle) is built the following table, exhibiting the quantity of a *degree* of longitude in each parallel of latitude.

Deg. of Lat.	English Stat. Miles of 5280 Feet.	Deg. of Lat.	English Stat. Miles of 5280 Feet.

DEGREE, in civil and canon law, denotes an interval in cognation or kinship, whereby proximity and remoteness of blood are computed.

*Degrees* are the intervals whereby it is known what persons are nearest to the stock or root.—Or they are the distances of one person from another in the line of consanguinity or affinity, reckoned from some common parent or ancestor. See CONSANGUINITY and AFFINITY.

We say, the second *degree*, the third *degree*; Gregory the great was the first who prohibited marriage to the seventh *degree*; which restriction was long observed; the second council of Lateran, under Innocent III. restrained the prohibition to the fourth *degree* inclusive, that is, to cousin Germans children. See MARRIAGE.

In the civil law, the *degrees* of kindred or cognation are differently computed from what they are in the canon law.—The first reckons by the number of persons issued from the same stock; each person sprung therefrom making one *degree*: but with this difference, that in the direct line the order begins with the first *degree*; and thus the father and son are in the first *degree*: but in the collateral line there is no first *degree* reckoned: two brothers being only related in the second *degree*, by reason the father, who is the common stock, makes the first *degree*.

The canon law observes the same rule as to the direct line; but in the collateral line, a generation only makes a *degree*: thus brothers are in the first *degree*, and cousin Germans in the second. Whereas, the civil law puts brothers in the second, and cousins German in the fourth.—So that two *degrees* in the civil law only make one in the canon law.

DEGREE, in medicine, denotes a certain pitch or intensity of the elementary qualities. See QUALITY.

The *degrees* usually allowed are four, answering to the number of the peripatetic elements. See ELEMENTS.

In the school philosophy, the same qualities are divided into eight: the last or highest *degree* of intension is called *actus*.

We say, a thing is cold in the second *degree*, pepper is hot in the third *degree*. See HEAT and COLD.

Fire is held hot in the eighth *degree*, and dry in the fourth *degree*. See FIRE.

DEGREE, in chymistry, is understood of the state or intensity of the fire, or heat. See FIRE.

*Chymists* distinguish four *degrees* of fire, or heat: the first, is two or three coals.

The second, that of four or five coals, or rather so much as is sufficient to warm a vessel sensibly; yet so, as that the hand may be held on it a considerable time.

The third *degree*, is when there is a fire capable of boiling a vessel of five or six pints of water.

The fourth, is when there is fire enough for a furnace.

These *degrees*, however, are all varied according to the different circumstances of operations, furnaces, vessels, subjects, &c.

DEGREES, in musick, are the little intervals whereof the concords, or harmonical intervals, are composed. See INTERVAL and CONCORD.

The musical *degrees* are three; the greater tone, the lesser tone, and semi-tone. See TONE and SEMI-TONE.

The primary cause of the invention of *degrees*, or intervals less than concords, and whereby the concords are divided, and as it were graduated, des Cartes judges to have been this, that if the voice were always to proceed by harmonical intervals, there would be too great a disproportion or inequality in the intensities thereof, which would weary both finger and hearer.

Thus, supposing A and B the distance of a greater third; if the voice were immediately to ascend from A to B, then because B being acuter, strikes the ear with more force than A, lest that disproportion should prove uneasy, another sound, C, is put between them; by which, as by a step or *degree*, we may ascend more easily, and with less unequal force in raising the voice.

Hence it appears, says that author, that the *degrees* are only certain mediums contrived to be put betwixt the extremes of the concords, for moderating their inequality, but which of themselves have not sweetness enough to satisfy the ear, and are of use only with regard to the concords. So that when the voice has moved one *degree*, the ear is not yet satisfied till we come to another, which therefore must be concord with the first found.

The substance of what is here alleged amounts to this, that by a fit division of the concurring intervals into lesser ones, the voice will pass smoothly from one note to another; and the hearer be prepared for a more exquisite relish of the perfect intervals, whose extremes are the proper points in which the ear finds the expected rest and pleasure.

Such is the end and office of the *degrees* or lesser intervals.—Now there are only three, that experience recommends as agreeable; whose ratios are 8 : 9, called the *greater tone*; 9 : 10, called the *lesser tone*; and 15 : 16, called the *semi-tone*. By these alone a sound can move upwards or downwards successively, from one extreme of a concord to another, and produce true melody; and by means of these, several voices are also capable of the necessary variety in passing from concord to concord.

As to the original of these *degrees*, they arise out of the simple concords, and are equal to their differences. Thus, 8 : 9, is the difference of a fifth and fourth; 9 : 10, is the difference of a lesser third and fourth, or of a fifth and greater sixth; and 15 : 16, the difference of a greater third and fourth, or of a fifth and lesser sixth.

For the use of DEGREES, in the construction of the scale of music. See SCALE and GAMMUT.

DEGREE, in universities, denotes a quality conferred on the students or members thereof, as a testimony of their proficiency in the arts or faculties, and entitling them to certain privileges, precedencies, &c. See UNIVERSITY, FACULTY, &c.

The *degrees* are much the same in the several universities: but the laws thereof, and the discipline or exercise previous thereto differ.—The *degrees* are *bachelor*, *master* and *doctor*; instead of which last, in some foreign universities, they have *licentiate*. See LICENTIATE.

In each faculty there are but two *degrees*, viz. *bachelor* and *doctor*, which were anciently called *bachelor* and *master*: nor do the arts admit of more than two, which still retain the denomination of the ancient *degrees*, viz. *bachelor* and *master*. At Oxford, *degrees* of master and doctor are only conferred once a year, viz. on the Monday after the seventh of July; when a solemn act is held for the purpose. See ACT.

The expenses of a *degree* of doctor in any of the faculties, in treats and set fees, usually amounts to about 100*l.* and that of a master of arts, 20 or 30*l.*—There proceed yearly about 150 doctors and masters. See DOCTOR and MASTER.

The *degree* of bachelor is only conferred in Lent; and there proceed usually about 200 yearly.

To take the *degree* of bachelor in arts, four years are required, and three more for master of arts. See BACHELOR. At Cambridge, matters are nearly on the same footing, only the discipline is somewhat more severe, and the exercises more difficult. The commencement which answers to the act of Oxford, is the Monday before the first Tuesday in July.—The *degrees* of bachelor are taken up in Lent, beginning on Ash-Wednesday.

To the *degree* of bachelor of arts, it is required, that the person have resided in the university near four years; and in his last year have kept philosophy acts, i. e. have defended three questions in natural philosophy, mathematics or ethics, and answered the objections of three several opponents at two several times; as also, that he have opposed three times. After which, being examined by the masters and fellows of the college, he is referred to seek his *degree* in the schools, where he is to sit three days, and be examined by two masters of arts appointed for the purpose.

The *degree* of master of arts is not given till above three years after that of bachelor; during which time, the candidate is obliged three several times to maintain two philosophical questions in the public schools, and to answer the ob-

jections raised against him by a master of arts.—He must also keep two acts in the bachelors school, and declaim one.

To pass bachelor of divinity, the candidate must have been seven years master of arts; must have opposed a bachelor of divinity twice; kept one divinity act; and preached before the university, once in Latin, and once in English.

For the DEGREE of doctor. See the article DOCTOR.

DYING, the art, or act of tinging cloth, stuff, or other matter with a permanent colour, which penetrates the substance thereof. See CLOTH, &c.

*Dying* differs from bleaching, or whitening, which is not the giving a new colour, but the brightening of an old one: it also differs from painting, gilding, marbling, and printing, or stamping, in that the colours in these only reach the surface. See BLEACHING, PAINTING, GILDING, &c.

*Dying* may be defined the art of colouring wool, linen, cotton, silk, hair, feathers, horn, leather, and the threads and webs thereof, with woods, roots, herbs, seeds and leaves, by means of salts, limes, lixiviums, waters, heats, fermentations, macerations, and other processes.

*Dying* with regard to the manner of applying the colours, is divided into hot, and cold.

DYING hot, *θερμαδωδη*, is that wherein the liquors and ingredients are boiled, before the cloth be dipped therein; or even where the cloths themselves are boiled in the dye.

DYING cold, *ψυχραδωδη*, is where the ingredients are dissolved cold; or at least are suffered to grow cold, ere the stuffs be put in them.—V. *Savart. D. Comu. T. 2. p. 1697. vnc. Teinture. Salmof. Exere. ad Solin. T. 2. p. 1167.*

Origin of DYING.—The *dying* art is of great antiquity; as appears from the traces of it in the oldest sacred, as well as profane writers. The honour of the invention is attributed to the Tyrians\*; though what lessens the merit of it, is that it is said to have owed its rise to chance. The juices of certain fruits, leaves, &c. accidentally crushed, are supposed to have furnished the first hint: Pliny assures us, that even in his time the Gauls made use of no other dyes: it is added, that coloured earths, and minerals washed and soaked with rain, gave the next *dying* materials<sup>b</sup>.—But purple, an animal juice, found in a shell-fish called *Murex*, *Cochylidium*, and *Parpura*, seems from history to have been prior to any of them. This indeed was reserved for the use of kings, and princes; private persons were forbidden by law to wear the least scrap of it<sup>c</sup>. The discovery of its tinging quality is said to have been taken from a dog, which having caught one of the purple fishes among the rocks, and eaten it up, stained his mouth and beard with the precious liquor; which struck the fancy of a Tyrian nymph so strongly, that the refused her lover Hercules any favours till he had brought her a mantle of the same colour<sup>d</sup>.—V. *Plin. Nat. Hist. Lib. XXII. c. 2.* <sup>e</sup> *Savart. Lib. cit. p. 1689.* <sup>f</sup> *Leg. I. C. Quæ res ven. non poss. Salmuth. ad Panciroli. Lib. I. Tit. 1. p. 8. seq.* <sup>g</sup> *Polli. Lib. I. de verb. Idem. ad Commod. Polyd. Virg. de Invent. Rer. Lib. III. c. 7.* See also the article PURPLE.

\* Pliny seems to ascribe the invention of the art of *dying* wools to the Lydians of Sardis: *lyferece lanas Sardibus Lydi*; where the word *lyferece* must be understood<sup>b</sup>. But a modern critic suspects a false reading here; and not without reason, for *Lydi*, substituted *Lydia*, the name of a city on the coast of Phœnicia, where the chief mart of the purple-dye was.—V. *Plin. Hist. Nat. Lib. VII. c. 56.* <sup>c</sup> *Hædon. not. ad loc.* <sup>d</sup> *Narra, in Bibl. Chœt. T. 20. p. 193. seq.*

† After the Phœnicians, the Sardinians seem to have arrived at the greatest perfection in the *dying* art; inasmuch that *βυσσα Σαρδινια*, *Sardinian dye* passed into a proverb among the Greeks. Aristophanes in two places, to express a thing red as scarlet, compares it to the *βυσσα Σαρδινια*<sup>e</sup>. Salmuth, Palmerius and Spanheim indeed for *βυσσα* substitute *Σαρδανω*, which they suppose a possessive of Sardis, and to denote *Sardinian dye*: but Nares in a dissertation expressly on the subject has strenuously supported the pretensions of his country against this innovation<sup>f</sup>.—Aristoph. in *Acharn. v. 118. Æon Pax. v. 11. 74.* <sup>g</sup> *I. Paul Nares Diff. de Faria Lævise Adgii βΑΜΜΑ ΣΑΡΔΙΝΙΑΚΟΝ, tintura Sardiniana. Flor. 1709. 4<sup>o</sup>.* le Clerc. *Bibl. Chœt. T. 20. p. 187. seq.*

Till the time of Alexander we find no other sort of dye in use but purple and scarlet.—It was under the successors of that monarch, that the Greeks applied themselves to the other colours, and invented, or at least perfected, blue, yellow, green, &c.<sup>h</sup>.—For the ancient purple it has been long lost, but the perfection to which the moderns have carried the other colours, abundantly indemnifies them of the loss. In this the French under the auspices of that excellent minister M. Colbert, seem to have outstripped most of their neighbours<sup>i</sup>. See GOBELINS.—V. *Pittic. L. Ant. T. 1. p. 249. vnc. Baphin.* <sup>j</sup> *Savart. lib. cit.*

Among the Romans, *dye-houses*, *baphia*, were all under the direction of the *comæ sacrarum argentiom*<sup>k</sup>; though they had each their peculiar præpositus, as at Alexandria, Tyre, &c.<sup>l</sup>.—The *dyers* of London make the 13th company of the city, incorporated under Hen. VI. consisting of a master, warden, and livery<sup>m</sup>.—At Paris, and in most of the great cities in France, the *dyers* are divided into three companies, viz. those of the *great dye*, *du grand et bon teint*, who are only to use the best ingredients, and such as strike the

surest and most lasting colours.—*Dyers of the lesser dye, du petit teint*, who are allowed to use the inferior sorts of drugs, which only yield false and fading colours.—And silk, wool and thread *dyers*.—All the higher prized cloths and stuffs are reserved to the *dyers of the first sort*: those of less value, particularly such as are not rated at above 40 sols the ell in white are committed to the masters of the *petit teint*. Blue, red, and yellow, are reserved more peculiarly to those of the *grand teint*; browns, fallows and blacks are common to both sorts. As to black, it is begun by the *dyers of the grand teint*, and finished by those of the *lesser*.—It seems there is a tradition among *dyers*, that Jesus Christ was of their profession; which we also find delivered in the *gospel of the infancy of Jesus*, though on what grounded we know not. But it is hence the Persian *dyers*, notwithstanding all their Mahometanism, have chosen Jesus for the patron of their art; inasmuch that among them a *dye-house* is called *Corist's shop*.—*V. Notit. Imper. Hoffm. L. T. 1. p. 469.* *Pittic. loc. cit.* *New View of Lond. T. 2. p. 601, seqq.* *Savar. D. Comm. T. 2. p. 1688. voc. Teint.* *Sike Not. ad Evang. Infans. p. 55.* *Hilfcher de Stud. Christ. in Misf. Ligt. Obf. 96. §. 10. T. 5. p. 34.*

*Requisites in DYING.*—There are three things demanded by the Greek chymists to a good *dye*; viz.—*ἀραιων*, opening or rarefying of the body to be *dyed*, to dispose it to imbibe the colour.—*ἄσθη*, the tincture or *dye itself*.—*ῥαρεσις*, or *ἔρως*, by the Romans called *aliquotio*, the binding or fixing the colour, to prevent its fading or being discharged.—Some add a fourth condition, viz. *εὐκρίσις*, by the Latins called *lumen*, by us *lustre* or *brightness*.

Among some, these three were done severally at three different operations, in different liquors, or decoctions: by the first, the stuff was prepared to receive the *dye*; this was called *παρασκευασ* and *ἀραιωσις*; by the second, the desired colour was given it; and by the third, the colour was fixed on it.—But others did all three at once, with one decoction, and one dip.—*V. Salmat. Exerc. ad Solin. T. 2. p. 1146, seq.*

*Advancement of DYING.* The basis of a just history of *dying*, must be a theory of light and colours. See *LIGHT, COLOUR and RAINBOW*.—Two things, it may be observed, are chiefly aimed at in the enquiry of colours, the first to increase the *materia tinctoria*, the second, to fix those colours we have.

In order to these it may be remembered, that some colours are *apparent*, as those of flowers, the juices of fruits, and the fancies of animals.—Others *latent*, and only discovered by the effects which the several species of salts and other things have on them.

Concerning the *apparent* colours of vegetables and animals, and the effects of different salts in changing them from one colour to another, we have many instances in Mr. Boyle, collected and ranged in a new order by Dr. Lister, as—*1<sup>st</sup>*, That acid salts advance the colours of flowers, and berries: thus they make the infusions of balsamita or pomegranate flowers, red-trees, clove-july flowers, mezerion, pease-bloom, violets, and cyanus flowers, of a fairer red; and the juices of the berries of lignitum, of black-cherries, and buck-thorn berries, of a much fairer red. To the same purpose it is observed, that acid salts make no great alterations upon the white flowers of jasmim and snow-drops.

*2<sup>dy</sup>*, Urinous salts and alkaly's, on the contrary, quite alter the colours of the flowers last named, as well as the juices of the berries abovementioned, from red to green.

*3<sup>dy</sup>*, Urinous salts and alkaly's advance, at least do not hurt the colours of the juices of vegetable leaves, woods and roots.—Thus urinous spirits and alkaly's make the yellow infusions of madder roots, red; of brazil wood purplish; of lignum nephriticum, blue; the red infusion of log-wood, purple; and of the leaves of fena, red.

*4<sup>th</sup>*, Acid salts quite alter the said infusions from red or blue to yellow.

*5<sup>th</sup>*, Cochineel, which of itself is red, upon the affusion of oil of vitriol, an acid salt, strikes the most vivid crimson that can be imagined; and with urinous salts and alkaly's, will be again changed into an obscure colour betwixt a violet and a purple.

*6<sup>th</sup>*, All red, blue and white flowers are immediately, upon the affusion of an alkaly, changed to a green colour; and thence, in no long process of time, turn yellow.

*7<sup>th</sup>*, All the parts of vegetables which are green, will in like manner strike a yellow with an alkaly.

*8<sup>th</sup>*, What flowers are already yellow, are not much changed, if at all, by an alkaly, or urinous spirit.

*9<sup>th</sup>*, The blue seed-hulls of glassum sylvestris old gathered and dry, diluted with water, stain a blue, which upon the affusion of hye strikes a green; which said green or blue being touched with oil of vitriol *dyer* a purple: and all these three colours stand.

*10<sup>th</sup>*, On the tops of the fungus tubulosus are certain red knots, which upon the affusion of lye, will strike a purple, and stand.

For the *latent* colours in animals and vegetables, discovered to us by the affusion of salts; they likewise are very nume-

rous. We will only mention a few;—*1<sup>st</sup>*, The milky juice of lactuca sylvestris, colza spinosa, & fonschus asper & levis, upon the affusion of lye, will strike a vivid flame-colour or crimson, and after some time quite degenerate into a dirty yellow.

*2<sup>dy</sup>*, The milk of cutapatia major, upon the affusion of lye, especially if it be drawn with a knife, and have any time stood upon the blade thereof, will strike a purple or blood red colour, and by and by change into an ignoble yellow.

*3<sup>dy</sup>*, The common hawthorn-caterpillar will strike a purple or carnation with lye, and stand.

*4<sup>th</sup>*, The heads of beetles, pismires, &c. will with lye strike the same carnation colour, and stand.

*5<sup>th</sup>*, The amber coloured scolopendra will give with lye a most beautiful and pleasant azure, or amethystine, and stand. It remains to be observed,—*1<sup>st</sup>*, That in all the instances abovementioned, whether vegetable or animal, there is not one colour truly fixed; though there may be some use made of them, as they are.—By not truly fixed, we mean, not proof against salt and fire; for, what seem to stand, and be lye-proof, are either wholly destroyed by a different salt, or changed into a much different colour; which must needs prove a stain and blemish, when it shall happen in the use of any of them.

*2<sup>dy</sup>*, That both the apparent and latent colours of vegetables are fixable: an instance whereof we may observe in the feed hulls of glassum, and the lye *dyers* make of the leaves of that plant after due preparation.

*3<sup>dy</sup>*, It is probable from the same instance, that we may learn from the colour of some part of the fruit or seed, what colour the leaves of any vegetable, and the whole plant, might be made to yield for our use.

*4<sup>th</sup>*, That the latent colours of vegetables are pre-existent, and not produced; from the same instance of wood; and likewise from this, that the milky juice of lactuca sylvestris affords of itself a red serum.

*5<sup>th</sup>*, That the change of colours in flowers is gradual and constant.

*6<sup>th</sup>*, That the colours of flowers, which will not stand with lye, seem to be wholly destroyed by it, and irrevocable.—Thus one part of a violet leaf, upon the affusion of lye, is changed very soon into yellow, and will never be revived into a red by an acid salt; but if another part of the same leaf be still green, it will be revived.

*7<sup>th</sup>*, That dryness seems to be a means, if not of fixing, yet of bringing the vegetable colour into a condition of not wholly and suddenly perishing by the otherwise destroying aley.

*8<sup>th</sup>*, That those plants or animals which will strike different yet vivid colours, upon the affusion of different salts, and stand, as the cochineel, and glassum, are of all others to be reckoned the best.—*V. List. in Phil. Trans. N<sup>o</sup> 70. p. 2132, seqq.* See also Koerb. *Elon. Chem. P. 3. T. 2. p. 467, seqq. Edit. Ligt.*

*DYING ingredients, or the materia tinctoria*, are best reduced under two heads:—*Coloured*, or those which properly give the colour.—And *non-coloured*, used to prepare the stuffs for better taking the *dye*, and to heighten the lustre of the colours.

The *coloured* ingredients are of three sorts, blue, yellow and red.—To the first sort, belong indigo, wood, wold, wood-wax, and log-wood; to the second, fustic; to the third, madder, brazil, cochineel, kermes, safflower and Sanders.—To which may be added annotto, and young fustic, for orange-colours: lastly, wood foot.

The *non-coloured* ingredients are,—*Certain restraining or binding materials*, as galls, fumac, alder bark, pomegranate peel, walnut rinds and roots, sapling bark and crab-tree bark.—*Certain salts*, as alum, argol, salt-petre, sal armoniac, pot-ashes, lime and urine.—*Liquors*, as well water, river water, aqua vite, vinegar, lemon juice, aqua fortis, honey and molasses.—*Gums*, as tragacanth, arabic, mastic, and sanguis draconis.—*Smeltich*, or *absterfives*, as soap, fullers earth, linseed oil, ox gall, &c.—*Metals*, as steel filings, flippe and pewter, to which add copperas, verdgrease, antimony, litharge and arsenic.—*Lastly*, bran, wheat flower, yolks of eggs, leaven, camin seed, fenugreek seed, agaric and fenns.

Of most of these ingredients some account may be found under their respective articles in the course of this book; but with regard to their use and effect in *dying*, it will be necessary to consider them more particularly, and to bring together in one view.

Among the *non-coloured drugs*, then, from the mineral kingdom come;—*1<sup>st</sup>*, Copperas, steel filings, and flipp (the fluff found in the troughs of old grind-stones whereon edge-tools have been ground) which are used for all true or Spanish blacks; though not for the Flanders blacks.—*2<sup>dy</sup>*, Pewter dissolved in aqua fortis, used for the new scarlet or bowlye.

*3<sup>dy</sup>*, Litharge, though not owned or allowed, is used to add weight to dyed silks.—*4<sup>th</sup>*, Antimony used chiefly for the same purpose, though it also contain a tingent sulphur, which by precipitation, &c. affords a great variety of colours.—*5<sup>th</sup>*, Arsenic used in *dying* crimson, on pretence of giving

giving a lustre.—*6thly*, Verdgrease, used by linen dyers, in their yellow and green colours.—*7thly*, Alum, much used, though with what intent is not agreed on; whether to render water a proper menstruum to extract the tinging particles of certain hard drugs? or to fower the fibres, which may interpose between the stuff and the dye, and hinder their due adhesion? or to intertuate the hairs of wool, and hair stuffs, that they may better imbibe their colours? or to contribute to the colour itself, as copperas does to galls in making black, or juice of lemons to cochineal in carnations, or aqua fortis impregnated with powder in the bowdye? or, which seems most probable, to serve as a vinculum between the cloth and the colour, as clammy oils, and gum waters, do in painting; alum being a substance whose aculeated particles, dissolved with hot liquors, will enter the pores of stuffs, and on which the particles of dying drugs will catch; though it may also serve another use, viz. to dry up certain particles which disagreed with the colour to be superinduced: to which add, that it may also serve to brighten a colour, by incrustating the stuff to be dyed with its crystals, on which the dye coming to be applied, has a finer effect, than if it were applied on a scabrous matter, such as un-bleached cloth is.—*8thly*, Bran, and bran water, whose slower entering the pores of the stuff, levigates its surface, and thus renders the colour laid on it more beautiful; much as woods to be gilded, are first smoothened over with white colours.—*9thly*, Saltpetre, used chiefly in aqua fortis, in the bowdye, to brighten colours by back boiling; for which purpose.—*10thly*, Argol is more commonly used.—*11thly*, Lime, or calke, used in the working of blue fatts.

Non-colouring ingredients of the animal kind, are.—*1st*, Honey.—*2dly*, Yolks of eggs.—*3dly*, Ox-gall: though this, and the two last, are only used by a few particular dyers, to fower, promote fermentation, and increase weight.—*4thly*, Stale urine, used as a lixivium to fower, also to help the fermenting, and heating of wood; though it is also used in the blue fatts instead of lime: in reality, as it discharges the yellow, wherewith blue, and most greens, are compounded, it is used to spend weld vitral: yet it is known, that the urine, or old mud of pissing places, will dye a well fowered piece of filver of a golden colour; it being with this (not Bath water, as imagined) that the Bath fixpences, &c. are prepared.

To the class of non-colouring ingredients may also be added water, by dyers called *white liquor*, which is of two sorts.—*1st*, Well water, used in reds, and in other colours wanting refringency, as well as in dying stuffs of a loose texture, as callico, fustian, and the several species of cottons: but naught for blues, and making yellows and greens look rusty.—*2dly*, River water, softer and sweeter than the former, and dissolving soap better, used in most cases by the dyers, for washing, rinsing, &c. their cloths after dying.—*3dly*, Liquor absolutely so called, which is bran liquor made of one part bran, and five river water, boiled an hour, and put in a leaden cistern to settle: four or five days in summer turn it too fower, and unfit for use: its office is to contribute to the holding of the colour: it is known that starch, which is only the flower of bran, makes a clinging paste, which will conglomerate paper, though not wood or metals. Accordingly, bran liquors are used to mealy dying stuffs, as to madder, which is rendered clammy and glutinous by being boiled in bran water; and thus made to stick better to the villi of the stuff dyed.—*4thly*, Gums, tragacanth, arabic, mastic, and fanguis draconis, are used in dying silk, chiefly to give it a glossiness, which may make it seem finer, as well as stiffer, and to encrease its weight.

For the colouring ingredients, *colorantia colorata*, we have,—*1st*, Iron and steel, or what is made from them, which, we have observed, are used in dying blacks; though how they contribute thereto is not so obvious: we know that green oaken boards become black by the friction of a saw; a green four apple cut with a knife turns of the same colour; the white grease wherewith the wheels of coaches are anointed becomes likewise black by means of the iron boxes wherewith the nave is lined, and the friction between the nave and the axle-tree; and that an oaken stick becomes black by a violent friction against other wood in a turning lathe; and the black colour on earthen ware is given with scalings of iron vitrified. From all which it seems to follow, that the business of blacking lies in the iron, and particularly in its usulation or friction. See BLACK, and BLACKNESS. Be this as it will, copperas, the most usual ingredient for dying black, is the salt of the pyrites wherewith old iron is incorporated. And, where-ever this is used, some of the astringents are to accompany it. See COPPERAS.—*2d*, Red-wood chopped, and ground in a mill, is used for dying cloth, rugs, &c. of the coarser sort. Its tincture, which is a sort of brick-colour, is got out by long boiling it with galls, and the cloth along with it. It stands better than brazil.—*3d*, Brazil, chopped also, and ground, dyes a pink-colour, or carnation nearest approaching cochineal: it is used with alum: with pot-ashes it also serves for purple. It easily stains. See BRAZIL.—*4d*, Madder gives a colour near approaching the bowe-dye, or new-scarlet: those called balfard-

scarlets are dyed with it. It endures much boiling, and is used both with alum and argol; and holds well: the brightest dyes with madder are made by over-dying the stuff, and then discharging part of it by back-boiling in argol. It is used with bran water instead of white liquor. See MADDER.—*5d*, Cochineal, used with bran liquor in a pewter furnace, with aqua fortis, gives the dye called among us, though improperly, *scarlet in grain*. Any acid takes off the intense redness of this colour, turns it towards an orange, or flame colour. With this colour the Spanish leather and wool used by ladies, are dyed. See COCHINEAL.—*6d*, Annatto gives an orange colour, especially to silks, linens and cottons; for it does not penetrate cloth: it is used with pot-ashes.—*7d*, Weld, by the help of pot-ashes, yields a deep lemon-colour; though it is used to give all sorts of yellows. See WELD.—*8d*, Wood-wax, or green-wood, called also *genista tinctoria*, and the *dyer's wood*, has the like effect as weld, though its use is chiefly confined to coarse cloths. It is set with pot-ashes, or urine.—*9d*, Fustic is of two sorts, young and old.—The former chopped and ground, yields a kind of reddish orange colour: the latter, a hair colour distant several degrees of yellow from the former. It spends with or without salts, works either hot or cold, and holds firm. See FUSTIC.—*10d*, Wood-foot, containing not only a colour, but a salt, needs nothing to extract its dye, or make it strike on the stuff. The natural colour it yields is that of honey, but it is the foundation of many other colours on wool, and cloth, only. See SOOT.—*11d*, Wood ground, or chopped with a mill for the purpose, is made up into balls, which being broken, and strewed on lime or urine, is used with pot-ashes, or sea-weed, and gives a lasting blue. The lime, or calke, accelerates the fermentation of the wood, which in three or four days will work like a gule of beer, and be covered with a greenish froth or flower. An intense wood colour is almost black, that is, is of a damson colour. It is the foundation of so many colours, in its different degrees or shades, that the dyers have a scale whereby to compute the lightness and depth of this colour.—See WOOD.—*12d*, Indigo is of the like nature, and used for the same purpose as wood, only that it is stronger. See INDIGO.—*13d*, Logwood, chopped and ground, yields a purplish blue: it may be used with alum: formerly it was of ill repute, as a moist salt and fading flower; but, since it has been used with galls, it is less complained of.—V. *Petty's Apparatus to Hist. of dyeing*, in *Sprat's Hist. Roy. Societ. P. 2. p. 288. seqq. Merr. Not. en Neris, t. 110. p. 335. seqq.*

The dyeing materials are generally applied in decoctions made in water, more or less strong, according to the occasion; sometimes by only dipping the stuff in the vat of dye; sometimes by boiling it therein; and sometimes by leaving it a day or more to steep.—For the alum, in dying silks, it is always applied cold, in which state alone it contributes to the brightness of the dye.

The art of DYEING may be divided into as many branches as there are different colours to be communicated, and sorts of different stuffs to be the subjects of it.

DYEING OF CLOTHS, SERGES, DRAGGETS, and other woollen manufactures.—For black, in cloths and stuffs of price, it is begun with a strong decoction of wood and indigo, which give a deep blue; after which, the stuffs being boiled with alum and tartar, or pot-ashes, are to be maddered with common madder; then dyed black with Aleppo galls, copperas and fumee; and finished by back-boiling in weld. See BLACK.—*Scarlet* is dyed with kermes and cochineal, with which may also be used agaric, and arsenic.—*Crimson scarlet* is given with cochineal mestic, aqua fortis, sal armoniac, sublimat, and spirit of wine.—*Violet-scarlet, purple, amarant, and pany-scarlets*, are given with wood, cochineal, indigo, brazoleto, brazil, and orchal. For common reds, pure madder is used, without other ingredients.—*Crimson-reds, carnations, flame and peach-colours*, are dyed according to their several hues, with cochineal mestic, without madder, or the like.—*Crimson-red* is prepared with Roman alum, and finished with cochineal.—*Peach-colour* must be back-boiled a little with galls and copperas, or the like.—*Orange-aurora, or golden-yellow, brick-colour, and onion-peel colour*, are given with wood and madder, tempered according to their respective shades.—For blues, the dark are given with a strong tincture of wood: the brighter, with the same liquor, as it weakens in working.—*Dark-browns, minims, and tan-colours*, are given with wood, weaker in decoction than for black, with alum and pot-ashes; after which, they are maddered higher than black: for tan-colours, a little cochineal is added.—*Peart-colours* are given with galls and copperas; some are begun with walnut-tree roots, and finished with the former; though to make them more serviceable they dip them in a weak tincture of cochineal.—*Greens* are begun with wood, and finished with weld.—*Pale-yellow, lemon-colour, and sulphur-colour*, are given with weld only.—*Olive-colours* of all degrees are first put in green, and taken down again with foot, more or less, according to the shade required.—*Fawn-colour, hair-colour, mist, and cinnamon-colour*, are given with weld and madder.—*Nacarot, or bright orange-red*, is given with weld, and goats hair, boiled with pot-ashes.

afhes. Fuffic here is forbid, as a falfe colour.—V. Savar. *D. de Gann.* T. 2. p. 1690, feqq. See alfo the *Tinturier Parfait*, Leid. 1708, 12°. Salm. *Pylogr.* l. 3. c. 37.

**DYING of wools for tapestry**, is performed after the fame manner as cloths, excepting blacks, which are only to be woaded, and then put in black, as above.

*Black wools for cloths and ferges* may be begun with walnut-tree root, and walnut rinds, and finished by dipping in a vat of black.

**DYING of filks**, is begun by boiling them with foap, &c. then fcowring and washing them out in the river, and fleeping them in alum water cold.—For crimfon they fcower them a fecond time before putting them in the cochineal vat.

*Red crimfon* is dyed with pure cochineal maffich, adding galls, turmeric, arfenic, and tartar, all put together in a copper of fair water almoff boiling; with thefe the filk is to be boiled an hour and a half; after which, it is fuffered to ftand in the liquor till next day.—*Violet crimfon* is alfo given with pure cochineal, arfenic, tartar, and galls; but the galls in lefs proportion than in the former. When taken out it is to be well washed, and put in a vat of indigo.—*Cinnamon crimfon* is begun like the violet, but finished by back boiling, if too bright, with copperas; if dark, with a dip in indigo.

*Light blues* are given in a back of indigo.—*Sky blues* are begun with orchal, and finished with indigo.—For *citron colours*, the filk is firft alumed, then welded, with a little indigo.—*Pale yellows*, after aluming, are dyed in weld alone.—*Pale and brown aurora's*, after aluming, are welded ftrongly, then taken down with rocou difolved with pot-afhes.—*Flame colour* is begun with rocou, then alumed, and dipped in a vat or two of brazil.—*Carnation, and rufe-colours*, are firft alumed, then dipped in brazil. *Cinnamon colour*, after aluming, is dipped in brazil, and brazilotto.—*Lead colour* is given with fuffic, or with weld, brazilotto, galls, and copperas. But the galls, on thefe and other occasions, are not to be over-dofed, which increafes the weight to the damage of the purchafer; for which reafon, it is punifhed in France as a fraud: in reality few but black filks need galls.

*Black filks, of the carfer fort*, are begun by fcowring them with foap, as for other colours; which done, they are washed out, wrung, and boiled an hour in old galls, where they are left to ftand a day or two; after which, they are washed again with fair water, wrung, and put in another vat of new and fine galls; then washed and wrung again, and finished in a vat of black.—*Fine black filks* are only put once into galls, viz. the new and fine fort, which has only boiled an hour; then they are washed, and wrung out, and dipped thrice in black, to be afterwards brought down by back-boiling with foap.—V. Savar. *lib. cit.* p. 1693, feqq.

**DYING of thread** is begun by fcowring it in a lye of good afbes; after which, it is wrung, rinsed out in river water, and wrung again.—For a *bright blue*, it is given with brazilotto, and indigo.—*Bright green* is firft dyed blue, then back-boiled with brazilotto, and verdeter, and lafly woaded.—For a *dark green* it is given like the former, only darkening more before woading.—*Lemon, or pale yellow*, is given with weld, mixt with rocou.—*Orange and flafhila*, with fuffic, weld, and rocou.—*Red*, both *bright and dark*, with *flame colour*, &c. are given with brazil, either alone, or with a mixture of rocou.—*Violes, sky rufe, and amarant*, are given with brazil, taken down with indigo.—*Ferulemori, and olive colour*, are given with galls and copperas, taken down with weld, rocou, or fuffic.—*Black* is given with galls and copperas, taken down and finished with brazilotto wood.

**DYING of hats** is done with brazilotto, galls, copperas, verde-greife, difolved and boiled in a copper capable of receiving, befides the liquor, twelve dozen of hats on their blocks, or moulds. Here the hats are fuffered to boil fome time; after which, they are taken out, and fuffered to ftand and cool; then dipped again; and thus alternately, oftener or feldomer, as the fluff is of a nature to take the dye with more or lefs difficulty. Savar. *lib. cit.* p. 1697. See alfo the article HAT.

**Proof of DYES**.—There are divers ways of proving the truth of dyes, or examining the juftnefs and legitimacy of their compofition.—To difcover whether a cloth have been daly treated by the dyer, and the proper foundations laid, a white fpot, by the French called *rolette*, of the bignefs of a fhilling, ought to be left; befides a white ftripe between the cloth and the lift.

Farther proof is had by boiling the dyed fluff in water with other ingredients different according to the quality of the dye to be proved. If the colour fuftain the teft, i. e. do not difcharge at all, or very little, fo that the water is not tintured by it, the dye is pronounced good: otherwife, falfe.

**Proof of the DYES of filks**.—For red crimfon, the proof is made by boiling the filk with an equal weight of alum.—For fcarlet crimfon, it is boiled with foap almoff of the weight of the filk.—For violet crimfon, with alum of equal weight with the filk, or with citron juice, about a pint to a pound of filk.—Thefe ingredients are to be mixed, and put in fair water when it begins to boil; after which, the filks are alfo to be put in; and after boiling the whole for half a quarter of an hour, if the dye be falfe, the liquor of

the red crimfon will be violet, in cafe it have been dyed with orchal, or very red, if with brazil.—That of crimfon (fcarlet, if rocou have been ufed, will become of an aurora colour, or, if brazil have been ufed, red.—And that of violet crimfon, if brazil, or orchal have been ufed, will be of a colour bordering on red.—On the contrary, if the three forts of crimfon be truly dyed, their liquors will difcover very little alteration.

A fill furer way to difcover whether crimfon filks have been rightly dyed, is by boiling a piece of ftandard dyed crimfon filk, kept for that purpofe at Dyers-hall, after the fame manner, and then comparing the tinctures of the two liquors.

To difcover whether other colours have been dyed with galls, the filk is put in fair boiling water, with pot-afhes, or foap, nearly of the weight of the filk; after fome time, it is taken out; upon which, if it have been dyed with galls, the colour will be all vanifhed, and nothing but that of the galls left, which is a fort of feulemort, or wood colour.

The dying of filk with galls may alfo be detected by putting it in boiling water, with a gallon of citron juice; being taken out, and washed in cold water, and then dipped in a black dye, if galls have been ufed, it will turn black; if not, it will be of a brown-bread colour.

To difcover whether black filk have been overdoled with galls, ftod filings, or flapp, it is boiled in fair water, with twice its weight of foap: if it be loaden with galls, it will turn reddifh, otherwife, it will keep its colour.

To difcover whether black cloth have been firft woaded, and maddered; a fample of it, and at the fame time, a fample of ftandard black, kept for that purpofe by the dyers company, is to be taken; and then as much Roman alum as is equal in weight to both, together with a like weight of pot-afhes, is to be put over the fire in a pan of bran water: when it begins to boil, the two famples to be put in; and after half an hour to be taken out, and compared.—The piece which has only been woaded will be found bluish, with fomewhat of a dull green; if it have been both woaded and maddered, it will be of a tan, or minim colour; and, if it have been neither woaded, nor maddered, its colour will be dunifh, between yellow and fallow.

For cloths dyed of a minim colour, the proof is to be made after the fame manner as that of blacks and minims.—V. Savar. *lib. cit.* T. 1. p. 1665, feqq. voce. Debuoulli.

To know whether fcarlet, or crimfon cloth, have been dyed with pure cochineal, they are to be boiled with an ounce of alum to a pound of cloth.

For cloths of other colours, the proof is to be made in the fame manner as that of blacks and minims.—V. Savar. *lib. cit.* T. 1. p. 1665, feqq. voce. Debuoulli.

**Theory of DYING**.—This article we cannot better clofe, than with fome general deductions which may let a little neceffary light into the theory of dying. As,

1°. That all the materials, which of themfelves give colour, are either red, yellow, or blue; fo that out of them, and the primitive fundamental colour, white, all that great variety, which we fee in dyed fluffs, arifes.—2°. That few of the colouring materials, (as cochineal, foot, wood-wax, or wood) are in their outward and firft appearance, of the fame colour, which by the flighteft diftempers and folutions in the weakeft menftras, they dye upon cloth, filk, &c.—3°.

That many of the colouring materials will not yield their colours without much grinding, fleeping, boiling, fermenting, or corroftion by powerful menftras; as red-wood, weld, wood, annotto, &c.—4°. That many of the fid colouring materials will of themfelves give no colouring at all, as copperas, or galls, or with much difadvantage, unless the cloth, or other fluff to be dyed, be firft covered or incruftated, as it were, with fome other matter, though colourlefs, beforehand; as madder, weld, and brazil, with alum.—5°.

That fome of the colouring materials, by the help of other colourlefs ones, do ftrike different colours from what they would alone, and of themfelves; as cochineal, and brazil.—6°. That fome colours, as madder, indigo, and wood, by reiterated tinctures, will at laft become black.—7°. That though green be the moft frequent and common of natural colours, yet there is no fimple ingredient, which is now ufed alone, to dye green with upon any material; fap-green, the condensed juice of the rannus berry, being the neareft; and this only ufed by country people.—8°. There is no black thing in ufe which dyes black; though both the coal and foot of moft things burn, or fcorched, be of that colour; and the blacker, by how much the matter, before it was burnt, was whiter, as in the famous inflance of ivory black.—9°.

The tincture of fome dying fluffs will fade even with lying, or with the air, or will ftain even with water; but very much with wine, vinegar, urine, &c.—10°. Some of the dyers materials are ufed to bind and ftrengthen a colour; fome to brighten it; fome to give lafture to the fluff, fome to difcharge and take off the colour, either in whole, or in part; and fome out of fraud, to make the material dyed, if coftly, to be heavier.—11°. Some dying ingredients, or drugs, by the coarfenefs of their bodies, make the thread of the dyed fluff fem coarse; and fome by fhinking them, fmaller; and fome by levigating their afperities, finer.—12°.

Many

Many of the same colours are dyed upon different stuffs with different materials; as red-wood used in cloth, not in silks; anatto in silks, not in cloth; so that they may be dyed at several prices.—13. Scouring, and washing of stuffs to be dyed, is to be done with appropriate materials; as sometimes with ox-galls, sometimes with fullers earth, sometimes with soap: this latter being pernicious in some cases, where potashes will stain or alter the colour.—14. Where great quantities of stuffs are to be dyed together, or where they are to be done with great speed, and where the pieces are very long, broad, thick, &c. they are to be differently handled, both in respect to the vessels and ingredients.—15. In some colours and stuffs the tingent liquor must be boiling; in other cases blood-warm, in some it may be cold.—16. Some tingent liquors are fitted for use by long keeping; and in some the virtue wears away by the fame.—17. Some colours, or stuffs, are best dyed by reiterated dippings even into the same liquor at several intervals of time; and some by continuing longer, and others lesser whiles therein.—18. In some cases, the matter of the vessel wherein the liquors are heated, and the tinctures prepared, must be regarded; as that the kettles be pewter for bowe-dye.—19. Little regard is had how much liquor is used in proportion to the dying drugs; the liquor being rather adjusted to the bulk of the stuff, as the vessels are to the breadth of the same; the quantity of dying drugs being proportioned to the colour higher or lower, and to the stuffs both; as likewise the salts are to the dying drugs. Concerning the weight which colours give to silks, for in them it is most taken notice of, as being sold by weight, and being a commodity of great price; it is observed, that one pound of raw silk loses four ounces by washing out the gums, and natural forces.—That the same coloured silk may be raised to above thirty ounces from the remaining twelve, if it be dyed black, with certain materials.—That the reason why black colour may be dyed the heaviest is, that all ponderous drugs may be dyed black, being all of colours lighter than it; whereas, perhaps, there seem to be few or no materials wherewith to encrease the weight of silk, which will consist with fair light colours; such as will having been used, as white arsenic to carnations.

Of things useful in dying, especially black, nothing encreases weight so much as galls; by means whereof black silks recover the weight which they lost by washing out their gum: Nor is it counted extraordinary, that blacks should gain about four or six ounces in the dying upon each pound.—Next to galls, old fixt encreases the weight, about  $\frac{1}{2}$  in 12.—Madder about one ounce.—Weld half an ounce.—The blue fat, in deep blues of the fifth fall, adds no considerable weight.—Neither do logwood, cochineal, or anatto; nor even coppers of itself, where galls are not.—Slipp adds much to the weight, and gives a deeper black than coppers, which affords a good excuse for the dyers that use it.—Petty's Appar. in Hist. of Dying, ap. Sprat. Lib. cit. p. 302, seq.

**DYING**, in a more extensive sense, is applied to all kinds of colourings given to bodies of any sort. See COLOUR. In which sense, dying amounts to the same with *coloratus*; and includes staining, painting, gilding, marbling, printing, &c. See PAINTING, GILDING, &c.—The Chinese are said to practise the dying of tea with catechu, which gives the green-tea leaf the colour, and its infusion the tincture of boba.—V. Short. *Diss. on Tea*, pref. p. 15. See also the articles TEA and CATECHU.

The sorts of dying, or coloration, now commonly used in vulgar trades, are, 1. Whitening of wax, and several sorts of linen and cotton clothes, by the sun, air, and reciprocal effusions of water. See BLEACHING, WAX, &c.—2. Staining of wood and leather by lime, salt, and liquors, as in staves, canes, marble leathers, marquetry, &c. See MARQUETRY.—3. Marbling of paper, by distempers the colours with ox-gall, and applying them upon a stiff gummed liquor. See PAPER.—4. Colouring, or rather discolouring silks, tiffanics, &c. by brimstone.—5. Colouring several iron and copper works into black with oil.—6. Giving leather a gold colour, or rather dying silver-leaves like gold, by varnishes; and in other cases, by urine and sulphur.—7. Staining of marble and alabaster, with heat and coloured oils. See MARBLE, &c.—8. Tinging silver into brass with brimstone or urine.—9. Colouring the barrels and locks of guns blue and purple with the temper of small-coal heat.—10. Colouring glass, crystals, and earthen ware, with the rusts, and solutions of metals. See POTTERY, &c.—11. Colouring live hair, as in Poland, both horse and man's hair; and also of furs &c.—12. Enamelling and annealing. See ENAMELLING.—13. Application of colours, as in the printing of books, and pictures, and the making of playing cards, jpanning, &c. See PRINTING, CARDS, JAPANING, &c.—14. Gilding, and tinning with mercury, black-tin, and sal armoniac. See GILDING and TINNING.—15. Colouring metals, as copper with calamine into brass, and with zink or spelter into gold, or into silver with arsenic: and of iron into copper with Hungarian vitriol. See CALAMINE, BRASS, ZINK, ARSENIC, &c.—16. Making painters colours, by

preparing of earth, chalk and slates, as in umber, oker, cullens-earth, &c. out of the calces of lead, as ceruss and minium; by sublimate of mercury and brimstone, as in vermilion; by tinging of white earths variously, as in verdeter, and some of the lakes; by concrete juices or fecule, as indigo, pinks, sap-green, and lakes; and by rusts, as in verdgrease, &c. See CERUSS, MINIMUM, VERMILION, INDIGO, &c.—17. The applying of these colours by the adhesion of ox-gall, as in the marbled paper aforesaid; or by gum-water, as in limning; or by clammy drying oils, as the oils of linseed, nuts, spike, turpentine, &c. See PAINTING, LIMNING, &c.—18. Watering of tabbies. See WATERING, CALENDER, TABBIE, &c.—V. Petty Appar. Hist. of Dying, ap. Sprat. Hist. Roy. Societ. p. 285, seq.

Glass dyed is the common matter of artificial jewels: the tinctures are given with saffer, manganese, ferret, crocus martis, &c. The processes are described at large in Antonio Neri, *de Re Vitrea*, Lib. I. c. 12, 13, 14, seq.—See also GLASS, GEM, &c.

† The Peruvian women, when grown old, dye their grey hair black by a very untoward operation; viz. holding the head some hours with the hair lopped in a boiling tincture of the root of a tree called *cucuba*, by the Spaniards *manay*.—These brooks and springs mentioned by Strabo, Pliny, and others, were much more common, which would change the colour of the hair as well as of the coats of animals, with only drinking their waters\*. For the use of styling, white hair is dyed green by boiling it in ale with alum, then steeping it in a decoction of coppers with wax and water.—It is dyed yellow by boiling in alum and ale with walnut-tree leaves stamped in it.—Brown, by steeping in salt and ale.—V. Men, *de Trev.* Sept. 1707. p. 1606, seq. \* Arif. Hist. Anim. de Geor. Lib. IV. and V. Prob. 4. §. Coaring, de Habit. Germ. Corp. Cap. p. 126. † Gent. Angl. p. 9, seq.

**DYING of leather, skins, &c.**—Blue is given by steeping the subject a day in urine and indigo, then boiling it with alum: or it may be given by tempering the indigo with red wine, and washing the skins therewith.—Red is given by washing the skins, and hying them two hours in galls; then wringing them out; dipping them in a liquor made with litigum, alum and verdgrease in water; and lastly, in a dye made of brazil wood boiled with lye.—Purple is given by wetting the skins with a solution of roche alum in warm water, and when dry again, rubbing them with the hand with a decoction of log-wood in water cold.—Green is given by smearing the skin with sap-green and alum-water, boiled: to darken the colour, a little more indigo may be added.—Dark green is also given with steel filings and sal armoniac steeped in urine till soft, then smearing over the skin; which is to be dried in the shade.—Sky-colour is given with indigo steeped in boiling water, and the next morning warmed and smeared over the skin.—Yellow, by smearing the skin over with aloes and linseed oil dissolved and strained: or by infusing it in weld.—Orange-colour is given by smearing with fustic berries boiled in alum-water: or for a deep orange, with turmeric.—V. Salm. *Poligr.* Lib. III. c. 34. p. 272, seq.

**DYING or staining of wood, for inlaying, veneering, &c.**—Red, is done by boiling the wood in water and alum; then taking it out, adding brazil to the liquor, and giving the wood another boil in it.—Black, by brushing it over with log-wood boiled in vinegar, hot; then washing it over with a decoction of galls, and coppers, till it be of the hue required.—Any other colour may be given by squeezing out the moisture of horse-dung through a sieve, mixing it with dissolved roche alum and gum arabic; and to the whole adding green, blue, or any other colour designed: after standing two or three days, pear-tree or other wood cut to the thickness of half a crown, is put into the liquor boiling hot, and suffered to remain till it be sufficiently coloured.—V. Park. *Treat. of Japan*, c. 27. p. 82, seq.

**DYING of bone, horn or ivory.**—Black is performed by steeping brass in aqua fortis till it be turned green: with this the bone, &c. is to be washed once, or twice; then put in a decoction of log-wood and water, warm.—Green is begun by boiling the bone, &c. in alum-water; then with verdgrease, sal armoniac and white wine vinegar; keeping it hot therein till sufficiently green.—Red\* is begun by boiling it in alum-water, and finished by decoction in a liquor compounded of quick-lime steeped in rain-water, strained, and to every pint an ounce of brazil wood added: the bone, &c. to be boiled herein till sufficiently red.—Other methods are given by Salmon\*.—And from him by Houghton\*.—V. Park. Lib. cit. p. 83, seq. \* Salm. *Poligr.* l. 3. c. 35. p. 275, seq. \* Hought. *Collect.* N<sup>o</sup> 138. T. 1. p. 361.

\* The refuse of the bow-dye given hops to feed on, is said to tinge their very bones red. This is a spontaneous kind of dye, not unlike that in Virgil; who speaks of dyeing wool on the sheeps backs, by their feeding on properly coloured vegetables:

*Nec variis difset mentis lana coloris:  
Ise sed in pratris arvis jam sauce rubesti  
Marrice, jam croco mutabit vellera lani:  
Sponte sua sandyx pascentis efficit agros.*

Ecl. 4. v. 42, seq.

The difficulty is to conceive how lambs should feed on the sandyx,

findyx, which is a mineral substance; the same with what is otherwise called *jaspararoba*. It is certain the poet takes it for a plant, as was long ago observed by Pliny: *Animali-um Virgilianum eximiam herbam id est*. Hist. Nat. l. 35. c. 6. This inference is chiefly drawn from the word *paucifera*, which can mean nothing else, but that the lambs browsing on the findyx, should receive the dye in their fleeces from the alimens. Dr. B.— here gives us a correction which sets all to rights: for *paucifera* he reads *maficera*. On which footing the tenor of the passage is this: from that time there will be no need of dying wool with beautiful colours; but the sheep shall have their fleeces dyed naturally, & spontaneously; some with the saues, or purple colour; others with the *lutus*, or yellow; others with *purpura*, or red. Those that were already in being, and had white fleeces, shall change them in *proutis*, in the meadows; but all the lambs shall be dyed beautifully *maficera*, at their birth. V. *Mem. of Liter.* T. 2. art. 2. p. 7. *1792*.

## G.

**GYMNASIUM**\*, a place fitted for performing exercises of the body. See GYMNASTICKS.

\* The word is Greek, γυμνασιον, formed of γυμνω, naked; by reason they anciently put off their clothes, to practise with the more freedom.

Among the ancients, *gymnasium*, was a public edifice destined for exercise, and where people were taught, and regularly disciplined therein, under proper masters.

If we may credit Solon in Lucian's *Anacharsis*, and Cicero de *Orat.* lib. 2. the Greeks were the first who had *gymnasia*; and among the Greeks, the Lacedæmonians: after them the Athenians; from whom the Romans borrowed them.

There were three principal *gymnasiums* at Athens; the *academy*, where Plato taught; the *lyceum*, noted for Aristotle's lectures; and the *gymnogeiton*, allotted for the populace. See ACADEMY, and LYCEUM.

Vitruvius describes the structure and form of the ancient *gymnasiums*, lib. 5. c. 11.—They were called *gymnasia*, because the champions performed *naked*; and *palaestra*, from wrestling, which was one of the most usual exercises there: the Romans sometimes also called them *therme*, because the baths and bagnio's made a principal part thereof. See PALÆSTRA, BATH, &c.

It appears that they did not perform their exercises quite naked as early as the time of Homer, but always in drawers; which they did not lay aside before the thirty second olympiad. One Orsippus is said to have been the first that introduced the practice; for having been worried by means of his drawers undoing, and entangling him, he threw them quite aside; and the rest afterwards imitated him.

The *gymnasia* consisted of several members or apartments. M. Burette, after Vitruvius, recites no less than twelve, viz.

1°. The exterior *portico*'s where the philosophers, rhetoricians, mathematicians, physicians, and other virtuosi, read public lectures, disputed, and rehearsed their performances.

2°. The *ephebeum*, where the youth assembled very early to learn their exercises in private, without any spectators.

3°. The *corrycum*, *apodyterion*, or *gymnasterion*, a kind of wardrobe where they strip, either to bathe or exercise.

4°. The *elastibulum*, *alipsterion*, or *antillarum*, appointed for the unctions which either preceded or followed the use of the bath, wrestling, pancratis, &c.

5°. The *conferium*, or *conistra*, in which they covered themselves with sand or dust to dry up the oil, or sweat.

6°. The *palaestra* properly so called, where they practised wrestling, the pugilato, pancratis, and divers other exercises.

7°. The *sphaisterium*, or tennis court, reserved for exercises wherein they used balls.

8°. Large unpaired alleys, which comprehended the space between the portico's, and the walls wherewith the edifice was surrounded.

9°. The *xysti*, which were portico's for the wrestlers in winter or bad weather.

10°. Other *xysti*, or open alleys, allotted for summer and fine weather; some of which were quite open, and others planted with trees.

11°. The *baths*, consisting of several different apartments.

See BATH. 12°. The *stadium*, a large space, of a semi-circular form, covered with sand, and surrounded with seats for the spectators. See STADIUM.

For the administration of the *gymnasia*, there were divers officers; the principal were, 1°. The *gymnastarcha*, who was the director and superintendent of the whole. 2°. The *xystarcha*, who presided in the *xystus* or stadium. 3°. The *gymnasia*, or master of the exercises, who understood their different effects, and could accommodate them to the different complexions of the athlete. 4°. The *pedotriba*, whose business was mechanically to teach the exercises, without understanding their theory or use. Under these four officers were a number of subalterns, whose names distinguished their different functions.

For the kinds of exercises practised in the *gymnasia*, they may be reduced to two classes, as they depend either on the action of the body alone, or as they require external agents, or instruments. The former are chiefly of two kinds; *erectio*, and *palaestica*.

The *erectio* comprehended, 1°. *Dancing*. 2°. *Cubistice*,

or the art of tumbling. 3°. *Sphaeristica*, or tennis, including all the exercises with pils, or balls.

The *palaestica* comprised all exercises under the denomination *palaestra*; as, wrestling, boxing, pancratis, *hoplomachia*, running, leaping, throwing the discus, the exercise of the javelin, and that of the hoop, denominated by the Greeks *xygga*, which consisted in rolling an iron hoop, five or six foot in diameter, beset with iron rings, the noise of which affrighted the people to give way, afforded them also an amusement. Both strength and skill were requisite in directing this hoop, which was to be driven with an iron rod.

To these must also be added, the exercises belonging to the medicinal gymnastics; as, 1°. *Walking*. 2°. *Vaciferatio*, or flouting. 3°. *Holding one's breath*.

The bodily exercises which depend on external agents, may be reduced to mounting the horse, riding in a chaise, litter, or other wheeled vehicle, resting in beds, or cradles, and sometimes *swimming*: to which may be added, the art of *swimming*.—Hoffman enumerates no less than fifty five sorts of gymnastic exercises.

**GYMNASTICKS**, GYMNASTICE, or the GYMNASTIC art, denotes the art of performing exercises of the body, whether for defence, health, or diversion. See GYMNASIUM.

The *gymnastic* art is divided into three species, or branches; *military*, *medicinal*, and *athletic*, or *sportive*.

Several modern writers have treated of this art, as Mercurialis, de arte *Gymnastica*; Faber, in *Aquasitie*. Joubert de *Gymnastic*; Capuzatus de *Sanit. mund.* Vossius de *Quatuor Artib. Popular.* Meurcius de *Orchestra*; Fuller in *Medicina Gymnastica*; and M. Burette in several dissertations on the ancient *Dancing*, *Sphaeristica*, *Athletica*, *Wrestling*, *Pugilato*, *Discus*, &c.

M. Burette has given the history of *gymnastics* in the *Mémoires de la Royal Academy of Inscriptions*.—According to him, this art is coeval with the world. In reality, we can hardly suppose mankind to have ever been without exercises of the body; which the defence of their persons, the preservation of health, and even recreation, and mirth, would necessarily lead them to. See EXERCISE.

On the first establishment of society, men, being apprized of the necessity of military exercises for repelling the insults of their neighbors, instituted games, and proposed prizes, to animate their youth to combats of divers kinds. See GAME. And, as running, leaping, strength and dexterity of arm, in throwing the javelin, driving a ball, or a quoit, together with wrestling, &c. were exercises suited to the manner of fighting in those days; so the youth vied to excel in them in the presence of the aged, who fat their judges, and dispensed prizes to the conquerors: till what was originally only amusement, became at length a matter of such importance, as to interest famous cities, and entire nations in its practice.

Hence an emulation and eagerness to excel, in hopes one day of being proclaimed and crowned conquerors in the public games, which was the highest honour a mortal could arrive at. Nay, they went so far as to imagine, that even gods and demi-gods were not insensible of what men were to be captivated withal; and in consequence hereof, to introduce the greatest part of these exercises into their religious ceremonies, the worship of their gods, and the funeral honours done the manes of the dead. See FUNERAL, &c.

Though it be hard to determine the precise epocha of the *gymnastic* art, yet it appears from several passages in Homer, and particularly the 23d book of the *Iliad*, where he describes the games celebrated at the funeral of Patroclus, that it was not unknown at the time of the Trojan war.—From that description, which is the earliest monument now extant of the Grecian *gymnastics*, it appears that they had chariot races, boxing, wrestling, foot races, gladiators, throwing the discus, drawing the bow, and hurling the javelin; and it should seem from the particular account Homer gives of these exercises, that even then the *gymnastic* art wanted little of perfection: so that when Galen says, there was no *gymnastic* art in Homer's days, and that it began to appear no earlier than Plato, he is to be understood of the medicinal *gymnastics* only. This last, indeed, had its rise later; because, while men continued sober and laborious, they had no occasion for it. But when luxury and idleness had reduced them to the sad necessity of applying to physicians; these who had found that nothing contributed so much to the preservation and re-establishment of health, as exercises proportioned to the different complexions, ages, and sexes, did not fail to remit them to the practice of *gymnastics*. According to Plato, one Herodicus, prior a little to Hippocrates, was the first who introduced this art into physic; and his successors, convinced by experience of its usefulness, applied themselves in earnest to improve it.

Hippocrates, in his book of *Regimes*, has given instances of it, where he treats of exercise in general, and of the particular effects of walking, with regard to health; also of the different sorts of races, either on foot or horseback, leaping, wrestling, the exercise of the suspended ball called *corrycum*, chironomy, unctions, frictions, rolling in the sand, &c. See FRICTION, &c.

But as physicians did not adopt all the exercises of the gymnastic art into their practice, it became divided between them and the masters of martial and athletic exercises, who kept schools, the number of which was greatly increased in Greece. See *ATHLETA*, &c.

At length the Romans also caught the same taste, and adopting the military and athletic exercises of the Greeks; improved and advanced them to the utmost pitch of magnificence, not to say extravagance. But the declension of the empire involved the arts in its ruin; and, among others, gymnastics and medicine; which last unhappily then relinquished the title it had to the former, and his neglected to invent it ever since. See *MEDICINE*.

## L.

**L**USTRATION, *Expiation*; sacrifices, or ceremonies, by which the Romans purified their cities, fields, armies, or people defiled by any crime, or impurity. See *LUSTRUM*, *EXPIATION*, *PURIFICATION*, &c.

Some of their *lustrations* were public, others private. There were three species, or manners of performing *lustration*; viz. by fire and sulphur; by water; and by air; which last was done by fanning and agitating the air, round the thing to be purified. See *ABLUTION*.

There was also a peculiar kind of *lustration* for young children. See *LUSTRAL day*.

Lomcier has a volume *expresso* on the *lustrations* of the ancients: Joh. Lomsceri Zutpennensis *Epimenides, five de veterum gentium Lustrationibus*; first printed at Utrecht in 1681, and since, with additions, in 1702. 4°.

All persons, slaves only excepted, he flows, were ministers of some sort of *lustration*.—When any one died, the house was to be swept after a particular manner, by way of purification: the priests threw water on new married people, with the like intention.—To purify themselves, people would even sometimes run naked through the streets; such was their extravagance. And, as if fancy were not fertile enough in inventing modes of *lustration*, they even used enchantments to raise the dead, in order to get instructions what they must do to purge themselves of their sins. Add, that they frequently raised the opinion of the faculty of their expiations by fictitious miracles.

The birds, say they, practise *lustration*, both by washing themselves, and throwing water on their nest. The hen takes straw, and uses it to purify her chickens.—There was scarce any action, at the beginning and end of which the Gentiles did not perform some ceremony to cleanse themselves, and appease the gods. When they had no animals to sacrifice, they made the figure of the beast they would offer in dough, metal, or other matter; and thus sacrificed in effigy.

Some expiations were performed in the water; for which reason, certain fountains and rivers were in great reputation: others were performed in the air.—A certain heathen caused himself to be seriously sifted in a sieve, as we now sift corn: another hung himself by a cord, and was tossed backwards and forwards: another shut his eyes, and set himself blindfold to find out a nosegay tied to a cord: others played at see-saw, as a more efficacious way of appeasing the gods.

Fire was much used for expiation: sometimes the penitents were cast into the fire; at others, only brought to the flame, or smoke.

It was common, on these occasions, to shed human blood: The priests of Cybele, Bellona, and Baal, made cruel incisions on themselves.—Erethius, king of Attica, sacrificed his daughter to Proserpina. Several had their throats cut at Rome, to obtain the emperor's health from the gods. Those who commanded armies, offered one of their soldiers to appease the anger of the gods; that he alone might suffer all the wrath the army deserved.

All sorts of perfumes, and odiferous herbs, had place in *lustration*.—The egg was much used upon them, as being the symbol of the four elements: its shell, they say, represents the earth; the yolk, a globe of fire; the white resembles the water, and besides, it has a spirit, which represents the air. For this reason it is, that the bonzas, or Indian priests, believe to this day that the world came out of an egg.—There is scarce any pot-herb, pulse, tree, mineral, or metal, which they did not offer the gods by way of expiation: nor did they forget milk, bread, wine, or honey: what is more, they made use of the very spittle, and urine.

The poets had feigned that the gods purified themselves, and they did not omit to purify their statues.—They made a *lustration* for children, the eighth day after their birth.—When a man who had been falsely reputed dead, returned home, he was not to enter his house by the door.—It was a settled custom to offer no expiation for those who were hanged by order of justice; or that were killed by thunder. Neither did they offer any for those who were drowned in the sea; it being the common opinion, that their souls perished with their bodies. And hence it was, that persons in danger of shipwreck sometimes thrust their swords through their bodies,

that they might not die in the sea; where they thought their soul, which they supposed to be a flame, would be totally extinguished.

The most celebrated expiatory sacrifice was the hecatomb, when they offered an hundred beasts; though they commonly did not offer so many, but contented themselves with killing twenty-five; but those being quadrupeds, their feet came to an hundred. See *HECATOMBA*.

*Lustrations*, and lustratory sacrifices were not only performed for men, but also for temples, altars, theaters, trees, fountains, rivers, sheep, fields and villages. When the Arval brothers offered a victim for the fields, their sacrifice was called *ambarvalia*. See *AMBARVALIA*.

Cities were all to be purified, from time to time: some walked the victim round their walls, and then slew him.—The Athenians sacrificed two men, one for the men of their city, and the other for the women. The Corinthians sacrificed the children of Medea so; though the poets say, Medea killed them herself. The Romans performed the ceremony of purifying their city every fifth year; whence the name of *lustrum*, given to the space of five years. See *LUSTRUM*.

Divers of the expiations were austere: some fasted; others abstained from all sensual pleasures: some, as the priests of Cybele, castrated themselves; others, that they might live chaste, eat raw, or lay under the branches of a shrub called *agnus castus*. See *AGNUS Castus*.

The postures of the penitents were different, according to the different sacrifices: they sometimes joined prayers to the solemnity: at other times, a public confession of sins was made.—The Indians, when they sacrifice to Hercules, call him a thousand reproachful names; and think they incur his anger, if any respectful term come out of their mouth.

The priests changed their habits, according to the ceremonies to be performed: white, purple, and black, were the most usual colours. They had their heads always covered, and long hair, except in the sacrifices of Saturn, Hercules, Honour, and a few others: only the priests of Isis were shaven, because that goddess underwent the same operation, after the death of her husband Osiris.—In some ceremonies the priests were shod, in others bare-foot: the poets express the former by the word *vincula*. They had no girdles; nay, they durst not pronounce the word *ivy*, because ivy cleaves to every thing.—In the sacrifices of Venus, and the Moon, every one took the habit of the contrary sex.—Every thing was to be done by odd numbers; because they looked on an even number, which may be equally divided, as the symbol of mortality and defraction. The odd number was with them holy; hence, Neptune's trident, Cerberus's three heads, and Jupiter's thunder-dart, with three points.

They cast into the river, or at least out of the city, the animals, or other things that had served for a *lustration*, or sacrifice of atonement; and thought themselves threatened with some great misfortune, when by chance they trod upon them.—At Marseilles, they took care to feed a poor man for some time; after which, they charged him with all the sins of the country, and drove him away: those of Leucade fastened a number of birds to a man charged with their sins, and in that condition cast him headlong from a high tower; and if the birds hindered his being killed, they drove him out of the country.

Part of these ceremonies were abolished by the emperor Constantine, and his successors; the rest subsisted till the Gothic kings were masters of Rome, under whom they expired; except that several of them were adopted by the popes, and brought into the church, where they make a figure to this day: witness the numerous consecrations, benedictions, exorcisms, ablutions, sprinklings, processions, feasts, &c. still in use in the Roman church. See *CONSECRATION*, &c.

**L**UXATION\*, *LUXATIO*, in medicine and surgery, the slipping of the head of a bone from its proper receptacle into another place; whereby the natural motion of the joint is destroyed. See *BONE*, and *ARTICULATION*.

\* The word is Latin, formed from *luxare*, to loosen. *Luxation* is the same with what is otherwise called *dislocation*; being the displacing of a bone, or rather the disjoining of two bones articulated together for the motion of the part.

*Luxations* are either *violent*, proceeding from some external cause; as falls, strains, blows, leaps, extensions, &c.—Or *gentle*, arising from internal causes; as a natural laxity of the ligaments, a fluxion of humours, or gradual collection thereof between the joints, &c.

*Luxation*, properly, has place only among bones whose structure determines them to a manifest motion, as are all those united by diarthrosis; those articulated by synarthrosis, where there is no manifest motion, are indeed subject to fracture, caries, exostosis, &c. but not to *luxation*. See *DIARTHRO-ISIS*, &c.

*Luxations*, again, are either *perfect*, or *imperfect*. *Perfect*, or *complete LUXATION*, ΕΡΑΡΘΡΩΣΗ, is that where the head of a bone is actually started out of the cavity of another.—It is known by a tumour, or protuberance, formed by the head of the separated bone, which raises up the skin, and muscular flesh above its natural level in the part not de-

flined to receive it; and a hollowess or sinking in the place from whence it is flared, perceivable by the touch.—It is also attended with great pain, a total abolition of motion, and a shortening of the limb.

*Imperfect, or partial LUXATION*, ΠΑΡΑΡΘΡΗΜΑ, called also *subluxation*, is where the motion is only much impaired, the joint weakened, and a deformity perceivable in it, when compared with the opposite part, which is found.—This is otherwise called a *strain*, when it proceeds from an external cause; or, simply, a *relaxation*, when from an internal one.

A *luxation* is said to be *simple*, when it has no other accident or injury accompanying it—*complicated*, when it is attended with a wound, inflammation, fracture, or the like.

The cure of a *luxation* is by a speedy reduction of the dislocated member to its natural place.—To this is necessary, 1<sup>o</sup>. *Extension*, *arthritis*, which a *luxation* as well as fractured member requires; as well on account of the contraction of the tendons, as that the head of the bone may more directly be intruded into its seat.—This extension is made either by the hands alone, which is called *motha palefricus*, because, among wrestlers, dislocated members use to be reduced after this manner; or by ligatures, or towels; or by instruments, or great machines, when the *luxation* is difficult, and inveterate.

2<sup>o</sup>. After extension, follows the intruding of the joint into the natural cavity; which, likewise, may either be effected by the hands only, or by the heel, (as when the head of the os hameri is fallen into the arm-pit) or by means of ladders, doors, pessels, or Hippocrates's instrument, called *ambic*.—This way is termed *methodical*, by way of distinction from the third, which is called *organical*, because performed by large instruments, and machines, but now altogether out of use.

Goarmlins to these adds, *arthritis*, the very act of reducing the member into its own place, which it to be known by the sound usually heard, and from the use and motion of the reduced joint.

Lastly, because on account of the laxity of the tendons, &c. the reduced bone cannot remain in its natural position, it is necessary yet further to apply compresses and bandage; by whose means the articulation is preserved safe, till the ligaments may acquire their usual strength of elasticity and strictness.

**LYRE**.—Mr. Barnes, in the prolegomena to his edition of *Anacreon*, has an enquiry into the antiquity and structure of the *lyre*; of which he makes Jubal the first inventor. For the several changes this instrument underwent, by the addition of new strings, he observes that, according to Diodorus, it had originally only three; whence it was called τριχοχορδον. Afterwards, it had seven strings; as appears from Homer, Pindar, Horace, Virgil, &c. Festus Avienus gives the *lyre* of Orpheus nine strings. David mentions an instrument of that sort fringed with ten, in *psalterio decachordo*. Timotheus of Miletus added four to the old seven, which made eleven. Josephus, in his *Jewish Antiquities*, makes mention of one with twelve strings; to which were afterwards added six others, which made eighteen in all.—Anacreon himself says, p. 253. of Mr. Barnes's edition, *canto viginis tatis chordis*.—For the modern *lyre*, or Welsh harp, consisting of forty strings, it is sufficiently known.

**LYRIC**.—This species of poetry was originally employed in celebrating the praises of gods and heroes; though it was afterwards introduced into feasts, and public diversions: it is a mistake to imagine Anacreon, as the Greeks do, the author of it; since it appears from scripture to have been in use above a thousand years before that poet.—Mr. Barnes shows how unjust it is to exclude heroic subjects and actions from this sort of verse, *lyric poetry* being capable of all the elevation and sublimity such subjects require; which he confirms by the example of Alcaeus, Sthenichorus, Anacreon, and Horace, and by his own essay, *A Triumphal Ode, inscribed to the duke of Marlborough*, at the head of this edition: he concludes with the history of *lyric poetry*, and of those ancient who excelled in it.

## P.

**PAPER**\*, a thin flexible leaf, usually white, artificially prepared of some vegetable substance, chiefly to write upon, with ink. See WRITING, INK, &c.

\* The word is formed from the Greek παπυρος, *papyrus*, the name of an Egyptian plant, called also βύβλος, *biblos*, whereon the ancients used to write.

Various are the materials, on which mankind in different ages and countries have contrived to write their sentiments; as on stones, bricks, the leaves of flowers, and trees, and their rinds or barks; also tables of wood, wax, and ivory; to which may be added plates of lead, linen rolls, &c. At length the Egyptian *papyrus* was invented; then parchment, cotton paper, and lastly the common or linen paper.

\* *Vid. Maffei flor. Diplom. l. 2. §. 3.—10. Bibl. Ital. T. 2. p. 242. Leo Allat. Antiq. Hæretic. p. 127. seq. Hug. de Scrib. Orig. Alex. ab Alexand. l. 2. c. 30. Barthol. Diss. 4. de Libr. Legend. p. 90. seq.*

In some places and ages they have even written on the skins of fishes; in others, on the intestines of serpents; and in others, on the backs of tortoises.—Not to mention what Euphianus relates, that Moses received the law written on tables of sapphire; nor what the Cabalists dream, that the same was written on a globe of fire; nor lastly, those military testaments spoken of by civilians, which were written in the dust or sand.

\* *Vid. Mabil. de Re Diplom. l. 1. c. 8. Fabric. Bibl. Ant. c. 21. §. 9. p. 610. seq. Reim. Idea System. Antiq. Liter. p. 309.* See also the article BOOK, PARCHMENT, &c.

There are few parts of plants but have been used for paper, and books; and hence the several terms, *biblos, codex, liber, folium, tabula, tilia, phibora, scheda, &c.* which express the several parts on which they were written: and though in Europe all disappeared upon the introduction of *papyrus* and parchment, yet in some other countries the use of divers of them obtain to this day.—In Ceylon, for instance, they write on the leaves of the Talipot: 'The Bramin MSS. in the Talinga language, sent to Oxford from Fort St. George, are written on leaves of the Ampara or Palma Malabarica: 'Hermans gives an account of a monstrous palm-tree called *Cordia panna*, or *Palma Montana Malabarica*, which about the 35th year of its age, rises to be 60 or 70 foot high, with plicated leaves nearly round, 20 foot broad; wherewith they commonly cover their houses; and on which they also write; part of one leaf sufficing to make a moderate book. They write between the folds, making the characters through the outer cuticle.

\* *Knox. Hist. Cyp. l. 3. Le Clerc, Bibl. Univ. T. 23. p. 242. Phil. Transf. No. 246. p. 422. seq. Vid. Hort. Ind. Malab. P. 3. Phil. Transf. No. 145. p. 108.*

In the Maldiver islands, the natives are said to write on the leaves of a tree called *macaregan*, which are a fathom and a half long and a foot broad. And in divers parts of the East-Indies, the leaves of the *maua arbor* or plantain tree dried in the sun, served the same use, till of late that the French have taught them the use of European paper.—Ray, in *fine*, enumerates divers kinds of Indian and American trees which bear paper; particularly one called *ragus*, which has something in it extraordinary: its leaves are so large, and of so close a texture, that they cover a man from top to toe, and shelter him from the rain, and other inclemencies of the air, like a cloak; from the innermost substance of which leaves, a paper is taken; being a white and fine membrane like the skin of an egg, as large as a skin of our vellum or parchment, and nothing inferior for beauty and goodness to the best of our papers.

\* *Vid. Savar. de Cassu. T. 2. p. 967. Vid. Ray Hist. Plantar. T. 2. l. 32. Nov. Rep. Lett. T. 12. p. 361.*

*Paper* is chiefly made among us of linen or hempen rags, beaten to a pulp in water, and moulded into square sheets, of the thickness required.—But it may also be made of nettles, hay, turneps, parsnips, colewort leaves, earth-flax, or any thing that is fibrous; nay it may be made of white woolen rags; though this would not serve for writing, because of the hairiness.—The Chinese paper is so fine, that many Europeans have thought it was made of silk; not considering, says du Halde, that silk cannot be beat into such a paste, as is necessary to make paper: though the same author afterwards speaks of a paper or parchment made of the balls of silk-worms; and the like we are assured by others is done at Cathay.

\* *Hought. Collect. No. 360. T. 2. p. 418. seq. Descript. of Chin. p. 360. seq. Vid. Bulleq. Legat. Turc. Egit. 4. p. 329.*

**PAPER** with regard to the manner of making it, and the materials employed therein, is reducible to divers kinds: *Egyptian, European and Chinese paper*; we also find mention of *cotton paper, bark paper, and asbestos or incombustible paper.*

*Egyptian PAPER*, is that which was principally used among the ancients; made of a rush called *papyrus*, or *biblos*, growing chiefly in Egypt about the banks of the Nile; though it was also found in India; and Guilandinus assures us, he saw in Chaldæa, at the confluence of the Tygris and Euphrates, large fens, wherein with his own hands he plucked a *papyrus* differing in nothing from that of the Nile. Strabo likewise speaks of a sort of *papyrus* growing in Italy; but we do not find it was ever used for making paper.

The description given by Phny of the *papyrus* or *paper-rush*, is somewhat obscure. Its root, according to him, is of the thickness of a man's arm, and ten cubits long: from this arise a great number of triangular stalks 6 or 7 cubits high, each thick enough to be easily spanned. Its leaves are long like those of the bull-rush; its flowers staminateous, ranged in clusters at the extremities of the stalks; its roots woody and knotted like those of rushes, and its taste and smell near a kin to those of the *Cyperus*.

\* *Vid. Phin. Hist. Nat. l. 13. c. 11. Vid. Theophr. Hist. Plant. l. 4. c. 9. and Dalecamp. who gives us a figure of it, Hist. l. 18. p. 1883.—See also Bauhin. l. 18. c. 186. who with Gefner makes it a species of *Cyperus*. Grew, Blot. Reg. Soclet. p. 2. Kût. 2. p. 225. seq. Maffei, flor. Diplom. Bibl. Ital. T. 2. p. 246.*

Besides paper, they make sails, ropes, and other naval rigging; as also mats, blankets, clothes, and even ships, of the stalk of the papyrus. Moses, we are told, when a child, was exposed on the banks of the Nile, in his swags, i. e. in a basket of papyrus. Add, that the Egyptian priests wore shoes of papyrus. Guilandinus, a Prussian physician, has a celebrated work expressly on the ancient papyrus, by way of commentary on three chapters of Pliny\*, wherein is amply, and with great learning, explained all that relates to this subject; yet Scaliger has written a severe critique on it, in which some inaccuracies of Guilandinus are pointed out\*\*, which has not hindered Kirchner from adopting almost Guilandinus's whole book in a dissertation on the papyrus\*\*\*. Add, that the most ingenious and learned count Scipio Maffei has lately vindicated Guilandinus against the exceptions of Scaliger, as well as of Vossius and Hardouin.—*Vid. Istor. Diplom. l. 2. Bibl. Ital. T. 2. p. 248.*

\* *Melch. Guilandini Papyrus, h. v. Commentarius in tria C. Plinii Majoris de papyro capita, sc. lib. XIII. c. 11, 12, 13. first published at Venice in 1572, and afterwards at Amberg in 1613, by Salmuth.—It seems Guilandinus intended a commentary on the whole of Pliny's Natural History; but this small part, not exceeding a moderate paper, taking him up full six months, it is no wonder he was discouraged from proceeding with the rest. In these three chapters he has restored above twenty passages in the text of Pliny, not merely from his own conjecture, or the help of MSS. but from the nature of the things described, and the testimonies of authors of the first rank; besides that, he had been upon the spot where formerly the papyrus was manufactured, and had carefully examined all the ancient Greek and Latin authors who speak of it.*

\*\* *Joh. Feil. Scaligeri Animadversiones in Melchioris Guilandini Commentarium in tria C. Plinii capita, lib. XIII. Historie Mandi sive Naturalis, quibus agit de papyro, first published in the Lettina Bibliothecarum memorabilis, of Rudolphus Capellus, at Hamburg in 1682.—Where he follows Guilandinus step by step, finds as many faults in him as his father had done in Cardan, and uses him altogether as coarsely; every where pointing out his literary mistakes, and labouring to show, that instead of restoring Pliny, he has often mistaken and corrupted him.*

\*\*\* *M. Seb. Kirchneri Uffenbainensis Franci Dissertationis Philologica de papyro veterum. Witsbergae, 1666. 4to.—He had done better service, if besides Guilandinus he had consulted others, and particularly Scaliger. But as he chose to follow one rather than many, and that too as the blind follow their guides, his fate has been much the same.*

The origin of the art of making paper of the papyrus is very obscure: no doubt it was first discovered in Egypt. Isidore fixes it more particularly to the city Memphis.—Orig. l. 6. c. 10. In which he seems to be countenanced by Lucan, where he says,

*Nondum flavineas Memphis contessere Bibbis  
Noveot ——— Pharfal. l. 3. v. 222.*

The era of this invention is warmly disputed: Varro the most learned of the Romans, fixed it to the time of Alexander the Great, after the building the city Alexandria by that conqueror; but several objections of no small weight are brought against this decision. Pliny recites a passage out of a very ancient annalist, one Cassius Hemina, wherein mention is made of paper books found in Numa's tomb 335 years after his death, which had been buried with him: now Numa was prior to Alexander by above 300 years. Guilandinus in effect, maintains with great erudition, that the name and use of the papyrus were known to the Greeks long before Alexander conquered Egypt; and that the words *βιβλίον* and *βιβλίον* occur in their received signification in authors prior to, or at least older than Alexander, particularly Anacreon, Alcæus, Plato the comedian, Aristomenes, Crætinus, Antiphanes, Plato the philosopher, Æschylus and Aristotle. And whereas some speak of I know not what *pseude-biblis*, known before the discovery of the true sort, he argues on the contrary, that the *biblis* mentioned by those authors prior to the conquest of Alexander, appears from Herodotus, Theophrastus, and others, to be the very same plant with the *biblis* or papyrus, of which paper was made. Even Homer and Hesiod, the most ancient Greek poets, and who, by Herodotus's testimony, lived about 400 years before himself, appear to have been no strangers to the papyrus, since they make express mention of it.

<sup>1</sup> *Vid. Plin. l. 13. c. 13.* <sup>2</sup> *Guiland. Papyr. Membr. 2. Reimm. Idea Syst. Antiq. Liter. p. 285, seq. Kirchner. Diff. de Papyr. Art. 11. §. 2.*

To this it may be answered, that supposing the plant papyrus known in Greece long before Alexander's conquest of Egypt, it no more follows, that they had then the use of paper, than it follows that men had wine immediately on the discovery of the vine: this last it is certain was known among them long before they made wine; and to this day, a part of the new world called Florida is said to abound with vines, though no use have been yet made of them either by the inhabitants or the Spaniards. As it was with the vine, which must have been known before wine could be made from it, so it is with papyrus, which among the Greeks was long used for tying up things, before it came to be written on. In reality, Guilandinus produces testimonies from Anacreon

and Alcæus, in which the papyrus is employed for binding and not for paper: add, that he ill translates *πυραμαστος* *αγοστος*, ellychnium, since *αγοστος* here is the torch itself. Nor does the poet say it was made of papyrus, but tied up with it.—*Vid. Scalig. lib. cit. Reimm. ubi supra, p. 305, seq.*

Some have even doubted whether the art of manufacturing the papyrus was so ancient as Alexander's time; chiefly on this ground, that for 200 years after Alexander, men wrote on skins, and barks of trees: but this is no-wise conclusive. The scarcity of the new manufacture may account for it: some ages afterwards, even as low as Tiberius, we read of such a scarcity of paper, that its use even in contracts was dispensed with by a decree of the senate, and the opinion of the judges. The same consideration may be carried further: paper might have been known in Egypt, Judæa, Syria, and Asia on this side Taurus, long before the birth of Alexander, though not in common use: but it was later ere the Europeans received it; and probably it was by means of Alexander's conquest that it first became publicly known there.

When the manufacture of the Egyptian paper ceased, is another question; for at present the *Papyræticinia Egyptiaca* may be reckoned among those arts that are lost. Euthasius, the learned commentator on Homer, testifies, that even in his time, viz. in 1170, it was disused; Mabillon indeed maintains that it continued till the Xth century after Christ, and cites one Frédego, a monkish poet of the Xth century, as speaking of it as subsisting in the age before his, that is in the IXth; but that it continued longer, the same Mabillon endeavours to evince from several papal bulls wrote on it as low as the Xth century<sup>4</sup>.

<sup>4</sup> *Vid. Euthas. ad Homer. Odys. q. Voss. de Art. Gram. l. 1. c. 37.* <sup>5</sup> *Vid. Mabill. de Re diplom. l. 1. c. 8. §. 6, seq. Reimm. Idea Syst. Antiq. Liter. p. 311.*

Maffei, on the other hand, maintains with more probability, that the papyrus was generally disused before the Vth century; for we find no authentic records written on it dated since that time; those bulls of popes, cited by Mabillon, appearing rather to be written on cotton paper<sup>5</sup>. But this we may observe, relates only to the general and legal use of the papyrus.—For that it should have continued to be made by particular persons several hundred years after it first began to give way, is not to be wondered at.

<sup>6</sup> *Vid. Maffei Istor. Diplom. lib. cit. Bibl. Ital. T. 2. p. 251.* In reality, a more commodious sort of paper, made of cotton, having been invented some ages before in the east, and coming to be introduced into Europe, seems to have turned the papyrus out of doors.—To which the continual wars with the Saracens, by which the traffick to Alexandria was rendered precarious, might possibly contribute.

Yet several books written on leaves of the papyrus have even continued to our days: Mabillon says, he had one of them, and adds, that there is another in the Petavian library, being a volume in small folio, containing several sermons of St. Augustin; he also mentions a third, containing that father's epistles, formerly belonging to the church of Narbonne, and now in the custody of Madame de Phirsson. Besides the homilies of Avitus bishop of Vienne, and divers diplomas or charters all written on the papyrus, which appear not to be less than 1100 years old<sup>6</sup>.—But the decisions of this learned father concerning MSS. notwithstanding all his diplomatic skill so highly boasted of, are not always infallible: witness his taking the MS. of St. Mark's gospel at Venice to be written on Egyptian papyrus, and that of Josephus at Milan not to be so.—Maffei shews on the contrary, that the former is cotton paper, and that the latter appears at first sight to be Egyptian: not but the Venetian MS. is very old; but it has been so much used, that its leaves are as it were transformed into the original paste from whence they were made<sup>7</sup>.

<sup>7</sup> *Vid. Mabill. Suppl. ad Libr. de Re diplom. Journ. des Sav. T. 32. P. 2. p. 992.* <sup>8</sup> *Vid. Maffei lib. cit. Bibl. Ital. T. 2. p. 252.*

**Manner of making the Egyptian PAPER.**—They began with lopping off the two extremes of the papyrus, viz. the head and root, as of no use in this manufacture: the remaining stem they cut length-wise into two equal parts, and from each of these they stripped the thin scaly coats or pellicles<sup>8</sup>, whereof it was composed, with the point of a penknife<sup>9</sup>. The innermost of those pellicles were looked on as the best; and those nearest the rind or bark the worst: they were kept apart accordingly, and constituted different sorts of paper.

<sup>8</sup> These pellicles are called in Pliny by twelve different names, viz. *phibara, rancetum, fibelo, cati, ptyxala, carium, carvia, fibrymex, statumex, pagina, tabula* and *papyrus*.

<sup>9</sup> The generality of critics, in lieu of a penknife, employ a needle to separate the pellicles: in which they are warranted by the common text of Pliny: *Præparantur ex eo chartæ, de quibus in præteritis, sed quoniam latissimas phibaras.* But Guilandinus makes a correction here: he had found by experience, that the pellicles of papyrus cannot be separated by a needle; but that a very sharp knife is required: for which reason instead of *de quibus* he reads *de quibus* *phibara*. In which he is followed by Maffei; though Hardouin, Vossius, Pletiscus, and others, retain the ancient reading<sup>10</sup>.

<sup>10</sup> *Vid. Guiland. Papyr. Membr. 10. §. 3 & 5. Maffei, Istor. Diplom.*

*Diplom. ap. Bibl. Ital. T. 2. p. 247, seq.* <sup>b</sup> *Voll. de Art. Grammat. l. 1. c. 37. Pitific. L. Art. T. 1. p. 413. var. Charis. Harou. ad Plin. l. 13. c. 12.*

As the pellicles were taken off, they extended them on a table: then two or more of them were laid over each other transversely, so as that their fibres made right angles; in this flate they were glued together by the muddy waters of the Nilus\*. These being next pressed to get out the water, then dried, and lastly flattened and smoothed by beating them with a mallet; constituted paper: which they sometimes polished further by rubbing it with a hemisphere of glass, or the like.—*Vid. Plin. Gouland. & Maffei loc. cit.*

\* In other countries, where the waters of the Nile were not to be had, the pellicles were softened together with a paste made of the finest wheat-flower, mixed with hot water, and a sprinkling of vinegar.

There were paper manufactures in divers cities of Egypt: but the greatest and most celebrated, was that at Alexandria, where, according to Varro's account, paper was first made. It is certain at least it was from hence that Greece and Italy were furnished, on account of the convenient situation of that port: and it is more than probable it was this gave the Romans occasion to conclude the art had been invented there. It was not till late, when Egypt was reduced into a Roman province, that they had much intercourse or even knowledge of the inland cities of Egypt, where paper was also made.—The trade and consumption of this commodity were in reality incredible. Vopiscus relates, that the tyrant Firmus who rebelled in Egypt, publicly declared he could maintain an army only with paper and glue, *papyrus & glutinus*. This, Casaubon understands as spoken of the produce, and revenue of paper; though Salmalius takes it to be meant of the *papyrus* itself, which could supply most of the necessaries of life.—*Vid. Montfauc. Paleogr. Græc. l. 1. c. 2. p. 14.*

We find divers species of Egyptian paper mentioned in ancient writers: some denominated from the places where they were manufactured; as, 1<sup>o</sup>, the *Amphibœtica*, supposed to have been made in some building belonging to an amphitheatre at Alexandria. Though Goulandinus, with more probability, reads it *Arithibitica*, from *Arithibis*, a city in the middle of the Delta, which was the place of its manufacture. What countenances the correction, is, that we find mention of this paper before there was so much as an amphitheatre at Rome, much less at Alexandria.—2<sup>o</sup>, *Saitica*, made in the city Sai.—3<sup>o</sup>, *Tænitiaca*, or according to others *Taitica*, whose place authors are not agreed on.

There were other sorts denominated from the makers; as, 1<sup>o</sup>, the *Fanniana*, from the grammarian Rhen. Fannius Palæmon, who kept a paper work. It was small, but finer than the amphibœtical paper; being first wrought at Alexandria, and afterwards finished at Rome.—2<sup>o</sup>, *Claudia*, first made by order of the emperor Claudius. This was reputed the best of all, in that besides the two pellicles, in common with the rest, it had a third.

Others were denominated from the uses they were intended for; as, 1<sup>o</sup>, *Hæretica*, the first or oldest sort, which was appropriated to religious uses; this was afterwards denominated *Augusta* and *Liviana*, in complement to the emperor of that name, and his wife; who, according to some, improved and made it whiter than before.—2<sup>o</sup>, *Emporetica*, or *Empyrica*, a small and coarse sort, serving shop-keepers uses to tie up goods, &c.

The qualities for which the ancient papers were prized, were their thinness, closeness, whiteness and smoothness: though their breadth also considerably enhanced their value.—That sort called *Charta Claudia* was thirteen inches wide; the *Hæretica*, eleven; the *Fanniana*, ten; *Amphibœtica*, nine; for the *Saitica*, it exceeded not the diameter of the mallet it was beaten with\*.

\* See further concerning the ancient paper in Nigrifoli *Diff. de Charta siveque usque apud antiquos Est. in Gallis. de Minerva. T. 3. p. 249, seq.* Other authors are enumerated in Fabric. *Bibl. Antiq. c. 21. §. 9. p. 609. Pitific. L. Art. loc. cit.*

**BARK PAPER**, if it may be so called, was only the liber, or inner whitish rind inclosed between the bark and the wood of divers trees, as the maple, plane, beech and elm, but especially the tilia, *quercus*, or linden tree, which was that mostly used for this purpose.—On this, stripped off, flattened, and dried, the ancients wrote books; several of which are said to be still extant\*.

\* *Vid. Plin. Hist. Nat. l. 13. c. 11. Harou. No. ad Eand. Suid. Lex. in Voc. quercus. Ibid. Orig. l. 6. c. 13. Alexand. ab Alexand. l. 2. c. 30. Salmas. ad Pansini. l. 2. tit. 13. p. 252, seq.*

Mabillon and Montfaucon speak frequently of manuscripts and diplomas on bark, and are very express in distinguishing between the *papyrus* used by the Egyptians, and the *liber* or bark in use in other countries. The two are alleged to differ in this, that the bark paper was thicker and brittle than the *papyrus*, as well as more apt to cleave or flake, by which the writing was sometimes lost; as is the case in a bark manuscript in the abbey of St. Germain, where the bottom of the paper remains, but the outer surface, on which the letters had been drawn, is in many places peeled off\*.

\* *Vid. Montfauc. Paleogr. Græc. l. 1. c. 2. p. 15. Mabill. de Re Diplom. l. 1. c. 8. Reimm. Idea Syst. Antiq. Liter. p. 311.*

But Maffei, it must not be forgot, combats the whole system of bark manuscripts, and charters, as a popular error; and maintains that the ancients never wrote diplomas on bark; that the distinction between the papers made of the *papyrus* and of *cortex* is without foundation; that the only use of the *tilia* or linden, was for making thin boards or tablets for ditycha or pocket-books, wherein they wrote on both sides, as is done among us: an advantage which they could not have in the Egyptian paper by reason of its thinness.

A late French writer on the rules of criticism wanders further out of the way; when he speaks of a sort of paper in Egypt made of the pith of the cyperus: he describes the manner of preparation, which was by reducing this pith to a pulp, and then spreading it out in leaves.—*Vid. Hon. St. Marie Reflex. sur les Regl. de la crit. T. 2. Diff. 4. p. 77. not.*—But this we suspect for a chimeric hatched only in the critic's brain.

Not but there occur divers anomalous sorts of paper, which antiquaries are not a little puzzled with, what species to refer them to: such is that of two bulls in the archives of the church of Gironne issued by the antipopes Romanus and Formosus, between the years 891 and 895. They are two ells long, and one broad, consist of two leaves or pellicles glued together transversely, and are still legible in most places. The conjectures of the French Savans are numerous: the abbot Hierat de Bellmont has a discursive express on the occasion. Some will have them made of the leaves of the *algæ*, or seaweed—others of the leaves of a rush called *la bage*, growing in the marshes of Rouffillon—others of *papyrus*—others of *cotton*—and others of *bark*. So little certainty there is in these things, on which the critics nevertheless often lay a great stress.—*Vid. Mem. de Trev. Sept. 1711. p. 1559, seq.*

**Cotton PAPER**, *Charta Baulycina*, *Boulbovine*, (thus called from *Boulbo*, a word which anciently signified silk, though in after times, *Boulbo* and *baouab* came to denote *cotton*) is a sort which has been in use upwards of 600 years, as is shewn by Montfaucon from several authorities: what is more, *cotton paper* appears to have been very common at that time, and consequently must have been invented long before. In the French king's library, are MSS. on this paper, which by the character, and other circumstances, appear to be of the Xth century. Be this as it will, from the XIIth century, *cotton MSS.* are more frequent than parchment ones\*.

\* *Vid. Montfauc. Paleogr. Græc. l. 1. c. 2. p. 17, seq. item l. 4. c. 6. p. 209. Maffei, lib. cit. Bibl. Ital. T. 2. p. 252.*

**INCOMBUSTIBLE PAPER** is made of the *lopis asbestus*, or *linum vitæum*, which will bear burning without being injured. See **ASBESTOS**.

Dr. Bruckmann, professor at Brunswick, has published a natural history of the *asbestos* or *incombustible paper*; and what is most remarkable, has printed four copies of his book on this paper: they are deposited in the library of Wolfenbüttel.—*Vid. Bibl. Germ. T. 14. p. 100.*

The manner of making this extraordinary paper is described by Mr. Lloyd from an essay made by himself.—He pounded a quantity of the *asbestos* in a stone mortar, till it became a downy substance; then sifted it through a fine sieve, and by this means purged it indifferent well from its terrene parts; for that what earth or stones he could not pick out of it before, or at the pounding, being reduced to a powder, came through the sieve, the *linum* remaining. This done, he brought it to the paper-mill; and putting it in water in a vessel just big enough to make a sheet with such a quantity, he stirred it pretty much, and desired the workmen to proceed with it in the usual method, with their writing-paper mould; only to stir it about always before they put their mould in; considering it as a far more ponderous substance than what they used, and that frequently, if not immediately taken up after it was agitated, it would subside.

The paper made of it proved but coarse, and too apt to tear: but this being the first trial, there is reason to believe it might be much improved; nor did the workmen doubt, but in case it were pounded in one of their mortars for twenty hours space, it would make good writing-paper.—*Vid. Phil. Trans. N° 166. p. 824.*

**LIEN or European PAPER**, is chiefly made of linen rags beaten to a pulp with huge hammers, and the soil carried off by a continual supply of fresh water conveyed among the pulp in little troughs, till it is rendered perfectly white.

Besides the chief use of this paper, which is for writing and printing on, there is a great consumption of it in packing up goods, and on other occasions.

The Turks, *Bufoequis* tells us, have a veneration for paper which approaches to superstition: they will not profane or prostitute the least bit to vile uses; but fold it very neatly, and lay it up safe, because the name of God, or some text, forsooth, of the Alcoran may be written on it.—*Vid. Bufoequ. Esq. l. Legat. Turc. p. 50.*

Books in *large paper*, are those which have wider margins than those on *small paper*, though otherwise of the same impression. See *BOOK, IMPRESSION, &c.*

The manufacture of *paper*, has got footing in most countries; though France, Holland, and Genoa, are the places where it succeeds best. In the general, it depends much on the quality of the linen worn in the country where it is made: where that is fine, or coarse, and brown, &c. the rags, and consequently the *paper* made thereof, must be so too. Hence the whiteness of the Dutch and Flemish *papers*, beyond the Italian and French, and much more the German *papers*. The English manufacture hitherto has been in no great reputation; but it is every day improving; inasmuch that we now import little of the ordinary sorts, which were formerly all brought from abroad. Yet *paper-mills* are of some standing among us. We find one erected at Dartford as early as the year 1588, which we believe was the first, and which is celebrated by a noted poet of that age, Tho. Churchyard, in a work in verse, intitled, *A description and discourse of papers, and the benefits it brings; with the setting forth of a paper-mill built near Dartford, by a High-German, called Mr. Spilman, Jeweller to the queen, Lond. 1588, 4°.*

In reality, the deficiency of the English *paper-manufacture*, does not seem owing so much to the quality of our rags, as the want of skill and attention in the makers. The encouragement given it by the legislature, in the high duty laid on foreign *paper* imported, we hope it will in time deserve. How considerable this, will appear from the following list.—Genoa royal fine *paper*, pays per ream, 7s. 7d. ½.—Genoa royal second, 6s. 10d. ½.—Fine Holland royal 7s. 7d. ½.—Fine Holland second, 5s.—Ordinary royal, 2s. 6d.—Genoa demy fine, 3s. 10d. ½.—Genoa demy second, 3s. 1d. ½.—Dutch printing demy, 3s. 4d. ½.—Genoa crown fine, 3s. 1d. ½.—Genoa crown second, 2s. 4d. ½.—Dutch crown fine, 2s. 4d. ½.—Dutch crown second, 2s.—Genoa fool's cap fine, 3s. 1d. ½.—Genoa fool's cap second, 2s. 4d. ½.—Dutch printing fool's cap, 2s.—Aths fine, 28s. 10d.

When and by whom *linen paper* was invented, is a secret, which Polydore Virgil owns he could never trace\*. Scalliger will have it to have been found out by the Germans: Masfiei affirms it certain, that the invention is owing to the Italians\*. Others ascribe it to some refugee Greeks at Basil, who took the hint from the manner of making *cotton paper* in their own country\*. Conringius takes the Arabs to have first brought it among us\*. Perhaps the Chinese have made *paper* much after the same manner\*, and even in some provinces of the same materials, viz. hemp, &c. &c.

\* Vid. Polyd. Virg. de Inventor. Rev. l. 2. c. 8.—Vid. Second. Scalliger. p. 7. Fabric. Bibl. Antiq. c. 9. §. 21.—Nor. Diplom. l. 2. Bibl. Ital. T. 2. p. 253.—Vid. Phil. Transf. N° 288. p. 1515.—Vid. Conringian. Epiß. op. Ab. Erud. Litf. Ac. 1720. p. 64.—Savus. D. Comm. T. 2. p. 913.—Du Hald. Deser. Chin. T. 1. p. 367.

*Linen paper* appears to have been first introduced among us towards the beginning of the XIVth century.—The learned Conringius denies that there are many manuscripts of this paper above 400 years old; with whom agrees the count Masfiei, who finds no marks of its use before the year 1300\*.

\* Vid. Conring. Epiß. op. Ab. Erud. Litf. Ac. 1720. p. 64.—Masfiei Nor. Diplom. l. 2. Bibl. Ital. T. 2. p. 253.

Some indeed go much further back; and take the *libri lineati* mentioned by Livy, and other Roman writers, to have been written on *linen paper*\*; but Guilandinus, and after him Allatius and others, have sufficiently refuted this notion; and shews, that the *libri lineati* were written on actual pieces of linen cloth, or canvas, prepared for this purpose, such as painters still use; and not on *paper* made of linen rags\*.

\* Vid. Liv. Dec. 1. l. 4. Plin. Hist. Nat. l. 13. c. 11. Pitife. L. Ant. T. 2. p. 87.—Guiland. Papp. Mem. 25. Salmuth ad Pavoral. l. 2. tit. 13. p. 253.

Others run into the contrary extreme, and make *paper* the invention but of yesterday. The jesuit Inchofer, dates its origin about 250 years ago\*; with whom agrees Millius in his *Hortus Philosphicus*, who maintains, that the art of making *paper* was not invented till about the year 1470\*. In effect, if the invention be owing to the refugee Greeks at Basil, who fled thither after the sacking of Constantinople, it must at least be posterior to the year 1452, when that city was taken\*. Some add a further argument for the novelty of *paper*, drawn from the novelty of hempen cloth, which Rabelais, who died in 1553, mentions as first found out about an hundred years before him; and which was so scarce in the time of Charles VII. of France, who died in 1461, that the queen his wife, was the only woman in France that had a couple of shifts of it\*.

\* Vid. Mabill. de Re Diplom. l. 1. c. 8. Reimm. Læto Syst. Antiq. Liter. p. 313. seq.—Balbin. Miscell. Hist. Bolon. c. 22. Ab. Erud. Litf. 1682. p. 243.—Phil. Transf. N° 288. p. 1515.—Naudæus. p. 87. Nov. Rep. Lit. T. 26. p. 571.

But these suggestions are refuted by Mabillon, from the testimonies of writers prior to the time here spoken of, and from many manuscripts about 400 years old, which are written on *linen paper*†. The jesuit Balbinus produces divers instances of *paper* MSS. written before the year 1340\*. An ingenious writer of our own country assures

us, he had a piece of *paper* which agreed well with a charter dated in 1358, in the 32<sup>d</sup> year of Edward III. He adds, that in the archives of the library belonging to the dean and chapter of Canterbury, is an inventory of the goods of Henry, prior of Christ Church, who died in 1340, written on *paper*; and that in the Cotton Library there are several writings on our *paper* in the times of most of our kings and queens as high as the 15<sup>th</sup> of Edward III. which coincides with the year 1335\*.

† Mabill. loc. cit.—Balbin. lib. cit.—Phil. Transf. N° 288. p. 1515.

Add, that the invention of *paper* may appear more modern than it is, by reason records were not used to be wrote on it, but it was a considerable time confined to letters, and other fugacious compositions; which is so true, that to this day, few instruments of any consequence are written on it, though it have been so long in use.—It is even alleged, that Peter, the venerable abbot of Cluny, who died in 1157, has a passage in his book against the Jews, which plainly indicates *paper* books to have been then known; on the authority whereof Valesius, in his notes on the panegyrick of Be-rengarius Augustus, scruples not to make *paper* upwards of 500 years old.—Vid. Mabill. ubi sup. Reimm. loc. cit.

Father Hardouin even assures us, he had seen records or diploma's on it prior to the XII<sup>th</sup> century.—But this will hardly be credited. Count Masfiei assures us, that in all his researches he could never meet with one more ancient than the year 1367. It is highly probable the learned jesuit mistook a cotton manuscript for a linen one; a mistake easily made, as the chief difference between the two consists in the greater thinness of the linen *paper*. But it is known we have linen *papers* of very different degrees of thickness; and the like may be said of those of cotton.—Vid. Masfiei Epiß. Diplom. l. 2. Bibl. Ital. T. 2. p. 253. seq.

*Method of making Linen PAPER.*—The process begins with preparing the rags.—These when brought to the paper-mills are first to be sorted into what they call the *grain fine*, *grain second*, and *grain tres*: for among the rest will be some linsiey-woolley, which the dirt makes indifcoverable till they are once washed.—The way of washing, is by putting them in a punchon with many holes in the bottom, and grates on the side made of strong wires. Here are the rags to be often stirred, that the dirt may run from them.

When sufficiently washed, they are laid in square heaps, and covered close with pieces of clean flannel, till they truly sweat and rot, which is called *fermenting*, and is usually performed in four or five days; if they be not taken in the due time, they are apt to mildew, discolour, and take fire. When duly fermented, they twist them in handfuls, then cut them with a sharp hook set fast in a frame, with the point upwards, and edge from the workman; still drawing them upwards, and cutting them piece by piece about half inch long, or as the fingers will allow.

With the rags thus prepared, they prime or feed the mortars, which are made oval, about half a yard deep, of heart of oak right season'd. At the bottom of each is an iron plate an inch thick, eight inches broad, and thirty long; shaped inward like a mould for a salmon with head and tail rounded. In the middle is a washing block grooved with five holes in it, and a piece of hair sieve fastened on the inside. This keeps the hammers from touching it, and prevents any thing going out except filthy water.

The mortars are supplied with water night and day by little troughs, from a cistern fed by buckets fixed to the several floats of a wheel, so long as the wheel goes.

In their mortars the rags being beaten fit for a remove to the presses just by, they take them out with little iron hoop-ed pails, out of any of the mortars, whose hammer they can stop whilst the others work.—This makes what they call the *first stuff*.

From the mortars, this first stuff is lodged in boxes of five foot high, made like the corn-chandlers bins, with the bottom board a-flant, and a little separation on the front for the water to drain away.—The pulp of rags being in, they take away as many of the front boards as are needful, and press the mafs down hard with their hands: the next day they put on another board and more pulp, till the box is full. And here it remains mellowing a-week, more or less, according to the weather.

In the whole process, there must be no iron work where it may be liable to grow rusty, which would ironmould the stuff, and spoil the *paper*.

After this, the stuff is again put into clean mortars, beaten afresh, and removed into boxes as before; in which state it is called the *second stuff*.

The like understand of the third time, which fits it for the pit mortar, when it is again beaten, till some of it being mixed with fair water, and brewed to and fro, appears like flower and water without any lumps in it.

This prepared, it is fit for the pit mortar which has flat hammers without nails. Into this, by a trough, runs water continually whilst they work at the fat; and here the beating and water dissolves it perfectly: after which it is carried into the fat, and more is brought from the Boxes.—And thus they do successfully. The

The fat is primed according to art, when the liquor has such a proportion of the pulp, as that a mould dipped in it, will take up as much as will make the sheet of paper of the thickness desired.

A mould is a square sieve about an inch deep, bottomed with brass-wire-cloth, supported with sticks to prevent the wire from bagging down, and kept it perfectly horizontal; for that if in any ways bags, one part of the sheet of Paper will be thicker than the other.

This mould the maker dips, with a deckle on, into the fat, and takes it out again shaking, that the water may run clear from the pulp in the sieve, and thus delivers it to the coucher, who couches it upon a felt laid on a plank, and lays another felt on it; and so successively, a sheet and a felt, a sheet and a felt, till a post, i. e. one pressing, containing six quire, be made.—Of post paper, they may make twenty posts or more per day.—The coucher having done his office, returns the mould to the maker, and the maker to the coucher successively.

A post being made, either the maker, or coucher whistles; upon which four or five men advance, one whereof draws the post under the press with two little hooks; and the rest press it with great force till no water is left, which is quickly done with two or three pulls.

This being done, the post is pulled from the press, and set on the right side by the laying stool; then the layer takes off the first felt, returns it to the coucher, and lays the first sheet on the laying stool, over which he lays the second; then the third very regularly; and thus successively till the whole post be laid out.—Which done, it is set by till toward the end of the day; and then the whole day's work is pressed again, and fit exactly one on another, so that it looks like one solid paste board.

This, after two or three pulls, as before, is taken out again by the dry workman, and carried up into the loft, and hung six or seven sheets together upon lines fastened to a thing called a *tribble*, each tribble containing thirty lines ten or twelve foot long.

When dried it is taken down, laid on a three footed stool, and there rubbed smooth with the hands; and afterwards placed in heaps, seven or eight foot high, in a very dry place; where it stands till fixing, which is the next operation.

Choosing a fine, dry, temperate day, they put into a copper two barrels of water; and into this, when just warm, sixty pounds weight of clean parchment or vellum shavings; which they boil till it be reduced to a perfect fine; then strain it through a fine cloth, on which is strewn a due proportion of white vitriol and rock-allum finely powdered, into a tub a foot deep.

Near to this tub are brought four or five reams of the paper; and a full page, or so much as can be taken up with the hands at a time, is dipped into the size, being as hot as the hands can well bear it; and by a certain gentle quick management, it is so ordered that every sheet shall be sized: after which, it is put regularly into the press, pressed, moved thence into the drying loft, and hung usually sheet by sheet till dry. But care is taken, that the direct rays of the sun come not nigh it till it be dry, which would otherwise endanger the evaporation of the size.

When thoroughly dry it is taken down, smoothed with the hands as before, heaped, pressed hard, and so it stands all night. Next morning it is taken out, and carried into the storeroom, where it is sorted; what is fit for inside quires, are laid by themselves, and the outside by themselves; and then it is pressed again, and so commonly stands all night.

In the morning it is carried into the storeroom again, where it is sold into quires of 24 or 25 Sheets each, folded, laid by in heaps; and when there is a press full, it is pressed again, double for a while, and then made into reams of 20 quires each, and bales of 10 reams to a bale.

\* *Vid. Hoegst. Collat. T. 2. p. 412, seq.*    <sup>1</sup> *Moor's Mathem.*

The broken sheets are commonly put together, and two of the worst quires placed on the outside of the ream, called the *cut-side* quires; thus being tied up in wrappers made of the settings of the fat, it is fit for sale.

With some of the aforesaid pulp, is also made pasteboard, after the same manner as paper, only that it is thicker. See PASTEBOARD.

With a fine sort of this pasteboard, they also make playing cards. See CARDS.

Paper is sold by the ream, every where we think, except in the paper-works of Auvergne, where it is sold by weight, at the rate of 14 ounces to the pound; each ream according to its kind, being to weigh a certain number of Pounds, prescribed by authority.—*Savar. l. c. cit.*

PAPERS are of various kinds.—With regard to colours, they may be divided into *white, brown, blue, &c.*—With regard to quality into *fine, second, bestfold, superfine, &c.*—With regard to use, into *writing, printing, pressing, cap, cartridge, copy, chamber, soft, &c.*—With regard to dimensions, into *demis, medium, crown, folio-cap, pot, royal, super-royal, imperial, elephant, atlas, &c.*—With regard to country, into *German, Lombard, Rachel, Geneva, Holland, &c.*

French papers are divided into *large, middle and small.*—To the small belong these called, *petit Roumain, petit Raisin, or Bâton royal, petit nom de Jesus, and petit à la main*, all thus denominated from the marks impressed on them in making. Also the *Cartier* for the backs of playing cards; *Pat* for the figure side; *Couronne*, which has commonly the arms of the comptroller general of the finances; *Tilliere*, with the arms of the late chancellor *Telliere*, and a double T; and *Chamy*, or a *Chaffis la Serpente*, so called from its mark, the serpent, which being extremely fine and thin, is used by fan-makers.

To the middling sort belong the *grand Raisin simple, Carré simple, Cavalier, and Lombard*, the three last of which are for printing; *l'Écu or de compte simple, carré double, l'Écu double, grand Raisin double, and Couronne double*, which three last are denominated double on account of their strength and thickness. Add to these the *Pantalou*, or paper with the Dutch arms, and *grand cornet*, so denominated from the impression on it.

To the large, belong the *grand Jesus, petite & grande fleur-de-lis, Choplet, Columbiere, grand Aigle, Dampin, Soleil, and l'Étoile*, which are thus called from the figures they bear, being all proper for printing either at the letter-press, or rolling-press; also for merchants books, and for drawing on. The *grand Monde* is the largest of all.—*Vid. Savar. D. de Comm. T. 2. p. 965, seq.*

We have also *Printed-PAPER*, to hang rooms withal.—*Stamp'd paper*, to write obligations, deeds and contracts upon.—*Ruled paper* for books of accounts, &c.—To which may be added *cut-paper*, and *gilt-paper* for letters, &c.

*Blue PAPER*, is a sort used by tradesmen to wrap up goods; as *figur-loaves, pieces of linen, &c.*

*Blotting PAPER*, is paper not sized, and in which therefore ink readily sinks or spreads. It is used in books of account, &c. in lieu of sand, to prevent blotting and disfiguring the opposite pages. The same is likewise used by apothecaries in filtrating juices and other matters, for which the *Manica Hypocratis* is not so proper.

*Tint or Demi-tint PAPER*, for designing on, is either *brown, blue, or bistre*.

*Bistred PAPER*, is white paper washed over with a sponge dipped in foot-water. Its use, is to save the labour of the crayon in places which are to be shadowed the same depth with the tint of this paper.—For light places, they are made thence with white chalk.—*Vid. Cornet. Elem. de la Peint. Prat. c. 15. p. 34, seq.*

*Marbled PAPER*, is a sort variously stained, or painted as it were with divers colours; made by applying a sheet on the surface of a liquor wherein colours diluted with oil or ox's gall are suspended. See DYING.

The manner of making it is thus.—A trough is provided of the shape and dimensions of a sheet of the paper to be marbled, and about four fingers deep, made of lead or wood well joined, and pitched or primed to contain the liquor.—For the liquor, a quarter of a pound of gum tragacanth is macerated four or five days in fair water, to which they add ten or twelve quarts of water, till it be of a consistency somewhat thinner than oil; then they strain it into the trough.

The colours to be applied thereon, for blue, are indigo ground up with white lead.—For green, indigo and ornament, the one ground, and the other tempered; mixed and boiled together with common water.—For yellow, ornament bruised and tempered. For red, the finest lake, ground with rasplings of brisil wood, which has been prepared by boiling half a day. Into all these colours they put a little ox-gall, which is two or three days old; and if the colours dilute not of themselves sufficiently, they add more gall.—On the contrary, if they spread too much, the gall is over-dosed, and must be corrected by adding more of the colour without gall.

For the operation of marbling; when the gum is well settled in the trough, they extend a sheet of paper, and plunge it very shallow into the liquor, suddenly lifting it out again, in order to stir up, and raise the subsiding gum towards the surface, and for the more universally impregnating of the liquor.

This done, and all the colours ranged in gallipots on the table, where also the trough is placed, they begin by dipping a brush of hog's hair into any colour, commonly the blue first, and sprinkle it on the surface of the liquor: If the colour were rightly prepared, it will dilate itself duly therein.—This done, the red is applied in the like manner, but with another pencil.—After this the yellow; lastly the green: for white, it is made by only sprinkling fair water, mixed with ox's gall, over the liquor.

When all the colours are thus floating on the liquor, to give them that agreeable cambletting which we admire in *marbled paper*, they use a pointed stick, which being applied by drawing it from one side of the trough to the other with address, stirs up the liquor and fluctuating colours; then with a comb taken by the head with both hands, they comb the surface of the liquor in the trough from one extreme to another, permitting only the teeth to enter: this

this being performed with a gentle and uniform motion, makes those clouds and undulations whereon much of the beauty of the paper depends.

If it be further desired to have the colours lie in any other fantastical posture, representing serpents or the like, it is effected with the pointed stick abovementioned, by drawing it over what has been already combed; but this must be done with a dexterous hand, and with a shallow dip into the liquor, circling as if you would draw some flourish, or figured letter.

Lastly, the colours being in this posture, the operator displays, and applies on them a sheet of white paper; to do which, artist-like, requires a sleight to be obtained only by practice; for that the surfaces of the liquor and the paper are to meet exactly in all parts: which done, before the colours have time to soak through, which, unless the paper be very thick, will be in the space of two or three pulses, he lifts up the paper nimbly, and with an even hand; and then spreading it a while on a board, hangs it on a line to dry; which when sufficiently done, they polish it with a marble stone, or ivory knob.—It must be observed, that the sprinkling of the colours is to be renewed, and all the other ceremonies performed with the stick and comb at every application of a fresh paper, by reason every paper takes off all the colour from the liquor.\*

\* *Vid. Kitch. de Lucis & Umbra. l. 10. Par. 2. c. 4. Merr. Observ. on Neri de art. Vitr. c. 42. p. 312. Hought. Collect. T. 2. p. 419. seq.*

Some clays have been made to enrich the marbling by mixing gold and silver with the colours, which succeeded well, especially for the French King's Library, though the expence has hindered the practice from obtaining.—Savar. *ubi supra*. **Chinese PAPER** is of various sorts; some made of the rinds, or barks of trees, especially those abounding in sap, as the mulberry-tree, and elm, but chiefly of the bambú and cotton-tree. In reality, almost each province has its several paper: that of So-chwen is made of hemp; that of Fo-kyen, of soft bambú; that used in the northern provinces, of the bark of the mulberry-tree; that of the province of Che-kyang, of wheat or rice straw; that of the province of Kyang-nan, of the skin found in the silkworms balls. In fine, in the province of Hu-quang, the tree chu, or ko-chu, furnishes the principal material for paper.

For PAPERS made of the barks of trees; the manner of their preparation may be exemplified in the instance of that of the bambú, a tree of the cane, or reed-kind, being hollow, and divided into joints; but much larger, smoother, harder and stronger than any other sort of reed.

For paper they ordinarily only use the second coat or skin of the bark, which is soft and white; this they beat in fair water to a pulp, which they take up in very large moulds or frames, so that they have sheets ten or twelve foot long, and sometimes more. They are completed by dipping them sheet by sheet in allom-water, which serves instead of the size used among us, and not only hinders the paper from imbibing the ink, but gives it that lustre, which at first sight makes it look silvered, or at least varnished over.

The paper thus made, is white, soft and close, without the least roughness to arrest the motion of the pencil, or occasion the rising of any of its fibres. Though, being made of the bark of a tree, it cracks more easily than the European paper: add, that it is more apt to take moisture, that the dust sticks to it, and that the worms soon get into it; to prevent which last inconveniency, they are obliged often to heat their books, and expose them to the sun. Add, that its thinness making it liable to be soon worn out, the Chinese are under a frequent necessity of renewing their books, by fresh impressions taken from their blocks<sup>b</sup>.

<sup>b</sup> *Vid. le Compt. Nav. Mem. sur Chine. Lett. 7. Kuff. Biblioth. nov. Libr. de 1697. p. 67. Eq. Lett. Edif. & Car. T. 19. p. 479.* But the paper of the bambú, it is to be observed, is neither the best, nor that most used in China. In the former of these respects, it yields the priority to the paper made of the cotton shrub, which is the whitest and finest, and at the same time least subject to the inconveniencies above mentioned; for that it keeps as well, and is as durable as the European paper.—Dr. Grew thinks we have many plants in England, which contain a down that in all probability would make as fine a paper as that made by the Chinese from their cotton shrub.—By which it appears he mistakenly imagined that the Chinese paper was made not from the rind of the cotton shrub, but from the down or cotton itself.—*Vid. Grew Adv. Reg. Soc. P. 2. §. 1. c. 5. p. 215.* But the paper in most common use in China, is that made of the tree called *Chu-Ko*, or *Ko-Chu*, which du Halde compares, first to a mulberry-tree, then to a fig-tree, then to a fig-tree, and lastly, to increase the embarrass, to a strawberry-tree.—By all which, we know less of it than if he had said nothing about it. But this is a way of describing very familiar to that author, who is often strangely jejune in the midst of the utmost prolixity, and is never more confused and incoherent, than when he aims most at order and exactness. But to return to the *Ku-Chu*.

The method of preparing it for paper, is by first scraping off lightly the thin outside bark of the tree, which is greenish:

then they take off the inner rind in long thin slips, which they bleach in water and the sun; and afterwards prepare them in the same manner as the bambú.

It must not be forgot, that in the other trees it is only the inward bark that serves for making paper; but the bambú, as well as the cotton shrub, have this peculiarity, that not only their bark, but their whole substance may be employed, by means of the following preparations.

Out of a wood of the largest bambú's, they select shoots of a year's growth, which are about the thickness of the calf of a man's leg: these they strip of their first green rind, and split them into fruit pieces of six or seven foot long: the pieces thus cleft, they steep in a pond of muddy water, till they rot and grow soft by the maceration. In a fortnight, they take them out, wash them in clean water, spread them in a large dry ditch, and cover them with lime for a few days; then take them out again, and having washed them a second time, slip them into filaments, which they expose in the sun to dry and whiten; then throw them into large coppers, where they are thoroughly boiled; and lastly reduce them by the strokes of large hammers to a thin paste, or pulp.

Then they take some shoots of a plant called *Ko-teng*, soak them four or five days in water, till there come out an unctuous sly sort of juice; this they mix with the pulp of which the paper is to be made, somewhat in the same manner as painters temper their colours; care being taken not to put in too much, nor too little of it, on which the goodness of the paper much depends.

When they have mixed the juice of *Ko-teng* with the cleft bambú, and beaten the whole till it resembles a thick clammy water; they pour it into a large deep reservoir, consisting of four walls raised breast high, and the sides and bottom is cemented, that the liquor cannot run out, nor soak in.

This being done, and the workmen placed at the sides of the reservoir, they dip in their moulds, and take up the surface of the liquor, which almost instantly becomes paper; the mucilaginous and gley juice of the *Ko-teng* binding the parts, and rendering the paper compact, soft, and glossy, qualities which the European paper is a stranger to when first made. To harden the sheets, and make them bear ink, they dip them in allom-water: this operation is called *sewing* from the Chinese word *fan*, which signifies allom. The manner is this.—Six ounces of fish-glass, cut very small, are put in divers porringers of water, which they afterwards boil up, stirring it all the time to prevent lumps: when the whole is reduced to a liquid substance, they throw into it three quarters of a pound of calcined allom, which they melt and incorporate with it. This mixture is next poured into a wide basin, across which is laid a small round stick: then they shut the edge of each sheet in another stick cleft from end to end, and in this manner dip the sheet, gently drawing it out as soon as it is wetted, by sliding it over the round stick. When the whole sheet has passed nimbly through this liquor, which makes it whiter and more compact, the long stick that holds the sheet by the edge, is stuck in a hole in the wall, and the sheet hung up to dry.

—For the mould wherewith they take up the sheet, its frame is so contrived that it may be raised or lowered at pleasure; and its bottom is not made with wire as ours, but with little slender slips of bambú drawn several times through holes made in a steel plate, whereby they are rendered as fine as wire: they are then boiled in oil till thoroughly soaked, that the mould may enter lightly into the water, and not sink deeper than is requisite to take up matter enough for a sheet.

To make sheets of any extraordinary size, care is taken to have a reservoir and mould large in proportion. This mould is sustained by strings which pass over a pulley; the moment these pull up the frame, the workmen placed aside the reservoir, assist to take the sheet off; working together in a regular manner.

For drying the sheets when taken off, they have a hollow wall, whose sides are well whitened: at one end hereof is an aperture, through which, by means of a pipe, they convey the heat of a neighbouring furnace; and at the opposite end is a small vent to let out the smoke. By help of this sort of stove, they dry the paper almost as fast as it is made.

Silvering of paper is another secret among the Chinese, practised at a very small charge, and without using any silver.—In order to this, they take two scruples of glue made of neat's leather, one of allom, and half a pint of clean water; these they simmer over a slow fire, till the water is consumed, that is, till no more steam arises; then on a smooth table they spread some sheets of paper, and on this, with a pencil, apply two or three layers of the glue: then they take a powder made of talc boiled, and mixed with  $\frac{1}{2}$  the quantity of allom: the two are ground together, sifted, and the powder boiled again in water, then dried in the sun, and lastly pounded.—This powder they sift through a fine sieve, spreading it uniformly on the sheets prepared as above: after which they hang them in the shade to dry; and

and this effected, lay them again on the table, and rub them gently with clean cotton to take off the superfluous tale, which serves a second time for the same Purpose. With this powder diluted in water mixed with glue and alum, they draw any figures at fancy on the paper.—*Vid. du Hald. Defer. Chin. T. 1. p. 368, seq.*

**PAPER-CLOTHES** became a mode a few years ago in France. M. Flaehs has a dissertation exprest on the subject, wherein he tells us this fashion scarce outlived half a day; and undertakes to shew that it is no new thing, but to have been practised among the ancients. But then it should be considered that the old Egyptian paper was a very different thing from ours; as being likewise used for sails, ropes, &c.—*Bibl. Germ. T. 1. p. 260.*

**PAPER-MILLS.** See the article **MILL**.

**PAPER-OFFICE,** is the name of an ancient office in the palace of Whitehall, wherein all the publick writings, matters of state and council, proclamations, letters, intelligences, negotiations of the king's ministers abroad, and generally all the papers and dispatches that pass through the offices of the secretaries of state, are lodged, and disposed in the way of library.—It was chiefly from this noble repository that the Bishop Barnet had the materials for his *History of the Reformation*.—*Vid. Nichol. Eng. Hist. Libr. P. 3. c. 1. p. 180.*

There is also an office belonging to the court of King's-bench, called by the same denomination.—*Jac. Law D. in sw.*

**PAPER-PORTRAITS, and Pictures.**—One Elizabeth Pyberg, who lived at the Hague in 1699, cut in paper not only tokens, as Loo and Hounslerydke, but faces to an extreme likeness. Mr. Ellys assures, she did king William and queen Mary better than any limner he had ever seen, and refused 1000 guilders for the pieces: which were so curious, that he could not believe the queen's drapery not to be point till he had most exquisitely inquired into it.—*Vid. Phil. Trans. N° 286. p. 1418.*

For the *Moving Paper-Work*, or High German paper engine, contrived by Mrs. Vandenhark, and now exposted to publick show in London, we can give no particular account of it.

**PAPERS** is also used for writings, especially those relating to a man's estate, property, dealings, or the like. See **WRITING**.

In which sense, *papers* include books of accounts, invoices, orders, also deeds, bonds, charters, and the like. See **ACT, INSTRUMENT, ACCOUNT, BOOKS, RECORD, ARCHIVE, REGISTER, &c.**

**PAPERS** is also sometimes used for manuscript-books. See **BOOK and MANUSCRIPT**.

Such an author left his *papers* to \*\*\* college. Several of Sir Isaac Newton's *papers* have been published since his death.—Tournefort assures us, that the heirs of M. de Peireff warmed themselves a whole winter with the *papers* he left in his cabinet. It had been cheaper, adds M. Tournefort, if they had burnt cedar, or aloes wood.—*Vid. Journ. Liter. T. 12. p. 64.*

**PAPERS** is more particularly used of late days for gazettes, journals, and other public news-writings. See **GAZETTE, JOURNAL, &c.**

In this sense we say, to read the *papers*; the *papers* abound with fallshoods; the multitude of *papers* is become a burthen on coffee-houses, but an advantage to the revenue.—We have daily *papers*, weekly *papers*, morning *papers*, evening *papers*, occasional *papers*, political *papers*, literary *papers*, *papers* of entertainment, &c.

**PAPER,** among bankers and other negociants, is also used for bills of exchange, bank, and promissory notes, &c. See **BILL, &c.**

I have no money to give you, but only *paper*; *paper* indeed as good as ready money. In the year 1720 multitudes were ruined by changing their money and lands for *paper*. It is the use and effect of credit to represent money by *paper*. See **MONEY, &c.**

Substituting *paper* for money, and giving the *paper* an arbitrary value, was the way of paying debts introduced in France by Mr. Law.—A royal bank was established, to which people were to carry their money, and receive the value of it in bills, which were to pass current in trade as so much money.—*Vid. Cheygn. Scienc. des Pers. de la Cour. T. 2. p. 292, seqq.*—It was made confiscation of goods, and the galleys, for any man to keep above 40 livres by him of any but *paper money*. When the regent was told what a rage was spirited up against him about the arrears for making *paper* current, and how openly the people threatened him, he answered coolly, the French were like watch dogs, they would bark but not bite, les Français ressemblent aux chiens a garde, ils aboient, mais ne mordent pas. *Mist Misl. Lett. T. 4. p. 16.*

**PAPER,** among fan-painters. See the article **FAN**.

**PLANETARY days.**—Among the ancients, the week was shared among the seven planets; each planet having its day. This we learn from Dion Cassius and Plutarch, *Sympos. l. 4. g. 7.* Herodotus adds, that it was the Egyptians who first discovered what God, that is, what planet presides over

each day, for that among this people the planets were directors. And hence it is, that in most European languages, the days of the week are still denominated from the planets; Sunday, Monday, &c. See **WEEK**.

**PLANETARY years,** the periods of time wherein the several planets make their revolutions round the sun, or the earth. See **YEAR, REVOLUTION, &c.**

As from the proper revolution of the sun, the solar year takes its original; so from the proper revolutions of the rest of the planets about the earth, so many sorts of years do arise, viz. the saturnian year, which is defined by 29 Egyptian years, 174 hours 58 minutes, equivalent in a round number to 30 solar years.—The jovial year, containing 317 days, 14 hours, 59 minutes.—The martial year containing 321 days, 23 hours, 31 minutes.—For Venus and Mercury, as their years, when judged of with regard to the earth, are almost equal to the solar year; they are more usually estimated from the sun, the true center of their motions: in which case, the former is equal to 224 days, 16 hours, 40 minutes, the latter to 87 days, 23 hours, 14 minutes. See **SATURN, JUPITER, MARS, &c.**

**PLANETARY squares,** the squares of the even numbers from 3 to 9 disposed magically. See **MAGIC squares**.

Corn. Agrippa, in his famous book of magic, has given the construction of the seven planetary squares: M. Poignard, canon of Brussels, in his treatise of sublime squares, gives new, easy, and general methods for making the seven planetary squares, and all others to infinity, by numbers in all sorts of progressions.

## S.

**SATYR**\*, SATYRA, or SATIRA, in a literary sense, signifies all manner of discourse wherein any person is reprehended; but more particularly a poem, wherein vices, follies, and vices are wittily exposted, in order to their reformation.

\* The origin of the word has been the occasion of a notable dispute among critics. The common opinion, supported by Scaliger, Heinſius and Vossius, deduces it from the Greek *Saturos*, *Satyr*, a sort of Sylvan deities, by the Romans called *Fauni*, to whose petulosity and wantonness this sort of composition is supposed to bear some resemblance.—On which footing *satyr* is considered as a poem of a wanton, and licentious nature, which like the *satyrs*, turns things upside down to find occasion for censure, and ridicule.—Cassaubon, on the contrary, followed by Spanheim and Dacier, derives the Roman *satyr* not from the Grecian divinities called *satyrs*, so which they assert it bears no relation, but from the Latin *ſaxo*, used for *plum* fall, a thing to which nothing is wanting.—Thus it is *ſaxo color*, denotes wool which has foolishly imbibed the colour, so that its dye cannot be further heightened: so *ſaxo natus* denoted a plentiful harvest; and *ſaxo gregis*, a various one.—From this *ſaxo* came *ſatura*, which was also written *ſatira* with an *i*, as *maximus* for *maximus*; and *ſatira* for *ſatira*. But *ſatura*, it is to be observed, is an adjective, referring to a substantive understood, which here is *lanx*; *ſatura lanx* being the name of a basin filled with all manner of fruits, which the Romans offered yearly to Ceres and Bacchus, as their first fruits. Thus the grammarian Diomedes: *Lanx referta variis multisque primitiis, ſatura Cereis inferrebat, & a copia & ſaturitate rei, ſatura vocabatur*. Hence also the word *ſatura* was applied to other mixtures; particularly to a dish consisting of several sorts of meats: *Quoddam genus ſarcinosis rebus refertum ſaturam dicit Varro vocitari* \*. And the same term was also translated to works of genius: thus, *leges ſaturae* denoted laws consisting of many heads or titles, as in Festus: *ſatura est lex multas alius legibus conferta*.—And the ancient Gloss. *ſatura* *ἑκαστα πλεονεξια*. Such, e. g. is this, *Vulſus, ſubſiſſe cum Japetha bellum comparator, & ſactus ſeriatas*: elephantus tradit, item omnes transfugas, &c.—Hence also a thing was said per *ſaturam fieri*, when it was done hastily and carelessly: thus per *ſaturam legem ferre*, was to pass a law carelessly and in the lump, without collecting the votes.—Lastly, *ſatura* also became the title of several books, as of that of Pekenius Festus, who wrote *historias ſaturas, or per ſaturam*.—From the whole it is inferred, that the *satirical* pieces of the poets were so called, as being various, and miscellaneous compositions; or as Porphyrius expresses it, *quod multis & variis rebus hoc carmen refertum est*.—On this principle it is urged, the word should be written in Latin with an *u* or *i*, *ſatura* or *ſatira*, and in English only with an *i*. They who write it with a *y*, do it as supposing with Scaliger, and others, that the *ſatyr* *ſatyr* gave name to this composition, and that from *ſatyr* came *ſatira*, which Cassaubon labours hard to disprove, by showing, that from *ſatyr* could never be formed *ſatira*, but *ſatyrice*, and by explaining the great difference between the Greek *ſatyr* poems and the Roman *ſatura*.—Scaliger nevertheless declines the ancient etymology from the Greek *Saturos*, which he makes the origin of the Latin *ſatura, ſatura lanx*, &c. which according to him were appellations first used in the sacrifices and ceremonies of Bacchus, where *ſatyr* were rehearsed: *Non a ſatura vel lege vel lanx dicta est, ut ſatyras ac carcer ſaturarum gratias, quin has a ſatyris dictas patet: cum lanxibus enim prædicant, & canebantur poema omni genere plenis, quibus nymphas ab-*

*licent* &c.—In effect, *satyrical* poetry, according to this critic, may be naturally enough deduced from the wantonness of the *satyrs*; and what confirms it, is that *Satyrus* is rendered in ancient glosses by *lutus*; and *satyrical*, by *satiricus*, *spertivus*, &c. Thus Seneca's *satyr* is called *lutus*, and Horace and Persius use *lutus* for *satyrus* *satyrus*—V. *Plin. Hist. Nat.* l. 50. c. 10. <sup>1</sup> Sever. in *Edna.* v. 12. <sup>2</sup> *Manil.* l. 6. v. 480. <sup>3</sup> *Diomed.* l. 3. <sup>4</sup> *Scal. Post.* l. 1. c. 12. <sup>5</sup> V. *Dan. Heimf. de satyr. Horatian.* l. 2. *Lugd.* 1628. 12<sup>o</sup>. *Fab. Tsch.* p. 2248.

*Satyr* bears a near affinity to railery, ridicule, lampoon, libel, &c. and stands opposed to panegyric. See LIBEL, PANEGYRIC, &c.—The reason why *satyrs* generally please, and panegyrics tickle the readers, seems to be, because the former are commonly true, and the latter false.—V. *Journ. des Sav.* T. 81. p. 294.

Horace calls his two books of *satyrs*, indifferently either *Sermones*, or *Satyræ*, two words which at first fight present very different ideas. See SERMONS.

The chief *satyrist* among the ancients are, Horace, Juvenal and Persius; among the moderns, Regnier and Boileau in French; and Dryden, Oldham, Rochester, Buckingham, Pope, Young, &c. among the English.

A *satyr* ought to be lively, pleasant, moral, and full of variety, wherein Juvenal and Horace excelled, though their *satyrs* ought not to be read without caution.—Among the qualifications requisite in a *satyrist*, one of the most essential is good-nature: all the sentiments which are beautiful in this way of writing must proceed from that quality in the author. It is good-nature produces that disdain of all baseness, vice and folly, which prompts the poet to express himself with firmness against the errors of men, but without bitterness towards their persons. It is this quality keeps the mind in equanimity, and never lets an offence unreasonably throw a man out of his character. When Virgil said, that did not hate Bavius might love Mævius, he was in perfect good humour, and was not so much moved at their absurdities, as passionately to call them fops, or blockheads in a direct invective, but laughed at them with a delicacy of scorn, without any mixture of anger.—The best good man with the worst-natured muse, was the character among us of a gentleman as famous for his humanity, as his wit. In reality, the ordinary subjects for *satyr* are such as incite the greatest indignation in the best tempers, and consequently men of such a make are best qualified for speaking of them: such men can behold vice and folly, when they injure persons with whom they are wholly unacquainted, with the same severity as others resent the ills they feel themselves.—In all the writings of Horace and Juvenal, there is not one ill-natured expression; not one sentence of severity which does not apparently proceed from the contrary disposition.—V. *Tat.* N<sup>o</sup> 242. T. 4. p. 219. *seq.*

*Satyr* may be divided with regard to the measure, and kind of verse, as well as the manner of the poem, and the character, into *narrative*, *dramatick*, *mixed*, &c.

*Narrative*, is a simple narration or recital of abuses in the poet's own person.—Such is the first of Juvenal.

*Dramatick*, is that wherein several persons discourse together; whether they be named, as in the first of Persius; or have names, as of Catus and Damasippus.

*Mixed*, is compounded of both the former; as that fine one of Horace, *Ibam forte via sacra*.

*Grace*, and animated, which inveigh with warmth and earnestness against corruption, and vice in every shape.—As those of Juvenal and Persius.

*Sportive*, and lighter, which seem to play with mens follies, but in playing omit no opportunity of making them feel the lash.—Such are those of Horace, hence said to be *sermone propiora*.

The *grotes* sort brandishes a naked sword, the *sportive* presents a thyrsus, like that of the ancient *satyrs* surrounded with vine leaves, with which it flabs unawares.—The heat of the former sometimes degenerates into fury, and indignation; and the calmness of the latter sometimes sinks to mere railery. But between the two extremes are a great number of intermediate species and degrees. The former, especially when dictated by passion, is much easier: nothing is more difficult than to make people of taste laugh, even at the expense of others. The attaining of this must be the fruit of genius and talents, rather than rules: perhaps it may be unnecessary to explain either; since vanity, self-love, and even malice are masters more than sufficient for a poet who wants not wit, and judgment. Thus Juvenal: *Si natura negat, facit indignatio versum*; and Boileau: *La colère suffit et valet un Apollon*.—V. *Mourg. Trait de la poes. Franc.* c. 4. *Mém. de Trev.* Nov. 1723. p. 2150.

In perusing the writings of the two leaders of the two sorts of *satyr* last mentioned, it may not be unnecessary to consider, that they lived in very different times: Horace was intimate with a prince of the greatest goodness, and humanity; and his court was formed after his example: therefore the faults that poet falls upon were little inconsistencies in behaviour, false pretences to politeness, or impertinent affectations of what men were not fit for. Vices of a coarser sort could not come under his consideration, or enter the palace of Augustus.—Juvenal, on the other hand, lived un-

der Domitian, in whose reign every thing great and noble was banished the habitations of the men in power. Therefore he attacks vice as it polles by in triumph, not as it breaks into conversation. The fall of empire, contempt of glory, and a general degeneracy of manners, are before his eyes in all his writings.—In the days of Augustus, to have talked like Juvenal had been madness, or in those of Domitian, like Horace. Morality and virtue are every where recommended in Horace, as became a man in a polite court, from the beauty, propriety, and convenience of pursuing them: vice and corruption are attacked by Juvenal in a style which denotes, he fears he shall not be heard unless he calls to them in their own language, with a bare-faced mention of the villainies and obscenities of his contemporaries.—V. *Tat.* T. 4. N<sup>o</sup> 242. p. 219. *seq.*

The Italians divide *satyr* into *serius*, as that in common use; and *iocose*, *giocosa*, which they also call *bernesca*, and we *burlesque*. See BURLESQUE.

Their chief *satyrist* in the *serius* way are, Dante (whom they particularly call *principe satirico*) Ariosto, Artico, Ercole Bentivoglio, Luigi Alamanni, Jacobo Soldani, Lorenzo Azzolino, Salvator Kolá, Lud. Adimari, and Benedetto Menzini.—Those who have excelled in the *iocose* kind are Francesco Berni (the inventor of it) Mauro, Firenzuolo, Casa, Coppetta Varchi Laeca, Caporali, &c.—V. *Bianchini della satira Italiana*, P. l. p. 9. *Giorn. de Letter d'Ital.* T. 20. p. 306. <sup>1</sup> *Ibid.* P. II. p. 25. *Giorn.* p. 310. *seq.*

*Satyr* is divided into *general*, which is levelled at common abuses wherein numbers are equally interested: and *personal*, which points out and exposes particular characters.—Which last, as it affects mens reputation, on which their interest greatly depends, is scarce distinguishable from defamation, and scandal. See INFAMOUS and SCANDAL.

To this last class belong most of those which bear the title of *Anti*: as the *Anti-Baillet de Menage*, with which M. Baillet was so stung, that he composed a treatise express on *personal satyrs* which bear the title *Anti*; to fluew the immorality, and unlawfulness of them, and their contrariety to the precepts of the gospel. See ANTI.

It is further objected to this kind of *satyr*, that a publick detection, far from producing the effect it is designed for, reformation, is apt to drive men to desperation, and harden them in their course. The excellent author of the treatise of the *Government of the Tongue*, speaking of uncharitable truths, says, a discovery of this kind serves not to reclaim, but enrage the offender, and precipitate him into farther degrees of ill. Modesty and fear of shame is one of those natural restraints which the wisdom of heaven has put on mankind: and he who once stumbles, may yet by a check of that bridle recover himself again. But when by a publick detection he is fallen under that infamy he feared, he will be then apt to discard all caution, and to think he owes himself the utmost pleasures of vice at the price of his reputation.—Nay, perhaps he advances farther, and sets up for a reversed sort of fame, by being eminently wicked: thus he who before was but a clandestine disciple, becomes a doctor of impiety.—Doubtless it was this sort of reasoning that induced our wise legislators lately to repeal the law which put the brand of infamy in the face of felons.—In effect, where crimes are enormous, the delinquent deserves little pity, yet the reporter may deserve less.—V. *Tat.* N<sup>o</sup> 74. T. 2. p. 154. *seq.* See also N<sup>o</sup> 76. p. 166. *seq.*

*Great SATYR*.—Casaubon makes a distinction between the *satyrical* poetry of the Greeks, and the *satyr* of the Romans, which he maintains was peculiar to themselves; in which also he seems to be justified by Quintilian. *Satyræ quidem ista nostra est, in qua primus insignem laudem adeptus Lucilius*. Which fame Lucilius is also expressly said by Horace to have been the first *satyrical* poet.

—*Est Lucilius ausus*

*Primus in hanc sperit componere carmina morem.*

For a like reason Horace calls *satyr*, *Græcis intuldem carmen*, a sort of poetry unknown to the Greeks. Spanheim in his fine preface to the *Cæsars* of the emperor Julian, has shown five or six essential differences between those two poems. The Greeks chiefly reprehended vice, &c. in their dramas though they had also a sort of narrative poems called *Silli*, like the Roman and our *satyrs*. Their *Silli* were cutting, or sarcastick poems, as may be easily seen by the fragments of Timon's *Silli*; with this difference, that the Greek *Silli* were parodies from one end to the other, which cannot be said of the Roman *satyr*. Or if we find sometimes a parody, it is what the poet did not design, and consequently the parody does not make the essence of *satyr*, as it does that of the *Silli*.—V. *Quint. Inst. Orat.* l. 10. c. 1. <sup>1</sup> *Hor. Sat.* s. l. 2. v. 62. <sup>2</sup> *I. Casaub. de satyrica Græcor. Poesi & Romanor. satyra.* l. 2. Par. 1605.—<sup>3</sup> See *Mafceus. Excer. Prior. in Horat. satyr.* §. 10. *Langheirich Diff. de Timon. Silligraph. Lips.* 1720 & 1721. *Stoll. Intrud. ad Hist. Liter.* P. l. c. 5. §. 38. Scaliger, notwithstanding all this, followed by some of the latest and best critics, scruples not to derive the *satyrical* poetry of the Latins from that of the Greeks. According to these authors, *satyr* in its origin was a sort of interlude in tragedy, wherein goat-footed *satyrs* were introduced to

alleviate the distress, and with their jeers and humour diversify the solemnity of the tragick scene: much like the mimes in comedy, and the feccancies in the Atellan sports.

See SATYRICAL.

At first it was only in the tragedies exhibited in the feasts of Bacchus, that satyrs, the supposed companions and priests of that god, were introduced: but afterwards they made a part in the solemnities of the other deities. So that satyr, in its first institution, was wholly dramatick.—V. Scallig. *Pœt.* l. 1. c. 11 & 12. See also the article SATYRICAL.

Roman SATYR.—Dacier, after Caubon, traces the institution of the Roman satyr very minutely; and distinguishes three species or states of it: the first dramatick, the second narrative, the third that called the *Varronian* or *Menippean* satyr. The ancient Romans had been without any feccal entertainments for almost four hundred years; till chance and merriment in one of their festivals gave rise to the saturnine and feccanine verses, which for some years supplied the place of theatrical performances. These verses were rude, and without any measure, being extemporary, and the productions of a savage people, who had no other instructors than the fumes of wine. Accordingly they were studded with gross raileries, and accompanied with gesticulations and dances. An idea of them may be formed by conceiving a knot of country fellows, dancing in a hobbling manner, talking about their home-spun jokes, and exposing each other's failings. Thus Horace, *Epist.* l. 1. lib. 2.

*Peccamina per hanc inventa licentia morem*

*Versibus alteris approbata rusticis fudit.*

The ancient Roman satyrs then were a sort of innocent farces, where spectators and actors were indifferently rallied.—And thus they continued till the time of Livius Andronicus, who first attempted to write plays in imitation of the Greeks. This new entertainment appearing more noble and perfect, drew crowds of spectators, which occasioned the satyrs to be neglected for some time; but they were afterwards resumed, and tacked to the ends of comedies, much like the modern farces. They were annexed more peculiarly to the Atellan pieces, and on this occasion changed their name satyrs for that of *evodia*, which they ever after retained. See EXORDIUM.

After Livius Andronicus, Ennius having observed the eagerness of the Romans for satyr, imagined that poems not accommodated to the theatre, but retaining the gall, railery and pleasantry of the theatrical satyr, would not fail of success. Accordingly, he wrote discourses under the title of satyrs, in which he took the liberty of mixing several sorts of verse together, as hexameters with iambick trimeters, and trochaic tetrameters. In these pieces were found the same variety, railery, allusions, fables, and even dialogue, in a word every thing that constituted the character and beauty of the first satyrs, except the dancing and music. Pacuvius succeeded, who also wrote satyrs in imitation of his uncle, or according to others, his grandfather Ennius. When Pacuvius was in his prime, Lucilius was born, who also composed satyrs, somewhat of a new turn, endeavouring to imitate the character of the ancient Greek comedy, of which the Romans had but an imperfect image in their own satyrs. This seems to be what Horace meant when he said, *satyr* l. 1. lib. 2.

*Quid, cum est Lucilius ausus*

*Primum in hanc operis componere carmina morem.*

He could not mean, that the Romans had no satyrs before Lucilius, since that poet was preceded by Ennius and Pacuvius, whom he imitated. Horace's design was only to hint that Lucilius's manner and turn was new, that he had embellished this poem, inasmuch that he might be looked upon as its first author. But in fact, Lucilius only added to it a little more politeness and salt, without other alteration. And though like Ennius he did not mix together several sorts of verse in the same piece, yet he composed different poems, some of which were entirely hexameter, others iambic, and others trochaic, as appears from his fragments.

The third kind of satyr was the *Varronian* or *Menippean*, so called from its author Varro, the most learned of the Romans, and because in this he imitated the manner of Menippus the Gadarenean, a cynic philosopher.

This satyr was not only a miscellany of different sorts of verse, but was also interlarded with prose, and Greek, and Latin.—Seneca's poem on the death of Claudius, Petronius's Satyricon, Lucian's Dialogues, the Golden Ass of Apuleius, and the Cæsars of the emperor Julian, are so many satyrs in the *Varronian* taste.—To the same head may also be referred the Catholicon of Spain, the Moric Encomium of Erasmus, the Don Quixot of Cervantes's, the advertisements from Parassius of Boccacini, the Tale of a Tub by Dr. S. &c.—V. Dacier *Discours sur la Satire*, in *Mém. de Litt. de l'Acad. R. des Inscri.* T. 3. p. 246. seq. And in the preface to his version of Horace's satyrs. V. Rapin *Reflex. sur la poët.* en *Partic.* §. 28. *Ouvr. Divers.* T. 2. p. 205. seq. SATYRICAL, something relating to, or that partakes of the nature of satyr. See SATYR.

We have satyric poets; satyric preachers, as South; satyrical historians, as Burnet and Mezeray; satyrical philosophers, as Apuleius and Montaign.—In the heathen theo-

gy, we find a satyric god, viz. Momus: Homer in his *Theristes* gives the character of a satyric courier. The Dutch have been charged with satyric prints, and medals; which have sometimes cost them dear.

Satyric poetry had its origin at Athens; though its perfection was owing to the Romans. According to father Mourgues, and Bianchini, it was at first a sort of tragedy acted at the feasts of Bacchus, wherein satyrs were introduced conversing with heroes. Burette rather takes it for a sort of pastoral farce tacked to the ends of tragedies. One of the chief ornaments of it was a wild, grotesque sort of dance performed by satyrs, and called *Sicinnis*. See DANCING.—Mourg. *Traité de la Poët. Franc.* c. 4. *Mém. de Trev.* Nov. 1723. p. 2149. ° Bianchini *Della Satira Italiana*, P. l. p. 5. *Jeqq.* *Giorn. de Lettere d'Ital.* T. 20. p. 203. ° Buret. *Mém.* 2. *sur la Danse*, in *Mém. Acad. R. Inscrip.* T. 2. p. 163. ° Buret. l. c. *Avellan. Præstit.* apud *Bibl. Clavis.* T. 22. p. 24.—The satyric shows of the Greeks were through maquerades: the actors herein were disguised variously, some in the habits of satyrs, Sileni, Centaurs, Memades, and other of Bacchus's crew; while others personated giants, cyclopes, monsters, and even beasts: the whole making a medley more romantick and extravagant than any thing on the modern stage, unless perhaps some of our late grotesque pantomime entertainments.—The only piece of the kind now extant is the *ΚΥΚΛΩΣ* of Euripides.—V. Boind. *sur les Mafq. & Habits de Theatr. des Anc.* in *Mém. Acad. R. Inscri.* T. 5. p. 176, & 188. ° V. Fabric. *Bibl. Græc.* l. 2. c. 18. §. 2. p. 645.

SATYRIC FOUNTAIN. See the article FOUNTAIN.  
SPINOZISM, or SPINOZISM, the doctrine of Spinoza; or, atheism and pantheism proposed after the manner of Spinoza. See ATHEISM.

The great principle of Spinozism is, that there is nothing properly and absolutely existing, but matter, and the modifications of matter; among which are even comprehended, thoughts, abstract and general ideas, comparisons, relations, combinations of relations, &c. See MATTER, SUBSTANCE, &c.

Benedict Spinoza, or *Esplanza*, was a man well known in Holland. He was born a Jew, at Amsterdam; but did not make profession of any religion, either the Jewish or Christian.—He composed several books in Latin; the most celebrated whereof, is his *Tractatus Theologico-Politicus*, wherein he overturns the foundation of all religion; the book, accordingly, was condemned by a publick decree of the states; though it has since been sold publicly, and even reprinted, both in Latin and French, in that country, and lately in English at London.

Spinoza, here, insinuates, that all religions are only political engines, calculated for the publick good; to render the people obedient to magistrates, and to make them practise virtue and morality.

He does not here lay down his notion of the Deity openly; but contents himself with suggesting it.—In his *Ethicks*, published among his posthumous works, he is more open and explicit; maintaining, that God is not, as we imagine him, an infinite, intelligent, happy and perfect Being; nor any thing, but that natural virtue, or faculty, which is diffused throughout all creatures. See NATURE.

Numbers have undertaken to refute Spinoza's doctrine; but all very weakly, except what we have in Dr. Clarke's sermons at Boyle's lecture.—Witius in Holland, Majus in Germany, and de la Mothe in England, wrote against his *Tractatus*; but Bredenburg, according to M. Bayle, succeeded best on the subject; who, however, is said to have afterwards been a convert to Spinozism, and to have written a demonstration of the truth of it.—The writers against Spinoza's *Ethicks*, are Veltshuyfen, in his *Tractatus de cultu naturali & origine moralitatis*; de Verfe, in *l'Espie convaincu, ou dissertation contre Spinoza*; Poiret in *Fundamento atheismi eversæ*; Wittichius in *Anti-Spinoza*; Lami in *Novæ Atheismi recensio*; Jaquelot in *Dissertation sur l'existence de Dieu*; Jent in *Examen Philosophicum sectæ definitivis partis primæ Ethicæ Bened. Spinozæ*. Besides many others enumerated in Colerus's life of Spinoza, p. 132. Jenichen's *Hist. Spinozismi Leonbæusianæ*, p. 58. Jeqq. Baddus's *Theses de Atheismo & Superstitione*, cap. 1. §. 26. and Fabricius's *Syllab. Script. de veritate religionis Christianæ*, p. 357. seq.

Spinoza, in his *Tractatus* above-mentioned, is very full on the subject of the authors of the scriptures; and endeavours to shew, that the Pentateuch is not the work of Moses; contrary to the common opinion, both of the Jews, and Christians. He has also his particular sentiments, as to the authors of the other books.—This part of the work has been answered by M. Hort, in his *Demonstratio Evangelicæ*; and by M. Simon, in his *Hist. Crit. du vieux Test.* See PENTATEUCH.

Spinozism is a species of naturalism, or pantheism, or hylotheism, as it is sometimes called, i. e. of the dogma which allows of no other God but nature, or the universe; and, therefore, makes matter to be God.—Accordingly, Buddeus, in a dissertation of *Spinozism ante Spinozam*, proves at large, that Spinoza's doctrine of God and the world, is far from being his own invention, but that it had been held by many

many philosophers of different sects, both among the Chaldeans and Greeks.—It is certain, the opinion of the Stoicks, and those who held an *animæ mundi*, was not far from it. See *ANIMA mundi*. Lucan introduces Cato discomfiting thus:

*Esse Dei sedes nisi terra, et pontus, et air,  
Et caelum, et virtus? Superis quid quovism ultra!  
Jupiter est quocumq; videt, quocumq; movetur.*

Luc. Phars. l. 9. v. 578.

Strato likewise, and others among the Peripateticks, maintained something very like it; and what is more, though no ancient sect seems farther removed from *Spinozism* than the Platonic, as they attributed the greatest freedom to God, and carefully distinguished him from matter; yet Gundlingius has proved at large, that Plato gave matter much the same origin with *Spinoza*.—But the sect that approached nearest to *Spinozism*, was that which taught that all things were one, as Xenophanes the Colophonian, Parmenides Melissus, and especially Zeno Eleates, whence it obtained the name of the *Eleatic system of atheism*.—To the same may also be reduced the opinion of those, who held the first matter for God, as Almaricus and David of Dinantum. Add, that the sect of Foe in China and Japan, that of the Souh in Persia, and that of the Zindikites in Turkey, are found to philosophize much after the manner of *Spinoza*. The chief articles in *Spinoza's* system are reducible to these.—That there is but one substance in nature; and that this only substance is endued with an infinite number of attributes, among which are extension and cognition.—That all the bodies in the universe are modifications of this substance considered as it is extended; and that all the souls of men are modifications of the same substance considered as cognitive.—That God is a necessary and infinitely perfect being, and is the cause of all things that exist, but is not a different being from them.—That there is but one being and one nature; and that this nature produces within itself, by an immanent act, all those which we call creatures.—And that this being is at the same time both agent and patient, efficient cause and subject; but that he produces nothing but modifications of himself.

This is the Deity made the sole agent as well as patient in all evil, both physical and moral, that called *malum pæne*, as well as *malum culpæ*: a doctrine fraught with more impieties than all the heathen poets have published concerning their Jupiter, Venus, Bacchus, &c.—What seems to have led *Spinoza* to frame this system, was the difficulty of conceiving, either that matter is eternal, and different from God, or that it could be produced from nothing, or that an infinite and free being could have made a world such as this.—A matter that exists necessarily, and which nevertheless is void of activity, and subject to the power of another principle, is an object that flurries our understanding; as there seems no agreement between the three conditions.—A matter created out of nothing is no less inconceivable, whatever efforts we make to form an idea of an act of the will that can change what before was nothing, into real substance. Besides its being contrary to that known maxim of philosophers, *ex nihilo nihil fit*.—In fine, that an infinitely good, holy, free being, who could have made his creatures good, and happy, should rather chuse to have them wicked, and eternally miserable, is no less incomprehensible; and the rather as it seems difficult to reconcile the freedom of man with the quality of a being made out of nothing.

These appear to have been the difficulties which led *Spinoza* to search for a new system, wherein God should not be distinct from matter, and wherein he should act necessarily, and to the extent of all his power, not out of himself [ad extra] but within himself.—But it is certain, if the new system rescue us from some difficulties, it involves us in others much greater.—For,

1<sup>o</sup>. It is impossible the universe should be but one substance; since every thing that is extended must necessarily have parts; and what has parts must be compounded. And as the parts of extension do not subsist in each other, it follows, either that extension in the general is not substance, or that every part of extension is a different substance. Now, according to *Spinoza*, extension in general is an attribute of substance. And he allows, with other philosophers, that the attributes of substance do not differ really from the substance itself. He must therefore allow, that extension in general is substance: whence it will follow, that every part of extension is a particular substance: which overturns the whole system. If it be objected, that *Spinoza* does not consider different bodies, as different parts of extension, but as different modifications of it; the distinction between *part* and *modification*, we doubt will hardly save him. For let him avoid the word *part* as much as he please, and substitute that of *modality* or *modification* for it, the doctrine will amount to much the same: the characters of diversity are not less real and evident, when matter is divided into modifications, than when it is divided into parts. The idea of the universe will still be that of a compound being, or an aggregate of several substances. For proof of this, it may be observed, that modalities are beings which cannot exist without the substance which modifies them; whence it follows, that the substance must be found wherever its modalities are found; and even that the substance must be multiplied in proportion as the number of incompatible modifications is multiplied: so that wherever there are five or six of these modifications, there must be five or six substances. It is evident,

that a square figure, and a circular figure are incompatible in the same piece of wax. Whence it follows, that the substance modified by the square figure cannot be the same substance with that modified by the round figure. So when I see a round and a square table in a room, I may safely assert, that the extension which makes the subject of the round table is a distinct substance from the extension which is the subject of the square table: since otherwise it would follow, that the square and round figures might be found in the same subject at the same time.—The subject, therefore, that is modified by two figures, must be two substances.

2<sup>o</sup>. If it be absurd to make God extended, as this robs him of his simplicity, and makes him be composed of parts; it is still worse to reduce him to the condition of matter, the lowest of all beings, and that which most of the ancient philosophers ranked immediately above nothing: matter! the theatre of all sorts of changes, the field of battle of contrary causes, the subject of all corruptions and generations; in a word, the being most incompatible with the immutability of the Deity!

The *Spinozists*, indeed, maintain, that it is not susceptible of any division; but the argument they allege is proof of it, we have elsewhere shewn to be false: it is, that, for matter to be divided, it is necessary that one of the parts be separated from the other by a void space, which is impossible: since there is no vacuum in nature. See *VACUUM*.

3. If *Spinozism* appear extravagant when we consider God as the subject of all the mutations, corruptions and generations in bodies; it will be found still worse, when we consider him as the subject of all the modifications of thinking. It is no small difficulty, to unite extension and thinking in the same substance; since it is not an union like that of two metals, or of water and wine, that will serve the purpose: these last require only juxtaposition; whereas to combine thinking and extension requires an identity: thinking and extended are two attributes identified with the substance; and consequently are identified with each other, by the fundamental rule of all logic.

Again, when we say, that a man desires this, affirms that, likes that, &c. we make all these attributes fall on the substance of his mind, not on his thoughts, which are only accidents or modifications of it. If therefore what *Spinoza* advances be true, that men are modalities of God; it would be false to say, Peter desires, likes, wills, &c. since in reality, on this system, it is God that desires, wills, &c. and consequently all the denominations which arise from the thoughts, desires, &c. of men, fall properly and physically on the substance of God. From whence it also follows, that God affirms and denies, loves and hates, wills and kills the same thing, at the same time, and under the same conditions: contrary to the great principle of reasoning: *opposita sunt que se negat de se invicem, nec di eodem tertio secundum idem, ad idem, eodem modo atq; tempore veri affirmari possunt*; which must be false, if *Spinozism* be true: since it cannot be denied but some men love and affirm what others hate and deny, under all the conditions expressed in the rule. 4<sup>o</sup>. But if it be physically absurd, to say the same subject is modified at the same time with all the different thoughts of all men; it is horrible when we consider it in a moral light. Since it will follow, that the infinite, the all-perfect Being is not constant, is not the same one moment, but is eternally possessed even with contrary passions; all the uniformity in him in this respect, will be, that for one good and wise thought he will have twenty foolish and wicked ones. He will not only be the efficient cause of all the errors, iniquities and impurities of men, but also the passive subject of them, the *subjectum infortunii*. He must be united with them in the closest manner that can be conceived, even by a penetrative union, or rather in identity, since the mode is not really distinct from the substance modified.

## T

**T**RVERSE, in law, denotes the denial of some matter of fact, alleged to be done in a declaration, or pleadings; upon which the other side coming and maintaining that it was done, issue is joined for the cause to proceed to trial. See *ISSUE*, and *TRIAL*. The formal words of a *traverse* are in the law French, *sans ceo*, in Latin, *absque hoc*, and in English, *without that*, &c.

An answer, says West (speaking of bills in chancery) is that which the defendant pleads or swears in bar to avoid the plaintiff's bill or action, either by confession and avoiding, or by denying and traversing the material parts thereof. A replication is the plaintiff's reply to the defendant's answer, which must affirm and pursue his bill, and confess and avoid, deny or traverse the defendant's answer.

A plea is sought which neither traverses nor confesseth the plaintiff's title, &c. Every matter in fact alleged by the plaintiff, may be traversed by the defendant, but not matter of law, or what is part matter of law, and part matter of fact; nor may a record be traversed, as this is not to be tried by a jury.

If a matter be expressly pleaded in the affirmative, which is expressly answered in the negative, no traverse is necessary, there being a sufficient issue joined: also where the defendant hath given a particular answer in his plea, to all the material points contained in the declaration, he need not take a traverse; for that when the thing is answered, there needs no further denial.

**T**RVERSE of an indictment or presentment, is the contradicting or denying some chief point of it, and taking issue thereon. See *INDICTMENT*, and *PRESENTMENT*.—Thus, in a presentment against a person for a highway overflowed with water, for default of scouring a ditch, &c. he may either traverse the matter, by alleging that there is no highway, or that the ditch is sufficiently scoured; or he may traverse the cause, viz. by alleging that he hath not the land, or that he and they whose estate &c. have not used cleanse the ditch.

**T**RVERSE of an office, is the proving that an inquisition made of lands or goods is defective, and untruly made. See *OFFICE*, and *INQUISITION*.

No person shall traverse an office, unless he can make to himself a good right and title: and if one be admitted to traverse an office, this admission of the party to the traverse, supposes the title to be in him, or else he had no cause of traverse.
